IEEE Std 1003.1™, 2013 Edition

The Open Group Technical Standard
Base Specifications, Issue 7
incorporates IEEE Std 1003.1™-2008, IEEE Std 1003.1™-2008/Cor 1-2013

Standard for Information Technology— Portable Operating System Interface (POSIX®)

Base Specifications, Issue 7

Sponsor

Portable Applications Standards Committee

of the

IEEE Computer Society

and

The Open Group

Abstract

POSIX.1-2008 is simultaneously IEEE Std 1003.1™-2008 and The Open Group Technical Standard Base Specifications, Issue 7. This 2013 Edition includes IEEE Std 1003.1-2008/Cor 1-2013 incorporated into IEEE Std 1003.1-2008 (the base document). The Technical Corrigendum addresses problems discovered since the approval of IEEE Std 1003.1-2008.

POSIX.1-2008 defines a standard operating system interface and environment, including a command interpreter (or “shell”), and common utility programs to support applications portability at the source code level. POSIX.1-2008 is intended to be used by both application developers and system implementors and comprises four major components (each in an associated volume):

- General terms, concepts, and interfaces common to all volumes of this standard, including utility conventions and C-language header definitions, are included in the Base Definitions volume.
- Definitions for system service functions and subroutines, language-specific system services for the C programming language, function issues, including portability, error handling, and error recovery, are included in the System Interfaces volume.
- Definitions for a standard source code-level interface to command interpretation services (a “shell”) and common utility programs for application programs are included in the Shell and Utilities volume.
- Extended rationale that did not fit well into the rest of the document structure, which contains historical information concerning the contents of POSIX.1-2008 and why features were included or discarded by the standard developers, is included in the Rationale (Informative) volume.

The following areas are outside the scope of POSIX.1-2008:

- Graphics interfaces
- Database management system interfaces
- Record I/O considerations
- Object or binary code portability
- System configuration and resource availability

POSIX.1-2008 describes the external characteristics and facilities that are of importance to application developers, rather than the internal construction techniques employed to achieve these capabilities. Special emphasis is placed on those functions and facilities that are needed in a wide variety of commercial applications.

Keywords

application program interface (API), argument, asynchronous, basic regular expression (BRE), batch job, batch system, built-in utility, byte, child, command language interpreter, CPU, extended regular expression (ERE), FIFO, file access control mechanism, IEEE 1003.1™, input/output (I/O), job control, network, parent, portable operating system interface (POSIX®), shell, stream, string, synchronous, system, thread, X/Open System Interface (XSI)

Permission to reproduce all or any part of this standard must be with the consent of both copyright holders and may be subject to a license fee. Both copyright holders will need to be satisfied that the other has granted permission. Requests should be sent by email to austin-group-permissions@opengroup.org.

Please be advised IEEE Std 1003.1, 2013 Edition is for convenience of the user only. It does not supersede the individual published documents listed below:

IEEE Std 1003.1™-2008, Standard for Information Technology—Portable Operating System Interface (POSIX®)

IEEE Std 1003.1™-2008/Cor 1-2013, IEEE Standard for Information Technology—Portable Operating System Interface (POSIX®), Technical Corrigendum 1

Notice and Disclaimer of Liability Concerning the Use of IEEE Documents: IEEE Standards documents are developed within the IEEE Societies and the Standards Coordinating Committees of the IEEE Standards Association (IEEE-SA) Standards Board. IEEE develops its standards through a consensus development process, approved by the American National Standards Institute, which brings together volunteers representing varied viewpoints and interests to achieve the final product. Volunteers are not necessarily members of the Institute and serve without compensation. While IEEE administers the process and establishes rules to promote fairness in the consensus development process, IEEE does not independently evaluate, test, or verify the accuracy of any of the information or the soundness of any judgments contained in its standards.

Use of an IEEE Standard is wholly voluntary. IEEE disclaims liability for any personal injury, property or other damage, of any nature whatsoever, whether special, indirect, consequential, or compensatory, directly or indirectly resulting from the publication, use of, or reliance upon any IEEE Standard document.

IEEE does not warrant or represent the accuracy or content of the material contained in its standards, and expressly disclaims any express or implied warranty, including any implied warranty of merchantability or fitness for a specific purpose, or that the use of the material contained in its standards is free from patent infringement. IEEE Standards documents are supplied “**AS IS**”.

The existence of an IEEE Standard does not imply that there are no other ways to produce, test, measure, purchase, market, or provide other goods and services related to the scope of the IEEE standard. Furthermore, the viewpoint expressed at the time a standard is approved and issued is subject to change brought about through developments in the state of the art and comments received from users of the standard. Every IEEE standard is subjected to review at least every ten years. When a document is more than ten years old and has not undergone a revision process, it is reasonable to conclude that its contents, although still of some value, do not wholly reflect the present state of the art. Users are cautioned to check to determine that they have the latest edition of any IEEE standard.

In publishing and making its standards available, IEEE is not suggesting or rendering professional or other services for, or on behalf of, any person or entity. Nor is IEEE undertaking to perform any duty owed by any other person or entity to another. Any person utilizing any IEEE Standards document should rely upon his or her own independent judgment in the exercise of reasonable care in any given circumstances or, as appropriate, seek the advice of a competent professional in determining the appropriateness of a given IEEE standard.

Translations: The IEEE consensus development process involves the review of documents in English only. In the event that an IEEE standard is translated, only the English version published by IEEE should be considered the approved IEEE standard.

Official Statements: A statement, written or oral, that is not processed in accordance with the IEEE-SA Standards Board Operations Manual shall not be considered the official position of IEEE or any of its committees and shall not be considered to be, nor be relied upon as, a formal position of IEEE. At lectures, symposia, seminars, or educational courses, an individual presenting information on IEEE standards shall make it clear that his or her views should be considered the personal views of that individual rather than the formal position of IEEE.

Comments on Standards: Comments for revision of IEEE Standards documents are welcome from any interested party, regardless of membership affiliation with IEEE. However, IEEE does not provide consulting information or advice pertaining to IEEE Standards documents. Suggestions for changes in documents should be in the form of a proposed change of text, together with appropriate supporting comments. Since IEEE standards represent a consensus of concerned interests, it is important to ensure that any responses to comments and questions also receive the concurrence of a balance of interests. For this reason, IEEE and the members of its societies and Standards Coordinating Committees are not able to provide an instant response to comments or questions except in those cases where the matter has previously been addressed. Any person who would like to participate in evaluating comments or revisions to an IEEE standard is welcome to join the relevant IEEE working group at <http://standards.ieee.org/develop/wg/>.

Comments on standards should be submitted to the following address:

Secretary, IEEE-SA Standards Board
445 Hoes Lane
Piscataway, NJ 08854
USA

Photocopies: Authorization to photocopy portions of any individual standard for internal or personal use is granted by The Institute of Electrical and Electronics Engineers, Inc., provided that the appropriate fee is paid to the Copyright Clearance Center. To arrange for payment of the licensing fee, please contact Copyright Clearance Center, Customer Service, 222 Rosewood Drive, Danvers, MA 01923 USA; +1 978 750 8400. Permission to photocopy portions of any individual standard for educational classroom use can also be obtained through the Copyright Clearance Center.

The Open Group

The Open Group is a global consortium that enables the achievement of business objectives through IT standards. With more than 400 member organizations, The Open Group has a diverse membership that spans all sectors of the IT community – customers, systems and solutions suppliers, tool vendors, integrators, and consultants, as well as academics and researchers – to:

- Capture, understand, and address current and emerging requirements, and establish policies and share best practices
- Facilitate interoperability, develop consensus, and evolve and integrate specifications and open source technologies
- Offer a comprehensive set of services to enhance the operational efficiency of consortia
- Operate the industry's premier certification service

Further information on The Open Group is available at www.opengroup.org.

The Open Group publishes a wide range of technical documentation, most of which is focused on development of Open Group Standards and Guides, but which also includes white papers, technical studies, certification and testing documentation, and business titles. Full details and a catalog are available at www.opengroup.org/bookstore.

Readers should note that updates – in the form of Corrigenda – may apply to any publication. This information is published at www.opengroup.org/corrigenda.

Notice to users

Laws and regulations

Users of IEEE Standards documents should consult all applicable laws and regulations. Compliance with the provisions of any IEEE Standards document does not imply compliance to any applicable regulatory requirements. Implementers of the standard are responsible for observing or referring to the applicable regulatory requirements. IEEE does not, by the publication of its standards, intend to urge action that is not in compliance with applicable laws, and these documents may not be construed as doing so.

Copyrights

This document is copyrighted by the IEEE and The Open Group. It is made available for a wide variety of both public and private uses. These include both use, by reference, in laws and regulations, and use in private self-regulation, standardization, and the promotion of engineering practices and methods. By making this document available for use and adoption by public authorities and private users, the IEEE and The Open Group do not waive any rights in copyright to this document.

Updating of IEEE documents

Users of IEEE Standards documents should be aware that these documents may be superseded at any time by the issuance of new editions or may be amended from time to time through the issuance of amendments, corrigenda, or errata. An official IEEE document at any point in time consists of the current edition of the document together with any amendments, corrigenda, or errata then in effect. In order to determine whether a given document is the current edition and whether it has been amended through the issuance of amendments, corrigenda, or errata, visit the IEEE-SA website at <http://standards.ieee.org/index.html> or contact the IEEE at the address listed previously. For more information about the IEEE Standards Association or the IEEE standards development process, visit the IEEE-SA website at <http://standards.ieee.org/index.html>.

Errata

Errata, if any, for this and all other standards can be accessed at the following URL: <http://standards.ieee.org/findstds/errata/index.html>. Users are encouraged to check this URL for errata periodically.

Patents

Attention is called to the possibility that implementation of this standard may require use of subject matter covered by patent rights. By publication of this standard, no position is taken by the IEEE with respect to the existence or validity of any patent rights in connection therewith. If a patent holder or patent applicant has filed a statement of assurance via an Accepted Letter of Assurance, then the statement is listed on the IEEE-SA website at <http://standards.ieee.org/about/sasb/patcom/patents.html>. Letters of Assurance may indicate whether the Submitter is willing or unwilling to grant licenses under patent rights without compensation or under reasonable rates, with reasonable terms and conditions that are demonstrably free of any unfair discrimination to applicants desiring to obtain such licenses.

Essential Patent Claims may exist for which a Letter of Assurance has not been received. The IEEE is not responsible for identifying Essential Patent Claims for which a license may be required, for conducting inquiries into the legal validity or scope of Patents Claims, or determining whether any licensing terms or conditions provided in connection with submission of a Letter of Assurance, if any, or in any licensing agreements are reasonable or non-discriminatory. Users of this standard are expressly advised that determination of the validity of any patent rights, and the risk of infringement of such rights, is entirely their own responsibility. Further information may be obtained from the IEEE Standards Association.

Participants

The Austin Group

IEEE Std 1003.1-2008 was prepared by the Austin Group, sponsored by the Portable Applications Standards Committee of the IEEE Computer Society, The Open Group, and ISO/IEC JTC 1/SC 22. At the time of approval, the membership of the Austin Group was as follows:

Andrew Josey, *Chair*

Donald W. Cragun, *Organizational Representative, IEEE PASC*

Nicholas Stoughton, *Organizational Representative, ISO/IEC JTC 1/SC 22*

Mark S. Brown, *Organizational Representative, The Open Group*

Cathy Fox, *Technical Editor*

The Open Group

When The Open Group approved the Base Specifications, Issue 7 on 24 July 2008, the membership of the Base Working Group was as follows:

Andrew Josey, *Chair*

Mark S. Brown, *Vice Chair and Austin Group Liaison*

Cathy Fox, *Technical Editor*

Base Working Group Members

Basabi Bhattacharya	Donald W. Cragun	Robbin Kawabata
Mark S. Brown	Ulrich Drepper	Craig Mohrman
David Butenhof	Lawrence D.K.B. Dwyer	Nicholas Stoughton
April Chin	Cynthia Eastham	William L. Toth
Geoff Clare	Roger Faulkner	Kenjiro Tsuji
David N. Clissold	Carol Fields	Kevin Van Vechten

IEEE

When the IEEE Standards Board approved IEEE Std 1003.1-2008 on 26 September 2008, the membership of the committees was as follows:

Portable Application Standards Committee (PASC)

Lowell G. Johnson, *Chair*

Joseph M. Gwinn, *Vice Chair*

Jay Ashford, *Functional Chair (Balloting)*

Andrew Josey, *Functional Chair (Interpretations)*

Curtis Royster Jr., *Functional Chair (Logistics)*

Nicholas Stoughton, *Secretary*

Balloting Committee

The following members of the individual balloting committee voted on this standard. Balloters may have voted for approval, disapproval, or abstention.

William J. Ackerman	Andrew Fieldsend	Gary Michel
Adewole Akpose	Michael Geipel	Bruce Muschlitz
Butch Anton	Randall Groves	Michael S. Newman
Jay Ashford	Scott Gudgel	Peter Petrov
Hugh Barrass	Joseph M. Gwinn	Vikram Punj

Yatin Trivedi
Phil Winston
Yu Yuan

*Member Emeritus

Also included are the following nonvoting IEEE-SA Standards Board liaisons:

Richard DeBlasio, *DOE Representative*

Michael Janezic, *NIST Representative*

Don Messina, *IEEE Standards Program Manager, Document Development*

Michael Kipness, *IEEE Standards Program Manager, Technical Program Development*

Introduction

This introduction is not part of IEEE Std 1003.1, 2013 Edition, Standard for Information Technology – Portable Operating System Interface (POSIX).

This standard was developed, and is maintained, by a joint working group of members of the IEEE Portable Applications Standards Committee, members of The Open Group, and members of ISO/IEC Joint Technical Committee 1. This joint working group is known as the Austin Group.^A

The Austin Group arose out of discussions amongst the parties which started in early 1998, leading to an initial meeting and formation of the group in September 1998. The purpose of the Austin Group is to develop and maintain the core open systems interfaces that are the POSIX[®] 1003.1 (and former 1003.2) standards, ISO/IEC 9945, and the core of the Single UNIX Specification.

The approach to specification development has been one of “write once, adopt everywhere”, with the deliverables being a set of specifications that carry the IEEE POSIX designation, The Open Group Technical Standard designation, and an ISO/IEC designation.

This unique development has combined both the industry-led efforts and the formal standardization activities into a single initiative, and included a wide spectrum of participants. The Austin Group continues as the maintenance body for this document.

Anyone wishing to participate in the Austin Group should contact the chair with their request. There are no fees for participation or membership. You may participate as an observer or as a contributor. You do not have to attend face-to-face meetings to participate; electronic participation is most welcome. For more information on the Austin Group and how to participate, see www.opengroup.org/austin.

Background

The developers of POSIX.1-2008 represent a cross-section of hardware manufacturers, vendors of operating systems and other software development tools, software designers, consultants, academics, authors, applications programmers, and others.

Conceptually, POSIX.1-2008 describes a set of fundamental services needed for the efficient construction of application programs. Access to these services has been provided by defining an interface, using the C programming language, a command interpreter, and common utility programs that establish standard semantics and syntax. Since this interface enables application developers to write portable applications – it was developed with that goal in mind – it has been designated POSIX^B, an acronym for Portable Operating System Interface.

Although originated to refer to the original IEEE Std 1003.1-1988, the name POSIX more correctly refers to a *family* of related standards: IEEE Std 1003.*n* and the parts of ISO/IEC 9945. In earlier editions of the IEEE standard, the term POSIX was used as a synonym for IEEE Std 1003.1-1988. A preferred term, POSIX.1, emerged. This maintained the advantages of readability of the symbol “POSIX” without being ambiguous with the POSIX family of standards.

^A The Austin Group is named after the location of the inaugural meeting held at the IBM facility in Austin, Texas in September 1998.

^B The Name POSIX was suggested by Richard Stallman. It is expected to be pronounced *pahz-icks*, as in *positive*, not *poh-six*, or other variations. The pronunciation has been published in an attempt to promulgate a standardized way of referring to a standard operating system interface.

Audience

The intended audience for POSIX.1-2008 is all persons concerned with an industry-wide standard operating system based on the UNIX system. This includes at least four groups of people:

- Persons buying hardware and software systems
- Persons managing companies that are deciding on future corporate computing directions
- Persons implementing operating systems, and especially
- Persons developing applications where portability is an objective

Purpose

Several principles guided the development of POSIX.1-2008:

- **Application-Oriented** – The basic goal was to promote portability of application programs across UNIX system environments by developing a clear, consistent, and unambiguous standard for the interface specification of a portable operating system based on the UNIX system documentation. POSIX.1-2008 codifies the common, existing definition of the UNIX system.
- **Interface, Not Implementation** – POSIX.1-2008 defines an interface, not an implementation. No distinction is made between library functions and system calls; both are referred to as functions. No details of the implementation of any function are given (although historical practice is sometimes indicated in the RATIONALE section). Symbolic names are given for constants (such as signals and error numbers) rather than numbers.
- **Source, Not Object, Portability** – POSIX.1-2008 has been written so that a program written and translated for execution on one conforming implementation may also be translated for execution on another conforming implementation. POSIX.1-2008 does not guarantee that executable (object or binary) code will execute under a different conforming implementation than that for which it was translated, even if the underlying hardware is identical.
- **The C Language** – The system interfaces and header definitions are written in terms of the standard C language as specified in the ISO C standard.
- **No Superuser, No System Administration** – There was no intention to specify all aspects of an operating system. System administration facilities and functions are excluded from this standard, and functions usable only by the superuser have not been included. Still, an implementation of the standard interface may also implement features not in POSIX.1-2008. POSIX.1-2008 is also not concerned with hardware constraints or system maintenance.
- **Minimal Interface, Minimally Defined** – In keeping with the historical design principles of the UNIX system, the mandatory core facilities of POSIX.1-2008 have been kept as minimal as possible. Additional capabilities have been added as optional extensions.
- **Broadly Implementable** – The developers of POSIX.1-2008 endeavored to make all specified functions implementable across a wide range of existing and potential systems, including:
 - All of the current major systems that are ultimately derived from the original UNIX system code (Version 7 or later)
 - Compatible systems that are not derived from the original UNIX system code
 - Emulations hosted on entirely different operating systems
 - Networked systems
 - Distributed systems
 - Systems running on a broad range of hardware

No direct references to this goal appear in POSIX.1-2008, but some results of it are mentioned in the Rationale (Informative) volume.

- Minimal Changes to Historical Implementations – When the original version – IEEE Std 1003.1-1988 – was published, there were no known historical implementations that did not have to change. However, there was a broad consensus on a set of functions, types, definitions, and concepts that formed an interface that was common to most historical implementations.

The adoption of the 1988 and 1990 IEEE system interface standards, the 1992 IEEE shell and utilities standard, the various Open Group (formerly X/Open) specifications, and IEEE Std 1003.1-2001 and its technical corrigenda have consolidated this consensus, and this version reflects the significantly increased level of consensus arrived at since the original versions. The authors of the original versions tried, as much as possible, to follow the principles below when creating new specifications:

- By standardizing an interface like one in an historical implementation; for example, directories
- By specifying an interface that is readily implementable in terms of, and backwards-compatible with, historical implementations, such as the extended *tar* format defined in the *pax* utility
- By specifying an interface that, when added to an historical implementation, will not conflict with it; for example, the *sigaction()* function

POSIX.1-2008 is specifically not a codification of a particular vendor's product.

It should be noted that implementations will have different kinds of extensions. Some will reflect “historical usage” and will be preserved for execution of pre-existing applications. These functions should be considered “obsolescent” and the standard functions used for new applications. Some extensions will represent functions beyond the scope of POSIX.1-2008. These need to be used with careful management to be able to adapt to future extensions of POSIX.1-2008 and/or port to implementations that provide these services in a different manner.

- Minimal Changes to Existing Application Code – A goal of POSIX.1-2008 was to minimize additional work for application developers. However, because every known historical implementation will have to change at least slightly to conform, some applications will have to change.

POSIX.1-2008

POSIX.1-2008 defines the Portable Operating System Interface (POSIX) requirements and consists of the following topics arranged as a series of volumes within the standard:

- Base Definitions
- System Interfaces
- Shell and Utilities
- Rationale (Informative)

Base Definitions

The Base Definitions volume provides common definitions for this standard, therefore readers should be familiar with it before using the other volumes.

This volume is structured as follows:

- Chapter 1 is an introduction.
- Chapter 2 defines the conformance requirements.
- Chapter 3 defines general terms used.
- Chapter 4 describes general concepts used.
- Chapter 5 describes the notation used to specify file input and output formats in this volume and the Shell and Utilities volume.
- Chapter 6 describes the portable character set and the process of character set definition.

- Chapter 7 describes the syntax for defining internationalization locales as well as the POSIX locale provided on all systems.
- Chapter 8 describes the use of environment variables for internationalization and other purposes.
- Chapter 9 describes the syntax of pattern matching using regular expressions employed by many utilities and matched by the *regcomp()* and *regexexec()* functions.
- Chapter 10 describes files and devices found on all systems.
- Chapter 11 describes the asynchronous terminal interface for many of the functions in the System Interfaces volume and the *stty* utility in the Shell and Utilities volume.
- Chapter 12 describes the policies for command line argument construction and parsing.
- Chapter 13 defines the contents of headers which declare the functions and global variables, and define types, constants, macros, and data structures that are needed by programs using the services provided by the System Interfaces volume.

Comprehensive references are available in the index.

System Interfaces

The System Interfaces volume describes the interfaces offered to application programs by POSIX-conformant systems. Readers are expected to be experienced C language programmers, and to be familiar with the Base Definitions volume.

This volume is structured as follows:

- Chapter 1 explains the status of this volume and its relationship to other formal standards.
- Chapter 2 contains important concepts, terms, and caveats relating to the rest of this volume.
- Chapter 3 defines the functional interfaces to the POSIX-conformant system.

Comprehensive references are available in the index.

Shell and Utilities

The Shell and Utilities volume describes the commands and utilities offered to application programs on POSIX-conformant systems. Readers are expected to be familiar with the Base Definitions volume.

This volume is structured as follows:

- Chapter 1 explains the status of this volume and its relationship to other formal standards. It also describes the defaults used by the utility descriptions.
- Chapter 2 describes the command language used in POSIX-conformant systems, and special built-in utilities.
- Chapter 3 describes a set of services and utilities that are implemented on systems supporting the Batch Environment Services and Utilities option.
- Chapter 4 consists of reference pages for all utilities, other than the special built-in utilities described in Chapter 2, available on POSIX-conformant systems.

Comprehensive references are available in the index.

Rationale (Informative)

The Rationale volume is published to assist in the process of review. It contains historical information concerning the contents of this standard and why features were included or discarded by the standard developers. It also contains notes of interest to application programmers on recommended programming practices, emphasizing the consequences of some aspects of POSIX.1-2008 that may not be immediately apparent.

This volume is organized in parallel to the normative volumes of this standard, with a separate part for each of the three normative volumes.

Within this volume, the following terms are used:

- Base standard – The portions of POSIX.1-2008 that are not optional, equivalent to the definitions of classic POSIX.1 and POSIX.2.
- POSIX.0 – Although this term is not used in the normative text of POSIX.1-2008, it is used in this volume to refer to IEEE Std 1003.0™-1995.
- POSIX.1b – Although this term is not used in the normative text of POSIX.1-2008, it is used in this volume to refer to the elements of the POSIX Realtime Extension amendment. (This was earlier referred to as POSIX.4 during the standard development process.)
- POSIX.1c – Although this term is not used in the normative text of POSIX.1-2008, it is used in this volume to refer to the POSIX Threads Extension amendment. (This was earlier referred to as POSIX.4a during the standard development process.)
- Standard developers – The individuals and companies in the development organizations responsible for POSIX.1-2008: the IEEE P1003.1 working groups, The Open Group Base working group, advised by the hundreds of individual technical experts who balloted the draft standards within the Austin Group, and the member bodies and technical experts of ISO/IEC JTC 1/SC 22.
- XSI option – The portions of POSIX.1-2008 addressing the extension added for support of the Single UNIX Specification.

Typographical Conventions

The following typographical conventions are used throughout this standard. In the text, this standard is referred to as POSIX.1-2008, which is technically identical to The Open Group Base Specifications, Issue 7.

The typographical conventions listed here are for ease of reading only. Editorial inconsistencies in the use of typography are unintentional and have no normative meaning in POSIX.1-2008.

Reference	Example	Notes
C-Language Data Structure	aiocb	
C-Language Data Structure Member	<i>aio_lio_opcode</i>	
C-Language Data Type	long	
C-Language External Variable	<i>errno</i>	
C-Language Function	<i>system()</i>	
C-Language Function Argument	<i>arg</i>	
C-Language Function Family	<i>exec</i>	
C-Language Header	<sys/stat.h>	
C-Language Keyword	return	
C-Language Macro with Argument	<i>assert()</i>	
C-Language Macro with No Argument	NET_ADDRSTRLEN	
C-Language Preprocessing Directive	#define	
Commands within a Utility	a, c	
Conversion Specifier, Specifier/Modifier Character	%A, g, E	1
Environment Variable	<i>PATH</i>	
Error Number	[EINTR]	
Example Output	Hello, World	
Filename	/tmp	
Literal Character	'c', '\r'	2
Literal String	"abcde"	2
Optional Items in Utility Syntax	[]	
Parameter	<i><directory pathname></i>	

Reference	Example	Notes
Special Character	<newline>	3
Symbolic Constant	POSIX_VDISABLE	
Symbolic Limit, Configuration Value	{LINE_MAX}	4
Syntax	#include <sys/stat.h>	
User Input and Example Code	echo Hello, World	5
Utility Name	awk	
Utility Operand	file_name	
Utility Option	-c	
Utility Option with Option-Argument	-w width	

Note that:

1. Conversion specifications, specifier characters, and modifier characters are used primarily in date-related functions and utilities and the *fprintf()* and *fscanf()* formatting functions.
2. Unless otherwise noted, the quotes shall not be used as input or output. When used in a list item, the quotes are omitted. The literal characters <apostrophe> (also known as single-quote) and <backslash> are either shown as the C constants ' \' and ' \ ' , respectively, or as the special characters <apostrophe>, single-quote, and <backslash> depending on context.
3. The style selected for some of the special characters, such as <newline>, matches the form of the input given to the *localedef* utility. Generally, the characters selected for this special treatment are those that are not visually distinct, such as the control characters <tab> or <newline>.
4. Names surrounded by braces represent symbolic limits or configuration values which may be declared in appropriate headers by means of the C **#define** construct.
5. Brackets shown in this font, " [] ", are part of the syntax and do not indicate optional items. In syntax the ' | ' symbol is used to separate alternatives, and ellipses (" . . . ") are used to show that additional arguments are optional.

Shading is used to identify extensions and options.

Footnotes and notes within the body of the normative text are for information only (informative).

Informative sections (such as Rationale, Change History, Application Usage, and so on) are denoted by continuous shading bars in the margins.

Ranges of values are indicated with parentheses or brackets as follows:

1. (a,b) means the range of all values from a to b , including neither a nor b .
2. $[a,b]$ means the range of all values from a to b , including a and b .
3. $[a,b)$ means the range of all values from a to b , including a , but not b .
4. $(a,b]$ means the range of all values from a to b , including b , but not a .

Note: A symbolic limit beginning with POSIX is treated differently, depending on context. In a C-language header, the symbol *POSIXstring* (where *string* may contain underscores) is represented by the C identifier `_POSIXstring`, with a leading underscore required to prevent ISO C standard name space pollution. However, in other contexts, such as languages other than C, the leading underscore is not used because this requirement does not exist.

4.20	Treatment of NaN Arguments for the Mathematical Functions	118
4.21	Utility	118
4.22	Variable Assignment.....	118
Chapter 5	File Format Notation.....	121
Chapter 6	Character Set	125

	6.1	Portable Character Set	125
	6.2	Character Encoding	128
	6.3	C Language Wide-Character Codes	129
	6.4	Character Set Description File	129
	6.4.1	State-Dependent Character Encodings	132
Chapter	7	Locale	135
	7.1	General.....	135
	7.2	POSIX Locale	136
	7.3	Locale Definition	136
	7.3.1	LC_CTYPE	139
	7.3.2	LC_COLLATE.....	147
	7.3.3	LC_MONETARY	154
	7.3.4	LC_NUMERIC.....	157
	7.3.5	LC_TIME	159
	7.3.6	LC_MESSAGES	164
	7.4	Locale Definition Grammar	165
	7.4.1	Locale Lexical Conventions	165
	7.4.2	Locale Grammar.....	166
Chapter	8	Environment Variables	173
	8.1	Environment Variable Definition.....	173
	8.2	Internationalization Variables	174
	8.3	Other Environment Variables.....	177
Chapter	9	Regular Expressions.....	181
	9.1	Regular Expression Definitions.....	181
	9.2	Regular Expression General Requirements.....	182
	9.3	Basic Regular Expressions	183
	9.3.1	BREs Matching a Single Character or Collating Element	183
	9.3.2	BRE Ordinary Characters.....	183
	9.3.3	BRE Special Characters	183
	9.3.4	Periods in BREs	184
	9.3.5	RE Bracket Expression.....	184
	9.3.6	BREs Matching Multiple Characters	186
	9.3.7	BRE Precedence	187
	9.3.8	BRE Expression Anchoring.....	187
	9.4	Extended Regular Expressions.....	188
	9.4.1	EREs Matching a Single Character or Collating Element	188
	9.4.2	ERE Ordinary Characters.....	188
	9.4.3	ERE Special Characters	188
	9.4.4	Periods in EREs	189
	9.4.5	ERE Bracket Expression	189
	9.4.6	EREs Matching Multiple Characters	189
	9.4.7	ERE Alternation.....	190
	9.4.8	ERE Precedence	190
	9.4.9	ERE Expression Anchoring.....	191
	9.5	Regular Expression Grammar	191
	9.5.1	BRE/ERE Grammar Lexical Conventions.....	191
	9.5.2	RE and Bracket Expression Grammar.....	192

	9.5.3	ERE Grammar	195
Chapter	10	Directory Structure and Devices	197
	10.1	Directory Structure and Files.....	197
	10.2	Output Devices and Terminal Types.....	198
Chapter	11	General Terminal Interface	199
	11.1	Interface Characteristics	199
	11.1.1	Opening a Terminal Device File.....	199
	11.1.2	Process Groups	200
	11.1.3	The Controlling Terminal.....	200
	11.1.4	Terminal Access Control	201
	11.1.5	Input Processing and Reading Data	201
	11.1.6	Canonical Mode Input Processing.....	202
	11.1.7	Non-Canonical Mode Input Processing.....	202
	11.1.8	Writing Data and Output Processing	203
	11.1.9	Special Characters	204
	11.1.10	Modem Disconnect	205
	11.1.11	Closing a Terminal Device File.....	205
	11.2	Parameters that Can be Set	205
	11.2.1	The termios Structure	205
	11.2.2	Input Modes.....	206
	11.2.3	Output Modes.....	207
	11.2.4	Control Modes	209
	11.2.5	Local Modes.....	210
	11.2.6	Special Control Characters.....	212
Chapter	12	Utility Conventions	213
	12.1	Utility Argument Syntax.....	213
	12.2	Utility Syntax Guidelines.....	215
Chapter	13	Headers	219
Volume	2	System Interfaces, Issue 7.....	467
Chapter	1	Introduction.....	469
	1.1	Relationship to Other Formal Standards.....	469
	1.2	Format of Entries.....	469
Chapter	2	General Information	471
	2.1	Use and Implementation of Interfaces	471
	2.1.1	Use and Implementation of Functions.....	471
	2.1.2	Use and Implementation of Macros	472
	2.2	The Compilation Environment	472
	2.2.1	POSIX.1 Symbols.....	472
	2.2.2	The Name Space.....	473
	2.3	Error Numbers.....	481
	2.3.1	Additional Error Numbers	488
	2.4	Signal Concepts	488
	2.4.1	Signal Generation and Delivery.....	488
	2.4.2	Realtime Signal Generation and Delivery	489

2.4.3	Signal Actions	490
2.4.4	Signal Effects on Other Functions.....	495
2.5	Standard I/O Streams	495
2.5.1	Interaction of File Descriptors and Standard I/O Streams	496
2.5.2	Stream Orientation and Encoding Rules	498
2.6	STREAMS.....	499
2.6.1	Accessing STREAMS	500
2.7	XSI Interprocess Communication	501
2.7.1	IPC General Description	501
2.8	Realtime.....	502
2.8.1	Realtime Signals	502
2.8.2	Asynchronous I/O.....	503
2.8.3	Memory Management.....	504
2.8.4	Process Scheduling.....	506
2.8.5	Clocks and Timers.....	510
2.9	Threads	512
2.9.1	Thread-Safety.....	512
2.9.2	Thread IDs.....	513
2.9.3	Thread Mutexes.....	513
2.9.4	Thread Scheduling	514
2.9.5	Thread Cancellation.....	516
2.9.6	Thread Read-Write Locks.....	520
2.9.7	Thread Interactions with Regular File Operations.....	521
2.9.8	Use of Application-Managed Thread Stacks.....	521
2.10	Sockets	522
2.10.1	Address Families	522
2.10.2	Addressing	522
2.10.3	Protocols	522
2.10.4	Routing	523
2.10.5	Interfaces	523
2.10.6	Socket Types.....	523
2.10.7	Socket I/O Mode.....	524
2.10.8	Socket Owner.....	524
2.10.9	Socket Queue Limits.....	524
2.10.10	Pending Error	524
2.10.11	Socket Receive Queue.....	525
2.10.12	Socket Out-of-Band Data State.....	525
2.10.13	Connection Indication Queue	526
2.10.14	Signals.....	526
2.10.15	Asynchronous Errors.....	526
2.10.16	Use of Options	527
2.10.17	Use of Sockets for Local UNIX Connections	530
2.10.18	Use of Sockets over Internet Protocols.....	530
2.10.19	Use of Sockets over Internet Protocols Based on IPv4.....	531
2.10.20	Use of Sockets over Internet Protocols Based on IPv6.....	531
2.11	Tracing	534
2.11.1	Tracing Data Definitions	536
2.11.2	Trace Event Type Definitions.....	540
2.11.3	Trace Functions.....	544

	2.12	Data Types.....	545
	2.12.1	Defined Types	545
	2.12.2	The char Type.....	546
Chapter	3	System Interfaces.....	547
Volume	3	Shell and Utilities, Issue 7	2299
Chapter	1	Introduction.....	2301
	1.1	Relationship to Other Documents	2301
	1.1.1	System Interfaces.....	2301
	1.1.2	Concepts Derived from the ISO C Standard	2305
	1.2	Utility Limits.....	2307
	1.3	Grammar Conventions.....	2309
	1.4	Utility Description Defaults.....	2310
	1.5	Considerations for Utilities in Support of Files of Arbitrary Size.....	2317
	1.6	Built-In Utilities	2318
Chapter	2	Shell Command Language	2319
	2.1	Shell Introduction.....	2319
	2.2	Quoting.....	2320
	2.2.1	Escape Character (Backslash)	2320
	2.2.2	Single-Quotes.....	2320
	2.2.3	Double-Quotes.....	2320
	2.3	Token Recognition.....	2321
	2.3.1	Alias Substitution.....	2322
	2.4	Reserved Words.....	2323
	2.5	Parameters and Variables.....	2323
	2.5.1	Positional Parameters	2323
	2.5.2	Special Parameters	2324
	2.5.3	Shell Variables.....	2324
	2.6	Word Expansions	2327
	2.6.1	Tilde Expansion	2327
	2.6.2	Parameter Expansion.....	2328
	2.6.3	Command Substitution	2331
	2.6.4	Arithmetic Expansion.....	2332
	2.6.5	Field Splitting	2333
	2.6.6	Pathname Expansion	2333
	2.6.7	Quote Removal.....	2333
	2.7	Redirection	2334
	2.7.1	Redirecting Input	2334
	2.7.2	Redirecting Output	2335
	2.7.3	Appending Redirected Output	2335
	2.7.4	Here-Document.....	2335
	2.7.5	Duplicating an Input File Descriptor	2336
	2.7.6	Duplicating an Output File Descriptor	2336
	2.7.7	Open File Descriptors for Reading and Writing.....	2337
	2.8	Exit Status and Errors	2337
	2.8.1	Consequences of Shell Errors	2337
	2.8.2	Exit Status for Commands	2337

	2.9	Shell Commands	2338
	2.9.1	Simple Commands.....	2338
	2.9.2	Pipelines	2341
	2.9.3	Lists	2341
	2.9.4	Compound Commands.....	2343
	2.9.5	Function Definition Command	2346
	2.10	Shell Grammar.....	2347
	2.10.1	Shell Grammar Lexical Conventions.....	2347

Trademarks

The following information is given for the convenience of users of POSIX.1-2008 and does not constitute an endorsement by the IEEE or The Open Group of these products. Equivalent products may be used if they can be shown to lead to the same results.

There may be other products mentioned in the text that might be covered by trademark protection and readers are advised to verify them independently.

AIX[®] and IBM[®] are registered trademarks of International Business Machines Corporation.

ArchiMate[®], Jericho Forum[®], Making Standards Work[®], The Open Group[®], TOGAF[®], UNIX[®], and the “X”[®] device are registered trademarks and Boundaryless Information Flow[™], DirecNet[™], FACE[™], and The Open Group Certification Mark[™] are trademarks of The Open Group.

AT&T[®] is a registered trademark of AT&T in the USA and other countries.

BSD[™] is a trademark of the University of California, Berkeley, USA.

Hewlett-Packard[®], HP[®], and HP-UX[®] are registered trademarks of Hewlett-Packard Company.

IEEE[®] and POSIX[®] are registered trademarks, and 754[™], 854[™], 1003.0[™], 1003.1[™], 1003.1d[™], 1003.1g[™], 1003.1j[™], 1003.1q[™], 1003.2[™], 1003.2a[™], 1003.2d[™], 1003.9[™], and 1003.13[™] are trademarks of The Institute of Electrical and Electronic Engineers, Inc.

Linux[®] is a registered trademark of Linus Torvalds.

Sun[®] and Sun Microsystems[®] are registered trademarks of Oracle America, Inc.

/usr/group[®] is a registered trademark of UniForum, the International Network of UNIX System Users.

Acknowledgements

The contributions of the following organizations to the development of POSIX.1-2008 are gratefully acknowledged:

- AT&T for permission to reproduce portions of its copyrighted System V Interface Definition (SVID) and material from the UNIX System V Release 2.0 documentation.
- Hewlett-Packard Company, International Business Machines Corporation, Novell Inc., The Open Software Foundation, and Sun Microsystems Inc. for permission to reproduce portions of their copyrighted documentation
- ISO/IEC JTC 1/SC 22/WG 14 C Language Committee
- Red Hat Inc. for permission to reproduce portions of its copyrighted documentation

POSIX.1-2008 was prepared by the Austin Group, a joint working group of the IEEE, The Open Group, and ISO/IEC JTC 1/SC 22.

3 *The Open Group*
4 *The Institute of Electrical and Electronics Engineers, Inc.*

1.1 Scope

POSIX.1-2008 defines a standard operating system interface and environment, including a command interpreter (or “shell”), and common utility programs to support applications portability at the source code level. It is intended to be used by both application developers and system implementors.

POSIX.1-2008 comprises four major components (each in an associated volume):

1. General terms, concepts, and interfaces common to all volumes of POSIX.1-2008, including utility conventions and C-language header definitions, are included in the Base Definitions volume of POSIX.1-2008.
2. Definitions for system service functions and subroutines, language-specific system services for the C programming language, function issues, including portability, error handling, and error recovery, are included in the System Interfaces volume of POSIX.1-2008.
3. Definitions for a standard source code-level interface to command interpretation services (a “shell”) and common utility programs for application programs are included in the Shell and Utilities volume of POSIX.1-2008.
4. Extended rationale that did not fit well into the rest of the document structure, containing historical information concerning the contents of POSIX.1-2008 and why features were included or discarded by the standard developers, is included in the Rationale (Informative) volume of POSIX.1-2008.

The following areas are outside of the scope of POSIX.1-2008:

- Graphics interfaces
- Database management system interfaces
- Record I/O considerations
- Object or binary code portability
- System configuration and resource availability

POSIX.1-2008 describes the external characteristics and facilities that are of importance to application developers, rather than the internal construction techniques employed to achieve these capabilities. Special emphasis is placed on those functions and facilities that are needed in a wide variety of commercial applications.

The facilities provided in POSIX.1-2008 are drawn from the following base documents:

- IEEE Std 1003.1, 2004 Edition (POSIX-1) (incorporating IEEE Std 1003.1-2001, IEEE Std 1003.1-2001/Cor 1-2002, and IEEE Std 1003.1-2001/Cor 2-2004)

- The Open Group Technical Standard, 2006, Extended API Set Part 1
- The Open Group Technical Standard, 2006, Extended API Set Part 2
- The Open Group Technical Standard, 2006, Extended API Set Part 3
- The Open Group Technical Standard, 2006, Extended API Set Part 4
- ISO/IEC 9899:1999, Programming Languages — C, including ISO/IEC 9899:1999/Cor.1:2001(E), ISO/IEC 9899:1999/Cor.2:2004(E), and ISO/IEC 9899:1999/Cor.3

Emphasis has been placed on standardizing existing practice for existing users, with changes and additions limited to correcting deficiencies in the following areas:

- Issues raised by Austin Group defect reports, IEEE Interpretations against IEEE Std 1003.1, and ISO/IEC defect reports against ISO/IEC 9945
- Issues raised in corrigenda for The Open Group Technical Standards and working group resolutions from The Open Group
- Issues arising from ISO TR 24715:2006, Conflicts between POSIX and the LSB
- Changes to make the text self-consistent with the additional material merged
- Features, marked Legacy or obsolescent in the base documents, have been considered for removal in this version
- A review and reorganization of the options within the standard
- Alignment with the ISO/IEC 9899:1999 standard, including ISO/IEC 9899:1999/Cor.2:2004(E)

1.2 Conformance

Conformance requirements for POSIX.1-2008 are defined in [Chapter 2](#) (on page 15).

1.3 Normative References

The following standards contain provisions which, through references in POSIX.1-2008, constitute provisions of POSIX.1-2008. At the time of publication, the editions indicated were valid. All standards are subject to revision, and parties to agreements based on POSIX.1-2008 are encouraged to investigate the possibility of applying the most recent editions of the standards listed below. Members of IEC and ISO maintain registers of currently valid International Standards.

ANS X3.9-1978

(Reaffirmed 1989) American National Standard for Information Systems: Standard X3.9-1978, Programming Language FORTRAN.¹

ISO/IEC 646:1991

ISO/IEC 646:1991, Information Processing — ISO 7-Bit Coded Character Set for Information Interchange.²

1.4 Change History

Change history is described in the Rationale (Informative) volume of POSIX.1-2008, and in the CHANGE HISTORY section of reference pages.

1.5 Terminology

For the purposes of POSIX.1-2008, the following terminology definitions apply:

can

Describes a permissible optional feature or behavior available to the user or application. The feature or behavior is mandatory for an implementation that conforms to POSIX.1-2008. An application can rely on the existence of the feature or behavior.

implementation-defined

Describes a value or behavior that is not defined by POSIX.1-2008 but is selected by an implementor. The value or behavior may vary among implementations that conform to POSIX.1-2008. An application should not rely on the existence of the value or behavior. An application that relies on such a value or behavior cannot be assured to be portable across conforming implementations.

The implementor shall document such a value or behavior so that it can be used correctly by an application.

legacy

Describes a feature or behavior that is being retained for compatibility with older applications, but which has limitations which make it inappropriate for developing portable applications. New applications should use alternative means of obtaining equivalent functionality.

may

Describes a feature or behavior that is optional for an implementation that conforms to POSIX.1-2008. An application should not rely on the existence of the feature or behavior. An application that relies on such a feature or behavior cannot be assured to be portable across conforming implementations.

2. ISO/IEC documents can be obtained from the ISO office: 1 Rue de Varembe, Case Postale 56, CH-1211, Genève 20, Switzerland/Suisse

To avoid ambiguity, the opposite of *may* is expressed as *need not*, instead of *may not*.

shall

For an implementation that conforms to POSIX.1-2008, describes a feature or behavior that is mandatory. An application can rely on the existence of the feature or behavior.

For an application or user, describes a behavior that is mandatory.

should

For an implementation that conforms to POSIX.1-2008, describes a feature or behavior that is recommended but not mandatory. An application should not rely on the existence of the feature or behavior. An application that relies on such a feature or behavior cannot be assured to be portable across conforming implementations.

For an application, describes a feature or behavior that is recommended programming practice for optimum portability.

undefined

Describes the nature of a value or behavior not defined by POSIX.1-2008 which results from use of an invalid program construct or invalid data input.

The value or behavior may vary among implementations that conform to POSIX.1-2008. An application should not rely on the existence or validity of the value or behavior. An application that relies on any particular value or behavior cannot be assured to be portable across conforming implementations.

unspecified

Describes the nature of a value or behavior not specified by POSIX.1-2008 which results from use of a valid program construct or valid data input.

The value or behavior may vary among implementations that conform to POSIX.1-2008. An application should not rely on the existence or validity of the value or behavior. An application that relies on any particular value or behavior cannot be assured to be portable across conforming implementations.

1.6 Definitions and Concepts

Definitions and concepts are defined in [Chapter 3](#) (on page 33) and [Chapter 4](#) (on page 107).

1.7 Portability

Some of the utilities in the Shell and Utilities volume of POSIX.1-2008 and functions in the System Interfaces volume of POSIX.1-2008 describe functionality that might not be fully portable to systems meeting the requirements for POSIX conformance (see [Chapter 2](#), on page 15).

Where optional, enhanced, or reduced functionality is specified, the text is shaded and a code in the margin identifies the nature of the option, extension, or warning (see [Section 1.7.1](#), on page 7). For maximum portability, an application should avoid such functionality.

Unless the primary task of a utility is to produce textual material on its standard output, application developers should not rely on the format or content of any such material that may be produced. Where the primary task *is* to provide such material, but the output format is incompletely specified, the description is marked with the OF margin code and shading. Application developers are warned not to expect that the output of such an interface on one

system is any guide to its behavior on another system.

1.7.1 Codes

The codes and their meanings are as follows. See also [Section 1.7.2](#) (on page 13).

ADV Advisory Information

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the ADV margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the ADV margin legend.

BE Batch Environment Services and Utilities

The functionality described is optional.

Where applicable, utilities are marked with the BE margin legend in the SYNOPSIS section. Where additional semantics apply to a utility, the material is identified by use of the BE margin legend.

CD C-Language Development Utilities

The functionality described is optional.

Where applicable, utilities are marked with the CD margin legend in the SYNOPSIS section. Where additional semantics apply to a utility, the material is identified by use of the CD margin legend.

CPT Process CPU-Time Clocks

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the CPT margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the CPT margin legend.

CX Extension to the ISO C standard

The functionality described is an extension to the ISO C standard. Application developers may make use of an extension as it is supported on all POSIX.1-2008-conforming systems.

With each function or header from the ISO C standard, a statement to the effect that “any conflict is unintentional” is included. That is intended to refer to a direct conflict. POSIX.1-2008 acts in part as a profile of the ISO C standard, and it may choose to further constrain behaviors allowed to vary by the ISO C standard. Such limitations and other compatible differences are not considered conflicts, even if a CX mark is missing. The markings are for information only.

Where additional semantics apply to a function or header, the material is identified by use of the CX margin legend.

FD FORTRAN Development Utilities

The functionality described is optional.

Where applicable, utilities are marked with the FD margin legend in the SYNOPSIS section. Where additional semantics apply to a utility, the material is identified by use of the FD margin legend.

FR FORTRAN Runtime Utilities

The functionality described is optional.

Where applicable, utilities are marked with the FR margin legend in the SYNOPSIS section.

200		Where additional semantics apply to a utility, the material is identified by use of the FR margin legend.
201		
202	FSC	File Synchronization
203		The functionality described is optional. The functionality described is also an extension to the
204		ISO C standard.
205		Where applicable, functions are marked with the FSC margin legend in the SYNOPSIS section.
206		Where additional semantics apply to a function, the material is identified by use of the FSC
207		margin legend.
208	IP6	IPV6
209		The functionality described is optional. The functionality described is also an extension to the
210		ISO C standard.
211		Where applicable, functions are marked with the IP6 margin legend in the SYNOPSIS section.
212		Where additional semantics apply to a function, the material is identified by use of the IP6
213		margin legend.
214	MC1	Non-Robust Mutex Priority Protection or Non-Robust Mutex Priority Inheritance or Robust
215		Mutex Priority Protection or Robust Mutex Priority Inheritance
216		The functionality described is optional. The functionality described is also an extension to the
217		ISO C standard.
218		This is a shorthand notation for combinations of multiple option codes.
219		Where applicable, functions are marked with the MC1 margin legend in the SYNOPSIS section.
220		Where additional semantics apply to a function, the material is identified by use of the MC1
221		margin legend.
222		Refer to Section 1.7.2 (on page 13).
223	ML	Process Memory Locking
224		The functionality described is optional. The functionality described is also an extension to the
225		ISO C standard.
226		Where applicable, functions are marked with the ML margin legend in the SYNOPSIS section.
227		Where additional semantics apply to a function, the material is identified by use of the ML
228		margin legend.
229	MLR	Range Memory Locking
230		The functionality described is optional. The functionality described is also an extension to the
231		ISO C standard.
232		Where applicable, functions are marked with the MLR margin legend in the SYNOPSIS section.
233		Where additional semantics apply to a function, the material is identified by use of the MLR
234		margin legend.
235	MON	Monotonic Clock
236		The functionality described is optional. The functionality described is also an extension to the
237		ISO C standard.
238		Where applicable, functions are marked with the MON margin legend in the SYNOPSIS section.
239		Where additional semantics apply to a function, the material is identified by use of the MON
240		margin legend.
241	MSG	Message Passing
242		The functionality described is optional. The functionality described is also an extension to the
243		ISO C standard.
244		Where applicable, functions are marked with the MSG margin legend in the SYNOPSIS section.

245		Where additional semantics apply to a function, the material is identified by use of the MSG
246		margin legend.
247	MX	IEC 60559 Floating-Point
248		The functionality described is optional. The functionality described is mandated by the ISO C
249		standard only for implementations that define <code>__STDC_IEC_559__</code> .
250	MXX	IEC 60559 Floating-Point Extension
251		The functionality described is optional. The functionality described is part of the IEC 60559
252		Floating-Point option, but is an extension to the ISO C standard.
253	OB	Obsolescent
254		The functionality described may be removed in a future version of this volume of POSIX.1-2008.
255		Strictly Conforming POSIX Applications and Strictly Conforming XSI Applications shall not use
256		obsolescent features.
257		Where applicable, the material is identified by use of the OB margin legend.
258	OF	Output Format Incompletely Specified
259		The functionality described is an XSI extension. The format of the output produced by the
260		utility is not fully specified. It is therefore not possible to post-process this output in a consistent
261		fashion. Typical problems include unknown length of strings and unspecified field delimiters.
262		Where applicable, the material is identified by use of the OF margin legend.
263	OH	Optional Header
264		In the SYNOPSIS section of some interfaces in the System Interfaces volume of POSIX.1-2008 an
265		included header is marked as in the following example:
266	OH	<pre>#include <sys/types.h></pre>
267		<pre>#include <grp.h></pre>
268		<pre>struct group *getgrnam(const char *name);</pre>
269		The OH margin legend indicates that the marked header is not required on XSI-conformant
270		systems.
271	PIO	Prioritized Input and Output
272		The functionality described is optional. The functionality described is also an extension to the
273		ISO C standard.
274		Where applicable, functions are marked with the PIO margin legend in the SYNOPSIS section.
275		Where additional semantics apply to a function, the material is identified by use of the PIO
276		margin legend.
277	PS	Process Scheduling
278		The functionality described is optional. The functionality described is also an extension to the
279		ISO C standard.
280		Where applicable, functions are marked with the PS margin legend in the SYNOPSIS section.
281		Where additional semantics apply to a function, the material is identified by use of the PS
282		margin legend.
283	RPI	Robust Mutex Priority Inheritance
284		The functionality described is optional. The functionality described is also an extension to the
285		ISO C standard.
286		Where applicable, functions are marked with the RPI margin legend in the SYNOPSIS section.
287		Where additional semantics apply to a function, the material is identified by use of the RPI
288		margin legend.

289	RPP	Robust Mutex Priority Protection
290		The functionality described is optional. The functionality described is also an extension to the
291		ISO C standard.
292		Where applicable, functions are marked with the RPP margin legend in the SYNOPSIS section.
293		Where additional semantics apply to a function, the material is identified by use of the RPP
294		margin legend.
295	RS	Raw Sockets
296		The functionality described is optional. The functionality described is also an extension to the
297		ISO C standard.
298		Where applicable, functions are marked with the RS margin legend in the SYNOPSIS section.
299		Where additional semantics apply to a function, the material is identified by use of the RS
300		margin legend.
301	SD	Software Development Utilities
302		The functionality described is optional.
303		Where applicable, utilities are marked with the SD margin legend in the SYNOPSIS section.
304		Where additional semantics apply to a utility, the material is identified by use of the SD margin
305		legend.
306	SHM	Shared Memory Objects
307		The functionality described is optional. The functionality described is also an extension to the
308		ISO C standard.
309		Where applicable, functions are marked with the SHM margin legend in the SYNOPSIS section.
310		Where additional semantics apply to a function, the material is identified by use of the SHM
311		margin legend.
312	SIO	Synchronized Input and Output
313		The functionality described is optional. The functionality described is also an extension to the
314		ISO C standard.
315		Where applicable, functions are marked with the SIO margin legend in the SYNOPSIS section.
316		Where additional semantics apply to a function, the material is identified by use of the SIO
317		margin legend.
318	SPN	Spawn
319		The functionality described is optional. The functionality described is also an extension to the
320		ISO C standard.
321		Where applicable, functions are marked with the SPN margin legend in the SYNOPSIS section.
322		Where additional semantics apply to a function, the material is identified by use of the SPN
323		margin legend.
324	SS	Process Sporadic Server
325		The functionality described is optional. The functionality described is also an extension to the
326		ISO C standard.
327		Where applicable, functions are marked with the SS margin legend in the SYNOPSIS section.
328		Where additional semantics apply to a function, the material is identified by use of the SS
329		margin legend.
330	TCT	Thread CPU-Time Clocks
331		The functionality described is optional. The functionality described is also an extension to the
332		ISO C standard.
333		Where applicable, functions are marked with the TCT margin legend in the SYNOPSIS section.

334		Where additional semantics apply to a function, the material is identified by use of the TCT
335		margin legend.
336	TEF	Trace Event Filter
337		The functionality described is optional. This functionality is dependent on support for the Trace
338		option. The functionality described is also an extension to the ISO C standard.
339		Where applicable, functions are marked with the TEF margin legend in the SYNOPSIS section.
340		Where additional semantics apply to a function, the material is identified by use of the TEF
341		margin legend.
342	TPI	Non-Robust Mutex Priority Inheritance
343		The functionality described is optional. The functionality described is also an extension to the
344		ISO C standard.
345		Where applicable, functions are marked with the TPI margin legend in the SYNOPSIS section.
346		Where additional semantics apply to a function, the material is identified by use of the TPI
347		margin legend.
348	TPP	Non-Robust Mutex Priority Protection
349		The functionality described is optional. The functionality described is also an extension to the
350		ISO C standard.
351		Where applicable, functions are marked with the TPP margin legend in the SYNOPSIS section.
352		Where additional semantics apply to a function, the material is identified by use of the TPP
353		margin legend.
354	TPS	Thread Execution Scheduling
355		The functionality described is optional. The functionality described is also an extension to the
356		ISO C standard.
357		Where applicable, functions are marked with the TPS margin legend for the SYNOPSIS section.
358		Where additional semantics apply to a function, the material is identified by use of the TPS
359		margin legend.
360	TRC	Trace
361		The functionality described is optional. The functionality described is also an extension to the
362		ISO C standard.
363		Where applicable, functions are marked with the TRC margin legend in the SYNOPSIS section.
364		Where additional semantics apply to a function, the material is identified by use of the TRC
365		margin legend.
366	TRI	Trace Inherit
367		The functionality described is optional. This functionality is dependent on support for the Trace
368		option. The functionality described is also an extension to the ISO C standard.
369		Where applicable, functions are marked with the TRI margin legend in the SYNOPSIS section.
370		Where additional semantics apply to a function, the material is identified by use of the TRI
371		margin legend.
372	TRL	Trace Log
373		The functionality described is optional. This functionality is dependent on support for the Trace
374		option. The functionality described is also an extension to the ISO C standard.
375		Where applicable, functions are marked with the TRL margin legend in the SYNOPSIS section.
376		Where additional semantics apply to a function, the material is identified by use of the TRL
377		margin legend.

378	TSA	Thread Stack Address Attribute
379		The functionality described is optional. The functionality described is also an extension to the
380		ISO C standard.
381		Where applicable, functions are marked with the TSA margin legend for the SYNOPSIS section.
382		Where additional semantics apply to a function, the material is identified by use of the TSA
383		margin legend.
384	TSH	Thread Process-Shared Synchronization
385		The functionality described is optional. The functionality described is also an extension to the
386		ISO C standard.
387		Where applicable, functions are marked with the TSH margin legend in the SYNOPSIS section.
388		Where additional semantics apply to a function, the material is identified by use of the TSH
389		margin legend.
390	TSP	Thread Sporadic Server
391		The functionality described is optional. The functionality described is also an extension to the
392		ISO C standard.
393		Where applicable, functions are marked with the TSP margin legend in the SYNOPSIS section.
394		Where additional semantics apply to a function, the material is identified by use of the TSP
395		margin legend.
396	TSS	Thread Stack Size Attribute
397		The functionality described is optional. The functionality described is also an extension to the
398		ISO C standard.
399		Where applicable, functions are marked with the TSS margin legend in the SYNOPSIS section.
400		Where additional semantics apply to a function, the material is identified by use of the TSS
401		margin legend.
402	TYM	Typed Memory Objects
403		The functionality described is optional. The functionality described is also an extension to the
404		ISO C standard.
405		Where applicable, functions are marked with the TYM margin legend in the SYNOPSIS section.
406		Where additional semantics apply to a function, the material is identified by use of the TYM
407		margin legend.
408	UP	User Portability Utilities
409		The functionality described is optional.
410		Where applicable, utilities are marked with the UP margin legend in the SYNOPSIS section.
411		Where additional semantics apply to a utility, the material is identified by use of the UP margin
412		legend.
413	UU	UUCP Utilities
414		The functionality described is optional. The functionality described is also an extension to the
415		ISO C standard.
416		Where applicable, functions are marked with the UU margin legend in the SYNOPSIS section.
417		Where additional semantics apply to a function, the material is identified by use of the UU
418		margin legend.
419	XSI	X/Open System Interfaces
420		The functionality described is part of the X/Open Systems Interfaces option. Functionality
421		marked XSI is an extension to the ISO C standard. Application developers may confidently
422		make use of such extensions on all systems supporting the X/Open System Interfaces option.

If an entire SYNOPSIS section is shaded and marked XSI, all the functionality described in that reference page is an extension. See [Section 2.1.4](#) (on page 19).

XSR

XSI STREAMS

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the XSR margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the XSR margin legend.

1.7.2 Margin Code Notation

Some of the functionality described in POSIX.1-2008 depends on support of more than one option, or independently may depend on several options. The following notation for margin codes is used to denote the following cases.

A Feature Dependent on One or Two Options

In this case, margin codes have a <space> separator; for example:

SHM

This feature requires support for only the Shared Memory Objects option.

SHM TYM

This feature requires support for both the Shared Memory Objects option and the Typed Memory Objects option; that is, an application which uses this feature is portable only between implementations that provide both options.

A Feature Dependent on Either of the Options Denoted

In this case, margin codes have a ' | ' separator to denote the logical OR; for example:

SHM | TYM

This feature is dependent on support for either the Shared Memory Objects option or the Typed Memory Objects option; that is, an application which uses this feature is portable between implementations that provide any (or all) of the options.

A Feature Dependent on More than Two Options

The following shorthand notations are used:

MC1

The MC1 margin code is shorthand for TPP | TPI | RPP | RPI. Features which are shaded with this margin code require support of either the Non-Robust Mutex Priority Protection option or the Non-Robust Mutex Priority Inheritance option or the Robust Mutex Priority Protection option or the Robust Mutex Priority Inheritance option.

Large Sections Dependent on an Option

Where large sections of text are dependent on support for an option, a lead-in text block is provided and shaded accordingly; for example:

XSI

This section describes extensions to support interprocess communication. The functionality described in this section shall be provided on implementations that support the XSI option (and the rest of this section is not further shaded).

Conformance

460

2.1 Implementation Conformance

461

For the purposes of POSIX.1-2008, the implementation conformance requirements given in this section apply.

462

463

2.1.1 Requirements

464

A *conforming implementation* shall meet all of the following criteria:

465

1. The system shall support all utilities, functions, and facilities defined within POSIX.1-2008 that are required for POSIX conformance (see [Section 2.1.3](#), on page 16). These interfaces shall support the functional behavior described herein.

466

467

468

2. The system may support the X/Open System Interfaces (XSI) option as described in [Section 2.1.4](#) (on page 19).

469

470

3. The system may support one or more options as described under [Section 2.1.5](#) (on page 20). When an implementation claims that an option is supported, all of its constituent parts shall be provided.

471

472

473

4. The system may provide non-standard extensions. These are features not required by POSIX.1-2008 and may include, but are not limited to:

474

475

- Additional functions

476

- Additional headers

477

- Additional symbols in standard headers

478

- Additional utilities

479

- Additional options for standard utilities

480

- Additional environment variables

481

- Additional file types

482

- Non-conforming file systems (for example, legacy file systems for which `_POSIX_NO_TRUNC` is false, case-insensitive file systems, or network file systems)

483

484

- Dynamically populated file systems (for example, `/proc`)

485

- Additional character special files with special properties (for example, `/dev/stdin`, `/dev/stdout`, and `/dev/stderr`)

486

487

Non-standard extensions of the utilities, functions, or facilities specified in POSIX.1-2008 should be identified as such in the system documentation. Non-standard extensions, when used, may change the behavior of utilities, functions, or facilities defined by POSIX.1-2008. The conformance document shall define an environment in which an application can be run with the behavior specified by POSIX.1-2008. In no case shall such

488

489

490

491

an environment require modification of a Strictly Conforming POSIX Application (see [Section 2.2.1](#), on page 29).

2.1.2 Documentation

A conformance document with the following information shall be available for an implementation claiming conformance to POSIX.1-2008. The conformance document shall have the same structure as POSIX.1-2008, with the information presented in the appropriate sections and subsections. Sections and subsections that consist solely of subordinate section titles, with no other information, are not required. The conformance document shall not contain information about extended facilities or capabilities outside the scope of POSIX.1-2008.

The conformance document shall contain a statement that indicates the full name, number, and date of the standard that applies. The conformance document may also list international software standards that are available for use by a Conforming POSIX Application. Applicable characteristics where documentation is required by one of these standards, or by standards of government bodies, may also be included.

The conformance document shall describe the limit values found in the headers [<limits.h>](#) (on page 270) and [<unistd.h>](#) (on page 433), stating values, the conditions under which those values may change, and the limits of such variations, if any.

The conformance document shall describe the behavior of the implementation for all implementation-defined features defined in POSIX.1-2008. This requirement shall be met by listing these features and providing either a specific reference to the system documentation or providing full syntax and semantics of these features. When the value or behavior in the implementation is designed to be variable or customized on each instantiation of the system, the implementation provider shall document the nature and permissible ranges of this variation.

The conformance document may specify the behavior of the implementation for those features where POSIX.1-2008 states that implementations may vary or where features are identified as undefined or unspecified.

The conformance document shall not contain documentation other than that specified in the preceding paragraphs except where such documentation is specifically allowed or required by other provisions of POSIX.1-2008.

The phrases “shall document” or “shall be documented” in POSIX.1-2008 mean that documentation of the feature shall appear in the conformance document, as described previously, unless there is an explicit reference in the conformance document to show where the information can be found in the system documentation.

The system documentation should also contain the information found in the conformance document.

2.1.3 POSIX Conformance

A conforming implementation shall meet the following criteria for POSIX conformance.

2.1.3.1 POSIX System Interfaces

The following requirements apply to the system interfaces (functions and headers):

- The system shall support all the mandatory functions and headers defined in POSIX.1-2008, and shall set the symbolic constant `_POSIX_VERSION` to the value 200809L.
- Although all implementations conforming to POSIX.1-2008 support all the features described below, there may be system-dependent or file system-dependent configuration procedures that can remove or modify any or all of these features. Such configurations should not be made if strict compliance is required.

The following symbolic constants shall be defined with a value other than `-1`. If a constant is defined with the value zero, applications should use the `sysconf()`, `pathconf()`, or `fpathconf()` functions, or the `getconf` utility, to determine which features are present on the system at that time or for the particular pathname in question.

— `_POSIX_CHOWN_RESTRICTED`

The use of `chown()` is restricted to a process with appropriate privileges, and to changing the group ID of a file only to the effective group ID of the process or to one of its supplementary group IDs.

— `_POSIX_NO_TRUNC`

Pathname components longer than `{NAME_MAX}` generate an error.

- The following symbolic constants shall be defined by the implementation as follows:

— Symbolic constants defined with the value 200809L:

```

_POSIX_ASYNCHRONOUS_IO
_POSIX_BARRIERS
_POSIX_CLOCK_SELECTION
_POSIX_MAPPED_FILES
_POSIX_MEMORY_PROTECTION
_POSIX_READER_WRITER_LOCKS
_POSIX_REALTIME_SIGNALS
_POSIX_SEMAPHORES
_POSIX_SPIN_LOCKS
_POSIX_THREAD_SAFE_FUNCTIONS
_POSIX_THREADS
_POSIX_TIMEOUTS
_POSIX_TIMERS

```

— Symbolic constants defined with a value greater than zero:

```

_POSIX_JOB_CONTROL
_POSIX_SAVED_IDS

```

— Symbolic constants defined with a value other than `-1`.

```

_POSIX_VDISABLE

```

Note: The symbols above represent historical options that are no longer allowed as options, but are retained here for backwards-compatibility of applications.

- The system may support one or more options (see [Section 2.1.6](#), on page 26) denoted by the following symbolic constants:

```

_POSIX_ADVISORY_INFO
_POSIX_CPUTIME
_POSIX_FSYNC
_POSIX_IPV6
_POSIX_MEMLOCK
_POSIX_MEMLOCK_RANGE
_POSIX_MESSAGE_PASSING
_POSIX_MONOTONIC_CLOCK
_POSIX_PRIORITIZED_IO
_POSIX_PRIORITY_SCHEDULING
_POSIX_RAW_SOCKETS
_POSIX_SHARED_MEMORY_OBJECTS
_POSIX_SPAWN
_POSIX_SPORADIC_SERVER
_POSIX_SYNCHRONIZED_IO
_POSIX_THREAD_ATTR_STACKADDR
_POSIX_THREAD_CPUTIME
_POSIX_THREAD_ATTR_STACKSIZE
_POSIX_THREAD_PRIO_INHERIT
_POSIX_THREAD_PRIO_PROTECT
_POSIX_THREAD_PRIORITY_SCHEDULING
_POSIX_THREAD_PROCESS_SHARED
_POSIX_THREAD_SPORADIC_SERVER
_POSIX_TRACE
_POSIX_TRACE_EVENT_FILTER
_POSIX_TRACE_INHERIT
_POSIX_TRACE_LOG
_POSIX_TYPED_MEMORY_OBJECTS
_XOPEN_CRYPT
_XOPEN_REALTIME
_XOPEN_REALTIME_THREADS
_XOPEN_STREAMS
_XOPEN_UNIX

```

If any of the symbolic constants `_POSIX_TRACE_EVENT_FILTER`, `_POSIX_TRACE_LOG`, or `_POSIX_TRACE_INHERIT` is defined to have a value other than `-1`, then the symbolic constant `_POSIX_TRACE` shall also be defined to have a value other than `-1`.

If the Advisory Information option is supported, there shall be at least one file system that supports the functionality.

2.1.3.2 POSIX Shell and Utilities

The following requirements apply to the shell and utilities:

- The system shall provide all the mandatory utilities in the Shell and Utilities volume of POSIX.1-2008 with all the functional behavior described therein.
- The system shall support the Large File capabilities described in the Shell and Utilities volume of POSIX.1-2008.

- The system may support one or more options (see [Section 2.1.6](#), on page 26) denoted by the following symbolic constants. (The literal names below apply to the *getconf* utility.)

```

        POSIX2_C_DEV
        POSIX2_CHAR_TERM
        POSIX2_FORT_DEV
        POSIX2_FORT_RUN
        POSIX2_LOCALEDEF
        POSIX2_PBS
        POSIX2_PBS_ACCOUNTING
        POSIX2_PBS_LOCATE
        POSIX2_PBS_MESSAGE
        POSIX2_PBS_TRACK
        POSIX2_SW_DEV
        POSIX2_UPE
        XOPEN_UNIX
        XOPEN_UUCP

```

Additional language bindings and development utility options may be provided in other related standards or in a future version of this standard. In the former case, additional symbolic constants of the same general form as shown in this subsection should be defined by the related standard document and made available to the application without requiring POSIX.1-2008 to be updated.

2.1.4 XSI Conformance

XSI This section describes the criteria for implementations providing conformance to the X/Open System Interfaces (XSI) option (see [Section 3.444](#), on page 104). The functionality described in this section shall be provided on implementations that support the XSI option (and the rest of this section is not further shaded).

POSIX.1-2008 describes utilities, functions, and facilities offered to application programs by the X/Open System Interfaces (XSI) option. An XSI-conforming implementation shall meet the criteria for POSIX conformance and the following requirements listed in this section.

XSI-conforming implementations shall set the symbolic constant `_XOPEN_UNIX` to a value other than `-1` and shall set the symbolic constant `_XOPEN_VERSION` to the value 700.

2.1.4.1 XSI System Interfaces

The following requirements apply to the system interfaces when the XSI option is supported:

- The system shall support all the functions and headers defined in POSIX.1-2008 as part of the XSI option denoted by the XSI marking in the SYNOPSIS section, and any extensions marked with the XSI option marking (see [Section 1.7.1](#), on page 7) within the text.
- The system shall support the following options defined within POSIX.1-2008 (see [Section 2.1.6](#), on page 26):

```

        _POSIX_FSYNC
        _POSIX_THREAD_ATTR_STACKADDR
        _POSIX_THREAD_ATTR_STACKSIZE
        _POSIX_THREAD_PROCESS_SHARED

```

- The system may support the following XSI Option Groups (see [Section 2.1.5.2](#), on page 22) defined within POSIX.1-2008:
 - Encryption
 - Realtime
 - Advanced Realtime
 - Realtime Threads
 - Advanced Realtime Threads
 - Tracing
 - XSI STREAMS

2.1.4.2 XSI Shell and Utilities Conformance

The following requirements apply to the shell and utilities when the XSI option is supported:

- The system shall support all the utilities defined in the Shell and Utilities volume of POSIX.1-2008 as part of the XSI option denoted by the XSI marking in the SYNOPSIS section, and any extensions marked with the XSI option marking (see [Section 1.7.1](#), on page 7) within the text.
- The system shall support the User Portability Utilities option and the Terminal Characteristics option.
- The system shall support creation of locales (see [Chapter 7](#), on page 135).
- The C-language Development utility *c99* shall be supported.
- The XSI Development Utilities option may be supported. It consists of the following software development utilities:

<i>admin</i>	<i>delta</i>	<i>rmdel</i>	<i>val</i>
<i>cflow</i>	<i>get</i>	<i>sact</i>	<i>what</i>
<i>ctags</i>	<i>nm</i>	<i>sccs</i>	
<i>cxref</i>	<i>prs</i>	<i>unget</i>	

2.1.5 Option Groups

An Option Group is a group of related functions or options defined within the System Interfaces volume of POSIX.1-2008.

If an implementation supports an Option Group, then the system shall support the functional behavior described herein.

If an implementation does not support an Option Group, then the system need not support the functional behavior described herein.

2.1.5.1 Subprofiling Considerations

Profiling standards supporting functional requirements less than that required in POSIX.1-2008 may subset both mandatory and optional functionality required for POSIX Conformance (see [Section 2.1.3](#), on page 16) or XSI Conformance (see [Section 2.1.4](#), on page 19). Such profiles shall organize the subsets into Subprofiling Option Groups.

XRAT [Appendix E](#) (on page 3741) describes a representative set of such Subprofiling Option Groups for use by profiles applicable to specialized realtime systems. POSIX.1-2008 does not require that the presence of Subprofiling Option Groups be testable at compile-time (as symbols defined in any header) or at runtime (via *sysconf()* or *getconf()*).

A Subprofiling Option Group may provide basic system functionality that other Subprofiling Option Groups and other options depend upon.³ If a profile of POSIX.1-2008 does not require an implementation to provide a Subprofiling Option Group that provides features utilized by a required Subprofiling Option Group (or option),⁴ the profile shall specify⁵ all of the following:

- Restricted or altered behavior of interfaces defined in POSIX.1-2008 that may differ on an implementation of the profile
- Additional behaviors that may produce undefined or unspecified results
- Additional implementation-defined behavior that implementations shall be required to document in the profile's conformance document

if any of the above is a result of the profile not requiring an interface required by POSIX.1-2008.

The following additional rules shall apply to all profiles of POSIX.1-2008:

- Any application that conforms to that profile shall also conform to POSIX.1-2008, unless the application depends on the definition of a profile support indicator macro in **<unistd.h>** (that is, a profile shall not require restricted, altered, or extended behaviors of an implementation of POSIX.1-2008).
- Profiles are permitted to require the definition of a *profile support indicator macro* with a name beginning **_POSIX_AEP_** in **<unistd.h>**.
- Profiles shall require the definition of the macro **_POSIX_SUBPROFILE** in **<unistd.h>** on implementations that do not meet all of the requirements of a POSIX.1-conforming implementation.
- Profiles are permitted to add additional requirements to the limits defined in **<limits.h>** and **<stdint.h>**, subject to the following:

For the limits in **<limits.h>** and **<stdint.h>**:

- If the limit is specified as having a fixed value, it shall not be changed by a profile.
- If a limit is specified as having a minimum or maximum acceptable value, it may be changed by a profile as follows:
 - A profile may increase a minimum acceptable value, but shall not make a minimum acceptable value smaller.

3. As an example, the File System profiling option group provides underlying support for pathname resolution and file creation which are needed by any interface in POSIX.1-2008 that parses a *path* argument. If a profile requires support for the Device Input and Output profiling option group but does not require support for the File System profiling option group, the profile must specify how pathname resolution is to behave in that profile, how the **O_CREAT** flag to *open()* is to be handled (and the use of the character 'a' in the *mode* argument of *fopen()* when a pathname argument names a file that does not exist), and specify lots of other details.

4. As an example, POSIX.1-2008 requires that implementations claiming to support the Range Memory Locking option also support the Process Memory Locking option. A profile could require that the Range Memory Locking option had to be supplied without requiring that the Process Memory Locking option be supplied as long as the profile specifies everything an application developer or system implementor would have to know to build an application or implementation conforming to the profile.

5. Note that the profile could just specify that any use of the features not specified by the profile would produce undefined or unspecified results.

— A profile may reduce a maximum acceptable value, but shall not make a maximum acceptable value larger.

- A profile shall not change a limit specified as having a minimum or maximum value into a limit specified as having a fixed value.
- A profile shall not create new limits.
- Any implementation that conforms to POSIX.1-2008 (including all options and extended limits required by the profile) shall also conform to that profile, except for the possible omission from `<unistd.h>` of a profile support indicator macro required by the profile.

2.1.5.2 XSI Option Groups

XSI This section describes Option Groups to support the definition of XSI conformance within the System Interfaces volume of POSIX.1-2008. The functionality described in this section shall be provided on implementations that support the XSI option and the appropriate Option Group (and the rest of this section is not further shaded).

The following Option Groups are defined.

Encryption

The Encryption Option Group is denoted by the symbolic constant `_XOPEN_CRYPT`. It includes the following functions:

`crypt()`, `encrypt()`, `setkey()`

These functions are marked CRYPT.

Due to export restrictions on the decoding algorithm in some countries, implementations may be restricted in making these functions available. All the functions in the Encryption Option Group may therefore return `[ENOSYS]` or, alternatively, `encrypt()` shall return `[ENOSYS]` for the decryption operation.

An implementation that claims conformance to this Option Group shall set `_XOPEN_CRYPT` to a value other than `-1`.

Realtime

The Realtime Option Group is denoted by the symbolic constant `_XOPEN_REALTIME`.

This Option Group includes a set of realtime functions drawn from options within POSIX.1-2008 (see [Section 2.1.6](#), on page 26).

Where entire functions are included in the Option Group, the NAME section is marked with REALTIME. Where additional semantics have been added to existing pages, the new material is identified by use of the appropriate margin legend for the underlying option defined within POSIX.1-2008.

An implementation that claims conformance to this Option Group shall set `_XOPEN_REALTIME` to a value other than `-1`.

This Option Group consists of the set of the following options from within POSIX.1-2008 (see [Section 2.1.6](#), on page 26):

```

774     _POSIX_FSYNC
775     _POSIX_MEMLOCK
776     _POSIX_MEMLOCK_RANGE
777     _POSIX_MESSAGE_PASSING
778     _POSIX_PRIORITIZED_IO
779     _POSIX_PRIORITY_SCHEDULING
780     _POSIX_SHARED_MEMORY_OBJECTS
781     _POSIX_SYNCHRONIZED_IO

```

782 If the symbolic constant `_XOPEN_REALTIME` is defined to have a value other than `-1`, then the
 783 following symbolic constants shall be defined by the implementation to have the value 200809L:

```

784     _POSIX_MEMLOCK
785     _POSIX_MEMLOCK_RANGE
786     _POSIX_MESSAGE_PASSING
787     _POSIX_PRIORITY_SCHEDULING
788     _POSIX_SHARED_MEMORY_OBJECTS
789     _POSIX_SYNCHRONIZED_IO

```

790 The functionality associated with `_POSIX_FSYNC` shall always be supported on XSI-conformant
 791 systems.

792 Support of `_POSIX_PRIORITIZED_IO` on XSI-conformant systems is optional. If
 793 `_POSIX_PRIORITIZED_IO` is supported, then asynchronous I/O operations performed by
 794 `aio_read()`, `aio_write()`, and `lio_listio()` shall be submitted at a priority equal to the scheduling
 795 priority equal to a base scheduling priority minus `aioctx->aio_reqprio`. If Thread Execution
 796 Scheduling is not supported, then the base scheduling priority is that of the calling process;
 797 otherwise, the base scheduling priority is that of the calling thread. The implementation shall
 798 also document for which files I/O prioritization is supported.

799 **Advanced Realtime**

800 An implementation that claims conformance to this Option Group shall also support the
 801 Realtime Option Group.

802 Where entire functions are included in the Option Group, the NAME section is marked with
 803 **ADVANCED REALTIME**. Where additional semantics have been added to existing pages, the
 804 new material is identified by use of the appropriate margin legend for the underlying option
 805 defined within POSIX.1-2008.

806 This Option Group consists of the set of the following options from within POSIX.1-2008 (see
 807 [Section 2.1.6](#), on page 26):

```

808     _POSIX_ADVISORY_INFO
809     _POSIX_CPUTIME
810     _POSIX_MONOTONIC_CLOCK
811     _POSIX_SPAWN
812     _POSIX_SPORADIC_SERVER
813     _POSIX_TYPED_MEMORY_OBJECTS

```

814 If the implementation supports the Advanced Realtime Option Group, then the following
 815 symbolic constants shall be defined by the implementation to have the value 200809L:

816 _POSIX_ADVISORY_INFO
 817 _POSIX_CPUTIME
 818 _POSIX_MONOTONIC_CLOCK
 819 _POSIX_SPAWN
 820 _POSIX_SPORADIC_SERVER
 821 _POSIX_TYPED_MEMORY_OBJECTS

822 If the symbolic constant _POSIX_SPORADIC_SERVER is defined, then the symbolic constant
 823 _POSIX_PRIORITY_SCHEDULING shall also be defined by the implementation to have the
 824 value 200809L.

825 **Realtime Threads**

826 The Realtime Threads Option Group is denoted by the symbolic constant
 827 _XOPEN_REALTIME_THREADS.

828 This Option Group consists of the set of the following options from within POSIX.1-2008 (see
 829 [Section 2.1.6](#), on page 26):

830 _POSIX_THREAD_PRIO_INHERIT
 831 _POSIX_THREAD_PRIO_PROTECT
 832 _POSIX_THREAD_PRIORITY_SCHEDULING
 833 _POSIX_THREAD_ROBUST_PRIO_INHERIT +
 834 _POSIX_THREAD_ROBUST_PRIO_PROTECT +

835 Where applicable, whole pages are marked REALTIME THREADS, together with the
 836 appropriate option margin legend for the SYNOPSIS section (see [Section 1.7.1](#), on page 7).

837 An implementation that claims conformance to this Option Group shall set
 838 _XOPEN_REALTIME_THREADS to a value other than -1.

839 If the symbol _XOPEN_REALTIME_THREADS is defined to have a value other than -1, then the
 840 following options shall also be defined by the implementation to have the value 200809L:

841 _POSIX_THREAD_PRIO_INHERIT
 842 _POSIX_THREAD_PRIO_PROTECT
 843 _POSIX_THREAD_PRIORITY_SCHEDULING
 844 _POSIX_THREAD_ROBUST_PRIO_INHERIT +
 845 _POSIX_THREAD_ROBUST_PRIO_PROTECT +

846 **Advanced Realtime Threads**

847 An implementation that claims conformance to this Option Group shall also support the
 848 Realtime Threads Option Group.

849 Where entire functions are included in the Option Group, the NAME section is marked with
 850 ADVANCED REALTIME THREADS. Where additional semantics have been added to existing
 851 pages, the new material is identified by use of the appropriate margin legend for the underlying
 852 option defined within POSIX.1-2008.

853 This Option Group consists of the set of the following options from within POSIX.1-2008 (see
 854 [Section 2.1.6](#), on page 26):

855 _POSIX_THREAD_CPUTIME
 856 _POSIX_THREAD_SPORADIC_SERVER

857 If the symbolic constant _POSIX_THREAD_SPORADIC_SERVER is defined to have the value

200809L, then the symbolic constant `_POSIX_THREAD_PRIORITY_SCHEDULING` shall also be defined by the implementation to have the value 200809L.

If the implementation supports the Advanced Realtime Threads Option Group, then the following symbolic constants shall be defined by the implementation to have the value 200809L:

```
_POSIX_THREAD_CPUTIME
_POSIX_THREAD_SPORADIC_SERVER
```

Tracing

This Option Group includes a set of tracing functions drawn from options within POSIX.1-2008 (see [Section 2.1.6](#), on page 26).

Where entire functions are included in the Option Group, the NAME section is marked with TRACING. Where additional semantics have been added to existing pages, the new material is identified by use of the appropriate margin legend for the underlying option defined within POSIX.1-2008.

This Option Group consists of the set of the following options from within POSIX.1-2008 (see [Section 2.1.6](#), on page 26):

```
_POSIX_TRACE
_POSIX_TRACE_EVENT_FILTER
_POSIX_TRACE_LOG
_POSIX_TRACE_INHERIT
```

If the implementation supports the Tracing Option Group, then the following symbolic constants shall be defined by the implementation to have the value 200809L:

```
_POSIX_TRACE
_POSIX_TRACE_EVENT_FILTER
_POSIX_TRACE_LOG
_POSIX_TRACE_INHERIT
```

XSI STREAMS

OB XSR This section describes the XSI STREAMS Option Group, denoted by the symbolic constant `_XOPEN_STREAMS`. The functionality described in this section shall be provided on implementations that support the XSI STREAMS option (and the rest of this section is not further shaded).

This Option Group includes functionality related to STREAMS, a uniform mechanism for implementing networking services and other character-based I/O as described in XSH [Section 2.6](#) (on page 499).

It includes the following functions:

```
fattach()      ioctl()
fdetach()      isastream()
getmsg()       putmsg()
getpmsg()      putpmsg()
```

and the `<stropts.h>` header.

Where applicable, whole pages are marked STREAMS, together with the appropriate option margin legend for the SYNOPSIS section (see [Section 1.7.1](#), on page 7). Where additional semantics have been added to existing pages, the new material is identified by use of the

appropriate margin legend for the underlying option defined within POSIX.1-2008.

An implementation that claims conformance to this Option Group shall set `_XOPEN_STREAMS` to a value other than `-1`.

2.1.6 Options

The symbolic constants defined in `<unistd.h>`, [Constants for Options and Option Groups](#) (on page 433) reflect implementation options for POSIX.1-2008. These symbols can be used by the application to determine which of three categories of support for optional facilities are provided by the implementation.

1. Option not supported for compilation.

The implementation advertises at compile time (by defining the constant in `<unistd.h>` with value `-1`, or by leaving it undefined) that the option is not supported for compilation and, at the time of compilation, is not supported for runtime use. In this case, the headers, data types, function interfaces, and utilities required only for the option need not be present. A later runtime check using the `fpathconf()`, `pathconf()`, or `sysconf` functions defined in the System Interfaces volume of POSIX.1-2008 or the `getconf` utility defined in the Shell and Utilities volume of POSIX.1-2008 can in some circumstances indicate that the option is supported at runtime. (For example, an old application binary might be run on a newer implementation to which support for the option has been added.)

2. Option always supported.

The implementation advertises at compile time (by defining the constant in `<unistd.h>` with a value greater than zero) that the option is supported both for compilation and for use at runtime. In this case, all headers, data types, function interfaces, and utilities required only for the option shall be available and shall operate as specified. Runtime checks with `fpathconf()`, `pathconf()`, or `sysconf` shall indicate that the option is supported.

3. Option might or might not be supported at runtime.

The implementation advertises at compile time (by defining the constant in `<unistd.h>` with value zero) that the option is supported for compilation and might or might not be supported at runtime. In this case, the `fpathconf()`, `pathconf()`, or `sysconf()` functions defined in the System Interfaces volume of POSIX.1-2008 or the `getconf` utility defined in the Shell and Utilities volume of POSIX.1-2008 can be used to retrieve the value of each symbol on each specific implementation to determine whether the option is supported at runtime. All headers, data types, and function interfaces required to compile and execute applications which use the option at runtime (after checking at runtime that the option is supported) shall be provided, but if the option is not supported at runtime they need not operate as specified. Utilities or other facilities required only for the option, but not needed to compile and execute such applications, need not be present.

If an option is not supported for compilation, an application that attempts to use anything associated only with the option is considered to be requiring an extension. Unless explicitly specified otherwise, the behavior of functions associated with an option that is not supported at runtime is unspecified, and an application that uses such functions without first checking `fpathconf()`, `pathconf()`, or `sysconf` is considered to be requiring an extension.

Margin codes are defined for each option (see [Section 1.7.1](#), on page 7).

942	2.1.6.1	<i>System Interfaces</i>
943		Refer to <unistd.h> , Constants for Options and Option Groups (on page 433) for the list of
944		options.
945	2.1.6.2	<i>Shell and Utilities</i>
946		Each of these symbols shall be considered valid names by the implementation. Refer to
947		<unistd.h> , Constants for Options and Option Groups (on page 433).
948		The literal names shown below apply only to the <i>getconf</i> utility.
949	CD	POSIX2_C_DEV
950		The system supports the C-Language Development Utilities option.
951		The utilities in the C-Language Development Utilities option are used for the development
952		of C-language applications, including compilation or translation of C source code and
953		complex program generators for simple lexical tasks and processing of context-free
954		grammars.
955		The utilities listed below may be provided by a conforming system; however, any system
956		claiming conformance to the C-Language Development Utilities option shall provide all of
957		the utilities listed.
958		<i>c99</i>
959		<i>lex</i>
960		<i>yacc</i>
961		POSIX2_CHAR_TERM
962		The system supports the Terminal Characteristics option. This value need not be present on
963		a system not supporting the User Portability Utilities option.
964		Where applicable, the dependency is noted within the description of the utility.
965		This option applies only to systems supporting the User Portability Utilities option. If
966		supported, then the system supports at least one terminal type capable of all operations
967		described in POSIX.1-2008; see Section 10.2 (on page 198).
968	FD	POSIX2_FORT_DEV
969		The system supports the FORTRAN Development Utilities option.
970		The <i>fort77</i> FORTRAN compiler is the only utility in the FORTRAN Development Utilities
971		option. This is used for the development of FORTRAN language applications, including
972		compilation or translation of FORTRAN source code.
973		The <i>fort77</i> utility may be provided by a conforming system; however, any system claiming
974		conformance to the FORTRAN Development Utilities option shall provide the <i>fort77</i> utility.
975	FR	POSIX2_FORT_RUN
976		The system supports the FORTRAN Runtime Utilities option.
977		The <i>asa</i> utility is the only utility in the FORTRAN Runtime Utilities option.
978		The <i>asa</i> utility may be provided by a conforming system; however, any system claiming
979		conformance to the FORTRAN Runtime Utilities option shall provide the <i>asa</i> utility.
980		POSIX2_LOCALEDEF
981		The system supports the Locale Creation Utilities option.
982		If supported, the system supports the creation of locales as described in the <i>localedef</i> utility.

983 The *localedef* utility may be provided by a conforming system; however, any system
 984 claiming conformance to the Locale Creation Utilities option shall provide the *localedef*
 985 utility.

986 OB BE POSIX2_PBS

987 The system supports the Batch Environment Services and Utilities option (see XCU [Chapter](#)
 988 [3](#), on page 2397).

989 **Note:** The Batch Environment Services and Utilities option is a combination of mandatory and
 990 optional batch services and utilities. The POSIX2_PBS symbolic constant implies the system
 991 supports all the mandatory batch services and utilities.

992 POSIX2_PBS_ACCOUNTING

993 The system supports the Batch Accounting option.

994 POSIX2_PBS_CHECKPOINT

995 The system supports the Batch Checkpoint/Restart option.

996 POSIX2_PBS_LOCATE

997 The system supports the Locate Batch Job Request option.

998 POSIX2_PBS_MESSAGE

999 The system supports the Batch Job Message Request option.

1000 POSIX2_PBS_TRACK

1001 The system supports the Track Batch Job Request option.

1002 SD POSIX2_SW_DEV

1003 The system supports the Software Development Utilities option.

1004 The utilities in the Software Development Utilities option are used for the development of
 1005 applications, including compilation or translation of source code, the creation and
 1006 maintenance of library archives, and the maintenance of groups of inter-dependent
 1007 programs.

1008 The utilities listed below may be provided by the conforming system; however, any system
 1009 claiming conformance to the Software Development Utilities option shall provide all of the
 1010 utilities listed here.

1011 *ar*
 1012 *make*
 1013 *nm*
 1014 *strip*

1015 UP POSIX2_UPE

1016 The system supports the User Portability Utilities option.

1017 The utilities in the User Portability Utilities option shall be implemented on all systems that
 1018 claim conformance to this option, except for the *vi* utility which is noted as having features
 1019 that cannot be implemented on all terminal types; if the POSIX2_CHAR_TERM option is
 1020 supported, the system shall support all such features on at least one terminal type; see
 1021 [Section 10.2](#) (on page 198).

1022 The list of utilities in the User Portability Utilities option is as follows:

1023 *bg* *fc* *jobs* *talk*
 1024 *ex* *fg* *more* *vi*

1025	XSI	XOPEN_UNIX
1026		The system supports the X/Open System Interfaces (XSI) option (see Section 2.1.4 , on page 19).
1027		
1028	UU	XOPEN_UUCP
1029		The system supports the UUCP Utilities option.
1030		The list of utilities in the UUCP Utilities option is as follows:
1031		<i>uucp</i>
1032		<i>uustat</i>
1033		<i>uux</i>

1034 2.2 Application Conformance

1035 For the purposes of POSIX.1-2008, the application conformance requirements given in this
1036 section apply.

1037 All applications claiming conformance to POSIX.1-2008 shall use only language-dependent
1038 services for the C programming language described in [Section 2.3](#) (on page 31), shall use only
1039 the utilities and facilities defined in the Shell and Utilities volume of POSIX.1-2008, and shall fall
1040 within one of the following categories.

1041 2.2.1 Strictly Conforming POSIX Application

1042 A Strictly Conforming POSIX Application is an application that requires only the facilities
1043 described in POSIX.1-2008. Such an application:

- 1044 1. Shall accept any implementation behavior that results from actions it takes in areas
1045 described in POSIX.1-2008 as *implementation-defined* or *unspecified*, or where POSIX.1-2008
1046 indicates that implementations may vary
- 1047 2. Shall not perform any actions that are described as producing *undefined* results
- 1048 3. For symbolic constants, shall accept any value in the range permitted by POSIX.1-2008,
1049 but shall not rely on any value in the range being greater than the minimums listed or
1050 being less than the maximums listed in POSIX.1-2008
- 1051 4. Shall not use facilities designated as *obsolescent*
- 1052 5. Is required to tolerate and permitted to adapt to the presence or absence of optional
1053 facilities whose availability is indicated by [Section 2.1.3](#) (on page 16)
- 1054 6. For the C programming language, shall not produce any output dependent on any
1055 behavior described in the ISO/IEC 9899:1999 standard as *unspecified*, *undefined*, or
1056 *implementation-defined*, unless the System Interfaces volume of POSIX.1-2008 specifies the
1057 behavior
- 1058 7. For the C programming language, shall not exceed any minimum implementation limit
1059 defined in the ISO/IEC 9899:1999 standard, unless the System Interfaces volume of
1060 POSIX.1-2008 specifies a higher minimum implementation limit
- 1061 8. For the C programming language, shall define `_POSIX_C_SOURCE` to be 200809L before
1062 any header is included

1063 Within POSIX.1-2008, any restrictions placed upon a Conforming POSIX Application shall

restrict a Strictly Conforming POSIX Application.

2.2.2 Conforming POSIX Application

2.2.2.1 ISO/IEC Conforming POSIX Application

An ISO/IEC Conforming POSIX Application is an application that uses only the facilities described in POSIX.1-2008 and approved Conforming Language bindings for any ISO or IEC standard. Such an application shall include a statement of conformance that documents all options and limit dependencies, and all other ISO or IEC standards used.

2.2.2.2 <National Body> Conforming POSIX Application

A <National Body> Conforming POSIX Application differs from an ISO/IEC Conforming POSIX Application in that it also may use specific standards of a single ISO/IEC member body referred to here as <National Body>. Such an application shall include a statement of conformance that documents all options and limit dependencies, and all other <National Body> standards used.

2.2.3 Conforming POSIX Application Using Extensions

A Conforming POSIX Application Using Extensions is an application that differs from a Conforming POSIX Application only in that it uses non-standard facilities that are consistent with POSIX.1-2008. Such an application shall fully document its requirements for these extended facilities, in addition to the documentation required of a Conforming POSIX Application. A Conforming POSIX Application Using Extensions shall be either an ISO/IEC Conforming POSIX Application Using Extensions or a <National Body> Conforming POSIX Application Using Extensions (see [Section 2.2.2.1](#) and [Section 2.2.2.2](#)).

2.2.4 Strictly Conforming XSI Application

A Strictly Conforming XSI Application is an application that requires only the facilities described in POSIX.1-2008. Such an application:

1. Shall accept any implementation behavior that results from actions it takes in areas described in POSIX.1-2008 as *implementation-defined* or *unspecified*, or where POSIX.1-2008 indicates that implementations may vary
2. Shall not perform any actions that are described as producing *undefined* results
3. For symbolic constants, shall accept any value in the range permitted by POSIX.1-2008, but shall not rely on any value in the range being greater than the minimums listed or being less than the maximums listed in POSIX.1-2008
4. Shall not use facilities designated as *obsolescent*
5. Is required to tolerate and permitted to adapt to the presence or absence of optional facilities whose availability is indicated by [Section 2.1.4](#) (on page 19)

6. For the C programming language, shall not produce any output dependent on any behavior described in the ISO C standard as *unspecified*, *undefined*, or *implementation-defined*, unless the System Interfaces volume of POSIX.1-2008 specifies the behavior
7. For the C programming language, shall not exceed any minimum implementation limit defined in the ISO C standard, unless the System Interfaces volume of POSIX.1-2008 specifies a higher minimum implementation limit
8. For the C programming language, shall define `_XOPEN_SOURCE` to be 700 before any header is included

Within POSIX.1-2008, any restrictions placed upon a Conforming POSIX Application shall restrict a Strictly Conforming XSI Application.

2.2.5 Conforming XSI Application Using Extensions

A Conforming XSI Application Using Extensions is an application that differs from a Strictly Conforming XSI Application only in that it uses non-standard facilities that are consistent with POSIX.1-2008. Such an application shall fully document its requirements for these extended facilities, in addition to the documentation required of a Strictly Conforming XSI Application.

2.3 Language-Dependent Services for the C Programming Language

Implementors seeking to claim conformance using the ISO C standard shall claim POSIX conformance as described in [Section 2.1.3](#) (on page 16).

2.4 Other Language-Related Specifications

POSIX.1-2008 is currently specified in terms of the shell command language and ISO C. Bindings to other programming languages are being developed.

If conformance to POSIX.1-2008 is claimed for implementation of any programming language, the implementation of that language shall support the use of external symbols distinct to at least 31 bytes in length in the source program text. (That is, identifiers that differ at or before the thirty-first byte shall be distinct.) If a national or international standard governing a language defines a maximum length that is less than this value, the language-defined maximum shall be supported. External symbols that differ only by case shall be distinct when the character set in use distinguishes uppercase and lowercase characters and the language permits (or requires) uppercase and lowercase characters to be distinct in external symbols.

1127

1128

Definitions

1129 For the purposes of POSIX.1-2008, the following terms and definitions apply. The Authoritative
1130 Dictionary of IEEE Standards Terms, Seventh Edition should be referenced for terms not defined
1131 in this section.

1132 **Note:** No shading to denote extensions or options occurs in this chapter. Where the terms and
1133 definitions given in this chapter are used elsewhere in text related to extensions and options,
1134 they are shaded as appropriate.

1135 3.1 Abortive Release

1136 An abrupt termination of a network connection that may result in the loss of data.

1137 3.2 Absolute Pathname

1138 A pathname beginning with a single or more than two <slash> characters; see also [Section 3.267](#)
1139 (on page 75).

1140 **Note:** Pathname Resolution is defined in detail in [Section 4.12](#) (on page 111).

1141 3.3 Access Mode

1142 A particular form of access permitted to a file.

1143 3.4 Additional File Access Control Mechanism

1144 An implementation-defined mechanism that is layered upon the access control mechanisms
1145 defined here, but which do not grant permissions beyond those defined herein, although they
1146 may further restrict them.

1147 **Note:** File Access Permissions are defined in detail in [Section 4.4](#) (on page 108).

1148 3.5 Address Space

1149 The memory locations that can be referenced by a process or the threads of a process.

1150 3.6 Advisory Information

1151 An interface that advises the implementation on (portable) application behavior so that it can
1152 optimize the system.

1153 3.7 Affirmative Response

1154 An input string that matches one of the responses acceptable to the *LC_MESSAGES* category
1155 keyword **yesexpr**, matching an extended regular expression in the current locale.

1156 **Note:** The *LC_MESSAGES* category is defined in detail in [Section 7.3.6](#) (on page 164).

1157 3.8 Alert

1158 To cause the user's terminal to give some audible or visual indication that an error or some other
1159 event has occurred. When the standard output is directed to a terminal device, the method for
1160 alerting the terminal user is unspecified. When the standard output is not directed to a terminal
1161 device, the alert is accomplished by writing the alert to standard output (unless the utility
1162 description indicates that the use of standard output produces undefined results in this case).

1163 3.9 Alert Character (<alert>)

1164 A character that in the output stream should cause a terminal to alert its user via a visual or
1165 audible notification. It is the character designated by '`\a`' in the C language. It is unspecified
1166 whether this character is the exact sequence transmitted to an output device by the system to
1167 accomplish the alert function.

1168 3.10 Alias Name

1169 In the shell command language, a word consisting solely of underscores, digits, and alphabets
1170 from the portable character set and any of the following characters: '`!`', '`%`', '`'`', '`,`', '`@`'.

1171 Implementations may allow other characters within alias names as an extension.

1172 **Note:** The Portable Character Set is defined in detail in [Section 6.1](#) (on page 125).

3.11 Alignment

A requirement that objects of a particular type be located on storage boundaries with addresses that are particular multiples of a byte address.

Note: See also the ISO C standard, Section B3.

3.12 Alternate File Access Control Mechanism

An implementation-defined mechanism that is independent of the access control mechanisms defined herein, and which if enabled on a file may either restrict or extend the permissions of a given user. POSIX.1-2008 defines when such mechanisms can be enabled and when they are disabled.

Note: File Access Permissions are defined in detail in [Section 4.4](#) (on page 108).

3.13 Alternate Signal Stack

Memory associated with a thread, established upon request by the implementation for a thread, separate from the thread signal stack, in which signal handlers responding to signals sent to that thread may be executed.

3.14 Ancillary Data

Protocol-specific, local system-specific, or optional information. The information can be both local or end-to-end significant, header information, part of a data portion, protocol-specific, and implementation or system-specific.

3.15 Angle Brackets

The characters '`<`' (left-angle-bracket) and '`>`' (right-angle-bracket). When used in the phrase “enclosed in angle brackets”, the symbol '`<`' immediately precedes the object to be enclosed, and '`>`' immediately follows it. When describing these characters in the portable character set, the names `<less-than-sign>` and `<greater-than-sign>` are used.

3.16 Apostrophe Character (<apostrophe>)

The character designated by '`\'`' in the C language, also known as the single-quote character.

3.17 Application

A computer program that performs some desired function.

3.18 Application Address

Endpoint address of a specific application.

3.19 Application Program Interface (API)

The definition of syntax and semantics for providing computer system services.

3.20 Appropriate Privileges

An implementation-defined means of associating privileges with a process with regard to the function calls, function call options, and the commands that need special privileges. There may be zero or more such means. These means (or lack thereof) are described in the conformance document.

Note: Function calls are defined in the System Interfaces volume of POSIX.1-2008, and commands are defined in the Shell and Utilities volume of POSIX.1-2008.

3.21 Argument

In the shell command language, a parameter passed to a utility as the equivalent of a single string in the *argv* array created by one of the *exec* functions. An argument is one of the options, option-arguments, or operands following the command name.

Note: The Utility Argument Syntax is defined in detail in [Section 12.1](#) (on page 213) and XCU [Section 2.9.1.1](#) (on page 2339).

In the C language, an expression in a function call expression or a sequence of preprocessing tokens in a function-like macro invocation.

3.22 Arm (a Timer)

To start a timer measuring the passage of time, enabling notifying a process when the specified time or time interval has passed.

3.23 Asterisk Character (<asterisk>)

The character ' * '.

3.24 Async-Cancel-Safe Function

A function that may be safely invoked by an application while the asynchronous form of cancellation is enabled. No function is async-cancel-safe unless explicitly described as such.

1227 **3.25 Asynchronous Events**

1228 Events that occur independently of the execution of the application.

1229 **3.26 Asynchronous Input and Output**

1230 A functionality enhancement to allow an application process to queue data input and output
1231 commands with asynchronous notification of completion.

1232 **3.27 Async-Signal-Safe Function**

1233 A function that may be invoked, without restriction, from signal-catching functions. No function
1234 is async-signal-safe unless explicitly described as such.

1235 **3.28 Asynchronously-Generated Signal**

1236 A signal that is not attributable to a specific thread. Examples are signals sent via *kill()*, signals
1237 sent from the keyboard, and signals delivered to process groups. Being asynchronous is a
1238 property of how the signal was generated and not a property of the signal number. All signals
1239 may be generated asynchronously.

1240 **Note:** The *kill()* function is defined in detail in the System Interfaces volume of POSIX.1-2008.

1241 **3.29 Asynchronous I/O Completion**

1242 For an asynchronous read or write operation, when a corresponding synchronous read or write
1243 would have completed and when any associated status fields have been updated.

1244 **3.30 Asynchronous I/O Operation**

1245 An I/O operation that does not of itself cause the thread requesting the I/O to be blocked from
1246 further use of the processor.

1247 This implies that the process and the I/O operation may be running concurrently.

1248 **3.31 Authentication**

1249 The process of validating a user or process to verify that the user or process is not a counterfeit.

3.32 Authorization

The process of verifying that a user or process has permission to use a resource in the manner requested.

To ensure security, the user or process would also need to be authenticated before granting access.

3.33 Background Job

See *Background Process Group* in [Section 3.35](#).

3.34 Background Process

A process that is a member of a background process group.

3.35 Background Process Group (or Background Job)

Any process group, other than a foreground process group, that is a member of a session that has established a connection with a controlling terminal.

3.36 Backquote Character

The character ' ` ', also known as <grave-accent>.

3.37 Backslash Character (<backslash>)

The character designated by ' \ ' in the C language, also known as reverse solidus.

3.38 Backspace Character (<backspace>)

A character that, in the output stream, should cause printing (or displaying) to occur one column position previous to the position about to be printed. If the position about to be printed is at the beginning of the current line, the behavior is unspecified. It is the character designated by ' \b ' in the C language. It is unspecified whether this character is the exact sequence transmitted to an output device by the system to accomplish the backspace function. The backspace defined here is not necessarily the ERASE special character.

Note: Special Characters are defined in detail in [Section 11.1.9](#) (on page 204).

1274 **3.39 Barrier**

1275 A synchronization object that allows multiple threads to synchronize at a particular point in
1276 their execution.

1277 **3.40 Basename**

1278 The final, or only, filename in a pathname.

1279 **3.41 Basic Regular Expression (BRE)**

1280 A regular expression (see [Section 3.317](#), on page 84) used by the majority of utilities that select
1281 strings from a set of character strings.

1282 **Note:** Basic Regular Expressions are described in detail in [Section 9.3](#) (on page 183).

1283 **3.42 Batch Access List**

1284 A list of user IDs and group IDs of those users and groups authorized to place batch jobs in a
1285 batch queue.

1286 A batch access list is associated with a batch queue. A batch server uses the batch access list of a
1287 batch queue as one of the criteria in deciding to put a batch job in a batch queue.

1288 **3.43 Batch Administrator**

1289 A user that is authorized to modify all the attributes of queues and jobs and to change the status
1290 of a batch server.

1291 **3.44 Batch Client**

1292 A computational entity that utilizes batch services by making requests of batch servers.

1293 Batch clients often provide the means by which users access batch services, although a batch
1294 server may act as a batch client by virtue of making requests of another batch server.

3.45 Batch Destination

The batch server in a batch system to which a batch job should be sent for processing.

Acceptance of a batch job at a batch destination is the responsibility of a receiving batch server. A batch destination may consist of a batch server-specific portion, a network-wide portion, or both. The batch server-specific portion is referred to as the “batch queue”. The network-wide portion is referred to as a “batch server name”.

3.46 Batch Destination Identifier

A string that identifies a specific batch destination.

A string of characters in the portable character set used to specify a particular batch destination.

Note: The Portable Character Set is defined in detail in [Section 6.1](#) (on page 125).

3.47 Batch Directive

A line from a file that is interpreted by the batch server. The line is usually in the form of a comment and is an additional means of passing options to the *qsub* utility.

Note: The *qsub* utility is defined in detail in the Shell and Utilities volume of POSIX.1-2008.

3.48 Batch Job

A set of computational tasks for a computing system.

Batch jobs are managed by batch servers.

Once created, a batch job may be executing or pending execution. A batch job that is executing has an associated session leader (a process) that initiates and monitors the computational tasks of the batch job.

3.49 Batch Job Attribute

A named data type whose value affects the processing of a batch job.

The values of the attributes of a batch job affect the processing of that job by the batch server that manages the batch job.

3.50 Batch Job Identifier

A unique name for a batch job. A name that is unique among all other batch job identifiers in a batch system and that identifies the batch server to which the batch job was originally submitted.

1323 **3.51 Batch Job Name**

1324 A label that is an attribute of a batch job. The batch job name is not necessarily unique.

1325 **3.52 Batch Job Owner**

1326 The *username@hostname* of the user submitting the batch job, where *username* is a user name (see
1327 also [Section 3.431](#), on page 102) and *hostname* is a network host name.

1328 **3.53 Batch Job Priority**

1329 A value specified by the user that may be used by an implementation to determine the order in
1330 which batch jobs are selected to be executed. Job priority has a numeric value in the range
1331 -1 024 to 1 023.

1332 **Note:** The batch job priority is not the execution priority (nice value) of the batch job.

1333 **3.54 Batch Job State**

1334 An attribute of a batch job which determines the types of requests that the batch server that
1335 manages the batch job can accept for the batch job. Valid states include QUEUED, RUNNING,
1336 HELD, WAITING, EXITING, and TRANSITING.

1337 **3.55 Batch Name Service**

1338 A service that assigns batch names that are unique within the batch name space, and that can
1339 translate a unique batch name into the location of the named batch entity.

1340 **3.56 Batch Name Space**

1341 The environment within which a batch name is known to be unique.

3.57 Batch Node

A host containing part or all of a batch system.

A batch node is a host meeting at least one of the following conditions:

- Capable of executing a batch client
- Contains a routing batch queue
- Contains an execution batch queue

3.58 Batch Operator

A user that is authorized to modify some, but not all, of the attributes of jobs and queues, and may change the status of the batch server.

3.59 Batch Queue

A manageable object that represents a set of batch jobs and is managed by a single batch server.

Note: A set of batch jobs is called a batch queue largely for historical reasons. Jobs are selected from the batch queue for execution based on attributes such as priority, resource requirements, and hold conditions.

See also XCU [Section 3.1.2](#) (on page 2398).

3.60 Batch Queue Attribute

A named data type whose value affects the processing of all batch jobs that are members of the batch queue.

A batch queue has attributes that affect the processing of batch jobs that are members of the batch queue.

3.61 Batch Queue Position

The place, relative to other jobs in the batch queue, occupied by a particular job in a batch queue. This is defined in part by submission time and priority; see also [Section 3.62](#).

3.62 Batch Queue Priority

The maximum job priority allowed for any batch job in a given batch queue.

The batch queue priority is set and may be changed by users with appropriate privileges. The priority is bounded in an implementation-defined manner.

3.63 Batch Rerunability

An attribute of a batch job indicating that it may be rerun after an abnormal termination from the beginning without affecting the validity of the results.

3.64 Batch Restart

The action of resuming the processing of a batch job from the point of the last checkpoint. Typically, this is done if the batch job has been interrupted because of a system failure.

3.65 Batch Server

A computational entity that provides batch services.

3.66 Batch Server Name

A string of characters in the portable character set used to specify a particular server in a network.

Note: The Portable Character Set is defined in detail in [Section 6.1](#) (on page 125).

3.67 Batch Service

Computational and organizational services performed by a batch system on behalf of batch jobs. Batch services are of two types: requested and deferred.

Note: Batch Services are listed in XCU [Table 3-5](#) (on page 2412).

3.68 Batch Service Request

A solicitation of services from a batch client to a batch server.

A batch service request may entail the exchange of any number of messages between the batch client and the batch server.

When naming specific types of service requests, the term “request” is qualified by the type of request, as in *Queue Batch Job Request* and *Delete Batch Job Request*.

3.69 Batch Submission

The process by which a batch client requests that a batch server create a batch job via a *Queue Job Request* to perform a specified computational task.

3.70 Batch System

A collection of one or more batch servers.

3.71 Batch Target User

The name of a user on the batch destination batch server.

The target user is the user name under whose account the batch job is to execute on the destination batch server.

3.72 Batch User

A user who is authorized to make use of batch services.

3.73 Bind

The process of assigning a network address to an endpoint.

3.74 Blank Character (<blank>)

One of the characters that belong to the **blank** character class as defined via the *LC_CTYPE* category in the current locale. In the POSIX locale, a <blank> character is either a <tab> or a <space>.

3.75 Blank Line

A line consisting solely of zero or more <blank> characters terminated by a <newline>; see also [Section 3.145](#) (on page 56).

3.76 Blocked Process (or Thread)

A process (or thread) that is waiting for some condition (other than the availability of a processor) to be satisfied before it can continue execution.

3.77 Blocking

A property of an open file description that causes function calls associated with it to wait for the requested action to be performed before returning.

3.78 Block-Mode Terminal

A terminal device operating in a mode incapable of the character-at-a-time input and output operations described by some of the standard utilities.

Note: Output Devices and Terminal Types are defined in detail in [Section 10.2](#) (on page 198).

3.79 Block Special File

A file that refers to a device. A block special file is normally distinguished from a character special file by providing access to the device in a manner such that the hardware characteristics of the device are not visible.

3.80 Braces

The characters ' {' (left-curly-bracket) and ' } ' (right-curly-bracket). When used in the phrase “enclosed in (curly) braces” the symbol ' {' immediately precedes the object to be enclosed, and ' } ' immediately follows it. When describing these characters in the portable character set, the names <left-curly-bracket> and <left-brace> are used for ' { ', and <right-curly-bracket> and <right-brace> are used for ' } '.

3.81 Brackets

The characters ' [' (left-square-bracket) and '] ' (right-square-bracket). When used in the phrase “enclosed in (square) brackets” the symbol ' [' immediately precedes the object to be enclosed, and '] ' immediately follows it. When describing these characters in the portable character set, the names <left-square-bracket> and <right-square-bracket> are used.

3.82 Broadcast

The transfer of data from one endpoint to several endpoints, as described in RFC 919 and RFC 922.

3.83 Built-In Utility (or Built-In)

A utility implemented within a shell. The utilities referred to as special built-ins have special qualities. Unless qualified, the term “built-in” includes the special built-in utilities. Regular built-ins are not required to be actually built into the shell on the implementation, but they do have special command-search qualities.

Note: Special Built-In Utilities are defined in detail in XCU [Section 2.14](#) (on page 2356).

Regular Built-In Utilities are defined in detail in XCU [Section 2.9.1.1](#) (on page 2339).

3.84 Byte

An individually addressable unit of data storage that is exactly an octet, used to store a character or a portion of a character; see also [Section 3.87](#) (on page 47). A byte is composed of a contiguous sequence of 8 bits. The least significant bit is called the “low-order” bit; the most significant is called the “high-order” bit.

Note: The definition of byte from the ISO C standard is broader than the above and might accommodate hardware architectures with different sized addressable units than octets.

3.85 Byte Input/Output Functions

The functions that perform byte-oriented input from streams or byte-oriented output to streams: *fgetc()*, *fgets()*, *fprintf()*, *fputc()*, *fputs()*, *fread()*, *fscanf()*, *fwrite()*, *getc()*, *getchar()*, *getdelim()*, *getline()*, *gets()*, *printf()*, *putc()*, *putchar()*, *puts()*, *scanf()*, *ungetc()*, *vfprintf()*, and *vprintf()*.

Note: Functions are defined in detail in the System Interfaces volume of POSIX.1-2008.

3.86 Carriage-Return Character (<carriage-return>)

A character that in the output stream indicates that printing should start at the beginning of the same physical line in which the carriage-return occurred. It is the character designated by ‘\r’ in the C language. It is unspecified whether this character is the exact sequence transmitted to an output device by the system to accomplish the movement to the beginning of the line.

3.87 Character

A sequence of one or more bytes representing a single graphic symbol or control code.

Note: This term corresponds to the ISO C standard term multi-byte character, where a single-byte character is a special case of a multi-byte character. Unlike the usage in the ISO C standard, *character* here has no necessary relationship with storage space, and *byte* is used when storage space is discussed.

See the definition of the portable character set in [Section 6.1](#) (on page 125) for a further explanation of the graphical representations of (abstract) characters, as opposed to character encodings.

3.88 Character Array

An array of elements of type **char**.

3.89 Character Class

A named set of characters sharing an attribute associated with the name of the class. The classes and the characters that they contain are dependent on the value of the *LC_CTYPE* category in the current locale.

Note: The *LC_CTYPE* category is defined in detail in [Section 7.3.1](#) (on page 139).

3.90 Character Set

A finite set of different characters used for the representation, organization, or control of data.

3.91 Character Special File

A file that refers to a device (such as a terminal device file) or that has special properties (such as */dev/null*).

Note: The General Terminal Interface is defined in detail in [Chapter 11](#) (on page 199).

3.92 Character String

A contiguous sequence of characters terminated by and including the first null byte.

3.93 Child Process

A new process created (by *fork()*, *posix_spawn()*, or *posix_spawnnp()*) by a given process. A child process remains the child of the creating process as long as both processes continue to exist.

Note: The *fork()*, *posix_spawn()*, and *posix_spawnnp()* functions are defined in detail in the System Interfaces volume of POSIX.1-2008.

3.94 Circumflex Character (<circumflex>)

The character ' ^ '.

3.95 Clock

A software or hardware object that can be used to measure the apparent or actual passage of time.

The current value of the time measured by a clock can be queried and, possibly, set to a value within the legal range of the clock.

3.96 Clock Jump

The difference between two successive distinct values of a clock, as observed from the application via one of the “get time” operations.

3.97 Clock Tick

An interval of time; an implementation-defined number of these occur each second. Clock ticks are one of the units that may be used to express a value found in type **clock_t**.

3.98 Coded Character Set

A set of unambiguous rules that establishes a character set and the one-to-one relationship between each character of the set and its bit representation.

3.99 Codeset

The result of applying rules that map a numeric code value to each element of a character set. An element of a character set may be related to more than one numeric code value but the reverse is not true. However, for state-dependent encodings the relationship between numeric code values and elements of a character set may be further controlled by state information. The character set may contain fewer elements than the total number of possible numeric code values; that is, some code values may be unassigned.

Note: Character Encoding is defined in detail in [Section 6.2](#) (on page 128).

3.100 Collating Element

The smallest entity used to determine the logical ordering of character or wide-character strings; see also [Section 3.102](#). A collating element consists of either a single character, or two or more characters collating as a single entity. The value of the *LC_COLLATE* category in the current locale determines the current set of collating elements.

3.101 Collation

The logical ordering of character or wide-character strings according to defined precedence rules. These rules identify a collation sequence between the collating elements, and such additional rules that can be used to order strings consisting of multiple collating elements.

3.102 Collation Sequence

The relative order of collating elements as determined by the setting of the *LC_COLLATE* category in the current locale. The collation sequence is used for sorting and is determined from the collating weights assigned to each collating element. In the absence of weights, the collation sequence is the order in which collating elements are specified between **order_start** and **order_end** keywords in the *LC_COLLATE* category.

Multi-level sorting is accomplished by assigning elements one or more collation weights, up to the limit {*COLL_WEIGHTS_MAX*}. On each level, elements may be given the same weight (at the primary level, called an equivalence class; see also [Section 3.151](#), on page 57) or be omitted from the sequence. Strings that collate equally using the first assigned weight (primary ordering) are then compared using the next assigned weight (secondary ordering), and so on.

Note: {*COLL_WEIGHTS_MAX*} is defined in detail in [<limits.h>](#).

3.103 Column Position

A unit of horizontal measure related to characters in a line.

It is assumed that each character in a character set has an intrinsic column width independent of any output device. Each printable character in the portable character set has a column width of one. The standard utilities, when used as described in POSIX.1-2008, assume that all characters have integral column widths. The column width of a character is not necessarily related to the internal representation of the character (numbers of bits or bytes).

The column position of a character in a line is defined as one plus the sum of the column widths of the preceding characters in the line. Column positions are numbered starting from 1.

3.104 Command

A directive to the shell to perform a particular task.

Note: Shell Commands are defined in detail in XCU [Section 2.9](#) (on page 2338).

3.105 Command Language Interpreter

An interface that interprets sequences of text input as commands. It may operate on an input stream or it may interactively prompt and read commands from a terminal. It is possible for applications to invoke utilities through a number of interfaces, which are collectively considered to act as command interpreters. The most obvious of these are the *sh* utility and the *system()* function, although *popen()* and the various forms of *exec* may also be considered to behave as interpreters.

Note: The *sh* utility is defined in detail in the Shell and Utilities volume of POSIX.1-2008.

The *system()*, *popen()*, and *exec* functions are defined in detail in the System Interfaces volume of POSIX.1-2008.

3.106 Composite Graphic Symbol

A graphic symbol consisting of a combination of two or more other graphic symbols in a single character position, such as a diacritical mark and a base character.

3.107 Condition Variable

A synchronization object which allows a thread to suspend execution, repeatedly, until some associated predicate becomes true. A thread whose execution is suspended on a condition variable is said to be blocked on the condition variable.

3.108 Connected Socket

A connection-mode socket for which a connection has been established, or a connectionless-mode socket for which a peer address has been set. See also [Section 3.109](#), [Section 3.110](#), [Section 3.111](#), and [Section 3.350](#) (on page 89).

3.109 Connection

An association established between two or more endpoints for the transfer of data

3.110 Connection Mode

The transfer of data in the context of a connection; see also [Section 3.111](#).

3.111 Connectionless Mode

The transfer of data other than in the context of a connection; see also [Section 3.110](#) and [Section 3.124](#) (on page 53).

3.112 Control Character

A character, other than a graphic character, that affects the recording, processing, transmission, or interpretation of text.

3.113 Control Operator

In the shell command language, a token that performs a control function. It is one of the following symbols:

`&    &&    (    )    ;    ;;    newline    |    ||`

The end-of-input indicator used internally by the shell is also considered a control operator.

Note: Token Recognition is defined in detail in XCU [Section 2.3](#) (on page 2321).

3.114 Controlling Process

The session leader that established the connection to the controlling terminal. If the terminal subsequently ceases to be a controlling terminal for this session, the session leader ceases to be the controlling process.

3.115 Controlling Terminal

A terminal that is associated with a session. Each session may have at most one controlling terminal associated with it, and a controlling terminal is associated with exactly one session. Certain input sequences from the controlling terminal cause signals to be sent to all processes in the foreground process group associated with the controlling terminal.

Note: The General Terminal Interface is defined in detail in [Chapter 11](#) (on page 199).

3.116 Conversion Descriptor

A per-process unique value used to identify an open codeset conversion.

3.117 Core File

A file of unspecified format that may be generated when a process terminates abnormally.

3.118 CPU Time (Execution Time)

The time spent executing a process or thread, including the time spent executing system services on behalf of that process or thread. If the Threads option is supported, then the value of the CPU-time clock for a process is implementation-defined. With this definition the sum of all the execution times of all the threads in a process might not equal the process execution time, even in a single-threaded process, because implementations may differ in how they account for time during context switches or for other reasons.

3.119 CPU-Time Clock

A clock that measures the execution time of a particular process or thread.

3.120 CPU-Time Timer

A timer attached to a CPU-time clock.

3.121 Current Job

In the context of job control, the job that will be used as the default for the *fg* or *bg* utilities. There is at most one current job; see also [Section 3.204](#) (on page 65).

3.122 Current Working Directory

See *Working Directory* in [Section 3.441](#) (on page 104).

3.123 Cursor Position

The line and column position on the screen denoted by the terminal's cursor.

3.124 Datagram

A unit of data transferred from one endpoint to another in connectionless mode service.

3.125 Data Segment

Memory associated with a process, that can contain dynamically allocated data.

3.126 Deferred Batch Service

A service that is performed as a result of events that are asynchronous with respect to requests.

Note: Once a batch job has been created, it is subject to deferred services.

3.127 Device

A computer peripheral or an object that appears to the application as such.

3.128 Device ID

A non-negative integer used to identify a device.

3.129 Directory

A file that contains directory entries. No two directory entries in the same directory have the same name.

3.130 Directory Entry (or Link)

An object that associates a filename with a file. Several directory entries can associate names

1634 with the same file.

1635 **3.131 Directory Stream**

1636 A sequence of all the directory entries in a particular directory. An open directory stream may be
1637 implemented using a file descriptor.

1638 **3.132 Disarm (a Timer)**

1639 To stop a timer from measuring the passage of time, disabling any future process notifications
1640 (until the timer is armed again).

1641 **3.133 Display**

1642 To output to the user's terminal. If the output is not directed to a terminal, the results are
1643 undefined.

1644 **3.134 Display Line**

1645 A line of text on a physical device or an emulation thereof. Such a line will have a maximum
1646 number of characters which can be presented.

1647 **Note:** This may also be written as "line on the display".

1648 **3.135 Dollar-Sign Character (<dollar-sign>)**

1649 The character '\$'.

1650 **3.136 Dot**

1651 In the context of naming files, the filename consisting of a single <period> character ('.').

1652 **Note:** In the context of shell special built-in utilities, see *dot* in XCU [Section 2.14](#) (on page 2356).

1653 Pathname Resolution is defined in detail in [Section 4.12](#) (on page 111).

3.137 Dot-Dot

The filename consisting solely of two <period> characters (" . ").

Note: Pathname Resolution is defined in detail in [Section 4.12](#) (on page 111).

3.138 Double-Quote Character

The character ' " ', also known as <quotation-mark>.

Note: The “double” adjective in this term refers to the two strokes in the character glyph. POSIX.1-2008 never uses the term “double-quote” to refer to two apostrophes or quotation-marks.

3.139 Downshifting

The conversion of an uppercase character that has a single-character lowercase representation into this lowercase representation.

3.140 Driver

A module that controls data transferred to and received from devices.

Note: Drivers are traditionally written to be a part of the system implementation, although they are frequently written separately from the writing of the implementation. A driver may contain processor-specific code, and therefore be non-portable.

3.141 Effective Group ID

An attribute of a process that is used in determining various permissions, including file access permissions; see also [Section 3.189](#) (on page 63).

3.142 Effective User ID

An attribute of a process that is used in determining various permissions, including file access permissions; see also [Section 3.430](#) (on page 102).

3.143 Eight-Bit Transparency

The ability of a software component to process 8-bit characters without modifying or utilizing any part of the character in a way that is inconsistent with the rules of the current coded character set.

3.144 Empty Directory

A directory that contains, at most, directory entries for dot and dot-dot, and has exactly one link to it (other than its own dot entry, if one exists), in dot-dot. No other links to the directory may exist. It is unspecified whether an implementation can ever consider the root directory to be empty.

3.145 Empty Line

A line consisting of only a <newline>; see also [Section 3.75](#) (on page 44).

3.146 Empty String (or Null String)

A string whose first byte is a null byte.

3.147 Empty Wide-Character String

A wide-character string whose first element is a null wide-character code.

3.148 Encoding Rule

The rules used to convert between wide-character codes and multi-byte character codes.

Note: Stream Orientation and Encoding Rules are defined in detail in XSH [Section 2.5.2](#) (on page 498).

3.149 Entire Regular Expression

The concatenated set of one or more basic regular expressions or extended regular expressions that make up the pattern specified for string selection.

Note: Regular Expressions are defined in detail in [Chapter 9](#) (on page 181).

3.150 Epoch

The time zero hours, zero minutes, zero seconds, on January 1, 1970 Coordinated Universal Time (UTC).

Note: See also *Seconds Since the Epoch* defined in [Section 4.15](#) (on page 113).

3.151 Equivalence Class

A set of collating elements with the same primary collation weight.

Elements in an equivalence class are typically elements that naturally group together, such as all accented letters based on the same base letter.

The collation order of elements within an equivalence class is determined by the weights assigned on any subsequent levels after the primary weight.

3.152 Era

A locale-specific method for counting and displaying years.

Note: The *LC_TIME* category is defined in detail in [Section 7.3.5](#) (on page 159).

3.153 Event Management

The mechanism that enables applications to register for and be made aware of external events such as data becoming available for reading.

3.154 Executable File

A regular file acceptable as a new process image file by the equivalent of the *exec* family of functions, and thus usable as one form of a utility. The standard utilities described as compilers can produce executable files, but other unspecified methods of producing executable files may also be provided. The internal format of an executable file is unspecified, but a conforming application cannot assume an executable file is a text file.

1720 3.155 Execute

1721 To perform command search and execution actions, as defined in the Shell and Utilities volume
1722 of POSIX.1-2008; see also [Section 3.201](#) (on page 65).

1723 **Note:** Command Search and Execution is defined in detail in XCU [Section 2.9.1.1](#) (on page 2339).

1724 3.156 Execution Time

1725 See *CPU Time* in [Section 3.118](#) (on page 52).

1726 3.157 Execution Time Monitoring

1727 A set of execution time monitoring primitives that allow online measuring of thread and process
1728 execution times.

1729 3.158 Expand

1730 In the shell command language, when not qualified, the act of applying word expansions.

1731 **Note:** Word Expansions are defined in detail in XCU [Section 2.6](#) (on page 2327).

1732 3.159 Extended Regular Expression (ERE)

1733 A regular expression (see also [Section 3.317](#), on page 84) that is an alternative to the Basic
1734 Regular Expression using a more extensive syntax, occasionally used by some utilities.

1735 **Note:** Extended Regular Expressions are described in detail in [Section 9.4](#) (on page 188).

1736 3.160 Extended Security Controls

1737 Implementation-defined security controls allowed by the file access permission and appropriate
1738 privileges (see also [Section 3.20](#), on page 36) mechanisms, through which an implementation can
1739 support different security policies from those described in POSIX.1-2008.

1740 **Note:** See also *Extended Security Controls* defined in [Section 4.3](#) (on page 107).

1741 File Access Permissions are defined in detail in [Section 4.4](#) (on page 108).

3.161 Feature Test Macro

A macro used to determine whether a particular set of features is included from a header.

Note: See also XSH [Section 2.2](#) (on page 472).

3.162 Field

In the shell command language, a unit of text that is the result of parameter expansion, arithmetic expansion, command substitution, or field splitting. During command processing, the resulting fields are used as the command name and its arguments.

Note: Parameter Expansion is defined in detail in XCU [Section 2.6.2](#) (on page 2328).

Arithmetic Expansion is defined in detail in XCU [Section 2.6.4](#) (on page 2332).

Command Substitution is defined in detail in XCU [Section 2.6.3](#) (on page 2331).

Field Splitting is defined in detail in XCU [Section 2.6.5](#) (on page 2333).

For further information on command processing, see XCU [Section 2.9.1](#) (on page 2338).

3.163 FIFO Special File (or FIFO)

A type of file with the property that data written to such a file is read on a first-in-first-out basis.

Note: Other characteristics of FIFOs are described in the System Interfaces volume of POSIX.1-2008, *lseek()*, *open()*, *read()*, and *write()*.

3.164 File

An object that can be written to, or read from, or both. A file has certain attributes, including access permissions and type. File types include regular file, character special file, block special file, FIFO special file, symbolic link, socket, and directory. Other types of files may be supported by the implementation.

3.165 File Description

See *Open File Description* in [Section 3.254](#) (on page 73).

3.166 File Descriptor

A per-process unique, non-negative integer used to identify an open file for the purpose of file access. The value of a newly-created file descriptor is from zero to {OPEN_MAX}-1. A file descriptor can have a value greater than or equal to {OPEN_MAX} if the value of {OPEN_MAX} has decreased (see *sysconf()*) since the file descriptor was opened. File descriptors may also be used to implement message catalog descriptors and directory streams; see also [Section 3.254](#) (on page 73).

Note: {OPEN_MAX} is defined in detail in [<limits.h>](#).

3.167 File Group Class

The property of a file indicating access permissions for a process related to the group identification of a process. A process is in the file group class of a file if the process is not in the file owner class and if the effective group ID or one of the supplementary group IDs of the process matches the group ID associated with the file. Other members of the class may be implementation-defined.

3.168 File Mode

An object containing the file mode bits and file type of a file.

Note: File mode bits and file types are defined in detail in [<sys/stat.h>](#).

3.169 File Mode Bits

A file's file permission bits, set-user-ID-on-execution bit (S_ISUID), set-group-ID-on-execution bit (S_ISGID), and, on directories, the restricted deletion flag bit (S_ISVTX).

Note: File Mode Bits are defined in detail in [<sys/stat.h>](#).

3.170 Filename

A sequence of bytes consisting of 1 to {NAME_MAX} bytes used to name a file. The bytes composing the name shall not contain the <NUL> or <slash> characters. In the context of a pathname, each filename shall be followed by a <slash> or a <NUL> character; elsewhere, a filename followed by a <NUL> character forms a string (but not necessarily a character string). The filenames **dot** and **dot-dot** have special meaning. A filename is sometimes referred to as a "pathname component". See also [Section 3.267](#) (on page 75).

Note: Pathname Resolution is defined in detail in [Section 4.12](#) (on page 111).

1794 3.171 Filename String

1795 A string consisting of a filename followed by a <NUL> character.

+

1796 3.172 File Offset

1797 The byte position in the file where the next I/O operation begins. Each open file description
1798 associated with a regular file, block special file, or directory has a file offset. A character special
1799 file that does not refer to a terminal device may have a file offset. There is no file offset specified
1800 for a pipe or FIFO.

1801 3.173 File Other Class

1802 The property of a file indicating access permissions for a process related to the user and group
1803 identification of a process. A process is in the file other class of a file if the process is not in the
1804 file owner class or file group class.

1805 3.174 File Owner Class

1806 The property of a file indicating access permissions for a process related to the user
1807 identification of a process. A process is in the file owner class of a file if the effective user ID of
1808 the process matches the user ID of the file.

1809 3.175 File Permission Bits

1810 Information about a file that is used, along with other information, to determine whether a
1811 process has read, write, or execute/search permission to a file. The bits are divided into three
1812 parts: owner, group, and other. Each part is used with the corresponding file class of processes.
1813 These bits are contained in the file mode.

1814 **Note:** File modes are defined in detail in [<sys/stat.h>](#).

1815 File Access Permissions are defined in detail in [Section 4.4](#) (on page 108).

1816 3.176 File Serial Number

1817 A per-file system unique identifier for a file.

1818 3.177 File System

1819 A collection of files and certain of their attributes. It provides a name space for file serial
1820 numbers referring to those files.

1821 3.178 File Type

1822 See *File* in [Section 3.164](#) (on page 59).

1823 3.179 Filter

1824 A command whose operation consists of reading data from standard input or a list of input files
1825 and writing data to standard output. Typically, its function is to perform some transformation
1826 on the data stream.

1827 3.180 First Open (of a File)

1828 When a process opens a file that is not currently an open file within any process.

1829 3.181 Flow Control

1830 The mechanism employed by a communications provider that constrains a sending entity to
1831 wait until the receiving entities can safely receive additional data without loss.

1832 3.182 Foreground Job

1833 See *Foreground Process Group* in [Section 3.184](#).

1834 3.183 Foreground Process

1835 A process that is a member of a foreground process group.

1836 3.184 Foreground Process Group (or Foreground Job)

1837 A process group whose member processes have certain privileges, denied to processes in
1838 background process groups, when accessing their controlling terminal. Each session that has
1839 established a connection with a controlling terminal has at most one process group of the session
1840 as the foreground process group of that controlling terminal.

1841 **Note:** The General Terminal Interface is defined in detail in [Chapter 11](#).

1842 3.185 Foreground Process Group ID

1843 The process group ID of the foreground process group.

3.186 Form-Feed Character (<form-feed>)

A character that in the output stream indicates that printing should start on the next page of an output device. It is the character designated by '`\f`' in the C language. If the form-feed is not the first character of an output line, the result is unspecified. It is unspecified whether this character is the exact sequence transmitted to an output device by the system to accomplish the movement to the next page.

3.187 Graphic Character

A member of the **graph** character class of the current locale.

Note: The **graph** character class is defined in detail in [Section 7.3.1](#) (on page 139).

3.188 Group Database

A system database that contains at least the following information for each group ID:

- Group name
- Numerical group ID
- List of users allowed in the group

The list of users allowed in the group is used by the *newgrp* utility.

Note: The *newgrp* utility is defined in detail in the Shell and Utilities volume of POSIX.1-2008.

3.189 Group ID

A non-negative integer, which can be contained in an object of type **gid_t**, that is used to identify a group of system users. Each system user is a member of at least one group. When the identity of a group is associated with a process, a group ID value is referred to as a real group ID, an effective group ID, one of the supplementary group IDs, or a saved set-group-ID.

3.190 Group Name

A string that is used to identify a group; see also [Section 3.188](#). To be portable across conforming systems, the value is composed of characters from the portable filename character set. The <hyphen> should not be used as the first character of a portable group name.

3.191 Hard Limit

A system resource limitation that may be reset to a lesser or greater limit by a privileged process. A non-privileged process is restricted to only lowering its hard limit.

1872 3.192 Hard Link

1873 The relationship between two directory entries that represent the same file; see also [Section 3.130](#)
1874 (on page 53). The result of an execution of the *ln* utility (without the *-s* option) or the *link()*
1875 function. This term is contrasted against symbolic link; see also [Section 3.375](#) (on page 94).

1876 3.193 Home Directory

1877 The directory specified by the *HOME* environment variable.

1878 3.194 Host Byte Order

1879 The arrangement of bytes in any integer type when using a specific machine architecture.

1880 **Note:** Two common methods of byte ordering are big-endian and little-endian. Big-endian is a format
1881 for storage of binary data in which the most significant byte is placed first, with the rest in
1882 descending order. Little-endian is a format for storage or transmission of binary data in which
1883 the least significant byte is placed first, with the rest in ascending order. See also [Section 4.9](#) (on
1884 page 110).

1885 3.195 Incomplete Line

1886 A sequence of one or more non-*<newline>* characters at the end of the file.

1887 3.196 Inf

1888 A value representing +infinity or a value representing -infinity that can be stored in a floating
1889 type. Not all systems support the Inf values.

1890 3.197 Instrumented Application

1891 An application that contains at least one call to the trace point function *posix_trace_event()*. Each
1892 process of an instrumented application has a mapping of trace event names to trace event type
1893 identifiers. This mapping is used by the trace stream that is created for that process.

1894 3.198 Interactive Shell

1895 A processing mode of the shell that is suitable for direct user interaction.

3.199 Internationalization

The provision within a computer program of the capability of making itself adaptable to the requirements of different native languages, local customs, and coded character sets.

3.200 Interprocess Communication

A functionality enhancement to add a high-performance, deterministic interprocess communication facility for local communication.

3.201 Invoke

To perform command search and execution actions, except that searching for shell functions and special built-in utilities is suppressed; see also [Section 3.155](#) (on page 58).

Note: Command Search and Execution is defined in detail in XCU [Section 2.9.1.1](#) (on page 2339).

3.202 Job

A set of processes, comprising a shell pipeline, and any processes descended from it, that are all in the same process group.

Note: See also XCU [Section 2.9.2](#) (on page 2341).

3.203 Job Control

A facility that allows users selectively to stop (suspend) the execution of processes and continue (resume) their execution at a later point. The user typically employs this facility via the interactive interface jointly supplied by the terminal I/O driver and a command interpreter.

3.204 Job Control Job ID

A handle that is used to refer to a job. The job control job ID can be any of the forms shown in the following table:

Table 3-1 Job Control Job ID Formats

Job Control Job ID	Meaning
%%	Current job.
%+	Current job.
%-	Previous job.
%n	Job number <i>n</i> .
%string	Job whose command begins with <i>string</i> .
%?string	Job whose command contains <i>string</i> .

3.205 Last Close (of a File)

When a process closes a file, resulting in the file not being an open file within any process.

3.206 Line

A sequence of zero or more non-<newline> characters plus a terminating <newline> character.

3.207 Linger

The period of time before terminating a connection, to allow outstanding data to be transferred.

3.208 Link

See *Directory Entry* in [Section 3.130](#) (on page 53).

3.209 Link Count

The number of directory entries that refer to a particular file.

3.210 Local Customs

The conventions of a geographical area or territory for such things as date, time, and currency formats.

3.211 Local Interprocess Communication (Local IPC)

The transfer of data between processes in the same system.

1941 3.212 Locale

1942 The definition of the subset of a user's environment that depends on language and cultural
1943 conventions.

1944 **Note:** Locales are defined in detail in [Chapter 7](#) (on page 135).

1945 3.213 Localization

1946 The process of establishing information within a computer system specific to the operation of
1947 particular native languages, local customs, and coded character sets.

1948 3.214 Login

1949 The unspecified activity by which a user gains access to the system. Each login is associated
1950 with exactly one login name.

1951 3.215 Login Name

1952 A user name that is associated with a login.

1953 3.216 Map

1954 To create an association between a page-aligned range of the address space of a process and
1955 some memory object, such that a reference to an address in that range of the address space
1956 results in a reference to the associated memory object. The mapped memory object is not
1957 necessarily memory-resident.

1958 3.217 Marked Message

1959 A STREAMS message on which a certain flag is set. Marking a message gives the application
1960 protocol-specific information. An application can use *ioctl()* to determine whether a given
1961 message is marked.

1962 **Note:** The *ioctl()* function is defined in detail in the System Interfaces volume of POSIX.1-2008.

3.218 Matched

A state applying to a sequence of zero or more characters when the characters in the sequence correspond to a sequence of characters defined by a basic regular expression or extended regular expression pattern.

Note: Regular Expressions are defined in detail in [Chapter 9](#) (on page 181).

3.219 Memory Mapped Files

A facility to allow applications to access files as part of the address space.

3.220 Memory Object

One of:

- A file (see [Section 3.164](#), on page 59)
- A shared memory object (see [Section 3.342](#), on page 88)
- A typed memory object (see [Section 3.423](#), on page 101)

When used in conjunction with `mmap()`, a memory object appears in the address space of the calling process.

Note: The `mmap()` function is defined in detail in the System Interfaces volume of POSIX.1-2008.

3.221 Memory-Resident

The process of managing the implementation in such a way as to provide an upper bound on memory access times.

3.222 Message

In the context of programmatic message passing, information that can be transferred between processes or threads by being added to and removed from a message queue. A message consists of a fixed-size message buffer.

3.223 Message Catalog

In the context of providing natural language messages to the user, a file or storage area containing program messages, command prompts, and responses to prompts for a particular native language, territory, and codeset.

1989 3.224 Message Catalog Descriptor

1990 In the context of providing natural language messages to the user, a per-process unique value
1991 used to identify an open message catalog. A message catalog descriptor may be implemented
1992 using a file descriptor.

1993 3.225 Message Queue

1994 In the context of programmatic message passing, an object to which messages can be added and
1995 removed. Messages may be removed in the order in which they were added or in priority order.

1996 3.226 Mode

1997 A collection of attributes that specifies a file's type and its access permissions.

1998 **Note:** File Access Permissions are defined in detail in [Section 4.4](#) (on page 108).

1999 3.227 Monotonic Clock

2000 A clock measuring real time, whose value cannot be set via `clock_settime()` and which cannot
2001 have negative clock jumps.

2002 3.228 Mount Point

2003 Either the system root directory or a directory for which the `st_dev` field of structure **stat** differs
2004 from that of its parent directory.

2005 **Note:** The **stat** structure is defined in detail in [<sys/stat.h>](#).

2006 3.229 Multi-Character Collating Element

2007 A sequence of two or more characters that collate as an entity. For example, in some coded
2008 character sets, an accented character is represented by a non-spacing accent, followed by the
2009 letter. Other examples are the Spanish elements *ch* and *ll*.

2010 3.230 Mutex

2011 A synchronization object used to allow multiple threads to serialize their access to shared data.
2012 The name derives from the capability it provides; namely, mutual-exclusion. The thread that has
2013 locked a mutex becomes its owner and remains the owner until that same thread unlocks the
2014 mutex.

2015 3.231 Name

2016 In the shell command language, a word consisting solely of underscores, digits, and alphabetic
 2017 from the portable character set. The first character of a name is not a digit.

2018 **Note:** The Portable Character Set is defined in detail in [Section 6.1](#) (on page 125).

2019 3.232 Named STREAM

2020 A STREAMS-based file descriptor that is attached to a name in the file system name space. All
 2021 subsequent operations on the named STREAM act on the STREAM that was associated with the
 2022 file descriptor until the name is disassociated from the STREAM.

2023 3.233 NaN (Not a Number)

2024 A set of values that may be stored in a floating type but that are neither Inf nor valid floating-
 2025 point numbers. Not all systems support NaN values.

2026 3.234 Native Language

2027 A computer user's spoken or written language, such as American English, British English,
 2028 Danish, Dutch, French, German, Italian, Japanese, Norwegian, or Swedish.

2029 3.235 Negative Response

2030 An input string that matches one of the responses acceptable to the *LC_MESSAGES* category
 2031 keyword **noexpr**, matching an extended regular expression in the current locale.

2032 **Note:** The *LC_MESSAGES* category is defined in detail in [Section 7.3.6](#) (on page 164).

2033 3.236 Network

2034 A collection of interconnected hosts.

2035 **Note:** The term “network” in POSIX.1-2008 is used to refer to the network of hosts. The term “batch
 2036 system” is used to refer to the network of batch servers.

2037 3.237 Network Address

2038 A network-visible identifier used to designate specific endpoints in a network. Specific
 2039 endpoints on host systems have addresses, and host systems may also have addresses.

3.238 Network Byte Order

The way of representing any integer type such that, when transmitted over a network via a network endpoint, the **int** type is transmitted as an appropriate number of octets with the most significant octet first, followed by any other octets in descending order of significance.

Note: This order is more commonly known as big-endian ordering. See also [Section 4.9](#) (on page 110).

3.239 Newline Character (<newline>)

A character that in the output stream indicates that printing should start at the beginning of the next line. It is the character designated by '`\n`' in the C language. It is unspecified whether this character is the exact sequence transmitted to an output device by the system to accomplish the movement to the next line.

3.240 Nice Value

A number used as advice to the system to alter process scheduling. Numerically smaller values give a process additional preference when scheduling a process to run. Numerically larger values reduce the preference and make a process less likely to run. Typically, a process with a smaller nice value runs to completion more quickly than an equivalent process with a higher nice value. The symbol {NZERO} specifies the default nice value of the system.

3.241 Non-Blocking

A property of an open file description that causes function calls involving it to return without delay when it is detected that the requested action associated with the function call cannot be completed without unknown delay.

Note: The exact semantics are dependent on the type of file associated with the open file description. For data reads from devices such as ttys and FIFOs, this property causes the read to return immediately when no data was available. Similarly, for writes, it causes the call to return immediately when the thread would otherwise be delayed in the write operation; for example, because no space was available. For networking, it causes functions not to await protocol events (for example, acknowledgements) to occur. See also XSH [Section 2.10.7](#) (on page 524).

3.242 Non-Spacing Characters

A character, such as a character representing a diacritical mark in the ISO/IEC 6937:2001 standard coded graphic character set, which is used in combination with other characters to form composite graphic symbols.

2070 3.243 NUL

2071 A character with all bits set to zero.

2072 3.244 Null Byte

2073 A byte with all bits set to zero.

2074 3.245 Null Pointer

2075 A pointer obtained by converting an integer constant expression with the value 0, or such an
2076 expression cast to type **void ***, to a pointer type; for example, **(char *)0**. The C language
2077 guarantees that a null pointer compares unequal to a pointer to any object or function, so it is
2078 used by many functions that return pointers to indicate an error.

2079 3.246 Null String

2080 See *Empty String* in [Section 3.146](#) (on page 56).

2081 3.247 Null Wide-Character Code

2082 A wide-character code with all bits set to zero.

2083 3.248 Number-Sign Character (<number-sign>)

2084 The character ' # ', also known as hash sign.

2085 3.249 Object File

2086 A regular file containing the output of a compiler, formatted as input to a linkage editor for
2087 linking with other object files into an executable form. The methods of linking are unspecified
2088 and may involve the dynamic linking of objects at runtime. The internal format of an object file
2089 is unspecified, but a conforming application cannot assume an object file is a text file.

2090 3.250 Octet

2091 Unit of data representation that consists of eight contiguous bits.

2092 **3.251 Offset Maximum**

2093 An attribute of an open file description representing the largest value that can be used as a file
2094 offset.

2095 **3.252 Opaque Address**

2096 An address such that the entity making use of it requires no details about its contents or format.

2097 **3.253 Open File**

2098 A file that is currently associated with a file descriptor.

2099 **3.254 Open File Description**

2100 A record of how a process or group of processes is accessing a file. Each file descriptor refers to
2101 exactly one open file description, but an open file description can be referred to by more than
2102 one file descriptor. The file offset, file status, and file access modes are attributes of an open file
2103 description.

2104 **3.255 Operand**

2105 An argument to a command that is generally used as an object supplying information to a utility
2106 necessary to complete its processing. Operands generally follow the options in a command line.

2107 **Note:** Utility Argument Syntax is defined in detail in [Section 12.1](#) (on page 213).

2108 **3.256 Operator**

2109 In the shell command language, either a control operator or a redirection operator.

2110 3.257 Option

2111 An argument to a command that is generally used to specify changes in the utility's default
2112 behavior.

2113 **Note:** Utility Argument Syntax is defined in detail in [Section 12.1](#) (on page 213).

2114 3.258 Option-Argument

2115 A parameter that follows certain options. In some cases an option-argument is included within
2116 the same argument string as the option—in most cases it is the next argument.

2117 **Note:** Utility Argument Syntax is defined in detail in [Section 12.1](#) (on page 213).

2118 3.259 Orientation

2119 A stream has one of three orientations: unoriented, byte-oriented, or wide-oriented.

2120 **Note:** For further information, see XSH [Section 2.5.2](#) (on page 498).

2121 3.260 Orphaned Process Group

2122 A process group in which the parent of every member is either itself a member of the group or is
2123 not a member of the group's session.

2124 3.261 Page

2125 The granularity of process memory mapping or locking.

2126 Physical memory and memory objects can be mapped into the address space of a process on
2127 page boundaries and in integral multiples of pages. Process address space can be locked into
2128 memory (made memory-resident) on page boundaries and in integral multiples of pages.

2129 3.262 Page Size

2130 The size, in bytes, of the system unit of memory allocation, protection, and mapping. On
2131 systems that have segment rather than page-based memory architectures, the term "page"
2132 means a segment.

3.263 Parameter

In the shell command language, an entity that stores values. There are three types of parameters: variables (named parameters), positional parameters, and special parameters. Parameter expansion is accomplished by introducing a parameter with the '\$' character.

Note: See also XCU [Section 2.5](#) (on page 2323).

In the C language, an object declared as part of a function declaration or definition that acquires a value on entry to the function, or an identifier following the macro name in a function-like macro definition.

3.264 Parent Directory

When discussing a given directory, the directory that both contains a directory entry for the given directory and is represented by the pathname dot-dot in the given directory.

When discussing other types of files, a directory containing a directory entry for the file under discussion.

This concept does not apply to dot and dot-dot.

3.265 Parent Process

The process which created (or inherited) the process under discussion.

3.266 Parent Process ID

An attribute of a new process identifying the parent of the process. The parent process ID of a process is the process ID of its creator, for the lifetime of the creator. After the creator's lifetime has ended, the parent process ID is the process ID of an implementation-defined system process.

3.267 Pathname

A string that is used to identify a file. In the context of POSIX.1-2008, a pathname may be limited to {PATH_MAX} bytes, including the terminating null byte. It has optional beginning <slash> characters, followed by zero or more filenames separated by <slash> characters. A pathname can optionally contain one or more trailing <slash> characters. Multiple successive <slash> characters are considered to be the same as one <slash>, except for the case of exactly two leading <slash> characters.

Note: If a pathname consists of only bytes corresponding to characters from the portable filename character set (see [Section 3.278](#), on page 78), <slash> characters, and a single terminating <NUL> character, the pathname will be usable as a character string in all supported locales; otherwise, the pathname might only be a string (rather than a character string). Additionally, since the single-byte encoding of the <slash> character is required to be the same across all locales and to not occur within a multi-byte character, references to a <slash> character within a pathname are well-defined even when the pathname is not a character string. However, this property does not necessarily hold for the remaining characters within the portable filename

2168 character set. +
 2169 Pathname Resolution is defined in detail in [Section 4.12](#) (on page 111).

2170 3.268 Pathname Component

2171 See *Filename* in [Section 3.170](#) (on page 60).

2172 3.269 Path Prefix

2173 The part of a pathname up to, but not including, the last component and any trailing <slash>
 2174 characters, unless the pathname consists entirely of <slash> characters, in which case the path
 2175 prefix is ' / ' for a pathname containing either a single <slash> or three or more <slash>
 2176 characters, and ' / / ' for the pathname //. The path prefix of a pathname containing no <slash>
 2177 characters is empty, but is treated as referring to the current working directory.

2178 **Note:** The term is used both in the sense of identifying part of a pathname that forms the prefix and of
 2179 joining a non-empty path prefix to a filename to form a pathname. In the latter case, the path
 2180 prefix need not have a trailing <slash> (in which case the joining is done with a <slash>
 2181 character).

2182 3.270 Pattern

2183 A sequence of characters used either with regular expression notation or for pathname
 2184 expansion, as a means of selecting various character strings or pathnames, respectively.

2185 **Note:** Regular Expressions are defined in detail in [Chapter 9](#) (on page 181).

2186 See also XCU [Section 2.6.6](#) (on page 2333).

2187 The syntaxes of the two types of patterns are similar, but not identical; POSIX.1-2008 always
 2188 indicates the type of pattern being referred to in the immediate context of the use of the term.

2189 3.271 Period Character (<period>)

2190 The character ' . '. The term “period” is contrasted with dot (see also [Section 3.136](#), on page 54),
 2191 which is used to describe a specific directory entry.

2192 3.272 Permissions

2193 Attributes of an object that determine the privilege necessary to access or manipulate the object.

2194 **Note:** File Access Permissions are defined in detail in [Section 4.4](#) (on page 108).

2195 3.273 Persistence

2196 A mode for semaphores, shared memory, and message queues requiring that the object and its
2197 state (including data, if any) are preserved after the object is no longer referenced by any
2198 process.

2199 Persistence of an object does not imply that the state of the object is maintained across a system
2200 crash or a system reboot.

2201 3.274 Pipe

2202 An object identical to a FIFO which has no links in the file hierarchy.

2203 **Note:** The *pipe()* function is defined in detail in the System Interfaces volume of POSIX.1-2008.

2204 3.275 Polling

2205 A scheduling scheme whereby the local process periodically checks until the pre-specified
2206 events (for example, read, write) have occurred.

2207 3.276 Portable Character Set

2208 The collection of characters that are required to be present in all locales supported by
2209 conforming systems.

2210 **Note:** The Portable Character Set is defined in detail in [Section 6.1](#) (on page 125).

2211 This term is contrasted against the smaller portable filename character set; see also [Section 3.278](#)
2212 (on page 78).

2213 3.277 Portable Filename

- 2214 A filename consisting only of characters from the portable filename character set. +
- 2215 **Note:** Applications should avoid using filenames that have the <hyphen> character as the first +
- 2216 character since this may cause problems when filenames are passed as command line +
- 2217 arguments. +

2218 3.278 Portable Filename Character Set

- 2219 The set of characters from which portable filenames are constructed.
- 2220 A B C D E F G H I J K L M N O P Q R S T U V W X Y Z
- 2221 a b c d e f g h i j k l m n o p q r s t u v w x y z
- 2222 0 1 2 3 4 5 6 7 8 9 . _ -
- 2223 The last three characters are the <period>, <underscore>, and <hyphen> characters, respectively. |
- 2224 See also [Section 3.267](#) (on page 75).

2225 3.279 Positional Parameter

- 2226 In the shell command language, a parameter denoted by a single digit or one or more digits in
- 2227 curly braces.
- 2228 **Note:** For further information, see XCU [Section 2.5.1](#) (on page 2323).

2229 3.280 Preallocation

- 2230 The reservation of resources in a system for a particular use.
- 2231 Preallocation does not imply that the resources are immediately allocated to that use, but merely
- 2232 indicates that they are guaranteed to be available in bounded time when needed.

2233 3.281 Preempted Process (or Thread)

- 2234 A running thread whose execution is suspended due to another thread becoming runnable at a
- 2235 higher priority.

2236 3.282 Previous Job

- 2237 In the context of job control, the job that will be used as the default for the *fg* or *bg* utilities if the
- 2238 current job exits. There is at most one previous job; see also [Section 3.204](#) (on page 65).

2239 3.283 Printable Character

2240 One of the characters included in the **print** character classification of the *LC_CTYPE* category in
2241 the current locale.

2242 **Note:** The *LC_CTYPE* category is defined in detail in [Section 7.3.1](#) (on page 139).

2243 3.284 Printable File

2244 A text file consisting only of the characters included in the **print** and **space** character
2245 classifications of the *LC_CTYPE* category and the <backspace>, all in the current locale.

2246 **Note:** The *LC_CTYPE* category is defined in detail in [Section 7.3.1](#) (on page 139).

2247 3.285 Priority

2248 A non-negative integer associated with processes or threads whose value is constrained to a
2249 range defined by the applicable scheduling policy. Numerically higher values represent higher
2250 priorities.

2251 3.286 Priority Band

2252 The queuing order applied to normal priority STREAMS messages. High priority STREAMS
2253 messages are not grouped by priority bands. The only differentiation made by the STREAMS
2254 mechanism is between zero and non-zero bands, but specific protocol modules may differentiate
2255 between priority bands.

2256 3.287 Priority Inversion

2257 A condition in which a thread that is not voluntarily suspended (waiting for an event or time
2258 delay) is not running while a lower priority thread is running. Such blocking of the higher
2259 priority thread is often caused by contention for a shared resource.

2260 3.288 Priority Scheduling

2261 A performance and determinism improvement facility to allow applications to determine the
2262 order in which threads that are ready to run are granted access to processor resources.

2263 3.289 Priority-Based Scheduling

2264 Scheduling in which the selection of a running thread is determined by the priorities of the
2265 runnable processes or threads.

3.290 Privilege

See *Appropriate Privileges* in [Section 3.20](#) (on page 36).

3.291 Process

An address space with one or more threads executing within that address space, and the required system resources for those threads.

Note: Many of the system resources defined by POSIX.1-2008 are shared among all of the threads within a process. These include the process ID, the parent process ID, process group ID, session membership, real, effective, and saved set-user-ID, real, effective, and saved set-group-ID, supplementary group IDs, current working directory, root directory, file mode creation mask, and file descriptors.

3.292 Process Group

A collection of processes that permits the signaling of related processes. Each process in the system is a member of a process group that is identified by a process group ID. A newly created process joins the process group of its creator.

3.293 Process Group ID

The unique positive integer identifier representing a process group during its lifetime.

Note: See also *Process Group ID Reuse* defined in [Section 4.13](#) (on page 112).

3.294 Process Group Leader

A process whose process ID is the same as its process group ID.

3.295 Process Group Lifetime

The period of time that begins when a process group is created and ends when the last remaining process in the group leaves the group, due either to the end of the lifetime of the last process or to the last remaining process calling the *setsid()* or *setpgid()* functions.

Note: The *setsid()* and *setpgid()* functions are defined in detail in the System Interfaces volume of POSIX.1-2008.

3.296 Process ID

The unique positive integer identifier representing a process during its lifetime.

Note: See also *Process ID Reuse* defined in [Section 4.13](#) (on page 112).

3.297 Process Lifetime

The period of time that begins when a process is created and ends when its process ID is returned to the system. After a process is created by *fork()*, *posix_spawn()*, or *posix_spawnnp()*, it is considered active. At least one thread of control and address space exist until it terminates. It then enters an inactive state where certain resources may be returned to the system, although some resources, such as the process ID, are still in use. When another process executes a *wait()*, *waitid()*, or *waitpid()* function for an inactive process, the remaining resources are returned to the system. The last resource to be returned to the system is the process ID. At this time, the lifetime of the process ends.

Note: The *fork()*, *posix_spawn()*, *posix_spawnnp()*, *wait()*, *waitid()*, and *waitpid()* functions are defined in detail in the System Interfaces volume of POSIX.1-2008.

3.298 Process Memory Locking

A performance improvement facility to bind application programs into the high-performance random access memory of a computer system. This avoids potential latencies introduced by the operating system in storing parts of a program that were not recently referenced on secondary memory devices.

3.299 Process Termination

There are two kinds of process termination:

1. Normal termination occurs by a return from *main()*, when requested with the *exit()*, *_exit()*, or *_Exit()* functions; or when the last thread in the process terminates by returning from its start function, by calling the *pthread_exit()* function, or through cancellation.
2. Abnormal termination occurs when requested by the *abort()* function or when some signals are received.

Note: The *_exit()*, *_Exit()*, *abort()*, and *exit()* functions are defined in detail in the System Interfaces volume of POSIX.1-2008.

3.300 Process-To-Process Communication

The transfer of data between processes.

3.301 Process Virtual Time

The measurement of time in units elapsed by the system clock while a process is executing.

3.302 Program

A prepared sequence of instructions to the system to accomplish a defined task. The term “program” in POSIX.1-2008 encompasses applications written in the Shell Command Language, complex utility input languages (for example, *awk*, *lex*, *sed*, and so on), and high-level languages.

3.303 Protocol

A set of semantic and syntactic rules for exchanging information.

3.304 Pseudo-Terminal

A facility that provides an interface that is identical to the terminal subsystem, except where noted otherwise in POSIX.1-2008. A pseudo-terminal is composed of two devices: the “master device” and a “slave device”. The slave device provides processes with an interface that is identical to the terminal interface, although there need not be hardware behind that interface. Anything written on the master device is presented to the slave as an input and anything written on the slave device is presented as an input on the master side.

3.305 Radix Character

The character that separates the integer part of a number from the fractional part.

3.306 Read-Only File System

A file system that has implementation-defined characteristics restricting modifications.

Note: File Times Update is described in detail in [Section 4.8](#) (on page 109).

3.307 Read-Write Lock

Multiple readers, single writer (read-write) locks allow many threads to have simultaneous read-only access to data while allowing only one thread to have write access at any given time. They are typically used to protect data that is read-only more frequently than it is changed.

Read-write locks can be used to synchronize threads in the current process and other processes if they are allocated in memory that is writable and shared among the cooperating processes and have been initialized for this behavior.

2349 **3.308 Real Group ID**

2350 The attribute of a process that, at the time of process creation, identifies the group of the user
2351 who created the process; see also [Section 3.189](#) (on page 63).

2352 **3.309 Real Time**

2353 Time measured as total units elapsed by the system clock without regard to which thread is
2354 executing.

2355 **3.310 Realtime Signal Extension**

2356 A determinism improvement facility to enable asynchronous signal notifications to an
2357 application to be queued without impacting compatibility with the existing signal functions.

2358 **3.311 Real User ID**

2359 The attribute of a process that, at the time of process creation, identifies the user who created the
2360 process; see also [Section 3.430](#) (on page 102).

2361 **3.312 Record**

2362 A collection of related data units or words which is treated as a unit.

2363 **3.313 Redirection**

2364 In the shell command language, a method of associating files with the input or output of
2365 commands.

2366 **Note:** For further information, see XCU [Section 2.7](#) (on page 2334).

2367 **3.314 Redirection Operator**

2368 In the shell command language, a token that performs a redirection function. It is one of the
2369 following symbols:

2370 < > >| << >> <& >& <<- <>

2371 **3.315 Referenced Shared Memory Object**

2372 A shared memory object that is open or has one or more mappings defined on it.

2373 **3.316 Refresh**

2374 To ensure that the information on the user's terminal screen is up-to-date.

2375 **3.317 Regular Expression**

2376 A pattern that selects specific strings from a set of character strings.

2377 **Note:** Regular Expressions are described in detail in [Chapter 9](#) (on page 181).

2378 **3.318 Region**

2379 In the context of the address space of a process, a sequence of addresses.

2380 In the context of a file, a sequence of offsets.

2381 **3.319 Regular File**

2382 A file that is a randomly accessible sequence of bytes, with no further structure imposed by the
2383 system.

2384 **3.320 Relative Pathname**

2385 A pathname not beginning with a <slash> character.

2386 **Note:** Pathname Resolution is defined in detail in [Section 4.12](#) (on page 111).

2387 **3.321 Relocatable File**

2388 A file holding code or data suitable for linking with other object files to create an executable or a
2389 shared object file.

2390 **3.322 Relocation**

2391 The process of connecting symbolic references with symbolic definitions. For example, when a
2392 program calls a function, the associated call instruction transfers control to the proper
2393 destination address at execution.

2394 **3.323 Requested Batch Service**

2395 A service that is either rejected or performed prior to a response from the service to the
2396 requester.

2397 **3.324 (Time) Resolution**

2398 The minimum time interval that a clock can measure or whose passage a timer can detect.

2399 **3.325 Robust Mutex**

2400 A mutex with the *robust* attribute set.

2401 **Note:** The *robust* attribute is defined in detail by the `pthread_mutexattr_getrobust()` function.

2402 **3.326 Root Directory**

2403 A directory, associated with a process, that is used in pathname resolution for pathnames that
2404 begin with a <slash> character.

2405 **3.327 Runnable Process (or Thread)**

2406 A thread that is capable of being a running thread, but for which no processor is available.

3.328 Running Process (or Thread)

A thread currently executing on a processor. On multi-processor systems there may be more than one such thread in a system at a time.

3.329 Saved Resource Limits

An attribute of a process that provides some flexibility in the handling of unrepresentable resource limits, as described in the *exec* family of functions and *setrlimit()*.

Note: The *exec* and *setrlimit()* functions are defined in detail in the System Interfaces volume of POSIX.1-2008.

3.330 Saved Set-Group-ID

An attribute of a process that allows some flexibility in the assignment of the effective group ID attribute, as described in the *exec* family of functions and *setgid()*.

Note: The *exec* and *setgid()* functions are defined in detail in the System Interfaces volume of POSIX.1-2008.

3.331 Saved Set-User-ID

An attribute of a process that allows some flexibility in the assignment of the effective user ID attribute, as described in the *exec* family of functions and *setuid()*.

Note: The *exec* and *setuid()* functions are defined in detail in the System Interfaces volume of POSIX.1-2008.

3.332 Scheduling

The application of a policy to select a runnable process or thread to become a running process or thread, or to alter one or more of the thread lists.

3.333 Scheduling Allocation Domain

The set of processors on which an individual thread can be scheduled at any given time.

3.334 Scheduling Contention Scope

A property of a thread that defines the set of threads against which that thread competes for resources.

2433 For example, in a scheduling decision, threads sharing scheduling contention scope compete for
2434 processor resources. In POSIX.1-2008, a thread has scheduling contention scope of either
2435 PTHREAD_SCOPE_SYSTEM or PTHREAD_SCOPE_PROCESS.

2436 3.335 Scheduling Policy

2437 A set of rules that is used to determine the order of execution of processes or threads to achieve
2438 some goal.

2439 **Note:** Scheduling Policy is defined in detail in [Section 4.14](#) (on page 112).

2440 3.336 Screen

2441 A rectangular region of columns and lines on a terminal display. A screen may be a portion of a
2442 physical display device or may occupy the entire physical area of the display device.

2443 3.337 Scroll

2444 To move the representation of data vertically or horizontally relative to the terminal screen.
2445 There are two types of scrolling:

- 2446 1. The cursor moves with the data.
- 2447 2. The cursor remains stationary while the data moves.

2448 3.338 Semaphore

2449 A minimum synchronization primitive to serve as a basis for more complex synchronization
2450 mechanisms to be defined by the application program.

2451 **Note:** Semaphores are defined in detail in [Section 4.16](#) (on page 113).

3.339 Session

A collection of process groups established for job control purposes. Each process group is a member of a session. A process is considered to be a member of the session of which its process group is a member. A newly created process joins the session of its creator. A process can alter its session membership; see *setsid()*. There can be multiple process groups in the same session.

Note: The *setsid()* function is defined in detail in the System Interfaces volume of POSIX.1-2008.

3.340 Session Leader

A process that has created a session.

Note: For further information, see the *setsid()* function defined in the System Interfaces volume of POSIX.1-2008.

3.341 Session Lifetime

The period between when a session is created and the end of the lifetime of all the process groups that remain as members of the session.

3.342 Shared Memory Object

An object that represents memory that can be mapped concurrently into the address space of more than one process.

3.343 Shell

A program that interprets sequences of text input as commands. It may operate on an input stream or it may interactively prompt and read commands from a terminal.

3.344 Shell, the

The Shell Command Language Interpreter; a specific instance of a shell.

Note: For further information, see the *sh* utility defined in the Shell and Utilities volume of POSIX.1-2008.

3.345 Shell Script

A file containing shell commands. If the file is made executable, it can be executed by specifying its name as a simple command. Execution of a shell script causes a shell to execute the commands within the script. Alternatively, a shell can be requested to execute the commands in a shell script by specifying the name of the shell script as the operand to the *sh* utility.

Note: Simple Commands are defined in detail in XCU [Section 2.9.1](#) (on page 2338).

The *sh* utility is defined in detail in the Shell and Utilities volume of POSIX.1-2008.

3.346 Signal

A mechanism by which a process or thread may be notified of, or affected by, an event occurring in the system. Examples of such events include hardware exceptions and specific actions by processes. The term signal is also used to refer to the event itself.

3.347 Signal Stack

Memory established for a thread, in which signal handlers catching signals sent to that thread are executed.

3.348 Single-Quote Character

The character designated by `'\''` in the C language, also known as <apostrophe>.

3.349 Slash Character (<slash>)

The character ' / ', also known as solidus.

3.350 Socket

A file of a particular type that is used as a communications endpoint for process-to-process communication as described in the System Interfaces volume of POSIX.1-2008.

3.351 Socket Address

An address associated with a socket or remote endpoint, including an address family identifier and addressing information specific to that address family. The address may include multiple parts, such as a network address associated with a host system and an identifier for a specific endpoint.

2501 3.352 Soft Limit

2502 A resource limitation established for each process that the process may set to any value less than
2503 or equal to the hard limit.

2504 3.353 Source Code

2505 When dealing with the Shell Command Language, input to the command language interpreter.
2506 The term “shell script” is synonymous with this meaning.

2507 When dealing with an ISO/IEC-conforming programming language, source code is input to a
2508 compiler conforming to that ISO/IEC standard.

2509 Source code also refers to the input statements prepared for the following standard utilities: *awk*,
2510 *bc*, *ed*, *lex*, *localedef*, *make*, *sed*, and *yacc*.

2511 Source code can also refer to a collection of sources meeting any or all of these meanings.

2512 **Note:** The *awk*, *bc*, *ed*, *lex*, *localedef*, *make*, *sed*, and *yacc* utilities are defined in detail in the Shell and
2513 Utilities volume of POSIX.1-2008.

2514 3.354 Space Character (<space>)

2515 The character defined in the portable character set as <space>. The <space> character is a
2516 member of the **space** character class of the current locale, but represents the single character, and
2517 not all of the possible members of the class; see also [Section 3.436](#) (on page 103).

2518 3.355 Spawn

2519 A process creation primitive useful for systems that have difficulty with *fork()* and as an efficient
2520 replacement for *fork()/exec*.

2521 3.356 Special Built-In

2522 See *Built-In Utility* in [Section 3.83](#) (on page 46).

2523 **3.357 Special Parameter**

2524 In the shell command language, a parameter named by a single character from the following list:

2525 * @ # ? ! - \$ 0

2526 **Note:** For further information, see XCU [Section 2.5.2](#) (on page 2324).

2527 **3.358 Spin Lock**

2528 A synchronization object used to allow multiple threads to serialize their access to shared data.

2529 **3.359 Sporadic Server**

2530 A scheduling policy for threads and processes that reserves a certain amount of execution
2531 capacity for processing aperiodic events at a given priority level.

2532 **3.360 Standard Error**

2533 An output stream usually intended to be used for diagnostic messages.

2534 **3.361 Standard Input**

2535 An input stream usually intended to be used for primary data input.

2536 **3.362 Standard Output**

2537 An output stream usually intended to be used for primary data output.

2538 **3.363 Standard Utilities**

2539 The utilities described in the Shell and Utilities volume of POSIX.1-2008.

3.364 Stream

Appearing in lowercase, a stream is a file access object that allows access to an ordered sequence of characters, as described by the ISO C standard. Such objects can be created by the *fdopen()*, *fmemopen()*, *fopen()*, *open_memstream()*, or *popen()* functions, and are associated with a file descriptor. A stream provides the additional services of user-selectable buffering and formatted input and output; see also [Section 3.365](#).

Note: For further information, see XSH [Section 2.5](#) (on page 495).

The *fdopen()*, *fmemopen()*, *fopen()*, *open_memstream()*, and *popen()* functions are defined in detail in the System Interfaces volume of POSIX.1-2008.

3.365 STREAM

Appearing in uppercase, STREAM refers to a full-duplex connection between a process and an open device or pseudo-device. It optionally includes one or more intermediate processing modules that are interposed between the process end of the STREAM and the device driver (or pseudo-device driver) end of the STREAM; see also [Section 3.364](#).

Note: For further information, see XSH [Section 2.6](#) (on page 499).

3.366 STREAM End

The STREAM end is the driver end of the STREAM and is also known as the downstream end of the STREAM.

3.367 STREAM Head

The STREAM head is the beginning of the STREAM and is at the boundary between the system and the application process. This is also known as the upstream end of the STREAM.

3.368 STREAMS Multiplexor

A driver with multiple STREAMS connected to it. Multiplexing with STREAMS connected above is referred to as N-to-1, or “upper multiplexing”. Multiplexing with STREAMS connected below is referred to as 1-to-N or “lower multiplexing”.

3.369 String

A contiguous sequence of bytes terminated by and including the first null byte.

3.370 Subshell

A shell execution environment, distinguished from the main or current shell execution environment.

Note: For further information, see XCU [Section 2.12](#) (on page 2353).

3.371 Successfully Transferred

For a write operation to a regular file, when the system ensures that all data written is readable on any subsequent open of the file (even one that follows a system or power failure) in the absence of a failure of the physical storage medium.

For a read operation, when an image of the data on the physical storage medium is available to the requesting process.

3.372 Supplementary Group ID

An attribute of a process used in determining file access permissions. A process has up to {NGROUPS_MAX} supplementary group IDs in addition to the effective group ID. The supplementary group IDs of a process are set to the supplementary group IDs of the parent process when the process is created.

3.373 Suspended Job

A job that has received a SIGSTOP, SIGTSTP, SIGTTIN, or SIGTTOU signal that caused the process group to stop. A suspended job is a background job, but a background job is not necessarily a suspended job.

3.374 Symbolic Constant

An object-like macro defined with a constant value.

Unless stated otherwise, the following shall apply to every symbolic constant:

- It expands to a compile-time constant expression with an integer type.
- It may be defined as another type of constant—e.g., an enumeration constant—as well as being a macro.
- It need not be usable in **#if** preprocessing directives.

3.375 Symbolic Link

A type of file with the property that when the file is encountered during pathname resolution, a string stored by the file is used to modify the pathname resolution. The stored string has a length of {SYMLINK_MAX} bytes or fewer.

Note: Pathname Resolution is defined in detail in [Section 4.12](#) (on page 111).

3.376 Synchronized Input and Output

A determinism and robustness improvement mechanism to enhance the data input and output mechanisms, so that an application can ensure that the data being manipulated is physically present on secondary mass storage devices.

3.377 Synchronized I/O Completion

The state of an I/O operation that has either been successfully transferred or diagnosed as unsuccessful.

3.378 Synchronized I/O Data Integrity Completion

For read, when the operation has been completed or diagnosed if unsuccessful. The read is complete only when an image of the data has been successfully transferred to the requesting process. If there were any pending write requests affecting the data to be read at the time that the synchronized read operation was requested, these write requests are successfully transferred prior to reading the data.

For write, when the operation has been completed or diagnosed if unsuccessful. The write is complete only when the data specified in the write request is successfully transferred and all file system information required to retrieve the data is successfully transferred.

File attributes that are not necessary for data retrieval (access time, modification time, status change time) need not be successfully transferred prior to returning to the calling process.

3.379 Synchronized I/O File Integrity Completion

Identical to a synchronized I/O data integrity completion with the addition that all file attributes relative to the I/O operation (including access time, modification time, status change time) are successfully transferred prior to returning to the calling process.

3.380 Synchronized I/O Operation

An I/O operation performed on a file that provides the application assurance of the integrity of its data and files.

3.381 Synchronous I/O Operation

An I/O operation that causes the thread requesting the I/O to be blocked from further use of the processor until that I/O operation completes.

Note: A synchronous I/O operation does not imply synchronized I/O data integrity completion or synchronized I/O file integrity completion.

3.382 Synchronously-Generated Signal

A signal that is attributable to a specific thread.

For example, a thread executing an illegal instruction or touching invalid memory causes a synchronously-generated signal. Being synchronous is a property of how the signal was generated and not a property of the signal number.

3.383 System

An implementation of POSIX.1-2008.

3.384 System Boot

An unspecified sequence of events that may result in the loss of transitory data; that is, data that is not saved in permanent storage. For example, message queues, shared memory, semaphores, and processes.

3.385 System Clock

A clock with at least one second resolution that contains seconds since the Epoch.

3.386 System Console

A device that receives messages sent by the *syslog()* function, and the *fntmsg()* function when the MM_CONSOLE flag is set.

Note: The *syslog()* and *fntmsg()* functions are defined in detail in the System Interfaces volume of POSIX.1-2008.

3.387 System Crash

An interval initiated by an unspecified circumstance that causes all processes (possibly other than special system processes) to be terminated in an undefined manner, after which any

2649 changes to the state and contents of files created or written to by an application prior to the
2650 interval are undefined, except as required elsewhere in POSIX.1-2008.

2651 **3.388 System Databases**

2652 An implementation provides two system databases: the “group database” (see also [Section](#)
2653 [3.188](#), on page 63) and the “user database” (see also [Section 3.429](#), on page 101).

2654 **3.389 System Documentation**

2655 All documentation provided with an implementation except for the conformance document.
2656 Electronically distributed documents for an implementation are considered part of the system
2657 documentation.

2658 **3.390 System Process**

2659 An object other than a process executing an application, that is provided by the system and has a
2660 process ID.

2661 **3.391 System Reboot**

2662 See *System Boot* defined in [Section 3.384](#) (on page 95).

2663 **3.392 System Trace Event**

2664 A trace event that is generated by the implementation, in response either to a system-initiated
2665 action or to an application-requested action, except for a call to *posix_trace_event()*. When
2666 supported by the implementation, a system-initiated action generates a process-independent
2667 system trace event and an application-requested action generates a process-dependent system
2668 trace event. For a system trace event not defined by POSIX.1-2008, the associated trace event
2669 type identifier is derived from the implementation-defined name for this trace event, and the
2670 associated data is of implementation-defined content and length.

2671 **3.393 System-Wide**

2672 Pertaining to events occurring in all processes existing in an implementation at a given point in
2673 time.

3.394 Tab Character (<tab>)

A character that in the output stream indicates that printing or displaying should start at the next horizontal tabulation position on the current line. It is the character designated by ‘\t’ in the C language. If the current position is at or past the last defined horizontal tabulation position, the behavior is unspecified. It is unspecified whether this character is the exact sequence transmitted to an output device by the system to accomplish the tabulation.

3.395 Terminal (or Terminal Device)

A character special file that obeys the specifications of the general terminal interface.

Note: The General Terminal Interface is defined in detail in [Chapter 11](#) (on page 199).

3.396 Text Column

A roughly rectangular block of characters capable of being laid out side-by-side next to other text columns on an output page or terminal screen. The widths of text columns are measured in column positions.

3.397 Text File

A file that contains characters organized into zero or more lines. The lines do not contain NUL characters and none can exceed {LINE_MAX} bytes in length, including the <newline> character. Although POSIX.1-2008 does not distinguish between text files and binary files (see the ISO C standard), many utilities only produce predictable or meaningful output when operating on text files. The standard utilities that have such restrictions always specify “text files” in their STDIN or INPUT FILES sections.

3.398 Thread

A single flow of control within a process. Each thread has its own thread ID, scheduling priority and policy, *errno* value, floating point environment, thread-specific key/value bindings, and the required system resources to support a flow of control. Anything whose address may be determined by a thread, including but not limited to static variables, storage obtained via *malloc()*, directly addressable storage obtained through implementation-defined functions, and automatic variables, are accessible to all threads in the same process.

Note: The *malloc()* function is defined in detail in the System Interfaces volume of POSIX.1-2008.

3.399 Thread ID

Each thread in a process is uniquely identified during its lifetime by a value of type **pthread_t** called a thread ID.

3.400 Thread List

An ordered set of runnable threads that all have the same ordinal value for their priority.

The ordering of threads on the list is determined by a scheduling policy or policies. The set of thread lists includes all runnable threads in the system.

3.401 Thread-Safe

A thread-safe function can be safely invoked concurrently with other calls to the same function, or with calls to any other thread-safe functions, by multiple threads. Each function defined in the System Interfaces volume of POSIX.1-2008 is thread-safe unless explicitly stated otherwise. Examples are any “pure” function, a function which holds a mutex locked while it is accessing static storage, or objects shared among threads.

3.402 Thread-Specific Data Key

A process global handle of type `pthread_key_t` which is used for naming thread-specific data.

Although the same key value may be used by different threads, the values bound to the key by `pthread_setspecific()` and accessed by `pthread_getspecific()` are maintained on a per-thread basis and persist for the life of the calling thread.

Note: The `pthread_getspecific()` and `pthread_setspecific()` functions are defined in detail in the System Interfaces volume of POSIX.1-2008.

3.403 Tilde Character (<tilde>)

The character ‘~’.

3.404 Timeouts

A method of limiting the length of time an interface will block; see also [Section 3.76](#) (on page 44).

3.405 Timer

A mechanism that can notify a thread when the time as measured by a particular clock has reached or passed a specified value, or when a specified amount of time has passed.

3.406 Timer Overrun

A condition that occurs each time a timer, for which there is already an expiration signal queued to the process, expires.

2732 3.407 Token

2733 In the shell command language, a sequence of characters that the shell considers as a single unit
2734 when reading input. A token is either an operator or a word.

2735 **Note:** The rules for reading input are defined in detail in XCU [Section 2.3](#) (on page 2321).

2736 3.408 Trace Analyzer Process

2737 A process that extracts trace events from a trace stream to retrieve information about the
2738 behavior of an application.

2739 3.409 Trace Controller Process

2740 A process that creates a trace stream for tracing a process.

2741 3.410 Trace Event

2742 A data object that represents an action executed by the system, and that is recorded in a trace
2743 stream.

2744 3.411 Trace Event Type

2745 A data object type that defines a class of trace event.

2746 3.412 Trace Event Type Mapping

2747 A one-to-one mapping between trace event types and trace event names.

2748 3.413 Trace Filter

2749 A filter that allows the trace controller process to specify those trace event types that are to be
2750 ignored; that is, not generated.

2751 3.414 Trace Generation Version

2752 A data object that is an implementation-defined character string, generated by the trace system
2753 and describing the origin and version of the trace system.

2754 3.415 Trace Log

2755 The flushed image of a trace stream, if the trace stream is created with a trace log.

2756 3.416 Trace Point

2757 An action that may cause a trace event to be generated.

2758 3.417 Trace Stream

2759 An opaque object that contains trace events plus internal data needed to interpret those trace
2760 events.

2761 3.418 Trace Stream Identifier

2762 A handle to manage tracing operations in a trace stream.

2763 3.419 Trace System

2764 A system that allows both system and user trace events to be generated into a trace stream.
2765 These trace events can be retrieved later.

2766 3.420 Traced Process

2767 A process for which at least one trace stream has been created. A traced process is also called a
2768 target process.

2769 3.421 Tracing Status of a Trace Stream

2770 A status that describes the state of an active trace stream. The tracing status of a trace stream can
2771 be retrieved from the trace stream attributes. An active trace stream can be in one of two states:
2772 running or suspended.

2773 3.422 Typed Memory Name Space

2774 A system-wide name space that contains the names of the typed memory objects present in the
2775 system. It is configurable for a given implementation.

2776 3.423 Typed Memory Object

2777 A combination of a typed memory pool and a typed memory port. The entire contents of the
2778 pool are accessible from the port. The typed memory object is identified through a name that
2779 belongs to the typed memory name space.

2780 3.424 Typed Memory Pool

2781 An extent of memory with the same operational characteristics. Typed memory pools may be
2782 contained within each other.

2783 3.425 Typed Memory Port

2784 A hardware access path to one or more typed memory pools.

2785 3.426 Unbind

2786 Remove the association between a network address and an endpoint.

2787 3.427 Unit Data

2788 See *Datagram* in [Section 3.124](#) (on page 53).

2789 3.428 Upshifting

2790 The conversion of a lowercase character that has a single-character uppercase representation into
2791 this uppercase representation.

2792 3.429 User Database

2793 A system database that contains at least the following information for each user ID:

- 2794 • User name
- 2795 • Numerical user ID
- 2796 • Initial numerical group ID
- 2797 • Initial working directory
- 2798 • Initial user program

2799 The initial numerical group ID is used by the *newgrp* utility. Any other circumstances under
2800 which the initial values are operative are implementation-defined.

- 2801 If the initial user program field is null, an implementation-defined program is used.
- 2802 If the initial working directory field is null, the interpretation of that field is implementation-
- 2803 defined.
- 2804 **Note:** The *newgrp* utility is defined in detail in the Shell and Utilities volume of POSIX.1-2008.

2805 3.430 User ID

- 2806 A non-negative integer that is used to identify a system user. When the identity of a user is
- 2807 associated with a process, a user ID value is referred to as a real user ID, an effective user ID, or
- 2808 a saved set-user-ID.

2809 3.431 User Name

- 2810 A string that is used to identify a user; see also [Section 3.429](#) (on page 101). To be portable across
- 2811 systems conforming to POSIX.1-2008, the value is composed of characters from the portable
- 2812 filename character set. The <hyphen> character should not be used as the first character of a
- 2813 portable user name.

2814 3.432 User Trace Event

- 2815 A trace event that is generated explicitly by the application as a result of a call to
- 2816 *posix_trace_event()*.

2817 3.433 Utility

- 2818 A program, excluding special built-in utilities provided as part of the Shell Command Language,
- 2819 that can be called by name from a shell to perform a specific task, or related set of tasks.
- 2820 **Note:** For further information on special built-in utilities, see XCU [Section 2.14](#) (on page 2356).

3.434 Variable

In the shell command language, a named parameter.

Note: For further information, see XCU [Section 2.5](#) (on page 2323).

3.435 Vertical-Tab Character (<vertical-tab>)

A character that in the output stream indicates that printing should start at the next vertical tabulation position. It is the character designated by '`\v`' in the C language. If the current position is at or past the last defined vertical tabulation position, the behavior is unspecified. It is unspecified whether this character is the exact sequence transmitted to an output device by the system to accomplish the tabulation.

3.436 White Space

A sequence of one or more characters that belong to the **space** character class as defined via the `LC_CTYPE` category in the current locale.

In the POSIX locale, white space consists of one or more `<blank>` (`<space>` and `<tab>` characters), `<newline>`, `<carriage-return>`, `<form-feed>`, and `<vertical-tab>` characters.

3.437 Wide-Character Code (C Language)

An integer value corresponding to a single graphic symbol or control code.

Note: C Language Wide-Character Codes are defined in detail in [Section 6.3](#) (on page 129).

3.438 Wide-Character Input/Output Functions

The functions that perform wide-oriented input from streams or wide-oriented output to streams: `fgetwc()`, `fgetws()`, `fputwc()`, `fputws()`, `fwprintf()`, `fwscanf()`, `getwc()`, `getwchar()`, `putwc()`, `putwchar()`, `ungetwc()`, `vfwprintf()`, `vfwscanf()`, `vwpprintf()`, `vwscanf()`, `wprintf()`, and `wscanf()`.

Note: These functions are defined in detail in the System Interfaces volume of POSIX.1-2008.

3.439 Wide-Character String

A contiguous sequence of wide-character codes terminated by and including the first null wide-character code.

2846 3.440 Word

2847 In the shell command language, a token other than an operator. In some cases a word is also a
2848 portion of a word token: in the various forms of parameter expansion, such as `${name-word}`,
2849 and variable assignment, such as `name=word`, the word is the portion of the token depicted by
2850 *word*. The concept of a word is no longer applicable following word expansions—only fields
2851 remain.

2852 **Note:** For further information, see XCU [Section 2.6.2](#) (on page 2328) and [Section 2.6](#) (on page 2327).

2853 3.441 Working Directory (or Current Working Directory)

2854 A directory, associated with a process, that is used in pathname resolution for pathnames that do
2855 not begin with a <slash> character.

2856 3.442 Worldwide Portability Interface

2857 Functions for handling characters in a codeset-independent manner.

2858 3.443 Write

2859 To output characters to a file, such as standard output or standard error. Unless otherwise stated,
2860 standard output is the default output destination for all uses of the term “write”; see the
2861 distinction between display and write in [Section 3.133](#) (on page 54).

2862 3.444 XSI

2863 The X/Open System Interfaces (XSI) option is the core application programming interface for C
2864 and *sh* programming for systems conforming to the Single UNIX Specification. This is a
2865 superset of the mandatory requirements for conformance to POSIX.1-2008.

2866 3.445 XSI-Conformant

2867 A system which allows an application to be built using a set of services that are consistent across
2868 all systems that conform to POSIX.1-2008 and that support the XSI option.

2869 **Note:** See also [Chapter 2](#) (on page 15).

2870 3.446 Zombie Process

2871 A process that has terminated and that is deleted when its exit status has been reported to
2872 another process which is waiting for that process to terminate.

2873 3.447 ± 0

2874 The algebraic sign provides additional information about any variable that has the value zero
2875 when the representation allows the sign to be determined.

2876

2877

General Concepts

2878

For the purposes of POSIX.1-2008, the general concepts given in [Chapter 4](#) apply.

2879

Note: No shading to denote extensions or options occurs in this chapter. Where the terms and definitions given in this chapter are used elsewhere in text related to extensions and options, they are shaded as appropriate.

2880

2881

4.1 Concurrent Execution

2882

2883

2884

Functions that suspend the execution of the calling thread shall not cause the execution of other threads to be indefinitely suspended.

4.2 Directory Protection

2885

2886

2887

If a directory is writable and the mode bit S_ISVTX is set on the directory, a process may remove or rename files within that directory only if one or more of the following is true:

2888

- The effective user ID of the process is the same as that of the owner ID of the file.

2889

- The effective user ID of the process is the same as that of the owner ID of the directory.

2890

- The process has appropriate privileges.

2891

- Optionally, the file is writable by the process. Whether or not files that are writable by the process can be removed or renamed is implementation-defined.

2892

2893

If the S_ISVTX bit is set on a non-directory file, the behavior is unspecified.

4.3 Extended Security Controls

2894

2895

2896

2897

2898

An implementation may provide implementation-defined extended security controls (see [Section 3.160](#), on page 58). These permit an implementation to provide security mechanisms to implement different security policies than those described in POSIX.1-2008. These mechanisms shall not alter or override the defined semantics of any of the interfaces in POSIX.1-2008.

4.4 File Access Permissions

The standard file access control mechanism uses the file permission bits, as described below.

Implementations may provide *additional* or *alternate* file access control mechanisms, or both. An additional access control mechanism shall only further restrict the access permissions defined by the file permission bits. An alternate file access control mechanism shall:

- Specify file permission bits for the file owner class, file group class, and file other class of that file, corresponding to the access permissions.
- Be enabled only by explicit user action, on a per-file basis by the file owner or a user with appropriate privileges.
- Be disabled for a file after the file permission bits are changed for that file with *chmod()*. The disabling of the alternate mechanism need not disable any additional mechanisms supported by an implementation.

Whenever a process requests file access permission for read, write, or execute/search, if no additional mechanism denies access, access shall be determined as follows:

- If a process has appropriate privileges:
 - If read, write, or directory search permission is requested, access shall be granted.
 - If execute permission is requested, access shall be granted if execute permission is granted to at least one user by the file permission bits or by an alternate access control mechanism; otherwise, access shall be denied.
- Otherwise:
 - The file permission bits of a file contain read, write, and execute/search permissions for the file owner class, file group class, and file other class.
 - Access shall be granted if an alternate access control mechanism is not enabled and the requested access permission bit is set for the class (file owner class, file group class, or file other class) to which the process belongs, or if an alternate access control mechanism is enabled and it allows the requested access; otherwise, access shall be denied.

4.5 File Hierarchy

Files in the system are organized in a hierarchical structure in which all of the non-terminal nodes are directories and all of the terminal nodes are any other type of file. Since multiple directory entries may refer to the same file, the hierarchy is properly described as a “directed graph”.

4.6 Filenames

Uppercase and lowercase letters shall retain their unique identities between conforming implementations.

4.7 Filename Portability

For a filename to be portable across implementations conforming to POSIX.1-2008, it shall consist only of the portable filename character set as defined in [Section 3.278](#) (on page 78).

Note: Applications should avoid using filenames that have the <hyphen> character as the first character since this may cause problems when filenames are passed as command line arguments.

4.8 File Times Update

Each file has three distinct associated timestamps: the time of last data access, the time of last data modification, and the time the file status last changed. These values are returned in the file characteristics structure **struct stat**, as described in [<sys/stat.h>](#) (on page 391).

Each function or utility in POSIX.1-2008 that reads or writes data (even if the data does not change) or performs an operation to change file status (even if the file status does not change) indicates which of the appropriate timestamps shall be marked for update. If an implementation of such a function or utility marks for update one of these timestamps in a place or time not specified by POSIX.1-2008, this shall be documented, except that any changes caused by pathname resolution need not be documented. For the other functions or utilities in POSIX.1-2008 (those that are not explicitly required to read or write file data or change file status, but that in some implementations happen to do so), the effect is unspecified.

An implementation may update timestamps that are marked for update immediately, or it may update such timestamps periodically. At the point in time when an update occurs, any marked timestamps shall be set to the current time and the update marks shall be cleared. All timestamps that are marked for update shall be updated when the file ceases to be open by any process or before a *fstat()*, *fstatat()*, *fsync()*, *futimens()*, *lstat()*, *stat()*, *utime()*, *utimensat()*, or *utimes()* is successfully performed on the file. Other times at which updates are done are unspecified. Marks for update, and updates themselves, shall not be done for files on read-only file systems; see [Section 3.306](#) (on page 82).

The resolution of timestamps of files in a file system is implementation-defined, but shall be no coarser than one-second resolution. The three timestamps shall always have values that are supported by the file system. Whenever any of a file's timestamps are to be set to a value *V* according to the rules of the preceding paragraphs of this section, the implementation shall immediately set the timestamp to the greatest value supported by the file system that is not greater than *V*.

4.9 Host and Network Byte Orders

When data is transmitted over the network, it is sent as a sequence of octets (8-bit unsigned values). If an entity (such as an address or a port number) can be larger than 8 bits, it needs to be stored in several octets. The convention is that all such values are stored with 8 bits in each octet, and with the first (lowest-addressed) octet holding the most-significant bits. This is called “network byte order”.

Network byte order may not be convenient for processing actual values. For this, it is more sensible for values to be stored as ordinary integers. This is known as “host byte order”. In host byte order:

- The most significant bit might not be stored in the first byte in address order.
- Bits might not be allocated to bytes in any obvious order at all.

8-bit values stored in `uint8_t` objects do not require conversion to or from host byte order, as they have the same representation. 16 and 32-bit values can be converted using the `htonl()`, `htons()`, `ntohl()`, and `ntohs()` functions. When reading data that is to be converted to host byte order, it should either be received directly into a `uint16_t` or `uint32_t` object or should be copied from an array of bytes using `memcpy()` or similar. Passing the data through other types could cause the byte order to be changed. Similar considerations apply when sending data.

4.10 Measurement of Execution Time

The mechanism used to measure execution time shall be implementation-defined. The implementation shall also define to whom the CPU time that is consumed by interrupt handlers and system services on behalf of the operating system will be charged. See [Section 3.118](#) (on page 52).

4.11 Memory Synchronization

Applications shall ensure that access to any memory location by more than one thread of control (threads or processes) is restricted such that no thread of control can read or modify a memory location while another thread of control may be modifying it. Such access is restricted using functions that synchronize thread execution and also synchronize memory with respect to other threads. The following functions synchronize memory with respect to other threads:

<code>fork()</code>	<code>pthread_mutex_trylock()</code>	<code>pthread_rwlock_unlock()</code>
<code>pthread_barrier_wait()</code>	<code>pthread_mutex_unlock()</code>	<code>pthread_rwlock_wrlock()</code>
<code>pthread_cond_broadcast()</code>	<code>pthread_spin_lock()</code>	<code>sem_post()</code>
<code>pthread_cond_signal()</code>	<code>pthread_spin_trylock()</code>	<code>sem_timedwait()</code>
<code>pthread_cond_timedwait()</code>	<code>pthread_spin_unlock()</code>	<code>sem_trywait()</code>
<code>pthread_cond_wait()</code>	<code>pthread_rwlock_rdlock()</code>	<code>sem_wait()</code>
<code>pthread_create()</code>	<code>pthread_rwlock_timedrdlock()</code>	<code>semctl()</code>
<code>pthread_join()</code>	<code>pthread_rwlock_timedwrlock()</code>	<code>semop()</code>
<code>pthread_mutex_lock()</code>	<code>pthread_rwlock_tryrdlock()</code>	<code>wait()</code>
<code>pthread_mutex_timedlock()</code>	<code>pthread_rwlock_trywrlock()</code>	<code>waitpid()</code>

The `pthread_once()` function shall synchronize memory for the first call in each thread for a given `pthread_once_t` object.

The `pthread_mutex_lock()` function need not synchronize memory if the mutex type is `PTHREAD_MUTEX_RECURSIVE` and the calling thread already owns the mutex. The `pthread_mutex_unlock()` function need not synchronize memory if the mutex type is `PTHREAD_MUTEX_RECURSIVE` and the mutex has a lock count greater than one.

Unless explicitly stated otherwise, if one of the above functions returns an error, it is unspecified whether the invocation causes memory to be synchronized.

Applications may allow more than one thread of control to read a memory location simultaneously.

4.12 Pathname Resolution

Pathname resolution is performed for a process to resolve a pathname to a particular directory entry for a file in the file hierarchy. There may be multiple pathnames that resolve to the same directory entry, and multiple directory entries for the same file. When a process resolves a pathname of an existing directory entry, the entire pathname shall be resolved as described below. When a process resolves a pathname of a directory entry that is to be created immediately after the pathname is resolved, pathname resolution terminates when all components of the path prefix of the last component have been resolved. It is then the responsibility of the process to create the final component.

Each filename in the pathname is located in the directory specified by its predecessor (for example, in the pathname fragment `a/b`, file `b` is located in directory `a`). Pathname resolution shall fail if this cannot be accomplished. If the pathname begins with a `<slash>`, the predecessor of the first filename in the pathname shall be taken to be the root directory of the process (such pathnames are referred to as “absolute pathnames”). If the pathname does not begin with a `<slash>`, the predecessor of the first filename of the pathname shall be taken to be either the current working directory of the process or for certain interfaces the directory identified by a file descriptor passed to the interface (such pathnames are referred to as “relative pathnames”).

The interpretation of a pathname component is dependent on the value of `{NAME_MAX}` and `_POSIX_NO_TRUNC` associated with the path prefix of that component. If any pathname component is longer than `{NAME_MAX}`, the implementation shall consider this an error.

A pathname that contains at least one non-`<slash>` character and that ends with one or more trailing `<slash>` characters shall not be resolved successfully unless the last pathname component before the trailing `<slash>` characters names an existing directory or a directory entry that is to be created for a directory immediately after the pathname is resolved. Interfaces using pathname resolution may specify additional constraints⁶ when a pathname that does not name an existing directory contains at least one non-`<slash>` character and contains one or more trailing `<slash>` characters.

If a symbolic link is encountered during pathname resolution, the behavior shall depend on whether the pathname component is at the end of the pathname and on the function being performed. If all of the following are true, then pathname resolution is complete:

1. This is the last pathname component of the pathname.
2. The pathname has no trailing `<slash>`.

6. The only interfaces that further constrain pathnames in POSIX.1-2008 are the `rename()` and `renameat()` functions (see XSH [rename\(\)](#)) and the `mv` utility (see XCU [mv](#)).

3. The function is required to act on the symbolic link itself, or certain arguments direct that the function act on the symbolic link itself.

In all other cases, the system shall prefix the remaining pathname, if any, with the contents of the symbolic link. If the combined length exceeds {PATH_MAX}, and the implementation considers this to be an error, *errno* shall be set to [ENAMETOOLONG] and an error indication shall be returned. Otherwise, the resolved pathname shall be the resolution of the pathname just created. If the resulting pathname does not begin with a <slash>, the predecessor of the first filename of the pathname is taken to be the directory containing the symbolic link.

If the system detects a loop in the pathname resolution process, it shall set *errno* to [ELOOP] and return an error indication. The same may happen if during the resolution process more symbolic links were followed than the implementation allows. This implementation-defined limit shall not be smaller than {SYMLOOP_MAX}.

The special filename dot shall refer to the directory specified by its predecessor. The special filename dot-dot shall refer to the parent directory of its predecessor directory. As a special case, in the root directory, dot-dot may refer to the root directory itself.

A pathname consisting of a single <slash> shall resolve to the root directory of the process. A null pathname shall not be successfully resolved. If a pathname begins with two successive <slash> characters, the first component following the leading <slash> characters may be interpreted in an implementation-defined manner, although more than two leading <slash> characters shall be treated as a single <slash> character.

Pathname resolution for a given pathname shall yield the same results when used by any interface in POSIX.1-2008 as long as there are no changes to any files evaluated during pathname resolution for the given pathname between resolutions.

4.13 Process ID Reuse

A process group ID shall not be reused by the system until the process group lifetime ends.

A process ID shall not be reused by the system until the process lifetime ends. In addition, if there exists a process group whose process group ID is equal to that process ID, the process ID shall not be reused by the system until the process group lifetime ends. A process that is not a system process shall not have a process ID of 1.

4.14 Scheduling Policy

A scheduling policy affects process or thread ordering:

- When a process or thread is a running thread and it becomes a blocked thread
- When a process or thread is a running thread and it becomes a preempted thread
- When a process or thread is a blocked thread and it becomes a runnable thread
- When a running thread calls a function that can change the priority or scheduling policy of a process or thread
- In other scheduling policy-defined circumstances

Conforming implementations shall define the manner in which each of the scheduling policies may modify the priorities or otherwise affect the ordering of processes or threads at each of the

occurrences listed above. Additionally, conforming implementations shall define in what other circumstances and in what manner each scheduling policy may modify the priorities or affect the ordering of processes or threads.

4.15 Seconds Since the Epoch

A value that approximates the number of seconds that have elapsed since the Epoch. A Coordinated Universal Time name (specified in terms of seconds (*tm_sec*), minutes (*tm_min*), hours (*tm_hour*), days since January 1 of the year (*tm_yday*), and calendar year minus 1900 (*tm_year*)) is related to a time represented as seconds since the Epoch, according to the expression below.

If the year is <1970 or the value is negative, the relationship is undefined. If the year is ≥1970 and the value is non-negative, the value is related to a Coordinated Universal Time name according to the C-language expression, where *tm_sec*, *tm_min*, *tm_hour*, *tm_yday*, and *tm_year* are all integer types:

$$tm\_sec + tm\_min*60 + tm\_hour*3600 + tm\_yday*86400 + \\ (tm\_year-70)*31536000 + ((tm\_year-69)/4)*86400 - \\ ((tm\_year-1)/100)*86400 + ((tm\_year+299)/400)*86400$$

The relationship between the actual time of day and the current value for seconds since the Epoch is unspecified.

How any changes to the value of seconds since the Epoch are made to align to a desired relationship with the current actual time is implementation-defined. As represented in seconds since the Epoch, each and every day shall be accounted for by exactly 86 400 seconds.

Note: The last three terms of the expression add in a day for each year that follows a leap year starting with the first leap year since the Epoch. The first term adds a day every 4 years starting in 1973, the second subtracts a day back out every 100 years starting in 2001, and the third adds a day back in every 400 years starting in 2001. The divisions in the formula are integer divisions; that is, the remainder is discarded leaving only the integer quotient.

4.16 Semaphore

A minimum synchronization primitive to serve as a basis for more complex synchronization mechanisms to be defined by the application program.

For the semaphores associated with the Semaphores option, a semaphore is represented as a shareable resource that has a non-negative integer value. When the value is zero, there is a (possibly empty) set of threads awaiting the availability of the semaphore.

For the semaphores associated with the X/Open System Interfaces (XSI) option, a semaphore is a positive integer (0 through 32767). The *semget()* function can be called to create a set or array of semaphores. A semaphore set can contain one or more semaphores up to an implementation-defined value.

Semaphore Lock Operation

An operation that is applied to a semaphore. If, prior to the operation, the value of the semaphore is zero, the semaphore lock operation shall cause the calling thread to be blocked and added to the set of threads awaiting the semaphore; otherwise, the value shall be decremented.

Semaphore Unlock Operation

An operation that is applied to a semaphore. If, prior to the operation, there are any threads in the set of threads awaiting the semaphore, then some thread from that set shall be removed from the set and becomes unblocked; otherwise, the semaphore value shall be incremented.

4.17 Thread-Safety

Refer to XSH [Section 2.9](#) (on page 512).

4.18 Tracing

The trace system allows a traced process to have a selection of events created for it. Traces consist of streams of trace event types.

A trace event type is identified on the one hand by a trace event type name, also referenced as a trace event name, and on the other hand by a trace event type identifier. A trace event name is a human-readable string. A trace event type identifier is an opaque identifier used by the trace system. There shall be a one-to-one relationship between trace event type identifiers and trace event names for a given trace stream and also for a given traced process. The trace event type identifier shall be generated automatically from a trace event name by the trace system either when a trace controller process invokes *posix_trace_trid_eventid_open()* or when an instrumented application process invokes *posix_trace_eventid_open()*. Trace event type identifiers are used to filter trace event types, to allow interpretation of user data, and to identify the kind of trace point that generated a trace event.

Each trace event shall be of a particular trace event type, and associated with a trace event type identifier. The execution of a trace point shall generate a trace event if a trace stream has been created and started for the process that executed the trace point and if the corresponding trace event type identifier is not ignored by filtering.

A generated trace event shall be recorded in a trace stream, and optionally also in a trace log if a trace log is associated with the trace stream, except that:

- For a trace stream, if no resources are available for the event, the event is lost.
- For a trace log, if no resources are available for the event, or a flush operation does not succeed, the event is lost.

A trace event recorded in an active trace stream may be retrieved by an application having appropriate privileges.

A trace event recorded in a trace log may be retrieved by an application having appropriate privileges after opening the trace log as a pre-recorded trace stream, with the function *posix_trace_open()*.

When a trace event is reported it is possible to retrieve the following:

- A trace event type identifier
- A timestamp
- The process ID of the traced process, if the trace event is process-dependent
- Any optional trace event data including its length
- If the Threads option is supported, the thread ID, if the trace event is process-dependent
- The program address at which the trace point was invoked

Trace events may be mapped from trace event types to trace event names. One such mapping shall be associated with each trace stream. An active trace stream is associated with a traced process, and also with its children if the Trace Inherit option is supported and also the inheritance policy is set to `_POSIX_TRACE_INHERIT`. Therefore each traced process has a mapping of the trace event names to trace event type identifiers that have been defined for that process.

Traces can be recorded into either trace streams or trace logs.

The implementation and format of a trace stream are unspecified. A trace stream need not be and generally is not persistent. A trace stream may be either active or pre-recorded:

- An active trace stream is a trace stream that has been created and has not yet been shut down. It can be of one of the two following classes:
 1. An active trace stream without a trace log that was created with the `posix_trace_create()` function
 2. If the Trace Log option is supported, an active trace stream with a trace log that was created with the `posix_trace_create_withlog()` function
- A pre-recorded trace stream is a trace stream that was opened from a trace log object using the `posix_trace_open()` function.

An active trace stream can loop. This behavior means that when the resources allocated by the trace system for the trace stream are exhausted, the trace system reuses the resources associated with the oldest recorded trace events to record new trace events.

If the Trace Log option is supported, an active trace stream with a trace log can be flushed. This operation causes the trace system to write trace events from the trace stream to the associated trace log, following the defined policies or using an explicit function call. After this operation, the trace system may reuse the resources associated with the flushed trace events.

An active trace stream with or without a trace log can be cleared. This operation shall cause all the resources associated with this trace stream to be reinitialized. The trace stream shall behave as if it was returning from its creation, except that the mapping of trace event type identifiers to trace event names shall not be cleared. If a trace log was associated with this trace stream, the trace log shall also be reinitialized.

A trace log shall be recorded when the `posix_trace_shutdown()` operation is invoked or during tracing, depending on the tracing strategy which is defined by a log policy. After the trace stream has been shut down, the trace information can be retrieved from the associated trace log using the same interface used to retrieve information from an active trace stream.

For a traced process, if the Trace Inherit option is supported and the trace stream's inheritance attribute is `_POSIX_TRACE_INHERIT`, the initial targeted traced process shall be traced together with all of its future children. The `posix_pid` member of each trace event in a trace stream shall be the process ID of the traced process.

Each trace point may be an implementation-defined action such as a context switch, or an application-programmed action such as a call to a specific operating system service (for example, *fork()*) or a call to *posix_trace_event()*.

Trace points may be filtered. The operation of the filter is to filter out (ignore) selected trace events. By default, no trace events are filtered.

The results of the tracing operations can be analyzed and monitored by a trace controller process or a trace analyzer process.

Only the trace controller process has control of the trace stream it has created. The control of the operation of a trace stream is done using its corresponding trace stream identifier. The trace controller process is able to:

- Initialize the attributes of a trace stream
- Create the trace stream
- Start and stop tracing
- Know the mapping of the traced process
- If the Trace Event Filter option is supported, filter the type of trace events to be recorded
- Shut the trace stream down

A traced process may also be a trace controller process. Only the trace controller process can control its trace stream(s). A trace stream created by a trace controller process shall be shut down if its controller process terminates or executes another file.

A trace controller process may also be a trace analyzer process. Trace analysis can be done concurrently with the traced process or can be done off-line, in the same or in a different platform.

4.19 Treatment of Error Conditions for Mathematical Functions

For all the functions in the **<math.h>** header, an application wishing to check for error situations should set *errno* to 0 and call *feclearexcept*(FE_ALL_EXCEPT) before calling the function. On return, if *errno* is non-zero or *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

The following error conditions are defined for all functions in the **<math.h>** header.

4.19.1 Domain Error

A “domain error” shall occur if an input argument is outside the domain over which the mathematical function is defined. The description of each function lists any required domain errors; an implementation may define additional domain errors, provided that such errors are consistent with the mathematical definition of the function.

On a domain error, the function shall return an implementation-defined value; if the integer expression (math_errhandling & MATH_ERRNO) is non-zero, *errno* shall be set to [EDOM]; if the integer expression (math_errhandling & MATH_ERREXCEPT) is non-zero, the “invalid” floating-point exception shall be raised.

4.19.2 Pole Error

A “pole error” occurs if the mathematical result of the function is an exact infinity (for example, $\log(0.0)$).

On a pole error, the function shall return the value of the macro `HUGE_VAL`, `HUGE_VALF`, or `HUGE_VALL` according to the return type, with the same sign as the correct value of the function; if the integer expression `(math_errhandling & MATH_ERRNO)` is non-zero, *errno* shall be set to `[ERANGE]`; if the integer expression `(math_errhandling & MATH_ERREXCEPT)` is non-zero, the “divide-by-zero” floating-point exception shall be raised.

4.19.3 Range Error

A “range error” shall occur if the finite mathematical result of the function cannot be represented in an object of the specified type, due to extreme magnitude.

4.19.3.1 Result Overflows

A floating result overflows if the magnitude of the mathematical result is finite but so large that the mathematical result cannot be represented without extraordinary roundoff error in an object of the specified type. If a floating result overflows and default rounding is in effect, then the function shall return the value of the macro `HUGE_VAL`, `HUGE_VALF`, or `HUGE_VALL` according to the return type, with the same sign as the correct value of the function; if the integer expression `(math_errhandling & MATH_ERRNO)` is non-zero, *errno* shall be set to `[ERANGE]`; if the integer expression `(math_errhandling & MATH_ERREXCEPT)` is non-zero, the “overflow” floating-point exception shall be raised.

4.19.3.2 Result Underflows

The result underflows if the magnitude of the mathematical result is so small that the mathematical result cannot be represented, without extraordinary roundoff error, in an object of the specified type. If the result underflows, the function shall return an implementation-defined value whose magnitude is no greater than the smallest normalized positive number in the specified type; if the integer expression `(math_errhandling & MATH_ERRNO)` is non-zero, whether *errno* is set to `[ERANGE]` is implementation-defined; if the integer expression `(math_errhandling & MATH_ERREXCEPT)` is non-zero, whether the “underflow” floating-point exception is raised is implementation-defined.

4.20 Treatment of NaN Arguments for the Mathematical Functions

For functions called with a NaN argument, no errors shall occur and a NaN shall be returned, except where stated otherwise.

If a function with one or more NaN arguments returns a NaN result, the result should be the same as one of the NaN arguments (after possible type conversion), except perhaps for the sign.

On implementations that support the IEC 60559:1989 standard floating point, functions with signaling NaN argument(s) shall be treated as if the function were called with an argument that is a required domain error and shall return a quiet NaN result, except where stated otherwise.

Note: The function might never see the signaling NaN, since it might trigger when the arguments are evaluated during the function call.

On implementations that support the IEC 60559:1989 standard floating point, for those functions that do not have a documented domain error, the following shall apply:

These functions shall fail if:

Domain Error Any argument is a signaling NaN.

Either, the integer expression (`math_errhandling & MATH_ERRNO`) is non-zero and *errno* shall be set to [EDOM], or the integer expression (`math_errhandling & MATH_ERREXCEPT`) is non-zero and the invalid floating-point exception shall be raised.

4.21 Utility

A utility program shall be either an executable file, such as might be produced by a compiler or linker system from computer source code, or a file of shell source code, directly interpreted by the shell. The program may have been produced by the user, provided by the system implementor, or acquired from an independent distributor.

The system may implement certain utilities as shell functions (see XCU [Section 2.9.5](#), on page 2346) or built-in utilities, but only an application that is aware of the command search order (as described in XCU [Section 2.9.1.1](#), on page 2339) or of performance characteristics can discern differences between the behavior of such a function or built-in utility and that of an executable file.

4.22 Variable Assignment

In the shell command language, a word consisting of the following parts:

varname=value

When used in a context where assignment is defined to occur and at no other time, the *value* (representing a word or field) shall be assigned as the value of the variable denoted by *varname*.

Note: For further information, see XCU [Section 2.9.1](#) (on page 2338).

The *varname* and *value* parts shall meet the requirements for a name and a word, respectively, except that they are delimited by the embedded unquoted <equals-sign>, in addition to other delimiters.

3306 **Note:** Additional delimiters are described in XCU [Section 2.3](#) (on page 2321).

3307 When a variable assignment is done, the variable shall be created if it did not already exist. If

3308 *value* is not specified, the variable shall be given a null value.

3309 **Note:** An alternative form of variable assignment:

3310 *symbol=value*

3311 (where *symbol* is a valid word delimited by an <equals-sign>, but not a valid name) produces

3312 unspecified results. The form *symbol=value* is used by the KornShell *name[expression]=value*

3313 syntax.

The STDIN, STDOUT, STDERR, INPUT FILES, and OUTPUT FILES sections of the utility descriptions use a syntax to describe the data organization within the files, when that organization is not otherwise obvious. The syntax is similar to that used by the System Interfaces volume of POSIX.1-2008 `printf()` function, as described in this chapter. When used in STDIN or INPUT FILES sections of the utility descriptions, this syntax describes the format that could have been used to write the text to be read, not a format that could be used by the System Interfaces volume of POSIX.1-2008 `scanf()` function to read the input file.

The description of an individual record is as follows:

"<format>", [*<arg1>*, *<arg2>*, . . . , *<argn>*]

The *format* is a character string that contains three types of objects defined below:

1. *Characters* that are not “escape sequences” or “conversion specifications”, as described below, shall be copied to the output.
2. *Escape Sequences* represent non-graphic characters and the escape character (<backslash>).
3. *Conversion Specifications* specify the output format of each argument; see below.

The following characters have the following special meaning in the format string:

' ' (An empty character position.) Represents one or more <blank> characters.

Δ Represents exactly one <space> character.

Table 5-1 lists escape sequences and associated actions on display devices capable of the action.

Table 5-1 Escape Sequences and Associated Actions

Escape Sequence	Represents Character	Terminal Action
\\	<backslash>	Print the <backslash> character.
\a	<alert>	Attempt to alert the user through audible or visible notification.
\b	<backspace>	Move the printing position to one column before the current position, unless the current position is the start of a line.
\f	<form-feed>	Move the printing position to the initial printing position of the next logical page.
\n	<newline>	Move the printing position to the start of the next line.
\r	<carriage-return>	Move the printing position to the start of the current line.
\t	<tab>	Move the printing position to the next tab position on the current line. If there are no more tab positions remaining on the line, the behavior is undefined.
\v	<vertical-tab>	Move the printing position to the start of the next <vertical-tab> position. If there are no more <vertical-tab> positions left on the page, the behavior is undefined.

3351	Each conversion specification is introduced by the <percent-sign> character ('%'). After the	
3352	character '%', the following shall appear in sequence:	
3353	<i>flags</i>	Zero or more <i>flags</i> , in any order, that modify the meaning of the conversion
3354		specification.
3355	<i>field width</i>	An optional string of decimal digits to specify a minimum field width. For an
3356		output field, if the converted value has fewer bytes than the field width, it shall be
3357		padded on the left (or right, if the left-adjustment flag ('-'), described below, has
3358		been given) to the field width.
3359	<i>precision</i>	Gives the minimum number of digits to appear for the d, o, i, u, x, or X conversion
3360		specifiers (the field is padded with leading zeros), the number of digits to appear
3361		after the radix character for the e and f conversion specifiers, the maximum
3362		number of significant digits for the g conversion specifier; or the maximum
3363		number of bytes to be written from a string in the s conversion specifier. The
3364		precision shall take the form of a <period> ('.') followed by a decimal digit
3365		string; a null digit string is treated as zero.
3366	<i>conversion specifier characters</i>	
3367		A conversion specifier character (see below) that indicates the type of conversion
3368		to be applied.
3369	The <i>flag</i> characters and their meanings are:	
3370	-	The result of the conversion shall be left-justified within the field.
3371	+	The result of a signed conversion shall always begin with a sign ('+' or '-').
3372	<space>	If the first character of a signed conversion is not a sign, a <space> shall be
3373		prefixed to the result. This means that if the <space> and '+' flags both appear,
3374		the <space> flag shall be ignored.
3375	#	The value shall be converted to an alternative form. For c, d, i, u, and s
3376		conversion specifiers, the behavior is undefined. For the o conversion specifier, it
3377		shall increase the precision to force the first digit of the result to be a zero. For x or
3378		X conversion specifiers, a non-zero result has 0x or 0X prefixed to it, respectively.
3379		For a, A, e, E, f, F, g, and G conversion specifiers, the result shall always contain a
3380		radix character, even if no digits follow the radix character. For g and G conversion
3381		specifiers, trailing zeros shall not be removed from the result as they usually are.
3382	0	For a, A, d, e, E, f, F, g, G, i, o, u, x, and X conversion specifiers, leading zeros
3383		(following any indication of sign or base) shall be used to pad to the field width
3384		rather than performing space padding, except when converting an infinity or NaN.
3385		If the '0' and '-' flags both appear, the '0' flag shall be ignored. For d, i, o, u,
3386		x, and X conversion specifiers, if a precision is specified, the '0' flag shall be
3387		ignored. For other conversion specifiers, the behavior is undefined.
3388	Each conversion specifier character shall result in fetching zero or more arguments. The results	
3389	are undefined if there are insufficient arguments for the format. If the format is exhausted while	
3390	arguments remain, the excess arguments shall be ignored.	
3391	The conversion specifiers and their meanings are:	
3392	a,A	The floating-point number argument representing a floating-point number shall be
3393		converted in the style "[-] 0xh.hhhhp±d", where there is one hexadecimal digit
3394		(which shall be non-zero if the argument is a normalized floating-point number
3395		and is otherwise unspecified) before the decimal-point character and the number
3396		of hexadecimal digits after it is equal to the precision; if the precision is missing

3397		and FLT_RADIX is a power of 2, then the precision shall be sufficient for an exact
3398		representation of the value; if the precision is missing and FLT_RADIX is not a
3399		power of 2, then the precision shall be sufficient to distinguish different floating-
3400		point values in the internal representation used by the utility, except that trailing
3401		zeros may be omitted; if the precision is zero and the # flag is not specified, no
3402		decimal-point character shall appear. The letters "abcdef" shall be used for a
3403		conversion and the letters "ABCDEF" for A conversion. The A conversion specifier
3404		produces a number with X and P instead of x and p. The exponent shall always
3405		contain at least one digit, and only as many more digits as necessary to represent
3406		the decimal exponent of 2. If the value is zero, the exponent shall be zero. A
3407		floating-point number argument representing an infinity or NaN shall be
3408		converted in the style of an f or F conversion specifier.
3409	d,i,o,u,x,X	The integer argument shall be written as signed decimal (d or i), unsigned octal
3410		(o), unsigned decimal (u), or unsigned hexadecimal notation (x and X). The d and
3411		i specifiers shall convert to signed decimal in the style "[-]dddd". The x
3412		conversion specifier shall use the numbers and letters "0123456789abcdef" and
3413		the X conversion specifier shall use the numbers and letters
3414		"0123456789ABCDEF". The <i>precision</i> component of the argument shall specify
3415		the minimum number of digits to appear. If the value being converted can be
3416		represented in fewer digits than the specified minimum, it shall be expanded with
3417		leading zeros. The default precision shall be 1. The result of converting a zero
3418		value with a precision of 0 shall be no characters. If both the field width and
3419		precision are omitted, the implementation may precede, follow, or precede and
3420		follow numeric arguments of types d, i, and u with <blank> characters; arguments
3421		of type o (octal) may be preceded with leading zeros.
3422	f,F	The floating-point number argument shall be written in decimal notation in the
3423		style [-]ddd.ddd, where the number of digits after the radix character (shown here
3424		as a decimal point) shall be equal to the <i>precision</i> specification. The LC_NUMERIC
3425		locale category shall determine the radix character to use in this format. If the
3426		<i>precision</i> is omitted from the argument, six digits shall be written after the radix
3427		character; if the <i>precision</i> is explicitly 0, no radix character shall appear.
3428		A floating-point number argument representing an infinity shall be converted in
3429		one of the styles "[-]inf" or "[-]infinity"; which style is implementation-
3430		defined. A floating-point number argument representing a NaN shall be converted
3431		in one of the styles "[-]nan(<i>n-char-sequence</i>)" or "[-]nan"; which style,
3432		and the meaning of any <i>n-char-sequence</i> , is implementation-defined. The F
3433		conversion specifier produces "INF", "INFINITY", or "NAN" instead of "inf",
3434		"infinity", or "nan", respectively.
3435	e,E	The floating-point number argument shall be written in the style [-]d.ddde±dd (the
3436		symbol '±' indicates either a <plus-sign> or minus-sign), where there is one digit
3437		before the radix character (shown here as a decimal point) and the number of
3438		digits after it is equal to the precision. The LC_NUMERIC locale category shall
3439		determine the radix character to use in this format. When the precision is missing,
3440		six digits shall be written after the radix character; if the precision is 0, no radix
3441		character shall appear. The E conversion specifier shall produce a number with E
3442		instead of e introducing the exponent. The exponent shall always contain at least
3443		two digits. However, if the value to be written requires an exponent greater than
3444		two digits, additional exponent digits shall be written as necessary.
3445		A floating-point number argument representing an infinity or NaN shall be
3446		converted in the style of an f or F conversion specifier.

3447	g,G	The floating-point number argument shall be written in style <code>f</code> or <code>e</code> (or in style <code>F</code> or <code>E</code> in the case of a <code>G</code> conversion specifier), with the precision specifying the number of significant digits. The style used depends on the value converted: style <code>e</code> (or <code>E</code>) shall be used only if the exponent resulting from the conversion is less than -4 or greater than or equal to the precision. Trailing zeros are removed from the result. A radix character shall appear only if it is followed by a digit.
3448		
3449		
3450		
3451		
3452		
3453		A floating-point number argument representing an infinity or NaN shall be converted in the style of an <code>f</code> or <code>F</code> conversion specifier.
3454		
3455	c	The single-byte character argument shall be written.
3456	s	The argument shall be taken to be a string and bytes from the string shall be written until the end of the string or the number of bytes indicated by the <i>precision</i> specification of the argument is reached. If the precision is omitted from the argument, it shall be taken to be infinite, so all bytes up to the end of the string shall be written.
3457		
3458		
3459		
3460		
3461	%	Write a ' % ' character; no argument is converted.
3462		In no case does a nonexistent or insufficient field width cause truncation of a field; if the result of a conversion is wider than the field width, the field is simply expanded to contain the conversion result. The term “field width” should not be confused with the term “precision” used in the description of <code>%s</code> .
3463		
3464		
3465		

Examples

To represent the output of a program that prints a date and time in the form Sunday, July 3, 10:02, where *weekday* and *month* are strings:

```
"%s,%s,%d,%d:%.2d\n" <weekday>, <month>, <day>, <hour>, <min>
```

To show ' π ' written to 5 decimal places:

```
"pi=%f\n", <value of  $\pi$ >
```

To show an input file format consisting of five <colon>-separated fields:

```
"%s:%s:%s:%s:%s\n", <arg1>, <arg2>, <arg3>, <arg4>, <arg5>
```

6.1 Portable Character Set

Conforming implementations shall support one or more coded character sets. Each supported locale shall include the *portable character set*, which is the set of symbolic names for characters in [Table 6-1](#). This is used to describe characters within the text of POSIX.1-2008. The first eight entries in [Table 6-1](#) are defined in the ISO/IEC 6429: 1992 standard and the rest of the characters are defined in the ISO/IEC 10646-1: 2000 standard.

Table 6-1 Portable Character Set

Symbolic Name	Glyph	UCS	Description
<NUL>		<U0000>	NULL (NUL)

POSIX.1-2008 uses character names other than the above, but only in an informative way; for example, in examples to illustrate the use of characters beyond the portable character set with the facilities of POSIX.1-2008.

Table 6-1 (on page 125) defines the characters in the portable character set and the corresponding symbolic character names used to identify each character in a character set description file. The table contains more than one symbolic character name for characters whose traditional name differs from the chosen name. Characters defined in **Table 6-2** (on page 130) may also be used in character set description files.

POSIX.1-2008 places only the following requirements on the encoded values of the characters in the portable character set:

- If the encoded values associated with each member of the portable character set are not invariant across all locales supported by the implementation, if an application uses any pair of locales where the character encodings differ, or accesses data from an application using a locale which has different encodings from the locales used by the application, the results are unspecified.
- The encoded values associated with the digits 0 to 9 shall be such that the value of each character after 0 shall be one greater than the value of the previous character.

- A null character, NUL, which has all bits set to zero, shall be in the set of characters.
- The encoded values associated with `<slash>` and `<period>` shall be invariant across all locales supported by the implementation.
- The encoded values associated with the members of the portable character set are each represented in a single byte. Moreover, if the value is stored in an object of C-language type `char`, it is guaranteed to be positive (except the NUL, which is always zero).

Conforming implementations shall support certain character and character set attributes, as defined in [Section 7.2](#) (on page 136).

6.2 Character Encoding

The POSIX locale contains the characters in [Table 6-1](#) (on page 125) and [Table 6-2](#) (on page 130) which have the properties listed in [Section 7.3.1](#) (on page 139). In other locales, the presence, meaning, and representation of any additional characters are locale-specific.

In locales other than the POSIX locale, a character may have a state-dependent encoding. There are two types of these encodings:

- A single-shift encoding (where each character not in the initial shift state is preceded by a shift code) can be defined if each shift-code and character sequence is considered a multi-byte character. This is done using the concatenated-constant format in a character set description file, as described in [Section 6.4](#) (on page 129). If the implementation supports a character encoding of this type, all of the standard utilities in the Shell and Utilities volume of POSIX.1-2008 shall support it. Use of a single-shift encoding with any of the functions in the System Interfaces volume of POSIX.1-2008 that do not specifically mention the effects of state-dependent encoding is implementation-defined.
- A locking-shift encoding (where the state of the character is determined by a shift code that may affect more than the single character following it) cannot be defined with the current character set description file format. Use of a locking-shift encoding with any of the standard utilities in the Shell and Utilities volume of POSIX.1-2008 or with any of the functions in the System Interfaces volume of POSIX.1-2008 that do not specifically mention the effects of state-dependent encoding is implementation-defined.

While in the initial shift state, all characters in the portable character set shall retain their usual interpretation and shall not alter the shift state. The interpretation for subsequent bytes in the sequence shall be a function of the current shift state. A byte with all bits zero shall be interpreted as the null character independent of shift state. Such a byte shall not occur as part of any other character. Likewise, the byte values used to encode `<period>` and `<slash>` shall not occur as part of any other character in any locale.

The maximum allowable number of bytes in a character in the current locale shall be indicated by `{MB_CUR_MAX}`, defined in the `<stdlib.h>` header and by the `<mb_cur_max>` value in a character set description file; see [Section 6.4](#) (on page 129). The implementation's maximum number of bytes in a character shall be defined by the C-language macro `{MB_LEN_MAX}`.

6.3 C Language Wide-Character Codes

In the shell, the standard utilities are written so that the encodings of characters are described by the locale's `LC_CTYPE` definition (see [Section 7.3.1](#), on page 139) and there is no differentiation between characters consisting of single octets (8-bit bytes) or multiple bytes. However, in the C language, a differentiation is made. To ease the handling of variable length characters, the C language has introduced the concept of wide-character codes.

All wide-character codes in a given process consist of an equal number of bits. This is in contrast to characters, which can consist of a variable number of bytes. The byte or byte sequence that represents a character can also be represented as a wide-character code. Wide-character codes thus provide a uniform size for manipulating text data. A wide-character code having all bits zero is the null wide-character code (see [Section 3.247](#), on page 72), and terminates wide-character strings (see [Section 3.437](#), on page 103). The wide-character value for each member of the portable character set shall equal its value when used as the lone character in an integer character constant. Wide-character codes for other characters are locale and implementation-defined. State shift bytes shall not have a wide-character code representation. POSIX.1-2008 provides no means of defining a wide-character codeset.

6.4 Character Set Description File

Implementations shall provide a character set description file for at least one coded character set supported by the implementation. These files are referred to elsewhere in POSIX.1-2008 as *charmap* files. It is implementation-defined whether or not users or applications can provide additional character set description files.

POSIX.1-2008 does not require that multiple character sets or codesets be supported. Although multiple charmap files are supported, it is the responsibility of the implementation to provide the file or files; if only one is provided, only that one is accessible using the *localedef* utility's `-f` option.

Each character set description file, except those that use the ISO/IEC 10646-1:2000 standard position values as the encoding values, shall define characteristics for the coded character set and the encoding for the characters specified in [Table 6-1](#) (on page 125), and may define encoding for additional characters supported by the implementation. Other information about the coded character set may also be in the file. Coded character set character values shall be defined using symbolic character names followed by character encoding values.

Each symbolic name specified in [Table 6-1](#) (on page 125) shall be included in the file and shall be mapped to a unique coding value, except as noted below. The glyphs represented by the C character constants `'{', '}', ' ', '_, ' -', ' /', ' \', ' .',` and `'^'` have more than one symbolic name; all symbolic names for each such glyph shall be included, each with identical encoding. If some or all of the control characters identified in [Table 6-2](#) (on page 130) are supported by the implementation, the symbolic names and their corresponding encoding values shall be included in the file. The encoding values shall each be represented in a single byte. Some of the encodings associated with the symbolic names in [Table 6-2](#) (on page 130) may be the same as characters found in [Table 6-1](#) (on page 125); both names shall be provided for each encoding.

Table 6-2 Control Character Set

<ACK>	<DC2>	<ENQ>	<FS>	<IS4>	<SOH>
<BEL>	<DC3>	<EOT>	<GS>	<LF>	<STX>
<BS>	<DC4>	<ESC>	<HT>	<NAK>	<SUB>
<CAN>	<DEL>	<ETB>	<IS1>	<RS>	<SYN>
<CR>	<DLE>	<ETX>	<IS2>	<SI>	<US>
<DC1>		<FF>	<IS3>	<SO>	<VT>

The following declarations can precede the character definitions. Each shall consist of the symbol shown in the following list, starting in column 1, including the surrounding brackets, followed by one or more <blank> characters, followed by the value to be assigned to the symbol.

<code_set_name> The name of the coded character set for which the character set description file is defined. The characters of the name shall be taken from the set of characters with visible glyphs defined in Table 6-1 (on page 125).

<mb_cur_max> The maximum number of bytes in a multi-byte character. This shall default to 1.

<mb_cur_min> An unsigned positive integer value that defines the minimum number of bytes in a character for the encoded character set. On XSI-conformant systems, <mb_cur_min> shall always be 1.

<escape_char> The character used to indicate that the characters following shall be interpreted in a special way, as defined later in this section. This shall default to <backslash> ('\\'), which is the character used in all the following text and examples, unless otherwise noted.

<comment_char> The character that, when placed in column 1 of a charmap line, is used to indicate that the line shall be ignored. The default character shall be the <number-sign> ('#').

The character set mapping definitions shall be all the lines immediately following an identifier line containing the string "CHARMAP" starting in column 1, and preceding a trailer line containing the string "END CHARMAP" starting in column 1. Empty lines and lines containing a <comment_char> in the first column shall be ignored. Each non-comment line of the character set mapping definition (that is, between the "CHARMAP" and "END CHARMAP" lines of the file) shall be in either of two forms:

"%s %s %s\n", <symbolic-name>, <encoding>, <comments>

or:

"%s...%s %s %s\n", <symbolic-name>, <symbolic-name>,
<encoding>, <comments>

In the first format, the line in the character set mapping definition shall define a single symbolic name and a corresponding encoding. A symbolic name is one or more characters from the set shown with visible glyphs in Table 6-1 (on page 125), enclosed between angle brackets. A character following an escape character is interpreted as itself; for example, the sequence "<\\>" represents the symbolic name "<\\>" enclosed between angle brackets.

In the second format, the line in the character set mapping definition shall define a range of one or more symbolic names. In this form, the symbolic names shall consist of zero or more non-numeric characters from the set shown with visible glyphs in Table 6-1 (on page 125), followed by an integer formed by one or more decimal digits. Both integers shall contain the same

number of digits. The characters preceding the integer shall be identical in the two symbolic names, and the integer formed by the digits in the second symbolic name shall be equal to or greater than the integer formed by the digits in the first name. This shall be interpreted as a series of symbolic names formed from the common part and each of the integers between the first and the second integer, inclusive. As an example, `<j0101>...<j0104>` is interpreted as the symbolic names `<j0101>`, `<j0102>`, `<j0103>`, and `<j0104>`, in that order.

A character set mapping definition line shall exist for all symbolic names specified in [Table 6-1](#) (on page 125), and shall define the coded character value that corresponds to the character indicated in the table, or the coded character value that corresponds to the control character symbolic name. If the control characters commonly associated with the symbolic names in [Table 6-2](#) (on page 130) are supported by the implementation, the symbolic name and the corresponding encoding value shall be included in the file. Additional unique symbolic names may be included. A coded character value can be represented by more than one symbolic name.

The encoding part is expressed as one (for single-byte character values) or more concatenated decimal, octal, or hexadecimal constants in the following formats:

```
%cd%u", <escape_char>, <decimal byte value>
%cx%x", <escape_char>, <hexadecimal byte value>
%c%o", <escape_char>, <octal byte value>
```

Decimal constants shall be represented by two or three decimal digits, preceded by the escape character and the lowercase letter 'd'; for example, `"\d05"`, `"\d97"`, or `"\d143"`. Hexadecimal constants shall be represented by two hexadecimal digits, preceded by the escape character and the lowercase letter 'x'; for example, `"\x05"`, `"\x61"`, or `"\x8f"`. Octal constants shall be represented by two or three octal digits, preceded by the escape character; for example, `"\05"`, `"\141"`, or `"\217"`. In a portable charmap file, each constant represents an 8-bit byte. When constants are concatenated for multi-byte character values, they shall be of the same type, and interpreted in sequence from first to last with the first byte of the multi-byte character specified by the first byte in the sequence. The manner in which these constants are represented in the character stored in the system is implementation-defined. (This notation was chosen for reasons of portability. There is no requirement that the internal representation in the computer memory be in this same order.) Omitting bytes from a multi-byte character definition produces undefined results.

In lines defining ranges of symbolic names, the encoded value shall be the value for the first symbolic name in the range (the symbolic name preceding the ellipsis). Subsequent symbolic names defined by the range shall have encoding values in increasing order. Bytes shall be treated as unsigned octets, and carry shall be propagated between the bytes as necessary to represent the range. However, because this causes a null byte in the second or subsequent bytes of a character, such a declaration should not be specified. For example, the line:

```
<j0101>...<j0104>  \d129\d254
```

is interpreted as:

```
<j0101>          \d129\d254
<j0102>          \d129\d255
<j0103>          \d130\d00
<j0104>          \d130\d01
```

The expanded declaration of the symbol `<j0103>` in the above example is an invalid specification, because it contains a null byte in the second byte of a character.

The comment is optional.

POSIX.1-2008 provides no means of defining a wide-character codeset.

The following declarations can follow the character set mapping definitions (after the "END CHARMAP" statement). Each shall consist of the keyword shown in the following list, starting in column 1, followed by the value(s) to be associated to the keyword, as defined below.

WIDTH A non-negative integer value defining the column width (see [Section 3.103](#), on page 50) for the printable characters in the coded character set specified in [Table 6-1](#) (on page 125) and [Table 6-2](#) (on page 130). Coded character set character values shall be defined using symbolic character names followed by column width values. Defining a character with more than one **WIDTH** produces undefined results. The **END WIDTH** keyword shall be used to terminate the **WIDTH** definitions. Specifying the width of a non-printable character in a **WIDTH** declaration produces undefined results.

WIDTH_DEFAULT A non-negative integer value defining the default column width for any printable character not listed by one of the **WIDTH** keywords. If no **WIDTH_DEFAULT** keyword is included in the charmap, the default character width shall be 1.

Example

After the "END CHARMAP" statement, a syntax for a width definition would be:

```
WIDTH
<A> 1
<B> 1
<C>...<Z> 1
...
<fool>...<foon> 2
...
END WIDTH
```

In this example, the numerical code point values represented by the symbols **<A>** and **** are assigned a width of 1. The code point values **<C>** to **<Z>** inclusive (**<C>**, **<D>**, **<E>**, and so on) are also assigned a width of 1. Using **<A>...<Z>** would have required fewer lines, but the alternative was shown to demonstrate flexibility. The keyword **WIDTH_DEFAULT** could have been added as appropriate.

6.4.1 State-Dependent Character Encodings

This section addresses the use of state-dependent character encodings (that is, those in which the encoding of a character is dependent on one or more shift codes that may precede it).

A single-shift encoding (where each character not in the initial shift state is preceded by a shift code) can be defined in the charmap format if each shift-code/character sequence is considered a multi-byte character, defined using the concatenated-constant format described in [Section 6.4](#) (on page 129). If the implementation supports a character encoding of this type, all of the standard utilities shall support it. A locking-shift encoding (where the state of the character is determined by a shift code that may affect more than the single character following it) could be defined with an extension to the charmap format described in [Section 6.4](#) (on page 129).

3824 If the implementation supports a character encoding of this type, any of the standard utilities
3825 that describe character (*versus* byte) or text-file manipulation shall have the following
3826 characteristics:

- 3827 1. The utility shall process the statefully encoded data as a concatenation of state-
3828 independent characters. The presence of redundant locking shifts shall not affect the
3829 comparison of two statefully encoded strings.
- 3830 2. A utility that divides, truncates, or extracts substrings from statefully encoded data shall
3831 produce output that contains locking shifts at the beginning or end of the resulting data,
3832 if appropriate, to retain correct state information.

Locale

7.1 General

A locale is the definition of the subset of a user's environment that depends on language and cultural conventions. It is made up from one or more categories. Each category is identified by its name and controls specific aspects of the behavior of components of the system. Category names correspond to the following environment variable names:

LC_CTYPE Character classification and case conversion.

LC_COLLATE Collation order.

LC_MONETARY Monetary formatting.

LC_NUMERIC Numeric, non-monetary formatting.

LC_TIME Date and time formats.

LC_MESSAGES Formats of informative and diagnostic messages and interactive responses.

The standard utilities in the Shell and Utilities volume of POSIX.1-2008 shall base their behavior on the current locale, as defined in the ENVIRONMENT VARIABLES section for each utility. The behavior of some of the C-language functions defined in the System Interfaces volume of POSIX.1-2008 shall also be modified based on a locale selection. The locale to be used by these functions can be selected in the following ways:

1. For functions such as *isalnum_l()* that take a locale object as an argument, a locale object can be obtained from *newlocale()* or *duplocale()* and passed to the function.

2. For functions that do not take a locale object as an argument, the current locale for the thread can be set by calling *uselocale()* or the global locale for the process can be set by calling *setlocale()*. Such functions shall use the current locale of the calling thread if one has been set for that thread; otherwise, they shall use the global locale.

Locales other than those supplied by the implementation can be created via the *localedef* utility, provided that the *_POSIX2_LOCALEDEF* symbol is defined on the system. Even if *localedef* is not provided, all implementations conforming to the System Interfaces volume of POSIX.1-2008 shall provide one or more locales that behave as described in this chapter. The input to the utility is described in [Section 7.3](#) (on page 136). The value that is used to specify a locale when using environment variables shall be the string specified as the *name* operand to the *localedef* utility when the locale was created. The strings "C" and "POSIX" are reserved as identifiers for the POSIX locale (see [Section 7.2](#), on page 136). When the value of a locale environment variable begins with a <slash> (' / '), it shall be interpreted as the pathname of the locale definition; the type of file (regular, directory, and so on) used to store the locale definition is implementation-defined. If the value does not begin with a <slash>, the mechanism used to locate the locale is implementation-defined.

If different character sets are used by the locale categories, the results achieved by an application utilizing these categories are undefined. Likewise, if different codesets are used for the data

being processed by interfaces whose behavior is dependent on the current locale, or the codeset is different from the codeset assumed when the locale was created, the result is also undefined.

Applications can select the desired locale by calling the *newlocale()* or *setlocale()* function with the appropriate value. If the function is invoked with an empty string, such as:

```
newlocale(LC_ALL_MASK, "", (locale_t)0);
```

or:

```
setlocale(LC_ALL, "");
```

the value of the corresponding environment variable is used. If the environment variable is unset or is set to the empty string, the implementation shall set the appropriate environment as defined in [Chapter 8](#) (on page 173).

7.2 POSIX Locale

Conforming systems shall provide a POSIX locale, also known as the C locale. The behavior of standard utilities and functions in the POSIX locale shall be as if the locale was defined via the *localedef* utility with input data from the POSIX locale tables in [Section 7.3](#).

The tables in [Section 7.3](#) describe the characteristics and behavior of the POSIX locale for data consisting entirely of characters from the portable character set and the control character set. For other characters, the behavior is unspecified. For C-language programs, the POSIX locale shall be the default locale when the *setlocale()* function is not called.

The POSIX locale can be specified by assigning to the appropriate environment variables the values "C" or "POSIX".

All implementations shall define a locale as the default locale, to be invoked when no environment variables are set, or set to the empty string. This default locale can be the POSIX locale or any other implementation-defined locale. Some implementations may provide facilities for local installation administrators to set the default locale, customizing it for each location. POSIX.1-2008 does not require such a facility.

7.3 Locale Definition

The capability to specify additional locales to those provided by an implementation is optional, denoted by the `_POSIX2_LOCALEDEF` symbol. If the option is not supported, only implementation-supplied locales are available. Such locales shall be documented using the format specified in this section.

Locales can be described with the file format presented in this section. The file format is that accepted by the *localedef* utility. For the purposes of this section, the file is referred to as the "locale definition file", but no locales shall be affected by this file unless it is processed by *localedef* or some similar mechanism. Any requirements in this section imposed upon the utility shall apply to *localedef* or to any other similar utility used to install locale information using the locale definition file format described here.

The locale definition file shall contain one or more locale category source definitions, and shall not contain more than one definition for the same locale category. If the file contains source definitions for more than one category, implementation-defined categories, if present, shall appear after the categories defined by [Section 7.1](#) (on page 135). A category source definition

contains either the definition of a category or a **copy** directive. For a description of the **copy** directive, see *localedef*. In the event that some of the information for a locale category, as specified in this volume of POSIX.1-2008, is missing from the locale source definition, the behavior of that category, if it is referenced, is unspecified.

A category source definition shall consist of a category header, a category body, and a category trailer. A category header shall consist of the character string naming of the category, beginning with the characters *LC_*. The category trailer shall consist of the string "END", followed by one or more <blank> characters and the string used in the corresponding category header.

The category body shall consist of one or more lines of text. Each line shall contain an identifier, optionally followed by one or more operands. Identifiers shall be either keywords, identifying a particular locale element, or collating elements. In addition to the keywords defined in this volume of POSIX.1-2008, the source can contain implementation-defined keywords. Each keyword within a locale shall have a unique name (that is, two categories cannot have a commonly-named keyword); no keyword shall start with the characters *LC_*. Identifiers shall be separated from the operands by one or more <blank> characters.

Operands shall be characters, collating elements, or strings of characters. Strings shall be enclosed in double-quotes. Literal double-quotes within strings shall be preceded by the <escape character>, described below. When a keyword is followed by more than one operand, the operands shall be separated by <semicolon> characters; <blank> characters shall be allowed both before and after a <semicolon>.

The first category header in the file can be preceded by a line modifying the comment character. It shall have the following format, starting in column 1:

```
"comment_char %c\n", <comment character>
```

The comment character shall default to the <number-sign> ('#'). Blank lines and lines containing the <comment character> in the first position shall be ignored.

The first category header in the file can be preceded by a line modifying the escape character to be used in the file. It shall have the following format, starting in column 1:

```
"escape_char %c\n", <escape character>
```

The escape character shall default to <backslash>, which is the character used in all examples shown in this volume of POSIX.1-2008.

A line can be continued by placing an escape character as the last character on the line; this continuation character shall be discarded from the input. Although the implementation need not accept any one portion of a continued line with a length exceeding {LINE_MAX} bytes, it shall place no limits on the accumulated length of the continued line. Comment lines shall not be continued on a subsequent line using an escaped <newline>.

Individual characters, characters in strings, and collating elements shall be represented using symbolic names, as defined below. In addition, characters can be represented using the characters themselves or as octal, hexadecimal, or decimal constants. When non-symbolic notation is used, the resultant locale definitions are in many cases not portable between systems. The left angle bracket ('<') is a reserved symbol, denoting the start of a symbolic name; when used to represent itself it shall be preceded by the escape character. The following rules apply to character representation:

1. A character can be represented via a symbolic name, enclosed within angle brackets '<' and '>'. The symbolic name, including the angle brackets, shall exactly match a symbolic name defined in the charmap file specified via the *localedef* -f option, and it shall be replaced by a character value determined from the value associated with the symbolic name in the charmap file. The use of a symbolic name not found in the charmap file shall

constitute an error, unless the category is *LC_CTYPE* or *LC_COLLATE*, in which case it shall constitute a warning condition (see *localedef* for a description of actions resulting from errors and warnings). The specification of a symbolic name in a **collating-element** or **collating-symbol** section that duplicates a symbolic name in the charmap file (if present) shall be an error. Use of the escape character or a right angle bracket within a symbolic name is invalid unless the character is preceded by the escape character.

For example:

```
<c>;<c-cedilla>  "<M><a><y>"
```

2. A character in the portable character set can be represented by the character itself, in which case the value of the character is implementation-defined. (Implementations may allow other characters to be represented as themselves, but such locale definitions are not portable.) Within a string, the double-quote character, the escape character, and the right angle bracket character shall be escaped (preceded by the escape character) to be interpreted as the character itself. Outside strings, the characters:

```
,      ;      <      >      escape_char
```

shall be escaped to be interpreted as the character itself.

For example:

```
c      "May"
```

3. A character can be represented as an octal constant. An octal constant shall be specified as the escape character followed by two or three octal digits. Each constant shall represent a byte value. Multi-byte values can be represented by concatenated constants specified in byte order with the last constant specifying the least significant byte of the character.

For example:

```
\143;\347;\143\150  "\115\141\171"
```

4. A character can be represented as a hexadecimal constant. A hexadecimal constant shall be specified as the escape character followed by an 'x' followed by two hexadecimal digits. Each constant shall represent a byte value. Multi-byte values can be represented by concatenated constants specified in byte order with the last constant specifying the least significant byte of the character.

For example:

```
\x63;\xe7;\x63\x68  "\x4d\x61\x79"
```

5. A character can be represented as a decimal constant. A decimal constant shall be specified as the escape character followed by a 'd' followed by two or three decimal digits. Each constant represents a byte value. Multi-byte values can be represented by concatenated constants specified in byte order with the last constant specifying the least significant byte of the character.

For example:

```
\d99;\d231;\d99\d104  "\d77\d97\d121"
```

Implementations may accept single-digit octal, decimal, or hexadecimal constants following the escape character. Only characters existing in the character set for which the locale definition is created shall be specified, whether using symbolic names, the characters themselves, or octal, decimal, or hexadecimal constants. If a charmap file is present, only characters defined in the charmap can be specified using octal, decimal, or hexadecimal constants. Symbolic names not present in the charmap file can be specified and shall be ignored, as specified under item 1

4002 above.

4003 7.3.1 LC_CTYPE

4004 The *LC_CTYPE* category shall define character classification, case conversion, and other
 4005 character attributes. In addition, a series of characters can be represented by three adjacent
 4006 <period> characters representing an ellipsis symbol (" . . . "). The ellipsis specification shall be
 4007 interpreted as meaning that all values between the values preceding and following it represent
 4008 valid characters. The ellipsis specification shall be valid only within a single encoded character
 4009 set; that is, within a group of characters of the same size. An ellipsis shall be interpreted as
 4010 including in the list all characters with an encoded value higher than the encoded value of the
 4011 character preceding the ellipsis and lower than the encoded value of the character following the
 4012 ellipsis.

4013 For example:

4014 \x30; . . . ; \x39;

4015 includes in the character class all characters with encoded values between the endpoints.

4016 The following keywords shall be recognized. In the descriptions, the term “automatically
 4017 included” means that it shall not be an error either to include or omit any of the referenced
 4018 characters; the implementation provides them if missing (even if the entire keyword is missing)
 4019 and accepts them silently if present. When the implementation automatically includes a missing
 4020 character, it shall have an encoded value dependent on the charmap file in effect (see the
 4021 description of the *localedef* -f option); otherwise, it shall have a value derived from an
 4022 implementation-defined character mapping.

4023 The character classes **digit**, **xdigit**, **lower**, **upper**, and **space** have a set of automatically included
 4024 characters. These only need to be specified if the character values (that is, encoding) differ from
 4025 the implementation default values. It is not possible to define a locale without these
 4026 automatically included characters unless some implementation extension is used to prevent
 4027 their inclusion. Such a definition would not be a proper superset of the C or POSIX locale and,
 4028 thus, it might not be possible for conforming applications to work properly.

4029 **copy** Specify the name of an existing locale which shall be used as the definition of
 4030 this category. If this keyword is specified, no other keyword shall be specified.

4031 **upper** Define characters to be classified as uppercase letters.
 4032 In the POSIX locale, the 26 uppercase letters shall be included:

4033 A B C D E F G H I J K L M N O P Q R S T U V W X Y Z

4034 In a locale definition file, no character specified for the keywords **cntrl**, **digit**,
 4035 **punct**, or **space** shall be specified. The uppercase letters <A> to <Z>, as
 4036 defined in [Section 6.4](#) (on page 129) (the portable character set), are
 4037 automatically included in this class.

4038 **lower** Define characters to be classified as lowercase letters.
 4039 In the POSIX locale, the 26 lowercase letters shall be included:

4040 a b c d e f g h i j k l m n o p q r s t u v w x y z

4041 In a locale definition file, no character specified for the keywords **cntrl**, **digit**,
 4042 **punct**, or **space** shall be specified. The lowercase letters <a> to <z> of the
 4043 portable character set are automatically included in this class.

4044	alpha	Define characters to be classified as letters.
4045		In the POSIX locale, all characters in the classes upper and lower shall be
4046		included.
4047		In a locale definition file, no character specified for the keywords cntrl , digit ,
4048		punct , or space shall be specified. Characters classified as either upper or
4049		lower are automatically included in this class.
4050	digit	Define the characters to be classified as numeric digits.
4051		In the POSIX locale, only:
4052		0 1 2 3 4 5 6 7 8 9
4053		shall be included.
4054		In a locale definition file, only the digits <zero>, <one>, <two>, <three>,
4055		<four>, <five>, <six>, <seven>, <eight>, and <nine> shall be specified, and in
4056		contiguous ascending sequence by numerical value. The digits <zero> to
4057		<nine> of the portable character set are automatically included in this class.
4058	alnum	Define characters to be classified as letters and numeric digits. Only the
4059		characters specified for the alpha and digit keywords shall be specified.
4060		Characters specified for the keywords alpha and digit are automatically
4061		included in this class.
4062	space	Define characters to be classified as white-space characters.
4063		In the POSIX locale, exactly <space>, <form-feed>, <newline>, <carriage-
4064		return>, <tab>, and <vertical-tab> shall be included.
4065		In a locale definition file, no character specified for the keywords upper ,
4066		lower , alpha , digit , graph , or xdigit shall be specified. The <space>, <form-
4067		feed>, <newline>, <carriage-return>, <tab>, and <vertical-tab> of the portable
4068		character set, and any characters included in the class blank are automatically
4069		included in this class.
4070	cntrl	Define characters to be classified as control characters.
4071		In the POSIX locale, no characters in classes alpha or print shall be included.
4072		In a locale definition file, no character specified for the keywords upper ,
4073		lower , alpha , digit , punct , graph , print , or xdigit shall be specified.
4074	punct	Define characters to be classified as punctuation characters.
4075		In the POSIX locale, neither the <space> nor any characters in classes alpha ,
4076		digit , or cntrl shall be included.
4077		In a locale definition file, no character specified for the keywords upper ,
4078		lower , alpha , digit , cntrl , xdigit , or as the <space> shall be specified.
4079	graph	Define characters to be classified as printable characters, not including the
4080		<space>.
4081		In the POSIX locale, all characters in classes alpha , digit , and punct shall be
4082		included; no characters in class cntrl shall be included.
4083		In a locale definition file, characters specified for the keywords upper , lower ,
4084		alpha , digit , xdigit , and punct are automatically included in this class. No
4085		character specified for the keyword cntrl shall be specified.

4086	print	Define characters to be classified as printable characters, including the
4087		<space>.
4088		In the POSIX locale, all characters in class graph shall be included; no
4089		characters in class cntrl shall be included.
4090		In a locale definition file, characters specified for the keywords upper , lower ,
4091		alpha , digit , xdigit , punct , graph , and the <space> are automatically included
4092		in this class. No character specified for the keyword cntrl shall be specified.
4093	xdigit	Define the characters to be classified as hexadecimal digits.
4094		In the POSIX locale, only:
4095		0 1 2 3 4 5 6 7 8 9 A B C D E F a b c d e f
4096		shall be included.
4097		In a locale definition file, only the characters defined for the class digit shall be
4098		specified, in contiguous ascending sequence by numerical value, followed by
4099		one or more sets of six characters representing the hexadecimal digits 10 to 15
4100		inclusive, with each set in ascending order (for example, <A>, , <C>, <D>,
4101		<E>, <F>, <a>, , <c>, <d>, <e>, <f>). The digits <zero> to <nine>, the
4102		uppercase letters <A> to <F>, and the lowercase letters <a> to <f> of the
4103		portable character set are automatically included in this class.
4104	blank	Define characters to be classified as <blank> characters.
4105		In the POSIX locale, only the <space> and <tab> shall be included.
4106		In a locale definition file, the <space> and <tab> are automatically included in
4107		this class.
4108	charclass	Define one or more locale-specific character class names as strings separated
4109		by <semicolon> characters. Each named character class can then be defined
4110		subsequently in the <i>LC_CTYPE</i> definition. A character class name shall consist
4111		of at least one and at most {CHARCLASS_NAME_MAX} bytes of
4112		alphanumeric characters from the portable filename character set. The first
4113		character of a character class name shall not be a digit. The name shall not
4114		match any of the <i>LC_CTYPE</i> keywords defined in this volume of
4115		POSIX.1-2008. Future versions of this standard will not specify any <i>LC_CTYPE</i>
4116		keywords containing uppercase letters.
4117	<i>charclass-name</i>	Define characters to be classified as belonging to the named locale-specific
4118		character class. In the POSIX locale, locale-specific named character classes
4119		need not exist.
4120		If a class name is defined by a charclass keyword, but no characters are
4121		subsequently assigned to it, this is not an error; it represents a class without
4122		any characters belonging to it.
4123		The <i>charclass-name</i> can be used as the <i>property</i> argument to the <i>wctype()</i>
4124		function, in regular expression and shell pattern-matching bracket
4125		expressions, and by the <i>tr</i> command.
4126	toupper	Define the mapping of lowercase letters to uppercase letters.
4127		In the POSIX locale, at a minimum, the 26 lowercase characters:
4128		a b c d e f g h i j k l m n o p q r s t u v w x y z
4129		shall be mapped to the corresponding 26 uppercase characters:

4130 A B C D E F G H I J K L M N O P Q R S T U V W X Y Z

4131 In a locale definition file, the operand shall consist of character pairs,
 4132 separated by <semicolon> characters. The characters in each character pair
 4133 shall be separated by a <comma> and the pair enclosed by parentheses. The
 4134 first character in each pair is the lowercase letter, the second the corresponding
 4135 uppercase letter. Only characters specified for the keywords **lower** and **upper**
 4136 shall be specified. The lowercase letters <a> to <z>, and their corresponding
 4137 uppercase letters <A> to <Z>, of the portable character set are automatically
 4138 included in this mapping, but only when the **toupper** keyword is omitted
 4139 from the locale definition.

4140 **tolower** Define the mapping of uppercase letters to lowercase letters.

4141 In the POSIX locale, at a minimum, the 26 uppercase characters:

4142 A B C D E F G H I J K L M N O P Q R S T U V W X Y Z

4143 shall be mapped to the corresponding 26 lowercase characters:

4144 a b c d e f g h i j k l m n o p q r s t u v w x y z

4145 In a locale definition file, the operand shall consist of character pairs,
 4146 separated by <semicolon> characters. The characters in each character pair
 4147 shall be separated by a <comma> and the pair enclosed by parentheses. The
 4148 first character in each pair is the uppercase letter, the second the
 4149 corresponding lowercase letter. Only characters specified for the keywords
 4150 **lower** and **upper** shall be specified. If the **tolower** keyword is omitted from
 4151 the locale definition, the mapping is the reverse mapping of the one specified
 4152 for **toupper**.

4153 The following table shows the character class combinations allowed:

4154 **Table 7-1** Valid Character Class Combinations

In Class	Can Also Belong To										
	upper	lower	alpha	digit	space	cntrl	punct	graph	print	xdigit	blank
upper		—	A	x	x	x	x	A	A	—	x
lower	—		A	x	x	x	x	A	A	—	x
alpha	—	—		x	x	x	x	A	A	—	x
digit	x	x	x		x	x	x	A	A	A	x
space	x	x	x	x		—	*	*	*	x	—
cntrl	x	x	x	x	—		x	x	x	x	—
punct	x	x	x	x	—	x		A	A	x	—
graph	—	—	—	—	—	x	—		A	—	—
print	—	—	—	—	—	x	—	—		—	—
xdigit	—	—	—	—	x	x	x	A	A		x
blank	x	x	x	x	A	—	*	*	*	x	

Notes:

1. Explanation of codes:
 - A Automatically included; see text.
 - Permitted.
 - x Mutually-exclusive.
 - * See note 2.
2. The <space>, which is part of the **space** and **blank** classes, cannot belong to **punct** or **graph**, but shall automatically belong to the **print** class. Other **space** or **blank** characters can be classified as any of **punct**, **graph**, or **print**.

7.3.1.1 LC_CTYPE Category in the POSIX Locale

The character classifications for the POSIX locale follow; the code listing depicts the *localedef* input, and the table represents the same information, sorted by character.

```
LC_CTYPE
# The following is the POSIX locale LC_CTYPE.
# "alpha" is by default "upper" and "lower"
# "alnum" is by definition "alpha" and "digit"
# "print" is by default "alnum", "punct", and the <space>
# "graph" is by default "alnum" and "punct"
#
upper    <A>;<B>;<C>;<D>;<E>;<F>;<G>;<H>;<I>;<J>;<K>;<L>;<M>;\
         <N>;<O>;<P>;<Q>;<R>;<S>;<T>;<U>;<V>;<W>;<X>;<Y>;<Z>
#
lower    <a>;<b>;<c>;<d>;<e>;<f>;<g>;<h>;<i>;<j>;<k>;<l>;<m>;\
         <n>;<o>;<p>;<q>;<r>;<s>;<t>;<u>;<v>;<w>;<x>;<y>;<z>
#
digit    <zero>;<one>;<two>;<three>;<four>;<five>;<six>;\
         <seven>;<eight>;<nine>
#
space    <tab>;<newline>;<vertical-tab>;<form-feed>;\
         <carriage-return>;<space>
#
cntrl    <alert>;<backspace>;<tab>;<newline>;<vertical-tab>;\
         <form-feed>;<carriage-return>;\

7.3.2 LC_COLLATE

The *LC_COLLATE* category provides a collation sequence definition for numerous utilities in the Shell and Utilities volume of POSIX.1-2008 (*sort*, *uniq*, and so on), regular expression matching (see [Chapter 9](#), on page 181), and the *strcoll()*, *strxfrm()*, *wscoll()*, and *wcsxfrm()* functions in the System Interfaces volume of POSIX.1-2008.

A collation sequence definition shall define the relative order between collating elements (characters and multi-character collating elements) in the locale. This order is expressed in terms of collation values; that is, by assigning each element one or more collation values (also known as collation weights). This does not imply that implementations shall assign such values, but that ordering of strings using the resultant collation definition in the locale behaves as if such assignment is done and used in the collation process. At least the following capabilities are provided:

1. **Multi-character collating elements.** Specification of multi-character collating elements (that is, sequences of two or more characters to be collated as an entity).
2. **User-defined ordering of collating elements.** Each collating element shall be assigned a collation value defining its order in the character (or basic) collation sequence. This ordering is used by regular expressions and pattern matching and, unless collation weights are explicitly specified, also as the collation weight to be used in sorting.
3. **Multiple weights and equivalence classes.** Collating elements can be assigned one or more (up to the limit {*COLL_WEIGHTS_MAX*}, as defined in [limits.h](#)) collating weights for use in sorting. The first weight is hereafter referred to as the primary weight.
4. **One-to-many mapping.** A single character is mapped into a string of collating elements.
5. **Equivalence class definition.** Two or more collating elements have the same collation value (primary weight).
6. **Ordering by weights.** When two strings are compared to determine their relative order, the two strings are first broken up into a series of collating elements; the elements in each successive pair of elements are then compared according to the relative primary weights for the elements. If equal, and more than one weight has been assigned, then the pairs of collating elements are re-compared according to the relative subsequent weights, until either a pair of collating elements compare unequal or the weights are exhausted.

The following keywords shall be recognized in a collation sequence definition. They are described in detail in the following sections.

copy	Specify the name of an existing locale which shall be used as the definition of this category. If this keyword is specified, no other keyword shall be specified.
collating-element	Define a collating-element symbol representing a multi-character collating element. This keyword is optional.
collating-symbol	Define a collating symbol for use in collation order statements. This keyword is optional.
order_start	Define collation rules. This statement shall be followed by one or more collation order statements, assigning character collation values and collation weights to collating elements.
order_end	Specify the end of the collation-order statements.

4407 7.3.2.1 *The collating-element Keyword*

4408 In addition to the collating elements in the character set, the **collating-element** keyword can be
 4409 used to define multi-character collating elements. The syntax is as follows:

4410 "collating-element %s from \"%s\\n\", <collating-symbol>, <string>

4411 The <collating-symbol> operand shall be a symbolic name, enclosed between angle brackets ('<' and '>'), and shall not duplicate any symbolic name in the current charmap file (if any), or any
 4412 other symbolic name defined in this collation definition. The string operand is a string of two or
 4413 more characters that collates as an entity. A <collating-element> defined via this keyword is only
 4414 recognized with the LC_COLLATE category.
 4415

4416 For example:

4417 collating-element <ch> from "<c><h>"
 4418 collating-element <e-acute> from "<acute><e>"
 4419 collating-element <ll> from "ll"

4420 7.3.2.2 *The collating-symbol Keyword*

4421 This keyword shall be used to define symbols for use in collation sequence statements; that is,
 4422 between the **order_start** and the **order_end** keywords. The syntax is as follows:

4423 "collating-symbol %s\\n\", <collating-symbol>

4424 The <collating-symbol> shall be a symbolic name, enclosed between angle brackets ('<' and '>'), and shall not duplicate any symbolic name in the current charmap file (if any), or any
 4425 other symbolic name defined in this collation definition. A <collating-symbol> defined via this
 4426 keyword is only recognized within the LC_COLLATE category.
 4427

4428 For example:

4429 collating-symbol <UPPER_CASE>
 4430 collating-symbol <HIGH>

4431 The **collating-symbol** keyword defines a symbolic name that can be associated with a relative
 4432 position in the character order sequence. While such a symbolic name does not represent any
 4433 collating element, it can be used as a weight.

4434 7.3.2.3 *The order_start Keyword*

4435 The **order_start** keyword shall precede collation order entries and also define the number of
 4436 weights for this collation sequence definition and other collation rules. The syntax is as follows:

4437 "order_start %s;%s;...;%s\\n\", <sort-rules>, <sort-rules> ...

4438 The operands to the **order_start** keyword are optional. If present, the operands define rules to be
 4439 applied when strings are compared. The number of operands define how many weights each
 4440 element is assigned; if no operands are present, one **forward** operand is assumed. If present, the
 4441 first operand defines rules to be applied when comparing strings using the first (primary)
 4442 weight; the second when comparing strings using the second weight, and so on. Operands shall
 4443 be separated by <semicolon> characters (';'). Each operand shall consist of one or more
 4444 collation directives, separated by <comma> characters (','). If the number of operands exceeds
 4445 the {COLL_WEIGHTS_MAX} limit, the utility shall issue a warning message. The following
 4446 directives shall be supported:

4447 **forward** Specifies that comparison operations for the weight level shall proceed from start
4448 of string towards the end of string.

4449 **backward** Specifies that comparison operations for the weight level shall proceed from end of
4450 string towards the beginning of string.

4451 **position** Specifies that comparison operations for the weight level shall consider the relative
4452 position of elements in the strings not subject to **IGNORE**. The string containing
4453 an element not subject to **IGNORE** after the fewest collating elements subject to
4454 **IGNORE** from the start of the compare shall collate first. If both strings contain a
4455 character not subject to **IGNORE** in the same relative position, the collating values
4456 assigned to the elements shall determine the ordering. In case of equality,
4457 subsequent characters not subject to **IGNORE** shall be considered in the same
4458 manner.

4459 The directives **forward** and **backward** are mutually-exclusive.

4460 If no operands are specified, a single **forward** operand shall be assumed.

4461 For example:

4462 order_start forward;backward

4463 7.3.2.4 Collation Order

4464 The **order_start** keyword shall be followed by collating identifier entries. The syntax for the
4465 collating element entries is as follows:

4466 "%s %s;%s;...;%s\n", <collating-identifier>, <weight>, <weight>, ...

4467 Each *collating-identifier* shall consist of either a character (in any of the forms defined in [Section](#)
4468 7.3, on page 136), a <collating-element>, a <collating-symbol>, an ellipsis, or the special symbol
4469 **UNDEFINED**. The order in which collating elements are specified determines the character
4470 order sequence, such that each collating element shall compare less than the elements following
4471 it.

4472 A <collating-element> shall be used to specify multi-character collating elements, and indicates
4473 that the character sequence specified via the <collating-element> is to be collated as a unit and in
4474 the relative order specified by its place.

4475 A <collating-symbol> can be used to define a position in the relative order for use in weights. No
4476 weights shall be specified with a <collating-symbol>.

4477 The ellipsis symbol specifies that a sequence of characters shall collate according to their
4478 encoded character values. It shall be interpreted as indicating that all characters with a coded
4479 character set value higher than the value of the character in the preceding line, and lower than
4480 the coded character set value for the character in the following line, in the current coded
4481 character set, shall be placed in the character collation order between the previous and the
4482 following character in ascending order according to their coded character set values. An initial
4483 ellipsis shall be interpreted as if the preceding line specified the NUL character, and a trailing
4484 ellipsis as if the following line specified the highest coded character set value in the current
4485 coded character set. An ellipsis shall be treated as invalid if the preceding or following lines do
4486 not specify characters in the current coded character set. The use of the ellipsis symbol ties the
4487 definition to a specific coded character set and may preclude the definition from being portable
4488 between implementations.

4489 The symbol **UNDEFINED** shall be interpreted as including all coded character set values not
4490 specified explicitly or via the ellipsis symbol. Such characters shall be inserted in the character

collation order at the point indicated by the symbol, and in ascending order according to their coded character set values. If no **UNDEFINED** symbol is specified, and the current coded character set contains characters not specified in this section, the utility shall issue a warning message and place such characters at the end of the character collation order.

The optional operands for each collation-element shall be used to define the primary, secondary, or subsequent weights for the collating element. The first operand specifies the relative primary weight, the second the relative secondary weight, and so on. Two or more collation-elements can be assigned the same weight; they belong to the same “equivalence class” if they have the same primary weight. Collation shall behave as if, for each weight level, elements subject to **IGNORE** are removed, unless the **position** collation directive is specified for the corresponding level with the **order_start** keyword. Then each successive pair of elements shall be compared according to the relative weights for the elements. If the two strings compare equal, the process shall be repeated for the next weight level, up to the limit {**COLL_WEIGHTS_MAX**}.

Weights shall be expressed as characters (in any of the forms specified in [Section 7.3](#), on page 136), *<collating-symbol>*s, *<collating-element>*s, an ellipsis, or the special symbol **IGNORE**. A single character, a *<collating-symbol>*, or a *<collating-element>* shall represent the relative position in the character collating sequence of the character or symbol, rather than the character or characters themselves. Thus, rather than assigning absolute values to weights, a particular weight is expressed using the relative order value assigned to a collating element based on its order in the character collation sequence.

One-to-many mapping is indicated by specifying two or more concatenated characters or symbolic names. For example, if the *<eszet>* is given the string “*<s><s>*” as a weight, comparisons are performed as if all occurrences of the *<eszet>* are replaced by “*<s><s>*” (assuming that “*<s>*” has the collating weight “*<s>*”). If it is necessary to define *<eszet>* and “*<s><s>*” as an equivalence class, then a collating element must be defined for the string “*ss*”.

All characters specified via an ellipsis shall by default be assigned unique weights, equal to the relative order of characters. Characters specified via an explicit or implicit **UNDEFINED** special symbol shall by default be assigned the same primary weight (that is, they belong to the same equivalence class). An ellipsis symbol as a weight shall be interpreted to mean that each character in the sequence shall have unique weights, equal to the relative order of their character in the character collation sequence. The use of the ellipsis as a weight shall be treated as an error if the collating element is neither an ellipsis nor the special symbol **UNDEFINED**.

The special keyword **IGNORE** as a weight shall indicate that when strings are compared using the weights at the level where **IGNORE** is specified, the collating element shall be ignored; that is, as if the string did not contain the collating element. In regular expressions and pattern matching, all characters that are subject to **IGNORE** in their primary weight form an equivalence class.

An empty operand shall be interpreted as the collating element itself.

For example, the order statement:

```
<a>      <a>; <a>
```

is equal to:

```
<a>
```

An ellipsis can be used as an operand if the collating element was an ellipsis, and shall be interpreted as the value of each character defined by the ellipsis.

The collation order as defined in this section affects the interpretation of bracket expressions in regular expressions (see [Section 9.3.5](#), on page 184).

```

4537     For example:
4538     order_start    forward;backward
4539     UNDEFINED      IGNORE; IGNORE
4540     <LOW>
4541     <space>        <LOW>; <space>
4542     ...            <LOW>; ...
4543     <a>             <a>; <a>
4544     <a-acute>       <a>; <a-acute>
4545     <a-grave>       <a>; <a-grave>
4546     <A>            <a>; <A>
4547     <A-acute>       <a>; <A-acute>
4548     <A-grave>       <a>; <A-grave>
4549     <ch>           <ch>; <ch>
4550     <Ch>           <ch>; <Ch>
4551     <s>            <s>; <s>
4552     <eszet>        "<s><s>"; "<eszet><eszet>"
4553     order_end

```

4554 This example is interpreted as follows:

- 4555 1. The **UNDEFINED** means that all characters not specified in this definition (explicitly or
4556 via the ellipsis) shall be ignored for collation purposes.
- 4557 2. All characters between <space> and 'a' shall have the same primary equivalence class
4558 and individual secondary weights based on their ordinal encoded values.
- 4559 3. All characters based on the uppercase or lowercase character 'a' belong to the same
4560 primary equivalence class.
- 4561 4. The multi-character collating element <ch> is represented by the collating symbol <ch>
4562 and belongs to the same primary equivalence class as the multi-character collating
4563 element <Ch>.

4564 7.3.2.5 The order_end Keyword

4565 The collating order entries shall be terminated with an **order_end** keyword.

4566 7.3.2.6 LC_COLLATE Category in the POSIX Locale

4567 The collation sequence definition of the POSIX locale follows; the code listing depicts the
4568 *localedef* input.

```

4569 LC_COLLATE
4570 # This is the POSIX locale definition for the LC_COLLATE category.
4571 # The order is the same as in the ASCII codeset.

4702      #
4703      END LC_COLLATE

```

4704 7.3.3 LC_MONETARY

4705 The *LC_MONETARY* category shall define the rules and symbols that are used to format
 4706 monetary numeric information.

4707 This information is available through the *localeconv()* function and is used by the *strfmon()*
 4708 function.

4709 Some of the information is also available in an alternative form via the *nl_langinfo()* function
 4710 (see CRNCYSTR in [<langinfo.h>](#)).

4711 The following items are defined in this category of the locale. The item names are the keywords
 4712 recognized by the *localedef* utility when defining a locale. They are also similar to the member
 4713 names of the *lconv* structure defined in [<locale.h>](#); see [<locale.h>](#) for the exact symbols in the
 4714 header. The *localeconv()* function returns {CHAR_MAX} for unspecified integer items and the
 4715 empty string (" ") for unspecified or size zero string items.

4716 In a locale definition file, the operands are strings, formatted as indicated by the grammar in
 4717 [Section 7.4](#) (on page 165). For some keywords, the strings can contain only integers. Keywords
 4718 that are not provided, string values set to the empty string (" "), or integer keywords set to -1,
 4719 are used to indicate that the value is not available in the locale. The following keywords shall be
 4720 recognized:

4721 **copy** Specify the name of an existing locale which shall be used as the
 4722 definition of this category. If this keyword is specified, no other keyword
 4723 shall be specified.

4724 **Note:** This is a *localedef* utility keyword, unavailable through *localeconv()*.

4725 **int_curr_symbol** The international currency symbol. The operand shall be a four-character
 4726 string, with the first three characters containing the alphabetic
 4727 international currency symbol. The international currency symbol should
 4728 be chosen in accordance with those specified in the ISO 4217 standard.
 4729 The fourth character shall be the character used to separate the
 4730 international currency symbol from the monetary quantity.

4731 **currency_symbol** The string that shall be used as the local currency symbol.

4732	mon_decimal_point	The operand is a string containing the symbol that shall be used as the decimal delimiter (radix character) in monetary formatted quantities.
4733		
4734	mon_thousands_sep	The operand is a string containing the symbol that shall be used as a separator for groups of digits to the left of the decimal delimiter in formatted monetary quantities.
4735		
4736		
4737	mon_grouping	Define the size of each group of digits in formatted monetary quantities. The operand is a sequence of integers separated by <semicolon> characters. Each integer specifies the number of digits in each group, with the initial integer defining the size of the group immediately preceding the decimal delimiter, and the following integers defining the preceding groups. If the last integer is not -1, then the size of the previous group (if any) shall be repeatedly used for the remainder of the digits. If the last integer is -1, then no further grouping shall be performed.
4738		
4739		
4740		
4741		
4742		
4743		
4744		
4745	positive_sign	A string that shall be used to indicate a non-negative-valued formatted monetary quantity.
4746		
4747	negative_sign	A string that shall be used to indicate a negative-valued formatted monetary quantity.
4748		
4749	int_frac_digits	An integer representing the number of fractional digits (those to the right of the decimal delimiter) to be written in a formatted monetary quantity using int_curr_symbol .
4750		
4751		
4752	frac_digits	An integer representing the number of fractional digits (those to the right of the decimal delimiter) to be written in a formatted monetary quantity using currency_symbol .
4753		
4754		
4755	p_cs_precedes	An integer set to 1 if the currency_symbol precedes the value for a monetary quantity with a non-negative value, and set to 0 if the symbol succeeds the value.
4756		
4757		
4758	p_sep_by_space	Set to a value indicating the separation of the currency_symbol , the sign string, and the value for a non-negative formatted monetary quantity.
4759		
4760		The values of p_sep_by_space , n_sep_by_space , int_p_sep_by_space , and int_n_sep_by_space are interpreted according to the following:
4761		
4762		0 No <space> separates the currency symbol and value.
4763		1 If the currency symbol and sign string are adjacent, a <space> separates them from the value; otherwise, a <space> separates the currency symbol from the value.
4764		
4765		
4766		2 If the currency symbol and sign string are adjacent, a <space> separates them; otherwise, a <space> separates the sign string from the value.
4767		
4768		
4769	n_cs_precedes	An integer set to 1 if the currency_symbol precedes the value for a monetary quantity with a negative value, and set to 0 if the symbol succeeds the value.
4770		
4771		
4772	n_sep_by_space	Set to a value indicating the separation of the currency_symbol , the sign string, and the value for a negative formatted monetary quantity.
4773		
4774	p_sign_posn	An integer set to a value indicating the positioning of the positive_sign for a monetary quantity with a non-negative value. The following integer values shall be recognized for int_n_sign_posn , int_p_sign_posn ,
4775		
4776		

4777		n_sign_posn , and p_sign_posn :
4778	0	Parentheses enclose the quantity and the currency_symbol .
4779	1	The sign string precedes the quantity and the currency_symbol .
4780	2	The sign string succeeds the quantity and the currency_symbol .
4781	3	The sign string precedes the currency_symbol .
4782	4	The sign string succeeds the currency_symbol .
4783	n_sign_posn	An integer set to a value indicating the positioning of the negative_sign for a negative formatted monetary quantity.
4784		
4785	int_p_cs_precedes	An integer set to 1 if the int_curr_symbol precedes the value for a monetary quantity with a non-negative value, and set to 0 if the symbol succeeds the value.
4786		
4787		
4788	int_n_cs_precedes	An integer set to 1 if the int_curr_symbol precedes the value for a monetary quantity with a negative value, and set to 0 if the symbol succeeds the value.
4789		
4790		
4791	int_p_sep_by_space	Set to a value indicating the separation of the int_curr_symbol , the sign string, and the value for a non-negative internationally formatted monetary quantity.
4792		
4793		
4794	int_n_sep_by_space	Set to a value indicating the separation of the int_curr_symbol , the sign string, and the value for a negative internationally formatted monetary quantity.
4795		
4796		
4797	int_p_sign_posn	An integer set to a value indicating the positioning of the positive_sign for a positive monetary quantity formatted with the international format.
4798		
4799	int_n_sign_posn	An integer set to a value indicating the positioning of the negative_sign for a negative monetary quantity formatted with the international format.
4800		

4801 7.3.3.1 LC_MONETARY Category in the POSIX Locale

4802 The monetary formatting definitions for the POSIX locale follow; the code listing depicting the
 4803 *localedef* input, the table representing the same information with the addition of *localeconv()* and
 4804 *nl_langinfo()* formats. All values are unspecified in the POSIX locale.

```

4805 LC_MONETARY

4855 The entry N/A indicates that the value is not available in the POSIX locale.

4856 7.3.4 LC_NUMERIC

4857 The *LC_NUMERIC* category shall define the rules and symbols that are used to format non-
4858 monetary numeric information. This information is available through the *localeconv()* function.

4859 Some of the information is also available in an alternative form via the *nl_langinfo()* function.

4860 The following items are defined in this category of the locale. The item names are the keywords
4861 recognized by the *localedef* utility when defining a locale. They are also similar to the member
4862 names of the **lconv** structure defined in [<locale.h>](#); see [<locale.h>](#) for the exact symbols in the
4863 header. The *localeconv()* function returns {CHAR_MAX} for unspecified integer items and the
4864 empty string (" ") for unspecified or size zero string items.

4865 In a locale definition file, the operands are strings, formatted as indicated by the grammar in
4866 [Section 7.4](#) (on page 165). For some keywords, the strings can only contain integers. Keywords

that are not provided, string values set to the empty string (" "), or integer keywords set to -1, shall be used to indicate that the value is not available in the locale. The following keywords shall be recognized:

copy Specify the name of an existing locale which shall be used as the definition of this category. If this keyword is specified, no other keyword shall be specified.

Note: This is a *localedef* utility keyword, unavailable through *localeconv()*.

decimal_point The operand is a string containing the symbol that shall be used as the decimal delimiter (radix character) in numeric, non-monetary formatted quantities. This keyword cannot be omitted and cannot be set to the empty string. In contexts where standards limit the **decimal_point** to a single byte, the result of specifying a multi-byte operand shall be unspecified.

thousands_sep The operand is a string containing the symbol that shall be used as a separator for groups of digits to the left of the decimal delimiter in numeric, non-monetary formatted monetary quantities. In contexts where standards limit the **thousands_sep** to a single byte, the result of specifying a multi-byte operand shall be unspecified.

grouping Define the size of each group of digits in formatted non-monetary quantities. The operand is a sequence of integers separated by <semicolon> characters. Each integer specifies the number of digits in each group, with the initial integer defining the size of the group immediately preceding the decimal delimiter, and the following integers defining the preceding groups. If the last integer is not -1, then the size of the previous group (if any) shall be repeatedly used for the remainder of the digits. If the last integer is -1, then no further grouping shall be performed.

7.3.4.1 LC_NUMERIC Category in the POSIX Locale

The non-monetary numeric formatting definitions for the POSIX locale follow; the code listing depicting the *localedef* input, the table representing the same information with the addition of *localeconv()* values, and *nl_langinfo()* constants.

```
LC_NUMERIC
# This is the POSIX locale definition for
# the LC_NUMERIC category.
#
decimal_point      "<period>"
thousands_sep      ""
grouping           -1
#
END LC_NUMERIC
```

Item	langinfo Constant	POSIX Locale Value	localeconv() Value	localedef Value
decimal_point	RADIXCHAR	"."	"."	"."
thousands_sep	THOUSEP	N/A	" "	" "
grouping	—	N/A	" "	-1

The entry N/A indicates that the value is not available in the POSIX locale.

7.3.5 LC_TIME

The *LC_TIME* category shall define the interpretation of the conversion specifications supported by the *date* utility and shall affect the behavior of the *strftime()*, *wcsftime()*, *strptime()*, and *nl_langinfo()* functions. Since the interfaces for C-language access and locale definition differ significantly, they are described separately.

7.3.5.1 LC_TIME Locale Definition

In a locale definition, the following mandatory keywords shall be recognized:

copy	Specify the name of an existing locale which shall be used as the definition of this category. If this keyword is specified, no other keyword shall be specified.
abday	Define the abbreviated weekday names, corresponding to the %a conversion specification (conversion specification in the <i>strftime()</i> , <i>wcsftime()</i> , and <i>strptime()</i> functions). The operand shall consist of seven &ltsemicolon>-separated strings, each surrounded by double-quotes. The first string shall be the abbreviated name of the day corresponding to Sunday, the second the abbreviated name of the day corresponding to Monday, and so on.
day	Define the full weekday names, corresponding to the %A conversion specification. The operand shall consist of seven &ltsemicolon>-separated strings, each surrounded by double-quotes. The first string is the full name of the day corresponding to Sunday, the second the full name of the day corresponding to Monday, and so on.
abmon	Define the abbreviated month names, corresponding to the %b conversion specification. The operand shall consist of twelve &ltsemicolon>-separated strings, each surrounded by double-quotes. The first string shall be the abbreviated name of the first month of the year (January), the second the abbreviated name of the second month, and so on.
mon	Define the full month names, corresponding to the %B conversion specification. The operand shall consist of twelve &ltsemicolon>-separated strings, each surrounded by double-quotes. The first string shall be the full name of the first month of the year (January), the second the full name of the second month, and so on.
d_t_fmt	Define the appropriate date and time representation, corresponding to the %c conversion specification. The operand shall consist of a string containing any combination of characters and conversion specifications. In addition, the string can contain escape sequences defined in the table in Table 5-1 (on page 121) ('\\', '\a', '\b', '\f', '\n', '\r', '\t', '\v').
d_fmt	Define the appropriate date representation, corresponding to the %x conversion specification. The operand shall consist of a string containing any combination of characters and conversion specifications. In addition, the string can contain escape sequences defined in Table 5-1 (on page 121).
t_fmt	Define the appropriate time representation, corresponding to the %X conversion specification. The operand shall consist of a string containing any combination of characters and conversion specifications. In addition, the string can contain escape sequences defined in Table 5-1 (on page 121).

4953	am_pm	Define the appropriate representation of the <i>ante-meridiem</i> and <i>post-meridiem</i> strings, corresponding to the %p conversion specification. The operand shall consist of two strings, separated by a <semicolon>, each surrounded by double-quotes. The first string shall represent the <i>ante-meridiem</i> designation, the last string the <i>post-meridiem</i> designation.
4954		
4955		
4956		
4957		
4958	t_fmt_ampm	Define the appropriate time representation in the 12-hour clock format with am_pm , corresponding to the %r conversion specification. The operand shall consist of a string and can contain any combination of characters and conversion specifications. If the string is empty, the 12-hour format is not supported in the locale.
4959		
4960		
4961		
4962		
4963	era	Define how years are counted and displayed for each era in a locale. The operand shall consist of <semicolon>-separated strings. Each string shall be an era description segment with the format:
4964		
4965		
4966		<i>direction:offset:start_date:end_date:era_name:era_format</i>
4967		according to the definitions below. There can be as many era description segments as are necessary to describe the different eras.
4968		
4969	Note:	The start of an era might not be the earliest point in the era—it may be the latest. For example, the Christian era BC starts on the day before January 1, AD 1, and increases with earlier time.
4970		
4971		
4972	<i>direction</i>	Either a '+' or a '-' character. The '+' character shall indicate that years closer to the <i>start_date</i> have lower numbers than those closer to the <i>end_date</i> . The '-' character shall indicate that years closer to the <i>start_date</i> have higher numbers than those closer to the <i>end_date</i> .
4973		
4974		
4975		
4976		
4977	<i>offset</i>	The number of the year closest to the <i>start_date</i> in the era, corresponding to the %EY conversion specification.
4978		
4979	<i>start_date</i>	A date in the form <i>yyyy/mm/dd</i> , where <i>yyyy</i> , <i>mm</i> , and <i>dd</i> are the year, month, and day numbers respectively of the start of the era. Years prior to AD 1 shall be represented as negative numbers.
4980		
4981		
4982	<i>end_date</i>	The ending date of the era, in the same format as the <i>start_date</i> , or one of the two special values "-*" or "+*". The value "-*" shall indicate that the ending date is the beginning of time. The value "+*" shall indicate that the ending date is the end of time.
4983		
4984		
4985		
4986	<i>era_name</i>	A string representing the name of the era, corresponding to the %EC conversion specification.
4987		
4988	<i>era_format</i>	A string for formatting the year in the era, corresponding to the %EY conversion specification.
4989		
4990	era_d_fmt	Define the format of the date in alternative era notation, corresponding to the %Ex conversion specification.
4991		
4992	era_t_fmt	Define the locale's appropriate alternative time format, corresponding to the %EX conversion specification.
4993		
4994	era_d_t_fmt	Define the locale's appropriate alternative date and time format, corresponding to the %Ec conversion specification.
4995		
4996	alt_digits	Define alternative symbols for digits, corresponding to the %O modified conversion specification. The operand shall consist of <semicolon>-separated strings, each surrounded by double-quotes. The first string shall be the
4997		
4998		

alternative symbol corresponding with zero, the second string the symbol corresponding with one, and so on. Up to 100 alternative symbol strings can be specified. The %O modifier shall indicate that the string corresponding to the value specified via the conversion specification shall be used instead of the value.

5004 7.3.5.2 LC_TIME C-Language Access

5005 The following constants used to identify items of *langinfo* data can be used as arguments to the
5006 *nl_langinfo()* function to access information in the *LC_TIME* category. These constants are
5007 defined in the **<langinfo.h>** header.

5008 **ABDAY_x** The abbreviated weekday names (for example, Sun), where *x* is a number
5009 from 1 to 7.

5010 **DAY_x** The full weekday names (for example, Sunday), where *x* is a number from 1 to
5011 7.

5012 **ABMON_x** The abbreviated month names (for example, Jan), where *x* is a number from 1
5013 to 12.

5014 **MON_x** The full month names (for example, January), where *x* is a number from 1 to
5015 12.

5016 **D_T_FMT** The appropriate date and time representation.

5017 **D_FMT** The appropriate date representation.

5018 **T_FMT** The appropriate time representation.

5019 **AM_STR** The appropriate ante-meridiem affix.

5020 **PM_STR** The appropriate post-meridiem affix.

5021 **T_FMT_AMPM** The appropriate time representation in the 12-hour clock format with
5022 **AM_STR** and **PM_STR**.

5023 **ERA** The era description segments, which describe how years are counted and
5024 displayed for each era in a locale. Each era description segment shall have the
5025 format:

5026 *direction:offset:start_date:end_date:era_name:era_format*

5027 according to the definitions below. There can be as many era description
5028 segments as are necessary to describe the different eras. Era description
5029 segments are separated by <semicolon> characters.

5030 *direction* Either a '+' or a '-' character. The '+' character shall indicate
5031 that years closer to the *start_date* have lower numbers than those
5032 closer to the *end_date*. The '-' character shall indicate that years
5033 closer to the *start_date* have higher numbers than those closer to
5034 the *end_date*.

5035 *offset* The number of the year closest to the *start_date* in the era.

5036 *start_date* A date in the form *yyyy/mm/dd*, where *yyyy*, *mm*, and *dd* are the
5037 year, month, and day numbers respectively of the start of the era.
5038 Years prior to AD 1 shall be represented as negative numbers.

5039	<i>end_date</i>	The ending date of the era, in the same format as the <i>start_date</i> ,
5040		or one of the two special values "-*" or "+*". The value "-*" shall indicate that the ending date is the beginning of time. The
5041		value "+*" shall indicate that the ending date is the end of time.
5042		
5043	<i>era_name</i>	The era, corresponding to the %EC conversion specification.
5044	<i>era_format</i>	The format of the year in the era, corresponding to the %EY
5045		conversion specification.
5046	ERA_D_FMT	The era date format.
5047	ERA_T_FMT	The locale's appropriate alternative time format, corresponding to the %EX
5048		conversion specification.
5049	ERA_D_T_FMT	The locale's appropriate alternative date and time format, corresponding to
5050		the %Ec conversion specification.
5051	ALT_DIGITS	The alternative symbols for digits, corresponding to the %O conversion
5052		specification modifier. The value consists of <semicolon>-separated symbols.
5053		The first is the alternative symbol corresponding to zero, the second is the
5054		symbol corresponding to one, and so on. Up to 100 alternative symbols may
5055		be specified.

5056 7.3.5.3 LC_TIME Category in the POSIX Locale

5057 The *LC_TIME* category definition of the POSIX locale follows; the code listing depicts the
 5058 *localedef* input; the table represents the same information with the addition of *localedef* keywords,
 5059 conversion specifiers used by the *date* utility and the *strftime()*, *wcsftime()*, and *strptime()*
 5060 functions, and *nl_langinfo()* constants.

```

5061 LC_TIME
5062 # This is the POSIX locale definition for
5063 # the LC_TIME category.
5064 #
5065 # Abbreviated weekday names (%a)
5066 abday      "<S><u><n>"; "<M><o><n>"; "<T><u><e>"; "<W><e><d>"; \
5067            "<T><h><u>"; "<F><r><i>"; "<S><a><t>"

The entry N/A indicates the value is not available in the POSIX locale.

7.3.6 LC_MESSAGES

The *LC_MESSAGES* category shall define the format and values used by various utilities for affirmative and negative responses. This information is available through the *nl_langinfo()* function.

The message catalog used by the standard utilities and selected by the *catopen()* function shall be determined by the setting of *NLSPATH*; see [Chapter 8](#) (on page 173). The *LC_MESSAGES* category can be specified as part of an *NLSPATH* substitution field.

The following keywords shall be recognized as part of the locale definition file.

copy Specify the name of an existing locale which shall be used as the definition of this category. If this keyword is specified, no other keyword shall be specified.

Note: This is a *localedef* keyword, unavailable through *nl_langinfo()*.

yesexpr The operand consists of an extended regular expression (see [Section 9.4](#), on page 188) that describes acceptable affirmative responses to a question expecting an affirmative or negative response.

noexpr The operand consists of an extended regular expression that describes acceptable negative responses to a question expecting an affirmative or negative response.

5182 7.3.6.1 LC_MESSAGES Category in the POSIX Locale

5183 The format and values for affirmative and negative responses of the POSIX locale follow; the
 5184 code listing depicting the *localedef* input, the table representing the same information with the
 5185 addition of *nl_langinfo()* constants.

```

5186 LC_MESSAGES
5187 # This is the POSIX locale definition for
5188 # the LC_MESSAGES category.
5189 #
5190 yesexpr "<circumflex><left-square-bracket><y><Y><right-square-bracket>"
5191 #
5192 noexpr  "<circumflex><left-square-bracket><n><N><right-square-bracket>"
5193 #
5194 END LC_MESSAGES

```

localedef Keyword	langinfo Constant	POSIX Locale Value
yesexpr	YESEXPR	" ^ [yY] "
noexpr	NOEXPR	" ^ [nN] "

5198 7.4 Locale Definition Grammar

5199 The grammar and lexical conventions in this section shall together describe the syntax for the
 5200 locale definition source. The general conventions for this style of grammar are described in XCU
 5201 [Section 1.3](#) (on page 2309). The grammar shall take precedence over the text in this chapter.

5202 7.4.1 Locale Lexical Conventions

5203 The lexical conventions for the locale definition grammar are described in this section.

5204 The following tokens shall be processed (in addition to those string constants shown in the
 5205 grammar):

5206	LOC_NAME	A string of characters representing the name of a locale.
5207	CHAR	Any single character.
5208	NUMBER	A decimal number, represented by one or more decimal digits.
5209	COLLSYMBOL	A symbolic name, enclosed between angle brackets. The string cannot duplicate any charmap symbol defined in the current charmap (if any), or a COLLELEMENT symbol.
5210		
5211		
5212	COLLELEMENT	A symbolic name, enclosed between angle brackets, which cannot duplicate either any charmap symbol or a COLLSYMBOL symbol.
5213		
5214	CHARCLASS	A string of alphanumeric characters from the portable character set, the first of which is not a digit, consisting of at least one and at most {CHARCLASS_NAME_MAX} bytes, and optionally surrounded by double-quotes.
5215		
5216		
5217		
5218	CHARSYMBOL	A symbolic name, enclosed between angle brackets, from the current charmap (if any).
5219		

5220	OCTAL_CHAR	One or more octal representations of the encoding of each byte in a
5221		single character. The octal representation consists of an escape
5222		character (normally a <backslash>) followed by two or more octal
5223		digits.
5224	HEX_CHAR	One or more hexadecimal representations of the encoding of each
5225		byte in a single character. The hexadecimal representation consists of
5226		an escape character followed by the constant <i>x</i> and two or more
5227		hexadecimal digits.
5228	DECIMAL_CHAR	One or more decimal representations of the encoding of each byte in
5229		a single character. The decimal representation consists of an escape
5230		character followed by a character 'd' and two or more decimal
5231		digits.
5232	ELLIPSIS	The string ". . .".
5233	EXTENDED_REG_EXP	An extended regular expression as defined in the grammar in Section
5234		9.5 (on page 191).
5235	EOL	The line termination character <newline>.

5236 7.4.2 Locale Grammar

5237 This section presents the grammar for the locale definition.

Chapter 8 Environment Variables

8.1 Environment Variable Definition

Environment variables defined in this chapter affect the operation of multiple utilities, functions, and applications. There are other environment variables that are of interest only to specific utilities. Environment variables that apply to a single utility only are defined as part of the utility description. See the ENVIRONMENT VARIABLES section of the utility descriptions in the Shell and Utilities volume of POSIX.1-2008 for information on environment variable usage.

The value of an environment variable is a string of characters. For a C-language program, an array of strings called the environment shall be made available when a process begins. The array is pointed to by the external variable *environ*, which is defined as:

```
extern char **environ;
```

These strings have the form *name=value*; *names* shall not contain the character '='. For values to be portable across systems conforming to POSIX.1-2008, the value shall be composed of characters from the portable character set (except NUL and as indicated below). There is no meaning associated with the order of strings in the environment. If more than one string in an environment of a process has the same *name*, the consequences are undefined.

Environment variable names used by the utilities in the Shell and Utilities volume of POSIX.1-2008 consist solely of uppercase letters, digits, and the <underscore> ('_') from the characters defined in Table 6-1 (on page 125) and do not begin with a digit. Other characters may be permitted by an implementation; applications shall tolerate the presence of such names. Uppercase and lowercase letters shall retain their unique identities and shall not be folded together. The name space of environment variable names containing lowercase letters is reserved for applications. Applications can define any environment variables with names from this name space without modifying the behavior of the standard utilities.

Note: Other applications may have difficulty dealing with environment variable names that start with a digit. For this reason, use of such names is not recommended anywhere.

The *values* that the environment variables may be assigned are not restricted except that they are considered to end with a null byte and the total space used to store the environment and the arguments to the process is limited to {ARG_MAX} bytes.

Other *name=value* pairs may be placed in the environment by, for example, calling any of the *setenv()*, *unsetenv()*, or *putenv()* functions, assigning a new value to the *environ* variable, or by using *envp* arguments when creating a process; see *exec* in the System Interfaces volume of POSIX.1-2008.

If the application modifies the pointers to which *environ* points, the behavior of all interfaces described in the System Interfaces volume of POSIX.1-2008 is undefined.

It is unwise to conflict with certain variables that are frequently exported by widely used command interpreters and applications:

5519	ARFLAGS	IFS	MAILPATH	PS1
5520	CC	LANG	MAILRC	PS2
5521	CDPATH	LC_ALL	MAKEFLAGS	PS3
5522	CFLAGS	LC_COLLATE	MAKESHELL	PS4
5523	CHARSET	LC_CTYPE	MANPATH	PWD
5524	COLUMNS	LC_MESSAGES	MBOX	RANDOM
5525	DATMSK	LC_MONETARY	MORE	SECONDS
5526	DEAD	LC_NUMERIC	MSGVERB	SHELL
5527	EDITOR	LC_TIME	NLSPATH	TERM
5528	ENV	LDFLAGS	NPROC	TERMCAP
5529	EXINIT	LEX	OLDPWD	TERMINFO
5530	FC	LFLAGS	OPTARG	TMPDIR
5531	FCEDIT	LINENO	OPTERR	TZ
5532	FFLAGS	LINES	OPTIND	USER
5533	GET	LISTER	PAGER	VISUAL
5534	GFLAGS	LOGNAME	PATH	YACC
5535	HISTFILE	LPDEST	PPID	YFLAGS
5536	HISTORY	MAIL	PRINTER	
5537	HISTSIZE	MAILCHECK	PROCLANG	
5538	HOME	MAILER	PROJECTDIR	

If the variables in the following two sections are present in the environment during the execution of an application or utility, they shall be given the meaning described below. Some are placed into the environment by the implementation at the time the user logs in; all can be added or changed by the user or any ancestor of the current process. The implementation adds or changes environment variables named in POSIX.1-2008 only as specified in POSIX.1-2008. If they are defined in the application's environment, the utilities in the Shell and Utilities volume of POSIX.1-2008 and the functions in the System Interfaces volume of POSIX.1-2008 assume they have the specified meaning. Conforming applications shall not set these environment variables to have meanings other than as described. See *getenv()* (on page 1017) and XCU [Section 2.12](#) (on page 2353) for methods of accessing these variables.

8.2 Internationalization Variables

This section describes environment variables that are relevant to the operation of internationalized interfaces described in POSIX.1-2008.

Users may use the following environment variables to announce specific localization requirements to applications. Applications can retrieve this information using the *setlocale()* function to initialize the correct behavior of the internationalized interfaces. The descriptions of the internationalization environment variables describe the resulting behavior only when the application locale is initialized in this way. The use of the internationalization variables by utilities described in the Shell and Utilities volume of POSIX.1-2008 is described in the ENVIRONMENT VARIABLES section for those utilities in addition to the global effects described in this section.

LANG This variable shall determine the locale category for native language, local customs, and coded character set in the absence of the *LC_ALL* and other *LC_** (*LC_COLLATE*, *LC_CTYPE*, *LC_MESSAGES*, *LC_MONETARY*, *LC_NUMERIC*, *LC_TIME*) environment variables. This can be used by applications to determine the language to use for error messages and instructions, collating sequences, date formats, and so on.

5566	<i>LC_ALL</i>	This variable shall determine the values for all locale categories. The value of the <i>LC_ALL</i> environment variable has precedence over any of the other environment variables starting with <i>LC_</i> (<i>LC_COLLATE</i> , <i>LC_CTYPE</i> , <i>LC_MESSAGES</i> , <i>LC_MONETARY</i> , <i>LC_NUMERIC</i> , <i>LC_TIME</i>) and the <i>LANG</i> environment variable.
5571	<i>LC_COLLATE</i>	This variable shall determine the locale category for character collation. It determines collation information for regular expressions and sorting, including equivalence classes and multi-character collating elements, in various utilities and the <i>strcoll()</i> and <i>strxfrm()</i> functions. Additional semantics of this variable, if any, are implementation-defined.
5576	<i>LC_CTYPE</i>	This variable shall determine the locale category for character handling functions, such as <i>tolower()</i> , <i>toupper()</i> , and <i>isalpha()</i> . This environment variable determines the interpretation of sequences of bytes of text data as characters (for example, single as opposed to multi-byte characters), the classification of characters (for example, alpha, digit, graph), and the behavior of character classes. Additional semantics of this variable, if any, are implementation-defined.
5583	<i>LC_MESSAGES</i>	This variable shall determine the locale category for processing affirmative and negative responses and the language and cultural conventions in which messages should be written. It also affects the behavior of the <i>catopen()</i> function in determining the message catalog. Additional semantics of this variable, if any, are implementation-defined. The language and cultural conventions of diagnostic and informative messages whose format is unspecified by POSIX.1-2008 should be affected by the setting of <i>LC_MESSAGES</i> .
5591	<i>LC_MONETARY</i>	This variable shall determine the locale category for monetary-related numeric formatting information. Additional semantics of this variable, if any, are implementation-defined.
5594	<i>LC_NUMERIC</i>	This variable shall determine the locale category for numeric formatting (for example, thousands separator and radix character) information in various utilities as well as the formatted I/O operations in <i>printf()</i> and <i>scanf()</i> and the string conversion functions in <i>strtod()</i> . Additional semantics of this variable, if any, are implementation-defined.
5599	<i>LC_TIME</i>	This variable shall determine the locale category for date and time formatting information. It affects the behavior of the time functions in <i>strptime()</i> . Additional semantics of this variable, if any, are implementation-defined.
5602	<i>NLSPATH</i>	This variable shall contain a sequence of templates that the <i>catopen()</i> function uses when attempting to locate message catalogs. Each template consists of an optional prefix, one or more conversion specifications, a pathname, and an optional suffix.
5606		For example:
5607		<code>NLSPATH="/system/nlslib/%N.cat"</code>
5608		defines that <i>catopen()</i> should look for all message catalogs in the directory /system/nlslib , where the catalog name should be constructed from the <i>name</i> parameter passed to <i>catopen()</i> (<i>%N</i>), with the suffix .cat .
5611		Conversion specifications consist of a ' <i>%</i> ' symbol, followed by a single-letter keyword. The following keywords are currently defined:
5612		

5613 %N The value of the *name* parameter passed to *catopen()*.

5614 %L The value of the *LC_MESSAGES* category.

5615 %l The *language* element from the *LC_MESSAGES* category.

5616 %t The *territory* element from the *LC_MESSAGES* category.

5617 %c The *codeset* element from the *LC_MESSAGES* category.

5618 %% A single '%' character.

5619 An empty string is substituted if the specified value is not currently defined.

5620 The separators <underscore> ('_') and <period> ('.') are not included in

5621 the %t and %c conversion specifications.

5622 Templates defined in *NLSPATH* are separated by <colon> characters (':'). A

5623 leading or two adjacent <colon> characters (": : ") is equivalent to specifying

5624 %N. For example:

5625 NLSPATH=":%N.cat:/nlslib/%L/%N.cat "

5626 indicates to *catopen()* that it should look for the requested message catalog in

5627 *name*, *name.cat*, and */nlslib/category/name.cat*, where *category* is the value of the

5628 *LC_MESSAGES* category of the current locale.

5629 Users should not set the *NLSPATH* variable unless they have a specific reason

5630 to override the default system path. Setting *NLSPATH* to override the default

5631 system path produces undefined results in the standard utilities and in

5632 applications with appropriate privileges.

5633 The environment variables *LANG*, *LC_ALL*, *LC_COLLATE*, *LC_CTYPE*, *LC_MESSAGES*,

5634 *LC_MONETARY*, *LC_NUMERIC*, *LC_TIME*, and *NLSPATH* provide for the support of

5635 internationalized applications. The standard utilities shall make use of these environment

5636 variables as described in this section and the individual ENVIRONMENT VARIABLES sections

5637 for the utilities. If these variables specify locale categories that are not based upon the same

5638 underlying codeset, the results are unspecified.

5639 The values of locale categories shall be determined by a precedence order; the first condition met

5640 below determines the value:

- 5641 1. If the *LC_ALL* environment variable is defined and is not null, the value of *LC_ALL* shall
- 5642 be used.
- 5643 2. If the *LC_** environment variable (*LC_COLLATE*, *LC_CTYPE*, *LC_MESSAGES*,
- 5644 *LC_MONETARY*, *LC_NUMERIC*, *LC_TIME*) is defined and is not null, the value of the
- 5645 environment variable shall be used to initialize the category that corresponds to the
- 5646 environment variable.
- 5647 3. If the *LANG* environment variable is defined and is not null, the value of the *LANG*
- 5648 environment variable shall be used.
- 5649 4. If the *LANG* environment variable is not set or is set to the empty string, the
- 5650 implementation-defined default locale shall be used.

5651 If the locale value is "C" or "POSIX", the POSIX locale shall be used and the standard utilities

5652 behave in accordance with the rules in [Section 7.2](#) (on page 136) for the associated category.

5653 If the locale value begins with a <slash>, it shall be interpreted as the pathname of a file that was

5654 created in the output format used by the *localedef* utility; see OUTPUT FILES under *localedef*.

5655 Referencing such a pathname shall result in that locale being used for the indicated category.

5656 XSI If the locale value has the form:

5657 `language[_territory][.codeset]`

5658 it refers to an implementation-provided locale, where settings of language, territory, and codeset
5659 are implementation-defined.

5660 `LC_COLLATE`, `LC_CTYPE`, `LC_MESSAGES`, `LC_MONETARY`, `LC_NUMERIC`, and `LC_TIME` are
5661 defined to accept an additional field `@modifier`, which allows the user to select a specific instance
5662 of localization data within a single category (for example, for selecting the dictionary as opposed
5663 to the character ordering of data). The syntax for these environment variables is thus defined as:

5664 `[language[_territory][.codeset][@modifier]]`

5665 For example, if a user wanted to interact with the system in French, but required to sort German
5666 text files, `LANG` and `LC_COLLATE` could be defined as:

5667 `LANG=Fr_FR`
5668 `LC_COLLATE=De_DE`

5669 This could be extended to select dictionary collation (say) by use of the `@modifier` field; for
5670 example:

5671 `LC_COLLATE=De_DE@dict`

5672 An implementation may support other formats.

5673 If the locale value is not recognized by the implementation, the behavior is unspecified.

5674 These environment variables are used by the `newlocale()` and `setlocale()` functions, and by the
5675 standard utilities.

5676 Additional criteria for determining a valid locale name are implementation-defined.

5677 8.3 Other Environment Variables

5678 **COLUMNS** This variable shall represent a decimal integer >0 used to indicate the user's
5679 preferred width in column positions for the terminal screen or window; see
5680 [Section 3.103](#) (on page 50). If this variable is unset or null, the implementation
5681 determines the number of columns, appropriate for the terminal or window,
5682 in an unspecified manner. When `COLUMNS` is set, any terminal-width
5683 information implied by `TERM` is overridden. Users and conforming
5684 applications should not set `COLUMNS` unless they wish to override the
5685 system selection and produce output unrelated to the terminal characteristics.

5686 Users should not need to set this variable in the environment unless there is a
5687 specific reason to override the implementation's default behavior, such as to
5688 display data in an area arbitrarily smaller than the terminal or window.

5689 XSI **DATEMSK** Indicates the pathname of the template file used by `getdate()`.

5690 **HOME** The system shall initialize this variable at the time of login to be a pathname of
5691 the user's home directory. See [<pwd.h>](#).

5692 **LINES** This variable shall represent a decimal integer >0 used to indicate the user's
5693 preferred number of lines on a page or the vertical screen or window size in
5694 lines. A line in this case is a vertical measure large enough to hold the tallest
5695 character in the character set being displayed. If this variable is unset or null,

5696		the implementation determines the number of lines, appropriate for the
5697		terminal or window (size, terminal baud rate, and so on), in an unspecified
5698		manner. When <i>LINES</i> is set, any terminal-height information implied by
5699		<i>TERM</i> is overridden. Users and conforming applications should not set <i>LINES</i>
5700		unless they wish to override the system selection and produce output
5701		unrelated to the terminal characteristics.
5702		Users should not need to set this variable in the environment unless there is a
5703		specific reason to override the implementation's default behavior, such as to
5704		display data in an area arbitrarily smaller than the terminal or window.
5705	<i>LOGNAME</i>	The system shall initialize this variable at the time of login to be the user's
5706		login name. See <pwd.h> . For a value of <i>LOGNAME</i> to be portable across
5707		implementations of POSIX.1-2008, the value should be composed of characters
5708		from the portable filename character set.
5709	XSI <i>MSGVERB</i>	Describes which message components shall be used in writing messages by
5710		<i>fntmsg()</i> .
5711	<i>PATH</i>	This variable shall represent the sequence of path prefixes that certain
5712		functions and utilities apply in searching for an executable file known only by
5713		a filename. The prefixes shall be separated by a <colon> (' : '). When a non-
5714		zero-length prefix is applied to this filename, a <slash> shall be inserted
5715		between the prefix and the filename if the prefix did not end in <slash>. A
5716		zero-length prefix is a legacy feature that indicates the current working
5717		directory. It appears as two adjacent <colon> characters (" : "), as an initial
5718		<colon> preceding the rest of the list, or as a trailing <colon> following the
5719		rest of the list. A strictly conforming application shall use an actual pathname
5720		(such as .) to represent the current working directory in <i>PATH</i> . The list shall
5721		be searched from beginning to end, applying the filename to each prefix, until
5722		an executable file with the specified name and appropriate execution
5723		permissions is found. If the pathname being sought contains a <slash>, the
5724		search through the path prefixes shall not be performed. If the pathname
5725		begins with a <slash>, the specified path is resolved (see Section 4.12 , on page
5726		111). If <i>PATH</i> is unset or is set to null, the path search is implementation-
5727		defined.
5728		Since <colon> is a separator in this context, directory names that might be +
5729		used in <i>PATH</i> should not include a <colon> character.
5730	<i>PWD</i>	This variable shall represent an absolute pathname of the current working
5731		directory. It shall not contain any components that are dot or dot-dot. The
5732		value is set by the <i>cd</i> utility, and by the <i>sh</i> utility during initialization.
5733	<i>SHELL</i>	This variable shall represent a pathname of the user's preferred command
5734		language interpreter. If this interpreter does not conform to the Shell
5735		Command Language in XCU Chapter 2 (on page 2319), utilities may behave
5736		differently from those described in POSIX.1-2008.
5737	<i>TMPDIR</i>	This variable shall represent a pathname of a directory made available for
5738		programs that need a place to create temporary files.
5739	<i>TERM</i>	This variable shall represent the terminal type for which output is to be
5740		prepared. This information is used by utilities and application programs
5741		wishing to exploit special capabilities specific to a terminal. The format and
5742		allowable values of this environment variable are unspecified.

5743	<i>TZ</i>	This variable shall represent timezone information. The contents of the
5744		environment variable named <i>TZ</i> shall be used by the <i>ctime()</i> , <i>ctime_r()</i> ,
5745		<i>localtime()</i> , <i>localtime_r()</i> , <i>strptime()</i> , <i>mktime()</i> , functions, and by various
5746		utilities, to override the default timezone. The value of <i>TZ</i> has one of the two
5747		forms (spaces inserted for clarity):
5748		<i>:characters</i>
5749		or:
5750		<i>std offset dst offset, rule</i>
5751		If <i>TZ</i> is of the first format (that is, if the first character is a <colon>), the
5752		characters following the <colon> are handled in an implementation-defined
5753		manner.
5754		The expanded format (for all <i>TZ</i> s whose value does not have a <colon> as the
5755		first character) is as follows:
5756		<i>stdoffset[dst[offset][,start[/time],end[/time]]]</i>
5757		Where:
5758	<i>std</i> and <i>dst</i>	Indicate no less than three, nor more than {TZNAME_MAX},
5759		bytes that are the designation for the standard (<i>std</i>) or the
5760		alternative (<i>dst</i> —such as Daylight Savings Time) timezone. Only
5761		<i>std</i> is required; if <i>dst</i> is missing, then the alternative time does
5762		not apply in this locale.
5763		Each of these fields may occur in either of two formats quoted or
5764		unquoted:
5765		— In the quoted form, the first character shall be the <less-
5766		than-sign> ('<') character and the last character shall be
5767		the <greater-than-sign> ('>') character. All characters
5768		between these quoting characters shall be alphanumeric
5769		characters from the portable character set in the current
5770		locale, the <plus-sign> ('+') character, or the minus-sign
5771		('−') character. The <i>std</i> and <i>dst</i> fields in this case shall not
5772		include the quoting characters.
5773		— In the unquoted form, all characters in these fields shall be
5774		alphabetic characters from the portable character set in the
5775		current locale.
5776		The interpretation of these fields is unspecified if either field is
5777		less than three bytes (except for the case when <i>dst</i> is missing),
5778		more than {TZNAME_MAX} bytes, or if they contain characters
5779		other than those specified.
5780	<i>offset</i>	Indicates the value added to the local time to arrive at
5781		Coordinated Universal Time. The <i>offset</i> has the form:
5782		<i>hh[:mm[:ss]]</i>
5783		The minutes (<i>mm</i>) and seconds (<i>ss</i>) are optional. The hour (<i>hh</i>)
5784		shall be required and may be a single digit. The <i>offset</i> following
5785		<i>std</i> shall be required. If no <i>offset</i> follows <i>dst</i> , the alternative time
5786		is assumed to be one hour ahead of standard time. One or more
5787		digits may be used; the value is always interpreted as a decimal

5788		number. The hour shall be between zero and 24, and the minutes
5789		(and seconds)—if present—between zero and 59. The result of
5790		using values outside of this range is unspecified. If preceded by
5791		a '−', the timezone shall be east of the Prime Meridian;
5792		otherwise, it shall be west (which may be indicated by an
5793		optional preceding '+').
5794	<i>rule</i>	Indicates when to change to and back from the alternative time.
5795		The <i>rule</i> has the form:
5796		<code>date[/time], date[/time]</code>
5797		where the first <i>date</i> describes when the change from standard to
5798		alternative time occurs and the second <i>date</i> describes when the
5799		change back happens. Each <i>time</i> field describes when, in current
5800		local time, the change to the other time is made.
5801		The format of <i>date</i> is one of the following:
5802	<i>Jn</i>	The Julian day <i>n</i> ($1 \leq n \leq 365$). Leap days shall not be
5803		counted. That is, in all years—including leap years—
5804		February 28 is day 59 and March 1 is day 60. It is
5805		impossible to refer explicitly to the occasional February
5806		29.
5807	<i>n</i>	The zero-based Julian day ($0 \leq n \leq 365$). Leap days shall
5808		be counted, and it is possible to refer to February 29.
5809	<i>Mm.n.d</i>	The <i>d</i> 'th day ($0 \leq d \leq 6$) of week <i>n</i> of month <i>m</i> of the
5810		year ($1 \leq n \leq 5, 1 \leq m \leq 12$, where week 5 means “the last
5811		<i>d</i> day in month <i>m</i> ” which may occur in either the fourth
5812		or the fifth week). Week 1 is the first week in which the
5813		<i>d</i> 'th day occurs. Day zero is Sunday.
5814		The <i>time</i> has the same format as <i>offset</i> except that no leading sign
5815		('−' or '+') is allowed. The default, if <i>time</i> is not given, shall be
5816		02:00:00.

5817

5818

Regular Expressions

5819 Regular Expressions (REs) provide a mechanism to select specific strings from a set of character
5820 strings.

5821 Regular expressions are a context-independent syntax that can represent a wide variety of
5822 character sets and character set orderings, where these character sets are interpreted according
5823 to the current locale. While many regular expressions can be interpreted differently depending
5824 on the current locale, many features, such as character class expressions, provide for contextual
5825 invariance across locales.

5826 The Basic Regular Expression (BRE) notation and construction rules in [Section 9.3](#) (on page 183)
5827 shall apply to most utilities supporting regular expressions. Some utilities, instead, support the
5828 Extended Regular Expressions (ERE) described in [Section 9.4](#) (on page 188); any exceptions for
5829 both cases are noted in the descriptions of the specific utilities using regular expressions. Both
5830 BREs and EREs are supported by the Regular Expression Matching interface in the System
5831 Interfaces volume of POSIX.1-2008 under *regcomp()*, *regex()*, and related functions.

5832 9.1 Regular Expression Definitions

5833 For the purposes of this section, the following definitions shall apply:

5834 entire regular expression

5835 The concatenated set of one or more BREs or EREs that make up the pattern specified for
5836 string selection.

5837 matched

5838 A sequence of zero or more characters shall be said to be matched by a BRE or ERE when
5839 the characters in the sequence correspond to a sequence of characters defined by the
5840 pattern.

5841 Matching shall be based on the bit pattern used for encoding the character, not on the
5842 graphic representation of the character. This means that if a character set contains two or
5843 more encodings for a graphic symbol, or if the strings searched contain text encoded in
5844 more than one codeset, no attempt is made to search for any other representation of the
5845 encoded symbol. If that is required, the user can specify equivalence classes containing all
5846 variations of the desired graphic symbol.

5847 The search for a matching sequence starts at the beginning of a string and stops when the
5848 first sequence matching the expression is found, where “first” is defined to mean “begins
5849 earliest in the string”. If the pattern permits a variable number of matching characters and
5850 thus there is more than one such sequence starting at that point, the longest such sequence
5851 is matched. For example, the BRE “bb*” matches the second to fourth characters of the
5852 string “abbbc”, and the ERE “(wee|week)(knights|night)” matches all ten
5853 characters of the string “weeknights”.

5854 Consistent with the whole match being the longest of the leftmost matches, each subpattern,
5855 from left to right, shall match the longest possible string. For this purpose, a null string shall
5856 be considered to be longer than no match at all. For example, matching the BRE

"\ (. * \) . *" against "abcdef", the subexpression " (\1) " is "abcdef", and matching the BRE "\ (a * \) *" against "bc", the subexpression " (\1) " is the null string.

When a multi-character collating element in a bracket expression (see [Section 9.3.5](#), on page 184) is involved, the longest sequence shall be measured in characters consumed from the string to be matched; that is, the collating element counts not as one element, but as the number of characters it matches.

BRE (ERE) matching a single character

A BRE or ERE that shall match either a single character or a single collating element.

Only a BRE or ERE of this type that includes a bracket expression (see [Section 9.3.5](#), on page 184) can match a collating element.

BRE (ERE) matching multiple characters

A BRE or ERE that shall match a concatenation of single characters or collating elements.

Such a BRE or ERE is made up from a BRE (ERE) matching a single character and BRE (ERE) special characters.

invalid

This section uses the term “invalid” for certain constructs or conditions. Invalid REs shall cause the utility or function using the RE to generate an error condition. When invalid is not used, violations of the specified syntax or semantics for REs produce undefined results: this may entail an error, enabling an extended syntax for that RE, or using the construct in error as literal characters to be matched. For example, the BRE construct "\ {1, 2, 3\}" does not comply with the grammar. A conforming application cannot rely on it producing an error nor matching the literal characters "\ {1, 2, 3\}".

9.2 Regular Expression General Requirements

The requirements in this section shall apply to both basic and extended regular expressions.

The use of regular expressions is generally associated with text processing. REs (BREs and EREs) operate on text strings; that is, zero or more characters followed by an end-of-string delimiter (typically NUL). Some utilities employing regular expressions limit the processing to lines; that is, zero or more characters followed by a <newline>. In the regular expression processing described in POSIX.1-2008, the <newline> is regarded as an ordinary character and both a <period> and a non-matching list can match one. The Shell and Utilities volume of POSIX.1-2008 specifies within the individual descriptions of those standard utilities employing regular expressions whether they permit matching of <newline> characters; if not stated otherwise, the use of literal <newline> characters or any escape sequence equivalent produces undefined results. Those utilities (like *grep*) that do not allow <newline> characters to match are responsible for eliminating any <newline> from strings before matching against the RE. The *regcomp()* function in the System Interfaces volume of POSIX.1-2008, however, can provide support for such processing without violating the rules of this section.

The interfaces specified in POSIX.1-2008 do not permit the inclusion of a NUL character in an RE or in the string to be matched. If during the operation of a standard utility a NUL is included in the text designated to be matched, that NUL may designate the end of the text string for the purposes of matching.

When a standard utility or function that uses regular expressions specifies that pattern matching shall be performed without regard to the case (uppercase or lowercase) of either data or patterns, then when each character in the string is matched against the pattern, not only the

character, but also its case counterpart (if any), shall be matched. This definition of case-insensitive processing is intended to allow matching of multi-character collating elements as well as characters, as each character in the string is matched using both its cases. For example, in a locale where "Ch" is a multi-character collating element and where a matching list expression matches such elements, the RE "[[.Ch.]]" when matched against the string "char" is in reality matched against "ch", "Ch", "cH", and "CH".

The implementation shall support any regular expression that does not exceed 256 bytes in length.

9.3 Basic Regular Expressions

9.3.1 BREs Matching a Single Character or Collating Element

A BRE ordinary character, a special character preceded by a <backslash>, or a <period> shall match a single character. A bracket expression shall match a single character or a single collating element.

9.3.2 BRE Ordinary Characters

An ordinary character is a BRE that matches itself: any character in the supported character set, except for the BRE special characters listed in [Section 9.3.3](#).

The interpretation of an ordinary character preceded by a <backslash> ('\\') is undefined, except for:

- The characters ') ' , ' (' , ' { ' , and ' } '
- The digits 1 to 9 inclusive (see [Section 9.3.6](#), on page 186)
- A character inside a bracket expression

9.3.3 BRE Special Characters

A BRE special character has special properties in certain contexts. Outside those contexts, or when preceded by a <backslash>, such a character is a BRE that matches the special character itself. The BRE special characters and the contexts in which they have their special meaning are as follows:

. [\ The <period>, <left-square-bracket>, and <backslash> shall be special except when used in a bracket expression (see [Section 9.3.5](#), on page 184). An expression containing a ' [' that is not preceded by a <backslash> and is not part of a bracket expression produces undefined results.

* The <asterisk> shall be special except when used:

- In a bracket expression
- As the first character of an entire BRE (after an initial ' ^ ' , if any)

- 5934 — As the first character of a subexpression (after an initial '[^]', if any); see [Section](#)
 5935 [9.3.6](#) (on page 186)
- 5936 ^ The <circumflex> shall be special when used as:
 5937 — An anchor (see [Section 9.3.8](#), on page 187)
 5938 — The first character of a bracket expression (see [Section 9.3.5](#))
- 5939 \$ The <dollar-sign> shall be special when used as an anchor.

5940 9.3.4 Periods in BREs

5941 A <period> ('.'), when used outside a bracket expression, is a BRE that shall match any
 5942 character in the supported character set except NUL.

5943 9.3.5 RE Bracket Expression

5944 A bracket expression (an expression enclosed in square brackets, "[]") is an RE that shall
 5945 match a single collating element contained in the non-empty set of collating elements
 5946 represented by the bracket expression.

5947 The following rules and definitions apply to bracket expressions:

- 5948 1. A bracket expression is either a matching list expression or a non-matching list
 5949 expression. It consists of one or more expressions: collating elements, collating symbols,
 5950 equivalence classes, character classes, or range expressions. The <right-square-bracket>
 5951 ('] ') shall lose its special meaning and represent itself in a bracket expression if it occurs
 5952 first in the list (after an initial <circumflex> ('[^]'), if any). Otherwise, it shall terminate
 5953 the bracket expression, unless it appears in a collating symbol (such as "[.] .] ") or is the
 5954 ending <right-square-bracket> for a collating symbol, equivalence class, or character
 5955 class. The special characters '.', '*', '[', and '\\ ' (<period>, <asterisk>, <left-square-
 5956 bracket>, and <backslash>, respectively) shall lose their special meaning within a bracket
 5957 expression.
 5958 The character sequences "[. ", "[= ", and "[: " (<left-square-bracket> followed by a
 5959 <period>, <equals-sign>, or <colon>) shall be special inside a bracket expression and are
 5960 used to delimit collating symbols, equivalence class expressions, and character class
 5961 expressions. These symbols shall be followed by a valid expression and the matching
 5962 terminating sequence ".] ", "=] ", or ":] ", as described in the following items.
- 5963 2. A matching list expression specifies a list that shall match any single-character collating
 5964 element in any of the expressions represented in the list. The first character in the list shall
 5965 not be the <circumflex>; for example, "[abc]" is an RE that matches any of the
 5966 characters 'a', 'b', or 'c'. It is unspecified whether a matching list expression matches
 5967 a multi-character collating element that is matched by one of the expressions.
- 5968 3. A non-matching list expression begins with a <circumflex> ('[^]'), and specifies a list that
 5969 shall match any single-character collating element except for the expressions represented
 5970 in the list after the leading <circumflex>. For example, "[^abc]" is an RE that matches
 5971 any character except the characters 'a', 'b', or 'c'. It is unspecified whether a non-
 5972 matching list expression matches a multi-character collating element that is not matched
 5973 by any of the expressions. The <circumflex> shall have this special meaning only when it
 5974 occurs first in the list, immediately following the <left-square-bracket>.

4. A collating symbol is a collating element enclosed within bracket-period ("[" and ".]") delimiters. Collating elements are defined as described in [Section 7.3.2.4](#) (on page 149). Conforming applications shall represent multi-character collating elements as collating symbols when it is necessary to distinguish them from a list of the individual characters that make up the multi-character collating element. For example, if the string "ch" is a collating element defined using the line:

```
collating-element <ch-digraph> from "<c><h>"
```

in the locale definition, the expression "[.ch.]" shall be treated as an RE containing the collating symbol 'ch', while "[ch]" shall be treated as an RE matching 'c' or 'h'. Collating symbols are recognized only inside bracket expressions. If the string is not a collating element in the current locale, the expression is invalid.

5. An equivalence class expression shall represent the set of collating elements belonging to an equivalence class, as described in [Section 7.3.2.4](#) (on page 149). Only primary equivalence classes shall be recognized. The class shall be expressed by enclosing any one of the collating elements in the equivalence class within bracket-equal ("[" and "=") delimiters. For example, if 'a', 'à', and '^' belong to the same equivalence class, then "[[=a=]b]", "[[=à=]b]", and "[[=^=]b]" are each equivalent to "[aà^b]". If the collating element does not belong to an equivalence class, the equivalence class expression shall be treated as a collating symbol.
6. A character class expression shall represent the union of two sets:

- a. The set of single-character collating elements whose characters belong to the character class, as defined in the *LC_CTYPE* category in the current locale.
- b. An unspecified set of multi-character collating elements.

All character classes specified in the current locale shall be recognized. A character class expression is expressed as a character class name enclosed within bracket-colon ("[: " and ":]") delimiters.

The following character class expressions shall be supported in all locales:

```
[ :alnum:]      [ :cntrl:]      [ :lower:]      [ :space:]
[ :alpha:]      [ :digit:]      [ :print:]      [ :upper:]
[ :blank:]      [ :graph:]      [ :punct:]      [ :xdigit:]
```

In addition, character class expressions of the form:

```
[ :name:]
```

are recognized in those locales where the *name* keyword has been given a **charclass** definition in the *LC_CTYPE* category.

7. In the POSIX locale, a range expression represents the set of collating elements that fall between two elements in the collation sequence, inclusive. In other locales, a range expression has unspecified behavior: strictly conforming applications shall not rely on whether the range expression is valid, or on the set of collating elements matched. A range expression shall be expressed as the starting point and the ending point separated by a <hyphen> ('-').

In the following, all examples assume the POSIX locale.

The starting range point and the ending range point shall be a collating element or collating symbol. An equivalence class expression used as a starting or ending point of a range expression produces unspecified results. An equivalence class can be used portably within a bracket expression, but only outside the range. If the represented set of collating

elements is empty, it is unspecified whether the expression matches nothing, or is treated as invalid.

The interpretation of range expressions where the ending range point is also the starting range point of a subsequent range expression (for example, "[a-m-o]") is undefined.

The <hyphen> character shall be treated as itself if it occurs first (after an initial '^', if any) or last in the list, or as an ending range point in a range expression. As examples, the expressions "[a-c]" and "[ac-]" are equivalent and match any of the characters 'a', 'c', or '-'; "[^a-c]" and "[^ac-]" are equivalent and match any characters except 'a', 'c', or '-'; the expression "[%--]" matches any of the characters between '%' and '-' inclusive; the expression "[--@]" matches any of the characters between '-' and '@' inclusive; and the expression "[a--@]" is either invalid or equivalent to '@', because the letter 'a' follows the symbol '-' in the POSIX locale. To use a <hyphen> as the starting range point, it shall either come first in the bracket expression or be specified as a collating symbol; for example, "[[][-.-]-0]", which matches either a <right-square-bracket> or any character or collating element that collates between <hyphen> and 0, inclusive.

If a bracket expression specifies both '-' and ']', the ']' shall be placed first (after the '^', if any) and the '-' last within the bracket expression.

8. If a bracket expression contains at least three list elements, where the first and last list elements are the same single-character element of <period>, <equals-sign>, or <colon>, then it is unspecified whether the bracket expression will be treated as a collating symbol, equivalence class, or character class, respectively; treated as a matching list expression; or rejected as an error.

9.3.6 BREs Matching Multiple Characters

The following rules can be used to construct BREs matching multiple characters from BREs matching a single character:

1. The concatenation of BREs shall match the concatenation of the strings matched by each component of the BRE.
2. A subexpression can be defined within a BRE by enclosing it between the character pairs "\(" and "\)". Such a subexpression shall match whatever it would have matched without the "\(" and "\)", except that anchoring within subexpressions is optional behavior; see [Section 9.3.8](#) (on page 187). Subexpressions can be arbitrarily nested.
3. The back-reference expression '\n' shall match the same (possibly empty) string of characters as was matched by a subexpression enclosed between "\(" and "\)" preceding the '\n'. The character 'n' shall be a digit from 1 through 9, specifying the *n*th subexpression (the one that begins with the *n*th "\(" from the beginning of the pattern and ends with the corresponding paired "\)"). The expression is invalid if less than *n* subexpressions precede the '\n'. The string matched by a contained subexpression shall be within the string matched by the containing subexpression. If the containing subexpression does not match, or if there is no match for the contained subexpression within the string matched by the containing subexpression, then back-reference expressions corresponding to the contained subexpression shall not match. When a subexpression matches more than one string, a back-reference expression corresponding to the subexpression shall refer to the last matched string. For example, the expression "\^(.*)\1\$" matches lines consisting of two adjacent appearances of the same string, and the expression "\(a\)*\1" fails to match 'a', the expression "\(a\)(b\)*\2" fails to match 'abab', and the expression "\^(ab\)*\1\$" matches lines consisting of one or more appearances of 'ab' followed by 'ab'.

matches 'ababbabb', but fails to match 'ababbab'.

4. When a BRE matching a single character, a subexpression, or a back-reference is followed by the special character <asterisk> ('*'), together with that <asterisk> it shall match what zero or more consecutive occurrences of the BRE would match. For example, "[ab]*" and "[ab][ab]" are equivalent when matching the string "ab".
5. When a BRE matching a single character, a subexpression, or a back-reference is followed by an interval expression of the format "{m}", "{m,}", or "{m,n}", together with that interval expression it shall match what repeated consecutive occurrences of the BRE would match. The values of *m* and *n* are decimal integers in the range $0 \leq m \leq n \leq \{RE\_DUP\_MAX\}$, where *m* specifies the exact or minimum number of occurrences and *n* specifies the maximum number of occurrences. The expression "{m}" shall match exactly *m* occurrences of the preceding BRE, "{m,}" shall match at least *m* occurrences, and "{m,n}" shall match any number of occurrences between *m* and *n*, inclusive.

For example, in the string "abababcccccd" the BRE "c{3}" is matched by characters seven to nine, the BRE "\ (ab\)\{4,}" is not matched at all, and the BRE "c{1,3}d" is matched by characters ten to thirteen.

The behavior of multiple adjacent duplication symbols ('*' and intervals) produces undefined results.

A subexpression repeated by an <asterisk> ('*') or an interval expression shall not match a null expression unless this is the only match for the repetition or it is necessary to satisfy the exact or minimum number of occurrences for the interval expression.

9.3.7 BRE Precedence

The order of precedence shall be as shown in the following table:

BRE Precedence (from high to low)	
Collation-related bracket symbols	[==] [::] [..]
Escaped characters	\<special character>
Bracket expression	[]
Subexpressions/back-references	\ (\) \n
Single-character-BRE duplication	* \{m,n\}
Concatenation	
Anchoring	^ \$

9.3.8 BRE Expression Anchoring

A BRE can be limited to matching strings that begin or end a line; this is called "anchoring". The <circumflex> and <dollar-sign> special characters shall be considered BRE anchors in the following contexts:

1. A <circumflex> ('^') shall be an anchor when used as the first character of an entire BRE. The implementation may treat the <circumflex> as an anchor when used as the first character of a subexpression. The <circumflex> shall anchor the expression (or optionally subexpression) to the beginning of a string; only sequences starting at the first character of a string shall be matched by the BRE. For example, the BRE "^ab" matches "ab" in the string "abcdef", but fails to match in the string "cdefab". The BRE "\ (^ab\)" may match the former string. A portable BRE shall escape a leading <circumflex> in a

subexpression to match a literal circumflex.

2. A <dollar-sign> ('\$') shall be an anchor when used as the last character of an entire BRE. The implementation may treat a <dollar-sign> as an anchor when used as the last character of a subexpression. The <dollar-sign> shall anchor the expression (or optionally subexpression) to the end of the string being matched; the <dollar-sign> can be said to match the end-of-string following the last character.
3. A BRE anchored by both '^' and '\$' shall match only an entire string. For example, the BRE "^abcdef\$" matches strings consisting only of "abcdef".

9.4 Extended Regular Expressions

The extended regular expression (ERE) notation and construction rules shall apply to utilities defined as using extended regular expressions; any exceptions to the following rules are noted in the descriptions of the specific utilities using EREs.

9.4.1 EREs Matching a Single Character or Collating Element

An ERE ordinary character, a special character preceded by a <backslash> or a <period> shall match a single character. A bracket expression shall match a single character or a single collating element. An ERE matching a single character enclosed in parentheses shall match the same as the ERE without parentheses would have matched.

9.4.2 ERE Ordinary Characters

An ordinary character is an ERE that matches itself. An ordinary character is any character in the supported character set, except for the ERE special characters listed in [Section 9.4.3](#). The interpretation of an ordinary character preceded by a <backslash> ('\\ ') is undefined.

9.4.3 ERE Special Characters

An ERE special character has special properties in certain contexts. Outside those contexts, or when preceded by a <backslash>, such a character shall be an ERE that matches the special character itself. The extended regular expression special characters and the contexts in which they shall have their special meaning are as follows:

- . [\ (The <period>, <left-square-bracket>, <backslash>, and <left-parenthesis> shall be special except when used in a bracket expression (see [Section 9.3.5](#), on page 184). Outside a bracket expression, a <left-parenthesis> immediately followed by a <right-parenthesis> produces undefined results.
-) The <right-parenthesis> shall be special when matched with a preceding <left-parenthesis>, both outside a bracket expression.
- * + ? { The <asterisk>, <plus-sign>, <question-mark>, and <left-brace> shall be special except when used in a bracket expression (see [Section 9.3.5](#), on page 184). Any of the following uses produce undefined results:
 - If these characters appear first in an ERE, or immediately following a <vertical-line>, <circumflex>, or <left-parenthesis>

- 6147 — If a <left-brace> is not part of a valid interval expression (see [Section 9.4.6](#))
- 6148 | The <vertical-line> is special except when used in a bracket expression (see [Section](#)
- 6149 9.3.5, on page 184). A <vertical-line> appearing first or last in an ERE, or immediately
- 6150 following a <vertical-line> or a <left-parenthesis>, or immediately preceding a <right-
- 6151 parenthesis>, produces undefined results.
- 6152 ^ The <circumflex> shall be special when used as:
- 6153 — An anchor (see [Section 9.4.9](#), on page 191)
- 6154 — The first character of a bracket expression (see [Section 9.3.5](#), on page 184)
- 6155 \$ The <dollar-sign> shall be special when used as an anchor.

6156 9.4.4 Periods in EREs

6157 A <period> (' . '), when used outside a bracket expression, is an ERE that shall match any
6158 character in the supported character set except NUL.

6159 9.4.5 ERE Bracket Expression

6160 The rules for ERE Bracket Expressions are the same as for Basic Regular Expressions; see [Section](#)
6161 9.3.5 (on page 184).

6162 9.4.6 EREs Matching Multiple Characters

6163 The following rules shall be used to construct EREs matching multiple characters from EREs
6164 matching a single character:

- 6165 1. A concatenation of EREs shall match the concatenation of the character sequences
6166 matched by each component of the ERE. A concatenation of EREs enclosed in parentheses
6167 shall match whatever the concatenation without the parentheses matches. For example,
6168 both the ERE "cd" and the ERE "(cd)" are matched by the third and fourth character of
6169 the string "abcdefabcdef".
- 6170 2. When an ERE matching a single character or an ERE enclosed in parentheses is followed
6171 by the special character <plus-sign> (' + '), together with that <plus-sign> it shall match
6172 what one or more consecutive occurrences of the ERE would match. For example, the
6173 ERE "b+(bc)" matches the fourth to seventh characters in the string "acabbbbcde".
6174 And, "[ab]+" and "[ab][ab]*" are equivalent.
- 6175 3. When an ERE matching a single character or an ERE enclosed in parentheses is followed
6176 by the special character <asterisk> (' * '), together with that <asterisk> it shall match
6177 what zero or more consecutive occurrences of the ERE would match. For example, the
6178 ERE "b*c" matches the first character in the string "cabbbbcde", and the ERE "b*cd"
6179 matches the third to seventh characters in the string "cabbbbcdebbbbbbbcdbbc". And,
6180 "[ab]*" and "[ab][ab]" are equivalent when matching the string "ab".
- 6181 4. When an ERE matching a single character or an ERE enclosed in parentheses is followed
6182 by the special character <question-mark> (' ? '), together with that <question-mark> it
6183 shall match what zero or one consecutive occurrences of the ERE would match. For
6184 example, the ERE "b?c" matches the second character in the string "acabbbbcde".

5. When an ERE matching a single character or an ERE enclosed in parentheses is followed by an interval expression of the format " $\{m\}$ ", " $\{m, \}$ ", or " $\{m, n\}$ ", together with that interval expression it shall match what repeated consecutive occurrences of the ERE would match. The values of m and n are decimal integers in the range $0 \leq m \leq n \leq \{RE\_DUP\_MAX\}$, where m specifies the exact or minimum number of occurrences and n specifies the maximum number of occurrences. The expression " $\{m\}$ " matches exactly m occurrences of the preceding ERE, " $\{m, \}$ " matches at least m occurrences, and " $\{m, n\}$ " matches any number of occurrences between m and n , inclusive.

For example, in the string "abababcccccccd" the ERE " $c\{3\}$ " is matched by characters seven to nine and the ERE " $(ab)\{2, \}$ " is matched by characters one to six.

The behavior of multiple adjacent duplication symbols ('+', '*', '?', and intervals) produces undefined results.

An ERE matching a single character repeated by an '*', '?', or an interval expression shall not match a null expression unless this is the only match for the repetition or it is necessary to satisfy the exact or minimum number of occurrences for the interval expression.

9.4.7 ERE Alternation

Two EREs separated by the special character <vertical-line> ('|') shall match a string that is matched by either. For example, the ERE " $a((bc)|d)$ " matches the string "abc" and the string "ad". Single characters, or expressions matching single characters, separated by the <vertical-line> and enclosed in parentheses, shall be treated as an ERE matching a single character.

9.4.8 ERE Precedence

The order of precedence shall be as shown in the following table:

ERE Precedence (from high to low)	
Collation-related bracket symbols	[==] [::] [..]
Escaped characters	\<special character>
Bracket expression	[]
Grouping	()
Single-character-ERE duplication	* + ? {m,n}
Concatenation	
Anchoring	^ \$
Alternation	

For example, the ERE " $abba|cde$ " matches either the string "abba" or the string "cde" (rather than the string "abbade" or "abbcde", because concatenation has a higher order of precedence than alternation).

9.4.9 ERE Expression Anchoring

An ERE can be limited to matching strings that begin or end a line; this is called “anchoring”. The <circumflex> and <dollar-sign> special characters shall be considered ERE anchors when used anywhere outside a bracket expression. This shall have the following effects:

1. A <circumflex> ('^') outside a bracket expression shall anchor the expression or subexpression it begins to the beginning of a string; such an expression or subexpression can match only a sequence starting at the first character of a string. For example, the EREs "^ab" and "(^ab)" match "ab" in the string "abcdef", but fail to match in the string "cdefab", and the ERE "a^b" is valid, but can never match because the 'a' prevents the expression "a^b" from matching starting at the first character.
2. A <dollar-sign> ('\$') outside a bracket expression shall anchor the expression or subexpression it ends to the end of a string; such an expression or subexpression can match only a sequence ending at the last character of a string. For example, the EREs "ef\$" and "(ef\$)" match "ef" in the string "abcdef", but fail to match in the string "cdefab", and the ERE "e\$f" is valid, but can never match because the 'f' prevents the expression "e\$" from matching ending at the last character.

9.5 Regular Expression Grammar

Grammars describing the syntax of both basic and extended regular expressions are presented in this section. The grammar takes precedence over the text. See XCU [Section 1.3](#) (on page 2309).

9.5.1 BRE/ERE Grammar Lexical Conventions

The lexical conventions for regular expressions are as described in this section.

Except as noted, the longest possible token or delimiter beginning at a given point is recognized.

The following tokens are processed (in addition to those string constants shown in the grammar):

COLL_ELEM_SINGLE	Any single-character collating element, unless it is a META_CHAR .
COLL_ELEM_MULTI	Any multi-character collating element.
BACKREF	Applicable only to basic regular expressions. The character string consisting of a <backslash> character followed by a single-digit numeral, '1' to '9'.
DUP_COUNT	Represents a numeric constant. It shall be an integer in the range 0 ≤ DUP_COUNT ≤ { RE_DUP_MAX }. This token is only recognized when the context of the grammar requires it. At all other times, digits not preceded by a <backslash> character are treated as ORD_CHAR .
META_CHAR	One of the characters: ^ When found first in a bracket expression – When found anywhere but first (after an initial '^', if any) or last in a bracket expression, or as the ending range point in a range expression

6258		]	When found anywhere but first (after an initial ' ^ ', if any) in a bracket expression
6260	L_ANCHOR		Applicable only to basic regular expressions. The character ' ^ ' when it appears as the first character of a basic regular expression and when not QUOTED_CHAR . The ' ^ ' may be recognized as an anchor elsewhere; see Section 9.3.8 (on page 187).
6264	ORD_CHAR		A character, other than one of the special characters in SPEC_CHAR .
6265	QUOTED_CHAR		In a BRE, one of the character sequences:
6266		\ ^ \ . \ * \ [\ \$ \ \	
6267			In an ERE, one of the character sequences:
6268		\ ^ \ . \ [\ \$ \ (\) \	
6269		\ * \ + \ ? \ { \ \	
6270	R_ANCHOR		(Applicable only to basic regular expressions.) The character ' \$ ' when it appears as the last character of a basic regular expression and when not QUOTED_CHAR . The ' \$ ' may be recognized as an anchor elsewhere; see Section 9.3.8 (on page 187).
6274	SPEC_CHAR		For basic regular expressions, one of the following special characters:
6275		.	Anywhere outside bracket expressions
6276		\	Anywhere outside bracket expressions
6277		[	Anywhere outside bracket expressions
6278		^	When used as an anchor (see Section 9.3.8 , on page 187) or when first in a bracket expression
6279		\$	When used as an anchor
6281		*	Anywhere except first in an entire RE, anywhere in a bracket expression, directly following " \(", directly following an anchoring ' ^ '
6284			For extended regular expressions, shall be one of the following special characters found anywhere outside bracket expressions:
6285		^ . [\$ ()	
6286		* + ? { \	
6288			(The close-parenthesis shall be considered special in this context only if matched with a preceding open-parenthesis.)
6289			

9.5.2 RE and Bracket Expression Grammar

This section presents the grammar for basic regular expressions, including the bracket expression grammar that is common to both BREs and EREs.

6293	%token	ORD_CHAR	QUOTED_CHAR	DUP_COUNT
6294	%token	BACKREF	L_ANCHOR	R_ANCHOR
6295	%token	Back_open_paren	Back_close_paren	
6296	/*	' \'	' \')	*/
6297	%token	Back_open_brace	Back_close_brace	

```

6298      /*      '\{'      '\}'      */
6299      /* The following tokens are for the Bracket Expression
6300         grammar common to both REs and EREs. */
6301      %token      COLL_ELEM_SINGLE COLL_ELEM_MULTI META_CHAR
6302      %token      Open_equal Equal_close Open_dot Dot_close Open_colon Colon_close
6303      /*      '['      '='      '['      '.'      ':'      ':'      */
6304      %token      class_name

```

The BRE grammar does not permit **L_ANCHOR** or **R_ANCHOR** inside "\(" and "\)" (which implies that '^' and '\$' are ordinary characters). This reflects the semantic limits on the application, as noted in [Section 9.3.8](#) (on page 187). Implementations are permitted to extend the language to interpret '^' and '\$' as anchors in these locations, and as such, conforming applications cannot use unescaped '^' and '\$' in positions inside "\(" and "\)" that might be interpreted as anchors.

9.5.3 ERE Grammar

This section presents the grammar for extended regular expressions, excluding the bracket expression grammar.

Note: The bracket expression grammar and the associated **%token** lines are identical between BREs and EREs. It has been omitted from the ERE section to avoid unnecessary editorial duplication.

```
%token  ORD_CHAR QUOTED_CHAR DUP_COUNT
%start  extended_reg_exp
%%

/* -----
   Extended Regular Expression
   ----- */
extended_reg_exp      :      ERE_branch
                       | extended_reg_exp ' | ' ERE_branch
                       ;
ERE_branch             :      ERE_expression
                       | ERE_branch ERE_expression
                       ;
ERE_expression        : one_char_or_coll_elem_ERE
                       | '^'
                       | '$'
                       | '(' extended_reg_exp ')'
                       | ERE_expression ERE_dupl_symbol
                       ;
one_char_or_coll_elem_ERE : ORD_CHAR
                       | QUOTED_CHAR
                       | '.'
                       | bracket_expression
                       ;
ERE_dupl_symbol        : '*'
                       | '+'
                       | '?'
                       | '{' DUP_COUNT '}'
                       | '{' DUP_COUNT ',' '}'
                       | '{' DUP_COUNT ',' DUP_COUNT '}'
                       ;
```

The ERE grammar does not permit several constructs that previous sections specify as having undefined results:

- **ORD_CHAR** preceded by a <backslash> character
- One or more *ERE_dupl_symbols* appearing first in an ERE, or immediately following ' | ', '^', or ' ('
- '{' not part of a valid *ERE_dupl_symbol*
- '| ' appearing first or last in an ERE, or immediately following ' | ' or ' (', or immediately preceding ') '

Implementations are permitted to extend the language to allow these. Conforming applications cannot use such constructs.

6435
6436

6437 **10.1 Directory Structure and Files**

6438 The following directories shall exist on conforming systems and conforming applications shall
6439 make use of them only as described. Strictly conforming applications shall not assume the
6440 ability to create files in any of these directories, unless specified below.

6441 **/** The root directory.

6442 **/dev** Contains **/dev/console**, **/dev/null**, and **/dev/tty**, described below.

6443 The following directory shall exist on conforming systems and shall be used as described:

6444 **/tmp** A directory made available for applications that need a place to create temporary
6445 files. Applications shall be allowed to create files in this directory, but shall not
6446 assume that such files are preserved between invocations of the application.

6447 The following files shall exist on conforming systems and shall be both readable and writable:

6448 **/dev/null** An empty data source and infinite data sink. Data written to **/dev/null** shall be
6449 discarded. Reads from **/dev/null** shall always return end-of-file (EOF).

6450 **/dev/tty** In each process, a synonym for the controlling terminal associated with the process
6451 group of that process, if any. It is useful for programs or shell procedures that wish
6452 to be sure of writing messages to or reading data from the terminal no matter how
6453 output has been redirected. It can also be used for applications that demand the
6454 name of a file for output, when typed output is desired and it is tiresome to find
6455 out what terminal is currently in use.

6456 The following file shall exist on conforming systems and need not be readable or writable:

6457 **/dev/console** The **/dev/console** file is a generic name given to the system console (see [Section](#)
6458 [3.386](#), on page 95). It is usually linked to an implementation-defined special file. It
6459 shall provide an interface to the system console conforming to the requirements of
6460 [Chapter 11](#) (on page 199).

10.2 Output Devices and Terminal Types

The utilities in the Shell and Utilities volume of POSIX.1-2008 historically have been implemented on a wide range of terminal types, but a conforming implementation need not support all features of all utilities on every conceivable terminal. POSIX.1-2008 states which features are optional for certain classes of terminals in the individual utility description sections. The implementation shall document in the system documentation which terminal types it supports and which of these features and utilities are not supported by each terminal.

When a feature or utility is not supported on a specific terminal type, as allowed by POSIX.1-2008, and the implementation considers such a condition to be an error preventing use of the feature or utility, the implementation shall indicate such conditions through diagnostic messages or exit status values or both (as appropriate to the specific utility description) that inform the user that the terminal type lacks the appropriate capability.

POSIX.1-2008 uses a notational convention based on historical practice that identifies some of the control characters defined in [Section 7.3.1](#) (on page 139) in a manner easily remembered by users on many terminals. The correspondence between this “<control>-char” notation and the actual control characters is shown in the following table. When POSIX.1-2008 refers to a character by its <control>-name, it is referring to the actual control character shown in the Value column of the table, which is not necessarily the exact control key sequence on all terminals. Some terminals have keyboards that do not allow the direct transmission of all the non-alphanumeric characters shown. In such cases, the system documentation shall describe which data sequences transmitted by the terminal are interpreted by the system as representing the special characters.

Table 10-1 Control Character Names

Name	Value	Symbolic Name	Name	Value	Symbolic Name
<control>-A	<SOH>	<SOH>	<control>-Q	<DC1>	<DC1>
<control>-B	<STX>	<STX>	<control>-R	<DC2>	<DC2>
<control>-C	<ETX>	<ETX>	<control>-S	<DC3>	<DC3>
<control>-D	<EOT>	<EOT>	<control>-T	<DC4>	<DC4>
<control>-E	<ENQ>	<ENQ>	<control>-U	<NAK>	<NAK>
<control>-F	<ACK>	<ACK>	<control>-V	<SYN>	<SYN>
<control>-G	<BEL>	<alert>	<control>-W	<ETB>	<ETB>
<control>-H	<BS>	<backspace>	<control>-X	<CAN>	<CAN>
<control>-I	<HT>	<tab>	<control>-Y		
<control>-J	<LF>	<linefeed>	<control>-Z	<SUB>	<SUB>
<control>-K	<VT>	<vertical-tab>	<control>-[	<ESC>	<ESC>
<control>-L	<FF>	<form-feed>	<control>-\ <control>-]	<FS>	<FS>
<control>-M	<CR>	<carriage-return>	<control>-]	<GS>	<GS>
<control>-N	<SO>	<SO>	<control>-^	<RS>	<RS>
<control>-O	<SI>	<SI>	<control>-_ <control>-?	<US>	<US>
<control>-P	<DLE>	<DLE>	<control>-?	<DEL>	<DEL>

Note: The notation uses uppercase letters for arbitrary editorial reasons. There is no implication that the keystrokes represent control-shift-letter sequences.

6503

6504

General Terminal Interface

6505 This chapter describes a general terminal interface that shall be provided. It shall be supported
6506 on any asynchronous communications ports if the implementation provides them. It is
6507 implementation-defined whether it supports network connections or synchronous ports, or
6508 both.

6509 11.1 Interface Characteristics

6510 11.1.1 Opening a Terminal Device File

6511 When a terminal device file is opened, it normally causes the thread to wait until a connection is
6512 established. In practice, application programs seldom open these files; they are opened by
6513 special programs and become an application's standard input, output, and error files.

6514 Cases where applications do open a terminal device are as follows:

- 6515 1. Opening `/dev/tty`, or the pathname returned by `ctermid()`, in order to obtain a file
6516 descriptor for the controlling terminal; see [Section 11.1.3](#) (on page 200).
- 6517 2. Opening the slave side of a pseudo-terminal; see XSH [ptsname\(\)](#).
- 6518 3. Opening a modem or similar piece of equipment connected by a serial line. In this case,
6519 the terminal parameters (see [Section 11.2](#), on page 205) may be initialized to default
6520 settings by the implementation in between the last close of the device by any process and
6521 the next open of the device, or they may persist from one use to the next. The terminal
6522 parameters can be set to values that ensure the terminal behaves in a conforming manner
6523 by means of the `O_TTY_INIT` open flag when opening a terminal device that is not
6524 already open in any process, or by executing the `stty` utility with the operand **sane**.

6525 As described in `open()`, opening a terminal device file with the `O_NONBLOCK` flag clear shall
6526 cause the thread to block until the terminal device is ready and available. If `CLOCAL` mode is
6527 not set, this means blocking until a connection is established. If `CLOCAL` mode is set in the
6528 terminal, or the `O_NONBLOCK` flag is specified in the `open()`, the `open()` function shall return a
6529 file descriptor without waiting for a connection to be established.

11.1.2 Process Groups

A terminal may have a foreground process group associated with it. This foreground process group plays a special role in handling signal-generating input characters, as discussed in [Section 11.1.9](#) (on page 204).

A command interpreter process supporting job control can allocate the terminal to different jobs, or process groups, by placing related processes in a single process group and associating this process group with the terminal. A terminal's foreground process group may be set or examined by a process, assuming the permission requirements are met; see *tcgetpgrp()* and *tcsetpgrp()*. The terminal interface aids in this allocation by restricting access to the terminal by processes that are not in the current process group; see [Section 11.1.4](#) (on page 201).

When there is no longer any process whose process ID or process group ID matches the foreground process group ID, the terminal shall have no foreground process group. It is unspecified whether the terminal has a foreground process group when there is a process whose process ID matches the foreground process group ID, but whose process group ID does not. No actions defined in POSIX.1-2008, other than allocation of a controlling terminal or a successful call to *tcsetpgrp()*, shall cause a process group to become the foreground process group of the terminal.

11.1.3 The Controlling Terminal

A terminal may belong to a process as its controlling terminal. Each process of a session that has a controlling terminal has the same controlling terminal. A terminal may be the controlling terminal for at most one session. The controlling terminal for a session is allocated by the session leader in an implementation-defined manner. If a session leader has no controlling terminal, and opens a terminal device file that is not already associated with a session without using the *O_NOCTTY* option (see *open()*), it is implementation-defined whether the terminal becomes the controlling terminal of the session leader. If a process which is not a session leader opens a terminal file, or the *O_NOCTTY* option is used on *open()*, then that terminal shall not become the controlling terminal of the calling process. When a controlling terminal becomes associated with a session, its foreground process group shall be set to the process group of the session leader.

The controlling terminal is inherited by a child process during a *fork()* function call. A process relinquishes its controlling terminal when it creates a new session with the *setsid()* function; other processes remaining in the old session that had this terminal as their controlling terminal continue to have it. Upon the close of the last file descriptor in the system (whether or not it is in the current session) associated with the controlling terminal, it is unspecified whether all processes that had that terminal as their controlling terminal cease to have any controlling terminal. Whether and how a session leader can reacquire a controlling terminal after the controlling terminal has been relinquished in this fashion is unspecified. A process does not relinquish its controlling terminal simply by closing all of its file descriptors associated with the controlling terminal if other processes continue to have it open.

When a controlling process terminates, the controlling terminal is dissociated from the current session, allowing it to be acquired by a new session leader. Subsequent access to the terminal by other processes in the earlier session may be denied, with attempts to access the terminal treated as if a modem disconnect had been sensed.

11.1.4 Terminal Access Control

If a process is in the foreground process group of its controlling terminal, read operations shall be allowed, as described in [Section 11.1.5](#). Any attempts by a process in a background process group to read from its controlling terminal cause its process group to be sent a SIGTTIN signal unless one of the following special cases applies: if the reading process is ignoring the SIGTTIN signal or the reading thread is blocking the SIGTTIN signal, or if the process group of the reading process is orphaned, the *read()* shall return -1 , with *errno* set to [EIO] and no signal shall be sent. The default action of the SIGTTIN signal shall be to stop the process to which it is sent. See [<signal.h>](#).

If a process is in the foreground process group of its controlling terminal, write operations shall be allowed as described in [Section 11.1.8](#) (on page 203). Attempts by a process in a background process group to write to its controlling terminal shall cause the process group to be sent a SIGTTOU signal unless one of the following special cases applies: if TOSTOP is not set, or if TOSTOP is set and the process is ignoring the SIGTTOU signal or the writing thread is blocking the SIGTTOU signal, the process is allowed to write to the terminal and the SIGTTOU signal is not sent. If TOSTOP is set, the process group of the writing process is orphaned, the writing process is not ignoring the SIGTTOU signal, and the writing thread is not blocking the SIGTTOU signal, the *write()* shall return -1 , with *errno* set to [EIO] and no signal shall be sent.

Certain calls that set terminal parameters are treated in the same fashion as *write()*, except that TOSTOP is ignored; that is, the effect is identical to that of terminal writes when TOSTOP is set (see [Section 11.2.5](#) (on page 210), *tcdrain()*, *tcflow()*, *tcflush()*, *tcsendbreak()*, *tcsetattr()*, and *tcsetpgrp()*).

11.1.5 Input Processing and Reading Data

A terminal device associated with a terminal device file may operate in full-duplex mode, so that data may arrive even while output is occurring. Each terminal device file has an input queue associated with it, into which incoming data is stored by the system before being read by a process. The system may impose a limit, {MAX_INPUT}, on the number of bytes that may be stored in the input queue. The behavior of the system when this limit is exceeded is implementation-defined.

Two general kinds of input processing are available, determined by whether the terminal device file is in canonical mode or non-canonical mode. These modes are described in [Section 11.1.6](#) (on page 202) and [Section 11.1.7](#) (on page 202). Additionally, input characters are processed according to the *c_iflag* (see [Section 11.2.2](#), on page 206) and *c_lflag* (see [Section 11.2.5](#), on page 210) fields. Such processing can include “echoing”, which in general means transmitting input characters immediately back to the terminal when they are received from the terminal. This is useful for terminals that can operate in full-duplex mode.

The manner in which data is provided to a process reading from a terminal device file is dependent on whether the terminal file is in canonical or non-canonical mode, and on whether or not the O_NONBLOCK flag is set by *open()* or *fcntl()*.

If the O_NONBLOCK flag is clear, then the read request shall be blocked until data is available or a signal has been received. If the O_NONBLOCK flag is set, then the read request shall be completed, without blocking, in one of three ways:

1. If there is enough data available to satisfy the entire request, the *read()* shall complete successfully and shall return the number of bytes read.

2. If there is not enough data available to satisfy the entire request, the `read()` shall complete successfully, having read as much data as possible, and shall return the number of bytes it was able to read.
3. If there is no data available, the `read()` shall return `-1`, with `errno` set to `[EAGAIN]`.

When data is available depends on whether the input processing mode is canonical or non-canonical. [Section 11.1.6](#) and [Section 11.1.7](#) describe each of these input processing modes.

11.1.6 Canonical Mode Input Processing

In canonical mode input processing, terminal input is processed in units of lines. A line is delimited by a <newline> character (NL), an end-of-file character (EOF), or an end-of-line (EOL) character. See [Section 11.1.9](#) (on page 204) for more information on EOF and EOL. This means that a read request shall not return until an entire line has been typed or a signal has been received. Also, no matter how many bytes are requested in the `read()` call, at most one line shall be returned. It is not, however, necessary to read a whole line at once; any number of bytes, even one, may be requested in a `read()` without losing information.

If `{MAX_CANON}` is defined for this terminal device, it shall be a limit on the number of bytes in a line. The behavior of the system when this limit is exceeded is implementation-defined. If `{MAX_CANON}` is not defined, there shall be no such limit; see `pathconf()`.

Erase and kill processing occur when either of two special characters, the ERASE and KILL characters (see [Section 11.1.9](#), on page 204), is received. This processing shall affect data in the input queue that has not yet been delimited by an NL, EOF, or EOL character. This un-delimited data makes up the current line. The ERASE character shall delete the last character in the current line, if there is one. The KILL character shall delete all data in the current line, if there is any. The ERASE and KILL characters shall have no effect if there is no data in the current line. The ERASE and KILL characters themselves shall not be placed in the input queue.

11.1.7 Non-Canonical Mode Input Processing

In non-canonical mode input processing, input bytes are not assembled into lines, and erase and kill processing shall not occur. The values of the MIN and TIME members of the `c_cc` array are used to determine how to process the bytes received. POSIX.1-2008 does not specify whether the setting of `O_NONBLOCK` takes precedence over MIN or TIME settings. Therefore, if `O_NONBLOCK` is set, `read()` may return immediately, regardless of the setting of MIN or TIME. Also, if no data is available, `read()` may either return 0, or return `-1` with `errno` set to `[EAGAIN]`.

MIN represents the minimum number of bytes that should be received when the `read()` function returns successfully. TIME is a timer of 0.1 second granularity that is used to time out bursty and short-term data transmissions. If MIN is greater than `{MAX_INPUT}`, the response to the request is undefined. The four possible values for MIN and TIME and their interactions are described below.

Case A: MIN>0, TIME>0

In case A, TIME serves as an inter-byte timer which shall be activated after the first byte is received. Since it is an inter-byte timer, it shall be reset after a byte is received. The interaction between MIN and TIME is as follows. As soon as one byte is received, the inter-byte timer shall be started. If MIN bytes are received before the inter-byte timer expires (remember that the timer is reset upon receipt of each byte), the read shall be satisfied. If the timer expires before MIN bytes are received, the characters received to that point shall be returned to the user. Note that if TIME expires at least one byte shall be returned because the timer would not have been enabled unless a byte was received. In this case (MIN>0, TIME>0) the read shall block until the MIN and TIME mechanisms are activated by the receipt of the first byte, or a signal is received. If data is in the buffer at the time of the *read()*, the result shall be as if data has been received immediately after the *read()*.

Case B: MIN>0, TIME=0

In case B, since the value of TIME is zero, the timer plays no role and only MIN is significant. A pending read shall not be satisfied until MIN bytes are received (that is, the pending read shall block until MIN bytes are received), or a signal is received. A program that uses case B to read record-based terminal I/O may block indefinitely in the read operation.

Case C: MIN=0, TIME>0

In case C, since MIN=0, TIME no longer represents an inter-byte timer. It now serves as a read timer that shall be activated as soon as the *read()* function is processed. A read shall be satisfied as soon as a single byte is received or the read timer expires. Note that in case C if the timer expires, no bytes shall be returned. If the timer does not expire, the only way the read can be satisfied is if a byte is received. If bytes are not received, the read shall not block indefinitely waiting for a byte; if no byte is received within TIME*0.1 seconds after the read is initiated, the *read()* shall return a value of zero, having read no data. If data is in the buffer at the time of the *read()*, the timer shall be started as if data has been received immediately after the *read()*.

Case D: MIN=0, TIME=0

The minimum of either the number of bytes requested or the number of bytes currently available shall be returned without waiting for more bytes to be input. If no characters are available, *read()* shall return a value of zero, having read no data.

11.1.8 Writing Data and Output Processing

When a process writes one or more bytes to a terminal device file, they are processed according to the *c_oflag* field (see [Section 11.2.3](#), on page 207). The implementation may provide a buffering mechanism; as such, when a call to *write()* completes, all of the bytes written have been scheduled for transmission to the device, but the transmission has not necessarily completed. See *write()* for the effects of O_NONBLOCK on *write()*.

11.1.9 Special Characters

Certain characters have special functions on input or output or both. These functions are summarized as follows:

INTR Special character on input, which is recognized if the ISIG flag is set. Generates a SIGINT signal which is sent to all processes in the foreground process group for which the terminal is the controlling terminal. If ISIG is set, the INTR character shall be discarded when processed.

QUIT Special character on input, which is recognized if the ISIG flag is set. Generates a SIGQUIT signal which is sent to all processes in the foreground process group for which the terminal is the controlling terminal. If ISIG is set, the QUIT character shall be discarded when processed.

ERASE Special character on input, which is recognized if the ICANON flag is set. Erases the last character in the current line; see [Section 11.1.6](#) (on page 202). It shall not erase beyond the start of a line, as delimited by an NL, EOF, or EOL character. If ICANON is set, the ERASE character shall be discarded when processed.

KILL Special character on input, which is recognized if the ICANON flag is set. Deletes the entire line, as delimited by an NL, EOF, or EOL character. If ICANON is set, the KILL character shall be discarded when processed.

EOF Special character on input, which is recognized if the ICANON flag is set. When received, all the bytes waiting to be read are immediately passed to the process without waiting for a <newline>, and the EOF is discarded. Thus, if there are no bytes waiting (that is, the EOF occurred at the beginning of a line), a byte count of zero shall be returned from the *read()*, representing an end-of-file indication. If ICANON is set, the EOF character shall be discarded when processed.

NL Special character on input, which is recognized if the ICANON flag is set. It is the line delimiter <newline>. It cannot be changed.

EOL Special character on input, which is recognized if the ICANON flag is set. It is an additional line delimiter, like NL.

SUSP If the ISIG flag is set, receipt of the SUSP character shall cause a SIGTSTP signal to be sent to all processes in the foreground process group for which the terminal is the controlling terminal, and the SUSP character shall be discarded when processed.

STOP Special character on both input and output, which is recognized if the IXON (output control) or IXOFF (input control) flag is set. Can be used to suspend output temporarily. It is useful with CRT terminals to prevent output from disappearing before it can be read. If IXON is set, the STOP character shall be discarded when processed.

START Special character on both input and output, which is recognized if the IXON (output control) or IXOFF (input control) flag is set. Can be used to resume output that has been suspended by a STOP character. If IXON is set, the START character shall be discarded when processed.

CR Special character on input, which is recognized if the ICANON flag is set; it is the carriage-return character. When ICANON and ICRNL are set and IGNCR is not set, this character shall be translated into an NL, and shall have the same effect as an NL character.

The NL and CR characters cannot be changed. It is implementation-defined whether the START and STOP characters can be changed. The values for INTR, QUIT, ERASE, KILL, EOF, EOL, and SUSP shall be changeable to suit individual tastes. Special character functions associated with

changeable special control characters can be disabled individually.

If two or more special characters have the same value, the function performed when that character is received is undefined.

A special character is recognized not only by its value, but also by its context; for example, an implementation may support multi-byte sequences that have a meaning different from the meaning of the bytes when considered individually. Implementations may also support additional single-byte functions. These implementation-defined multi-byte or single-byte functions shall be recognized only if the IEXTEN flag is set; otherwise, data is received without interpretation, except as required to recognize the special characters defined in this section.

XSI If IEXTEN is set, the ERASE, KILL, and EOF characters can be escaped by a preceding `<backslash>` character, in which case no special function shall occur.

11.1.10 Modem Disconnect

If a modem disconnect is detected by the terminal interface for a controlling terminal, and if CLOCAL is not set in the `c_cflag` field for the terminal (see [Section 11.2.4](#), on page 209), the SIGHUP signal shall be sent to the controlling process for which the terminal is the controlling terminal. Unless other arrangements have been made, this shall cause the controlling process to terminate (see `exit()`). Any subsequent read from the terminal device shall return the value of zero, indicating end-of-file; see `read()`. Thus, processes that read a terminal file and test for end-of-file can terminate appropriately after a disconnect. If the EIO condition as specified in `read()` also exists, it is unspecified whether on EOF condition or [EIO] is returned. Any subsequent `write()` to the terminal device shall return `-1`, with `errno` set to [EIO], until the device is closed.

11.1.11 Closing a Terminal Device File

The last process to close a terminal device file shall cause any output to be sent to the device and shall cause any input to be discarded. If HUPCL is set in the control modes and the communications port supports a disconnect function, the terminal device shall perform a disconnect.

11.2 Parameters that Can be Set

11.2.1 The `termios` Structure

Routines that need to control certain terminal I/O characteristics shall do so by using the `termios` structure as defined in the `<termios.h>` header.

Since the `termios` structure may include additional members, and the standard members may include both standard and non-standard modes, the structure should never be initialized directly by the application as this may cause the terminal to behave in a non-conforming manner. When opening a terminal device (other than a pseudo-terminal) that is not already open in any process, it should be opened with the `O_TTY_INIT` flag before initializing the structure using `tcgetattr()` to ensure that any non-standard elements of the `termios` structure are set to values that result in conforming behavior of the terminal interface.

The members of the **termios** structure include (but are not limited to):

Member Type	Array Size	Member Name	Description
tcflag_t	NCCS	<i>c_iflag</i>	Input modes.
tcflag_t		<i>c_oflag</i>	Output modes.
tcflag_t		<i>c_cflag</i>	Control modes.
tcflag_t		<i>c_lflag</i>	Local modes.
cc_t		<i>c_cc[]</i>	Control characters.

The **tcflag_t** and **cc_t** types are defined in the **<termios.h>** header. They shall be unsigned integer types.

11.2.2 Input Modes

Values of the *c_iflag* field describe the basic terminal input control, and are composed of the bitwise-inclusive OR of the masks shown, which shall be bitwise-distinct. The mask name symbols in this table are defined in **<termios.h>**:

Mask Name	Description
BRKINT	Signal interrupt on break.
ICRNL	Map CR to NL on input.
IGNBRK	Ignore break condition.
IGNCR	Ignore CR.
IGNPAR	Ignore characters with parity errors.
INLCR	Map NL to CR on input.
INPCK	Enable input parity check.
ISTRIP	Strip character.
IXANY	Enable any character to restart output.
IXOFF	Enable start/stop input control.
IXON	Enable start/stop output control.
PARMRK	Mark parity errors.

In the context of asynchronous serial data transmission, a break condition shall be defined as a sequence of zero-valued bits that continues for more than the time to send one byte. The entire sequence of zero-valued bits is interpreted as a single break condition, even if it continues for a time equivalent to more than one byte. In contexts other than asynchronous serial data transmission, the definition of a break condition is implementation-defined.

If IGNBRK is set, a break condition detected on input shall be ignored; that is, not put on the input queue and therefore not read by any process. If IGNBRK is not set and BRKINT is set, the break condition shall flush the input and output queues, and if the terminal is the controlling terminal of a foreground process group, the break condition shall generate a single SIGINT signal to that foreground process group. If neither IGNBRK nor BRKINT is set, a break condition shall be read as a single 0x00, or if PARMRK is set, as 0xff 0x00 0x00.

If IGNPAR is set, a byte with a framing or parity error (other than break) shall be ignored.

If PARMRK is set, and IGNPAR is not set, a byte with a framing or parity error (other than break) shall be given to the application as the three-byte sequence 0xff 0x00 X, where 0xff 0x00 is a two-byte flag preceding each sequence and X is the data of the byte received in error. To avoid ambiguity in this case, if ISTRIP is not set, a valid byte of 0xff is given to the application as 0xff 0xff. If neither PARMRK nor IGNPAR is set, a framing or parity error (other than break) shall be given to the application as a single byte 0x00.

6817 If INPCK is set, input parity checking shall be enabled. If INPCK is not set, input parity checking
6818 shall be disabled, allowing output parity generation without input parity errors. Note that
6819 whether input parity checking is enabled or disabled is independent of whether parity detection
6820 is enabled or disabled (see [Section 11.2.4](#), on page 209). If parity detection is enabled but input
6821 parity checking is disabled, the hardware to which the terminal is connected shall recognize the
6822 parity bit, but the terminal special file shall not check whether or not this bit is correctly set.

6823 If ISTRIP is set, valid input bytes shall first be stripped to seven bits; otherwise, all eight bits
6824 shall be processed.

6825 If INLCR is set, a received NL character shall be translated into a CR character. If IGNCR is set, a
6826 received CR character shall be ignored (not read). If IGNCR is not set and ICRNL is set, a
6827 received CR character shall be translated into an NL character.

6828 If IXANY is set, any input character shall restart output that has been suspended.

6829 If IXON is set, start/stop output control shall be enabled. A received STOP character shall
6830 suspend output and a received START character shall restart output. When IXON is set, START
6831 and STOP characters are not read, but merely perform flow control functions. When IXON is not
6832 set, the START and STOP characters shall be read.

6833 If IXOFF is set, start/stop input control shall be enabled. The system shall transmit STOP
6834 characters, which are intended to cause the terminal device to stop transmitting data, as needed
6835 to prevent the input queue from overflowing and causing implementation-defined behavior,
6836 and shall transmit START characters, which are intended to cause the terminal device to resume
6837 transmitting data, as soon as the device can continue transmitting data without risk of
6838 overflowing the input queue. The precise conditions under which STOP and START characters
6839 are transmitted are implementation-defined.

6840 The initial input control value after *open()* is implementation-defined.

6841 11.2.3 Output Modes

6842 The *c_oflag* field specifies the terminal interface's treatment of output, and is composed of the
6843 bitwise-inclusive OR of the masks shown, which shall be bitwise-distinct. The mask name
6844 symbols in the following table are defined in [<termios.h>](#):

6845	Mask Name	Description
6846	OPOST	Perform output processing.
6847	XSI	ONLCR
6848	OCRNL	Map NL to CR-NL on output.
6849	ONOCR	Map CR to NL on output.
6850	ONLRET	No CR output at column 0.
6851	ONLRET	NL performs CR function.
6852	OFILL	Use fill characters for delay.
6853	OFDEL	Fill is DEL, else NUL.
6854	NLDLY	Select newline delays:
6855	NL0	Newline character type 0.
6856	NL1	Newline character type 1.
6857	CRDLY	Select carriage-return delays:
6858	CR0	Carriage-return delay type 0.
6859	CR1	Carriage-return delay type 1.
6860	CR2	Carriage-return delay type 2.
6861	CR3	Carriage-return delay type 3.
6862	TABDLY	Select horizontal-tab delays:
6863	TAB0	Horizontal-tab delay type 0.
6864	TAB1	Horizontal-tab delay type 1.
6865	TAB2	Horizontal-tab delay type 2.
6866	TAB3	Expand tabs to spaces.
6867	BSDLY	Select backspace delays:
6868	BS0	Backspace-delay type 0.
6869	BS1	Backspace-delay type 1.
6870	VTDLY	Select vertical-tab delays:
6871	VT0	Vertical-tab delay type 0.
6872	VT1	Vertical-tab delay type 1.
6873	FFDLY	Select form-feed delays:
6874	FF0	Form-feed delay type 0.
6875	FF1	Form-feed delay type 1.

If OPOST is set, output data shall be post-processed as described below, so that lines of text are modified to appear appropriately on the terminal device; otherwise, characters shall be transmitted without change.

If ONLCR is set, the NL character shall be transmitted as the CR-NL character pair. If OCRNL is set, the CR character shall be transmitted as the NL character. If ONOCR is set, no CR character shall be transmitted when at column 0 (first position). If ONLRET is set, the NL character is assumed to do the carriage-return function; the column pointer shall be set to 0 and the delays specified for CR shall be used. Otherwise, the NL character is assumed to do just the line-feed function; the column pointer remains unchanged. The column pointer shall also be set to 0 if the CR character is actually transmitted.

The delay bits specify how long transmission stops to allow for mechanical or other movement when certain characters are sent to the terminal. In all cases a value of 0 shall indicate no delay. If OFILL is set, fill characters shall be transmitted for delay instead of a timed delay. This is useful for high baud rate terminals which need only a minimal delay. If OFDEL is set, the fill character shall be DEL; otherwise, NUL.

If a <form-feed> or <vertical-tab> delay is specified, it shall last for about 2 seconds.

Newline delay shall last about 0.10 seconds. If ONLRET is set, the carriage-return delays shall be used instead of the newline delays. If OFILL is set, two fill characters shall be transmitted.

Carriage-return delay type 1 shall be dependent on the current column position, type 2 shall be

about 0.10 seconds, and type 3 shall be about 0.15 seconds. If OFILL is set, delay type 1 shall transmit two fill characters, and type 2 four fill characters.

Horizontal-tab delay type 1 shall be dependent on the current column position. Type 2 shall be about 0.10 seconds. Type 3 specifies that <tab> characters shall be expanded into <space> characters. If OFILL is set, two fill characters shall be transmitted for any delay.

Backspace delay shall last about 0.05 seconds. If OFILL is set, one fill character shall be transmitted.

The actual delays depend on line speed and system load.

The initial output control value after *open()* is implementation-defined.

11.2.4 Control Modes

The *c_cflag* field describes the hardware control of the terminal, and is composed of the bitwise-inclusive OR of the masks shown, which shall be bitwise-distinct. The mask name symbols in this table are defined in [<termios.h>](#); not all values specified are required to be supported by the underlying hardware (if any). If the terminal is a pseudo-terminal, it is unspecified whether non-default values are unsupported, or are supported and emulated in software, or are handled by *tcsetattr()*, *tcgetattr()*, and the *stty* utility as if they are supported but have no effect on the behavior of the terminal interface.

Mask Name	Description
CLOCAL	Ignore modem status lines.
CREAD	Enable receiver.
CSIZE	Number of bits transmitted or received per byte:
CS5	5 bits
CS6	6 bits
CS7	7 bits
CS8	8 bits.
CSTOPB	Send two stop bits, else one.
HUPCL	Hang up on last close.
PARENB	Parity enable.
PARODD	Odd parity, else even.

In addition, the input and output baud rates are stored in the **termios** structure. The symbols in the following table are defined in [<termios.h>](#). Not all values specified are required to be supported by the underlying hardware (if any). For pseudo-terminals, the input and output baud rates set in the **termios** structure need not affect the speed of data transmission through the terminal interface.

Note: The term “baud” is used historically here, but is not technically correct. This is properly “bits per second”, which may not be the same as baud. However, the term is used because of the historical usage and understanding.

Name	Description	Name	Description
B0	Hang up	B600	600 baud
B50	50 baud	B1200	1200 baud
B75	75 baud	B1800	1800 baud
B110	110 baud	B2400	2400 baud
B134	134.5 baud	B4800	4800 baud
B150	150 baud	B9600	9600 baud
B200	200 baud	B19200	19200 baud
B300	300 baud	B38400	38400 baud

The following functions are provided for getting and setting the values of the input and output baud rates in the **termios** structure: `cfgetispeed()`, `cfgetospeed()`, `cfsetispeed()`, and `cfsetospeed()`. The effects on the terminal device shall not become effective and not all errors need be detected until the `tcsetattr()` function is successfully called.

The CSIZE bits shall specify the number of transmitted or received bits per byte. If ISTRIP is not set, the value of all the other bits is unspecified. If ISTRIP is set, the value of all but the 7 low-order bits shall be zero, but the value of any other bits beyond CSIZE is unspecified when read. CSIZE shall not include the parity bit, if any. If CSTOPB is set, two stop bits shall be used; otherwise, one stop bit. For example, at 110 baud, two stop bits are normally used.

If CREAD is set, the receiver shall be enabled; otherwise, no characters shall be received.

If PARENB is set, parity generation and detection shall be enabled and a parity bit is added to each byte. If parity is enabled, PARODD shall specify odd parity if set; otherwise, even parity shall be used.

If HUPCL is set, the modem control lines for the port shall be lowered when the last process with the port open closes the port or the process terminates. The modem connection shall be broken.

If CLOCAL is set, a connection shall not depend on the state of the modem status lines. If CLOCAL is clear, the modem status lines shall be monitored.

Under normal circumstances, a call to the `open()` function shall wait for the modem connection to complete. However, if the `O_NONBLOCK` flag is set (see `open()`) or if CLOCAL has been set, the `open()` function shall return immediately without waiting for the connection.

If the object for which the control modes are set is not an asynchronous serial connection, some of the modes may be ignored; for example, if an attempt is made to set the baud rate on a network connection to a terminal on another host, the baud rate need not be set on the connection between that terminal and the machine to which it is directly connected.

The initial hardware control value after `open()` is implementation-defined.

11.2.5 Local Modes

The `c_lflag` field of the argument structure is used to control various functions. It is composed of the bitwise-inclusive OR of the masks shown, which shall be bitwise-distinct. The mask name symbols in this table are defined in [<termios.h>](#).

6970
6971
6972
6973
6974
6975
6976
6977
6978
6979

Mask Name	Description
ECHO	Enable echo.
ECHOE	Echo ERASE as an error correcting backspace.
ECHOK	Echo KILL.
ECHONL	Echo <newline>.
ICANON	Canonical input (erase and kill processing).
IEXTEN	Enable extended (implementation-defined) functions.
ISIG	Enable signals.
NOFLSH	Disable flush after interrupt, quit, or suspend.
TOSTOP	Send SIGTTOU for background output.

6980 If ECHO is set, input characters shall be echoed back to the terminal. If ECHO is clear, input
6981 characters shall not be echoed.

6982 If ECHOE and ICANON are set, the ERASE character shall cause the terminal to erase, if
6983 possible, the last character in the current line from the display. If there is no character to erase, an
6984 implementation may echo an indication that this was the case, or do nothing.

6985 If ECHOK and ICANON are set, the KILL character shall either cause the terminal to erase the
6986 line from the display or shall echo the <newline> character after the KILL character.

6987 If ECHONL and ICANON are set, the <newline> character shall be echoed even if ECHO is not
6988 set.

6989 If ICANON is set, canonical processing shall be enabled. This enables the erase and kill edit
6990 functions, and the assembly of input characters into lines delimited by NL, EOF, and EOL, as
6991 described in [Section 11.1.6](#) (on page 202).

6992 If ICANON is not set, read requests shall be satisfied directly from the input queue. A read shall
6993 not be satisfied until at least MIN bytes have been received or the timeout value TIME expired
6994 between bytes. The time value represents tenths of a second. See [Section 11.1.7](#) (on page 202) for
6995 more details.

6996 If IEXTEN is set, implementation-defined functions shall be recognized from the input data. It is
6997 implementation-defined how IEXTEN being set interacts with ICANON, ISIG, IXON, or IXOFF.
6998 If IEXTEN is not set, implementation-defined functions shall not be recognized and the
6999 corresponding input characters are processed as described for ICANON, ISIG, IXON, and
7000 IXOFF.

7001 If ISIG is set, each input character shall be checked against the special control characters INTR,
7002 QUIT, and SUSP. If an input character matches one of these control characters, the function
7003 associated with that character shall be performed. If ISIG is not set, no checking shall be done.
7004 Thus these special input functions are possible only if ISIG is set.

7005 If NOFLSH is set, the normal flush of the input and output queues associated with the INTR,
7006 QUIT, and SUSP characters shall not be done.

7007 If TOSTOP is set, the signal SIGTTOU shall be sent to the process group of a process that tries to |
7008 write to its controlling terminal if it is not in the foreground process group for that terminal. This |
7009 signal, by default, stops the members of the process group. Otherwise, the output generated by |
7010 that process shall be output to the current output stream. If the writing process is ignoring the |
7011 SIGTTOU signal or the writing thread is blocking the SIGTTOU signal, the process is allowed to |
7012 produce output, and the SIGTTOU signal shall not be sent.

7013 The initial local control value after *open()* is implementation-defined.

11.2.6 Special Control Characters

The special control character values shall be defined by the array `c_cc`. The subscript name and description for each element in both canonical and non-canonical modes are as follows:

Subscript Usage		Description
Canonical Mode	Non-Canonical Mode	
VEOF	VINTR	EOF character
VEOL		EOL character
VERASE		ERASE character
VINTR		INTR character
VKILL		KILL character
	VMIN	MIN value
VQUIT	VQUIT	QUIT character
VSUSP	VSUSP	SUSP character
	VTIME	TIME value
VSTART	VSTART	START character
VSTOP	VSTOP	STOP character

The subscript values are unique, except that the VMIN and VTIME subscripts may have the same values as the VEOF and VEOL subscripts, respectively.

Implementations that do not support changing the START and STOP characters may ignore the character values in the `c_cc` array indexed by the VSTART and VSTOP subscripts when `tcsetattr()` is called, but shall return the value in use when `tcgetattr()` is called.

The initial values of all control characters are implementation-defined.

If the value of one of the changeable special control characters (see [Section 11.1.9](#), on page 204) is `_POSIX_VDISABLE`, that function shall be disabled; that is, no input data is recognized as the disabled special character. If ICANON is not set, the value of `_POSIX_VDISABLE` has no special meaning for the VMIN and VTIME entries of the `c_cc` array.

Utility Conventions

12.1 Utility Argument Syntax

This section describes the argument syntax of the standard utilities and introduces terminology used throughout POSIX.1-2008 for describing the arguments processed by the utilities.

Within POSIX.1-2008, a special notation is used for describing the syntax of a utility's arguments. Unless otherwise noted, all utility descriptions use this notation, which is illustrated by this example (see XCU [Section 2.9.1](#), on page 2338):

```
utility_name[-a] [-b] [-c option_argument]
          [-d|-e] [-f[option_argument]] [operand...]
```

The notation used for the SYNOPSIS sections imposes requirements on the implementors of the standard utilities and provides a simple reference for the application developer or system user.

1. The utility in the example is named *utility_name*. It is followed by options, option-arguments, and operands. The arguments that consist of <hyphen> characters and single letters or digits, such as 'a', are known as "options" (or, historically, "flags"). Certain options are followed by an "option-argument", as shown with [-c *option_argument*]. The arguments following the last options and option-arguments are named "operands".

2. Option-arguments are shown separated from their options by <blank> characters, except when the option-argument is enclosed in the '[' and ']' notation to indicate that it is optional. This reflects the situation in which an optional option-argument (if present) is included within the same argument string as the option; for a mandatory option-argument, it is the next argument. The Utility Syntax Guidelines in [Section 12.2](#) (on page 215) require that the option be a separate argument from its option-argument and that option-arguments not be optional, but there are some exceptions in POSIX.1-2008 to ensure continued operation of historical applications:

- a. If the SYNOPSIS of a standard utility shows an option with a mandatory option-argument (as with [-c *option_argument*] in the example), a conforming application shall use separate arguments for that option and its option-argument. However, a conforming implementation shall also permit applications to specify the option and option-argument in the same argument string without intervening <blank> characters.

- b. If the SYNOPSIS shows an optional option-argument (as with [-f[*option_argument*]] in the example), a conforming application shall place any option-argument for that option directly adjacent to the option in the same argument string, without intervening <blank> characters. If the utility receives an argument containing only the option, it shall behave as specified in its description for an omitted option-argument; it shall not treat the next argument (if any) as the option-argument for that option.

3. Options are usually listed in alphabetical order unless this would make the utility description more confusing. There are no implied relationships between the options based upon the order in which they appear, unless otherwise stated in the OPTIONS section, or unless the exception in Guideline 11 of [Section 12.2](#) (on page 215) applies. If an option that does not have option-arguments is repeated, the results are undefined, unless otherwise stated.

4. Frequently, names of parameters that require substitution by actual values are shown with embedded <underscore> characters. Alternatively, parameters are shown as follows:

```
<parameter name>
```

The angle brackets are used for the symbolic grouping of a phrase representing a single parameter and conforming applications shall not include them in data submitted to the utility.

5. When a utility has only a few permissible options, they are sometimes shown individually, as in the example. Utilities with many flags generally show all of the individual flags (that do not take option-arguments) grouped, as in:

```
utility_name [-abcDxyz] [-p arg] [operand]
```

Utilities with very complex arguments may be shown as follows:

```
utility_name [options] [operands]
```

6. Unless otherwise specified, whenever an operand or option-argument is, or contains, a numeric value:

- The number is interpreted as a decimal integer.
- Numerals in the range 0 to 2 147 483 647 are syntactically recognized as numeric values.
- When the utility description states that it accepts negative numbers as operands or option-arguments, numerals in the range -2 147 483 647 to 2 147 483 647 are syntactically recognized as numeric values.
- Ranges greater than those listed here are allowed.

This does not mean that all numbers within the allowable range are necessarily semantically correct. A standard utility that accepts an option-argument or operand that is to be interpreted as a number, and for which a range of values smaller than that shown above is permitted by the POSIX.1-2008, describes that smaller range along with the description of the option-argument or operand. If an error is generated, the utility's diagnostic message shall indicate that the value is out of the supported range, not that it is syntactically incorrect.

7. Arguments or option-arguments enclosed in the ' [' and '] ' notation are optional and can be omitted. Conforming applications shall not include the ' [' and '] ' symbols in data submitted to the utility.

8. Arguments separated by the ' | ' (<vertical-line>) bar notation are mutually-exclusive. Conforming applications shall not include the ' | ' symbol in data submitted to the utility. Alternatively, mutually-exclusive options and operands may be listed with multiple synopsis lines.

For example:

```
utility_name -d[-a] [-c option_argument] [operand...]
utility_name [-a] [-b] [operand...]
```

When multiple synopsis lines are given for a utility, it is an indication that the utility has mutually-exclusive arguments. These mutually-exclusive arguments alter the functionality of the utility so that only certain other arguments are valid in combination with one of the mutually-exclusive arguments. Only one of the mutually-exclusive arguments is allowed for invocation of the utility. Unless otherwise stated in an accompanying OPTIONS section, the relationships between arguments depicted in the SYNOPSIS sections are mandatory requirements placed on conforming applications. The use of conflicting mutually-exclusive arguments produces undefined results, unless a utility description specifies otherwise. When an option is shown without the '[' and ']' brackets, it means that option is required for that version of the SYNOPSIS. However, it is not required to be the first argument, as shown in the example above, unless otherwise stated.

9. Ellipses ("...") are used to denote that one or more occurrences of an operand are allowed. When an option or an operand followed by ellipses is enclosed in brackets, zero or more options or operands can be specified. The form:

```
utility_name [-g option_argument]...[operand...]
```

indicates that multiple occurrences of the option and its option-argument preceding the ellipses are valid, with semantics as indicated in the OPTIONS section of the utility. (See also Guideline 11 in [Section 12.2](#).)

The form:

```
utility_name -f option_argument [-f option_argument]... [operand...]
```

indicates that the -f option is required to appear at least once and may appear multiple times.

10. When the synopsis line is too long to be printed on a single line in the Shell and Utilities volume of POSIX.1-2008, the indented lines following the initial line are continuation lines. An actual use of the command would appear on a single logical line.

12.2 Utility Syntax Guidelines

The following guidelines are established for the naming of utilities and for the specification of options, option-arguments, and operands. The *getopt()* function in the System Interfaces volume of POSIX.1-2008 assists utilities in handling options and operands that conform to these guidelines.

Operands and option-arguments can contain characters not specified in the portable character set.

The guidelines are intended to provide guidance to the authors of future utilities, such as those written specific to a local system or that are components of a larger application. Some of the standard utilities do not conform to all of these guidelines; in those cases, the OPTIONS sections describe the deviations.

7160	Guideline 1:	Utility names should be between two and nine characters, inclusive.	
7161	Guideline 2:	Utility names should include lowercase letters (the lower character classification) and digits only from the portable character set.	
7162			
7163	Guideline 3:	Each option name should be a single alphanumeric character (the alnum character classification) from the portable character set. The -W (capital-W) option shall be reserved for vendor options.	
7164			
7165			
7166		Multi-digit options should not be allowed.	
7167	Guideline 4:	All options should be preceded by the '-' delimiter character.	
7168	Guideline 5:	One or more options without option-arguments, followed by at most one option that takes an option-argument, should be accepted when grouped behind one '-' delimiter.	
7169			
7170			
7171	Guideline 6:	Each option and option-argument should be a separate argument, except as noted in Section 12.1 (on page 213), item (2).	
7172			
7173	Guideline 7:	Option-arguments should not be optional.	
7174	Guideline 8:	When multiple option-arguments are specified to follow a single option, they should be presented as a single argument, using <comma> characters within that argument or <blank> characters within that argument to separate them.	
7175			
7176			
7177	Guideline 9:	All options should precede operands on the command line.	
7178	Guideline 10:	The first -- argument that is not an option-argument should be accepted as a delimiter indicating the end of options. Any following arguments should be treated as operands, even if they begin with the '-' character.	
7179			
7180			
7181	Guideline 11:	The order of different options relative to one another should not matter, unless the options are documented as mutually-exclusive and such an option is documented to override any incompatible options preceding it. If an option that has option-arguments is repeated, the option and option-argument combinations should be interpreted in the order specified on the command line.	
7182			
7183			
7184			
7185			
7186			
7187	Guideline 12:	The order of operands may matter and position-related interpretations should be determined on a utility-specific basis.	
7188			
7189	Guideline 13:	For utilities that use operands to represent files to be opened for either reading or writing, the '-' operand should be used to mean only standard input (or standard output when it is clear from context that an output file is being specified) or a file named - .	
7190			
7191			
7192			
7193	Guideline 14:	If an argument can be identified according to Guidelines 3 through 10 as an option, or as a group of options without option-arguments behind one '-' delimiter, then it should be treated as such.	
7194			
7195			
7196	The utilities in the Shell and Utilities volume of POSIX.1-2008 that claim conformance to these guidelines shall conform completely to these guidelines as if these guidelines contained the term "shall" instead of "should". On some implementations, the utilities accept usage in violation of these guidelines for backwards-compatibility as well as accepting the required form.		
7197			
7198			
7199			
7200	Where a utility described in the Shell and Utilities volume of POSIX.1-2008 as conforming to these guidelines is required to accept, or not to accept, the operand '-' to mean standard input or output, this usage is explained in the OPERANDS section. Otherwise, if such a utility uses operands to represent files, it is implementation-defined whether the operand '-' stands for standard input (or standard output), or for a file named - .		
7201			
7202			
7203			
7204			

7205 It is recommended that all future utilities and applications use these guidelines to enhance user
7206 portability. The fact that some historical utilities could not be changed (to avoid breaking
7207 existing applications) should not deter this future goal.

7208

7209

Headers

7210 This chapter describes the contents of headers.

7211 Headers contain function prototypes, the definition of symbolic constants, common structures,
 7212 preprocessor macros, and defined types. Each function in the System Interfaces volume of
 7213 POSIX.1-2008 specifies the headers that an application shall include in order to use that function.
 7214 In most cases, only one header is required. These headers are present on an application
 7215 development system; they need not be present on the target execution system.

7216 **Format of Entries**

7217 The entries in this chapter are based on a common format as follows. The only sections relating
 7218 to conformance are the SYNOPSIS and DESCRIPTION.

7219 **NAME**

7220 This section gives the name or names of the entry and briefly states its purpose.

7221 **SYNOPSIS**

7222 This section summarizes the use of the entry being described.

7223 **DESCRIPTION**

7224 This section describes the functionality of the header.

7225 **APPLICATION USAGE**

7226 This section is informative. This section gives warnings and advice to application
 7227 developers about the entry. In the event of conflict between warnings and advice and a
 7228 normative part of this volume of POSIX.1-2008, the normative material is to be taken as
 7229 correct.

7230 **RATIONALE**

7231 This section is informative. This section contains historical information concerning the
 7232 contents of this volume of POSIX.1-2008 and why features were included or discarded
 7233 by the standard developers.

7234 **FUTURE DIRECTIONS**

7235 This section is informative. This section provides comments which should be used as a
 7236 guide to current thinking; there is not necessarily a commitment to adopt these future
 7237 directions.

7238 **SEE ALSO**

7239 This section is informative. This section gives references to related information.

7240 **CHANGE HISTORY**

7241 This section is informative. This section shows the derivation of the entry and any
 7242 significant changes that have been made to it.

7243 NAME

7244 aio.h — asynchronous input and output

7245 SYNOPSIS

7246 #include <aio.h>

7247 DESCRIPTION

7248 The <aio.h> header shall define the **aio_cb** structure, which shall include at least the following
7249 members:

7250	int	aio_fildes	File descriptor.
7251	off_t	aio_offset	File offset.
7252	volatile void *	aio_buf	Location of buffer.
7253	size_t	aio_nbytes	Length of transfer.
7254	int	aio_reqprio	Request priority offset.
7255	struct sigevent	aio_sigevent	Signal number and value.
7256	int	aio_lio_opcode	Operation to be performed.

7257 The <aio.h> header shall define the **off_t**, **pthread_attr_t**, **size_t**, and **ssize_t** types as described
7258 in <sys/types.h>.7259 The <aio.h> header shall define the **struct timespec** structure as described in <time.h>.7260 The tag **sigevent** shall be declared as naming an incomplete structure type, the contents of which
7261 are described in the <signal.h> header.

7262 The <aio.h> header shall define the following symbolic constants:

7263 AIO_ALLDONE A return value indicating that none of the requested operations could be
7264 canceled since they are already complete.7265 AIO_CANCELED A return value indicating that all requested operations have been
7266 canceled.

7267 AIO_NOTCANCELED

7268 A return value indicating that some of the requested operations could not
7269 be canceled since they are in progress.7270 LIO_NOP A *lio_listio()* element operation option indicating that no transfer is
7271 requested.7272 LIO_NOWAIT A *lio_listio()* synchronization operation indicating that the calling thread
7273 is to continue execution while the *lio_listio()* operation is being
7274 performed, and no notification is given when the operation is complete.7275 LIO_READ A *lio_listio()* element operation option requesting a read.7276 LIO_WAIT A *lio_listio()* synchronization operation indicating that the calling thread
7277 is to suspend until the *lio_listio()* operation is complete.7278 LIO_WRITE A *lio_listio()* element operation option requesting a write.7279 The following shall be declared as functions and may also be defined as macros. Function
7280 prototypes shall be provided.

7281	int	aio_cancel(int, struct aio_cb *);
7282	int	aio_error(const struct aio_cb *);
7283	FSC SIO	int aio_fsync(int, struct aio_cb *);
7284	int	aio_read(struct aio_cb *);
7285	ssize_t	aio_return(struct aio_cb *);
7286	int	aio_suspend(const struct aio_cb *const [], int,

```

7287         const struct timespec *);
7288     int      aio_write(struct aiocb *);
7289     int      lio_listio(int, struct aiocb *restrict const [restrict], int,
7290         struct sigevent *restrict);

```

7291 Inclusion of the <aio.h> header may make visible symbols defined in the headers <fcntl.h>,
 7292 <signal.h>, and <time.h>.

7293 APPLICATION USAGE

7294 None.

7295 RATIONALE

7296 None.

7297 FUTURE DIRECTIONS

7298 None.

7299 SEE ALSO

7300 <fcntl.h>, <signal.h>, <sys/types.h>, <time.h>

7301 XSH *aio_cancel()*, *aio_error()*, *aio_fsync()*, *aio_read()*, *aio_return()*, *aio_suspend()*, *aio_write()*,
 7302 *fsync()*, *lio_listio()*, *lseek()*, *read()*, *write()*

7303 CHANGE HISTORY

7304 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

7305 Issue 6

7306 The <aio.h> header is marked as part of the Asynchronous Input and Output option.

7307 The description of the constants is expanded.

7308 The **restrict** keyword is added to the prototype for *lio_listio()*.

7309 Issue 7

7310 The <aio.h> header is moved from the Asynchronous Input and Output option to the Base.

7311 This reference page is clarified with respect to macros and symbolic constants, and type and
 7312 structure declarations are added.

7313 POSIX.1-2008, Technical Corrigendum 1, XBD/TC1-2008/0038 [98] is applied.

+

NAME

arpa/inet.h — definitions for internet operations

SYNOPSIS

```
#include <arpa/inet.h>
```

DESCRIPTION

The <arpa/inet.h> header shall define the **in_port_t** and **in_addr_t** types as described in <netinet/in.h>.

The <arpa/inet.h> header shall define the **in_addr** structure as described in <netinet/in.h>.

IP6 The <arpa/inet.h> header shall define the **INET_ADDRSTRLEN** and **INET6_ADDRSTRLEN** macros as described in <netinet/in.h>.

The following shall be declared as functions, or defined as macros, or both. If functions are declared, function prototypes shall be provided.

```
uint32_t htonl(uint32_t);
uint16_t htons(uint16_t);
uint32_t ntohl(uint32_t);
uint16_t ntohs(uint16_t);
```

The <arpa/inet.h> header shall define the **uint32_t** and **uint16_t** types as described in <inttypes.h>.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
in_addr_t    inet_addr(const char *);
char         *inet_ntoa(struct in_addr);
const char   *inet_ntop(int, const void *restrict, char *restrict,
                        socklen_t);
int          inet_pton(int, const char *restrict, void *restrict);
```

Inclusion of the <arpa/inet.h> header may also make visible all symbols from <netinet/in.h> and <inttypes.h>.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

XSH *htonl()*, *inet_addr()*, *inet_ntop()*

CHANGE HISTORY

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

The **restrict** keyword is added to the prototypes for *inet_ntop()* and *inet_pton()*.

Issue 7

SD5-XBD-ERN-6 is applied.

NAME

assert.h — verify program assertion

SYNOPSIS

```
#include <assert.h>
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

The <assert.h> header shall define the *assert()* macro. It refers to the macro NDEBUG which is not defined in the header. If NDEBUG is defined as a macro name before the inclusion of this header, the *assert()* macro shall be defined simply as:

```
#define assert(ignore) ((void) 0)
```

Otherwise, the macro behaves as described in *assert()*.

The *assert()* macro shall be redefined according to the current state of NDEBUG each time <assert.h> is included.

The *assert()* macro shall be implemented as a macro, not as a function. If the macro definition is suppressed in order to access an actual function, the behavior is undefined.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

XSH *assert()*

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

The definition of the *assert()* macro is changed for alignment with the ISO/IEC 9899:1999 standard.

7385 NAME

7386 complex.h — complex arithmetic

7387 SYNOPSIS

7388 #include <complex.h>

7389 DESCRIPTION

7390 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 7391 conflict between the requirements described here and the ISO C standard is unintentional. This
 7392 volume of POSIX.1-2008 defers to the ISO C standard.

7393 The <complex.h> header shall define the following macros:

7394 complex Expands to **_Complex**.

7395 **_Complex_I** Expands to a constant expression of type **const float _Complex**, with the value
 7396 of the imaginary unit (that is, a number i such that $i^2 = -1$).

7397 imaginary Expands to **_Imaginary**.

7398 **_Imaginary_I** Expands to a constant expression of type **const float _Imaginary** with the
 7399 value of the imaginary unit.

7400 **I** Expands to either **_Imaginary_I** or **_Complex_I**. If **_Imaginary_I** is not defined,
 7401 **I** expands to **_Complex_I**.

7402 The macros **imaginary** and **_Imaginary_I** shall be defined if and only if the implementation
 7403 supports imaginary types.

7404 An application may undefine and then, perhaps, redefine the **complex**, **imaginary**, and **I** macros.

7405 The following shall be declared as functions and may also be defined as macros. Function
 7406 prototypes shall be provided.

```

7407 double      cabs(double complex);
7408 float       cabsf(float complex);
7409 long double cabsl(long double complex);
7410 double complex cacos(double complex);
7411 float complex cacosf(float complex);
7412 double complex cacosh(double complex);
7413 float complex cacoshf(float complex);
7414 long double complex cacoshl(long double complex);
7415 long double complex cacosl(long double complex);
7416 double      carg(double complex);
7417 float       cargf(float complex);
7418 long double cargl(long double complex);
7419 double complex casin(double complex);
7420 float complex casinf(float complex);
7421 double complex casinh(double complex);
7422 float complex casinhf(float complex);
7423 long double complex casinhl(long double complex);
7424 long double complex casinl(long double complex);
7425 double complex catan(double complex);
7426 float complex catanf(float complex);
7427 double complex catanh(double complex);
7428 float complex catanhf(float complex);
7429 long double complex catanhl(long double complex);
7430 long double complex catanl(long double complex);

```

```

7431     double complex      ccos(double complex);
7432     float complex       ccosf(float complex);
7433     double complex      ccosh(double complex);
7434     float complex       ccoshf(float complex);
7435     long double complex ccoshl(long double complex);
7436     long double complex ccosl(long double complex);
7437     double complex      cexp(double complex);
7438     float complex       cexpf(float complex);
7439     long double complex cexpl(long double complex);
7440     double              cimag(double complex);
7441     float               cimagf(float complex);
7442     long double         cimagl(long double complex);
7443     double complex      clog(double complex);
7444     float complex       clogf(float complex);
7445     long double complex clogl(long double complex);
7446     double complex      conj(double complex);
7447     float complex       conjf(float complex);
7448     long double complex conjl(long double complex);
7449     double complex      cpow(double complex, double complex);
7450     float complex       cpowf(float complex, float complex);
7451     long double complex cpowl(long double complex, long double complex);
7452     double complex      cproj(double complex);
7453     float complex       cprojf(float complex);
7454     long double complex cprojl(long double complex);
7455     double              creal(double complex);
7456     float               crealf(float complex);
7457     long double         creall(long double complex);
7458     double complex      csin(double complex);
7459     float complex       csinf(float complex);
7460     double complex      csinh(double complex);
7461     float complex       csinhf(float complex);
7462     long double complex csinhl(long double complex);
7463     long double complex csinl(long double complex);
7464     double complex      csqrt(double complex);
7465     float complex       csqrtf(float complex);
7466     long double complex csqrtl(long double complex);
7467     double complex      ctan(double complex);
7468     float complex       ctanf(float complex);
7469     double complex      ctanh(double complex);
7470     float complex       ctanhf(float complex);
7471     long double complex ctanhl(long double complex);
7472     long double complex ctanl(long double complex);

```

APPLICATION USAGE

Values are interpreted as radians, not degrees.

RATIONALE

The choice of *I* instead of *i* for the imaginary unit concedes to the widespread use of the identifier *i* for other purposes. The application can use a different identifier, say *j*, for the imaginary unit by following the inclusion of the <complex.h> header with:

```
#undef I
#define j _Imaginary_I
```

An *I* suffix to designate imaginary constants is not required, as multiplication by *I* provides a sufficiently convenient and more generally useful notation for imaginary terms. The corresponding real type for the imaginary unit is **float**, so that use of *I* for algorithmic or notational convenience will not result in widening types.

On systems with imaginary types, the application has the ability to control whether use of the macro *I* introduces an imaginary type, by explicitly defining *I* to be `_Imaginary_I` or `_Complex_I`. Disallowing imaginary types is useful for some applications intended to run on implementations without support for such types.

The macro `_Imaginary_I` provides a test for whether imaginary types are supported.

The `cis()` function ($\cos(x) + I\sin(x)$) was considered but rejected because its implementation is easy and straightforward, even though some implementations could compute sine and cosine more efficiently in tandem.

FUTURE DIRECTIONS

The following function names and the same names suffixed with *f* or *l* are reserved for future use, and may be added to the declarations in the <complex.h> header.

```
cerf()      cexpm1()   clog2()
cerfc()     clog10()  clgamma()
cexp2()     clog1p()  ctgamma()
```

CHANGE HISTORY

First released in Issue 6. Included for alignment with the ISO/IEC 9899:1999 standard.

NAME

cpio.h — cpio archive values

SYNOPSIS

```
#include <cpio.h>
```

DESCRIPTION

The <cpio.h> header shall define the symbolic constants needed by the *c_mode* field of the *cpio* archive format, with the names and values given in the following table:

Name	Description	Value (Octal)
C_IRUSR	Read by owner.	0000400
C_IWUSR	Write by owner.	0000200
C_IXUSR	Execute by owner.	0000100
C_IRGRP	Read by group.	0000040
C_IWGRP	Write by group.	0000020
C_IXGRP	Execute by group.	0000010
C_IROTH	Read by others.	0000004
C_IWOTH	Write by others.	0000002
C_IXOTH	Execute by others.	0000001
C_ISUID	Set user ID.	0004000
C_ISGID	Set group ID.	0002000
C_ISVTX	On directories, restricted deletion flag.	0001000
C_ISDIR	Directory.	0040000
C_ISFIFO	FIFO.	0010000
C_ISREG	Regular file.	0100000
C_ISBLK	Block special.	0060000
C_ISCHR	Character special.	0020000
C_ISCTG	Reserved.	0110000
C_ISLNK	Symbolic link.	0120000
C_ISSOCK	Socket.	0140000

The <cpio.h> header shall define the following symbolic constant as a string:

```
MAGIC      "070707"
```

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in the Headers Interface, Issue 3 specification. Derived from the POSIX.1-1988 standard.

Issue 6

The SEE ALSO is updated to refer to *pax*.

Issue 7

7547 The **<pio.h>** header is moved from the XSI option to the Base.

7548 This reference page is clarified with respect to macros and symbolic constants.

7550 **NAME**

7551 ctype.h — character types

7552 **SYNOPSIS**

7553 #include <ctype.h>

7554 **DESCRIPTION**

7555 CX Some of the functionality described on this reference page extends the ISO C standard.
7556 Applications shall define the appropriate feature test macro (see XSH [Section 2.2](#), on page 472) to
7557 enable the visibility of these symbols in this header.

7558 The <ctype.h> header shall define the **locale_t** type as described in <locale.h>, representing a
7559 locale object.

7560 The following shall be declared as functions and may also be defined as macros. Function
7561 prototypes shall be provided for use with ISO C standard compilers.

```
7562 int isalnum(int);
7563 CX int isalnum_l(int, locale_t);
7564 int isalpha(int);
7565 CX int isalpha_l(int, locale_t);
7566 OB XSI int isascii(int);
7567 int isblank(int);
7568 CX int isblank_l(int, locale_t);
7569 int iscntrl(int);
7570 CX int iscntrl_l(int, locale_t);
7571 int isdigit(int);
7572 CX int isdigit_l(int, locale_t);
7573 int isgraph(int);
7574 CX int isgraph_l(int, locale_t);

7606 CHANGE HISTORY

7607 First released in Issue 1. Derived from Issue 1 of the SVID.

7608 Issue 6

7609 Extensions beyond the ISO C standard are marked.

7610 Issue 7

7611 SD5-XBD-ERN-6 is applied, updating the wording regarding the function declarations for
7612 consistency.

7613 The *_l() functions are added from The Open Group Technical Standard, 2006, Extended API Set
7614 Part 4.

NAME

dirent.h — format of directory entries

SYNOPSIS

```
#include <dirent.h>
```

DESCRIPTION

The internal format of directories is unspecified.

The <dirent.h> header shall define the following type:

DIR A type representing a directory stream. The **DIR** type may be an incomplete type.

It shall also define the structure **dirent** which shall include the following members:

XSI	<code>ino_t</code>	<code>d_ino</code>	File serial number.
	<code>char</code>	<code>d_name[]</code>	Filename string of entry.

The <dirent.h> header shall define the `ino_t` type as described in <sys/types.h>.

The array `d_name` is of unspecified size, but shall contain a filename of at most {NAME_MAX} + bytes followed by a terminating null byte.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
int      alphasort(const struct dirent **, const struct dirent **);
int      closedir(DIR *);
int      dirfd(DIR *);
DIR      *fdopendir(int);
DIR      *opendir(const char *);
struct dirent *readdir(DIR *);
int      readdir_r(DIR *restrict, struct dirent *restrict,
                struct dirent **restrict);
void      rewinddir(DIR *);
int      scandir(const char *, struct dirent ***,
                int (*)(const struct dirent *),
                int (*)(const struct dirent **),
                const struct dirent **));
XSI      void      seekdir(DIR *, long);
long      telldir(DIR *);
```

APPLICATION USAGE

None.

RATIONALE

Information similar to that in the <dirent.h> header is contained in a file <sys/dir.h> in 4.2 BSD - and 4.3 BSD. The equivalent in these implementations of **struct dirent** from this volume of POSIX.1-2008 is **struct direct**. The filename was changed because the name <sys/dir.h> was also used in earlier implementations to refer to definitions related to the older access method; this produced name conflicts. The name of the structure was changed because this volume of POSIX.1-2008 does not completely define what is in the structure, so it could be different on some implementations from **struct direct**.

The name of an array of **char** of an unspecified size should not be used as an lvalue. Use of:

```
sizeof(d_name)
```

is incorrect; use:

7659 `strlen(d_name)`

7660 instead.

7661 The array of **char** *d_name* is not a fixed size. Implementations may need to declare **struct dirent**
 7662 with an array size for *d_name* of 1, but the actual number of bytes provided matches (or only
 7663 slightly exceeds) the length of the filename string.

7664 **FUTURE DIRECTIONS**

7665 None.

7669 **CHANGE HISTORY**

7670 First released in Issue 2.

7671 **Issue 5**

7672 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

7673 **Issue 6**

7674 The Open Group Corrigendum U026/7 is applied, correcting the prototype for *readdir_r()*.

7675 The **restrict** keyword is added to the prototype for *readdir_r()*.

7676 **Issue 7**

7677 The *alphasort()*, *dirfd()*, and *scandir()* functions are added from The Open Group Technical
 7678 Standard, 2006, Extended API Set Part 1.

7679 The *fdopendir()* function is added from The Open Group Technical Standard, 2006, Extended API
 7680 Set Part 2.

7681 Austin Group Interpretation 1003.1-2001 #110 is applied, clarifying the definition of the **DIR**
 7682 type.

7683 POSIX.1-2008, Technical Corrigendum 1, XBD/TC1-2008/0039 [291], XBD/TC1-2008/0040 [291], +
 7684 XBD/TC1-2008/0041 [291], and XBD/TC1-2008/0042 [206] are applied.

7685 **NAME**

7686 dlfcn.h — dynamic linking

7687 **SYNOPSIS**

7688 #include <dlfcn.h>

7689 **DESCRIPTION**

7690 The <dlfcn.h> header shall define at least the following symbolic constants for use in the
7691 construction of a *dlopen()* *mode* argument:

7692	RTLD_LAZY	Relocations are performed at an implementation-defined time.
7693	RTLD_NOW	Relocations are performed when the object is loaded.
7694	RTLD_GLOBAL	All symbols are available for relocation processing of other modules.
7695	RTLD_LOCAL	All symbols are not made available for relocation processing by other
7696		modules.

7697 The following shall be declared as functions and may also be defined as macros. Function
7698 prototypes shall be provided.

```
7699         int     dlclose(void *);
7700         char    *dlerror(void);
7701         void    *dlopen(const char *, int);
7702         void    *dlsym(void *restrict, const char *restrict);
```

7703 **APPLICATION USAGE**

7717 This reference page is clarified with respect to macros and symbolic constants.

7718 **NAME**

7719 errno.h — system error numbers

7720 **SYNOPSIS**

7721 #include <errno.h>

7722 **DESCRIPTION**

7723 CX Some of the functionality described on this reference page extends the ISO C standard. Any
 7724 conflict between the requirements described here and the ISO C standard is unintentional. This
 7725 volume of POSIX.1-2008 defers to the ISO C standard.

7726 The ISO C standard only requires the symbols [EDOM], [EILSEQ], and [ERANGE] to be defined.

7727 The <errno.h> header shall provide a declaration or definition for *errno*. The symbol *errno* shall
 7728 expand to a modifiable lvalue of type **int**. It is unspecified whether *errno* is a macro or an
 7729 identifier declared with external linkage. If a macro definition is suppressed in order to access an
 7730 actual object, or a program defines an identifier with the name *errno*, the behavior is undefined.

7731 The <errno.h> header shall define the following macros which shall expand to integer constant
 7732 expressions with type **int**, distinct positive values (except as noted below), and which shall be
 7733 suitable for use in **#if** preprocessing directives:

7734	[E2BIG]	Argument list too long.
7735	[EACCES]	Permission denied.
7736	[EADDRINUSE]	Address in use.
7737	[EADDRNOTAVAIL]	Address not available.
7738	[EAFNOSUPPORT]	Address family not supported.
7739	[EAGAIN]	Resource unavailable, try again (may be the same value as
7740		[EWOULDBLOCK]).
7741	[EALREADY]	Connection already in progress.
7742	[EBADF]	Bad file descriptor.
7743	[EBADMSG]	Bad message.
7744	[EBUSY]	Device or resource busy.
7745	[ECANCELED]	Operation canceled.
7746	[ECHILD]	No child processes.
7747	[ECONNABORTED]	Connection aborted.
7748	[ECONNREFUSED]	Connection refused.
7749	[ECONNRESET]	Connection reset.
7750	[EDEADLK]	Resource deadlock would occur.
7751	[EDESTADDRREQ]	Destination address required.
7752	[EDOM]	Mathematics argument out of domain of function.
7753	[EDQUOT]	Reserved.
7754	[EEXIST]	File exists.

7755		[EFAULT]	Bad address.
7756		[EFBIG]	File too large.
7757		[EHOSTUNREACH]	Host is unreachable.
7758		[EIDRM]	Identifier removed.
7759		[EILSEQ]	Illegal byte sequence.
7760		[EINPROGRESS]	Operation in progress.
7761		[EINTR]	Interrupted function.
7762		[EINVAL]	Invalid argument.
7763		[EIO]	I/O error.
7764		[EISCONN]	Socket is connected.
7765		[EISDIR]	Is a directory.
7766		[ELOOP]	Too many levels of symbolic links.
7767		[EMFILE]	File descriptor value too large.
7768		[EMLINK]	Too many links.
7769		[EMSGSIZE]	Message too large.
7770		[EMULTIHOP]	Reserved.
7771		[ENAMETOOLONG]	Filename too long.
7772		[ENETDOWN]	Network is down.
7773		[ENETRESET]	Connection aborted by network.
7774		[ENETUNREACH]	Network unreachable.
7775		[ENFILE]	Too many files open in system.
7776		[ENOBUFS]	No buffer space available.
7777	OB XSR	[ENODATA]	No message is available on the STREAM head read queue.
7778		[ENODEV]	No such device.
7779		[ENOENT]	No such file or directory.
7780		[ENOEXEC]	Executable file format error.
7781		[ENOLCK]	No locks available.
7782		[ENOLINK]	Reserved.
7783		[ENOMEM]	Not enough space.
7784		[ENOMSG]	No message of the desired type.
7785		[ENOPROTOOPT]	Protocol not available.
7786		[ENOSPC]	No space left on device.
7787	OB XSR	[ENOSR]	No STREAM resources.

7788	OB XSR	[ENOSTR]	Not a STREAM.	
7789		[ENOSYS]	Function not supported.	
7790		[ENOTCONN]	The socket is not connected.	
7791		[ENOTDIR]	Not a directory or a symbolic link to a directory.	
7792		[ENOTEMPTY]	Directory not empty.	
7793		[ENOTRECOVERABLE]		
7794			State not recoverable.	
7795		[ENOTSOCK]	Not a socket.	
7796		[ENOTSUP]	Not supported (may be the same value as [EOPNOTSUPP]).	
7797		[ENOTTY]	Inappropriate I/O control operation.	
7798		[ENXIO]	No such device or address.	
7799		[EOPNOTSUPP]	Operation not supported on socket (may be the same value as	
7800			[ENOTSUP]).	
7801		[EOVERFLOW]	Value too large to be stored in data type.	
7802		[EOWNERDEAD]	Previous owner died.	
7803		[EPERM]	Operation not permitted.	
7804		[EPIPE]	Broken pipe.	
7805		[EPROTO]	Protocol error.	
7806		[EPROTONOSUPPORT]		
7807			Protocol not supported.	
7808		[EPROTOTYPE]	Protocol wrong type for socket.	
7809		[ERANGE]	Result too large.	
7810		[EROFS]	Read-only file system.	
7811		[ESPIPE]	Invalid seek.	
7812		[ESRCH]	No such process.	
7813		[ESTALE]	Reserved.	
7814	OB XSR	[ETIME]	Stream <i>ioctl()</i> timeout.	
7815		[ETIMEDOUT]	Connection timed out.	
7816		[ETXTBSY]	Text file busy.	
7817		[EWOULDBLOCK]	Operation would block (may be the same value as [EAGAIN]).	
7818		[EXDEV]	Cross-device link.	

APPLICATION USAGE

Additional error numbers may be defined on conforming systems; see the System Interfaces volume of POSIX.1-2008.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

XSH [Section 2.3](#) (on page 481)

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

Updated for alignment with the POSIX Realtime Extension.

Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The majority of the error conditions previously marked as extensions are now mandatory, except for the STREAMS-related error conditions.

Values for *errno* are now required to be distinct positive values rather than non-zero values. This change is for alignment with the ISO/IEC 9899:1999 standard.

Issue 7

Austin Group Interpretation 1003.1-2001 #050 is applied, allowing [ENOTSUP] and [EOPNOTSUPP] to be the same values.

The [ENOTRECOVERABLE] and [EOWNERDEAD] errors are added from The Open Group Technical Standard, 2006, Extended API Set Part 2.

Functionality relating to the XSI STREAMS option is marked obsolescent.

Functionality relating to the Threads option is moved to the Base.

This reference page is clarified with respect to macros and symbolic constants.

POSIX.1-2008, Technical Corrigendum 1, XBD/TC1-2008/0043 [324] is applied.

+

NAME

fcntl.h — file control options

SYNOPSIS

#include <fcntl.h>

DESCRIPTION

The <fcntl.h> header shall define the following symbolic constants for the *cmd* argument used by *fcntl()*. The values shall be unique and shall be suitable for use in **#if** preprocessing directives.

F_DUPFD Duplicate file descriptor.

F_DUPFD_CLOEXEC

Duplicate file descriptor with the close-on-exec flag **FD_CLOEXEC** set.

F_GETFD Get file descriptor flags.

F_SETFD Set file descriptor flags.

F_GETFL Get file status flags and file access modes.

F_SETFL Set file status flags.

F_GETLK Get record locking information.

F_SETLK Set record locking information.

F_SETLKW Set record locking information; wait if blocked.

F_GETOWN Get process or process group ID to receive SIGURG signals.

F_SETOWN Set process or process group ID to receive SIGURG signals.

The <fcntl.h> header shall define the following symbolic constant used for the *fcntl()* file descriptor flags, which shall be suitable for use in **#if** preprocessing directives.

FD_CLOEXEC Close the file descriptor upon execution of an *exec* family function.

The <fcntl.h> header shall also define the following symbolic constants for the *l_type* argument used for record locking with *fcntl()*. The values shall be unique and shall be suitable for use in **#if** preprocessing directives.

F_RDLCK Shared or read lock.

F_UNLCK Unlock.

F_WRLCK Exclusive or write lock.

The <fcntl.h> header shall define the values used for *l_whence*, **SEEK_SET**, **SEEK_CUR**, and **SEEK_END** as described in <stdio.h>.

The <fcntl.h> header shall define the following symbolic constants as file creation flags for use in the *oflag* value to *open()* and *openat()*. The values shall be bitwise-distinct and shall be suitable for use in **#if** preprocessing directives.

O_CLOEXEC The **FD_CLOEXEC** flag associated with the new descriptor shall be set to close +
the file descriptor upon execution of an *exec* family function.

O_CREAT Create file if it does not exist.

O_DIRECTORY Fail if not a directory. +

7886		O_EXCL	Exclusive use flag.	
7887		O_NOCTTY	Do not assign controlling terminal.	
7888		O_NOFOLLOW	Do not follow symbolic links.	+
7889		O_TRUNC	Truncate flag.	
7890		O_TTY_INIT	Set the termios structure terminal parameters to a state that provides conforming behavior; see Section 11.2 (on page 205).	
7892		The O_TTY_INIT flag can have the value zero and in this case it need not be bitwise-distinct from the other flags.		
7894		The <fcntl.h> header shall define the following symbolic constants for use as file status flags for <i>open()</i> , <i>openat()</i> , and <i>fcntl()</i> . The values shall be suitable for use in #if preprocessing directives.		
7896		O_APPEND	Set append mode.	
7897	SIO	O_DSYNC	Write according to synchronized I/O data integrity completion.	
7898		O_NONBLOCK	Non-blocking mode.	
7899	SIO	O_RSYNC	Synchronized read I/O operations.	
7900		O_SYNC	Write according to synchronized I/O file integrity completion.	
7901		The <fcntl.h> header shall define the following symbolic constant for use as the mask for file access modes. The value shall be suitable for use in #if preprocessing directives.		
7903		O_ACCMODE	Mask for file access modes.	
7904		The <fcntl.h> header shall define the following symbolic constants for use as the file access modes for <i>open()</i> , <i>openat()</i> , and <i>fcntl()</i> . The values shall be unique, except that O_EXEC and O_SEARCH may have equal values. The values shall be suitable for use in #if preprocessing directives.		
7908		O_EXEC	Open for execute only (non-directory files). The result is unspecified if this flag is applied to a directory.	
7910		O_RDONLY	Open for reading only.	
7911		O_RDWR	Open for reading and writing.	
7912		O_SEARCH	Open directory for search only. The result is unspecified if this flag is applied to a non-directory file.	
7914		O_WRONLY	Open for writing only.	
7915		The <fcntl.h> header shall define the symbolic constants for file modes for use as values of mode_t as described in <sys/stat.h>.		
7917		The <fcntl.h> header shall define the following symbolic constant as a special value used in place of a file descriptor for the <i>*at()</i> functions which take a directory file descriptor as a parameter:		
7920		AT_FDCWD	Use the current working directory to determine the target of relative file paths.	
7921		The <fcntl.h> header shall define the following symbolic constant as a value for the <i>flag</i> used by <i>faccessat()</i> :		
7923		AT_EACCESS	Check access using effective user and group ID.	
7924		The <fcntl.h> header shall define the following symbolic constant as a value for the <i>flag</i> used by		

7925 *fstatat()*, *fchmodat()*, *fchownat()*, and *utimensat()*:

7926 AT_SYMLINK_NOFOLLOW

7927 Do not follow symbolic links.

7928 The <fcntl.h> header shall define the following symbolic constant as a value for the flag used by *linkat()*:

7930 AT_SYMLINK_FOLLOW

7931 Follow symbolic link.

7932 The <fcntl.h> header shall define the following symbolic constant as a value for the flag used by *unlinkat()*:

7934 AT_REMOVEDIR

7935 Remove directory instead of file.

7936 ADV The <fcntl.h> header shall define the following symbolic constants for the *advice* argument used by *posix_fadvise()*:

7938 POSIX_FADV_DONTNEED

7939 The application expects that it will not access the specified data in the near future.

7940 POSIX_FADV_NOREUSE

7941 The application expects to access the specified data once and then not reuse it thereafter.

7942 POSIX_FADV_NORMAL

7943 The application has no advice to give on its behavior with respect to the specified data. It is the default characteristic if no advice is given for an open file.

7945 POSIX_FADV_RANDOM

7946 The application expects to access the specified data in a random order.

7947 POSIX_FADV_SEQUENTIAL

7948 The application expects to access the specified data sequentially from lower offsets to higher offsets.

7950 POSIX_FADV_WILLNEED

7951 The application expects to access the specified data in the near future.

7952 The <fcntl.h> header shall define the **flock** structure describing a file lock. It shall include the following members:

7954 short l_type Type of lock; F_RDLCK, F_WRLCK, F_UNLCK.

7955 short l_whence Flag for starting offset.

7956 off_t l_start Relative offset in bytes.

7957 off_t l_len Size; if 0 then until EOF.

7958 pid_t l_pid Process ID of the process holding the lock; returned with F_GETLK.

7959 The <fcntl.h> header shall define the **mode_t**, **off_t**, and **pid_t** types as described in <sys/types.h>.

7961 The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

7963 int creat(const char *, mode_t);

7964 int fcntl(int, int, ...);

7965 int open(const char *, int, ...);

7966 int openat(int, const char *, int, ...);

```
7967 ADV int posix_fadvise(int, off_t, off_t, int);
7968 int posix_fallocate(int, off_t, off_t);
```

7969 Inclusion of the <fcntl.h> header may also make visible all symbols from <sys/stat.h> and
7970 <unistd.h>.

7971 APPLICATION USAGE

7972 Although no existing implementation defines AT_SYMLINK_FOLLOW and
7973 AT_SYMLINK_NOFOLLOW as the same numeric value, POSIX.1-2008 does not prohibit that as
7974 the two constants are not used with the same interfaces.

7975 RATIONALE

7976 While many of the symbolic constants introduced in the <fcntl.h> header do not strictly need to
7977 be used in #if preprocessor directives, widespread historic practice has defined them as macros
7978 that are usable in such constructs, and examination of existing applications has shown that they
7979 are occasionally used in such a way. Therefore it was decided to retain this requirement on an
7980 implementation in POSIX.1-2008.

7981 FUTURE DIRECTIONS

7982 None.

7983 SEE ALSO

7984 [<stdio.h>](#), [<sys/stat.h>](#), [<sys/types.h>](#), [<unistd.h>](#)

7986 CHANGE HISTORY

7987 First released in Issue 1. Derived from Issue 1 of the SVID.

7988 Issue 5

7989 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension.

7990 Issue 6

7991 The following changes are made for alignment with the ISO POSIX-1: 1996 standard:

- 7992 • O_DSYNC and O_RSYNC are marked as part of the Synchronized Input and Output
7993 option.

7994 The following new requirements on POSIX implementations derive from alignment with the
7995 Single UNIX Specification:

- 7996 • The definition of the **mode_t**, **off_t**, and **pid_t** types is mandated.

7997 The F_GETOWN and F_SETOWN values are added for sockets.

7998 The [posix_fadvise\(\)](#), [posix_fallocate\(\)](#), and [posix_madvise\(\)](#) functions are added for alignment with
7999 IEEE Std 1003.1d-1999.

8000 IEEE PASC Interpretation 1003.1 #102 is applied, moving the prototype for [posix_madvise\(\)](#) to
8001 [<sys/mman.h>](#).

8002 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/18 is applied, updating the prototypes for
8003 [posix_fadvise\(\)](#) and [posix_fallocate\(\)](#) to be large file-aware, using **off_t** instead of **size_t**.

8004 Issue 7

8005 Austin Group Interpretation 1003.1-2001 #144 is applied, adding the O_TTY_INIT flag.

8006 Austin Group Interpretation 1003.1-2001 #171 is applied, adding support to set the
8007 FD_CLOEXEC flag atomically at [open\(\)](#), and adding the F_DUPFD_CLOEXEC flag.

8008 The *openat()* function is added from The Open Group Technical Standard, 2006, Extended API
8009 Set Part 2.

8010 Additional flags are added to support *faccessat()*, *fchmodat()*, *fchownat()*, *fstatat()*, *linkat()*,
8011 *open()*, *openat()*, and *unlinkat()*.

8012 This reference page is clarified with respect to macros and symbolic constants.

8013 Changes are made related to support for finegrained timestamps.

8014 Changes are made to allow a directory to be opened for searching.

8015 POSIX.1-2008, Technical Corrigendum 1, XBD/TC1-2008/0044 [274] and XBD/TC1-2008/0045 +
8016 [78,432] are applied.

8017 **NAME**

8018 fenv.h — floating-point environment

8019 **SYNOPSIS**

8020 #include <fenv.h>

8021 **DESCRIPTION**

8022 CX The functionality described on this reference page is aligned with the ISO C standard. Any
8023 conflict between the requirements described here and the ISO C standard is unintentional. This
8024 volume of POSIX.1-2008 defers to the ISO C standard.

8025 The <fenv.h> header shall define the following data types through **typedef**:

8026 **fenv_t** Represents the entire floating-point environment. The floating-point environment
8027 refers collectively to any floating-point status flags and control modes supported
8028 by the implementation.

8029 **fexcept_t** Represents the floating-point status flags collectively, including any status the
8030 implementation associates with the flags. A floating-point status flag is a system
8031 variable whose value is set (but never cleared) when a floating-point exception is
8032 raised, which occurs as a side-effect of exceptional floating-point arithmetic to
8033 provide auxiliary information. A floating-point control mode is a system variable
8034 whose value may be set by the user to affect the subsequent behavior of floating-
8035 point arithmetic.

8036 The <fenv.h> header shall define each of the following macros if and only if the implementation
8037 supports the floating-point exception by means of the floating-point functions *feclearexcept()*,
8038 *fegetexceptflag()*, *feraiseexcept()*, *fesetexceptflag()*, and *fetestexcept()*. The defined macros shall
8039 expand to integer constant expressions with values that are bitwise-distinct.

8040 FE_DIVBYZERO
8041 FE_INEXACT
8042 FE_INVALID
8043 FE_OVERFLOW
8044 FE_UNDERFLOW

8045 MX If the implementation supports the IEC 60559 Floating-Point option, all five macros shall be
8046 defined. Additional implementation-defined floating-point exceptions with macros beginning
8047 with FE_ and an uppercase letter may also be specified by the implementation.

8048 The <fenv.h> header shall define the macro FE_ALL_EXCEPT as the bitwise-inclusive OR of all
8049 floating-point exception macros defined by the implementation, if any. If no such macros are
8050 defined, then the macro FE_ALL_EXCEPT shall be defined as zero.

8051 The <fenv.h> header shall define each of the following macros if and only if the implementation
8052 supports getting and setting the represented rounding direction by means of the *fegetround()*
8053 and *fesetround()* functions. The defined macros shall expand to integer constant expressions
8054 whose values are distinct non-negative values.

8055 FE_DOWNWARD
8056 FE_TONEAREST
8057 FE_TOWARDZERO
8058 FE_UPWARD

8059 MX If the implementation supports the IEC 60559 Floating-Point option, all four macros shall be
8060 defined. Additional implementation-defined rounding directions with macros beginning with
8061 FE_ and an uppercase letter may also be specified by the implementation.

The <fenv.h> header shall define the following macro, which represents the default floating-point environment (that is, the one installed at program startup) and has type pointer to const-qualified `fenv_t`. It can be used as an argument to the functions within the <fenv.h> header that manage the floating-point environment.

```
FE_DFL_ENV
```

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
int feclearexcept(int);
int fegetenv(fenv_t *);
int fegetexceptflag(fexcept_t *, int);
int fegetround(void);
int feholdexcept(fenv_t *);
int feraiseexcept(int);
int fesetenv(const fenv_t *);
int fesetexceptflag(const fexcept_t *, int);
int fesetround(int);
int fetestexcept(int);
int feupdateenv(const fenv_t *);
```

The `FENV_ACCESS` pragma provides a means to inform the implementation when an application might access the floating-point environment to test floating-point status flags or run under non-default floating-point control modes. The pragma shall occur either outside external declarations or preceding all explicit declarations and statements inside a compound statement. When outside external declarations, the pragma takes effect from its occurrence until another `FENV_ACCESS` pragma is encountered, or until the end of the translation unit. When inside a compound statement, the pragma takes effect from its occurrence until another `FENV_ACCESS` pragma is encountered (including within a nested compound statement), or until the end of the compound statement; at the end of a compound statement the state for the pragma is restored to its condition just before the compound statement. If this pragma is used in any other context, the behavior is undefined. If part of an application tests floating-point status flags, sets floating-point control modes, or runs under non-default mode settings, but was translated with the state for the `FENV_ACCESS` pragma off, the behavior is undefined. The default state (on or off) for the pragma is implementation-defined. (When execution passes from a part of the application translated with `FENV_ACCESS` off to a part translated with `FENV_ACCESS` on, the state of the floating-point status flags is unspecified and the floating-point control modes have their default settings.)

APPLICATION USAGE

This header is designed to support the floating-point exception status flags and directed-rounding control modes required by the IEC 60559:1989 standard, and other similar floating-point state information. Also it is designed to facilitate code portability among all systems.

Certain application programming conventions support the intended model of use for the floating-point environment:

- A function call does not alter its caller's floating-point control modes, clear its caller's floating-point status flags, nor depend on the state of its caller's floating-point status flags unless the function is so documented.
- A function call is assumed to require default floating-point control modes, unless its documentation promises otherwise.

- A function call is assumed to have the potential for raising floating-point exceptions, unless its documentation promises otherwise.

With these conventions, an application can safely assume default floating-point control modes (or be unaware of them). The responsibilities associated with accessing the floating-point environment fall on the application that does so explicitly.

Even though the rounding direction macros may expand to constants corresponding to the values of FLT_ROUNDS, they are not required to do so.

For example:

```
#include <fenv.h>
void f(double x)
{
    #pragma STDC FENV_ACCESS ON
    void g(double);
    void h(double);
    /* ... */
    g(x + 1);
    h(x + 1);
    /* ... */
}
```

If the function `g()` might depend on status flags set as a side-effect of the first `x+1`, or if the second `x+1` might depend on control modes set as a side-effect of the call to function `g()`, then the application shall contain an appropriately placed invocation as follows:

```
#pragma STDC FENV_ACCESS ON
```

RATIONALE

The `fexcept_t` Type

`fexcept_t` does not have to be an integer type. Its values must be obtained by a call to `fegetexceptflag()`, and cannot be created by logical operations from the exception macros. An implementation might simply implement `fexcept_t` as an `int` and use the representations reflected by the exception macros, but is not required to; other representations might contain extra information about the exceptions. `fexcept_t` might be a `struct` with a member for each exception (that might hold the address of the first or last floating-point instruction that caused that exception). The ISO/IEC 9899:1999 standard makes no claims about the internals of an `fexcept_t`, and so the user cannot inspect it.

Exception and Rounding Macros

Macros corresponding to unsupported modes and rounding directions are not defined by the implementation and must not be defined by the application. An application might use `#ifdef` to test for this.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 6. Included for alignment with the ISO/IEC 9899:1999 standard.

The return types for *feclearexcept()*, *fegetexceptflag()*, *feraiseexcept()*, *fesetexceptflag()*, *fegetenv()*, *fesetenv()*, and *feupdateenv()* are changed from **void** to **int** for alignment with the ISO/IEC 9899:1999 standard, Defect Report 202.

Issue 7

ISO/IEC 9899:1999 standard, Technical Corrigendum 2 #37 (SD5-XBD-ERN-49) is applied.

ISO/IEC 9899:1999 standard, Technical Corrigendum 3 #36 is applied.

SD5-XBD-ERN-48 and SD5-XBD-ERN-69 are applied.

This reference page is clarified with respect to macros and symbolic constants.

NAME

float.h — floating types

SYNOPSIS

```
#include <float.h>
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

The characteristics of floating types are defined in terms of a model that describes a representation of floating-point numbers and values that provide information about an implementation's floating-point arithmetic.

The following parameters are used to define the model for each floating-point type:

s Sign (± 1).

b Base or radix of exponent representation (an integer > 1).

e Exponent (an integer between a minimum $e_{\min}$ and a maximum $e_{\max}$).

p Precision (the number of base-*b* digits in the significand).

f_k Non-negative integers less than *b* (the significand digits).

A floating-point number *x* is defined by the following model:

$$x = sb^e \sum_{k=1}^p f_k b^{-k}, e_{\min} \leq e \leq e_{\max}$$

In addition to normalized floating-point numbers ($f_1 > 0$ if $x \neq 0$), floating types may be able to contain other kinds of floating-point numbers, such as subnormal floating-point numbers ($x \neq 0$, $e = e_{\min}$, $f_1 = 0$) and unnormalized floating-point numbers ($x \neq 0$, $e > e_{\min}$, $f_1 = 0$), and values that are not floating-point numbers, such as infinities and NaNs. A NaN is an encoding signifying Not-a-Number. A *quiet NaN* propagates through almost every arithmetic operation without raising a floating-point exception; a *signaling NaN* generally raises a floating-point exception when occurring as an arithmetic operand.

An implementation may give zero and non-numeric values, such as infinities and NaNs, a sign, or may leave them unsigned. Wherever such values are unsigned, any requirement in POSIX.1-2008 to retrieve the sign shall produce an unspecified sign and any requirement to set the sign shall be ignored.

The accuracy of the floating-point operations ('+', '-', '*', '/') and of the functions in <math.h> and <complex.h> that return floating-point results is implementation-defined, as is the accuracy of the conversion between floating-point internal representations and string representations performed by the functions in <stdio.h>, <stdlib.h>, and <wchar.h>. The implementation may state that the accuracy is unknown.

All integer values in the <float.h> header, except FLT_ROUNDS, shall be constant expressions suitable for use in #if preprocessing directives; all floating values shall be constant expressions. All except DECIMAL_DIG, FLT_EVAL_METHOD, FLT_RADIX, and FLT_ROUNDS have separate names for all three floating-point types. The floating-point model representation is provided for all values except FLT_EVAL_METHOD and FLT_ROUNDS.

The rounding mode for floating-point addition is characterized by the implementation-defined

8200 value of FLT_ROUNDS:

8201 -1 Indeterminable.

8202 0 Toward zero.

8203 1 To nearest.

8204 2 Toward positive infinity.

8205 3 Toward negative infinity.

8206 All other values for FLT_ROUNDS characterize implementation-defined rounding behavior.

8207 The values of operations with floating operands and values subject to the usual arithmetic

8208 conversions and of floating constants are evaluated to a format whose range and precision may

8209 be greater than required by the type. The use of evaluation formats is characterized by the

8210 implementation-defined value of FLT_EVAL_METHOD:

8211 -1 Indeterminable.

8212 0 Evaluate all operations and constants just to the range and precision of the type.

8213 1 Evaluate operations and constants of type **float** and **double** to the range and precision of

8214 the **double** type; evaluate **long double** operations and constants to the range and precision

8215 of the **long double** type.

8216 2 Evaluate all operations and constants to the range and precision of the **long double** type.

8217 All other negative values for FLT_EVAL_METHOD characterize implementation-defined

8218 behavior.

8219 The <float.h> header shall define the following values as constant expressions with

8220 implementation-defined values that are greater or equal in magnitude (absolute value) to those

8221 shown, with the same sign.

8222 • Radix of exponent representation, b .

8223 FLT_RADIX 2

8224 • Number of base-FLT_RADIX digits in the floating-point significand, p .

8225 FLT_MANT_DIG

8226 DBL_MANT_DIG

8227 LDBL_MANT_DIG

8228 • Number of decimal digits, n , such that any floating-point number in the widest supported

8229 floating type with $p_{\max}$ radix b digits can be rounded to a floating-point number with n

8230 decimal digits and back again without change to the value.

$$\begin{cases} p_{\max} \log_{10} b & \text{if } b \text{ is a power of } 10 \\ \left\lceil 1 + p_{\max} \log_{10} b \right\rceil & \text{otherwise} \end{cases}$$

8231 DECIMAL_DIG 10

- 8232 • Number of decimal digits, q , such that any floating-point number with q decimal digits can
 8233 be rounded into a floating-point number with p radix b digits and back again without
 8234 change to the q decimal digits.

$$\begin{cases} p \log_{10} b & \text{if } b \text{ is a power of } 10 \\ \left\lceil (p-1) \log_{10} b \right\rceil & \text{otherwise} \end{cases}$$

8235 FLT_DIG 6

8236 DBL_DIG 10

8237 LDBL_DIG 10

- 8238 • Minimum negative integer such that FLT_RADIX raised to that power minus 1 is a
 8239 normalized floating-point number, $e_{\min}$.

8240 FLT_MIN_EXP

8241 DBL_MIN_EXP

8242 LDBL_MIN_EXP

- 8243 • Minimum negative integer such that 10 raised to that power is in the range of normalized
 8244 floating-point numbers.

$$\left\lceil \log_{10} b^{e_{\min} - 1} \right\rceil$$

8245 FLT_MIN_10_EXP -37

8246 DBL_MIN_10_EXP -37

8247 LDBL_MIN_10_EXP -37

- 8248 • Maximum integer such that FLT_RADIX raised to that power minus 1 is a representable
 8249 finite floating-point number, $e_{\max}$.

8250 FLT_MAX_EXP

8251 DBL_MAX_EXP

8252 LDBL_MAX_EXP

8253 CX Additionally, FLT_MAX_EXP shall be at least as large as FLT_MANT_DIG, +
 8254 DBL_MAX_EXP shall be at least as large as DBL_MANT_DIG, and LDBL_MAX_EXP shall +
 8255 be at least as large as LDBL_MANT_DIG; which has the effect that FLT_MAX, DBL_MAX, +
 8256 and LDBL_MAX are integral.

- 8257 • Maximum integer such that 10 raised to that power is in the range of representable finite
 8258 floating-point numbers.

$$\left\lceil \log_{10}((1 - b^{-p}) b^{e_{\max}}) \right\rceil$$

8259 FLT_MAX_10_EXP +37

8260 DBL_MAX_10_EXP +37

8261 LDBL_MAX_10_EXP +37

8262 The <float.h> header shall define the following values as constant expressions with
8263 implementation-defined values that are greater than or equal to those shown:

- 8264
- Maximum representable finite floating-point number.

$$(1 - b^{-p}) b^{\epsilon_{\max}}$$

8265 FLT_MAX 1E+37

8266 DBL_MAX 1E+37

8267 LDBL_MAX 1E+37

8268 The <float.h> header shall define the following values as constant expressions with
8269 implementation-defined (positive) values that are less than or equal to those shown:

- 8270
- The difference between 1 and the least value greater than 1 that is representable in the
8271 given floating-point type, b^{1-p} .

8272 FLT_EPSILON 1E-5

8273 DBL_EPSILON 1E-9

8274 LDBL_EPSILON 1E-9

- 8275
- Minimum normalized positive floating-point number, $b^{\epsilon_{\min}-1}$.

8276 FLT_MIN 1E-37

8277 DBL_MIN 1E-37

8278 LDBL_MIN 1E-37

8279 APPLICATION USAGE

8280 None.

8281 RATIONALE

8282 All known hardware floating-point formats satisfy the property that the exponent range is larger
8283 than the number of mantissa digits. The ISO C standard permits a floating-point format where
8284 this property is not true, such that the largest finite value would not be integral; however, it is
8285 unlikely that there will ever be hardware support for such a floating-point format, and it
8286 introduces boundary cases that portable programs should not have to be concerned with (for
8287 example, a non-integral DBL_MAX means that *ceil()* would have to worry about overflow).
8288 Therefore, this standard imposes an additional requirement that the largest representable finite
8289 value is integral.

8290 FUTURE DIRECTIONS

8291 None.

CHANGE HISTORY

First released in Issue 4. Derived from the ISO C standard.

Issue 6

The description of the operations with floating-point values is updated for alignment with the ISO/IEC 9899:1999 standard.

Issue 7

ISO/IEC 9899:1999 standard, Technical Corrigendum 2 #4 (SD5-XBD-ERN-50) and #5 (SD5-XBD-ERN-51) are applied.

POSIX.1-2008, Technical Corrigendum 1, XBD/TC1-2008/0046 [346] and XBD/TC1-2008/0047 + [346] are applied.

NAME

fmtmsg.h — message display structures

SYNOPSISXSI `#include <fmtmsg.h>`**DESCRIPTION**

The <fmtmsg.h> header shall define the following symbolic constants:

MM_HARD	Source of the condition is hardware.
MM_SOFT	Source of the condition is software.
MM_FIRM	Source of the condition is firmware.
MM_APPL	Condition detected by application.
MM_UTIL	Condition detected by utility.
MM_OPSYS	Condition detected by operating system.
MM_RECOVER	Recoverable error.
MM_NRECOV	Non-recoverable error.
MM_HALT	Error causing application to halt.
MM_ERROR	Application has encountered a non-fatal fault.
MM_WARNING	Application has detected unusual non-error condition.
MM_INFO	Informative message.
MM_NOSEV	No severity level provided for the message.
MM_PRINT	Display message on standard error.
MM_CONSOLE	Display message on system console.

The table below indicates the null values and identifiers for *fmtmsg()* arguments. The <fmtmsg.h> header shall define the symbolic constants in the **Identifier** column, which shall have the type indicated in the **Type** column:

Argument	Type	Null-Value	Identifier
<i>label</i>	char *	(char*)0	MM_NULLLBL
<i>severity</i>	int	0	MM_NULLSEV
<i>class</i>	long	0L	MM_NULLMC
<i>text</i>	char *	(char*)0	MM_NULLTXT
<i>action</i>	char *	(char*)0	MM_NULLACT
<i>tag</i>	char *	(char*)0	MM_NULLTAG

The <fmtmsg.h> header shall also define the following symbolic constants for use as return values for *fmtmsg()*:

MM_OK	The function succeeded.
MM_NOTOK	The function failed completely.
MM_NOMSG	The function was unable to generate a message on standard error, but otherwise succeeded.

8341 MM_NOCON The function was unable to generate a console message, but otherwise
8342 succeeded.

8343 The following shall be declared as a function and may also be defined as a macro. A function
8344 prototype shall be provided.

NAME

ftw.h — file tree traversal

SYNOPSIS

```
XSI      #include <ftw.h>
```

DESCRIPTION

The <ftw.h> header shall define the **FTW** structure, which shall include at least the following members:

```
int  base
int  level
```

The <ftw.h> header shall define the following symbolic constants for use as values of the third argument to the application-supplied function that is passed as the second argument to *ftw()* and *nftw()*:

FTW_F	Non-directory file.
FTW_D	Directory.
FTW_DNR	Directory without read permission.
FTW_DP	Directory with subdirectories visited.
FTW_NS	Unknown type; <i>stat()</i> failed.
FTW_SL	Symbolic link.
FTW_SLN	Symbolic link that names a nonexistent file.

The <ftw.h> header shall define the following symbolic constants for use as values of the fourth argument to *nftw()*:

FTW_PHYS	Physical walk, does not follow symbolic links. Otherwise, <i>nftw()</i> follows links but does not walk down any path that crosses itself.
FTW_MOUNT	The walk does not cross a mount point.
FTW_DEPTH	All subdirectories are visited before the directory itself.
FTW_CHDIR	The walk changes to each directory before reading it.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
OB      int ftw(const char *, int (*)(const char *, const struct stat *,
8417      int), int);
8418      int nftw(const char *, int (*)(const char *, const struct stat *,
8419      int, struct FTW *), int, int);
```

The <ftw.h> header shall define the **stat** structure and the symbolic names for *st_mode* and the file type test macros as described in <sys/stat.h>.

Inclusion of the <ftw.h> header may also make visible all symbols from <sys/stat.h>.

8423 APPLICATION USAGE

8424 None.

8425 RATIONALE

8426 None.

+

8440 **NAME**

8441 glob.h — pathname pattern-matching types

8442 **SYNOPSIS**

8443 #include <glob.h>

8444 **DESCRIPTION**

8445 The <glob.h> header shall define the structures and symbolic constants used by the *glob()*
8446 function.

8447 The <glob.h> header shall define the **glob_t** structure type, which shall include at least the
8448 following members:

8449 size_t gl_pathc Count of paths matched by *pattern*.
8450 char **gl_pathv Pointer to a list of matched pathnames.
8451 size_t gl_offs Slots to reserve at the beginning of *gl_pathv*.

8452 The <glob.h> header shall define the **size_t** type as described in <sys/types.h>.

8453 The <glob.h> header shall define the following symbolic constants as values for the *flags*
8454 argument:

8455 GLOB_APPEND Append generated pathnames to those previously obtained.
8456 GLOB_DOOFFS Specify how many null pointers to add to the beginning of *gl_pathv*.
8457 GLOB_ERR Cause *glob()* to return on error.
8458 GLOB_MARK Each pathname that is a directory that matches *pattern* has a <slash>
8459 appended.
8460 GLOB_NOCHECK If *pattern* does not match any pathname, then return a list consisting of
8461 only *pattern*.
8462 GLOB_NOESCAPE Disable backslash escaping.
8463 GLOB_NOSORT Do not sort the pathnames returned.
8464 The <glob.h> header shall define the following symbolic constants as error return values:
8465 GLOB_ABORTED The scan was stopped because GLOB_ERR was set or (*errfunc)() returned non-zero.
8466
8467 GLOB_NOMATCH The pattern does not match any existing pathname, and
8468 GLOB_NOCHECK was not set in *flags*.
8469 GLOB_NOSPACE An attempt to allocate memory failed.

8470 The following shall be declared as functions and may also be defined as macros. Function
8471 prototypes shall be provided.

8472 int glob(const char *restrict, int, int (*)(const char *, int),
8473 glob_t *restrict);
8474 void globfree(glob_t *);

8485 First released in Issue 4. Derived from the ISO POSIX-2 standard.

8486 **Issue 6**8487 The **restrict** keyword is added to the prototype for *glob()*.

8488 The GLOB_NOSYS constant is marked obsolescent.

8489 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/8 is applied, correcting the *glob()*
8490 prototype definition by removing the **restrict** qualifier from the function pointer argument.8491 **Issue 7**8492 SD5-XBD-ERN-56 is applied, adding a reference to <sys/types.h> for the **size_t**

8493 The obsolescent GLOB_NOSYS constant is removed.

8494 This reference page is clarified with respect to macros and symbolic constants.

8495 **NAME**

8496 grp.h — group structure

8497 **SYNOPSIS**

8498 #include <grp.h>

8499 **DESCRIPTION**

8500 The <grp.h> header shall declare the **group** structure, which shall include the following
8501 members:

8502 char *gr_name The name of the group.
8503 gid_t gr_gid Numerical group ID.
8504 char **gr_mem Pointer to a null-terminated array of character
8505 pointers to member names.

8506 The <grp.h> header shall define the **gid_t** and **size_t** types as described in <sys/types.h>.

8507 The following shall be declared as functions and may also be defined as macros. Function
8508 prototypes shall be provided.

8509 XSI void endgrent(void);
8510 struct group *getgrent(void);
8511 struct group *getgrgid(gid_t);
8512 int getgrgid_r(gid_t, struct group *, char *,
8513 size_t, struct group **);
8514 struct group *getgrnam(const char *);
8515 int getgrnam_r(const char *, struct group *, char *,
8516 size_t, struct group **);

8529 **Issue 5**

8530 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

8531 **Issue 6**

8532 The following new requirements on POSIX implementations derive from alignment with the
8533 Single UNIX Specification:

- 8534 • The definition of **gid_t** is mandated.
- 8535 • The *getgrgid_r()* and *getgrnam_r()* functions are marked as part of the Thread-Safe
8536 Functions option.

8537 **Issue 7**

8538 SD5-XBD-ERN-56 is applied, adding a reference to <sys/types.h> for the **size_t** type.

8539 POSIX.1-2008, Technical Corrigendum 1, XBD/TC1-2008/0049 [24] is applied.

8540 **NAME**

8541 iconv.h — codeset conversion facility

8542 **SYNOPSIS**

8543 #include <iconv.h>

8544 **DESCRIPTION**

8545 The <iconv.h> header shall define the following types:

8546 **iconv_t** Identifies the conversion from one codeset to another.

8547 **size_t** As described in <sys/types.h>.

8548 The following shall be declared as functions and may also be defined as macros. Function
8549 prototypes shall be provided.

```
8550 size_t iconv(iconv_t, char **restrict, size_t *restrict,
8551             char **restrict, size_t *restrict);
8552 int iconv_close(iconv_t);
8553 iconv_t iconv_open(const char *, const char *);
```

8565 **Issue 6**

8566 The **restrict** keyword is added to the prototype for *iconv()*.

8567 **Issue 7**

8568 SD5-XBD-ERN-56 is applied, adding a reference to <sys/types.h> for the **size_t** type.

8569 The <iconv.h> header is moved from the XSI option to the Base.

8570 NAME

8571 inttypes.h — fixed size integer types

8572 SYNOPSIS

8573 #include <inttypes.h>

8574 DESCRIPTION

8575 CX Some of the functionality described on this reference page extends the ISO C standard.
 8576 Applications shall define the appropriate feature test macro (see XSH Section 2.2, on page 472) to
 8577 enable the visibility of these symbols in this header.

8578 The <inttypes.h> header shall include the <stdint.h> header.

8579 The <inttypes.h> header shall define at least the following types: |

8580 **imaxdiv_t** Structure type that is the type of the value returned by the *imaxdiv()* function.8581 CX **wchar_t** As described in <stddef.h>. +

8582 The <inttypes.h> header shall define the following macros. Each expands to a character string
 8583 literal containing a conversion specifier, possibly modified by a length modifier, suitable for use
 8584 within the *format* argument of a formatted input/output function when converting the
 8585 corresponding integer type. These macros have the general form of PRI (character string literals
 8586 for the *fprintf()* and *fwprintf()* family of functions) or SCN (character string literals for the
 8587 *fscanf()* and *fwscanf()* family of functions), followed by the conversion specifier, followed by a
 8588 name corresponding to a similar type name in <stdint.h>. In these names, *N* represents the
 8589 width of the type as described in <stdint.h>. For example, *PRIdFAST32* can be used in a format
 8590 string to print the value of an integer of type **int_fast32_t**.

8591 The *fprintf()* macros for signed integers are:

8592	PRIdN	PRIdLEASTN	PRIdFASTN	PRIdMAX	PRIdPTR
8593	PRiN	PRiLEASTN	PRiFASTN	PRiMAX	PRiPTR

8594 The *fprintf()* macros for unsigned integers are:

8595	PRIoN	PRIoLEASTN	PRIoFASTN	PRIoMAX	PRIoPTR
8596	PRiUN	PRiULEASTN	PRiUFASTN	PRiUMAX	PRiUPTR
8597	PRIxN	PRiXLEASTN	PRiXFASTN	PRiXMAX	PRiXPTR
8598	PRIXN	PRiXLEASTN	PRiXFASTN	PRiXMAX	PRiXPTR

8599 The *fscanf()* macros for signed integers are:

8600	SCNdN	SCNdLEASTN	SCNdFASTN	SCNdMAX	SCNdPTR
8601	SCNiN	SCNiLEASTN	SCNiFASTN	SCNiMAX	SCNiPTR

8602 The *fscanf()* macros for unsigned integers are:

8603	SCNoN	SCNoLEASTN	SCNoFASTN	SCNoMAX	SCNoPTR
8604	SCNuN	SCNuLEASTN	SCNuFASTN	SCNuMAX	SCNuPTR
8605	SCNxN	SCNxLEASTN	SCNxFASTN	SCNxMAX	SCNxPTR

8606 For each type that the implementation provides in <stdint.h>, the corresponding *fprintf()* and
 8607 *fwprintf()* macros shall be defined and the corresponding *fscanf()* and *fwscanf()* macros shall be
 8608 defined unless the implementation does not have a suitable modifier for the type.

8609 The following shall be declared as functions and may also be defined as macros. Function
 8610 prototypes shall be provided.

```

8611     intmax_t  imaxabs(intmax_t);
8612     imaxdiv_t imaxdiv(intmax_t, intmax_t);
8613     intmax_t  strtoumax(const char *restrict, char **restrict, int);
8614     uintmax_t strtoumax(const char *restrict, char **restrict, int);
8615     intmax_t  wcstoumax(const wchar_t *restrict, wchar_t **restrict, int);
8616     uintmax_t wcstoumax(const wchar_t *restrict, wchar_t **restrict, int);

```

EXAMPLES

```

8617     #include <inttypes.h>
8618     #include <wchar.h>
8619     int main(void)
8620     {
8621         uintmax_t i = UINTMAX_MAX; // This type always exists.
8622         wprintf(L"The largest integer value is %020"
8623             PRIxMAX "\n", i);
8624         return 0;
8625     }
8626

```

APPLICATION USAGE

The purpose of **<inttypes.h>** is to provide a set of integer types whose definitions are consistent across machines and independent of operating systems and other implementation idiosyncrasies. It defines, through **typedef**, integer types of various sizes. Implementations are free to **typedef** them as ISO C standard integer types or extensions that they support. Consistent use of this header will greatly increase the portability of applications across platforms.

RATIONALE

The ISO/IEC 9899:1990 standard specified that the language should support four signed and unsigned integer data types—**char**, **short**, **int**, and **long**—but placed very little requirement on their size other than that **int** and **short** be at least 16 bits and **long** be at least as long as **int** and not smaller than 32 bits. For 16-bit systems, most implementations assigned 8, 16, 16, and 32 bits to **char**, **short**, **int**, and **long**, respectively. For 32-bit systems, the common practice has been to assign 8, 16, 32, and 32 bits to these types. This difference in **int** size can create some problems for users who migrate from one system to another which assigns different sizes to integer types, because the ISO C standard integer promotion rule can produce silent changes unexpectedly. The need for defining an extended integer type increased with the introduction of 64-bit systems.

FUTURE DIRECTIONS

Macro names beginning with PRI or SCN followed by any lowercase letter or 'X' may be added to the macros defined in the **<inttypes.h>** header.

8688 **NAME**

8689 langinfo.h — language information constants

8690 **SYNOPSIS**

8691 #include <langinfo.h>

8692 **DESCRIPTION**8693 The <langinfo.h> header shall define the symbolic constants used to identify items of *langinfo*
8694 data (see *nl_langinfo()*).8695 The <langinfo.h> header shall define the **locale_t** type as described in <locale.h>.8696 The <langinfo.h> header shall define the **nl_item** type as described in <nl_types.h>.8697 The <langinfo.h> header shall define the following symbolic constants with type **nl_item**. The
8698 entries under **Category** indicate in which *setlocale()* category each item is defined.

Constant	Category	Meaning
CODESET	LC_CTYPE	Codeset name.
D_T_FMT	LC_TIME	String for formatting date and time.
D_FMT	LC_TIME	Date format string.
T_FMT	LC_TIME	Time format string.
T_FMT_AMPM	LC_TIME	a.m. or p.m. time format string.
AM_STR	LC_TIME	Ante-meridiem affix.
PM_STR	LC_TIME	Post-meridiem affix.
DAY_1	LC_TIME	Name of the first day of the week (for example, Sunday).
DAY_2	LC_TIME	Name of the second day of the week (for example, Monday).
DAY_3	LC_TIME	Name of the third day of the week (for example, Tuesday).
DAY_4	LC_TIME	Name of the fourth day of the week (for example, Wednesday).
DAY_5	LC_TIME	Name of the fifth day of the week (for example, Thursday).
DAY_6	LC_TIME	Name of the sixth day of the week (for example, Friday).
DAY_7	LC_TIME	Name of the seventh day of the week (for example, Saturday).
ABDAY_1	LC_TIME	Abbreviated name of the first day of the week.
ABDAY_2	LC_TIME	Abbreviated name of the second day of the week.
ABDAY_3	LC_TIME	Abbreviated name of the third day of the week.
ABDAY_4	LC_TIME	Abbreviated name of the fourth day of the week.
ABDAY_5	LC_TIME	Abbreviated name of the fifth day of the week.
ABDAY_6	LC_TIME	Abbreviated name of the sixth day of the week.
ABDAY_7	LC_TIME	Abbreviated name of the seventh day of the week.
MON_1	LC_TIME	Name of the first month of the year.
MON_2	LC_TIME	Name of the second month.
MON_3	LC_TIME	Name of the third month.
MON_4	LC_TIME	Name of the fourth month.
MON_5	LC_TIME	Name of the fifth month.
MON_6	LC_TIME	Name of the sixth month.
MON_7	LC_TIME	Name of the seventh month.
MON_8	LC_TIME	Name of the eighth month.
MON_9	LC_TIME	Name of the ninth month.
MON_10	LC_TIME	Name of the tenth month.
MON_11	LC_TIME	Name of the eleventh month.
MON_12	LC_TIME	Name of the twelfth month.
ABMON_1	LC_TIME	Abbreviated name of the first month.

Constant	Category	Meaning
ABMON_2	LC_TIME	Abbreviated name of the second month.
ABMON_3	LC_TIME	Abbreviated name of the third month.
ABMON_4	LC_TIME	Abbreviated name of the fourth month.
ABMON_5	LC_TIME	Abbreviated name of the fifth month.
ABMON_6	LC_TIME	Abbreviated name of the sixth month.
ABMON_7	LC_TIME	Abbreviated name of the seventh month.
ABMON_8	LC_TIME	Abbreviated name of the eighth month.
ABMON_9	LC_TIME	Abbreviated name of the ninth month.
ABMON_10	LC_TIME	Abbreviated name of the tenth month.
ABMON_11	LC_TIME	Abbreviated name of the eleventh month.
ABMON_12	LC_TIME	Abbreviated name of the twelfth month.
ERA	LC_TIME	Era description segments.
ERA_D_FMT	LC_TIME	Era date format string.
ERA_D_T_FMT	LC_TIME	Era date and time format string.
ERA_T_FMT	LC_TIME	Era time format string.
ALT_DIGITS	LC_TIME	Alternative symbols for digits.
RADIXCHAR	LC_NUMERIC	Radix character.
THOUSEP	LC_NUMERIC	Separator for thousands.
YESEXPR	LC_MESSAGES	Affirmative response expression.
NOEXPR	LC_MESSAGES	Negative response expression.
CRNCYSTR	LC_MONETARY	Local currency symbol, preceded by '-' if the symbol should appear before the value, '+' if the symbol should appear after the value, or '.' if the symbol should replace the radix character. If the local currency symbol is the empty string, implementations may return the empty string ("").

If the locale's values for **p_cs_precedes** and **n_cs_precedes** do not match, the value of `nl_langinfo(CRNCYSTR)` and `nl_langinfo_l(CRNCYSTR, loc)` is unspecified.

The following shall be declared as a function and may also be defined as a macro. A function prototype shall be provided.

```
char *nl_langinfo(nl_item);
char *nl_langinfo_l(nl_item, locale_t);
```

Inclusion of the <langinfo.h> header may also make visible all symbols from <nl_types.h>.

APPLICATION USAGE

Wherever possible, users are advised to use functions compatible with those in the ISO C standard to access items of *langinfo* data. In particular, the `strftime()` function should be used to access date and time information defined in category `LC_TIME`. The `localeconv()` function should be used to access information corresponding to `RADIXCHAR`, `THOUSEP`, and `CRNCYSTR`.

RATIONALE

None.

FUTURE DIRECTIONS

None.

NAME

limits.h — implementation-defined constants

SYNOPSIS

```
#include <limits.h>
```

DESCRIPTION

Some of the functionality described on this reference page extends the ISO C standard. Applications shall define the appropriate feature test macro (see XSH [Section 2.2](#), on page 472) to enable the visibility of these symbols in this header.

Many of the symbols listed here are not defined by the ISO/IEC 9899:1999 standard. Such symbols are not shown as CX shaded, except under the heading “Numerical Limits”.

The <limits.h> header shall define macros and symbolic constants for various limits. Different categories of limits are described below, representing various limits on resources that the implementation imposes on applications. All macros and symbolic constants defined in this header shall be suitable for use in #if preprocessing directives.

Implementations may choose any appropriate value for each limit, provided it is not more restrictive than the Minimum Acceptable Values listed below. Symbolic constant names beginning with _POSIX may be found in <unistd.h>.

Applications should not assume any particular value for a limit. To achieve maximum portability, an application should not require more resource than the Minimum Acceptable Value quantity. However, an application wishing to avail itself of the full amount of a resource available on an implementation may make use of the value given in <limits.h> on that particular implementation, by using the macros and symbolic constants listed below. It should be noted, however, that many of the listed limits are not invariant, and at runtime, the value of the limit may differ from those given in this header, for the following reasons:

- The limit is pathname-dependent.
- The limit differs between the compile and runtime machines.

For these reasons, an application may use the *fpathconf()*, *pathconf()*, and *sysconf()* functions to determine the actual value of a limit at runtime.

The items in the list ending in _MIN give the most negative values that the mathematical types are guaranteed to be capable of representing. Numbers of a more negative value may be supported on some implementations, as indicated by the <limits.h> header on the implementation, but applications requiring such numbers are not guaranteed to be portable to all implementations. For positive constants ending in _MIN, this indicates the minimum acceptable value.

Runtime Invariant Values (Possibly Indeterminate)

A definition of one of the symbolic constants in the following list shall be omitted from <limits.h> on specific implementations where the corresponding value is equal to or greater than the stated minimum, but is unspecified.

This indetermination might depend on the amount of available memory space on a specific instance of a specific implementation. The actual value supported by a specific instance shall be provided by the *sysconf()* function.

{AIO_LISTIO_MAX}

Maximum number of I/O operations in a single list I/O call supported by the implementation.

Minimum Acceptable Value: {_POSIX_AIO_LISTIO_MAX}

8867 {AIO_MAX}
8868 Maximum number of outstanding asynchronous I/O operations supported by the
8869 implementation.
8870 Minimum Acceptable Value: {_POSIX_AIO_MAX}

8871 {AIO_PRIO_DELTA_MAX}
8872 The maximum amount by which a process can decrease its asynchronous I/O priority level
8873 from its own scheduling priority.
8874 Minimum Acceptable Value: 0

8875 {ARG_MAX}
8876 Maximum length of argument to the *exec* functions including environment data.
8877 Minimum Acceptable Value: {_POSIX_ARG_MAX}

8878 {ATEXIT_MAX}
8879 Maximum number of functions that may be registered with *atexit()*.
8880 Minimum Acceptable Value: 32

8881 {CHILD_MAX}
8882 Maximum number of simultaneous processes per real user ID.
8883 Minimum Acceptable Value: {_POSIX_CHILD_MAX}

8884 {DELAYTIMER_MAX}
8885 Maximum number of timer expiration overruns.
8886 Minimum Acceptable Value: {_POSIX_DELAYTIMER_MAX}

8887 {HOST_NAME_MAX}
8888 Maximum length of a host name (not including the terminating null) as returned from the
8889 *gethostname()* function.
8890 Minimum Acceptable Value: {_POSIX_HOST_NAME_MAX}

8891 XSI {IOV_MAX}
8892 Maximum number of **iovec** structures that one process has available for use with *readv()* or
8893 *writev()*.
8894 Minimum Acceptable Value: {_XOPEN_IOV_MAX}

8895 {LOGIN_NAME_MAX}
8896 Maximum length of a login name.
8897 Minimum Acceptable Value: {_POSIX_LOGIN_NAME_MAX}

8898 MSG {MQ_OPEN_MAX}
8899 The maximum number of open message queue descriptors a process may hold.
8900 Minimum Acceptable Value: {_POSIX_MQ_OPEN_MAX}

8901 MSG {MQ_PRIO_MAX}
8902 The maximum number of message priorities supported by the implementation.
8903 Minimum Acceptable Value: {_POSIX_MQ_PRIO_MAX}

8904 {OPEN_MAX}
8905 A value one greater than the maximum value that the system may assign to a newly-created
8906 file descriptor.
8907 Minimum Acceptable Value: {_POSIX_OPEN_MAX}

8908 {PAGESIZE}
8909 Size in bytes of a page.
8910 Minimum Acceptable Value: 1

8911 XSI **{PAGE_SIZE}**
8912 Equivalent to {PAGESIZE}. If either {PAGESIZE} or {PAGE_SIZE} is defined, the other is
8913 defined with the same value.

8914 {PTHREAD_DESTRUCTOR_ITERATIONS}
8915 Maximum number of attempts made to destroy a thread's thread-specific data values on
8916 thread exit.
8917 Minimum Acceptable Value: {_POSIX_THREAD_DESTRUCTOR_ITERATIONS}

8918 {PTHREAD_KEYS_MAX}
8919 Maximum number of data keys that can be created by a process.
8920 Minimum Acceptable Value: {_POSIX_THREAD_KEYS_MAX}

8921 {PTHREAD_STACK_MIN}
8922 Minimum size in bytes of thread stack storage.
8923 Minimum Acceptable Value: 0

8924 {PTHREAD_THREADS_MAX}
8925 Maximum number of threads that can be created per process.
8926 Minimum Acceptable Value: {_POSIX_THREAD_THREADS_MAX}

8927 {RE_DUP_MAX}
8928 Maximum number of repeated occurrences of a BRE or ERE interval expression; see [Section](#)
8929 [9.3.6](#) (on page 186) and [Section 9.4.6](#) (on page 189).
8930 Minimum Acceptable Value: {_POSIX2_RE_DUP_MAX}

8931 {RTSIG_MAX}
8932 Maximum number of realtime signals reserved for application use in this implementation.
8933 Minimum Acceptable Value: {_POSIX_RTSIG_MAX}

8934 {SEM_NSEMS_MAX}
8935 Maximum number of semaphores that a process may have.
8936 Minimum Acceptable Value: {_POSIX_SEM_NSEMS_MAX}

8937 {SEM_VALUE_MAX}
8938 The maximum value a semaphore may have.
8939 Minimum Acceptable Value: {_POSIX_SEM_VALUE_MAX}

8940 {SIGQUEUE_MAX}
8941 Maximum number of queued signals that a process may send and have pending at the
8942 receiver(s) at any time.
8943 Minimum Acceptable Value: {_POSIX_SIGQUEUE_MAX}

8944 SS | TSP **{SS_REPL_MAX}**
8945 The maximum number of replenishment operations that may be simultaneously pending
8946 for a particular sporadic server scheduler.
8947 Minimum Acceptable Value: {_POSIX_SS_REPL_MAX}

8948 {STREAM_MAX}
8949 Maximum number of streams that one process can have open at one time. If defined, it has
8950 the same value as {FOPEN_MAX} (see <stdio.h>).
8951 Minimum Acceptable Value: {_POSIX_STREAM_MAX}

8952 {SYMLOOP_MAX}
8953 Maximum number of symbolic links that can be reliably traversed in the resolution of a
8954 pathname in the absence of a loop.
8955 Minimum Acceptable Value: {_POSIX_SYMLOOP_MAX}

8956 {TIMER_MAX}
 8957 Maximum number of timers per process supported by the implementation.
 8958 Minimum Acceptable Value: {_POSIX_TIMER_MAX}

8959 OB TRC {TRACE_EVENT_NAME_MAX}
 8960 Maximum length of the trace event name (not including the terminating null).
 8961 Minimum Acceptable Value: {_POSIX_TRACE_EVENT_NAME_MAX}

8962 OB TRC {TRACE_NAME_MAX}
 8963 Maximum length of the trace generation version string or of the trace stream name (not
 8964 including the terminating null).
 8965 Minimum Acceptable Value: {_POSIX_TRACE_NAME_MAX}

8966 OB TRC {TRACE_SYS_MAX}
 8967 Maximum number of trace streams that may simultaneously exist in the system.
 8968 Minimum Acceptable Value: {_POSIX_TRACE_SYS_MAX}

8969 OB TRC {TRACE_USER_EVENT_MAX}
 8970 Maximum number of user trace event type identifiers that may simultaneously exist in a
 8971 traced process, including the predefined user trace event
 8972 POSIX_TRACE_UNNAMED_USER_EVENT.
 8973 Minimum Acceptable Value: {_POSIX_TRACE_USER_EVENT_MAX}

8974 {TTY_NAME_MAX}
 8975 Maximum length of terminal device name.
 8976 Minimum Acceptable Value: {_POSIX_TTY_NAME_MAX}

8977 {TZNAME_MAX}
 8978 Maximum number of bytes supported for the name of a timezone (not of the TZ variable).
 8979 Minimum Acceptable Value: {_POSIX_TZNAME_MAX}

8980 **Note:** The length given by {TZNAME_MAX} does not include the quoting characters mentioned in
 8981 [Section 8.3](#) (on page 177).

Pathname Variable Values

The values in the following list may be constants within an implementation or may vary from one pathname to another. For example, file systems or directories may have different characteristics.

A definition of one of the symbolic constants in the following list shall be omitted from the <limits.h> header on specific implementations where the corresponding value is equal to or greater than the stated minimum, but where the value can vary depending on the file to which it is applied. The actual value supported for a specific pathname shall be provided by the *pathconf()* function.

8991 {FILESIZEBITS}
 8992 Minimum number of bits needed to represent, as a signed integer value, the maximum size
 8993 of a regular file allowed in the specified directory.
 8994 Minimum Acceptable Value: 32

8995 {LINK_MAX}
 8996 Maximum number of links to a single file.
 8997 Minimum Acceptable Value: {_POSIX_LINK_MAX}

8998 {MAX_CANON}
 8999 Maximum number of bytes in a terminal canonical input line.
 9000 Minimum Acceptable Value: {_POSIX_MAX_CANON}

9001		{MAX_INPUT}
9002		Minimum number of bytes for which space is available in a terminal input queue; therefore,
9003		the maximum number of bytes a conforming application may require to be typed as input
9004		before reading them.
9005		Minimum Acceptable Value: {_POSIX_MAX_INPUT}
9006		{NAME_MAX}
9007		Maximum number of bytes in a filename (not including the terminating null of a filename
9008		string).
9009		Minimum Acceptable Value: {_POSIX_NAME_MAX}
9010	XSI	Minimum Acceptable Value: {_XOPEN_NAME_MAX}
9011		{PATH_MAX}
9012		Maximum number of bytes the implementation will store as a pathname in a user-supplied
9013		buffer of unspecified size, including the terminating null character. Minimum number the
9014		implementation will accept as the maximum number of bytes in a pathname.
9015		Minimum Acceptable Value: {_POSIX_PATH_MAX}
9016	XSI	Minimum Acceptable Value: {_XOPEN_PATH_MAX}
9017		{PIPE_BUF}
9018		Maximum number of bytes that is guaranteed to be atomic when writing to a pipe.
9019		Minimum Acceptable Value: {_POSIX_PIPE_BUF}
9020	ADV	{POSIX_ALLOC_SIZE_MIN}
9021		Minimum number of bytes of storage actually allocated for any portion of a file.
9022		Minimum Acceptable Value: Not specified.
9023	ADV	{POSIX_REC_INCR_XFER_SIZE}
9024		Recommended increment for file transfer sizes between the
9025		{POSIX_REC_MIN_XFER_SIZE} and {POSIX_REC_MAX_XFER_SIZE} values.
9026		Minimum Acceptable Value: Not specified.
9027	ADV	{POSIX_REC_MAX_XFER_SIZE}
9028		Maximum recommended file transfer size.
9029		Minimum Acceptable Value: Not specified.
9030	ADV	{POSIX_REC_MIN_XFER_SIZE}
9031		Minimum recommended file transfer size.
9032		Minimum Acceptable Value: Not specified.
9033	ADV	{POSIX_REC_XFER_ALIGN}
9034		Recommended file transfer buffer alignment.
9035		Minimum Acceptable Value: Not specified.
9036		{SYMLINK_MAX}
9037		Maximum number of bytes in a symbolic link.
9038		Minimum Acceptable Value: {_POSIX_SYMLINK_MAX}

Runtime Increaseable Values

The magnitude limitations in the following list shall be fixed by specific implementations. An application should assume that the value of the symbolic constant defined by <limits.h> in a specific implementation is the minimum that pertains whenever the application is run under that implementation. A specific instance of a specific implementation may increase the value relative to that supplied by <limits.h> for that implementation. The actual value supported by a specific instance shall be provided by the *sysconf()* function.

{BC_BASE_MAX}

Maximum *obase* values allowed by the *bc* utility.

Minimum Acceptable Value: {_POSIX2_BC_BASE_MAX}

{BC_DIM_MAX}

Maximum number of elements permitted in an array by the *bc* utility.

Minimum Acceptable Value: {_POSIX2_BC_DIM_MAX}

{BC_SCALE_MAX}

Maximum *scale* value allowed by the *bc* utility.

Minimum Acceptable Value: {_POSIX2_BC_SCALE_MAX}

{BC_STRING_MAX}

Maximum length of a string constant accepted by the *bc* utility.

Minimum Acceptable Value: {_POSIX2_BC_STRING_MAX}

{CHARCLASS_NAME_MAX}

Maximum number of bytes in a character class name.

Minimum Acceptable Value: {_POSIX2_CHARCLASS_NAME_MAX}

{COLL_WEIGHTS_MAX}

Maximum number of weights that can be assigned to an entry of the *LC_COLLATE* **order** keyword in the locale definition file; see [Chapter 7](#) (on page 135).

Minimum Acceptable Value: {_POSIX2_COLL_WEIGHTS_MAX}

{EXPR_NEST_MAX}

Maximum number of expressions that can be nested within parentheses by the *expr* utility.

Minimum Acceptable Value: {_POSIX2_EXPR_NEST_MAX}

{LINE_MAX}

Unless otherwise noted, the maximum length, in bytes, of a utility's input line (either standard input or another file), when the utility is described as processing text files. The length includes room for the trailing <newline>.

Minimum Acceptable Value: {_POSIX2_LINE_MAX}

{NGROUPS_MAX}

Maximum number of simultaneous supplementary group IDs per process.

Minimum Acceptable Value: {_POSIX2_NGROUPS_MAX}

{RE_DUP_MAX}

Maximum number of repeated occurrences of a regular expression permitted when using the interval notation *\{m,n\}*; see [Chapter 9](#) (on page 181).

Minimum Acceptable Value: {_POSIX2_RE_DUP_MAX}

9080 **Maximum Values**

9081 The <limits.h> header shall define the following symbolic constants with the values shown.
 9082 These are the most restrictive values for certain features on an implementation. A conforming
 9083 implementation shall provide values no larger than these values. A conforming application must
 9084 not require a smaller value for correct operation.

9085 {_POSIX_CLOCKRES_MIN}

9086 The resolution of the CLOCK_REALTIME clock, in nanoseconds.

9087 Value: 20 000 000

9088 MON If the Monotonic Clock option is supported, the resolution of the CLOCK_MONOTONIC
 9089 clock, in nanoseconds, is represented by {_POSIX_CLOCKRES_MIN}.

9090 **Minimum Values**

9091 The <limits.h> header shall define the following symbolic constants with the values shown.
 9092 These are the most restrictive values for certain features on an implementation conforming to
 9093 this volume of POSIX.1-2008. Related symbolic constants are defined elsewhere in this volume
 9094 of POSIX.1-2008 which reflect the actual implementation and which need not be as restrictive. |
 9095 For each of these limits, a conforming implementation shall provide a value at least this large or |
 9096 shall have no limit. A strictly conforming application must not require a larger value for correct |
 9097 operation.

9098 {_POSIX_AIO_LISTIO_MAX}

9099 The number of I/O operations that can be specified in a list I/O call.

9100 Value: 2

9101 {_POSIX_AIO_MAX}

9102 The number of outstanding asynchronous I/O operations.

9103 Value: 1

9104 {_POSIX_ARG_MAX}

9105 Maximum length of argument to the *exec* functions including environment data.

9106 Value: 4 096

9107 {_POSIX_CHILD_MAX}

9108 Maximum number of simultaneous processes per real user ID.

9109 Value: 25

9110 {_POSIX_DELAYTIMER_MAX}

9111 The number of timer expiration overruns.

9112 Value: 32

9113 {_POSIX_HOST_NAME_MAX}

9114 Maximum length of a host name (not including the terminating null) as returned from the
 9115 *gethostname()* function.

9116 Value: 255

9117 {_POSIX_LINK_MAX}

9118 Maximum number of links to a single file.

9119 Value: 8

9120 {_POSIX_LOGIN_NAME_MAX}

9121 The size of the storage required for a login name, in bytes (including the terminating null).

9122 Value: 9

9123		{_POSIX_MAX_CANON}	
9124		Maximum number of bytes in a terminal canonical input queue.	
9125		Value: 255	
9126		{_POSIX_MAX_INPUT}	
9127		Maximum number of bytes allowed in a terminal input queue.	
9128		Value: 255	
9129	MSG	{_POSIX_MQ_OPEN_MAX}	
9130		The number of message queues that can be open for a single process.	
9131		Value: 8	
9132	MSG	{_POSIX_MQ_PRIO_MAX}	
9133		The maximum number of message priorities supported by the implementation.	
9134		Value: 32	
9135		{_POSIX_NAME_MAX}	
9136		Maximum number of bytes in a filename (not including the terminating null of a filename string).	
9137		Value: 14	
9138			
9139		{_POSIX_NGROUPS_MAX}	
9140		Maximum number of simultaneous supplementary group IDs per process.	
9141		Value: 8	
9142		{_POSIX_OPEN_MAX}	
9143		A value one greater than the maximum value that the system may assign to a newly-created file descriptor.	
9144		Value: 20	
9145			
9146		{_POSIX_PATH_MAX}	
9147		Minimum number the implementation will accept as the maximum number of bytes in a pathname.	
9148		Value: 256	
9149			
9150		{_POSIX_PIPE_BUF}	
9151		Maximum number of bytes that is guaranteed to be atomic when writing to a pipe.	
9152		Value: 512	
9153		{_POSIX_RE_DUP_MAX}	
9154		The number of repeated occurrences of a BRE permitted by the <i>regexec()</i> and <i>regcomp()</i> functions when using the interval notation $\{ \backslash(m,n\backslash \}$; see Section 9.3.6 (on page 186).	
9155		Value: 255	
9156			
9157		{_POSIX_RTSIG_MAX}	
9158		The number of realtime signal numbers reserved for application use.	
9159		Value: 8	
9160		{_POSIX_SEM_NSEMS_MAX}	
9161		The number of semaphores that a process may have.	
9162		Value: 256	
9163		{_POSIX_SEM_VALUE_MAX}	
9164		The maximum value a semaphore may have.	
9165		Value: 32 767	

9166		{_POSIX_SIGQUEUE_MAX}
9167		The number of queued signals that a process may send and have pending at the receiver(s)
9168		at any time.
9169		Value: 32
9170		{_POSIX_SSIZE_MAX}
9171		The value that can be stored in an object of type ssize_t .
9172		Value: 32 767
9173	SS TSP	{_POSIX_SS_REPL_MAX}
9174		The number of replenishment operations that may be simultaneously pending for a
9175		particular sporadic server scheduler.
9176		Value: 4
9177		{_POSIX_STREAM_MAX}
9178		The number of streams that one process can have open at one time.
9179		Value: 8
9180		{_POSIX_SYMLINK_MAX}
9181		The number of bytes in a symbolic link.
9182		Value: 255
9183		{_POSIX_SYMLINK_MAX}
9184		The number of symbolic links that can be traversed in the resolution of a pathname in the
9185		absence of a loop.
9186		Value: 8
9187		{_POSIX_THREAD_DESTRUCTOR_ITERATIONS}
9188		The number of attempts made to destroy a thread's thread-specific data values on thread
9189		exit.
9190		Value: 4
9191		{_POSIX_THREAD_KEYS_MAX}
9192		The number of data keys per process.
9193		Value: 128
9194		{_POSIX_THREAD_THREADS_MAX}
9195		The number of threads per process.
9196		Value: 64
9197		{_POSIX_TIMER_MAX}
9198		The per-process number of timers.
9199		Value: 32
9200	OB TRC	{_POSIX_TRACE_EVENT_NAME_MAX}
9201		The length in bytes of a trace event name (not including the terminating null).
9202		Value: 30
9203	OB TRC	{_POSIX_TRACE_NAME_MAX}
9204		The length in bytes of a trace generation version string or a trace stream name (not
9205		including the terminating null).
9206		Value: 8
9207	OB TRC	{_POSIX_TRACE_SYS_MAX}
9208		The number of trace streams that may simultaneously exist in the system.
9209		Value: 8

9210 OB TRC `{_POSIX_TRACE_USER_EVENT_MAX}`
 9211 The number of user trace event type identifiers that may simultaneously exist in a traced
 9212 process, including the predefined user trace event
 9213 `POSIX_TRACE_UNNAMED_USER_EVENT`.
 9214 Value: 32

9215 `{_POSIX_TTY_NAME_MAX}`
 9216 The size of the storage required for a terminal device name, in bytes (including the
 9217 terminating null).
 9218 Value: 9

9219 `{_POSIX_TZNAME_MAX}`
 9220 Maximum number of bytes supported for the name of a timezone (not of the *TZ* variable).
 9221 Value: 6

9222 **Note:** The length given by `{_POSIX_TZNAME_MAX}` does not include the quoting characters
 9223 mentioned in [Section 8.3](#) (on page 177).

9224 `{_POSIX2_BC_BASE_MAX}`
 9225 Maximum *obase* values allowed by the *bc* utility.
 9226 Value: 99

9227 `{_POSIX2_BC_DIM_MAX}`
 9228 Maximum number of elements permitted in an array by the *bc* utility.
 9229 Value: 2 048

9230 `{_POSIX2_BC_SCALE_MAX}`
 9231 Maximum *scale* value allowed by the *bc* utility.
 9232 Value: 99

9233 `{_POSIX2_BC_STRING_MAX}`
 9234 Maximum length of a string constant accepted by the *bc* utility.
 9235 Value: 1 000

9236 `{_POSIX2_CHARCLASS_NAME_MAX}`
 9237 Maximum number of bytes in a character class name.
 9238 Value: 14

9239 `{_POSIX2_COLL_WEIGHTS_MAX}`
 9240 Maximum number of weights that can be assigned to an entry of the *LC_COLLATE* **order**
 9241 keyword in the locale definition file; see [Chapter 7](#) (on page 135).
 9242 Value: 2

9243 `{_POSIX2_EXPR_NEST_MAX}`
 9244 Maximum number of expressions that can be nested within parentheses by the *expr* utility.
 9245 Value: 32

9246 `{_POSIX2_LINE_MAX}`
 9247 Unless otherwise noted, the maximum length, in bytes, of a utility's input line (either
 9248 standard input or another file), when the utility is described as processing text files. The
 9249 length includes room for the trailing <newline>.
 9250 Value: 2 048

9251 `{_POSIX2_RE_DUP_MAX}`
 9252 Maximum number of repeated occurrences of a regular expression permitted when using
 9253 the interval notation `\{m,n\}`; see [Chapter 9](#) (on page 181).
 9254 Value: 255

9255 XSI **{_XOPEN_IOV_MAX}**
 9256 Maximum number of **iovec** structures that one process has available for use with *readv()* or
 9257 *writev()*.
 9258 Value: 16

9259 XSI **{_XOPEN_NAME_MAX}**
 9260 Maximum number of bytes in a filename (not including the terminating null of a filename
 9261 string).
 9262 Value: 255

9263 XSI **{_XOPEN_PATH_MAX}**
 9264 Minimum number the implementation will accept as the maximum number of bytes in a
 9265 pathname.
 9266 Value: 1 024

9267 Numerical Limits

9268 The <limits.h> header shall define the following macros and, except for {CHAR_BIT},
 9269 {LONG_BIT}, {MB_LEN_MAX}, and {WORD_BIT}, they shall be replaced by expressions that
 9270 have the same type as would an expression that is an object of the corresponding type converted
 9271 according to the integer promotions.

9272 If the value of an object of type **char** is treated as a signed integer when used in an expression,
 9273 the value of {CHAR_MIN} is the same as that of {SCHAR_MIN} and the value of {CHAR_MAX}
 9274 is the same as that of {SCHAR_MAX}. Otherwise, the value of {CHAR_MIN} is 0 and the value
 9275 of {CHAR_MAX} is the same as that of {UCHAR_MAX}.

9276 {CHAR_BIT}
 9277 Number of bits in a type **char**.
 9278 CX Value: 8

9279 {CHAR_MAX}
 9280 Maximum value for an object of type **char**.
 9281 Value: {UCHAR_MAX} or {SCHAR_MAX}

9282 {CHAR_MIN}
 9283 Minimum value for an object of type **char**.
 9284 Value: {SCHAR_MIN} or 0

9285 {INT_MAX}
 9286 Maximum value for an object of type **int**.
 9287 CX Minimum Acceptable Value: 2 147 483 647

9288 {INT_MIN}
 9289 Minimum value for an object of type **int**.
 9290 CX Maximum Acceptable Value: -2 147 483 647

9291 {LLONG_MAX}
 9292 Maximum value for an object of type **long long**.
 9293 Minimum Acceptable Value: +9 223 372 036 854 775 807

9294 {LLONG_MIN}
 9295 Minimum value for an object of type **long long**.
 9296 Maximum Acceptable Value: -9 223 372 036 854 775 807

9297 CX **{LONG_BIT}**
 9298 Number of bits in an object of type **long**.
 9299 Minimum Acceptable Value: 32

9300		{LONG_MAX}
9301		Maximum value for an object of type long .
9302		Minimum Acceptable Value: +2 147 483 647
9303		{LONG_MIN}
9304		Minimum value for an object of type long .
9305		Maximum Acceptable Value: -2 147 483 647
9306		{MB_LEN_MAX}
9307		Maximum number of bytes in a character, for any supported locale.
9308		Minimum Acceptable Value: 1
9309		{SCHAR_MAX}
9310		Maximum value for an object of type signed char .
9311	CX	Value: +127
9312		{SCHAR_MIN}
9313		Minimum value for an object of type signed char .
9314	CX	Value: -128
9315		{SHRT_MAX}
9316		Maximum value for an object of type short .
9317		Minimum Acceptable Value: +32 767
9318		{SHRT_MIN}
9319		Minimum value for an object of type short .
9320		Maximum Acceptable Value: -32 767
9321	CX	{SSIZE_MAX}
9322		Maximum value for an object of type ssize_t .
9323		Minimum Acceptable Value: {_POSIX_SSIZE_MAX}
9324		{UCHAR_MAX}
9325		Maximum value for an object of type unsigned char .
9326	CX	Value: 255
9327		{UINT_MAX}
9328		Maximum value for an object of type unsigned .
9329	CX	Minimum Acceptable Value: 4 294 967 295
9330		{ULLONG_MAX}
9331		Maximum value for an object of type unsigned long long .
9332		Minimum Acceptable Value: 18 446 744 073 709 551 615
9333		{ULONG_MAX}
9334		Maximum value for an object of type unsigned long .
9335		Minimum Acceptable Value: 4 294 967 295
9336		{USHRT_MAX}
9337		Maximum value for an object of type unsigned short .
9338		Minimum Acceptable Value: 65 535
9339	CX	{WORD_BIT}
9340		Number of bits in an object of type int .
9341		Minimum Acceptable Value: 32

Other Invariant Values

The <limits.h> header shall define the following symbolic constants:

{NL_ARGMAX}

Maximum value of *n* in conversion specifications using the "%n\$" sequence in calls to the *printf()* and *scanf()* families of functions.

Minimum Acceptable Value: 9

{NL_LANGMAX}

Maximum number of bytes in a *LANG* name.

Minimum Acceptable Value: 14

{NL_MSGMAX}

Maximum message number.

Minimum Acceptable Value: 32 767

{NL_SETMAX}

Maximum set number.

Minimum Acceptable Value: 255

{NL_TEXTMAX}

Maximum number of bytes in a message string.

Minimum Acceptable Value: {_POSIX2_LINE_MAX}

{NZERO}

Default process priority.

Minimum Acceptable Value: 20

APPLICATION USAGE

None.

RATIONALE

A request was made to reduce the value of {_POSIX_LINK_MAX} from the value of 8 specified for it in the POSIX.1-1990 standard to 2. The standard developers decided to deny this request for several reasons:

- They wanted to avoid making any changes to the standard that could break conforming applications, and the requested change could have that effect.
- The use of multiple hard links to a file cannot always be replaced with use of symbolic links. Symbolic links are semantically different from hard links in that they associate a pathname with another pathname rather than a pathname with a file. This has implications for access control, file permanence, and transparency.
- The original standard developers had considered the issue of allowing for implementations that did not in general support hard links, and decided that this would reduce consensus on the standard.

Systems that support historical versions of the development option of the ISO POSIX-2 standard retain the name {_POSIX2_RE_DUP_MAX} as an alias for {_POSIX_RE_DUP_MAX}.

{PATH_MAX}

IEEE PASC Interpretation 1003.1 #15 addressed the inconsistency in the standard with the definition of pathname and the description of {PATH_MAX}, allowing application developers to allocate either {PATH_MAX} or {PATH_MAX}+1 bytes. The inconsistency has been removed by correction to the {PATH_MAX} definition to include the null character. With this change, applications that previously allocated {PATH_MAX} bytes will continue to succeed.

9387 {SYMLINK_MAX}
 9388 This symbol refers to space for data that is stored in the file system, as opposed to
 9389 {PATH_MAX} which is the length of a name that can be passed to a function. In some
 9390 existing implementations, the pathnames pointed to by symbolic links are stored in the
 9391 *inodes* of the links, so it is important that {SYMLINK_MAX} not be constrained to be as large
 9392 as {PATH_MAX}.

9393 FUTURE DIRECTIONS

9394 None.

9398 CHANGE HISTORY

9399 First released in Issue 1.

9400 Issue 5

9401 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX
 9402 Threads Extension.

9403 {FILESIZEBITS} is added for the Large File Summit extensions.

9404 The minimum acceptable values for {INT_MAX}, {INT_MIN}, and {UINT_MAX} are changed to
 9405 make 32-bit values the minimum requirement.

9406 The entry is restructured to improve readability.

9407 Issue 6

9408 The Open Group Corrigendum U033/4 is applied. The wording is made clear for {CHAR_MIN},
 9409 {INT_MIN}, {LONG_MIN}, {SCHAR_MIN}, and {SHRT_MIN} that these are maximum
 9410 acceptable values.

9411 The following new requirements on POSIX implementations derive from alignment with the
 9412 Single UNIX Specification:

- 9413 • The minimum value for {CHILD_MAX} is 25. This is a FIPS requirement.
- 9414 • The minimum value for {OPEN_MAX} is 20. This is a FIPS requirement.
- 9415 • The minimum value for {NGROUPS_MAX} is 8. This is also a FIPS requirement.

9416 Symbolic constants are added for {_POSIX_SYMLINK_MAX}, {_POSIX_SYMLOOP_MAX},
 9417 {_POSIX_RE_DUP_MAX}, {RE_DUP_MAX}, {SYMLOOP_MAX}, and {SYMLINK_MAX}.

9418 The following values are added for alignment with IEEE Std 1003.1d-1999:

9419 {_POSIX_SS_REPL_MAX}
 9420 {SS_REPL_MAX}
 9421 {POSIX_ALLOC_SIZE_MIN}
 9422 {POSIX_REC_INCR_XFER_SIZE}
 9423 {POSIX_REC_MAX_XFER_SIZE}
 9424 {POSIX_REC_MIN_XFER_SIZE}
 9425 {POSIX_REC_XFER_ALIGN}

9426 Reference to CLOCK_MONOTONIC is added in the description of {_POSIX_CLOCKRES_MIN}
 9427 for alignment with IEEE Std 1003.1j-2000.

9428 The constants {LLONG_MIN}, {LLONG_MAX}, and {ULLONG_MAX} are added for alignment

with the ISO/IEC 9899: 1999 standard.

The following values are added for alignment with IEEE Std 1003.1q-2000:

```
{_POSIX_TRACE_EVENT_NAME_MAX}
{TRACE_EVENT_NAME_MAX}
{TRACE_NAME_MAX}
{TRACE_SYS_MAX}
{TRACE_USER_EVENT_MAX}
```

The new limits {_XOPEN_NAME_MAX} and {_XOPEN_PATH_MAX} are added as minimum values for {PATH_MAX} and {NAME_MAX} limits on XSI-conformant systems.

The LEGACY symbols {PASS_MAX} and {TMP_MAX} are removed.

The values for the limits {CHAR_BIT}, {SCHAR_MAX}, and {UCHAR_MAX} are now required to be 8, +127, and 255, respectively.

The value for the limit {CHAR_MAX} is now {UCHAR_MAX} or {SCHAR_MAX}.

The value for the limit {CHAR_MIN} is now {SCHAR_MIN} or zero.

IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/10 is applied, correcting the value of {_POSIX_CHILD_MAX} from 6 to 25. This is for FIPS 151-2 alignment.

IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/19 is applied, updating the values for {INT_MAX}, {UINT_MAX}, and {INT_MIN} to be CX extensions over the ISO C standard, and correcting {WORD_BIT} from 16 to 32.

IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/20 is applied, removing {CHARCLASS_NAME_MAX} from the “Other Invariant Values” section (it also occurs under “Runtime Inceasable Values”).

Issue 7

Austin Group Interpretations 1003.1-2001 #143 and #160 are applied.

Austin Group Interpretation 1003.1-2001 #173 is applied, updating the descriptions of {TRACE_EVENT_NAME_MAX} and {TRACE_NAME_MAX} to not include the terminating null.

SD5-XBD-ERN-36 is applied, changing the description of {RE_DUP_MAX}.

SD5-XBD-ERN-90 is applied.

{NL_NMAX} is removed; it should have been removed in Issue 6.

The Trace option values are marked obsolescent.

The {ATEXIT_MAX}, {LONG_BIT}, {NL_MSGMAX}, {NL_SETMAX}, {NL_TEXTMAX}, and {WORD_BIT} values are moved from the XSI option to the Base.

The AIO_* and _POSIX_AIO_* values are moved from the Asynchronous Input and Output option to the Base.

The {_POSIX_RT_SIG_MAX}, {_POSIX_SIGQUEUE_MAX}, {RTSIG_MAX}, and {SIGQUEUE_MAX} values are moved from the Realtime Signals Extension option to the Base.

Functionality relating to the Threads and Timers options is moved to the Base.

9470 This reference page is clarified with respect to macros and symbolic constants.
 9471 POSIX.1-2008, Technical Corrigendum 1, XBD/TC1-2008/0052 [108], XBD/TC1-2008/0053 [291], +

 9473 XBD/TC1-2008/0057 [291], XBD/TC1-2008/0058 [108], and XBD/TC1-2008/0059 [291] are +
 9474 applied.

9475 **NAME**

9476 locale.h — category macros

9477 **SYNOPSIS**

9478 #include <locale.h>

9479 **DESCRIPTION**

9480 CX Some of the functionality described on this reference page extends the ISO C standard.
 9481 Applications shall define the appropriate feature test macro (see XSH [Section 2.2](#), on page 472) to
 9482 enable the visibility of these symbols in this header.

9483 The <locale.h> header shall define the **lconv** structure, which shall include at least the following
 9484 members. (See the definitions of *LC_MONETARY* in [Section 7.3.3](#) (on page 154) and [Section 7.3.4](#)
 9485 (on page 157).)

```

9486 char    *currency_symbol
9487 char    *decimal_point
9488 char    frac_digits
9489 char    *grouping
9490 char    *int_curr_symbol
9491 char    int_frac_digits
9492 char    int_n_cs_precedes
9493 char    int_n_sep_by_space
9494 char    int_n_sign_posn
9495 char    int_p_cs_precedes
9496 char    int_p_sep_by_space
9497 char    int_p_sign_posn
9498 char    *mon_decimal_point
9499 char    *mon_grouping
9500 char    *mon_thousands_sep
9501 char    *negative_sign
9502 char    n_cs_precedes
9503 char    n_sep_by_space
9504 char    n_sign_posn
9505 char    *positive_sign
9506 char    p_cs_precedes
9507 char    p_sep_by_space
9508 char    p_sign_posn
9509 char    *thousands_sep

```

9510 The <locale.h> header shall define NULL (as described in <stddef.h>) and at least the following
 9511 as macros:

```

9512 LC_ALL
9513 LC_COLLATE
9514 LC_CTYPE
9515 CX LC_MESSAGES
9516 LC_MONETARY
9517 LC_NUMERIC
9518 LC_TIME

```

9519 which shall expand to integer constant expressions with distinct values for use as the first
 9520 argument to the *setlocale()* function.

9521 Implementations may add additional masks using the form *LC_** and an uppercase letter.

9522 CX The <locale.h> header shall contain at least the following macros representing bitmasks for use
 9523 with the *newlocale()* function for each supported locale category:

9524 LC_COLLATE_MASK
 9525 LC_CTYPE_MASK
 9526 LC_MESSAGES_MASK
 9527 LC_MONETARY_MASK
 9528 LC_NUMERIC_MASK
 9529 LC_TIME_MASK

9530 Implementations may add additional masks using the form LC_*_MASK.
 9531 In addition, a macro to set the bits for all categories set shall be defined:
 9532 LC_ALL_MASK

9533 The <locale.h> header shall define LC_GLOBAL_LOCALE, a special locale object descriptor
 9534 used by the *duplocale()* and *uselocale()* functions.

9535 The <locale.h> header shall define the **locale_t** type, representing a locale object.

9536 The following shall be declared as functions and may also be defined as macros. Function
 9537 prototypes shall be provided for use with ISO C standard compilers.

9538 CX `locale_t duplocale(locale_t);`
 9539 `void freelocale(locale_t);`
 9540 `struct lconv *localeconv(void);`
 9541 CX `locale_t newlocale(int, const char *, locale_t);`
 9542 `char *setlocale(int, const char *);`
 9543 CX `locale_t uselocale(locale_t);`

9544 APPLICATION USAGE

9545 None.

9546 RATIONALE

9547 None.

9548 FUTURE DIRECTIONS

9549 None.

9550 SEE ALSO

9551 [Chapter 8](#) (on page 173), [<stddef.h>](#)

9552 XSH [duplocale\(\)](#), [freelocale\(\)](#), [localeconv\(\)](#), [newlocale\(\)](#), [setlocale\(\)](#), [uselocale\(\)](#)

9553 CHANGE HISTORY

9554 First released in Issue 3.

9555 Included for alignment with the ISO C standard.

9556 Issue 6

9557 The **lconv** structure is expanded with new members (**int_n_cs_precedes**, **int_n_sep_by_space**,
 9558 **int_n_sign_posn**, **int_p_cs_precedes**, **int_p_sep_by_space**, and **int_p_sign_posn**) for alignment
 9559 with the ISO/IEC 9899:1999 standard.

9560 Extensions beyond the ISO C standard are marked.

Issue 7

The *duplocale()*, *freelocale()*, *newlocale()*, and *uselocale()* functions are added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

This reference page is clarified with respect to macros and symbolic constants.

POSIX.1-2008, Technical Corrigendum 1, XBD/TC1-2008/0060 [301,427] is applied.

+

9566 **NAME**

9567 **math.h** — mathematical declarations

9568 **SYNOPSIS**

9569 `#include <math.h>`

9570 **DESCRIPTION**

9571 CX Some of the functionality described on this reference page extends the ISO C standard.
9572 Applications shall define the appropriate feature test macro (see XSH [Section 2.2](#), on page 472) to
9573 enable the visibility of these symbols in this header.

9574 The <math.h> header shall define at least the following types:

9575 **float_t** A real-floating type at least as wide as **float**.

9576 **double_t** A real-floating type at least as wide as **double**, and at least as wide as **float_t**.

9577 If FLT_EVAL_METHOD equals 0, **float_t** and **double_t** shall be **float** and **double**, respectively; if
9578 FLT_EVAL_METHOD equals 1, they shall both be **double**; if FLT_EVAL_METHOD equals 2,
9579 they shall both be **long double**; for other values of FLT_EVAL_METHOD, they are otherwise
9580 implementation-defined.

9581 The <math.h> header shall define the following macros, where real-floating indicates that the
9582 argument shall be an expression of real-floating type:

```
9583 int fpclassify(real-floating x);
9584 int isfinite(real-floating x);
9585 int isgreater(real-floating x, real-floating y);
9586 int isgreaterequal(real-floating x, real-floating y);
9587 int isinf(real-floating x);
9588 int isless(real-floating x, real-floating y);
9589 int islessequal(real-floating x, real-floating y);
9590 int islessgreater(real-floating x, real-floating y);
9591 int isnan(real-floating x);
9592 int isnormal(real-floating x);
9593 int isunordered(real-floating x, real-floating y);
9594 int signbit(real-floating x);
```

9595 The <math.h> header shall define the following symbolic constants. The values shall have type
9596 **double** and shall be accurate within the precision of the **double** type.

9597	XSI	M_E	Value of e
9598	XSI	M_LOG2E	Value of $\log_2 e$
9599	XSI	M_LOG10E	Value of $\log_{10} e$
9600	XSI	M_LN2	Value of $\log_e 2$
9601	XSI	M_LN10	Value of $\log_e 10$
9602	XSI	M_PI	Value of π
9603	XSI	M_PI_2	Value of $\pi/2$
9604	XSI	M_PI_4	Value of $\pi/4$
9605	XSI	M_1_PI	Value of $1/\pi$
9606	XSI	M_2_PI	Value of $2/\pi$

9607	XSI	M_2_SQRTPI	Value of $2/\sqrt{\pi}$
9608	XSI	M_SQRT2	Value of $\sqrt{2}$
9609	XSI	M_SQRT1_2	Value of $1/\sqrt{2}$
9610		The <math.h> header shall define the following symbolic constant:	
9611	OB XSI	MAXFLOAT	Same value as FLT_MAX in <float.h>.
9612		The <math.h> header shall define the following macros:	
9613		HUGE_VAL	A positive double constant expression, not necessarily representable as a
9614			float . Used as an error value returned by the mathematics library.
9615			HUGE_VAL evaluates to +infinity on systems supporting IEEE Std 754-1985.
9616		HUGE_VALF	A positive float constant expression. Used as an error value returned by the
9617			mathematics library. HUGE_VALF evaluates to +infinity on systems
9618			supporting IEEE Std 754-1985.
9619		HUGE_VALL	A positive long double constant expression. Used as an error value returned
9620			by the mathematics library. HUGE_VALL evaluates to +infinity on systems
9621			supporting IEEE Std 754-1985.
9622		INFINITY	A constant expression of type float representing positive or unsigned infinity,
9623			if available; else a positive constant of type float that overflows at translation
9624			time.
9625		NAN	A constant expression of type float representing a quiet NaN. This macro is
9626			only defined if the implementation supports quiet NaNs for the float type.
9627		The following macros shall be defined for number classification. They represent the mutually-	
9628		exclusive kinds of floating-point values. They expand to integer constant expressions with	
9629		distinct values. Additional implementation-defined floating-point classifications, with macro	
9630		definitions beginning with FP_ and an uppercase letter, may also be specified by the	
9631		implementation.	
9632		FP_INFINITE	
9633		FP_NAN	
9634		FP_NORMAL	
9635		FP_SUBNORMAL	
9636		FP_ZERO	
9637		The following optional macros indicate whether the <i>fma()</i> family of functions are fast compared	
9638		with direct code:	
9639		FP_FAST_FMA	
9640		FP_FAST_FMAF	
9641		FP_FAST_FMAL	
9642		If defined, the FP_FAST_FMA macro shall expand to the integer constant 1 and shall indicate	
9643		that the <i>fma()</i> function generally executes about as fast as, or faster than, a multiply and an add	
9644		of double operands. If undefined, the speed of execution is unspecified. The other macros have	
9645		the equivalent meaning for the float and long double versions.	
9646		The following macros shall expand to integer constant expressions whose values are returned by	
9647		<i>ilogb(x)</i> if <i>x</i> is zero or NaN, respectively. The value of FP_ILOGB0 shall be either {INT_MIN} or	
9648		-{INT_MAX}. The value of FP_ILOGBNAN shall be either {INT_MAX} or {INT_MIN}.	

9649 FP_ILOGB0
9650 FP_ILOGBNAN

9651 The following macros shall expand to the integer constants 1 and 2, respectively;

9652 MATH_ERRNO
9653 MATH_ERREXCEPT

9654 The following macro shall expand to an expression that has type **int** and the value
9655 MATH_ERRNO, MATH_ERREXCEPT, or the bitwise-inclusive OR of both:

9656 math_errhandling

9657 The value of math_errhandling is constant for the duration of the program. It is unspecified
9658 whether math_errhandling is a macro or an identifier with external linkage. If a macro definition
9659 is suppressed or a program defines an identifier with the name math_errhandling , the behavior
9660 is undefined. If the expression (math_errhandling & MATH_ERREXCEPT) can be non-zero, the
9661 implementation shall define the macros FE_DIVBYZERO, FE_INVALID, and FE_OVERFLOW in
9662 <fenv.h>.

9663 The following shall be declared as functions and may also be defined as macros. Function
9664 prototypes shall be provided.

9665 double acos(double);
9666 float acosf(float);
9667 double acosh(double);
9668 float acoshf(float);
9669 long double acoshl(long double);
9670 long double acosl(long double);
9671 double asin(double);
9672 float asinf(float);
9673 double asinh(double);
9674 float asinhf(float);
9675 long double asinhl(long double);
9676 long double asinl(long double);
9677 double atan(double);
9678 double atan2(double, double);
9679 float atan2f(float, float);
9680 long double atan2l(long double, long double);
9681 float atanf(float);
9682 double atanh(double);
9683 float atanhf(float);
9684 long double atanh1(long double);
9685 long double atan1(long double);
9686 double cbrt(double);
9687 float cbrtf(float);
9688 long double cbrtl(long double);
9689 double ceil(double);
9690 float ceilf(float);
9691 long double ceill(long double);
9692 double copysign(double, double);
9693 float copysignf(float, float);
9694 long double copysignl(long double, long double);
9695 double cos(double);

```

9696     float      cosf(float);
9697     double     cosh(double);
9698     float      coshf(float);
9699     long double coshl(long double);
9700     long double cosl(long double);
9701     double     erf(double);
9702     double     erfc(double);
9703     float      erfcf(float);
9704     long double erfcl(long double);
9705     float      erff(float);
9706     long double erfl(long double);
9707     double     exp(double);
9708     double     exp2(double);
9709     float      exp2f(float);
9710     long double exp2l(long double);
9711     float      expf(float);
9712     long double expl(long double);
9713     double     expm1(double);
9714     float      expm1f(float);
9715     long double expm1l(long double);
9716     double     fabs(double);
9717     float      fabsf(float);
9718     long double fabsl(long double);
9719     double     fdim(double, double);
9720     float      fdimf(float, float);
9721     long double fdiml(long double, long double);
9722     double     floor(double);
9723     float      floorf(float);
9724     long double floorl(long double);
9725     double     fma(double, double, double);
9726     float      fmaf(float, float, float);
9727     long double fmal(long double, long double, long double);
9728     double     fmax(double, double);
9729     float      fmaxf(float, float);
9730     long double fmaxl(long double, long double);
9731     double     fmin(double, double);
9732     float      fminf(float, float);
9733     long double fminl(long double, long double);
9734     double     fmod(double, double);
9735     float      fmodf(float, float);
9736     long double fmodl(long double, long double);
9737     double     frexp(double, int *);
9738     float      frexpf(float, int *);

9834     float        tgammaf(float);
9835     long double tgamma1(long double);
9836     double      trunc(double);
9837     float        truncf(float);
9838     long double trunc1(long double);
9839     XSI double    y0(double);
9840     double      y1(double);
9841     double      yn(int, double);

```

9842 The following external variable shall be defined:

```

9843 XSI extern int signgam;

```

9844 The behavior of each of the functions defined in <math.h> is specified in the System Interfaces
9845 volume of POSIX.1-2008 for all representable values of its input arguments, except where stated
9846 otherwise. Each function shall execute as if it were a single operation without generating any
9847 externally visible exceptional conditions.

APPLICATION USAGE

The FP_CONTRACT pragma can be used to allow (if the state is on) or disallow (if the state is off) the implementation to contract expressions. Each pragma can occur either outside external declarations or preceding all explicit declarations and statements inside a compound statement. When outside external declarations, the pragma takes effect from its occurrence until another FP_CONTRACT pragma is encountered, or until the end of the translation unit. When inside a compound statement, the pragma takes effect from its occurrence until another FP_CONTRACT pragma is encountered (including within a nested compound statement), or until the end of the compound statement; at the end of a compound statement the state for the pragma is restored to its condition just before the compound statement. If this pragma is used in any other context, the behavior is undefined. The default state (on or off) for the pragma is implementation-defined.

Applications should use FLT_MAX as described in the <float.h> header instead of the obsolescent MAXFLOAT.

RATIONALE

Before the ISO/IEC 9899:1999 standard, the math library was defined only for the floating type **double**. All the names formed by appending 'f' or 'l' to a name in <math.h> were reserved to allow for the definition of **float** and **long double** libraries; and the ISO/IEC 9899:1999 standard provides for all three versions of math functions.

The functions *ecvt()*, *fcvt()*, and *gcvt()* have been dropped from the ISO C standard since their capability is available through *sprintf()*.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1.

Issue 6

This reference page is updated to align with the ISO/IEC 9899:1999 standard.

IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/21 is applied, making it clear that the meaning of the FP_FAST_FMA macro is unspecified if the macro is undefined.

Issue 7

ISO/IEC 9899:1999 standard, Technical Corrigendum 2 #47 (SD5-XBD-ERN-52) is applied, clarifying the wording of the FP_FAST_FMA macro.

The MAXFLOAT constant is marked obsolescent.

This reference page is clarified with respect to macros and symbolic constants.

9890 **NAME**

9891 monetary.h — monetary types

9892 **SYNOPSIS**

9893 #include <monetary.h>

9894 **DESCRIPTION**9895 The <monetary.h> header shall define the **locale_t** type as described in <locale.h>.9896 The <monetary.h> header shall define the **size_t** type as described in <stddef.h>.9897 The <monetary.h> header shall define the **ssize_t** type as described in <sys/types.h>.9898 The following shall be declared as functions and may also be defined as macros. Function
9899 prototypes shall be provided for use with ISO C standard compilers.

9900 ssize_t strfmon(char *restrict, size_t, const char *restrict, ...);

9901 ssize_t strfmon_l(char *restrict, size_t, locale_t,

9902 const char *restrict, ...);

9911 XSH *strfmon()*9912 **CHANGE HISTORY**

9913 First released in Issue 4.

9914 **Issue 6**9915 The **restrict** keyword is added to the prototype for *strfmon()*.9916 **Issue 7**

9917 The <monetary.h> header is moved from the XSI option to the Base.

9918 The *strfmon_l()* function is added from The Open Group Technical Standard, 2006, Extended API
9919 Set Part 4.9920 A declaration for the **locale_t** type is added.

9921 **NAME**

9922 mqueue.h — message queues (**REALTIME**)

9923 **SYNOPSIS**

9924 MSG #include <mqueue.h>

9925 **DESCRIPTION**

9926 The <mqueue.h> header shall define the **mqd_t** type, which is used for message queue
9927 descriptors. This is not an array type.

9928 The <mqueue.h> header shall define the **pthread_attr_t**, **size_t**, and **ssize_t** types as described
9929 in <sys/types.h>.

9930 The <mqueue.h> header shall define the **struct timespec** structure as described in <time.h>.

9931 The tag **sigevent** shall be declared as naming an incomplete structure type, the contents of which
9932 are described in the <signal.h> header.

9933 The <mqueue.h> header shall define the **mq_attr** structure, which is used in getting and setting
9934 the attributes of a message queue. Attributes are initially set when the message queue is created.
9935 An **mq_attr** structure shall have at least the following fields:

9936 long mq_flags Message queue flags.
9937 long mq_maxmsg Maximum number of messages.
9938 long mq_msgsize Maximum message size.
9939 long mq_curmsgs Number of messages currently queued.

9940 The following shall be declared as functions and may also be defined as macros. Function
9941 prototypes shall be provided.

9942 int mq_close(mqd_t);
9943 int mq_getattr(mqd_t, struct mq_attr *);
9944 int mq_notify(mqd_t, const struct sigevent *);
9945 mqd_t mq_open(const char *, int, ...);
9946 ssize_t mq_receive(mqd_t, char *, size_t, unsigned *);
9947 int mq_send(mqd_t, const char *, size_t, unsigned);
9948 int mq_setattr(mqd_t, const struct mq_attr *restrict,
9949 struct mq_attr *restrict);
9950 ssize_t mq_timedreceive(mqd_t, char *restrict, size_t,
9951 unsigned *restrict, const struct timespec *restrict);
9952 int mq_timedsend(mqd_t, const char *, size_t, unsigned,
9953 const struct timespec *);
9954 int mq_unlink(const char *);

9955 Inclusion of the <mqueue.h> header may make visible symbols defined in the headers
9956 <fcntl.h>, <signal.h>, and <time.h>.

9957 **APPLICATION USAGE**

9958 None.

9959 **RATIONALE**

9960 None.

9961 **FUTURE DIRECTIONS**

9962 None.

mq_unlink()

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6

The **<mqqueue.h>** header is marked as part of the Message Passing option.

The *mq_timedreceive()* and *mq_timedsend()* functions are added for alignment with IEEE Std 1003.1d-1999.

The **restrict** keyword is added to the prototypes for *mq_setattr()* and *mq_timedreceive()*.

Issue 7

Type and structure declarations are added.

9976 **NAME**

9977 ndbm.h — definitions for ndbm database operations

9978 **SYNOPSIS**

9979 XSI `#include <ndbm.h>`

9980 **DESCRIPTION**

9981 The <ndbm.h> header shall define the **datum** type as a structure, which shall include at least the
9982 following members:

9983 `void *dptr` A pointer to the application's data.
9984 `size_t dsize` The size of the object pointed to by *dptr*.

9985 The <ndbm.h> header shall define the **size_t** type as described in <stddef.h>.

9986 The <ndbm.h> header shall define the **DBM** type.

9987 The <ndbm.h> header shall define the following symbolic constants as possible values for the
9988 *store_mode* argument to *dbm_store()*:

9989 **DBM_INSERT** Insertion of new entries only.
9990 **DBM_REPLACE** Allow replacing existing entries.

9991 The following shall be declared as functions and may also be defined as macros. Function
9992 prototypes shall be provided.

9993 `int dbm_clearerr(DBM *);`
9994 `void dbm_close(DBM *);`
9995 `int dbm_delete(DBM *, datum);`
9996 `int dbm_error(DBM *);`
9997 `datum dbm_fetch(DBM *, datum);`
9998 `datum dbm_firstkey(DBM *);`
9999 `datum dbm_nextkey(DBM *);`
10000 `DBM *dbm_open(const char *, int, mode_t);`
10001 `int dbm_store(DBM *, datum, datum, int);`

10002 The <ndbm.h> header shall define the **mode_t** type through **typedef**, as described in
10003 <sys/types.h>.

10004 **APPLICATION USAGE**

10005 None.

10006 **RATIONALE**

10013 **CHANGE HISTORY**

10014 First released in Issue 4, Version 2.

10015 **Issue 5**

10016 References to the definitions of **size_t** and **mode_t** are added to the DESCRIPTION.

10017 **Issue 7**

10018 This reference page is clarified with respect to macros and symbolic constants.

10019 **NAME**

10020 net/if.h — sockets local interfaces

10021 **SYNOPSIS**

10022 #include <net/if.h>

10023 **DESCRIPTION**

10024 The <net/if.h> header shall define the **if_nameindex** structure, which shall include at least the
10025 following members:

10026 unsigned if_index Numeric index of the interface.
10027 char *if_name Null-terminated name of the interface.

10028 The <net/if.h> header shall define the following symbolic constant for the length of a buffer
10029 containing an interface name (including the terminating NULL character):

10030 IF_NAMESIZE Interface name length.

10031 The following shall be declared as functions and may also be defined as macros. Function
10032 prototypes shall be provided.

10033 void if_freenameindex(struct if_nameindex *);
10034 char *if_indextoname(unsigned, char *);
10035 struct if_nameindex *if_nameindex(void);
10036 unsigned if_nametoindex(const char *);

10046 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

10047 **Issue 7**

10048 This reference page is clarified with respect to macros and symbolic constants.

10049 **NAME**

10050 netdb.h — definitions for network database operations

10051 **SYNOPSIS**

10052 #include <netdb.h>

10053 **DESCRIPTION**10054 The <netdb.h> header may define the **in_port_t** type and the **in_addr_t** type as described in
10055 <netinet/in.h>.10056 The <netdb.h> header shall define the **hostent** structure, which shall include at least the
10057 following members:

10058	char	*h_name	Official name of the host.
10059	char	**h_aliases	A pointer to an array of pointers to 10060 alternative host names, terminated by a 10061 null pointer.
10062	int	h_addrtype	Address type.
10063	int	h_length	The length, in bytes, of the address.
10064	char	**h_addr_list	A pointer to an array of pointers to network 10065 addresses (in network byte order) for the host, 10066 terminated by a null pointer.

10067 The <netdb.h> header shall define the **netent** structure, which shall include at least the
10068 following members:

10069	char	*n_name	Official, fully-qualified (including the 10070 domain) name of the host.
10071	char	**n_aliases	A pointer to an array of pointers to 10072 alternative network names, terminated by a 10073 null pointer.
10074	int	n_addrtype	The address type of the network.
10075	uint32_t	n_net	The network number, in host byte order.

10076 The <netdb.h> header shall define the **uint32_t** type as described in <inttypes.h>.10077 The <netdb.h> header shall define the **protoent** structure, which shall include at least the
10078 following members:

10079	char	*p_name	Official name of the protocol.
10080	char	**p_aliases	A pointer to an array of pointers to 10081 alternative protocol names, terminated by 10082 a null pointer.
10083	int	p_proto	The protocol number.

10084 The <netdb.h> header shall define the **servent** structure, which shall include at least the
10085 following members:

10086	char	*s_name	Official name of the service.
10087	char	**s_aliases	A pointer to an array of pointers to 10088 alternative service names, terminated by 10089 a null pointer.
10090	int	s_port	A value which, when converted to uint16_t , 10091 yields the port number in network byte order 10092 at which the service resides.
10093	char	*s_proto	The name of the protocol to use when 10094 contacting the service.

10095 The <netdb.h> header shall define the IPPORT_RESERVED symbolic constant with the value of
10096 the highest reserved Internet port number.

10097 Address Information Structure

10098 The <netdb.h> header shall define the **addrinfo** structure, which shall include at least the
10099 following members:

10100	int	ai_flags	Input flags.
10101	int	ai_family	Address family of socket.
10102	int	ai_socktype	Socket type.
10103	int	ai_protocol	Protocol of socket.
10104	socklen_t	ai_addrlen	Length of socket address.
10105	struct sockaddr	*ai_addr	Socket address of socket.
10106	char	*ai_canonname	Canonical name of service location.
10107	struct addrinfo	*ai_next	Pointer to next in list.

10108 The <netdb.h> header shall define the following symbolic constants that evaluate to bitwise-
10109 distinct integer constants for use in the *flags* field of the **addrinfo** structure:

10110	AI_PASSIVE	Socket address is intended for <i>bind()</i> .
10111	AI_CANONNAME	Request for canonical name.
10112	AI_NUMERICHOST	Return numeric host address as name.
10113	AI_NUMERICSERV	Inhibit service name resolution.
10114	AI_V4MAPPED	If no IPv6 addresses are found, query for IPv4 addresses and return them 10115 to the caller as IPv4-mapped IPv6 addresses.
10116	AI_ALL	Query for both IPv4 and IPv6 addresses.
10117	AI_ADDRCONFIG	Query for IPv4 addresses only when an IPv4 address is configured; query 10118 for IPv6 addresses only when an IPv6 address is configured.

10119 The <netdb.h> header shall define the following symbolic constants that evaluate to bitwise-
10120 distinct integer constants for use in the *flags* argument to *getnameinfo()*:

10121	NI_NOFQDN	Only the nodename portion of the FQDN is returned for local hosts.
10122	NI_NUMERICHOST	The numeric form of the node's address is returned instead of its name.
10123	NI_NAMEREQD	Return an error if the node's name cannot be located in the database.
10124	NI_NUMERICSERV	The numeric form of the service address is returned instead of its name.
10125	NI_NUMERICSCOPE	
10126		For IPv6 addresses, the numeric form of the scope identifier is returned 10127 instead of its name.
10128	NI_DGRAM	Indicates that the service is a datagram service (SOCK_DGRAM).

10129 **Address Information Errors**

10130 The <netdb.h> header shall define the following symbolic constants for use as error values for
 10131 *getaddrinfo()* and *getnameinfo()*. The values shall be suitable for use in **#if** preprocessing
 10132 directives.

10133	EAI_AGAIN	The name could not be resolved at this time. Future attempts may
10134		succeed.
10135	EAI_BADFLAGS	The flags had an invalid value.
10136	EAI_FAIL	A non-recoverable error occurred.
10137	EAI_FAMILY	The address family was not recognized or the address length was invalid
10138		for the specified family.
10139	EAI_MEMORY	There was a memory allocation failure.
10140	EAI_NONAME	The name does not resolve for the supplied parameters.
10141		NI_NAMEREQD is set and the host's name cannot be located, or both
10142		<i>nodename</i> and <i>servname</i> were null.
10143	EAI_SERVICE	The service passed was not recognized for the specified socket type.
10144	EAI_SOCKTYPE	The intended socket type was not recognized.
10145	EAI_SYSTEM	A system error occurred. The error code can be found in <i>errno</i> .
10146	EAI_OVERFLOW	An argument buffer overflowed.

10147 The following shall be declared as functions and may also be defined as macros. Function
 10148 prototypes shall be provided.

10149	void	<i>endhostent</i> (void);
10150	void	<i>endnetent</i> (void);
10151	void	<i>endprotoent</i> (void);
10152	void	<i>endservent</i> (void);
10153	void	<i>freeaddrinfo</i> (struct <i>addrinfo</i> *);
10154	const char	* <i>gai_strerror</i> (int);
10155	int	<i>getaddrinfo</i> (const char *restrict, const char *restrict,
10156		const struct <i>addrinfo</i> *restrict,
10157		struct <i>addrinfo</i> **restrict);
10158	struct <i>hostent</i>	* <i>gethostent</i> (void);
10159	int	<i>getnameinfo</i> (const struct <i>sockaddr</i> *restrict, <i>socklen_t</i> ,
10160		char *restrict, <i>socklen_t</i> , char *restrict,
10161		<i>socklen_t</i> , int);
10162	struct <i>netent</i>	* <i>getnetbyaddr</i> (<i>uint32_t</i> , int);
10163	struct <i>netent</i>	* <i>getnetbyname</i> (const char *);
10164	struct <i>netent</i>	* <i>getnetent</i> (void);
10165	struct <i>protoent</i>	* <i>getprotobyname</i> (const char *);
10166	struct <i>protoent</i>	* <i>getprotobynumber</i> (int);
10167	struct <i>protoent</i>	* <i>getprotoent</i> (void);
10168	struct <i>servent</i>	* <i>getservbyname</i> (const char *, const char *);
10169	struct <i>servent</i>	* <i>getservbyport</i> (int, const char *);
10170	struct <i>servent</i>	* <i>getservent</i> (void);
10171	void	<i>sethostent</i> (int);
10172	void	<i>setnetent</i> (int);
10173	void	<i>setprotoent</i> (int);

10174 void setservernt(int);

10175 The <netdb.h> header shall define the **socklen_t** type through **typedef**, as described in

10176 <sys/socket.h>.

10177 Inclusion of the <netdb.h> header may also make visible all symbols from <netinet/in.h>,

10178 <sys/socket.h>, and <inttypes.h>.

10179 **APPLICATION USAGE**

10180 None.

10181 **RATIONALE**

10182 None.

10183 **FUTURE DIRECTIONS**

10184 None.

10185 **SEE ALSO**

10188 *getnameinfo()*

10189 **CHANGE HISTORY**

10190 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

10191 The Open Group Base Resolution bwg2001-009 is applied, which changes the return type for

10192 *gai_strerror()* from **char *** to **const char ***. This is for coordination with the IPnG Working Group.

10193 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/11 is applied, adding a description of the

10194 NI_NUMERICSCOPE macro and correcting the *getnameinfo()* function prototype. These changes

10195 are for alignment with IPv6.

10196 **Issue 7**

10197 SD5-XBD-ERN-14 is applied, changing the description of the *s_port* member of the **servent**

10198 structure.

10199 The obsolescent *h_errno* external integer, and the obsolescent *gethostbyaddr()* and *gethostbyname()*

10200 functions are removed, along with the HOST_NOT_FOUND, NO_DATA, NO_RECOVERY, and

10201 TRY_AGAIN macros.

10202 This reference page is clarified with respect to macros and symbolic constants.

10203 **NAME**

10204 netinet/in.h — Internet address family

10205 **SYNOPSIS**

10206 #include <netinet/in.h>

10207 **DESCRIPTION**

10208 The <netinet/in.h> header shall define the following types:

10209 **in_port_t** Equivalent to the type **uint16_t** as described in <inttypes.h>.10210 **in_addr_t** Equivalent to the type **uint32_t** as described in <inttypes.h>.10211 The <netinet_in.h> header shall define the **sa_family_t** type as described in <sys/socket.h>.10212 The <netinet_in.h> header shall define the **uint8_t** and **uint32_t** types as described in
10213 <inttypes.h>. Inclusion of the <netinet/in.h> header may also make visible all symbols from
10214 <inttypes.h> and <sys/socket.h>.10215 The <netinet/in.h> header shall define the **in_addr** structure, which shall include at least the
10216 following member:

10217 in_addr_t s_addr

10218 The <netinet/in.h> header shall define the **sockaddr_in** structure, which shall include at least
10219 the following members:10220 sa_family_t sin_family AF_INET.
10221 in_port_t sin_port Port number.
10222 struct in_addr sin_addr IP address.10223 The *sin_port* and *sin_addr* members shall be in network byte order.10224 The **sockaddr_in** structure is used to store addresses for the Internet address family. Pointers to
10225 this type shall be cast by applications to **struct sockaddr *** for use with socket functions.10226 **IPv6** The <netinet/in.h> header shall define the **in6_addr** structure, which shall include at least the
10227 following member:

10228 uint8_t s6_addr[16]

10229 This array is used to contain a 128-bit IPv6 address, stored in network byte order.

10230 The <netinet/in.h> header shall define the **sockaddr_in6** structure, which shall include at least
10231 the following members:10232 sa_family_t sin6_family AF_INET6.
10233 in_port_t sin6_port Port number.
10234 uint32_t sin6_flowinfo IPv6 traffic class and flow information.
10235 struct in6_addr sin6_addr IPv6 address.
10236 uint32_t sin6_scope_id Set of interfaces for a scope.10237 The *sin6_port* and *sin6_addr* members shall be in network byte order.10238 The **sockaddr_in6** structure shall be set to zero by an application prior to using it, since
10239 implementations are free to have additional, implementation-defined fields in **sockaddr_in6**.10240 The *sin6_scope_id* field is a 32-bit integer that identifies a set of interfaces as appropriate for the
10241 scope of the address carried in the *sin6_addr* field. For a link scope *sin6_addr*, the application
10242 shall ensure that *sin6_scope_id* is a link index. For a site scope *sin6_addr*, the application shall
10243 ensure that *sin6_scope_id* is a site index. The mapping of *sin6_scope_id* to an interface or set of
10244 interfaces is implementation-defined.

10245		The <netinet/in.h> header shall declare the following external variable:
10246		<code>const struct in6_addr in6addr_any</code>
10247		This variable is initialized by the system to contain the wildcard IPv6 address. The
10248		<netinet/in.h> header also defines the IN6ADDR_ANY_INIT macro. This macro must be
10249		constant at compile time and can be used to initialize a variable of type struct in6_addr to the
10250		IPv6 wildcard address.
10251		The <netinet/in.h> header shall declare the following external variable:
10252		<code>const struct in6_addr in6addr_loopback</code>
10253		This variable is initialized by the system to contain the loopback IPv6 address. The
10254		<netinet/in.h> header also defines the IN6ADDR_LOOPBACK_INIT macro. This macro must be
10255		constant at compile time and can be used to initialize a variable of type struct in6_addr to the
10256		IPv6 loopback address.
10257		The <netinet/in.h> header shall define the ipv6_mreq structure, which shall include at least the
10258		following members:
10259		<code>struct in6_addr</code> <code>ipv6mr_multiaddr</code> IPv6 multicast address.
10260		<code>unsigned</code> <code>ipv6mr_interface</code> Interface index.
10261		The <netinet/in.h> header shall define the following symbolic constants for use as values of the
10262		<i>level</i> argument of <i>getsockopt()</i> and <i>setsockopt()</i> :
10263		IPPROTO_IP Internet protocol.
10264	IP6	IPPROTO_IPV6 Internet Protocol Version 6.
10265		IPPROTO_ICMP Control message protocol.
10266	RS	IPPROTO_RAW Raw IP Packets Protocol.
10267		IPPROTO_TCP Transmission control protocol.
10268		IPPROTO_UDP User datagram protocol.
10269		The <netinet/in.h> header shall define the following symbolic constants for use as destination
10270		addresses for <i>connect()</i> , <i>sendmsg()</i> , and <i>sendto()</i> :
10271		INADDR_ANY IPv4 local host address.
10272		INADDR_BROADCAST IPv4 broadcast address.
10273		The <netinet/in.h> header shall define the following symbolic constant, with the value
10274		specified, to help applications declare buffers of the proper size to store IPv4 addresses in string
10275		form:
10276		INET_ADDRSTRLEN 16. Length of the string form for IP.
10277		The <i>htonl()</i> , <i>htons()</i> , <i>ntohl()</i> , and <i>ntohs()</i> functions shall be available as described in
10278		<arpa/inet.h>. Inclusion of the <netinet/in.h> header may also make visible all symbols from
10279		<arpa/inet.h>.
10280	IP6	The <netinet/in.h> header shall define the following symbolic constant, with the value
10281		specified, to help applications declare buffers of the proper size to store IPv6 addresses in string
10282		form:

10283		INET6_ADDRSTRLEN	46. Length of the string form for IPv6.
10284	IP6	The <netinet/in.h> header shall define the following symbolic constants, with distinct integer values, for use in the <i>option_name</i> argument in the <i>getsockopt()</i> or <i>setsockopt()</i> functions at protocol level IPPROTO_IPV6:	
10285			
10286			
10287		IPV6_JOIN_GROUP	Join a multicast group.
10288		IPV6_LEAVE_GROUP	Quit a multicast group.
10289		IPV6_MULTICAST_HOPS	Multicast hop limit.
10290			
10291		IPV6_MULTICAST_IF	Interface to use for outgoing multicast packets.
10292		IPV6_MULTICAST_LOOP	Multicast packets are delivered back to the local application.
10293			
10294		IPV6_UNICAST_HOPS	Unicast hop limit.
10295		IPV6_V6ONLY	Restrict AF_INET6 socket to IPv6 communications only.
10296		The <netinet/in.h> header shall define the following macros that test for special IPv6 addresses. Each macro is of type int and takes a single argument of type const struct in6_addr * :	
10297			
10298		IN6_IS_ADDR_UNSPECIFIED	Unspecified address.
10299			
10300		IN6_IS_ADDR_LOOPBACK	Loopback address.
10301			
10302		IN6_IS_ADDR_MULTICAST	Multicast address.
10303			
10304		IN6_IS_ADDR_LINKLOCAL	Unicast link-local address.
10305			
10306		IN6_IS_ADDR_SITELOCAL	Unicast site-local address.
10307			
10308		IN6_IS_ADDR_V4MAPPED	IPv4 mapped address.
10309			
10310		IN6_IS_ADDR_V4COMPAT	IPv4-compatible address.
10311			
10312		IN6_IS_ADDR_MC_NODELOCAL	Multicast node-local address.
10313			
10314		IN6_IS_ADDR_MC_LINKLOCAL	Multicast link-local address.
10315			
10316		IN6_IS_ADDR_MC_SITELOCAL	Multicast site-local address.
10317			
10318		IN6_IS_ADDR_MC_ORGLOCAL	Multicast organization-local address.
10319			
10320		IN6_IS_ADDR_MC_GLOBAL	Multicast global address.
10321

10342 **NAME**

10343 netinet/tcp.h — definitions for the Internet Transmission Control Protocol (TCP)

10344 **SYNOPSIS**

10345 #include <netinet/tcp.h>

10346 **DESCRIPTION**

10347 The <netinet/tcp.h> header shall define the following symbolic constant for use as a socket
10348 option at the IPPROTO_TCP level:

10349 TCP_NODELAY Avoid coalescing of small segments.

10350 The implementation need not allow the value of the option to be set via *setsockopt()* or retrieved
10351 via *getsockopt()*.

10352 **APPLICATION USAGE**

10353 None.

10354 **RATIONALE**

10355 None.

10356 **FUTURE DIRECTIONS**

10363 **Issue 7**

10364 This reference page is clarified with respect to macros and symbolic constants.

10365 **NAME**

10366 nl_types.h — data types

10367 **SYNOPSIS**

10368 #include <nl_types.h>

10369 **DESCRIPTION**

10370 The <nl_types.h> header shall define at least the following types:

10371 **nl_catd** Used by the message catalog functions *catopen()*, *catgets()*, and *catclose()*
10372 to identify a catalog descriptor.

10373 **nl_item** Used by *nl_langinfo()* to identify items of *langinfo* data. Values of objects
10374 of type **nl_item** are defined in <langinfo.h>.

10375 The <nl_types.h> header shall define at least the following symbolic constants:

10376 **NL_SETD** Used by *gencat* when no *\$set* directive is specified in a message text source
10377 file. This constant can be passed as the value of *set_id* on subsequent calls
10378 to *catgets()* (that is, to retrieve messages from the default message set).
10379 The value of **NL_SETD** is implementation-defined.

10380 **NL_CAT_LOCALE** Value that must be passed as the *oflag* argument to *catopen()* to ensure that
10381 message catalog selection depends on the *LC_MESSAGES* locale category,
10382 rather than directly on the *LANG* environment variable.

10383 The following shall be declared as functions and may also be defined as macros. Function
10384 prototypes shall be provided.

10385 int catclose(nl_catd);
10386 char *catgets(nl_catd, int, int, const char *);
10387 nl_catd catopen(const char *, int);

10388 **APPLICATION USAGE**

10389 None.

10390 **RATIONALE**

10391 None.

10392 **FUTURE DIRECTIONS**

10393 None.

10398 **CHANGE HISTORY**

10399 First released in Issue 2.

10400 **Issue 7**

10401 The <nl_types.h> header is moved from the XSI option to the Base.

10402 This reference page is clarified with respect to macros and symbolic constants.

10403 **NAME**

10404 poll.h — definitions for the poll() function

10405 **SYNOPSIS**

10406 #include <poll.h>

10407 **DESCRIPTION**10408 The <poll.h> header shall define the **pollfd** structure, which shall include at least the following
10409 members:

10410 int fd The following descriptor being polled.

10411 short events The input event flags (see below).

10412 short revents The output event flags (see below).

10413 The <poll.h> header shall define the following type through **typedef**:10414 **nfds_t** An unsigned integer type used for the number of file descriptors.10415 The implementation shall support one or more programming environments in which the width
10416 of **nfds_t** is no greater than the width of type **long**. The names of these programming
10417 environments can be obtained using the *confstr()* function or the *getconf* utility.10418 The <poll.h> header shall define the following symbolic constants, zero or more of which may
10419 be OR'ed together to form the *events* or *revents* members in the **pollfd** structure:

10420 POLLIN Data other than high-priority data may be read without blocking.

10421 POLLRDNORM Normal data may be read without blocking.

10422 POLLRDBAND Priority data may be read without blocking.

10423 POLLPRI High priority data may be read without blocking.

10424 POLLOUT Normal data may be written without blocking.

10425 POLLWRNORM Equivalent to POLLOUT.

10426 POLLWRBAND Priority data may be written.

10427 POLLERR An error has occurred (*revents* only).10428 POLLHUP Device has been disconnected (*revents* only).10429 POLLNVAL Invalid *fd* member (*revents* only).10430 The significance and semantics of normal, priority, and high-priority data are file and device-
10431 specific.10432 The following shall be declared as a function and may also be defined as a macro. A function
10433 prototype shall be provided.

10434 int poll(struct pollfd [], nfds_t, int);

10435 **APPLICATION USAGE**

10436 None.

10437 **RATIONALE**

10438 None.

10439 **FUTURE DIRECTIONS**

10440 None.

10441 **SEE ALSO**

10442 XSH *confstr()*, *poll()*

10443 XCU *getconf*

10444 **CHANGE HISTORY**

10445 First released in Issue 4, Version 2.

10446 **Issue 6**

10447 The description of the symbolic constants is updated to match the *poll()* function.

10448 Text related to STREAMS has been moved to the *poll()* reference page.

10449 A note is added to the DESCRIPTION regarding the significance and semantics of normal,
10450 priority, and high-priority data.

10451 **Issue 7**

10452 The <poll.h> header is moved from the XSI option to the Base.

10453 **NAME**

10454 pthread.h — threads

10455 **SYNOPSIS**

10456 #include <pthread.h>

10457 **DESCRIPTION**

10458 The <pthread.h> header shall define the following symbolic constants:

10459 PTHREAD_BARRIER_SERIAL_THREAD
 10460 PTHREAD_CANCEL_ASYNCHRONOUS
 10461 PTHREAD_CANCEL_ENABLE
 10462 PTHREAD_CANCEL_DEFERRED
 10463 PTHREAD_CANCEL_DISABLE
 10464 PTHREAD_CANCELED
 10465 PTHREAD_CREATE_DETACHED
 10466 PTHREAD_CREATE_JOINABLE
 10467 TPS PTHREAD_EXPLICIT_SCHED
 10468 PTHREAD_INHERIT_SCHED
 10469 PTHREAD_MUTEX_DEFAULT
 10470 PTHREAD_MUTEX_ERRORCHECK
 10471 PTHREAD_MUTEX_NORMAL
 10472 PTHREAD_MUTEX_RECURSIVE
 10473 PTHREAD_MUTEX_ROBUST
 10474 PTHREAD_MUTEX_STALLED
 10475 PTHREAD_ONCE_INIT
 10476 RPI | TPI PTHREAD_PRIO_INHERIT
 10477 MC1 PTHREAD_PRIO_NONE
 10478 RPP | TPP PTHREAD_PRIO_PROTECT
 10479 PTHREAD_PROCESS_SHARED
 10480 PTHREAD_PROCESS_PRIVATE
 10481 TPS PTHREAD_SCOPE_PROCESS
 10482 PTHREAD_SCOPE_SYSTEM

10483 The <pthread.h> header shall define the following compile-time constant expressions valid as
 10484 initializers for the following types:

	Name	Initializer for Type
10485	PTHREAD_COND_INITIALIZER	pthread_cond_t
10486	PTHREAD_MUTEX_INITIALIZER	pthread_mutex_t
10487	PTHREAD_RWLOCK_INITIALIZER	pthread_rwlock_t
10488		

10489 The <pthread.h> header shall define the pthread_attr_t, pthread_barrier_t,
 10490 pthread_barrierattr_t, pthread_cond_t, pthread_condattr_t, pthread_key_t, pthread_mutex_t,
 10491 pthread_mutexattr_t, pthread_once_t, pthread_rwlock_t, pthread_rwlockattr_t,
 10492 pthread_spinlock_t, and pthread_t types as described in <sys/types.h>.

10493 The following shall be declared as functions and may also be defined as macros. Function
 10494 prototypes shall be provided.

```
10495 int pthread_atfork(void (*) (void), void (*) (void),
10496                  void (*) (void));
10497 int pthread_attr_destroy(pthread_attr_t *);
10498 int pthread_attr_getdetachstate(const pthread_attr_t *, int *);
10499 int pthread_attr_getguardsize(const pthread_attr_t *restrict,
```

```

10500         size_t *restrict);
10501 TPS      int  pthread_attr_getinheritsched(const pthread_attr_t *restrict,
10502         int *restrict);

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6

The RTT margin markers are broken out into their POSIX options.

The Open Group Corrigendum U021/9 is applied, correcting the prototype for the *pthread_cond_wait()* function.

The Open Group Corrigendum U026/2 is applied, correcting the prototype for the *pthread_setschedparam()* function so that its second argument is of type **int**.

The *pthread_getcpuclockid()* and *pthread_mutex_timedlock()* functions are added for alignment with IEEE Std 1003.1d-1999.

The following functions are added for alignment with IEEE Std 1003.1j-2000:

*pthread_barrier_destroy(), pthread_barrier_init(), pthread_barrier_wait(),
pthread_barrierattr_destroy(), pthread_barrierattr_getpshared(), pthread_barrierattr_init(),
pthread_barrierattr_setpshared(), pthread_condattr_getclock(), pthread_condattr_setclock(),
pthread_rwlock_timedrdlock(), pthread_rwlock_timedwrlock(), pthread_spin_destroy(),
pthread_spin_init(), pthread_spin_lock(), pthread_spin_trylock(), and pthread_spin_unlock().*

PTHREAD_RWLOCK_INITIALIZER is removed for alignment with IEEE Std 1003.1j-2000.

Functions previously marked as part of the Read-Write Locks option are now moved to the Threads option.

The **restrict** keyword is added to the prototypes for *pthread_attr_getguardsize(),
pthread_attr_getinheritsched(), pthread_attr_getschedparam(), pthread_attr_getschedpolicy(),
pthread_attr_getscope(), pthread_attr_getstackaddr(), pthread_attr_getstacksize(),
pthread_attr_setschedparam(), pthread_barrier_init(), pthread_barrierattr_getpshared(),
pthread_cond_init(), pthread_cond_signal(), pthread_cond_timedwait(), pthread_cond_wait(),
pthread_condattr_getclock(), pthread_condattr_getpshared(), pthread_create(),
pthread_getschedparam(), pthread_mutex_getprioceiling(), pthread_mutex_init(),
pthread_mutex_setprioceiling(), pthread_mutexattr_getprioceiling(), pthread_mutexattr_getprotocol(),
pthread_mutexattr_getpshared(), pthread_mutexattr_gettype(), pthread_rwlock_init(),
pthread_rwlock_timedrdlock(), pthread_rwlock_timedwrlock(), pthread_rwlockattr_getpshared(), and
pthread_sigmask().*

IEEE PASC Interpretation 1003.1 #86 is applied, allowing the symbols from <sched.h> and <time.h> to be made visible when <pthread.h> is included. Previously this was an XSI option.

IEEE PASC Interpretation 1003.1c #42 is applied, removing the requirement for prototypes for the *pthread_kill()* and *pthread_sigmask()* functions. These are required to be in the <signal.h> header. They are allowed here through the name space rules.

IEEE PASC Interpretation 1003.1 #96 is applied, adding the *pthread_setschedprio()* function.

IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/13 is applied, correcting shading errors that were in contradiction with the System Interfaces volume of POSIX.1-2008.

Issue 7

SD5-XBD-ERN-55 is applied, adding the **restrict** keyword to the *pthread_mutex_timedlock()* function prototype.

SD5-XBD-ERN-62 is applied.

Austin Group Interpretation 1003.1-2001 #048 is applied, reinstating the PTHREAD_RWLOCK_INITIALIZER symbol.

The <pthread.h> header is moved from the Threads option to the Base.

The following extended mutex types are moved from the XSI option to the Base:

```
PTHREAD_MUTEX_NORMAL
PTHREAD_MUTEX_ERRORCHECK
PTHREAD_MUTEX_RECURSIVE
PTHREAD_MUTEX_DEFAULT
```

The PTHREAD_MUTEX_ROBUST and PTHREAD_MUTEX_STALLED symbols and the *pthread_mutex_consistent()*, *pthread_mutexattr_getrobust()*, and *pthread_mutexattr_setrobust()* functions are added from The Open Group Technical Standard, 2006, Extended API Set Part 2.

Functionality relating to the Thread Priority Protection and Thread Priority Inheritance options is changed to be Non-Robust Mutex or Robust Mutex Priority Protection and Non-Robust Mutex or Robust Mutex Priority Inheritance, respectively.

This reference page is clarified with respect to macros and symbolic constants.

10713 **NAME**

10714 pwd.h — password structure

10715 **SYNOPSIS**

10716 #include <pwd.h>

10717 **DESCRIPTION**10718 The <pwd.h> header shall define the **struct passwd**, structure, which shall include at least the
10719 following members:

10720	char	*pw_name	User's login name.
10721	uid_t	pw_uid	Numerical user ID.
10722	gid_t	pw_gid	Numerical group ID.
10723	char	*pw_dir	Initial working directory.
10724	char	*pw_shell	Program to use as shell.

10725 The <pwd.h> header shall define the **gid_t**, **uid_t**, and **size_t** types as described in
10726 <sys/types.h>.10727 The following shall be declared as functions and may also be defined as macros. Function
10728 prototypes shall be provided.

10729	XSI	void	endpwent(void);
10730		struct passwd *	getpwent(void);
10731		struct passwd *	getpwnam(const char *);
10732		int	getpwnam_r(const char *, struct passwd *, char *,
10733			size_t, struct passwd **);
10734		struct passwd *	getpwuid(uid_t);
10735		int	getpwuid_r(uid_t, struct passwd *, char *,
10736			size_t, struct passwd **);
10737	XSI	void	setpwent(void);

10738 **APPLICATION USAGE**

10739 None.

10740 **RATIONALE**

10741 None.

10742 **FUTURE DIRECTIONS**

10743 None.

10744 **SEE ALSO**

10745 <sys/types.h>

10746 XSH *endpwent()*, *getpwnam()*, *getpwuid()*10747 **CHANGE HISTORY**

10748 First released in Issue 1.

10749 **Issue 5**

10750 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

10751 **Issue 6**10752 The following new requirements on POSIX implementations derive from alignment with the
10753 Single UNIX Specification:

- 10754
- The **gid_t** and **uid_t** types are mandated.

- 10755 • The `getpwnam_r()` and `getpwuid_r()` functions are marked as part of the Thread-Safe
- 10756 Functions option.
- 10757 **Issue 7**
- 10758 SD5-XBD-ERN-56 is applied, adding a reference to <sys/types.h> for the `size_t` type.

10759 **NAME**

10760 regex.h — regular expression matching types

10761 **SYNOPSIS**

10762 #include <regex.h>

10763 **DESCRIPTION**10764 The <regex.h> header shall define the structures and symbolic constants used by the *regcomp()*,
10765 *regexexec()*, *regerror()*, and *regfree()* functions.10766 The <regex.h> header shall define the **regex_t** structure type, which shall include at least the
10767 following member:

10768 size_t re_nsub Number of parenthesized subexpressions.

10769 The <regex.h> header shall define the **size_t** type as described in <sys/types.h>.10770 The <regex.h> header shall define the **regoff_t** type as a signed integer type that can hold the
10771 largest value that can be stored in either a **ptrdiff_t** type or a **ssize_t** type.10772 The <regex.h> header shall define the **regmatch_t** structure type, which shall include at least the
10773 following members:10774 regoff_t rm_so Byte offset from start of string
10775 to start of substring.10776 regoff_t rm_eo Byte offset from start of string of the
10777 first character after the end of substring.10778 The <regex.h> header shall define the following symbolic constants for the *cflags* parameter to
10779 the *regcomp()* function:

10780 REG_EXTENDED Use Extended Regular Expressions.

10781 REG_ICASE Ignore case in match.

10782 REG_NOSUB Report only success or fail in *regexexec()*.

10783 REG_NEWLINE Change the handling of <newline>.

10784 The <regex.h> header shall define the following symbolic constants for the *eflags* parameter to
10785 the *regexexec()* function:10786 REG_NOTBOL The <circumflex> character ('^'), when taken as a special character, does
10787 not match the beginning of *string*.10788 REG_NOTEOL The <dollar-sign> ('\$'), when taken as a special character, does not
10789 match the end of *string*.

10790 The <regex.h> header shall define the following symbolic constants as error return values:

10791 REG_NOMATCH *regexexec()* failed to match.

10792 REG_BADPAT Invalid regular expression.

10793 REG_ECOLLATE Invalid collating element referenced.

10794 REG_ETYPE Invalid character class type referenced.

10795 REG_EESCAPE Trailing <backslash> character in pattern.

10796 REG_ESUBREG Number in *\digit* invalid or in error.

10797	REG_EBRACK	"[]" imbalance.
10798	REG_EPAREN	"\(\)" or "()" imbalance.
10799	REG_EBRACE	"\{\}" imbalance.
10800	REG_BADBR	Content of "\{\}" invalid: not a number, number too large, more than
10801		two numbers, first larger than second.
10802	REG_ERANGE	Invalid endpoint in range expression.
10803	REG_ESPACE	Out of memory.
10804	REG_BADRPT	'?', '*', or '+' not preceded by valid regular expression.
10805	The following shall be declared as functions and may also be defined as macros. Function	
10806	prototypes shall be provided.	
10807	<code>int regcomp(regex_t *restrict, const char *restrict, int);</code>	
10808	<code>size_t regerror(int, const regex_t *restrict, char *restrict, size_t);</code>	
10809	<code>int regexec(const regex_t *restrict, const char *restrict, size_t,</code>	
10810	<code>regmatch_t [restrict], int);</code>	
10811	<code>void regfree(regex_t *);</code>	
10812	The implementation may define additional macros or constants using names beginning with	
10813	REG_.	
10814	APPLICATION USAGE	
10815	None.	
10816	RATIONALE	
10817	None.	
10818	FUTURE DIRECTIONS	
10819	None.	
10820	SEE ALSO	
10821	<sys/types.h>	
10822	XSH regcomp()	
10823	CHANGE HISTORY	
10824	First released in Issue 4.	
10825	Originally derived from the ISO POSIX-2 standard.	
10826	Issue 6	
10827	The REG_ENOSYS constant is marked obsolescent.	
10828	The restrict keyword is added to the prototypes for <i>regcomp()</i> , <i>regerror()</i> , and <i>regexec()</i> .	
10829	A statement is added that the size_t type is defined as described in <sys/types.h> .	
10830	Issue 7	
10831	SD5-XBD-ERN-60 is applied.	
10832	The obsolescent REG_ENOSYS constant is removed.	
10833	This reference page is clarified with respect to macros and symbolic constants.	

10834 **NAME**

10835 sched.h — execution scheduling

10836 **SYNOPSIS**

10837 #include <sched.h>

10838 **DESCRIPTION**10839 PS The <sched.h> header shall define the **pid_t** type as described in <sys/types.h>.10840 SS|TSP The <sched.h> header shall define the **time_t** type as described in <sys/types.h>.10841 The <sched.h> header shall define the **timespec** structure as described in <time.h>.

10842 The <sched.h> header shall define the **sched_param** structure, which shall include the
 10843 scheduling parameters required for implementation of each supported scheduling policy. This
 10844 structure shall include at least the following member:

10845 int sched_priority Process or thread execution scheduling priority.

10846 SS|TSP The **sched_param** structure defined in <sched.h> shall include the following members in
 10847 addition to those specified above:

10848 int sched_ss_low_priority Low scheduling priority for
 10849 sporadic server.

10850 struct timespec sched_ss_repl_period Replenishment period for
 10851 sporadic server.

10852 struct timespec sched_ss_init_budget Initial budget for sporadic server.

10853 int sched_ss_max_repl Maximum pending replenishments for
 10854 sporadic server.

10855 Each process or thread is controlled by an associated scheduling policy and priority. Associated
 10856 with each policy is a priority range. Each policy definition specifies the minimum priority range
 10857 for that policy. The priority ranges for each policy may overlap the priority ranges of other
 10858 policies.

10859 Four scheduling policies are defined; others may be defined by the implementation. The four
 10860 standard policies are indicated by the values of the following symbolic constants:

10861 PS|TPS **SCHED_FIFO** First in-first out (FIFO) scheduling policy.

10862 PS|TPS **SCHED_RR** Round robin scheduling policy.

10863 SS|TSP **SCHED_SPORADIC** Sporadic server scheduling policy.

10864 PS|TPS **SCHED_OTHER** Another scheduling policy.

10865 The values of these constants are distinct.

10866 The following shall be declared as functions and may also be defined as macros. Function
 10867 prototypes shall be provided.

```
10868 PS|TPS int sched_get_priority_max(int);
10869 int sched_get_priority_min(int);
10870 PS int sched_getparam(pid_t, struct sched_param *);
10871 int sched_getscheduler(pid_t);
10872 PS|TPS int sched_rr_get_interval(pid_t, struct timespec *);
10873 PS int sched_setparam(pid_t, const struct sched_param *);
10874 int sched_setscheduler(pid_t, int, const struct sched_param *);
10875 int sched_yield(void);
```

10876 Inclusion of the <sched.h> header may make visible all symbols from the <time.h> header.

10877 **APPLICATION USAGE**

10878 None.

10879 **RATIONALE**

10880 None.

10881 **FUTURE DIRECTIONS**

10882 None.

10883 **SEE ALSO**

10884 <sys/types.h>, <time.h>

10885 XSH *sched_get_priority_max()*, *sched_getparam()*, *sched_getscheduler()*, *sched_rr_get_interval()*,
 10886 *sched_setparam()*, *sched_setscheduler()*, *sched_yield()*

10887 **CHANGE HISTORY**

10888 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

10889 **Issue 6**

10890 The <sched.h> header is marked as part of the Process Scheduling option.

10891 Sporadic server members are added to the **sched_param** structure, and the SCHED_SPORADIC
 10892 scheduling policy is added for alignment with IEEE Std 1003.1d-1999.

10893 IEEE PASC Interpretation 1003.1 #108 is applied, correcting the **sched_param** structure whose
 10894 members *sched_ss_repl_period* and *sched_ss_init_budget* should be type **struct timespec** and not
 10895 **timespec**.

10896 Symbols from <time.h> may be made visible when <sched.h> is included.

10897 IEEE Std 1003.1-2001/Cor 1-2002, items XSH/TC1/D6/52 and XSH/TC1/D6/53 are applied,
 10898 aligning the function prototype shading and margin codes with the System Interfaces volume of
 10899 IEEE Std 1003.1-2001.

10900 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/23 is applied, updating the
 10901 DESCRIPTION to differentiate between thread and process execution.

10902 **Issue 7**

10903 SD5-XBD-ERN-13 is applied.

10904 Austin Group Interpretation 1003.1-2001 #064 is applied, correcting the options markings.

10905 The <sched.h> headers is moved from the Threads option to the Base.

10906 Declarations for the **pid_t** and **time_t** types and the **timespec** structure are added.

10907 **NAME**

10908 search.h — search tables

10909 **SYNOPSIS**10910 XSI `#include <search.h>`10911 **DESCRIPTION**

10912 The <search.h> header shall define the **ENTRY** type for structure **entry** which shall include the
 10913 following members:

```
10914 char    *key
10915 void     *data
```

10916 and shall define **ACTION** and **VISIT** as enumeration data types through type definitions as
 10917 follows:

```
10918 enum { FIND, ENTER } ACTION;
10919 enum { preorder, postorder, endorder, leaf } VISIT;
```

10920 The <search.h> header shall define the **size_t** type as described in <sys/types.h>.

10921 The following shall be declared as functions and may also be defined as macros. Function
 10922 prototypes shall be provided.

```
10923 int      hcreate(size_t);
10924 void     hdestroy(void);
10925 ENTRY *hsearch(ENTRY, ACTION);
10926 void     insque(void *, void *);
10927 void     *lfind(const void *, const void *, size_t *,
10928               size_t, int (*)(const void *, const void *));
10929 void     *lsearch(const void *, void *, size_t *,
10930               size_t, int (*)(const void *, const void *));
10931 void     remque(void *);
10932 void     *tdelete(const void *restrict, void **restrict,
10933               int (*)(const void *, const void *));
10934 void     *tfind(const void *, void *const *,
10935               int (*)(const void *, const void *));
10936 void     *tsearch(const void *, void **,
10937               int (*)(const void *, const void *));
10938 void     twalk(const void *,
10939               void (*)(const void *, VISIT, int ));
```

10940 **APPLICATION USAGE**

10941 None.

10942 **RATIONALE**

10943 None.

10944 **FUTURE DIRECTIONS**

10945 None.

10946 **SEE ALSO**10947 [<sys/types.h>](#)10948 XSH [hcreate\(\)](#), [insque\(\)](#), [lsearch\(\)](#), [tdelete\(\)](#)

10949 **CHANGE HISTORY**

10950 First released in Issue 1. Derived from Issue 1 of the SVID.

10951 **Issue 6**

10952 The Open Group Corrigendum U021/6 is applied, updating the prototypes for *tdelete()* and
10953 *tsearch()*.

10954 The **restrict** keyword is added to the prototype for *tdelete()*.

10955 **NAME**

10956 semaphore.h — semaphores

10957 **SYNOPSIS**

10958 #include <semaphore.h>

10959 **DESCRIPTION**

10960 The <semaphore.h> header shall define the **sem_t** type, used in performing semaphore
 10961 operations. The semaphore may be implemented using a file descriptor, in which case
 10962 applications are able to open up at least a total of {OPEN_MAX} files and semaphores.

10963 The <semaphore.h> header shall define the symbolic constant SEM_FAILED which shall have
 10964 type **sem_t** *.

10965 The following shall be declared as functions and may also be defined as macros. Function
 10966 prototypes shall be provided.

```
10967 int      sem_close(sem_t *);
10968 int      sem_destroy(sem_t *);
10969 int      sem_getvalue(sem_t *restrict, int *restrict);
10970 int      sem_init(sem_t *, int, unsigned);
10971 sem_t *sem_open(const char *, int, ...);
10972 int      sem_post(sem_t *);
10973 int      sem_timedwait(sem_t *restrict, const struct timespec *restrict);
10974 int      sem_trywait(sem_t *);
10975 int      sem_unlink(const char *);
10976 int      sem_wait(sem_t *);
```

10977 Inclusion of the <semaphore.h> header may make visible symbols defined in the <fcntl.h> and
 10978 <time.h> headers.

10979 **APPLICATION USAGE**

10980 None.

10981 **RATIONALE**

10982 None.

10983 **FUTURE DIRECTIONS**

10984 None.

10985 **SEE ALSO**

10986 <fcntl.h>, <sys/types.h>, <time.h>

10987 XSH *sem_close()*, *sem_destroy()*, *sem_getvalue()*, *sem_init()*, *sem_open()*, *sem_post()*,
 10988 *sem_timedwait()*, *sem_trywait()*, *sem_unlink()*

10989 **CHANGE HISTORY**

10990 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

10991 **Issue 6**

10992 The <semaphore.h> header is marked as part of the Semaphores option.

10993 The Open Group Corrigendum U021/3 is applied, adding a description of SEM_FAILED.

10994 The *sem_timedwait()* function is added for alignment with IEEE Std 1003.1d-1999.10995 The **restrict** keyword is added to the prototypes for *sem_getvalue()* and *sem_timedwait()*.

10996 **Issue 7**

10997 SD5-XBD-ERN-57 is applied, allowing the header to make visible symbols from the <time.h>
10998 header.

10999 The <semaphore.h> header is moved from the Semaphores option to the Base.

11000 This reference page is clarified with respect to macros and symbolic constants.

11001 **NAME**

11002 setjmp.h — stack environment declarations

11003 **SYNOPSIS**

11004 #include <setjmp.h>

11005 **DESCRIPTION**

11006 CX Some of the functionality described on this reference page extends the ISO C standard.
 11007 Applications shall define the appropriate feature test macro (see XSH [Section 2.2](#), on page 472) to
 11008 enable the visibility of these symbols in this header.

11009 CX The <setjmp.h> header shall define the array types **jmp_buf** and **sigjmp_buf**.

11010 The following shall be declared as functions and may also be defined as macros. Function
 11011 prototypes shall be provided.

11012 OB XSI void _longjmp(jmp_buf, int);

11013 void longjmp(jmp_buf, int);

11014 CX void siglongjmp(sigjmp_buf, int);

11015 The following may be declared as functions, or defined as macros, or both. If functions are
 11016 declared, function prototypes shall be provided.

11017 OB XSI int _setjmp(jmp_buf);

11018 int setjmp(jmp_buf);

11019 CX int sigsetjmp(sigjmp_buf, int);

11020 **APPLICATION USAGE**

11021 None.

11022 **RATIONALE**

11023 None.

11024 **FUTURE DIRECTIONS**

11025 None.

11026 **SEE ALSO**11027 XSH [Section 2.2](#) (on page 472), [_longjmp\(\)](#), [longjmp\(\)](#), [setjmp\(\)](#), [siglongjmp\(\)](#), [sigsetjmp\(\)](#)11028 **CHANGE HISTORY**

11029 First released in Issue 1.

11030 **Issue 6**

11031 Extensions beyond the ISO C standard are marked.

11032 **Issue 7**

11033 SD5-XBD-ERN-6 is applied.

11034 **NAME**

11035 signal.h — signals

11036 **SYNOPSIS**

11037 #include <signal.h>

11038 **DESCRIPTION**

11039 CX Some of the functionality described on this reference page extends the ISO C standard.
11040 Applications shall define the appropriate feature test macro (see XSH [Section 2.2](#), on page 472) to
11041 enable the visibility of these symbols in this header.

11042 The <signal.h> header shall define the following macros, which shall expand to constant
11043 expressions with distinct values that have a type compatible with the second argument to, and
11044 the return value of, the *signal()* function, and whose values shall compare unequal to the
11045 address of any declarable function.

11046 SIG_DFL Request for default signal handling.

11047 SIG_ERR Return value from *signal()* in case of error.

11048 OB XSI SIG_HOLD Request that signal be held.

11049 SIG_IGN Request that signal be ignored.

11050 CX The <signal.h> header shall define the **pthread_t**, **size_t**, and **uid_t** types as described in
11051 <sys/types.h>.

11052 The <signal.h> header shall define the **timespec** structure as described in <time.h>.

11053 The <signal.h> header shall define the following data types:

11054 **sig_atomic_t** Possibly volatile-qualified integer type of an object that can be accessed as
11055 an atomic entity, even in the presence of asynchronous interrupts.

11056 CX **sigset_t** Integer or structure type of an object used to represent sets of signals.

11057 CX **pid_t** As described in <sys/types.h>.

11058 CX The <signal.h> header shall define the **pthread_attr_t** type as described in <sys/types.h>.

11059 The <signal.h> header shall define the **sigevent** structure, which shall include at least the
11060 following members:

11061	int	sigev_notify	Notification type.
11062	int	sigev_signo	Signal number.
11063	union sigval	sigev_value	Signal value.
11064	void	(*sigev_notify_function) (union sigval)	Notification function.
11065			Notification attributes.
11066	pthread_attr_t *	sigev_notify_attributes	

11067 The <signal.h> header shall define the following symbolic constants for the values of
11068 *sigev_notify*:

11069 SIGEV_NONE No asynchronous notification is delivered when the event of interest
11070 occurs.

11071 SIGEV_SIGNAL A queued signal, with an application-defined value, is generated when
11072 the event of interest occurs.

11073 SIGEV_THREAD A notification function is called to perform notification.

11074 The **signal** union shall be defined as:

11075 `int sival_int` Integer signal value.

11076 `void *sival_ptr` Pointer signal value.

11077 The <**signal.h**> header shall declare the SIGRTMIN and SIGRTMAX macros, which shall expand

11078 to positive integer expressions with type **int**, but which need not be constant expressions. These

11079 macros specify a range of signal numbers that are reserved for application use and for which the

11080 realtime signal behavior specified in this volume of POSIX.1-2008 is supported. The signal

11081 numbers in this range do not overlap any of the signals specified in the following table.

11082 The range SIGRTMIN through SIGRTMAX inclusive shall include at least {RTSIG_MAX} signal

11083 numbers.

11084 It is implementation-defined whether realtime signal behavior is supported for other signals.

11085 The <**signal.h**> header shall define the following macros that are used to refer to the signals that

11086 occur in the system. Signals defined here begin with the letters SIG followed by an uppercase

11087 letter. The macros shall expand to positive integer constant expressions with type **int** and

11088 distinct values. The value 0 is reserved for use as the null signal (see *kill()*). Additional

11089 implementation-defined signals may occur in the system.

11090 CX The ISO C standard only requires the signal names SIGABRT, SIGFPE, SIGILL, SIGINT,

11091 SIGSEGV, and SIGTERM to be defined.

11092 The following signals shall be supported on all implementations (default actions are explained

11093 below the table):

	Signal	Default Action	Description
11094			
11095	SIGABRT	A	Process abort signal.
11096	SIGALRM	T	Alarm clock.
11097	SIGBUS	A	Access to an undefined portion of a memory object.
11098	SIGCHLD	I	Child process terminated, stopped,
11099	XSI		or continued.
11100	SIGCONT	C	Continue executing, if stopped.
11101	SIGFPE	A	Erroneous arithmetic operation.
11102	SIGHUP	T	Hangup.
11103	SIGILL	A	Illegal instruction.
11104	SIGINT	T	Terminal interrupt signal.
11105	SIGKILL	T	Kill (cannot be caught or ignored).
11106	SIGPIPE	T	Write on a pipe with no one to read it.
11107	SIGQUIT	A	Terminal quit signal.
11108	SIGSEGV	A	Invalid memory reference.
11109	SIGSTOP	S	Stop executing (cannot be caught or ignored).
11110	SIGTERM	T	Termination signal.
11111	SIGTSTP	S	Terminal stop signal.
11112	SIGTTIN	S	Background process attempting read.
11113	SIGTTOU	S	Background process attempting write.
11114	SIGUSR1	T	User-defined signal 1.
11115	SIGUSR2	T	User-defined signal 2.
11116	OB XSR	T	Pollable event.
11117	OB XSI	T	Profiling timer expired.
11118	XSI	A	Bad system call.
11119		A	Trace/breakpoint trap.
11120	SIGURG	I	High bandwidth data is available at a socket.
11121	XSI	T	Virtual timer expired.
11122		A	CPU time limit exceeded.
11123		A	File size limit exceeded.

11124 The default actions are as follows:

- 11125 T Abnormal termination of the process.
- 11126 XSI A Abnormal termination of the process with additional actions.
- 11127 I Ignore the signal.
- 11128 S Stop the process.
- 11129 C Continue the process, if it is stopped; otherwise, ignore the signal.

11130 The effects on the process in each case are described in XSH [Section 2.4.3](#) (on page 490).

11131 CX The <signal.h> header shall declare the **sigaction** structure, which shall include at least the

11132 following members:

```

11133 void    (*sa_handler)(int)    Pointer to a signal-catching function
11134                                     or one of the SIG_IGN or SIG_DFL.
11135 sigset_t sa_mask              Set of signals to be blocked during execution
11136                                     of the signal handling function.
11137 int      sa_flags              Special flags.
11138 void    (*sa_sigaction)(int, siginfo_t *, void *)
11139                                     Pointer to a signal-catching function.
```

11140	CX	The storage occupied by <i>sa_handler</i> and <i>sa_sigaction</i> may overlap, and a conforming application shall not use both simultaneously.	
11141			
11142		The <signal.h> header shall define the following macros which shall expand to integer constant expressions that need not be usable in #if preprocessing directives:	
11143			
11144	CX	SIG_BLOCK	The resulting set is the union of the current set and the signal set pointed to by the argument <i>set</i> .
11145			
11146	CX	SIG_UNBLOCK	The resulting set is the intersection of the current set and the complement of the signal set pointed to by the argument <i>set</i> .
11147			
11148	CX	SIG_SETMASK	The resulting set is the signal set pointed to by the argument <i>set</i> .
11149		The <signal.h> header shall also define the following symbolic constants:	
11150	CX	SA_NOCLDSTOP	Do not generate SIGCHLD when children stop
11151	XSI		or stopped children continue.
11152	XSI	SA_ONSTACK	Causes signal delivery to occur on an alternate stack.
11153	CX	SA_RESETHAND	Causes signal dispositions to be set to SIG_DFL on entry to signal handlers.
11154			
11155	CX	SA_RESTART	Causes certain functions to become restartable.
11156	CX	SA_SIGINFO	Causes extra information to be passed to signal handlers at the time of receipt of a signal.
11157			
11158	CX	SA_NOCLDWAIT	Causes implementations not to create zombie processes on child death.
11159	CX	SA_NODEFER	Causes signal not to be automatically blocked on entry to signal handler.
11160	XSI	SS_ONSTACK	Process is executing on an alternate signal stack.
11161	XSI	SS_DISABLE	Alternate signal stack is disabled.
11162	XSI	MINSIGSTKSZ	Minimum stack size for a signal handler.
11163	XSI	SIGSTKSZ	Default size in bytes for the alternate signal stack.
11164	CX	The <signal.h> header shall define the mcontext_t type through typedef .	
11165	CX	The <signal.h> header shall define the ucontext_t type as a structure that shall include at least the following members:	
11166			
11167		ucontext_t *uc_link	Pointer to the context that is resumed when this context returns.
11168			
11169		sigset_t uc_sigmask	The set of signals that are blocked when this context is active.
11170			
11171		stack_t uc_stack	The stack used by this context.
11172		mcontext_t uc_mcontext	A machine-specific representation of the saved context.
11173			
11174		The <signal.h> header shall define the stack_t type as a structure, which shall include at least the following members:	
11175			
11176		void *ss_sp	Stack base or pointer.
11177		size_t ss_size	Stack size.
11178		int ss_flags	Flags.

11179 CX The <signal.h> header shall define the **siginfo_t** type as a structure, which shall include at least
11180 the following members:

11181	CX	int	si_signo	Signal number.
11182		int	si_code	Signal code.
11183	XSI	int	si_errno	If non-zero, an <i>errno</i> value associated with
11184				this signal, as described in <errno.h>.
11185	CX	pid_t	si_pid	Sending process ID.
11186		uid_t	si_uid	Real user ID of sending process.
11187		void	*si_addr	Address of faulting instruction.
11188		int	si_status	Exit value or signal.
11189	OB XSR	long	si_band	Band event for SIGPOLL.
11190	CX	union sigval	si_value	Signal value.

11191 CX The <signal.h> header shall define the symbolic constants in the **Code** column of the following
11192 table for use as values of *si_code* that are signal-specific or non-signal-specific reasons why the
11193 signal was generated.

		Signal	Code	Reason
11194				
11195	CX	SIGILL	ILL_ILLOPC	Illegal opcode.
11196			ILL_ILLOPN	Illegal operand.
11197			ILL_ILLADR	Illegal addressing mode.
11198			ILL_ILLTRP	Illegal trap.
11199			ILL_PRVOPC	Privileged opcode.
11200			ILL_PRVREG	Privileged register.
11201			ILL_COPROC	Coprocessor error.
11202			ILL_BADSTK	Internal stack error.
11203		SIGFPE	FPE_INTDIV	Integer divide by zero.
11204			FPE_INTOVF	Integer overflow.
11205			FPE_FLTDIV	Floating-point divide by zero.
11206			FPE_FLTOVF	Floating-point overflow.
11207			FPE_FLTUND	Floating-point underflow.
11208			FPE_FLTRES	Floating-point inexact result.
11209			FPE_FLTINV	Invalid floating-point operation.
11210			FPE_FLTSUB	Subscript out of range.
11211		SIGSEGV	SEGV_MAPERR	Address not mapped to object.
11212			SEGV_ACCERR	Invalid permissions for mapped object.
11213		SIGBUS	BUS_ADRALN	Invalid address alignment.
11214			BUS_ADRERR	Nonexistent physical address.
11215			BUS_OBJERR	Object-specific hardware error.
11216	XSI	SIGTRAP	TRAP_BRKPT	Process breakpoint.
11217			TRAP_TRACE	Process trace trap.
11218	CX	SIGCHLD	CLD_EXITED	Child has exited.
11219			CLD_KILLED	Child has terminated abnormally and did not create a core file.
11220			CLD_DUMPED	Child has terminated abnormally and created a core file.
11221			CLD_TRAPPED	Traced child has trapped.
11222			CLD_STOPPED	Child has stopped.
11223			CLD_CONTINUED	Stopped child has continued.
11224	OB XSR	SIGPOLL	POLL_IN	Data input available.
11225			POLL_OUT	Output buffers available.
11226			POLL_MSG	Input message available.
11227			POLL_ERR	I/O error.
11228			POLL_PRI	High priority input available.
11229			POLL_HUP	Device disconnected.
11230	CX	Any	SI_USER	Signal sent by <i>kill()</i> .
11231			SI_QUEUE	Signal sent by <i>sigqueue()</i> .
11232			SI_TIMER	Signal generated by expiration of a timer set by <i>timer_settime()</i> .
11233			SI_ASYNCIO	Signal generated by completion of an asynchronous I/O request.
11234				
11235			SI_MESGQ	Signal generated by arrival of a message on an empty message queue
11236				
11237	CX	Implementations may support additional <i>si_code</i> values not included in this list, may generate values included in this list under circumstances other than those described in this list, and may contain extensions or limitations that prevent some values from being generated. Implementations do not generate a different value from the ones described in this list for circumstances described in this list.		
11238				
11239				
11240				
11241				

11242 CX In addition, the following signal-specific information shall be available:

Signal	Member	Value
SIGILL SIGFPE	void * <i>si_addr</i>	Address of faulting instruction.
SIGSEGV SIGBUS	void * <i>si_addr</i>	Address of faulting memory reference.
SIGCHLD	pid_t <i>si_pid</i> int <i>si_status</i> uid_t <i>si_uid</i>	Child process ID. Exit value or signal. Real user ID of the process that sent the signal.
SIGPOLL	long <i>si_band</i>	Band event for POLL_IN, POLL_OUT, or POLL_MSG

11252 For some implementations, the value of *si_addr* may be inaccurate.

11253 The following shall be declared as functions and may also be defined as macros. Function
11254 prototypes shall be provided.

```

11255 CX int kill(pid_t, int);
11256 XSI int killpg(pid_t, int);
11257 CX void psiginfo(const siginfo_t *, const char *);
11258 void psignal(int, const char *);
11259 int pthread_kill(pthread_t, int);
11260 int pthread_sigmask(int, const sigset_t *restrict,
11261 sigset_t *restrict);
11262 int raise(int);
11263 CX int sigaction(int, const struct sigaction *restrict,
11264 struct sigaction *restrict);
11265 int sigaddset(sigset_t *, int);
11266 XSI int sigaltstack(const stack_t *restrict, stack_t *restrict);
11267 CX int sigdelset(sigset_t *, int);
11268 int sigemptyset(sigset_t *);
11269 int sigfillset(sigset_t *);
11270 OB XSI int sighold(int);
11271 int sigignore(int);
11272 int siginterrupt(int, int);
11273 CX int sigismember(const sigset_t *, int);
11274 void (*signal(int, void (*)(int)))(int);
11275 OB XSI int sigpause(int);
11276 CX int sigpending(sigset_t *);
11277 int sigprocmask(int, const sigset_t *restrict, sigset_t *restrict);
11278 int sigqueue(pid_t, int, const union sigval);
11279 OB XSI int sigrelse(int);
11280 void (*sigset(int, void (*)(int)))(int);
11281 CX int sigsuspend(const sigset_t *);
11282 int sigtimedwait(const sigset_t *restrict, siginfo_t *restrict,
11283 const struct timespec *restrict);
11284 int sigwait(const sigset_t *restrict, int *restrict);
11285 int sigwaitinfo(const sigset_t *restrict, siginfo_t *restrict);

```

11286 CX Inclusion of the <signal.h> header may make visible all symbols from the <time.h> header.

APPLICATION USAGE

On systems not supporting the XSI option, the *si_pid* and *si_uid* members of **siginfo_t** are only required to be valid when *si_code* is SI_USER or SI_QUEUE. On XSI-conforming systems, they are also valid for all *si_code* values less than or equal to 0; however, it is unspecified whether SI_USER and SI_QUEUE have values less than or equal to zero, and therefore XSI applications should check whether *si_code* has the value SI_USER or SI_QUEUE or is less than or equal to 0 to tell whether *si_pid* and *si_uid* are valid.

RATIONALE

None.

FUTURE DIRECTIONS

The SIGPOLL and SIGPROF signals may be removed in a future version.

SEE ALSO

[<errno.h>](#), [<stropts.h>](#), [<sys/types.h>](#), [<time.h>](#)

XSH Section 2.2 (on page 472), *alarm()*, *ioctl()*, *kill()*, *killpg()*, *psiginfo()*, *pthread_kill()*, *pthread_sigmask()*, *raise()*, *sigaction()*, *sigaddset()*, *sigaltstack()*, *sigdelset()*, *sigemptyset()*, *sigfillset()*, *sighold()*, *siginterrupt()*, *sigismember()*, *signal()*, *sigpending()*, *sigqueue()*, *sigsuspend()*, *sigtimedwait()*, *sigwait()*, *timer_create()*, *wait()*, *waitid()*

CHANGE HISTORY

First released in Issue 1.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX Threads Extension.

The default action for SIGURG is changed from i to iii. The function prototype for *sigmask()* is removed.

Issue 6

The Open Group Corrigendum U035/2 is applied. In the DESCRIPTION, the wording for abnormal termination is clarified.

The Open Group Corrigendum U028/8 is applied, correcting the prototype for the *sigset()* function.

The Open Group Corrigendum U026/3 is applied, correcting the type of the *sigev_notify_function* function member of the **sigevent** structure.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The SIGCHLD, SIGCONT, SIGSTOP, SIGTSTP, SIGTTIN, and SIGTTOU signals are now mandated. This is also a FIPS requirement.
- The **pid_t** definition is mandated.

The RT markings are changed to RTS to denote that the semantics are part of the Realtime Signals Extension option.

The **restrict** keyword is added to the prototypes for *sigaction()*, *sigaltstack()*, *sigprocmask()*, *sigtimedwait()*, *sigwait()*, and *sigwaitinfo()*.

IEEE PASC Interpretation 1003.1 #85 is applied, adding the statement that symbols from [<time.h>](#) may be made visible when [<signal.h>](#) is included.

Extensions beyond the ISO C standard are marked.

11330	IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/14 is applied, changing the descriptive
11331	text for members of the sigaction structure.
11332	IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/15 is applied, correcting the definition of
11333	the <i>sa_sigaction</i> member of the sigaction structure.
11334	IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/24 is applied, reworking the ordering of
11335	the siginfo_t type structure in the DESCRIPTION. This is an editorial change and no normative
11336	change is intended.
11337	Issue 7
11338	SD5-XBD-ERN-5 is applied.
11339	SD5-XBD-ERN-39 is applied, removing the sigstack structure which should have been removed
11340	at the same time as the LEGACY <i>sigstack()</i> function.
11341	SD5-XBD-ERN-56 is applied, adding a reference to <sys/types.h> for the size_t type.
11342	Austin Group Interpretation 1003.1-2001 #034 is applied.
11343	The ucontext_t and mcontext_t structures are added here from the obsolescent <ucontext.h>
11344	header.
11345	The <i>psiginfo()</i> and <i>psignal()</i> functions are added from The Open Group Technical Standard, 2006,
11346	Extended API Set Part 1.
11347	The SIGPOLL and SIGPROF signals and text relating to the XSI STREAMS option are marked
11348	obsolescent.
11349	The SA_RESETHAND, SA_RESTART, SA_SIGINFO, SA_NOCLDWAIT, and SA_NODEFER
11350	constants are moved from the XSI option to the Base.
11351	Functionality relating to the Realtime Signals Extension option is moved to the Base.
11352	This reference page is clarified with respect to macros and symbolic constants, and declarations
11353	for the pthread_attr_t , pthread_t , and uid_t types and the timespec structure are added.
11354	SIGRTMIN and SIGRTMAX are required to be positive integer expressions.
11355	The APPLICATION USAGE section is updated to describe the <i>si_pid</i> and <i>si_uid</i> members of
11356	siginfo_t .
11357	POSIX.1-2008, Technical Corrigendum 1, XBD/TC1-2008/0062 [208], XBD/TC1-2008/0063 [80], +
11358	and XBD/TC1-2008/0064 [157] are applied.

11359 NAME

11360 spawn.h — spawn (ADVANCED REALTIME)

11361 SYNOPSIS

11362 SPN `#include <spawn.h>`

11363 DESCRIPTION

11364 The <spawn.h> header shall define the **posix_spawnattr_t** and **posix_spawn_file_actions_t**
 11365 types used in performing spawn operations.

11366 The <spawn.h> header shall define the **mode_t** and **pid_t** types as described in <sys/types.h>.

11367 The <spawn.h> header shall define the **sigset_t** type as described in <signal.h>.

11368 The tag **sched_param** shall be declared as naming an incomplete structure type, the contents of
 11369 which are described in the <sched.h> header.

11370 The <spawn.h> header shall define the following symbolic constants for use as the flags that
 11371 may be set in a **posix_spawnattr_t** object using the *posix_spawnattr_setflags()* function:

11372 POSIX_SPAWN_RESETIDS

11373 POSIX_SPAWN_SETPGROUP

11374 PS POSIX_SPAWN_SETSCHEDPARAM

11375 POSIX_SPAWN_SETSCHEDULER

11376 POSIX_SPAWN_SETSIGDEF

11377 POSIX_SPAWN_SETSIGMASK

11378 The following shall be declared as functions and may also be defined as macros. Function
 11379 prototypes shall be provided.

```

11380 int    posix_spawn(pid_t *restrict, const char *restrict,
11381                  const posix_spawn_file_actions_t *,
11382                  const posix_spawnattr_t *restrict, char *const [restrict],
11383                  char *const [restrict]);
11384 int    posix_spawn_file_actions_addclose(posix_spawn_file_actions_t *,
11385                  int);
11386 int    posix_spawn_file_actions_adddup2(posix_spawn_file_actions_t *,
11387                  int, int);
11388 int    posix_spawn_file_actions_addopen(posix_spawn_file_actions_t *restrict,
11389                  int, const char *restrict, int, mode_t);
11390 int    posix_spawn_file_actions_destroy(posix_spawn_file_actions_t *);
11391 int    posix_spawn_file_actions_init(posix_spawn_file_actions_t *);
11392 int    posix_spawnattr_destroy(posix_spawnattr_t *);
11393 int    posix_spawnattr_getflags(const posix_spawnattr_t *restrict,
11394                  short *restrict);
11395 int    posix_spawnattr_getpgroup(const posix_spawnattr_t *restrict,
11396                  pid_t *restrict);
11397 PS int    posix_spawnattr_getschedparam(const posix_spawnattr_t *restrict,
11398                  struct sched_param *restrict);
11399 int    posix_spawnattr_getschedpolicy(const posix_spawnattr_t *restrict,
11400                  int *restrict);
11401 int    posix_spawnattr_getsigdefault(const posix_spawnattr_t *restrict,
11402                  sigset_t *restrict);
11403 int    posix_spawnattr_getsigmask(const posix_spawnattr_t *restrict,
11404                  sigset_t *restrict);
11405 int    posix_spawnattr_init(posix_spawnattr_t *);

```

```

11406     int    posix_spawnattr_setflags(posix_spawnattr_t *, short);
11407     int    posix_spawnattr_setpgroup(posix_spawnattr_t *, pid_t);
11408 PS     int    posix_spawnattr_setschedparam(posix_spawnattr_t *restrict,
11409         const struct sched_param *restrict);
11410     int    posix_spawnattr_setschedpolicy(posix_spawnattr_t *, int);
11411     int    posix_spawnattr_setsigdefault(posix_spawnattr_t *restrict,
11412         const sigset_t *restrict);
11413     int    posix_spawnattr_setsigmask(posix_spawnattr_t *restrict,
11414         const sigset_t *restrict);
11415     int    posix_spawn(pid_t *restrict, const char *restrict,
11416         const posix_spawn_file_actions_t *,
11417         const posix_spawnattr_t *restrict,
11418         char *const [restrict], char *const [restrict]);

```

11419 Inclusion of the <spawn.h> header may make visible symbols defined in the <sched.h> and
 11420 <signal.h> headers.

11421 APPLICATION USAGE

11422 None.

11423 RATIONALE

11424 None.

11440 Issue 7

11441 This reference page is clarified with respect to macros and symbolic constants, and declarations
 11442 for the **mode_t**, **pid_t**, and **sigset_t** types are added.

11443 NAME

11444 stdarg.h — handle variable argument list

11445 SYNOPSIS

```
11446       #include <stdarg.h>

11447       void va_start(va_list ap, argN);
11448       void va_copy(va_list dest, va_list src);
11449       type va_arg(va_list ap, type);
11450       void va_end(va_list ap);
```

11451 DESCRIPTION

11452 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 11453 conflict between the requirements described here and the ISO C standard is unintentional. This
 11454 volume of POSIX.1-2008 defers to the ISO C standard.

11455 The <stdarg.h> header shall contain a set of macros which allows portable functions that accept
 11456 variable argument lists to be written. Functions that have variable argument lists (such as
 11457 *printf()*) but do not use these macros are inherently non-portable, as different systems use
 11458 different argument-passing conventions.

11459 The <stdarg.h> header shall define the **va_list** type for variables used to traverse the list.

11460 The *va_start()* macro is invoked to initialize *ap* to the beginning of the list before any calls to
 11461 *va_arg()*.

11462 The *va_copy()* macro initializes *dest* as a copy of *src*, as if the *va_start()* macro had been applied
 11463 to *dest* followed by the same sequence of uses of the *va_arg()* macro as had previously been used
 11464 to reach the present state of *src*. Neither the *va_copy()* nor *va_start()* macro shall be invoked to
 11465 reinitialize *dest* without an intervening invocation of the *va_end()* macro for the same *dest*.

11466 The object *ap* may be passed as an argument to another function; if that function invokes the
 11467 *va_arg()* macro with parameter *ap*, the value of *ap* in the calling function is unspecified and shall
 11468 be passed to the *va_end()* macro prior to any further reference to *ap*. The parameter *argN* is the
 11469 identifier of the rightmost parameter in the variable parameter list in the function definition (the
 11470 one just before the *...*). If the parameter *argN* is declared with the **register** storage class, with a
 11471 function type or array type, or with a type that is not compatible with the type that results after
 11472 application of the default argument promotions, the behavior is undefined.

11473 The *va_arg()* macro shall return the next argument in the list pointed to by *ap*. Each invocation
 11474 of *va_arg()* modifies *ap* so that the values of successive arguments are returned in turn. The *type*
 11475 parameter shall be a type name specified such that the type of a pointer to an object that has the
 11476 specified type can be obtained simply by postfixing a '*' to type. If there is no actual next
 11477 argument, or if *type* is not compatible with the type of the actual next argument (as promoted
 11478 according to the default argument promotions), the behavior is undefined, except for the
 11479 following cases:

- 11480 • One type is a signed integer type, the other type is the corresponding unsigned integer
 11481 type, and the value is representable in both types.
- 11482 • One type is a pointer to **void** and the other is a pointer to a character type.
- 11483 XSI • Both types are pointers.

11484 Different types can be mixed, but it is up to the routine to know what type of argument is
 11485 expected.

11486 The *va_end()* macro is used to clean up; it invalidates *ap* for use (unless *va_start()* or *va_copy()* is
 11487 invoked again).

Each invocation of the *va_start()* and *va_copy()* macros shall be matched by a corresponding invocation of the *va_end()* macro in the same function.

Multiple traversals, each bracketed by *va_start()* ... *va_end()*, are possible.

EXAMPLES

This example is a possible implementation of *execl()*:

```
#include <stdarg.h>

#define MAXARGS 31

/*
 * execl is called by
 * execl(file, arg1, arg2, ..., (char *) (0));
 */
int execl(const char *file, const char *args, ...)
{
    va_list ap;
    char *array[MAXARGS + 1];
    int argno = 0;

    va_start(ap, args);
    while (args != 0 && argno < MAXARGS)
    {
        array[argno++] = args;
        args = va_arg(ap, const char *);
    }
    array[argno] = (char *) 0;
    va_end(ap);
    return execv(file, array);
}
```

APPLICATION USAGE

It is up to the calling routine to communicate to the called routine how many arguments there are, since it is not always possible for the called routine to determine this in any other way. For example, *execl()* is passed a null pointer to signal the end of the list. The *printf()* function can tell how many arguments are there by the *format* argument.

RATIONALE

None.

FUTURE DIRECTIONS

None.

XSH *exec*, *fprintf()*

CHANGE HISTORY

First released in Issue 4. Derived from the ANSI C standard.

Issue 6

This reference page is updated to align with the ISO/IEC 9899:1999 standard.

11529 **NAME**

11530 stdbool.h — boolean type and values

11531 **SYNOPSIS**

11532 #include <stdbool.h>

11533 **DESCRIPTION**

11534 CX The functionality described on this reference page is aligned with the ISO C standard. Any
11535 conflict between the requirements described here and the ISO C standard is unintentional. This
11536 volume of POSIX.1-2008 defers to the ISO C standard.

11537 The <stdbool.h> header shall define the following macros:

11538 bool Expands to **_Bool**.

11539 true Expands to the integer constant 1.

11540 false Expands to the integer constant 0.

11541 __bool_true_false_are_defined

11542 Expands to the integer constant 1.

11543 An application may undefine and then possibly redefine the macros bool, true, and false.

11544 **APPLICATION USAGE**

11545 None.

11546 **RATIONALE**

11547 None.

11548 **FUTURE DIRECTIONS**

11549 The ability to undefine and redefine the macros bool, true, and false is an obsolescent feature
11550 and may be removed in a future version.

11551 **SEE ALSO**

11552 None.

11553 **CHANGE HISTORY**

11554 First released in Issue 6. Included for alignment with the ISO/IEC 9899:1999 standard.

11555 **NAME**

11556 **stddef.h** — standard type definitions

11557 **SYNOPSIS**

11558 #include <stddef.h>

11559 **DESCRIPTION**

11560 CX The functionality described on this reference page is aligned with the ISO C standard. Any
11561 conflict between the requirements described here and the ISO C standard is unintentional. This
11562 volume of POSIX.1-2008 defers to the ISO C standard.

11563 The <stddef.h> header shall define the following macros:

11564 CX **NULL** Null pointer constant. The macro shall expand to an integer constant expression
11565 with the value 0 cast to type **void ***.

11566 offsetof(*type*, *member-designator*)

11567 Integer constant expression of type **size_t**, the value of which is the offset in bytes
11568 to the structure member (*member-designator*), from the beginning of its structure
11569 (*type*).

11570 The <stddef.h> header shall define the following types:

11571 **ptrdiff_t** Signed integer type of the result of subtracting two pointers.

11572 **wchar_t** Integer type whose range of values can represent distinct codes for all members of
11573 the largest extended character set specified among the supported locales; the null
11574 character shall have the code value zero. Each member of the basic character set
11575 shall have a code value equal to its value when used as the lone character in an
11576 integer character constant if an implementation does not define
11577 __STDC_MB_MIGHT_NEQ_WC__.

11578 **size_t** Unsigned integer type of the result of the *sizeof* operator.

11579 The implementation shall support one or more programming environments in which the widths
11580 of **ptrdiff_t**, **size_t**, and **wchar_t** are no greater than the width of type **long**. The names of these
11581 programming environments can be obtained using the *confstr()* function or the *getconf* utility.

11582 **APPLICATION USAGE**

11583 None.

11584 **RATIONALE**

11585 The ISO C standard does not require the **NULL** macro to include the cast to type **void *** and
11586 specifies that the **NULL** macro be implementation-defined. POSIX.1-2008 requires the cast and
11587 therefore need not be implementation-defined.

11588 **FUTURE DIRECTIONS**

11589 None.

11590 **SEE ALSO**

11591 [<sys/types.h>](#), [<wchar.h>](#)

11592 XSH *confstr()*

11593 XCU *getconf*

11594 **CHANGE HISTORY**

11595 First released in Issue 4. Derived from the ANSI C standard.

11596 Issue 7

11597 This reference page is clarified with respect to macros and symbolic constants.

11598 SD5-XBD-ERN-53 is applied, updating the definition of **wchar_t** to align with
11599 ISO/IEC 9899:1999 standard, Technical Corrigendum 3.

11600 **NAME**

11601 stdint.h — integer types

11602 **SYNOPSIS**

11603 #include <stdint.h>

11604 **DESCRIPTION**

11605 CX Some of the functionality described on this reference page extends the ISO C standard.
11606 Applications shall define the appropriate feature test macro (see XSH [Section 2.2](#), on page 472) to
11607 enable the visibility of these symbols in this header.

11608 The <stdint.h> header shall declare sets of integer types having specified widths, and shall
11609 define corresponding sets of macros. It shall also define macros that specify limits of integer
11610 types corresponding to types defined in other standard headers.

11611 **Note:** The “width” of an integer type is the number of bits used to store its value in a pure binary
11612 system; the actual type may use more bits than that (for example, a 28-bit type could be stored
11613 in 32 bits of actual storage). An N -bit signed type has values in the range -2^{N-1} or $1-2^{N-1}$ to
11614 $2^{N-1}-1$, while an N -bit unsigned type has values in the range 0 to 2^N-1 .

11615 Types are defined in the following categories:

- 11616 • Integer types having certain exact widths
- 11617 • Integer types having at least certain specified widths
- 11618 • Fastest integer types having at least certain specified widths
- 11619 • Integer types wide enough to hold pointers to objects
- 11620 • Integer types having greatest width

11621 (Some of these types may denote the same type.)

11622 Corresponding macros specify limits of the declared types and construct suitable constants.

11623 For each type described herein that the implementation provides, the <stdint.h> header shall
11624 declare that **typedef** name and define the associated macros. Conversely, for each type described
11625 herein that the implementation does not provide, the <stdint.h> header shall not declare that
11626 **typedef** name, nor shall it define the associated macros. An implementation shall provide those
11627 types described as required, but need not provide any of the others (described as optional).

11628 **Integer Types**

11629 When **typedef** names differing only in the absence or presence of the initial u are defined, they
11630 shall denote corresponding signed and unsigned types as described in the ISO/IEC 9899:1999
11631 standard, Section 6.2.5; an implementation providing one of these corresponding types shall also
11632 provide the other.

11633 In the following descriptions, the symbol N represents an unsigned decimal integer with no
11634 leading zeros (for example, 8 or 24, but not 04 or 048).

- 11635 • Exact-width integer types

11636 The **typedef** name **intN_t** designates a signed integer type with width N , no padding bits,
11637 and a two’s-complement representation. Thus, **int8_t** denotes a signed integer type with a
11638 width of exactly 8 bits.

11639 The **typedef** name **uintN_t** designates an unsigned integer type with width N . Thus,
11640 **uint24_t** denotes an unsigned integer type with a width of exactly 24 bits.

11641 CX The following types are required:

11642 **int8_t**
 11643 **int16_t**
 11644 **int32_t**
 11645 **uint8_t**
 11646 **uint16_t**
 11647 **uint32_t**

11648 If an implementation provides integer types with width 64 that meet these requirements,
 11649 then the following types are required:

11650 **int64_t**
 11651 **uint64_t**

11652 CX In particular, this will be the case if any of the following are true:

- 11653 — The implementation supports the `_POSIX_V7_ILP32_OFFBIG` programming
 11654 environment and the application is being built in the `_POSIX_V7_ILP32_OFFBIG`
 11655 programming environment (see the Shell and Utilities volume of POSIX.1-2008, *c99*,
 11656 Programming Environments).
- 11657 — The implementation supports the `_POSIX_V7_LP64_OFF64` programming
 11658 environment and the application is being built in the `_POSIX_V7_LP64_OFF64`
 11659 programming environment.
- 11660 — The implementation supports the `_POSIX_V7_LPBIG_OFFBIG` programming
 11661 environment and the application is being built in the `_POSIX_V7_LPBIG_OFFBIG`
 11662 programming environment.

11663 All other types of this form are optional.

11664 • Minimum-width integer types

11665 The **typedef** name **int_leastN_t** designates a signed integer type with a width of at least *N*,
 11666 such that no signed integer type with lesser size has at least the specified width. Thus,
 11667 **int_least32_t** denotes a signed integer type with a width of at least 32 bits.

11668 The **typedef** name **uint_leastN_t** designates an unsigned integer type with a width of at
 11669 least *N*, such that no unsigned integer type with lesser size has at least the specified width.
 11670 Thus, **uint_least16_t** denotes an unsigned integer type with a width of at least 16 bits.

11671 The following types are required:

11672 **int_least8_t**
 11673 **int_least16_t**
 11674 **int_least32_t**
 11675 **int_least64_t**
 11676 **uint_least8_t**
 11677 **uint_least16_t**
 11678 **uint_least32_t**
 11679 **uint_least64_t**

11680 All other types of this form are optional.

11681 • Fastest minimum-width integer types

11682 Each of the following types designates an integer type that is usually fastest to operate
11683 with among all integer types that have at least the specified width.

11684 The designated type is not guaranteed to be fastest for all purposes; if the implementation
11685 has no clear grounds for choosing one type over another, it will simply pick some integer
11686 type satisfying the signedness and width requirements.

11687 The **typedef** name **int_fastN_t** designates the fastest signed integer type with a width of at
11688 least *N*. The **typedef** name **uint_fastN_t** designates the fastest unsigned integer type with
11689 a width of at least *N*.

11690 The following types are required:

11691 **int_fast8_t**
11692 **int_fast16_t**
11693 **int_fast32_t**
11694 **int_fast64_t**
11695 **uint_fast8_t**
11696 **uint_fast16_t**
11697 **uint_fast32_t**
11698 **uint_fast64_t**

11699 All other types of this form are optional.

11700 • Integer types capable of holding object pointers

11701 The following type designates a signed integer type with the property that any valid
11702 pointer to **void** can be converted to this type, then converted back to a pointer to **void**, and
11703 the result will compare equal to the original pointer:

11704 **intptr_t**

11705 The following type designates an unsigned integer type with the property that any valid
11706 pointer to **void** can be converted to this type, then converted back to a pointer to **void**, and
11707 the result will compare equal to the original pointer:

11708 **uintptr_t**

11709 XSI On XSI-conformant systems, the **intptr_t** and **uintptr_t** types are required; otherwise, they
11710 are optional.

11711 • Greatest-width integer types

11712 The following type designates a signed integer type capable of representing any value of
11713 any signed integer type:

11714 **intmax_t**

11715 The following type designates an unsigned integer type capable of representing any value
11716 of any unsigned integer type:

11717 **uintmax_t**

11718 These types are required.

11719 **Note:** Applications can test for optional types by using the corresponding limit macro from [Limits of](#)
 11720 [Specified-Width Integer Types](#).

11721 **Limits of Specified-Width Integer Types**

11722 The following macros specify the minimum and maximum limits of the types declared in the
 11723 **<stdint.h>** header. Each macro name corresponds to a similar type name in [Integer Types](#) (on
 11724 page 347).

11725 Each instance of any defined macro shall be replaced by a constant expression suitable for use in
 11726 **#if** preprocessing directives, and this expression shall have the same type as would an
 11727 expression that is an object of the corresponding type converted according to the integer
 11728 promotions. Its implementation-defined value shall be equal to or greater in magnitude
 11729 (absolute value) than the corresponding value given below, with the same sign, except where
 11730 stated to be exactly the given value.

- 11731 • Limits of exact-width integer types
 - 11732 — Minimum values of exact-width signed integer types:
 - 11733 {INTN_MIN} Exactly $-(2^{N-1})$
 - 11734 — Maximum values of exact-width signed integer types:
 - 11735 {INTN_MAX} Exactly $2^{N-1} - 1$
 - 11736 — Maximum values of exact-width unsigned integer types:
 - 11737 {UINTN_MAX} Exactly $2^N - 1$
- 11738 • Limits of minimum-width integer types
 - 11739 — Minimum values of minimum-width signed integer types:
 - 11740 {INT_LEASTN_MIN} $-(2^{N-1} - 1)$
 - 11741 — Maximum values of minimum-width signed integer types:
 - 11742 {INT_LEASTN_MAX} $2^{N-1} - 1$
 - 11743 — Maximum values of minimum-width unsigned integer types:
 - 11744 {UINT_LEASTN_MAX} $2^N - 1$
- 11745 • Limits of fastest minimum-width integer types
 - 11746 — Minimum values of fastest minimum-width signed integer types:
 - 11747 {INT_FASTN_MIN} $-(2^{N-1} - 1)$
 - 11748 — Maximum values of fastest minimum-width signed integer types:
 - 11749 {INT_FASTN_MAX} $2^{N-1} - 1$
 - 11750 — Maximum values of fastest minimum-width unsigned integer types:
 - 11751 {UINT_FASTN_MAX} $2^N - 1$
- 11752 • Limits of integer types capable of holding object pointers
 - 11753 — Minimum value of pointer-holding signed integer type:
 - 11754 {INTPTR_MIN} $-(2^{15} - 1)$

- 11755 — Maximum value of pointer-holding signed integer type:
- 11756 {INTPTR_MAX} $2^{15} - 1$
- 11757 — Maximum value of pointer-holding unsigned integer type:
- 11758 {UINTPTR_MAX} $2^{16} - 1$
- 11759 • Limits of greatest-width integer types
- 11760 — Minimum value of greatest-width signed integer type:
- 11761 {INTMAX_MIN} $-(2^{63} - 1)$
- 11762 — Maximum value of greatest-width signed integer type:
- 11763 {INTMAX_MAX} $2^{63} - 1$
- 11764 — Maximum value of greatest-width unsigned integer type:
- 11765 {UINTMAX_MAX} $2^{64} - 1$

11766 Limits of Other Integer Types

11767 The following macros specify the minimum and maximum limits of integer types corresponding
11768 to types defined in other standard headers.

11769 Each instance of these macros shall be replaced by a constant expression suitable for use in **#if**
11770 preprocessing directives, and this expression shall have the same type as would an expression
11771 that is an object of the corresponding type converted according to the integer promotions. Its
11772 implementation-defined value shall be equal to or greater in magnitude (absolute value) than
11773 the corresponding value given below, with the same sign.

- 11774 • Limits of **ptrdiff_t**:
- 11775 {PTRDIFF_MIN} −65 535
- 11776 {PTRDIFF_MAX} +65 535
- 11777 • Limits of **sig_atomic_t**:
- 11778 {SIG_ATOMIC_MIN} See below.
- 11779 {SIG_ATOMIC_MAX} See below.
- 11780 • Limit of **size_t**:
- 11781 {SIZE_MAX} 65 535
- 11782 • Limits of **wchar_t**:
- 11783 {WCHAR_MIN} See below.
- 11784 {WCHAR_MAX} See below.
- 11785 • Limits of **wint_t**:
- 11786 {WINT_MIN} See below.
- 11787 {WINT_MAX} See below.

11788 If **sig_atomic_t** (see the <signal.h> header) is defined as a signed integer type, the value of
11789 {SIG_ATOMIC_MIN} shall be no greater than −127 and the value of {SIG_ATOMIC_MAX} shall
11790 be no less than 127; otherwise, **sig_atomic_t** shall be defined as an unsigned integer type, and
11791 the value of {SIG_ATOMIC_MIN} shall be 0 and the value of {SIG_ATOMIC_MAX} shall be no

11792 less than 255.

11793 If **wchar_t** (see the <stddef.h> header) is defined as a signed integer type, the value of
 11794 {WCHAR_MIN} shall be no greater than -127 and the value of {WCHAR_MAX} shall be no less
 11795 than 127; otherwise, **wchar_t** shall be defined as an unsigned integer type, and the value of
 11796 {WCHAR_MIN} shall be 0 and the value of {WCHAR_MAX} shall be no less than 255.

11797 If **wint_t** (see the <wchar.h> header) is defined as a signed integer type, the value of
 11798 {WINT_MIN} shall be no greater than -32767 and the value of {WINT_MAX} shall be no less
 11799 than 32767; otherwise, **wint_t** shall be defined as an unsigned integer type, and the value of
 11800 {WINT_MIN} shall be 0 and the value of {WINT_MAX} shall be no less than 65535.

11801 **Macros for Integer Constant Expressions**

11802 The following macros expand to integer constant expressions suitable for initializing objects that
 11803 have integer types corresponding to types defined in the <stdint.h> header. Each macro name
 11804 corresponds to a similar type name listed under *Minimum-width integer types* and *Greatest-width*
 11805 *integer types*.

11806 Each invocation of one of these macros shall expand to an integer constant expression suitable
 11807 for use in **#if** preprocessing directives. The type of the expression shall have the same type as
 11808 would an expression that is an object of the corresponding type converted according to the
 11809 integer promotions. The value of the expression shall be that of the argument.

11810 The argument in any instance of these macros shall be an unsuffixed integer constant with a
 11811 value that does not exceed the limits for the corresponding type.

- 11812 • Macros for minimum-width integer constant expressions

11813 The macro **INTN_C(value)** shall expand to an integer constant expression corresponding to
 11814 the type **int_leastN_t**. The macro **UINTN_C(value)** shall expand to an integer constant
 11815 expression corresponding to the type **uint_leastN_t**. For example, if **uint_least64_t** is a
 11816 name for the type **unsigned long long**, then **UINT64_C(0x123)** might expand to the integer
 11817 constant **0x123ULL**.

- 11818 • Macros for greatest-width integer constant expressions

11819 The following macro expands to an integer constant expression having the value specified
 11820 by its argument and the type **intmax_t**:

11821 **INTMAX_C(value)**

11822 The following macro expands to an integer constant expression having the value specified
 11823 by its argument and the type **uintmax_t**:

11824 **UINTMAX_C(value)**

11825 **APPLICATION USAGE**

11826 None.

11827 **RATIONALE**

11828 The <stdint.h> header is a subset of the <inttypes.h> header more suitable for use in
 11829 freestanding environments, which might not support the formatted I/O functions. In some
 11830 environments, if the formatted conversion support is not wanted, using this header instead of
 11831 the <inttypes.h> header avoids defining such a large number of macros.

11832 As a consequence of adding **int8_t**, the following are true:

11833 • A byte is exactly 8 bits.

11834 • {CHAR_BIT} has the value 8, {SCHAR_MAX} has the value 127, {SCHAR_MIN} has the

11835 value -128, and {UCHAR_MAX} has the value 255.

11836 (The POSIX standard explicitly requires 8-bit char and two's-complement arithmetic.)

11837 **FUTURE DIRECTIONS**

11838 **typedef** names beginning with **int** or **uint** and ending with **_t** may be added to the types defined

11839 in the **<stdint.h>** header. Macro names beginning with **INT** or **UINT** and ending with **_MAX**,

11840 **_MIN**, or **_C** may be added to the macros defined in the **<stdint.h>** header.

11843 XSH [Section 2.2](#) (on page 472)

11844 **CHANGE HISTORY**

11845 First released in Issue 6. Included for alignment with the ISO/IEC 9899:1999 standard.

11846 ISO/IEC 9899:1999 standard, Technical Corrigendum 1 is applied.

11847 **Issue 7**

11848 ISO/IEC 9899:1999 standard, Technical Corrigendum 3 #40 is applied.

11849 SD5-XBD-ERN-67 is applied.

11850 **NAME**

11851 stdio.h — standard buffered input/output

11852 **SYNOPSIS**

11853 #include <stdio.h>

11854 **DESCRIPTION**

11855 CX Some of the functionality described on this reference page extends the ISO C standard.
 11856 Applications shall define the appropriate feature test macro (see XSH [Section 2.2](#), on page 472) to
 11857 enable the visibility of these symbols in this header.

11858 The <stdio.h> header shall define the following data types through **typedef**:

11859	FILE	A structure containing information about a file.
11860	fpos_t	A non-array type containing all information needed to specify uniquely every position within a file.
11861		
11862	off_t	As described in <sys/types.h>.
11863	size_t	As described in <stddef.h>.
11864	CX ssize_t	As described in <sys/types.h>.
11865	CX va_list	As described in <stdarg.h>.

11866 The <stdio.h> header shall define the following macros which shall expand to integer constant
 11867 expressions:

11868	CX BUFSIZ	Size of <stdio.h> buffers. This shall expand to a positive value.
11869	CX L_ctermid	Maximum size of character array to hold <i>ctermid()</i> output.
11870	OB L_tmpnam	Maximum size of character array to hold <i>tmpnam()</i> output.

11871 The <stdio.h> header shall define the following macros which shall expand to integer constant
 11872 expressions with distinct values:

11873	_IOFBF	Input/output fully buffered.
11874	_IOLBF	Input/output line buffered.
11875	_IONBF	Input/output unbuffered.

11876 The <stdio.h> header shall define the following macros which shall expand to integer constant
 11877 expressions with distinct values:

11878	SEEK_CUR	Seek relative to current position.
11879	SEEK_END	Seek relative to end-of-file.
11880	SEEK_SET	Seek relative to start-of-file.

11881 The <stdio.h> header shall define the following macros which shall expand to integer constant
 11882 expressions denoting implementation limits:

11883	{FILENAME_MAX}	Maximum size in bytes of the longest pathname that the implementation guarantees can be opened.
11884		
11885	{FOPEN_MAX}	Number of streams which the implementation guarantees can be open simultaneously. The value is at least eight.
11886		
11887	OB {TMP_MAX}	Minimum number of unique filenames generated by <i>tmpnam()</i> . Maximum number of times an application can call <i>tmpnam()</i> reliably. The value of {TMP_MAX} is at least 25.
11888		
11889		

11890	OB XSI	On XSI-conformant systems, the value of {TMP_MAX} is at least 10 000.
11891		The <stdio.h> header shall define the following macro which shall expand to an integer constant
11892		expression with type int and a negative value:
11893		EOF End-of-file return value.
11894		The <stdio.h> header shall define NULL as described in <stddef.h>.
11895		The <stdio.h> header shall define the following macro which shall expand to a string constant:
11896	OB XSI	P_tmpdir Default directory prefix for <i>tempnam()</i> .
11897		The <stdio.h> header shall define the following macros which shall expand to expressions of
11898		type “pointer to FILE ” that point to the FILE objects associated, respectively, with the standard
11899		error, input, and output streams:
11900		<i>stderr</i> Standard error output stream.
11901		<i>stdin</i> Standard input stream.
11902		<i>stdout</i> Standard output stream.
11903		The following shall be declared as functions and may also be defined as macros. Function
11904		prototypes shall be provided.
11905		void clearerr(FILE *);
11906	CX	char *ctermid(char *);
11907		int dprintf(int, const char *restrict, ...)
11908		int fclose(FILE *);
11909	CX	FILE *fdopen(int, const char *);
11910		int feof(FILE *);
11911		int ferror(FILE *);
11912		int fflush(FILE *);
11913		int fgetc(FILE *);
11914		int fgetpos(FILE *restrict, fpos_t *restrict);
11915		char *fgets(char *restrict, int, FILE *restrict);
11916	CX	int fileno(FILE *);
11917		void flockfile(FILE *);
11918		FILE *fmemopen(void *restrict, size_t, const char *restrict);
11919		FILE *fopen(const char *restrict, const char *restrict);
11920		int fprintf(FILE *restrict, const char *restrict, ...);
11921		int fputc(int, FILE *);
11922		int fputs(const char *restrict, FILE *restrict);
11923		size_t fread(void *restrict, size_t, size_t, FILE *restrict);
11924		FILE *freopen(const char *restrict, const char *restrict,
11925		FILE *restrict);
11926		int fscanf(FILE *restrict, const char *restrict, ...);
11927		int fseek(FILE *, long, int);
11928	CX	int fseeko(FILE *, off_t, int);
11929		int fsetpos(FILE *, const fpos_t *);
11930		long ftell(FILE *);
11931	CX	off_t ftello(FILE *);
11932		int ftrylockfile(FILE *);
11933		void funlockfile(FILE *);
11934		size_t fwrite(const void *restrict, size_t, size_t, FILE *restrict);
11935		int getc(FILE *);

```

11936      int      getchar(void);
11937 CX      int     getc_unlocked(FILE *);
11938      int      getchar_unlocked(void);
11939      ssize_t   getdelim(char **restrict, size_t *restrict, int,
11940                        FILE *restrict);
11941      ssize_t   getline(char **restrict, size_t *restrict, FILE *restrict);
11942 OB      char     *gets(char *);
11943 CX      FILE     *open_memstream(char **, size_t *);
11944      int      pclose(FILE *);
11945      void      perror(const char *);
11946 CX      FILE     *popen(const char *, const char *);
11947      int      printf(const char *restrict, ...);
11948      int      putc(int, FILE *);
11949      int      putchar(int);
11950 CX      int      putc_unlocked(int, FILE *);
11951      int      putchar_unlocked(int);
11952      int      puts(const char *);
11953      int      remove(const char *);
11954      int      rename(const char *, const char *);
11955 CX      int      renameat(int, const char *, int, const char *);
11956      void      rewind(FILE *);
11957      int      scanf(const char *restrict, ...);
11958      void      setbuf(FILE *restrict, char *restrict);
11959      int      setvbuf(FILE *restrict, char *restrict, int, size_t);
11960      int      snprintf(char *restrict, size_t, const char *restrict, ...);
11961      int      sprintf(char *restrict, const char *restrict, ...);
11962      int      sscanf(const char *restrict, const char *restrict, ...);
11963 OB XSI     char     *tempnam(const char *, const char *);
11964      FILE     *tmpfile(void);
11965 OB      char     *tmpnam(char *);
11966      int      ungetc(int, FILE *);
11967 CX      int      vdprintf(int, const char *restrict, va_list);
11968      int      vfprintf(FILE *restrict, const char *restrict, va_list);
11969      int      vfscanf(FILE *restrict, const char *restrict, va_list);
11970      int      vprintf(const char *restrict, va_list);
11971      int      vscanf(const char *restrict, va_list);
11972      int      vsnprintf(char *restrict, size_t, const char *restrict,
11973                        va_list);
11974      int      vsprintf(char *restrict, const char *restrict, va_list);
11975      int      vsscanf(const char *restrict, const char *restrict, va_list);
11976 CX      Inclusion of the <stdio.h> header may also make visible all symbols from <stddef.h>.

```

11977 APPLICATION USAGE

11978 Since standard I/O streams may use an underlying file descriptor to access the file associated
11979 with a stream, application developers need to be aware that {FOPEN_MAX} streams may not be
11980 available if file descriptors are being used to access files that are not associated with streams.

11981 RATIONALE

11982 There is a conflict between the ISO C standard and the POSIX definition of the {TMP_MAX}
11983 macro that is addressed by ISO/IEC 9899:1999 standard, Defect Report 336. The POSIX standard
11984 is in alignment with the public record of the response to the Defect Report. This change has not
11985 yet been published as part of the ISO C standard.

11986 **FUTURE DIRECTIONS**

11987 None.

11996 **CHANGE HISTORY**

11997 First released in Issue 1. Derived from Issue 1 of the SVID.

11998 **Issue 5**

11999 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

12000 Large File System extensions are added.

12001 The constant `L_cuserid` and the external variables `optarg`, `opterr`, `optind`, and `optopt` are marked as
12002 extensions and LEGACY.

12003 The `cuserid()` and `getopt()` functions are marked LEGACY.

12004 **Issue 6**

12005 The constant `L_cuserid` and the external variables `optarg`, `opterr`, `optind`, and `optopt` are removed
12006 as they were previously marked LEGACY.

12007 The `cuserid()`, `getopt()`, and `getw()` functions are removed as they were previously marked
12008 LEGACY.

12009 Several functions are marked as part of the Thread-Safe Functions option.

12010 This reference page is updated to align with the ISO/IEC 9899:1999 standard. Note that the
12011 description of the `fpos_t` type is now explicitly updated to exclude array types.

12012 Extensions beyond the ISO C standard are marked.

12013 **Issue 7**

12014 Austin Group Interpretation 1003.1-2001 #172 is applied, adding rationale about a conflict for the
12015 definition of `{TMP_MAX}` with the ISO C standard.

12016 SD5-XBD-ERN-99 is applied, adding APPLICATION USAGE.

12017 The `dprintf()`, `fmemopen()`, `getdelim()`, `getline()`, `open_memstream()`, and `vdprintf()` functions are
12018 added from The Open Group Technical Standard, 2006, Extended API Set Part 1.

12019 The `renameat()` function is added from The Open Group Technical Standard, 2006, Extended API
12020 Set Part 2.

12021 The `gets()`, `tmpnam()`, and `tempnam()` functions and the `L_tmpnam` macro are marked
12022 obsolescent.

12023 This reference page is clarified with respect to macros and symbolic constants, and a declaration
12024 for the `off_t` type is added.

12025 POSIX.1-2008, Technical Corrigendum 1, XBD/TC1-2008/0065 [291,427] is applied.

+

12026 **NAME**

12027 stdlib.h — standard library definitions

12028 **SYNOPSIS**

12029 #include <stdlib.h>

12030 **DESCRIPTION**

12031 CX Some of the functionality described on this reference page extends the ISO C standard.
 12032 Applications shall define the appropriate feature test macro (see XSH [Section 2.2](#), on page 472) to
 12033 enable the visibility of these symbols in this header.

12034 The <stdlib.h> header shall define the following macros which shall expand to integer constant
 12035 expressions:

12036 EXIT_FAILURE Unsuccessful termination for *exit()*; evaluates to a non-zero value.

12037 EXIT_SUCCESS Successful termination for *exit()*; evaluates to 0.

12038 {RAND_MAX} Maximum value returned by *rand()*; at least 32 767.

12039 The <stdlib.h> header shall define the following macro which shall expand to a positive integer
 12040 expression with type **size_t**:

12041 {MB_CUR_MAX} Maximum number of bytes in a character specified by the current locale
 12042 (category *LC_CTYPE*).

12043 The <stdlib.h> header shall define NULL as described in <stddef.h>.

12044 The <stdlib.h> header shall define the following data types through **typedef**:

12045 **div_t** Structure type returned by the *div()* function.

12046 **ldiv_t** Structure type returned by the *ldiv()* function.

12047 **lldiv_t** Structure type returned by the *lldiv()* function.

12048 **size_t** As described in <stddef.h>.

12049 **wchar_t** As described in <stddef.h>.

12050 CX In addition, the <stdlib.h> header shall define the following symbolic constants and macros as
 12051 described in <sys/wait.h>:

12052 WEXITSTATUS
 12053 WIFEXITED
 12054 WIFSIGNALED
 12055 WIFSTOPPED
 12056 WNOHANG
 12057 WSTOPSIG
 12058 WTERMSIG
 12059 WUNTRACED

12060 The following shall be declared as functions and may also be defined as macros. Function
 12061 prototypes shall be provided.

12062 void _Exit(int);
 12063 XSI long a64l(const char *);
 12064 void abort(void);
 12065 int abs(int);
 12066 int atexit(void (*)(void));
 12067 double atof(const char *);

12068		int	atoi(const char *);
12069		long	atol(const char *);
12070		long long	atoll(const char *);
12071		void	*bsearch(const void *, const void *, size_t, size_t, int (*)(const void *, const void *));
12072			
12073		void	*calloc(size_t, size_t);
12074		div_t	div(int, int);
12075	XSI	double	drand48(void);
12076		double	erand48(unsigned short [3]);
12077		void	exit(int);
12078		void	free(void *);
12079		char	*getenv(const char *);
12080	CX	int	getsubopt(char **, char *const *, char **);
12081	XSI	int	grantpt(int);
12082		char	*initstate(unsigned, char *, size_t);
12083		long	jrand48(unsigned short [3]);
12084		char	*l64a(long);
12085		long	labs(long);
12086	XSI	void	lcong48(unsigned short [7]);
12087		ldiv_t	ldiv(long, long);
12088		long long	llabs(long long);
12089		lldiv_t	lldiv(long long, long long);
12090	XSI	long	lrand48(void);
12091		void	*malloc(size_t);
12092		int	mblen(const char *, size_t);
12093		size_t	mbstowcs(wchar_t *restrict, const char *restrict, size_t);
12094		int	mbtowc(wchar_t *restrict, const char *restrict, size_t);
12095	CX	char	*mkdtemp(char *);
12096		int	mkstemp(char *);
12097	XSI	long	mrnd48(void);
12098		long	nrnd48(unsigned short [3]);
12099	ADV	int	posix_memalign(void **, size_t, size_t);
12100	XSI	int	posix_openpt(int);
12101		char	*ptsname(int);
12102		int	putenv(char *);
12103		void	qsort(void *, size_t, size_t, int (*)(const void *, const void *));
12104			
12105		int	rand(void);
12106	OB CX	int	rand_r(unsigned *);
12107	XSI	long	random(void);
12108		void	*realloc(void *, size_t);
12109	XSI	char	*realpath(const char *restrict, char *restrict);
12110		unsigned short	*seed48(unsigned short [3]);
12111	CX	int	setenv(const char *, const char *, int);
12112	XSI	void	setkey(const char *);
12113		char	*setstate(char *);
12114		void	srand(unsigned);
12115	XSI	void	srand48(long);
12116		void	srandom(unsigned);
12117		double	strtod(const char *restrict, char **restrict);
12118		float	strtof(const char *restrict, char **restrict);
12119		long	strtol(const char *restrict, char **restrict, int);

```

12120     long double    strtold(const char *restrict, char **restrict);
12121     long long      strtoll(const char *restrict, char **restrict, int);
12122     unsigned long   strtoul(const char *restrict, char **restrict, int);
12123     unsigned long long
12124     strtoull(const char *restrict, char **restrict, int);
12125     int             system(const char *);
12126 XSI    int         unlockpt(int);
12127 CX     int         unsetenv(const char *);
12128     size_t          wcstombs(char *restrict, const wchar_t *restrict, size_t);
12129     int             wctomb(char *, wchar_t);

12130 CX     Inclusion of the <stdlib.h> header may also make visible all symbols from <stddef.h>,
12131         <limits.h>, <math.h>, and <sys/wait.h>.

12145 CHANGE HISTORY

12146 First released in Issue 3.

12147 Issue 5

12148 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

12149 The [ttyslot\(\)](#) and [valloc\(\)](#) functions are marked LEGACY.

12150 The type of the third argument to [initstate\(\)](#) is changed from **int** to **size_t**. The type of the return
12151 value from [setstate\(\)](#) is changed from **char** to **char ***, and the type of the first argument is
12152 changed from **char *** to **const char ***.

12153 Issue 6

12154 The Open Group Corrigendum U021/1 is applied, correcting the prototype for [realpath\(\)](#) to be
12155 consistent with the reference page.

12156 The Open Group Corrigendum U028/13 is applied, correcting the prototype for [putenv\(\)](#) to be
12157 consistent with the reference page.

12158 The [rand_r\(\)](#) function is marked as part of the Thread-Safe Functions option.

12159 Function prototypes for [setenv\(\)](#) and [unsetenv\(\)](#) are added.

12160 The [posix_memalign\(\)](#) function is added for alignment with IEEE Std 1003.1d-1999.

12161 This reference page is updated to align with the ISO/IEC 9899:1999 standard.

12162 The [ecvt\(\)](#), [fcvt\(\)](#), [gcvt\(\)](#), and [mktemp\(\)](#) functions are marked LEGACY.

- 12163 The *ttyslot()* and *valloc()* functions are removed as they were previously marked LEGACY.
- 12164 Extensions beyond the ISO C standard are marked.
- 12165 **Issue 7**
- 12166 SD5-XBD-ERN-79 and SD5-XBD-ERN-105 are applied.
- 12167 The LEGACY functions are removed.
- 12168 The *mkdtemp()* function is added from The Open Group Technical Standard, 2006, Extended API
- 12169 Set Part 1.
- 12170 The *rand_r()* function is marked obsolescent.
- 12171 This reference page is clarified with respect to macros and symbolic constants.
- 12172 The type of the first argument to *setstate()* is changed from **const char *** to **char ***.
- 12173 POSIX.1-2008, Technical Corrigendum 1, XBD/TC1-2008/0066 [197] is applied. +

12174 NAME

12175 string.h — string operations

12176 SYNOPSIS

12177 #include <string.h>

12178 DESCRIPTION

12179 CX Some of the functionality described on this reference page extends the ISO C standard.
 12180 Applications shall define the appropriate feature test macro (see XSH [Section 2.2](#), on page 472) to
 12181 enable the visibility of these symbols in this header.

12182 The <string.h> header shall define NULL and **size_t** as described in <stddef.h>.

12183 CX The <string.h> header shall define the **locale_t** type as described in <locale.h>.

12184 The following shall be declared as functions and may also be defined as macros. Function
 12185 prototypes shall be provided for use with ISO C standard compilers.

```

12186 XSI void *memcpy(void *restrict, const void *restrict, int, size_t);
12187 void *memchr(const void *, int, size_t);
12188 int memcmp(const void *, const void *, size_t);
12189 void *memcpy(void *restrict, const void *restrict, size_t);
12190 void *memmove(void *, const void *, size_t);
12191 void *memset(void *, int, size_t);
12192 CX char *strcpy(char *restrict, const char *restrict);
12193 char *strncpy(char *restrict, const char *restrict, size_t);
12194 char *strcat(char *restrict, const char *restrict);
12195 char *strchr(const char *, int);
12196 int strcmp(const char *, const char *);
12197 int strcoll(const char *, const char *);
12198 CX int strcoll_l(const char *, const char *, locale_t);
12199 char *strcpy(char *restrict, const char *restrict);
12200 size_t strcspn(const char *, const char *);
12201 CX char *strdup(const char *);
12202 char *strerror(int);
12203 CX char *strerror_l(int, locale_t);
12204 int strerror_r(int, char *, size_t);
12205 size_t strlen(const char *);
12206 char *strncat(char *restrict, const char *restrict, size_t);
12207 int strncmp(const char *, const char *, size_t);
12208 char *strncpy(char *restrict, const char *restrict, size_t);
12209 CX char *strndup(const char *, size_t);
12210 size_t strnlen(const char *, size_t);
12211 char *strpbrk(const char *, const char *);
12212 char *strrchr(const char *, int);
12213 CX char *strsignal(int);
12214 size_t strspn(const char *, const char *);
12215 char *strstr(const char *, const char *);
12216 char *strtok(char *restrict, const char *restrict);
12217 CX char *strtok_r(char *restrict, const char *restrict, char **restrict);
12218 size_t strxfrm(char *restrict, const char *restrict, size_t);
12219 CX size_t strxfrm_l(char *restrict, const char *restrict,
12220 size_t, locale_t);

```

12221	CX	Inclusion of the <string.h> header may also make visible all symbols from <stddef.h>.

12271 XSH *ffs()*, *strcasecmp()*12272 **CHANGE HISTORY**

12273 First released in Issue 4, Version 2.

12274 **Issue 6**

12275 The Open Group Corrigendum U021/2 is applied, correcting the prototype for *index()* to be
 12276 consistent with the reference page.

12277 The *bcmp()*, *bcopy()*, *bzero()*, *index()*, and *rindex()* functions are marked LEGACY.12278 **Issue 7**12279 SD5-XBD-ERN-56 is applied, adding a reference to <sys/types.h> for the **size_t** type.

12280 The LEGACY functions are removed.

12281 The <strings.h> header is moved from the XSI option to the Base.

12282 The *strcasecmp_l()* and *strncasecmp_l()* functions are added from The Open Group Technical
 12283 Standard, 2006, Extended API Set Part 4.

12284 A declaration for the **locale_t** type is added.

12285 **NAME**12286 stropts.h — STREAMS interface (**STREAMS**)12287 **SYNOPSIS**

12288 OB XSR #include <stropts.h>

12289 **DESCRIPTION**12290 The <stropts.h> header shall define the **bandinfo** structure, which shall include at least the
12291 following members:

12292	int	bi_flag	Flushing type.
12293	unsigned char	bi_pri	Priority band.

12294 The <stropts.h> header shall define the **strpeek** structure, which shall include at least the
12295 following members:

12296	struct strbuf	ctlbuf	The control portion of the message.
12297	struct strbuf	databuf	The data portion of the message.
12298	t_uscalar_t	flags	RS_HIPRI or 0.

12299 The <stropts.h> header shall define the **strbuf** structure, which shall include at least the
12300 following members:

12301	char	*buf	Pointer to buffer.
12302	int	len	Length of data.
12303	int	maxlen	Maximum buffer length.

12304 The <stropts.h> header shall define the **strfdinsert** structure, which shall include at least the
12305 following members:

12306	struct strbuf	ctlbuf	The control portion of the message.
12307	struct strbuf	databuf	The data portion of the message.
12308	int	fildes	File descriptor of the other STREAM.
12309	t_uscalar_t	flags	RS_HIPRI or 0.
12310	int	offset	Relative location of the stored value.

12311 The <stropts.h> header shall define the **striocctl** structure, which shall include at least the
12312 following members:

12313	int	ic_cmd	ioctl() command.
12314	char	*ic_dp	Pointer to buffer.
12315	int	ic_len	Length of data.
12316	int	ic_timeout	Timeout for response.

12317 The <stropts.h> header shall define the **strrecvfd** structure, which shall include at least the
12318 following members:

12319	int	fd	Received file descriptor.
12320	gid_t	gid	GID of sender.
12321	uid_t	uid	UID of sender.

12322 The <stropts.h> header shall define the **uid_t** and **gid_t** types through **typedef**, as described in
12323 <sys/types.h>.12324 The <stropts.h> header shall define the **t_scalar_t** and **t_uscalar_t** types, respectively, as signed
12325 and unsigned opaque types of equal length of at least 32 bits.12326 The <stropts.h> header shall define the **str_list** structure, which shall include at least the
12327 following members:

```

12328     struct str_mlist  *sl_modlist  STREAMS module names.
12329     int                sl_nmods    Number of STREAMS module names.

12330     The <stropts.h> header shall define the str_mlist structure, which shall include at least the
12331     following member:

12332     char  l_name[FMNAMESZ+1]  A STREAMS module name.

12333     The <stropts.h> header shall define at least the following symbolic constants for use as the
12334     request argument to ioctl():

12335     I_ATMARK      Is the top message “marked”?
12336     I_CANPUT      Is a band writable?
12337     I_CKBAND      See if any messages exist in a band.
12338     I_FDINSERT    Send implementation-defined information about another STREAM.
12339     I_FIND        Look for a STREAMS module.
12340     I_FLUSH       Flush a STREAM.
12341     I_FLUSHBAND   Flush one band of a STREAM.
12342     I_GETBAND     Get the band of the top message on a STREAM.
12343     I_GETCLTIME   Get close time delay.
12344     I_GETSIG      Retrieve current notification signals.
12345     I_GRDOPT      Get the read mode.
12346     I_GWROPT      Get the write mode.
12347     I_LINK        Connect two STREAMS.
12348     I_LIST        Get all the module names on a STREAM.
12349     I_LOOK        Get the top module name.
12350     I_NREAD       Size the top message.
12351     I_PEEK        Peek at the top message on a STREAM.
12352     I_PLINK       Persistently connect two STREAMS.
12353     I_POP         Pop a STREAMS module.
12354     I_PUNLINK     Dismantle a persistent STREAMS link.
12355     I_PUSH        Push a STREAMS module.
12356     I_RECVFD      Get a file descriptor sent via I_SENDFD.
12357     I_SENDFD      Pass a file descriptor through a STREAMS pipe.
12358     I_SETCLTIME   Set close time delay.
12359     I_SETSIG      Ask for notification signals.
12360     I_SRDOPT      Set the read mode.
12361     I_STR         Send a STREAMS ioctl().

```

12362	I_SWROPT	Set the write mode.
12363	I_UNLINK	Disconnect two STREAMs.
12364	The <stropts.h> header shall define at least the following symbolic constant for use with	
12365	I_LOOK:	
12366	FMNAMESZ	The minimum size in bytes of the buffer referred to by the <i>arg</i> argument.
12367	The <stropts.h> header shall define at least the following symbolic constants for use with	
12368	I_FLUSH:	
12369	FLUSHR	Flush read queues.
12370	FLUSHRW	Flush read and write queues.
12371	FLUSHW	Flush write queues.
12372	The <stropts.h> header shall define at least the following symbolic constants for use with	
12373	I_SETSIG:	
12374	S_BANDURG	When used in conjunction with S_RDBAND, SIGURG is generated instead of SIGPOLL when a priority message reaches the front of the STREAM head read queue.
12375		
12376		
12377	S_ERROR	Notification of an error condition reaches the STREAM head.
12378	S_HANGUP	Notification of a hangup reaches the STREAM head.
12379	S_HIPRI	A high-priority message is present on a STREAM head read queue.
12380	S_INPUT	A message, other than a high-priority message, has arrived at the head of a STREAM head read queue.
12381		
12382	S_MSG	A STREAMS signal message that contains the SIGPOLL signal reaches the front of the STREAM head read queue.
12383		
12384	S_OUTPUT	The write queue for normal data (priority band 0) just below the STREAM head is no longer full. This notifies the process that there is room on the queue for sending (or writing) normal data downstream.
12385		
12386		
12387	S_RDBAND	A message with a non-zero priority band has arrived at the head of a STREAM head read queue.
12388		
12389	S_RDNORM	A normal (priority band set to 0) message has arrived at the head of a STREAM head read queue.
12390		
12391	S_WRBAND	The write queue for a non-zero priority band just below the STREAM head is no longer full.
12392		
12393	S_WRNORM	Equivalent to S_OUTPUT.
12394	The <stropts.h> header shall define at least the following symbolic constant for use with	
12395	I_PEEK:	
12396	RS_HIPRI	Only look for high-priority messages.
12397	The <stropts.h> header shall define at least the following symbolic constants for use with	
12398	I_SRDOPT:	
12399	RMSGD	Message-discard mode.

12400	RMSGN	Message-non-discard mode.
12401	RNORM	Byte-STREAM mode, the default.
12402	RPROTDAT	Deliver the control part of a message as data when a process issues a <i>read()</i> .
12403	RPROTDIS	Discard the control part of a message, delivering any data part, when a
12404		process issues a <i>read()</i> .
12405	RPROTNORM	Fail <i>read()</i> with [EBADMSG] if a message containing a control part is at the
12406		front of the STREAM head read queue.
12407	The <stropts.h> header shall define at least the following symbolic constant for use with	
12408	L_SWOPT:	
12409	SNDZERO	Send a zero-length message downstream when a <i>write()</i> of 0 bytes occurs.
12410	The <stropts.h> header shall define at least the following symbolic constants for use with	
12411	L_ATMARK:	
12412	ANYMARK	Check if the message is marked.
12413	LASTMARK	Check if the message is the last one marked on the queue.
12414	The <stropts.h> header shall define at least the following symbolic constant for use with	
12415	L_UNLINK:	
12416	MUXID_ALL	Unlink all STREAMs linked to the STREAM associated with <i>files</i> .
12417	The <stropts.h> header shall define the following symbolic constants for <i>getmsg()</i> , <i>getpmsg()</i> ,	
12418	<i>putmsg()</i> , and <i>putpmsg()</i> :	
12419	MORECTL	More control information is left in message.
12420	MOREDATA	More data is left in message.
12421	MSG_ANY	Receive any message.
12422	MSG_BAND	Receive message from specified band.
12423	MSG_HIPRI	Send/receive high-priority message.
12424	The <stropts.h> header may make visible all of the symbols from <unistd.h>.	
12425	The following shall be declared as functions and may also be defined as macros. Function	
12426	prototypes shall be provided.	
12427	<code>int fattach(int, const char *);</code>	
12428	<code>int fdetach(const char *);</code>	
12429	<code>int getmsg(int, struct strbuf *restrict, struct strbuf *restrict,</code>	
12430	<code> int *restrict);</code>	
12431	<code>int getpmsg(int, struct strbuf *restrict, struct strbuf *restrict,</code>	
12432	<code> int *restrict, int *restrict);</code>	
12433	<code>int ioctl(int, int, ...);</code>	
12434	<code>int isastream(int);</code>	
12435	<code>int putmsg(int, const struct strbuf *, const struct strbuf *, int);</code>	
12436	<code>int putpmsg(int, const struct strbuf *, const struct strbuf *, int,</code>	
12437	<code> int);</code>	

12438 **APPLICATION USAGE**

12439 None.

12440 **RATIONALE**

12449 First released in Issue 4, Version 2.

12450 **Issue 5**12451 The *flags* members of the **strpeek** and **strfdinsert** structures are changed from **type long** to
12452 **t_uscalar_t**.12453 **Issue 6**

12454 This header is marked as part of the XSI STREAMS Option Group.

12455 The **restrict** keyword is added to the prototypes for [getmsg\(\)](#) and [getpmsg\(\)](#).12456 **Issue 7**12457 SD5-XBD-ERN-87 is applied, correcting an error in the **strrecvfd** structure.12458 The **<stropts.h>** header is marked obsolescent.

12459 This reference page is clarified with respect to macros and symbolic constants.

12460 **NAME**

12461 sys/ipc.h — XSI interprocess communication access structure

12462 **SYNOPSIS**12463 XSI `#include <sys/ipc.h>`12464 **DESCRIPTION**

12465 The **<sys/ipc.h>** header is used by three mechanisms for XSI interprocess communication (IPC):
 12466 messages, semaphores, and shared memory. All use a common structure type, **ipc_perm**, to pass
 12467 information used in determining permission to perform an IPC operation.

12468 The **<sys/ipc.h>** header shall define the **ipc_perm** structure, which shall include the following
 12469 members:

12470	uid_t	uid	Owner's user ID.
12471	gid_t	gid	Owner's group ID.
12472	uid_t	cuid	Creator's user ID.
12473	gid_t	cgid	Creator's group ID.
12474	mode_t	mode	Read/write permission.

12475 The **<sys/ipc.h>** header shall define the **uid_t**, **gid_t**, **mode_t**, and **key_t** types as described in
 12476 **<sys/types.h>**.

12477 The **<sys/ipc.h>** header shall define the following symbolic constants.

12478 Mode bits:

12479	IPC_CREAT	Create entry if key does not exist.
12480	IPC_EXCL	Fail if key exists.
12481	IPC_NOWAIT	Error if request must wait.

12482 Keys:

12483	IPC_PRIVATE	Private key.

12484 Control commands:

12485	IPC_RMID	Remove identifier.
12486	IPC_SET	Set options.
12487	IPC_STAT	Get options.

12488 The following shall be declared as a function and may also be defined as a macro. A function
 12489 prototype shall be provided.

12490 `key_t ftok(const char *, int);`

12491 **APPLICATION USAGE**

12500 **CHANGE HISTORY**

12501 First released in Issue 2. Derived from System V Release 2.0.

12502 **Issue 7**

12503 This reference page is clarified with respect to macros and symbolic constants.

12504 **NAME**

12505 sys/mman.h — memory management declarations

12506 **SYNOPSIS**

12507 #include <sys/mman.h>

12508 **DESCRIPTION**12509 The <sys/mman.h> header shall define the following symbolic constants for use as protection
12510 options:

12511 PROT_EXEC Page can be executed.

12512 PROT_NONE Page cannot be accessed.

12513 PROT_READ Page can be read.

12514 PROT_WRITE Page can be written.

12515 The <sys/mman.h> header shall define the following symbolic constants for use as flag options:

12516 MAP_FIXED Interpret *addr* exactly.

12517 MAP_PRIVATE Changes are private.

12518 MAP_SHARED Share changes.

12519 XSI|SIO The <sys/mman.h> header shall define the following symbolic constants for the *msync()*
12520 function:

12521 MS_ASYNC Perform asynchronous writes.

12522 MS_INVALIDATE Invalidate mappings.

12523 MS_SYNC Perform synchronous writes.

12524 ML The <sys/mman.h> header shall define the following symbolic constants for the *mlockall()*
12525 function:

12526 MCL_CURRENT Lock currently mapped pages.

12527 MCL_FUTURE Lock pages that become mapped.

12528 The <sys/mman.h> header shall define the symbolic constant MAP_FAILED which shall have
12529 type **void *** and shall be used to indicate a failure from the *mmap()* function .12530 ADV If the Advisory Information option is supported, the <sys/mman.h> header shall define
12531 symbolic constants for the *advice* argument to the *posix_madvise()* function as follows:

12532 POSIX_MADV_DONTNEED

12533 The application expects that it will not access the specified range in the near future.

12534 POSIX_MADV_NORMAL

12535 The application has no advice to give on its behavior with respect to the specified range. It
12536 is the default characteristic if no advice is given for a range of memory.

12537 POSIX_MADV_RANDOM

12538 The application expects to access the specified range in a random order.

12539 POSIX_MADV_SEQUENTIAL

12540 The application expects to access the specified range sequentially from lower addresses to
12541 higher addresses.

12542		POSIX_MADV_WILLNEED
12543		The application expects to access the specified range in the near future.
12544	TYM	The <sys/mman.h> header shall define the following symbolic constants for use as flags for the <i>posix_typed_mem_open()</i> function:
12545		
12546		POSIX_TYPED_MEM_ALLOCATE
12547		Allocate on <i>mmap()</i> .
12548		POSIX_TYPED_MEM_ALLOCATE_CONTIG
12549		Allocate contiguously on <i>mmap()</i> .
12550		POSIX_TYPED_MEM_MAP_ALLOCATABLE
12551		Map on <i>mmap()</i> , without affecting allocatability.
12552		The <sys/mman.h> header shall define the mode_t , off_t , and size_t types as described in
12553		<sys/types.h>.
12554	TYM	The <sys/mman.h> header shall define the posix_typed_mem_info structure, which shall
12555		include at least the following member:
12556		size_t posix_tmi_length Maximum length which may be allocated
12557		from a typed memory object.
12558		The following shall be declared as functions and may also be defined as macros. Function
12559		prototypes shall be provided.
12560	MLR	int mlock(const void *, size_t);
12561	ML	int mlockall(int);
12562		void *mmap(void *, size_t, int, int, int, off_t);
12563		int mprotect(void *, size_t, int);
12564	XSI SIO	int msync(void *, size_t, int);
12565	MLR	int munlock(const void *, size_t);
12566	ML	int munlockall(void);
12567		int munmap(void *, size_t);
12568	ADV	int posix_madvise(void *, size_t, int);
12569	TYM	int posix_mem_offset(const void *restrict, size_t, off_t *restrict,
12570		size_t *restrict, int *restrict);
12571		int posix_typed_mem_get_info(int, struct posix_typed_mem_info *);
12572		int posix_typed_mem_open(const char *, int, int);
12573	SHM	int shm_open(const char *, int, mode_t);
12574		int shm_unlink(const char *);

12575 **APPLICATION USAGE**

12576 None.

12577 **RATIONALE**

12578 None.

12579 **FUTURE DIRECTIONS**

12580 None.

12581 **SEE ALSO**12582 [<sys/types.h>](#)

 12585 [shm_unlink\(\)](#)

12586 **CHANGE HISTORY**

12587 First released in Issue 4, Version 2.

12588 **Issue 5**

12589 Updated for alignment with the POSIX Realtime Extension.

12590 **Issue 6**

12591 The [<sys/mman.h>](#) header is marked as dependent on support for either the Memory Mapped
 12592 Files, Process Memory Locking, or Shared Memory Objects options.

12593 The following changes are made for alignment with IEEE Std 1003.1j-2000:

- 12594 • The TYM margin code is added to the list of margin codes for the [<sys/mman.h>](#) header
 12595 line, as well as for other lines.
- 12596 • The POSIX_TYPED_MEM_ALLOCATE, POSIX_TYPED_MEM_ALLOCATE_CONTIG,
 12597 and POSIX_TYPED_MEM_MAP_ALLOCATABLE flags are added.
- 12598 • The [posix_tmi_length](#) structure is added.
- 12599 • The [posix_mem_offset\(\)](#), [posix_typed_mem_get_info\(\)](#), and [posix_typed_mem_open\(\)](#) functions
 12600 are added.

12601 The **restrict** keyword is added to the prototype for [posix_mem_offset\(\)](#).12602 IEEE PASC Interpretation 1003.1 #102 is applied, adding the prototype for [posix_madvise\(\)](#).

12603 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/16 is applied, correcting margin code and
 12604 shading errors for the [mlock\(\)](#) and [munlock\(\)](#) functions.

12605 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/34 is applied, changing the margin code
 12606 for the [mmap\(\)](#) function from MF|SHM to MC3 (notation for MF|SHM|TYM).

12607 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/36 is applied, changing the margin code
 12608 for the [munmap\(\)](#) function from MF|SHM to MC3 (notation for MF|SHM|TYM).

12609 **Issue 7**

12610 SD5-XBD-ERN-5 is applied, rewriting the DESCRIPTION.

12611 Functionality relating to the Memory Protection and Memory Mapped Files options is moved to
 12612 the Base.

12613 This reference page is clarified with respect to macros and symbolic constants.

12614 **NAME**

12615 sys/msg.h — XSI message queue structures

12616 **SYNOPSIS**

12617 XSI `#include <sys/msg.h>`

12618 **DESCRIPTION**

12619 The <sys/msg.h> header shall define the following data types through **typedef**:

12620 **msgqnum_t** Used for the number of messages in the message queue.

12621 **msglen_t** Used for the number of bytes allowed in a message queue.

12622 These types shall be unsigned integer types that are able to store values at least as large as a type
12623 **unsigned short**.

12624 The <sys/msg.h> header shall define the following symbolic constant as a message operation
12625 flag:

12626 MSG_NOERROR No error if big message.

12627 The <sys/msg.h> header shall define the **msqid_ds** structure, which shall include the following
12628 members:

12629	struct ipc_perm	msg_perm	Operation permission structure.
12630	msgqnum_t	msg_qnum	Number of messages currently on queue.
12631	msglen_t	msg_qbytes	Maximum number of bytes allowed on queue.
12632	pid_t	msg_lspid	Process ID of last <i>msgsnd()</i> .
12633	pid_t	msg_lrpid	Process ID of last <i>msgrcv()</i> .
12634	time_t	msg_stime	Time of last <i>msgsnd()</i> .
12635	time_t	msg_rtime	Time of last <i>msgrcv()</i> .
12636	time_t	msg_ctime	Time of last change.

12637 The <sys/msg.h> header shall define the **pid_t**, **size_t**, **ssize_t**, and **time_t** types as described in
12638 <sys/types.h>.

12639 The following shall be declared as functions and may also be defined as macros. Function
12640 prototypes shall be provided.

```
12641 int      msgctl(int, int, struct msqid_ds *);
12642 int      msgget(key_t, int);
12643 ssize_t  msgrcv(int, void *, size_t, long, int);
12644 int      msgsnd(int, const void *, size_t, int);
```

12645 In addition, the <sys/msg.h> header shall include the <sys/ipc.h> header.

12646 **APPLICATION USAGE**

12647 None.

12648 **RATIONALE**

12649 None.

12650 **FUTURE DIRECTIONS**

12651 None.

12655 **CHANGE HISTORY**

12656 First released in Issue 2. Derived from System V Release 2.0.

12657 **Issue 7**

12658 Austin Group Interpretation 1003.1-2001 #179 is applied.

12659 This reference page is clarified with respect to macros and symbolic constants.

12660 **NAME**

12661 sys/resource.h — definitions for XSI resource operations

12662 **SYNOPSIS**

12663 XSI `#include <sys/resource.h>`

12664 **DESCRIPTION**

12665 The <sys/resource.h> header shall define the following symbolic constants as possible values of
12666 the *which* argument of *getpriority()* and *setpriority()*:

12667 PRIO_PROCESS Identifies the *who* argument as a process ID.

12668 PRIO_PGRP Identifies the *who* argument as a process group ID.

12669 PRIO_USER Identifies the *who* argument as a user ID.

12670 The <sys/resource.h> header shall define the following type through **typedef**:

12671 **rlim_t** Unsigned integer type used for limit values.

12672 The <sys/resource.h> header shall define the following symbolic constants, which shall have
12673 values suitable for use in **#if** preprocessing directives:

12674 RLIM_INFINITY A value of **rlim_t** indicating no limit.

12675 RLIM_SAVED_MAX A value of type **rlim_t** indicating an unrepresentable saved hard
12676 limit.

12677 RLIM_SAVED_CUR A value of type **rlim_t** indicating an unrepresentable saved soft limit.

12678 On implementations where all resource limits are representable in an object of type **rlim_t**,
12679 RLIM_SAVED_MAX and RLIM_SAVED_CUR need not be distinct from RLIM_INFINITY.

12680 The <sys/resource.h> header shall define the following symbolic constants as possible values of
12681 the *who* parameter of *getrusage()*:

12682 RUSAGE_SELF Returns information about the current process.

12683 RUSAGE_CHILDREN Returns information about children of the current process.

12684 The <sys/resource.h> header shall define the **rlimit** structure, which shall include at least the
12685 following members:

12686 `rlim_t rlim_cur` The current (soft) limit.

12687 `rlim_t rlim_max` The hard limit.

12688 The <sys/resource.h> header shall define the **rusage** structure, which shall include at least the
12689 following members:

12690 `struct timeval ru_utime` User time used.

12691 `struct timeval ru_stime` System time used.

12692 The <sys/resource.h> header shall define the **timeval** structure as described in <sys/time.h>.

12693 The <sys/resource.h> header shall define the following symbolic constants as possible values for
12694 the *resource* argument of *getrlimit()* and *setrlimit()*:

12695 RLIMIT_CORE Limit on size of **core** file.

12696 RLIMIT_CPU Limit on CPU time per process.

12697	RLIMIT_DATA	Limit on data segment size.
12698	RLIMIT_FSIZE	Limit on file size.
12699	RLIMIT_NOFILE	Limit on number of open files.
12700	RLIMIT_STACK	Limit on stack size.
12701	RLIMIT_AS	Limit on address space size.

12727 **NAME**

12728 sys/select.h — select types

12729 **SYNOPSIS**

12730 #include <sys/select.h>

12731 **DESCRIPTION**

12732 The <sys/select.h> header shall define the **timeval** structure, which shall include at least the
12733 following members:

12734	time_t	tv_sec	Seconds.
12735	suseconds_t	tv_usec	Microseconds.

12736 The <sys/select.h> header shall define the **time_t** and **suseconds_t** types as described in
12737 <sys/types.h>.

12738 The <sys/select.h> header shall define the **sigset_t** type as described in <signal.h>.

12739 The <sys/select.h> header shall define the **timespec** structure as described in <time.h>.

12740 The <sys/select.h> header shall define the **fd_set** type as a structure.

12741 The <sys/select.h> header shall define the following symbolic constant, which shall have a value
12742 suitable for use in #if preprocessing directives:

12743 FD_SETSIZE Maximum number of file descriptors in an **fd_set** structure.

12744 The following shall be declared as functions, defined as macros, or both. If functions are
12745 declared, function prototypes shall be provided.

```
12746 void FD_CLR(int, fd_set *);
12747 int FD_ISSET(int, fd_set *);
12748 void FD_SET(int, fd_set *);
12749 void FD_ZERO(fd_set *);
```

12750 If implemented as macros, these may evaluate their arguments more than once, so applications
12751 should ensure that the arguments they supply are never expressions with side-effects.

12752 The following shall be declared as functions and may also be defined as macros. Function
12753 prototypes shall be provided.

```
12754 int pselect(int, fd_set *restrict, fd_set *restrict, fd_set *restrict,
12755             const struct timespec *restrict, const sigset_t *restrict);
12756 int select(int, fd_set *restrict, fd_set *restrict, fd_set *restrict,
12757            struct timeval *restrict);
```

12758 Inclusion of the <sys/select.h> header may make visible all symbols from the headers
12759 <signal.h> and <time.h>.

12760 **APPLICATION USAGE**

12761 None.

12762 **RATIONALE**

12763 None.

12770 First released in Issue 6. Derived from IEEE Std 1003.1g-2000.

12771 The requirement for the **fd_set** structure to have a member *fds_bits* has been removed as per The
12772 Open Group Base Resolution bwg2001-005.12773 **Issue 7**

12774 SD5-XBD-ERN-6 is applied, reordering the DESCRIPTION.

12775 This reference page is clarified with respect to macros and symbolic constants.

12776 **NAME**

12777 sys/sem.h — XSI semaphore facility

12778 **SYNOPSIS**

12779 XSI `#include <sys/sem.h>`

12780 **DESCRIPTION**

12781 The **<sys/sem.h>** header shall define the following symbolic constant for use as a semaphore
12782 operation flag:

12783 SEM_UNDO Set up adjust on exit entry.

12784 The **<sys/sem.h>** header shall define the following symbolic constants for use as commands for
12785 the *semctl()* function:

12786 GETNCNT Get *semmcnt*.

12787 GETPID Get *sempid*.

12788 GETVAL Get *semval*.

12789 GETALL Get all cases of *semval*.

12790 GETZCNT Get *semzcnt*.

12791 SETVAL Set *semval*.

12792 SETALL Set all cases of *semval*.

12793 The **<sys/sem.h>** header shall define the **semid_ds** structure, which shall include the following
12794 members:

12795 struct ipc_perm sem_perm Operation permission structure.

12796 unsigned short sem_nsems Number of semaphores in set.

12797 time_t sem_otime Last *semop()* time.

12798 time_t sem_ctime Last time changed by *semctl()*.

12799 The **<sys/sem.h>** header shall define the **pid_t**, **size_t**, and **time_t** types as described in
12800 **<sys/types.h>**.

12801 A semaphore shall be represented by an anonymous structure, which shall include the following
12802 members:

12803 unsigned short semval Semaphore value.

12804 pid_t sempid Process ID of last operation.

12805 unsigned short semncnt Number of processes waiting for *semval*
12806 to become greater than current value.

12807 unsigned short semzcnt Number of processes waiting for *semval*
12808 to become 0.

12809 The **<sys/sem.h>** header shall define the **sembuf** structure, which shall include the following
12810 members:

12811 unsigned short sem_num Semaphore number.

12812 short sem_op Semaphore operation.

12813 short sem_flg Operation flags.

12814 The following shall be declared as functions and may also be defined as macros. Function
12815 prototypes shall be provided.

12816 int semctl(int, int, int, ...);

```
12817         int    semget(key_t, int, int);
12818         int    semop(int, struct sembuf *, size_t);
```

12819 In addition, the **<sys/sem.h>** header shall include the **<sys/ipc.h>** header.

12820 **APPLICATION USAGE**

12821 None.

12822 **RATIONALE**

12823 None.

12824 **FUTURE DIRECTIONS**

12825 None.

12826 **SEE ALSO**

12829 **CHANGE HISTORY**

12830 First released in Issue 2. Derived from System V Release 2.0.

12831 **Issue 7**

12832 Austin Group Interpretation 1003.1-2001 #179 is applied.

12833 This reference page is clarified with respect to macros and symbolic constants.

12834 **NAME**

12835 sys/shm.h — XSI shared memory facility

12836 **SYNOPSIS**

12837 XSI `#include <sys/shm.h>`

12838 **DESCRIPTION**

12839 The <sys/shm.h> header shall define the following symbolic constants:

12840 SHM_RDONLY Attach read-only (else read-write).

12841 SHM_RND Round attach address to SHMLBA.

12842 SHMLBA Segment low boundary address multiple.

12843 The <sys/shm.h> header shall define the following data types through **typedef**:

12844 **shmatt_t** Unsigned integer used for the number of current attaches that must be able to
12845 store values at least as large as a type **unsigned short**.

12846 The <sys/shm.h> header shall define the **shmid_ds** structure, which shall include the following
12847 members:

12848	struct ipc_perm	shm_perm	Operation permission structure.
12849	size_t	shm_segsz	Size of segment in bytes.
12850	pid_t	shm_lpid	Process ID of last shared memory operation.
12851	pid_t	shm_cpid	Process ID of creator.
12852	shmatt_t	shm_nattch	Number of current attaches.
12853	time_t	shm_atime	Time of last <i>shmat</i> ().
12854	time_t	shm_dtime	Time of last <i>shmdt</i> ().
12855	time_t	shm_ctime	Time of last change by <i>shmctl</i> ().

12856 The <sys/shm.h> header shall define the **pid_t**, **size_t**, and **time_t** types as described in
12857 <sys/types.h>.

12858 The following shall be declared as functions and may also be defined as macros. Function
12859 prototypes shall be provided.

```
12860 void *shmat(int, const void *, int);
12861 int shmctl(int, int, struct shmid_ds *);
12862 int shmdt(const void *);
12863 int shmget(key_t, size_t, int);
```

12864 In addition, the <sys/shm.h> header shall include the <sys/ipc.h> header.

12865 **APPLICATION USAGE**

12866 None.

12867 **RATIONALE**

12868 None.

12869 **FUTURE DIRECTIONS**

12870 None.

CHANGE HISTORY

12874
12875 First released in Issue 2. Derived from System V Release 2.0.

Issue 5

12876
12877 The type of *shm_segsz* is changed from **int** to **size_t**.

Issue 7

12878
12879 Austin Group Interpretation 1003.1-2001 #179 is applied.

12880 This reference page is clarified with respect to macros and symbolic constants.

12881 **NAME**

12882 sys/socket.h — main sockets header

12883 **SYNOPSIS**

12884 #include <sys/socket.h>

12885 **DESCRIPTION**

12886 The <sys/socket.h> header shall define the **socklen_t** type, which is an integer type of width of
12887 at least 32 bits; see APPLICATION USAGE.

12888 The <sys/socket.h> header shall define the **sa_family_t** unsigned integer type.

12889 The <sys/socket.h> header shall define the **sockaddr** structure, which shall include at least the
12890 following members:

12891 sa_family_t sa_family Address family.
12892 char sa_data[] Socket address (variable-length data).

12893 The **sockaddr** structure is used to define a socket address which is used in the *bind()*, *connect()*,
12894 *getpeername()*, *getsockname()*, *recvfrom()*, and *sendto()* functions.

12895 The <sys/socket.h> header shall define the **sockaddr_storage** structure, which shall be:

- 12896 • Large enough to accommodate all supported protocol-specific address structures
- 12897 • Aligned at an appropriate boundary so that pointers to it can be cast as pointers to
12898 protocol-specific address structures and used to access the fields of those structures
12899 without alignment problems

12900 The **sockaddr_storage** structure shall include at least the following members:

12901 sa_family_t ss_family

12902 When a pointer to a **sockaddr_storage** structure is cast as a pointer to a **sockaddr** structure, the
12903 *ss_family* field of the **sockaddr_storage** structure shall map onto the *sa_family* field of the
12904 **sockaddr** structure. When a pointer to a **sockaddr_storage** structure is cast as a pointer to a
12905 protocol-specific address structure, the *ss_family* field shall map onto a field of that structure that
12906 is of type **sa_family_t** and that identifies the protocol's address family.

12907 The <sys/socket.h> header shall define the **msghdr** structure, which shall include at least the
12908 following members:

12909 void *msg_name Optional address.
12910 socklen_t msg_namelen Size of address.
12911 struct iovec *msg_iov Scatter/gather array.
12912 int msg_iovlen Members in *msg_iov*.
12913 void *msg_control Ancillary data; see below.
12914 socklen_t msg_controllen Ancillary data buffer *len*.
12915 int msg_flags Flags on received message.

12916 The **msghdr** structure is used to minimize the number of directly supplied parameters to the
12917 *recvmsg()* and *sendmsg()* functions. This structure is used as a *value-result* parameter in the
12918 *recvmsg()* function and *value* only for the *sendmsg()* function.

12919 The <sys/socket.h> header shall define the **iovec** structure as described in <sys/uio.h>.

12920 The <sys/socket.h> header shall define the **cmsg_hdr** structure, which shall include at least the
12921 following members:

12922 socklen_t cmsg_len Data byte count, including the **cmsg_hdr**.
12923 int cmsg_level Originating protocol.

12924 int cmsg_type Protocol-specific type.

12925 The **cmsg_hdr** structure is used for storage of ancillary data object information.

12926 Ancillary data consists of a sequence of pairs, each consisting of a **cmsg_hdr** structure followed
12927 by a data array. The data array contains the ancillary data message, and the **cmsg_hdr** structure
12928 contains descriptive information that allows an application to correctly parse the data.

12929 The values for *cmsg_level* shall be legal values for the *level* argument to the *getsockopt()* and
12930 *setsockopt()* functions. The system documentation shall specify the *cmsg_type* definitions for the
12931 supported protocols.

12932 Ancillary data is also possible at the socket level. The **<sys/socket.h>** header shall define the
12933 following symbolic constant for use as the *cmsg_type* value when *cmsg_level* is SOL_SOCKET:

12934 SCM_RIGHTS Indicates that the data array contains the access rights to be sent or
12935 received.

12936 The **<sys/socket.h>** header shall define the following macros to gain access to the data arrays in
12937 the ancillary data associated with a message header:

12938 CMMSG_DATA(*cmsg*)
12939 If the argument is a pointer to a **cmsg_hdr** structure, this macro shall return an unsigned
12940 character pointer to the data array associated with the **cmsg_hdr** structure.

12941 CMMSG_NXTHDR(*mhdr, cmsg*)
12942 If the first argument is a pointer to a **msghdr** structure and the second argument is a pointer
12943 to a **cmsg_hdr** structure in the ancillary data pointed to by the *msg_control* field of that
12944 **msghdr** structure, this macro shall return a pointer to the next **cmsg_hdr** structure, or a null
12945 pointer if this structure is the last **cmsg_hdr** in the ancillary data.

12946 CMMSG_FIRSTHDR(*mhdr*)
12947 If the argument is a pointer to a **msghdr** structure, this macro shall return a pointer to the
12948 first **cmsg_hdr** structure in the ancillary data associated with this **msghdr** structure, or a null
12949 pointer if there is no ancillary data associated with the **msghdr** structure.

12950 The **<sys/socket.h>** header shall define the **linger** structure, which shall include at least the
12951 following members:

12952 int l_onoff Indicates whether linger option is enabled.
12953 int l_linger Linger time, in seconds.

12954 The **<sys/socket.h>** header shall define the following symbolic constants with distinct values:

12955 SOCK_DGRAM Datagram socket.

12956 RS SOCK_RAW Raw Protocol Interface.

12957 SOCK_SEQPACKET Sequenced-packet socket.

12958 SOCK_STREAM Byte-stream socket.

12959 The **<sys/socket.h>** header shall define the following symbolic constant for use as the *level*
12960 argument of *setsockopt()* and *getsockopt()*.

12961 SOL_SOCKET Options to be accessed at socket level, not protocol level.

12962 The **<sys/socket.h>** header shall define the following symbolic constants with distinct values for
12963 use as the *option_name* argument in *getsockopt()* or *setsockopt()* calls (see XSH [Section 2.10.16](#), on
12964 page 527):

12965	SO_ACCEPTCONN	Socket is accepting connections.
12966	SO_BROADCAST	Transmission of broadcast messages is supported.
12967	SO_DEBUG	Debugging information is being recorded.
12968	SO_DONTROUTE	Bypass normal routing.
12969	SO_ERROR	Socket error status.
12970	SO_KEEPALIVE	Connections are kept alive with periodic messages.
12971	SO_LINGER	Socket lingers on close.
12972	SO_OOBINLINE	Out-of-band data is transmitted in line.
12973	SO_RCVBUF	Receive buffer size.
12974	SO_RCVLOWAT	Receive “low water mark”.
12975	SO_RCVTIMEO	Receive timeout.
12976	SO_REUSEADDR	Reuse of local addresses is supported.
12977	SO_SNDBUF	Send buffer size.
12978	SO_SNDLOWAT	Send “low water mark”.
12979	SO_SNDTIMEO	Send timeout.
12980	SO_TYPE	Socket type.
12981	The <sys/socket.h> header shall define the following symbolic constant for use as the maximum	
12982	<i>backlog</i> queue length which may be specified by the <i>backlog</i> field of the <i>listen()</i> function:	
12983	SOMAXCONN	The maximum <i>backlog</i> queue length.
12984	The <sys/socket.h> header shall define the following symbolic constants with distinct values for	
12985	use as the valid values for the <i>msg_flags</i> field in the msghdr structure, or the <i>flags</i> parameter in	
12986	<i>recv()</i> , <i>recvfrom()</i> , <i>recvmsg()</i> , <i>send()</i> , <i>sendmsg()</i> , or <i>sendto()</i> calls:	
12987	MSG_CTRUNC	Control data truncated.
12988	MSG_DONTROUTE	Send without using routing tables.
12989	MSG_EOR	Terminates a record (if supported by the protocol).
12990	MSG_OOB	Out-of-band data.
12991	MSG_NOSIGNAL	No SIGPIPE generated when an attempt to send is made on a stream-
12992		oriented socket that is no longer connected.
12993	MSG_PEEK	Leave received data in queue.
12994	MSG_TRUNC	Normal data truncated.
12995	MSG_WAITALL	Attempt to fill the read buffer.
12996	The <sys/socket.h> header shall define the following symbolic constants with distinct values:	
12997	AF_INET	Internet domain sockets for use with IPv4 addresses.
12998	IP6 AF_INET6	Internet domain sockets for use with IPv6 addresses.
12999	AF_UNIX	UNIX domain sockets.

13000 AF_UNSPEC Unspecified.

13001 The <sys/socket.h> header shall define the following symbolic constants with distinct values:

13002 SHUT_RD Disables further receive operations.

13003 SHUT_RDWR Disables further send and receive operations.

13004 SHUT_WR Disables further send operations.

13005 The <sys/socket.h> header shall define the **size_t** and **ssize_t** types as described in

13006 <sys/types.h>.

13007 The following shall be declared as functions and may also be defined as macros. Function

13008 prototypes shall be provided.

```

13009 int      accept(int, struct sockaddr *restrict, socklen_t *restrict);
13010 int      bind(int, const struct sockaddr *, socklen_t);
13011 int      connect(int, const struct sockaddr *, socklen_t);
13012 int      getpeername(int, struct sockaddr *restrict, socklen_t *restrict);
13013 int      getsockname(int, struct sockaddr *restrict, socklen_t *restrict);
13014 int      getsockopt(int, int, int, void *restrict, socklen_t *restrict);
13015 int      listen(int, int);
13016 ssize_t  recv(int, void *, size_t, int);
13017 ssize_t  recvfrom(int, void *restrict, size_t, int,
13018                 struct sockaddr *restrict, socklen_t *restrict);
13019 ssize_t  recvmsg(int, struct msghdr *, int);
13020 ssize_t  send(int, const void *, size_t, int);
13021 ssize_t  sendmsg(int, const struct msghdr *, int);
13022 ssize_t  sendto(int, const void *, size_t, int, const struct sockaddr *,
13023                socklen_t);
13024 int      setsockopt(int, int, int, const void *, socklen_t);
13025 int      shutdown(int, int);
13026 int      socketatmark(int);
13027 int      socket(int, int, int);
13028 int      socketpair(int, int, int, int [2]);

```

13029 Inclusion of <sys/socket.h> may also make visible all symbols from <sys/uio.h>.

13030 APPLICATION USAGE

13031 To forestall portability problems, it is recommended that applications not use values larger than

13032 $2^{31} - 1$ for the **socklen_t** type.

13033 The **sockaddr_storage** structure solves the problem of declaring storage for automatic variables

13034 which is both large enough and aligned enough for storing the socket address data structure of

13035 any family. For example, code with a file descriptor and without the context of the address

13036 family can pass a pointer to a variable of this type, where a pointer to a socket address structure

13037 is expected in calls such as *getpeername()*, and determine the address family by accessing the

13038 received content after the call.

13039 The example below illustrates a data structure which aligns on a 64-bit boundary. An

13040 implementation-defined field *_ss_align* following *_ss_pad1* is used to force a 64-bit alignment

13041 which covers proper alignment good enough for needs of at least **sockaddr_in6** (IPv6) and

13042 **sockaddr_in** (IPv4) address data structures. The size of padding field *_ss_pad1* depends on the

13043 chosen alignment boundary. The size of padding field *_ss_pad2* depends on the value of overall

13044 size chosen for the total size of the structure. This size and alignment are represented in the

13045 above example by implementation-defined (not required) constants *_SS_MAXSIZE* (chosen

value 128) and `_SS_ALIGNMENT` (with chosen value 8). Constants `_SS_PAD1SIZE` (derived value 6) and `_SS_PAD2SIZE` (derived value 112) are also for illustration and not required. The implementation-defined definitions and structure field names above start with an <underscore> to denote implementation private name space. Portable code is not expected to access or reference those fields or constants.

```

/*
 * Desired design of maximum size and alignment.
 */
#define _SS_MAXSIZE 128
/* Implementation-defined maximum size. */
#define _SS_ALIGNSIZE (sizeof(int64_t))
/* Implementation-defined desired alignment. */

/*
 * Definitions used for sockaddr_storage structure paddings design.
 */
#define _SS_PAD1SIZE (_SS_ALIGNSIZE - sizeof(sa_family_t))
#define _SS_PAD2SIZE (_SS_MAXSIZE - (sizeof(sa_family_t)+ \
                                   _SS_PAD1SIZE + _SS_ALIGNSIZE))
struct sockaddr_storage {
    sa_family_t  ss_family; /* Address family. */
/*
 * Following fields are implementation-defined.
 */
    char _ss_pad1[_SS_PAD1SIZE];
    /* 6-byte pad; this is to make implementation-defined
       pad up to alignment field that follows explicit in
       the data structure. */
    int64_t _ss_align; /* Field to force desired structure
                       storage alignment. */
    char _ss_pad2[_SS_PAD2SIZE];
    /* 112-byte pad to achieve desired size,
       _SS_MAXSIZE value minus size of ss_family
       __ss_pad1, __ss_align fields is 112. */
};

```

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

The **restrict** keyword is added to the prototypes for *accept()*, *getpeername()*, *getsockname()*, *getsockopt()*, and *recvfrom()*.

Issue 7

SD5-XBD-ERN-56 is applied, adding a reference to **<sys/types.h>** for the **ssize_t** type.

SD5-XBD-ERN-62 is applied.

The MSG_NOSIGNAL symbolic constant is added from The Open Group Technical Standard, 2006, Extended API Set Part 2.

This reference page is clarified with respect to macros and symbolic constants, and a declaration for the **size_t** type is added.

POSIX.1-2008, Technical Corrigendum 1, XBD/TC1-2008/0067 [355] is applied.

+

13101 **NAME**

13102 sys/stat.h — data returned by the `stat()` function

13103 **SYNOPSIS**

13104 `#include <sys/stat.h>`

13105 **DESCRIPTION**

13106 The <sys/stat.h> header shall define the structure of the data returned by the `fstat()`, `lstat()`, and
13107 `stat()` functions.

13108 The <sys/stat.h> header shall define the **stat** structure, which shall include at least the following
13109 members:

13110	<code>dev_t st_dev</code>	Device ID of device containing file.
13111	<code>ino_t st_ino</code>	File serial number.
13112	<code>mode_t st_mode</code>	Mode of file (see below).
13113	<code>nlink_t st_nlink</code>	Number of hard links to the file.
13114	<code>uid_t st_uid</code>	User ID of file.
13115	<code>gid_t st_gid</code>	Group ID of file.
13116	XSI <code>dev_t st_rdev</code>	Device ID (if file is character or block special).
13117	<code>off_t st_size</code>	For regular files, the file size in bytes.
13118		For symbolic links, the length in bytes of the
13119		pathname contained in the symbolic link.
13120	SHM	For a shared memory object, the length in bytes.
13121	TYM	For a typed memory object, the length in bytes.
13122		For other file types, the use of this field is
13123		unspecified.
13124	<code>struct timespec st_atim</code>	Last data access timestamp.
13125	<code>struct timespec st_mtim</code>	Last data modification timestamp.
13126	<code>struct timespec st_ctim</code>	Last file status change timestamp.
13127	XSI <code>blksize_t st_blksize</code>	A file system-specific preferred I/O block size
13128		for this object. In some file system types, this
13129		may vary from file to file.
13130	<code>blkcnt_t st_blocks</code>	Number of blocks allocated for this object.

13131 The `st_ino` and `st_dev` fields taken together uniquely identify the file within the system.

13132 XSI The <sys/stat.h> header shall define the **blkcnt_t**, **blksize_t**, **dev_t**, **ino_t**, **mode_t**, **nlink_t**,
13133 **uid_t**, **gid_t**, **off_t**, and **time_t** types as described in <sys/types.h>.

13134 The <sys/stat.h> header shall define the **timespec** structure as described in <time.h>. Times
13135 shall be given in seconds since the Epoch.

13136 Which structure members have meaningful values depends on the type of file. For further
13137 information, see the descriptions of `fstat()`, `lstat()`, and `stat()` in the System Interfaces volume of
13138 POSIX.1-2008.

13139 For compatibility with earlier versions of this standard, the `st_atime` macro shall be defined with
13140 the value `st_atim.tv_sec`. Similarly, `st_ctime` and `st_mtime` shall be defined as macros with the
13141 values `st_ctim.tv_sec` and `st_mtim.tv_sec`, respectively.

The <sys/stat.h> header shall define the following symbolic constants for the file types encoded in type **mode_t**. The values shall be suitable for use in **#if** preprocessing directives:

S_IFMT	Type of file.
S_IFBLK	Block special.
S_IFCHR	Character special.
S_IFIFO	FIFO special.
S_IFREG	Regular.
S_IFDIR	Directory.
S_IFLNK	Symbolic link.
S_IFSOCK	Socket.

The <sys/stat.h> header shall define the following symbolic constants for the file mode bits encoded in type **mode_t**, with the indicated numeric values. These macros shall expand to an expression which has a type that allows them to be used, either singly or OR'ed together, as the third argument to *open()* without the need for a **mode_t** cast. The values shall be suitable for use in **#if** preprocessing directives.

Name	Numeric Value	Description
S_IRWXU	0700	Read, write, execute/search by owner.
S_IRUSR	0400	Read permission, owner.
S_IWUSR	0200	Write permission, owner.
S_IXUSR	0100	Execute/search permission, owner.
S_IRWXG	070	Read, write, execute/search by group.
S_IRGRP	040	Read permission, group.
S_IWGRP	020	Write permission, group.
S_IXGRP	010	Execute/search permission, group.
S_IRWXO	07	Read, write, execute/search by others.
S_IROTH	04	Read permission, others.
S_IWOTH	02	Write permission, others.
S_IXOTH	01	Execute/search permission, others.
S_ISUID	04000	Set-user-ID on execution.
S_ISGID	02000	Set-group-ID on execution.
S_ISVTX	01000	On directories, restricted deletion flag.

The following macros shall be provided to test whether a file is of the specified type. The value *m* supplied to the macros is the value of *st_mode* from a **stat** structure. The macro shall evaluate to a non-zero value if the test is true; 0 if the test is false.

S_ISBLK(<i>m</i>)	Test for a block special file.
S_ISCHR(<i>m</i>)	Test for a character special file.
S_ISDIR(<i>m</i>)	Test for a directory.
S_ISFIFO(<i>m</i>)	Test for a pipe or FIFO special file.
S_ISREG(<i>m</i>)	Test for a regular file.

13181		<code>S_ISLNK(<i>m</i>)</code>	Test for a symbolic link.
13182		<code>S_ISSOCK(<i>m</i>)</code>	Test for a socket.
13183		The implementation may implement message queues, semaphores, or shared memory objects as distinct file types. The following macros shall be provided to test whether a file is of the specified type. The value of the <i>buf</i> argument supplied to the macros is a pointer to a stat structure. The macro shall evaluate to a non-zero value if the specified object is implemented as a distinct file type and the specified file type is contained in the stat structure referenced by <i>buf</i> . Otherwise, the macro shall evaluate to zero.	
13184			
13185			
13186			
13187			
13188			
13189		<code>S_TYPEISMQ(<i>buf</i>)</code>	Test for a message queue.
13190		<code>S_TYPEISSEM(<i>buf</i>)</code>	Test for a semaphore.
13191		<code>S_TYPEISSHM(<i>buf</i>)</code>	Test for a shared memory object.
13192	TYM	The implementation may implement typed memory objects as distinct file types, and the following macro shall test whether a file is of the specified type. The value of the <i>buf</i> argument supplied to the macros is a pointer to a stat structure. The macro shall evaluate to a non-zero value if the specified object is implemented as a distinct file type and the specified file type is contained in the stat structure referenced by <i>buf</i> . Otherwise, the macro shall evaluate to zero.	
13193			
13194			
13195			
13196			
13197		<code>S_TYPEISTMO(<i>buf</i>)</code>	Test macro for a typed memory object.
13198		The <sys/stat.h> header shall define the following symbolic constants as distinct integer values outside of the range [0,999 999 999], for use with the <i>futimens()</i> and <i>utimensat()</i> functions:	
13199			
13200		<code>UTIME_NOW</code>	
13201		<code>UTIME_OMIT</code>	
13202		The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.	
13203			
13204		<code>int</code>	<code>chmod(const char *, mode_t);</code>
13205		<code>int</code>	<code>fchmod(int, mode_t);</code>
13206		<code>int</code>	<code>fchmodat(int, const char *, mode_t, int);</code>
13207		<code>int</code>	<code>fstat(int, struct stat *);</code>
13208		<code>int</code>	<code>fstatat(int, const char *restrict, struct stat *restrict, int);</code>
13209		<code>int</code>	<code>futimens(int, const struct timespec [2]);</code>
13210		<code>int</code>	<code>lstat(const char *restrict, struct stat *restrict);</code>
13211		<code>int</code>	<code>mkdir(const char *, mode_t);</code>
13212		<code>int</code>	<code>mkdirat(int, const char *, mode_t);</code>
13213		<code>int</code>	<code>mkfifo(const char *, mode_t);</code>
13214		<code>int</code>	<code>mkfifoat(int, const char *, mode_t);</code>
13215	XSI	<code>int</code>	<code>mknod(const char *, mode_t, dev_t);</code>
13216		<code>int</code>	<code>mknodat(int, const char *, mode_t, dev_t);</code>
13217		<code>int</code>	<code>stat(const char *restrict, struct stat *restrict);</code>
13218		<code>mode_t</code>	<code>umask(mode_t);</code>
13219		<code>int</code>	<code>utimensat(int, const char *, const struct timespec [2], int);</code>

13220 APPLICATION USAGE

13221 Use of the macros is recommended for determining the type of a file.

13222 RATIONALE

13223 A conforming C-language application must include **<sys/stat.h>** for functions that have
 13224 arguments or return values of type **mode_t**, so that symbolic values for that type can be used.
 13225 An alternative would be to require that these constants are also defined by including
 13226 **<sys/types.h>**.

13227 The **S_ISUID** and **S_ISGID** bits may be cleared on any write, not just on *open()*, as some
 13228 historical implementations do.

13229 System calls that update the time entry fields in the **stat** structure must be documented by the
 13230 implementors. POSIX-conforming systems should not update the time entry fields for functions
 13231 listed in the System Interfaces volume of POSIX.1-2008 unless the standard requires that they do,
 13232 except in the case of documented extensions to the standard.

13233 Upon assignment, file timestamps are immediately converted to the resolution of the file system
 13234 by truncation (i.e., the recorded time can be older than the actual time). For example, if the file
 13235 system resolution is 1 microsecond, then a conforming *stat()* must always return an
 13236 *st_mtim.tv_nsec* that is a multiple of 1000. Some older implementations returned higher-
 13237 resolution timestamps while the *inode* information was cached, and then spontaneously
 13238 truncated the *tv_nsec* fields when they were stored to and retrieved from disk, but this behavior
 13239 does not conform.

13240 Note that *st_dev* must be unique within a Local Area Network (LAN) in a “system” made up of
 13241 multiple computers’ file systems connected by a LAN.

13242 Networked implementations of a POSIX-conforming system must guarantee that all files visible
 13243 within the file tree (including parts of the tree that may be remotely mounted from other
 13244 machines on the network) on each individual processor are uniquely identified by the
 13245 combination of the *st_ino* and *st_dev* fields.

13246 The unit for the *st_blocks* member of the **stat** structure is not defined within POSIX.1-2008. In
 13247 some implementations it is 512 bytes. It may differ on a file system basis. There is no correlation
 13248 between values of the *st_blocks* and *st_blksize*, and the *f_bsize* (from **<sys/statvfs.h>**) structure
 13249 members.

13250 Traditionally, some implementations defined the multiplier for *st_blocks* in **<sys/param.h>** as the
 13251 symbol **DEV_BSIZE**.

13252 Some earlier versions of this standard did not specify values for the file mode bit macros. The
 13253 expectation was that some implementors might choose to use a different encoding for these bits
 13254 than the traditional one, and that new applications would use symbolic file modes instead of
 13255 numeric. This version of the standard specifies the traditional encoding, in recognition that
 13256 nearly 20 years after the first publication of this standard numeric file modes are still in
 13257 widespread use by application developers, and that all conforming implementations still use the
 13258 traditional encoding.

13259 FUTURE DIRECTIONS

13260 No new **S_IFMT** symbolic names for the file type values of **mode_t** will be defined by
 13261 POSIX.1-2008; if new file types are required, they will only be testable through *S_ISxx()* or
 13262 *S_TYPEISxxx()* macros instead.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Realtime Extension.

The type of *st_blksize* is changed from **long** to **blksize_t**; the type of *st_blocks* is changed from **long** to **blkcnt_t**.

Issue 6

The S_TYPEISMQ(), S_TYPEISSEM(), and S_TYPEISSHM() macros are unconditionally mandated.

The Open Group Corrigendum U035/4 is applied. In the DESCRIPTION, the types **blksize_t** and **blkcnt_t** have been described.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The **dev_t**, **ino_t**, **mode_t**, **nlink_t**, **uid_t**, **gid_t**, **off_t**, and **time_t** types are mandated.

S_IFSOCK and S_ISSOCK are added for sockets.

The description of **stat** structure members is changed to reflect contents when file type is a symbolic link.

The test macro S_TYPEISTMO is added for alignment with IEEE Std 1003.1j-2000.

The **restrict** keyword is added to the prototypes for *lstat()* and *stat()*.

The *lstat()* function is made mandatory.

IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/17 is applied, adding text regarding the *st_blocks* member of the **stat** structure to the RATIONALE.

IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/25 is applied, adding to the DESCRIPTION that the **timespec** structure may be defined as described in the <time.h> header.

Issue 7

SD5-XSH-ERN-161 is applied, updating the DESCRIPTION to clarify that the descriptions of the interfaces should be consulted in order to determine which structure members have meaningful values.

The *fchmodat()*, *fstatat()*, *mkdirat()*, *mkfifoat()*, *mknodat()*, and *utimensat()* functions are added from The Open Group Technical Standard, 2006, Extended API Set Part 2.

The *futimens()* function is added.

This reference page is clarified with respect to macros and symbolic constants.

Changes are made related to support for finegrained timestamps and the **UTIME_NOW** and **UTIME_OMIT** symbolic constants are added.

POSIX.1-2008, Technical Corrigendum 1, XBD/TC1-2008/0068 [207] is applied.

+

13301 **NAME**

13302 sys/statvfs.h — VFS File System information structure

13303 **SYNOPSIS**

13304 #include <sys/statvfs.h>

13305 **DESCRIPTION**13306 The <sys/statvfs.h> header shall define the **statvfs** structure, which shall include at least the
13307 following members:

13308	unsigned long	f_bsize	File system block size.
13309	unsigned long	f_frsize	Fundamental file system block size.
13310	fsblkcnt_t	f_blocks	Total number of blocks on file system in units of <i>f_frsize</i> .
13311	fsblkcnt_t	f_bfree	Total number of free blocks.
13312	fsblkcnt_t	f_bavail	Number of free blocks available to non-privileged process.
13313			
13314	fsfilcnt_t	f_files	Total number of file serial numbers.
13315	fsfilcnt_t	f_ffree	Total number of free file serial numbers.
13316	fsfilcnt_t	f_favail	Number of file serial numbers available to non-privileged process.
13317			
13318	unsigned long	f_fsid	File system ID.
13319	unsigned long	f_flag	Bit mask of <i>f_flag</i> values.
13320	unsigned long	f_namemax	Maximum filename length.

13321 The <sys/statvfs.h> header shall define the **fsblkcnt_t** and **fsfilcnt_t** types as described in
13322 <sys/types.h>.13323 The <sys/statvfs.h> header shall define the following symbolic constants for the *f_flag* member:

13324 ST_RDONLY Read-only file system.

13325 ST_NOSUID Does not support the semantics of the ST_ISUID and ST_ISGID file mode bits.

13326 The following shall be declared as functions and may also be defined as macros. Function
13327 prototypes shall be provided.

13328 int fstatvfs(int, struct statvfs *);

13329 int statvfs(const char *restrict, struct statvfs *restrict);

13330 **APPLICATION USAGE**

13331 None.

13332 **RATIONALE**

13333 None.

13334 **FUTURE DIRECTIONS**

13335 None.

13336 **SEE ALSO**

13337 <sys/types.h>

13338 XSH *fstatvfs()*13339 **CHANGE HISTORY**

13340 First released in Issue 4, Version 2.

13341 **Issue 5**13342 The type of *f_blocks*, *f_bfree*, and *f_bavail* is changed from **unsigned long** to **fsblkcnt_t**; the type of
13343 *f_files*, *f_ffree*, and *f_favail* is changed from **unsigned long** to **fsfilcnt_t**.

13344 **Issue 6**

13345 The Open Group Corrigendum U035/5 is applied. In the DESCRIPTION, the types **fsblkcnt_t**
13346 and **fsfilcnt_t** have been described.

13347 The **restrict** keyword is added to the prototype for *statvfs()*.

13348 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/18 is applied, changing the description of
13349 ST_NOSUID from “Does not support *setuid()*/*setgid()* semantics” to “Does not support the
13350 semantics of the ST_ISUID and ST_ISGID file mode bits”.

13351 **Issue 7**

13352 The <sys/statvfs.h> header is moved from the XSI option to the Base.

13353 This reference page is clarified with respect to macros and symbolic constants.

13354 **NAME**

13355 sys/time.h — time types

13356 **SYNOPSIS**13357 XSI `#include <sys/time.h>`13358 **DESCRIPTION**

13359 The **<sys/time.h>** header shall define the **timeval** structure, which shall include at least the
 13360 following members:

13361	time_t	tv_sec	Seconds.
13362	suseconds_t	tv_usec	Microseconds.

13363 OB The **<sys/time.h>** header shall define the **itimerval** structure, which shall include at least the
 13364 following members:

13365	struct timeval	it_interval	Timer interval.
13366	struct timeval	it_value	Current value.

13367 The **<sys/time.h>** header shall define the **time_t** and **suseconds_t** types as described in
 13368 **<sys/types.h>**.

13369 The **<sys/time.h>** header shall define the **fd_set** type as described in **<sys/select.h>**.

13370 OB The **<sys/time.h>** header shall define the following symbolic constants for the *which* argument of
 13371 *getitimer()* and *setitimer()*:

13372	ITIMER_REAL	Decrements in real time.
13373	ITIMER_VIRTUAL	Decrements in process virtual time.
13374	ITIMER_PROF	Decrements both in process virtual time and when the system is running 13375 on behalf of the process.

13376 The **<sys/time.h>** header shall define the following as described in **<sys/select.h>**:

```
13377 FD_CLR()
13378 FD_ISSET()
13379 FD_SET()
13380 FD_ZERO()
13381 FD_SETSIZE
```

13382 The following shall be declared as functions and may also be defined as macros. Function
 13383 prototypes shall be provided.

```
13384 OB int getitimer(int, struct itimerval *);
13385 int gettimeofday(struct timeval *restrict, void *restrict);
13386 int setitimer(int, const struct itimerval *restrict,
13387             struct itimerval *restrict);
13388 int select(int, fd_set *restrict, fd_set *restrict, fd_set *restrict,
13389           struct timeval *restrict);
13390 int utimes(const char *, const struct timeval [2]);
```

13391 Inclusion of the **<sys/time.h>** header may make visible all symbols from the **<sys/select.h>**
 13392 header.

13393 **APPLICATION USAGE**

13394 None.

13395 **RATIONALE**

13396 None.

13397 **FUTURE DIRECTIONS**

13398 None.

13402 **CHANGE HISTORY**

13403 First released in Issue 4, Version 2.

13404 **Issue 5**

13405 The type of *tv_usec* is changed from **long** to **suseconds_t**.

13406 **Issue 6**

13407 The **restrict** keyword is added to the prototypes for *gettimeofday()*, *select()*, and *setitimer()*.

13408 The note is added that inclusion of this header may also make symbols visible from
13409 **<sys/select.h>**.

13410 The *utimes()* function is marked LEGACY.

13411 **Issue 7**

13412 This reference page is clarified with respect to macros and symbolic constants.

13413 **NAME**

13414 sys/times.h — file access and modification times structure

13415 **SYNOPSIS**

13416 #include <sys/times.h>

13417 **DESCRIPTION**13418 The <sys/times.h> header shall define the **tms** structure, which is returned by *times()* and shall
13419 include at least the following members:

13420 clock_t tms_utime User CPU time.

13421 clock_t tms_stime System CPU time.

13422 clock_t tms_cutime User CPU time of terminated child processes.

13423 clock_t tms_cstime System CPU time of terminated child processes.

13424 The <sys/times.h> header shall define the **clock_t** type as described in <sys/types.h>.13425 The following shall be declared as a function and may also be defined as a macro. A function
13426 prototype shall be provided.

13427 clock_t times(struct tms *);

13428 **APPLICATION USAGE**

13429 None.

13438 First released in Issue 1. Derived from Issue 1 of the SVID.

13439 **NAME**

13440 sys/types.h — data types

13441 **SYNOPSIS**

13442 #include <sys/types.h>

13443 **DESCRIPTION**

13444 The <sys/types.h> header shall define at least the following types:

13445	blkcnt_t	Used for file block counts.
13446	blksize_t	Used for block sizes.
13447	clock_t	Used for system times in clock ticks or CLOCKS_PER_SEC; see <time.h>.
13448		
13449	clockid_t	Used for clock ID type in the clock and timer functions.
13450	dev_t	Used for device IDs.
13451	fsblkcnt_t	Used for file system block counts.
13452	fsfilcnt_t	Used for file system file counts.
13453	gid_t	Used for group IDs.
13454	id_t	Used as a general identifier; can be used to contain at least a pid_t ,
13455		uid_t , or gid_t .
13456	ino_t	Used for file serial numbers.
13457	XSI key_t	Used for XSI interprocess communication.
13458	mode_t	Used for some file attributes.
13459	nlink_t	Used for link counts.
13460	off_t	Used for file sizes.
13461	pid_t	Used for process IDs and process group IDs.
13462	pthread_attr_t	Used to identify a thread attribute object.
13463	pthread_barrier_t	Used to identify a barrier.
13464	pthread_barrierattr_t	Used to define a barrier attributes object.
13465	pthread_cond_t	Used for condition variables.
13466	pthread_condattr_t	Used to identify a condition attribute object.
13467	pthread_key_t	Used for thread-specific data keys.
13468	pthread_mutex_t	Used for mutexes.
13469	pthread_mutexattr_t	Used to identify a mutex attribute object.
13470	pthread_once_t	Used for dynamic package initialization.
13471	pthread_rwlock_t	Used for read-write locks.
13472	pthread_rwlockattr_t	Used for read-write lock attributes.
13473	pthread_spinlock_t	Used to identify a spin lock.

13474		pthread_t	Used to identify a thread.	
13475		size_t	Used for sizes of objects.	
13476		ssize_t	Used for a count of bytes or an error indication.	
13477	XSI	suseconds_t	Used for time in microseconds.	
13478		time_t	Used for time in seconds.	
13479		timer_t	Used for timer ID returned by <i>timer_create()</i> .	
13480	OB TRC	trace_attr_t	Used to identify a trace stream attributes object	
13481	OB TRC	trace_event_id_t	Used to identify a trace event type.	
13482	OB TEF	trace_event_set_t	Used to identify a trace event type set.	
13483	OB TRC	trace_id_t	Used to identify a trace stream.	
13484		uid_t	Used for user IDs.	
13485		All of the types shall be defined as arithmetic types of an appropriate length, with the following exceptions:		
13486				
13487		pthread_attr_t		
13488		pthread_barrier_t		
13489		pthread_barrierattr_t		
13490		pthread_cond_t		
13491		pthread_condattr_t		
13492		pthread_key_t		
13493		pthread_mutex_t		
13494		pthread_mutexattr_t		
13495		pthread_once_t		
13496		pthread_rwlock_t		
13497		pthread_rwlockattr_t		
13498		pthread_spinlock_t		
13499		pthread_t		
13500	OB TRC	trace_attr_t		
13501		trace_event_id_t		
13502	OB TEF	trace_event_set_t		
13503	OB TRC	trace_id_t		
13504		Additionally:		
13505		• mode_t shall be an integer type.		
13506		• dev_t shall be an integer type.		+
13507		• nlink_t , uid_t , gid_t , and id_t shall be integer types.		
13508		• blkcnt_t and off_t shall be signed integer types.		
13509		• fsblkcnt_t , fsfilcnt_t , and ino_t shall be defined as unsigned integer types.		
13510		• size_t shall be an unsigned integer type.		
13511		• blksize_t , pid_t , and ssize_t shall be signed integer types.		

13512 CX • **clock_t** shall be an integer or real-floating type. **time_t** shall be an integer type. |

13513 The type **ssize_t** shall be capable of storing values at least in the range $[-1, \{\text{SSIZE\_MAX}\}]$.

13514 XSI The type **suseconds_t** shall be a signed integer type capable of storing values at least in the

13515 range $[-1, 1\,000\,000]$.

13516 The implementation shall support one or more programming environments in which the widths

13517 of **blksize_t**, **pid_t**, **size_t**, **ssize_t**, and **suseconds_t** are no greater than the width of type **long**.

13518 The names of these programming environments can be obtained using the *confstr()* function or

13519 the *getconf* utility.

13520 There are no defined comparison or assignment operators for the following types:

13521 **pthread_attr_t**

13522 **pthread_barrier_t**

13523 **pthread_barrierattr_t**

13524 **pthread_cond_t**

13525 **pthread_condattr_t**

13526 **pthread_mutex_t**

13527 **pthread_mutexattr_t**

13528 **pthread_rwlock_t**

13529 **pthread_rwlockattr_t**

13530 **pthread_spinlock_t**

13531 OB TRC **trace_attr_t**

13532 APPLICATION USAGE

13542 CHANGE HISTORY

13543 First released in Issue 1. Derived from Issue 1 of the SVID.

13544 Issue 5

13545 The **clockid_t** and **timer_t** types are defined for alignment with the POSIX Realtime Extension.

13546 The types **blkcnt_t**, **blksize_t**, **fsblkcnt_t**, **fsfilcnt_t**, and **suseconds_t** are added.

13547 Large File System extensions are added.

13548 Updated for alignment with the POSIX Threads Extension.

13549 Issue 6

13550 The **pthread_barrier_t**, **pthread_barrierattr_t**, and **pthread_spinlock_t** types are added for

13551 alignment with IEEE Std 1003.1j-2000.

13552 The margin code is changed from XSI to THR for the **pthread_rwlock_t** and

13553 **pthread_rwlockattr_t** types as Read-Write Locks have been absorbed into the POSIX Threads

13554 option. The threads types are marked THR.

13555 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/26 is applied, adding **pthread_t** to the list
13556 of types that are not required to be arithmetic types, thus allowing **pthread_t** to be defined as a
13557 structure.

13558 **Issue 7**

13559 Austin Group Interpretation 1003.1-2001 #033 is applied, requiring **key_t** to be an arithmetic
13560 type.

13561 The Trace option types are marked obsolescent.

13562 The **clock_t** and **id_t** types are moved from the XSI option to the Base.

13563 The **pthread_barrier_t** and **pthread_barrierattr_t** types are moved from the Barriers option to
13564 the Base.

13565 The **pthread_spinlock_t** type is moved from the Spin Locks option to the Base.

13566 Functionality relating to the Timers and Threads options is moved to the Base.

13567 POSIX.1-2008, Technical Corrigendum 1, XBD/TC1-2008/0069 [210], XBD/TC1-2008/0070 [28], +
13568 XBD/TC1-2008/0071 [376], XBD/TC1-2008/0072 [210], and XBD/TC1-2008/0073 [327] are +
13569 applied.

13570 NAME

13571 sys/uio.h — definitions for vector I/O operations

13572 SYNOPSIS

13573 XSI `#include <sys/uio.h>`

13574 DESCRIPTION

13575 The <sys/uio.h> header shall define the **iovec** structure, which shall include at least the
13576 following members:

13577 `void *iov_base` Base address of a memory region for input or output.
13578 `size_t iov_len` The size of the memory pointed to by *iov_base*.

13579 The <sys/uio.h> header uses the **iovec** structure for scatter/gather I/O.

13580 The <sys/uio.h> header shall define the **ssize_t** and **size_t** types as described in <sys/types.h>.

13581 The following shall be declared as functions and may also be defined as macros. Function
13582 prototypes shall be provided.

13583 `ssize_t readv(int, const struct iovec *, int);`
13584 `ssize_t writev(int, const struct iovec *, int);`

13585 APPLICATION USAGE

13586 The implementation can put a limit on the number of scatter/gather elements which can be
13587 processed in one call. The symbol {IOV_MAX} defined in <limits.h> should always be used to
13588 learn about the limits instead of assuming a fixed value.

13589 RATIONALE

13590 Traditionally, the maximum number of scatter/gather elements the system can process in one
13591 call were described by the symbolic value {UIO_MAXIOV}. In IEEE Std 1003.1-2001 this value is
13592 replaced by the constant {IOV_MAX} which can be found in <limits.h>.

13593 FUTURE DIRECTIONS

13594 None.

13595 SEE ALSO

13596 <limits.h>, <sys/types.h>

13597 XSH *read()*, *readv()*, *write()*, *writev()*

13598 CHANGE HISTORY

13599 First released in Issue 4, Version 2.

13600 Issue 6

13601 Text referring to scatter/gather I/O is added to the DESCRIPTION.

13602 **NAME**

13603 sys/un.h — definitions for UNIX domain sockets

13604 **SYNOPSIS**

13605 #include <sys/un.h>

13606 **DESCRIPTION**

13607 The <sys/un.h> header shall define the **sockaddr_un** structure, which shall include at least the
 13608 following members:

13609 sa_family_t sun_family Address family.
 13610 char sun_path[] Socket pathname.

13611 The **sockaddr_un** structure is used to store addresses for UNIX domain sockets. Pointers to this
 13612 type shall be cast by applications to **struct sockaddr *** for use with socket functions.

13613 The <sys/un.h> header shall define the **sa_family_t** type as described in <sys/socket.h>.

13614 **APPLICATION USAGE**

13615 The size of *sun_path* has intentionally been left undefined. This is because different
 13616 implementations use different sizes. For example, 4.3 BSD uses a size of 108, and 4.4 BSD uses a
 13617 size of 104. Since most implementations originate from BSD versions, the size is typically in the
 13618 range 92 to 108.

13619 Applications should not assume a particular length for *sun_path* or assume that it can hold
 13620 {_POSIX_PATH_MAX} bytes (256).

13621 **RATIONALE**

13622 None.

13623 **FUTURE DIRECTIONS**

13624 None.

13625 **SEE ALSO**

13626 <sys/socket.h>

13627 XSH *bind()*, *socket()*, *socketpair()*13628 **CHANGE HISTORY**

13629 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

13630 **Issue 7**

13631 The value for {_POSIX_PATH_MAX} is updated to 256.

13632 POSIX.1-2008, Technical Corrigendum 1, XBD/TC1-2008/0074 [355] is applied.

+

13633 **NAME**

13634 sys/utsname.h — system name structure

13635 **SYNOPSIS**

13636 #include <sys/utsname.h>

13637 **DESCRIPTION**

13638 The <sys/utsname.h> header shall define the structure **utsname** which shall include at least the
13639 following members:

13640	char	sysname[]	Name of this implementation of the operating system.
13641	char	nodename[]	Name of this node within the communications
13642			network to which this node is attached, if any.
13643	char	release[]	Current release level of this implementation.
13644	char	version[]	Current version level of this release.
13645	char	machine[]	Name of the hardware type on which the system is running.

13646 The character arrays are of unspecified size, but the data stored in them shall be terminated by a
13647 null byte.

13648 The following shall be declared as a function and may also be defined as a macro:

13649 int uname(struct utsname *);

13650 **APPLICATION USAGE**

13651 None.

13652 **RATIONALE**

13653 None.

13654 **FUTURE DIRECTIONS**

13655 None.

13656 **SEE ALSO**

13657 XSH *uname()*

13658 **CHANGE HISTORY**

13659 First released in Issue 1. Derived from Issue 1 of the SVID.

13660 **Issue 6**

13661 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/27 is applied, changing the description of
13662 *nodename* within the **utsname** structure from “an implementation-defined communications
13663 network” to “the communications network to which this node is attached, if any”.

13664 **NAME**

13665 sys/wait.h — declarations for waiting

13666 **SYNOPSIS**

13667 #include <sys/wait.h>

13668 **DESCRIPTION**13669 The <sys/wait.h> header shall define the following symbolic constants for use with *waitpid()*:13670 XSI **WCONTINUED** Report status of continued child process.13671 **WNOHANG** Do not hang if no status is available; return immediately.13672 **WUNTRACED** Report status of stopped child process.

13673 The <sys/wait.h> header shall define the following macros for analysis of process status values:

13674 **WEXITSTATUS** Return exit status.13675 XSI **WIFCONTINUED** True if child has been continued.13676 **WIFEXITED** True if child exited normally.13677 **WIFSIGNALED** True if child exited due to uncaught signal.13678 **WIFSTOPPED** True if child is currently stopped.13679 **WSTOPSIG** Return signal number that caused process to stop.13680 **WTERMSIG** Return signal number that caused process to terminate.13681 The <sys/wait.h> header shall define the following symbolic constants as possible values for the
13682 *options* argument to *waitid()*:13683 **WEXITED** Wait for processes that have exited.13684 **WNOWAIT** Keep the process whose status is returned in *info* in a waitable state.13685 **WSTOPPED** Status is returned for any child that has stopped upon receipt of a signal.13686 XSI The **WCONTINUED** and **WNOHANG** constants, described above for *waitpid()*, can also be
13687 used with *waitid()*.13688 The type **idtype_t** shall be defined as an enumeration type whose possible values shall include
13689 at least the following:13690 **P_ALL**13691 **P_PGID**13692 **P_PID**13693 The <sys/wait.h> header shall define the **id_t** and **pid_t** types as described in <sys/types.h>.13694 The <sys/wait.h> header shall define the **siginfo_t** type as described in <signal.h>.

13695 Inclusion of the <sys/wait.h> header may also make visible all symbols from <signal.h>.

13696 The following shall be declared as functions and may also be defined as macros. Function
13697 prototypes shall be provided.13698 **pid_t** wait(int *);13699 **int** waitid(idtype_t, id_t, siginfo_t *, int);13700 **pid_t** waitpid(pid_t, int *, int);

13701 **APPLICATION USAGE**

13702 None.

13703 **RATIONALE**

13704 None.

13705 **FUTURE DIRECTIONS**

13706 None.

13707 **SEE ALSO**

13708 <signal.h>, <sys/types.h>

13709 XSH *wait()*, *waitid()*

13710 **CHANGE HISTORY**

13711 First released in Issue 3.

13712 Included for alignment with the POSIX.1-1988 standard.

13713 **Issue 6**

13714 The *wait3()* function is removed.

13715 **Issue 7**

13716 The *waitid()* function and symbolic constants for its *options* argument are moved to the Base.

13717 The description of the WNOHANG constant is clarified.

13718 **NAME**

13719 syslog.h — definitions for system error logging

13720 **SYNOPSIS**

13721 XSI #include <syslog.h>

13722 **DESCRIPTION**13723 The <syslog.h> header shall define the following symbolic constants, zero or more of which
13724 may be OR'ed together to form the *logopt* option of *openlog()*:

13725 LOG_PID Log the process ID with each message.

13726 LOG_CONS Log to the system console on error.

13727 LOG_NDELAY Connect to syslog daemon immediately.

13728 LOG_ODELAY Delay open until *syslog()* is called.

13729 LOG_NOWAIT Do not wait for child processes.

13730 The <syslog.h> header shall define the following symbolic constants for use as the *facility*
13731 argument to *openlog()*:

13732 LOG_KERN Reserved for message generated by the system.

13733 LOG_USER Message generated by a process.

13734 LOG_MAIL Reserved for message generated by mail system.

13735 LOG_NEWS Reserved for message generated by news system.

13736 LOG_UUCP Reserved for message generated by UUCP system.

13737 LOG_DAEMON Reserved for message generated by system daemon.

13738 LOG_AUTH Reserved for message generated by authorization daemon.

13739 LOG_CRON Reserved for message generated by clock daemon.

13740 LOG_LPR Reserved for message generated by printer system.

13741 LOG_LOCAL0 Reserved for local use.

13742 LOG_LOCAL1 Reserved for local use.

13743 LOG_LOCAL2 Reserved for local use.

13744 LOG_LOCAL3 Reserved for local use.

13745 LOG_LOCAL4 Reserved for local use.

13746 LOG_LOCAL5 Reserved for local use.

13747 LOG_LOCAL6 Reserved for local use.

13748 LOG_LOCAL7 Reserved for local use.

13749 The <syslog.h> header shall define the following macros for constructing the *maskpri* argument
13750 to *setlogmask()*. The following macros expand to an expression of type **int** when the argument
13751 *pri* is an expression of type **int**:13752 LOG_MASK(*pri*) A mask for priority *pri*.13753 The <syslog.h> header shall define the following symbolic constants for use as the *priority*
13754 argument of *syslog()*:

13755	LOG_EMERG	A panic condition was reported to all processes.
13756	LOG_ALERT	A condition that should be corrected immediately.
13757	LOG_CRIT	A critical condition.
13758	LOG_ERR	An error message.
13759	LOG_WARNING	A warning message.
13760	LOG_NOTICE	A condition requiring special handling.
13761	LOG_INFO	A general information message.
13762	LOG_DEBUG	A message useful for debugging programs.
13763	The following shall be declared as functions and may also be defined as macros. Function	
13764	prototypes shall be provided.	
13765	void closelog(void);	
13766	void openlog(const char *, int, int);	
13767	int setlogmask(int);	
13768	void syslog(int, const char *, ...);

13783 **NAME**

13784 tar.h — extended tar definitions

13785 **SYNOPSIS**

13786 #include <tar.h>

13787 **DESCRIPTION**

13788 The <tar.h> header shall define the following symbolic constants with the indicated values.

13789 General definitions:

13790

13791

13792

13793

13794

Name	Value	Description
TMAGIC	"ustar"	ustar plus null byte.
TMAGLEN	6	Length of the above.
TVERSION	"00"	00 without a null byte.
TVERSLEN	2	Length of the above.

13795

Typeflag field definitions:

13796

13797

13798

13799

13800

13801

13802

13803

13804

13805

Name	Value	Description
REGTYPE	'0'	Regular file.
AREGTYPE	'\0'	Regular file.
LNKTYPE	'1'	Link.
SYMTYPE	'2'	Symbolic link.
CHRTYPE	'3'	Character special.
BLKTYPE	'4'	Block special.
DIRTYPE	'5'	Directory.
FIFOTYPE	'6'	FIFO special.
CONTTYPE	'7'	Reserved.

13806

Mode field bit definitions (octal):

13807

13808

13809

13810 XSI

13811

13812

13813

13814

13815

13816

13817

13818

13819

Name	Value	Description
TSUID	04000	Set UID on execution.
TSGID	02000	Set GID on execution.
TSVTX	01000	On directories, restricted deletion flag.
TUREAD	00400	Read by owner.
TUWRITE	00200	Write by owner special.
TUEXEC	00100	Execute/search by owner.
TGREAD	00040	Read by group.
TGWRITE	00020	Write by group.
TGEXEC	00010	Execute/search by group.
TOREAD	00004	Read by other.
TOWRITE	00002	Write by other.
TOEXEC	00001	Execute/search by other.

13832 **Issue 7**

13833 This reference page is clarified with respect to macros and symbolic constants.

13834 **NAME**

13835 termios.h — define values for termios

13836 **SYNOPSIS**

13837 #include <termios.h>

13838 **DESCRIPTION**

13839 The <termios.h> header shall contain the definitions used by the terminal I/O interfaces (see
 13840 [Chapter 11](#) (on page 199) for the structures and names defined).

13841 **The termios Structure**

13842 The <termios.h> header shall define the following data types through **typedef**:

13843 **cc_t** Used for terminal special characters.

13844 **speed_t** Used for terminal baud rates.

13845 **tcflag_t** Used for terminal modes.

13846 The above types shall be all unsigned integer types.

13847 The implementation shall support one or more programming environments in which the widths
 13848 of **cc_t**, **speed_t**, and **tcflag_t** are no greater than the width of type **long**. The names of these
 13849 programming environments can be obtained using the *confstr()* function or the *getconf* utility.

13850 The <termios.h> header shall define the **termios** structure, which shall include at least the
 13851 following members:

13852	tcflag_t	c_iflag	Input modes.
13853	tcflag_t	c_oflag	Output modes.
13854	tcflag_t	c_cflag	Control modes.
13855	tcflag_t	c_lflag	Local modes.
13856	cc_t	c_cc[NCCS]	Control characters.

13857 The <termios.h> header shall define the following symbolic constant:

13858 **NCCS** Size of the array **c_cc** for control characters.

13859 The <termios.h> header shall define the following symbolic constants for use as subscripts for
 13860 the array **c_cc**:

	Subscript Usage		Description
	Canonical Mode	Non-Canonical Mode	
13861	VEOF	VINTR	EOF character.
13862	VEOL		EOL character.
13863	VERASE		ERASE character.
13864	VINTR		INTR character.
13865	VKILL		KILL character.
13866		VMIN	MIN value.
13867	VQUIT	VQUIT	QUIT character.
13868	VSTART	VSTART	START character.
13869	VSTOP	VSTOP	STOP character.
13870	VSUSP	VSUSP	SUSP character.
13871		VTIME	TIME value.

13874 The subscript values shall be suitable for use in **#if** preprocessing directives and shall be distinct,
 13875 except that the VMIN and VTIME subscripts may have the same values as the VEOF and VEOL
 13876 subscripts, respectively.

13877 **Input Modes**

13878 The <termios.h> header shall define the following symbolic constants for use as flags in the
 13879 *c_iflag* field. The *c_iflag* field describes the basic terminal input control.

13880	BRKINT	Signal interrupt on break.
13881	ICRNL	Map CR to NL on input.
13882	IGNBRK	Ignore break condition.
13883	IGNCR	Ignore CR.
13884	IGNPAR	Ignore characters with parity errors.
13885	INLCR	Map NL to CR on input.
13886	INPCK	Enable input parity check.
13887	ISTRIP	Strip character.
13888	IXANY	Enable any character to restart output.
13889	IXOFF	Enable start/stop input control.
13890	IXON	Enable start/stop output control.
13891	PARMRK	Mark parity errors.

13892 **Output Modes**

13893 The <termios.h> header shall define the following symbolic constants for use as flags in the
 13894 *c_oflag* field. The *c_oflag* field specifies the system treatment of output.

13895	OPOST	Post-process output.
13896	XSI ONLCR	Map NL to CR-NL on output.
13897	XSI OCRNL	Map CR to NL on output.
13898	XSI ONOCR	No CR output at column 0.
13899	XSI ONLRET	NL performs CR function.
13900	XSI OFDEL	Fill is DEL.
13901	XSI OFILL	Use fill characters for delay.
13902	XSI NLDLY	Select newline delays:
13903		NL0 Newline type 0.
13904		NL1 Newline type 1.
13905	XSI CRDLY	Select carriage-return delays:
13906		CR0 Carriage-return delay type 0.
13907		CR1 Carriage-return delay type 1.
13908		CR2 Carriage-return delay type 2.
13909		CR3 Carriage-return delay type 3.

13910	XSI	TABDLY	Select horizontal-tab delays:
13911		TAB0	Horizontal-tab delay type 0.
13912		TAB1	Horizontal-tab delay type 1.
13913		TAB2	Horizontal-tab delay type 2.
13914		TAB3	Expand tabs to spaces.
13915	XSI	BSDLY	Select backspace delays:
13916		BS0	Backspace-delay type 0.
13917		BS1	Backspace-delay type 1.
13918	XSI	VTDLY	Select vertical-tab delays:
13919		VT0	Vertical-tab delay type 0.
13920		VT1	Vertical-tab delay type 1.
13921	XSI	FFDLY	Select form-feed delays:
13922		FF0	Form-feed delay type 0.
13923		FF1	Form-feed delay type 1.

13924 **Baud Rate Selection**

13925 The <termios.h> header shall define the following symbolic constants for use as values of
 13926 objects of type **speed_t**.

13927 The input and output baud rates are stored in the **termios** structure. These are the valid values
 13928 for objects of type **speed_t**. Not all baud rates need be supported by the underlying hardware.

13929	B0	Hang up
13930	B50	50 baud
13931	B75	75 baud
13932	B110	110 baud
13933	B134	134.5 baud
13934	B150	150 baud
13935	B200	200 baud
13936	B300	300 baud
13937	B600	600 baud
13938	B1200	1 200 baud
13939	B1800	1 800 baud
13940	B2400	2 400 baud

13941	B4800	4 800 baud
13942	B9600	9 600 baud
13943	B19200	19 200 baud
13944	B38400	38 400 baud

13945 **Control Modes**

13946 The <termios.h> header shall define the following symbolic constants for use as flags in the
 13947 *c_cflag* field. The *c_cflag* field describes the hardware control of the terminal; not all values
 13948 specified are required to be supported by the underlying hardware.

13949	CSIZE	Character size:
13950		CS5 5 bits
13951		CS6 6 bits
13952		CS7 7 bits
13953		CS8 8 bits
13954	CSTOPB	Send two stop bits, else one.
13955	CREAD	Enable receiver.
13956	PARENB	Parity enable.
13957	PARODD	Odd parity, else even.
13958	HUPCL	Hang up on last close.
13959	CLOCAL	Ignore modem status lines.

13960 The implementation shall support the functionality associated with the symbols CS7, CS8,
 13961 CSTOPB, PARODD, and PARENB.

13962 **Local Modes**

13963 The <termios.h> header shall define the following symbolic constants for use as flags in the
 13964 *c_lflag* field. The *c_lflag* field of the argument structure is used to control various terminal
 13965 functions.

13966	ECHO	Enable echo.
13967	ECHOE	Echo erase character as error-correcting backspace.
13968	ECHOK	Echo KILL.
13969	ECHONL	Echo NL.
13970	ICANON	Canonical input (erase and kill processing).
13971	IEXTEN	Enable extended input character processing.
13972	ISIG	Enable signals.
13973	NOFLSH	Disable flush after interrupt or quit.
13974	TOSTOP	Send SIGTTOU for background output.

Attribute Selection

The <termios.h> header shall define the following symbolic constants for use with *tcsetattr()*:

TCSANOW Change attributes immediately.
 TCSADRAIN Change attributes when output has drained.
 TCSAFLUSH Change attributes when output has drained; also flush pending input.

Line Control

The <termios.h> header shall define the following symbolic constants for use with *tcflush()*:

TCIFLUSH Flush pending input.
 TCIOFLUSH Flush both pending input and untransmitted output.
 TCOFLUSH Flush untransmitted output.

The <termios.h> header shall define the following symbolic constants for use with *tcflow()*:

TCIOFF Transmit a STOP character, intended to suspend input data.
 TCION Transmit a START character, intended to restart input data.
 TCOOFF Suspend output.
 TCOON Restart output.

The <termios.h> header shall define the **pid_t** type as described in <sys/types.h>.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
speed_t cfgetispeed(const struct termios *);
speed_t cfgetospeed(const struct termios *);
int      cfsetispeed(struct termios *, speed_t);
int      cfsetospeed(struct termios *, speed_t);
int      tcdrain(int);
int      tcflow(int, int);
int      tcflush(int, int);
int      tcgetattr(int, struct termios *);
pid_t    tcgetsid(int);
int      tcsendbreak(int, int);
int      tcsetattr(int, int, const struct termios *);
```

APPLICATION USAGE

The following names are reserved for XSI-conformant systems to use as an extension to the above; therefore strictly conforming applications shall not use them:

CBAUD	EXTB	VDSUSP
DEFECHO	FLUSHO	VLNEXT
ECHOCTL	LOBLK	VREPRINT
ECHOK	PENDIN	VSTATUS
ECHOPRT	SWTCH	VWERASE
EXTA	VDISCARD

14034	SD5-XBD-ERN-35 is applied, adding the OFDEL output mode.
14035	This reference page is clarified with respect to macros and symbolic constants, and a declaration
14036	for the pid_t type is added.

14037 **NAME**14038 `tgmath.h` — type-generic macros14039 **SYNOPSIS**14040 `#include <tgmath.h>`14041 **DESCRIPTION**

14042 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 14043 conflict between the requirements described here and the ISO C standard is unintentional. This
 14044 volume of POSIX.1-2008 defers to the ISO C standard.

14045 The **<tgmath.h>** header shall include the headers **<math.h>** and **<complex.h>** and shall define
 14046 several type-generic macros.

14047 Of the functions contained within the **<math.h>** and **<complex.h>** headers without an *f* (**float**)
 14048 or *l* (**long double**) suffix, several have one or more parameters whose corresponding real type is
 14049 XSI **double**. For each such function, except *modf()*, *j0()*, *j1()*, *jn()*, *y0()*, *y1()*, and *yn()*, there shall
 14050 be a corresponding type-generic macro. The parameters whose corresponding real type is
 14051 **double** in the function synopsis are generic parameters. Use of the macro invokes a function
 14052 whose corresponding real type and type domain are determined by the arguments for the
 14053 generic parameters.

14054 Use of the macro invokes a function whose generic parameters have the corresponding real type
 14055 determined as follows:

- 14056 • First, if any argument for generic parameters has type **long double**, the type determined is
 14057 **long double**.
- 14058 • Otherwise, if any argument for generic parameters has type **double** or is of integer type,
 14059 the type determined is **double**.
- 14060 • Otherwise, the type determined is **float**.

14061 For each unsuffixed function in the **<math.h>** header for which there is a function in the
 14062 **<complex.h>** header with the same name except for a *c* prefix, the corresponding type-generic
 14063 macro (for both functions) has the same name as the function in the **<math.h>** header. The
 14064 corresponding type-generic macro for *fabs()* and *cabs()* is *fabs()*.

<math.h> Function	<complex.h> Function	Type-Generic Macro
<i>acos()</i>	<i>cacos()</i>	<i>acos()</i>
<i>asin()</i>	<i>casin()</i>	<i>asin()</i>
<i>atan()</i>	<i>catan()</i>	<i>atan()</i>
<i>acosh()</i>	<i>cacosh()</i>	<i>acosh()</i>
<i>asinh()</i>	<i>casinh()</i>	<i>asinh()</i>
<i>atanh()</i>	<i>catanh()</i>	<i>atanh()</i>
<i>cos()</i>	<i>ccos()</i>	<i>cos()</i>
<i>sin()</i>	<i>csin()</i>	<i>sin()</i>
<i>tan()</i>	<i>ctan()</i>	<i>tan()</i>
<i>cosh()</i>	<i>ccosh()</i>	<i>cosh()</i>
<i>sinh()</i>	<i>csinh()</i>	<i>sinh()</i>
<i>tanh()</i>	<i>ctanh()</i>	<i>tanh()</i>
<i>exp()</i>	<i>cexp()</i>	<i>exp()</i>
<i>log()</i>	<i>clog()</i>	<i>log()</i>
<i>pow()</i>	<i>cpow()</i>	<i>pow()</i>
<i>sqrt()</i>	<i>csqrt()</i>	<i>sqrt()</i>
<i>fabs()</i>	<i>cabs()</i>	<i>fabs()</i>

If at least one argument for a generic parameter is complex, then use of the macro invokes a complex function; otherwise, use of the macro invokes a real function.

For each unsuffixed function in the **<math.h>** header without a *c*-prefixed counterpart in the **<complex.h>** header, except for *modf()*, *j0()*, *j1()*, *jn()*, *y0()*, *y1()*, and *yn()*, the corresponding type-generic macro has the same name as the function. These type-generic macros are:

<i>atan2()</i>	<i>fma()</i>	<i>llround()</i>	<i>remainder()</i>
<i>cbrt()</i>	<i>fmax()</i>	<i>log10()</i>	<i>remquo()</i>
<i>ceil()</i>	<i>fmin()</i>	<i>log1p()</i>	<i>rint()</i>
<i>copysign()</i>	<i>fmod()</i>	<i>log2()</i>	<i>round()</i>
<i>erf()</i>	<i>frexp()</i>	<i>logb()</i>	<i>scalbln()</i>
<i>erfc()</i>	<i>hypot()</i>	<i>lrint()</i>	<i>scalbn()</i>
<i>exp2()</i>	<i>ilogb()</i>	<i>lround()</i>	<i>tgamma()</i>
<i>expm1()</i>	<i>ldexp()</i>	<i>nearbyint()</i>	<i>trunc()</i>
<i>fdim()</i>	<i>lgamma()</i>	<i>nextafter()</i>	
<i>floor()</i>	<i>llrint()</i>	<i>nexttoward()</i>	

If all arguments for generic parameters are real, then use of the macro invokes a real function; otherwise, use of the macro results in undefined behavior.

For each unsuffixed function in the **<complex.h>** header that is not a *c*-prefixed counterpart to a function in the **<math.h>** header, the corresponding type-generic macro has the same name as the function. These type-generic macros are:

carg()
cimag()
conj()
cproj()
creal()

Use of the macro with any real or complex argument invokes a complex function.

APPLICATION USAGE

With the declarations:

```
#include <tgmath.h>
int n;
float f;
double d;
long double ld;
float complex fc;
double complex dc;
long double complex ldc;
```

functions invoked by use of type-generic macros are shown in the following table:

Macro	Use Invokes
<i>exp(n)</i>	<i>exp(n)</i> , the function
<i>acosh(f)</i>	<i>acoshf(f)</i>
<i>sin(d)</i>	<i>sin(d)</i> , the function
<i>atan(ld)</i>	<i>atanl(ld)</i>
<i>log(fc)</i>	<i>clogf(fc)</i>
<i>sqrt(dc)</i>	<i>csqrt(dc)</i>

Macro	Use Invokes
<i>pow(ldc,f)</i>	<i>cpowl(ldc,f)</i>
<i>remainder(n,n)</i>	<i>remainder(n,n)</i> , the function
<i>nextafter(d,f)</i>	<i>nextafter(d,f)</i> , the function
<i>nexttoward(f,ld)</i>	<i>nexttowardf(f,ld)</i>
<i>copysign(n,ld)</i>	<i>copysignl(n,ld)</i>
<i>ceil(fc)</i>	Undefined behavior
<i>rint(dc)</i>	Undefined behavior
<i>fmax(ldc,ld)</i>	Undefined behavior
<i>carg(n)</i>	<i>carg(n)</i> , the function
<i>cproj(f)</i>	<i>cprojf(f)</i>
<i>creal(d)</i>	<i>creal(d)</i> , the function
<i>cimag(ld)</i>	<i>cimagl(ld)</i>
<i>cabs(fc)</i>	<i>cabsf(fc)</i>
<i>carg(dc)</i>	<i>carg(dc)</i> , the function
<i>cproj(ldc)</i>	<i>cprojl(ldc)</i>

RATIONALE

Type-generic macros allow calling a function whose type is determined by the argument type, as is the case for C operators such as '+' and '*'. For example, with a type-generic *cos()* macro, the expression *cos((float)x)* will have type **float**. This feature enables writing more portably efficient code and alleviates need for awkward casting and suffixing in the process of porting or adjusting precision. Generic math functions are a widely appreciated feature of Fortran.

The only arguments that affect the type resolution are the arguments corresponding to the parameters that have type **double** in the synopsis. Hence the type of a type-generic call to *nexttoward()*, whose second parameter is **long double** in the synopsis, is determined solely by the type of the first argument.

The term “type-generic” was chosen over the proposed alternatives of intrinsic and overloading. The term is more specific than intrinsic, which already is widely used with a more general meaning, and reflects a closer match to Fortran’s generic functions than to C++ overloading.

The macros are placed in their own header in order not to silently break old programs that include the <math.h> header; for example, with:

```
printf ("%e", sin(x))
```

*modf(double, double *)* is excluded because no way was seen to make it safe without complicating the type resolution.

The implementation might, as an extension, endow appropriate ones of the macros that POSIX.1-2008 specifies only for real arguments with the ability to invoke the complex functions.

POSIX.1-2008 does not prescribe any particular implementation mechanism for generic macros. It could be implemented simply with built-in macros. The generic macro for *sqrt()*, for example, could be implemented with:

```
#undef sqrt
#define sqrt(x) __BUILTIN_GENERIC_sqrt(x)
```

Generic macros are designed for a useful level of consistency with C++ overloaded math functions.

The great majority of existing C programs are expected to be unaffected when the <tgmath.h> header is included instead of the <math.h> or <complex.h> headers. Generic macros are similar to the ISO/IEC 9899:1999 standard library masking macros, though the semantic types of return

14173 values differ.

14174 The ability to overload on integer as well as floating types would have been useful for some
 14175 functions; for example, *copysign()*. Overloading with different numbers of arguments would
 14176 have allowed reusing names; for example, *remainder()* for *remquo()*. However, these facilities
 14177 would have complicated the specification; and their natural consistent use, such as for a floating
 14178 *abs()* or a two-argument *atan()*, would have introduced further inconsistencies with the
 14179 ISO/IEC 9899:1999 standard for insufficient benefit.

14180 The ISO C standard in no way limits the implementation's options for efficiency, including
 14181 inlining library functions.

14182 **FUTURE DIRECTIONS**

14183 None.

14187 **CHANGE HISTORY**

14188 First released in Issue 6. Included for alignment with the ISO/IEC 9899:1999 standard.

14189 **Issue 7**

14190 Austin Group Interpretation 1003.1-2001 #184 is applied, clarifying the functions for which a
 14191 corresponding type-generic macro exists with the same name as the function.

14192 POSIX.1-2008, Technical Corrigendum 1, XBD/TC1-2008/0075 [357,427] is applied. +

14193 NAME

14194 time.h — time types

14195 SYNOPSIS

14196 #include <time.h>

14197 DESCRIPTION

14198 CX Some of the functionality described on this reference page extends the ISO C standard.
 14199 Applications shall define the appropriate feature test macro (see XSH [Section 2.2](#), on page 472) to
 14200 enable the visibility of these symbols in this header.

14201 The <time.h> header shall define the **clock_t**, **size_t**, **time_t**, types as described in
 14202 <sys/types.h>.

14203 CX The <time.h> header shall define the **clockid_t** and **timer_t** types as described in <sys/types.h>. -

14204 The <time.h> header shall define the **locale_t** type as described in <locale.h>. -

14205 CPT The <time.h> header shall define the **pid_t** type as described in <sys/types.h>.

14206 CX The tag **sigevent** shall be declared as naming an incomplete structure type, the contents of which
 14207 are described in the <signal.h> header.

14208 The <time.h> header shall declare the **tm** structure, which shall include at least the following
 14209 members:

14210	int	tm_sec	Seconds [0,60].
14211	int	tm_min	Minutes [0,59].
14212	int	tm_hour	Hour [0,23].
14213	int	tm_mday	Day of month [1,31].
14214	int	tm_mon	Month of year [0,11].
14215	int	tm_year	Years since 1900.
14216	int	tm_wday	Day of week [0,6] (Sunday =0).
14217	int	tm_yday	Day of year [0,365].
14218	int	tm_isdst	Daylight Savings flag.

14219 The value of *tm_isdst* shall be positive if Daylight Savings Time is in effect, 0 if Daylight Savings
 14220 Time is not in effect, and negative if the information is not available.

14221 CX The <time.h> header shall declare the **timespec** structure, which shall include at least the
 14222 following members:

14223	time_t	tv_sec	Seconds.
14224	long	tv_nsec	Nanoseconds.

14225 The <time.h> header shall also declare the **itimerspec** structure, which shall include at least the
 14226 following members:

14227	struct timespec	it_interval	Timer period.
14228	struct timespec	it_value	Timer expiration.

14229 The <time.h> header shall define the following macros:

14230 NULL As described in <stddef.h>.

14231 CLOCKS_PER_SEC A number used to convert the value returned by the *clock()* function into
 14232 XSI seconds. The value shall be an expression with type **clock_t**. The value of
 14233 CLOCKS_PER_SEC shall be 1 million on XSI-conformant systems.
 14234 However, it may be variable on other systems, and it should not be

14235		assumed that <code>CLOCKS_PER_SEC</code> is a compile-time constant.
14236	CX	The <time.h> header shall define the following symbolic constants. The values shall have a type
14237		that is assignment-compatible with <code>clockid_t</code> .
14238	MON	<code>CLOCK_MONOTONIC</code>
14239		The identifier for the system-wide monotonic clock, which is defined as a
14240		clock measuring real time, whose value cannot be set via <code>clock_settime()</code>
14241		and which cannot have negative clock jumps. The maximum possible
14242		clock jump shall be implementation-defined.
14243	CPT	<code>CLOCK_PROCESS_CPUTIME_ID</code>
14244		The identifier of the CPU-time clock associated with the process making a
14245		<code>clock()</code> or <code>timer*()</code> function call.
14246	CX	<code>CLOCK_REALTIME</code> The identifier of the system-wide clock measuring real time.
14247	TCT	<code>CLOCK_THREAD_CPUTIME_ID</code>
14248		The identifier of the CPU-time clock associated with the thread making a
14249		<code>clock()</code> or <code>timer*()</code> function call.
14250	CX	The <time.h> header shall define the following symbolic constant:
14251		<code>TIMER_ABSTIME</code> Flag indicating time is absolute. For functions taking timer objects, this
14252		refers to the clock associated with the timer.
14253	XSI	The <time.h> header shall provide a declaration or definition for <code>getdate_err</code> . The <code>getdate_err</code>
14254		symbol shall expand to an expression of type <code>int</code> . It is unspecified whether <code>getdate_err</code> is a macro
14255		or an identifier declared with external linkage, and whether or not it is a modifiable lvalue. If a
14256		macro definition is suppressed in order to access an actual object, or a program defines an
14257		identifier with the name <code>getdate_err</code> , the behavior is undefined.
14258		The following shall be declared as functions and may also be defined as macros. Function
14259		prototypes shall be provided.
14260	OB	<code>char *asctime(const struct tm *);</code>
14261	OB CX	<code>char *asctime_r(const struct tm *restrict, char *restrict);</code>
14262		<code>clock_t clock(void);</code>
14263	CPT	<code>int clock_getcpuclockid(pid_t, clockid_t *);</code>
14264	CX	<code>int clock_getres(clockid_t, struct timespec *);</code>
14265		<code>int clock_gettime(clockid_t, struct timespec *);</code>
14266		<code>int clock_nanosleep(clockid_t, int, const struct timespec *,</code>
14267		<code>struct timespec *);</code>
14268		<code>int clock_settime(clockid_t, const struct timespec *);</code>
14269	OB	<code>char *ctime(const time_t *);</code>
14270	OB CX	<code>char *ctime_r(const time_t *, char *);</code>
14271		<code>double difftime(time_t, time_t);</code>
14272	XSI	<code>struct tm *getdate(const char *);</code>
14273		<code>struct tm *gmtime(const time_t *);</code>
14274	CX	<code>struct tm *gmtime_r(const time_t *restrict, struct tm *restrict);</code>
14275		<code>struct tm *localtime(const time_t *);</code>
14276	CX	<code>struct tm *localtime_r(const time_t *restrict, struct tm *restrict);</code>
14277		<code>time_t mktime(struct tm *);</code>
14278	CX	<code>int nanosleep(const struct timespec *, struct timespec *);</code>
14279		<code>size_t strftime(char *restrict, size_t, const char *restrict,</code>
14280		<code>const struct tm *restrict);</code>

```

14281 CX      size_t      strftime_l(char *restrict, size_t, const char *restrict,
14282                const struct tm *restrict, locale_t);
14283 XSI      char        *strptime(const char *restrict, const char *restrict,
14284                struct tm *restrict);
14285          time_t      time(time_t *);
14286 CX      int          timer_create(clockid_t, struct sigevent *restrict,
14287                timer_t *restrict);
14288          int          timer_delete(timer_t);
14289          int          timer_getoverrun(timer_t);
14290          int          timer_gettime(timer_t, struct itimerspec *);
14291          int          timer_settime(timer_t, int, const struct itimerspec *restrict,
14292                struct itimerspec *restrict);
14293          void         tzset(void);

```

14294 The <time.h> header shall declare the following as variables:

```

14295 XSI      extern int     daylight;
14296          extern long    timezone;
14297 CX      extern char     *tzname[];

```

14298 CX Inclusion of the <time.h> header may make visible all symbols from the <signal.h> header.

14299 APPLICATION USAGE

14300 The range [0,60] for *tm_sec* allows for the occasional leap second.

14301 *tm_year* is a signed value; therefore, years before 1900 may be represented.

14302 To obtain the number of clock ticks per second returned by the *times()* function, applications
14303 should call *sysconf(_SC_CLK_TCK)*.

14304 RATIONALE

14305 The range [0,60] seconds allows for positive or negative leap seconds. The formal definition of
14306 UTC does not permit double leap seconds, so all mention of double leap seconds has been
14307 removed, and the range shortened from the former [0,61] seconds seen in earlier versions of this
14308 standard.

14309 FUTURE DIRECTIONS

14310 None.

14318 CHANGE HISTORY

14319 First released in Issue 1. Derived from Issue 1 of the SVID.

14320 Issue 5

14321 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX
14322 Threads Extension.

Issue 6

The Open Group Corrigendum U035/6 is applied. In the DESCRIPTION, the types **clockid_t** and **timer_t** have been described.

The following changes are made for alignment with the ISO POSIX-1: 1996 standard:

- The POSIX timer-related functions are marked as part of the Timers option.

The symbolic name CLK_TCK is removed. Application usage is added describing how its equivalent functionality can be obtained using *sysconf()*.

The *clock_getcpuclockid()* function and manifest constants CLOCK_PROCESS_CPUTIME_ID and CLOCK_THREAD_CPUTIME_ID are added for alignment with IEEE Std 1003.1d-1999.

The manifest constant CLOCK_MONOTONIC and the *clock_nanosleep()* function are added for alignment with IEEE Std 1003.1j-2000.

The following changes are made for alignment with the ISO/IEC 9899: 1999 standard:

- The range for seconds is changed from [0,61] to [0,60].
- The **restrict** keyword is added to the prototypes for *asctime_r()*, *gmtime_r()*, *localtime_r()*, *strftime()*, *strptime()*, *timer_create()*, and *timer_settime()*.

IEEE PASC Interpretation 1003.1 #84 is applied adding the statement that symbols from the <signal.h> header may be made visible when the <time.h> header is included.

Extensions beyond the ISO C standard are marked.

Issue 7

Austin Group Interpretation 1003.1-2001 #111 is applied.

SD5-XBD-ERN-74 is applied.

The *strptime_l()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

Functionality relating to the Timers option is moved to the Base.

This reference page is clarified with respect to macros and symbolic constants, and declarations for the **locale_t** and **pid_t** types and the **sigevent** structure are added.

The description of the *getdate_err* value is expanded.

POSIX.1-2008, Technical Corrigendum 1, XBD/TC1-2008/0076 [212] and XBD/TC1-2008/0077 + [212] are applied.

14352 **NAME**

14353 trace.h — tracing

14354 **SYNOPSIS**

14355 OB TRC #include <trace.h>

14356 **DESCRIPTION**

14357 The <trace.h> header shall define the **posix_trace_event_info** structure, which shall include at
 14358 least the following members:

```

14359       trace_event_id_t   posix_event_id
14360       pid_t              posix_pid
14361       void               *posix_prog_address
14362       pthread_t          posix_thread_id
14363       struct timespec    posix_timestamp
14364       int                posix_truncation_status

```

14365 The <trace.h> header shall define the **posix_trace_status_info** structure, which shall include at
 14366 least the following members:

```

14367       int        posix_stream_full_status
14368       int        posix_stream_overrun_status
14369       int        posix_stream_status
14370 OB TRL   int        posix_log_full_status
14371       int        posix_log_overrun_status
14372       int        posix_stream_flush_error
14373       int        posix_stream_flush_status

```

14374 The <trace.h> header shall define the following symbolic constants:

```

14375       POSIX_TRACE_ALL_EVENTS
14376 OB TRL   POSIX_TRACE_APPEND
14377 OB TRI   POSIX_TRACE_CLOSE_FOR_CHILD
14378 OB TEF   POSIX_TRACE_FILTER
14379 OB TRL   POSIX_TRACE_FLUSH
14380       POSIX_TRACE_FLUSH_START
14381       POSIX_TRACE_FLUSH_STOP
14382       POSIX_TRACE_FLUSHING
14383       POSIX_TRACE_FULL
14384       POSIX_TRACE_LOOP
14385       POSIX_TRACE_NO_OVERRUN
14386 OB TRL   POSIX_TRACE_NOT_FLUSHING
14387       POSIX_TRACE_NOT_FULL
14388 OB TRI   POSIX_TRACE_INHERITED
14389       POSIX_TRACE_NOT_TRUNCATED
14390       POSIX_TRACE_OVERFLOW
14391       POSIX_TRACE_OVERRUN
14392       POSIX_TRACE_RESUME
14393       POSIX_TRACE_RUNNING
14394       POSIX_TRACE_START
14395       POSIX_TRACE_STOP
14396       POSIX_TRACE_SUSPENDED
14397       POSIX_TRACE_SYSTEM_EVENTS
14398       POSIX_TRACE_TRUNCATED_READ

```

```

14399     POSIX_TRACE_TRUNCATED_RECORD
14400     POSIX_TRACE_UNNAMED_USER_EVENT
14401     POSIX_TRACE_UNTIL_FULL
14402     POSIX_TRACE_WOPID_EVENTS

14403 OB TEF The <trace.h> header shall define the size_t, trace_attr_t, trace_event_id_t, trace_event_set_t,
14404 and trace_id_t types as described in <sys/types.h>.

14405 The following shall be declared as functions and may also be defined as macros. Function
14406 prototypes shall be provided.

14407     int  posix_trace_attr_destroy(trace_attr_t *);
14408     int  posix_trace_attr_getclockres(const trace_attr_t *,
14409         struct timespec *);

14495 **CHANGE HISTORY**

14496 First released in Issue 6. Derived from IEEE Std 1003.1q-2000.

14497 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/40 is applied, adding the TRL margin
14498 code to the *posix_trace_flush()* function, for alignment with the System Interfaces volume of
14499 POSIX.1-2008.

14500 **Issue 7**

14501 SD5-XBD-ERN-56 is applied, adding a reference to <sys/types.h> for the **size_t** type.

14502 The <trace.h> header is marked obsolescent.

14503 This reference page is clarified with respect to macros and symbolic constants.

14504 NAME

14505 ulimit.h — ulimit commands

14506 SYNOPSIS

14507 OB XSI #include <ulimit.h>

14508 DESCRIPTION

14509 The **<ulimit.h>** header shall define the symbolic constants used by the *ulimit()* function.

14510 Symbolic constants:

14511 UL_GETFSIZE Get maximum file size.

14512 UL_SETFSIZE Set maximum file size.

14513 The following shall be declared as a function and may also be defined as a macro. A function
14514 prototype shall be provided.

14515 long ulimit(int, ...);

14516 APPLICATION USAGE

14517 See *ulimit()*.

14518 RATIONALE

14524 CHANGE HISTORY

14525 First released in Issue 3.

14526 Issue 7

14527 The **<ulimit.h>** header is marked obsolescent.

14528 **NAME**

14529 unistd.h — standard symbolic constants and types

14530 **SYNOPSIS**

14531 #include <unistd.h>

14532 **DESCRIPTION**

14533 The <unistd.h> header defines miscellaneous symbolic constants and types, and declares
14534 miscellaneous functions. The actual values of the constants are unspecified except as shown. The
14535 contents of this header are shown below.

14536 **Version Test Macros**

14537 The <unistd.h> header shall define the following symbolic constants. The values shall be
14538 suitable for use in #if preprocessing directives.

14539 _POSIX_VERSION

14540 Integer value indicating version of this standard (C-language binding) to which the
14541 implementation conforms. For implementations conforming to POSIX.1-2008, the value
14542 shall be 200809L.

14543 _POSIX2_VERSION

14544 Integer value indicating version of the Shell and Utilities volume of POSIX.1 to which the
14545 implementation conforms. For implementations conforming to POSIX.1-2008, the value
14546 shall be 200809L. For profile implementations that define _POSIX_SUBPROFILE (see
14547 Section 2.1.5.1) in <unistd.h>, POSIX2_VERSION may be left undefined or be defined with
14548 the value -1 to indicate that the Shell and Utilities volume of POSIX.1 is not supported. In
14549 this case, a call to sysconf(_SC_2_VERSION) shall return either 200809L or -1 indicating that
14550 the Shell and Utilities volume of POSIX.1 is or is not, respectively, supported at runtime.

14551 The <unistd.h> header shall define the following symbolic constant only if the implementation
14552 supports the XSI option; see Section 2.1.4 (on page 19). If defined, its value shall be suitable for
14553 use in #if preprocessing directives.

14554 XSI _XOPEN_VERSION

14555 Integer value indicating version of the X/Open Portability Guide to which the
14556 implementation conforms. The value shall be 700.

14557 **Constants for Options and Option Groups**

14558 The following symbolic constants, if defined in <unistd.h>, shall have a value of -1, 0, or
14559 greater, unless otherwise specified below. For profile implementations that define
14560 _POSIX_SUBPROFILE (see Section 2.1.5.1) in <unistd.h>, constants described below as always
14561 having a value greater than zero need not be defined and, if defined, may have a value of -1, 0,
14562 or greater. The values shall be suitable for use in #if preprocessing directives.

14563 If a symbolic constant is not defined or is defined with the value -1, the option is not supported
14564 for compilation. If it is defined with a value greater than zero, the option shall always be
14565 supported when the application is executed. If it is defined with the value zero, the option shall
14566 be supported for compilation and might or might not be supported at runtime. See Section 2.1.6
14567 (on page 26) for further information about the conformance requirements of these three
14568 categories of support.

14569 ADV _POSIX_ADVISORY_INFO

14570 The implementation supports the Advisory Information option. If this symbol is defined in
14571 <unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this symbol reported by
14572 sysconf() shall either be -1 or 200809L.

14573		_POSIX_ASYNCHRONOUS_IO
14574		The implementation supports asynchronous input and output. This symbol shall always be
14575		set to the value 200809L.
14576		_POSIX_BARRIERS
14577		The implementation supports barriers. This symbol shall always be set to the value
14578		200809L.
14579		_POSIX_CHOWN_RESTRICTED
14580		The use of <i>chown()</i> and <i>fchown()</i> is restricted to a process with appropriate privileges, and
14581		to changing the group ID of a file only to the effective group ID of the process or to one of
14582		its supplementary group IDs. This symbol shall be defined with a value other than -1.
14583		_POSIX_CLOCK_SELECTION
14584		The implementation supports clock selection. This symbol shall always be set to the value
14585		200809L.
14586	CPT	_POSIX_CPUTIME
14587		The implementation supports the Process CPU-Time Clocks option. If this symbol is
14588		defined in <unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this symbol
14589		reported by <i>sysconf()</i> shall either be -1 or 200809L.
14590	FSC	_POSIX_FSYNC
14591		The implementation supports the File Synchronization option. If this symbol is defined in
14592		<unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this symbol reported by
14593		<i>sysconf()</i> shall either be -1 or 200809L.
14594		_POSIX_IPV6
14595		The implementation supports the IPv6 option. If this symbol is defined in <unistd.h>, it
14596		shall be defined to be -1, 0, or 200809L. The value of this symbol reported by <i>sysconf()</i> shall
14597		either be -1 or 200809L.
14598		_POSIX_JOB_CONTROL
14599		The implementation supports job control. This symbol shall always be set to a value greater
14600		than zero.
14601		_POSIX_MAPPED_FILES
14602		The implementation supports memory mapped Files. This symbol shall always be set to the
14603		value 200809L.
14604	ML	_POSIX_MEMLOCK
14605		The implementation supports the Process Memory Locking option. If this symbol is defined
14606		in <unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this symbol reported
14607		by <i>sysconf()</i> shall either be -1 or 200809L.
14608	MLR	_POSIX_MEMLOCK_RANGE
14609		The implementation supports the Range Memory Locking option. If this symbol is defined
14610		in <unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this symbol reported
14611		by <i>sysconf()</i> shall either be -1 or 200809L.
14612		_POSIX_MEMORY_PROTECTION
14613		The implementation supports memory protection. This symbol shall always be set to the
14614		value 200809L.
14615	MSG	_POSIX_MESSAGE_PASSING
14616		The implementation supports the Message Passing option. If this symbol is defined in
14617		<unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this symbol reported by
14618		<i>sysconf()</i> shall either be -1 or 200809L.

14619	MON	_POSIX_MONOTONIC_CLOCK
14620		The implementation supports the Monotonic Clock option. If this symbol is defined in
14621		<unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this symbol reported by
14622		<i>sysconf()</i> shall either be -1 or 200809L.
14623		_POSIX_NO_TRUNC
14624		Pathname components longer than {NAME_MAX} generate an error. This symbol shall be
14625		defined with a value other than -1.
14626	PIO	_POSIX_PRIORITIZED_IO
14627		The implementation supports the Prioritized Input and Output option. If this symbol is
14628		defined in <unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this symbol
14629		reported by <i>sysconf()</i> shall either be -1 or 200809L.
14630	PS	_POSIX_PRIORITY_SCHEDULING
14631		The implementation supports the Process Scheduling option. If this symbol is defined in
14632		<unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this symbol reported by
14633		<i>sysconf()</i> shall either be -1 or 200809L.
14634	RS	_POSIX_RAW_SOCKETS
14635		The implementation supports the Raw Sockets option. If this symbol is defined in
14636		<unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this symbol reported by
14637		<i>sysconf()</i> shall either be -1 or 200809L.
14638		_POSIX_READER_WRITER_LOCKS
14639		The implementation supports read-write locks. This symbol shall always be set to the value
14640		200809L.
14641		_POSIX_REALTIME_SIGNALS
14642		The implementation supports realtime signals. This symbol shall always be set to the value
14643		200809L.
14644		_POSIX_REGEX
14645		The implementation supports the Regular Expression Handling option. This symbol shall
14646		always be set to a value greater than zero.
14647		_POSIX_SAVED_IDS
14648		Each process has a saved set-user-ID and a saved set-group-ID. This symbol shall always be
14649		set to a value greater than zero.
14650		_POSIX_SEMAPHORES
14651		The implementation supports semaphores. This symbol shall always be set to the value
14652		200809L.
14653	SHM	_POSIX_SHARED_MEMORY_OBJECTS
14654		The implementation supports the Shared Memory Objects option. If this symbol is defined
14655		in <unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this symbol reported
14656		by <i>sysconf()</i> shall either be -1 or 200809L.
14657		_POSIX_SHELL
14658		The implementation supports the POSIX shell. This symbol shall always be set to a value
14659		greater than zero.
14660	SPN	_POSIX_SPAWN
14661		The implementation supports the Spawn option. If this symbol is defined in <unistd.h>, it
14662		shall be defined to be -1, 0, or 200809L. The value of this symbol reported by <i>sysconf()</i> shall
14663		either be -1 or 200809L.

14664		_POSIX_SPIN_LOCKS
14665		The implementation supports spin locks. This symbol shall always be set to the value
14666		200809L.
14667	SS	_POSIX_SPORADIC_SERVER
14668		The implementation supports the Process Sporadic Server option. If this symbol is defined
14669		in <unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this symbol reported
14670		by <i>sysconf()</i> shall either be -1 or 200809L.
14671	SIO	_POSIX_SYNCHRONIZED_IO
14672		The implementation supports the Synchronized Input and Output option. If this symbol is
14673		defined in <unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this symbol
14674		reported by <i>sysconf()</i> shall either be -1 or 200809L.
14675	TSA	_POSIX_THREAD_ATTR_STACKADDR
14676		The implementation supports the Thread Stack Address Attribute option. If this symbol is
14677		defined in <unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this symbol
14678		reported by <i>sysconf()</i> shall either be -1 or 200809L.
14679	TSS	_POSIX_THREAD_ATTR_STACKSIZE
14680		The implementation supports the Thread Stack Size Attribute option. If this symbol is
14681		defined in <unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this symbol
14682		reported by <i>sysconf()</i> shall either be -1 or 200809L.
14683	TCT	_POSIX_THREAD_CPU_TIME
14684		The implementation supports the Thread CPU-Time Clocks option. If this symbol is
14685		defined in <unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this symbol
14686		reported by <i>sysconf()</i> shall either be -1 or 200809L.
14687	TPI	_POSIX_THREAD_PRIO_INHERIT
14688		The implementation supports the Non-Robust Mutex Priority Inheritance option. If this
14689		symbol is defined in <unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this
14690		symbol reported by <i>sysconf()</i> shall either be -1 or 200809L.
14691	TPP	_POSIX_THREAD_PRIO_PROTECT
14692		The implementation supports the Non-Robust Mutex Priority Protection option. If this
14693		symbol is defined in <unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this
14694		symbol reported by <i>sysconf()</i> shall either be -1 or 200809L.
14695	TPS	_POSIX_THREAD_PRIORITY_SCHEDULING
14696		The implementation supports the Thread Execution Scheduling option. If this symbol is
14697		defined in <unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this symbol
14698		reported by <i>sysconf()</i> shall either be -1 or 200809L.
14699	TSH	_POSIX_THREAD_PROCESS_SHARED
14700		The implementation supports the Thread Process-Shared Synchronization option. If this
14701		symbol is defined in <unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this
14702		symbol reported by <i>sysconf()</i> shall either be -1 or 200809L.
14703	RPI	_POSIX_THREAD_ROBUST_PRIO_INHERIT
14704		The implementation supports the Robust Mutex Priority Inheritance option. If this symbol
14705		is defined in <unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this symbol
14706		reported by <i>sysconf()</i> shall either be -1 or 200809L.
14707	RPP	_POSIX_THREAD_ROBUST_PRIO_PROTECT
14708		The implementation supports the Robust Mutex Priority Protection option. If this symbol is
14709		defined in <unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this symbol

14710		reported by <i>sysconf()</i> shall either be <code>-1</code> or <code>200809L</code> .
14711		<code>_POSIX_THREAD_SAFE_FUNCTIONS</code>
14712		The implementation supports thread-safe functions. This symbol shall always be set to the
14713		value <code>200809L</code> .
14714	TSP	<code>_POSIX_THREAD_SPORADIC_SERVER</code>
14715		The implementation supports the Thread Sporadic Server option. If this symbol is defined
14716		in <code><unistd.h></code> , it shall be defined to be <code>-1</code> , <code>0</code> , or <code>200809L</code> . The value of this symbol reported
14717		by <i>sysconf()</i> shall either be <code>-1</code> or <code>200809L</code> .
14718		<code>_POSIX_THREADS</code>
14719		The implementation supports threads. This symbol shall always be set to the value
14720		<code>200809L</code> .
14721		<code>_POSIX_TIMEOUTS</code>
14722		The implementation supports timeouts. This symbol shall always be set to the value
14723		<code>200809L</code> .
14724		<code>_POSIX_TIMERS</code>
14725		The implementation supports timers. This symbol shall always be set to the value <code>200809L</code> .
14726	OB TRC	<code>_POSIX_TRACE</code>
14727		The implementation supports the Trace option. If this symbol is defined in <code><unistd.h></code> , it
14728		shall be defined to be <code>-1</code> , <code>0</code> , or <code>200809L</code> . The value of this symbol reported by <i>sysconf()</i> shall
14729		either be <code>-1</code> or <code>200809L</code> .
14730	OB TEF	<code>_POSIX_TRACE_EVENT_FILTER</code>
14731		The implementation supports the Trace Event Filter option. If this symbol is defined in
14732		<code><unistd.h></code> , it shall be defined to be <code>-1</code> , <code>0</code> , or <code>200809L</code> . The value of this symbol reported by
14733		<i>sysconf()</i> shall either be <code>-1</code> or <code>200809L</code> .
14734	OB TRI	<code>_POSIX_TRACE_INHERIT</code>
14735		The implementation supports the Trace Inherit option. If this symbol is defined in
14736		<code><unistd.h></code> , it shall be defined to be <code>-1</code> , <code>0</code> , or <code>200809L</code> . The value of this symbol reported by
14737		<i>sysconf()</i> shall either be <code>-1</code> or <code>200809L</code> .
14738	OB TRL	<code>_POSIX_TRACE_LOG</code>
14739		The implementation supports the Trace Log option. If this symbol is defined in <code><unistd.h></code> ,
14740		it shall be defined to be <code>-1</code> , <code>0</code> , or <code>200809L</code> . The value of this symbol reported by <i>sysconf()</i>
14741		shall either be <code>-1</code> or <code>200809L</code> .
14742	TYM	<code>_POSIX_TYPED_MEMORY_OBJECTS</code>
14743		The implementation supports the Typed Memory Objects option. If this symbol is defined
14744		in <code><unistd.h></code> , it shall be defined to be <code>-1</code> , <code>0</code> , or <code>200809L</code> . The value of this symbol reported
14745		by <i>sysconf()</i> shall either be <code>-1</code> or <code>200809L</code> .
14746	OB	<code>_POSIX_V6_ILP32_OFF32</code>
14747		The implementation provides a C-language compilation environment with 32-bit int , long ,
14748		pointer , and off_t types.
14749	OB	<code>_POSIX_V6_ILP32_OFFBIG</code>
14750		The implementation provides a C-language compilation environment with 32-bit int , long ,
14751		and pointer types and an off_t type using at least 64 bits.
14752	OB	<code>_POSIX_V6_LP64_OFF64</code>
14753		The implementation provides a C-language compilation environment with 32-bit int and
14754		64-bit long , pointer , and off_t types.

14755	OB	_POSIX_V6_LPBIG_OFFBIG
14756		The implementation provides a C-language compilation environment with an int type
14757		using at least 32 bits and long , pointer , and off_t types using at least 64 bits.
14758		_POSIX_V7_ILP32_OFF32
14759		The implementation provides a C-language compilation environment with 32-bit int , long ,
14760		pointer , and off_t types.
14761		_POSIX_V7_ILP32_OFFBIG
14762		The implementation provides a C-language compilation environment with 32-bit int , long ,
14763		and pointer types and an off_t type using at least 64 bits.
14764		_POSIX_V7_LP64_OFF64
14765		The implementation provides a C-language compilation environment with 32-bit int and
14766		64-bit long , pointer , and off_t types.
14767		_POSIX_V7_LPBIG_OFFBIG
14768		The implementation provides a C-language compilation environment with an int type
14769		using at least 32 bits and long , pointer , and off_t types using at least 64 bits.
14770		_POSIX2_C_BIND
14771		The implementation supports the C-Language Binding option. This symbol shall always
14772		have the value 200809L.
14773	CD	_POSIX2_C_DEV
14774		The implementation supports the C-Language Development Utilities option. If this symbol
14775		is defined in <unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this symbol
14776		reported by <i>sysconf()</i> shall either be -1 or 200809L.
14777		_POSIX2_CHAR_TERM
14778		The implementation supports the Terminal Characteristics option. The value of this symbol
14779		reported by <i>sysconf()</i> shall either be -1 or a value greater than zero.
14780	FD	_POSIX2_FORT_DEV
14781		The implementation supports the FORTRAN Development Utilities option. If this symbol
14782		is defined in <unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this symbol
14783		reported by <i>sysconf()</i> shall either be -1 or 200809L.
14784	FR	_POSIX2_FORT_RUN
14785		The implementation supports the FORTRAN Runtime Utilities option. If this symbol is
14786		defined in <unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this symbol
14787		reported by <i>sysconf()</i> shall either be -1 or 200809L.
14788		_POSIX2_LOCALEDEF
14789		The implementation supports the creation of locales by the <i>localedef</i> utility. If this symbol is
14790		defined in <unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this symbol
14791		reported by <i>sysconf()</i> shall either be -1 or 200809L.
14792	OB BE	_POSIX2_PBS
14793		The implementation supports the Batch Environment Services and Utilities option. If this
14794		symbol is defined in <unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this
14795		symbol reported by <i>sysconf()</i> shall either be -1 or 200809L.
14796	OB BE	_POSIX2_PBS_ACCOUNTING
14797		The implementation supports the Batch Accounting option. If this symbol is defined in
14798		<unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this symbol reported by
14799		<i>sysconf()</i> shall either be -1 or 200809L.

14800	OB BE	_POSIX2_PBS_CHECKPOINT	
14801			The implementation supports the Batch Checkpoint/Restart option. If this symbol is
14802			defined in <unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this symbol
14803			reported by <i>sysconf()</i> shall either be -1 or 200809L.
14804	OB BE	_POSIX2_PBS_LOCATE	
14805			The implementation supports the Locate Batch Job Request option. If this symbol is defined
14806			in <unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this symbol reported
14807			by <i>sysconf()</i> shall either be -1 or 200809L.
14808	OB BE	_POSIX2_PBS_MESSAGE	
14809			The implementation supports the Batch Job Message Request option. If this symbol is
14810			defined in <unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this symbol
14811			reported by <i>sysconf()</i> shall either be -1 or 200809L.
14812	OB BE	_POSIX2_PBS_TRACK	
14813			The implementation supports the Track Batch Job Request option. If this symbol is defined
14814			in <unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this symbol reported
14815			by <i>sysconf()</i> shall either be -1 or 200809L.
14816	SD	_POSIX2_SW_DEV	
14817			The implementation supports the Software Development Utilities option. If this symbol is
14818			defined in <unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this symbol
14819			reported by <i>sysconf()</i> shall either be -1 or 200809L.
14820	UP	_POSIX2_UPE	
14821			The implementation supports the User Portability Utilities option. If this symbol is defined
14822			in <unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this symbol reported
14823			by <i>sysconf()</i> shall either be -1 or 200809L.
14824	XSI	_XOPEN_CRYPT	
14825			The implementation supports the X/Open Encryption Option Group.
14826		_XOPEN_ENH_I18N	
14827			The implementation supports the Issue 4, Version 2 Enhanced Internationalization Option
14828			Group. This symbol shall always be set to a value other than -1.
14829		_XOPEN_REALTIME	
14830			The implementation supports the X/Open Realtime Option Group.
14831		_XOPEN_REALTIME_THREADS	
14832			The implementation supports the X/Open Realtime Threads Option Group.
14833		_XOPEN_SHM	
14834			The implementation supports the Issue 4, Version 2 Shared Memory Option Group. This
14835			symbol shall always be set to a value other than -1.
14836	OB XSR	_XOPEN_STREAMS	
14837			The implementation supports the XSI STREAMS Option Group.
14838	XSI	_XOPEN_UNIX	
14839			The implementation supports the XSI option.
14840	UU	_XOPEN_UUCP	
14841			The implementation supports the UUCP Utilities option. If this symbol is defined in
14842			<unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this symbol reported by
14843			<i>sysconf()</i> shall be either -1 or 200809L.

Execution-Time Symbolic Constants

If any of the following symbolic constants are not defined in the **<unistd.h>** header, the value shall vary depending on the file to which it is applied. If defined, they shall have values suitable for use in **#if** preprocessing directives.

If any of the following symbolic constants are defined to have value **-1** in the **<unistd.h>** header, the implementation shall not provide the option on any file; if any are defined to have a value other than **-1** in the **<unistd.h>** header, the implementation shall provide the option on all applicable files.

All of the following values, whether defined as symbolic constants in **<unistd.h>** or not, may be queried with respect to a specific file using the *pathconf()* or *fpathconf()* functions:

_POSIX_ASYNC_IO

Asynchronous input or output operations may be performed for the associated file.

_POSIX_PRIO_IO

Prioritized input or output operations may be performed for the associated file.

_POSIX_SYNC_IO

Synchronized input or output operations may be performed for the associated file.

If the following symbolic constants are defined in the **<unistd.h>** header, they apply to files and all paths in all file systems on the implementation:

_POSIX_TIMESTAMP_RESOLUTION

The resolution in nanoseconds for all file timestamps.

_POSIX2_SYMLINKS

Symbolic links can be created.

Constants for Functions

The **<unistd.h>** header shall define **NULL** as described in **<stddef.h>**.

The **<unistd.h>** header shall define the following symbolic constants for use with the *access()* function. The values shall be suitable for use in **#if** preprocessing directives.

F_OK Test for existence of file.

R_OK Test for read permission.

W_OK Test for write permission.

X_OK Test for execute (search) permission.

The constants **F_OK**, **R_OK**, **W_OK**, and **X_OK** and the expressions **R_OK | W_OK**, **R_OK | X_OK**, and **R_OK | W_OK | X_OK** shall all have distinct values.

The **<unistd.h>** header shall define the following symbolic constants for the *confstr()* function:

_CS_PATH

This is the value for the *PATH* environment variable that finds all standard utilities.

_CS_POSIX_V7_ILP32_OFF32_CFLAGS

If *sysconf(SC_V7_ILP32_OFF32)* returns **-1**, the meaning of this value is unspecified. Otherwise, this value is the set of initial options to be given to the *c99* utility to build an application using a programming model with 32-bit **int**, **long**, **pointer**, and **off_t** types.

14883 `_CS_POSIX_V7_ILP32_OFF32_LDFLAGS`
 14884 If `sysconf(_SC_V7_ILP32_OFF32)` returns `-1`, the meaning of this value is unspecified.
 14885 Otherwise, this value is the set of final options to be given to the `c99` utility to build an
 14886 application using a programming model with 32-bit **int**, **long**, **pointer**, and **off_t** types.

14887 `_CS_POSIX_V7_ILP32_OFF32_LIBS`
 14888 If `sysconf(_SC_V7_ILP32_OFF32)` returns `-1`, the meaning of this value is unspecified.
 14889 Otherwise, this value is the set of libraries to be given to the `c99` utility to build an
 14890 application using a programming model with 32-bit **int**, **long**, **pointer**, and **off_t** types.

14891 `_CS_POSIX_V7_ILP32_OFFBIG_CFLAGS`
 14892 If `sysconf(_SC_V7_ILP32_OFFBIG)` returns `-1`, the meaning of this value is unspecified.
 14893 Otherwise, this value is the set of initial options to be given to the `c99` utility to build an
 14894 application using a programming model with 32-bit **int**, **long**, and **pointer** types, and an
 14895 **off_t** type using at least 64 bits.

14896 `_CS_POSIX_V7_ILP32_OFFBIG_LDFLAGS`
 14897 If `sysconf(_SC_V7_ILP32_OFFBIG)` returns `-1`, the meaning of this value is unspecified.
 14898 Otherwise, this value is the set of final options to be given to the `c99` utility to build an
 14899 application using a programming model with 32-bit **int**, **long**, and **pointer** types, and an
 14900 **off_t** type using at least 64 bits.

14901 `_CS_POSIX_V7_ILP32_OFFBIG_LIBS`
 14902 If `sysconf(_SC_V7_ILP32_OFFBIG)` returns `-1`, the meaning of this value is unspecified.
 14903 Otherwise, this value is the set of libraries to be given to the `c99` utility to build an
 14904 application using a programming model with 32-bit **int**, **long**, and **pointer** types, and an
 14905 **off_t** type using at least 64 bits.

14906 `_CS_POSIX_V7_LP64_OFF64_CFLAGS`
 14907 If `sysconf(_SC_V7_LP64_OFF64)` returns `-1`, the meaning of this value is unspecified.
 14908 Otherwise, this value is the set of initial options to be given to the `c99` utility to build an
 14909 application using a programming model with 32-bit **int** and 64-bit **long**, **pointer**, and **off_t**
 14910 types.

14911 `_CS_POSIX_V7_LP64_OFF64_LDFLAGS`
 14912 If `sysconf(_SC_V7_LP64_OFF64)` returns `-1`, the meaning of this value is unspecified.
 14913 Otherwise, this value is the set of final options to be given to the `c99` utility to build an
 14914 application using a programming model with 32-bit **int** and 64-bit **long**, **pointer**, and **off_t**
 14915 types.

14916 `_CS_POSIX_V7_LP64_OFF64_LIBS`
 14917 If `sysconf(_SC_V7_LP64_OFF64)` returns `-1`, the meaning of this value is unspecified.
 14918 Otherwise, this value is the set of libraries to be given to the `c99` utility to build an
 14919 application using a programming model with 32-bit **int** and 64-bit **long**, **pointer**, and **off_t**
 14920 types.

14921 `_CS_POSIX_V7_LPBIG_OFFBIG_CFLAGS`
 14922 If `sysconf(_SC_V7_LPBIG_OFFBIG)` returns `-1`, the meaning of this value is unspecified.
 14923 Otherwise, this value is the set of initial options to be given to the `c99` utility to build an
 14924 application using a programming model with an **int** type using at least 32 bits and **long**,
 14925 **pointer**, and **off_t** types using at least 64 bits.

14926 `_CS_POSIX_V7_LPBIG_OFFBIG_LDFLAGS`
 14927 If `sysconf(_SC_V7_LPBIG_OFFBIG)` returns `-1`, the meaning of this value is unspecified.
 14928 Otherwise, this value is the set of final options to be given to the `c99` utility to build an
 14929 application using a programming model with an **int** type using at least 32 bits and **long**,

14930 **pointer**, and **off_t** types using at least 64 bits.

14931 **_CS_POSIX_V7_LPBIG_OFFBIG_LIBS**

14932 If *sysconf*(*_SC_V7_LPBIG_OFFBIG*) returns -1, the meaning of this value is unspecified.

14933 Otherwise, this value is the set of libraries to be given to the *c99* utility to build an

14934 application using a programming model with an **int** type using at least 32 bits and **long**,

14935 **pointer**, and **off_t** types using at least 64 bits.

14936 **_CS_POSIX_V7_THREADS_CFLAGS**

14937 If *sysconf*(*_SC_POSIX_THREADS*) returns -1, the meaning of this value is unspecified.

14938 Otherwise, this value is the set of initial options to be given to the *c99* utility to build a

14939 multi-threaded application. These flags are in addition to those associated with any of the

14940 other *_CS_POSIX_V7_*_CFLAGS* values used to specify particular type size programming

14941 environments.

14942 **_CS_POSIX_V7_THREADS_LDFLAGS**

14943 If *sysconf*(*_SC_POSIX_THREADS*) returns -1, the meaning of this value is unspecified.

14944 Otherwise, this value is the set of final options to be given to the *c99* utility to build a multi-

14945 threaded application. These flags are in addition to those associated with any of the other

14946 *_CS_POSIX_V7_*_LDFLAGS* values used to specify particular type size programming

14947 environments.

14948 **_CS_POSIX_V7_WIDTH_RESTRICTED_ENVS**

14949 This value is a <newline>-separated list of names of programming environments supported

14950 by the implementation in which the widths of the **blksize_t**, **cc_t**, **mode_t**, **nfds_t**, **pid_t**,

14951 **ptrdiff_t**, **size_t**, **speed_t**, **ssize_t**, **suseconds_t**, **tcflag_t**, **wchar_t**, and **wint_t** types are no

14952 greater than the width of type **long**. The format of each name shall be suitable for use with

14953 the *getconf* -v option.

14954 **_CS_V7_ENV**

14955 This is the value that provides the environment variable information (other than that

14956 provided by *_CS_PATH*) that is required by the implementation to create a conforming

14957 environment, as described in the implementation's conformance documentation.

14958 OB The following symbolic constants are reserved for compatibility with Issue 6:

14959 **_CS_POSIX_V6_ILP32_OFF32_CFLAGS**

14960 **_CS_POSIX_V6_ILP32_OFF32_LDFLAGS**

14961 **_CS_POSIX_V6_ILP32_OFF32_LIBS**

14962 **_CS_POSIX_V6_ILP32_OFFBIG_CFLAGS**

14963 **_CS_POSIX_V6_ILP32_OFFBIG_LDFLAGS**

14964 **_CS_POSIX_V6_ILP32_OFFBIG_LIBS**

14965 **_CS_POSIX_V6_LP64_OFF64_CFLAGS**

14966 **_CS_POSIX_V6_LP64_OFF64_LDFLAGS**

14967 **_CS_POSIX_V6_LP64_OFF64_LIBS**

14968 **_CS_POSIX_V6_LPBIG_OFFBIG_CFLAGS**

14969 **_CS_POSIX_V6_LPBIG_OFFBIG_LDFLAGS**

14970 **_CS_POSIX_V6_LPBIG_OFFBIG_LIBS**

14971 **_CS_POSIX_V6_WIDTH_RESTRICTED_ENVS**

14972 **_CS_V6_ENV**

14973 The <unistd.h> header shall define *SEEK_CUR*, *SEEK_END*, and *SEEK_SET* as described in

14974 <stdio.h>.

14975 XSI The <unistd.h> header shall define the following symbolic constants as possible values for the
14976 *function* argument to the *lockf()* function:

14977	F_LOCK	Lock a section for exclusive use.
14978	F_TEST	Test section for locks by other processes.
14979	F_TLOCK	Test and lock a section for exclusive use.
14980	F_ULOCK	Unlock locked sections.

14981 The <unistd.h> header shall define the following symbolic constants for *pathconf()*:

14982	_PC_2_SYMLINKS
14983	_PC_ALLOC_SIZE_MIN
14984	_PC_ASYNC_IO
14985	_PC_CHOWN_RESTRICTED
14986	_PC_FILESIZEBITS
14987	_PC_LINK_MAX
14988	_PC_MAX_CANON
14989	_PC_MAX_INPUT
14990	_PC_NAME_MAX
14991	_PC_NO_TRUNC
14992	_PC_PATH_MAX
14993	_PC_PIPE_BUF
14994	_PC_PRIO_IO
14995	_PC_REC_INCR_XFER_SIZE
14996	_PC_REC_MAX_XFER_SIZE
14997	_PC_REC_MIN_XFER_SIZE
14998	_PC_REC_XFER_ALIGN
14999	_PC_SYMLINK_MAX
15000	_PC_SYNC_IO
15001	_PC_TIMESTAMP_RESOLUTION
15002	_PC_VDISABLE

15003 The <unistd.h> header shall define the following symbolic constants for *sysconf()*:

15004	_SC_2_C_BIND
15005	_SC_2_C_DEV
15006	_SC_2_CHAR_TERM
15007	_SC_2_FORT_DEV
15008	_SC_2_FORT_RUN
15009	_SC_2_LOCALEDEF
15010	_SC_2_PBS
15011	_SC_2_PBS_ACCOUNTING
15012	_SC_2_PBS_CHECKPOINT
15013	_SC_2_PBS_LOCATE
15014	_SC_2_PBS_MESSAGE
15015	_SC_2_PBS_TRACK
15016	_SC_2_SW_DEV
15017	_SC_2_UPE
15018	_SC_2_VERSION
15019	_SC_ADVISORY_INFO
15020	_SC_AIO_LISTIO_MAX
15021	_SC_AIO_MAX

15022 _SC_AIO_PRIO_DELTA_MAX

15122     _SC_XOPEN_REALTIME
15123     _SC_XOPEN_REALTIME_THREADS
15124     _SC_XOPEN_SHM
15125     _SC_XOPEN_STREAMS

```

```

15126 _SC_XOPEN_UNIX
15127 _SC_XOPEN_UUCP
15128 _SC_XOPEN_VERSION

```

15129 The two constants `_SC_PAGESIZE` and `_SC_PAGE_SIZE` may be defined to have the same value.

15130 The <unistd.h> header shall define the following symbolic constants for file streams:

```

15131 STDERR_FILENO    File number of stderr; 2.
15132 STDIN_FILENO     File number of stdin; 0.
15133 STDOUT_FILENO    File number of stdout; 1.

```

15134 The <unistd.h> header shall define the following symbolic constant for terminal special
15135 character handling:

```

15136 _POSIX_VDISABLE This symbol shall be defined to be the value of a character that shall
15137                  disable terminal special character handling as described in Section 11.2.6
15138                  (on page 212). This symbol shall always be set to a value other than -1.

```

15139 Type Definitions

15140 The <unistd.h> header shall define the `size_t`, `ssize_t`, `uid_t`, `gid_t`, `off_t`, and `pid_t` types as
15141 described in <sys/types.h>.

15142 The <unistd.h> header shall define the `intptr_t` type as described in <inttypes.h>.

15143 Declarations

15144 The following shall be declared as functions and may also be defined as macros. Function
15145 prototypes shall be provided.

```

15146 int      access(const char *, int);
15147 unsigned alarm(unsigned);
15148 int      chdir(const char *);
15149 int      chown(const char *, uid_t, gid_t);
15150 int      close(int);
15151 size_t   confstr(int, char *, size_t);
15152 XSI char *crypt(const char *, const char *);
15153 int      dup(int);
15154 int      dup2(int, int);
15155 void     _exit(int);
15156 XSI void encrypt(char [64], int);
15157 int      execl(const char *, const char *, ...);
15158 int      execlp(const char *, const char *, ...);
15159 int      execlp(const char *, const char *, ...);
15160 int      execv(const char *, char *const []);
15161 int      execve(const char *, char *const [], char *const []);
15162 int      execvp(const char *, char *const []);
15163 int      faccessat(int, const char *, int, int);
15164 int      fchdir(int);
15165 int      fchown(int, uid_t, gid_t);
15166 int      fchownat(int, const char *, uid_t, gid_t, int);
15167 SIO int  fdatsync(int);
15168 int      fexecve(int, char *const [], char *const []);
15169 pid_t    fork(void);

```

15170		long	fpathconf(int, int);
15171	FSC	int	fsync(int);
15172		int	ftruncate(int, off_t);
15173		char	*getcwd(char *, size_t);
15174		gid_t	getegid(void);

15218	XSI	void	sync(void);
15219		long	sysconf(int);
15220		pid_t	tcgetpgrp(int);
15221		int	tcsetpgrp(int, pid_t);

```

15222     int            truncate(const char *, off_t);
15223     char          *ttyname(int);
15224     int           ttyname_r(int, char *, size_t);
15225     int           unlink(const char *);
15226     int           unlinkat(int, const char *, int);
15227     ssize_t       write(int, const void *, size_t);

```

15228 OB Implementations may also include the `pthread_atfork()` prototype as defined in `<pthread.h>`. +
 15229 Implementations may also include the `ctermid()` prototype as defined in `<stdio.h>`.

15230 The `<unistd.h>` header shall declare the following external variables:

```

15231     extern char    *optarg;
15232     extern int     opterr, optind, optopt;

```

15233 APPLICATION USAGE

15234 POSIX.1-2008 only describes the behavior of systems that claim conformance to it. However,
 15235 application developers who want to write applications that adapt to other versions of this
 15236 standard (or to systems that do not conform to any POSIX standard) may find it useful to code
 15237 them so as to conditionally compile different code depending on the value of
 15238 `_POSIX_VERSION`, for example:

```

15239     #if _POSIX_VERSION >= 200112L
15240     /* Use the newer function that copes with large files. */
15241     off_t pos=ftello(fp);
15242     #else
15243     /* Either this is an old version of POSIX, or _POSIX_VERSION is
15244        not even defined, so use the traditional function. */
15245     long pos=ftell(fp);
15246     #endif

```

15247 Earlier versions of POSIX.1-2008 and of the Single UNIX Specification can be identified by the
 15248 following macros:

15249 POSIX.1-1988 standard
 15250 `_POSIX_VERSION == 198808L`

15251 POSIX.1-1990 standard
 15252 `_POSIX_VERSION == 199009L`

15253 ISO POSIX-1: 1996 standard
 15254 `_POSIX_VERSION == 199506L`

15255 Single UNIX Specification, Version 1
 15256 `_XOPEN_UNIX` and `_XOPEN_VERSION == 4`

15257 Single UNIX Specification, Version 2
 15258 `_XOPEN_UNIX` and `_XOPEN_VERSION == 500`

15259 ISO POSIX-1: 2001 and Single UNIX Specification, Version 3
 15260 `_POSIX_VERSION == 200112L`, plus (if the XSI option is supported) `_XOPEN_UNIX` and
 15261 `_XOPEN_VERSION == 600`

15262 POSIX.1-2008 does not make any attempt to define application binary interaction with the
 15263 underlying operating system. However, application developers may find it useful to query
 15264 `_SC_VERSION` at runtime via `sysconf()` to determine whether the current version of the
 15265 operating system supports the necessary functionality as in the following program fragment:

```

15266     if (sysconf(_SC_VERSION) < 200809L) {

```

```

15267         fprintf(stderr, "POSIX.1-2008 system required, terminating \n");
15268         exit(1);
15269     }

```

15270 New applications should not use `_XOPEN_SHM` or `_XOPEN_ENH_I18N`.

15271 RATIONALE

15272 As POSIX.1-2008 evolved, certain options became sufficiently standardized that it was
 15273 concluded that simply requiring one of the option choices was simpler than retaining the option.
 15274 However, for backwards-compatibility, the option flags (with required constant values) are
 15275 retained.

15276 Version Test Macros

15277 The standard developers considered altering the definition of `_POSIX_VERSION` and removing
 15278 `_SC_VERSION` from the specification of `sysconf()` since the utility to an application was deemed
 15279 by some to be minimal, and since the implementation of the functionality is potentially
 15280 problematic. However, they recognized that support for existing application binaries is a
 15281 concern to manufacturers, application developers, and the users of implementations conforming
 15282 to POSIX.1-2008.

15283 While the example using `_SC_VERSION` in the APPLICATION USAGE section does not provide
 15284 the greatest degree of imaginable utility to the application developer or user, it is arguably better
 15285 than a **core** file or some other equally obscure result. (It is also possible for implementations to
 15286 encode and recognize application binaries compiled in various POSIX.1-conforming
 15287 environments, and modify the semantics of the underlying system to conform to the
 15288 expectations of the application.) For the reasons outlined in the preceding paragraphs and in the
 15289 APPLICATION USAGE section, the standard developers elected to retain the `_POSIX_VERSION`
 15290 and `_SC_VERSION` functionality.

15291 Compile-Time Symbolic Constants for System-Wide Options

15292 POSIX.1-2008 includes support in certain areas for the newly adopted policy governing options
 15293 and stubs.

15294 This policy provides flexibility for implementations in how they support options. It also
 15295 specifies how conforming applications can adapt to different implementations that support
 15296 different sets of options. It allows the following:

- 15297 1. If an implementation has no interest in supporting an option, it does not have to provide
 15298 anything associated with that option beyond the announcement that it does not support
 15299 it.
- 15300 2. An implementation can support a partial or incompatible version of an option (as a non-
 15301 standard extension) as long as it does not claim to support the option.
- 15302 3. An application can determine whether the option is supported. A strictly conforming
 15303 application must check this announcement mechanism before first using anything
 15304 associated with the option.

15305 There is an important implication of this policy. POSIX.1-2008 cannot dictate the behavior of
 15306 interfaces associated with an option when the implementation does not claim to support the
 15307 option. In particular, it cannot require that a function associated with an unsupported option
 15308 will fail if it does not perform as specified. However, this policy does not prevent a standard
 15309 from requiring certain functions to always be present, but that they shall always fail on some
 15310 implementations. The `setpgid()` function in the POSIX.1-1990 standard, for example, is
 15311 considered appropriate.

The POSIX standards include various options, and the C-language binding support for an option implies that the implementation must supply data types and function interfaces. An application must be able to discover whether the implementation supports each option.

Any application must consider the following three cases for each option:

1. Option never supported.

The implementation advertises at compile time that the option will never be supported. In this case, it is not necessary for the implementation to supply any of the data types or function interfaces that are provided only as part of the option. The implementation might provide data types and functions that are similar to those defined by POSIX.1-2008, but there is no guarantee for any particular behavior.

2. Option always supported.

The implementation advertises at compile time that the option will always be supported. In this case, all data types and function interfaces shall be available and shall operate as specified.

3. Option might or might not be supported.

Some implementations might not provide a mechanism to specify support of options at compile time. In addition, the implementation might be unable or unwilling to specify support or non-support at compile time. In either case, any application that might use the option at runtime must be able to compile and execute. The implementation must provide, at compile time, all data types and function interfaces that are necessary to allow this. In this situation, there must be a mechanism that allows the application to query, at runtime, whether the option is supported. If the application attempts to use the option when it is not supported, the result is unspecified unless explicitly specified otherwise in POSIX.1-2008.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX Threads Extension.

The symbolic constants `_XOPEN_REALTIME` and `_XOPEN_REALTIME_THREADS` are added. `_POSIX2_C_BIND`, `_XOPEN_ENH_I18N`, and `_XOPEN_SHM` must now be set to a value other than `-1` by a conforming implementation.

Large File System extensions are added.

15357 The type of the argument to *sbrk()* is changed from **int** to **intptr_t**.

15358 *_XBS_* constants are added to the list of constants for Options and Option Groups, to the list of
 15359 constants for the *confstr()* function, and to the list of constants to the *sysconf()* function. These
 15360 are all marked EX.

15361 **Issue 6**

15362 *_POSIX2_C_VERSION* is removed.

15363 The Open Group Corrigendum U026/4 is applied, adding the prototype for *fdatasync()*.

15364 The Open Group Corrigendum U026/1 is applied, adding the symbols *_SC_XOPEN_LEGACY*,
 15365 *_SC_XOPEN_REALTIME*, and *_SC_XOPEN_REALTIME_THREADS*.

15366 The symbols *_XOPEN_STREAMS* and *_SC_XOPEN_STREAMS* are added to support the XSI
 15367 STREAMS Option Group.

15368 Text in the DESCRIPTION relating to conformance requirements is moved elsewhere in
 15369 IEEE Std 1003.1-2001.

15370 The LEGACY symbol *_SC_PASS_MAX* is removed.

15371 The following new requirements on POSIX implementations derive from alignment with the
 15372 Single UNIX Specification:

- 15373 • The *_CS_POSIX_** and *_CS_XBS5_** constants are added for the *confstr()* function.
- 15374 • The *_SC_XBS5_** constants are added for the *sysconf()* function.
- 15375 • The symbolic constants *F_ULOCK*, *F_LOCK*, *F_TLOCK*, and *F_TEST* are added.
- 15376 • The **uid_t**, **gid_t**, **off_t**, **pid_t**, and **useconds_t** types are mandated.

15377 The *gethostname()* prototype is added for sockets.

15378 A new section is added for System-Wide Options.

15379 Function prototypes for *setegid()* and *seteuid()* are added.

15380 Option symbolic constants are added for *_POSIX_ADVISORY_INFO*, *_POSIX_CPUTIME*,
 15381 *_POSIX_SPAWN*, *_POSIX_SPORADIC_SERVER*, *_POSIX_THREAD_CPUTIME*,
 15382 *_POSIX_THREAD_SPORADIC_SERVER*, and *_POSIX_TIMEOUTS*, and *pathconf()* variables are
 15383 added for *_PC_ALLOC_SIZE_MIN*, *_PC_REC_INCR_XFER_SIZE*, *_PC_REC_MAX_XFER_SIZE*,
 15384 *_PC_REC_MIN_XFER_SIZE*, and *_PC_REC_XFER_ALIGN* for alignment with IEEE Std
 15385 1003.1d-1999.

15386 The following are added for alignment with IEEE Std 1003.1j-2000:

- 15387 • Option symbolic constants *_POSIX_BARRIERS*, *_POSIX_CLOCK_SELECTION*,
 15388 *_POSIX_MONOTONIC_CLOCK*, *_POSIX_READER_WRITER_LOCKS*,
 15389 *_POSIX_SPIN_LOCKS*, and *_POSIX_TYPED_MEMORY_OBJECTS*
- 15390 • *sysconf()* variables *_SC_BARRIERS*, *_SC_CLOCK_SELECTION*,
 15391 *_SC_MONOTONIC_CLOCK*, *_SC_READER_WRITER_LOCKS*, *_SC_SPIN_LOCKS*, and
 15392 *_SC_TYPED_MEMORY_OBJECTS*

15393 The *_SC_XBS5* macros associated with the ISO/IEC 9899:1990 standard are marked LEGACY,
 15394 and new equivalent *_SC_V6* macros associated with the ISO/IEC 9899:1999 standard are
 15395 introduced.

15396 The *getwd()* function is marked LEGACY.

15397 The **restrict** keyword is added to the prototypes for *readlink()* and *swab()*.

Constants for options are now harmonized, so when supported they take the year of approval of IEEE Std 1003.1-2001 as the value.

The following are added for alignment with IEEE Std 1003.1q-2000:

- Optional symbolic constants `_POSIX_TRACE`, `_POSIX_TRACE_EVENT_FILTER`, `_POSIX_TRACE_LOG`, and `_POSIX_TRACE_INHERIT`
- The `sysconf()` symbolic constants `_SC_TRACE`, `_SC_TRACE_EVENT_FILTER`, `_SC_TRACE_LOG`, and `_SC_TRACE_INHERIT`

The `brk()` and `sbrk()` LEGACY functions are removed.

The Open Group Base Resolution bwg2001-006 is applied, which reworks the XSI versioning information.

The Open Group Base Resolution bwg2001-008 is applied, changing the *namelen* parameter for `gethostname()` from `socklen_t` to `size_t`.

IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/2 is applied, changing “Thread Stack Address Size” to “Thread Stack Size Attribute”.

IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/20 is applied, adding the `_POSIX_IPV6`, `_SC_V6`, and `_SC_RAW_SOCKETS` symbols.

IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/21 is applied, correcting the description in “Constants for Functions” for the `_CS_POSIX_V6_LP64_OFF64_CFLAGS`, `_CS_POSIX_V6_LP64_OFF64_LDFLAGS`, and `_CS_POSIX_V6_LP64_OFF64_LIBS` symbols.

IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/22 is applied, removing the shading for the `_PC*` and `_SC*` constants, since these are mandatory on all implementations.

IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/23 is applied, adding the `_PC_SYMLINK_MAX` and `_SC_SYMLINK_MAX` constants.

IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/24 is applied, correcting the shading and margin code for the `fsync()` function.

IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/25 is applied, adding the following text to the APPLICATION USAGE section: “New applications should not use `_XOPEN_SHM` or `_XOPEN_ENH_I18N`.”.

IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/29 is applied, clarifying the requirements for when constants for Options and Option Groups can be defined or undefined.

IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/30 is applied, changing the `_V6_ILP32_OFF32`, `_V6_ILP32_OFFBIG`, `_V6_LP64_OFF64`, and `_V6_LP64_OFFBIG` symbols to `_POSIX_V6_ILP32_OFF32`, `_POSIX_V6_ILP32_OFFBIG`, `_POSIX_V6_LP64_OFF64`, and `_POSIX_V6_LP64_OFFBIG`, respectively. This is for consistency with the `sysconf()` and *c99* reference pages.

IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/31 is applied, adding that the format of names of programming environments can be obtained using the `getconf -v` option.

IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/32 is applied, deleting the `_SC_FILE_LOCKING`, `_SC_2_C_VERSION`, and `_SC_XOPEN_XCU_VERSION` constants.

IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/33 is applied, adding `_SC_SS_REPL_MAX`, `_SC_TRACE_EVENT_NAME_MAX`, `_SC_TRACE_NAME_MAX`, `_SC_TRACE_SYS_MAX`, and `_SC_TRACE_USER_EVENT_MAX` to the list of symbolic constants for `sysconf()`.

15441 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/34 is applied, updating the prototype for
15442 the *symlink()* function to match that in the System Interfaces volume of IEEE Std 1003.1-2001.

15443 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/35 is applied, adding *_PC_2_SYMLINKS*
15444 to the symbolic constants list for *pathconf()*. This corresponds to the definition of
15445 *POSIX2_SYMLINKS* in the Shell and Utilities volume of IEEE Std 1003.1-2001.

15446 **Issue 7**

15447 Austin Group Interpretations 1003.1-2001 #026 and #047 are applied.

15448 Austin Group Interpretation 1003.1-2001 #166 is applied to permit an additional compiler flag to
15449 enable threads.

15450 Austin Group Interpretation 1003.1-2001 #178 is applied, clarifying the values allowed for
15451 *_POSIX2_CHAR_TERM*.

15452 SD5-XBD-ERN-41 is applied, adding the *_POSIX2_SYMLINKS* constant.

15453 SD5-XBD-ERN-76 and SD5-XBD-ERN-77 are applied.

15454 Symbols to support the UUCP Utilities option are added.

15455 The variables for the supported programming environments are updated to be V7.

15456 The LEGACY and obsolescent symbols are removed.

15457 The *faccessat()*, *fchownat()*, *fexecve()*, *linkat()*, *readlinkat()*, *symlinkat()*, and *unlinkat()* functions
15458 are added from The Open Group Technical Standard, 2006, Extended API Set Part 2.

15459 The *_POSIX_TRACE** constants from the Trace option are marked obsolescent.

15460 The *_POSIX2_PBS** constants from the Batch Environment Services and Utilities option are
15461 marked obsolescent.

15462 Functionality relating to the Asynchronous Input and Output, Barriers, Clock Selection, Memory
15463 Mapped Files, Memory Protection, Realtime Signals Extension, Semaphores, Spin Locks,
15464 Threads, Timeouts, and Timers options is moved to the Base.

15465 Functionality relating to the Thread Priority Protection and Thread Priority Inheritance options
15466 is changed to be Non-Robust Mutex or Robust Mutex Priority Protection and Non-Robust Mutex
15467 or Robust Mutex Priority Inheritance, respectively.

15468 This reference page is clarified with respect to macros and symbolic constants.

15469 Changes are made related to support for finegrained timestamps and the
15470 *_POSIX_TIMESTAMP_RESOLUTION* constant is added.

15471 The *_SC_THREAD_ROBUST_PRIO_INHERIT* and *_SC_THREAD_ROBUST_PRIO_PROTECT*
15472 symbolic constants are added.

15473 POSIX.1-2008, Technical Corrigendum 1, XBD/TC1-2008/0078 [311], XBD/TC1-2008/0079 [209], +
15474 and XBD/TC1-2008/0080 [360] are applied.

15475 **NAME**

15476 utime.h — access and modification times structure

15477 **SYNOPSIS**15478 OB `#include <utime.h>`15479 **DESCRIPTION**15480 The <utime.h> header shall declare the **utimbuf** structure, which shall include the following
15481 members:15482 `time_t` `actime` Access time.
15483 `time_t` `modtime` Modification time.

15484 The times shall be measured in seconds since the Epoch.

15485 The <utime.h> header shall define the **time_t** type as described in <sys/types.h>.15486 The following shall be declared as a function and may also be defined as a macro. A function
15487 prototype shall be provided.15488 `int utime(const char *, const struct utimbuf *);`15489 **APPLICATION USAGE**15490 The *utime()* function only allows setting file timestamps to the nearest second. Applications
15491 should use the *utimensat()* function instead. See <sys/stat.h>.15492 **RATIONALE**

15493 None.

15494 **FUTURE DIRECTIONS**

15495 The <utime.h> header may be removed in a future version.

15496 **SEE ALSO**15497 [<sys/stat.h>](#), [<sys/types.h>](#)15498 XSH *futimens()*, *utime()*15499 **CHANGE HISTORY**

15500 First released in Issue 3.

15501 **Issue 6**15502 The following new requirements on POSIX implementations derive from alignment with the
15503 Single UNIX Specification:

- 15504
- The **time_t** type is defined.

15505 **Issue 7**

15506 The <utime.h> header is marked obsolescent.

15507 **NAME**

15508 utmpx.h — user accounting database definitions

15509 **SYNOPSIS**

15510 XSI `#include <utmpx.h>`

15511 **DESCRIPTION**

15512 The <utmpx.h> header shall define the **utmpx** structure that shall include at least the following
15513 members:

15514	char	ut_user[]	User login name.
15515	char	ut_id[]	Unspecified initialization process identifier.
15516	char	ut_line[]	Device name.
15517	pid_t	ut_pid	Process ID.
15518	short	ut_type	Type of entry.
15519	struct timeval	ut_tv	Time entry was made.

15520 The <utmpx.h> header shall define the **pid_t** type through **typedef**, as described in
15521 <sys/types.h>.

15522 The <utmpx.h> header shall define the **timeval** structure as described in <sys/time.h>.

15523 Inclusion of the <utmpx.h> header may also make visible all symbols from <sys/time.h>.

15524 The <utmpx.h> header shall define the following symbolic constants as possible values for the
15525 *ut_type* member of the **utmpx** structure:

15526	EMPTY	No valid user accounting information.
15527	BOOT_TIME	Identifies time of system boot.
15528	OLD_TIME	Identifies time when system clock changed.
15529	NEW_TIME	Identifies time after system clock changed.
15530	USER_PROCESS	Identifies a process.
15531	INIT_PROCESS	Identifies a process spawned by the init process.
15532	LOGIN_PROCESS	Identifies the session leader of a logged-in user.
15533	DEAD_PROCESS	Identifies a session leader who has exited.

15534 The following shall be declared as functions and may also be defined as macros. Function
15535 prototypes shall be provided.

```

15536 void          endutxent(void);
15537 struct utmpx *getutxent(void);
15538 struct utmpx *getutxid(const struct utmpx *);
15539 struct utmpx *getutxline(const struct utmpx *);
15540 struct utmpx *pututxline(const struct utmpx *);
15541 void          setutxent(void);

```

15542 **APPLICATION USAGE**

15543 None.

15544 **RATIONALE**

15545 None.

15552 First released in Issue 4, Version 2.

15553 **NAME**

15554 wchar.h — wide-character handling

15555 **SYNOPSIS**

15556 #include <wchar.h>

15557 **DESCRIPTION**

15558 CX Some of the functionality described on this reference page extends the ISO C standard.
15559 Applications shall define the appropriate feature test macro (see XSH [Section 2.2](#), on page 472) to
15560 enable the visibility of these symbols in this header.

15561 The <wchar.h> header shall define the following types:

15562 CX **FILE** As described in <stdio.h>.

15563 CX **locale_t** As described in <locale.h>.

15564 **mbstate_t** An object type other than an array type that can hold the conversion state
15565 information necessary to convert between sequences of (possibly multi-byte)
15566 CX characters and wide characters. If a codeset is being used such that an
15567 **mbstate_t** needs to preserve more than two levels of reserved state, the results
15568 are unspecified.

15569 **size_t** As described in <stddef.h>.

15570 CX **va_list** As described in <stdarg.h>.

15571 **wchar_t** As described in <stddef.h>.

15572 OB XSI **wctype_t** A scalar type of a data object that can hold values which represent locale-
15573 specific character classification.

15574 **wint_t** An integer type capable of storing any valid value of **wchar_t** or WEOF.

15575 The tag **tm** shall be declared as naming an incomplete structure type, the contents of which are
15576 described in the <time.h> header.

15577 The implementation shall support one or more programming environments in which the width
15578 of **wint_t** is no greater than the width of type **long**. The names of these programming
15579 environments can be obtained using the *confstr()* function or the *getconf* utility.

15580 The <wchar.h> header shall define the following macros:

15581 **WCHAR_MAX** As described in <stdint.h>.

15582 **WCHAR_MIN** As described in <stdint.h>.

15583 **WEOF** Constant expression of type **wint_t** that is returned by several WP functions to
15584 indicate end-of-file.

15585 **NULL** As described in <stddef.h>.

15586 CX Inclusion of the <wchar.h> header may make visible all symbols from the headers <ctype.h>,
15587 <string.h>, <stdarg.h>, <stddef.h>, <stdio.h>, <stdlib.h>, and <time.h>.

15588 The following shall be declared as functions and may also be defined as macros. Function
15589 prototypes shall be provided for use with ISO C standard compilers.

15590 **wint_t** btowc(int);
15591 **wint_t** fgetwc(FILE *);
15592 **wchar_t** *fgetws(wchar_t *restrict, int, FILE *restrict);
15593 **wint_t** fputwc(wchar_t, FILE *);
15594 **int** fputws(const wchar_t *restrict, FILE *restrict);

```

15595     int          fwide(FILE *, int);
15596     int          fwprintf(FILE *restrict, const wchar_t *restrict, ...);
15597     int          fwscanf(FILE *restrict, const wchar_t *restrict, ...);
15598     wint_t       getwc(FILE *);
15599     wint_t       getwchar(void);
15600     OB XSI      int          iswalnum(wint_t);
15601                int          iswalpha(wint_t);
15602                int          iswcntrl(wint_t);
15603                int          iswctype(wint_t, wctype_t);
15604                int          iswdigit(wint_t);
15605                int          iswgraph(wint_t);
15606                int          iswlower(wint_t);
15607                int          iswprint(wint_t);
15608                int          iswpunct(wint_t);
15609                int          iswspace(wint_t);
15610                int          iswupper(wint_t);
15611                int          iswxdigit(wint_t);
15612     size_t       mbrlen(const char *restrict, size_t, mbstate_t *restrict);
15613     size_t       mbrtowc(wchar_t *restrict, const char *restrict, size_t,
15614                          mbstate_t *restrict);
15615     int          mbsinit(const mbstate_t *);
15616     CX          size_t       mbsnrtowcs(wchar_t *restrict, const char **restrict,
15617                                         size_t, size_t, mbstate_t *restrict);
15618     size_t       mbsrtowcs(wchar_t *restrict, const char **restrict, size_t,
15619                          mbstate_t *restrict);
15620     CX          FILE        *open_wmemstream(wchar_t **, size_t *);
15621     wint_t       putwc(wchar_t, FILE *);
15622     wint_t       putwchar(wchar_t);
15623     int          swprintf(wchar_t *restrict, size_t,

15691		int	wprintf(const wchar_t *restrict, ...);
15692		int	wscanf(const wchar_t *restrict, ...);

APPLICATION USAGE

The `iswblank()` function was a late addition to the ISO C standard and was introduced at the same time as the ISO C standard introduced **<wctype.h>**, which contains all of the `isw*()` functions. The Open Group Base Specifications had previously aligned with the MSE working draft and had introduced the rest of the `isw*()` functions into **<wchar.h>**. For backwards-compatibility, the original set of `isw*()` functions, without `iswblank()`, are permitted (as part of the XSI option) in **<wchar.h>**. For maximum portability, applications should include **<wctype.h>** in order to obtain declarations for the `isw*()` functions. This compatibility has been made obsolescent.

RATIONALE

In the ISO C standard, the symbols referenced as XSI extensions are in **<wctype.h>**. Their presence here is thus an extension.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 4.

Issue 5

Aligned with the ISO/IEC 9899:1990/Amendment 1:1995 (E).

Issue 6

The Open Group Corrigendum U021/10 is applied. The prototypes for `wcswidth()` and `wcwidth()` are marked as extensions.

The Open Group Corrigendum U028/5 is applied, correcting the prototype for the `mbsinit()` function.

The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- Various function prototypes are updated to add the **restrict** keyword.
- The functions `vfwscanf()`, `vwscanf()`, `wcstof()`, `wcstold()`, `wcstoll()`, and `wcstoull()` are added.

The type **wctype_t**, the `isw*()`, `to*()`, and `wctype()` functions are marked as XSI extensions.

IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/26 is applied, adding the APPLICATION USAGE section.

15736 **Issue 7**

15737 The *mbsnrtowcs()*, *open_wmemstream()*, *wcpcpy()*, *wcpncpy()*, *wscasecmp()*, *wcsdup()*,
15738 *wcsncasecmp()*, *wcsnlen()*, and *wcsnrtombs()* functions are added from The Open Group
15739 Technical Standard, 2006, Extended API Set Part 1.

15740 The *wscasecmp_l()*, *wcsncasecmp_l()*, *wscoll_l()*, and *wcsxfrm_l()* functions are added from The
15741 Open Group Technical Standard, 2006, Extended API Set Part 4.

15742 The **wctype_t** type, and the *isw**, *towlower()*, and *towupper()* functions are marked obsolescent in
15743 <wchar.h> since the ISO C standard requires the declarations to be in <wctype.h>.

15744 This reference page is clarified with respect to macros and symbolic constants, and a declaration
15745 for the **locale_t** type is added.

15746 POSIX.1-2008, Technical Corrigendum 1, XBD/TC1-2008/0081 [380] is applied.

+

15747 **NAME**15748 `wctype.h` — wide-character classification and mapping utilities15749 **SYNOPSIS**15750 `#include <wctype.h>`15751 **DESCRIPTION**

15752 CX Some of the functionality described on this reference page extends the ISO C standard.
 15753 Applications shall define the appropriate feature test macro (see XSH [Section 2.2](#), on page 472) to
 15754 enable the visibility of these symbols in this header.

15755 The `<wctype.h>` header shall define the following types:15756 **wint_t** As described in `<wchar.h>`.

15757 **wctrans_t** A scalar type that can hold values which represent locale-specific character
 15758 mappings.

15759 **wctype_t** As described in `<wchar.h>`.15760 CX The `<wctype.h>` header shall define the **locale_t** type as described in `<locale.h>`.15761 The `<wctype.h>` header shall define the following macro:15762 **WEOF** As described in `<wchar.h>`.

15763 For all functions described in this header that accept an argument of type **wint_t**, the value is
 15764 representable as a **wchar_t** or equals the value of WEOF. If this argument has any other value,
 15765 the behavior is undefined.

15766 The behavior of these functions shall be affected by the `LC_CTYPE` category of the current locale.

15767 CX Inclusion of the `<wctype.h>` header may make visible all symbols from the headers `<ctype.h>`,
 15768 `<stdarg.h>`, `<stddef.h>`, `<stdio.h>`, `<stdlib.h>`, `<string.h>`, `<time.h>`, and `<wchar.h>`.

15769 The following shall be declared as functions and may also be defined as macros. Function
 15770 prototypes shall be provided for use with ISO C standard compilers.

```

15771 int      iswalnum(wint_t);
15772 CX int    iswalnum_l(wint_t, locale_t);
15773 int      iswalpha(wint_t);
15774 CX int    iswalpha_l(wint_t, locale_t);
15775 int      iswblank(wint_t);
15776 CX int    iswblank_l(wint_t, locale_t);
15777 int      iswcntrl(wint_t);
15778 CX int    iswcntrl_l(wint_t, locale_t);
15779 int      iswctype(wint_t, wctype_t);
15780 CX int    iswctype_l(wint_t, wctype_t, locale_t);
15781 int      iswdigit(wint_t);
15782 CX int    iswdigit_l(wint_t, locale_t);
15783 int      iswgraph(wint_t);
15784 CX int    iswgraph_l(wint_t, locale_t);
15785 int      iswlower(wint_t);
15786 CX int    iswlower_l(wint_t, locale_t);
15787 int      iswprint(wint_t);
15788 CX int    iswprint_l(wint_t, locale_t);
15789 int      iswpunct(wint_t);
15790 CX int    iswpunct_l(wint_t, locale_t);
15791 int      iswspace(wint_t);
  
```

```

15792 CX      int      iswspace_l(wint_t, locale_t);
15793          int      iswupper(wint_t);
15794 CX      int      iswupper_l(wint_t, locale_t);
15795          int      iswxdigit(wint_t);
15796 CX      int      iswxdigit_l(wint_t, locale_t);
15797          wint_t    towctrans(wint_t, wctrans_t);
15798 CX      wint_t    towctrans_l(wint_t, wctrans_t, locale_t);
15799          wint_t    towlower(wint_t);
15800 CX      wint_t    towlower_l(wint_t, locale_t);
15801          wint_t    towupper(wint_t);
15802 CX      wint_t    towupper_l(wint_t, locale_t);
15803          wctrans_t wctrans(const char *);
15804 CX      wctrans_t wctrans_l(const char *, locale_t);
15805          wctype_t  wctype(const char *);
15806 CX      wctype_t  wctype_l(const char *, locale_t);

```

15819 CHANGE HISTORY

15820 First released in Issue 5. Derived from the ISO/IEC 9899:1990/Amendment 1:1995 (E).

15821 Issue 6

15822 The *iswblank()* function is added for alignment with the ISO/IEC 9899:1999 standard.

15823 Issue 7

15824 SD5-XBD-ERN-6 is applied.

15825 The **l()* functions are added from The Open Group Technical Standard, 2006, Extended API Set
15826 Part 4.

15827 This reference page is clarified with respect to macros and symbolic constants.

15828 **NAME**

15829 wordexp.h — word-expansion types

15830 **SYNOPSIS**

15831 #include <wordexp.h>

15832 **DESCRIPTION**

15833 The <wordexp.h> header shall define the structures and symbolic constants used by the
 15834 *wordexp()* and *wordfree()* functions.

15835 The <wordexp.h> header shall define the **wordexp_t** structure type, which shall include at least
 15836 the following members:

15837 `size_t we_wordc` Count of words matched by *words*.
 15838 `char **we_wordv` Pointer to list of expanded words.
 15839 `size_t we_offs` Slots to reserve at the beginning of *we_wordv*.

15840 The <wordexp.h> header shall define the following symbolic constants for use as flags for the
 15841 *wordexp()* function:

15842 **WRDE_APPEND** Append words to those previously generated.
 15843 **WRDE_DOOFFS** Number of null pointers to prepend to *we_wordv*.
 15844 **WRDE_NOCMD** Fail if command substitution is requested.
 15845 **WRDE_REUSE** The *pwordexp* argument was passed to a previous successful call to
 15846 *wordexp()*, and has not been passed to *wordfree()*. The result is the same
 15847 as if the application had called *wordfree()* and then called *wordexp()*
 15848 without **WRDE_REUSE**.

15849 **WRDE_SHOWERR** Do not redirect *stderr* to **/dev/null**.

15850 **WRDE_UNDEF** Report error on an attempt to expand an undefined shell variable.

15851 The <wordexp.h> header shall define the following symbolic constants as error return values:

15852 **WRDE_BADCHAR** One of the unquoted characters—<newline>, ' | ', ' & ', ' ; ', ' < ', ' > ',
 15853 ' (', ') ', ' { ', ' } '—appears in *words* in an inappropriate context.
 15854 **WRDE_BADVAL** Reference to undefined shell variable when **WRDE_UNDEF** is set in *flags*.
 15855 **WRDE_CMDSUB** Command substitution requested when **WRDE_NOCMD** was set in *flags*.
 15856 **WRDE_NOSPACE** Attempt to allocate memory failed.
 15857 **WRDE_SYNTAX** Shell syntax error, such as unbalanced parentheses or unterminated
 15858 string.

15859 The <wordexp.h> header shall define the **size_t** type as described in <stddef.h>.

15860 The following shall be declared as functions and may also be defined as macros. Function
 15861 prototypes shall be provided.

15862 `int wordexp(const char *restrict, wordexp_t *restrict, int);`
 15863 `void wordfree(wordexp_t *);`

15864 **APPLICATION USAGE**

15865 None.

15866 **RATIONALE**

15873 **CHANGE HISTORY**

15874 First released in Issue 4. Derived from the ISO POSIX-2 standard.

15875 **Issue 6**

15876 The **restrict** keyword is added to the prototype for *wordexp()*.

15877 The WRDE_NOSYS constant is marked obsolescent.

15878 **Issue 7**

15879 The obsolescent WRDE_NOSYS constant is removed.

15880 This reference page is clarified with respect to macros and symbolic constants.

15881

Technical Standard

15882

Vol. 2:

15883

System Interfaces, Issue 7

15884

The Open Group

15885

The Institute of Electrical and Electronics Engineers, Inc.

15886
15887

Chapter 1 Introduction

15888
15889

The System Interfaces volume of POSIX.1-2008 describes the interfaces offered to application programs by POSIX-conformant systems.

1.1 Relationship to Other Formal Standards

15891
15892

Great care has been taken to ensure that this volume of POSIX.1-2008 is fully aligned with the following standards:

15893
15894
15895
15896

ISO C (1999)
ISO/IEC 9899:1999, Programming Languages — C, including ISO/IEC 9899:1999/Cor.1:2001(E), ISO/IEC 9899:1999/Cor.2:2004(E), and ISO/IEC 9899:1999/Cor.3.

15897
15898
15899
15900
15901
15902

Parts of the ISO/IEC 9899:1999 standard (hereinafter referred to as the ISO C standard) are referenced to describe requirements also mandated by this volume of POSIX.1-2008. Some functions and headers included within this volume of POSIX.1-2008 have a version in the ISO C standard; in this case CX markings are added as appropriate to show where the ISO C standard has been extended (see [Section 1.7.1](#), on page 7). Any conflict between this volume of POSIX.1-2008 and the ISO C standard is unintentional.

15903
15904

This volume of POSIX.1-2008 also allows, but does not require, mathematics functions to support IEEE Std 754-1985 and IEEE Std 854-1987.

1.2 Format of Entries

15906
15907

The entries in [Chapter 3](#) are based on a common format as follows. The only sections relating to conformance are the SYNOPSIS, DESCRIPTION, RETURN VALUE, and ERRORS sections.

15908
15909

NAME

This section gives the name or names of the entry and briefly states its purpose.

15910
15911
15912
15913

SYNOPSIS

This section summarizes the use of the entry being described. If it is necessary to include a header to use this function, the names of such headers are shown, for example:

15914

```
#include <stdio.h>
```

15915
15916

DESCRIPTION

This section describes the functionality of the function or header.

15917
15918

RETURN VALUE

This section indicates the possible return values, if any.

15919

If the implementation can detect errors, “successful completion” means that no error

15920 has been detected during execution of the function. If the implementation does detect
15921 an error, the error is indicated.

15922 For functions where no errors are defined, “successful completion” means that if the
15923 implementation checks for errors, no error has been detected. If the implementation can
15924 detect errors, and an error is detected, the indicated return value is returned and *errno*
15925 may be set.

15926 **ERRORS**

15927 This section gives the symbolic names of the error values returned by a function or
15928 stored into a variable accessed through the symbol *errno* if an error occurs.

15929 “No errors are defined” means that error values returned by a function or stored into a
15930 variable accessed through the symbol *errno*, if any, depend on the implementation.

15931 **EXAMPLES**

15932 This section is informative.

15933 This section gives examples of usage, where appropriate. In the event of conflict
15934 between an example and a normative part of this volume of POSIX.1-2008, the
15935 normative material is to be taken as correct.

15936 **APPLICATION USAGE**

15937 This section is informative.

15938 This section gives warnings and advice to application developers about the entry. In the
15939 event of conflict between warnings and advice and a normative part of this volume of
15940 POSIX.1-2008, the normative material is to be taken as correct.

15941 **RATIONALE**

15942 This section is informative.

15943 This section contains historical information concerning the contents of this volume of
15944 POSIX.1-2008 and why features were included or discarded by the standard
15945 developers.

15946 **FUTURE DIRECTIONS**

15947 This section is informative.

15948 This section provides comments which should be used as a guide to current thinking;
15949 there is not necessarily a commitment to adopt these future directions.

15950 **SEE ALSO**

15951 This section is informative.

15952 This section gives references to related information.

15953 **CHANGE HISTORY**

15954 This section is informative.

15955 This section shows the derivation of the entry and any significant changes that have
15956 been made to it.

15957

15958

15959

This chapter covers information that is relevant to all the functions specified in [Chapter 3](#) and XBD [Chapter 13](#) (on page 219).

15960

15961

2.1 Use and Implementation of Interfaces

15962

2.1.1 Use and Implementation of Functions

15963

Each of the following statements shall apply to all functions unless explicitly stated otherwise in the detailed descriptions that follow:

15964

15965

1. If an argument to a function has an invalid value (such as a value outside the domain of the function, or a pointer outside the address space of the program, or a null pointer), the behavior is undefined.

15966

15967

15968

2. Any function declared in a header may also be implemented as a macro defined in the header, so a function should not be declared explicitly if its header is included. Any macro definition of a function can be suppressed locally by enclosing the name of the function in parentheses, because the name is then not followed by the <left-parenthesis> that indicates expansion of a macro function name. For the same syntactic reason, it is permitted to take the address of a function even if it is also defined as a macro. The use of the C-language **#undef** construct to remove any such macro definition shall also ensure that an actual function is referred to.

15969

15970

15971

15972

15973

15974

15975

15976

3. Any invocation of a function that is implemented as a macro shall expand to code that evaluates each of its arguments exactly once, fully protected by parentheses where necessary, so it is generally safe to use arbitrary expressions as arguments.

15977

15978

15979

4. Provided that a function can be declared without reference to any type defined in a header, it is also permissible to declare the function explicitly and use it without including its associated header.

15980

15981

15982

5. If a function that accepts a variable number of arguments is not declared (explicitly or by including its associated header), the behavior is undefined.

15983

2.1.2 Use and Implementation of Macros

Each of the following statements shall apply to all macros unless explicitly stated otherwise:

1. Any definition of an object-like macro in a header shall expand to code that is fully protected by parentheses where necessary, so that it groups in an arbitrary expression as if it were a single identifier.
2. All object-like macros listed as expanding to integer constant expressions shall additionally be suitable for use in **#if** preprocessing directives.
3. Any definition of a function-like macro in a header shall expand to code that evaluates each of its arguments exactly once, fully protected by parentheses where necessary, so that it is generally safe to use arbitrary expressions as arguments.
4. Any definition of a function-like macro in a header can be invoked in an expression anywhere a function with a compatible return type could be called.

2.2 The Compilation Environment

2.2.1 POSIX.1 Symbols

Certain symbols in this volume of POSIX.1-2008 are defined in headers (see XBD [Chapter 13](#), on page 219). Some of those headers could also define symbols other than those defined by POSIX.1-2008, potentially conflicting with symbols used by the application. Also, POSIX.1-2008 defines symbols that are not permitted by other standards to appear in those headers without some control on the visibility of those symbols.

Symbols called “feature test macros” are used to control the visibility of symbols that might be included in a header. Implementations, future versions of this standard, and other standards may define additional feature test macros.

In the compilation of an application that **#defines** a feature test macro specified by POSIX.1-2008, no header defined by POSIX.1-2008 shall be included prior to the definition of the feature test macro. This restriction also applies to any implementation-provided header in which these feature test macros are used. If the definition of the macro does not precede the **#include**, the result is undefined.

Feature test macros shall begin with the <underscore> character (`'_'`).

2.2.1.1 The `_POSIX_C_SOURCE` Feature Test Macro

A POSIX-conforming application shall ensure that the feature test macro `_POSIX_C_SOURCE` is defined before inclusion of any header.

When an application includes a header described by POSIX.1-2008, and when this feature test macro is defined to have the value 200809L:

1. All symbols required by POSIX.1-2008 to appear when the header is included shall be made visible.

2. Symbols that are explicitly permitted, but not required, by POSIX.1-2008 to appear in that header (including those in reserved name spaces) may be made visible.
3. Additional symbols not required or explicitly permitted by POSIX.1-2008 to be in that header shall not be made visible, except when enabled by another feature test macro.

Identifiers in POSIX.1-2008 may only be undefined using the **#undef** directive as described in [Section 2.1](#) (on page 471) or [Section 2.2.2](#). These **#undef** directives shall follow all **#include** directives of any header in POSIX.1-2008.

Note: The POSIX.1-1990 standard specified a macro called `_POSIX_SOURCE`. This has been superseded by `_POSIX_C_SOURCE`.

2.2.1.2 The `_XOPEN_SOURCE` Feature Test Macro

XSI An XSI-conforming application shall ensure that the feature test macro `_XOPEN_SOURCE` is defined with the value 700 before inclusion of any header. This is needed to enable the functionality described in [Section 2.2.1.1](#) (on page 472) and to ensure that the XSI option is enabled.

Since this volume of POSIX.1-2008 is aligned with the ISO C standard, and since all functionality enabled by `_POSIX_C_SOURCE` set equal to 200809L is enabled by `_XOPEN_SOURCE` set equal to 700, there should be no need to define `_POSIX_C_SOURCE` if `_XOPEN_SOURCE` is so defined. Therefore, if `_XOPEN_SOURCE` is set equal to 700 and `_POSIX_C_SOURCE` is set equal to 200809L, the behavior is the same as if only `_XOPEN_SOURCE` is defined and set equal to 700. However, should `_POSIX_C_SOURCE` be set to a value greater than 200809L, the behavior is unspecified.

If `_XOPEN_SOURCE` is defined with the value 700 and `_POSIX_C_SOURCE` is undefined before inclusion of any header, then the header may define the `_POSIX_C_SOURCE` macro with the value 200809L.

2.2.2 The Name Space

XSI All identifiers in this volume of POSIX.1-2008, except *environ*, are defined in at least one of the headers, as shown in XBD [Chapter 13](#) (on page 219). When `_XOPEN_SOURCE` or `_POSIX_C_SOURCE` is defined, each header defines or declares some identifiers, potentially conflicting with identifiers used by the application. The set of identifiers visible to the application consists of precisely those identifiers from the header pages of the included headers, as well as additional identifiers reserved for the implementation. In addition, some headers may make visible identifiers from other headers as indicated on the relevant header pages.

Implementations may also add members to a structure or union without controlling the visibility of those members with a feature test macro, as long as a user-defined macro with the same name cannot interfere with the correct interpretation of the program. The identifiers reserved for use by the implementation are described below:

1. Each identifier with external linkage described in the header section is reserved for use as an identifier with external linkage if the header is included.
2. Each macro described in the header section is reserved for any use if the header is included.
3. Each identifier with file scope described in the header section is reserved for use as an identifier with file scope in the same name space if the header is included.

The prefixes `posix_`, `POSIX_`, and `_POSIX_` are reserved for use by POSIX.1-2008 and other

16062 POSIX standards. Implementations may add symbols to the headers shown in the following
16063 table, provided the identifiers for those symbols either:

- 16064 1. Begin with the corresponding reserved prefixes in the table, or
- 16065 2. Have one of the corresponding complete names in the table, or
- 16066 3. End in the string indicated as a reserved suffix in the table and do not use the reserved
16067 prefixes `posix_`, `POSIX_`, or `_POSIX_`, as long as the reserved suffix is in that part of the
16068 name considered significant by the implementation.

16069 Symbols that use the reserved prefix `_POSIX_` may be made visible by implementations in any
16070 header defined by POSIX.1-2008.

16071				
16072		Header	Prefix	Suffix
16073		<aio.h>	aio_, lio_, AIO_, LIO_	
16074		<arpa/inet.h>	inet_	
16075		<ctype.h>	to[a-z], is[a-z]	
16076		<dlfcn.h>	RTLD_

16137		<utime.h>	utim_		
16138	XSI	<utmpx.h>	ut_	_LVL, _PROCESS, _TIME	
16139					
16140		<wchar.h>	wcs[a-z]		
16141		<wctype.h>	is[a-z], to[a-z]		
16142		<wordexp.h>	we_, WRDE_		
16143		ANY header		_t	

Note: The notation [A–Z] indicates any uppercase letter in the portable character set. The notation [a–z] indicates any lowercase letter in the portable character set. Commas and spaces in the lists of prefixes and complete names in the above table are not part of any prefix or complete name.

If any header in the following table is included, macros with the prefixes shown may be defined. After the last inclusion of a given header, an application may use identifiers with the corresponding prefixes for its own purpose, provided their use is preceded by a **#undef** of the corresponding macro.

Header	Prefix
<errno.h>	E[0-9], E[A-Z]
<fcntl.h>	F_, O_
<fenv.h>	FE_[A-Z]
<inttypes.h>	PRI[Xa-z], SCN[Xa-z]
<locale.h>	LC_[A-Z]
<math.h>	FP_[A-Z]
<netinet/in.h>	IMPLINK_, IN_, IP_, IPPORT_, SOCK_,
	IN6_
<signal.h>	SIG_, SIG[A-Z],
	SV_
<stdio.h>	SEEK_
<stropts.h>	M_, MUXID_R[A-Z], STR
<sys/resource.h>	RLIM_
<sys/socket.h>	CMSG_
<sys/stat.h>	S_
<sys/uio.h>	IOV_
<termios.h>	I, O, V (See below.)
<unistd.h>	SEEK_

The following are used to reserve complete names for the **<stdint.h>** header:

```

INT[0-9A-Za-z-]*_MIN
INT[0-9A-Za-z-]*_MAX
INT[0-9A-Za-z-]*_C
UINT[0-9A-Za-z-]*_MIN
UINT[0-9A-Za-z-]*_MAX
UINT[0-9A-Za-z-]*_C

```

Note: The notation [0–9] indicates any digit. The notation [A–Z] indicates any uppercase letter in the portable character set. The notation [0–9a–z–_] indicates any digit, any lowercase letter in the portable character set, or <underscore>.

The following reserved names are used as exact matches for **<termios.h>**:

```

CBAUD      EXTB      VDSUSP
DEFECHO    FLUSHO    VLNEXT
ECHOCTL    LOBLK     VREPRINT
ECHOKE     PENDIN    VSTATUS
ECHOPRT    SWTCH     VWERASE
EXTA       VDISCARD

```

- 16187 The following identifiers are reserved regardless of the inclusion of headers:
- 16188 1. With the exception of identifiers beginning with the prefix `_POSIX_`, all identifiers that
- 16189 begin with an `<underscore>` and either an uppercase letter or another `<underscore>` are
- 16190 always reserved for any use by the implementation.
- 16191 2. All identifiers that begin with an `<underscore>` are always reserved for use as identifiers
- 16192 with file scope in both the ordinary identifier and tag name spaces.
- 16193 3. All identifiers in the table below are reserved for use as identifiers with external linkage.
- 16194 Some of these identifiers do not appear in this volume of POSIX.1-2008, but are reserved for
- 16195 future use by the ISO C standard.
- 16196 4. All functions and external identifiers defined in XBD [Chapter 13](#) (on page 219) are reserved
- 16197 for use as identifiers with external linkage.
- 16198 5. All the identifiers defined in this volume of POSIX.1-2008 that have external linkage are
- 16199 always reserved for use as identifiers with external linkage.
- 16200 **Note:** The notation `[a–z]` indicates any lowercase letter in the portable character set. The notation `' * '`
- 16201 indicates any combination of digits, letters in the portable character set, or `<underscore>`.
- 16202 No other identifiers are reserved.

Applications shall not declare or define identifiers with the same name as an identifier reserved in the same context. Since macro names are replaced whenever found, independent of scope and name space, macro names matching any of the reserved identifier names shall not be defined by an application if any associated header is included.

Except that the effect of each inclusion of **<assert.h>** depends on the definition of **NDEBUG**, headers may be included in any order, and each may be included more than once in a given scope, with no difference in effect from that of being included only once.

If used, the application shall ensure that a header is included outside of any external declaration or definition, and it shall be first included before the first reference to any type or macro it defines, or to any function or object it declares. However, if an identifier is declared or defined in more than one header, the second and subsequent associated headers may be included after the initial reference to the identifier. Prior to the inclusion of a header, the application shall not define any macros with names lexically identical to symbols defined by that header.

2.3 Error Numbers

Most functions can provide an error number. The means by which each function provides its error numbers is specified in its description.

Some functions provide the error number in a variable accessed through the symbol *errno*, defined by including the `<errno.h>` header. The value of *errno* should only be examined when it is indicated to be valid by a function's return value. No function in this volume of POSIX.1-2008 shall set *errno* to zero. For each thread of a process, the value of *errno* shall not be affected by function calls or assignments to *errno* by other threads.

Some functions return an error number directly as the function value. These functions return a value of zero to indicate success.

If more than one error occurs in processing a function call, any one of the possible errors may be returned, as the order of detection is undefined.

Implementations may support additional errors not included in this list, may generate errors included in this list under circumstances other than those described here, or may contain extensions or limitations that prevent some errors from occurring.

The ERRORS section on each reference page specifies which error conditions shall be detected by all implementations ("shall fail") and which may be optionally detected by an implementation ("may fail"). If no error condition is detected, the action requested shall be successful. If an error condition is detected, the action requested may have been partially performed, unless otherwise stated.

Implementations may generate error numbers listed here under circumstances other than those described, if and only if all those error conditions can always be treated identically to the error conditions as described in this volume of POSIX.1-2008. Implementations shall not generate a different error number from one required by this volume of POSIX.1-2008 for an error condition described in this volume of POSIX.1-2008, but may generate additional errors unless explicitly disallowed for a particular function.

Each implementation shall document, in the conformance document, situations in which each of the optional conditions defined in POSIX.1-2008 is detected. The conformance document may also contain statements that one or more of the optional error conditions are not detected.

Certain threads-related functions are not allowed to return an error code of [EINTR]. Where this applies it is stated in the ERRORS section on the individual function pages.

The following macro names identify the possible error numbers, in the context of the functions specifically defined in this volume of POSIX.1-2008; these general descriptions are more precisely defined in the ERRORS sections of the functions that return them. Only these macro names should be used in programs, since the actual value of the error number is unspecified. All values listed in this section shall be unique, except as noted below. The values for all these macros shall be found in the `<errno.h>` header defined in the Base Definitions volume of POSIX.1-2008. The actual values are unspecified by this volume of POSIX.1-2008.

[E2BIG]

Argument list too long. The sum of the number of bytes used by the new process image's argument list and environment list is greater than the system-imposed limit of {ARG_MAX} bytes.

or:

Lack of space in an output buffer.

or:

16345		Argument is greater than the system-imposed maximum.
16346		[EACCES]
16347		Permission denied. An attempt was made to access a file in a way forbidden by its file
16348		access permissions.
16349		[EADDRINUSE]
16350		Address in use. The specified address is in use.
16351		[EADDRNOTAVAIL]
16352		Address not available. The specified address is not available from the local system.
16353		[EAFNOSUPPORT]
16354		Address family not supported. The implementation does not support the specified address
16355		family, or the specified address is not a valid address for the address family of the specified
16356		socket.
16357		[EAGAIN]
16358		Resource temporarily unavailable. This is a temporary condition and later calls to the same
16359		routine may complete normally.
16360		[EALREADY]
16361		Connection already in progress. A connection request is already in progress for the specified
16362		socket.
16363		[EBADF]
16364		Bad file descriptor. A file descriptor argument is out of range, refers to no open file, or a
16365		read (write) request is made to a file that is only open for writing (reading).
16366		[EBADMSG]
16367	OB XSR	Bad message. During a <i>read()</i> , <i>getmsg()</i> , <i>getpmsg()</i> , or <i>ioctl()</i> I_RECVFD request to a
16368		STREAMS device, a message arrived at the head of the STREAM that is inappropriate for
16369		the function receiving the message.
16370		<i>read()</i> Message waiting to be read on a STREAM is not a data message.
16371		<i>getmsg()</i> or <i>getpmsg()</i>
16372		A file descriptor was received instead of a control message.
16373		<i>ioctl()</i> Control or data information was received instead of a file descriptor when
16374		I_RECVFD was specified.
16375		or:
16376		Bad Message. The implementation has detected a corrupted message.
16377		[EBUSY]
16378		Resource busy. An attempt was made to make use of a system resource that is not currently
16379		available, as it is being used by another process in a manner that would have conflicted
16380		with the request being made by this process.
16381		[ECANCELED]
16382		Operation canceled. The associated asynchronous operation was canceled before
16383		completion.
16384		[ECHILD]
16385		No child process. A <i>wait()</i> , <i>waitid()</i> , or <i>waitpid()</i> function was executed by a process that
16386		had no existing or unwaited-for child process.

16387	[ECONNABORTED]
16388	Connection aborted. The connection has been aborted.
16389	[ECONNREFUSED]
16390	Connection refused. An attempt to connect to a socket was refused because there was no
16391	process listening or because the queue of connection requests was full and the underlying
16392	protocol does not support retransmissions.
16393	[ECONNRESET]
16394	Connection reset. The connection was forcibly closed by the peer.
16395	[EDEADLK]
16396	Resource deadlock would occur. An attempt was made to lock a system resource that would
16397	have resulted in a deadlock situation.
16398	[EDESTADDRREQ]
16399	Destination address required. No bind address was established.
16400	[EDOM]
16401	Domain error. An input argument is outside the defined domain of the mathematical
16402	function (defined in the ISO C standard).
16403	[EDQUOT]
16404	Reserved.
16405	[EEXIST]
16406	File exists. An existing file was mentioned in an inappropriate context; for example, as a
16407	new link name in the <i>link()</i> function.
16408	[EFAULT]
16409	Bad address. The system detected an invalid address in attempting to use an argument of a
16410	call. The reliable detection of this error cannot be guaranteed, and when not detected may
16411	result in the generation of a signal, indicating an address violation, which is sent to the
16412	process.
16413	[EFBIG]
16414	File too large. The size of a file would exceed the maximum file size of an implementation
16415	or offset maximum established in the corresponding file description.
16416	[EHOSTUNREACH]
16417	Host is unreachable. The destination host cannot be reached (probably because the host is
16418	down or a remote router cannot reach it).
16419	[EIDRM]
16420	Identifier removed. Returned during XSI interprocess communication if an identifier has
16421	been removed from the system.
16422	[EILSEQ]
16423	Illegal byte sequence. A wide-character code has been detected that does not correspond to
16424	a valid character, or a byte sequence does not form a valid wide-character code (defined in
16425	the ISO C standard).
16426	[EINPROGRESS]
16427	Operation in progress. This code is used to indicate that an asynchronous operation has not
16428	yet completed.
16429	or:
16430	O_NONBLOCK is set for the socket file descriptor and the connection cannot be
16431	immediately established.

16432	[EINTR]	
16433		Interrupted function call. An asynchronous signal was caught by the process during the
16434		execution of an interruptible function. If the signal handler performs a normal return, the
16435		interrupted function call may return this condition (see the Base Definitions volume of
16436		POSIX.1-2008, <signal.h>).
16437	[EINVAL]	
16438		Invalid argument. Some invalid argument was supplied; for example, specifying an
16439		undefined signal in a <i>signal()</i> function or a <i>kill()</i> function.
16440	[EIO]	
16441		Input/output error. Some physical input or output error has occurred. This error may be
16442		reported on a subsequent operation on the same file descriptor. Any other error-causing
16443		operation on the same file descriptor may cause the [EIO] error indication to be lost.
16444	[EISCONN]	
16445		Socket is connected. The specified socket is already connected.
16446	[EISDIR]	
16447		Is a directory. An attempt was made to open a directory with write mode specified.
16448	[ELOOP]	
16449		Symbolic link loop. A loop exists in symbolic links encountered during pathname
16450		resolution. This error may also be returned if more than {SYMLOOP_MAX} symbolic links
16451		are encountered during pathname resolution.
16452	[EMFILE]	
16453		File descriptor value too large or too many open streams. An attempt was made to open a
16454	XSI	file descriptor with a value greater than or equal to {OPEN_MAX}, or greater than or equal
16455		to the soft limit RLIMIT_NOFILE for the process (if smaller than {OPEN_MAX}); or an
16456		attempt was made to open more than the maximum number of streams allowed in the
16457		process.
16458	[EMLINK]	
16459		Too many links. An attempt was made to have the link count of a single file exceed
16460		{LINK_MAX}.
16461	[EMSGSIZE]	
16462		Message too large. A message sent on a transport provider was larger than an internal
16463		message buffer or some other network limit.
16464		or:
16465		Inappropriate message buffer length.
16466	[EMULTIHOP]	
16467		Reserved.
16468	[ENAMETOOLONG]	
16469		Filename too long. The length of a pathname exceeds {PATH_MAX} and the
16470		implementation considers this to be an error, or a pathname component is longer than
16471		{NAME_MAX}. This error may also occur when pathname substitution, as a result of
16472		encountering a symbolic link during pathname resolution, results in a pathname string the
16473		size of which exceeds {PATH_MAX}.
16474	[ENETDOWN]	
16475		Network is down. The local network interface used to reach the destination is down.

16476		[ENETRESET]
16477		The connection was aborted by the network.
16478		[ENETUNREACH]
16479		Network unreachable. No route to the network is present.
16480		[ENFILE]
16481		Too many files open in system. Too many files are currently open in the system. The system
16482		has reached its predefined limit for simultaneously open files and temporarily cannot
16483		accept requests to open another one.
16484		[ENOBUFS]
16485		No buffer space available. Insufficient buffer resources were available in the system to
16486		perform the socket operation.
16487	OB XSR	[ENODATA]
16488		No message available. No message is available on the STREAM head read queue.
16489		[ENODEV]
16490		No such device. An attempt was made to apply an inappropriate function to a device; for
16491		example, trying to read a write-only device such as a printer.
16492		[ENOENT]
16493		No such file or directory. A component of a specified pathname does not exist, or the
16494		pathname is an empty string.
16495		[ENOEXEC]
16496		Executable file format error. A request is made to execute a file that, although it has
16497		appropriate privileges, is not in the format required by the implementation for executable
16498		files.
16499		[ENOLCK]
16500		No locks available. A system-imposed limit on the number of simultaneous file and record
16501		locks has been reached and no more are currently available.
16502		[ENOLINK]
16503		Reserved.
16504		[ENOMEM]
16505		Not enough space. The new process image requires more memory than is allowed by the
16506		hardware or system-imposed memory management constraints.
16507		[ENOMSG]
16508		No message of the desired type. The message queue does not contain a message of the
16509		required type during XSI interprocess communication.
16510		[ENOPROTOPT]
16511		Protocol not available. The protocol option specified to <i>setsockopt()</i> is not supported by the
16512		implementation.
16513		[ENOSPC]
16514		No space left on a device. During the <i>write()</i> function on a regular file or when extending a
16515		directory, there is no free space left on the device.
16516	OB XSR	[ENOSR]
16517		No STREAM resources. Insufficient STREAMS memory resources are available to perform a
16518		STREAMS-related function. This is a temporary condition; it may be recovered from if other
16519		processes release resources.

16520	OB XSR	[ENOSTR]	
16521		Not a STREAM. A STREAM function was attempted on a file descriptor that was not	
16522		associated with a STREAMS device.	
16523		[ENOSYS]	
16524		Function not implemented. An attempt was made to use a function that is not available in	
16525		this implementation.	
16526		[ENOTCONN]	
16527		Socket not connected. The socket is not connected.	
16528		[ENOTDIR]	
16529		Not a directory. A component of the specified pathname exists, but it is not a directory,	
16530		when a directory was expected; or an attempt was made to create a non-directory file, and	
16531		the specified pathname contains at least one non- <code><slash></code> character and ends with one or	
16532		more trailing <code><slash></code> characters.	
16533		[ENOTEMPTY]	
16534		Directory not empty. A directory other than an empty directory was supplied when an	
16535		empty directory was expected.	
16536		[ENOTRECOVERABLE]	
16537		State not recoverable. The state protected by a robust mutex is not recoverable.	
16538		[ENOTSOCK]	
16539		Not a socket. The file descriptor does not refer to a socket.	
16540		[ENOTSUP]	
16541		Not supported. The implementation does not support the requested feature or value.	
16542		[ENOTTY]	
16543		Inappropriate I/O control operation. A control function has been attempted for a file or	
16544		special file for which the operation is inappropriate.	
16545		[ENXIO]	
16546		No such device or address. Input or output on a special file refers to a device that does not	
16547		exist, or makes a request beyond the capabilities of the device. It may also occur when, for	
16548		example, a tape drive is not on-line.	
16549		[EOPNOTSUPP]	
16550		Operation not supported on socket. The type of socket (address family or protocol) does not	
16551		support the requested operation. A conforming implementation may assign the same values	
16552		for [EOPNOTSUPP] and [ENOTSUP].	
16553		[EOVERFLOW]	
16554		Value too large to be stored in data type. An operation was attempted which would	
16555		generate a value that is outside the range of values that can be represented in the relevant	
16556		data type or that are allowed for a given data item.	
16557		[EOWNERDEAD]	
16558		Previous owner died. The owner of a robust mutex terminated while holding the mutex	
16559		lock.	
16560		[EPERM]	
16561		Operation not permitted. An attempt was made to perform an operation limited to	
16562		processes with appropriate privileges or to the owner of a file or other resource.	
16563		[EPIPE]	
16564		Broken pipe. A write was attempted on a socket, pipe, or FIFO for which there is no process	
16565		to read the data.	

16566		[EPROTO]
16567		Protocol error. Some protocol error occurred. This error is device-specific, but is generally
16568		not related to a hardware failure.
16569		[EPROTONOSUPPORT]
16570		Protocol not supported. The protocol is not supported by the address family, or the protocol
16571		is not supported by the implementation.
16572		[EPROTOTYPE]
16573		Protocol wrong type for socket. The socket type is not supported by the protocol.
16574		[ERANGE]
16575		Result too large or too small. The result of the function is too large (overflow) or too small
16576		(underflow) to be represented in the available space (defined in the ISO C standard).
16577		[EROFS]
16578		Read-only file system. An attempt was made to modify a file or directory on a file system
16579		that is read-only.
16580		[ESPIPE]
16581		Invalid seek. An attempt was made to access the file offset associated with a pipe or FIFO.
16582		[ESRCH]
16583		No such process. No process can be found corresponding to that specified by the given
16584		process ID.
16585		[ESTALE]
16586		Reserved.
16587	OB XSR	[ETIME]
16588		STREAM <i>ioctl()</i> timeout. The timer set for a STREAMS <i>ioctl()</i> call has expired. The cause of
16589		this error is device-specific and could indicate either a hardware or software failure, or a
16590		timeout value that is too short for the specific operation. The status of the <i>ioctl()</i> operation is
16591		unspecified.
16592		[ETIMEDOUT]
16593		Connection timed out. The connection to a remote machine has timed out. If the connection
16594		timed out during execution of the function that reported this error (as opposed to timing
16595		out prior to the function being called), it is unspecified whether the function has completed
16596		some or all of the documented behavior associated with a successful completion of the
16597		function.
16598		or:
16599		Operation timed out. The time limit associated with the operation was exceeded before the
16600		operation completed.
16601		[ETXTBSY]
16602		Text file busy. An attempt was made to execute a pure-procedure program that is currently
16603		open for writing, or an attempt has been made to open for writing a pure-procedure
16604		program that is being executed.
16605		[EWOULDBLOCK]
16606		Operation would block. An operation on a socket marked as non-blocking has encountered
16607		a situation such as no data available that otherwise would have caused the function to
16608		suspend execution.
16609		A conforming implementation may assign the same values for [EWOULDBLOCK] and
16610		[EAGAIN].

16611 [EXDEV]
 16612 Improper link. A link to a file on another file system was attempted.

16613 2.3.1 Additional Error Numbers

16614 Additional implementation-defined error numbers may be defined in `<errno.h>`.

16615 2.4 Signal Concepts

16616 2.4.1 Signal Generation and Delivery

16617 A signal is said to be “generated” for (or sent to) a process or thread when the event that causes
 16618 the signal first occurs. Examples of such events include detection of hardware faults, timer
 16619 expiration, signals generated via the **sigevent** structure and terminal activity, as well as
 16620 invocations of the `kill()` and `sigqueue()` functions. In some circumstances, the same event
 16621 generates signals for multiple processes.

16622 At the time of generation, a determination shall be made whether the signal has been generated
 16623 for the process or for a specific thread within the process. Signals which are generated by some
 16624 action attributable to a particular thread, such as a hardware fault, shall be generated for the
 16625 thread that caused the signal to be generated. Signals that are generated in association with a
 16626 process ID or process group ID or an asynchronous event, such as terminal activity, shall be
 16627 generated for the process.

16628 Each process has an action to be taken in response to each signal defined by the system (see
 16629 [Section 2.4.3](#), on page 490). A signal is said to be “delivered” to a process when the appropriate
 16630 action for the process and signal is taken. A signal is said to be “accepted” by a process when the
 16631 signal is selected and returned by one of the `sigwait()` functions.

16632 During the time between the generation of a signal and its delivery or acceptance, the signal is
 16633 said to be “pending”. Ordinarily, this interval cannot be detected by an application. However, a
 16634 signal can be “blocked” from delivery to a thread. If the action associated with a blocked signal
 16635 is anything other than to ignore the signal, and if that signal is generated for the thread, the
 16636 signal shall remain pending until it is unblocked, it is accepted when it is selected and returned
 16637 by a call to the `sigwait()` function, or the action associated with it is set to ignore the signal.
 16638 Signals generated for the process shall be delivered to exactly one of those threads within the
 16639 process which is in a call to a `sigwait()` function selecting that signal or has not blocked delivery
 16640 of the signal. If there are no threads in a call to a `sigwait()` function selecting that signal, and if all
 16641 threads within the process block delivery of the signal, the signal shall remain pending on the
 16642 process until a thread calls a `sigwait()` function selecting that signal, a thread unblocks delivery
 16643 of the signal, or the action associated with the signal is set to ignore the signal. If the action
 16644 associated with a blocked signal is to ignore the signal and if that signal is generated for the
 16645 process, it is unspecified whether the signal is discarded immediately upon generation or
 16646 remains pending.

16647 Each thread has a “signal mask” that defines the set of signals currently blocked from delivery
 16648 to it. The signal mask for a thread shall be initialized from that of its parent or creating thread,
 16649 or from the corresponding thread in the parent process if the thread was created as the result of a
 16650 call to `fork()`. The `pthread_sigmask()`, `sigaction()`, `sigprocmask()`, and `sigsuspend()` functions control
 16651 the manipulation of the signal mask.

The determination of which action is taken in response to a signal is made at the time the signal is delivered, allowing for any changes since the time of generation. This determination is independent of the means by which the signal was originally generated. If a subsequent occurrence of a pending signal is generated, it is implementation-defined as to whether the signal is delivered or accepted more than once in circumstances other than those in which queuing is required. The order in which multiple, simultaneously pending signals outside the range SIGRTMIN to SIGRTMAX are delivered to or accepted by a process is unspecified.

When any stop signal (SIGSTOP, SIGTSTP, SIGTTIN, SIGTTOU) is generated for a process or thread, all pending SIGCONT signals for that process or any of the threads within that process shall be discarded. Conversely, when SIGCONT is generated for a process or thread, all pending stop signals for that process or any of the threads within that process shall be discarded. When SIGCONT is generated for a process that is stopped, the process shall be continued, even if the SIGCONT signal is ignored by the process or is blocked by all threads within the process and there are no threads in a call to a *sigwait()* function selecting SIGCONT. If SIGCONT is blocked by all threads within the process, there are no threads in a call to a *sigwait()* function selecting SIGCONT, and SIGCONT is not ignored by the process, the SIGCONT signal shall remain pending on the process until it is either unblocked by a thread or a thread calls a *sigwait()* function selecting SIGCONT, or a stop signal is generated for the process or any of the threads within the process.

An implementation shall document any condition not specified by this volume of POSIX.1-2008 under which the implementation generates signals.

2.4.2 Realtime Signal Generation and Delivery

This section describes functionality to support realtime signal generation and delivery.

Some signal-generating functions, such as high-resolution timer expiration, asynchronous I/O completion, interprocess message arrival, and the *sigqueue()* function, support the specification of an application-defined value, either explicitly as a parameter to the function or in a **sigevent** structure parameter. The **sigevent** structure is defined in **<signal.h>** and contains at least the following members:

Member Type	Member Name	Description
int	<i>sigev_notify</i>	Notification type.
int	<i>sigev_signo</i>	Signal number.
union signal	<i>sigev_value</i>	Signal value.
void(*)(union signal)	<i>sigev_notify_function</i>	Notification function.
(pthread_attr_t*)	<i>sigev_notify_attributes</i>	Notification attributes.

The *sigev_notify* member specifies the notification mechanism to use when an asynchronous event occurs. This volume of POSIX.1-2008 defines the following values for the *sigev_notify* member:

SIGEV_NONE No asynchronous notification shall be delivered when the event of interest occurs.

SIGEV_SIGNAL The signal specified in *sigev_signo* shall be generated for the process when the event of interest occurs. If the implementation supports the Realtime Signals Extension option and if the SA_SIGINFO flag is set for that signal number, then the signal shall be queued to the process and the value specified in *sigev_value* shall be the *si_value* component of the generated signal. If SA_SIGINFO is not set for that signal number, it is unspecified whether the signal is queued and what value, if any, is sent.

SIGEV_THREAD A notification function shall be called to perform notification.

An implementation may define additional notification mechanisms.

The *sigeval_signo* member specifies the signal to be generated. The *sigeval_value* member is the application-defined value to be passed to the signal-catching function at the time of the signal delivery or to be returned at signal acceptance as the *si_value* member of the **siginfo_t** structure.

The **sigval** union is defined in **<signal.h>** and contains at least the following members:

Member Type	Member Name	Description
int	<i>sival_int</i>	Integer signal value.
void*	<i>sival_ptr</i>	Pointer signal value.

The *sival_int* member shall be used when the application-defined value is of type **int**; the *sival_ptr* member shall be used when the application-defined value is a pointer.

When a signal is generated by the *sigqueue()* function or any signal-generating function that supports the specification of an application-defined value, the signal shall be marked pending and, if the SA_SIGINFO flag is set for that signal, the signal shall be queued to the process along with the application-specified signal value. Multiple occurrences of signals so generated are queued in FIFO order. It is unspecified whether signals so generated are queued when the SA_SIGINFO flag is not set for that signal.

Signals generated by the *kill()* function or other events that cause signals to occur, such as detection of hardware faults, *alarm()* timer expiration, or terminal activity, and for which the implementation does not support queuing, shall have no effect on signals already queued for the same signal number.

When multiple unblocked signals, all in the range SIGRTMIN to SIGRTMAX, are pending, the behavior shall be as if the implementation delivers the pending unblocked signal with the lowest signal number within that range. No other ordering of signal delivery is specified.

If, when a pending signal is delivered, there are additional signals queued to that signal number, the signal shall remain pending. Otherwise, the pending indication shall be reset.

Multi-threaded programs can use an alternate event notification mechanism. When a notification is processed, and the *sigeval_notify* member of the **sigevent** structure has the value SIGEV_THREAD, the function *sigeval_notify_function* is called with parameter *sigeval_value*.

The function shall be executed in an environment as if it were the *start_routine* for a newly created thread with thread attributes specified by *sigeval_notify_attributes*. If *sigeval_notify_attributes* is NULL, the behavior shall be as if the thread were created with the *detachstate* attribute set to PTHREAD_CREATE_DETACHED. Supplying an attributes structure with a *detachstate* attribute of PTHREAD_CREATE_JOINABLE results in undefined behavior. The signal mask of this thread is implementation-defined.

2.4.3 Signal Actions

There are three types of action that can be associated with a signal: SIG_DFL, SIG_IGN, or a pointer to a function. Initially, all signals shall be set to SIG_DFL or SIG_IGN prior to entry of the *main()* routine (see the *exec* functions). The actions prescribed by these values are as follows.

SIG_DFL

Signal-specific default action.

The default actions for the signals defined in this volume of POSIX.1-2008 are specified under **<signal.h>**. The default actions for the realtime signals in the range SIGRTMIN to SIGRTMAX shall be to terminate the process abnormally.

If the default action is to terminate the process abnormally, the process is terminated as if by a call to `_exit()`, except that the status made available to `wait()`, `waitid()`, and `waitpid()` indicates abnormal termination by the signal. If the default action is to terminate the process abnormally with additional actions, implementation-defined abnormal termination actions, such as creation of a core file, may also occur.

If the default action is to stop the process, the execution of that process is temporarily suspended. When a process stops, a SIGCHLD signal shall be generated for its parent process, unless the parent process has set the SA_NOCLDSTOP flag. While a process is stopped, any additional signals that are sent to the process shall not be delivered until the process is continued, except SIGKILL which always terminates the receiving process. A process that is a member of an orphaned process group shall not be allowed to stop in response to the SIGTSTP, SIGTTIN, or SIGTTOU signals. In cases where delivery of one of these signals would stop such a process, the signal shall be discarded.

If the default action is to ignore the signal, delivery of the signal shall have no effect on the process.

Setting a signal action to SIG_DFL for a signal that is pending, and whose default action is to ignore the signal (for example, SIGCHLD), shall cause the pending signal to be discarded, whether or not it is blocked. Any queued values pending shall be discarded and the resources used to queue them shall be released and returned to the system for other use.

The default action for SIGCONT is to resume execution at the point where the process was stopped, after first handling any pending unblocked signals.

When a stopped process is continued, a SIGCHLD signal may be generated for its parent process, unless the parent process has set the SA_NOCLDSTOP flag.

SIG_IGN

Ignore signal.

Delivery of the signal shall have no effect on the process. The behavior of a process is undefined after it ignores a SIGFPE, SIGILL, SIGSEGV, or SIGBUS signal that was not generated by `kill()`, `sigqueue()`, or `raise()`.

The system shall not allow the action for the signals SIGKILL or SIGSTOP to be set to SIG_IGN.

Setting a signal action to SIG_IGN for a signal that is pending shall cause the pending signal to be discarded, whether or not it is blocked.

If a process sets the action for the SIGCHLD signal to SIG_IGN, the behavior is unspecified, except as specified below.

If the action for the SIGCHLD signal is set to SIG_IGN, child processes of the calling processes shall not be transformed into zombie processes when they terminate. If the calling process subsequently waits for its children, and the process has no unwaited-for children that were transformed into zombie processes, it shall block until all of its children terminate, and `wait()`, `waitid()`, and `waitpid()` shall fail and set `errno` to [ECHILD].

Any queued values pending shall be discarded and the resources used to queue them shall be

released and made available to queue other signals.

Pointer to a Function

Catch signal.

On delivery of the signal, the receiving process is to execute the signal-catching function at the specified address. After returning from the signal-catching function, the receiving process shall resume execution at the point at which it was interrupted.

If the SA_SIGINFO flag for the signal is cleared, the signal-catching function shall be entered as a C-language function call as follows:

```
void func(int signo);
```

If the SA_SIGINFO flag for the signal is set, the signal-catching function shall be entered as a C-language function call as follows:

```
void func(int signo, siginfo_t *info, void *context);
```

where *func* is the specified signal-catching function, *signo* is the signal number of the signal being delivered, and *info* is a pointer to a **siginfo_t** structure defined in **<signal.h>** containing at least the following members:

Member Type	Member Name	Description
int	<i>si_signo</i>	Signal number.
int	<i>si_code</i>	Cause of the signal.
pid_t	<i>si_pid</i>	Sending process ID.
uid_t	<i>si_uid</i>	Real user ID of sending process.
void *	<i>si_addr</i>	Address of faulting instruction.
int	<i>si_status</i>	Exit value or signal.
union signal	<i>si_value</i>	Signal value.

The *si_signo* member shall contain the signal number. This shall be the same as the *signo* parameter. The *si_code* member shall contain a code identifying the cause of the signal. The following non-signal-specific values are defined for *si_code*:

SI_USER The signal was sent by the *kill()* function. The implementation may set *si_code* to SI_USER if the signal was sent by the *raise()* or *abort()* functions or any similar functions provided as implementation extensions.

SI_QUEUE The signal was sent by the *sigqueue()* function.

SI_TIMER The signal was generated by the expiration of a timer set by *timer_settime()*.

SI_ASYNCIO The signal was generated by the completion of an asynchronous I/O request.

MSG SI_MESGQ The signal was generated by the arrival of a message on an empty message queue.

Signal-specific values for *si_code* are also defined, as described in XBD **<signal.h>**.

If the signal was not generated by one of the functions or events listed above, *si_code* shall be set either to one of the signal-specific values described in XBD **<signal.h>**, or to an implementation-defined value that is not equal to any of the values defined above.

XSI If *si_code* is SI_USER or SI_QUEUE, or any value less than or equal to 0, then the signal was generated by a process and *si_pid* and *si_uid* shall be set to the process ID and the real user ID of the sender, respectively.

In addition, *si_addr*, *si_pid*, *si_status*, and *si_uid* shall be set for certain signal-specific values of

16823	<i>si_code</i> , as described in XBD <signal.h>.	
16824	If <i>si_code</i> is one of SI_QUEUE, SI_TIMER, SI_ASYNCIO, or SI_MESGQ, then <i>si_value</i> shall	
16825	contain the application-specified signal value. Otherwise, the contents of <i>si_value</i> are undefined.	
16826	The behavior of a process is undefined after it returns normally from a signal-catching function	
16827	for a SIGBUS, SIGFPE, SIGILL, or SIGSEGV signal that was not generated by <i>kill()</i> , <i>sigqueue()</i> ,	
16828	or <i>raise()</i> .	
16829	The system shall not allow a process to catch the signals SIGKILL and SIGSTOP.	
16830	If a process establishes a signal-catching function for the SIGCHLD signal while it has a	
16831	terminated child process for which it has not waited, it is unspecified whether a SIGCHLD	
16832	signal is generated to indicate that child process.	
16833	If the process is multi-threaded, or if the process is single-threaded and a signal handler is	
16834	executed other than as the result of:	
16835	• The process calling <i>abort()</i> , <i>raise()</i> , <i>kill()</i> , <i>pthread_kill()</i> , or <i>sigqueue()</i> to generate a signal	
16836	that is not blocked	
16837	• A pending signal being unblocked and being delivered before the call that unblocked it	
16838	returns	
16839	the behavior is undefined if the signal handler refers to any object other than <i>errno</i> with static	
16840	storage duration other than by assigning a value to an object declared as volatile sig_atomic_t ,	
16841	or if the signal handler calls any function defined in this standard other than one of the functions	
16842	listed in the following table.	
16843	The following table defines a set of functions that shall be async-signal-safe. Therefore,	
16844	applications can invoke them, without restriction, from signal-catching functions:	

16845	<code>_Exit()</code>	<code>fexecve()</code>	<code>posix_trace_event()</code>	<code>sigprocmask()</code>
16846	<code>_exit()</code>	<code>fork()</code>	<code>pselect()</code>	<code>sigqueue()</code>
16847	<code>abort()</code>	<code>fstat()</code>	<code>pthread_kill()</code>	<code>sigset()</code>
16848	<code>accept()</code>	<code>fstatat()</code>	<code>pthread_self()</code>	<code>sigsuspend()</code>
16849	<code>access()</code>	<code>fsync()</code>	<code>pthread_sigmask()</code>	<code>sleep()</code>
16850	<code>aio_error()</code>	<code>ftruncate()</code>	<code>raise()</code>	<code>socketatmark()</code>
16851	<code>aio_return()</code>	<code>futimens()</code>	<code>read()</code>	<code>socket()</code>
16852	<code>aio_suspend()</code>	<code>getegid()</code>	<code>readlink()</code>	<code>socketpair()</code>
16853	<code>alarm()</code>	<code>geteuid()</code>	<code>readlinkat()</code>	<code>stat()</code>
16854	<code>bind()</code>	<code>getgid()</code>	<code>recv()</code>	<code>symlink()</code>
16855	<code>cfgetispeed()</code>	<code>getgroups()</code>	<code>recvfrom()</code>	<code>symlinkat()</code>
16856	<code>cfgetospeed()</code>	<code>getpeername()</code>	<code>recvmsg()</code>	<code>tcdrain()</code>
16857	<code>cfsetispeed()</code>	<code>getpggrp()</code>	<code>rename()</code>	<code>tcflow()</code>
16858	<code>cfsetospeed()</code>	<code>getpid()</code>	<code>renameat()</code>	<code>tcflush()</code>
16859	<code>chdir()</code>	<code>getppid()</code>	<code>rmdir()</code>	<code>tcgetattr()</code>
16860	<code>chmod()</code>	<code>getsockname()</code>	<code>select()</code>	<code>tcgetpgrp()</code>
16861	<code>chown()</code>	<code>getsockopt()</code>	<code>sem_post()</code>	<code>tcsendbreak()</code>
16862	<code>clock_gettime()</code>	<code>getuid()</code>	<code>send()</code>	<code>tcsetattr()</code>
16863	<code>close()</code>	<code>kill()</code>	<code>sendmsg()</code>	<code>tcsetpgrp()</code>
16864	<code>connect()</code>	<code>link()</code>	<code>sendto()</code>	<code>time()</code>
16865	<code>creat()</code>	<code>linkat()</code>	<code>setgid()</code>	<code>timer_getoverrun()</code>
16866	<code>dup()</code>	<code>listen()</code>	<code>setpgid()</code>	<code>timer_gettime()</code>
16867	<code>dup2()</code>	<code>lseek()</code>	<code>setsid()</code>	<code>timer_settime()</code>
16868	<code>execl()</code>	<code>lstat()</code>	<code>setsockopt()</code>	<code>times()</code>
16869	<code>execle()</code>	<code>mkdir()</code>	<code>setuid()</code>	<code>umask()</code>
16870	<code>execv()</code>	<code>mkdirat()</code>	<code>shutdown()</code>	<code>uname()</code>
16871	<code>execve()</code>	<code>mkfifo()</code>	<code>sigaction()</code>	<code>unlink()</code>
16872	<code>faccessat()</code>	<code>mkfifoat()</code>	<code>sigaddset()</code>	<code>unlinkat()</code>
16873	<code>fchdir()</code>	<code>mknod()</code>	<code>sigdelset()</code>	<code>utime()</code>
16874	<code>fchmod()</code>	<code>mknodat()</code>	<code>sigemptyset()</code>	<code>utimensat()</code>
16875	<code>fchmodat()</code>	<code>open()</code>	<code>sigfillset()</code>	<code>utimes()</code>
16876	<code>fchown()</code>	<code>openat()</code>	<code>sigismember()</code>	<code>wait()</code>
16877	<code>fchownat()</code>	<code>pause()</code>	<code>signal()</code>	<code>waitpid()</code>
16878	<code>fcntl()</code>	<code>pipe()</code>	<code>sigpause()</code>	<code>write()</code>
16879	<code>fdatasync()</code>	<code>poll()</code>	<code>sigpending()</code>	

All functions not in the above table are considered to be unsafe with respect to signals. In the presence of signals, all functions defined by this volume of POSIX.1-2008 shall behave as defined when called from or interrupted by a signal-catching function, with a single exception: when a signal interrupts an unsafe function and the signal-catching function calls an unsafe function, the behavior is undefined.

Operations which obtain the value of *errno* and operations which assign a value to *errno* shall be async-signal-safe.

When a signal is delivered to a thread, if the action of that signal specifies termination, stop, or continue, the entire process shall be terminated, stopped, or continued, respectively.

2.4.4 Signal Effects on Other Functions

Signals affect the behavior of certain functions defined by this volume of POSIX.1-2008 if delivered to a process while it is executing such a function. If the action of the signal is to terminate the process, the process shall be terminated and the function shall not return. If the action of the signal is to stop the process, the process shall stop until continued or terminated. Generation of a SIGCONT signal for the process shall cause the process to be continued, and the original function shall continue at the point the process was stopped. If the action of the signal is to invoke a signal-catching function, the signal-catching function shall be invoked; in this case the original function is said to be “interrupted” by the signal. If the signal-catching function executes a **return** statement, the behavior of the interrupted function shall be as described individually for that function, except as noted for unsafe functions. Signals that are ignored shall not affect the behavior of any function; signals that are blocked shall not affect the behavior of any function until they are unblocked and then delivered, except as specified for the *sigpending()* and *sigwait()* functions.

2.5 Standard I/O Streams

A stream is associated with an external file (which may be a physical device) or memory buffer by “opening” a file or buffer. This may involve “creating” a new file. Creating an existing file causes its former contents to be discarded if necessary. If a file can support positioning requests (such as a disk file, as opposed to a terminal), then a “file position indicator” associated with the stream is positioned at the start (byte number 0) of the file, unless the file is opened with append mode, in which case it is implementation-defined whether the file position indicator is initially positioned at the beginning or end of the file. The file position indicator is maintained by subsequent reads, writes, and positioning requests, to facilitate an orderly progression through the file. All input takes place as if bytes were read by successive calls to *fgetc()*; all output takes place as if bytes were written by successive calls to *fputc()*.

When a stream is “unbuffered”, bytes are intended to appear from the source or at the destination as soon as possible; otherwise, bytes may be accumulated and transmitted as a block. When a stream is “fully buffered”, bytes are intended to be transmitted as a block when a buffer is filled. When a stream is “line buffered”, bytes are intended to be transmitted as a block when a <newline> byte is encountered. Furthermore, bytes are intended to be transmitted as a block when a buffer is filled, when input is requested on an unbuffered stream, or when input is requested on a line-buffered stream that requires the transmission of bytes. Support for these characteristics is implementation-defined, and may be affected via *setbuf()* and *setvbuf()*.

A file may be disassociated from a controlling stream by “closing” the file. Output streams are flushed (any unwritten buffer contents are transmitted) before the stream is disassociated from the file. The value of a pointer to a **FILE** object is unspecified after the associated file is closed (including the standard streams).

A file may be subsequently reopened, by the same or another program execution, and its contents reclaimed or modified (if it can be repositioned at its start). If the *main()* function returns to its original caller, or if the *exit()* function is called, all open files are closed (hence all output streams are flushed) before program termination. Other paths to program termination, such as calling *abort()*, need not close all files properly.

The address of the **FILE** object used to control a stream may be significant; a copy of a **FILE** object need not necessarily serve in place of the original.

At program start-up, three streams are predefined and need not be opened explicitly: *standard input* (for reading conventional input), *standard output* (for writing conventional output), and

standard error (for writing diagnostic output). When opened, the standard error stream is not fully buffered; the standard input and standard output streams are fully buffered if and only if the stream can be determined not to refer to an interactive device.

CX A stream associated with a memory buffer shall have the same operations for text files that a stream associated with an external file would have. In addition, the stream orientation shall be determined in exactly the same fashion.

Input and output operations on a stream associated with a memory buffer by a call to *fmemopen()* shall be constrained by the implementation to take place within the bounds of the memory buffer. In the case of a stream opened by *open_memstream()* or *open_wmemstream()*, the memory area shall grow dynamically to accommodate write operations as necessary. For output, data is moved from the buffer provided by *setvbuf()* to the memory stream during a flush or close operation.

2.5.1 Interaction of File Descriptors and Standard I/O Streams

CX This section describes the interaction of file descriptors and standard I/O streams. The functionality described in this section is an extension to the ISO C standard (and the rest of this section is not further CX shaded).

An open file description may be accessed through a file descriptor, which is created using functions such as *open()* or *pipe()*, or through a stream, which is created using functions such as *fopen()* or *popen()*. Either a file descriptor or a stream is called a “handle” on the open file description to which it refers; an open file description may have several handles.

Handles can be created or destroyed by explicit user action, without affecting the underlying open file description. Some of the ways to create them include *fcntl()*, *dup()*, *fdopen()*, *fileno()*, and *fork()*. They can be destroyed by at least *fclose()*, *close()*, and the *exec* functions.

A file descriptor that is never used in an operation that could affect the file offset (for example, *read()*, *write()*, or *lseek()*) is not considered a handle for this discussion, but could give rise to one (for example, as a consequence of *fdopen()*, *dup()*, or *fork()*). This exception does not include the file descriptor underlying a stream, whether created with *fopen()* or *fdopen()*, so long as it is not used directly by the application to affect the file offset. The *read()* and *write()* functions implicitly affect the file offset; *lseek()* explicitly affects it.

The result of function calls involving any one handle (the “active handle”) is defined elsewhere in this volume of POSIX.1-2008, but if two or more handles are used, and any one of them is a stream, the application shall ensure that their actions are coordinated as described below. If this is not done, the result is undefined.

A handle which is a stream is considered to be closed when either an *fclose()* or *freopen()* is executed on it (the result of *freopen()* is a new stream, which cannot be a handle on the same open file description as its previous value), or when the process owning that stream terminates with *exit()*, *abort()*, or due to a signal. A file descriptor is closed by *close()*, *_exit()*, or the *exec* functions when *FD_CLOEXEC* is set on that file descriptor.

For a handle to become the active handle, the application shall ensure that the actions below are performed between the last use of the handle (the current active handle) and the first use of the second handle (the future active handle). The second handle then becomes the active handle. All activity by the application affecting the file offset on the first handle shall be suspended until it again becomes the active file handle. (If a stream function has as an underlying function one that affects the file offset, the stream function shall be considered to affect the file offset.)

The handles need not be in the same process for these rules to apply.

Note that after a *fork()*, two handles exist where one existed before. The application shall ensure that, if both handles can ever be accessed, they are both in a state where the other could become the active handle first. The application shall prepare for a *fork()* exactly as if it were a change of active handle. (If the only action performed by one of the processes is one of the *exec* functions or *_exit()* (not *exit()*), the handle is never accessed in that process.)

For the first handle, the first applicable condition below applies. After the actions required below are taken, if the handle is still open, the application can close it.

- If it is a file descriptor, no action is required.
- If the only further action to be performed on any handle to this open file descriptor is to close it, no action need be taken.
- If it is a stream which is unbuffered, no action need be taken.
- If it is a stream which is line buffered, and the last byte written to the stream was a <newline> (that is, as if a:

```
putc ( '\n' )
```

was the most recent operation on that stream), no action need be taken.

- If it is a stream which is open for writing or appending (but not also open for reading), the application shall either perform an *fflush()*, or the stream shall be closed.
- If the stream is open for reading and it is at the end of the file (*feof()* is true), no action need be taken.
- If the stream is open with a mode that allows reading and the underlying open file description refers to a device that is capable of seeking, the application shall either perform an *fflush()*, or the stream shall be closed.

For the second handle:

- If any previous active handle has been used by a function that explicitly changed the file offset, except as required above for the first handle, the application shall perform an *lseek()* or *fseek()* (as appropriate to the type of handle) to an appropriate location.

If the active handle ceases to be accessible before the requirements on the first handle, above, have been met, the state of the open file description becomes undefined. This might occur during functions such as a *fork()* or *_exit()*.

The *exec* functions make inaccessible all streams that are open at the time they are called, independent of which streams or file descriptors may be available to the new process image.

When these rules are followed, regardless of the sequence of handles used, implementations shall ensure that an application, even one consisting of several processes, shall yield correct results: no data shall be lost or duplicated when writing, and all data shall be written in order, except as requested by seeks. It is implementation-defined whether, and under what conditions, all input is seen exactly once.

Each function that operates on a stream is said to have zero or more “underlying functions”. This means that the stream function shares certain traits with the underlying functions, but does not require that there be any relation between the implementations of the stream function and its underlying functions.

2.5.2 Stream Orientation and Encoding Rules

For conformance to the ISO/IEC 9899:1999 standard, the definition of a stream includes an “orientation”. After a stream is associated with an external file, but before any operations are performed on it, the stream is without orientation. Once a wide-character input/output function has been applied to a stream without orientation, the stream shall become “wide-oriented”. Similarly, once a byte input/output function has been applied to a stream without orientation, the stream shall become “byte-oriented”. Only a call to the *freopen()* function or the *fwide()* function can otherwise alter the orientation of a stream.

A successful call to *freopen()* shall remove any orientation. The three predefined streams *standard input*, *standard output*, and *standard error* shall be unoriented at program start-up.

Byte input/output functions cannot be applied to a wide-oriented stream, and wide-character input/output functions cannot be applied to a byte-oriented stream. The remaining stream operations shall not affect and shall not be affected by a stream’s orientation, except for the following additional restriction:

- For wide-oriented streams, after a successful call to a file-positioning function that leaves the file position indicator prior to the end-of-file, a wide-character output function can overwrite a partial character; any file contents beyond the byte(s) written are henceforth undefined.

Each wide-oriented stream has an associated **mbstate_t** object that stores the current parse state of the stream. A successful call to *fgetpos()* shall store a representation of the value of this **mbstate_t** object as part of the value of the **fpos_t** object. A later successful call to *fsetpos()* using the same stored **fpos_t** value shall restore the value of the associated **mbstate_t** object as well as the position within the controlled stream.

Implementations that support multiple encoding rules associate an encoding rule with the stream. The encoding rule shall be determined by the setting of the *LC_CTYPE* category in the current locale at the time when the stream becomes wide-oriented. As with the stream’s orientation, the encoding rule associated with a stream cannot be changed once it has been set, except by a successful call to *freopen()* which clears the encoding rule and resets the orientation to unoriented.

Although wide-oriented streams are conceptually sequences of wide characters, the external file associated with a wide-oriented stream is a sequence of (possibly multi-byte) characters generalized as follows:

- Multi-byte encodings within files may contain embedded null bytes (unlike multi-byte encodings valid for use internal to the program).
- A file need not begin nor end in the initial shift state.

Moreover, the encodings used for characters may differ among files. Both the nature and choice of such encodings are implementation-defined.

The wide-character input functions read characters from the stream and convert them to wide characters as if they were read by successive calls to the *fgetwc()* function. Each conversion shall occur as if by a call to the *mbrtowc()* function, with the conversion state described by the stream’s own **mbstate_t** object, except the encoding rule associated with the stream is used instead of the encoding rule implied by the *LC_CTYPE* category of the current locale.

The wide-character output functions convert wide characters to (possibly multi-byte) characters and write them to the stream as if they were written by successive calls to the *fputwc()* function. Each conversion shall occur as if by a call to the *wcrtomb()* function, with the conversion state described by the stream’s own **mbstate_t** object, except the encoding rule associated with the stream is used instead of the encoding rule implied by the *LC_CTYPE* category of the current

locale.

An “encoding error” shall occur if the character sequence presented to the underlying `mbrtowc()` function does not form a valid (generalized) character, or if the code value passed to the underlying `wcrtomb()` function does not correspond to a valid (generalized) character. The wide-character input/output functions and the byte input/output functions store the value of the macro `[EILSEQ]` in `errno` if and only if an encoding error occurs.

2.6 STREAMS

OB XSR STREAMS functionality is provided on implementations supporting the XSI STREAMS Option Group. The functionality described in this section is dependent on support of the XSI STREAMS option (and the rest of this section is not further shaded for this option).

STREAMS provides a uniform mechanism for implementing networking services and other character-based I/O. The STREAMS function provides direct access to protocol modules. STREAMS modules are unspecified objects. Access to STREAMS modules is provided by interfaces in POSIX.1-2008. Creation of STREAMS modules is outside the scope of POSIX.1-2008.

A STREAM is typically a full-duplex connection between a process and an open device or pseudo-device. However, since pipes may be STREAMS-based, a STREAM can be a full-duplex connection between two processes. The STREAM itself exists entirely within the implementation and provides a general character I/O function for processes. It optionally includes one or more intermediate processing modules that are interposed between the process end of the STREAM (STREAM head) and a device driver at the end of the STREAM (STREAM end).

STREAMS I/O is based on messages. There are three types of message:

- *Data messages* containing actual data for input or output
- *Control data* containing instructions for the STREAMS modules and underlying implementation
- Other messages, which include file descriptors

The interface between the STREAM and the rest of the implementation is provided by a set of functions at the STREAM head. When a process calls `write()`, `writew()`, `putmsg()`, `putpmsg()`, or `ioctl()`, messages are sent down the STREAM, and `read()`, `readv()`, `getmsg()`, or `getpmsg()` accepts data from the STREAM and passes it to a process. Data intended for the device at the downstream end of the STREAM is packaged into messages and sent downstream, while data and signals from the device are composed into messages by the device driver and sent upstream to the STREAM head.

When a STREAMS-based device is opened, a STREAM shall be created that contains the STREAM head and the STREAM end (driver). If pipes are STREAMS-based in an implementation, when a pipe is created, two STREAMS shall be created, each containing a STREAM head. Other modules are added to the STREAM using `ioctl()`. New modules are “pushed” onto the STREAM one at a time in last-in, first-out (LIFO) style, as though the STREAM was a push-down stack.

Priority

Message types are classified according to their queuing priority and may be *normal* (non-priority), *priority*, or *high-priority* messages. A message belongs to a particular priority band that determines its ordering when placed on a queue. Normal messages have a priority band of 0 and shall always be placed at the end of the queue following all other messages in the queue. High-priority messages are always placed at the head of a queue, but shall be discarded if there is already a high-priority message in the queue. Their priority band shall be ignored; they are high-priority by virtue of their type. Priority messages have a priority band greater than 0. Priority messages are always placed after any messages of the same or higher priority. High-priority and priority messages are used to send control and data information outside the normal flow of control. By convention, high-priority messages shall not be affected by flow control. Normal and priority messages have separate flow controls.

Message Parts

A process may access STREAMS messages that contain a data part, control part, or both. The data part is that information which is transmitted over the communication medium and the control information is used by the local STREAMS modules. The other types of messages are used between modules and are not accessible to processes. Messages containing only a data part are accessible via *putmsg()*, *putpmsg()*, *getmsg()*, *getpmsg()*, *read()*, *readv()*, *write()*, or *writv()*. Messages containing a control part with or without a data part are accessible via calls to *putmsg()*, *putpmsg()*, *getmsg()*, or *getpmsg()*.

2.6.1 Accessing STREAMS

A process accesses STREAMS-based files using the standard functions *close()*, *ioctl()*, *getmsg()*, *getpmsg()*, *open()*, *pipe()*, *poll()*, *putmsg()*, *putpmsg()*, *read()*, or *write()*. Refer to the applicable function definitions for general properties and errors.

Calls to *ioctl()* shall perform control functions on the STREAM associated with the file descriptor *fdes*. The control functions may be performed by the STREAM head, a STREAMS module, or the STREAMS driver for the STREAM.

STREAMS modules and drivers can detect errors, sending an error message to the STREAM head, thus causing subsequent functions to fail and set *errno* to the value specified in the message. In addition, STREAMS modules and drivers can elect to fail a particular *ioctl()* request alone by sending a negative acknowledgement message to the STREAM head. This shall cause just the pending *ioctl()* request to fail and set *errno* to the value specified in the message.

2.7 XSI Interprocess Communication

This section describes extensions to support interprocess communication. The functionality described in this section shall be provided on implementations that support the XSI option (and the rest of this section is not further shaded).

The following message passing, semaphore, and shared memory services form an XSI interprocess communication facility. Certain aspects of their operation are common, and are defined as follows.

IPC Functions		
<i>msgctl()</i>	<i>semctl()</i>	<i>shmat()</i>
<i>msgget()</i>	<i>semget()</i>	<i>shmctl()</i>
<i>msgrcv()</i>	<i>semop()</i>	<i>shmdt()</i>
<i>msgsnd()</i>		<i>shmget()</i>

Another interprocess communication facility is provided by functions in the Realtime Option Group; see [Section 2.8](#) (on page 502).

2.7.1 IPC General Description

Each individual shared memory segment, message queue, and semaphore set shall be identified by a unique positive integer, called, respectively, a shared memory identifier, *shmid*, a semaphore identifier, *semid*, and a message queue identifier, *msqid*. The identifiers shall be returned by calls to *shmget()*, *semget()*, and *msgget()*, respectively.

Associated with each identifier is a data structure which contains data related to the operations which may be or may have been performed; see the Base Definitions volume of POSIX.1-2008, [<sys/shm.h>](#), [<sys/sem.h>](#), and [<sys/msg.h>](#) for their descriptions.

Each of the data structures contains both ownership information and an **ipc_perm** structure (see the Base Definitions volume of POSIX.1-2008, [<sys/ipc.h>](#)) which are used in conjunction to determine whether or not read/write (read/alter for semaphores) permissions should be granted to processes using the IPC facilities. The *mode* member of the **ipc_perm** structure acts as a bit field which determines the permissions.

The values of the bits are given below in octal notation.

Bit	Meaning
0400	Read by user.
0200	Write by user.
0040	Read by group.
0020	Write by group.
0004	Read by others.
0002	Write by others.

The name of the **ipc_perm** structure is *shm_perm*, *sem_perm*, or *msg_perm*, depending on which service is being used. In each case, read and write/alter permissions shall be granted to a process if one or more of the following are true ("*xxx*" is replaced by *shm*, *sem*, or *msg*, as appropriate):

- The process has appropriate privileges.
- The effective user ID of the process matches *xxx_perm.cuid* or *xxx_perm.uid* in the data structure associated with the IPC identifier, and the appropriate bit of the *user* field in *xxx_perm.mode* is set.

- The effective user ID of the process does not match *xxx_perm.cuid* or *xxx_perm.uid* but the effective group ID of the process matches *xxx_perm.cgid* or *xxx_perm.gid* in the data structure associated with the IPC identifier, and the appropriate bit of the *group* field in *xxx_perm.mode* is set.
- The effective user ID of the process does not match *xxx_perm.cuid* or *xxx_perm.uid* and the effective group ID of the process does not match *xxx_perm.cgid* or *xxx_perm.gid* in the data structure associated with the IPC identifier, but the appropriate bit of the *other* field in *xxx_perm.mode* is set.

Otherwise, the permission shall be denied.

In addition to the **ipc_perm** structure, each associated data structure includes several **time_t** fields for recording timestamps of particular operations. When an operation is described as setting a timestamp to the current time, that particular timestamp member of the associated data structure shall be set to the largest **time_t** value which is not greater than the current time.

2.8 Realtime

This section defines functions to support the source portability of applications with realtime requirements. The presence of some of these functions is dependent on support for implementation options described in the text.

The specific functional areas included in this section and their scope include the following. Full definitions of these terms can be found in XBD [Chapter 3](#) (on page 33).

- Semaphores
- Process Memory Locking
- Memory Mapped Files and Shared Memory Objects
- Priority Scheduling
- Realtime Signal Extension
- Timers
- Interprocess Communication
- Synchronized Input and Output
- Asynchronous Input and Output

All the realtime functions defined in this volume of POSIX.1-2008 are portable, although some of the numeric parameters used by an implementation may have hardware dependencies.

2.8.1 Realtime Signals

See [Section 2.4.2](#) (on page 489).

2.8.2 Asynchronous I/O

An asynchronous I/O control block structure **aiocb** is used in many asynchronous I/O functions. It is defined in the Base Definitions volume of POSIX.1-2008, <**aio.h**> and has at least the following members:

Member Type	Member Name	Description
int	<i>aio_fildes</i>	File descriptor.
off_t	<i>aio_offset</i>	File offset.
volatile void*	<i>aio_buf</i>	Location of buffer.
size_t	<i>aio_nbytes</i>	Length of transfer.
int	<i>aio_reqprio</i>	Request priority offset.
struct sigevent	<i>aio_sigevent</i>	Signal number and value.
int	<i>aio_lio_opcode</i>	Operation to be performed.

The *aio_fildes* element is the file descriptor on which the asynchronous operation is performed.

If **O_APPEND** is not set for the file descriptor *aio_fildes* and if *aio_fildes* is associated with a device that is capable of seeking, then the requested operation takes place at the absolute position in the file as given by *aio_offset*, as if *lseek()* were called immediately prior to the operation with an *offset* argument equal to *aio_offset* and a *whence* argument equal to **SEEK_SET**. If **O_APPEND** is set for the file descriptor, or if *aio_fildes* is associated with a device that is incapable of seeking, write operations append to the file in the same order as the calls were made, with the following exception: under implementation-defined circumstances, such as operation on a multi-processor or when requests of differing priorities are submitted at the same time, the ordering restriction may be relaxed. Since there is no way for a strictly conforming application to determine whether this relaxation applies, all strictly conforming applications which rely on ordering of output shall be written in such a way that they will operate correctly if the relaxation applies. After a successful call to enqueue an asynchronous I/O operation, the value of the file offset for the file is unspecified. The *aio_nbytes* and *aio_buf* elements are the same as the *nbyte* and *buf* arguments defined by *read()* and *write()*, respectively.

If **_POSIX_PRIORITIZED_IO** and **_POSIX_PRIORITY_SCHEDULING** are defined, then asynchronous I/O is queued in priority order, with the priority of each asynchronous operation based on the current scheduling priority of the calling process. The *aio_reqprio* member can be used to lower (but not raise) the asynchronous I/O operation priority and is within the range zero through **{AIO_PRIO_DELTA_MAX}**, inclusive. Unless both **_POSIX_PRIORITIZED_IO** and **_POSIX_PRIORITY_SCHEDULING** are defined, the order of processing asynchronous I/O requests is unspecified. When both **_POSIX_PRIORITIZED_IO** and **_POSIX_PRIORITY_SCHEDULING** are defined, the order of processing of requests submitted by processes whose schedulers are not **SCHED_FIFO**, **SCHED_RR**, or **SCHED_SPORADIC** is unspecified. The priority of an asynchronous request is computed as (process scheduling priority) minus *aio_reqprio*. The priority assigned to each asynchronous I/O request is an indication of the desired order of execution of the request relative to other asynchronous I/O requests for this file. If **_POSIX_PRIORITIZED_IO** is defined, requests issued with the same priority to a character special file are processed by the underlying device in FIFO order; the order of processing of requests of the same priority issued to files that are not character special files is unspecified. Numerically higher priority values indicate requests of higher priority. The value of *aio_reqprio* has no effect on process scheduling priority. When prioritized asynchronous I/O requests to the same file are blocked waiting for a resource required for that I/O operation, the higher-priority I/O requests shall be granted the resource before lower-priority I/O requests are granted the resource. The relative priority of asynchronous I/O and synchronous I/O is implementation-defined. If **_POSIX_PRIORITIZED_IO** is defined, the implementation shall define for which files I/O prioritization is supported.

The *aio_sigevent* determines how the calling process shall be notified upon I/O completion, as specified in [Section 2.4.1](#) (on page 488). If *aio_sigevent.sigev_notify* is SIGEV_NONE, then no signal shall be posted upon I/O completion, but the error status for the operation and the return status for the operation shall be set appropriately.

The *aio_lio_opcode* field is used only by the *lio_listio()* call. The *lio_listio()* call allows multiple asynchronous I/O operations to be submitted at a single time. The function takes as an argument an array of pointers to **aioctx** structures. Each **aioctx** structure indicates the operation to be performed (read or write) via the *aio_lio_opcode* field.

The address of the **aioctx** structure is used as a handle for retrieving the error status and return status of the asynchronous operation while it is in progress.

The **aioctx** structure and the data buffers associated with the asynchronous I/O operation are being used by the system for asynchronous I/O while, and only while, the error status of the asynchronous operation is equal to [EINPROGRESS]. Applications shall not modify the **aioctx** structure while the structure is being used by the system for asynchronous I/O.

The return status of the asynchronous operation is the number of bytes transferred by the I/O operation. If the error status is set to indicate an error completion, then the return status is set to the return value that the corresponding *read()*, *write()*, or *fsync()* call would have returned. When the error status is not equal to [EINPROGRESS], the return status shall reflect the return status of the corresponding synchronous operation.

2.8.3 Memory Management

2.8.3.1 Memory Locking

Range memory locking operations are defined in terms of pages. Implementations may restrict the size and alignment of range lockings to be on page-size boundaries. The page size, in bytes, is the value of the configurable system variable {PAGESIZE}. If an implementation has no restrictions on size or alignment, it may specify a 1-byte page size.

Memory locking guarantees the residence of portions of the address space. It is implementation-defined whether locking memory guarantees fixed translation between virtual addresses (as seen by the process) and physical addresses. Per-process memory locks are not inherited across a *fork()*, and all memory locks owned by a process are unlocked upon *exec* or process termination. Unmapping of an address range removes any memory locks established on that address range by this process.

2.8.3.2 Memory Mapped Files

Range memory mapping operations are defined in terms of pages. Implementations may restrict the size and alignment of range mappings to be on page-size boundaries. The page size, in bytes, is the value of the configurable system variable {PAGESIZE}. If an implementation has no restrictions on size or alignment, it may specify a 1-byte page size.

Memory mapped files provide a mechanism that allows a process to access files by directly incorporating file data into its address space. Once a file is mapped into a process address space, the data can be manipulated as memory. If more than one process maps a file, its contents are shared among them. If the mappings allow shared write access, then data written into the memory object through the address space of one process appears in the address spaces of all processes that similarly map the same portion of the memory object.

17304 SHM Shared memory objects are named regions of storage that may be independent of the file system
 17305 and can be mapped into the address space of one or more processes to allow them to share the
 17306 associated memory.

17307 SHM An *unlink()* of a file or *shm_unlink()* of a shared memory object, while causing the removal of
 17308 the name, does not unmap any mappings established for the object. Once the name has been
 17309 removed, the contents of the memory object are preserved as long as it is referenced. The
 17310 memory object remains referenced as long as a process has the memory object open or has some
 17311 area of the memory object mapped.

17312 2.8.3.3 *Memory Protection*

17313 When an object is mapped, various application accesses to the mapped region may result in
 17314 signals. In this context, SIGBUS is used to indicate an error using the mapped object, and
 17315 SIGSEGV is used to indicate a protection violation or misuse of an address:

- 17316 • A mapping may be restricted to disallow some types of access.
- 17317 • Write attempts to memory that was mapped without write access, or any access to
 17318 memory mapped PROT_NONE, shall result in a SIGSEGV signal.
- 17319 • References to unmapped addresses shall result in a SIGSEGV signal.
- 17320 • Reference to whole pages within the mapping, but beyond the current length of the object,
 17321 shall result in a SIGBUS signal.
- 17322 • The size of the object is unaffected by access beyond the end of the object (even if a
 17323 SIGBUS is not generated).

17324 2.8.3.4 *Typed Memory Objects*

17325 TYM The functionality described in this section shall be provided on implementations that support
 17326 the Typed Memory Objects option (and the rest of this section is not further shaded for this
 17327 option).

17328 Implementations may support the Typed Memory Objects option independently of support for
 17329 memory mapped files or shared memory objects. Typed memory objects are implementation-
 17330 configurable named storage pools accessible from one or more processors in a system, each via
 17331 one or more ports, such as backplane buses, LANs, I/O channels, and so on. Each valid
 17332 combination of a storage pool and a port is identified through a name that is defined at system
 17333 configuration time, in an implementation-defined manner; the name may be independent of the
 17334 file system. Using this name, a typed memory object can be opened and mapped into process
 17335 address space. For a given storage pool and port, it is necessary to support both dynamic
 17336 allocation from the pool as well as mapping at an application-supplied offset within the pool;
 17337 when dynamic allocation has been performed, subsequent deallocation must be supported.
 17338 Lastly, accessing typed memory objects from different ports requires a method for obtaining the
 17339 offset and length of contiguous storage of a region of typed memory (dynamically allocated or
 17340 not); this allows typed memory to be shared among processes and/or processors while being
 17341 accessed from the desired port.

2.8.4 Process Scheduling

PS The functionality described in this section shall be provided on implementations that support the Process Scheduling option (and the rest of this section is not further shaded for this option).

Scheduling Policies

The scheduling semantics described in this volume of POSIX.1-2008 are defined in terms of a conceptual model that contains a set of thread lists. No implementation structures are necessarily implied by the use of this conceptual model. It is assumed that no time elapses during operations described using this model, and therefore no simultaneous operations are possible. This model discusses only processor scheduling for runnable threads, but it should be noted that greatly enhanced predictability of realtime applications results if the sequencing of other resources takes processor scheduling policy into account.

There is, conceptually, one thread list for each priority. A runnable thread will be on the thread list for that thread's priority. Multiple scheduling policies shall be provided. Each non-empty thread list is ordered, contains a head as one end of its order, and a tail as the other. The purpose of a scheduling policy is to define the allowable operations on this set of lists (for example, moving threads between and within lists).

The POSIX model treats a "process" as an aggregation of system resources, including one or more threads that may be scheduled by the operating system on the processor(s) it controls. Although a process has its own set of scheduling attributes, these have an indirect effect (if any) on the scheduling behavior of individual threads as described below.

Each thread shall be controlled by an associated scheduling policy and priority. These parameters may be specified by explicit application execution of the *pthread_setschedparam()* function. Additionally, the scheduling parameters of a thread (but not its scheduling policy) may be changed by application execution of the *pthread_setschedprio()* function.

Each process shall be controlled by an associated scheduling policy and priority. These parameters may be specified by explicit application execution of the *sched_setscheduler()* or *sched_setparam()* functions.

The effect of the process scheduling attributes on individual threads in the process is dependent on the scheduling contention scope of the threads (see [Section 2.9.4](#), on page 514):

- For threads with system scheduling contention scope, the process scheduling attributes shall have no effect on the scheduling attributes or behavior either of the thread or an underlying kernel scheduling entity dedicated to that thread.
- For threads with process scheduling contention scope, the process scheduling attributes shall have no effect on the scheduling attributes of the thread. However, any underlying kernel scheduling entity used by these threads shall at all times behave as specified by the scheduling attributes of the containing process, and this behavior may affect the scheduling behavior of the process contention scope threads. For example, a process contention scope thread with scheduling policy *SCHED_FIFO* and the system maximum priority *H* (the value returned by *sched_get_priority_max(SCHED_FIFO)*) in a process with scheduling policy *SCHED_RR* and system minimum priority *L* (the value returned by *sched_get_priority_min(SCHED_RR)*) shall be subject to timeslicing and to preemption by any thread with an effective priority higher than *L*.

Associated with each policy is a priority range. Each policy definition shall specify the minimum priority range for that policy. The priority ranges for each policy may but need not overlap the priority ranges of other policies.

A conforming implementation shall select the thread that is defined as being at the head of the

17388 highest priority non-empty thread list to become a running thread, regardless of its associated
17389 policy. This thread is then removed from its thread list.

17390 Four scheduling policies are specifically required. Other implementation-defined scheduling
17391 policies may be defined. The following symbols are defined in the Base Definitions volume of
17392 POSIX.1-2008, <sched.h>:

17393 SCHED_FIFO First in, first out (FIFO) scheduling policy.

17394 SCHED_RR Round robin scheduling policy.

17395 SS SCHED_SPORADIC Sporadic server scheduling policy.

17396 SCHED_OTHER Another scheduling policy.

17397 The values of these symbols shall be distinct.

17398 SCHED_FIFO

17399 Conforming implementations shall include a scheduling policy called the FIFO scheduling
17400 policy.

17401 Threads scheduled under this policy are chosen from a thread list that is ordered by the time its
17402 threads have been on the list without being executed; generally, the head of the list is the thread
17403 that has been on the list the longest time, and the tail is the thread that has been on the list the
17404 shortest time.

17405 Under the SCHED_FIFO policy, the modification of the definitional thread lists is as follows:

- 17406 1. When a running thread becomes a preempted thread, it becomes the head of the thread
17407 list for its priority.
- 17408 2. When a blocked thread becomes a runnable thread, it becomes the tail of the thread list
17409 for its priority.
- 17410 3. When a running thread calls the *sched_setscheduler()* function, the process specified in the
17411 function call is modified to the specified policy and the priority specified by the *param*
17412 argument.
- 17413 4. When a running thread calls the *sched_setparam()* function, the priority of the process
17414 specified in the function call is modified to the priority specified by the *param* argument.
- 17415 5. When a running thread calls the *pthread_setschedparam()* function, the thread specified in
17416 the function call is modified to the specified policy and the priority specified by the *param*
17417 argument.
- 17418 6. When a running thread calls the *pthread_setschedprio()* function, the thread specified in the
17419 function call is modified to the priority specified by the *prio* argument.
- 17420 7. If a thread whose policy or priority has been modified other than by *pthread_setschedprio()*
17421 is a running thread or is runnable, it then becomes the tail of the thread list for its new
17422 priority.
- 17423 8. If a thread whose priority has been modified by *pthread_setschedprio()* is a running thread
17424 or is runnable, the effect on its position in the thread list depends on the direction of the
17425 modification, as follows:
 - 17426 a. If the priority is raised, the thread becomes the tail of the thread list.
 - 17427 b. If the priority is unchanged, the thread does not change position in the thread list.

- 17428 c. If the priority is lowered, the thread becomes the head of the thread list.
- 17429 9. When a running thread issues the *sched_yield()* function, the thread becomes the tail of
- 17430 the thread list for its priority.
- 17431 10. At no other time is the position of a thread with this scheduling policy within the thread
- 17432 lists affected.

17433 For this policy, valid priorities shall be within the range returned by the *sched_get_priority_max()*

17434 and *sched_get_priority_min()* functions when SCHED_FIFO is provided as the parameter.

17435 Conforming implementations shall provide a priority range of at least 32 priorities for this

17436 policy.

17437 SCHED_RR

17438 Conforming implementations shall include a scheduling policy called the “round robin”

17439 scheduling policy. This policy shall be identical to the SCHED_FIFO policy with the additional

17440 condition that when the implementation detects that a running thread has been executing as a

17441 running thread for a time period of the length returned by the *sched_rr_get_interval()* function or

17442 longer, the thread shall become the tail of its thread list and the head of that thread list shall be

17443 removed and made a running thread.

17444 The effect of this policy is to ensure that if there are multiple SCHED_RR threads at the same

17445 priority, one of them does not monopolize the processor. An application should not rely only on

17446 the use of SCHED_RR to ensure application progress among multiple threads if the application

17447 includes threads using the SCHED_FIFO policy at the same or higher priority levels or

17448 SCHED_RR threads at a higher priority level.

17449 A thread under this policy that is preempted and subsequently resumes execution as a running

17450 thread completes the unexpired portion of its round robin interval time period.

17451 For this policy, valid priorities shall be within the range returned by the *sched_get_priority_max()*

17452 and *sched_get_priority_min()* functions when SCHED_RR is provided as the parameter.

17453 Conforming implementations shall provide a priority range of at least 32 priorities for this

17454 policy.

17455 SCHED_SPORADIC

17456 SS|TSP The functionality described in this section shall be provided on implementations that support

17457 the Process Sporadic Server or Thread Sporadic Server options (and the rest of this section is not

17458 further shaded for these options).

17459 If `_POSIX_SPORADIC_SERVER` or `_POSIX_THREAD_SPORADIC_SERVER` is defined, the

17460 implementation shall include a scheduling policy identified by the value SCHED_SPORADIC.

17461 The sporadic server policy is based primarily on two time parameters: the replenishment period

17462 and the available execution capacity. The replenishment period is given by the

17463 *sched_ss_repl_period* member of the **sched_param** structure. The available execution capacity is

17464 initialized to the value given by the *sched_ss_init_budget* member of the same parameter. The

17465 sporadic server policy is identical to the SCHED_FIFO policy with some additional conditions

17466 that cause the thread’s assigned priority to be switched between the values specified by the

17467 *sched_priority* and *sched_ss_low_priority* members of the **sched_param** structure.

17468 The priority assigned to a thread using the sporadic server scheduling policy is determined in

17469 the following manner: if the available execution capacity is greater than zero and the number of

17470 pending replenishment operations is strictly less than *sched_ss_max_repl*, the thread is assigned

17471 the priority specified by *sched_priority*; otherwise, the assigned priority shall be

17472 *sched_ss_low_priority*. If the value of *sched_priority* is less than or equal to the value of

sched_ss_low_priority, the results are undefined. When active, the thread shall belong to the thread list corresponding to its assigned priority level, according to the mentioned priority assignment. The modification of the available execution capacity and, consequently of the assigned priority, is done as follows:

1. When the thread at the head of the *sched_priority* list becomes a running thread, its execution time shall be limited to at most its available execution capacity, plus the resolution of the execution time clock used for this scheduling policy. This resolution shall be implementation-defined.
2. Each time the thread is inserted at the tail of the list associated with *sched_priority*—because as a blocked thread it became runnable with priority *sched_priority* or because a replenishment operation was performed—the time at which this operation is done is posted as the *activation_time*.
3. When the running thread with assigned priority equal to *sched_priority* becomes a preempted thread, it becomes the head of the thread list for its priority, and the execution time consumed is subtracted from the available execution capacity. If the available execution capacity would become negative by this operation, it shall be set to zero.
4. When the running thread with assigned priority equal to *sched_priority* becomes a blocked thread, the execution time consumed is subtracted from the available execution capacity, and a replenishment operation is scheduled, as described in 6 and 7. If the available execution capacity would become negative by this operation, it shall be set to zero.
5. When the running thread with assigned priority equal to *sched_priority* reaches the limit imposed on its execution time, it becomes the tail of the thread list for *sched_ss_low_priority*, the execution time consumed is subtracted from the available execution capacity (which becomes zero), and a replenishment operation is scheduled, as described in 6 and 7.
6. Each time a replenishment operation is scheduled, the amount of execution capacity to be replenished, *replenish_amount*, is set equal to the execution time consumed by the thread since the *activation_time*. The replenishment is scheduled to occur at *activation_time* plus *sched_ss_repl_period*. If the scheduled time obtained is before the current time, the replenishment operation is carried out immediately. Several replenishment operations may be pending at the same time, each of which will be serviced at its respective scheduled time. With the above rules, the number of replenishment operations simultaneously pending for a given thread that is scheduled under the sporadic server policy shall not be greater than *sched_ss_max_repl*.
7. A replenishment operation consists of adding the corresponding *replenish_amount* to the available execution capacity at the scheduled time. If, as a consequence of this operation, the execution capacity would become larger than *sched_ss_initial_budget*, it shall be rounded down to a value equal to *sched_ss_initial_budget*. Additionally, if the thread was runnable or running, and had assigned priority equal to *sched_ss_low_priority*, then it becomes the tail of the thread list for *sched_priority*.

Execution time is defined in XBD [Section 3.118](#) (on page 52).

For this policy, changing the value of a CPU-time clock via *clock_settime()* shall have no effect on its behavior.

For this policy, valid priorities shall be within the range returned by the *sched_get_priority_min()* and *sched_get_priority_max()* functions when SCHED_SPORADIC is provided as the parameter. Conforming implementations shall provide a priority range of at least 32 distinct priorities for this policy.

If the scheduling policy of the target process is either SCHED_FIFO or SCHED_RR, the *sched_ss_low_priority*, *sched_ss_repl_period*, and *sched_ss_init* budget members of the *param* argument shall have no effect on the scheduling behavior. If the scheduling policy of this process is not SCHED_FIFO, SCHED_RR, or SCHED_SPORADIC, the effects of these members are implementation-defined; this case includes the SCHED_OTHER policy.

SCHED_OTHER

Conforming implementations shall include one scheduling policy identified as SCHED_OTHER (which may execute identically with either the FIFO or round robin scheduling policy). The effect of scheduling threads with the SCHED_OTHER policy in a system in which other threads are executing under SCHED_FIFO, SCHED_RR, or SCHED_SPORADIC is implementation-defined.

This policy is defined to allow strictly conforming applications to be able to indicate in a portable manner that they no longer need a realtime scheduling policy.

For threads executing under this policy, the implementation shall use only priorities within the range returned by the *sched_get_priority_max()* and *sched_get_priority_min()* functions when SCHED_OTHER is provided as the parameter.

2.8.5 Clocks and Timers

The `<time.h>` header defines the types and manifest constants used by the timing facility.

Time Value Specification Structures

Many of the timing facility functions accept or return time value specifications. A time value structure **timespec** specifies a single time value and includes at least the following members:

Member Type	Member Name	Description
time_t	<i>tv_sec</i>	Seconds.
long	<i>tv_nsec</i>	Nanoseconds.

The *tv_nsec* member is only valid if greater than or equal to zero, and less than the number of nanoseconds in a second (1 000 million). The time interval described by this structure is $(tv\_sec * 10^9 + tv\_nsec)$ nanoseconds.

A time value structure **itimerspec** specifies an initial timer value and a repetition interval for use by the per-process timer functions. This structure includes at least the following members:

Member Type	Member Name	Description
struct timespec	<i>it_interval</i>	Timer period.
struct timespec	<i>it_value</i>	Timer expiration.

If the value described by *it_value* is non-zero, it indicates the time to or time of the next timer expiration (for relative and absolute timer values, respectively). If the value described by *it_value* is zero, the timer shall be disarmed.

If the value described by *it_interval* is non-zero, it specifies an interval which shall be used in reloading the timer when it expires; that is, a periodic timer is specified. If the value described by *it_interval* is zero, the timer is disarmed after its next expiration; that is, a one-shot timer is specified.

17559 Timer Event Notification Control Block

17560 Per-process timers may be created that notify the process of timer expirations by queuing a
 17561 realtime extended signal. The **sigevent** structure, defined in the Base Definitions volume of
 17562 POSIX.1-2008, **<signal.h>**, is used in creating such a timer. The **sigevent** structure contains the
 17563 signal number and an application-specific data value which shall be used when notifying the
 17564 calling process of timer expiration events.

17565 Manifest Constants

17566 The following constants are defined in the Base Definitions volume of POSIX.1-2008, **<time.h>**:

17567 **CLOCK_REALTIME** The identifier for the system-wide realtime clock.

17568 **TIMER_ABSTIME** Flag indicating time is absolute with respect to the clock associated
 17569 with a timer.

17570 **CLOCK_MONOTONIC** The identifier for the system-wide monotonic clock, which is defined
 17571 as a clock whose value cannot be set via *clock_settime()* and which
 17572 cannot have backward clock jumps. The maximum possible clock
 17573 jump is implementation-defined.

17574 **MON** The maximum allowable resolution for **CLOCK_REALTIME** and **CLOCK_MONOTONIC** clocks
 17575 and all time services based on these clocks is represented by **{_POSIX_CLOCKRES_MIN}** and
 17576 shall be defined as 20 ms (1/50 of a second). Implementations may support smaller values of
 17577 resolution for these clocks to provide finer granularity time bases. The actual resolution
 17578 supported by an implementation for a specific clock is obtained using the *clock_getres()* function.
 17579 If the actual resolution supported for a time service based on one of these clocks differs from the
 17580 resolution supported for that clock, the implementation shall document this difference.

17581 **MON** The minimum allowable maximum value for **CLOCK_REALTIME** and **CLOCK_MONOTONIC**
 17582 clocks and all absolute time services based on them is the same as that defined by the ISO C
 17583 standard for the **time_t** type. If the maximum value supported by a time service based on one of
 17584 these clocks differs from the maximum value supported by that clock, the implementation shall
 17585 document this difference.

17586 Execution Time Monitoring

17587 **CPT** If **_POSIX_CPUTIME** is defined, process CPU-time clocks shall be supported in addition to the
 17588 clocks described in [Manifest Constants](#).

17589 **TCT** If **_POSIX_THREAD_CPUTIME** is defined, thread CPU-time clocks shall be supported.

17590 **CPT|TCT** CPU-time clocks measure execution or CPU time, which is defined in XBD [Section 3.118](#) (on
 17591 page 52). The mechanism used to measure execution time is described in XBD [Section 4.10](#) (on
 17592 page 110).

17593 **CPT** If **_POSIX_CPUTIME** is defined, the following constant of the type **clockid_t** is defined in
 17594 **<time.h>**:

17595 **CLOCK_PROCESS_CPUTIME_ID**

17596 When this value of the type **clockid_t** is used in a *clock()* or *timer*()* function call, it is
 17597 interpreted as the identifier of the CPU-time clock associated with the process making the
 17598 function call.

17599 **TCT** If **_POSIX_THREAD_CPUTIME** is defined, the following constant of the type **clockid_t** is
 17600 defined in **<time.h>**:

CLOCK_THREAD_CPUTIME_ID

When this value of the type `clockid_t` is used in a `clock()` or `timer*()` function call, it is interpreted as the identifier of the CPU-time clock associated with the thread making the function call.

2.9 Threads

This section defines functionality to support multiple flows of control, called “threads”, within a process. For the definition of threads, see XBD [Section 3.398](#) (on page 97).

The specific functional areas covered by threads and their scope include:

- Thread management: the creation, control, and termination of multiple flows of control in the same process under the assumption of a common shared address space
- Synchronization primitives optimized for tightly coupled operation of multiple control flows in a common, shared address space

2.9.1 Thread-Safety

All functions defined by this volume of POSIX.1-2008 shall be thread-safe, except that the following functions⁷ need not be thread-safe.

<code>asctime()</code>	<code>ftw()</code>	<code>getservbyport()</code>	<code>nl_langinfo()</code>
<code>basename()</code>	<code>getc_unlocked()</code>	<code>getservent()</code>	<code>ptsname()</code>
<code>catgets()</code>	<code>getchar_unlocked()</code>	<code>getutxent()</code>	<code>putc_unlocked()</code>
<code>crypt()</code>	<code>getdate()</code>	<code>getutxid()</code>	<code>putchar_unlocked()</code>
<code>ctime()</code>	<code>getenv()</code>	<code>getutxline()</code>	<code>putenv()</code>
<code>dbm_clearerr()</code>	<code>getgrent()</code>	<code>gmtime()</code>	<code>pututxline()</code>
<code>dbm_close()</code>	<code>getgrgid()</code>	<code>hcreate()</code>	<code>rand()</code>
<code>dbm_delete()</code>	<code>getgrnam()</code>	<code>hdestroy()</code>	<code>readdir()</code>
<code>dbm_error()</code>	<code>gethostent()</code>	<code>hsearch()</code>	<code>setenv()</code>
<code>dbm_fetch()</code>	<code>getlogin()</code>	<code>inet_ntoa()</code>	<code>setgrent()</code>
<code>dbm_firstkey()</code>	<code>getnetbyaddr()</code>	<code>l64a()</code>	<code>setkey()</code>
<code>dbm_nextkey()</code>	<code>getnetbyname()</code>	<code>lgamma()</code>	<code>setpwent()</code>
<code>dbm_open()</code>	<code>getnetent()</code>	<code>lgammaf()</code>	<code>setutxent()</code>
<code>dbm_store()</code>	<code>getopt()</code>	<code>lgammal()</code>	<code>strerror()</code>
<code>dirname()</code>	<code>getprotobyname()</code>	<code>localeconv()</code>	<code>strsignal()</code>
<code>dlderror()</code>	<code>getprotobynumber()</code>	<code>localtime()</code>	<code>strtok()</code>
<code>drand48()</code>	<code>getprotoent()</code>	<code>lrand48()</code>	<code>system()</code>
<code>encrypt()</code>	<code>getpwent()</code>	<code>mblen()</code>	<code>ttyname()</code>
<code>endgrent()</code>	<code>getpwnam()</code>	<code>mbtowc()</code>	<code>unsetenv()</code>
<code>endpwent()</code>	<code>getpwuid()</code>	<code>mrand48()</code>	<code>wctomb()</code>
<code>endutxent()</code>	<code>getservbyname()</code>	<code>nftw()</code>	

The `ctermid()` and `tmpnam()` functions need not be thread-safe if passed a NULL argument. The `mbrlen()`, `mbrtowc()`, `mbsnrtowcs()`, `mbsrtowcs()`, `wcrtomb()`, `wcsnrtombs()`, and `wcsrtombs()` functions need not be thread-safe if passed a NULL `ps` argument.

⁷ The functions in the table are not shaded to denote applicable options. Individual reference pages should be consulted.

Implementations shall provide internal synchronization as necessary in order to satisfy this requirement.

Since multi-threaded applications are not allowed to use the *environ* variable to access or modify any environment variable while any other thread is concurrently modifying any environment variable, any function dependent on any environment variable is not thread-safe if another thread is modifying the environment; see XSH *exec* (on page 777).

2.9.2 Thread IDs

Although implementations may have thread IDs that are unique in a system, applications should only assume that thread IDs are usable and unique within a single process. The effect of calling any of the functions defined in this volume of POSIX.1-2008 and passing as an argument the thread ID of a thread from another process is unspecified. The lifetime of a thread ID ends after the thread terminates if it was created with the *detachstate* attribute set to `PTHREAD_CREATE_DETACHED` or if *pthread_detach()* or *pthread_join()* has been called for that thread. A conforming implementation is free to reuse a thread ID after its lifetime has ended. If an application attempts to use a thread ID whose lifetime has ended, the behavior is undefined.

If a thread is detached, its thread ID is invalid for use as an argument in a call to *pthread_detach()* or *pthread_join()*.

2.9.3 Thread Mutexes

A thread that has blocked shall not prevent any unblocked thread that is eligible to use the same processing resources from eventually making forward progress in its execution. Eligibility for processing resources is determined by the scheduling policy.

A thread shall become the owner of a mutex, *m*, when one of the following occurs:

- It calls *pthread_mutex_lock()* with *m* as the *mutex* argument and the call returns zero or `[EOWNERDEAD]`.
- It calls *pthread_mutex_trylock()* with *m* as the *mutex* argument and the call returns zero or `[EOWNERDEAD]`.
- It calls *pthread_mutex_timedlock()* with *m* as the *mutex* argument and the call returns zero or `[EOWNERDEAD]`.
- It calls *pthread_mutex_setprioceiling()* with *m* as the *mutex* argument and the call returns `[EOWNERDEAD]`.
- It calls *pthread_cond_wait()* with *m* as the *mutex* argument and the call returns zero or certain error numbers (see *pthread_cond_timedwait()*).
- It calls *pthread_cond_timedwait()* with *m* as the *mutex* argument and the call returns zero or certain error numbers (see *pthread_cond_timedwait()*).

The thread shall remain the owner of *m* until one of the following occurs:

- It executes *pthread_mutex_unlock()* with *m* as the *mutex* argument
- It blocks in a call to *pthread_cond_wait()* with *m* as the *mutex* argument.
- It blocks in a call to *pthread_cond_timedwait()* with *m* as the *mutex* argument.

The implementation shall behave as if at all times there is at most one owner of any mutex.

A thread that becomes the owner of a mutex is said to have “acquired” the mutex and the mutex

is said to have become “locked”; when a thread gives up ownership of a mutex it is said to have “released” the mutex and the mutex is said to have become “unlocked”.

A problem can occur if a process terminates while one of its threads holds a mutex lock. Depending on the mutex type, it might be possible for another thread to unlock the mutex and recover the state of the mutex. However, it is difficult to perform this recovery reliably.

Robust mutexes provide a means to enable the implementation to notify other threads in the event of a process terminating while one of its threads holds a mutex lock. The next thread that acquires the mutex is notified about the termination by the return value [EOWNERDEAD] from the locking function. The notified thread can then attempt to recover the state protected by the mutex, and if successful mark the state protected by the mutex as consistent by a call to `pthread_mutex_consistent()`. If the notified thread is unable to recover the state, it can declare the state as not recoverable by a call to `pthread_mutex_unlock()` without a prior call to `pthread_mutex_consistent()`.

Whether or not the state protected by a mutex can be recovered is dependent solely on the application using robust mutexes. The robust mutex support provided in the implementation provides notification only that a mutex owner has terminated while holding a lock, or that the state of the mutex is not recoverable.

2.9.4 Thread Scheduling

TPS

The functionality described in this section shall be provided on implementations that support the Thread Execution Scheduling option (and the rest of this section is not further shaded for this option).

Thread Scheduling Attributes

In support of the scheduling function, threads have attributes which are accessed through the `pthread_attr_t` thread creation attributes object.

The *contentionscope* attribute defines the scheduling contention scope of the thread to be either `PTHREAD_SCOPE_PROCESS` or `PTHREAD_SCOPE_SYSTEM`.

The *inheritsched* attribute specifies whether a newly created thread is to inherit the scheduling attributes of the creating thread or to have its scheduling values set according to the other scheduling attributes in the `pthread_attr_t` object.

The *schedpolicy* attribute defines the scheduling policy for the thread. The *schedparam* attribute defines the scheduling parameters for the thread. The interaction of threads having different policies within a process is described as part of the definition of those policies.

If the Thread Execution Scheduling option is defined, and the *schedpolicy* attribute specifies one of the priority-based policies defined under this option, the *schedparam* attribute contains the scheduling priority of the thread. A conforming implementation ensures that the priority value in *schedparam* is in the range associated with the scheduling policy when the thread attributes object is used to create a thread, or when the scheduling attributes of a thread are dynamically modified. The meaning of the priority value in *schedparam* is the same as that of *priority*.

TSP

If `_POSIX_THREAD_SPORADIC_SERVER` is defined, the *schedparam* attribute supports four new members that are used for the sporadic server scheduling policy. These members are *sched_ss_low_priority*, *sched_ss_repl_period*, *sched_ss_init_budget*, and *sched_ss_max_repl*. The meaning of these attributes is the same as in the definitions that appear under [Section 2.8.4](#) (on page 506).

When a process is created, its single thread has a scheduling policy and associated attributes

equal to the policy and attributes of the process. The default scheduling contention scope value is implementation-defined. The default values of other scheduling attributes are implementation-defined.

Thread Scheduling Contention Scope

The scheduling contention scope of a thread defines the set of threads with which the thread competes for use of the processing resources. The scheduling operation selects at most one thread to execute on each processor at any point in time and the thread's scheduling attributes (for example, *priority*), whether under process scheduling contention scope or system scheduling contention scope, are the parameters used to determine the scheduling decision.

The scheduling contention scope, in the context of scheduling a mixed scope environment, affects threads as follows:

- A thread created with `PTHREAD_SCOPE_SYSTEM` scheduling contention scope contends for resources with all other threads in the same scheduling allocation domain relative to their system scheduling attributes. The system scheduling attributes of a thread created with `PTHREAD_SCOPE_SYSTEM` scheduling contention scope are the scheduling attributes with which the thread was created. The system scheduling attributes of a thread created with `PTHREAD_SCOPE_PROCESS` scheduling contention scope are the implementation-defined mapping into system attribute space of the scheduling attributes with which the thread was created.
- Threads created with `PTHREAD_SCOPE_PROCESS` scheduling contention scope contend directly with other threads within their process that were created with `PTHREAD_SCOPE_PROCESS` scheduling contention scope. The contention is resolved based on the threads' scheduling attributes and policies. It is unspecified how such threads are scheduled relative to threads in other processes or threads with `PTHREAD_SCOPE_SYSTEM` scheduling contention scope.
- Conforming implementations shall support the `PTHREAD_SCOPE_PROCESS` scheduling contention scope, the `PTHREAD_SCOPE_SYSTEM` scheduling contention scope, or both.

Scheduling Allocation Domain

Implementations shall support scheduling allocation domains containing one or more processors. It should be noted that the presence of multiple processors does not automatically indicate a scheduling allocation domain size greater than one. Conforming implementations on multi-processors may map all or any subset of the CPUs to one or multiple scheduling allocation domains, and could define these scheduling allocation domains on a per-thread, per-process, or per-system basis, depending on the types of applications intended to be supported by the implementation. The scheduling allocation domain is independent of scheduling contention scope, as the scheduling contention scope merely defines the set of threads with which a thread contends for processor resources, while scheduling allocation domain defines the set of processors for which it contends. The semantics of how this contention is resolved among threads for processors is determined by the scheduling policies of the threads.

The choice of scheduling allocation domain size and the level of application control over scheduling allocation domains is implementation-defined. Conforming implementations may change the size of scheduling allocation domains and the binding of threads to scheduling allocation domains at any time.

For application threads with scheduling allocation domains of size equal to one, the scheduling rules defined for `SCHED_FIFO` and `SCHED_RR` shall be used; see [Scheduling Policies](#) (on page 506). All threads with system scheduling contention scope, regardless of the processes in which they reside, compete for the processor according to their priorities. Threads with process

17772 scheduling contention scope compete only with other threads with process scheduling
17773 contention scope within their process.

17774 For application threads with scheduling allocation domains of size greater than one, the rules
17775 TSP defined for SCHED_FIFO, SCHED_RR, and SCHED_SPORADIC shall be used in an
17776 implementation-defined manner. Each thread with system scheduling contention scope
17777 competes for the processors in its scheduling allocation domain in an implementation-defined
17778 manner according to its priority. Threads with process scheduling contention scope are
17779 scheduled relative to other threads within the same scheduling contention scope in the process.

17780 TSP If _POSIX_THREAD_SPORADIC_SERVER is defined, the rules defined for SCHED_SPORADIC
17781 in *Scheduling Policies* (on page 506) shall be used in an implementation-defined manner for
17782 application threads whose scheduling allocation domain size is greater than one.

17783 Scheduling Documentation

17784 If _POSIX_PRIORITY_SCHEDULING is defined, then any scheduling policies beyond
17785 TSP SCHED_OTHER, SCHED_FIFO, SCHED_RR, and SCHED_SPORADIC, as well as the effects of
17786 the scheduling policies indicated by these other values, and the attributes required in order to
17787 support such a policy, are implementation-defined. Furthermore, the implementation shall
17788 document the effect of all processor scheduling allocation domain values supported for these
17789 policies.

17790 2.9.5 Thread Cancellation

17791 The thread cancellation mechanism allows a thread to terminate the execution of any other
17792 thread in the process in a controlled manner. The target thread (that is, the one that is being
17793 canceled) is allowed to hold cancellation requests pending in a number of ways and to perform
17794 application-specific cleanup processing when the notice of cancellation is acted upon.

17795 Cancellation is controlled by the cancellation control functions. Each thread maintains its own
17796 cancelability state. Cancellation may only occur at cancellation points or when the thread is
17797 asynchronously cancelable.

17798 The thread cancellation mechanism described in this section depends upon programs having set
17799 *deferred* cancelability state, which is specified as the default. Applications shall also carefully
17800 follow static lexical scoping rules in their execution behavior. For example, use of *setjmp()*,
17801 *return*, *goto*, and so on, to leave user-defined cancellation scopes without doing the necessary
17802 scope pop operation results in undefined behavior.

17803 Use of asynchronous cancelability while holding resources which potentially need to be released
17804 may result in resource loss. Similarly, cancellation scopes may only be safely manipulated
17805 (pushed and popped) when the thread is in the *deferred* or *disabled* cancelability states.

17806 2.9.5.1 Cancelability States

17807 The cancelability state of a thread determines the action taken upon receipt of a cancellation
17808 request. The thread may control cancellation in a number of ways.

17809 Each thread maintains its own cancelability state, which may be encoded in two bits:

- 17810 1. Cancelability-Enable: When cancelability is PTHREAD_CANCEL_DISABLE (as defined
17811 in the Base Definitions volume of POSIX.1-2008, **<pthread.h>**), cancellation requests
17812 against the target thread are held pending. By default, cancelability is set to
17813 PTHREAD_CANCEL_ENABLE (as defined in **<pthread.h>**).

17814 2. Cancelability Type: When cancelability is enabled and the cancelability type is
 17815 PTHREAD_CANCEL_ASYNCHRONOUS (as defined in **<pthread.h>**), new or pending
 17816 cancellation requests may be acted upon at any time. When cancelability is enabled and
 17817 the cancelability type is PTHREAD_CANCEL_DEFERRED (as defined in **<pthread.h>**),
 17818 cancellation requests are held pending until a cancellation point (see below) is reached. If
 17819 cancelability is disabled, the setting of the cancelability type has no immediate effect as all
 17820 cancellation requests are held pending; however, once cancelability is enabled again the
 17821 new type is in effect. The cancelability type is PTHREAD_CANCEL_DEFERRED in all
 17822 newly created threads including the thread in which *main()* was first invoked.

17823 2.9.5.2 Cancellation Points

17824 Cancellation points shall occur when a thread is executing the following functions:

17825 <i>accept()</i>	<i>nanosleep()</i>	<i>select()</i>
17826 <i>aio_suspend()</i>	<i>open()</i>	<i>sem_timedwait()</i>
17827 <i>clock_nanosleep()</i>	<i>openat()</i>	<i>sem_wait()</i>
17828 <i>close()</i>	<i>pause()</i>	<i>send()</i>
17829 <i>connect()</i>	<i>poll()</i>	<i>sendmsg()</i>
17830 <i>creat()</i>	<i>pread()</i>	<i>sendto()</i>
17831 <i>fcntl()</i> [†]	<i>pselect()</i>	<i>sigsuspend()</i>
17832 <i>fdatasync()</i>	<i>pthread_cond_timedwait()</i>	<i>sigtimedwait()</i>
17833 <i>fsync()</i>	<i>pthread_cond_wait()</i>	<i>sigwait()</i>
17834 <i>getmsg()</i>	<i>pthread_join()</i>	<i>sigwaitinfo()</i>
17835 <i>getpmsg()</i>	<i>pthread_testcancel()</i>	<i>sleep()</i>
17836 <i>lockf()</i> ^{††}	<i>putmsg()</i>	<i>system()</i>
17837 <i>mq_receive()</i>	<i>putpmsg()</i>	<i>tcdrain()</i>
17838 <i>mq_send()</i>	<i>pwrite()</i>	<i>wait()</i>
17839 <i>mq_timedreceive()</i>	<i>read()</i>	<i>waitid()</i>
17840 <i>mq_timedsend()</i>	<i>readv()</i>	<i>waitpid()</i>
17841 <i>msgrcv()</i>	<i>recv()</i>	<i>write()</i>
17842 <i>msgsnd()</i>	<i>recvfrom()</i>	<i>writv()</i>
17843 <i>msync()</i>	<i>recvmsg()</i>	

17844 † When the *cmd* argument is F_SETLK.

17845 †† When the *function* argument is F_LOCK.

17846 A cancellation point may also occur when a thread is executing the following functions:

17847	<i>access()</i>	<i>fprintf()</i>	<i>getprotobyname()</i>
17848	<i>asctime()</i>	<i>fputc()</i>	<i>getprotoent()</i>
17849	<i>asctime_r()</i>	<i>fputs()</i>	<i>getpwent()</i>
17850	<i>catclose()</i>	<i>fputwc()</i>	<i>getpwnam()</i>
17851	<i>catgets()</i>	<i>fputws()</i>	<i>getpwnam_r()</i>
17852	<i>catopen()</i>	<i>fread()</i>	<i>getpwuid()</i>
17853	<i>chmod()</i>	<i>freopen()</i>	<i>getpwuid_r()</i>
17854	<i>chown()</i>	<i>fscanf()</i>	<i>gets()</i>
17855	<i>closedir()</i>	<i>fseek()</i>	<i>getservbyname()</i>
17856	<i>closelog()</i>	<i>fseeko()</i>	<i>getservbyport()</i>
17857	<i>ctermid()</i>	<i>fsetpos()</i>	<i>getservent()</i>
17858	<i>ctime()</i>	<i>fstat()</i>	<i>getutxent()</i>
17859	<i>ctime_r()</i>	<i>fstatat()</i>	<i>getutxid()</i>
17860	<i>dbm_close()</i>	<i>ftell()</i>	<i>getutxline()</i>
17861	<i>dbm_delete()</i>	<i>ftello()</i>	<i>getwc()</i>
17862	<i>dbm_fetch()</i>	<i>ftw()</i>	<i>getwchar()</i>
17863	<i>dbm_nextkey()</i>	<i>futimens()</i>	<i>glob()</i>
17864	<i>dbm_open()</i>	<i>fwprintf()</i>	<i>iconv_close()</i>
17865	<i>dbm_store()</i>	<i>fwrite()</i>	<i>iconv_open()</i>
17866	<i>dlclose()</i>	<i>fwscanf()</i>	<i>ioctl()</i>
17867	<i>dlopen()</i>	<i>getaddrinfo()</i>	<i>link()</i>
17868	<i>dprintf()</i>	<i>getc()</i>	<i>linkat()</i>
17869	<i>endgrent()</i>	<i>getc_unlocked()</i>	<i>lio_listio()</i>
17870	<i>endhostent()</i>	<i>getchar()</i>	<i>localtime()</i>
17871	<i>endnetent()</i>	<i>getchar_unlocked()</i>	<i>localtime_r()</i>
17872	<i>endprotoent()</i>	<i>getcwd()</i>	<i>lockf()</i>
17873	<i>endpwent()</i>	<i>getdate()</i>	<i>lseek()</i>
17874	<i>endservent()</i>	<i>getdelim()</i>	<i>lstat()</i>
17875	<i>endutxent()</i>	<i>getgrent()</i>	<i>mkdir()</i>
17876	<i>faccessat()</i>	<i>getgrgid()</i>	<i>mkdirat()</i>
17877	<i>fchmod()</i>	<i>getgrgid_r()</i>	<i>mkdtemp()</i>
17878	<i>fchmodat()</i>	<i>getgrnam()</i>	<i>mkfifo()</i>
17879	<i>fchown()</i>	<i>getgrnam_r()</i>	<i>mkfifoat()</i>
17880	<i>fchownat()</i>	<i>gethostent()</i>	<i>mknod()</i>
17881	<i>fclose()</i>	<i>gethostid()</i>	<i>mknodat()</i>
17882	<i>fcntl()</i> †	<i>gethostname()</i>	<i>mkstemp()</i>
17883	<i>fflush()</i>	<i>getline()</i>	<i>mktime()</i>
17884	<i>fgetc()</i>	<i>getlogin()</i>	<i>nftw()</i>
17885	<i>fgetpos()</i>	<i>getlogin_r()</i>	<i>opendir()</i>
17886	<i>fgets()</i>	<i>getnameinfo()</i>	<i>openlog()</i>
17887	<i>fgetwc()</i>	<i>getnetbyaddr()</i>	<i>pathconf()</i>
17888	<i>fgetws()</i>	<i>getnetbyname()</i>	<i>pclose()</i>
17889	<i>fntmsg()</i>	<i>getnetent()</i>	<i>perror()</i>
17890	<i>fopen()</i>	<i>getopt()</i> ††	<i>popen()</i>
17891	<i>fpathconf()</i>	<i>getprotobyname()</i>	<i>posix_fadvise()</i>

17892	<i>posix_fallocate()</i>	<i>putc_unlocked()</i>	<i>strerror_l()</i>
17893	<i>posix_madvise()</i>	<i>putchar()</i>	<i>strerror_r()</i>
17894	<i>posix_openpt()</i>	<i>putchar_unlocked()</i>	<i>strftime()</i>
17895	<i>posix_spawn()</i>	<i>puts()</i>	<i>strftime_l()</i>
17896	<i>posix_spawnnp()</i>	<i>pututxline()</i>	<i>symlink()</i>
17897	<i>posix_trace_clear()</i>	<i>putwc()</i>	<i>symlinkat()</i>
17898	<i>posix_trace_close()</i>	<i>putwchar()</i>	<i>sync()</i>
17899	<i>posix_trace_create()</i>	<i>readdir()</i>	<i>syslog()</i>
17900	<i>posix_trace_create_withlog()</i>	<i>readdir_r()</i>	<i>tmpfile()</i>

An implementation shall not introduce cancellation points into any other functions specified in this volume of POSIX.1-2008.

The side-effects of acting upon a cancellation request while suspended during a call of a function are the same as the side-effects that may be seen in a single-threaded program when a call to a function is interrupted by a signal and the given function returns [EINTR]. Any such side-effects occur before any cancellation cleanup handlers are called.

Whenever a thread has cancelability enabled and a cancellation request has been made with that thread as the target, and the thread then calls any function that is a cancellation point (such as *pthread_testcancel()* or *read()*), the cancellation request shall be acted upon before the function returns. If a thread has cancelability enabled and a cancellation request is made with the thread as a target while the thread is suspended at a cancellation point, the thread shall be awakened and the cancellation request shall be acted upon. It is unspecified whether the cancellation request is acted upon or whether the cancellation request remains pending and the thread resumes normal execution if:

- The thread is suspended at a cancellation point and the event for which it is waiting occurs

† For any value of the *cmd* argument.

†† If *opterr* is non-zero.

- A specified timeout expired

before the cancellation request is acted upon.

2.9.5.3 Thread Cancellation Cleanup Handlers

Each thread maintains a list of cancellation cleanup handlers. The programmer uses the *pthread_cleanup_push()* and *pthread_cleanup_pop()* functions to place routines on and remove routines from this list.

When a cancellation request is acted upon, or when a thread calls *pthread_exit()*, the thread first disables cancellation by setting its cancelability state to `PTHREAD_CANCEL_DISABLE` and its cancelability type to `PTHREAD_CANCEL_DEFERRED`. The cancelability state shall remain set to `PTHREAD_CANCEL_DISABLE` until the thread has terminated. The behavior is undefined if a cancellation cleanup handler or thread-specific data destructor routine changes the cancelability state to `PTHREAD_CANCEL_ENABLE`.

The routines in the thread's list of cancellation cleanup handlers are invoked one by one in LIFO sequence; that is, the last routine pushed onto the list (Last In) is the first to be invoked (First Out). When the cancellation cleanup handler for a scope is invoked, the storage for that scope remains valid. If the last cancellation cleanup handler returns, thread-specific data destructors (if any) associated with thread-specific data keys for which the thread has non-NULL values will be run, in unspecified order, as described for *pthread_key_create()*.

After all cancellation cleanup handlers and thread-specific data destructors have returned, thread execution is terminated. If the thread has terminated because of a call to *pthread_exit()*, the *value_ptr* argument is made available to any threads joining with the target. If the thread has terminated by acting on a cancellation request, a status of `PTHREAD_CANCELED` is made available to any threads joining with the target. The symbolic constant `PTHREAD_CANCELED` expands to a constant expression of type `(void *)` whose value matches no pointer to an object in memory nor the value `NULL`.

A side-effect of acting upon a cancellation request while in a condition variable wait is that the mutex is re-acquired before calling the first cancellation cleanup handler. In addition, the thread is no longer considered to be waiting for the condition and the thread shall not have consumed any pending condition signals on the condition.

A cancellation cleanup handler cannot exit via *longjmp()* or *siglongjmp()*.

2.9.5.4 Async-Cancel Safety

The *pthread_cancel()*, *pthread_setcancelstate()*, and *pthread_setcanceltype()* functions are defined to be async-cancel safe.

No other functions in this volume of POSIX.1-2008 are required to be async-cancel-safe.

2.9.6 Thread Read-Write Locks

Multiple readers, single writer (read-write) locks allow many threads to have simultaneous read-only access to data while allowing only one thread to have exclusive write access at any given time. They are typically used to protect data that is read more frequently than it is changed.

One or more readers acquire read access to the resource by performing a read lock operation on the associated read-write lock. A writer acquires exclusive write access by performing a write lock operation. Basically, all readers exclude any writers and a writer excludes all readers and

17981 any other writers.

17982 A thread that has blocked on a read-write lock (for example, has not yet returned from a
17983 *pthread_rwlock_rdlock()* or *pthread_rwlock_wrlock()* call) shall not prevent any unblocked thread
17984 that is eligible to use the same processing resources from eventually making forward progress in
17985 its execution. Eligibility for processing resources shall be determined by the scheduling policy.

17986 Read-write locks can be used to synchronize threads in the current process and other processes if
17987 they are allocated in memory that is writable and shared among the cooperating processes and
17988 have been initialized for this behavior.

17989 2.9.7 Thread Interactions with Regular File Operations

17990 All of the following functions shall be atomic with respect to each other in the effects specified in
17991 POSIX.1-2008 when they operate on regular files or symbolic links:

17992	<i>chmod()</i>	<i>fchownat()</i>	<i>lseek()</i>	<i>readv()</i>	<i>unlink()</i>
17993	<i>chown()</i>	<i>fcntl()</i>	<i>lstat()</i>	<i>pwrite()</i>	<i>unlinkat()</i>
17994	<i>close()</i>	<i>fstat()</i>	<i>open()</i>	<i>rename()</i>	<i>utime()</i>
17995	<i>creat()</i>	<i>fstatat()</i>	<i>openat()</i>	<i>renameat()</i>	<i>utimensat()</i>
17996	<i>dup2()</i>	<i>ftruncate()</i>	<i>pread()</i>	<i>stat()</i>	<i>utimes()</i>
17997	<i>fchmod()</i>	<i>lchown()</i>	<i>read()</i>	<i>symlink()</i>	<i>write()</i>
17998	<i>fchmodat()</i>	<i>link()</i>	<i>readlink()</i>	<i>symlinkat()</i>	<i>writev()</i>
17999	<i>fchown()</i>	<i>linkat()</i>	<i>readlinkat()</i>	<i>truncate()</i>	

18000 If two threads each call one of these functions, each call shall either see all of the specified effects
18001 of the other call, or none of them.

18002 2.9.8 Use of Application-Managed Thread Stacks

18003 An “application-managed thread stack” is a region of memory allocated by the application—for
18004 example, memory returned by the *malloc()* or *mmap()* functions—and designated as a stack
18005 through the act of passing the address and size of the stack, respectively, as the *stackaddr* and
18006 *stacksize* arguments to *pthread_attr_setstack()*. Application-managed stacks allow the application
18007 to precisely control the placement and size of a stack.

18008 The application grants to the implementation permanent ownership of and control over the
18009 application-managed stack when the attributes object in which the *stack* or *stackaddr* attribute has
18010 been set is used, either by presenting that attribute’s object as the *attr* argument in a call to
18011 *pthread_create()* that completes successfully, or by storing a pointer to the attributes object in the
18012 *sigev_notify_attributes* member of a **struct sigevent** and passing that **struct sigevent** to a function
18013 accepting such argument that completes successfully. The application may thereafter utilize the
18014 memory within the stack only within the normal context of stack usage within or properly
18015 synchronized with a thread that has been scheduled by the implementation with stack pointer
18016 value(s) that are within the range of that stack. In particular, the region of memory cannot be
18017 freed, nor can it be later specified as the stack for another thread.

18018 When specifying an attributes object with an application-managed stack through the
18019 *sigev_notify_attributes* member of a **struct sigevent**, the results are undefined if the requested
18020 signal is generated multiple times (as for a repeating timer).

18021 Until an attributes object in which the *stack* or *stackaddr* attribute has been set is used, the
18022 application retains ownership of and control over the memory allocated to the stack. It may free
18023 or reuse the memory as long as it either deletes the attributes object, or before using the

attributes object replaces the stack by making an additional call to `pthread_attr_setstack()`, that was used originally to designate the stack. There is no mechanism to retract the reference to an application-managed stack by an existing attributes object.

Once an attributes object with an application-managed stack has been used, that attributes object cannot be used again by a subsequent call to `pthread_create()` or any function accepting a **struct sigevent** with `sigev_notify_attributes` containing a pointer to the attributes object, without designating an unused application-managed stack by making an additional call to `pthread_attr_setstack()`.

2.10 Sockets

A socket is an endpoint for communication using the facilities described in this section. A socket is created with a specific socket type, described in [Section 2.10.6](#) (on page 523), and is associated with a specific protocol, detailed in [Section 2.10.3](#). A socket is accessed via a file descriptor obtained when the socket is created.

2.10.1 Address Families

All network protocols are associated with a specific address family. An address family provides basic services to the protocol implementation to allow it to function within a specific network environment. These services may include packet fragmentation and reassembly, routing, addressing, and basic transport. An address family is normally comprised of a number of protocols, one per socket type. Each protocol is characterized by an abstract socket type. It is not required that an address family support all socket types. An address family may contain multiple protocols supporting the same socket abstraction.

[Section 2.10.17](#) (on page 530), [Section 2.10.19](#) (on page 531), and [Section 2.10.20](#) (on page 531), respectively, describe the use of sockets for local UNIX connections, for Internet protocols based on IPv4, and for Internet protocols based on IPv6.

2.10.2 Addressing

An address family defines the format of a socket address. All network addresses are described using a general structure, called a **sockaddr**, as defined in the Base Definitions volume of POSIX.1-2008, `<sys/socket.h>`. However, each address family imposes finer and more specific structure, generally defining a structure with fields specific to the address family. The field `sa_family` in the **sockaddr** structure contains the address family identifier, specifying the format of the `sa_data` area. The size of the `sa_data` area is unspecified.

2.10.3 Protocols

A protocol supports one of the socket abstractions detailed in [Section 2.10.6](#) (on page 523). Selecting a protocol involves specifying the address family, socket type, and protocol number to the `socket()` function. Certain semantics of the basic socket abstractions are protocol-specific. All protocols are expected to support the basic model for their particular socket type, but may, in addition, provide non-standard facilities or extensions to a mechanism.

2.10.4 Routing

Sockets provides packet routing facilities. A routing information database is maintained, which is used in selecting the appropriate network interface when transmitting packets.

2.10.5 Interfaces

Each network interface in a system corresponds to a path through which messages can be sent and received. A network interface usually has a hardware device associated with it, though certain interfaces such as the loopback interface, do not.

2.10.6 Socket Types

A socket is created with a specific type, which defines the communication semantics and which allows the selection of an appropriate communication protocol. Four types are defined: SOCK_DGRAM, SOCK_RAW, SOCK_SEQPACKET, and SOCK_STREAM. Implementations may specify additional socket types.

The SOCK_STREAM socket type provides reliable, sequenced, full-duplex octet streams between the socket and a peer to which the socket is connected. A socket of type SOCK_STREAM must be in a connected state before any data may be sent or received. Record boundaries are not maintained; data sent on a stream socket using output operations of one size may be received using input operations of smaller or larger sizes without loss of data. Data may be buffered; successful return from an output function does not imply that the data has been delivered to the peer or even transmitted from the local system. If data cannot be successfully transmitted within a given time then the connection is considered broken, and subsequent operations shall fail. A SIGPIPE signal is raised if a thread attempts to send data on a broken stream (one that is no longer connected), except that the signal is suppressed if the MSG_NOSIGNAL flag is used in calls to *send()*, *sendto()*, and *sendmsg()*. Support for an out-of-band data transmission facility is protocol-specific.

The SOCK_SEQPACKET socket type is similar to the SOCK_STREAM type, and is also connection-oriented. The only difference between these types is that record boundaries are maintained using the SOCK_SEQPACKET type. A record can be sent using one or more output operations and received using one or more input operations, but a single operation never transfers parts of more than one record. Record boundaries are visible to the receiver via the MSG_EOR flag in the received message flags returned by the *recvmsg()* function. It is protocol-specific whether a maximum record size is imposed.

The SOCK_DGRAM socket type supports connectionless data transfer which is not necessarily acknowledged or reliable. Datagrams may be sent to the address specified (possibly multicast or broadcast) in each output operation, and incoming datagrams may be received from multiple sources. The source address of each datagram is available when receiving the datagram. An application may also pre-specify a peer address, in which case calls to output functions that do not specify a peer address shall send to the pre-specified peer. If a peer has been specified, only datagrams from that peer shall be received. A datagram must be sent in a single output operation, and must be received in a single input operation. The maximum size of a datagram is protocol-specific; with some protocols, the limit is implementation-defined. Output datagrams may be buffered within the system; thus, a successful return from an output function does not guarantee that a datagram is actually sent or received. However, implementations should attempt to detect any errors possible before the return of an output function, reporting any error by an unsuccessful return value.

18105 RS The SOCK_RAW socket type is similar to the SOCK_DGRAM type. It differs in that it is
18106 normally used with communication providers that underlie those used for the other socket
18107 types. For this reason, the creation of a socket with type SOCK_RAW shall require appropriate
18108 privileges. The format of datagrams sent and received with this socket type generally include
18109 specific protocol headers, and the formats are protocol-specific and implementation-defined.

18110 2.10.7 Socket I/O Mode

18111 The I/O mode of a socket is described by the O_NONBLOCK file status flag which pertains to
18112 the open file description for the socket. This flag is initially off when a socket is created, but may
18113 be set and cleared by the use of the F_SETFL command of the *fcntl()* function.

18114 When the O_NONBLOCK flag is set, certain functions that would normally block until they are
18115 complete shall return immediately.

18116 The *bind()* function initiates an address assignment and shall return without blocking when
18117 O_NONBLOCK is set; if the socket address cannot be assigned immediately, *bind()* shall return
18118 the [EINPROGRESS] error to indicate that the assignment was initiated successfully, but that it
18119 has not yet completed.

18120 The *connect()* function initiates a connection and shall return without blocking when
18121 O_NONBLOCK is set; it shall return the error [EINPROGRESS] to indicate that the connection
18122 was initiated successfully, but that it has not yet completed.

18123 Data transfer operations (the *read()*, *write()*, *send()*, and *recv()* functions) shall complete
18124 immediately, transfer only as much as is available, and then return without blocking, or return
18125 an error indicating that no transfer could be made without blocking.

18126 2.10.8 Socket Owner

18127 The owner of a socket is unset when a socket is created. The owner may be set to a process ID or
18128 process group ID using the F_SETOWN command of the *fcntl()* function.

18129 2.10.9 Socket Queue Limits

18130 The transmit and receive queue sizes for a socket are set when the socket is created. The default
18131 sizes used are both protocol-specific and implementation-defined. The sizes may be changed
18132 using the *setsockopt()* function.

18133 2.10.10 Pending Error

18134 Errors may occur asynchronously, and be reported to the socket in response to input from the
18135 network protocol. The socket stores the pending error to be reported to a user of the socket at the
18136 next opportunity. The error is returned in response to a subsequent *send()*, *recv()*, or *getsockopt()*
18137 operation on the socket, and the pending error is then cleared.

2.10.11 Socket Receive Queue

A socket has a receive queue that buffers data when it is received by the system until it is removed by a receive call. Depending on the type of the socket and the communication provider, the receive queue may also contain ancillary data such as the addressing and other protocol data associated with the normal data in the queue, and may contain out-of-band or expedited data. The limit on the queue size includes any normal, out-of-band data, datagram source addresses, and ancillary data in the queue. The description in this section applies to all sockets, even though some elements cannot be present in some instances.

The contents of a receive buffer are logically structured as a series of data segments with associated ancillary data and other information. A data segment may contain normal data or out-of-band data, but never both. A data segment may complete a record if the protocol supports records (always true for types SOCK_SEQPACKET and SOCK_DGRAM). A record may be stored as more than one segment; the complete record might never be present in the receive buffer at one time, as a portion might already have been returned to the application, and another portion might not yet have been received from the communications provider. A data segment may contain ancillary protocol data, which is logically associated with the segment. Ancillary data is received as if it were queued along with the first normal data octet in the segment (if any). A segment may contain ancillary data only, with no normal or out-of-band data. For the purposes of this section, a datagram is considered to be a data segment that terminates a record, and that includes a source address as a special type of ancillary data. Data segments are placed into the queue as data is delivered to the socket by the protocol. Normal data segments are placed at the end of the queue as they are delivered. If a new segment contains the same type of data as the preceding segment and includes no ancillary data, and if the preceding segment does not terminate a record, the segments are logically merged into a single segment.

The receive queue is logically terminated if an end-of-file indication has been received or a connection has been terminated. A segment shall be considered to be terminated if another segment follows it in the queue, if the segment completes a record, or if an end-of-file or other connection termination has been reported. The last segment in the receive queue shall also be considered to be terminated while the socket has a pending error to be reported.

A receive operation shall never return data or ancillary data from more than one segment.

2.10.12 Socket Out-of-Band Data State

The handling of received out-of-band data is protocol-specific. Out-of-band data may be placed in the socket receive queue, either at the end of the queue or before all normal data in the queue. In this case, out-of-band data is returned to an application program by a normal receive call. Out-of-band data may also be queued separately rather than being placed in the socket receive queue, in which case it shall be returned only in response to a receive call that requests out-of-band data. It is protocol-specific whether an out-of-band data mark is placed in the receive queue to demarcate data preceding the out-of-band data and following the out-of-band data. An out-of-band data mark is logically an empty data segment that cannot be merged with other segments in the queue. An out-of-band data mark is never returned in response to an input operation. The *socketatmark()* function can be used to test whether an out-of-band data mark is the first element in the queue. If an out-of-band data mark is the first element in the queue when an input function is called without the MSG_PEEK option, the mark is removed from the queue and the following data (if any) is processed as if the mark had not been present.

2.10.13 Connection Indication Queue

Sockets that are used to accept incoming connections maintain a queue of outstanding connection indications. This queue is a list of connections that are awaiting acceptance by the application; see *listen()*.

2.10.14 Signals

One category of event at the socket interface is the generation of signals. These signals report protocol events or process errors relating to the state of the socket. The generation or delivery of a signal does not change the state of the socket, although the generation of the signal may have been caused by a state change.

The SIGPIPE signal shall be sent to a thread that attempts to send data on a socket that is no longer able to send (one that is no longer connected), except that the signal is suppressed if the MSG_NOSIGNAL flag is used in calls to *send()*, *sendto()*, and *sendmsg()*. Regardless of whether the generation of the signal is suppressed, the send operation shall fail with the [EPIPE] error.

If a socket has an owner, the SIGURG signal is sent to the owner of the socket when it is notified of expedited or out-of-band data. The socket state at this time is protocol-dependent, and the status of the socket is specified in [Section 2.10.17](#) (on page 530), [Section 2.10.19](#) (on page 531), and [Section 2.10.20](#) (on page 531). Depending on the protocol, the expedited data may or may not have arrived at the time of signal generation.

2.10.15 Asynchronous Errors

If any of the following conditions occur asynchronously for a socket, the corresponding value listed below shall become the pending error for the socket:

[ECONNABORTED]

The connection was aborted locally.

[ECONNREFUSED]

For a connection-mode socket attempting a non-blocking connection, the attempt to connect was forcefully rejected. For a connectionless-mode socket, an attempt to deliver a datagram was forcefully rejected.

[ECONNRESET]

The peer has aborted the connection.

[EHOSTDOWN]

The destination host has been determined to be down or disconnected.

[EHOSTUNREACH]

The destination host is not reachable.

[EMSGSIZE]

For a connectionless-mode socket, the size of a previously sent datagram prevented delivery.

[ENETDOWN]

The local network connection is not operational.

[ENETRESET]

The connection was aborted by the network.

18223 [ENETUNREACH]
18224 The destination network is not reachable.

18225 **2.10.16 Use of Options**

18226 There are a number of socket options which either specialize the behavior of a socket or provide
18227 useful information. These options may be set at different protocol levels and are always present
18228 at the uppermost “socket” level.

18229 Socket options are manipulated by two functions, *getsockopt()* and *setsockopt()*. These functions
18230 allow an application program to customize the behavior and characteristics of a socket to
18231 provide the desired effect.

18232 All of the options have default values. The type and meaning of these values is defined by the
18233 protocol level to which they apply. Instead of using the default values, an application program
18234 may choose to customize one or more of the options. However, in the bulk of cases, the default
18235 values are sufficient for the application.

18236 Some of the options are used to enable or disable certain behavior within the protocol modules
18237 (for example, turn on debugging) while others may be used to set protocol-specific information
18238 (for example, IP time-to-live on all the application’s outgoing packets). As each of the options is
18239 introduced, its effect on the underlying protocol modules is described.

18240 [Table 2-1](#) shows the value for the socket level.

18241 **Table 2-1** Value of Level for Socket Options

18242	Name	Description
18243	SOL_SOCKET	Options are intended for the sockets level.

18244 [Table 2-2](#) (on page 528) lists those options present at the socket level; that is, when the *level*
18245 parameter of the *getsockopt()* or *setsockopt()* function is SOL_SOCKET, the types of the option
18246 value parameters associated with each option, and a brief synopsis of the meaning of the option
18247 value parameter. Unless otherwise noted, each may be examined with *getsockopt()* and set with
18248 *setsockopt()* on all types of socket. Options at other protocol levels vary in format and name.

Table 2-2 Socket-Level Options

Option	Parameter Type	Parameter Meaning
SO_ACCEPTCONN	int	Non-zero indicates that socket listening is enabled (<i>getsockopt()</i> only).
SO_BROADCAST	int	Non-zero requests permission to transmit broadcast datagrams (SOCK_DGRAM sockets only).
SO_DEBUG	int	Non-zero requests debugging in underlying protocol modules.
SO_DONTROUTE	int	Non-zero requests bypass of normal routing; route based on destination address only.
SO_ERROR	int	Requests and clears pending error information on the socket (<i>getsockopt()</i> only).
SO_KEEPAIVE	int	Non-zero requests periodic transmission of keepalive messages (protocol-specific).
SO_LINGER	struct linger	Specify actions to be taken for queued, unsent data on <i>close()</i> : linger on/off and linger time in seconds.
SO_OOINLINE	int	Non-zero requests that out-of-band data be placed into normal data input queue as received.
SO_RCVBUF	int	Size of receive buffer (in bytes).
SO_RCVLOWAT	int	Minimum amount of data to return to application for input operations (in bytes).
SO_RCVTIMEO	struct timeval	Timeout value for a socket receive operation.
SO_REUSEADDR	int	Non-zero requests reuse of local addresses in <i>bind()</i> (protocol-specific).
SO_SNDBUF	int	Size of send buffer (in bytes).
SO_SNDLOWAT	int	Minimum amount of data to send for output operations (in bytes).
SO_SNDTIMEO	struct timeval	Timeout value for a socket send operation.
SO_TYPE	int	Identify socket type (<i>getsockopt()</i> only).

The SO_ACCEPTCONN option is used only on *getsockopt()*. When this option is specified, *getsockopt()* shall report whether socket listening is enabled for the socket. A value of zero shall indicate that socket listening is disabled; non-zero that it is enabled. SO_ACCEPTCONN has no default value.

The SO_BROADCAST option requests permission to send broadcast datagrams on the socket. Support for SO_BROADCAST is protocol-specific. The default for SO_BROADCAST is that the ability to send broadcast datagrams on a socket is disabled.

The SO_DEBUG option enables debugging in the underlying protocol modules. This can be useful for tracing the behavior of the underlying protocol modules during normal system operation. The semantics of the debug reports are implementation-defined. The default value for SO_DEBUG is for debugging to be turned off.

The SO_DONTROUTE option requests that outgoing messages bypass the standard routing facilities. The destination must be on a directly-connected network, and messages are directed to the appropriate network interface according to the destination address. It is protocol-specific whether this option has any effect and how the outgoing network interface is chosen. Support for this option with each protocol is implementation-defined.

The SO_ERROR option is used only on *getsockopt()*. When this option is specified, *getsockopt()*

shall return any pending error on the socket and clear the error status. It shall return a value of 0 if there is no pending error. `SO_ERROR` may be used to check for asynchronous errors on connected connectionless-mode sockets or for other types of asynchronous errors. `SO_ERROR` has no default value.

The `SO_KEEPALIVE` option enables the periodic transmission of messages on a connected socket. The behavior of this option is protocol-specific. On a connection-mode socket for which a connection has been established, if `SO_KEEPALIVE` is enabled and the connected socket fails to respond to the keep-alive messages, the connection shall be broken. The default value for `SO_KEEPALIVE` is zero, specifying that this capability is turned off.

The `SO_LINGER` option controls the action of the interface when unsent messages are queued on a socket and a `close()` is performed. The details of this option are protocol-specific. If `SO_LINGER` is enabled, the system shall block the calling thread during `close()` until it can transmit the data or until the end of the interval indicated by the `l_linger` member, whichever comes first. If `SO_LINGER` is not specified, and `close()` is issued, the system handles the call in a way that allows the calling thread to continue as quickly as possible. The default value for `SO_LINGER` is zero, or off, for the `l_onoff` element of the option value and zero seconds for the linger time specified by the `l_linger` element.

The `SO_OOBINLINE` option is valid only on protocols that support out-of-band data. The `SO_OOBINLINE` option requests that out-of-band data be placed in the normal data input queue as received; it is then accessible using the `read()` or `recv()` functions without the `MSG_OOB` flag set. The default for `SO_OOBINLINE` is off; that is, for out-of-band data not to be placed in the normal data input queue.

The `SO_RCVBUF` option requests that the buffer space allocated for receive operations on this socket be set to the value, in bytes, of the option value. Applications may wish to increase buffer size for high volume connections, or may decrease buffer size to limit the possible backlog of incoming data. The default value for the `SO_RCVBUF` option value is implementation-defined, and may vary by protocol.

The `SO_RCVLOWAT` option sets the minimum number of bytes to process for socket input operations. In general, receive calls block until any (non-zero) amount of data is received, then return the smaller of the amount available or the amount requested. The default value for `SO_RCVLOWAT` is 1, and does not affect the general case. If `SO_RCVLOWAT` is set to a larger value, blocking receive calls normally wait until they have received the smaller of the low water mark value or the requested amount. Receive calls may still return less than the low water mark if an error occurs, a signal is caught, or the type of data next in the receive queue is different from that returned (for example, out-of-band data). As mentioned previously, the default value for `SO_RCVLOWAT` is 1 byte. It is implementation-defined whether the `SO_RCVLOWAT` option can be set.

The `SO_RCVTIMEO` option is an option to set a timeout value for input operations. It accepts a **timeval** structure with the number of seconds and microseconds specifying the limit on how long to wait for an input operation to complete. If a receive operation has blocked for this much time without receiving additional data, it shall return with a partial count or `errno` shall be set to `[EAGAIN]` or `[EWOULDBLOCK]` if no data were received. The default for this option is the value zero, which indicates that a receive operation will not time out. It is implementation-defined whether the `SO_RCVTIMEO` option can be set.

The `SO_REUSEADDR` option indicates that the rules used in validating addresses supplied in a `bind()` should allow reuse of local addresses. Operation of this option is protocol-specific. The default value for `SO_REUSEADDR` is off; that is, reuse of local addresses is not permitted.

The `SO_SNDBUF` option requests that the buffer space allocated for send operations on this socket be set to the value, in bytes, of the option value. The default value for the `SO_SNDBUF`

option value is implementation-defined, and may vary by protocol.

The `SO_SNDLOWAT` option sets the minimum number of bytes to process for socket output operations. Most output operations process all of the data supplied by the call, delivering data to the protocol for transmission and blocking as necessary for flow control. Non-blocking output operations process as much data as permitted subject to flow control without blocking, but process no data if flow control does not allow the smaller of the send low water mark value or the entire request to be processed. A `select()` operation testing the ability to write to a socket shall return true only if the send low water mark could be processed. The default value for `SO_SNDLOWAT` is implementation-defined and protocol-specific. It is implementation-defined whether the `SO_SNDLOWAT` option can be set.

The `SO_SNDTIMEO` option is an option to set a timeout value for the amount of time that an output function shall block because flow control prevents data from being sent. As noted in [Table 2-2](#) (on page 528), the option value is a **timeval** structure with the number of seconds and microseconds specifying the limit on how long to wait for an output operation to complete. If a send operation has blocked for this much time, it shall return with a partial count or *errno* set to `[EAGAIN]` or `[EWOULDBLOCK]` if no data were sent. The default for this option is the value zero, which indicates that a send operation will not time out. It is implementation-defined whether the `SO_SNDTIMEO` option can be set.

The `SO_TYPE` option is used only on `getsockopt()`. When this option is specified, `getsockopt()` shall return the type of the socket (for example, `SOCK_STREAM`). This option is useful to servers that inherit sockets on start-up. `SO_TYPE` has no default value.

2.10.17 Use of Sockets for Local UNIX Connections

Support for UNIX domain sockets is mandatory.

UNIX domain sockets provide process-to-process communication in a single system.

2.10.17.1 Headers

The symbolic constant `AF_UNIX` defined in the `<sys/socket.h>` header is used to identify the UNIX domain address family. The `<sys/un.h>` header contains other definitions used in connection with UNIX domain sockets. See [XBD Chapter 13](#) (on page 219).

The **sockaddr_storage** structure defined in `<sys/socket.h>` shall be large enough to accommodate a **sockaddr_un** structure (see the `<sys/un.h>` header defined in [XBD Chapter 13](#), on page 219) and shall be aligned at an appropriate boundary so that pointers to it can be cast as pointers to **sockaddr_un** structures and used to access the fields of those structures without alignment problems. When a **sockaddr_storage** structure is cast as a **sockaddr_un** structure, the *ss_family* field maps onto the *sun_family* field.

2.10.18 Use of Sockets over Internet Protocols

When a socket is created in the Internet family with a protocol value of zero, the implementation shall use the protocol listed below for the type of socket created.

`SOCK_STREAM` `IPPROTO_TCP`.

`SOCK_DGRAM` `IPPROTO_UDP`.

18385 RS SOCK_RAW IPPROTO_RAW.

18386 SOCK_SEQPACKET Unspecified.

18387 RS A raw interface to IP is available by creating an Internet socket of type SOCK_RAW. The default
 18388 protocol for type SOCK_RAW shall be identified in the IP header with the value
 18389 IPPROTO_RAW. Applications should not use the default protocol when creating a socket with
 18390 type SOCK_RAW, but should identify a specific protocol by value. The ICMP control protocol is
 18391 accessible from a raw socket by specifying a value of IPPROTO_ICMP for protocol.

18392 2.10.19 Use of Sockets over Internet Protocols Based on IPv4

18393 Support for sockets over Internet protocols based on IPv4 is mandatory.

18394 2.10.19.1 Headers

18395 The symbolic constant AF_INET defined in the `<sys/socket.h>` header is used to identify the
 18396 IPv4 Internet address family. The `<netinet/in.h>` header contains other definitions used in
 18397 connection with IPv4 Internet sockets. See XBD [Chapter 13](#) (on page 219).

18398 The `sockaddr_storage` structure defined in `<sys/socket.h>` shall be large enough to
 18399 accommodate a `sockaddr_in` structure (see the `<netinet/in.h>` header defined in XBD [Chapter](#)
 18400 [13](#), on page 219) and shall be aligned at an appropriate boundary so that pointers to it can be
 18401 cast as pointers to `sockaddr_in` structures and used to access the fields of those structures
 18402 without alignment problems. When a `sockaddr_storage` structure is cast as a `sockaddr_in`
 18403 structure, the `ss_family` field maps onto the `sin_family` field.

18404 2.10.20 Use of Sockets over Internet Protocols Based on IPv6

18405 IP6 This section describes extensions to support sockets over Internet protocols based on IPv6. The
 18406 functionality described in this section shall be provided on implementations that support the
 18407 IPV6 option (and the rest of this section is not further shaded for this option).

18408 To enable smooth transition from IPv4 to IPv6, the features defined in this section may, in certain
 18409 circumstances, also be used in connection with IPv4; see [Section 2.10.20.2](#) (on page 532).

18410 2.10.20.1 Addressing

18411 IPv6 overcomes the addressing limitations of earlier versions by using 128-bit addresses instead
 18412 of 32-bit addresses. The IPv6 address architecture is described in RFC 2373.

18413 There are three kinds of IPv6 address:

18414 Unicast

18415 Identifies a single interface.

18416 A unicast address can be global, link-local (designed for use on a single link), or site-local
 18417 (designed for systems not connected to the Internet). Link-local and site-local addresses
 18418 need not be globally unique.

18419 Anycast

18420 Identifies a set of interfaces such that a packet sent to the address can be delivered to any
 18421 member of the set.

18422 An anycast address is similar to a unicast address; the nodes to which an anycast address is

assigned must be explicitly configured to know that it is an anycast address.

Multicast

Identifies a set of interfaces such that a packet sent to the address should be delivered to every member of the set.

An application can send multicast datagrams by simply specifying an IPv6 multicast address in the *address* argument of *sendto()*. To receive multicast datagrams, an application must join the multicast group (using *setsockopt()* with `IPV6_JOIN_GROUP`) and must bind to the socket the UDP port on which datagrams will be received. Some applications should also bind the multicast group address to the socket, to prevent other datagrams destined to that port from being delivered to the socket.

A multicast address can be global, node-local, link-local, site-local, or organization-local.

The following special IPv6 addresses are defined:

Unspecified

An address that is not assigned to any interface and is used to indicate the absence of an address.

Loopback

A unicast address that is not assigned to any interface and can be used by a node to send packets to itself.

Two sets of IPv6 addresses are defined to correspond to IPv4 addresses:

IPv4-compatible addresses

These are assigned to nodes that support IPv6 and can be used when traffic is “tunneled” through IPv4.

IPv4-mapped addresses

These are used to represent IPv4 addresses in IPv6 address format; see [Section 2.10.20.2](#).

Note that the unspecified address and the loopback address must not be treated as IPv4-compatible addresses.

2.10.20.2 Compatibility with IPv4

The API provides the ability for IPv6 applications to interoperate with applications using IPv4, by using IPv4-mapped IPv6 addresses. These addresses can be generated automatically by the *getaddrinfo()* function when the specified host has only IPv4 addresses.

Applications can use `AF_INET6` sockets to open TCP connections to IPv4 nodes, or send UDP packets to IPv4 nodes, by simply encoding the destination’s IPv4 address as an IPv4-mapped IPv6 address, and passing that address, within a **sockaddr_in6** structure, in the *connect()*, *sendto()*, or *sendmsg()* function. When applications use `AF_INET6` sockets to accept TCP connections from IPv4 nodes, or receive UDP packets from IPv4 nodes, the system shall return the peer’s address to the application in the *accept()*, *recvfrom()*, *recvmsg()*, or *getpeername()* function using a **sockaddr_in6** structure encoded this way. If a node has an IPv4 address, then the implementation shall allow applications to communicate using that address via an `AF_INET6` socket. In such a case, the address will be represented at the API by the corresponding IPv4-mapped IPv6 address. Also, the implementation may allow an `AF_INET6` socket bound to **in6addr_any** to receive inbound connections and packets destined to one of the node’s IPv4 addresses.

An application can use `AF_INET6` sockets to bind to a node’s IPv4 address by specifying the address as an IPv4-mapped IPv6 address in a **sockaddr_in6** structure in the *bind()* function. For an `AF_INET6` socket bound to a node’s IPv4 address, the system shall return the address in the

18468 `getsockname()` function as an IPv4-mapped IPv6 address in a **sockaddr_in6** structure.

18469 2.10.20.3 Interface Identification

18470 Each local interface is assigned a unique positive integer as a numeric index. Indexes start at 1;
 18471 zero is not used. There may be gaps so that there is no current interface for a particular positive
 18472 index. Each interface also has a unique implementation-defined name.

18473 2.10.20.4 Options

18474 The following options apply at the IPPROTO_IPV6 level:

18475 IPV6_JOIN_GROUP

18476 When set via `setsockopt()`, it joins the application to a multicast group on an interface
 18477 (identified by its index) and addressed by a given multicast address, enabling packets sent
 18478 to that address to be read via the socket. If the interface index is specified as zero, the
 18479 system selects the interface (for example, by looking up the address in a routing table and
 18480 using the resulting interface).

18481 An attempt to read this option using `getsockopt()` shall result in an [EOPNOTSUPP] error.

18482 The parameter type of this option is a pointer to an **ipv6_mreq** structure.

18483 IPV6_LEAVE_GROUP

18484 When set via `setsockopt()`, it removes the application from the multicast group on an
 18485 interface (identified by its index) and addressed by a given multicast address.

18486 An attempt to read this option using `getsockopt()` shall result in an [EOPNOTSUPP] error.

18487 The parameter type of this option is a pointer to an **ipv6_mreq** structure.

18488 IPV6_MULTICAST_HOPS

18489 The value of this option is the hop limit for outgoing multicast IPv6 packets sent via the
 18490 socket. Its possible values are the same as those of IPV6_UNICAST_HOPS. If the
 18491 IPV6_MULTICAST_HOPS option is not set, a value of 1 is assumed. This option can be set
 18492 via `setsockopt()` and read via `getsockopt()`.

18493 The parameter type of this option is a pointer to an **int**. (Default value: 1)

18494 IPV6_MULTICAST_IF

18495 The index of the interface to be used for outgoing multicast packets. It can be set via
 18496 `setsockopt()` and read via `getsockopt()`. If the interface index is specified as zero, the system
 18497 selects the interface (for example, by looking up the address in a routing table and using the
 18498 resulting interface).

18499 The parameter type of this option is a pointer to an **unsigned int**. (Default value: 0)

18500 IPV6_MULTICAST_LOOP

18501 This option controls whether outgoing multicast packets should be delivered back to the
 18502 local application when the sending interface is itself a member of the destination multicast
 18503 group. If it is set to 1 they are delivered. If it is set to 0 they are not. Other values result in an
 18504 [EINVAL] error. This option can be set via `setsockopt()` and read via `getsockopt()`.

18505 The parameter type of this option is a pointer to an **unsigned int** which is used as a Boolean
 18506 value. (Default value: 1)

18507 IPV6_UNICAST_HOPS

18508 The value of this option is the hop limit for outgoing unicast IPv6 packets sent via the
 18509 socket. If the option is not set, or is set to -1, the system selects a default value. Attempts to

18510 set a value less than -1 or greater than 255 shall result in an [EINVAL] error. This option can
 18511 be set via *setsockopt()* and read via *getsockopt()*.

18512 The parameter type of this option is a pointer to an **int**. (Default value: Unspecified)

18513 IPV6_V6ONLY

18514 This socket option restricts AF_INET6 sockets to IPv6 communications only. AF_INET6
 18515 sockets may be used for both IPv4 and IPv6 communications. Some applications may want
 18516 to restrict their use of an AF_INET6 socket to IPv6 communications only. For these
 18517 applications, the IPV6_V6ONLY socket option is defined. When this option is turned on, the
 18518 socket can be used to send and receive IPv6 packets only. This is an IPPROTO_IPV6-level
 18519 option.

18520 The parameter type of this option is a pointer to an **int** which is used as a Boolean value.
 18521 (Default value: 0)

18522 An [EOPNOTSUPP] error shall result if IPV6_JOIN_GROUP or IPV6_LEAVE_GROUP is used
 18523 with *getsockopt()*.

18524 2.10.20.5 Headers

18525 The symbolic constant AF_INET6 is defined in the `<sys/socket.h>` header to identify the IPv6
 18526 Internet address family. See XBD Chapter 13 (on page 219).

18527 The **sockaddr_storage** structure defined in `<sys/socket.h>` shall be large enough to
 18528 accommodate a **sockaddr_in6** structure (see the `<netinet/in.h>` header defined in XBD Chapter
 18529 13, on page 219) and shall be aligned at an appropriate boundary so that pointers to it can be
 18530 cast as pointers to **sockaddr_in6** structures and used to access the fields of those structures
 18531 without alignment problems. When a **sockaddr_storage** structure is cast as a **sockaddr_in6**
 18532 structure, the *ss_family* field maps onto the *sin6_family* field.

18533 The `<netinet/in.h>`, `<arpa/inet.h>`, and `<netdb.h>` headers contain other definitions used in
 18534 connection with IPv6 Internet sockets; see XBD Chapter 13 (on page 219).

18535 2.11 Tracing

18536 OB TRC This section describes extensions to support tracing of user applications. The functionality
 18537 described in this section is dependent on support of the Trace option (and the rest of this section
 18538 is not further shaded for this option).

18539 The tracing facilities defined in POSIX.1-2008 allow a process to select a set of trace event types,
 18540 to activate a trace stream of the selected trace events as they occur in the flow of execution, and
 18541 to retrieve the recorded trace events.

18542 The tracing operation relies on three logically different components: the traced process, the
 18543 controller process, and the analyzer process. During the execution of the traced process, when a
 18544 trace point is reached, a trace event is recorded into the trace streams created for that process in
 18545 which the associated trace event type identifier is not being filtered out. The controller process
 18546 controls the operation of recording the trace events into the trace stream. It shall be able to:

- 18547 • Initialize the attributes of a trace stream
- 18548 • Create the trace stream (for a specified traced process) using those attributes

- Start and stop tracing for the trace stream
- Filter the type of trace events to be recorded, if the Trace Event Filter option is supported
- Shut a trace stream down

These operations can be done for an active trace stream. The analyzer process retrieves the traced events either at runtime, when the trace stream has not yet been shut down, but is still recording trace events; or after opening a trace log that had been previously recorded and shut down. These three logically different operations can be performed by the same process, or can be distributed into different processes.

A trace stream identifier can be created by a call to *posix_trace_create()*, *posix_trace_create_withlog()*, or *posix_trace_open()*. The *posix_trace_create()* and *posix_trace_create_withlog()* functions should be used by a controller process. The *posix_trace_open()* should be used by an analyzer process.

The tracing functions can serve different purposes. One purpose is debugging the possibly pre-instrumented code, while another is post-mortem fault analysis. These two potential uses differ in that the first requires pre-filtering capabilities to avoid overwhelming the trace stream and permits focusing on expected information; while the second needs comprehensive trace capabilities in order to be able to record all types of information.

The events to be traced belong to two classes:

1. User trace events (generated by the application instrumentation)
2. System trace events (generated by the operating system)

The trace interface defines several system trace event types associated with control of and operation of the trace stream. This small set of system trace events includes the minimum required to interpret correctly the trace event information present in the stream. Other desirable system trace events for some particular application profile may be implemented and are encouraged; for example, process and thread scheduling, signal occurrence, and so on.

Each traced process shall have a mapping of the trace event names to trace event type identifiers that have been defined for that process. Each active trace stream shall have a mapping that incorporates all the trace event type identifiers predefined by the trace system plus all the mappings of trace event names to trace event type identifiers of the processes that are being traced into that trace stream. These mappings are defined from the instrumented application by calling the *posix_trace_eventid_open()* function and from the controller process by calling the *posix_trace_trid_eventid_open()* function. For a pre-recorded trace stream, the list of trace event types is obtained from the pre-recorded trace log.

The last data modification and file status change timestamps of a file associated with an active trace stream shall be marked for update every time any of the tracing operations modifies that file.

The last data access timestamp of a file associated with a trace stream shall be marked for update every time any of the tracing operations causes data to be read from that file.

Results are undefined if the application performs any operation on a file descriptor associated with an active or pre-recorded trace stream until *posix_trace_shutdown()* or *posix_trace_close()* is called for that trace stream. Results are also undefined if the analyzer process and the traced process do not share the same programming environment (see *c99*, Programming Environments in the Shell and Utilities volume of POSIX.1-2008).

The main purpose of this option is to define a complete set of functions and concepts that allow a conforming application to be traced from creation to termination, whatever its realtime constraints and properties.

2.11.1 Tracing Data Definitions

2.11.1.1 Structures

The **<trace.h>** header shall define the *posix_trace_status_info* and *posix_trace_event_info* structures described below. Implementations may add extensions to these structures.

posix_trace_status_info Structure

To facilitate control of a trace stream, information about the current state of an active trace stream can be obtained dynamically. This structure is returned by a call to the *posix_trace_get_status()* function.

The **posix_trace_status_info** structure defined in **<trace.h>** shall contain at least the following members:

Member Type	Member Name	Description
int	<i>posix_stream_status</i>	The operating mode of the trace stream.
int	<i>posix_stream_full_status</i>	The full status of the trace stream.
int	<i>posix_stream_overrun_status</i>	Indicates whether trace events were lost in the trace stream.

If the Trace Log option is supported in addition to the Trace option, the **posix_trace_status_info** structure defined in **<trace.h>** shall contain at least the following additional members:

Member Type	Member Name	Description
int	<i>posix_stream_flush_status</i>	Indicates whether a flush is in progress.
int	<i>posix_stream_flush_error</i>	Indicates whether any error occurred during the last flush operation.
int	<i>posix_log_overrun_status</i>	Indicates whether trace events were lost in the trace log.
int	<i>posix_log_full_status</i>	The full status of the trace log.

The *posix_stream_status* member indicates the operating mode of the trace stream and shall have one of the following values defined by manifest constants in the **<trace.h>** header:

POSIX_TRACE_RUNNING

Tracing is in progress; that is, the trace stream is accepting trace events.

POSIX_TRACE_SUSPENDED

The trace stream is not accepting trace events. The tracing operation has not yet started or has stopped, either following a *posix_trace_stop()* function call or because the trace resources are exhausted.

The *posix_stream_full_status* member indicates the full status of the trace stream, and it shall have one of the following values defined by manifest constants in the **<trace.h>** header:

POSIX_TRACE_FULL

The space in the trace stream for trace events is exhausted.

POSIX_TRACE_NOT_FULL

There is still space available in the trace stream.

The combination of the *posix_stream_status* and *posix_stream_full_status* members also indicates the actual status of the stream. The status shall be interpreted as follows:

18635 POSIX_TRACE_RUNNING and POSIX_TRACE_NOT_FULL
 18636 This status combination indicates that tracing is in progress, and there is space available for
 18637 recording more trace events.

18638 POSIX_TRACE_RUNNING and POSIX_TRACE_FULL
 18639 This status combination indicates that tracing is in progress and that the trace stream is full
 18640 of trace events. This status combination cannot occur unless the *stream-full-policy* is set to
 18641 POSIX_TRACE_LOOP. The trace stream contains trace events recorded during a moving
 18642 time window of prior trace events, and some older trace events may have been overwritten
 18643 and thus lost.

18644 POSIX_TRACE_SUSPENDED and POSIX_TRACE_NOT_FULL
 18645 This status combination indicates that tracing has not yet been started, has been stopped by
 18646 the *posix_trace_stop()* function, or has been cleared by the *posix_trace_clear()* function.

18647 POSIX_TRACE_SUSPENDED and POSIX_TRACE_FULL
 18648 This status combination indicates that tracing has been stopped by the implementation
 18649 because the *stream-full-policy* attribute was POSIX_TRACE_UNTIL_FULL and trace
 18650 resources were exhausted, or that the trace stream was stopped by the function
 18651 *posix_trace_stop()* at a time when trace resources were exhausted.

18652 The *posix_stream_overrun_status* member indicates whether trace events were lost in the trace
 18653 stream, and shall have one of the following values defined by manifest constants in the
 18654 **<trace.h>** header:

18655 POSIX_TRACE_OVERRUN
 18656 At least one trace event was lost and thus was not recorded in the trace stream.

18657 POSIX_TRACE_NO_OVERRUN
 18658 No trace events were lost.

18659 When the corresponding trace stream is created, the *posix_stream_overrun_status* member shall be
 18660 set to POSIX_TRACE_NO_OVERRUN.

18661 Whenever an overrun occurs, the *posix_stream_overrun_status* member shall be set to
 18662 POSIX_TRACE_OVERRUN.

18663 An overrun occurs when:

- 18664 • The policy is POSIX_TRACE_LOOP and a recorded trace event is overwritten.
- 18665 • The policy is POSIX_TRACE_UNTIL_FULL and the trace stream is full when a trace event
 18666 is generated.
- 18667 • If the Trace Log option is supported, the policy is POSIX_TRACE_FLUSH and at least one
 18668 trace event is lost while flushing the trace stream to the trace log.

18669 The *posix_stream_overrun_status* member is reset to zero after its value is read.

18670 If the Trace Log option is supported in addition to the Trace option, the *posix_stream_flush_status*,
 18671 *posix_stream_flush_error*, *posix_log_overrun_status*, and *posix_log_full_status* members are defined
 18672 as follows; otherwise, they are undefined.

18673 The *posix_stream_flush_status* member indicates whether a flush operation is being performed
 18674 and shall have one of the following values defined by manifest constants in the header
 18675 **<trace.h>**:

18676 POSIX_TRACE_FLUSHING
 18677 The trace stream is currently being flushed to the trace log.

18678 POSIX_TRACE_NOT_FLUSHING
 18679 No flush operation is in progress.

18680 The *posix_stream_flush_status* member shall be set to POSIX_TRACE_FLUSHING if a flush
 18681 operation is in progress either due to a call to the *posix_trace_flush()* function (explicit or caused
 18682 by a trace stream shutdown operation) or because the trace stream has become full with the
 18683 *stream-full-policy* attribute set to POSIX_TRACE_FLUSH. The *posix_stream_flush_status* member
 18684 shall be set to POSIX_TRACE_NOT_FLUSHING if no flush operation is in progress.

18685 The *posix_stream_flush_error* member shall be set to zero if no error occurred during flushing. If
 18686 an error occurred during a previous flushing operation, the *posix_stream_flush_error* member
 18687 shall be set to the value of the first error that occurred. If more than one error occurs while
 18688 flushing, error values after the first shall be discarded. The *posix_stream_flush_error* member is
 18689 reset to zero after its value is read.

18690 The *posix_log_outrun_status* member indicates whether trace events were lost in the trace log,
 18691 and shall have one of the following values defined by manifest constants in the **<trace.h>**
 18692 header:

18693 POSIX_TRACE_OVERRUN
 18694 At least one trace event was lost.

18695 POSIX_TRACE_NO_OVERRUN
 18696 No trace events were lost.

18697 When the corresponding trace stream is created, the *posix_log_outrun_status* member shall be set
 18698 to POSIX_TRACE_NO_OVERRUN. Whenever an overrun occurs, this status shall be set to
 18699 POSIX_TRACE_OVERRUN. The *posix_log_outrun_status* member is reset to zero after its value
 18700 is read.

18701 The *posix_log_full_status* member indicates the full status of the trace log, and it shall have one of
 18702 the following values defined by manifest constants in the **<trace.h>** header:

18703 POSIX_TRACE_FULL
 18704 The space in the trace log is exhausted.

18705 POSIX_TRACE_NOT_FULL
 18706 There is still space available in the trace log.

18707 The *posix_log_full_status* member is only meaningful if the *log-full-policy* attribute is either
 18708 POSIX_TRACE_UNTIL_FULL or POSIX_TRACE_LOOP.

18709 For an active trace stream without log, that is created by the *posix_trace_create()* function, the
 18710 *posix_log_outrun_status* member shall be set to POSIX_TRACE_NO_OVERRUN and the
 18711 *posix_log_full_status* member shall be set to POSIX_TRACE_NOT_FULL.

18712 **posix_trace_event_info Structure**

18713 The trace event structure **posix_trace_event_info** contains the information for one recorded
 18714 trace event. This structure is returned by the set of functions *posix_trace_getnext_event()*,
 18715 *posix_trace_timedgetnext_event()*, and *posix_trace_trygetnext_event()*.

18716 The **posix_trace_event_info** structure defined in **<trace.h>** shall contain at least the following
 18717 members:

Member Type	Member Name	Description
trace_event_id_t	<i>posix_event_id</i>	Trace event type identification.
pid_t	<i>posix_pid</i>	Process ID of the process that generated the trace event.
void *	<i>posix_prog_address</i>	Address at which the trace point was invoked.
int	<i>posix_truncation_status</i>	Status about the truncation of the data associated with this trace event.
struct timespec	<i>posix_timestamp</i>	Time at which the trace event was generated.

In addition, the **posix_trace_event_info** structure defined in **<trace.h>** shall contain the following additional member:

Member Type	Member Name	Description
pthread_t	<i>posix_thread_id</i>	Thread ID of the thread that generated the trace event.

The *posix_event_id* member represents the identification of the trace event type and its value is not directly defined by the user. This identification is returned by a call to one of the following functions: *posix_trace_trid_eventid_open()*, *posix_trace_eventtypelist_getnext_id()*, or *posix_trace_eventid_open()*. The name of the trace event type can be obtained by calling *posix_trace_eventid_get_name()*.

The *posix_pid* is the process identifier of the traced process which generated the trace event. If the *posix_event_id* member is one of the implementation-defined system trace events and that trace event is not associated with any process, the *posix_pid* member shall be set to zero.

For a user trace event, the *posix_prog_address* member is the process mapped address of the point at which the associated call to the *posix_trace_event()* function was made. For a system trace event, if the trace event is caused by a system service explicitly called by the application, the *posix_prog_address* member shall be the address of the process at the point where the call to that system service was made.

The *posix_truncation_status* member defines whether the data associated with a trace event has been truncated at the time the trace event was generated, or at the time the trace event was read from the trace stream, or (if the Trace Log option is supported) from the trace log (see the *event* argument from the *posix_trace_getnext_event()* function). The *posix_truncation_status* member shall have one of the following values defined by manifest constants in the **<trace.h>** header:

POSIX_TRACE_NOT_TRUNCATED

All the traced data is available.

POSIX_TRACE_TRUNCATED_RECORD

Data was truncated at the time the trace event was generated.

POSIX_TRACE_TRUNCATED_READ

Data was truncated at the time the trace event was read from a trace stream or a trace log because the reader's buffer was too small. This truncation status overrides the POSIX_TRACE_TRUNCATED_RECORD status.

The *posix_timestamp* member shall be the time at which the trace event was generated. The clock used is implementation-defined, but the resolution of this clock can be retrieved by a call to the *posix_trace_attr_getclockres()* function.

The *posix_thread_id* member is the identifier of the thread that generated the trace event. If the *posix_event_id* member is one of the implementation-defined system trace events and that trace

event is not associated with any thread, the *posix_thread_id* member shall be set to zero.

2.11.1.2 Trace Stream Attributes

Trace streams have attributes that compose the **posix_trace_attr_t** trace stream attributes object. This object shall contain at least the following attributes:

- The *generation-version* attribute identifies the origin and version of the trace system.
- The *trace-name* attribute is a character string defined by the trace controller, and that identifies the trace stream.
- The *creation-time* attribute represents the time of the creation of the trace stream.
- The *clock-resolution* attribute defines the clock resolution of the clock used to generate timestamps.
- The *stream-min-size* attribute defines the minimum size in bytes of the trace stream strictly reserved for the trace events.
- The *stream-full-policy* attribute defines the policy followed when the trace stream is full; its value is `POSIX_TRACE_LOOP`, `POSIX_TRACE_UNTIL_FULL`, or `POSIX_TRACE_FLUSH`.
- The *max-data-size* attribute defines the maximum record size in bytes of a trace event.

In addition, if the Trace option and the Trace Inherit option are both supported, the **posix_trace_attr_t** trace stream creation attributes object shall contain at least the following attributes:

- The *inheritance* attribute specifies whether a newly created trace stream will inherit tracing in its parent's process trace stream. It is either `POSIX_TRACE_INHERITED` or `POSIX_TRACE_CLOSE_FOR_CHILD`.

In addition, if the Trace option and the Trace Log option are both supported, the **posix_trace_attr_t** trace stream creation attributes object shall contain at least the following attribute:

- If the file type corresponding to the trace log supports the `POSIX_TRACE_LOOP` or the `POSIX_TRACE_UNTIL_FULL` policies, the *log-max-size* attribute defines the maximum size in bytes of the trace log associated with an active trace stream. Other stream data—for example, trace attribute values—shall not be included in this size.
- The *log-full-policy* attribute defines the policy of a trace log associated with an active trace stream to be `POSIX_TRACE_LOOP`, `POSIX_TRACE_UNTIL_FULL`, or `POSIX_TRACE_APPEND`.

2.11.2 Trace Event Type Definitions

2.11.2.1 System Trace Event Type Definitions

The following system trace event types, defined in the **<trace.h>** header, track the invocation of the trace operations:

- `POSIX_TRACE_START` shall be associated with a trace start operation.

- POSIX_TRACE_STOP shall be associated with a trace stop operation.
- If the Trace Event Filter option is supported, POSIX_TRACE_FILTER shall be associated with a trace event type filter change operation.

The following system trace event types, defined in the `<trace.h>` header, report operational trace events:

- POSIX_TRACE_OVERFLOW shall mark the beginning of a trace overflow condition.
- POSIX_TRACE_RESUME shall mark the end of a trace overflow condition.
- If the Trace Log option is supported, POSIX_TRACE_FLUSH_START shall mark the beginning of a flush operation.
- If the Trace Log option is supported, POSIX_TRACE_FLUSH_STOP shall mark the end of a flush operation.
- If an implementation-defined trace error condition is reported, it shall be marked POSIX_TRACE_ERROR.

The interpretation of a trace stream or a trace log by a trace analyzer process relies on the information recorded for each trace event, and also on system trace events that indicate the invocation of trace control operations and trace system operational trace events.

The POSIX_TRACE_START and POSIX_TRACE_STOP trace events specify the time windows during which the trace stream is running.

- The POSIX_TRACE_STOP trace event with an associated data that is equal to zero indicates a call of the function `posix_trace_stop()`.
- The POSIX_TRACE_STOP trace event with an associated data that is different from zero indicates an automatic stop of the trace stream (see the definition of the `posix_trace_attr_getstreamfullpolicy()` function in `posix_trace_attr_getinherited()`).

The POSIX_TRACE_FILTER trace event indicates that a trace event type filter value changed while the trace stream was running.

The POSIX_TRACE_ERROR serves to inform the analyzer process that an implementation-defined internal error of the trace system occurred.

The POSIX_TRACE_OVERFLOW trace event shall be reported with a timestamp equal to the timestamp of the first trace event overwritten. This is an indication that some generated trace events have been lost.

The POSIX_TRACE_RESUME trace event shall be reported with a timestamp equal to the timestamp of the first valid trace event reported after the overflow condition ends and shall be reported before this first valid trace event. This is an indication that the trace system is reliably recording trace events after an overflow condition.

Each of these trace event types shall be defined by a constant trace event name and a **trace_event_id_t** constant; trace event data is associated with some of these trace events.

If the Trace option is supported and the Trace Event Filter option and the Trace Log option are not supported, the following predefined system trace events in [Table 2-3](#) (on page 542) shall be defined:

18839

Table 2-3 Trace Option: System Trace Events

18840

18841

Event Name	Constant	Associated Data
		Data Type
posix_trace_error	POSIX_TRACE_ERROR	error int
posix_trace_start	POSIX_TRACE_START	event_filter trace_event_set_t
posix_trace_stop	POSIX_TRACE_STOP	auto int
posix_trace_filter	POSIX_TRACE_FILTER	old_event_filter new_event_filter trace_event_set_t
posix_trace_overflow	POSIX_TRACE_OVERFLOW	None.
posix_trace_resume	POSIX_TRACE_RESUME	None.

18866

18867

18868

If the Trace option and the Trace Log option are both supported, and if the Trace Event Filter option is not supported, the following predefined system trace events in [Table 2-5](#) (on page 543) shall be defined:

Table 2-5 Trace and Trace Log Options: System Trace Events

Event Name	Constant	Associated Data
		Data Type
posix_trace_error	POSIX_TRACE_ERROR	error int
posix_trace_start	POSIX_TRACE_START	None.
posix_trace_stop	POSIX_TRACE_STOP	auto int
posix_trace_overflow	POSIX_TRACE_OVERFLOW	None.
posix_trace_resume	POSIX_TRACE_RESUME	None.
posix_trace_flush_start	POSIX_TRACE_FLUSH_START	None.
posix_trace_flush_stop	POSIX_TRACE_FLUSH_STOP	None.

If the Trace option, the Trace Event Filter option, and the Trace Log option are all supported, the following predefined system trace events in [Table 2-6](#) shall be defined:

Table 2-6 Trace, Trace Log, and Trace Event Filter Options: System Trace Events

Event Name	Constant	Associated Data
		Data Type
posix_trace_error	POSIX_TRACE_ERROR	error int
posix_trace_start	POSIX_TRACE_START	event_filter trace_event_set_t
posix_trace_stop	POSIX_TRACE_STOP	auto int
posix_trace_filter	POSIX_TRACE_FILTER	old_event_filter new_event_filter trace_event_set_t
posix_trace_overflow	POSIX_TRACE_OVERFLOW	None.
posix_trace_resume	POSIX_TRACE_RESUME	None.
posix_trace_flush_start	POSIX_TRACE_FLUSH_START	None.
posix_trace_flush_stop	POSIX_TRACE_FLUSH_STOP	None.

2.11.2.2 User Trace Event Type Definitions

The user trace event `POSIX_TRACE_UNNAMED_USEREVENT` is defined in the `<trace.h>` header. If the limit of per-process user trace event names represented by `{TRACE_USER_EVENT_MAX}` has already been reached, this predefined user event shall be returned when the application tries to register more events than allowed. The data associated with this trace event is application-defined.

The following predefined user trace event in [Table 2-7](#) (on page 544) shall be defined:

Table 2-7 Trace Option: User Trace Event

Event Name	Constant
posix_trace_unnamed_userevent	POSIX_TRACE_UNNAMED_USEREVENT

2.11.3 Trace Functions

The trace interface is built and structured to improve portability through use of trace data of opaque type. The object-oriented approach for the manipulation of trace attributes and trace event type identifiers requires definition of many constructor and selector functions which operate on these opaque types. Also, the trace interface must support several different tracing roles. To facilitate reading the trace interface, the trace functions are grouped into small functional sets supporting the three different roles:

- A trace controller process requires functions to set up and customize all the resources needed to run a trace stream, including:
 - Attribute initialization and destruction (*posix_trace_attr_init()*)
 - Identification information manipulation (*posix_trace_attr_getgenversion()*)
 - Trace system behavior modification (*posix_trace_attr_getinherited()*)
 - Trace stream and trace log size set (*posix_trace_attr_getmaxusereventsize()*)
 - Trace stream creation, flush, and shutdown (*posix_trace_create()*)
 - Trace stream and trace log clear (*posix_trace_clear()*)
 - Trace event type identifier manipulation (*posix_trace_trid_eventid_open()*)
 - Trace event type identifier list exploration (*posix_trace_eventtypelist_getnext_id()*)
 - Trace event type set manipulation (*posix_trace_eventset_empty()*)
 - Trace event type filter set (*posix_trace_set_filter()*)
 - Trace stream start and stop (*posix_trace_start()*)
 - Trace stream information and status read (*posix_trace_get_attr()*)
- A traced process requires functions to instrument trace points:
 - Trace event type identifiers definition and trace points insertion (*posix_trace_event()*)
- A trace analyzer process requires functions to retrieve information from a trace stream and trace log:
 - Identification information read (*posix_trace_attr_getgenversion()*)
 - Trace system behavior information read (*posix_trace_attr_getinherited()*)
 - Trace stream and trace log size get (*posix_trace_attr_getmaxusereventsize()*)
 - Trace event type identifier manipulation (*posix_trace_trid_eventid_open()*)
 - Trace event type identifier list exploration (*posix_trace_eventtypelist_getnext_id()*)
 - Trace log open, rewind, and close (*posix_trace_open()*)

- 18940 — Trace stream information and status read (*posix_trace_get_attr()*)
- 18941 — Trace event read (*posix_trace_getnext_event()*)

18942 2.12 Data Types

18943 2.12.1 Defined Types

18944 All of the data types used by various functions are defined by the implementation. The
 18945 following table describes some of these types. Other types referenced in the description of a
 18946 function, not mentioned here, can be found in the appropriate header for that function.

Defined Type	Description
cc_t	Type used for terminal special characters.
clock_t	Integer or real-floating type used for processor times, as defined in the ISO C standard.
clockid_t	Used for clock ID type in some timer functions.
dev_t	Integer type used for device numbers.
DIR	Type representing a directory stream.
div_t	Structure type returned by the <i>div()</i> function.
FILE	Structure containing information about a file.
glob_t	Structure type used in pathname pattern matching.
fpos_t	Type containing all information needed to specify uniquely every position within a file.
gid_t	Integer type used for group IDs.
iconv_t	Type used for conversion descriptors.
id_t	Integer type used as a general identifier; can be used to contain at least the largest of a pid_t , uid_t , or gid_t .
ino_t	Unsigned integer type used for file serial numbers.
key_t	Arithmetic type used for XSI interprocess communication.
ldiv_t	Structure type returned by the <i>ldiv()</i> function.
mode_t	Integer type used for file attributes.
mqd_t	Used for message queue descriptors.
nfds_t	Integer type used for the number of file descriptors.
nlink_t	Integer type used for link counts.
off_t	Signed integer type used for file sizes.
pid_t	Signed integer type used for process and process group IDs.
pthread_attr_t	Used to identify a thread attribute object.
pthread_cond_t	Used for condition variables.
pthread_condattr_t	Used to identify a condition attribute object.
pthread_key_t	Used for thread-specific data keys.
pthread_mutex_t	Used for mutexes.
pthread_mutexattr_t	Used to identify a mutex attribute object.
pthread_once_t	Used for dynamic package initialization.
pthread_rwlock_t	Used for read-write locks.
pthread_rwlockattr_t	Used for read-write lock attributes.
pthread_t	Used to identify a thread.

	Defined Type	Description
18982		
18983	ptrdiff_t	Signed integer type of the result of subtracting two pointers.
18984	regex_t	Structure type used in regular expression matching.
18985	regmatch_t	Structure type used in regular expression matching.
18986	rlim_t	Unsigned integer type used for limit values, to which objects of type int and off_t can be cast without loss of value.
18987		
18988	sem_t	Type used in performing semaphore operations.
18989	sig_atomic_t	Integer type of an object that can be accessed as an atomic entity, even in the presence of asynchronous interrupts.
18990		
18991	sigset_t	Integer or structure type of an object used to represent sets of signals.
18992		
18993	size_t	Unsigned integer type used for size of objects.
18994	speed_t	Type used for terminal baud rates.
18995	ssize_t	Signed integer type used for a count of bytes or an error indication.
18996		
18997	suseconds_t	Signed integer type used for time in microseconds.
18998	tcflag_t	Type used for terminal modes.
18999	time_t	Integer type used for time in seconds, as defined in the ISO C standard.
19000		
19001	timer_t	Used for timer ID returned by the <i>timer_create()</i> function.
19002	uid_t	Integer type used for user IDs.
19003	va_list	Type used for traversing variable argument lists.
19004	wchar_t	Integer type whose range of values can represent distinct codes for all members of the largest extended character set specified by the supported locales.
19005		
19006		
19007	wctype_t	Scalar type which represents a character class descriptor.
19008	wint_t	Integer type capable of storing any valid value of wchar_t or WEOF.
19009		
19010	wordexp_t	Structure type used in word expansion.

19011 2.12.2 The char Type

19012 The type **char** is defined as a single byte; see XBD [Chapter 3](#) (on page 33) (Byte and Character). -

19013

Chapter 3

19014

System Interfaces

19015

This chapter describes the functions, macros, and external variables to support applications portability at the C-language source level.

19016

19017 **NAME**

19018 FD_CLR — macros for synchronous I/O multiplexing

19019 **SYNOPSIS**

```
19020       #include <sys/select.h>
19021       void FD_CLR(int fd, fd_set *fdset);
19022       int FD_ISSET(int fd, fd_set *fdset);
19023       void FD_SET(int fd, fd_set *fdset);
19024       void FD_ZERO(fd_set *fdset);
```

19025 **DESCRIPTION**

19026 Refer to *pselect()*.

19027 **NAME**

19028 _exit, _exit — terminate a process

19029 **SYNOPSIS**

19030 #include <stdlib.h>

19031 void _Exit(int *status*);

19032 #include <unistd.h>

19033 void _exit(int *status*);19034 **DESCRIPTION**

19035 CX For `_Exit()`: The functionality described on this reference page is aligned with the ISO C
 19036 standard. Any conflict between the requirements described here and the ISO C standard is
 19037 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

19038 CX The value of *status* may be 0, EXIT_SUCCESS, EXIT_FAILURE, or any other value, though only
 19039 the least significant 8 bits (that is, *status* & 0377) shall be available to a waiting parent process.

19040 CX The `_Exit()` and `_exit()` functions shall be functionally equivalent.

19041 CX The `_Exit()` and `_exit()` functions shall not call functions registered with `atexit()` nor any
 19042 CX registered signal handlers. Open streams shall not be flushed. Whether open streams are
 19043 closed (without flushing) is implementation-defined. Finally, the calling process shall be
 19044 terminated with the consequences described below.

19045 **Consequences of Process Termination**

19046 CX Process termination caused by any reason shall have the following consequences:

19047 **Note:** These consequences are all extensions to the ISO C standard and are not further CX shaded.
 19048 However, functionality relating to the XSI option is shaded.

19049 • All of the file descriptors, directory streams, conversion descriptors, and message catalog
 19050 descriptors open in the calling process shall be closed.

19051 XSI • If the parent process of the calling process is executing a `wait()`, `waitid()`, or `waitpid()`, and
 19052 has neither set its SA_NOCLDWAIT flag nor set SIGCHLD to SIG_IGN, it shall be notified
 19053 of termination of the calling process and the low-order eight bits (that is, bits 0377) of *status*
 19054 shall be made available to it. If the parent is not waiting, the child's status shall be made
 19055 available to it when the parent subsequently executes `wait()`, `waitid()`, or `waitpid()`.

19056 The semantics of the `waitid()` function shall be equivalent to `wait()`.

19057 XSI • If the parent process of the calling process is not executing a `wait()`, `waitid()`, or `waitpid()`,
 19058 and has neither set its SA_NOCLDWAIT flag nor set SIGCHLD to SIG_IGN, the calling
 19059 process shall be transformed into a *zombie process*. A *zombie process* is an inactive process
 19060 and it shall be deleted at some later time when its parent process executes `wait()`, `waitid()`,
 19061 or `waitpid()`.

19062 XSI The semantics of the `waitid()` function shall be equivalent to `wait()`.

19063 • Termination of a process does not directly terminate its children. The sending of a SIGHUP
 19064 signal as described below indirectly terminates children in some circumstances.

19065 • Either:

19066 If the implementation supports the SIGCHLD signal, a SIGCHLD shall be sent to the
 19067 parent process.

19068 Or:

- 19069 XSI If the parent process has set its SA_NOCLDWAIT flag, or set SIGCHLD to SIG_IGN, the
 19070 status shall be discarded, and the lifetime of the calling process shall end immediately. If
 19071 SA_NOCLDWAIT is set, it is implementation-defined whether a SIGCHLD signal is sent to
 19072 the parent process.
- 19073 • The parent process ID of all of the existing child processes and zombie processes of the
 19074 calling process shall be set to the process ID of an implementation-defined system process.
 19075 That is, these processes shall be inherited by a special system process.
- 19076 XSI • Each attached shared-memory segment is detached and the value of *shm_nattch* (see
 19077 *shmget()*) in the data structure associated with its shared memory ID shall be decremented
 19078 by 1.
- 19079 XSI • For each semaphore for which the calling process has set a *semadj* value (see *semop()*), that
 19080 value shall be added to the *semval* of the specified semaphore.
- 19081 • If the process is a controlling process, the SIGHUP signal shall be sent to each process in
 19082 the foreground process group of the controlling terminal belonging to the calling process.
- 19083 • If the process is a controlling process, the controlling terminal associated with the session
 19084 shall be disassociated from the session, allowing it to be acquired by a new controlling
 19085 process.
- 19086 • If the exit of the process causes a process group to become orphaned, and if any member of
 19087 the newly-orphaned process group is stopped, then a SIGHUP signal followed by a
 19088 SIGCONT signal shall be sent to each process in the newly-orphaned process group.
- 19089 • All open named semaphores in the calling process shall be closed as if by appropriate calls
 19090 to *sem_close()*.
- 19091 ML • Any memory locks established by the process via calls to *mlockall()* or *mlock()* shall be
 19092 removed. If locked pages in the address space of the calling process are also mapped into
 19093 the address spaces of other processes and are locked by those processes, the locks
 19094 established by the other processes shall be unaffected by the call by this process to *_Exit()*
 19095 or *_exit()*.
- 19096 • Memory mappings that were created in the process shall be unmapped before the process
 19097 is destroyed.
- 19098 TYM • Any blocks of typed memory that were mapped in the calling process shall be unmapped,
 19099 as if *munmap()* was implicitly called to unmap them.
- 19100 MSG • All open message queue descriptors in the calling process shall be closed as if by
 19101 appropriate calls to *mq_close()*.
- 19102 • Any outstanding cancelable asynchronous I/O operations may be canceled. Those
 19103 asynchronous I/O operations that are not canceled shall complete as if the *_Exit()* or
 19104 *_exit()* operation had not yet occurred, but any associated signal notifications shall be
 19105 suppressed. The *_Exit()* or *_exit()* operation may block awaiting such I/O completion.
 19106 Whether any I/O is canceled, and which I/O may be canceled upon *_Exit()* or *_exit()*, is
 19107 implementation-defined.
- 19108 • Threads terminated by a call to *_Exit()* or *_exit()* shall not invoke their cancellation
 19109 cleanup handlers or per-thread data destructors.
- 19110 OB TRC • If the calling process is a trace controller process, any trace streams that were created by
 19111 the calling process shall be shut down as described by the *posix_trace_shutdown()* function,
 19112 and mapping of trace event names to trace event type identifiers of any process built for
 19113 these trace streams may be deallocated.

19114 RETURN VALUE

19115 These functions do not return.

19116 ERRORS

19117 No errors are defined.

19118 EXAMPLES

19119 None.

19120 APPLICATION USAGE

19121 Normally applications should use *exit()* rather than *_Exit()* or *_exit()*.

19122 RATIONALE**19123 Process Termination**

19124 Early proposals drew a distinction between normal and abnormal process termination.
19125 Abnormal termination was caused only by certain signals and resulted in implementation-
19126 defined “actions”, as discussed below. Subsequent proposals distinguished three types of
19127 termination: *normal termination* (as in the current specification), *simple abnormal termination*, and
19128 *abnormal termination with actions*. Again the distinction between the two types of abnormal
19129 termination was that they were caused by different signals and that implementation-defined
19130 actions would result in the latter case. Given that these actions were completely implementation-
19131 defined, the early proposals were only saying when the actions could occur and how their
19132 occurrence could be detected, but not what they were. This was of little or no use to conforming
19133 applications, and thus the distinction is not made in this volume of POSIX.1-2008.

19134 The implementation-defined actions usually include, in most historical implementations, the
19135 creation of a file named **core** in the current working directory of the process. This file contains an
19136 image of the memory of the process, together with descriptive information about the process,
19137 perhaps sufficient to reconstruct the state of the process at the receipt of the signal.

19138 There is a potential security problem in creating a **core** file if the process was set-user-ID and the
19139 current user is not the owner of the program, if the process was set-group-ID and none of the
19140 user’s groups match the group of the program, or if the user does not have permission to write
19141 in the current directory. In this situation, an implementation either should not create a **core** file
19142 or should make it unreadable by the user.

19143 Despite the silence of this volume of POSIX.1-2008 on this feature, applications are advised not
19144 to create files named **core** because of potential conflicts in many implementations. Some
19145 implementations use a name other than **core** for the file; for example, by appending the process
19146 ID to the filename.

19147 Terminating a Process

19148 It is important that the consequences of process termination as described occur regardless of
19149 whether the process called *_exit()* (perhaps indirectly through *exit()*) or instead was terminated
19150 due to a signal or for some other reason. Note that in the specific case of *exit()* this means that
19151 the *status* argument to *exit()* is treated in the same way as the *status* argument to *_exit()*.

19152 A language other than C may have other termination primitives than the C-language *exit()*
19153 function, and programs written in such a language should use its native termination primitives,
19154 but those should have as part of their function the behavior of *_exit()* as described.
19155 Implementations in languages other than C are outside the scope of this version of this volume
19156 of POSIX.1-2008, however.

19157 As required by the ISO C standard, using **return** from *main()* has the same behavior (other than

with respect to language scope issues) as calling *exit()* with the returned value. Reaching the end of the *main()* function has the same behavior as calling *exit(0)*.

A value of zero (or `EXIT_SUCCESS`, which is required to be zero) for the argument *status* conventionally indicates successful termination. This corresponds to the specification for *exit()* in the ISO C standard. The convention is followed by utilities such as *make* and various shells, which interpret a zero status from a child process as success. For this reason, applications should not call *exit(0)* or *_exit(0)* when they terminate unsuccessfully; for example, in signal-catching functions.

Historically, the implementation-defined process that inherits children whose parents have terminated without waiting on them is called *init* and has a process ID of 1.

The sending of a `SIGHUP` to the foreground process group when a controlling process terminates corresponds to somewhat different historical implementations. In System V, the kernel sends a `SIGHUP` on termination of (essentially) a controlling process. In 4.2 BSD, the kernel does not send `SIGHUP` in a case like this, but the termination of a controlling process is usually noticed by a system daemon, which arranges to send a `SIGHUP` to the foreground process group with the *vhangup()* function. However, in 4.2 BSD, due to the behavior of the shells that support job control, the controlling process is usually a shell with no other processes in its process group. Thus, a change to make *_exit()* behave this way in such systems should not cause problems with existing applications.

The termination of a process may cause a process group to become orphaned in either of two ways. The connection of a process group to its parent(s) outside of the group depends on both the parents and their children. Thus, a process group may be orphaned by the termination of the last connecting parent process outside of the group or by the termination of the last direct descendant of the parent process(es). In either case, if the termination of a process causes a process group to become orphaned, processes within the group are disconnected from their job control shell, which no longer has any information on the existence of the process group. Stopped processes within the group would languish forever. In order to avoid this problem, newly orphaned process groups that contain stopped processes are sent a `SIGHUP` signal and a `SIGCONT` signal to indicate that they have been disconnected from their session. The `SIGHUP` signal causes the process group members to terminate unless they are catching or ignoring `SIGHUP`. Under most circumstances, all of the members of the process group are stopped if any of them are stopped.

The action of sending a `SIGHUP` and a `SIGCONT` signal to members of a newly orphaned process group is similar to the action of 4.2 BSD, which sends `SIGHUP` and `SIGCONT` to each stopped child of an exiting process. If such children exit in response to the `SIGHUP`, any additional descendants receive similar treatment at that time. In this volume of POSIX.1-2008, the signals are sent to the entire process group at the same time. Also, in this volume of POSIX.1-2008, but not in 4.2 BSD, stopped processes may be orphaned, but may be members of a process group that is not orphaned; therefore, the action taken at *_exit()* must consider processes other than child processes.

It is possible for a process group to be orphaned by a call to *setpgid()* or *setsid()*, as well as by process termination. This volume of POSIX.1-2008 does not require sending `SIGHUP` and `SIGCONT` in those cases, because, unlike process termination, those cases are not caused accidentally by applications that are unaware of job control. An implementation can choose to send `SIGHUP` and `SIGCONT` in those cases as an extension; such an extension must be documented as required in **<signal.h>**.

The ISO/IEC 9899:1999 standard adds the *_Exit()* function that results in immediate program termination without triggering signals or *atexit()*-registered functions. In POSIX.1-2008, this is

19206 equivalent to the `_exit()` function.

19207 FUTURE DIRECTIONS

19208 None.

19209 SEE ALSO

19210 `atexit()`, `exit()`, `mlock()`, `mlockall()`, `mq_close()`, `munmap()`, `posix_trace_create()`, `sem_close()`,

19213 CHANGE HISTORY

19214 First released in Issue 1. Derived from Issue 1 of the SVID.

19215 Issue 5

19216 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX
19217 Threads Extension.

19218 Interactions with the SA_NOCLDWAIT flag and SIGCHLD signal are further clarified.

19219 The values of *status* from `exit()` are better described.

19220 Issue 6

19221 Extensions beyond the ISO C standard are marked.

19222 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by adding semantics
19223 for typed memory.

19224 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- 19225 • The `_Exit()` function is included.
- 19226 • The DESCRIPTION is updated.

19227 The description of tracing semantics is added for alignment with IEEE Std 1003.1q-2000.

19228 References to the `wait3()` function are removed.

19229 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/16 is applied, correcting grammar in the
19230 DESCRIPTION.

19231 Issue 7

19232 Austin Group Interpretation 1003.1-2001 #031 is applied, separating these functions from the
19233 `exit()` function.

19234 Austin Group Interpretation 1003.1-2001 #085 is applied, clarifying the text regarding flushing of
19235 streams and closing of temporary files.

19236 Functionality relating to the Asynchronous Input and Output, Memory Mapped Files, and
19237 Semaphores options is moved to the Base.

19238 NAME

19239 _longjmp, _setjmp — non-local goto

19240 SYNOPSIS

```
19241 OB XSI  #include <setjmp.h>
19242         void _longjmp(jmp_buf env, int val);
19243         int _setjmp(jmp_buf env);
```

19244 DESCRIPTION

19245 The *_longjmp()* and *_setjmp()* functions shall be equivalent to *longjmp()* and *setjmp()*,
19246 respectively, with the additional restriction that *_longjmp()* and *_setjmp()* shall not manipulate
19247 the signal mask.

19248 If *_longjmp()* is called even though *env* was never initialized by a call to *_setjmp()*, or when the
19249 last such call was in a function that has since returned, the results are undefined.

19250 RETURN VALUE

19251 Refer to *longjmp()* and *setjmp()*.

19252 ERRORS

19253 No errors are defined.

19254 EXAMPLES

19255 None.

19256 APPLICATION USAGE

19257 If *_longjmp()* is executed and the environment in which *_setjmp()* was executed no longer exists,
19258 errors can occur. The conditions under which the environment of the *_setjmp()* no longer exists
19259 include exiting the function that contains the *_setjmp()* call, and exiting an inner block with
19260 temporary storage. This condition might not be detectable, in which case the *_longjmp()* occurs
19261 and, if the environment no longer exists, the contents of the temporary storage of an inner block
19262 are unpredictable. This condition might also cause unexpected process termination. If the
19263 function has returned, the results are undefined.

19264 Passing *longjmp()* a pointer to a buffer not created by *setjmp()*, passing *_longjmp()* a pointer to a
19265 buffer not created by *_setjmp()*, passing *siglongjmp()* a pointer to a buffer not created by
19266 *sigsetjmp()*, or passing any of these three functions a buffer that has been modified by the user
19267 can cause all the problems listed above, and more.

19268 The *_longjmp()* and *_setjmp()* functions are included to support programs written to historical
19269 system interfaces. New applications should use *siglongjmp()* and *sigsetjmp()* respectively.

19270 RATIONALE

19271 None.

19272 FUTURE DIRECTIONS

19273 The *_longjmp()* and *_setjmp()* functions may be removed in a future version.

19274 SEE ALSO

19275 *longjmp()*, *setjmp()*, *siglongjmp()*, *sigsetjmp()*

19277 CHANGE HISTORY

19278 First released in Issue 4, Version 2.

19279 **Issue 5**

19280 Moved from X/OPEN UNIX extension to BASE.

19281 **Issue 7**19282 The *_longjmp()* and *_setjmp()* functions are marked obsolescent.

19283 NAME

19284 _toupper — transliterate uppercase characters to lowercase

19285 SYNOPSIS

```
19286 OB XSI  #include <ctype.h>
19287         int _toupper(int c);
```

19288 DESCRIPTION

19289 The *_toupper()* macro shall be equivalent to *toupper(c)* except that the application shall ensure
19290 that the argument *c* is an uppercase letter.

19291 RETURN VALUE

19292 Upon successful completion, *_toupper()* shall return the lowercase letter corresponding to the
19293 argument passed.

19294 ERRORS

19295 No errors are defined.

19296 EXAMPLES

19297 None.

19298 APPLICATION USAGE

19299 Applications should use the *toupper()* function instead of the obsolescent *_toupper()* function.

19300 RATIONALE

19301 None.

19302 FUTURE DIRECTIONS

19303 The *_toupper()* function may be removed in a future version.

19337 CHANGE HISTORY

19338 First released in Issue 1. Derived from Issue 1 of the SVID.

19339 Issue 6

19340 The normative text is updated to avoid use of the term “must” for application requirements.

19341 Issue 7

19342 The *_toupper()* function is marked obsolescent.

19343 **NAME**

19344 a64l, l64a — convert between a 32-bit integer and a radix-64 ASCII string

19345 **SYNOPSIS**

```
19346 XSI      #include <stdlib.h>
19347          long a64l(const char *s);
19348          char *l64a(long value);
```

19349 **DESCRIPTION**

19350 These functions maintain numbers stored in radix-64 ASCII characters. This is a notation by
 19351 which 32-bit integers can be represented by up to six characters; each character represents a digit
 19352 in radix-64 notation. If the type **long** contains more than 32 bits, only the low-order 32 bits shall
 19353 be used for these operations.

19354 The characters used to represent digits are ' .' (dot) for 0, ' / ' for 1, ' 0 ' through ' 9 ' for [2,11],
 19355 ' A ' through ' Z ' for [12,37], and ' a ' through ' z ' for [38,63].

19356 The *a64l()* function shall take a pointer to a radix-64 representation, in which the first digit is the
 19357 least significant, and return the corresponding **long** value. If the string pointed to by *s* contains
 19358 more than six characters, *a64l()* shall use the first six. If the first six characters of the string
 19359 contain a null terminator, *a64l()* shall use only characters preceding the null terminator. The
 19360 *a64l()* function shall scan the character string from left to right with the least significant digit on
 19361 the left, decoding each character as a 6-bit radix-64 number. If the type **long** contains more than
 19362 32 bits, the resulting value is sign-extended. The behavior of *a64l()* is unspecified if *s* is a null
 19363 pointer or the string pointed to by *s* was not generated by a previous call to *l64a()*.

19364 The *l64a()* function shall take a **long** argument and return a pointer to the corresponding
 19365 radix-64 representation. The behavior of *l64a()* is unspecified if *value* is negative.

19366 The value returned by *l64a()* may be a pointer into a static buffer. Subsequent calls to *l64a()* may
 19367 overwrite the buffer.

19368 The *l64a()* function need not be thread-safe.

19369 **RETURN VALUE**

19370 Upon successful completion, *a64l()* shall return the **long** value resulting from conversion of the
 19371 input string. If a string pointed to by *s* is an empty string, *a64l()* shall return 0L.

19372 The *l64a()* function shall return a pointer to the radix-64 representation. If *value* is 0L, *l64a()* shall
 19373 return a pointer to an empty string.

19374 **ERRORS**

19375 No errors are defined.

19376 **EXAMPLES**

19377 None.

19378 **APPLICATION USAGE**

19379 If the type **long** contains more than 32 bits, the result of *a64l(l64a(x))* is *x* in the low-order 32 bits.

19380 **RATIONALE**

19381 This is not the same encoding as used by either encoding variant of the *uuencode* utility.

19382 **FUTURE DIRECTIONS**

19383 None.

19384 **SEE ALSO**19385 [strtoul\(\)](#)19386 XBD [<stdlib.h>](#)19387 XCU [uuencode](#)19388 **CHANGE HISTORY**

19389 First released in Issue 4, Version 2.

19390 **Issue 5**

19391 Moved from X/OPEN UNIX extension to BASE.

19392 Normative text previously in the APPLICATION USAGE section is moved to the
19393 DESCRIPTION.19394 A note indicating that the *l64a()* function need not be reentrant is added to the DESCRIPTION.19395 **Issue 7**

19396 Austin Group Interpretation 1003.1-2001 #156 is applied.

19397 **NAME**

19398 abort — generate an abnormal process abort

19399 **SYNOPSIS**

19400 #include <stdlib.h>

19401 void abort(void);

19402 **DESCRIPTION**

19403 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 19404 conflict between the requirements described here and the ISO C standard is unintentional. This
 19405 volume of POSIX.1-2008 defers to the ISO C standard.

19406 The *abort()* function shall cause abnormal process termination to occur, unless the signal
 19407 SIGABRT is being caught and the signal handler does not return.

19408 CX The abnormal termination processing shall include the default actions defined for SIGABRT and
 19409 may include an attempt to effect *fclose()* on all open streams.

19410 The SIGABRT signal shall be sent to the calling process as if by means of *raise()* with the
 19411 argument SIGABRT.

19412 CX The status made available to *wait()*, *waitid()*, or *waitpid()* by *abort()* shall be that of a process
 19413 terminated by the SIGABRT signal. The *abort()* function shall override blocking or ignoring the
 19414 SIGABRT signal.

19415 **RETURN VALUE**19416 The *abort()* function shall not return.19417 **ERRORS**

19418 No errors are defined.

19419 **EXAMPLES**

19420 None.

19421 **APPLICATION USAGE**

19422 Catching the signal is intended to provide the application developer with a portable means to
 19423 abort processing, free from possible interference from any implementation-supplied functions.

19424 **RATIONALE**

19425 The ISO/IEC 9899:1999 standard requires the *abort()* function to be async-signal-safe. Since
 19426 POSIX.1-2008 defers to the ISO C standard, this required a change to the DESCRIPTION from
 19427 “shall include the effect of *fclose()*” to “may include an attempt to effect *fclose()*.”

19428 The revised wording permits some backwards-compatibility and avoids a potential deadlock
 19429 situation.

19430 The Open Group Base Resolution bwg2002-003 is applied, removing the following XSI shaded
 19431 paragraph from the DESCRIPTION:

19432 “On XSI-conformant systems, in addition the abnormal termination processing shall include the
 19433 effect of *fclose()* on message catalog descriptors.”

19434 There were several reasons to remove this paragraph:

- 19435 • No special processing of open message catalogs needs to be performed prior to abnormal
 19436 process termination.
- 19437 • The main reason to specifically mention that *abort()* includes the effect of *fclose()* on open
 19438 streams is to flush output queued on the stream. Message catalogs in this context are read-
 19439 only and, therefore, do not need to be flushed.

- The effect of *fclose()* on a message catalog descriptor is unspecified. Message catalog descriptors are allowed, but not required to be implemented using a file descriptor, but there is no mention in POSIX.1-2008 of a message catalog descriptor using a standard I/O stream FILE object as would be expected by *fclose()*.

FUTURE DIRECTIONS

None.

XBD <stdlib.h>

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

Extensions beyond the ISO C standard are marked.

Changes are made to the DESCRIPTION for alignment with the ISO/IEC 9899:1999 standard.

The Open Group Base Resolution bwg2002-003 is applied.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/10 is applied, changing the DESCRIPTION of abnormal termination processing and adding to the RATIONALE section.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/9 is applied, changing “implementation-defined functions” to “implementation-supplied functions” in the APPLICATION USAGE section.

19460 **NAME**

19461 abs — return an integer absolute value

19462 **SYNOPSIS**

19463 #include <stdlib.h>

19464 int abs(int i);

19465 **DESCRIPTION**

19466 CX The functionality described on this reference page is aligned with the ISO C standard. Any
19467 conflict between the requirements described here and the ISO C standard is unintentional. This
19468 volume of POSIX.1-2008 defers to the ISO C standard.

19469 The *abs()* function shall compute the absolute value of its integer operand, *i*. If the result cannot
19470 be represented, the behavior is undefined.

19471 **RETURN VALUE**19472 The *abs()* function shall return the absolute value of its integer operand.19473 **ERRORS**

19474 No errors are defined.

19475 **EXAMPLES**

19476 None.

19477 **APPLICATION USAGE**

19478 In two's-complement representation, the absolute value of the negative integer with largest
19479 magnitude {INT_MIN} might not be representable.

19480 **RATIONALE**

19481 None.

19482 **FUTURE DIRECTIONS**

19483 None.

19484 **SEE ALSO**19485 *fabs()*, *labs()*

19486 XBD <stdlib.h>

19487 **CHANGE HISTORY**

19488 First released in Issue 1. Derived from Issue 1 of the SVID.

19489 **Issue 6**

19490 Extensions beyond the ISO C standard are marked.

19491 **NAME**

19492 accept — accept a new connection on a socket

19493 **SYNOPSIS**

```
19494       #include <sys/socket.h>
19495       int accept(int socket, struct sockaddr *restrict address,
19496                 socklen_t *restrict address_len);
```

19497 **DESCRIPTION**

19498 The *accept()* function shall extract the first connection on the queue of pending connections,
 19499 create a new socket with the same socket type protocol and address family as the specified
 19500 socket, and allocate a new file descriptor for that socket.

19501 The *accept()* function takes the following arguments:

19502 *socket* Specifies a socket that was created with *socket()*, has been bound to an address
 19503 with *bind()*, and has issued a successful call to *listen()*.

19504 *address* Either a null pointer, or a pointer to a **sockaddr** structure where the address of
 19505 the connecting socket shall be returned.

19506 *address_len* Either a null pointer, if *address* is a null pointer, or a pointer to a **socklen_t**
 19507 object which on input specifies the length of the supplied **sockaddr** structure,
 19508 and on output specifies the length of the stored address.

19509 If *address* is not a null pointer, the address of the peer for the accepted connection shall be stored
 19510 in the **sockaddr** structure pointed to by *address*, and the length of this address shall be stored in
 19511 the object pointed to by *address_len*.

19512 If the actual length of the address is greater than the length of the supplied **sockaddr** structure,
 19513 the stored address shall be truncated.

19514 If the protocol permits connections by unbound clients, and the peer is not bound, then the
 19515 value stored in the object pointed to by *address* is unspecified.

19516 If the listen queue is empty of connection requests and O_NONBLOCK is not set on the file
 19517 descriptor for the socket, *accept()* shall block until a connection is present. If the *listen()* queue is
 19518 empty of connection requests and O_NONBLOCK is set on the file descriptor for the socket,
 19519 *accept()* shall fail and set *errno* to [EAGAIN] or [EWOULDBLOCK].

19520 The accepted socket cannot itself accept more connections. The original socket remains open and
 19521 can accept more connections.

19522 **RETURN VALUE**

19523 Upon successful completion, *accept()* shall return the non-negative file descriptor of the accepted
 19524 socket. Otherwise, -1 shall be returned and *errno* set to indicate the error.

19525 **ERRORS**

19526 The *accept()* function shall fail if:

19527 [EAGAIN] or [EWOULDBLOCK]

19528 O_NONBLOCK is set for the socket file descriptor and no connections are
 19529 present to be accepted.

19530 [EBADF] The *socket* argument is not a valid file descriptor.

19531 [ECONNABORTED]

19532 A connection has been aborted.

19533	[EINTR]	The <i>accept()</i> function was interrupted by a signal that was caught before a valid connection arrived.
19534		
19535	[EINVAL]	The <i>socket</i> is not accepting connections.
19536	[EMFILE]	All file descriptors available to the process are currently open.
19537	[ENFILE]	The maximum number of file descriptors in the system are already open.
19538	[ENOBUFS]	No buffer space is available.
19539	[ENOMEM]	There was insufficient memory available to complete the operation.
19540	[ENOTSOCK]	The <i>socket</i> argument does not refer to a socket.
19541	[EOPNOTSUPP]	The socket type of the specified socket does not support accepting connections.
19542		
19543		The <i>accept()</i> function may fail if:
19544	OB XSR [EPROTO]	A protocol error has occurred; for example, the STREAMS protocol stack has not been initialized.
19545		

19546 EXAMPLES

19547 None.

19548 APPLICATION USAGE

19549 When a connection is available, *select()* indicates that the file descriptor for the socket is ready
19550 for reading.

19551 RATIONALE

19552 None.

19553 FUTURE DIRECTIONS

19554 None.

19555 SEE ALSO

19556 *bind()*, *connect()*, *listen()*, *socket()*

19557 XBD <sys/socket.h>

19558 CHANGE HISTORY

19559 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

19560 The **restrict** keyword is added to the *accept()* prototype for alignment with the
19561 ISO/IEC 9899:1999 standard.

19562 Issue 7

19563 SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.

19564 Austin Group Interpretation 1003.1-2001 #044 is applied, changing the “may fail” [ENOBUFS]
19565 and [ENOMEM] errors to become “shall fail” errors.

19566 Functionality relating to XSI STREAMS is marked obsolescent.

19567 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0018 [464] is applied.

+

NAME

access, faccessat — determine accessibility of a file relative to directory file descriptor

SYNOPSIS

```
#include <unistd.h>

int access(const char *path, int amode);
int faccessat(int fd, const char *path, int amode, int flag);
```

DESCRIPTION

The *access()* function shall check the file named by the pathname pointed to by the *path* argument for accessibility according to the bit pattern contained in *amode*, using the real user ID in place of the effective user ID and the real group ID in place of the effective group ID.

The value of *amode* is either the bitwise-inclusive OR of the access permissions to be checked (R_OK, W_OK, X_OK) or the existence test (F_OK).

If any access permissions are checked, each shall be checked individually, as described in XBD [Section 4.4](#) (on page 108), except that where that description refers to execute permission for a process with appropriate privileges, an implementation may indicate success for X_OK even if execute permission is not granted to any user.

The *faccessat()* function shall be equivalent to the *access()* function, except in the case where *path* specifies a relative path. In this case the file whose accessibility is to be determined shall be located relative to the directory associated with the file descriptor *fd* instead of the current working directory. If the file descriptor was opened without O_SEARCH, the function shall check whether directory searches are permitted using the current permissions of the directory underlying the file descriptor. If the file descriptor was opened with O_SEARCH, the function shall not perform the check.

If *faccessat()* is passed the special value AT_FDCWD in the *fd* parameter, the current working directory shall be used and the behavior shall be identical to a call to *access()*.

Values for *flag* are constructed by a bitwise-inclusive OR of flags from the following list, defined in *<fcntl.h>*:

AT_EACCESS	The checks for accessibility are performed using the effective user and group IDs instead of the real user and group ID as required in a call to <i>access()</i> .

RETURN VALUE

Upon successful completion, these functions shall return 0. Otherwise, these functions shall return -1 and set *errno* to indicate the error.

ERRORS

These functions shall fail if:

[EACCES]	Permission bits of the file mode do not permit the requested access, or search permission is denied on a component of the path prefix.
[ELOOP]	A loop exists in symbolic links encountered during resolution of the <i>path</i> argument.
[ENAMETOOLONG]	The length of a component of a pathname is longer than {NAME_MAX}.
[ENOENT]	A component of <i>path</i> does not name an existing file or <i>path</i> is an empty string.
[ENOTDIR]	A component of the path prefix names an existing file that is neither a directory nor a symbolic link to a directory, or the <i>path</i> argument contains at least one non- <i><slash></i> character and ends with one or more trailing <i><slash></i>

19612 characters and the last pathname component names an existing file that is
 19613 neither a directory nor a symbolic link to a directory.

19614 [EROFS] Write access is requested for a file on a read-only file system.

19615 The *faccessat()* function shall fail if:

19616 [EACCES] *fd* was not opened with O_SEARCH and the permissions of the directory
 19617 underlying *fd* do not permit directory searches.

19618 [EBADF] The *path* argument does not specify an absolute path and the *fd* argument is
 19619 neither AT_FDCWD nor a valid file descriptor open for reading or searching.

19620 [ENOTDIR] The *path* argument is not an absolute path and *fd* is a file descriptor associated +
 19621 with a non-directory file.

19622 These functions may fail if:

19623 [EINVAL] The value of the *amode* argument is invalid.

19624 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
 19625 resolution of the *path* argument.

19626 [ENAMETOOLONG]
 19627 The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a
 19628 symbolic link produced an intermediate result with a length that exceeds
 19629 {PATH_MAX}.

19630 [ETXTBSY] Write access is requested for a pure procedure (shared text) file that is being
 19631 executed.

19632 The *faccessat()* function may fail if:

19633 [EINVAL] The value of the *flag* argument is not valid. -

19634 EXAMPLES

19635 Testing for the Existence of a File

19636 The following example tests whether a file named **myfile** exists in the **/tmp** directory.

```
19637 #include <unistd.h>
19638 ...
19639 int result;
19640 const char *pathname = "/tmp/myfile";
19641 result = access (pathname, F_OK);
```

19642 APPLICATION USAGE

19643 Additional values of *amode* other than the set defined in the description may be valid; for
 19644 example, if a system has extended access controls.

19645 The use of the AT_EACCESS value for *flag* enables functionality not available in *access()*.

19646 RATIONALE

19647 In early proposals, some inadequacies in the *access()* function led to the creation of an *eaccess()*
 19648 function because:

- 19649 1. Historical implementations of *access()* do not test file access correctly when the process'
 19650 real user ID is superuser. In particular, they always return zero when testing execute
 19651 permissions without regard to whether the file is executable.

2. The superuser has complete access to all files on a system. As a consequence, programs started by the superuser and switched to the effective user ID with lesser privileges cannot use *access()* to test their file access permissions.

However, the historical model of *eaccess()* does not resolve problem (1), so this volume of POSIX.1-2008 now allows *access()* to behave in the desired way because several implementations have corrected the problem. It was also argued that problem (2) is more easily solved by using *open()*, *chdir()*, or one of the *exec* functions as appropriate and responding to the error, rather than creating a new function that would not be as reliable. Therefore, *eaccess()* is not included in this volume of POSIX.1-2008.

The sentence concerning appropriate privileges and execute permission bits reflects the two possibilities implemented by historical implementations when checking superuser access for *X_OK*.

New implementations are discouraged from returning *X_OK* unless at least one execution permission bit is set.

The purpose of the *faccessat()* function is to enable the checking of the accessibility of files in directories other than the current working directory without exposure to race conditions. Any part of the path of a file could be changed in parallel to a call to *access()*, resulting in unspecified behavior. By opening a file descriptor for the target directory and using the *faccessat()* function it can be guaranteed that the file tested for accessibility is located relative to the desired directory.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The [ELOOP] mandatory error condition is added.
- A second [ENAMETOOLONG] is added as an optional error condition.
- The [ETXTBSY] optional error condition is added.

The following changes were made to align with the IEEE P1003.1a draft standard:

- The [ELOOP] optional error condition is added.

Issue 7

Austin Group Interpretations 1003.1-2001 #046 and #143 are applied.

The *faccessat()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 2.

Changes are made to allow a directory to be opened for searching.

The [ENOTDIR] error condition is clarified to cover the condition where the last component of a pathname exists but is not a directory or a symbolic link to a directory.

19696 **NAME**

19697 acos, acosf, acosl — arc cosine functions

19698 **SYNOPSIS**

```
19699       #include <math.h>
19700       double acos(double x);
19701       float acosf(float x);
19702       long double acosl(long double x);
```

19703 **DESCRIPTION**

19704 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any
 19705 conflict between the requirements described here and the ISO C standard is unintentional. This
 19706 volume of POSIX.1-2008 defers to the ISO C standard.

19707 These functions shall compute the principal value of the arc cosine of their argument *x*. The
 19708 value of *x* should be in the range $[-1,1]$.

19709 An application wishing to check for error situations should set *errno* to zero and call
 19710 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 19711 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 19712 zero, an error has occurred.

19713 **RETURN VALUE**

19714 Upon successful completion, these functions shall return the arc cosine of *x*, in the range $[0,\pi]$
 19715 radians.

19716 **MX** For finite values of *x* not in the range $[-1,1]$, a domain error shall occur, and either a NaN (if
 19717 supported), or an implementation-defined value shall be returned.

19718 **MX** If *x* is NaN, a NaN shall be returned.

19719 If *x* is +1, +0 shall be returned.

19720 If *x* is $\pm\text{Inf}$, a domain error shall occur, and a NaN shall be returned.

19721 **ERRORS**

19722 These functions shall fail if:

19723 **MX** Domain Error The *x* argument is finite and is not in the range $[-1,1]$, or is $\pm\text{Inf}$.

19724 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 19725 then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling*
 19726 & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
 19727 shall be raised.

19728 **EXAMPLES**

19729 None.

19730 **APPLICATION USAGE**

19731 On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* &
 19732 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

19733 **RATIONALE**

19753 **NAME**19754 `acosh, acoshf, acoshl` — inverse hyperbolic cosine functions19755 **SYNOPSIS**

```
19756 #include <math.h>
19757 double acosh(double x);
19758 float acoshf(float x);
19759 long double acoshl(long double x);
```

19760 **DESCRIPTION**

19761 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 19762 conflict between the requirements described here and the ISO C standard is unintentional. This
 19763 volume of POSIX.1-2008 defers to the ISO C standard.

19764 These functions shall compute the inverse hyperbolic cosine of their argument x .

19765 An application wishing to check for error situations should set *errno* to zero and call
 19766 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 19767 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 19768 zero, an error has occurred.

19769 **RETURN VALUE**

19770 Upon successful completion, these functions shall return the inverse hyperbolic cosine of their
 19771 argument.

19772 MX For finite values of $x < 1$, a domain error shall occur, and either a NaN (if supported), or an
 19773 implementation-defined value shall be returned.

19774 MX If x is NaN, a NaN shall be returned.

19775 If x is +1, +0 shall be returned.

19776 If x is +Inf, +Inf shall be returned.

19777 If x is -Inf, a domain error shall occur, and a NaN shall be returned. |

19778 **ERRORS**

19779 These functions shall fail if:

19780 MX Domain Error The x argument is finite and less than +1.0, or is -Inf.

19781 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 19782 then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling*
 19783 & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
 19784 shall be raised.

19785 **EXAMPLES**

19786 None.

19787 **APPLICATION USAGE**

19788 On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* &
 19789 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

NAME

aio_cancel — cancel an asynchronous I/O request

SYNOPSIS

```
#include <aio.h>
```

```
int aio_cancel(int fildev, struct aiocb *aiocbp);
```

DESCRIPTION

The *aio_cancel()* function shall attempt to cancel one or more asynchronous I/O requests currently outstanding against file descriptor *fildev*. The *aiocbp* argument points to the asynchronous I/O control block for a particular request to be canceled. If *aiocbp* is NULL, then all outstanding cancelable asynchronous I/O requests against *fildev* shall be canceled.

Normal asynchronous notification shall occur for asynchronous I/O operations that are successfully canceled. If there are requests that cannot be canceled, then the normal asynchronous completion process shall take place for those requests when they are completed.

For requested operations that are successfully canceled, the associated error status shall be set to [ECANCELED] and the return status shall be -1. For requested operations that are not successfully canceled, the *aiocbp* shall not be modified by *aio_cancel()*.

If *aiocbp* is not NULL, then if *fildev* does not have the same value as the file descriptor with which the asynchronous operation was initiated, unspecified results occur.

Which operations are cancelable is implementation-defined.

RETURN VALUE

The *aio_cancel()* function shall return the value AIO_CANCELED if the requested operation(s) were canceled. The value AIO_NOTCANCELED shall be returned if at least one of the requested operation(s) cannot be canceled because it is in progress. In this case, the state of the other operations, if any, referenced in the call to *aio_cancel()* is not indicated by the return value of *aio_cancel()*. The application may determine the state of affairs for these operations by using *aio_error()*. The value AIO_ALLDONE is returned if all of the operations have already completed. Otherwise, the function shall return -1 and set *errno* to indicate the error.

ERRORS

The *aio_cancel()* function shall fail if:

[EBADF] The *fildev* argument is not a valid file descriptor.

19859 **CHANGE HISTORY**

19860 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

19861 **Issue 6**

19862 The [ENOSYS] error condition has been removed as stubs need not be provided if an
19863 implementation does not support the Asynchronous Input and Output option.

19864 The APPLICATION USAGE section is added.

19865 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/10 is applied, removing the words “to the
19866 calling process” in the RETURN VALUE section. The term was unnecessary and precluded
19867 threads.

19868 **Issue 7**

19869 The *aio_cancel()* function is moved from the Asynchronous Input and Output option to the Base.

19870 **NAME**

19871 **aiio_error** — retrieve errors status for an asynchronous I/O operation

19872 **SYNOPSIS**

19873 `#include <aiio.h>`

19874 `int aiio_error(const struct aiocb *aiocbp);`

19875 **DESCRIPTION**

19876 The *aiio_error()* function shall return the error status associated with the **aiocb** structure
 19877 referenced by the *aiocbp* argument. The error status for an asynchronous I/O operation is the
 19878 SIO *errno* value that would be set by the corresponding *read()*, *write()*, *fdatasync()*, or *fsync()*
 19879 operation. If the operation has not yet completed, then the error status shall be equal to
 19880 [EINPROGRESS].

19881 If the **aiocb** structure pointed to by *aiocbp* is not associated with an operation that has been
 19882 scheduled, the results are undefined.

19883 **RETURN VALUE**

19884 If the asynchronous I/O operation has completed successfully, then 0 shall be returned. If the
 19885 asynchronous operation has completed unsuccessfully, then the error status, as described for
 19886 SIO *read()*, *write()*, *fdatasync()*, and *fsync()*, shall be returned. If the asynchronous I/O operation has
 19887 not yet completed, then [EINPROGRESS] shall be returned.

19888 If the *aiio_error()* function fails, it shall return -1 and set *errno* to indicate the error.

19889 **ERRORS**

19890 The *aiio_error()* function may fail if:

19891 [EINVAL] The *aiocbp* argument does not refer to an asynchronous operation whose
 19892 return status has not yet been retrieved.

19893 **EXAMPLES**

19894 None.

19914 The *aio_error()* function is moved from the Asynchronous Input and Output option to the Base.

19915 **NAME**

19916 aio_fsync — asynchronous file synchronization

19917 **SYNOPSIS**

```
19918 #include <aio.h>
19919 int aio_fsync(int op, struct aiocb *aiocbp);
```

19920 **DESCRIPTION**

19921 The *aio_fsync()* function shall asynchronously perform a file synchronization operation, as
 19922 specified by the *op* argument, for I/O operations associated with the file indicated by the file
 19923 descriptor *aio_fildes* member of the **aiocb** structure referenced by the *aiocbp* argument and
 19924 queued at the time of the call to *aio_fsync()*. The function call shall return when the
 19925 synchronization request has been initiated or queued to the file or device (even when the data
 19926 cannot be synchronized immediately).

19927 SIO If *op* is O_DSYNC, all currently queued I/O operations shall be completed as if by a call to
 19928 *fdatsync()*; that is, as defined for synchronized I/O data integrity completion.

19929 FSC If *op* is O_SYNC, all currently queued I/O operations shall be completed as if by a call to *fsync()*;
 19930 FSC SIO that is, as defined for synchronized I/O file integrity completion. If the *aio_fsync()* function
 19931 fails, or if the operation queued by *aio_fsync()* fails, then outstanding I/O operations are not
 19932 guaranteed to have been completed.

19933 If *aio_fsync()* succeeds, then it is only the I/O that was queued at the time of the call to
 19934 *aio_fsync()* that is guaranteed to be forced to the relevant completion state. The completion of
 19935 subsequent I/O on the file descriptor is not guaranteed to be completed in a synchronized
 19936 fashion.

19937 The *aiocbp* argument refers to an asynchronous I/O control block. The *aiocbp* value may be used
 19938 as an argument to *aio_error()* and *aio_return()* in order to determine the error status and return
 19939 status, respectively, of the asynchronous operation while it is proceeding. When the request is
 19940 queued, the error status for the operation is [EINPROGRESS]. When all data has been
 19941 successfully transferred, the error status shall be reset to reflect the success or failure of the
 19942 operation. If the operation does not complete successfully, the error status for the operation shall
 19943 be set to indicate the error. The *aio_sigevent* member determines the asynchronous notification to
 19944 occur as specified in [Section 2.4.1](#) (on page 488) when all operations have achieved synchronized
 19945 I/O completion. All other members of the structure referenced by *aiocbp* are ignored. If the
 19946 control block referenced by *aiocbp* becomes an illegal address prior to asynchronous I/O
 19947 completion, then the behavior is undefined.

19948 If the *aio_fsync()* function fails or *aiocbp* indicates an error condition, data is not guaranteed to
 19949 have been successfully transferred.

19950 **RETURN VALUE**

19951 The *aio_fsync()* function shall return the value 0 if the I/O operation is successfully queued;
 19952 otherwise, the function shall return the value -1 and set *errno* to indicate the error.

19953 **ERRORS**

19954 The *aio_fsync()* function shall fail if:

19955 19956	[EAGAIN]	The requested asynchronous operation was not queued due to temporary resource limitations.
19957 19958	[EBADF]	The <i>aio_fildes</i> member of the aiocb structure referenced by the <i>aiocbp</i> argument is not a valid file descriptor open for writing.

19959	SIO	[EINVAL]	This implementation does not support synchronized I/O for this file.	
19960	FSC	[EINVAL]	The <i>aio_fildes</i> member of the aio_cb structure refers to a file on which an <i>fsync()</i> operation is not possible.	+

19994 **NAME**

19995 aio_read — asynchronous read from a file

19996 **SYNOPSIS**

19997 #include <aio.h>

19998 int aio_read(struct aiocb *aiocbp);

19999 **DESCRIPTION**

20000 The *aio_read()* function shall read *aiocbp->aio_nbytes* from the file associated with
 20001 *aiocbp->aio_fildes* into the buffer pointed to by *aiocbp->aio_buf*. The function call shall return
 20002 when the read request has been initiated or queued to the file or device (even when the data
 20003 cannot be delivered immediately).

20004 **PIO** If prioritized I/O is supported for this file, then the asynchronous operation shall be submitted
 20005 at a priority equal to a base scheduling priority minus *aiocbp->aio_reqprio*. If Thread Execution
 20006 Scheduling is not supported, then the base scheduling priority is that of the calling process;
 20007 **PIO TPS** otherwise, the base scheduling priority is that of the calling thread.

20008 The *aiocbp* value may be used as an argument to *aio_error()* and *aio_return()* in order to
 20009 determine the error status and return status, respectively, of the asynchronous operation while it
 20010 is proceeding. If an error condition is encountered during queuing, the function call shall return
 20011 without having initiated or queued the request. The requested operation takes place at the
 20012 absolute position in the file as given by *aio_offset*, as if *lseek()* were called immediately prior to
 20013 the operation with an *offset* equal to *aio_offset* and a *whence* equal to *SEEK_SET*. After a
 20014 successful call to enqueue an asynchronous I/O operation, the value of the file offset for the file
 20015 is unspecified.

20016 The *aio_sigevent* member specifies the notification which occurs when the request is completed.

20017 The *aiocbp->aio_lio_opcode* field shall be ignored by *aio_read()*.

20018 The *aiocbp* argument points to an **aiocb** structure. If the buffer pointed to by *aiocbp->aio_buf* or
 20019 the control block pointed to by *aiocbp* becomes an illegal address prior to asynchronous I/O
 20020 completion, then the behavior is undefined.

20021 Simultaneous asynchronous operations using the same *aiocbp* produce undefined results.

20022 **SIO** If synchronized I/O is enabled on the file associated with *aiocbp->aio_fildes*, the behavior of this
 20023 function shall be according to the definitions of synchronized I/O data integrity completion and
 20024 synchronized I/O file integrity completion.

20025 For any system action that changes the process memory space while an asynchronous I/O is
 20026 outstanding to the address range being changed, the result of that action is undefined.

20027 For regular files, no data transfer shall occur past the offset maximum established in the open
 20028 file description associated with *aiocbp->aio_fildes*.

20029 **RETURN VALUE**

20030 The *aio_read()* function shall return the value zero if the I/O operation is successfully queued;
 20031 otherwise, the function shall return the value -1 and set *errno* to indicate the error.

20032 **ERRORS**

20033 The *aio_read()* function shall fail if:

20034 [EAGAIN] The requested asynchronous I/O operation was not queued due to system
 20035 resource limitations.

20036 Each of the following conditions may be detected synchronously at the time of the call to
 20037 *aio_read()*, or asynchronously. If any of the conditions below are detected synchronously, the

20038 *aio_read()* function shall return `-1` and set *errno* to the corresponding value. If any of the
 20039 conditions below are detected asynchronously, the return status of the asynchronous operation
 20040 is set to `-1`, and the error status of the asynchronous operation is set to the corresponding value.

20041 [EBADF] The *aiocbp*→*aio_fildes* argument is not a valid file descriptor open for reading.

20042 [EINVAL] The file offset value implied by *aiocbp*→*aio_offset* would be invalid,
 20043 PIO *aiocbp*→*aio_reqprio* is not a valid value, or *aiocbp*→*aio_nbytes* is an invalid
 20044 value.

20045 In the case that the *aio_read()* successfully queues the I/O operation but the operation is
 20046 subsequently canceled or encounters an error, the return status of the asynchronous operation is
 20047 one of the values normally returned by the *read()* function call. In addition, the error status of
 20048 the asynchronous operation is set to one of the error statuses normally set by the *read()* function
 20049 call, or one of the following values:

20050 [EBADF] The *aiocbp*→*aio_fildes* argument is not a valid file descriptor open for reading.

20051 [ECANCELED] The requested I/O was canceled before the I/O completed due to an explicit
 20052 *aio_cancel()* request.

20053 [EINVAL] The file offset value implied by *aiocbp*→*aio_offset* would be invalid.

20054 The following condition may be detected synchronously or asynchronously:

20055 [EOVERFLOW] The file is a regular file, *aiocbp*→*aio_nbytes* is greater than 0, and the starting
 20056 offset in *aiocbp*→*aio_offset* is before the end-of-file and is at or beyond the
 20057 offset maximum in the open file description associated with *aiocbp*→*aio_fildes*.

20092 **NAME**

20093 aio_return — retrieve return status of an asynchronous I/O operation

20094 **SYNOPSIS**

```
20095 #include <aio.h>
20096 ssize_t aio_return(struct aiocb *aiocbp);
```

20097 **DESCRIPTION**

20098 The *aio_return()* function shall return the return status associated with the **aiocb** structure
 20099 referenced by the *aiocbp* argument. The return status for an asynchronous I/O operation is the
 20100 value that would be returned by the corresponding *read()*, *write()*, or *fsync()* function call. If the
 20101 error status for the operation is equal to [EINPROGRESS], then the return status for the
 20102 operation is undefined. The *aio_return()* function may be called exactly once to retrieve the
 20103 return status of a given asynchronous operation; thereafter, if the same **aiocb** structure is used in
 20104 a call to *aio_return()* or *aio_error()*, an error may be returned. When the **aiocb** structure referred
 20105 to by *aiocbp* is used to submit another asynchronous operation, then *aio_return()* may be
 20106 successfully used to retrieve the return status of that operation.

20107 **RETURN VALUE**

20108 If the asynchronous I/O operation has completed, then the return status, as described for *read()*,
 20109 *write()*, and *fsync()*, shall be returned. If the asynchronous I/O operation has not yet completed,
 20110 the results of *aio_return()* are undefined.

20111 If the *aio_return()* function fails, it shall return -1 and set *errno* to indicate the error.

20112 **ERRORS**

20113 The *aio_return()* function may fail if:

20114 [EINVAL] The *aiocbp* argument does not refer to an asynchronous operation whose
 20115 return status has not yet been retrieved.

20116 **EXAMPLES**

20117 None.

20127 XBD [<aio.h>](#)

20128 **CHANGE HISTORY**

20129 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

20130 **Issue 6**

20131 The [ENOSYS] error condition has been removed as stubs need not be provided if an
 20132 implementation does not support the Asynchronous Input and Output option.

20133 The APPLICATION USAGE section is added.

20134 The [EINVAL] error condition is made optional. This is for consistency with the DESCRIPTION.

20135 **Issue 7**

20136 SD5-XSH-ERN-148 is applied.

20137 The *aio_return()* function is moved from the Asynchronous Input and Output option to the Base.

NAME

aio_suspend — wait for an asynchronous I/O request

SYNOPSIS

```
#include <aio.h>

int aio_suspend(const struct aiocb *const list[], int nent,
               const struct timespec *timeout);
```

DESCRIPTION

The *aio_suspend()* function shall suspend the calling thread until at least one of the asynchronous I/O operations referenced by the *list* argument has completed, until a signal interrupts the function, or, if *timeout* is not NULL, until the time interval specified by *timeout* has passed. If any of the **aiocb** structures in the list correspond to completed asynchronous I/O operations (that is, the error status for the operation is not equal to [EINPROGRESS]) at the time of the call, the function shall return without suspending the calling thread. The *list* argument is an array of pointers to asynchronous I/O control blocks. The *nent* argument indicates the number of elements in the array. Each **aiocb** structure pointed to has been used in initiating an asynchronous I/O request via *aio_read()*, *aio_write()*, or *lio_listio()*. This array may contain null pointers, which are ignored. If this array contains pointers that refer to **aiocb** structures that have not been used in submitting asynchronous I/O, the effect is undefined.

If the time interval indicated in the **timespec** structure pointed to by *timeout* passes before any of the I/O operations referenced by *list* are completed, then *aio_suspend()* shall return with an error.

MON If the Monotonic Clock option is supported, the clock that shall be used to measure this time interval shall be the CLOCK_MONOTONIC clock.

RETURN VALUE

If the *aio_suspend()* function returns after one or more asynchronous I/O operations have completed, the function shall return zero. Otherwise, the function shall return a value of -1 and set *errno* to indicate the error.

The application may determine which asynchronous I/O completed by scanning the associated error and return status using *aio_error()* and *aio_return()*, respectively.

ERRORS

The *aio_suspend()* function shall fail if:

[EAGAIN] No asynchronous I/O indicated in the list referenced by *list* completed in the time interval indicated by *timeout*.

[EINTR] A signal interrupted the *aio_suspend()* function. Note that, since each asynchronous I/O operation may possibly provoke a signal when it completes, this error return may be caused by the completion of one (or more) of the very I/O operations being awaited.

20184 XBD <aio.h>

20185 **CHANGE HISTORY**

20186 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

20187 **Issue 6**20188 The [ENOSYS] error condition has been removed as stubs need not be provided if an
20189 implementation does not support the Asynchronous Input and Output option.

20190 The APPLICATION USAGE section is added.

20191 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that the
20192 CLOCK_MONOTONIC clock, if supported, is used.20193 **Issue 7**20194 The *aio_suspend()* function is moved from the Asynchronous Input and Output option to the
20195 Base.

20196 **NAME**

20197 aio_write — asynchronous write to a file

20198 **SYNOPSIS**

20199 #include <aio.h>

20200 int aio_write(struct aiocb *aiocbp);

20201 **DESCRIPTION**

20202 The *aio_write()* function shall write *aiocbp->aio_nbytes* to the file associated with
 20203 *aiocbp->aio_fildes* from the buffer pointed to by *aiocbp->aio_buf*. The function shall return when
 20204 the write request has been initiated or, at a minimum, queued to the file or device.

20205 **PIO** If prioritized I/O is supported for this file, then the asynchronous operation shall be submitted
 20206 at a priority equal to a base scheduling priority minus *aiocbp->aio_reqprio*. If Thread Execution
 20207 Scheduling is not supported, then the base scheduling priority is that of the calling process;
 20208 **PIO TPS** otherwise, the base scheduling priority is that of the calling thread.

20209 The *aiocbp* argument may be used as an argument to *aio_error()* and *aio_return()* in order to
 20210 determine the error status and return status, respectively, of the asynchronous operation while it
 20211 is proceeding.

20212 The *aiocbp* argument points to an **aiocb** structure. If the buffer pointed to by *aiocbp->aio_buf* or
 20213 the control block pointed to by *aiocbp* becomes an illegal address prior to asynchronous I/O
 20214 completion, then the behavior is undefined.

20215 If O_APPEND is not set for the file descriptor *aio_fildes*, then the requested operation shall take
 20216 place at the absolute position in the file as given by *aio_offset*, as if *lseek()* were called
 20217 immediately prior to the operation with an *offset* equal to *aio_offset* and a *whence* equal to
 20218 SEEK_SET. If O_APPEND is set for the file descriptor, or if *aio_fildes* is associated with a device
 20219 that is incapable of seeking, write operations append to the file in the same order as the calls
 20220 were made, except under circumstances described in [Section 2.8.2](#). After a successful call to
 20221 enqueue an asynchronous I/O operation, the value of the file offset for the file is unspecified.

20222 The *aio_sigevent* member specifies the notification which occurs when the request is completed.

20223 The *aiocbp->aio_lio_opcode* field shall be ignored by *aio_write()*.

20224 Simultaneous asynchronous operations using the same *aiocbp* produce undefined results.

20225 **SIO** If synchronized I/O is enabled on the file associated with *aiocbp->aio_fildes*, the behavior of this
 20226 function shall be according to the definitions of synchronized I/O data integrity completion, and
 20227 synchronized I/O file integrity completion.

20228 For any system action that changes the process memory space while an asynchronous I/O is
 20229 outstanding to the address range being changed, the result of that action is undefined.

20230 For regular files, no data transfer shall occur past the offset maximum established in the open
 20231 file description associated with *aiocbp->aio_fildes*.

20232 **RETURN VALUE**

20233 The *aio_write()* function shall return the value zero if the I/O operation is successfully queued;
 20234 otherwise, the function shall return the value -1 and set *errno* to indicate the error.

20235 **ERRORS**

20236 The *aio_write()* function shall fail if:

20237 [EAGAIN] The requested asynchronous I/O operation was not queued due to system
 20238 resource limitations.

20239 Each of the following conditions may be detected synchronously at the time of the call to

20240 *aio_write()*, or asynchronously. If any of the conditions below are detected synchronously, the
 20241 *aio_write()* function shall return `-1` and set *errno* to the corresponding value. If any of the
 20242 conditions below are detected asynchronously, the return status of the asynchronous operation
 20243 shall be set to `-1`, and the error status of the asynchronous operation is set to the corresponding
 20244 value.

20245 [EBADF] The *aiocbp*→*aio_fildes* argument is not a valid file descriptor open for writing.

20246 [EINVAL] The file offset value implied by *aiocbp*→*aio_offset* would be invalid,
 20247 PIO *aiocbp*→*aio_reqprio* is not a valid value, or *aiocbp*→*aio_nbytes* is an invalid
 20248 value.

20249 In the case that the *aio_write()* successfully queues the I/O operation, the return status of the
 20250 asynchronous operation shall be one of the values normally returned by the *write()* function call.
 20251 If the operation is successfully queued but is subsequently canceled or encounters an error, the
 20252 error status for the asynchronous operation contains one of the values normally set by the
 20253 *write()* function call, or one of the following:

20254 [EBADF] The *aiocbp*→*aio_fildes* argument is not a valid file descriptor open for writing.

20255 [EINVAL] The file offset value implied by *aiocbp*→*aio_offset* would be invalid.

20256 [ECANCELED] The requested I/O was canceled before the I/O completed due to an explicit
 20257 *aio_cancel()* request.

20258 The following condition may be detected synchronously or asynchronously:

20259 [EFBIG] The file is a regular file, *aiocbp*→*aio_nbytes* is greater than 0, and the starting
 20260 offset in *aiocbp*→*aio_offset* is at or beyond the offset maximum in the open file
 20261 description associated with *aiocbp*→*aio_fildes*.

20274 CHANGE HISTORY

20275 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

20276 Large File Summit extensions are added.

20277 Issue 6

20278 The [ENOSYS] error condition has been removed as stubs need not be provided if an
 20279 implementation does not support the Asynchronous Input and Output option.

20280 The APPLICATION USAGE section is added.

20281 The following new requirements on POSIX implementations derive from alignment with the

20282	Single UNIX Specification:
20283	• In the DESCRIPTION, text is added to indicate that for regular files no data transfer occurs
20284	past the offset maximum established in the open file description associated with
20285	<i>aiocbp</i> → <i>aio_fildes</i> .
20286	• The [EFBIG] error is added as part of the large file support extensions.
20287	IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/14 is applied, rewording the
20288	DESCRIPTION when prioritized I/O is supported to account for threads, and removing the
20289	words “to the calling process” in the RETURN VALUE section.
20290	IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/15 is applied, updating the [EINVAL]
20291	error, so that detection of an [EINVAL] error for an invalid value of <i>aiocbp</i> → <i>aio_reqprio</i> is only
20292	required if the Prioritized Input and Output option is supported.
20293	Issue 7
20294	Austin Group Interpretation 1003.1-2001 #082 is applied.
20295	The <i>aio_write()</i> function is moved from the Asynchronous Input and Output option to the Base.
20296	POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0028 [317] is applied.

+

20297 **NAME**

20298 alarm — schedule an alarm signal

20299 **SYNOPSIS**

20300 #include <unistd.h>

20301 unsigned alarm(unsigned seconds);

20302 **DESCRIPTION**

20303 The *alarm()* function shall cause the system to generate a SIGALRM signal for the process after
 20304 the number of realtime seconds specified by *seconds* have elapsed. Processor scheduling delays
 20305 may prevent the process from handling the signal as soon as it is generated.

20306 If *seconds* is 0, a pending alarm request, if any, is canceled.

20307 Alarm requests are not stacked; only one SIGALRM generation can be scheduled in this manner.
 20308 If the SIGALRM signal has not yet been generated, the call shall result in rescheduling the time
 20309 at which the SIGALRM signal is generated.

20310 XSI Interactions between *alarm()* and *setitimer()* are unspecified.

20311 **RETURN VALUE**

20312 If there is a previous *alarm()* request with time remaining, *alarm()* shall return a non-zero value
 20313 that is the number of seconds until the previous request would have generated a SIGALRM
 20314 signal. Otherwise, *alarm()* shall return 0.

20315 **ERRORS**

20316 The *alarm()* function is always successful, and no return value is reserved to indicate an error.

20317 **EXAMPLES**

20318 None.

20319 **APPLICATION USAGE**

20320 The *fork()* function clears pending alarms in the child process. A new process image created by
 20321 one of the *exec* functions inherits the time left to an alarm signal in the image of the old process.

20322 Application developers should note that the type of the argument *seconds* and the return value of
 20323 *alarm()* is **unsigned**. That means that a Strictly Conforming POSIX System Interfaces
 20324 Application cannot pass a value greater than the minimum guaranteed value for {UINT_MAX},
 20325 which the ISO C standard sets as 65 535, and any application passing a larger value is restricting
 20326 its portability. A different type was considered, but historical implementations, including those
 20327 with a 16-bit **int** type, consistently use either **unsigned** or **int**.

20328 Application developers should be aware of possible interactions when the same process uses
 20329 both the *alarm()* and *sleep()* functions.

20330 **RATIONALE**

20331 Many historical implementations (including Version 7 and System V) allow an alarm to occur up
 20332 to a second early. Other implementations allow alarms up to half a second or one clock tick
 20333 early or do not allow them to occur early at all. The latter is considered most appropriate, since it
 20334 gives the most predictable behavior, especially since the signal can always be delayed for an
 20335 indefinite amount of time due to scheduling. Applications can thus choose the *seconds* argument
 20336 as the minimum amount of time they wish to have elapse before the signal.

20337 The term “realtime” here and elsewhere (*sleep()*, *times()*) is intended to mean “wall clock” time
 20338 as common English usage, and has nothing to do with “realtime operating systems”. It is in
 20339 contrast to *virtual time*, which could be misinterpreted if just *time* were used.

20340 In some implementations, including 4.3 BSD, very large values of the *seconds* argument are
 20341 silently rounded down to an implementation-specific maximum value. This maximum is large

20342 enough (to the order of several months) that the effect is not noticeable.

20343 There were two possible choices for alarm generation in multi-threaded applications: generation
20344 for the calling thread or generation for the process. The first option would not have been
20345 particularly useful since the alarm state is maintained on a per-process basis and the alarm that
20346 is established by the last invocation of *alarm()* is the only one that would be active.

20347 Furthermore, allowing generation of an asynchronous signal for a thread would have
20348 introduced an exception to the overall signal model. This requires a compelling reason in order
20349 to be justified.

20350 FUTURE DIRECTIONS

20351 None.

20355 CHANGE HISTORY

20356 First released in Issue 1. Derived from Issue 1 of the SVID.

20357 Issue 6

20358 The following new requirements on POSIX implementations derive from alignment with the
20359 Single UNIX Specification:

- 20360 • The DESCRIPTION is updated to indicate that interactions with the *setitimer()*, *ualarm()*,
20361 and *usleep()* functions are unspecified.

20362 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/16 is applied, replacing “an
20363 implementation-defined maximum value” with “an implementation-specific maximum value”
20364 in the RATIONALE.

20365 **NAME**

20366 alphasort, scandir — scan a directory

20367 **SYNOPSIS**

```
20368     #include <dirent.h>

20369     int alphasort(const struct dirent **d1, const struct dirent **d2);
20370     int scandir(const char *dir, struct dirent ***namelist,
20371                int (*sel)(const struct dirent *),
20372                int (*compar)(const struct dirent **, const struct dirent **));
```

20373 **DESCRIPTION**

20374 The *alphasort()* function can be used as the comparison function for the *scandir()* function to sort
 20375 the directory entries, *d1* and *d2*, into alphabetical order. Sorting happens as if by calling the
 20376 *strcoll()* function on the *d_name* element of the **dirent** structures passed as the two parameters. If
 20377 the *strcoll()* function fails, the return value of *alphasort()* is unspecified.

20378 The *alphasort()* function shall not change the setting of *errno* if successful. Since no return value
 20379 is reserved to indicate an error, an application wishing to check for error situations should set
 20380 *errno* to 0, then call *alphasort()*, then check *errno*.

20381 The *scandir()* function shall scan the directory *dir*, calling the function referenced by *sel* on each
 20382 directory entry. Entries for which the function referenced by *sel* returns non-zero shall be stored
 20383 in strings allocated as if by a call to *malloc()*, and sorted as if by a call to *qsort()* with the
 20384 comparison function *compar*, except that *compar* need not provide total ordering. The strings are
 20385 collected in array *namelist* which shall be allocated as if by a call to *malloc()*. If *sel* is a null
 20386 pointer, all entries shall be selected. If the comparison function *compar* does not provide total
 20387 ordering, the order in which the directory entries are stored is unspecified.

20388 **RETURN VALUE**

20389 Upon successful completion, the *alphasort()* function shall return an integer greater than, equal
 20390 to, or less than 0, according to whether the name of the directory entry pointed to by *d1* is
 20391 lexically greater than, equal to, or less than the directory pointed to by *d2* when both are
 20392 interpreted as appropriate to the current locale. There is no return value reserved to indicate an
 20393 error.

20394 Upon successful completion, the *scandir()* function shall return the number of entries in the
 20395 array and a pointer to the array through the parameter *namelist*. Otherwise, the *scandir()*
 20396 function shall return -1.

20397 **ERRORS**

20398 The *scandir()* function shall fail if:

20399 20400	[EACCES]	Search permission is denied for the component of the path prefix of <i>dir</i> or read permission is denied for <i>dir</i> .
20401 20402	[ELOOP]	A loop exists in symbolic links encountered during resolution of the <i>dir</i> argument.
20403 20404	[ENAMETOOLONG]	The length of a component of a pathname is longer than {NAME_MAX}.
20405 20406	[ENOENT]	A component of <i>dir</i> does not name an existing directory or <i>dir</i> is an empty string.
20407	[ENOMEM]	Insufficient storage space is available.

20408	[ENOTDIR]	A component of <i>dir</i> names an existing file that is neither a directory nor a	
20409		symbolic link to a directory.	
20410	[EOVERFLOW]	One of the values to be returned or passed to a callback function cannot be	
20411		represented correctly.	
20412	The <i>scandir()</i> function may fail if:		
20413	[ELOOP]	More than {SYMLOOP_MAX} symbolic links were encountered during	
20414		resolution of the <i>dir</i> argument.	
20415	[EMFILE]	All file descriptors available to the process are currently open.	
20416	[ENAMETOOLONG]		
20417		The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a	
20418		symbolic link produced an intermediate result with a length that exceeds	
20419		{PATH_MAX}.	
20420	[ENFILE]	Too many files are currently open in the system.	

EXAMPLES

An example to print the files in the current directory:

```
#include <dirent.h>
#include <stdio.h>
#include <stdlib.h>
...
struct dirent **namelist;
int i, n;

n = scandir(".", &namelist, 0, alphasort);
if (n < 0)
    perror("scandir");
else {
    for (i = 0; i < n; i++) {
        printf("%s\n", namelist[i]->d_name);
        free(namelist[i]);
    }
    free(namelist);
...

```

APPLICATION USAGE

If *dir* contains filenames that do not form character strings, or which contain characters outside the domain of the collating sequence of the current locale, the *alphasort()* function need not provide a total ordering. This condition is not possible if all filenames within the directory consist only of characters from the portable filename character set.

The *scandir()* function may allocate dynamic storage during its operation. If *scandir()* is forcibly terminated, such as by *longjmp()* or *siglongjmp()* being executed by the function pointed to by *sel* or *compar*, or by an interrupt routine, *scandir()* does not have a chance to free that storage, so it remains permanently allocated. A safe way to handle interrupts is to store the fact that an interrupt has occurred, then wait until *scandir()* returns to act on the interrupt.

For functions that allocate memory as if by *malloc()*, the application should release such memory when it is no longer required by a call to *free()*. For *scandir()*, this is *namelist* (including all of the individual strings in *namelist*).

20453 **RATIONALE**

20454 None.

20455 **FUTURE DIRECTIONS**

20456 None.

20457 **SEE ALSO**20458 *qsort()*, *strcoll()*

20459 XBD <dirent.h>

20460 **CHANGE HISTORY**

20461 First released in Issue 7.

20462 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0029 [324], XSH/TC1-2008/0030 [404], +
20463 XSH/TC1-2008/0031 [393], and XSH/TC1-2008/0032 [291] are applied.

20464 **NAME**

20465 asctime, asctime_r — convert date and time to a string

20466 **SYNOPSIS**

```

20467 OB      #include <time.h>
20468          char *asctime(const struct tm *timeptr);
20469 OB CX    char *asctime_r(const struct tm *restrict tm, char *restrict buf);

```

20470 **DESCRIPTION**

20471 CX For *asctime()*: The functionality described on this reference page is aligned with the ISO C
 20472 standard. Any conflict between the requirements described here and the ISO C standard is
 20473 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

20474 The *asctime()* function shall convert the broken-down time in the structure pointed to by *timeptr*
 20475 into a string in the form:

20476 Sun Sep 16 01:03:52 1973\n\0

20477 using the equivalent of the following algorithm:

```

20478 char *asctime(const struct tm *timeptr)
20479 {
20480     static char wday_name[7][3] = {
20481         "Sun", "Mon", "Tue", "Wed", "Thu", "Fri", "Sat"
20482     };
20483     static char mon_name[12][3] = {
20484         "Jan", "Feb", "Mar", "Apr", "May", "Jun",
20485         "Jul", "Aug", "Sep", "Oct", "Nov", "Dec"
20486     };
20487     static char result[26];
20488     sprintf(result, "%.3s %.3s%3d %.2d:%.2d:%.2d %d\n",
20489         wday_name[timeptr->tm_wday],
20490         mon_name[timeptr->tm_mon],
20491         timeptr->tm_mday, timeptr->tm_hour,
20492         timeptr->tm_min, timeptr->tm_sec,
20493         1900 + timeptr->tm_year);
20494     return result;
20495 }

```

20496 However, the behavior is undefined if *timeptr->tm_wday* or *timeptr->tm_mon* are not within the
 20497 normal ranges as defined in **<time.h>**, or if *timeptr->tm_year* exceeds {INT_MAX}-1990, or if the
 20498 above algorithm would attempt to generate more than 26 bytes of output (including the
 20499 terminating null).

20500 The **tm** structure is defined in the **<time.h>** header.

20501 CX The *asctime()*, *ctime()*, *gmtime()*, and *localtime()* functions shall return values in one of two static
 20502 objects: a broken-down time structure and an array of type **char**. Execution of any of the
 20503 functions may overwrite the information returned in either of these objects by any of the other
 20504 functions.

20505 The *asctime()* function need not be thread-safe.

20506 The *asctime_r()* function shall convert the broken-down time in the structure pointed to by *tm*
 20507 into a string (of the same form as that returned by *asctime()*, and with the same undefined
 20508 behavior when input or output is out of range) that is placed in the user-supplied buffer pointed

20509 to by *buf* (which shall contain at least 26 bytes) and then return *buf*.

20510 RETURN VALUE

20511 CX Upon successful completion, *asctime()* shall return a pointer to the string. If the function is
20512 unsuccessful, it shall return NULL.

20513 Upon successful completion, *asctime_r()* shall return a pointer to a character string containing
20514 the date and time. This string is pointed to by the argument *buf*. If the function is unsuccessful,
20515 it shall return NULL.

20516 ERRORS

20517 No errors are defined.

20518 EXAMPLES

20519 None.

20520 APPLICATION USAGE

20521 These functions are included only for compatibility with older implementations. They have
20522 undefined behavior if the resulting string would be too long, so the use of these functions
20523 should be discouraged. On implementations that do not detect output string length overflow, it
20524 is possible to overflow the output buffers in such a way as to cause applications to fail, or
20525 possible system security violations. Also, these functions do not support localized date and time
20526 formats. To avoid these problems, applications should use *strftime()* to generate strings from
20527 broken-down times.

20528 Values for the broken-down time structure can be obtained by calling *gmtime()* or *localtime()*.

20529 The *asctime_r()* function is thread-safe and shall return values in a user-supplied buffer instead
20530 of possibly using a static data area that may be overwritten by each call.

20531 RATIONALE

20532 The standard developers decided to mark the *asctime()* and *asctime_r()* functions obsolescent
20533 even though *asctime()* is in the ISO C standard due to the possibility of buffer overflow. The
20534 ISO C standard also provides the *strftime()* function which can be used to avoid these problems.

20535 FUTURE DIRECTIONS

20536 These functions may be removed in a future version.

20540 CHANGE HISTORY

20541 First released in Issue 1. Derived from Issue 1 of the SVID.

20542 Issue 5

20543 Normative text previously in the APPLICATION USAGE section is moved to the
20544 DESCRIPTION.

20545 The *asctime_r()* function is included for alignment with the POSIX Threads Extension.

20546 A note indicating that the *asctime()* function need not be reentrant is added to the
20547 DESCRIPTION.

20548 Issue 6

20549 The *asctime_r()* function is marked as part of the Thread-Safe Functions option.

20550 Extensions beyond the ISO C standard are marked.

20551 The APPLICATION USAGE section is updated to include a note on the thread-safe function and

- 20552 its avoidance of possibly using a static data area.
- 20553 The DESCRIPTION of *asctime_r()* is updated to describe the format of the string returned.
- 20554 The **restrict** keyword is added to the *asctime_r()* prototype for alignment with the
20555 ISO/IEC 9899:1999 standard
- 20556 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/17 is applied, adding the CX extension in
20557 the RETURN VALUE section requiring that if the *asctime()* function is unsuccessful it returns
20558 NULL.
- 20559 **Issue 7**
- 20560 Austin Group Interpretation 1003.1-2001 #053 is applied, marking these functions obsolescent.
- 20561 Austin Group Interpretation 1003.1-2001 #156 is applied.
- 20562 The *asctime_r()* function is moved from the Thread-Safe Functions option to the Base.
- 20563 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0033 [86,429] is applied. +

20564 **NAME**

20565 asin, asinf, asinl — arc sine function

20566 **SYNOPSIS**

```
20567 #include <math.h>
20568 double asin(double x);
20569 float asinf(float x);
20570 long double asinl(long double x);
```

20571 **DESCRIPTION**

20572 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 20573 conflict between the requirements described here and the ISO C standard is unintentional. This
 20574 volume of POSIX.1-2008 defers to the ISO C standard.

20575 These functions shall compute the principal value of the arc sine of their argument x . The value
 20576 of x should be in the range $[-1,1]$.

20577 An application wishing to check for error situations should set *errno* to zero and call
 20578 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 20579 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 20580 zero, an error has occurred.

20581 **RETURN VALUE**

20582 Upon successful completion, these functions shall return the arc sine of x , in the range
 20583 $[-\pi/2, \pi/2]$ radians.

20584 MX For finite values of x not in the range $[-1,1]$, a domain error shall occur, and either a NaN (if
 20585 supported), or an implementation-defined value shall be returned.

20586 MX If x is NaN, a NaN shall be returned.

20587 If x is ± 0 , x shall be returned.

20588 If x is $\pm \text{Inf}$, a domain error shall occur, and a NaN shall be returned. |

20589 If x is subnormal, a range error may occur |

20590 MXX and x should be returned.

20591 MX If x is not returned, *asin()*, *asinf()*, and *asinl()* shall return an implementation-defined value no
 20592 greater in magnitude than DBL_MIN, FLT_MIN, and LDBL_MIN, respectively. +

20593 **ERRORS**

20594 These functions shall fail if:

20595 MX Domain Error The x argument is finite and is not in the range $[-1,1]$, or is $\pm \text{Inf}$.

20596 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 20597 then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling*
 20598 & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
 20599 shall be raised.

20600 These functions may fail if:

20601 MX Range Error The value of x is subnormal.

20602 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 20603 then *errno* shall be set to [ERANGE]. If the integer expression
 20604 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the underflow
 20605 floating-point exception shall be raised.

EXAMPLES

None.

APPLICATION USAGE

On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated to indicate how an application should check for an error. This text was previously published in the APPLICATION USAGE section.

Issue 6

The *asinf()* and *asinl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899:1999 standard.

IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are marked.

Issue 7

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0034 [320] and XSH/TC1-2008/0035 + [68] are applied.

20632 **NAME**

20633 asinh, asinhf, asinhl — inverse hyperbolic sine functions

20634 **SYNOPSIS**

```
20635 #include <math.h>
20636 double asinh(double x);
20637 float asinhf(float x);
20638 long double asinhl(long double x);
```

20639 **DESCRIPTION**

20640 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any
 20641 conflict between the requirements described here and the ISO C standard is unintentional. This
 20642 volume of POSIX.1-2008 defers to the ISO C standard.

20643 These functions shall compute the inverse hyperbolic sine of their argument x .

20644 An application wishing to check for error situations should set *errno* to zero and call
 20645 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 20646 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 20647 zero, an error has occurred.

20648 **RETURN VALUE**

20649 Upon successful completion, these functions shall return the inverse hyperbolic sine of their
 20650 argument.

20651 **MX** If x is NaN, a NaN shall be returned.

20652 If x is ± 0 , or $\pm \text{Inf}$, x shall be returned.

20653 If x is subnormal, a range error may occur

20654 **MX** and x should be returned.

20655 **MX** If x is not returned, *asinh*(), *asinhf*(), and *asinhl*() shall return an implementation-defined value
 20656 no greater in magnitude than DBL_MIN, FLT_MIN, and LDBL_MIN, respectively.

20657 **ERRORS**

20658 These functions may fail if:

20659 **MX** **Range Error** The value of x is subnormal.

20660 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 20661 then *errno* shall be set to [ERANGE]. If the integer expression
 20662 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the underflow
 20663 floating-point exception shall be raised.

20664 **EXAMPLES**

20665 None.

20666 **APPLICATION USAGE**

20667 On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* &
 20668 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

+

20690 **NAME**20691 **asinl** — arc sine function20692 **SYNOPSIS**20693 `#include <math.h>`20694 `long double asinl(long double x);`20695 **DESCRIPTION**20696 Refer to *asin()*.

20697 **NAME**

20698 assert — insert program diagnostics

20699 **SYNOPSIS**

20700 #include <assert.h>

20701 void assert(scalar expression);

20702 **DESCRIPTION**

20703 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any
 20704 conflict between the requirements described here and the ISO C standard is unintentional. This
 20705 volume of POSIX.1-2008 defers to the ISO C standard.

20706 The *assert()* macro shall insert diagnostics into programs; it shall expand to a **void** expression.
 20707 When it is executed, if *expression* (which shall have a **scalar** type) is false (that is, compares equal
 20708 to 0), *assert()* shall write information about the particular call that failed on *stderr* and shall call
 20709 *abort()*.

20710 The information written about the call that failed shall include the text of the argument, the
 20711 name of the source file, the source file line number, and the name of the enclosing function; the
 20712 latter are, respectively, the values of the preprocessing macros `__FILE__` and `__LINE__` and of
 20713 the identifier `__func__`.

20714 Forcing a definition of the name `NDEBUG`, either from the compiler command line or with the
 20715 preprocessor control statement **#define** `NDEBUG` ahead of the **#include** `<assert.h>` statement,
 20716 shall stop assertions from being compiled into the program.

20717 **RETURN VALUE**20718 The *assert()* macro shall not return a value.20719 **ERRORS**

20720 No errors are defined.

20721 **EXAMPLES**

20722 None.

20723 **APPLICATION USAGE**

20724 None.

20725 **RATIONALE**

20726 None.

20727 **FUTURE DIRECTIONS**

20728 None.

20729 **SEE ALSO**20730 *abort()*, *stdin*20731 XBD `<assert.h>`20732 **CHANGE HISTORY**

20733 First released in Issue 1. Derived from Issue 1 of the SVID.

20734 **Issue 6**

20735 The prototype for the *expression* argument to *assert()* is changed from **int** to **scalar** for alignment
 20736 with the ISO/IEC 9899:1999 standard.

20737 The DESCRIPTION of *assert()* is updated for alignment with the ISO/IEC 9899:1999 standard.

20738 **NAME**

20739 atan, atanf, atanl — arc tangent function

20740 **SYNOPSIS**

```
20741 #include <math.h>
20742 double atan(double x);
20743 float atanf(float x);
20744 long double atanl(long double x);
```

20745 **DESCRIPTION**

20746 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 20747 conflict between the requirements described here and the ISO C standard is unintentional. This
 20748 volume of POSIX.1-2008 defers to the ISO C standard.

20749 These functions shall compute the principal value of the arc tangent of their argument x .

20750 An application wishing to check for error situations should set *errno* to zero and call
 20751 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 20752 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 20753 zero, an error has occurred.

20754 **RETURN VALUE**

20755 Upon successful completion, these functions shall return the arc tangent of x in the range
 20756 $[-\pi/2, \pi/2]$ radians.

20757 MX If x is NaN, a NaN shall be returned.

20758 If x is ± 0 , x shall be returned.

20759 If x is $\pm \text{Inf}$, $\pm \pi/2$ shall be returned.

20760 If x is subnormal, a range error may occur

20761 MXX and x should be returned.

20762 MX If x is not returned, *atan()*, *atanf()*, and *atanl()* shall return an implementation-defined value no
 20763 greater in magnitude than DBL_MIN, FLT_MIN, and LDBL_MIN, respectively.

20764 **ERRORS**

20765 These functions may fail if:

20766 MX **Range Error** The value of x is subnormal.

20767 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 20768 then *errno* shall be set to [ERANGE]. If the integer expression
 20769 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the underflow
 20770 floating-point exception shall be raised.

20771 **EXAMPLES**

20772 None.

20773 **APPLICATION USAGE**

20774 On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* &
 20775 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

20776 **RATIONALE**

20777 None.

20778 **FUTURE DIRECTIONS**

20779 None.

+

20796 **NAME**

20797 atan2, atan2f, atan2l — arc tangent functions

20798 **SYNOPSIS**

```
20799 #include <math.h>
20800 double atan2(double y, double x);
20801 float atan2f(float y, float x);
20802 long double atan2l(long double y, long double x);
```

20803 **DESCRIPTION**

20804 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 20805 conflict between the requirements described here and the ISO C standard is unintentional. This
 20806 volume of POSIX.1-2008 defers to the ISO C standard.

20807 These functions shall compute the principal value of the arc tangent of y/x , using the signs of
 20808 both arguments to determine the quadrant of the return value.

20809 An application wishing to check for error situations should set *errno* to zero and call
 20810 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 20811 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 20812 zero, an error has occurred.

20813 **RETURN VALUE**

20814 Upon successful completion, these functions shall return the arc tangent of y/x in the range
 20815 $[-\pi, \pi]$ radians.

20816 If y is ± 0 and x is < 0 , $\pm\pi$ shall be returned.

20817 If y is ± 0 and x is > 0 , ± 0 shall be returned.

20818 If y is < 0 and x is ± 0 , $-\pi/2$ shall be returned.

20819 If y is > 0 and x is ± 0 , $\pi/2$ shall be returned.

20820 If x is 0, a pole error shall not occur.

20821 MX If either x or y is NaN, a NaN shall be returned.

20822 If the correct value would cause underflow, a range error may occur, and *atan*(), *atan2f*(), and
 20823 *atan2l*() shall return an implementation-defined value no greater in magnitude than DBL_MIN,
 20824 FLT_MIN, and LDBL_MIN, respectively.

20825 MXX If the IEC 60559 Floating-Point option is supported, y/x should be returned.

20826 MX If y is ± 0 and x is -0 , $\pm\pi$ shall be returned.

20827 If y is ± 0 and x is $+0$, ± 0 shall be returned.

20828 For finite values of $\pm y > 0$, if x is $-\text{Inf}$, $\pm\pi$ shall be returned.

20829 For finite values of $\pm y > 0$, if x is $+\text{Inf}$, ± 0 shall be returned.

20830 For finite values of x , if y is $\pm\text{Inf}$, $\pm\pi/2$ shall be returned.

20831 If y is $\pm\text{Inf}$ and x is $-\text{Inf}$, $\pm 3\pi/4$ shall be returned.

20832 If y is $\pm\text{Inf}$ and x is $+\text{Inf}$, $\pm\pi/4$ shall be returned.

20833 If both arguments are 0, a domain error shall not occur.

ERRORS

These functions may fail if:

MX

Range Error

The result underflows.

If the integer expression *(math_errhandling & MATH_ERRNO)* is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression *(math_errhandling & MATH_ERREXCEPT)* is non-zero, then the underflow floating-point exception shall be raised.

EXAMPLES**Converting Cartesian to Polar Coordinates System**

The function below uses *atan2()* to convert a 2d vector expressed in cartesian coordinates *(x,y)* to the polar coordinates *(rho,theta)*. There are other ways to compute the angle *theta*, using *asin()*, *acos()*, or *atan()*. However, *atan2()* presents here two advantages:

- The angle's quadrant is automatically determined.
- The singular cases *(0,y)* are taken into account.

Finally, this example uses *hypot()* rather than *sqrt()* since it is better for special cases; see *hypot()* for more information.

```
#include <math.h>

void
cartesian_to_polar(const double x, const double y,
                  double *rho, double *theta)
{
    *rho    = hypot (x,y); /* better than sqrt(x*x+y*y) */
    *theta  = atan2 (y,x);
}
```

APPLICATION USAGE

On error, the expressions *(math_errhandling & MATH_ERRNO)* and *(math_errhandling & MATH_ERREXCEPT)* are independent of each other, but at least one of them must be non-zero.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

acos(), *asin()*, *atan()*, *feclearexcept()*, *fetestexcept()*, *hypot()*, *isnan()*, *sqrt()*, *tan()*

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated to indicate how an application should check for an error. This text was previously published in the APPLICATION USAGE section.

20874 **Issue 6**

20875 The *atan2f()* and *atan2l()* functions are added for alignment with the ISO/IEC 9899:1999
20876 standard.

20877 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are
20878 revised to align with the ISO/IEC 9899:1999 standard, and the IEC 60559:1989 standard
20879 floating-point extensions over the ISO/IEC 9899:1999 standard are marked. -

20880 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/18 is applied, adding to the EXAMPLES
20881 section.

20882 **Issue 7**

20883 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0038 [68,428] is applied. +

20884 **NAME**

20885 atanf — arc tangent function

20886 **SYNOPSIS**

20887 #include <math.h>

20888 float atanf(float x);

20889 **DESCRIPTION**20890 Refer to *atan()*.

20891 **NAME**

20892 atanh, atanhf, atanh1 — inverse hyperbolic tangent functions

20893 **SYNOPSIS**

```
20894       #include <math.h>
20895       double atanh(double x);
20896       float atanhf(float x);
20897       long double atanh1(long double x);
```

20898 **DESCRIPTION**

20899 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 20900 conflict between the requirements described here and the ISO C standard is unintentional. This
 20901 volume of POSIX.1-2008 defers to the ISO C standard.

20902 These functions shall compute the inverse hyperbolic tangent of their argument x .

20903 An application wishing to check for error situations should set *errno* to zero and call
 20904 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 20905 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 20906 zero, an error has occurred.

20907 **RETURN VALUE**

20908 Upon successful completion, these functions shall return the inverse hyperbolic tangent of their
 20909 argument.

20910 If x is ± 1 , a pole error shall occur, and *atanh*(), *atanhf*(), and *atanhl*() shall return the value of the
 20911 macro HUGE_VAL, HUGE_VALF, and HUGE_VALL, respectively, with the same sign as the
 20912 correct value of the function.

20913 MX For finite $|x| > 1$, a domain error shall occur, and either a NaN (if supported), or an
 20914 implementation-defined value shall be returned.

20915 MX If x is NaN, a NaN shall be returned.

20916 If x is ± 0 , x shall be returned.

20917 If x is $\pm \text{Inf}$, a domain error shall occur, and a NaN shall be returned. |

20918 If x is subnormal, a range error may occur |

20919 MXX and x should be returned.

20920 MX If x is not returned, *atanh*(), *atanhf*(), and *atanhl*() shall return an implementation-defined value +
 20921 no greater in magnitude than DBL_MIN, FLT_MIN, and LDBL_MIN, respectively.

20922 **ERRORS**

20923 These functions shall fail if:

20924 MX Domain Error The x argument is finite and not in the range $[-1, 1]$, or is $\pm \text{Inf}$.

20925 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 20926 then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling*
 20927 & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
 20928 shall be raised.

20929 Pole Error The x argument is ± 1 .

20930 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 20931 then *errno* shall be set to [ERANGE]. If the integer expression
 20932 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the divide-by-zero
 20933 floating-point exception shall be raised.

20934 These functions may fail if:

20935	MX	Range Error	The value of x is subnormal.
20936			If the integer expression $(\text{math\_errhandling} \ \& \ \text{MATH\_ERRNO})$ is non-zero,
20937			then <i>errno</i> shall be set to [ERANGE]. If the integer expression
20938			$(\text{math\_errhandling} \ \& \ \text{MATH\_ERREXCEPT})$ is non-zero, then the underflow
20939			floating-point exception shall be raised.

20940 **EXAMPLES**

20941 None.

20942 **APPLICATION USAGE**

20943 On error, the expressions $(\text{math\_errhandling} \ \& \ \text{MATH\_ERRNO})$ and $(\text{math\_errhandling} \ \& \ \text{MATH\_ERREXCEPT})$ are independent of each other, but at least one of them must be non-zero.

20945 **RATIONALE**

20946 None.

20947 **FUTURE DIRECTIONS**

20948 None.

20949 **SEE ALSO**

20951 XBD [Section 4.19](#) (on page 116), `<math.h>`

20952 **CHANGE HISTORY**

20953 First released in Issue 4, Version 2.

20954 **Issue 5**

20955 Moved from X/OPEN UNIX extension to BASE.

20956 **Issue 6**

20957 The *atanh()* function is no longer marked as an extension.

20958 The *atanhf()* and *atanhl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

20960 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899:1999 standard.

20962 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are marked.

20964 **Issue 7**

20965 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0039 [320] and XSH/TC1-2008/0040 +
20966 [680] are applied.

20967 **NAME**

20968 atanl — arc tangent function

20969 **SYNOPSIS**

20970 #include <math.h>

20971 long double atanl(long double x);

20972 **DESCRIPTION**20973 Refer to *atan()*.

20974 **NAME**

20975 atexit — register a function to run at process termination

20976 **SYNOPSIS**

20977 #include <stdlib.h>

20978 int atexit(void (*func)(void));

20979 **DESCRIPTION**

20980 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 20981 conflict between the requirements described here and the ISO C standard is unintentional. This
 20982 volume of POSIX.1-2008 defers to the ISO C standard.

20983 The *atexit()* function shall register the function pointed to by *func*, to be called without
 20984 arguments at normal program termination. At normal program termination, all functions
 20985 registered by the *atexit()* function shall be called, in the reverse order of their registration, except
 20986 that a function is called after any previously registered functions that had already been called at
 20987 the time it was registered. Normal termination occurs either by a call to *exit()* or a return from
 20988 *main()*.

20989 At least 32 functions can be registered with *atexit()*.

20990 CX After a successful call to any of the *exec* functions, any functions previously registered by *atexit()*
 20991 shall no longer be registered.

20992 **RETURN VALUE**20993 Upon successful completion, *atexit()* shall return 0; otherwise, it shall return a non-zero value.20994 **ERRORS**

20995 No errors are defined.

20996 **EXAMPLES**

20997 None.

20998 **APPLICATION USAGE**20999 The functions registered by a call to *atexit()* must return to ensure that all registered functions
21000 are called.

21001 The application should call *sysconf()* to obtain the value of {ATEXIT_MAX}, the number of
 21002 functions that can be registered. There is no way for an application to tell how many functions
 21003 have already been registered with *atexit()*.

21004 Since the behavior is undefined if the *exit()* function is called more than once, portable
 21005 applications calling *atexit()* must ensure that the *exit()* function is not called at normal process
 21006 termination when all functions registered by the *atexit()* function are called.

21007 All functions registered by the *atexit()* function are called at normal process termination, which
 21008 occurs by a call to the *exit()* function or a return from *main()* or on the last thread termination,
 21009 when the behavior is as if the implementation called *exit()* with a zero argument at thread
 21010 termination time.

21011 If, at normal process termination, a function registered by the *atexit()* function is called and a
 21012 portable application needs to stop further *exit()* processing, it must call the *_exit()* function or
 21013 the *_Exit()* function or one of the functions which cause abnormal process termination.

21014 **RATIONALE**

21015 None.

21016 FUTURE DIRECTIONS

21017 None.

21018 SEE ALSO

21019 *exec*, *exit()*, *sysconf()*

21020 XBD <stdlib.h>

21021 CHANGE HISTORY

21022 First released in Issue 4. Derived from the ANSI C standard.

21023 Issue 6

21024 Extensions beyond the ISO C standard are marked.

21025 The DESCRIPTION is updated for alignment with the ISO/IEC 9899:1999 standard.

21026 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/19 is applied, adding further clarification
21027 to the APPLICATION USAGE section.

21028 **NAME**

21029 atof — convert a string to a double-precision number

21030 **SYNOPSIS**

21031 #include <stdlib.h>

21032 double atof(const char *str);

21033 **DESCRIPTION**

21034 CX The functionality described on this reference page is aligned with the ISO C standard. Any
21035 conflict between the requirements described here and the ISO C standard is unintentional. This
21036 volume of POSIX.1-2008 defers to the ISO C standard.

21037 The call *atof(str)* shall be equivalent to:

21038 strtod(str, (char **) NULL),

21039 except that the handling of errors may differ. If the value cannot be represented, the behavior is
21040 undefined.

21041 **RETURN VALUE**21042 The *atof()* function shall return the converted value if the value can be represented.21043 **ERRORS**

21044 No errors are defined.

21045 **EXAMPLES**

21046 None.

21047 **APPLICATION USAGE**

21048 The *atof()* function is subsumed by *strtod()* but is retained because it is used extensively in
21049 existing code. If the number is not known to be in range, *strtod()* should be used because *atof()*
21050 is not required to perform any error checking.

21051 **RATIONALE**

21052 None.

21053 **FUTURE DIRECTIONS**

21054 None.

21055 **SEE ALSO**21056 *strtod()*

21057 XBD <stdlib.h>

21058 **CHANGE HISTORY**

21059 First released in Issue 1. Derived from Issue 1 of the SVID.

21060 **NAME**

21061 atoi — convert a string to an integer

21062 **SYNOPSIS**

21063 #include <stdlib.h>

21064 int atoi(const char *str);

21065 **DESCRIPTION**

21066 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 21067 conflict between the requirements described here and the ISO C standard is unintentional. This
 21068 volume of POSIX.1-2008 defers to the ISO C standard.

21069 The call *atoi(str)* shall be equivalent to:

21070 (int) strtol(str, (char **)NULL, 10)

21071 except that the handling of errors may differ. If the value cannot be represented, the behavior is
 21072 undefined.

21073 **RETURN VALUE**21074 The *atoi()* function shall return the converted value if the value can be represented.21075 **ERRORS**

21076 No errors are defined.

21077 **EXAMPLES**21078 **Converting an Argument**

21079 The following example checks for proper usage of the program. If there is an argument and the
 21080 decimal conversion of this argument (obtained using *atoi()*) is greater than 0, then the program
 21081 has a valid number of minutes to wait for an event.

```
21082       #include <stdlib.h>
21083       #include <stdio.h>
21084       ...
21085       int minutes_to_event;
21086       ...
21087       if (argc < 2 || ((minutes_to_event = atoi (argv[1]))) <= 0) {
21088           fprintf(stderr, "Usage: %s minutes\n", argv[0]); exit(1);
21089       }
21090       ...
```

21091 **APPLICATION USAGE**

21092 The *atoi()* function is subsumed by *strtol()* but is retained because it is used extensively in
 21093 existing code. If the number is not known to be in range, *strtol()* should be used because *atoi()* is
 21094 not required to perform any error checking.

21137 **CHANGE HISTORY**

21138 First released in Issue 1. Derived from Issue 1 of the SVID.

21139 **Issue 6**

21140 The `atoll()` function is added for alignment with the ISO/IEC 9899:1999 standard.

21141 **Issue 7**

21142 SD5-XSH-ERN-61 is applied, correcting the DESCRIPTION of `atoll()`.

21143 **NAME**21144 **basename** — return the last component of a pathname21145 **SYNOPSIS**

```
21146 XSI      #include <libgen.h>
21147          char *basename(char *path);
```

21148 **DESCRIPTION**

21149 The *basename()* function shall take the pathname pointed to by *path* and return a pointer to the
 21150 final component of the pathname, deleting any trailing '/' characters.

21151 If the string pointed to by *path* consists entirely of the '/' character, *basename()* shall return a
 21152 pointer to the string "/". If the string pointed to by *path* is exactly "///", it is implementation-
 21153 defined whether '/' or "///" is returned.

21154 If *path* is a null pointer or points to an empty string, *basename()* shall return a pointer to the
 21155 string ".".

21156 The *basename()* function may modify the string pointed to by *path*, and may return a pointer to
 21157 internal storage. The returned pointer might be invalidated or the storage might be overwritten
 21158 by a subsequent call to *basename()*.

21159 The *basename()* function need not be thread-safe.

21160 **RETURN VALUE**

21161 The *basename()* function shall return a pointer to the final component of *path*.

21162 **ERRORS**

21163 No errors are defined.

21164 **EXAMPLES**21165 **Using basename()**

21166 The following program fragment returns a pointer to the value *lib*, which is the base name of
 21167 */usr/lib*.

```
21168     #include <libgen.h>
21169     ...
21170     char *name = "/usr/lib";
21171     char *base;

21172     base = basename(name);
21173     ...
```

21174 **Sample Input and Output Strings for basename()**

21175 In the following table, the input string is the value pointed to by *path*, and the output string is
 21176 the return value of the *basename()* function.

Input String	Output String
"/usr/lib"	"lib"
"/usr/"	"usr"
"/"	"/"
"/" / "	"/"
"/usr//lib//"	"lib"

21183 APPLICATION USAGE

21193 CHANGE HISTORY

21194 First released in Issue 4, Version 2.

21195 Issue 5

21196 Moved from X/OPEN UNIX extension to BASE.

21197 Normative text previously in the APPLICATION USAGE section is moved to the
21198 DESCRIPTION.

21199 A note indicating that this function need not be reentrant is added to the DESCRIPTION.

21200 Issue 6

21201 In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

21202 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/20 is applied, changing the
21203 DESCRIPTION to make it clear that the string referenced is the string pointed to by *path*.

21204 Issue 7

21205 Austin Group Interpretation 1003.1-2001 #156 is applied.

21206 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0041 [75] is applied.

+

21207 NAME

21208 bind — bind a name to a socket

21209 SYNOPSIS

```
21210       #include <sys/socket.h>
21211       int bind(int socket, const struct sockaddr *address,
21212               socklen_t address_len);
```

21213 DESCRIPTION

21214 The *bind()* function shall assign a local socket address *address* to a socket identified by descriptor
 21215 *socket* that has no local socket address assigned. Sockets created with the *socket()* function are
 21216 initially unnamed; they are identified only by their address family.

21217 The *bind()* function takes the following arguments:

21218	<i>socket</i>	Specifies the file descriptor of the socket to be bound.
21219	<i>address</i>	Points to a sockaddr structure containing the address to be bound to the
21220		socket. The length and format of the address depend on the address family of
21221		the socket.
21222	<i>address_len</i>	Specifies the length of the sockaddr structure pointed to by the <i>address</i>
21223		argument.

21224 The socket specified by *socket* may require the process to have appropriate privileges to use the
 21225 *bind()* function.

21226 If the address family of the socket is AF_UNIX and the pathname in *address* names a symbolic +
 21227 link, *bind()* shall fail and set *errno* to [EADDRINUSE]. +

21228 If the socket address cannot be assigned immediately and O_NONBLOCK is set for the file
 21229 descriptor for the socket, *bind()* shall fail and set *errno* to [EINPROGRESS], but the assignment
 21230 request shall not be aborted, and the assignment shall be completed asynchronously. Subsequent
 21231 calls to *bind()* for the same socket, before the assignment is completed, shall fail and set *errno* to
 21232 [EALREADY].

21233 When the assignment has been performed asynchronously, *pselect()*, *select()*, and *poll()* shall
 21234 indicate that the file descriptor for the socket is ready for reading and writing.

21235 RETURN VALUE

21236 Upon successful completion, *bind()* shall return 0; otherwise, -1 shall be returned and *errno* set
 21237 to indicate the error.

21238 ERRORS

21239	The <i>bind()</i> function shall fail if:	
21240	[EADDRINUSE]	The specified address is already in use.
21241	[EADDRNOTAVAIL]	
21242		The specified address is not available from the local machine.
21243	[EAFNOSUPPORT]	
21244		The specified address is not a valid address for the address family of the
21245		specified socket.
21246	[EALREADY]	An assignment request is already in progress for the specified socket.
21247	[EBADF]	The <i>socket</i> argument is not a valid file descriptor.

21248	[EINPROGRESS]	O_NONBLOCK is set for the file descriptor for the socket and the assignment cannot be immediately performed; the assignment shall be performed asynchronously.	
21249			
21250			
21251	[EINVAL]	The socket is already bound to an address, and the protocol does not support binding to a new address; or the socket has been shut down.	
21252			
21253	[ENOBUFS]	Insufficient resources were available to complete the call.	
21254	[ENOTSOCK]	The <i>socket</i> argument does not refer to a socket.	
21255	[EOPNOTSUPP]	The socket type of the specified socket does not support binding to an address.	
21256		If the address family of the socket is AF_UNIX, then <i>bind()</i> shall fail if:	
21257	[EACCES]	A component of the path prefix denies search permission, or the requested name requires writing in a directory with a mode that denies write permission.	
21258			
21259			
21260	[EDESTADDRREQ] or [EISDIR]		
21261		The <i>address</i> argument is a null pointer.	
21262	[EIO]	An I/O error occurred.	
21263	[ELOOP]	A loop exists in symbolic links encountered during resolution of the pathname in <i>address</i> .	
21264			
21265	[ENAMETOOLONG]		
21266		The length of a component of a pathname is longer than {NAME_MAX}.	
21267	[ENOENT]	A component of the path prefix of the pathname in <i>address</i> does not name an existing file or the pathname is an empty string.	
21268			
21269	[ENOENT] or [ENOTDIR]		
21270		The pathname in <i>address</i> contains at least one non- <i><slash></i> character and ends with one or more trailing <i><slash></i> characters. If the pathname names an existing file, an [ENOENT] error shall not occur.	
21271			
21272			
21273	[ENOTDIR]	A component of the path prefix of the pathname in <i>address</i> names an existing file that is neither a directory nor a symbolic link to a directory, or the pathname in <i>address</i> contains at least one non- <i><slash></i> character and ends with one or more trailing <i><slash></i> characters and the last pathname component names an existing file that is neither a directory nor a symbolic link to a directory.	
21274			
21275			
21276			
21277			
21278			
21279	[EROFS]	The name would reside on a read-only file system.	
21280		The <i>bind()</i> function may fail if:	
21281	[EACCES]	The specified address is protected and the current user does not have permission to bind to it.	
21282			
21283	[EINVAL]	The <i>address_len</i> argument is not a valid length for the address family.	
21284	[EISCONN]	The socket is already connected.	
21285	[ELOOP]	More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the pathname in <i>address</i> .	
21286			
21287	[ENAMETOOLONG]		
21288		The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a symbolic link produced an intermediate result with a length that exceeds	
21289			

21290 {PATH_MAX}.

21291 EXAMPLES

21292 The following code segment shows how to create a socket and bind it to a name in the AF_UNIX
21293 domain.

```
21294 #define MY_SOCKET_PATH "/somepath"
21295 int sfd;
21296 struct sockaddr_un my_addr;
21297 sfd = socket(AF_UNIX, SOCK_STREAM, 0);
21298 if (sfd == -1)
21299     /* Handle error */;
21300 memset(&my_addr, '\0', sizeof(struct sockaddr_un));
21301     /* Clear structure */
21302 my_addr.sun_family = AF_UNIX;
21303 strncpy(my_addr.sun_path, MY_SOCKET_PATH, sizeof(my_addr.sun_path) - 1);
21304 if (bind(sfd, (struct sockaddr *) &my_addr,
21305         sizeof(struct sockaddr_un)) == -1)
21306     /* Handle error */;
```

21307 APPLICATION USAGE

21308 An application program can retrieve the assigned socket name with the *getsockname()* function.

21309 RATIONALE

21316 CHANGE HISTORY

21317 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

21318 Issue 7

21319 Austin Group Interpretation 1003.1-2001 #044 is applied, changing the “may fail” [ENOBUFFS]
21320 error to become a “shall fail” error.

21321 Austin Group Interpretation 1003.1-2001 #143 is applied.

21322 SD5-XSH-ERN-185 is applied.

21323 An example is added.

21324 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0042 [146], XSH/TC1-2008/0043 [146], +
21325 and XSH/TC1-2008/0044 [324] are applied.

NAME

bsearch — binary search a sorted table

SYNOPSIS

```
#include <stdlib.h>
```

```
void *bsearch(const void *key, const void *base, size_t nel,
             size_t width, int (*compar)(const void *, const void *));
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

The `bsearch()` function shall search an array of *nel* objects, the initial element of which is pointed to by *base*, for an element that matches the object pointed to by *key*. The size of each element in the array is specified by *width*. If the *nel* argument has the value zero, the comparison function pointed to by *compar* shall not be called and no match shall be found.

The comparison function pointed to by *compar* shall be called with two arguments that point to the *key* object and to an array element, in that order.

The application shall ensure that the comparison function pointed to by *compar* does not alter the contents of the array. The implementation may reorder elements of the array between calls to the comparison function, but shall not alter the contents of any individual element.

The implementation shall ensure that the first argument is always a pointer to the key.

When the same objects (consisting of width bytes, irrespective of their current positions in the array) are passed more than once to the comparison function, the results shall be consistent with one another. That is, the same object shall always compare the same way with the key.

The application shall ensure that the function returns an integer less than, equal to, or greater than 0 if the *key* object is considered, respectively, to be less than, to match, or to be greater than the array element. The application shall ensure that the array consists of all the elements that compare less than, all the elements that compare equal to, and all the elements that compare greater than the *key* object, in that order.

RETURN VALUE

The `bsearch()` function shall return a pointer to a matching member of the array, or a null pointer if no match is found. If two or more members compare equal, which member is returned is unspecified.

ERRORS

No errors are defined.

EXAMPLES

The example below searches a table containing pointers to nodes consisting of a string and its length. The table is ordered alphabetically on the string in the node pointed to by each entry.

The code fragment below reads in strings and either finds the corresponding node and prints out the string and its length, or prints an error message.

```
#include <stdio.h>
#include <stdlib.h>
#include <string.h>
```

```
#define TABSIZE 1000
```

[illegible]

```

21370     char *string;
21371     int length;
21372 };
21373 struct node table[TABSIZE];    /* Table to be searched. */
21374     .
21375     .
21376     .
21377 {
21378     struct node *node_ptr, node;
21379     /* Routine to compare 2 nodes. */
21380     int node_compare(const void *, const void *);
21381     .
21382     .
21383     .
21384     while (scanf("%ms", &node.string) != EOF) {
21385         node_ptr = (struct node *)bsearch((void *)(&node),
21386             (void *)table, TABSIZE,
21387             sizeof(struct node), node_compare);
21388         if (node_ptr != NULL) {
21389             (void)printf("string = %20s, length = %d\n",
21390                 node_ptr->string, node_ptr->length);
21391         } else {
21392             (void)printf("not found: %s\n", node.string);
21393         }
21394         free(node.string);
21395     }
21396 }
21397 /*
21398     This routine compares two nodes based on an
21399     alphabetical ordering of the string field.
21400 */
21401 int
21402 node_compare(const void *node1, const void *node2)
21403 {
21404     return strcoll(((const struct node *)node1)->string,
21405         ((const struct node *)node2)->string);
21406 }

```

APPLICATION USAGE

The pointers to the key and the element at the base of the table should be of type pointer-to-element.

The comparison function need not compare every byte, so arbitrary data may be contained in the elements in addition to the values being compared.

In practice, the array is usually sorted according to the comparison function.

RATIONALE

The requirement that the second argument (hereafter referred to as *p*) to the comparison function is a pointer to an element of the array implies that for every call all of the following expressions are non-zero:

```

((char *)p - (char *(base) % width == 0
(char *)p >= (char *)base

```

21419 (char *)p < (char *)base + nel * width

21425 **CHANGE HISTORY**

21426 First released in Issue 1. Derived from Issue 1 of the SVID.

21427 **Issue 6**

21428 The normative text is updated to avoid use of the term “must” for application requirements.

21429 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/11 is applied, adding to the
21430 DESCRIPTION the last sentence of the first non-shaded paragraph, and the following three
21431 paragraphs. The RATIONALE section is also updated. These changes are for alignment with the
21432 ISO C standard.

21433 **Issue 7**

21434 The EXAMPLES section is revised.

21435 **NAME**

21436 btowc — single byte to wide character conversion

21437 **SYNOPSIS**

21438 #include <stdio.h>

21439 #include <wchar.h>

21440 wint_t btowc(int c);

21441 **DESCRIPTION**

21442 CX The functionality described on this reference page is aligned with the ISO C standard. Any
21443 conflict between the requirements described here and the ISO C standard is unintentional. This
21444 volume of POSIX.1-2008 defers to the ISO C standard.

21445 The *btowc()* function shall determine whether *c* constitutes a valid (one-byte) character in the
21446 initial shift state.

21447 The behavior of this function shall be affected by the *LC_CTYPE* category of the current locale.

21448 **RETURN VALUE**

21449 The *btowc()* function shall return WEOF if *c* has the value EOF or if (**unsigned char**) *c* does not
21450 constitute a valid (one-byte) character in the initial shift state. Otherwise, it shall return the
21451 wide-character representation of that character.

21452 **ERRORS**

21453 No errors are defined.

21559 **NAME**

21560 cacosl — complex arc cosine functions

21561 **SYNOPSIS**

21562 #include <complex.h>

21563 long double complex cacosl(long double complex z);

21564 **DESCRIPTION**21565 Refer to *cacos()*.

21566 NAME

21567 `calloc` — a memory allocator

21568 SYNOPSIS

21569 `#include <stdlib.h>`

21570 `void *calloc(size_t nelem, size_t elsize);`

21571 DESCRIPTION

21572 CX The functionality described on this reference page is aligned with the ISO C standard. Any
21573 conflict between the requirements described here and the ISO C standard is unintentional. This
21574 volume of POSIX.1-2008 defers to the ISO C standard.

21575 The `calloc()` function shall allocate unused space for an array of *nelem* elements each of whose
21576 size in bytes is *elsize*. The space shall be initialized to all bits 0.

21577 The order and contiguity of storage allocated by successive calls to `calloc()` is unspecified. The
21578 pointer returned if the allocation succeeds shall be suitably aligned so that it may be assigned to
21579 a pointer to any type of object and then used to access such an object or an array of such objects
21580 in the space allocated (until the space is explicitly freed or reallocated). Each such allocation shall
21581 yield a pointer to an object disjoint from any other object. The pointer returned shall point to the
21582 start (lowest byte address) of the allocated space. If the space cannot be allocated, a null pointer
21583 shall be returned. If the size of the space requested is 0, the behavior is implementation-defined:
21584 the value returned shall be either a null pointer or a unique pointer.

21585 RETURN VALUE

21586 Upon successful completion with both *nelem* and *elsize* non-zero, `calloc()` shall return a pointer to
21587 the allocated space. If either *nelem* or *elsize* is 0, then either a null pointer or a unique pointer
21588 value that can be successfully passed to `free()` shall be returned. Otherwise, it shall return a null
21589 CX pointer and set *errno* to indicate the error.

21590 ERRORS

21591 The `calloc()` function shall fail if:

21592 CX [ENOMEM] Insufficient memory is available.

21593 EXAMPLES

21594 None.

21595 APPLICATION USAGE

21596 There is now no requirement for the implementation to support the inclusion of `<malloc.h>`.

21597 RATIONALE

21598 None.

21599 FUTURE DIRECTIONS

21600 None.

21774 **CHANGE HISTORY**

21775 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

21776 **NAME**

21777 catanl — complex arc tangent functions

21778 **SYNOPSIS**

21779 #include <complex.h>

21780 long double complex catanl(long double complex z);

21781 **DESCRIPTION**21782 Refer to *catan()*.

21783 **NAME**

21784 catclose — close a message catalog descriptor

21785 **SYNOPSIS**

21786 #include <nl_types.h>

21787 int catclose(nl_catd catd);

21788 **DESCRIPTION**

21789 The *catclose()* function shall close the message catalog identified by *catd*. If a file descriptor is
21790 used to implement the type **nl_catd**, that file descriptor shall be closed.

21791 **RETURN VALUE**

21792 Upon successful completion, *catclose()* shall return 0; otherwise, -1 shall be returned, and *errno*
21793 set to indicate the error.

21794 **ERRORS**21795 The *catclose()* function may fail if:

21796 [EBADF] The catalog descriptor is not valid.

21797 [EINTR] The *catclose()* function was interrupted by a signal.21798 **EXAMPLES**

21799 None.

21800 **APPLICATION USAGE**

21801 None.

21802 **RATIONALE**

21803 None.

21809 **CHANGE HISTORY**

21810 First released in Issue 2.

21811 **Issue 7**21812 The *catclose()* function is moved from the XSI option to the Base.

21813 **NAME**

21814 catgets — read a program message

21815 **SYNOPSIS**

21816 #include <nl_types.h>

21817 char *catgets(nl_catd catd, int set_id, int msg_id, const char *s);

21818 **DESCRIPTION**

21819 The *catgets()* function shall attempt to read message *msg_id*, in set *set_id*, from the message
 21820 catalog identified by *catd*. The *catd* argument is a message catalog descriptor returned from an
 21821 earlier call to *catopen()*. The results are undefined if *catd* is not a value returned by *catopen()* for
 21822 a message catalog still open in the process. The *s* argument points to a default message string
 21823 which shall be returned by *catgets()* if it cannot retrieve the identified message.

21824 The *catgets()* function need not be thread-safe.21825 **RETURN VALUE**

21826 If the identified message is retrieved successfully, *catgets()* shall return a pointer to an internal
 21827 buffer area containing the null-terminated message string. If the call is unsuccessful for any
 21828 reason, *s* shall be returned and *errno* shall be set to indicate the error.

21829 **ERRORS**21830 The *catgets()* function shall fail if:

21831 [EINTR] The read operation was terminated due to the receipt of a signal, and no data
 21832 was transferred.

21833 [ENOMSG] The message identified by *set_id* and *msg_id* is not in the message catalog.21834 The *catgets()* function may fail if:21835 [EBADF] The *catd* argument is not a valid message catalog descriptor open for reading.

21836 [EBADMSG] The message identified by *set_id* and *msg_id* in the specified message catalog
 21837 did not satisfy implementation-defined security criteria.

21838 [EINVAL] The message catalog identified by *catd* is corrupted.21839 **EXAMPLES**

21840 None.

21841 **APPLICATION USAGE**

21842 None.

21846 None.

21847 **SEE ALSO**21848 *catclose()*, *catopen()*

21849 XBD <nl_types.h>

21850 **CHANGE HISTORY**

21851 First released in Issue 2.

21852 **Issue 5**

21853 A note indicating that this function need not be reentrant is added to the DESCRIPTION.

21854 **Issue 6**

21855 In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

21856 **Issue 7**

21857 Austin Group Interpretation 1003.1-2001 #044 is applied, changing the “may fail” [EINTR] and
21858 [ENOMSG] errors to become “shall fail” errors, updating the RETURN VALUE section, and
21859 updating the DESCRIPTION to note that: “The results are undefined if *catd* is not a value
21860 returned by *catopen()* for a message catalog still open in the process.

21861 Austin Group Interpretation 1003.1-2001 #148 is applied, adding

21862 The *catgets()* function is moved from the XSI option to the Base.

21863 **NAME**

21864 catopen — open a message catalog

21865 **SYNOPSIS**

21866 #include <nl_types.h>

21867 nl_catd catopen(const char *name, int oflag);

21868 **DESCRIPTION**

21869 The *catopen()* function shall open a message catalog and return a message catalog descriptor.
 21870 The *name* argument specifies the name of the message catalog to be opened. If *name* contains a
 21871 ' / ', then *name* specifies a complete name for the message catalog. Otherwise, the environment
 21872 variable *NLSPATH* is used with *name* substituted for the %N conversion specification (see XBD
 21873 Chapter 8, on page 173). If *NLSPATH* exists in the environment when the process starts, then if
 21874 the process has appropriate privileges, the behavior of *catopen()* is undefined. If *NLSPATH* does
 21875 not exist in the environment, or if a message catalog cannot be found in any of the components
 21876 specified by *NLSPATH*, then an implementation-defined default path shall be used. This default
 21877 may be affected by the setting of *LC_MESSAGES* if the value of *oflag* is *NL_CAT_LOCALE*, or
 21878 the *LANG* environment variable if *oflag* is 0.

21879 A message catalog descriptor shall remain valid in a process until that process closes it, or a
 21880 successful call to one of the *exec* functions. A change in the setting of the *LC_MESSAGES*
 21881 category may invalidate existing open catalogs.

21882 If a file descriptor is used to implement message catalog descriptors, the *FD_CLOEXEC* flag
 21883 shall be set; see <fcntl.h>.

21884 If the value of the *oflag* argument is 0, the *LANG* environment variable is used to locate the
 21885 catalog without regard to the *LC_MESSAGES* category. If the *oflag* argument is
 21886 *NL_CAT_LOCALE*, the *LC_MESSAGES* category is used to locate the message catalog (see XBD
 21887 Section 8.2, on page 174).

21888 **RETURN VALUE**

21889 Upon successful completion, *catopen()* shall return a message catalog descriptor for use on
 21890 subsequent calls to *catgets()* and *catclose()*. Otherwise, *catopen()* shall return (*nl_catd*) -1 and set
 21891 *errno* to indicate the error.

21892 **ERRORS**21893 The *catopen()* function may fail if:

21894 [EACCES] Search permission is denied for the component of the path prefix of the
 21895 message catalog or read permission is denied for the message catalog.

21896 [EMFILE] All file descriptors available to the process are currently open.

21897 [ENAMETOOLONG]
 21898 The length of a component of a pathname is longer than {NAME_MAX}.

21899 [ENAMETOOLONG]
 21900 The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a
 21901 symbolic link produced an intermediate result with a length that exceeds
 21902 {PATH_MAX}.

21903 [ENFILE] Too many files are currently open in the system.

21904 [ENOENT] The message catalog does not exist or the *name* argument points to an empty
 21905 string.

21906	[ENOMEM]	Insufficient storage space is available.	
21907	[ENOTDIR]	A component of the path prefix of the message catalog names an existing file	
21908		that is neither a directory nor a symbolic link to a directory, or the pathname	
21909		of the message catalog contains at least one non- <code><slash></code> character and ends	
21910		with one or more trailing <code><slash></code> characters and the last pathname	
21911		component names an existing file that is neither a directory nor a symbolic	
21912		link to a directory.	

EXAMPLES

21913
21914 None.

APPLICATION USAGE

21916 Some implementations of *catopen()* use *malloc()* to allocate space for internal buffer areas. The
21917 *catopen()* function may fail if there is insufficient storage space available to accommodate these
21918 buffers.

21919 Conforming applications must assume that message catalog descriptors are not valid after a call
21920 to one of the *exec* functions.

21921 Application developers should be aware that guidelines for the location of message catalogs
21922 have not yet been developed. Therefore they should take care to avoid conflicting with catalogs
21923 used by other applications and the standard utilities.

RATIONALE

21924
21925 None.

FUTURE DIRECTIONS

21926
21927 None.

22038 **SYNOPSIS**

22039 #include <complex.h>

22040 long double complex ccosl(long double complex z);

22041 **DESCRIPTION**22042 Refer to *ccos()*.

22043 **NAME**

22044 ceil, ceilf, ceill — ceiling value function

22045 **SYNOPSIS**

```
22046       #include <math.h>
22047       double ceil(double x);
22048       float ceilf(float x);
22049       long double ceill(long double x);
```

22050 **DESCRIPTION**

22051 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 22052 conflict between the requirements described here and the ISO C standard is unintentional. This
 22053 volume of POSIX.1-2008 defers to the ISO C standard.

22054 These functions shall compute the smallest integral value not less than *x*. -

22055 **RETURN VALUE**

22056 MX The result shall have the same sign as *x*. +

22057 Upon successful completion, *ceil()*, *ceilf()*, and *ceill()* shall return the smallest integral value not
 22058 less than *x*, expressed as a type **double**, **float**, or **long double**, respectively.

22059 MX If *x* is NaN, a NaN shall be returned.

22060 If *x* is ± 0 or $\pm \text{Inf}$, *x* shall be returned. -

22061 **ERRORS**

22062 No errors are defined. |

22063 **EXAMPLES**

22064 None.

22065 **APPLICATION USAGE**

22066 The integral value returned by these functions need not be expressible as an **intmax_t**. The
 22067 return value should be tested before assigning it to an integer type to avoid the undefined
 22068 results of an integer overflow.

22069 These functions may raise the inexact floating-point exception if the result differs in value from |
 22070 the argument.

22071 **RATIONALE**

22072 None.

22073 **FUTURE DIRECTIONS**

22074 None.

22075 **SEE ALSO**

22076 *feclearexcept()*, *fetestexcept()*, *floor()*, *isnan()*

22077 XBD Section 4.19 (on page 116), **<math.h>**

22078 **CHANGE HISTORY**

22079 First released in Issue 1. Derived from Issue 1 of the SVID.

22080 **Issue 5**

22081 The DESCRIPTION is updated to indicate how an application should check for an error. This
 22082 text was previously published in the APPLICATION USAGE section.

Issue 6

22083 The *ceilf()* and *ceil()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

22084
22085 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are
22086 revised to align with the ISO/IEC 9899:1999 standard.

22087 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are
22088 marked.

Issue 7

22089 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0046 [346] is applied.

+

22091 **NAME**

22092 cexp, cexpf, cexpl — complex exponential functions

22093 **SYNOPSIS**

22094 #include <complex.h>

22095 double complex cexp(double complex z);

22096 float complex cexpf(float complex z);

22097 long double complex cexpl(long double complex z);

22098 **DESCRIPTION**

22099 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 22100 conflict between the requirements described here and the ISO C standard is unintentional. This
 22101 volume of POSIX.1-2008 defers to the ISO C standard.

22102 These functions shall compute the complex exponent of z , defined as e^z .22103 **RETURN VALUE**22104 These functions shall return the complex exponential value of z .22105 **ERRORS**

22106 No errors are defined.

22107 **EXAMPLES**

22108 None.

22109 **APPLICATION USAGE**

22110 None.

22120 **NAME**

22121 cfgetispeed — get input baud rate

22122 **SYNOPSIS**

22123 #include <termios.h>

22124 speed_t cfgetispeed(const struct termios *termios_p);

22125 **DESCRIPTION**

22126 The *cfgetispeed()* function shall extract the input baud rate from the **termios** structure to which
 22127 the *termios_p* argument points.

22128 This function shall return exactly the value in the **termios** data structure, without interpretation.

22129 **RETURN VALUE**

22130 Upon successful completion, *cfgetispeed()* shall return a value of type **speed_t** representing the
 22131 input baud rate.

22132 **ERRORS**

22133 No errors are defined.

22134 **EXAMPLES**

22135 None.

22136 **APPLICATION USAGE**

22137 None.

22138 **RATIONALE**

22139 The term “baud” is used historically here, but is not technically correct. This is properly “bits per
 22140 second”, which may not be the same as baud. However, the term is used because of the
 22141 historical usage and understanding.

22142 The *cfgetispeed()*, *cfsetispeed()*, *cfsetospeed()*, and *cfsetispeed()* functions do not take arguments as
 22143 numbers, but rather as symbolic names. There are two reasons for this:

- 22144 1. Historically, numbers were not used because of the way the rate was stored in the data
 22145 structure. This is retained even though a function is now used.
- 22146 2. More importantly, only a limited set of possible rates is at all portable, and this constrains
 22147 the application to that set.

22148 There is nothing to prevent an implementation accepting as an extension a number (such as 126),
 22149 and since the encoding of the Bxxx symbols is not specified, this can be done to avoid
 22150 introducing ambiguity.

22151 Setting the input baud rate to zero was a mechanism to allow for split baud rates. Clarifications
 22152 in this volume of POSIX.1-2008 have made it possible to determine whether split rates are
 22153 supported and to support them without having to treat zero as a special case. Since this
 22154 functionality is also confusing, it has been declared obsolescent. The 0 argument referred to is
 22155 the literal constant 0, not the symbolic constant B0. This volume of POSIX.1-2008 does not
 22156 preclude B0 from being defined as the value 0; in fact, implementations would likely benefit
 22157 from the two being equivalent. This volume of POSIX.1-2008 does not fully specify whether the
 22158 previous *cfsetispeed()* value is retained after a *tcgetattr()* as the actual value or as zero. Therefore,
 22159 conforming applications should always set both the input speed and output speed when setting
 22160 either.

22161 In historical implementations, the baud rate information is traditionally kept in **c_cflag**.
 22162 Applications should be written to presume that this might be the case (and thus not blindly copy
 22163 **c_cflag**), but not to rely on it in case it is in some other field of the structure. Setting the **c_cflag**
 22164 field absolutely after setting a baud rate is a non-portable action because of this. In general, the

22165 unused parts of the flag fields might be used by the implementation and should not be blindly
22166 copied from the descriptions of one terminal device to another.

22270 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

22271 **Issue 6**22272 The following new requirements on POSIX implementations derive from alignment with the
22273 Single UNIX Specification:

- 22274
- The optional setting of *errno* and the [EINVAL] error conditions are added.

22275 **NAME**

22276 chdir — change working directory

22277 **SYNOPSIS**

22278 #include <unistd.h>

22279 int chdir(const char *path);

22280 **DESCRIPTION**

22281 The *chdir()* function shall cause the directory named by the pathname pointed to by the *path*
 22282 argument to become the current working directory; that is, the starting point for path searches
 22283 for pathnames not beginning with '/ '.

22284 **RETURN VALUE**

22285 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned, the current
 22286 working directory shall remain unchanged, and *errno* shall be set to indicate the error.

22287 **ERRORS**22288 The *chdir()* function shall fail if:

22289 [EACCES] Search permission is denied for any component of the pathname.

22290 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*
 22291 argument.

22292 [ENAMETOOLONG]

22293 The length of a component of a pathname is longer than {NAME_MAX}.

22294 [ENOENT] A component of *path* does not name an existing directory or *path* is an empty
 22295 string.

22296 [ENOTDIR] A component of the pathname names an existing file that is neither a directory
 22297 nor a symbolic link to a directory.

22298 The *chdir()* function may fail if:

22299 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
 22300 resolution of the *path* argument.

22301 [ENAMETOOLONG]

22302 The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a
 22303 symbolic link produced an intermediate result with a length that exceeds
 22304 {PATH_MAX}.

22305 **EXAMPLES**22306 **Changing the Current Working Directory**

22307 The following example makes the value pointed to by **directory**, */tmp*, the current working
 22308 directory.

22309 #include <unistd.h>

22310 ...

22311 char *directory = "/tmp";

22312 int ret;

22313 ret = chdir (directory);

22314 **APPLICATION USAGE**

22315 None.

22316 **RATIONALE**22317 The *chdir()* function only affects the working directory of the current process.22318 **FUTURE DIRECTIONS**

22319 None.

22320 **SEE ALSO**22321 *getcwd()*

22322 XBD <unistd.h>

22323 **CHANGE HISTORY**

22324 First released in Issue 1. Derived from Issue 1 of the SVID.

22325 **Issue 6**

22326 The APPLICATION USAGE section is added.

22327 The following new requirements on POSIX implementations derive from alignment with the
22328 Single UNIX Specification:

- 22329 • The [ELOOP] mandatory error condition is added.
- 22330 • A second [ENAMETOOLONG] is added as an optional error condition.

22331 The following changes were made to align with the IEEE P1003.1a draft standard:

- 22332 • The [ELOOP] optional error condition is added.

22333 **Issue 7**

22334 Austin Group Interpretation 1003.1-2001 #143 is applied.

22335 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0047 [324] is applied.

+

22336 **NAME**

22337 chmod, fchmodat — change mode of a file relative to directory file descriptor

22338 **SYNOPSIS**

22339 #include <sys/stat.h>

22340 int chmod(const char *path, mode_t mode);

22341 int fchmodat(int fd, const char *path, mode_t mode, int flag);

22342 **DESCRIPTION**

22343 XSI The *chmod()* function shall change S_ISUID, S_ISGID, S_ISVTX, and the file permission bits of
 22344 the file named by the pathname pointed to by the *path* argument to the corresponding bits in the
 22345 *mode* argument. The application shall ensure that the effective user ID of the process matches the
 22346 owner of the file or the process has appropriate privileges in order to do this.

22347 XSI S_ISUID, S_ISGID, S_ISVTX, and the file permission bits are described in <sys/stat.h>.

22348 If the calling process does not have appropriate privileges, and if the group ID of the file does
 22349 not match the effective group ID or one of the supplementary group IDs and if the file is a
 22350 regular file, bit S_ISGID (set-group-ID on execution) in the file's mode shall be cleared upon
 22351 successful return from *chmod()*.

22352 Additional implementation-defined restrictions may cause the S_ISUID and S_ISGID bits in
 22353 *mode* to be ignored.

22354 Upon successful completion, *chmod()* shall mark for update the last file status change timestamp
 22355 of the file.

22356 The *fchmodat()* function shall be equivalent to the *chmod()* function except in the case where *path*
 22357 specifies a relative path. In this case the file to be changed is determined relative to the directory
 22358 associated with the file descriptor *fd* instead of the current working directory. If the file
 22359 descriptor was opened without O_SEARCH, the function shall check whether directory searches
 22360 are permitted using the current permissions of the directory underlying the file descriptor. If the
 22361 file descriptor was opened with O_SEARCH, the function shall not perform the check.

22362 Values for *flag* are constructed by a bitwise-inclusive OR of flags from the following list, defined
 22363 in <fcntl.h>:

22364 AT_SYMLINK_NOFOLLOW

22365 If *path* names a symbolic link, then the mode of the symbolic link is changed.

22366 If *fchmodat()* is passed the special value AT_FDCWD in the *fd* parameter, the current working
 22367 directory shall be used. If also *flag* is zero, the behavior shall be identical to a call to *chmod()*.

22368 **RETURN VALUE**

22369 Upon successful completion, these functions shall return 0. Otherwise, these functions shall
 22370 return -1 and set *errno* to indicate the error. If -1 is returned, no change to the file mode occurs.

22371 **ERRORS**

22372 These functions shall fail if:

22373 [EACCES] Search permission is denied on a component of the path prefix.

22374 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*
 22375 argument.

22376 [ENAMETOOLONG]

22377 The length of a component of a pathname is longer than {NAME_MAX}.

22378	[ENOENT]	A component of <i>path</i> does not name an existing file or <i>path</i> is an empty string.	
22379	[ENOTDIR]	A component of the <i>path</i> prefix names an existing file that is neither a directory nor a symbolic link to a directory, or the <i>path</i> argument contains at least one non- <code><slash></code> character and ends with one or more trailing <code><slash></code> characters and the last pathname component names an existing file that is neither a directory nor a symbolic link to a directory.	
22380			
22381			
22382			
22383			
22384	[EPERM]	The effective user ID does not match the owner of the file and the process does not have appropriate privileges.	
22385			
22386	[EROFS]	The named file resides on a read-only file system.	
22387	The <i>fchmodat()</i> function shall fail if:		
22388	[EACCES]	<i>fd</i> was not opened with <code>O_SEARCH</code> and the permissions of the directory underlying <i>fd</i> do not permit directory searches.	
22389			
22390	[EBADF]	The <i>path</i> argument does not specify an absolute path and the <i>fd</i> argument is neither <code>AT_FDCWD</code> nor a valid file descriptor open for reading or searching.	
22391			
22392	[ENOTDIR]	The <i>path</i> argument is not an absolute path and <i>fd</i> is a file descriptor associated with a non-directory file.	+
22393			
22394	These functions may fail if:		
22395	[EINTR]	A signal was caught during execution of the function.	
22396	[EINVAL]	The value of the <i>mode</i> argument is invalid.	
22397	[ELOOP]	More than <code>{SYMLOOP_MAX}</code> symbolic links were encountered during resolution of the <i>path</i> argument.	
22398			
22399	[ENAMETOOLONG]	The length of a pathname exceeds <code>{PATH_MAX}</code> , or pathname resolution of a symbolic link produced an intermediate result with a length that exceeds <code>{PATH_MAX}</code> .	
22400			
22401			
22402			
22403	The <i>fchmodat()</i> function may fail if:		
22404	[EINVAL]	The value of the <i>flag</i> argument is invalid.	-
22405	[EOPNOTSUPP]	The <code>AT_SYMLINK_NOFOLLOW</code> bit is set in the <i>flag</i> argument, <i>path</i> names a symbolic link, and the system does not support changing the mode of a symbolic link.	
22406			
22407			

EXAMPLES

Setting Read Permissions for User, Group, and Others

The following example sets read permissions for the owner, group, and others.

```
#include <sys/stat.h>

const char *path;
...
chmod(path, S_IRUSR | S_IRGRP | S_IROTH);
```

Setting Read, Write, and Execute Permissions for the Owner Only

The following example sets read, write, and execute permissions for the owner, and no permissions for group and others.

```
#include <sys/stat.h>

const char *path;
...
chmod(path, S_IRWXU);
```

Setting Different Permissions for Owner, Group, and Other

The following example sets owner permissions for CHANGEFILE to read, write, and execute, group permissions to read and execute, and other permissions to read.

```
#include <sys/stat.h>

#define CHANGEFILE "/etc/myfile"
...
chmod(CHANGEFILE, S_IRWXU|S_IRGRP|S_IXGRP|S_IROTH);
```

Setting and Checking File Permissions

The following example sets the file permission bits for a file named **/home/cnd/mod1**, then calls the *stat()* function to verify the permissions.

```
#include <sys/types.h>
#include <sys/stat.h>

int status;
struct stat buffer
...
chmod("home/cnd/mod1", S_IRWXU|S_IRWXG|S_IROTH|S_IWOTH);
status = stat("home/cnd/mod1", &buffer);
```

APPLICATION USAGE

In order to ensure that the *S_ISUID* and *S_ISGID* bits are set, an application requiring this should use *stat()* after a successful *chmod()* to verify this.

Any file descriptors currently open by any process on the file could possibly become invalid if the mode of the file is changed to a value which would deny access to that process. One situation where this could occur is on a stateless file system. This behavior will not occur in a conforming environment.

RATIONALE

This volume of POSIX.1-2008 specifies that the *S_ISGID* bit is cleared by *chmod()* on a regular file under certain conditions. This is specified on the assumption that regular files may be executed, and the system should prevent users from making executable *setgid()* files perform with privileges that the caller does not have. On implementations that support execution of other file types, the *S_ISGID* bit should be cleared for those file types under the same circumstances.

Implementations that use the *S_ISUID* bit to indicate some other function (for example, mandatory record locking) on non-executable files need not clear this bit on writing. They should clear the bit for executable files and any other cases where the bit grants special powers to processes that change the file contents. Similar comments apply to the *S_ISGID* bit.

The purpose of the *fchmodat()* function is to enable changing the mode of files in directories

other than the current working directory without exposure to race conditions. Any part of the path of a file could be changed in parallel to a call to *chmod()*, resulting in unspecified behavior. By opening a file descriptor for the target directory and using the *fchmodat()* function it can be guaranteed that the changed file is located relative to the desired directory. Some implementations might allow changing the mode of symbolic links. This is not supported by the interfaces in the POSIX specification. Systems with such support provide an interface named *lchmod()*. To support such implementations *fchmodat()* has a *flag* parameter.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include [*<sys/types.h>*](#) has been removed. Although [*<sys/types.h>*](#) was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- The [EINVAL] and [EINTR] optional error conditions are added.
- A second [ENAMETOOLONG] is added as an optional error condition.

The following changes were made to align with the IEEE P1003.1a draft standard:

- The [ELOOP] optional error condition is added.

The normative text is updated to avoid use of the term “must” for application requirements.

Issue 7

Austin Group Interpretation 1003.1-2001 #143 is applied.

The *fchmodat()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 2.

Changes are made related to support for finegrained timestamps.

Changes are made to allow a directory to be opened for searching.

The [ENOTDIR] error condition is clarified to cover the condition where the last component of a pathname exists but is not a directory or a symbolic link to a directory.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0048 [300], XSH/TC1-2008/0049 [461], + XSH/TC1-2008/0050 [324], XSH/TC1-2008/0051 [278], and XSH/TC1-2008/0052 [278] are + applied.

NAME

chown, fchownat — change owner and group of a file relative to directory file descriptor

SYNOPSIS

```
#include <unistd.h>

int chown(const char *path, uid_t owner, gid_t group);
int fchownat(int fd, const char *path, uid_t owner, gid_t group,
             int flag);
```

DESCRIPTION

The *chown()* function shall change the user and group ownership of a file.

The *path* argument points to a pathname naming a file. The user ID and group ID of the named file shall be set to the numeric values contained in *owner* and *group*, respectively.

Only processes with an effective user ID equal to the user ID of the file or with appropriate privileges may change the ownership of a file. If `_POSIX_CHOWN_RESTRICTED` is in effect for *path*:

- Changing the user ID is restricted to processes with appropriate privileges.
- Changing the group ID is permitted to a process with an effective user ID equal to the user ID of the file, but without appropriate privileges, if and only if *owner* is equal to the file's user ID or `(uid_t)-1` and *group* is equal either to the calling process' effective group ID or to one of its supplementary group IDs.

If the specified file is a regular file, one or more of the `S_IXUSR`, `S_IXGRP`, or `S_IXOTH` bits of the file mode are set, and the process does not have appropriate privileges, the set-user-ID (`S_ISUID`) and set-group-ID (`S_ISGID`) bits of the file mode shall be cleared upon successful return from *chown()*. If the specified file is a regular file, one or more of the `S_IXUSR`, `S_IXGRP`, or `S_IXOTH` bits of the file mode are set, and the process has appropriate privileges, it is implementation-defined whether the set-user-ID and set-group-ID bits are altered. If the *chown()* function is successfully invoked on a file that is not a regular file and one or more of the `S_IXUSR`, `S_IXGRP`, or `S_IXOTH` bits of the file mode are set, the set-user-ID and set-group-ID bits may be cleared.

If *owner* or *group* is specified as `(uid_t)-1` or `(gid_t)-1`, respectively, the corresponding ID of the file shall not be changed. If both *owner* and *group* are `-1`, the times need not be updated.

Upon successful completion, *chown()* shall mark for update the last file status change timestamp of the file.

The *fchownat()* function shall be equivalent to the *chown()* and *lchown()* functions except in the case where *path* specifies a relative path. In this case the file to be changed is determined relative to the directory associated with the file descriptor *fd* instead of the current working directory. If the file descriptor was opened without `O_SEARCH`, the function shall check whether directory searches are permitted using the current permissions of the directory underlying the file descriptor. If the file descriptor was opened with `O_SEARCH`, the function shall not perform the check.

Values for *flag* are constructed by a bitwise-inclusive OR of flags from the following list, defined in `<fcntl.h>`:

`AT_SYMLINK_NOFOLLOW`

If *path* names a symbolic link, ownership of the symbolic link is changed.

If *fchownat()* is passed the special value `AT_FDCWD` in the *fd* parameter, the current working directory shall be used and the behavior shall be identical to a call to *chown()* or *lchown()*.

22538 respectively, depending on whether or not the AT_SYMLINK_NOFOLLOW bit is set in the *flag*
 22539 argument.

22540 RETURN VALUE

22541 Upon successful completion, these functions shall return 0. Otherwise, these functions shall
 22542 return -1 and set *errno* to indicate the error. If -1 is returned, no changes are made in the user ID
 22543 and group ID of the file.

22544 ERRORS

22545 These functions shall fail if:

22546 [EACCES] Search permission is denied on a component of the path prefix.

22547 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*
 22548 argument.

22549 [ENAMETOOLONG]

22550 The length of a component of a pathname is longer than {NAME_MAX}.

22551 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.

22552 [ENOTDIR] A component of the path prefix names an existing file that is neither a |
 22553 directory nor a symbolic link to a directory, or the *path* argument contains at
 22554 least one non-*<slash>* character and ends with one or more trailing *<slash>*
 22555 characters and the last pathname component names an existing file that is
 22556 neither a directory nor a symbolic link to a directory.

22557 [EPERM] The effective user ID does not match the owner of the file, or the calling
 22558 process does not have appropriate privileges and
 22559 _POSIX_CHOWN_RESTRICTED indicates that such privilege is required.

22560 [EROFS] The named file resides on a read-only file system.

22561 The *fchownat()* function shall fail if:

22562 [EACCES] *fd* was not opened with O_SEARCH and the permissions of the directory
 22563 underlying *fd* do not permit directory searches.

22564 [EBADF] The *path* argument does not specify an absolute path and the *fd* argument is
 22565 neither AT_FDCWD nor a valid file descriptor open for reading or searching.

22566 [ENOTDIR] The *path* argument is not an absolute path and *fd* is a file descriptor associated +
 22567 with a non-directory file.

22568 These functions may fail if:

22569 [EIO] An I/O error occurred while reading or writing to the file system.

22570 [EINTR] The *chown()* function was interrupted by a signal which was caught.

22571 [EINVAL] The owner or group ID supplied is not a value supported by the
 22572 implementation.

22573 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
 22574 resolution of the *path* argument.

22575 [ENAMETOOLONG]

22576 The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a
 22577 symbolic link produced an intermediate result with a length that exceeds
 22578 {PATH_MAX}.

22579 The *fchownat()* function may fail if:
 22580 [EINVAL] The value of the *flag* argument is not valid. -

22581 EXAMPLES

22582 None.

22583 APPLICATION USAGE

22584 Although *chown()* can be used on some implementations by the file owner to change the owner
 22585 and group to any desired values, the only portable use of this function is to change the group of
 22586 a file to the effective GID of the calling process or to a member of its group set.

22587 RATIONALE

22588 System III and System V allow a user to give away files; that is, the owner of a file may change
 22589 its user ID to anything. This is a serious problem for implementations that are intended to meet
 22590 government security regulations. Version 7 and 4.3 BSD permit only the superuser to change the
 22591 user ID of a file. Some government agencies (usually not ones concerned directly with security)
 22592 find this limitation too confining. This volume of POSIX.1-2008 uses *may* to permit secure
 22593 implementations while not disallowing System V.

22594 System III and System V allow the owner of a file to change the group ID to anything. Version 7
 22595 permits only the superuser to change the group ID of a file. 4.3 BSD permits the owner to
 22596 change the group ID of a file to its effective group ID or to any of the groups in the list of
 22597 supplementary group IDs, but to no others.

22598 The POSIX.1-1990 standard requires that the *chown()* function invoked by a non-appropriate
 22599 privileged process clear the S_ISGID and the S_ISUID bits for regular files, and permits them to
 22600 be cleared for other types of files. This is so that changes in accessibility do not accidentally
 22601 cause files to become security holes. Unfortunately, requiring these bits to be cleared on non-
 22602 executable data files also clears the mandatory file locking bit (shared with S_ISGID), which is
 22603 an extension on many implementations (it first appeared in System V). These bits should only be
 22604 required to be cleared on regular files that have one or more of their execute bits set.

22605 The purpose of the *fchownat()* function is to enable changing ownership of files in directories
 22606 other than the current working directory without exposure to race conditions. Any part of the
 22607 path of a file could be changed in parallel to a call to *chown()* or *lchown()*, resulting in
 22608 unspecified behavior. By opening a file descriptor for the target directory and using the
 22609 *fchownat()* function it can be guaranteed that the changed file is located relative to the desired
 22610 directory.

22611 FUTURE DIRECTIONS

22612 None.

22616 CHANGE HISTORY

22617 First released in Issue 1. Derived from Issue 1 of the SVID.

22618 Issue 6

22619 The following changes are made for alignment with the ISO POSIX-1:1996 standard:

- 22620 • The wording describing the optional dependency on `_POSIX_CHOWN_RESTRICTED` is
- 22621 restored.

- The [EPERM] error is restored as an error dependent on _POSIX_CHOWN_RESTRICTED. This is since its operand is a pathname and applications should be aware that the error may not occur for that pathname if the file system does not support _POSIX_CHOWN_RESTRICTED.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- The value for *owner* of `(uid_t)-1` allows the use of `-1` by the owner of a file to change the group ID only. A corresponding change is made for group.
- The [ELOOP] mandatory error condition is added.
- The [EIO] and [EINTR] optional error conditions are added.
- A second [ENAMETOOLONG] is added as an optional error condition.

The following changes were made to align with the IEEE P1003.1a draft standard:

- Clarification is added that the `S_ISUID` and `S_ISGID` bits do not need to be cleared when the process has appropriate privileges.
- The [ELOOP] optional error condition is added.

Issue 7

Austin Group Interpretation 1003.1-2001 #143 is applied.

The `fchownat()` function is added from The Open Group Technical Standard, 2006, Extended API Set Part 2.

Changes are made related to support for finegrained timestamps.

Changes are made to allow a directory to be opened for searching.

The [ENOTDIR] error condition is clarified to cover the condition where the last component of a pathname exists but is not a directory or a symbolic link to a directory.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0053 [461], XSH/TC1-2008/0054 [324], + XSH/TC1-2008/0055 [278], and XSH/TC1-2008/0056 [278] are applied.

22650 NAME

22651 cimag, cimagf, cimagl — complex imaginary functions

22652 SYNOPSIS

```
22653 #include <complex.h>
22654 double cimag(double complex z);
22655 float cimagf(float complex z);
22656 long double cimagl(long double complex z);
```

22657 DESCRIPTION

22658 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 22659 conflict between the requirements described here and the ISO C standard is unintentional. This
 22660 volume of POSIX.1-2008 defers to the ISO C standard.

22661 These functions shall compute the imaginary part of *z*.

22662 RETURN VALUE

22663 These functions shall return the imaginary part value (as a real).

22664 ERRORS

22665 No errors are defined.

22666 EXAMPLES

22667 None.

22668 APPLICATION USAGE

22669 For a variable *z* of complex type:

```
22670 z == creal(z) + cimag(z)*I
```

22671 RATIONALE

22672 None.

22673 FUTURE DIRECTIONS

22707 First released in Issue 1. Derived from Issue 1 of the SVID.

22708 **Issue 7**

22709 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0057 [401] is applied. +

22710 **NAME**

22711 clock — report CPU time used

22712 **SYNOPSIS**

22713 #include <time.h>

22714 clock_t clock(void);

22715 **DESCRIPTION**

22716 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 22717 conflict between the requirements described here and the ISO C standard is unintentional. This
 22718 volume of POSIX.1-2008 defers to the ISO C standard.

22719 The *clock()* function shall return the implementation's best approximation to the processor time
 22720 used by the process since the beginning of an implementation-defined era related only to the
 22721 process invocation.

22722 **RETURN VALUE**

22723 To determine the time in seconds, the value returned by *clock()* should be divided by the value
 22724 XSI of the macro CLOCKS_PER_SEC. CLOCKS_PER_SEC is defined to be one million in <time.h>.
 22725 If the processor time used is not available or its value cannot be represented, the function shall
 22726 return the value (clock_t)−1.

22727 **ERRORS**

22728 No errors are defined.

22729 **EXAMPLES**

22730 None.

22731 **APPLICATION USAGE**

22732 In order to measure the time spent in a program, *clock()* should be called at the start of the
 22733 program and its return value subtracted from the value returned by subsequent calls. The value
 22734 returned by *clock()* is defined for compatibility across systems that have clocks with different
 22735 resolutions. The resolution on any particular system need not be to microsecond accuracy.

22736 The value returned by *clock()* may wrap around on some implementations. For example, on a
 22737 machine with 32-bit values for **clock_t**, it wraps after 2 147 seconds or 36 minutes.

22738 **RATIONALE**

22739 None.

22740 **FUTURE DIRECTIONS**

22741 None.

NAME

clock_getcpuclockid — access a process CPU-time clock (**ADVANCED REALTIME**)

SYNOPSIS

```
#include <time.h>

int clock_getcpuclockid(pid_t pid, clockid_t *clock_id);
```

DESCRIPTION

The *clock_getcpuclockid()* function shall return the clock ID of the CPU-time clock of the process specified by *pid*. If the process described by *pid* exists and the calling process has permission, the clock ID of this clock shall be returned in *clock_id*.

If *pid* is zero, the *clock_getcpuclockid()* function shall return the clock ID of the CPU-time clock of the process making the call, in *clock_id*.

The conditions under which one process has permission to obtain the CPU-time clock ID of other processes are implementation-defined.

RETURN VALUE

Upon successful completion, *clock_getcpuclockid()* shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *clock_getcpuclockid()* function shall fail if:

[EPERM] The requesting process does not have permission to access the CPU-time clock for the process.

The *clock_getcpuclockid()* function may fail if:

[ESRCH] No process can be found corresponding to the process specified by *pid*.

EXAMPLES

None.

APPLICATION USAGE

The *clock_getcpuclockid()* function is part of the Process CPU-Time Clocks option and need not be provided on all implementations.

RATIONALE

None.

FUTURE DIRECTIONS

None.

clock_getres(), *timer_create()*

XBD **<time.h>**

CHANGE HISTORY

First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

In the SYNOPSIS, the inclusion of **<sys/types.h>** is no longer required.

22784 **NAME**

22785 clock_getres, clock_gettime, clock_settime — clock and timer functions

22786 **SYNOPSIS**

```

22787 CX    #include <time.h>
22788
22788     int clock_getres(clockid_t clock_id, struct timespec *res);
22789     int clock_gettime(clockid_t clock_id, struct timespec *tp);
22790     int clock_settime(clockid_t clock_id, const struct timespec *tp);

```

22791 **DESCRIPTION**

22792 The *clock_getres()* function shall return the resolution of any clock. Clock resolutions are
 22793 implementation-defined and cannot be set by a process. If the argument *res* is not NULL, the
 22794 resolution of the specified clock shall be stored in the location pointed to by *res*. If *res* is NULL,
 22795 the clock resolution is not returned. If the *time* argument of *clock_settime()* is not a multiple of *res*,
 22796 then the value is truncated to a multiple of *res*.

22797 The *clock_gettime()* function shall return the current value *tp* for the specified clock, *clock_id*.

22798 The *clock_settime()* function shall set the specified clock, *clock_id*, to the value specified by *tp*.
 22799 Time values that are between two consecutive non-negative integer multiples of the resolution of
 22800 the specified clock shall be truncated down to the smaller multiple of the resolution.

22801 A clock may be system-wide (that is, visible to all processes) or per-process (measuring time that
 22802 is meaningful only within a process). All implementations shall support a *clock_id* of
 22803 CLOCK_REALTIME as defined in **<time.h>**. This clock represents the clock measuring real time
 22804 for the system. For this clock, the values returned by *clock_gettime()* and specified by
 22805 *clock_settime()* represent the amount of time (in seconds and nanoseconds) since the Epoch. An
 22806 implementation may also support additional clocks. The interpretation of time values for these
 22807 clocks is unspecified.

22808 If the value of the CLOCK_REALTIME clock is set via *clock_settime()*, the new value of the clock
 22809 shall be used to determine the time of expiration for absolute time services based upon the
 22810 CLOCK_REALTIME clock. This applies to the time at which armed absolute timers expire. If the
 22811 absolute time requested at the invocation of such a time service is before the new value of the
 22812 clock, the time service shall expire immediately as if the clock had reached the requested time
 22813 normally.

22814 Setting the value of the CLOCK_REALTIME clock via *clock_settime()* shall have no effect on
 22815 threads that are blocked waiting for a relative time service based upon this clock, including the
 22816 *nanosleep()* function; nor on the expiration of relative timers based upon this clock.
 22817 Consequently, these time services shall expire when the requested relative interval elapses,
 22818 independently of the new or old value of the clock.

22819 MON If the Monotonic Clock option is supported, all implementations shall support a *clock_id* of
 22820 CLOCK_MONOTONIC defined in **<time.h>**. This clock represents the monotonic clock for the
 22821 system. For this clock, the value returned by *clock_gettime()* represents the amount of time (in
 22822 seconds and nanoseconds) since an unspecified point in the past (for example, system start-up
 22823 time, or the Epoch). This point does not change after system start-up time. The value of the
 22824 CLOCK_MONOTONIC clock cannot be set via *clock_settime()*. This function shall fail if it is
 22825 invoked with a *clock_id* argument of CLOCK_MONOTONIC.

22826 The effect of setting a clock via *clock_settime()* on armed per-process timers associated with a
 22827 clock other than CLOCK_REALTIME is implementation-defined.

22828 If the value of the CLOCK_REALTIME clock is set via *clock_settime()*, the new value of the clock
 22829 shall be used to determine the time at which the system shall awaken a thread blocked on an

absolute *clock_nanosleep()* call based upon the CLOCK_REALTIME clock. If the absolute time requested at the invocation of such a time service is before the new value of the clock, the call shall return immediately as if the clock had reached the requested time normally.

Setting the value of the CLOCK_REALTIME clock via *clock_settime()* shall have no effect on any thread that is blocked on a relative *clock_nanosleep()* call. Consequently, the call shall return when the requested relative interval elapses, independently of the new or old value of the clock.

Appropriate privileges to set a particular clock are implementation-defined.

CPT If `_POSIX_CPUTIME` is defined, implementations shall support clock ID values obtained by invoking *clock_getcpuclockid()*, which represent the CPU-time clock of a given process. Implementations shall also support the special `clockid_t` value `CLOCK_PROCESS_CPUTIME_ID`, which represents the CPU-time clock of the calling process when invoking one of the *clock_**() or *timer_**() functions. For these clock IDs, the values returned by *clock_gettime()* and specified by *clock_settime()* represent the amount of execution time of the process associated with the clock. Changing the value of a CPU-time clock via *clock_settime()* shall have no effect on the behavior of the sporadic server scheduling policy (see [Scheduling Policies](#)).

TCT If `_POSIX_THREAD_CPUTIME` is defined, implementations shall support clock ID values obtained by invoking *pthread_getcpuclockid()*, which represent the CPU-time clock of a given thread. Implementations shall also support the special `clockid_t` value `CLOCK_THREAD_CPUTIME_ID`, which represents the CPU-time clock of the calling thread when invoking one of the *clock_**() or *timer_**() functions. For these clock IDs, the values returned by *clock_gettime()* and specified by *clock_settime()* shall represent the amount of execution time of the thread associated with the clock. Changing the value of a CPU-time clock via *clock_settime()* shall have no effect on the behavior of the sporadic server scheduling policy (see [Scheduling Policies](#)).

22855 RETURN VALUE

A return value of 0 shall indicate that the call succeeded. A return value of -1 shall indicate that an error occurred, and *errno* shall be set to indicate the error.

22858 ERRORS

The *clock_getres()*, *clock_gettime()*, and *clock_settime()* functions shall fail if:

[EINVAL] The *clock_id* argument does not specify a known clock.

The *clock_gettime()* function shall fail if: +

[EOVERFLOW] The number of seconds will not fit in an object of type `time_t`. +

The *clock_settime()* function shall fail if:

[EINVAL] The *tp* argument to *clock_settime()* is outside the range for the given clock ID.

[EINVAL] The *tp* argument specified a nanosecond value less than zero or greater than or equal to 1 000 million.

MON [EINVAL] The value of the *clock_id* argument is `CLOCK_MONOTONIC`.

The *clock_settime()* function may fail if:

[EPERM] The requesting process does not have appropriate privileges to set the specified clock.

EXAMPLES

None.

APPLICATION USAGE

Note that the absolute value of the monotonic clock is meaningless (because its origin is arbitrary), and thus there is no need to set it. Furthermore, realtime applications can rely on the fact that the value of this clock is never set and, therefore, that time intervals measured with this clock will not be affected by calls to *clock_settime()*.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Timers option.

The APPLICATION USAGE section is added.

The following changes were made to align with the IEEE P1003.1a draft standard:

- Clarification is added of the effect of resetting the clock resolution.

CPU-time clocks and the *clock_getcpuclockid()* function are added for alignment with IEEE Std 1003.1d-1999.

The following changes are added for alignment with IEEE Std 1003.1j-2000:

- The DESCRIPTION is updated as follows:
 - The value returned by *clock_gettime()* for CLOCK_MONOTONIC is specified.
 - The *clock_settime()* function failing for CLOCK_MONOTONIC is specified.
 - The effects of *clock_settime()* on the *clock_nanosleep()* function with respect to CLOCK_REALTIME are specified.
- An [EINVAL] error is added to the ERRORS section, indicating that *clock_settime()* fails for CLOCK_MONOTONIC.
- The APPLICATION USAGE section notes that the CLOCK_MONOTONIC clock need not and shall not be set by *clock_settime()* since the absolute value of the CLOCK_MONOTONIC clock is meaningless.
- The *clock_nanosleep()*, *mq_timedreceive()*, *mq_timedsend()*, *pthread_mutex_timedlock()*, *sem_timedwait()*, *timer_create()*, and *timer_settime()* functions are added to the SEE ALSO section.

22911	Issue 7	
22912	Functionality relating to the Clock Selection option is moved to the Base.	
22913	The <i>clock_getres()</i> , <i>clock_gettime()</i> , and <i>clock_settime()</i> functions are moved from the Timers	
22914	option to the Base.	
22915	POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0058 [106] is applied.	+

NAME

clock_nanosleep — high resolution sleep with specifiable clock

SYNOPSIS

```
#include <time.h>

int clock_nanosleep(clockid_t clock_id, int flags,
    const struct timespec *rqtp, struct timespec *rmtp);
```

DESCRIPTION

If the flag `TIMER_ABSTIME` is not set in the *flags* argument, the *clock_nanosleep()* function shall cause the current thread to be suspended from execution until either the time interval specified by the *rqtp* argument has elapsed, or a signal is delivered to the calling thread and its action is to invoke a signal-catching function, or the process is terminated. The clock used to measure the time shall be the clock specified by *clock_id*.

If the flag `TIMER_ABSTIME` is set in the *flags* argument, the *clock_nanosleep()* function shall cause the current thread to be suspended from execution until either the time value of the clock specified by *clock_id* reaches the absolute time specified by the *rqtp* argument, or a signal is delivered to the calling thread and its action is to invoke a signal-catching function, or the process is terminated. If, at the time of the call, the time value specified by *rqtp* is less than or equal to the time value of the specified clock, then *clock_nanosleep()* shall return immediately and the calling process shall not be suspended.

The suspension time caused by this function may be longer than requested because the argument value is rounded up to an integer multiple of the sleep resolution, or because of the scheduling of other activity by the system. But, except for the case of being interrupted by a signal, the suspension time for the relative *clock_nanosleep()* function (that is, with the `TIMER_ABSTIME` flag not set) shall not be less than the time interval specified by *rqtp*, as measured by the corresponding clock. The suspension for the absolute *clock_nanosleep()* function (that is, with the `TIMER_ABSTIME` flag set) shall be in effect at least until the value of the corresponding clock reaches the absolute time specified by *rqtp*, except for the case of being interrupted by a signal.

The use of the *clock_nanosleep()* function shall have no effect on the action or blockage of any signal.

The *clock_nanosleep()* function shall fail if the *clock_id* argument refers to the CPU-time clock of the calling thread. It is unspecified whether *clock_id* values of other CPU-time clocks are allowed.

RETURN VALUE

If the *clock_nanosleep()* function returns because the requested time has elapsed, its return value shall be zero.

If the *clock_nanosleep()* function returns because it has been interrupted by a signal, it shall return the corresponding error value. For the relative *clock_nanosleep()* function, if the *rmtp* argument is non-NULL, the **timespec** structure referenced by it shall be updated to contain the amount of time remaining in the interval (the requested time minus the time actually slept). If the *rmtp* argument is NULL, the remaining time is not returned. The absolute *clock_nanosleep()* function has no effect on the structure referenced by *rmtp*.

If *clock_nanosleep()* fails, it shall return the corresponding error value.

ERRORS

The *clock_nanosleep()* function shall fail if:

- [EINTR] The *clock_nanosleep()* function was interrupted by a signal.
- [EINVAL] The *rqt* argument specified a nanosecond value less than zero or greater than or equal to 1 000 million; or the *TIMER_ABSTIME* flag was specified in *flags* and the *rqt* argument is outside the range for the clock specified by *clock_id*; or the *clock_id* argument does not specify a known clock, or specifies the CPU-time clock of the calling thread.
- [ENOTSUP] The *clock_id* argument specifies a clock for which *clock_nanosleep()* is not supported, such as a CPU-time clock.

EXAMPLES

None.

APPLICATION USAGE

Calling *clock_nanosleep()* with the value *TIMER_ABSTIME* not set in the *flags* argument and with a *clock_id* of *CLOCK_REALTIME* is equivalent to calling *nanosleep()* with the same *rqt* and *rmt* arguments.

RATIONALE

The *nanosleep()* function specifies that the system-wide clock *CLOCK_REALTIME* is used to measure the elapsed time for this time service. However, with the introduction of the monotonic clock *CLOCK_MONOTONIC* a new relative sleep function is needed to allow an application to take advantage of the special characteristics of this clock.

There are many applications in which a process needs to be suspended and then activated multiple times in a periodic way; for example, to poll the status of a non-interrupting device or to refresh a display device. For these cases, it is known that precise periodic activation cannot be achieved with a relative *sleep()* or *nanosleep()* function call. Suppose, for example, a periodic process that is activated at time *T0*, executes for a while, and then wants to suspend itself until time *T0+T*, the period being *T*. If this process wants to use the *nanosleep()* function, it must first call *clock_gettime()* to get the current time, then calculate the difference between the current time and *T0+T* and, finally, call *nanosleep()* using the computed interval. However, the process could be preempted by a different process between the two function calls, and in this case the interval computed would be wrong; the process would wake up later than desired. This problem would not occur with the absolute *clock_nanosleep()* function, since only one function call would be necessary to suspend the process until the desired time. In other cases, however, a relative sleep is needed, and that is why both functionalities are required.

Although it is possible to implement periodic processes using the timers interface, this implementation would require the use of signals, and the reservation of some signal numbers. In this regard, the reasons for including an absolute version of the *clock_nanosleep()* function in POSIX.1-2008 are the same as for the inclusion of the relative *nanosleep()*.

It is also possible to implement precise periodic processes using *pthread_cond_timedwait()*, in which an absolute timeout is specified that takes effect if the condition variable involved is never signaled. However, the use of this interface is unnatural, and involves performing other operations on mutexes and condition variables that imply an unnecessary overhead. Furthermore, *pthread_cond_timedwait()* is not available in implementations that do not support threads.

Although the interface of the relative and absolute versions of the new high resolution sleep service is the same *clock_nanosleep()* function, the *rmt* argument is only used in the relative sleep. This argument is needed in the relative *clock_nanosleep()* function to reissue the function

23005 call if it is interrupted by a signal, but it is not needed in the absolute *clock_nanosleep()* function
23006 call; if the call is interrupted by a signal, the absolute *clock_nanosleep()* function can be invoked
23007 again with the same *rqtp* argument used in the interrupted call.

23008 **FUTURE DIRECTIONS**

23009 None.

23014 First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

23015 **Issue 7**

23016 The *clock_nanosleep()* function is moved from the Clock Selection option to the Base.

23017 **NAME**

23018 clock_settime — clock and timer functions

23019 **SYNOPSIS**

```
23020 CX      #include <time.h>
23021          int clock_settime(clockid_t clock_id, const struct timespec *tp);
```

23022 **DESCRIPTION**23023 Refer to *clock_getres()*.

23024 **NAME**

23025 clog, clogf, clogl — complex natural logarithm functions

23026 **SYNOPSIS**

```
23027 #include <complex.h>
23028 double complex clog(double complex z);
23029 float complex clogf(float complex z);
23030 long double complex clogl(long double complex z);
```

23031 **DESCRIPTION**

23032 CX The functionality described on this reference page is aligned with the ISO C standard. Any
23033 conflict between the requirements described here and the ISO C standard is unintentional. This
23034 volume of POSIX.1-2008 defers to the ISO C standard.

23035 These functions shall compute the complex natural (base e) logarithm of z , with a branch cut
23036 along the negative real axis.

23037 **RETURN VALUE**

23038 These functions shall return the complex natural logarithm value, in the range of a strip
23039 mathematically unbounded along the real axis and in the interval $[-i\pi, +i\pi]$ along the imaginary
23040 axis.

23041 **ERRORS**

23056 **NAME**

23057 close — close a file descriptor

23058 **SYNOPSIS**

23059 #include <unistd.h>

23060 int close(int *fildes*);23061 **DESCRIPTION**

23062 The *close()* function shall deallocate the file descriptor indicated by *fildes*. To deallocate means to
 23063 make the file descriptor available for return by subsequent calls to *open()* or other functions that
 23064 allocate file descriptors. All outstanding record locks owned by the process on the file associated
 23065 with the file descriptor shall be removed (that is, unlocked).

23066 If *close()* is interrupted by a signal that is to be caught, it shall return -1 with *errno* set to [EINTR]
 23067 and the state of *fildes* is unspecified. If an I/O error occurred while reading from or writing to
 23068 the file system during *close()*, it may return -1 with *errno* set to [EIO]; if this error is returned, the
 23069 state of *fildes* is unspecified.

23070 When all file descriptors associated with a pipe or FIFO special file are closed, any data
 23071 remaining in the pipe or FIFO shall be discarded.

23072 When all file descriptors associated with an open file description have been closed, the open file
 23073 description shall be freed.

23074 If the link count of the file is 0, when all file descriptors associated with the file are closed, the
 23075 space occupied by the file shall be freed and the file shall no longer be accessible.

23076 OB XSR If a STREAMS-based *fildes* is closed and the calling process was previously registered to receive
 23077 a SIGPOLL signal for events associated with that STREAM, the calling process shall be
 23078 unregistered for events associated with the STREAM. The last *close()* for a STREAM shall cause
 23079 the STREAM associated with *fildes* to be dismantled. If O_NONBLOCK is not set and there have
 23080 been no signals posted for the STREAM, and if there is data on the module's write queue, *close()*
 23081 shall wait for an unspecified time (for each module and driver) for any output to drain before
 23082 dismantling the STREAM. The time delay can be changed via an I_SETCLTIME *ioctl()* request. If
 23083 the O_NONBLOCK flag is set, or if there are any pending signals, *close()* shall not wait for
 23084 output to drain, and shall dismantle the STREAM immediately.

23085 If the implementation supports STREAMS-based pipes, and *fildes* is associated with one end of a
 23086 pipe, the last *close()* shall cause a hangup to occur on the other end of the pipe. In addition, if the
 23087 other end of the pipe has been named by *fattach()*, then the last *close()* shall force the named end
 23088 to be detached by *fdetach()*. If the named end has no open file descriptors associated with it and
 23089 gets detached, the STREAM associated with that end shall also be dismantled.

23090 XSI If *fildes* refers to the master side of a pseudo-terminal, and this is the last close, a SIGHUP signal
 23091 shall be sent to the controlling process, if any, for which the slave side of the pseudo-terminal is
 23092 the controlling terminal. It is unspecified whether closing the master side of the pseudo-terminal
 23093 flushes all queued input and output.

23094 OB XSR If *fildes* refers to the slave side of a STREAMS-based pseudo-terminal, a zero-length message
 23095 may be sent to the master.

23096 When there is an outstanding cancelable asynchronous I/O operation against *fildes* when *close()*
 23097 is called, that I/O operation may be canceled. An I/O operation that is not canceled completes
 23098 as if the *close()* operation had not yet occurred. All operations that are not canceled shall
 23099 complete as if the *close()* blocked until the operations completed. The *close()* operation itself
 23100 need not block awaiting such I/O completion. Whether any I/O operation is canceled, and
 23101 which I/O operation may be canceled upon *close()*, is implementation-defined.

23102 SHM If a memory mapped file or a shared memory object remains referenced at the last close (that is,
 23103 a process has it mapped), then the entire contents of the memory object shall persist until the
 23104 SHM memory object becomes unreferenced. If this is the last close of a memory mapped file or a
 23105 shared memory object and the close results in the memory object becoming unreferenced, and
 23106 the memory object has been unlinked, then the memory object shall be removed.

23107 If *fildest* refers to a socket, *close()* shall cause the socket to be destroyed. If the socket is in
 23108 connection-mode, and the `SO_LINGER` option is set for the socket with non-zero linger time,
 23109 and the socket has untransmitted data, then *close()* shall block for up to the current linger
 23110 interval until all data is transmitted.

23111 RETURN VALUE

23112 Upon successful completion, 0 shall be returned; otherwise, -1 shall be returned and *errno* set to
 23113 indicate the error.

23114 ERRORS

23115 The *close()* function shall fail if:

23116 [EBADF] The *fildest* argument is not a open file descriptor. |

23117 [EINTR] The *close()* function was interrupted by a signal.

23118 The *close()* function may fail if:

23119 [EIO] An I/O error occurred while reading from or writing to the file system.

23120 EXAMPLES

23121 Reassigning a File Descriptor

23122 The following example closes the file descriptor associated with standard output for the current
 23123 process, re-assigns standard output to a new file descriptor, and closes the original file descriptor
 23124 to clean up. This example assumes that the file descriptor 0 (which is the descriptor for standard
 23125 input) is not closed.

```
23126 #include <unistd.h>
23127 ...
23128 int pfd;
23129 ...
23130 close(1);
23131 dup(pfd);
23132 close(pfd);
23133 ...
```

23134 Incidentally, this is exactly what could be achieved using:

```
23135 dup2(pfd, 1);
23136 close(pfd);
```

Closing a File Descriptor

In the following example, *close()* is used to close a file descriptor after an unsuccessful attempt is made to associate that file descriptor with a stream.

```
#include <stdio.h>
#include <unistd.h>
#include <stdlib.h>

#define LOCKFILE "/etc/ptmp"
...
int pfd;
FILE *fpfd;
...
if ((fpfd = fdopen (pfd, "w")) == NULL) {
    close(pfd);
    unlink(LOCKFILE);
    exit(1);
}
...
```

APPLICATION USAGE

An application that had used the *stdio* routine *fopen()* to open a file should use the corresponding *fclose()* routine rather than *close()*. Once a file is closed, the file descriptor no longer exists, since the integer corresponding to it no longer refers to a file.

Implementations may use file descriptors that must be inherited into child processes for the child process to remain conforming, such as for message catalog or tracing purposes. Therefore, an application that calls *close()* on an arbitrary integer risks non-conforming behavior, and *close()* can only portably be used on file descriptor values that the application has obtained through explicit actions, as well as the three file descriptors corresponding to the standard file streams. In multi-threaded parent applications, the practice of calling *close()* in a loop after *fork()* and before an *exec* call in order to avoid a race condition of leaking an unintended file descriptor into a child process, is therefore unsafe, and the race should instead be combatted by opening all file descriptors with the FD_CLOEXEC bit set unless the file descriptor is intended to be inherited across *exec*.

RATIONALE

The use of interruptible device close routines should be discouraged to avoid problems with the implicit closes of file descriptors by *exec* and *exit()*. This volume of POSIX.1-2008 only intends to permit such behavior by specifying the [EINTR] error condition.

Note that the requirement for *close()* on a socket to block for up to the current linger interval is not conditional on the O_NONBLOCK setting.

The standard developers rejected a proposal to add *closefrom()* to the standard. Because the standard permits implementations to use inherited file descriptors as a means of providing a conforming environment for the child process, it is not possible to standardize an interface that closes arbitrary file descriptors above a certain value while still guaranteeing a conforming environment.

FUTURE DIRECTIONS

None.

23181 **SEE ALSO**23182 Section 2.6 (on page 499), *exec*, *fattach()*, *fclose()*, *fdetach()*, *fopen()*, *ioctl()*, *open()*, *unlink()*

23183 XBD <unistd.h>

23184 **CHANGE HISTORY**

23185 First released in Issue 1. Derived from Issue 1 of the SVID.

23186 **Issue 5**

23187 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension.

23188 **Issue 6**23189 The DESCRIPTION related to a STREAMS-based file or pseudo-terminal is marked as part of
23190 the XSI STREAMS Option Group.23191 The following new requirements on POSIX implementations derive from alignment with the
23192 Single UNIX Specification:

- 23193 • The [EIO] error condition is added as an optional error.
- 23194 • The DESCRIPTION is updated to describe the state of the *fildes* file descriptor as
23195 unspecified if an I/O error occurs and an [EIO] error condition is returned.

23196 Text referring to sockets is added to the DESCRIPTION.

23197 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that
23198 shared memory objects and memory mapped files (and not typed memory objects) are the types
23199 of memory objects to which the paragraph on last closes applies.

23200 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/12 is applied, correcting the XSH shaded
23201 text relating to the master side of a pseudo-terminal. The reason for the change is that the
23202 behavior of pseudo-terminals and regular terminals should be as much alike as possible in this
23203 case; the change achieves that and matches historical behavior.

23204 **Issue 7**

23205 Functionality relating to the XSI STREAMS option is marked obsolescent.

23206 Functionality relating to the Asynchronous Input and Output and Memory Mapped Files
23207 options is moved to the Base.

23208 Austin Group Interpretation 1003.1-2001 #139 is applied, clarifying that the requirement for
23209 *close()* on a socket to block for up to the current linger interval is not conditional on the
23210 O_NONBLOCK setting.

23211 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0059 [419], XSH/TC1-2008/0060 [149], +
23212 and XSH/TC1-2008/0061 [149] are applied.

23213 **NAME**

23214 closedir — close a directory stream

23215 **SYNOPSIS**

23216 #include <dirent.h>

23217 int closedir(DIR *dirp);

23218 **DESCRIPTION**

23219 The *closedir()* function shall close the directory stream referred to by the argument *dirp*. Upon
 23220 return, the value of *dirp* may no longer point to an accessible object of the type **DIR**. If a file
 23221 descriptor is used to implement type **DIR**, that file descriptor shall be closed.

23222 **RETURN VALUE**

23223 Upon successful completion, *closedir()* shall return 0; otherwise, -1 shall be returned and *errno*
 23224 set to indicate the error.

23225 **ERRORS**23226 The *closedir()* function may fail if:

23227 [EBADF] The *dirp* argument does not refer to an open directory stream.

23228 [EINTR] The *closedir()* function was interrupted by a signal.

23229 **EXAMPLES**23230 **Closing a Directory Stream**23231 The following program fragment demonstrates how the *closedir()* function is used.

```

23232       ...
23233       DIR *dir;
23234       struct dirent *dp;
23235       ...
23236       if ((dir = opendir(".")) == NULL) {
23237       ...
23238       }
23239       while ((dp = readdir (dir)) != NULL) {
23240       ...
23241       }
23242       closedir(dir);
23243       ...

```

23244 **APPLICATION USAGE**

23245 None.

23246 **RATIONALE**

23247 None.

23248 **FUTURE DIRECTIONS**

23249 None.

23250 **SEE ALSO**23251 *dirfd()*, *fdopendir()*

23252 XBD <dirent.h>

23253 **CHANGE HISTORY**

23254 First released in Issue 2.

23255 **Issue 6**23256 In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.23257 The following new requirements on POSIX implementations derive from alignment with the
23258 Single UNIX Specification:

- 23259 • The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was
23260 required for conforming implementations of previous POSIX specifications, it was not
23261 required for UNIX applications.
- 23262 • The [EINTR] error condition is added as an optional error condition.

NAME

closelog, openlog, setlogmask, syslog — control system log

SYNOPSIS

```
XSI    #include <syslog.h>

void closelog(void);
void openlog(const char *ident, int logopt, int facility);
int setlogmask(int maskpri);
void syslog(int priority, const char *message, ... /* arguments */);
```

DESCRIPTION

The *syslog()* function shall send a message to an implementation-defined logging facility, which may log it in an implementation-defined system log, write it to the system console, forward it to a list of users, or forward it to the logging facility on another host over the network. The logged message shall include a message header and a message body. The message header contains at least a timestamp and a tag string.

The message body is generated from the *message* and following arguments in the same manner as if these were arguments to *printf()*, except that the additional conversion specification *%m* shall be recognized; it shall convert no arguments, shall cause the output of the error message string associated with the value of *errno* on entry to *syslog()*, and may be mixed with argument specifications of the "*%n\$*" form. If a complete conversion specification with the *m* conversion specifier character is not just *%m*, the behavior is undefined. A trailing <newline> may be added if needed.

Values of the *priority* argument are formed by OR'ing together a severity-level value and an optional facility value. If no facility value is specified, the current default facility value is used.

Possible values of severity level include:

LOG_EMERG	A panic condition.
LOG_ALERT	A condition that should be corrected immediately, such as a corrupted system database.
LOG_CRIT	Critical conditions, such as hard device errors.
LOG_ERR	Errors.
LOG_WARNING	Warning messages.
LOG_NOTICE	Conditions that are not error conditions, but that may require special handling.
LOG_INFO	Informational messages.
LOG_DEBUG	Messages that contain information normally of use only when debugging a program.

The facility indicates the application or system component generating the message. Possible facility values include:

LOG_USER	Messages generated by arbitrary processes. This is the default facility identifier if none is specified.
LOG_LOCAL0	Reserved for local use.

23304	LOG_LOCAL1	Reserved for local use.
23305	LOG_LOCAL2	Reserved for local use.
23306	LOG_LOCAL3	Reserved for local use.
23307	LOG_LOCAL4	Reserved for local use.
23308	LOG_LOCAL5	Reserved for local use.
23309	LOG_LOCAL6	Reserved for local use.
23310	LOG_LOCAL7	Reserved for local use.
23311	The <i>openlog()</i> function shall set process attributes that affect subsequent calls to <i>syslog()</i> . The	
23312	<i>ident</i> argument is a string that is prepended to every message. The <i>logopt</i> argument indicates	
23313	logging options. Values for <i>logopt</i> are constructed by a bitwise-inclusive OR of zero or more of	
23314	the following:	
23315	LOG_PID	Log the process ID with each message. This is useful for identifying specific
23316		processes.
23317	LOG_CONS	Write messages to the system console if they cannot be sent to the logging
23318		facility. The <i>syslog()</i> function ensures that the process does not acquire the
23319		console as a controlling terminal in the process of writing the message.
23320	LOG_NDELAY	Open the connection to the logging facility immediately. Normally the open is
23321		delayed until the first message is logged. This is useful for programs that need
23322		to manage the order in which file descriptors are allocated.
23323	LOG_ODELAY	Delay open until <i>syslog()</i> is called.
23324	LOG_NOWAIT	Do not wait for child processes that may have been created during the course
23325		of logging the message. This option should be used by processes that enable
23326		notification of child termination using SIGCHLD, since <i>syslog()</i> may
23327		otherwise block waiting for a child whose exit status has already been
23328		collected.
23329	The <i>facility</i> argument encodes a default facility to be assigned to all messages that do not have an	
23330	explicit facility already encoded. The initial default facility is LOG_USER.	
23331	The <i>openlog()</i> and <i>syslog()</i> functions may allocate a file descriptor. It is not necessary to call	
23332	<i>openlog()</i> prior to calling <i>syslog()</i> .	
23333	The <i>closelog()</i> function shall close any open file descriptors allocated by previous calls to	
23334	<i>openlog()</i> or <i>syslog()</i> .	
23335	The <i>setlogmask()</i> function shall set the log priority mask for the current process to <i>maskpri</i> and	
23336	return the previous mask. If the <i>maskpri</i> argument is 0, the current log mask is not modified.	
23337	Calls by the current process to <i>syslog()</i> with a priority not set in <i>maskpri</i> shall be rejected. The	
23338	default log mask allows all priorities to be logged. A call to <i>openlog()</i> is not required prior to	
23339	calling <i>setlogmask()</i> .	
23340	Symbolic constants for use as values of the <i>logopt</i> , <i>facility</i> , <i>priority</i> , and <i>maskpri</i> arguments are	
23341	defined in the <syslog.h> header.	
23342	RETURN VALUE	
23343	The <i>setlogmask()</i> function shall return the previous log priority mask. The <i>closelog()</i> , <i>openlog()</i> ,	
23344	and <i>syslog()</i> functions shall not return a value.	

23345 ERRORS

23346 No errors are defined.

23347 EXAMPLES**23348 Using openlog()**

23349 The following example causes subsequent calls to *syslog()* to log the process ID with each
23350 message, and to write messages to the system console if they cannot be sent to the logging
23351 facility.

```
23352 #include <syslog.h>
23353 char *ident = "Process demo";
23354 int logopt = LOG_PID | LOG_CONS;
23355 int facility = LOG_USER;
23356 ...
23357 openlog(ident, logopt, facility);
```

23358 Using setlogmask()

23359 The following example causes subsequent calls to *syslog()* to accept error messages, and to reject
23360 all other messages.

```
23361 #include <syslog.h>
23362 int result;
23363 int mask = LOG_MASK (LOG_ERR);
23364 ...
23365 result = setlogmask(mask);
```

23366 Using syslog

23367 The following example sends the message "This is a message" to the default logging
23368 facility, marking the message as an error message generated by random processes.

```
23369 #include <syslog.h>
23370 char *message = "This is a message";
23371 int priority = LOG_ERR | LOG_USER;
23372 ...
23373 syslog(priority, message);
```

23383 **CHANGE HISTORY**

23384 First released in Issue 4, Version 2.

23385 **Issue 5**

23386 Moved from X/OPEN UNIX extension to BASE.

23387 **Issue 6**23388 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/13 is applied, correcting the EXAMPLES
23389 section.

23390 **NAME**

23391 confstr — get configurable variables

23392 **SYNOPSIS**

23393 #include <unistd.h>

23394 size_t confstr(int *name*, char **buf*, size_t *len*);23395 **DESCRIPTION**

23396 The *confstr()* function shall return configuration-defined string values. Its use and purpose are
 23397 similar to *sysconf()*, but it is used where string values rather than numeric values are returned.

23398 The *name* argument represents the system variable to be queried. The implementation shall
 23399 support the following name values, defined in <unistd.h>. It may support others:

23400 _CS_PATH
 23401 _CS_POSIX_V7_ILP32_OFF32_CFLAGS
 23402 _CS_POSIX_V7_ILP32_OFF32_LDFLAGS
 23403 _CS_POSIX_V7_ILP32_OFF32_LIBS
 23404 _CS_POSIX_V7_ILP32_OFFBIG_CFLAGS
 23405 _CS_POSIX_V7_ILP32_OFFBIG_LDFLAGS
 23406 _CS_POSIX_V7_ILP32_OFFBIG_LIBS
 23407 _CS_POSIX_V7_LP64_OFF64_CFLAGS
 23408 _CS_POSIX_V7_LP64_OFF64_LDFLAGS
 23409 _CS_POSIX_V7_LP64_OFF64_LIBS
 23410 _CS_POSIX_V7_LPBIG_OFFBIG_CFLAGS
 23411 _CS_POSIX_V7_LPBIG_OFFBIG_LDFLAGS
 23412 _CS_POSIX_V7_LPBIG_OFFBIG_LIBS
 23413 _CS_POSIX_V7_THREADS_CFLAGS
 23414 _CS_POSIX_V7_THREADS_LDFLAGS
 23415 _CS_POSIX_V7_WIDTH_RESTRICTED_ENVS
 23416 _CS_V7_ENV
 23417 OB _CS_POSIX_V6_ILP32_OFF32_CFLAGS
 23418 _CS_POSIX_V6_ILP32_OFF32_LDFLAGS
 23419 _CS_POSIX_V6_ILP32_OFF32_LIBS
 23420 _CS_POSIX_V6_ILP32_OFFBIG_CFLAGS
 23421 _CS_POSIX_V6_ILP32_OFFBIG_LDFLAGS
 23422 _CS_POSIX_V6_ILP32_OFFBIG_LIBS
 23423 _CS_POSIX_V6_LP64_OFF64_CFLAGS
 23424 _CS_POSIX_V6_LP64_OFF64_LDFLAGS
 23425 _CS_POSIX_V6_LP64_OFF64_LIBS
 23426 _CS_POSIX_V6_LPBIG_OFFBIG_CFLAGS
 23427 _CS_POSIX_V6_LPBIG_OFFBIG_LDFLAGS
 23428 _CS_POSIX_V6_LPBIG_OFFBIG_LIBS
 23429 _CS_POSIX_V6_WIDTH_RESTRICTED_ENVS
 23430 _CS_V6_ENV

23431 If *len* is not 0, and if *name* has a configuration-defined value, *confstr()* shall copy that value into
 23432 the *len*-byte buffer pointed to by *buf*. If the string to be returned is longer than *len* bytes,
 23433 including the terminating null, then *confstr()* shall truncate the string to *len*–1 bytes and null-
 23434 terminate the result. The application can detect that the string was truncated by comparing the
 23435 value returned by *confstr()* with *len*.

23436 If *len* is 0 and *buf* is a null pointer, then *confstr()* shall still return the integer value as defined
 23437 below, but shall not return a string. If *len* is 0 but *buf* is not a null pointer, the result is

23438 unspecified.

23439 After a call to:

23440 `confstr(_CS_V7_ENV, buf, sizeof(buf))`

23441 the string stored in *buf* will contain the <space>-separated list of variable=value environment
23442 variable pairs required by the implementation to create a conforming environment, as described
23443 in the implementations' conformance documentation.

23444 If the implementation supports the POSIX shell option, the string stored in *buf* after a call to:

23445 `confstr(_CS_PATH, buf, sizeof(buf))`

23446 can be used as a value of the *PATH* environment variable that accesses all of the standard
23447 utilities of POSIX.1-2008, if the return value is less than or equal to *sizeof(buf)*.

23448 RETURN VALUE

23449 If *name* has a configuration-defined value, *confstr()* shall return the size of buffer that would be
23450 needed to hold the entire configuration-defined value including the terminating null. If this
23451 return value is greater than *len*, the string returned in *buf* is truncated.

23452 If *name* is invalid, *confstr()* shall return 0 and set *errno* to indicate the error.

23453 If *name* does not have a configuration-defined value, *confstr()* shall return 0 and leave *errno*
23454 unchanged.

23455 ERRORS

23456 The *confstr()* function shall fail if:

23457 [EINVAL] The value of the *name* argument is invalid.

23458 EXAMPLES

23459 None.

23460 APPLICATION USAGE

23461 An application can distinguish between an invalid *name* parameter value and one that
23462 corresponds to a configurable variable that has no configuration-defined value by checking if
23463 *errno* is modified. This mirrors the behavior of *sysconf()*.

23464 The original need for this function was to provide a way of finding the configuration-defined
23465 default value for the environment variable *PATH*. Since *PATH* can be modified by the user to
23466 include directories that could contain utilities replacing the standard utilities in the Shell and
23467 Utilities volume of POSIX.1-2008, applications need a way to determine the system-supplied
23468 *PATH* environment variable value that contains the correct search path for the standard utilities.

23469 An application could use:

23470 `confstr(name, (char *)NULL, (size_t)0)`

23471 to find out how big a buffer is needed for the string value; use *malloc()* to allocate a buffer to
23472 hold the string; and call *confstr()* again to get the string. Alternately, it could allocate a fixed,
23473 static buffer that is big enough to hold most answers (perhaps 512 or 1024 bytes), but then use
23474 *malloc()* to allocate a larger buffer if it finds that this is too small.

23475 RATIONALE

23476 Application developers can normally determine any configuration variable by means of reading
23477 from the stream opened by a call to:

23478 `popen("command -p getconf variable", "r");`

23479 The *confstr()* function with a *name* argument of *_CS_PATH* returns a string that can be used as a

23480 *PATH* environment variable setting that will reference the standard shell and utilities as
 23481 described in the Shell and Utilities volume of POSIX.1-2008.

23482 The *confstr()* function copies the returned string into a buffer supplied by the application instead
 23483 of returning a pointer to a string. This allows a cleaner function in some implementations (such
 23484 as those with lightweight threads) and resolves questions about when the application must copy
 23485 the string returned.

23486 FUTURE DIRECTIONS

23487 None.

23492 CHANGE HISTORY

23493 First released in Issue 4. Derived from the ISO POSIX-2 standard.

23494 Issue 5

23495 A table indicating the permissible values of *name* is added to the DESCRIPTION. All those
 23496 marked EX are new in this version.

23497 Issue 6

23498 The Open Group Corrigendum U033/7 is applied. The return value for the case returning the
 23499 size of the buffer now explicitly states that this includes the terminating null.

23500 The following new requirements on POSIX implementations derive from alignment with the
 23501 Single UNIX Specification:

- 23502 • The DESCRIPTION is updated with new arguments which can be used to determine
- 23503 configuration strings for C compiler flags, linker/loader flags, and libraries for each
- 23504 different supported programming environment. This is a change to support data size
- 23505 neutrality.

23506 The following changes were made to align with the IEEE P1003.1a draft standard:

- 23507 • The DESCRIPTION is updated to include text describing how *_CS_PATH* can be used to
- 23508 obtain a *PATH* to access the standard utilities.

23509 The macros associated with the *c89* programming models are marked LEGACY and new
 23510 equivalent macros associated with *c99* are introduced.

23511 Issue 7

23512 Austin Group Interpretation 1003.1-2001 #047 is applied, adding the *_CS_V7_ENV* variable.

23513 Austin Group Interpretations 1003.1-2001 #166 is applied to permit an additional compiler flag
 23514 to enable threads.

23515 The V6 variables for the supported programming environments are marked obsolescent.

23516 The variables for the supported programming environments are updated to be V7.

23517 The LEGACY variables and obsolescent values are removed.

23518 **NAME**

NAME

connect — connect a socket

SYNOPSIS

```
#include <sys/socket.h>

int connect(int socket, const struct sockaddr *address,
            socklen_t address_len);
```

DESCRIPTION

The *connect()* function shall attempt to make a connection on a connection-mode socket or to set or reset the peer address of a connectionless-mode socket. The function takes the following arguments:

<i>socket</i>	Specifies the file descriptor associated with the socket.
<i>address</i>	Points to a sockaddr structure containing the peer address. The length and format of the address depend on the address family of the socket.
<i>address_len</i>	Specifies the length of the sockaddr structure pointed to by the <i>address</i> argument.

If the socket has not already been bound to a local address, *connect()* shall bind it to an address which, unless the socket's address family is AF_UNIX, is an unused local address.

If the initiating socket is not connection-mode, then *connect()* shall set the socket's peer address, and no connection is made. For SOCK_DGRAM sockets, the peer address identifies where all datagrams are sent on subsequent *send()* functions, and limits the remote sender for subsequent *recv()* functions. If the *sa_family* member of *address* is AF_UNSPEC, the socket's peer address shall be reset. Note that despite no connection being made, the term “connected” is used to describe a connectionless-mode socket for which a peer address has been set.

If the initiating socket is connection-mode, then *connect()* shall attempt to establish a connection to the address specified by the *address* argument. If the connection cannot be established immediately and O_NONBLOCK is not set for the file descriptor for the socket, *connect()* shall block for up to an unspecified timeout interval until the connection is established. If the timeout interval expires before the connection is established, *connect()* shall fail and the connection attempt shall be aborted. If *connect()* is interrupted by a signal that is caught while blocked waiting to establish a connection, *connect()* shall fail and set *errno* to [EINTR], but the connection request shall not be aborted, and the connection shall be established asynchronously.

If the connection cannot be established immediately and O_NONBLOCK is set for the file descriptor for the socket, *connect()* shall fail and set *errno* to [EINPROGRESS], but the connection request shall not be aborted, and the connection shall be established asynchronously. Subsequent calls to *connect()* for the same socket, before the connection is established, shall fail and set *errno* to [EALREADY].

When the connection has been established asynchronously, *pselect()*, *select()*, and *poll()* shall indicate that the file descriptor for the socket is ready for writing.

The socket in use may require the process to have appropriate privileges to use the *connect()* function.

RETURN VALUE

Upon successful completion, *connect()* shall return 0; otherwise, -1 shall be returned and *errno* set to indicate the error.

23591 **ERRORS**23592 The *connect()* function shall fail if:

23593 [EADDRNOTAVAIL]

23594 The specified address is not available from the local machine.

23595 [EAFNOSUPPORT]

23596 The specified address is not a valid address for the address family of the
23597 specified socket.

23598 [EALREADY] A connection request is already in progress for the specified socket.

23599 [EBADF] The *socket* argument is not a valid file descriptor.

23600 [ECONNREFUSED]

23601 The target address was not listening for connections or refused the connection
23602 request.23603 [EINPROGRESS] O_NONBLOCK is set for the file descriptor for the socket and the connection
23604 cannot be immediately established; the connection shall be established
23605 asynchronously.23606 [EINTR] The attempt to establish a connection was interrupted by delivery of a signal
23607 that was caught; the connection shall be established asynchronously.

23608 [EISCONN] The specified socket is connection-mode and is already connected.

23609 [ENETUNREACH]

23610 No route to the network is present.

23611 [ENOTSOCK] The *socket* argument does not refer to a socket.23612 [EPROTOTYPE] The specified address has a different type than the socket bound to the
23613 specified peer address.

23614 [ETIMEDOUT] The attempt to connect timed out before a connection was made.

23615 If the address family of the socket is AF_UNIX, then *connect()* shall fail if:

23616 [EIO] An I/O error occurred while reading from or writing to the file system.

23617 [ELOOP] A loop exists in symbolic links encountered during resolution of the pathname
23618 in *address*.

23619 [ENAMETOOLONG]

23620 The length of a component of a pathname is longer than {NAME_MAX}.

23621 [ENOENT] A component of the pathname does not name an existing file or the pathname
23622 is an empty string.23623 [ENOTDIR] A component of the path prefix of the pathname in *address* names an existing |
23624 file that is neither a directory nor a symbolic link to a directory, or the |
23625 pathname in *address* contains at least one non-*<slash>* character and ends with
23626 one or more trailing *<slash>* characters and the last pathname component
23627 names an existing file that is neither a directory nor a symbolic link to a
23628 directory.23629 The *connect()* function may fail if:23630 [EACCES] Search permission is denied for a component of the path prefix; or write access
23631 to the named socket is denied.

- 23632 [EADDRINUSE] Attempt to establish a connection that uses addresses that are already in use.
- 23633 [ECONNRESET] Remote host reset the connection request.
- 23634 [EHOSTUNREACH]
- 23635 The destination host cannot be reached (probably because the host is down or
- 23636 a remote router cannot reach it).
- 23637 [EINVAL] The *address_len* argument is not a valid length for the address family; or
- 23638 invalid address family in the **sockaddr** structure.
- 23639 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
- 23640 resolution of the pathname in *address*.
- 23641 [ENAMETOOLONG]
- 23642 The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a
- 23643 symbolic link produced an intermediate result with a length that exceeds
- 23644 {PATH_MAX}.
- 23645 [ENETDOWN] The local network interface used to reach the destination is down.
- 23646 [ENOBUFS] No buffer space is available.
- 23647 [EOPNOTSUPP] The socket is listening and cannot be connected.

EXAMPLES

23648 None.

APPLICATION USAGE

23651 If *connect()* fails, the state of the socket is unspecified. Conforming applications should close the

23652 file descriptor and create a new socket before attempting to reconnect.

RATIONALE

23653 None.

FUTURE DIRECTIONS

23655 None.

CHANGE HISTORY

23661 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

23662 The wording of the mandatory [ELOOP] error condition is updated, and a second optional

23663 [ELOOP] error condition is added.

Issue 7

23665 Austin Group Interpretation 1003.1-2001 #035 is applied, clarifying the description of connected

23666 sockets.

23667 Austin Group Interpretation 1003.1-2001 #143 is applied.

23668 Austin Group Interpretation 1003.1-2001 #188 is applied, changing the method used to reset a

23669 peer address for a datagram socket.

23670 SD5-XSH-ERN-185 is applied.

23671 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0062 [324] is applied.

+

23672 **NAME**

23673 copysign, copysignf, copysignl — number manipulation function

23674 **SYNOPSIS**

```
23675 #include <math.h>
23676 double copysign(double x, double y);
23677 float copysignf(float x, float y);
23678 long double copysignl(long double x, long double y);
```

23679 **DESCRIPTION**

23680 CX The functionality described on this reference page is aligned with the ISO C standard. Any
23681 conflict between the requirements described here and the ISO C standard is unintentional. This
23682 volume of POSIX.1-2008 defers to the ISO C standard.

23683 These functions shall produce a value with the magnitude of *x* and the sign of *y*. On
23684 implementations that represent a signed zero but do not treat negative zero consistently in
23685 arithmetic operations, these functions regard the sign of zero as positive.

23686 **RETURN VALUE**

23687 Upon successful completion, these functions shall return a value with the magnitude of *x* and
23688 the sign of *y*.

23689 **ERRORS**

23690 No errors are defined.

23691 **EXAMPLES**

23692 None.

23693 **APPLICATION USAGE**

23694 None.

23695 **RATIONALE**

23696 None.

23697 **FUTURE DIRECTIONS**

23698 None.

23699 **SEE ALSO**23700 [signbit\(\)](#)23701 XBD [<math.h>](#)23702 **CHANGE HISTORY**

23703 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

23704 **NAME**

23705 cos, cosf, cosl — cosine function

23706 **SYNOPSIS**

```
23707 #include <math.h>
23708 double cos(double x);
23709 float cosf(float x);
23710 long double cosl(long double x);
```

23711 **DESCRIPTION**

23712 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 23713 conflict between the requirements described here and the ISO C standard is unintentional. This
 23714 volume of POSIX.1-2008 defers to the ISO C standard.

23715 These functions shall compute the cosine of their argument x , measured in radians.

23716 An application wishing to check for error situations should set *errno* to zero and call
 23717 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 23718 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 23719 zero, an error has occurred.

23720 **RETURN VALUE**

23721 Upon successful completion, these functions shall return the cosine of x .

23722 MX If x is NaN, a NaN shall be returned.

23723 If x is ± 0 , the value 1.0 shall be returned.

23724 If x is $\pm \text{Inf}$, a domain error shall occur, and a NaN shall be returned.

23725 **ERRORS**

23726 These functions shall fail if:

23727 MX **Domain Error** The x argument is $\pm \text{Inf}$.

23728 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 23729 then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling*
 23730 & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
 23731 shall be raised.

23732 **EXAMPLES**23733 **Taking the Cosine of a 45-Degree Angle**

```
23734 #include <math.h>
23735 ...
23736 double radians = 45 * M_PI / 180;
23737 double result;
23738 ...
23739 result = cos(radians);
```

23740 **APPLICATION USAGE**

23741 These functions may lose accuracy when their argument is near an odd multiple of $\pi/2$ or is far
 23742 from 0.

23743 On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* &
 23744 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

23745 **RATIONALE**

23746 None.

23747 **FUTURE DIRECTIONS**

23748 None.

23749 **SEE ALSO**23750 *acos()*, *feclearexcept()*, *fetestexcept()*, *isnan()*, *sin()*, *tan()*23751 XBD Section 4.19 (on page 116), **<math.h>**23752 **CHANGE HISTORY**

23753 First released in Issue 1. Derived from Issue 1 of the SVID.

23754 **Issue 5**23755 The DESCRIPTION is updated to indicate how an application should check for an error. This
23756 text was previously published in the APPLICATION USAGE section.23757 **Issue 6**23758 The *cosf()* and *cosl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.23759 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are
23760 revised to align with the ISO/IEC 9899:1999 standard.23761 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are
23762 marked.23763 **Issue 7**

23764 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0063 [320] is applied.

+

23765 **NAME**

23766 cosh, coshf, coshl — hyperbolic cosine functions

23767 **SYNOPSIS**

```
23768 #include <math.h>
23769 double cosh(double x);
23770 float coshf(float x);
23771 long double coshl(long double x);
```

23772 **DESCRIPTION**

23773 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 23774 conflict between the requirements described here and the ISO C standard is unintentional. This
 23775 volume of POSIX.1-2008 defers to the ISO C standard.

23776 These functions shall compute the hyperbolic cosine of their argument x .

23777 An application wishing to check for error situations should set *errno* to zero and call
 23778 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 23779 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 23780 zero, an error has occurred.

23781 **RETURN VALUE**

23782 Upon successful completion, these functions shall return the hyperbolic cosine of x .

23783 If the correct value would cause overflow, a range error shall occur and *cosh()*, *coshf()*, and
 23784 *coshl()* shall return the value of the macro HUGE_VAL, HUGE_VALF, and HUGE_VALL,
 23785 respectively.

23786 MX If x is NaN, a NaN shall be returned.

23787 If x is ± 0 , the value 1.0 shall be returned.

23788 If x is $\pm\text{Inf}$, $+\text{Inf}$ shall be returned.

23789 **ERRORS**

23790 These functions shall fail if:

23791 Range Error The result would cause an overflow.

23792 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 23793 then *errno* shall be set to [ERANGE]. If the integer expression
 23794 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the overflow
 23795 floating-point exception shall be raised.

23796 **EXAMPLES**

23797 None.

23798 **APPLICATION USAGE**

23799 On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* &
 23800 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

23801 For IEEE Std 754-1985 **double**, $710.5 < |x|$ implies that *cosh*(x) has overflowed.

23802 **RATIONALE**

23803 None.

23804 **FUTURE DIRECTIONS**

23805 None.

23806 **SEE ALSO**23807 *acosh()*, *feclearexcept()*, *fetestexcept()*, *isnan()*, *sinh()*, *tanh()*23808 XBD Section 4.19 (on page 116), **<math.h>**23809 **CHANGE HISTORY**

23810 First released in Issue 1. Derived from Issue 1 of the SVID.

23811 **Issue 5**23812 The DESCRIPTION is updated to indicate how an application should check for an error. This
23813 text was previously published in the APPLICATION USAGE section.23814 **Issue 6**23815 The *coshf()* and *coshl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.23816 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are

23850 None.

23851 **FUTURE DIRECTIONS**

23852 None.

23853 **SEE ALSO**23854 *cabs()*, *csqrt()*

23855 XBD <complex.h>

23856 **CHANGE HISTORY**

23857 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

23858 **NAME**

23859 cproj, cprojf, cprojl — complex projection functions

23860 **SYNOPSIS**

```
23861 #include <complex.h>
23862 double complex cproj(double complex z);
23863 float complex cprojf(float complex z);
23864 long double complex cprojl(long double complex z);
```

23865 **DESCRIPTION**

23866 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 23867 conflict between the requirements described here and the ISO C standard is unintentional. This
 23868 volume of POSIX.1-2008 defers to the ISO C standard.

23869 These functions shall compute a projection of *z* onto the Riemann sphere: *z* projects to *z*, except
 23870 that all complex infinities (even those with one infinite part and one NaN part) project to
 23871 positive infinity on the real axis. If *z* has an infinite part, then *cproj(z)* shall be equivalent to:

```
23872 INFINITY + I * copysign(0.0, cimag(z))
```

23873 **RETURN VALUE**

23874 These functions shall return the value of the projection onto the Riemann sphere.

23875 **ERRORS**

23876 No errors are defined.

23877 **EXAMPLES**

23878 None.

23879 **APPLICATION USAGE**

23880 None.

23881 **RATIONALE**

23882 Two topologies are commonly used in complex mathematics: the complex plane with its
 23883 continuum of infinities, and the Riemann sphere with its single infinity. The complex plane is
 23884 better suited for transcendental functions, the Riemann sphere for algebraic functions. The
 23885 complex types with their multiplicity of infinities provide a useful (though imperfect) model for
 23886 the complex plane. The *cproj()* function helps model the Riemann sphere by mapping all
 23887 infinities to one, and should be used just before any operation, especially comparisons, that
 23888 might give spurious results for any of the other infinities. Note that a complex value with one
 23889 infinite part and one NaN part is regarded as an infinity, not a NaN, because if one part is
 23890 infinite, the complex value is infinite independent of the value of the other part. For the same
 23891 reason, *cabs()* returns an infinity if its argument has an infinite part and a NaN part.

23892 **FUTURE DIRECTIONS**

23893 None.

23894 **SEE ALSO**23895 *carg()*, *cimag()*, *conj()*, *creal()*23896 XBD **<complex.h>**23897 **CHANGE HISTORY**

23898 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

23899 **NAME**

23900 creal, crealf, creall — complex real functions

23901 **SYNOPSIS**

```
23902     #include <complex.h>
23903     double creal(double complex z);
23904     float crealf(float complex z);
23905     long double creall(long double complex z);
```

23906 **DESCRIPTION**

23907 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 23908 conflict between the requirements described here and the ISO C standard is unintentional. This
 23909 volume of POSIX.1-2008 defers to the ISO C standard.

23910 These functions shall compute the real part of *z*.23911 **RETURN VALUE**

23912 These functions shall return the real part value.

23913 **ERRORS**

23914 No errors are defined.

23915 **EXAMPLES**

23916 None.

23917 **APPLICATION USAGE**23918 For a variable *z* of type **complex**:23919 `z == creal(z) + cimag(z)*I`23920 **RATIONALE**

23921 None.

23922 **FUTURE DIRECTIONS**

23923 None.

23924 **SEE ALSO**23925 *carg()*, *cimag()*, *conj()*, *cproj()*23926 XBD **<complex.h>**23927 **CHANGE HISTORY**

23928 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

23929 **NAME**

23930 creat — create a new file or rewrite an existing one

23931 **SYNOPSIS**23932 OH `#include <sys/stat.h>`23933 `#include <fcntl.h>`23934 `int creat(const char *path, mode_t mode);`23935 **DESCRIPTION**23936 The *creat()* function shall behave as if it is implemented as follows:23937 `int creat(const char *path, mode_t mode)`23938 `{`23939 `return open(path, O_WRONLY|O_CREAT|O_TRUNC, mode);`23940 `}`23941 **RETURN VALUE**23942 Refer to *open()*.23943 **ERRORS**23944 Refer to *open()*.23945 **EXAMPLES**23946 **Creating a File**

23947 The following example creates the file **/tmp/file** with read and write permissions for the file
 23948 owner and read permission for group and others. The resulting file descriptor is assigned to the
 23949 *fd* variable.

23950 `#include <fcntl.h>`23951 `...`23952 `int fd;`23953 `mode_t mode = S_IRUSR | S_IWUSR | S_IRGRP | S_IROTH;`23954 `char *pathname = "/tmp/file";`23955 `...`23956 `fd = creat(pathname, mode);`23957 `...`23958 **APPLICATION USAGE**

23959 None.

23960 **RATIONALE**

23961 The *creat()* function is redundant. Its services are also provided by the *open()* function. It has
 23962 been included primarily for historical purposes since many existing applications depend on it. It
 23963 is best considered a part of the C binding rather than a function that should be provided in other
 23964 languages.

23965 **FUTURE DIRECTIONS**

23966 None.

23967 **SEE ALSO**23968 *mknod()*, *open()*23969 XBD *<fcntl.h>*, *<sys/stat.h>*, *<sys/types.h>*

23970 **CHANGE HISTORY**

23971 First released in Issue 1. Derived from Issue 1 of the SVID.

23972 **Issue 6**23973 In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.23974 The following new requirements on POSIX implementations derive from alignment with the
23975 Single UNIX Specification:

- 23976
- The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was
-
- 23977 required for conforming implementations of previous POSIX specifications, it was not
-
- 23978 required for UNIX applications.

23979 **Issue 7**

23980 SD5-XSH-ERN-186 is applied.

23981 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0064 [291] is applied.

+

23982 **NAME**23983 `crypt` — string encoding function (**CRYPT**)23984 **SYNOPSIS**

```
23985 XSI      #include <unistd.h>
23986         char *crypt(const char *key, const char *salt);
```

23987 **DESCRIPTION**23988 The `crypt()` function is a string encoding function. The algorithm is implementation-defined.

23989 The *key* argument points to a string to be encoded. The *salt* argument shall be a string of at least
 23990 two bytes in length not including the null character chosen from the set:

```
23991 a b c d e f g h i j k l m n o p q r s t u v w x y z
23992 A B C D E F G H I J K L M N O P Q R S T U V W X Y Z
23993 0 1 2 3 4 5 6 7 8 9 . /
```

23994 The first two bytes of this string may be used to perturb the encoding algorithm.

23995 The return value of `crypt()` points to static data that is overwritten by each call.23996 The `crypt()` function need not be thread-safe.23997 **RETURN VALUE**

23998 Upon successful completion, `crypt()` shall return a pointer to the encoded string. The first two
 23999 bytes of the returned value shall be those of the *salt* argument. Otherwise, it shall return a null
 24000 pointer and set *errno* to indicate the error.

24001 **ERRORS**24002 The `crypt()` function shall fail if:

24003 [ENOSYS] The functionality is not supported on this implementation.

24004 **EXAMPLES**24005 **Encoding Passwords**

24006 The following example finds a user database entry matching a particular user name and changes
 24007 the current password to a new password. The `crypt()` function generates an encoded version of
 24008 each password. The first call to `crypt()` produces an encoded version of the old password; that
 24009 encoded password is then compared to the password stored in the user database. The second
 24010 call to `crypt()` encodes the new password before it is stored.

24011 The `putpwent()` function, used in the following example, is not part of POSIX.1-2008.

```
24012 #include <unistd.h>
24013 #include <pwd.h>
24014 #include <string.h>
24015 #include <stdio.h>
24016 ...
24017 int valid_change;
24018 int pfd; /* Integer for file descriptor returned by open(). */
24019 FILE *fpfd; /* File pointer for use in putpwent(). */
24020 struct passwd *p;
24021 char user[100];
24022 char oldpasswd[100];
24023 char newpasswd[100];
24024 char savepasswd[100];
```

```

24025     ...
24026     valid_change = 0;
24027     while ((p = getpwent()) != NULL) {
24028         /* Change entry if found. */
24029         if (strcmp(p->pw_name, user) == 0) {
24030             if (strcmp(p->pw_passwd, crypt(oldpasswd, p->pw_passwd)) == 0) {
24031                 strcpy(savepasswd, crypt(newpasswd, user));
24032                 p->pw_passwd = savepasswd;
24033                 valid_change = 1;
24034             }
24035             else {
24036                 fprintf(stderr, "Old password is not valid\n");
24037             }
24038         }
24039         /* Put passwd entry into ptmp. */
24040         putpwent(p, fpfd);
24041     }

```

APPLICATION USAGE

The values returned by this function need not be portable among XSI-conformant systems.

RATIONALE

None.

FUTURE DIRECTIONS

None.

24218 **DESCRIPTION**24219 Refer to *ctan()*.

NAME

ctermid — generate a pathname for the controlling terminal

SYNOPSIS

```
CX      #include <stdio.h>
      char *ctermid(char *s);
```

DESCRIPTION

The *ctermid()* function shall generate a string that, when used as a pathname, refers to the current controlling terminal for the current process. If *ctermid()* returns a pathname, access to the file is not guaranteed.

The *ctermid()* function need not be thread-safe if called with a NULL parameter.

RETURN VALUE

If *s* is a null pointer, the string shall be generated in an area that may be static, the address of which shall be returned. The application shall not modify the string returned. The returned pointer might be invalidated or the string content might be overwritten by a subsequent call to *ctermid()*. If *s* is not a null pointer, *s* is assumed to point to a character array of at least `L_ctermid` bytes; the string is placed in this array and the value of *s* shall be returned. The symbolic constant `L_ctermid` is defined in `<stdio.h>`, and shall have a value greater than 0.

The *ctermid()* function shall return an empty string if the pathname that would refer to the controlling terminal cannot be determined, or if the function is unsuccessful.

ERRORS

No errors are defined.

EXAMPLES**Determining the Controlling Terminal for the Current Process**

The following example returns a pointer to a string that identifies the controlling terminal for the current process. The pathname for the terminal is stored in the array pointed to by the *ptr* argument, which has a size of `L_ctermid` bytes, as indicated by the *term* argument.

```
#include <stdio.h>
...
char term[L_ctermid];
char *ptr;

ptr = ctermid(term);
```

APPLICATION USAGE

The difference between *ctermid()* and *ttyname()* is that *ttyname()* must be handed a file descriptor and return a path of the terminal associated with that file descriptor, while *ctermid()* returns a string (such as `"/dev/tty"`) that refers to the current controlling terminal if used as a pathname.

RATIONALE

`L_ctermid` must be defined appropriately for a given implementation and must be greater than zero so that array declarations using it are accepted by the compiler. The value includes the terminating null byte.

Conforming applications that use multiple threads cannot call *ctermid()* with NULL as the parameter. If *s* is not NULL, the *ctermid()* function generates a string that, when used as a pathname, refers to the current controlling terminal for the current process. If *s* is NULL, the

24263 return value of *ctermid()* is undefined.

24264 There is no additional burden on the programmer—changing to use a hypothetical thread-safe
24265 version of *ctermid()* along with allocating a buffer is more of a burden than merely allocating a
24266 buffer. Application code should not assume that the returned string is short, as some
24267 implementations have more than two pathname components before reaching a logical device
24268 name.

24269 **FUTURE DIRECTIONS**

24270 None.

24271 **SEE ALSO**

24272 *ttynname()*

+

24283 **NAME**

24284 ctime, ctime_r — convert a time value to a date and time string

24285 **SYNOPSIS**

```

24286 OB      #include <time.h>
24287          char *ctime(const time_t *clock);
24288 OB CX    char *ctime_r(const time_t *clock, char *buf);

```

24289 **DESCRIPTION**

24290 CX For *ctime()*: The functionality described on this reference page is aligned with the ISO C
 24291 standard. Any conflict between the requirements described here and the ISO C standard is
 24292 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

24293 The *ctime()* function shall convert the time pointed to by *clock*, representing time in seconds
 24294 since the Epoch, to local time in the form of a string. It shall be equivalent to:

```
24295 asctime(localtime(clock))
```

24296 CX The *asctime()*, *ctime()*, *gmtime()*, and *localtime()* functions shall return values in one of two static
 24297 objects: a broken-down time structure and an array of **char**. Execution of any of the functions
 24298 may overwrite the information returned in either of these objects by any of the other functions.

24299 The *ctime()* function need not be thread-safe.

24300 The *ctime_r()* function shall convert the calendar time pointed to by *clock* to local time in exactly
 24301 the same form as *ctime()* and put the string into the array pointed to by *buf* (which shall be at
 24302 least 26 bytes in size) and return *buf*.

24303 Unlike *ctime()*, the *ctime_r()* function is not required to set *tzname*. If *ctime_r()* does not set +
 24304 *tzname*, it shall not set *daylight* and shall not set *timezone*.

24305 **RETURN VALUE**

24306 The *ctime()* function shall return the pointer returned by *asctime()* with that broken-down time
 24307 as an argument.

24308 CX Upon successful completion, *ctime_r()* shall return a pointer to the string pointed to by *buf*.
 24309 When an error is encountered, a null pointer shall be returned.

24310 **ERRORS**

24311 No errors are defined.

24312 **EXAMPLES**

24313 None.

24314 **APPLICATION USAGE**

24315 These functions are included only for compatibility with older implementations. They have
 24316 undefined behavior if the resulting string would be too long, so the use of these functions
 24317 should be discouraged. On implementations that do not detect output string length overflow, it
 24318 is possible to overflow the output buffers in such a way as to cause applications to fail, or
 24319 possible system security violations. Also, these functions do not support localized date and time
 24320 formats. To avoid these problems, applications should use *strftime()* to generate strings from
 24321 broken-down times.

24322 Values for the broken-down time structure can be obtained by calling *gmtime()* or *localtime()*.

24323 The *ctime_r()* function is thread-safe and shall return values in a user-supplied buffer instead of
 24324 possibly using a static data area that may be overwritten by each call.

24325 Attempts to use *ctime()* or *ctime_r()* for times before the Epoch or for times beyond the year 9999

24326 produce undefined results. Refer to *asctime()* (on page 595).

24327 RATIONALE

24328 The standard developers decided to mark the *ctime()* and *ctime_r()* functions obsolescent even
 24329 though they are in the ISO C standard due to the possibility of buffer overflow. The ISO C
 24330 standard also provides the *strftime()* function which can be used to avoid these problems.

24331 FUTURE DIRECTIONS

24332 These functions may be removed in a future version.

24336 CHANGE HISTORY

24337 First released in Issue 1. Derived from Issue 1 of the SVID.

24338 Issue 5

24339 Normative text previously in the APPLICATION USAGE section is moved to the
 24340 DESCRIPTION.

24341 The *ctime_r()* function is included for alignment with the POSIX Threads Extension.

24342 A note indicating that the *ctime()* function need not be reentrant is added to the DESCRIPTION.

24343 Issue 6

24344 Extensions beyond the ISO C standard are marked.

24345 In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

24346 The APPLICATION USAGE section is updated to include a note on the thread-safe function and
 24347 its avoidance of possibly using a static data area.

24348 Issue 7

24349 Austin Group Interpretation 1003.1-2001 #156 is applied.

24350 SD5-XSH-ERN-25 is applied, updating the APPLICATION USAGE.

24351 Austin Group Interpretation 1003.1-2001 #053 is applied, marking these functions obsolescent.

24352 The *ctime_r()* function is moved from the Thread-Safe Functions option to the Base.

24353 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0066 [321,428] is applied.

NAME

dbm_clearerr, dbm_close, dbm_delete, dbm_error, dbm_fetch, dbm_firstkey, dbm_nextkey, dbm_open, dbm_store — database functions

SYNOPSIS

```
XSI
#include <ndbm.h>

int dbm_clearerr(DBM *db);
void dbm_close(DBM *db);
int dbm_delete(DBM *db, datum key);
int dbm_error(DBM *db);
datum dbm_fetch(DBM *db, datum key);
datum dbm_firstkey(DBM *db);
datum dbm_nextkey(DBM *db);
DBM *dbm_open(const char *file, int open_flags, mode_t file_mode);
int dbm_store(DBM *db, datum key, datum content, int store_mode);
```

DESCRIPTION

These functions create, access, and modify a database.

A **datum** consists of at least two members, *dptr* and *dsize*. The *dptr* member points to an object that is *dsize* bytes in length. Arbitrary binary data, as well as character strings, may be stored in the object pointed to by *dptr*.

A database shall be stored in one or two files. When one file is used, the name of the database file shall be formed by appending the suffix **.db** to the *file* argument given to *dbm_open()*. When two files are used, the names of the database files shall be formed by appending the suffixes **.dir** and **.pag** respectively to the *file* argument.

The *dbm_open()* function shall open a database. The *file* argument to the function is the pathname of the database. The *open_flags* argument has the same meaning as the *flags* argument of *open()* except that a database opened for write-only access opens the files for read and write access and the behavior of the **O_APPEND** flag is unspecified. The *file_mode* argument has the same meaning as the third argument of *open()*.

The *dbm_open()* function need not accept pathnames longer than {PATH_MAX}-4 bytes (including the terminating null), or pathnames with a last component longer than {NAME_MAX}-4 bytes (excluding the terminating null).

The *dbm_close()* function shall close a database. The application shall ensure that argument *db* is a pointer to a **dbm** structure that has been returned from a call to *dbm_open()*.

These database functions shall support an internal block size large enough to support key/content pairs of at least 1 023 bytes.

The *dbm_fetch()* function shall read a record from a database. The argument *db* is a pointer to a database structure that has been returned from a call to *dbm_open()*. The argument *key* is a **datum** that has been initialized by the application to the value of the key that matches the key of the record the program is fetching.

The *dbm_store()* function shall write a record to a database. The argument *db* is a pointer to a database structure that has been returned from a call to *dbm_open()*. The argument *key* is a **datum** that has been initialized by the application to the value of the key that identifies (for subsequent reading, writing, or deleting) the record the application is writing. The argument *content* is a **datum** that has been initialized by the application to the value of the record the program is writing. The argument *store_mode* controls whether *dbm_store()* replaces any pre-existing record that has the same key that is specified by the *key* argument. The application shall

set *store_mode* to either DBM_INSERT or DBM_REPLACE. If the database contains a record that matches the *key* argument and *store_mode* is DBM_REPLACE, the existing record shall be replaced with the new record. If the database contains a record that matches the *key* argument and *store_mode* is DBM_INSERT, the existing record shall be left unchanged and the new record ignored. If the database does not contain a record that matches the *key* argument and *store_mode* is either DBM_INSERT or DBM_REPLACE, the new record shall be inserted in the database.

If the sum of a key/content pair exceeds the internal block size, the result is unspecified. Moreover, the application shall ensure that all key/content pairs that hash together fit on a single block. The *dbm_store()* function shall return an error in the event that a disk block fills with inseparable data.

The *dbm_delete()* function shall delete a record and its key from the database. The argument *db* is a pointer to a database structure that has been returned from a call to *dbm_open()*. The argument *key* is a **datum** that has been initialized by the application to the value of the key that identifies the record the program is deleting.

The *dbm_firstkey()* function shall return the first key in the database. The argument *db* is a pointer to a database structure that has been returned from a call to *dbm_open()*.

The *dbm_nextkey()* function shall return the next key in the database. The argument *db* is a pointer to a database structure that has been returned from a call to *dbm_open()*. The application shall ensure that the *dbm_firstkey()* function is called before calling *dbm_nextkey()*. Subsequent calls to *dbm_nextkey()* return the next key until all of the keys in the database have been returned.

The *dbm_error()* function shall return the error condition of the database. The argument *db* is a pointer to a database structure that has been returned from a call to *dbm_open()*.

The *dbm_clearerr()* function shall clear the error condition of the database. The argument *db* is a pointer to a database structure that has been returned from a call to *dbm_open()*.

The *dptr* pointers returned by these functions may point into static storage that may be changed by subsequent calls.

These functions need not be thread-safe.

RETURN VALUE

The *dbm_store()* and *dbm_delete()* functions shall return 0 when they succeed and a negative value when they fail.

The *dbm_store()* function shall return 1 if it is called with a *flags* value of DBM_INSERT and the function finds an existing record with the same key.

The *dbm_error()* function shall return 0 if the error condition is not set and return a non-zero value if the error condition is set.

The return value of *dbm_clearerr()* is unspecified.

The *dbm_firstkey()* and *dbm_nextkey()* functions shall return a key **datum**. When the end of the database is reached, the *dptr* member of the key is a null pointer. If an error is detected, the *dptr* member of the key shall be a null pointer and the error condition of the database shall be set.

The *dbm_fetch()* function shall return a content **datum**. If no record in the database matches the key or if an error condition has been detected in the database, the *dptr* member of the content shall be a null pointer.

The *dbm_open()* function shall return a pointer to a database structure. If an error is detected during the operation, *dbm_open()* shall return a (DBM *)0.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

The following code can be used to traverse the database:

```
for(key = dbm_firstkey(db); key.dptr != NULL; key = dbm_nextkey(db))
```

The *dbm_** functions provided in this library should not be confused in any way with those of a general-purpose database management system. These functions do not provide for multiple search keys per entry, they do not protect against multi-user access (in other words they do not lock records or files), and they do not provide the many other useful database functions that are found in more robust database management systems. Creating and updating databases by use of these functions is relatively slow because of data copies that occur upon hash collisions. These functions are useful for applications requiring fast lookup of relatively static information that is to be indexed by a single key.

Note that a strictly conforming application is extremely limited by these functions: since there is no way to determine that the keys in use do not all hash to the same value (although that would be rare), a strictly conforming application cannot be guaranteed that it can store more than one block's worth of data in the database. As long as a key collision does not occur, additional data may be stored, but because there is no way to determine whether an error is due to a key collision or some other error condition (*dbm_error()* being effectively a Boolean), once an error is detected, the application is effectively limited to guessing what the error might be if it wishes to continue using these functions.

The *dbm_delete()* function need not physically reclaim file space, although it does make it available for reuse by the database.

After calling *dbm_store()* or *dbm_delete()* during a pass through the keys by *dbm_firstkey()* and *dbm_nextkey()*, the application should reset the database by calling *dbm_firstkey()* before again calling *dbm_nextkey()*. The contents of these files are unspecified and may not be portable.

Applications should take care that database pathname arguments specified to *dbm_open()* are not prefixes of unrelated files. This might be done, for example, by placing databases in a separate directory.

Since some implementations use three characters for a suffix and others use four characters for a suffix, applications should ensure that the maximum portable pathname length passed to *dbm_open()* is no greater than {PATH_MAX}-4 bytes, with the last component of the pathname no greater than {NAME_MAX}-4 bytes.

RATIONALE

Previously the standard required the database to be stored in two files, one file being a directory containing a bitmap of keys and having **.dir** as its suffix. The second file containing all data and having **.pag** as its suffix. This has been changed not to specify the use of the files and to allow newer implementations of the Berkeley DB interface using a single file that have evolved while remaining compatible with the application programming interface. The standard developers considered removing the specific suffixes altogether but decided to retain them so as not to pollute the application file name space more than necessary and to allow for portable backups of the database.

NAME

dirfd — extract the file descriptor used by a DIR stream

SYNOPSIS

```
#include <dirent.h>

int dirfd(DIR *dirp);
```

DESCRIPTION

The *dirfd()* function shall return a file descriptor referring to the same directory as the *dirp* argument. This file descriptor shall be closed by a call to *closedir()*. If any attempt is made to close the file descriptor, or to modify the state of the associated description, other than by means of *closedir()*, *readdir()*, *readdir_r()*, *rewinddir()*, or *seekdir()*, the behavior is undefined.

RETURN VALUE

Upon successful completion, the *dirfd()* function shall return an integer which contains a file descriptor for the stream pointed to by *dirp*. Otherwise, it shall return *-1* and may set *errno* to indicate the error.

ERRORS

The *dirfd()* function may fail if:

[EINVAL]	The <i>dirp</i> argument does not refer to a valid directory stream.
[ENOTSUP]	The implementation does not support the association of a file descriptor with a directory.

EXAMPLES

None.

APPLICATION USAGE

The *dirfd()* function is intended to be a mechanism by which an application may obtain a file descriptor to use for the *fchdir()* function.

RATIONALE

This interface was introduced because the Base Definitions volume of POSIX.1-2008 does not make public the **DIR** data structure. Applications tend to use the *fchdir()* function on the file descriptor returned by this interface, and this has proven useful for security reasons; in particular, it is a better technique than others where directory names might change.

The description uses the term “a file descriptor” rather than “the file descriptor”. The implication intended is that an implementation that does not use an *fd* for *opendir()* could still *open()* the directory to implement the *dirfd()* function. Such a descriptor must be closed later during a call to *closedir()*.

An implementation that does not support file descriptors referring to directories may fail with [ENOTSUP].

If it is necessary to allocate an *fd* to be returned by *dirfd()*, it should be done at the time of a call to *opendir()*.

FUTURE DIRECTIONS

None.

+

24586 **NAME**

24587 dirname — report the parent directory name of a file pathname

24588 **SYNOPSIS**

```
24589 XSI      #include <libgen.h>
24590      char *dirname(char *path);
```

24591 **DESCRIPTION**

24592 The *dirname()* function shall take a pointer to a character string that contains a pathname, and
 24593 return a pointer to a string that is a pathname of the parent directory of that file. Trailing '/'
 24594 characters in the path are not counted as part of the path.

24595 If *path* does not contain a '/' , then *dirname()* shall return a pointer to the string ".". If *path* is a
 24596 null pointer or points to an empty string, *dirname()* shall return a pointer to the string ".".

24597 The *dirname()* function need not be thread-safe.

24598 **RETURN VALUE**

24599 The *dirname()* function shall return a pointer to a string that is the parent directory of *path*. If
 24600 *path* is a null pointer or points to an empty string, a pointer to a string "." is returned.

24601 The *dirname()* function may modify the string pointed to by *path*, and may return a pointer to
 24602 internal storage. The returned pointer might be invalidated or the storage might be overwritten
 24603 by a subsequent call to *dirname()*.

24604 **ERRORS**

24605 No errors are defined.

24606 **EXAMPLES**

24607 The following code fragment reads a pathname, changes the current working directory to the
 24608 parent directory, and opens the file.

```
24609      char *path = NULL, *pathcopy;
24610      size_t buflen = 0;
24611      ssize_t linelen = 0;
24612      int fd;

24613      linelen = getline(&path, &buflen, stdin);

24614      path[linelen-1] = 0;
24615      pathcopy = strdup(path);
24616      if (chdir(dirname(pathcopy)) < 0) {
24617          ...
24618      }
24619      if ((fd = open(basename(path), O_RDONLY)) >= 0) {
24620          ...
24621          close (fd);
24622      }
24623      ...
24624      free (pathcopy);
24625      free (path);
```

Sample Input and Output Strings for `dirname()`

In the following table, the input string is the value pointed to by *path*, and the output string is the return value of the *dirname()* function.

Input String	Output String
<code>"/usr/lib"</code>	<code>"/usr"</code>
<code>"/usr/"</code>	<code>"/"</code>
<code>"usr"</code>	<code>."</code>
<code>"/"</code>	<code>"/"</code>
<code>."</code>	<code>."</code>
<code>".."</code>	<code>."</code>

APPLICATION USAGE

The *dirname()* and *basename()* functions together yield a complete pathname. The expression *dirname(path)* obtains the pathname of the directory where *basename(path)* is found.

Since the meaning of the leading `"/"` is implementation-defined, *dirname("//foo")* may return either `"/"` or `"/"` (but nothing else).

RATIONALE

None.

FUTURE DIRECTIONS

None.

- POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0068 [75] is applied.

24659 **NAME**24660 `div` — compute the quotient and remainder of an integer division24661 **SYNOPSIS**24662 `#include <stdlib.h>`24663 `div_t div(int numer, int denom);`24664 **DESCRIPTION**

24665 CX The functionality described on this reference page is aligned with the ISO C standard. Any
24666 conflict between the requirements described here and the ISO C standard is unintentional. This
24667 volume of POSIX.1-2008 defers to the ISO C standard.

24668 The `div()` function shall compute the quotient and remainder of the division of the numerator
24669 *numer* by the denominator *denom*. If the division is inexact, the resulting quotient is the integer
24670 of lesser magnitude that is the nearest to the algebraic quotient. If the result cannot be
24671 represented, the behavior is undefined; otherwise, *quot*denom+rem* shall equal *numer*.

24672 **RETURN VALUE**

24673 The `div()` function shall return a structure of type `div_t`, comprising both the quotient and the
24674 remainder. The structure includes the following members, in any order:

```
24675 int quot; /* quotient */
24676 int rem; /* remainder */
```

NAME

dlclose — close a symbol table handle

SYNOPSIS

```
#include <dlfcn.h>
```

```
int dlclose(void *handle);
```

DESCRIPTION

The *dlclose()* function shall inform the system that the symbol table handle specified by *handle* is no longer needed by the application.

An application writer may use *dlclose()* to make a statement of intent on the part of the process, but this statement does not create any requirement upon the implementation. When the symbol table handle is closed, the implementation may unload the executable object files that were loaded by *dlopen()* when the symbol table handle was opened and those that were loaded by *dlsym()* when using the symbol table handle identified by *handle*.

Once a symbol table handle has been closed, an application should assume that any symbols (function identifiers and data object identifiers) made visible using *handle*, are no longer available to the process.

Although a *dlclose()* operation is not required to remove any functions or data objects from the address space, neither is an implementation prohibited from doing so. The only restriction on such a removal is that no function nor data object shall be removed to which references have been relocated, until or unless all such references are removed. For instance, an executable object file that had been loaded with a *dlopen()* operation specifying the *RTLD_GLOBAL* flag might provide a target for dynamic relocations performed in the processing of other relocatable objects—in such environments, an application may assume that no relocation, once made, shall be undone or remade unless the executable object file containing the relocated object has itself been removed.

RETURN VALUE

If the referenced symbol table handle was successfully closed, *dlclose()* shall return 0. If *handle* does not refer to an open symbol table handle or if the symbol table handle could not be closed, *dlclose()* shall return a non-zero value. More detailed diagnostic information shall be available through *dLError()*.

ERRORS

No errors are defined.

EXAMPLES

The following example illustrates use of *dlopen()* and *dlclose()*:

```
#include <dlfcn.h>
int eret;
void *mylib;
...
/* Open a dynamic library and then close it ... */
mylib = dlopen("mylib.so", RTLD_LOCAL | RTLD_LAZY);
...
eret = dlclose(mylib);
...
```

APPLICATION USAGE

A conforming application should employ a symbol table handle returned from a *dlopen()* invocation only within a given scope bracketed by a *dlopen()* operation and the corresponding *dlclose()* operation. Implementations are free to use reference counting or other techniques such that multiple calls to *dlopen()* referencing the same executable object file may return a pointer to the same data object as the symbol table handle.

Implementations are also free to re-use a handle. For these reasons, the value of a handle must be treated as an opaque data type by the application, used only in calls to *dlsym()* and *dlclose()*.

RATIONALE

None.

FUTURE DIRECTIONS

None.

24758 NAME

24759 **dlerror** — get diagnostic information

24760 SYNOPSIS

```
24761 #include <dlfcn.h>
24762 char *dlerror(void);
```

24763 DESCRIPTION

24764 The *dlerror()* function shall return a null-terminated character string (with no trailing
24765 <newline>) that describes the last error that occurred during dynamic linking processing. If no
24766 dynamic linking errors have occurred since the last invocation of *dlerror()*, *dlerror()* shall return
24767 NULL. Thus, invoking *dlerror()* a second time, immediately following a prior invocation, shall
24768 result in NULL being returned.

24769 It is implementation-defined whether or not the *dlerror()* function is thread-safe. A thread-safe
24770 implementation shall return only errors that occur on the current thread.

24771 RETURN VALUE

24772 If successful, *dlerror()* shall return a null-terminated character string; otherwise, NULL shall be
24773 returned.

24774 The application shall not modify the string returned. The returned pointer might be invalidated +
24775 or the string content might be overwritten by a subsequent call to *dlerror()* in the same thread (if +
24776 *dlerror()* is thread-safe) or in any thread (if *dlerror()* is not thread-safe).

24777 ERRORS

24778 No errors are defined.

24779 EXAMPLES

24780 The following example prints out the last dynamic linking error:

```
24781 ...
24782 #include <dlfcn.h>
24783 char *errstr;
24784 errstr = dlerror();
24785 if (errstr != NULL)
24786     printf ("A dynamic linking error occurred: (%s)\n", errstr);
24787 ...
```

24788 APPLICATION USAGE

24789 Depending on the application environment with respect to asynchronous execution events, such -
24790 as signals or other asynchronous computation sharing the address space, conforming
24791 applications should use a critical section to retrieve the error pointer and buffer.

24792 RATIONALE

24793 None.

24794 FUTURE DIRECTIONS

24808 **NAME**

24809 dlopen — open a symbol table handle |

24810 **SYNOPSIS**

24811 #include <dlfcn.h>

24812 void *dlopen(const char *file, int mode);

24813 **DESCRIPTION**

24814 The *dlopen()* function shall make the symbols (function identifiers and data object identifiers) in |
 24815 the executable object file specified by *file* available to the calling program. |

24816 The class of executable object files eligible for this operation and the manner of their |
 24817 construction are implementation-defined, though typically such files are shared libraries or |
 24818 programs. |

24819 Implementations may permit the construction of embedded dependencies in executable object |
 24820 files. In such cases, a *dlopen()* operation shall load those dependencies in addition to the |
 24821 executable object file specified by *file*. Implementations may also impose specific constraints on |
 24822 the construction of programs that can employ *dlopen()* and its related services. |

24823 A successful *dlopen()* shall return a symbol table handle which the caller may use on subsequent |
 24824 calls to *dlsym()* and *dlclose()*. |

24825 The value of this symbol table handle should not be interpreted in any way by the caller. |

24826 The *file* argument is used to construct a pathname to the executable object file. If *file* contains a |
 24827 <slash> character, the *file* argument is used as the pathname for the file. Otherwise, *file* is used in |
 24828 an implementation-defined manner to yield a pathname. |

24829 If *file* is a null pointer, *dlopen()* shall return a global symbol table handle for the currently |
 24830 running process image. This symbol table handle shall provide access to the symbols from an |
 24831 ordered set of executable object files consisting of the original program image file, any |
 24832 executable object files loaded at program start-up as specified by that process file (for example, |
 24833 shared libraries), and the set of executable object files loaded using *dlopen()* operations with the |
 24834 RTLD_GLOBAL flag. As the latter set of executable object files can change during execution, the |
 24835 set of symbols made available by this symbol table handle can also change dynamically. |

24836 Only a single copy of an executable object file shall be brought into the address space, even if |
 24837 *dlopen()* is invoked multiple times in reference to the executable object file, and even if different |
 24838 pathnames are used to reference the executable object file. |

24839 The *mode* parameter describes how *dlopen()* shall operate upon *file* with respect to the processing |
 24840 of relocations and the scope of visibility of the symbols provided within *file*. When an |
 24841 executable object file is brought into the address space of a process, it may contain references to |
 24842 symbols whose addresses are not known until the executable object file is loaded. |

24843 These references shall be relocated before the symbols can be accessed. The *mode* parameter |
 24844 governs when these relocations take place and may have the following values:

24845	RTLD_LAZY	Relocations shall be performed at an implementation-defined time, ranging
24846		from the time of the <i>dlopen()</i> call until the first reference to a given symbol
24847		occurs. Specifying RTLD_LAZY should improve performance on
24848		implementations supporting dynamic symbol binding since a process might
24849		not reference all of the symbols in an executable object file. And, for systems
24850		supporting dynamic symbol resolution for normal process execution, this
24851		behavior mimics the normal handling of process execution.

RTLD_NOW All necessary relocations shall be performed when the executable object file is first loaded. This may waste some processing if relocations are performed for symbols that are never referenced. This behavior may be useful for applications that need to know that all symbols referenced during execution will be available before *dlopen()* returns.

Any executable object file loaded by *dlopen()* that requires relocations against global symbols can reference the symbols in the original process image file, any executable object files loaded at program start-up, from the initial process image itself, from any other executable object file included in the same *dlopen()* invocation, and any executable object files that were loaded in any *dlopen()* invocation and which specified the RTLD_GLOBAL flag. To determine the scope of visibility for the symbols loaded with a *dlopen()* invocation, the *mode* parameter should be a bitwise-inclusive OR with one of the following values:

RTLD_GLOBAL The executable object file's symbols shall be made available for relocation processing of any other executable object file. In addition, symbol lookup using *dlopen(NULL,mode)* and an associated *dlsym()* allows executable object files loaded with this mode to be searched.

RTLD_LOCAL The executable object file's symbols shall not be made available for relocation processing of any other executable object file.

If neither RTLD_GLOBAL nor RTLD_LOCAL is specified, the default behavior is unspecified.

If an executable object file is specified in multiple *dlopen()* invocations, *mode* is interpreted at each invocation.

If RTLD_NOW has been specified, all relocations shall have been completed rendering further RTLD_NOW operations redundant and any further RTLD_LAZY operations irrelevant.

If RTLD_GLOBAL has been specified, the executable object file shall maintain the RTLD_GLOBAL status regardless of any previous or future specification of RTLD_LOCAL, as long as the executable object file remains in the address space (see *dlclose()*).

Symbols introduced into the process image through calls to *dlopen()* may be used in relocation activities. Symbols so introduced may duplicate symbols already defined by the program or previous *dlopen()* operations. To resolve the ambiguities such a situation might present, the resolution of a symbol reference to symbol definition is based on a symbol resolution order. Two such resolution orders are defined: load order and dependency order. Load order establishes an ordering among symbol definitions, such that the first definition loaded (including definitions from the process image file and any dependent executable object files loaded with it) has priority over executable object files added later (by *dlopen()*). Load ordering is used in relocation processing. Dependency ordering uses a breadth-first order starting with a given executable object file, then all of its dependencies, then any dependents of those, iterating until all dependencies are satisfied. With the exception of the global symbol table handle obtained via a *dlopen()* operation with a null pointer as the *file* argument, dependency ordering is used by the *dlsym()* function. Load ordering is used in *dlsym()* operations upon the global symbol table handle.

When an executable object file is first made accessible via *dlopen()*, it and its dependent executable object files are added in dependency order. Once all the executable object files are added, relocations are performed using load order. Note that if an executable object file or its dependencies had been previously loaded, the load and dependency orders may yield different resolutions.

The symbols introduced by *dlopen()* operations and available through *dlsym()* are at a minimum those which are exported as identifiers of global scope by the executable object file. Typically,

24899 such identifiers shall be those that were specified in (for example) C source code as having |
 24900 **extern** linkage. The precise manner in which an implementation constructs the set of exported |
 24901 symbols for an executable object file is implementation-defined.

24902 **RETURN VALUE**

24903 Upon successful completion, *dlopen()* shall return a symbol table handle. If *file* cannot be found, |
 24904 cannot be opened for reading, is not of an appropriate executable object file format for |
 24905 processing by *dlopen()*, or if an error occurs during the process of loading *file* or relocating its |
 24906 symbolic references, *dlopen()* shall return a null pointer. More detailed diagnostic information |
 24907 shall be available through *dlderror()*.

+

24931 **NAME**

24932 dlsym — get the address of a symbol from a symbol table handle |

24933 **SYNOPSIS**

24934 #include <dlfcn.h>

24935 void *dlsym(void *restrict handle, const char *restrict name);

24936 **DESCRIPTION**

24937 The *dlsym()* function shall obtain the address of a symbol (a function identifier or a data object
 24938 identifier) defined in the symbol table identified by the *handle* argument. The *handle* argument is
 24939 a symbol table handle returned from a call to *dlopen()* (and which has not since been released by
 24940 a call to *dlclose()*), and *name* is the symbol's name as a character string. The return value from
 24941 *dlsym()*, cast to a pointer to the type of the named symbol, can be used to call (in the case of a
 24942 function) or access the contents of (in the case of a data object) the named symbol.

24943 The *dlsym()* function shall search for the named symbol in the symbol table referenced by *handle*.
 24944 If the symbol table was created with lazy loading (see *RTLD_LAZY* in *dlopen()*), load ordering
 24945 shall be used in *dlsym()* operations to relocate executable object files needed to resolve the
 24946 symbol. The symbol resolution algorithm used shall be dependency order as described in
 24947 *dlopen()*.

24948 The *RTLD_DEFAULT* and *RTLD_NEXT* symbolic constants (which may be defined in
 24949 <dlfcn.h>) are reserved for future use as special values that applications may be allowed to use
 24950 for *handle*.

24951 **RETURN VALUE**

24952 Upon successful completion, if *name* names a function identifier, *dlsym()* shall return the address +
 24953 of the function converted from type pointer to function to type pointer to **void**; otherwise, +
 24954 *dlsym()* shall return the address of the data object associated with the data object identifier +
 24955 named by *name* converted from a pointer to the type of the data object to a pointer to **void**. If
 24956 *handle* does not refer to a valid symbol table handle or if the symbol named by *name* cannot be
 24957 found in the symbol table associated with *handle*, *dlsym()* shall return a null pointer. |

24958 More detailed diagnostic information shall be available through *dlerror()*.24959 **ERRORS**

24960 No errors are defined.

24961 **EXAMPLES**

24962 The following example shows how *dlopen()* and *dlsym()* can be used to access either a function |
 24963 or a data object. For simplicity, error checking has been omitted.

```
24964 void *handle; |
24965 int (*fptr)(int), *iptr, result; |
24966 /* open the needed symbol table */ |
24967 handle = dlopen("/usr/home/me/libfoo.so", RTLD_LOCAL | RTLD_LAZY); |
24968 /* find the address of the function my_function */ |
24969 fptr = (int (*)(int))dlsym(handle, "my_function"); |
24970 /* find the address of the data object my_object */ |
24971 iptr = (int *)dlsym(handle, "my_OBJ"); |
24972 /* invoke my_function, passing the value of my_OBJ as the parameter */ |
24973 result = (*fptr)(*iptr); |
```

APPLICATION USAGE

The following special purpose values for *handle* are reserved for future use and have the indicated meanings:

RTLD_DEFAULT The identifier lookup happens in the normal global scope; that is, a search for an identifier using *handle* would find the same definition as a direct use of this identifier in the program code.

RTLD_NEXT Specifies the next executable object file after this one that defines *name*. This one refers to the executable object file containing the invocation of *dlsym()*. The next executable object file is the one found upon the application of a load order symbol resolution algorithm (see *dlopen()*). The next symbol is either one of global scope (because it was introduced as part of the original process image or because it was added with a *dlopen()* operation including the **RTLD_GLOBAL** flag), or is in an executable object file that was included in the same *dlopen()* operation that loaded this one.

The **RTLD_NEXT** flag is useful to navigate an intentionally created hierarchy of multiply-defined symbols created through interposition. For example, if a program wished to create an implementation of *malloc()* that embedded some statistics gathering about memory allocations, such an implementation could use the real *malloc()* definition to perform the memory allocation — and itself only embed the necessary logic to implement the statistics gathering function.

Note that conversion from a **void *** pointer to a function pointer as in:

```
fptr = (int (*)(int))dlsym(handle, "my_function");
```

is not defined by the ISO C standard. This standard requires this conversion to work correctly on conforming implementations.

NAME

drand48, *erand48*, *jrand48*, *lcong48*, *lrand48*, *mrand48*, *rand48*, *seed48*, *srand48* — generate uniformly distributed pseudo-random numbers

SYNOPSIS

```
#include <stdlib.h>

double drand48(void);
double erand48(unsigned short xsubi[3]);
long jrand48(unsigned short xsubi[3]);
void lcong48(unsigned short param[7]);
long lrand48(void);
long mrand48(void);
long nrand48(unsigned short xsubi[3]);
unsigned short *seed48(unsigned short seed16v[3]);
void srand48(long seedval);
```

DESCRIPTION

This family of functions shall generate pseudo-random numbers using a linear congruential algorithm and 48-bit integer arithmetic.

The *drand48()* and *erand48()* functions shall return non-negative, double-precision, floating-point values, uniformly distributed over the interval [0.0,1.0).

The *lrand48()* and *nrand48()* functions shall return non-negative, long integers, uniformly distributed over the interval $[0, 2^{31})$.

The *mrand48()* and *jrand48()* functions shall return signed long integers uniformly distributed over the interval $[-2^{31}, 2^{31})$.

The *srand48()*, *seed48()*, and *lcong48()* functions are initialization entry points, one of which should be invoked before either *drand48()*, *lrand48()*, or *mrand48()* is called. (Although it is not recommended practice, constant default initializer values shall be supplied automatically if *drand48()*, *lrand48()*, or *mrand48()* is called without a prior call to an initialization entry point.) The *erand48()*, *nrand48()*, and *jrand48()* functions do not require an initialization entry point to be called first.

All the routines work by generating a sequence of 48-bit integer values, X_i , according to the linear congruential formula:

$$X_{n+1} = (aX_n + c)_{\text{mod } m} \quad n \geq 0$$

The parameter $m = 2^{48}$; hence 48-bit integer arithmetic is performed. Unless *lcong48()* is invoked, the multiplier value a and the addend value c are given by:

$$a = 5\text{DEECE66D}_{16} = 273673163155_8$$

$$c = \text{B}_{16} = 13_8$$

The value returned by any of the *drand48()*, *erand48()*, *jrand48()*, *lrand48()*, *mrand48()*, or *nrand48()* functions is computed by first generating the next 48-bit X_i in the sequence. Then the appropriate number of bits, according to the type of data item to be returned, are copied from the high-order (leftmost) bits of X_i and transformed into the returned value.

The *drand48()*, *lrand48()*, and *mrand48()* functions store the last 48-bit X_i generated in an internal buffer; that is why the application shall ensure that these are initialized prior to being invoked. The *erand48()*, *nrand48()*, and *jrand48()* functions require the calling program to

provide storage for the successive X_i values in the array specified as an argument when the functions are invoked. That is why these routines do not have to be initialized; the calling program merely has to place the desired initial value of X_i into the array and pass it as an argument. By using different arguments, *erand48()*, *nrand48()*, and *jrand48()* allow separate modules of a large program to generate several *independent* streams of pseudo-random numbers; that is, the sequence of numbers in each stream shall *not* depend upon how many times the routines are called to generate numbers for the other streams.

The initializer function *srand48()* sets the high-order 32 bits of X_i to the low-order 32 bits contained in its argument. The low-order 16 bits of X_i are set to the arbitrary value $330E_{16}$.

The initializer function *seed48()* sets the value of X_i to the 48-bit value specified in the argument array. The low-order 16 bits of X_i are set to the low-order 16 bits of *seed16v*[0]. The mid-order 16 bits of X_i are set to the low-order 16 bits of *seed16v*[1]. The high-order 16 bits of X_i are set to the low-order 16 bits of *seed16v*[2]. In addition, the previous value of X_i is copied into a 48-bit internal buffer, used only by *seed48()*, and a pointer to this buffer is the value returned by *seed48()*. This returned pointer, which can just be ignored if not needed, is useful if a program is to be restarted from a given point at some future time—use the pointer to get at and store the last X_i value, and then use this value to reinitialize via *seed48()* when the program is restarted.

The initializer function *lcong48()* allows the user to specify the initial X_i , the multiplier value a , and the addend value c . Argument array elements *param*[0-2] specify X_i , *param*[3-5] specify the multiplier a , and *param*[6] specifies the 16-bit addend c . After *lcong48()* is called, a subsequent call to either *srand48()* or *seed48()* shall restore the standard multiplier and addend values, a and c , specified above.

The *drand48()*, *lrand48()*, and *mrand48()* functions need not be thread-safe.

RETURN VALUE

As described in the DESCRIPTION above.

ERRORS

No errors are defined.

25117 int dup(int fd);
25118 int dup2(int fd, int fd2);
```

25119 **DESCRIPTION**

25120 The `dup()` function provides an alternative interface to the service provided by `fcntl()` using the
 25121 `F_DUPFD` command. The call `dup(fd)` shall be equivalent to:

```
25122 fcntl(fd, F_DUPFD, 0);
```

25123 The `dup2()` function shall cause the file descriptor *fd2* to refer to the same open file
 25124 description as the file descriptor *fd* and to share any locks, and shall return *fd2*. If *fd2* is
 25125 already a valid open file descriptor, it shall be closed first, unless *fd* is equal to *fd2* in which
 25126 case `dup2()` shall return *fd2* without closing it. If the close operation fails to close *fd2*,
 25127 `dup2()` shall return `-1` without changing the open file description to which *fd2* refers. If *fd*
 25128 is not a valid file descriptor, `dup2()` shall return `-1` and shall not close *fd2*. If *fd2* is less than
 25129 0 or greater than or equal to `{OPEN_MAX}`, `dup2()` shall return `-1` with *errno* set to `[EBADF]`.

25130 Upon successful completion, if *fd* is not equal to *fd2*, the `FD_CLOEXEC` flag associated
 25131 with *fd2* shall be cleared. If *fd* is equal to *fd2*, the `FD_CLOEXEC` flag associated with
 25132 *fd2* shall not be changed.

25133 **TYM** If *fd* refers to a typed memory object, the result of the `dup2()` function is unspecified.

25134 **RETURN VALUE**

25135 Upon successful completion a non-negative integer, namely the file descriptor, shall be returned;
 25136 otherwise, `-1` shall be returned and *errno* set to indicate the error.

25137 **ERRORS**

25138 The `dup()` function shall fail if:

25139 `[EBADF]` The *fd* argument is not a valid open file descriptor.

25140 `[EMFILE]` All file descriptors available to the process are currently open.

25141 The `dup2()` function shall fail if:

25142 `[EBADF]` The *fd* argument is not a valid open file descriptor or the argument *fd2* is
 25143 negative or greater than or equal to `{OPEN_MAX}`.

25144 `[EINTR]` The `dup2()` function was interrupted by a signal.

25145 The `dup2()` function may fail if:

25146 `[EIO]` An I/O error occurred while attempting to close *fd2*.

25147 **EXAMPLES**25148 **Redirecting Standard Output to a File**

25149 The following example closes standard output for the current processes, re-assigns standard
 25150 output to go to the file referenced by *pfid*, and closes the original file descriptor to clean up.

```
25151 #include <unistd.h>
25152 ...
25153 int pfid;
25154 ...
```

```

25155     close(1);
25156     dup(pfd);
25157     close(pfd);
25158     ...

```

25159 Redirecting Error Messages

25160 The following example redirects messages from *stderr* to *stdout*.

```

25161     #include <unistd.h>
25162     ...
25163     dup2(1, 2);
25164     ...

```

25165 APPLICATION USAGE

25166 Implementations may use file descriptors that must be inherited into child processes for the
 25167 child process to remain conforming, such as for message catalog or tracing purposes. Therefore,
 25168 an application that calls *dup2()* with an arbitrary integer for *fildest* risks non-conforming
 25169 behavior, and *dup2()* can only portably be used to overwrite file descriptor values that the
 25170 application has obtained through explicit actions, or for the three file descriptors corresponding
 25171 to the standard file streams. In order to avoid a race condition of leaking an unintended file
 25172 descriptor into a child process, an application should consider opening all file descriptors with
 25173 the FD_CLOEXEC bit set unless the file descriptor is intended to be inherited across *exec*.

25174 RATIONALE

25175 The *dup()* function is redundant. Its services are also provided by the *fcntl()* function. It has been
 25176 included in this volume of POSIX.1-2008 primarily for historical reasons, since many existing
 25177 applications use it. On the other hand, the *dup2()* function provides unique services, as no other
 25178 interface is able to atomically replace an existing file descriptor.

25179 The *dup2()* function is not marked obsolescent because it presents a type-safe version of
 25180 functionality provided in a type-unsafe version by *fcntl()*. It is used in the POSIX Ada binding.

25181 The *dup2()* function is not intended for use in critical regions as a synchronization mechanism.

25182 In the description of [EBADF], the case of *fildest* being out of range is covered by the given case of
 25183 *fildest* not being valid. The descriptions for *fildest* and *fildest2* are different because the only kind of
 25184 invalidity that is relevant for *fildest2* is whether it is out of range; that is, it does not matter
 25185 whether *fildest2* refers to an open file when the *dup2()* call is made.

25186 FUTURE DIRECTIONS

25187 None.

25191 CHANGE HISTORY

25192 First released in Issue 1. Derived from Issue 1 of the SVID.

25193 Issue 7

25194 SD5-XSH-ERN-187 is applied.

25195 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0075 [149,428] and +
 25196 XSH/TC1-2008/0076 [149] are applied.

25197 **NAME**

25198 duplocale — duplicate a locale object

25199 **SYNOPSIS**

```

25200 CX      #include <locale.h>
25201         locale_t duplocale(locale_t locobj);

```

25202 **DESCRIPTION**

25203 The *duplocale()* function shall create a duplicate copy of the locale object referenced by the *locobj*
 25204 argument.

25205 If the *locobj* argument is `LC_GLOBAL_LOCALE`, *duplocale()* shall create a new locale object +
 25206 containing a copy of the global locale determined by the *setlocale()* function. +

25207 The behavior is undefined if the *locobj* argument is not a valid locale object handle.

25208 **RETURN VALUE**

25209 Upon successful completion, the *duplocale()* function shall return a handle for a new locale
 25210 object. Otherwise, *duplocale()* shall return `(locale_t)0` and set *errno* to indicate the error.

25211 **ERRORS**

25212 The *duplocale()* function shall fail if:

25213 [ENOMEM] There is not enough memory available to create the locale object or load the
 25214 locale data.

25215 **EXAMPLES**25216 **Constructing an Altered Version of an Existing Locale Object**

25217 The following example shows a code fragment to create a slightly altered version of an existing
 25218 locale object. The function takes a locale object and a locale name and it replaces the *LC_TIME*
 25219 category data in the locale object with that from the named locale.

```

25220     #include <locale.h>
25221     ...
25222     locale_t
25223     with_changed_lc_time (locale_t obj, const char *name)
25224     {
25225         locale_t retval = duplocale (obj);
25226         if (retval != (locale_t) 0)
25227         {
25228             locale_t changed = newlocale (LC_TIME_MASK, name, retval);
25229             if (changed == (locale_t) 0)
25230                 /* An error occurred. Free all allocated resources. */
25231                 freelocale (retval);
25232             retval = changed;
25233         }
25234         return retval; }
25235     }

```

APPLICATION USAGE

The use of the *duplocale()* function is recommended for situations where a locale object is being used in multiple places, and it is possible that the lifetime of the locale object might end before all uses are finished. Another reason to duplicate a locale object is if a slightly modified form is needed. This can be achieved by a call to *newlocale()* following the *duplocale()* call.

As with the *newlocale()* function, handles for locale objects created by the *duplocale()* function should be released by a corresponding call to *freelocale()*.

The *duplocale()* function can also be used in conjunction with *uselocale(locale_t)*. This returns the locale in effect for the calling thread, but can have the value LC_GLOBAL_LOCALE. Passing LC_GLOBAL_LOCALE to functions such as *isalnum_l()* results in undefined behavior, but applications can convert it into a usable locale object by using *duplocale()*.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 7.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0077 [283,301], XSH/TC1-2008/0078 [283], and XSH/TC1-2008/0079 [301] are applied.

NAME

encrypt — encoding function (**CRYPT**)

SYNOPSIS

```
XSI      #include <unistd.h>
void encrypt(char block[64], int edflag);
```

DESCRIPTION

The *encrypt()* function shall provide access to an implementation-defined encoding algorithm. The key generated by *setkey()* is used to encrypt the string *block* with *encrypt()*.

The *block* argument to *encrypt()* shall be an array of length 64 bytes containing only the bytes with values of 0 and 1. The array is modified in place to a similar array using the key set by *setkey()*. If *edflag* is 0, the argument is encoded. If *edflag* is 1, the argument may be decoded (see the APPLICATION USAGE section); if the argument is not decoded, *errno* shall be set to [ENOSYS].

The *encrypt()* function shall not change the setting of *errno* if successful. An application wishing to check for error situations should set *errno* to 0 before calling *encrypt()*. If *errno* is non-zero on return, an error has occurred.

The *encrypt()* function need not be thread-safe.

RETURN VALUE

The *encrypt()* function shall not return a value.

ERRORS

The *encrypt()* function shall fail if:

[ENOSYS] The functionality is not supported on this implementation.

EXAMPLES

None.

APPLICATION USAGE

Historical implementations of the *encrypt()* function used a rather primitive encoding algorithm.

In some environments, decoding might not be implemented. This is related to some Government restrictions on encryption and decryption routines. Historical practice has been to ship a different version of the encryption library without the decryption feature in the routines supplied. Thus the exported version of *encrypt()* does encoding but not decoding.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

A note indicating that this function need not be reentrant is added to the DESCRIPTION.

Issue 6

In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

Issue 7

Austin Group Interpretation 1003.1-2001 #156 is applied.

25303 **NAME**

25304 endgrent, getgrent, setgrent — group database entry functions

25305 **SYNOPSIS**

```

25306 XSI      #include <grp.h>
25307          void endgrent(void);
25308          struct group *getgrent(void);
25309          void setgrent(void);

```

25310 **DESCRIPTION**

25311 The *getgrent()* function shall return a pointer to a structure containing the broken-out fields of an
 25312 entry in the group database. When first called, *getgrent()* shall return a pointer to a **group**
 25313 structure containing the first entry in the group database. Thereafter, it shall return a pointer to a
 25314 **group** structure containing the next group structure in the group database, so successive calls
 25315 may be used to search the entire database.

25316 An implementation that provides extended security controls may impose further
 25317 implementation-defined restrictions on accessing the group database. In particular, the system
 25318 may deny the existence of some or all of the group database entries associated with groups other
 25319 than those groups associated with the caller and may omit users other than the caller from the
 25320 list of members of groups in database entries that are returned.

25321 The *setgrent()* function shall rewind the group database to allow repeated searches.

25322 The *endgrent()* function may be called to close the group database when processing is complete.

25323 These functions need not be thread-safe.

25324 **RETURN VALUE**

25325 When first called, *getgrent()* shall return a pointer to the first group structure in the group
 25326 database. Upon subsequent calls it shall return the next group structure in the group database.
 25327 The *getgrent()* function shall return a null pointer on end-of-file or an error and *errno* may be set
 25328 to indicate the error.

25329 The application shall not modify the structure to which the return value points, nor any storage |
 25330 areas pointed to by pointers within the structure. The returned pointer, and pointers within the |
 25331 structure, might be invalidated or the structure or the storage areas might be overwritten by a |
 25332 subsequent call to *getgrgid()*, *getgrnam()*, or *getgrent()*.

25333 **ERRORS**

25334 The *getgrent()* function may fail if:

25335	[EINTR]	A signal was caught during the operation.
25336	[EIO]	An I/O error has occurred.
25337	[EMFILE]	All file descriptors available to the process are currently open.
25338	[ENFILE]	The maximum allowable number of files is currently open in the system.

25339 EXAMPLES

25340 None.

25341 APPLICATION USAGE

25342 These functions are provided due to their historical usage. Applications should avoid
25343 dependencies on fields in the group database, whether the database is a single file, or where in
25344 the file system name space the database resides. Applications should use *getgrnam()* and
25345 *getgrgid()* whenever possible because it avoids these dependencies.

25346 RATIONALE

25347 None.

25348 FUTURE DIRECTIONS

25349 None.

25350 SEE ALSO

25351 *endpwent()*, *getgrgid()*, *getgrnam()*, *getlogin()*

25355 Issue 5

25356 Moved from X/OPEN UNIX extension to BASE.

25357 Normative text previously in the APPLICATION USAGE section is moved to the RETURN
25358 VALUE section.

25359 A note indicating that these functions need not be reentrant is added to the DESCRIPTION.

25360 Issue 6

25361 In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

25362 Issue 7

25363 Austin Group Interpretation 1003.1-2001 #156 is applied.

25364 SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.

25365 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0080 [75] is applied.

+

25366 **NAME**

25367 endhostent, gethostent, sethostent — network host database functions

25368 **SYNOPSIS**

```
25369     #include <netdb.h>
25370
25370     void endhostent(void);
25371     struct hostent *gethostent(void);
25372     void sethostent(int stayopen);
```

25373 **DESCRIPTION**

25374 These functions shall retrieve information about hosts. This information is considered to be
 25375 stored in a database that can be accessed sequentially or randomly. The implementation of this
 25376 database is unspecified.

25377 **Note:** In many cases this database is implemented by the Domain Name System, as documented in
 25378 RFC 1034, RFC 1035, and RFC 1886.

25379 The *sethostent()* function shall open a connection to the database and set the next entry for
 25380 retrieval to the first entry in the database. If the *stayopen* argument is non-zero, the connection
 25381 shall not be closed by a call to *gethostent()*, and the implementation may maintain an open file
 25382 descriptor.

25383 The *gethostent()* function shall read the next entry in the database, opening and closing a
 25384 connection to the database as necessary.

25385 Entries shall be returned in **hostent** structures.

25386 The *endhostent()* function shall close the connection to the database, releasing any open file
 25387 descriptor.

25388 These functions need not be thread-safe.

25389 **RETURN VALUE**

25390 Upon successful completion, the *gethostent()* function shall return a pointer to a **hostent**
 25391 structure if the requested entry was found, and a null pointer if the end of the database was
 25392 reached or the requested entry was not found.

25393 The application shall not modify the structure to which the return value points, nor any storage +
 25394 areas pointed to by pointers within the structure. The returned pointer, and pointers within the +
 25395 structure, might be invalidated or the structure or the storage areas might be overwritten by a +
 25396 subsequent call to *gethostent()*.

25397 **ERRORS**

25398 No errors are defined for *endhostent()*, *gethostent()*, and *sethostent()*.

NAME

endnetent, getnetbyaddr, getnetbyname, getnetent, setnetent — network database functions

SYNOPSIS

```
#include <netdb.h>

void endnetent(void);
struct netent *getnetbyaddr(uint32_t net, int type);
struct netent *getnetbyname(const char *name);
struct netent *getnetent(void);
void setnetent(int stayopen);
```

DESCRIPTION

These functions shall retrieve information about networks. This information is considered to be stored in a database that can be accessed sequentially or randomly. The implementation of this database is unspecified.

The *setnetent()* function shall open and rewind the database. If the *stayopen* argument is non-zero, the connection to the *net* database shall not be closed after each call to *getnetent()* (either directly, or indirectly through one of the other *getnet*()* functions), and the implementation may maintain an open file descriptor to the database.

The *getnetent()* function shall read the next entry of the database, opening and closing a connection to the database as necessary.

The *getnetbyaddr()* function shall search the database from the beginning, and find the first entry for which the address family specified by *type* matches the *n_addrtype* member and the network number *net* matches the *n_net* member, opening and closing a connection to the database as necessary. The *net* argument shall be the network number in host byte order.

The *getnetbyname()* function shall search the database from the beginning and find the first entry for which the network name specified by *name* matches the *n_name* member, opening and closing a connection to the database as necessary.

The *getnetbyaddr()*, *getnetbyname()*, and *getnetent()* functions shall each return a pointer to a **netent** structure, the members of which shall contain the fields of an entry in the network database.

The *endnetent()* function shall close the database, releasing any open file descriptor.

These functions need not be thread-safe.

RETURN VALUE

Upon successful completion, *getnetbyaddr()*, *getnetbyname()*, and *getnetent()* shall return a pointer to a **netent** structure if the requested entry was found, and a null pointer if the end of the database was reached or the requested entry was not found. Otherwise, a null pointer shall be returned.

The application shall not modify the structure to which the return value points, nor any storage areas pointed to by pointers within the structure. The returned pointer, and pointers within the structure, might be invalidated or the structure or the storage areas might be overwritten by a subsequent call to *getnetbyaddr()*, *getnetbyname()*, or *getnetent()*.

25474 **NAME**

25475 endprotoent, getprotobyname, getprotobynumber, getprotoent, setprotoent — network protocol
 25476 database functions

25477 **SYNOPSIS**

```
25478 #include <netdb.h>
25479
25479 void endprotoent(void);
25480 struct protoent *getprotobyname(const char *name);
25481 struct protoent *getprotobynumber(int proto);
25482 struct protoent *getprotoent(void);
25483 void setprotoent(int stayopen);
```

25484 **DESCRIPTION**

25485 These functions shall retrieve information about protocols. This information is considered to be
 25486 stored in a database that can be accessed sequentially or randomly. The implementation of this
 25487 database is unspecified.

25488 The *setprotoent()* function shall open a connection to the database, and set the next entry to the
 25489 first entry. If the *stayopen* argument is non-zero, the connection to the network protocol database
 25490 shall not be closed after each call to *getprotoent()* (either directly, or indirectly through one of the
 25491 other *getproto**() functions), and the implementation may maintain an open file descriptor for
 25492 the database.

25493 The *getprotobyname()* function shall search the database from the beginning and find the first
 25494 entry for which the protocol name specified by *name* matches the *p_name* member, opening and
 25495 closing a connection to the database as necessary.

25496 The *getprotobynumber()* function shall search the database from the beginning and find the first
 25497 entry for which the protocol number specified by *proto* matches the *p_proto* member, opening
 25498 and closing a connection to the database as necessary.

25499 The *getprotoent()* function shall read the next entry of the database, opening and closing a
 25500 connection to the database as necessary.

25501 The *getprotobyname()*, *getprotobynumber()*, and *getprotoent()* functions shall each return a pointer
 25502 to a **protoent** structure, the members of which shall contain the fields of an entry in the network
 25503 protocol database.

25504 The *endprotoent()* function shall close the connection to the database, releasing any open file
 25505 descriptor.

25506 These functions need not be thread-safe.

25507 **RETURN VALUE**

25508 Upon successful completion, *getprotobyname()*, *getprotobynumber()*, and *getprotoent()* return a
 25509 pointer to a **protoent** structure if the requested entry was found, and a null pointer if the end of
 25510 the database was reached or the requested entry was not found. Otherwise, a null pointer is
 25511 returned.

25512 The application shall not modify the structure to which the return value points, nor any storage +
 25513 areas pointed to by pointers within the structure. The returned pointer, and pointers within the +
 25514 structure, might be invalidated or the structure or the storage areas might be overwritten by a +
 25515 subsequent call to *getprotobyname()*, *getprotobynumber()*, or *getprotoent()*.

NAME

endpwent, getpwent, setpwent — user database functions

SYNOPSIS

```
XSI    #include <pwd.h>

void endpwent(void);
struct passwd *getpwent(void);
void setpwent(void);
```

DESCRIPTION

These functions shall retrieve information about users.

The *getpwent()* function shall return a pointer to a structure containing the broken-out fields of an entry in the user database. Each entry in the user database contains a **passwd** structure. When first called, *getpwent()* shall return a pointer to a **passwd** structure containing the first entry in the user database. Thereafter, it shall return a pointer to a **passwd** structure containing the next entry in the user database. Successive calls can be used to search the entire user database.

If an end-of-file or an error is encountered on reading, *getpwent()* shall return a null pointer.

An implementation that provides extended security controls may impose further implementation-defined restrictions on accessing the user database. In particular, the system may deny the existence of some or all of the user database entries associated with users other than the caller.

The *setpwent()* function effectively rewinds the user database to allow repeated searches.

The *endpwent()* function may be called to close the user database when processing is complete.

These functions need not be thread-safe.

RETURN VALUE

The *getpwent()* function shall return a null pointer on end-of-file or error.

The application shall not modify the structure to which the return value points, nor any storage areas pointed to by pointers within the structure. The returned pointer, and pointers within the structure, might be invalidated or the structure or the storage areas might be overwritten by a subsequent call to *getpwuid()*, *getpwnam()*, or *getpwent()*.

ERRORS

These functions may fail if:

[EIO] An I/O error has occurred.

In addition, *getpwent()* and *setpwent()* may fail if:

[EMFILE] All file descriptors available to the process are currently open.

[ENFILE] The maximum allowable number of files is currently open in the system.

25568 **EXAMPLES**25569 **Searching the User Database**

25570 The following example uses the *getpwent()* function to get successive entries in the user
 25571 database, returning a pointer to a **passwd** structure that contains information about each user.
 25572 The call to *endpwent()* closes the user database and cleans up.

```
25573 #include <pwd.h>
25574 #include <stdio.h>

25575 void printname(uid_t uid)
25576 {
25577     struct passwd *pwd;

25578     setpwent();
25579     while((pwd = getpwent()) != NULL) {
25580         if (pwd->pw_uid == uid) {
25581             printf("name=%s\n", pwd->pw_name);
25582             break;
25583         }
25584     }
25585     endpwent();
25586 }
```

25587 **APPLICATION USAGE**

25588 These functions are provided due to their historical usage. Applications should avoid
 25589 dependencies on fields in the password database, whether the database is a single file, or where
 25590 in the file system name space the database resides. Applications should use *getpwuid()*
 25591 whenever possible because it avoids these dependencies.

NAME

endservent, getservbyname, getservbyport, getservent, setservent — network services database functions

SYNOPSIS

```
#include <netdb.h>

void endservent(void);
struct servent *getservbyname(const char *name, const char *proto);
struct servent *getservbyport(int port, const char *proto);
struct servent *getservent(void);
void setservent(int stayopen);
```

DESCRIPTION

These functions shall retrieve information about network services. This information is considered to be stored in a database that can be accessed sequentially or randomly. The implementation of this database is unspecified.

The *setservent()* function shall open a connection to the database, and set the next entry to the first entry. If the *stayopen* argument is non-zero, the *net* database shall not be closed after each call to the *getservent()* function (either directly, or indirectly through one of the other *getserv*()* functions), and the implementation may maintain an open file descriptor for the database.

The *getservent()* function shall read the next entry of the database, opening and closing a connection to the database as necessary.

The *getservbyname()* function shall search the database from the beginning and find the first entry for which the service name specified by *name* matches the *s_name* member and the protocol name specified by *proto* matches the *s_proto* member, opening and closing a connection to the database as necessary. If *proto* is a null pointer, any value of the *s_proto* member shall be matched.

The *getservbyport()* function shall search the database from the beginning and find the first entry for which the port specified by *port* matches the *s_port* member and the protocol name specified by *proto* matches the *s_proto* member, opening and closing a connection to the database as necessary. If *proto* is a null pointer, any value of the *s_proto* member shall be matched. The *port* argument shall be a value obtained by converting a **uint16_t** in network byte order to **int**.

The *getservbyname()*, *getservbyport()*, and *getservent()* functions shall each return a pointer to a **servent** structure, the members of which shall contain the fields of an entry in the network services database.

The *endservent()* function shall close the database, releasing any open file descriptor.

These functions need not be thread-safe.

RETURN VALUE

Upon successful completion, *getservbyname()*, *getservbyport()*, and *getservent()* return a pointer to a **servent** structure if the requested entry was found, and a null pointer if the end of the database was reached or the requested entry was not found. Otherwise, a null pointer is returned.

The application shall not modify the structure to which the return value points, nor any storage areas pointed to by pointers within the structure. The returned pointer, and pointers within the structure, might be invalidated or the structure or the storage areas might be overwritten by a subsequent call to *getservbyname()*, *getservbyport()*, or *getservent()*.

25656 **ERRORS**

25657 No errors are defined.

25658 **EXAMPLES**

25659 None.

25660 **APPLICATION USAGE**25661 The *port* argument of *getservbyport()* need not be compatible with the port values of all address
25662 families. -25663 **RATIONALE**

NAME

endutxent, getutxent, getutxid, getutxline, pututxline, setutxent — user accounting database functions

SYNOPSIS

```
#include <utmpx.h>

void endutxent(void);
struct utmpx *getutxent(void);
struct utmpx *getutxid(const struct utmpx *id);
struct utmpx *getutxline(const struct utmpx *line);
struct utmpx *pututxline(const struct utmpx *utmpx);
void setutxent(void);
```

DESCRIPTION

These functions shall provide access to the user accounting database.

The *getutxent()* function shall read the next entry from the user accounting database. If the database is not already open, it shall open it. If it reaches the end of the database, it shall fail.

The *getutxid()* function shall search forward from the current point in the database. If the *ut_type* value of the **utmpx** structure pointed to by *id* is *BOOT_TIME*, *OLD_TIME*, or *NEW_TIME*, then it shall stop when it finds an entry with a matching *ut_type* value. If the *ut_type* value is *INIT_PROCESS*, *LOGIN_PROCESS*, *USER_PROCESS*, or *DEAD_PROCESS*, then it shall stop when it finds an entry whose type is one of these four and whose *ut_id* member matches the *ut_id* member of the **utmpx** structure pointed to by *id*. If the end of the database is reached without a match, *getutxid()* shall fail.

The *getutxline()* function shall search forward from the current point in the database until it finds an entry of the type *LOGIN_PROCESS* or *USER_PROCESS* which also has a *ut_line* value matching that in the **utmpx** structure pointed to by *line*. If the end of the database is reached without a match, *getutxline()* shall fail.

The *getutxid()* or *getutxline()* function may cache data. For this reason, to use *getutxline()* to search for multiple occurrences, the application shall zero out the static data after each success, or *getutxline()* may return a pointer to the same **utmpx** structure.

There is one exception to the rule about clearing the structure before further reads are done. The implicit read done by *pututxline()* (if it finds that it is not already at the correct place in the user accounting database) shall not modify the static structure returned by *getutxent()*, *getutxid()*, or *getutxline()*, if the application has modified this structure and passed the pointer back to *pututxline()*.

For all entries that match a request, the *ut_type* member indicates the type of the entry. Other members of the entry shall contain meaningful data based on the value of the *ut_type* member as follows:

ut_type Member	Other Members with Meaningful Data
EMPTY	No others
BOOT_TIME	ut_tv
OLD_TIME	ut_tv
NEW_TIME	ut_tv
USER_PROCESS	ut_id, ut_user (login name of the user), ut_line, ut_pid, ut_tv
INIT_PROCESS	ut_id, ut_pid, ut_tv
LOGIN_PROCESS	ut_id, ut_user (implementation-defined name of the login process), ut_line, ut_pid, ut_tv
DEAD_PROCESS	ut_id, ut_pid, ut_tv

An implementation that provides extended security controls may impose implementation-defined restrictions on accessing the user accounting database. In particular, the system may deny the existence of some or all of the user accounting database entries associated with users other than the caller.

If the process has appropriate privileges, the *pututxline()* function shall write out the structure into the user accounting database. It shall search for a record as if by *getutxid()* that satisfies the request. If this search succeeds, then the entry shall be replaced. Otherwise, a new entry shall be made at the end of the user accounting database.

The *endutxent()* function shall close the user accounting database.

The *setutxent()* function shall reset the input to the beginning of the database. This should be done before each search for a new entry if it is desired that the entire database be examined.

These functions need not be thread-safe.

RETURN VALUE

Upon successful completion, *getutxent()*, *getutxid()*, and *getutxline()* shall return a pointer to a **utmpx** structure containing a copy of the requested entry in the user accounting database. Otherwise, a null pointer shall be returned.

The return value may point to a static area which is overwritten by a subsequent call to *getutxid()* or *getutxline()*.

Upon successful completion, *pututxline()* shall return a pointer to a **utmpx** structure containing a copy of the entry added to the user accounting database. Otherwise, a null pointer shall be returned.

The *endutxent()* and *setutxent()* functions shall not return a value.

ERRORS

No errors are defined for the *endutxent()*, *getutxent()*, *getutxid()*, *getutxline()*, and *setutxent()* functions.

The *pututxline()* function may fail if:

[EPERM] The process does not have appropriate privileges.

25751 EXAMPLES

25773 XSH/TC1-2008/0091 [213] are applied.

25774 NAME

25775 environ — array of character pointers to the environment strings

25776 SYNOPSIS

25777 extern char **environ;

25778 DESCRIPTION

25779 Refer to *exec* and XBD [Chapter 8](#) (on page 173).

25780 **NAME**

25781 erand48 — generate uniformly distributed pseudo-random numbers

25782 **SYNOPSIS**

25783 XSI #include <stdlib.h>

25784 double erand48(unsigned short xsubi[3]);

25785 **DESCRIPTION**25786 Refer to *drand48()*.

25787 **NAME**

25788 erf, erff, erfl — error functions

25789 **SYNOPSIS**

```
25790 #include <math.h>
25791 double erf(double x);
25792 float erff(float x);
25793 long double erfl(long double x);
```

25794 **DESCRIPTION**

25795 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 25796 conflict between the requirements described here and the ISO C standard is unintentional. This
 25797 volume of POSIX.1-2008 defers to the ISO C standard.

25798 These functions shall compute the error function of their argument x , defined as:

$$25799 \frac{2}{\sqrt{\pi}} \int_0^x e^{-t^2} dt$$

25800 An application wishing to check for error situations should set *errno* to zero and call
 25801 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 25802 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 25803 zero, an error has occurred.

25804 **RETURN VALUE**

25805 Upon successful completion, these functions shall return the value of the error function.

25806 MX If x is NaN, a NaN shall be returned.

25807 If x is ± 0 , ± 0 shall be returned.

25808 If x is $\pm \text{Inf}$, ± 1 shall be returned.

25809 If the correct value would cause underflow, a range error may occur, and *erf()*, *erff()*, and *erfl()* |
 25810 shall return an implementation-defined value no greater in magnitude than DBL_MIN, |
 25811 FLT_MIN, and LDBL_MIN, respectively. |

25812 MXX If the IEC 60559 Floating-Point option is supported, $2 * x / \sqrt{\pi}$ should be returned.

25813 **ERRORS**

25814 These functions may fail if:

25815 MX **Range Error** The result underflows.

25816 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 25817 then *errno* shall be set to [ERANGE]. If the integer expression
 25818 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the underflow
 25819 floating-point exception shall be raised.

25820 **EXAMPLES**25821 **Computing the Probability for a Normal Variate**

25822 This example shows how to use *erf()* to compute the probability that a normal variate assumes a
 25823 value in the range $[x_1, x_2]$ with $x_1 \leq x_2$.

25824 This example uses the constant `M_SQRT1_2` which is part of the XSI option.

```
25825 #include <math.h>
25826
25827 double
25828 Phi(const double x1, const double x2)
25829 {
25830     return ( erf(x2*M_SQRT1_2) - erf(x1*M_SQRT1_2) ) / 2;
```

25831 **APPLICATION USAGE**

25832 Underflow occurs when $|x| < \text{DBL\_MIN} * (\sqrt{\pi}/2)$.

25833 On error, the expressions `(math_errhandling & MATH_ERRNO)` and `(math_errhandling &`
 25834 `MATH_ERREXCEPT)` are independent of each other, but at least one of them must be non-zero.

25835 **RATIONALE**

25836 None.

25837 **FUTURE DIRECTIONS**

25838 None.

25839 **SEE ALSO**

25840 *erfc()*, *feclearexcept()*, *fetestexcept()*, *isnan()*

25841 XBD [Section 4.19](#) (on page 116), `<math.h>`

25842 **CHANGE HISTORY**

25843 First released in Issue 1. Derived from Issue 1 of the SVID.

25844 **Issue 5**

25845 The DESCRIPTION is updated to indicate how an application should check for an error. This
 25846 text was previously published in the APPLICATION USAGE section.

25847 **Issue 6**

25848 The *erf()* function is no longer marked as an extension.

25849 The *erfc()* function is split out onto its own reference page.

25850 The *erfff()* and *erfl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

25851 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are
 25852 revised to align with the ISO/IEC 9899:1999 standard.

25853 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are
 25854 marked.

25855 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/22 is applied, adding the example to the
 25856 EXAMPLES section.

25857 **Issue 7**

25858 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0092 [68] is applied.

+

25859 **NAME**25860 `erfc`, `erfcf`, `erfcl` — complementary error functions25861 **SYNOPSIS**

```
25862     #include <math.h>

25863     double erfc(double x);
25864     float erfcf(float x);
25865     long double erfcl(long double x);
```

25866 **DESCRIPTION**

25867 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 25868 conflict between the requirements described here and the ISO C standard is unintentional. This
 25869 volume of POSIX.1-2008 defers to the ISO C standard.

25870 These functions shall compute the complementary error function $1.0 - \text{erf}(x)$.

25871 An application wishing to check for error situations should set *errno* to zero and call
 25872 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 25873 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 25874 zero, an error has occurred.

25875 **RETURN VALUE**

25876 Upon successful completion, these functions shall return the value of the complementary error
 25877 function.

25878 MXX If the correct value would cause underflow, and is not representable, a range error may occur, |
 25879 MXX and *erfc*(), *erfcf*(), and *erfcl*() shall return 0.0, or (if the IEC 60559 Floating-Point option is not |
 25880 supported) an implementation-defined value no greater in magnitude than DBL_MIN, |
 25881 FLT_MIN, and LDBL_MIN, respectively.

25882 MX If *x* is NaN, a NaN shall be returned.

25883 If *x* is ± 0 , +1 shall be returned.

25884 If *x* is $-\text{Inf}$, +2 shall be returned.

25885 If *x* is $+\text{Inf}$, +0 shall be returned.

25886 MXX If the correct value would cause underflow and is representable, a range error may occur and
 25887 the correct value shall be returned.

25888 **ERRORS**

25889 These functions may fail if:

25890 Range Error The result underflows.

25891 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 25892 then *errno* shall be set to [ERANGE]. If the integer expression
 25893 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the underflow
 25894 floating-point exception shall be raised.

25895 **EXAMPLES**

25896 None.

25897 **APPLICATION USAGE**

25898 The *erfc()* function is provided because of the extreme loss of relative accuracy if *erf(x)* is called
25899 for large *x* and the result subtracted from 1.0.

25900 Note for IEEE Std 754-1985 **double**, $26.55 < x$ implies *erfc(x)* has underflowed.

25901 On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* &
25902 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

25903 **RATIONALE**

25904 None.

25905 **FUTURE DIRECTIONS**

25906 None.

25907 **SEE ALSO**25908 *erf()*, *feclearexcept()*, *fetestexcept()*, *isnan()*

25924 [68] are applied.

25925 **NAME**25926 **erff, erfl** — error functions25927 **SYNOPSIS**25928 `#include <math.h>`25929 `float erff(float x);`25930 `long double erfl(long double x);`25931 **DESCRIPTION**25932 Refer to *erf()*.

25933 NAME

25934 `errno` — error return value

25935 SYNOPSIS

25936 `#include <errno.h>`

25937 DESCRIPTION

25938 The lvalue *errno* is used by many functions to return error values.

25939 Many functions provide an error number in *errno*, which has type `int` and is defined in
25940 **<errno.h>**. The value of *errno* shall be defined only after a call to a function for which it is
25941 explicitly stated to be set and until it is changed by the next function call or if the application
25942 assigns it a value. The value of *errno* should only be examined when it is indicated to be valid by
25943 a function's return value. Applications shall obtain the definition of *errno* by the inclusion of
25944 **<errno.h>**. No function in this volume of POSIX.1-2008 shall set *errno* to 0. The setting of *errno*
25945 after a successful call to a function is unspecified unless the description of that function specifies
25946 that *errno* shall not be modified.

25947 It is unspecified whether *errno* is a macro or an identifier declared with external linkage. If a
25948 macro definition is suppressed in order to access an actual object, or a program defines an
25949 identifier with the name *errno*, the behavior is undefined.

25950 The symbolic values stored in *errno* are documented in the ERRORS sections on all relevant
25951 pages.

25952 RETURN VALUE

25953 None.

25954 ERRORS

25955 None.

25956 EXAMPLES

25957 None.

25958 APPLICATION USAGE

25959 Previously both POSIX and X/Open documents were more restrictive than the ISO C standard
25960 in that they required *errno* to be defined as an external variable, whereas the ISO C standard
25961 required only that *errno* be defined as a modifiable lvalue with type `int`.

25962 An application that needs to examine the value of *errno* to determine the error should set it to 0
25963 before a function call, then inspect it before a subsequent function call.

25964 RATIONALE

25965 None.

25966 FUTURE DIRECTIONS

25967 None.

25970 XBD **<errno.h>**

25971 CHANGE HISTORY

25972 First released in Issue 1. Derived from Issue 1 of the SVID.

25973 Issue 5

25974 The following sentence is deleted from the DESCRIPTION: “The value of *errno* is 0 at program
25975 start-up, but is never set to 0 by any XSI function”.

25976 The DESCRIPTION also no longer states that conforming implementations may support the
25977 declaration:

25978 `extern int errno;`

25979 **Issue 6**

25980 Obsolescent text regarding defining *errno* as:

25981 `extern int errno`

25982 is removed.

25983 Text regarding no function setting *errno* to zero to indicate an error is changed to no function
25984 shall set *errno* to zero. This is for alignment with the ISO/IEC 9899:1999 standard.

25985 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/23 is applied, adding text to the
25986 DESCRIPTION stating that the setting of *errno* after a successful call to a function is unspecified
25987 unless the description of the function requires that it will not be modified.

25988 **NAME**

25989 environ, execl, execlx, execlp, execv, execve, execvp, fexecve — execute a file

25990 **SYNOPSIS**

```

25991 #include <unistd.h>

25992 extern char **environ;
25993 int execl(const char *path, const char *arg0, ... /*, (char *)0 */);
25994 int execlx(const char *path, const char *arg0, ... /*,
25995           (char *)0, char *const envp[] */);
25996 int execlp(const char *file, const char *arg0, ... /*, (char *)0 */);
25997 int execv(const char *path, char *const argv[]);
25998 int execve(const char *path, char *const argv[], char *const envp[]);
25999 int execvp(const char *file, char *const argv[]);
26000 int fexecve(int fd, char *const argv[], char *const envp[]);

```

26001 **DESCRIPTION**

26002 The *exec* family of functions shall replace the current process image with a new process image.
 26003 The new image shall be constructed from a regular, executable file called the *new process image*
 26004 *file*. There shall be no return from a successful *exec*, because the calling process image is overlaid
 26005 by the new process image.

26006 The *fexecve()* function shall be equivalent to the *execve()* function except that the file to be
 26007 executed is determined by the file descriptor *fd* instead of a pathname. The file offset of *fd* is
 26008 ignored.

26009 When a C-language program is executed as a result of a call to one of the *exec* family of
 26010 functions, it shall be entered as a C-language function call as follows:

```
26011 int main (int argc, char *argv[]);
```

26012 where *argc* is the argument count and *argv* is an array of character pointers to the arguments |
 26013 themselves. In addition, the following variable, which must be declared by the user if it is to be |
 26014 used directly:

```
26015 extern char **environ;
```

26016 is initialized as a pointer to an array of character pointers to the environment strings. The *argv*
 26017 and *environ* arrays are each terminated by a null pointer. The null pointer terminating the *argv*
 26018 array is not counted in *argc*.

26019 Applications can change the entire environment in a single operation by assigning the *environ* +
 26020 variable to point to an array of character pointers to the new environment strings. After +
 26021 assigning a new value to *environ*, applications should not rely on the new environment strings +
 26022 XSI remaining part of the environment, as a call to *getenv()*, *putenv()*, *setenv()*, *unsetenv()*, or any +
 26023 function that is dependent on an environment variable may, on noticing that *environ* has +
 26024 changed, copy the environment strings to a new array and assign *environ* to point to it. +

26025 Any application that directly modifies the pointers to which the *environ* variable points has +
 26026 undefined behavior. +

26027 Conforming multi-threaded applications shall not use the *environ* variable to access or modify
 26028 any environment variable while any other thread is concurrently modifying any environment
 26029 variable. A call to any function dependent on any environment variable shall be considered a
 26030 use of the *environ* variable to access that environment variable.

26031 The arguments specified by a program with one of the *exec* functions shall be passed on to the
 26032 new process image in the corresponding *main()* arguments.

26033 The argument *path* points to a pathname that identifies the new process image file.

26034 The argument *file* is used to construct a pathname that identifies the new process image file. If
 26035 the *file* argument contains a <slash> character, the *file* argument shall be used as the pathname
 26036 for this file. Otherwise, the path prefix for this file is obtained by a search of the directories
 26037 passed as the environment variable *PATH* (see XBD Chapter 8, on page 173). If this environment
 26038 variable is not present, the results of the search are implementation-defined.

26039 There are two distinct ways in which the contents of the process image file may cause the
 26040 execution to fail, distinguished by the setting of *errno* to either [ENOEXEC] or [EINVAL] (see the
 26041 ERRORS section). In the cases where the other members of the *exec* family of functions would
 26042 fail and set *errno* to [ENOEXEC], the *execlp()* and *execvp()* functions shall execute a command
 26043 interpreter and the environment of the executed command shall be as if the process invoked the
 26044 *sh* utility using *execl()* as follows:

26045 `execl(<shell path>, arg0, file, arg1, ..., (char *)0);`

26046 where <shell path> is an unspecified pathname for the *sh* utility, *file* is the process image file, and
 26047 for *execvp()*, where *arg0*, *arg1*, and so on correspond to the values passed to *execvp()* in *argv*[0],
 26048 *argv*[1], and so on.

26049 The arguments represented by *arg0*,... are pointers to null-terminated character strings. These
 26050 strings shall constitute the argument list available to the new process image. The list is
 26051 terminated by a null pointer. The argument *arg0* should point to a filename string that is
 26052 associated with the process being started by one of the *exec* functions.

26053 The argument *argv* is an array of character pointers to null-terminated strings. The application
 26054 shall ensure that the last member of this array is a null pointer. These strings shall constitute the
 26055 argument list available to the new process image. The value in *argv*[0] should point to a filename
 26056 string that is associated with the process being started by one of the *exec* functions.

26057 The argument *envp* is an array of character pointers to null-terminated strings. These strings
 26058 shall constitute the environment for the new process image. The *envp* array is terminated by a
 26059 null pointer.

26060 For those forms not containing an *envp* pointer (*execl()*, *execv()*, *execlp()*, and *execvp()*), the
 26061 environment for the new process image shall be taken from the external variable *environ* in the
 26062 calling process.

26063 The number of bytes available for the new process' combined argument and environment lists is
 26064 {ARG_MAX}. It is implementation-defined whether null terminators, pointers, and/or any
 26065 alignment bytes are included in this total.

26066 File descriptors open in the calling process image shall remain open in the new process image,
 26067 except for those whose close-on-exec flag FD_CLOEXEC is set. For those file descriptors that
 26068 remain open, all attributes of the open file description remain unchanged. For any file descriptor
 26069 that is closed for this reason, file locks are removed as a result of the close as described in *close()*.
 26070 Locks that are not removed by closing of file descriptors remain unchanged.

26071 If file descriptor 0, 1, or 2 would otherwise be closed after a successful call to one of the *exec*
 26072 family of functions, implementations may open an unspecified file for the file descriptor in the
 26073 new process image. If a standard utility or a conforming application is executed with file
 26074 descriptor 0 not open for reading or with file descriptor 1 or 2 not open for writing, the
 26075 environment in which the utility or application is executed shall be deemed non-conforming,
 26076 and consequently the utility or application might not behave as described in this standard.

26077 Directory streams open in the calling process image shall be closed in the new process image.

26078		The state of the floating-point environment in the initial thread of the new process image shall
26079		be set to the default.
26080		The state of conversion descriptors and message catalog descriptors in the new process image is
26081		undefined.
26082		For the new process image, the equivalent of:
26083		<code>setlocale(LC_ALL, "C")</code>
26084		shall be executed at start-up.
26085		Signals set to the default action (SIG_DFL) in the calling process image shall be set to the default
26086		action in the new process image. Except for SIGCHLD, signals set to be ignored (SIG_IGN) by
26087		the calling process image shall be set to be ignored by the new process image. Signals set to be
26088		caught by the calling process image shall be set to the default action in the new process image
26089		(see <signal.h>).
26090		If the SIGCHLD signal is set to be ignored by the calling process image, it is unspecified whether
26091		the SIGCHLD signal is set to be ignored or to the default action in the new process image.
26092	XSI	After a successful call to any of the <i>exec</i> functions, alternate signal stacks are not preserved and
26093		the SA_ONSTACK flag shall be cleared for all signals.
26094		After a successful call to any of the <i>exec</i> functions, any functions previously registered by the
26095		<i>atexit()</i> or <i>pthread_atfork()</i> functions are no longer registered.
26096	XSI	If the ST_NOSUID bit is set for the file system containing the new process image file, then the
26097		effective user ID, effective group ID, saved set-user-ID, and saved set-group-ID are unchanged
26098		in the new process image. Otherwise, if the set-user-ID mode bit of the new process image file is
26099		set, the effective user ID of the new process image shall be set to the user ID of the new process
26100		image file. Similarly, if the set-group-ID mode bit of the new process image file is set, the
26101		effective group ID of the new process image shall be set to the group ID of the new process
26102		image file. The real user ID, real group ID, and supplementary group IDs of the new process
26103		image shall remain the same as those of the calling process image. The effective user ID and
26104		effective group ID of the new process image shall be saved (as the saved set-user-ID and the
26105		saved set-group-ID) for use by <i>setuid()</i> .
26106	XSI	Any shared memory segments attached to the calling process image shall not be attached to the
26107		new process image.
26108		Any named semaphores open in the calling process shall be closed as if by appropriate calls to
26109		<i>sem_close()</i> .
26110	TYM	Any blocks of typed memory that were mapped in the calling process are unmapped, as if
26111		<i>munmap()</i> was implicitly called to unmap them.
26112	ML	Memory locks established by the calling process via calls to <i>mlockall()</i> or <i>mlock()</i> shall be
26113		removed. If locked pages in the address space of the calling process are also mapped into the
26114		address spaces of other processes and are locked by those processes, the locks established by the
26115		other processes shall be unaffected by the call by this process to the <i>exec</i> function. If the <i>exec</i>
26116		function fails, the effect on memory locks is unspecified.
26117		Memory mappings created in the process are unmapped before the address space is rebuilt for
26118		the new process image.
26119	SS	When the calling process image does not use the SCHED_FIFO, SCHED_RR, or
26120		SCHED_SPORADIC scheduling policies, the scheduling policy and parameters of the new
26121		process image and the initial thread in that new process image are implementation-defined.

26122	PS	When the calling process image uses the SCHED_FIFO, SCHED_RR, or SCHED_SPORADIC scheduling policies, the process policy and scheduling parameter settings shall not be changed by a call to an <i>exec</i> function. The initial thread in the new process image shall inherit the process scheduling policy and parameters. It shall have the default system contention scope, but shall inherit its allocation domain from the calling process image.
26123		
26124	TPS	
26125		
26126		
26127		Per-process timers created by the calling process shall be deleted before replacing the current process image with the new process image.
26128		
26129	MSG	All open message queue descriptors in the calling process shall be closed, as described in <i>mq_close()</i> .
26130		
26131		Any outstanding asynchronous I/O operations may be canceled. Those asynchronous I/O operations that are not canceled shall complete as if the <i>exec</i> function had not yet occurred, but any associated signal notifications shall be suppressed. It is unspecified whether the <i>exec</i> function itself blocks awaiting such I/O completion. In no event, however, shall the new process image created by the <i>exec</i> function be affected by the presence of outstanding asynchronous I/O operations at the time the <i>exec</i> function is called. Whether any I/O is canceled, and which I/O may be canceled upon <i>exec</i> , is implementation-defined.
26132		
26133		
26134		
26135		
26136		
26137		
26138	CPT	The new process image shall inherit the CPU-time clock of the calling process image. This inheritance means that the process CPU-time clock of the process being <i>exec</i> -ed shall not be reinitialized or altered as a result of the <i>exec</i> function other than to reflect the time spent by the process executing the <i>exec</i> function itself.
26139		
26140		
26141		
26142	TCT	The initial value of the CPU-time clock of the initial thread of the new process image shall be set to zero.
26143		
26144	OB TRC	If the calling process is being traced, the new process image shall continue to be traced into the same trace stream as the original process image, but the new process image shall not inherit the mapping of trace event names to trace event type identifiers that was defined by calls to the <i>posix_trace_eventid_open()</i> or the <i>posix_trace_trid_eventid_open()</i> functions in the calling process image.
26145		
26146		
26147		
26148		If the calling process is a trace controller process, any trace streams that were created by the calling process shall be shut down as described in the <i>posix_trace_shutdown()</i> function.
26149		
26150		
26151		The thread ID of the initial thread in the new process image is unspecified.
26152		The size and location of the stack on which the initial thread in the new process image runs is unspecified.
26153		
26154		The initial thread in the new process image shall have its cancellation type set to <code>PTHREAD_CANCEL_DEFERRED</code> and its cancellation state set to <code>PTHREAD_CANCEL_ENABLED</code> .
26155		
26156		
26157		The initial thread in the new process image shall have all thread-specific data values set to NULL and all thread-specific data keys shall be removed by the call to <i>exec</i> without running destructors.
26158		
26159		
26160		The initial thread in the new process image shall be joinable, as if created with the <i>detachstate</i> attribute set to <code>PTHREAD_CREATE_JOINABLE</code> .
26161		
26162		The new process shall inherit at least the following attributes from the calling process image:
26163	XSI	Nice value (see <i>nice()</i>)

26164	XSI	• <code>semadj</code> values (see <code>semop()</code>)
26165		• Process ID
26166		• Parent process ID
26167		• Process group ID
26168		• Session membership
26169		• Real user ID
26170		• Real group ID
26171		• Supplementary group IDs
26172		• Time left until an alarm clock signal (see <code>alarm()</code>)
26173		• Current working directory
26174		• Root directory
26175		• File mode creation mask (see <code>umask()</code>)
26176	XSI	• File size limit (see <code>getrlimit()</code> and <code>setrlimit()</code>)
26177		• Process signal mask (see <code>pthread_sigmask()</code>)
26178		• Pending signal (see <code>sigpending()</code>)
26179		• <code>tms_utime</code>, <code>tms_stime</code>, <code>tms_cutime</code>, and <code>tms_cstime</code> (see <code>times()</code>)
26180	XSI	• Resource limits
26181		• Controlling terminal
26182	XSI	• Interval timers
26183		The initial thread of the new process shall inherit at least the following attributes from the
26184		calling thread:
26185		• Signal mask (see <code>sigprocmask()</code> and <code>pthread_sigmask()</code>)
26186		• Pending signals (see <code>sigpending()</code>)
26187		All other process attributes defined in this volume of POSIX.1-2008 shall be inherited in the new
26188		process image from the old process image. All other thread attributes defined in this volume of
26189		POSIX.1-2008 shall be inherited in the initial thread in the new process image from the calling
26190		thread in the old process image. The inheritance of process or thread attributes not defined by
26191		this volume of POSIX.1-2008 is implementation-defined.
26192		A call to any <i>exec</i> function from a process with more than one thread shall result in all threads
26193		being terminated and the new executable image being loaded and executed. No destructor
26194		functions or cleanup handlers shall be called.
26195		Upon successful completion, the <i>exec</i> functions shall mark for update the last data access
26196		timestamp of the file. If an <i>exec</i> function failed but was able to locate the process image file,
26197		whether the last data access timestamp is marked for update is unspecified. Should the <i>exec</i>
26198		function succeed, the process image file shall be considered to have been opened with <code>open()</code> .
26199		The corresponding <code>close()</code> shall be considered to occur at a time after this open, but before
26200		process termination or successful completion of a subsequent call to one of the <i>exec</i> functions,
26201		<code>posix_spawn()</code> , or <code>posix_spawnp()</code> . The <code>argv[]</code> and <code>envp[]</code> arrays of pointers and the strings to
26202		which those arrays point shall not be modified by a call to one of the <i>exec</i> functions, except as a
26203		consequence of replacing the process image.

26204 XSI The saved resource limits in the new process image are set to be a copy of the process'
26205 corresponding hard and soft limits.

26206 RETURN VALUE

26207 If one of the *exec* functions returns to the calling process image, an error has occurred; the return
26208 value shall be `-1`, and *errno* shall be set to indicate the error.

26209 ERRORS

26210 The *exec* functions shall fail if:

26211 [E2BIG] The number of bytes used by the new process image's argument list and
26212 environment list is greater than the system-imposed limit of `{ARG_MAX}`
26213 bytes.

26214 [EACCES] The new process image file is not a regular file and the implementation does |
26215 not support execution of files of its type.

26216 [EINVAL] The new process image file has appropriate privileges and has a recognized
26217 executable binary format, but the system does not support execution of a file
26218 with this format.

26219 The *exec* functions, except for *fexecve()*, shall fail if: +

26220 [EACCES] Search permission is denied for a directory listed in the new process image +
26221 file's path prefix, or the new process image file denies execution permission.

26222 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path* or *file*
26223 argument.

26224 [ENAMETOOLONG]

26225 The length of a component of a pathname is longer than `{NAME_MAX}`.

26226 [ENOENT] A component of *path* or *file* does not name an existing file or *path* or *file* is an
26227 empty string.

26228 [ENOTDIR] A component of the new process image file's path prefix names an existing file |
26229 that is neither a directory nor a symbolic link to a directory, or the new process |
26230 image file's pathname contains at least one non-`<slash>` character and ends
26231 with one or more trailing `<slash>` characters and the last pathname
26232 component names an existing file that is neither a directory nor a symbolic
26233 link to a directory.

26234 The *exec* functions, except for *execlp()* and *execvp()*, shall fail if:

26235 [ENOEXEC] The new process image file has the appropriate access permission but has an
26236 unrecognized format.

26237 The *fexecve()* function shall fail if:

26238 [EBADF] The *fd* argument is not a valid file descriptor open for executing.

26239 The *exec* functions may fail if:

26240 [ENOMEM] The new process image requires more memory than is allowed by the +
26241 hardware or system-imposed memory management constraints. +

26242 The *exec* functions, except for *fexecve()*, may fail if: +

26243 [ELOOP] More than `{SYMLOOP_MAX}` symbolic links were encountered during
26244 resolution of the *path* or *file* argument.

[ENAMETOOLONG]

The length of the *path* argument or the length of the pathname constructed from the *file* argument exceeds {PATH_MAX}, or pathname resolution of a symbolic link produced an intermediate result with a length that exceeds {PATH_MAX}.

[ETXTBSY]

The new process image file is a pure procedure (shared text) file that is currently open for writing by some process.

EXAMPLES

Using `execl()`

The following example executes the *ls* command, specifying the pathname of the executable (*/bin/ls*) and using arguments supplied directly to the command to produce single-column output.

```
#include <unistd.h>

int ret;
...
ret = execl ("/bin/ls", "ls", "-l", (char *)0);
```

Using `execle()`

The following example is similar to [Using `execl\(\)`](#). In addition, it specifies the environment for the new process image using the *env* argument.

```
#include <unistd.h>

int ret;
char *env[] = { "HOME=/usr/home", "LOGNAME=home", (char *)0 };
...
ret = execle ("/bin/ls", "ls", "-l", (char *)0, env);
```

Using `execlp()`

The following example searches for the location of the *ls* command among the directories specified by the *PATH* environment variable.

```
#include <unistd.h>

int ret;
...
ret = execlp ("ls", "ls", "-l", (char *)0);
```

Using `execv()`

The following example passes arguments to the *ls* command in the *cmd* array.

```
#include <unistd.h>

int ret;
char *cmd[] = { "ls", "-l", (char *)0 };
...
ret = execv ("/bin/ls", cmd);
```

Using `execve()`

The following example passes arguments to the `ls` command in the `cmd` array, and specifies the environment for the new process image using the `env` argument.

```
#include <unistd.h>

int ret;
char *cmd[] = { "ls", "-l", (char *)0 };
char *env[] = { "HOME=/usr/home", "LOGNAME=home", (char *)0 };
...
ret = execve ("/bin/ls", cmd, env);
```

Using `execvp()`

The following example searches for the location of the `ls` command among the directories specified by the `PATH` environment variable, and passes arguments to the `ls` command in the `cmd` array.

```
#include <unistd.h>

int ret;
char *cmd[] = { "ls", "-l", (char *)0 };
...
ret = execvp ("ls", cmd);
```

APPLICATION USAGE

As the state of conversion descriptors and message catalog descriptors in the new process image is undefined, conforming applications should not rely on their use and should close them prior to calling one of the *exec* functions.

Applications that require other than the default POSIX locale as the global locale in the new process image should call `setlocale()` with the appropriate parameters.

When assigning a new value to the *environ* variable, applications should ensure that the environment to which it will point contains at least the following:

1. Any implementation-defined variables required by the implementation to provide a conforming environment. See the `_CS_V7_ENV` entry in `<unistd.h>` and `confstr()` for details.
2. A value for `PATH` which finds conforming versions of all standard utilities before any other versions.

The same constraint applies to the `envp` array passed to `execle()` or `execve()`, in order to ensure that the new process image is invoked in a conforming environment.

Applications should not execute programs with file descriptor 0 not open for reading or with file descriptor 1 or 2 not open for writing, as this might cause the executed program to misbehave. In order not to pass on these file descriptors to an executed program, applications should not just close them but should reopen them on, for example, `/dev/null`. Some implementations may reopen them automatically, but applications should not rely on this being done.

If an application wants to perform a checksum test of the file being executed before executing it, the file will need to be opened with read permission to perform the checksum test.

Since execute permission is checked by `fexecve()`, the file description `fd` need not have been opened with the `O_EXEC` flag. However, if the file to be executed denies read and write permission for the process preparing to do the *exec*, the only way to provide the `fd` to `fexecve()`

will be to use the `O_EXEC` flag when opening *fd*. In this case, the application will not be able to perform a checksum test since it will not be able to read the contents of the file.

Note that when a file descriptor is opened with `O_RDONLY`, `O_RDWR`, or `O_WRONLY` mode, the file descriptor can be used to read, read and write, or write the file, respectively, even if the mode of the file changes after the file was opened. Using the `O_EXEC` open mode is different; *fexecve()* will ignore the mode that was used when the file descriptor was opened and the *exec* will fail if the mode of the file associated with *fd* does not grant execute permission to the calling process at the time *fexecve()* is called.

RATIONALE

Early proposals required that the value of *argc* passed to *main()* be “one or greater”. This was driven by the same requirement in drafts of the ISO C standard. In fact, historical implementations have passed a value of zero when no arguments are supplied to the caller of the *exec* functions. This requirement was removed from the ISO C standard and subsequently removed from this volume of POSIX.1-2008 as well. The wording, in particular the use of the word *should*, requires a Strictly Conforming POSIX Application to pass at least one argument to the *exec* function, thus guaranteeing that *argc* be one or greater when invoked by such an application. In fact, this is good practice, since many existing applications reference *argv[0]* without first checking the value of *argc*.

The requirement on a Strictly Conforming POSIX Application also states that the value passed as the first argument be a filename string associated with the process being started. Although some existing applications pass a pathname rather than a filename string in some circumstances, a filename string is more generally useful, since the common usage of *argv[0]* is in printing diagnostics. In some cases the filename passed is not the actual filename of the file; for example, many implementations of the *login* utility use a convention of prefixing a <hyphen> (‘-’) to the actual filename, which indicates to the command interpreter being invoked that it is a “login shell”.

Historically, there have been two ways that implementations can *exec* shell scripts.

One common historical implementation is that the *execl()*, *execv()*, *execle()*, and *execve()* functions return an `[ENOEXEC]` error for any file not recognizable as executable, including a shell script. When the *execlp()* and *execvp()* functions encounter such a file, they assume the file to be a shell script and invoke a known command interpreter to interpret such files. This is now required by POSIX.1-2008. These implementations of *execvp()* and *execlp()* only give the `[ENOEXEC]` error in the rare case of a problem with the command interpreter’s executable file. Because of these implementations, the `[ENOEXEC]` error is not mentioned for *execlp()* or *execvp()*, although implementations can still give it.

Another way that some historical implementations handle shell scripts is by recognizing the first two bytes of the file as the character string “#!” and using the remainder of the first line of the file as the name of the command interpreter to execute.

One potential source of confusion noted by the standard developers is over how the contents of a process image file affect the behavior of the *exec* family of functions. The following is a description of the actions taken:

1. If the process image file is a valid executable (in a format that is executable and valid and having appropriate privileges) for this system, then the system executes the file.
2. If the process image file has appropriate privileges and is in a format that is executable but not valid for this system (such as a recognized binary for another architecture), then this is an error and *errno* is set to `[EINVAL]` (see later RATIONALE on `[EINVAL]`).

3. If the process image file has appropriate privileges but is not otherwise recognized:
 - a. If this is a call to *execlp()* or *execvp()*, then they invoke a command interpreter assuming that the process image file is a shell script.
 - b. If this is not a call to *execlp()* or *execvp()*, then an error occurs and *errno* is set to [ENOEXEC].

Applications that do not require to access their arguments may use the form:

```
main(void)
```

as specified in the ISO C standard. However, the implementation will always provide the two arguments *argc* and *argv*, even if they are not used.

Some implementations provide a third argument to *main()* called *envp*. This is defined as a pointer to the environment. The ISO C standard specifies invoking *main()* with two arguments, so implementations must support applications written this way. Since this volume of POSIX.1-2008 defines the global variable *environ*, which is also provided by historical implementations and can be used anywhere that *envp* could be used, there is no functional need for the *envp* argument. Applications should use the *getenv()* function rather than accessing the environment directly via either *envp* or *environ*. Implementations are required to support the two-argument calling sequence, but this does not prohibit an implementation from supporting *envp* as an optional third argument.

This volume of POSIX.1-2008 specifies that signals set to SIG_IGN remain set to SIG_IGN, and that the new process image inherits the signal mask of the thread that called *exec* in the old process image. This is consistent with historical implementations, and it permits some useful functionality, such as the *nohup* command. However, it should be noted that many existing applications wrongly assume that they start with certain signals set to the default action and/or unblocked. In particular, applications written with a simpler signal model that does not include blocking of signals, such as the one in the ISO C standard, may not behave properly if invoked with some signals blocked. Therefore, it is best not to block or ignore signals across *execs* without explicit reason to do so, and especially not to block signals across *execs* of arbitrary (not closely cooperating) programs.

The *exec* functions always save the value of the effective user ID and effective group ID of the process at the completion of the *exec*, whether or not the set-user-ID or the set-group-ID bit of the process image file is set.

The statement about *argv[]* and *envp[]* being constants is included to make explicit to future writers of language bindings that these objects are completely constant. Due to a limitation of the ISO C standard, it is not possible to state that idea in standard C. Specifying two levels of *const-qualification* for the *argv[]* and *envp[]* parameters for the *exec* functions may seem to be the natural choice, given that these functions do not modify either the array of pointers or the characters to which the function points, but this would disallow existing correct code. Instead, only the array of pointers is noted as constant. The table of assignment compatibility for *dst=src* derived from the ISO C standard summarizes the compatibility:

<i>dst:</i>	char *[]	const char *[]	char *const[]	const char *const[]
<i>src:</i>				
char *[]	VALID	—	VALID	—
const char *[]	—	VALID	—	VALID
char * const []	—	—	VALID	—
const char *const[]	—	—	—	VALID

Since all existing code has a source type matching the first row, the column that gives the most

valid combinations is the third column. The only other possibility is the fourth column, but using it would require a cast on the *argv* or *envp* arguments. It is unfortunate that the fourth column cannot be used, because the declaration a non-expert would naturally use would be that in the second row.

The ISO C standard and this volume of POSIX.1-2008 do not conflict on the use of *environ*, but some historical implementations of *environ* may cause a conflict. As long as *environ* is treated in the same way as an entry point (for example, *fork()*), it conforms to both standards. A library can contain *fork()*, but if there is a user-provided *fork()*, that *fork()* is given precedence and no problem ensues. The situation is similar for *environ*: the definition in this volume of POSIX.1-2008 is to be used if there is no user-provided *environ* to take precedence. At least three implementations are known to exist that solve this problem.

[E2BIG] The limit {ARG_MAX} applies not just to the size of the argument list, but to the sum of that and the size of the environment list.

[EFAULT] Some historical systems return [EFAULT] rather than [ENOEXEC] when the new process image file is corrupted. They are non-conforming.

[EINVAL] This error condition was added to POSIX.1-2008 to allow an implementation to detect executable files generated for different architectures, and indicate this situation to the application. Historical implementations of shells, *execvp()*, and *execlp()* that encounter an [ENOEXEC] error will execute a shell on the assumption that the file is a shell script. This will not produce the desired effect when the file is a valid executable for a different architecture. An implementation may now choose to avoid this problem by returning [EINVAL] when a valid executable for a different architecture is encountered. Some historical implementations return [EINVAL] to indicate that the *path* argument contains a character with the high order bit set. The standard developers chose to deviate from historical practice for the following reasons:

1. The new utilization of [EINVAL] will provide some measure of utility to the user community.
2. Historical use of [EINVAL] is not acceptable in an internationalized operating environment.

[ENAMETOOLONG]

Since the file pathname may be constructed by taking elements in the *PATH* variable and putting them together with the filename, the [ENAMETOOLONG] error condition could also be reached this way.

[ETXTBSY] System V returns this error when the executable file is currently open for writing by some process. This volume of POSIX.1-2008 neither requires nor prohibits this behavior.

Other systems (such as System V) may return [EINTR] from *exec*. This is not addressed by this volume of POSIX.1-2008, but implementations may have a window between the call to *exec* and the time that a signal could cause one of the *exec* calls to return with [EINTR].

An explicit statement regarding the floating-point environment (as defined in the **<fenv.h>** header) was added to make it clear that the floating-point environment is set to its default when a call to one of the *exec* functions succeeds. The requirements for inheritance or setting to the default for other process and thread start-up functions is covered by more generic statements in their descriptions and can be summarized as follows:

26463 *posix_spawn()* Set to default.

26464 *fork()* Inherit.

26465 *pthread_create()* Inherit.

26466 The purpose of the *execve()* function is to enable executing a file which has been verified to be
 26467 the intended file. It is possible to actively check the file by reading from the file descriptor and be
 26468 sure that the file is not exchanged for another between the reading and the execution.
 26469 Alternatively, an function like *openat()* can be used to open a file which has been found by
 26470 reading the content of a directory using *readdir()*.

26471 FUTURE DIRECTIONS

26472 None.

26480 CHANGE HISTORY

26481 First released in Issue 1. Derived from Issue 1 of the SVID.

26482 Issue 5

26483 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX
 26484 Threads Extension.

26485 Large File Summit extensions are added.

26486 Issue 6

26487 The following new requirements on POSIX implementations derive from alignment with the
 26488 Single UNIX Specification:

- 26489 • In the DESCRIPTION, behavior is defined for when the process image file is not a valid
 26490 executable.
- 26491 • In this version, `_POSIX_SAVED_IDS` is mandated, thus the effective user ID and effective
 26492 group ID of the new process image shall be saved (as the saved set-user-ID and the saved
 26493 set-group-ID) for use by the *setuid()* function.
- 26494 • The [ELOOP] mandatory error condition is added.
- 26495 • A second [ENAMETOOLONG] is added as an optional error condition.
- 26496 • The [ETXTBSY] optional error condition is added.

26497 The following changes were made to align with the IEEE P1003.1a draft standard:

- 26498 • The [EINVAL] mandatory error condition is added.
- 26499 • The [ELOOP] optional error condition is added.

26500 The description of CPU-time clock semantics is added for alignment with IEEE Std 1003.1d-1999.

26501 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by adding semantics
 26502 for typed memory.

26503 The normative text is updated to avoid use of the term “must” for application requirements.

26504	The description of tracing semantics is added for alignment with IEEE Std 1003.1q-2000.
26505	IEEE PASC Interpretation 1003.1 #132 is applied.
26506	The DESCRIPTION is updated to make it explicit that the floating-point environment in the new
26507	process image is set to the default.
26508	The DESCRIPTION and RATIONALE are updated to include clarifications of how the contents
26509	of a process image file affect the behavior of the <i>exec</i> functions.
26510	IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/15 is applied, adding a new paragraph to
26511	the DESCRIPTION and text to the end of the APPLICATION USAGE section. This change
26512	addresses a security concern, where implementations may want to reopen file descriptors 0, 1,
26513	and 2 for programs with the set-user-id or set-group-id file mode bits calling the <i>exec</i> family of
26514	functions.
26515	IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/24 is applied, applying changes to the
26516	DESCRIPTION, addressing which attributes are inherited by threads, and behavioral
26517	requirements for threads attributes.
26518	IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/25 is applied, updating text in the
26519	RATIONALE from “the process signal mask be unchanged across an <i>exec</i> ” to “the new process
26520	image inherits the signal mask of the thread that called <i>exec</i> in the old process image”.
26521	Issue 7
26522	Austin Group Interpretation 1003.1-2001 #047 is applied, adding the description of <code>_CS_V7_ENV</code>
26523	to the APPLICATION USAGE.
26524	Austin Group Interpretation 1003.1-2001 #143 is applied.
26525	The <i>fexecve()</i> function is added from The Open Group Technical Standard, 2006, Extended API
26526	Set Part 2.
26527	Functionality relating to the Asynchronous Input and Output, Memory Mapped Files, Threads,
26528	and Timers options is moved to the Base.
26529	Changes are made related to support for finegrained timestamps.
26530	POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0095 [386], XSH/TC1-2008/0096 [167], +
26531	XSH/TC1-2008/0097 [291], XSH/TC1-2008/0098 [173], XSH/TC1-2008/0099 [296], +
26532	XSH/TC1-2008/00100 [324], XSH/TC1-2008/00101 [296], XSH/TC1-2008/00102 [302], +
26533	XSH/TC1-2008/00103 [167], XSH/TC1-2008/00104 [173], and XSH/TC1-2008/00105 [291,429] +
26534	are applied.

26535 **NAME**

26536 exit — terminate a process

26537 **SYNOPSIS**

26538 #include <stdlib.h>

26539 void exit(int status);

26540 **DESCRIPTION**

26541 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 26542 conflict between the requirements described here and the ISO C standard is unintentional. This
 26543 volume of POSIX.1-2008 defers to the ISO C standard.

26544 CX The value of *status* may be 0, EXIT_SUCCESS, EXIT_FAILURE, or any other value, though only
 26545 the least significant 8 bits (that is, *status* & 0377) shall be available to a waiting parent process.

26546 The *exit()* function shall first call all functions registered by *atexit()*, in the reverse order of their
 26547 registration, except that a function is called after any previously registered functions that had
 26548 already been called at the time it was registered. Each function is called as many times as it was
 26549 registered. If, during the call to any such function, a call to the *longjmp()* function is made that
 26550 would terminate the call to the registered function, the behavior is undefined.

26551 If a function registered by a call to *atexit()* fails to return, the remaining registered functions shall
 26552 not be called and the rest of the *exit()* processing shall not be completed. If *exit()* is called more
 26553 than once, the behavior is undefined.

26554 The *exit()* function shall then flush all open streams with unwritten buffered data and close all
 26555 CX open streams. Finally, the process shall be terminated with the same consequences as described
 26556 in [Consequences of Process Termination](#) (on page 549).

26557 **RETURN VALUE**26558 The *exit()* function does not return.26559 **ERRORS**

26560 No errors are defined.

26561 **EXAMPLES**

26562 None.

26563 **APPLICATION USAGE**

26564 None.

26565 **RATIONALE**26566 See *_Exit()*.26567 **FUTURE DIRECTIONS**

26568 None.

26569 **SEE ALSO**26570 *_Exit()*, *atexit()*, *exec*, *longjmp()*, *tmpfile()*26571 XBD [<stdlib.h>](#)26572 **CHANGE HISTORY**26573 **Issue 7**

26574 Austin Group Interpretation 1003.1-2001 #031 is applied, separating the *_Exit()* and *_exit()*
 26575 functions from the *exit()* function.

26576 Austin Group Interpretation 1003.1-2001 #085 is applied.

26577 **NAME**26578 `exp, expf, expl` — exponential function26579 **SYNOPSIS**

```
26580 #include <math.h>
26581 double exp(double x);
26582 float expf(float x);
26583 long double expl(long double x);
```

26584 **DESCRIPTION**

26585 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 26586 conflict between the requirements described here and the ISO C standard is unintentional. This
 26587 volume of POSIX.1-2008 defers to the ISO C standard.

26588 These functions shall compute the base-*e* exponential of *x*.

26589 An application wishing to check for error situations should set *errno* to zero and call
 26590 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 26591 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 26592 zero, an error has occurred.

26593 **RETURN VALUE**

26594 Upon successful completion, these functions shall return the exponential value of *x*.

26595 If the correct value would cause overflow, a range error shall occur and *exp()*, *expf()*, and *expl()*
 26596 shall return the value of the macro HUGE_VAL, HUGE_VALF, and HUGE_VALL, respectively.

26597 MXX If the correct value would cause underflow, and is not representable, a range error may occur, |
 26598 MXX and *exp()*, *expf()*, and *expl()* shall return 0.0, or (if the IEC 60559 Floating-Point option is not |
 26599 supported) an implementation-defined value no greater in magnitude than DBL_MIN, |
 26600 FLT_MIN, and LDBL_MIN, respectively.

26601 MX If *x* is NaN, a NaN shall be returned.

26602 If *x* is ± 0 , 1 shall be returned.

26603 If *x* is $-\text{Inf}$, +0 shall be returned.

26604 If *x* is $+\text{Inf}$, *x* shall be returned.

26605 MXX If the correct value would cause underflow, and is representable, a range error may occur and
 26606 the correct value shall be returned.

26607 **ERRORS**

26608 These functions shall fail if:

26609 Range Error The result overflows.

26610 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 26611 then *errno* shall be set to [ERANGE]. If the integer expression
 26612 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the overflow
 26613 floating-point exception shall be raised.

26614 These functions may fail if:

26615 Range Error The result underflows.

26616 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 26617 then *errno* shall be set to [ERANGE]. If the integer expression
 26618 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the underflow
 26619 floating-point exception shall be raised.

26620 **EXAMPLES**26621 **Computing the Density of the Standard Normal Distribution**

26622 This function shows an implementation for the density of the standard normal distribution
 26623 using `exp()`. This example uses the constant `M_PI` which is part of the XSI option.

```
26624 #include <math.h>
26625 double
26626 normal_density (double x)
26627 {
26628     return exp(-x*x/2) / sqrt (2*M_PI);
26629 }
```

26630 **APPLICATION USAGE**

26631 Note that for IEEE Std 754-1985 **double**, $709.8 < x$ implies `exp(x)` has overflowed. The value
 26632 $x < -708.4$ implies `exp(x)` has underflowed.

26633 On error, the expressions `(math_errhandling & MATH_ERRNO)` and `(math_errhandling &`
 26634 `MATH_ERREXCEPT)` are independent of each other, but at least one of them must be non-zero.

26635 **RATIONALE**

26636 None.

26637 **FUTURE DIRECTIONS**

26638 None.

26639 **SEE ALSO**

26642 **CHANGE HISTORY**

26643 First released in Issue 1. Derived from Issue 1 of the SVID.

26644 **Issue 5**

26645 The DESCRIPTION is updated to indicate how an application should check for an error. This
 26646 text was previously published in the APPLICATION USAGE section.

26647 **Issue 6**

26648 The `expf()` and `expl()` functions are added for alignment with the ISO/IEC 9899:1999 standard.

26649 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are
 26650 revised to align with the ISO/IEC 9899:1999 standard.

26651 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are
 26652 marked.

26653 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/26 is applied, adding the example to the
 26654 EXAMPLES section.

26655 **Issue 7**

26656 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0106 [68] and XSH/TC1-2008/0107 +
 26657 [68] are applied.

26658 **NAME**

26659 exp2, exp2f, exp2l — exponential base 2 functions

26660 **SYNOPSIS**

26661 #include <math.h>

26662 double exp2(double x);

26663 float exp2f(float x);

26664 long double exp2l(long double x);

26665 **DESCRIPTION**

26666 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any
 26667 conflict between the requirements described here and the ISO C standard is unintentional. This
 26668 volume of POSIX.1-2008 defers to the ISO C standard.

26669 These functions shall compute the base-2 exponential of x .

26670 An application wishing to check for error situations should set *errno* to zero and call
 26671 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 26672 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 26673 zero, an error has occurred.

26674 **RETURN VALUE**26675 Upon successful completion, these functions shall return 2^x .

26676 If the correct value would cause overflow, a range error shall occur and *exp2()*, *exp2f()*, and
 26677 *exp2l()* shall return the value of the macro HUGE_VAL, HUGE_VALF, and HUGE_VALL,
 26678 respectively.

26679 **MX** If the correct value would cause underflow, and is not representable, a range error may occur, |
 26680 **MX** and *exp2()*, *exp2f()*, and *exp2l()* shall return 0.0, or (if the IEC 60559 Floating-Point option is not |
 26681 supported) an implementation-defined value no greater in magnitude than DBL_MIN, |
 26682 FLT_MIN, and LDBL_MIN, respectively.

26683 **MX** If x is NaN, a NaN shall be returned.26684 If x is ± 0 , 1 shall be returned.26685 If x is $-\text{Inf}$, $+\text{0}$ shall be returned.26686 If x is $+\text{Inf}$, x shall be returned.

26687 **MX** If the correct value would cause underflow, and is representable, a range error may occur and
 26688 the correct value shall be returned.

26689 **ERRORS**

26690 These functions shall fail if:

26691 Range Error The result overflows.

26692 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 26693 then *errno* shall be set to [ERANGE]. If the integer expression
 26694 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the overflow
 26695 floating-point exception shall be raised.

26696 These functions may fail if:

26697 Range Error The result underflows.

26698 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 26699 then *errno* shall be set to [ERANGE]. If the integer expression
 26700 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the underflow

26701 floating-point exception shall be raised.

26702 **EXAMPLES**

26703 None.

26704 **APPLICATION USAGE**

26705 For IEEE Std 754-1985 **double**, $1024 \leq x$ implies $\exp2(x)$ has overflowed. The value $x < -1022$
26706 implies $\exp(x)$ has underflowed.

26707 On error, the expressions $(\text{math\_errhandling} \ \& \ \text{MATH\_ERRNO})$ and $(\text{math\_errhandling} \ \& \ \text{MATH\_ERREXCEPT})$
26708 are independent of each other, but at least one of them must be non-zero.

26709 **RATIONALE**

26710 None.

26711 **FUTURE DIRECTIONS**

26712 None.

26715 XBD [Section 4.19](#) (on page 116), [**<math.h>**](#)

26716 **CHANGE HISTORY**

26717 First released in Issue 6. Derived from the ISO/IEC 9899: 1999 standard.

26718 **Issue 7**

26719 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0108 [68] and XSH/TC1-2008/0109 +
26720 [68] are applied.

26721 **NAME**

26722 expm1, expm1f, expm1l — compute exponential functions

26723 **SYNOPSIS**

```
26724 #include <math.h>
26725 double expm1(double x);
26726 float expm1f(float x);
26727 long double expm1l(long double x);
```

26728 **DESCRIPTION**

26729 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 26730 conflict between the requirements described here and the ISO C standard is unintentional. This
 26731 volume of POSIX.1-2008 defers to the ISO C standard.

26732 These functions shall compute $e^x - 1.0$.

26733 An application wishing to check for error situations should set *errno* to zero and call
 26734 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 26735 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 26736 zero, an error has occurred.

26737 **RETURN VALUE**26738 Upon successful completion, these functions return $e^x - 1.0$.

26739 If the correct value would cause overflow, a range error shall occur and *expm1()*, *expm1f()*, and
 26740 *expm1l()* shall return the value of the macro HUGE_VAL, HUGE_VALF, and HUGE_VALL,
 26741 respectively.

26742 MX If *x* is NaN, a NaN shall be returned.26743 If *x* is ± 0 , ± 0 shall be returned.26744 If *x* is $-\text{Inf}$, -1 shall be returned.26745 If *x* is $+\text{Inf}$, *x* shall be returned.

26746 If *x* is subnormal, a range error may occur
 26747 MXX and *x* should be returned.

26748 MX If *x* is not returned, *expm1()*, *expm1f()*, and *expm1l()* shall return an implementation-defined
 26749 value no greater in magnitude than DBL_MIN, FLT_MIN, and LDBL_MIN, respectively.

26750 **ERRORS**

26751 These functions shall fail if:

26752 Range Error The result overflows.

26753 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 26754 then *errno* shall be set to [ERANGE]. If the integer expression
 26755 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the overflow
 26756 floating-point exception shall be raised.

26757 These functions may fail if:

26758 MX Range Error The value of *x* is subnormal.

26759 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 26760 then *errno* shall be set to [ERANGE]. If the integer expression
 26761 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the underflow
 26762 floating-point exception shall be raised.

EXAMPLES

None.

APPLICATION USAGE

The value of $\text{expm1}(x)$ may be more accurate than $\exp(x)-1.0$ for small values of x .

The $\text{expm1}()$ and $\text{log1p}()$ functions are useful for financial calculations of $((1+x)^n-1)/x$, namely:

```
expm1(n * log1p(x)) / x
```

when x is very small (for example, when calculating small daily interest rates). These functions also simplify writing accurate inverse hyperbolic functions.

For IEEE Std 754-1985 **double**, $709.8 < x$ implies $\text{expm1}(x)$ has overflowed.

On error, the expressions $(\text{math\_errhandling} \ \& \ \text{MATH\_ERRNO})$ and $(\text{math\_errhandling} \ \& \ \text{MATH\_ERREXCEPT})$ are independent of each other, but at least one of them must be non-zero.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Issue 6

The $\text{expm1f}()$ and $\text{expm1l}()$ functions are added for alignment with the ISO/IEC 9899:1999 standard.

The $\text{expm1}()$ function is no longer marked as an extension.

The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899:1999 standard.

IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are marked.

Issue 7

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0110 [68] is applied.

+

26795 **NAME**

26796 fabs, fabsf, fabsl — absolute value function

26797 **SYNOPSIS**

```

26798       #include <math.h>

26799       double fabs(double x);
26800       float fabsf(float x);
26801       long double fabsl(long double x);

```

26802 **DESCRIPTION**

26803 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 26804 conflict between the requirements described here and the ISO C standard is unintentional. This
 26805 volume of POSIX.1-2008 defers to the ISO C standard.

26806 These functions shall compute the absolute value of their argument x , $|x|$.26807 **RETURN VALUE**26808 Upon successful completion, these functions shall return the absolute value of x .26809 MX If x is NaN, a NaN shall be returned.26810 If x is ± 0 , $+0$ shall be returned.26811 If x is $\pm \text{Inf}$, $+\text{Inf}$ shall be returned.26812 **ERRORS**

26813 No errors are defined.

26814 **EXAMPLES**26815 **Computing the 1-Norm of a Floating-Point Vector**26816 This example shows the use of *fabs()* to compute the 1-norm of a vector defined as follows:26817 norm1(v) = $|v[0]| + |v[1]| + \dots + |v[n-1]|$

26818 where $|x|$ denotes the absolute value of x , n denotes the vector's dimension $v[i]$ denotes the i -th
 26819 component of v ($0 \leq i < n$).

```

26820       #include <math.h>

26821       double
26822       norm1(const double v[], const int n)
26823       {
26824           int       i;
26825           double   nl_v; /* 1-norm of v */

26826           nl_v = 0;
26827           for (i=0; i<n; i++) {
26828               nl_v += fabs (v[i]);
26829           }

26830           return nl_v;
26831       }

```

26841 **CHANGE HISTORY**

26842 First released in Issue 1. Derived from Issue 1 of the SVID.

26843 **Issue 5**26844 The DESCRIPTION is updated to indicate how an application should check for an error. This
26845 text was previously published in the APPLICATION USAGE section.26846 **Issue 6**26847 The *fabsf()* and *fabsl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.26848 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are
26849 revised to align with the ISO/IEC 9899:1999 standard.26850 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are
26851 marked.26852 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/27 is applied, adding the example to the
26853 EXAMPLES section.

26854 **NAME**

26855 faccessat — determine accessibility of a file relative to directory file descriptor

26856 **SYNOPSIS**

26857 #include <unistd.h>

26858 int faccessat(int *fd*, const char **path*, int *amode*, int *flag*);26859 **DESCRIPTION**26860 Refer to *access()*.

NAME

fattach — attach a STREAMS-based file descriptor to a file in the file system name space (STREAMS)

SYNOPSIS

```
#include <stropts.h>

int fattach(int fildes, const char *path);
```

DESCRIPTION

The *fattach()* function shall attach a STREAMS-based file descriptor to a file, effectively associating a pathname with *fildes*. The application shall ensure that the *fildes* argument is a valid open file descriptor associated with a STREAMS file. The *path* argument points to a pathname of an existing file. The application shall have appropriate privileges or be the owner of the file named by *path* and have write permission. A successful call to *fattach()* shall cause all pathnames that name the file named by *path* to name the STREAMS file associated with *fildes*, until the STREAMS file is detached from the file. A STREAMS file can be attached to more than one file and can have several pathnames associated with it.

The attributes of the named STREAMS file shall be initialized as follows: the permissions, user ID, group ID, and times are set to those of the file named by *path*, the number of links is set to 1, and the size and device identifier are set to those of the STREAMS file associated with *fildes*. If any attributes of the named STREAMS file are subsequently changed (for example, by *chmod()*), neither the attributes of the underlying file nor the attributes of the STREAMS file to which *fildes* refers shall be affected.

File descriptors referring to the underlying file, opened prior to an *fattach()* call, shall continue to refer to the underlying file.

RETURN VALUE

Upon successful completion, *fattach()* shall return 0. Otherwise, -1 shall be returned and *errno* set to indicate the error.

ERRORS

The *fattach()* function shall fail if:

[EACCES] Search permission is denied for a component of the path prefix, or the process is the owner of *path* but does not have write permissions on the file named by *path*.

[EBADF] The *fildes* argument is not a valid open file descriptor.

[EBUSY] The file named by *path* is currently a mount point or has a STREAMS file attached to it.

[ELOOP] A loop exists in symbolic links encountered during resolution of the *path* argument.

[ENAMETOOLONG]

The length of a component of a pathname is longer than {NAME_MAX}.

[ENOENT] A component of *path* does not name an existing file or *path* is an empty string.

[ENOTDIR] A component of the path prefix names an existing file that is neither a directory nor a symbolic link to a directory, or the *path* argument contains at least one non-`<slash>` character and ends with one or more trailing `<slash>` characters.

26904	[EPERM]	The effective user ID of the process is not the owner of the file named by <i>path</i>
26905		and the process does not have appropriate privileges.
26906		The <i>fattach()</i> function may fail if:
26907	[EINVAL]	The <i>fildev</i> argument does not refer to a STREAMS file.
26908	[ELOOP]	More than {SYMLOOP_MAX} symbolic links were encountered during
26909		resolution of the <i>path</i> argument.
26910	[ENAMETOOLONG]	
26911		The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a
26912		symbolic link produced an intermediate result with a length that exceeds
26913		{PATH_MAX}.
26914	[EXDEV]	A link to a file on another file system was attempted.

26915 EXAMPLES

26916 Attaching a File Descriptor to a File

26917 In the following example, *fd* refers to an open STREAMS file. The call to *fattach()* associates this
 26918 STREAM with the file **/tmp/named-STREAM**, such that any future calls to open **/tmp/named-**
 26919 **STREAM**, prior to breaking the attachment via a call to *fdetach()*, will instead create a new file
 26920 handle referring to the STREAMS file associated with *fd*.

```
26921 #include <stropts.h>
26922 ...
26923     int fd;
26924     char *pathname = "/tmp/named-STREAM";
26925     int ret;
26926
26927     ret = fattach(fd, pathname);
```

26927 APPLICATION USAGE

26928 The *fattach()* function behaves similarly to the traditional *mount()* function in the way a file is
 26929 temporarily replaced by the root directory of the mounted file system. In the case of *fattach()*, the
 26930 replaced file need not be a directory and the replacing file is a STREAMS file.

26931 RATIONALE

26932 The file attributes of a file which has been the subject of an *fattach()* call are specifically set
 26933 because of an artifact of the original implementation. The internal mechanism was the same as
 26934 for the *mount()* function. Since *mount()* is typically only applied to directories, the effects when
 26935 applied to a regular file are a little surprising, especially as regards the link count which rigidly
 26936 remains one, even if there were several links originally and despite the fact that all original links
 26937 refer to the STREAM as long as the *fattach()* remains in effect.

26938 FUTURE DIRECTIONS

26939 The *fattach()* function may be removed in a future version.

26943 CHANGE HISTORY

26944 First released in Issue 4, Version 2.

Issue 5

- 26945 Moved from X/OPEN UNIX extension to BASE.
26946
26947 The [EXDEV] error is added to the list of optional errors in the ERRORS section.

Issue 6

- 26948 This function is marked as part of the XSI STREAMS Option Group.
26949
26950 The normative text is updated to avoid use of the term “must” for application requirements.
26951 The wording of the mandatory [ELOOP] error condition is updated, and a second optional
26952 [ELOOP] error condition is added.

Issue 7

- 26953 Austin Group Interpretation 1003.1-2001 #143 is applied.
26954
26955 The *fattach()* function is marked obsolescent.
26956 The [ENOTDIR] error condition is clarified to cover the condition where the last component of a
26957 pathname exists but is not a directory or a symbolic link to a directory.
26958 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0111 [146,324] and +
26959 XSH/TC1-2008/0112 [291] are applied.

26960 **NAME**

26961 fchdir — change working directory

26962 **SYNOPSIS**

26963 #include <unistd.h>

26964 int fchdir(int *fildev*);26965 **DESCRIPTION**26966 The *fchdir()* function shall be equivalent to *chdir()* except that the directory that is to be the new
26967 current working directory is specified by the file descriptor *fildev*.26968 A conforming application can obtain a file descriptor for a file of type directory using *open()*,
26969 provided that the file status flags and access modes do not contain O_WRONLY or O_RDWR.26970 **RETURN VALUE**26971 Upon successful completion, *fchdir()* shall return 0. Otherwise, it shall return -1 and set *errno* to
26972 indicate the error. On failure the current working directory shall remain unchanged.26973 **ERRORS**26974 The *fchdir()* function shall fail if:26975 [EACCES] Search permission is denied for the directory referenced by *fildev*.26976 [EBADF] The *fildev* argument is not an open file descriptor.26977 [ENOTDIR] The open file descriptor *fildev* does not refer to a directory.26978 The *fchdir()* may fail if:26979 [EINTR] A signal was caught during the execution of *fchdir()*.

26980 [EIO] An I/O error occurred while reading from or writing to the file system.

26981 **EXAMPLES**

26994 **Issue 5**

26995 Moved from X/OPEN UNIX extension to BASE.

26996 **Issue 7**26997 The *fchdir()* function is moved from the XSI option to the Base.

26998 **NAME**

26999 fchmod — change mode of a file

27000 **SYNOPSIS**

27001 #include <sys/stat.h>

27002 int fchmod(int *fildes*, mode_t *mode*);27003 **DESCRIPTION**27004 The *fchmod()* function shall be equivalent to *chmod()* except that the file whose permissions are
27005 changed is specified by the file descriptor *fildes*.27006 SHM If *fildes* references a shared memory object, the *fchmod()* function need only affect the S_IRUSR,
27007 S_IWUSR, S_IRGRP, S_IWGRP, S_IROTH, and S_IWOTH file permission bits.27008 TYM If *fildes* references a typed memory object, the behavior of *fchmod()* is unspecified.27009 If *fildes* refers to a socket, the behavior of *fchmod()* is unspecified.27010 OB XSR If *fildes* refers to a STREAM (which is *fattach()*-ed into the file system name space) the call
27011 returns successfully, doing nothing.27012 **RETURN VALUE**27013 Upon successful completion, *fchmod()* shall return 0. Otherwise, it shall return -1 and set *errno* to
27014 indicate the error.27015 **ERRORS**27016 The *fchmod()* function shall fail if:27017 [EBADF] The *fildes* argument is not an open file descriptor.27018 [EPERM] The effective user ID does not match the owner of the file and the process does
27019 not have appropriate privileges.27020 [EROFS] The file referred to by *fildes* resides on a read-only file system.27021 The *fchmod()* function may fail if:27022 XSI [EINTR] The *fchmod()* function was interrupted by a signal.27023 XSI [EINVAL] The value of the *mode* argument is invalid.27024 [EINVAL] The *fildes* argument refers to a pipe and the implementation disallows
27025 execution of *fchmod()* on a pipe.27026 **EXAMPLES**27027 **Changing the Current Permissions for a File**27028 The following example shows how to change the permissions for a file named **/home/cnd/mod1**
27029 so that the owner and group have read/write/execute permissions, but the world only has
27030 read/write permissions.

27031 #include <sys/stat.h>

27032 #include <fcntl.h>

27033 mode_t mode;

27034 int fildes;

27035 ...

27036 fildes = open("/home/cnd/mod1", O_RDWR);

27037 fchmod(fildes, S_IRWXU | S_IRWXG | S_IROTH | S_IWOTH);

27038 APPLICATION USAGE

27039 None.

27040 RATIONALE

27041 None.

27042 FUTURE DIRECTIONS

27043 None.

27044 SEE ALSO

27045 *chmod()*, *chown()*, *creat()*, *fcntl()*, *fstatat()*, *fstatvfs()*, *mknod()*, *open()*, *read()*, *write()*

27046 XBD <sys/stat.h>

27047 CHANGE HISTORY

27048 First released in Issue 4, Version 2.

27049 Issue 5

27050 Moved from X/OPEN UNIX extension to BASE and aligned with *fchmod()* in the POSIX
27051 Realtime Extension. Specifically, the second paragraph of the DESCRIPTION is added and a
27052 second instance of [EINVAL] is defined in the list of optional errors.

27053 Issue 6

27054 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by stating that *fchmod()*
27055 behavior is unspecified for typed memory objects.

27056 **NAME**

27057 fchmodat — change mode of a file relative to directory file descriptor

27058 **SYNOPSIS**

27059 #include <sys/stat.h>

27060 int fchmodat(int *fd*, const char **path*, mode_t *mode*, int *flag*);27061 **DESCRIPTION**27062 Refer to *chmod()*.

27063 **NAME**27064 **fchown** — change owner and group of a file27065 **SYNOPSIS**27066 `#include <unistd.h>`27067 `int fchown(int fildes, uid_t owner, gid_t group);`27068 **DESCRIPTION**

27069 The *fchown()* function shall be equivalent to *chown()* except that the file whose owner and group
 27070 are changed is specified by the file descriptor *fil*des.

27071 **RETURN VALUE**

27072 Upon successful completion, *fchown()* shall return 0. Otherwise, it shall return -1 and set *errno* to
 27073 indicate the error.

27074 **ERRORS**27075 The *fchown()* function shall fail if:

27076 [EBADF] The *fil*des argument is not an open file descriptor.

27077 [EPERM] The effective user ID does not match the owner of the file or the process does
 27078 not have appropriate privileges and `_POSIX_CHOWN_RESTRICTED`
 27079 indicates that such privilege is required.

27080 [EROFS] The file referred to by *fil*des resides on a read-only file system.

27081 The *fchown()* function may fail if:

27082 [EINVAL] The owner or group ID is not a value supported by the implementation. The
 27083 OB XSR *fil*des argument refers to a pipe or socket or an *fattach()*-ed STREAM and the
 27084 implementation disallows execution of *fchown()* on a pipe.

27085 [EIO] A physical I/O error has occurred.

27086 [EINTR] The *fchown()* function was interrupted by a signal which was caught.

27087 **EXAMPLES**27088 **Changing the Current Owner of a File**

27089 The following example shows how to change the owner of a file named `/home/cnd/mod1` to
 27090 “jones” and the group to “cnd”.

27091 The numeric value for the user ID is obtained by extracting the user ID from the user database
 27092 entry associated with “jones”. Similarly, the numeric value for the group ID is obtained by
 27093 extracting the group ID from the group database entry associated with “cnd”. This example
 27094 assumes the calling program has appropriate privileges.

27095 `#include <sys/types.h>`27096 `#include <unistd.h>`27097 `#include <fcntl.h>`27098 `#include <pwd.h>`27099 `#include <grp.h>`27100 `struct passwd *pwd;`27101 `struct group *grp;`27102 `int fil`des;27103 `...`27104 `fil`des = open("/home/cnd/mod1", O_RDWR);27105 `pwd = getpwnam("jones");`

```
27106         grp = getgrnam("cnd");
27107         fchown(fildes, pwd->pw_uid, grp->gr_gid);
```

27108 APPLICATION USAGE

27109 None.

27117 CHANGE HISTORY

27118 First released in Issue 4, Version 2.

27119 Issue 5

27120 Moved from X/OPEN UNIX extension to BASE.

27121 Issue 6

27122 The following changes were made to align with the IEEE P1003.1a draft standard:

- 27123 • Clarification is added that a call to *fchown()* may not be allowed on a pipe.

27124 The *fchown()* function is defined as mandatory.

27125 Issue 7

27126 Functionality relating to XSI STREAMS is marked obsolescent.

27127 NAME

27128 fchownat — change owner and group of a file relative to directory file descriptor

27129 SYNOPSIS

27130 #include <unistd.h>

27131 int fchownat(int *fd*, const char **path*, uid_t *owner*, gid_t *group*,
27132 int *flag*);

27133 DESCRIPTION

27134 Refer to *chown()*.

27135 **NAME**

27136 `fclose` — close a stream

27137 **SYNOPSIS**

27138 `#include <stdio.h>`

27139 `int fclose(FILE *stream);`

27140 **DESCRIPTION**

27141 CX The functionality described on this reference page is aligned with the ISO C standard. Any
27142 conflict between the requirements described here and the ISO C standard is unintentional. This
27143 volume of POSIX.1-2008 defers to the ISO C standard.

27144 The `fclose()` function shall cause the stream pointed to by *stream* to be flushed and the associated
27145 file to be closed. Any unwritten buffered data for the stream shall be written to the file; any
27146 unread buffered data shall be discarded. Whether or not the call succeeds, the stream shall be
27147 disassociated from the file and any buffer set by the `setbuf()` or `setvbuf()` function shall be
27148 disassociated from the stream. If the associated buffer was automatically allocated, it shall be
27149 deallocated.

27150 CX If the file is not already at EOF, and the file is one capable of seeking, the file offset of the
27151 underlying open file description shall be set to the file position of the stream if the stream is the
27152 active handle to the underlying file description.

27153 The `fclose()` function shall mark for update the last data modification and last file status change
27154 timestamps of the underlying file, if the stream was writable, and if buffered data remains that
27155 has not yet been written to the file. The `fclose()` function shall perform the equivalent of a `close()`
27156 on the file descriptor that is associated with the stream pointed to by *stream*.

27157 After the call to `fclose()`, any use of *stream* results in undefined behavior.

27158 **RETURN VALUE**

27159 CX Upon successful completion, `fclose()` shall return 0; otherwise, it shall return EOF and set *errno*
27160 to indicate the error.

27161 **ERRORS**

27162 The `fclose()` function shall fail if:

27163 CX [EAGAIN] The O_NONBLOCK flag is set for the file descriptor underlying *stream* and
27164 the thread would be delayed in the write operation.

27165 CX [EBADF] The file descriptor underlying stream is not valid.

27166 CX [EFBIG] An attempt was made to write a file that exceeds the maximum file size.

27167 XSI [EFBIG] An attempt was made to write a file that exceeds the file size limit of the
27168 process.

27169 CX [EFBIG] The file is a regular file and an attempt was made to write at or beyond the
27170 offset maximum associated with the corresponding stream.

27171 CX [EINTR] The `fclose()` function was interrupted by a signal.

27172 CX [EIO] The process is a member of a background process group attempting to write to
27173 its controlling terminal, TOSTOP is set, the calling thread is not blocking
27174 SIGTTOU, the process is not ignoring SIGTTOU, and the process group of the
27175 process is orphaned. This error may also be returned under implementation-
27176 defined conditions.

27177 CX [ENOMEM] The underlying stream was created by *open_memstream()* or
 27178 *open_wmemstream()* and insufficient memory is available.

27179 CX [ENOSPC] There was no free space remaining on the device containing the file or in the
 27180 buffer used by the *fmemopen()* function.

27181 CX [EPIPE] An attempt is made to write to a pipe or FIFO that is not open for reading by
 27182 any process. A SIGPIPE signal shall also be sent to the thread.

27183 The *fclose()* function may fail if:

27184 CX [ENXIO] A request was made of a nonexistent device, or the request was outside the
 27185 capabilities of the device.

27197 CHANGE HISTORY

27198 First released in Issue 1. Derived from Issue 1 of the SVID.

27199 Issue 5

27200 Large File Summit extensions are added.

27201 Issue 6

27202 Extensions beyond the ISO C standard are marked.

27203 The following new requirements on POSIX implementations derive from alignment with the
 27204 Single UNIX Specification:

- 27205 • The [EFBIG] error is added as part of the large file support extensions.
- 27206 • The [ENXIO] optional error condition is added.

27207 The DESCRIPTION is updated to note that the stream and any buffer are disassociated whether
 27208 or not the call succeeds. This is for alignment with the ISO/IEC 9899:1999 standard.

27209 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/28 is applied, updating the [EAGAIN]
 27210 error in the ERRORS section from “the process would be delayed” to “the thread would be
 27211 delayed”.

27212 Issue 7

27213 Austin Group Interpretation 1003.1-2001 #002 is applied, clarifying the interaction of file
 27214 descriptors and streams.

27215 The [ENOSPC] error condition is updated and the [ENOMEM] error is added from The Open
 27216 Group Technical Standard, 2006, Extended API Set Part 1.

27217 Changes are made related to support for finegrained timestamps.

27218
27219

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0113 [87], XSH/TC1-2008/0114 [79], +
and XSH/TC1-2008/0115 [14] are applied.

27220 **NAME**

27221 fcntl — file control

27222 **SYNOPSIS**

27223 #include <fcntl.h>

27224 int fcntl(int *fildes*, int *cmd*, ...);27225 **DESCRIPTION**

27226 The *fcntl()* function shall perform the operations described below on open files. The *fildes*
 27227 argument is a file descriptor.

27228 The available values for *cmd* are defined in <fcntl.h> and are as follows:

27229 **F_DUPFD** Return a new file descriptor which shall be the lowest numbered
 27230 available (that is, not already open) file descriptor greater than or equal to
 27231 the third argument, *arg*, taken as an integer of type **int**. The new file
 27232 descriptor shall refer to the same open file description as the original file
 27233 descriptor, and shall share any locks. The FD_CLOEXEC flag associated
 27234 with the new file descriptor shall be cleared to keep the file open across
 27235 calls to one of the *exec* functions.

27236 **F_DUPFD_CLOEXEC**

27237 Like F_DUPFD, but the FD_CLOEXEC flag associated with the new file
 27238 descriptor shall be set.

27239 **F_GETFD** Get the file descriptor flags defined in <fcntl.h> that are associated with
 27240 the file descriptor *fildes*. File descriptor flags are associated with a single
 27241 file descriptor and do not affect other file descriptors that refer to the
 27242 same file.

27243 **F_SETFD** Set the file descriptor flags defined in <fcntl.h>, that are associated with
 27244 *fildes*, to the third argument, *arg*, taken as type **int**. If the FD_CLOEXEC
 27245 flag in the third argument is 0, the file descriptor shall remain open across
 27246 the *exec* functions; otherwise, the file descriptor shall be closed upon
 27247 successful execution of one of the *exec* functions.

27248 **F_GETFL** Get the file status flags and file access modes, defined in <fcntl.h>, for the
 27249 file description associated with *fildes*. The file access modes can be
 27250 extracted from the return value using the mask O_ACCMODE, which is
 27251 defined in <fcntl.h>. File status flags and file access modes are associated
 27252 with the file description and do not affect other file descriptors that refer
 27253 to the same file with different open file descriptions. The flags returned
 27254 may include non-standard file status flags which the application did not
 27255 set, provided that these additional flags do not alter the behavior of a
 27256 conforming application.

27257 **F_SETFL** Set the file status flags, defined in <fcntl.h>, for the file description
 27258 associated with *fildes* from the corresponding bits in the third argument,
 27259 *arg*, taken as type **int**. Bits corresponding to the file access mode and the
 27260 file creation flags, as defined in <fcntl.h>, that are set in *arg* shall be
 27261 ignored. If any bits in *arg* other than those mentioned here are changed by
 27262 the application, the result is unspecified. If *fildes* does not support non-
 27263 blocking operations, it is unspecified whether the O_NONBLOCK flag
 27264 will be ignored.

27265	F_GETOWN	If <i>fildev</i> refers to a socket, get the process or process group ID specified to receive SIGURG signals when out-of-band data is available. Positive values indicate a process ID; negative values, other than -1, indicate a process group ID. If <i>fildev</i> does not refer to a socket, the results are unspecified.
27266		
27267		
27268		
27269		
27270	F_SETOWN	If <i>fildev</i> refers to a socket, set the process or process group ID specified to receive SIGURG signals when out-of-band data is available, using the value of the third argument, <i>arg</i> , taken as type int . Positive values indicate a process ID; negative values, other than -1, indicate a process group ID. If <i>fildev</i> does not refer to a socket, the results are unspecified.
27271		
27272		
27273		
27274		
27275	The following values for <i>cmd</i> are available for advisory record locking. Record locking shall be supported for regular files, and may be supported for other files.	
27276		
27277	F_GETLK	Get the first lock which blocks the lock description pointed to by the third argument, <i>arg</i> , taken as a pointer to type struct flock , defined in <fcntl.h> . The information retrieved shall overwrite the information passed to <i>fcntl()</i> in the structure flock . If no lock is found that would prevent this lock from being created, then the structure shall be left unchanged except for the lock type which shall be set to F_UNLCK.
27278		
27279		
27280		
27281		
27282		
27283	F_SETLK	Set or clear a file segment lock according to the lock description pointed to by the third argument, <i>arg</i> , taken as a pointer to type struct flock , defined in <fcntl.h> . F_SETLK can establish shared (or read) locks (F_RDLCK) or exclusive (or write) locks (F_WRLCK), as well as to remove either type of lock (F_UNLCK). F_RDLCK, F_WRLCK, and F_UNLCK are defined in <fcntl.h> . If a shared or exclusive lock cannot be set, <i>fcntl()</i> shall return immediately with a return value of -1.
27284		
27285		
27286		
27287		
27288		
27289		
27290	F_SETLKW	This command shall be equivalent to F_SETLK except that if a shared or exclusive lock is blocked by other locks, the thread shall wait until the request can be satisfied. If a signal that is to be caught is received while <i>fcntl()</i> is waiting for a region, <i>fcntl()</i> shall be interrupted. Upon return from the signal handler, <i>fcntl()</i> shall return -1 with <i>errno</i> set to [EINTR], and the lock operation shall not be done.
27291		
27292		
27293		
27294		
27295		
27296	Additional implementation-defined values for <i>cmd</i> may be defined in <fcntl.h> . Their names shall start with F_.	
27297		
27298	When a shared lock is set on a segment of a file, other processes shall be able to set shared locks on that segment or a portion of it. A shared lock prevents any other process from setting an exclusive lock on any portion of the protected area. A request for a shared lock shall fail if the file descriptor was not opened with read access.	
27299		
27300		
27301		
27302	An exclusive lock shall prevent any other process from setting a shared lock or an exclusive lock on any portion of the protected area. A request for an exclusive lock shall fail if the file descriptor was not opened with write access.	
27303		
27304		
27305	The structure flock describes the type (<i>l_type</i>), starting offset (<i>l_whence</i>), relative offset (<i>l_start</i>), size (<i>l_len</i>), and process ID (<i>l_pid</i>) of the segment of the file to be affected.	
27306		
27307	The value of <i>l_whence</i> is SEEK_SET, SEEK_CUR, or SEEK_END, to indicate that the relative offset <i>l_start</i> bytes shall be measured from the start of the file, current position, or end of the file, respectively. The value of <i>l_len</i> is the number of consecutive bytes to be locked. The value of <i>l_len</i> may be negative (where the definition of off_t permits negative values of <i>l_len</i>). The <i>l_pid</i> field is only used with F_GETLK to return the process ID of the process holding a blocking lock. After	
27308		
27309		
27310		
27311		

27312 a successful F_GETLK request, when a blocking lock is found, the values returned in the **lock**
 27313 structure shall be as follows:

27314 *l_type* Type of blocking lock found.
 27315 *l_whence* SEEK_SET.
 27316 *l_start* Start of the blocking lock.
 27317 *l_len* Length of the blocking lock.
 27318 *l_pid* Process ID of the process that holds the blocking lock.

27319 If the command is F_SETLK and the process must wait for another process to release a lock,
 27320 then the range of bytes to be locked shall be determined before the *fcntl()* function blocks. If the
 27321 file size or file descriptor seek offset change while *fcntl()* is blocked, this shall not affect the
 27322 range of bytes locked.

27323 If *l_len* is positive, the area affected shall start at *l_start* and end at *l_start+l_len-1*. If *l_len* is
 27324 negative, the area affected shall start at *l_start+l_len* and end at *l_start-1*. Locks may start and
 27325 extend beyond the current end of a file, but shall not extend before the beginning of the file. A
 27326 lock shall be set to extend to the largest possible value of the file offset for that file by setting
 27327 *l_len* to 0. If such a lock also has *l_start* set to 0 and *l_whence* is set to SEEK_SET, the whole file
 27328 shall be locked.

27329 There shall be at most one type of lock set for each byte in the file. Before a successful return
 27330 from an F_SETLK or an F_SETLKW request when the calling process has previously existing
 27331 locks on bytes in the region specified by the request, the previous lock type for each byte in the
 27332 specified region shall be replaced by the new lock type. As specified above under the
 27333 descriptions of shared locks and exclusive locks, an F_SETLK or an F_SETLKW request
 27334 (respectively) shall fail or block when another process has existing locks on bytes in the specified
 27335 region and the type of any of those locks conflicts with the type specified in the request.

27336 All locks associated with a file for a given process shall be removed when a file descriptor for
 27337 that file is closed by that process or the process holding that file descriptor terminates. Locks are
 27338 not inherited by a child process.

27339 A potential for deadlock occurs if a process controlling a locked region is put to sleep by
 27340 attempting to lock the locked region of another process. If the system detects that sleeping until
 27341 a locked region is unlocked would cause a deadlock, *fcntl()* shall fail with an [EDEADLK] error.

27342 An unlock (F_UNLCK) request in which *l_len* is non-zero and the offset of the last byte of the
 27343 requested segment is the maximum value for an object of type **off_t**, when the process has an
 27344 existing lock in which *l_len* is 0 and which includes the last byte of the requested segment, shall
 27345 be treated as a request to unlock from the start of the requested segment with an *l_len* equal to 0.
 27346 Otherwise, an unlock (F_UNLCK) request shall attempt to unlock only the requested segment.

27347 SHM When the file descriptor *fildev* refers to a shared memory object, the behavior of *fcntl()* shall be
 27348 the same as for a regular file except the effect of the following values for the argument *cmd* shall
 27349 be unspecified: F_SETFL, F_GETLK, F_SETLK, and F_SETLKW.

27350 TYM If *fildev* refers to a typed memory object, the result of the *fcntl()* function is unspecified.

27351 RETURN VALUE

27352 Upon successful completion, the value returned shall depend on *cmd* as follows:

27353 F_DUPFD A new file descriptor.

27354	F_DUPFD_CLOEXEC	
27355		A new file descriptor.
27356	F_GETFD	Value of flags defined in <code><fcntl.h></code> . The return value shall not be negative.
27357	F_SETFD	Value other than <code>-1</code> .
27358	F_GETFL	Value of file status flags and access modes. The return value is not negative.
27359	F_SETFL	Value other than <code>-1</code> .
27360	F_GETLK	Value other than <code>-1</code> .
27361	F_SETLK	Value other than <code>-1</code> .
27362	F_SETLKW	Value other than <code>-1</code> .
27363	F_GETOWN	Value of the socket owner process or process group; this will not be <code>-1</code> .
27364	F_SETOWN	Value other than <code>-1</code> .
27365		Otherwise, <code>-1</code> shall be returned and <i>errno</i> set to indicate the error.

ERRORS

27366	The <i>fcntl()</i> function shall fail if:	
27367		
27368	[EACCES] or [EAGAIN]	
27369		The <i>cmd</i> argument is <code>F_SETLK</code> ; the type of lock (<i>l_type</i>) is a shared (<code>F_RDLCK</code>) or exclusive (<code>F_WRLCK</code>) lock and the segment of a file to be locked is already exclusive-locked by another process, or the type is an exclusive lock and some portion of the segment of a file to be locked is already shared-locked or exclusive-locked by another process.
27370		
27371		
27372		
27373		
27374	[EBADF]	The <i>fildest</i> argument is not a valid open file descriptor, or the argument <i>cmd</i> is <code>F_SETLK</code> or <code>F_SETLKW</code> , the type of lock, <i>l_type</i> , is a shared lock (<code>F_RDLCK</code>), and <i>fildest</i> is not a valid file descriptor open for reading, or the type of lock, <i>l_type</i> , is an exclusive lock (<code>F_WRLCK</code>), and <i>fildest</i> is not a valid file descriptor open for writing.
27375		
27376		
27377		
27378		
27379	[EINTR]	The <i>cmd</i> argument is <code>F_SETLKW</code> and the function was interrupted by a signal.
27380	[EINVAL]	The <i>cmd</i> argument is invalid, or the <i>cmd</i> argument is <code>F_DUPFD</code> or <code>F_DUPFD_CLOEXEC</code> and <i>arg</i> is negative or greater than or equal to <code>{OPEN_MAX}</code> , or the <i>cmd</i> argument is <code>F_GETLK</code> , <code>F_SETLK</code> , or <code>F_SETLKW</code> and the data pointed to by <i>arg</i> is not valid, or <i>fildest</i> refers to a file that does not support locking.
27381		
27382		
27383		
27384		
27385	[EMFILE]	The argument <i>cmd</i> is <code>F_DUPFD</code> or <code>F_DUPFD_CLOEXEC</code> and all file descriptors available to the process are currently open, or no file descriptors greater than or equal to <i>arg</i> are available.
27386		
27387		
27388	[ENOLCK]	The argument <i>cmd</i> is <code>F_SETLK</code> or <code>F_SETLKW</code> and satisfying the lock or unlock request would result in the number of locked regions in the system exceeding a system-imposed limit.
27389		
27390		
27391	[EOVERFLOW]	One of the values to be returned cannot be represented correctly.
27392	[EOVERFLOW]	The <i>cmd</i> argument is <code>F_GETLK</code> , <code>F_SETLK</code> , or <code>F_SETLKW</code> and the smallest or, if <i>l_len</i> is non-zero, the largest offset of any byte in the requested segment cannot be represented correctly in an object of type <code>off_t</code> .
27393		
27394		

27395 The *fcntl()* function may fail if:

27396 [EDEADLK] The *cmd* argument is F_SETLKW, the lock is blocked by a lock from another
 27397 process, and putting the calling process to sleep to wait for that lock to become
 27398 free would cause a deadlock.

27399 EXAMPLES

27400 Locking and Unlocking a File

27401 The following example demonstrates how to place a lock on bytes 100 to 109 of a file and then
 27402 later remove it. F_SETLKW is used to perform a non-blocking lock request so that the process does
 27403 not have to wait if an incompatible lock is held by another process; instead the process can take
 27404 some other action.

```

27405 #include <stdlib.h>
27406 #include <unistd.h>
27407 #include <fcntl.h>
27408 #include <errno.h>
27409 #include <stdio.h>

27410 int
27411 main(int argc, char *argv[])
27412 {
27413     int fd;
27414     struct flock fl;

27415     fd = open("testfile", O_RDWR);
27416     if (fd == -1)
27417         /* Handle error */;

27418     /* Make a non-blocking request to place a write lock
27419        on bytes 100-109 of testfile */

27420     fl.l_type = F_WRLCK;
27421     fl.l_whence = SEEK_SET;
27422     fl.l_start = 100;
27423     fl.l_len = 10;

27424     if (fcntl(fd, F_SETLKW, &fl) == -1) {
27425         if (errno == EACCES || errno == EAGAIN) {
27426             printf("Already locked by another process\n");
27427             /* We can't get the lock at the moment */

27428         } else {
27429             /* Handle unexpected error */;
27430         }
27431     } else { /* Lock was granted... */

27432         /* Perform I/O on bytes 100 to 109 of file */

27433         /* Unlock the locked bytes */

27434         fl.l_type = F_UNLCK;
27435         fl.l_whence = SEEK_SET;
27436         fl.l_start = 100;
27437         fl.l_len = 10;
27438         if (fcntl(fd, F_SETLKW, &fl) == -1)
  
```

```

27439             /* Handle error */;
27440         }
27441         exit(EXIT_SUCCESS);
27442     } /* main */

```

Setting the Close-on-Exec Flag

The following example demonstrates how to set the close-on-exec flag for the file descriptor *fd*.

```

27445 #include <unistd.h>
27446 #include <fcntl.h>
27447 ...
27448     int flags;
27449
27449     flags = fcntl(fd, F_GETFD);
27450     if (flags == -1)
27451         /* Handle error */;
27452     flags |= FD_CLOEXEC;
27453     if (fcntl(fd, F_SETFD, flags) == -1)
27454         /* Handle error */;

```

APPLICATION USAGE

The *arg* values to `F_GETFD`, `F_SETFD`, `F_GETFL`, and `F_SETFL` all represent flag values to allow for future growth. Applications using these functions should do a read-modify-write operation on them, rather than assuming that only the values defined by this volume of POSIX.1-2008 are valid. It is a common error to forget this, particularly in the case of `F_SETFD`. Some implementations set additional file status flags to advise the application of default behavior, even though the application did not request these flags.

RATIONALE

The ellipsis in the SYNOPSIS is the syntax specified by the ISO C standard for a variable number of arguments. It is used because System V uses pointers for the implementation of file locking functions.

This volume of POSIX.1-2008 permits concurrent read and write access to file data using the `fcntl()` function; this is a change from the 1984 `/usr/group` standard and early proposals. Without concurrency controls, this feature may not be fully utilized without occasional loss of data.

Data losses occur in several ways. One case occurs when several processes try to update the same record, without sequencing controls; several updates may occur in parallel and the last writer “wins”. Another case is a bit-tree or other internal list-based database that is undergoing reorganization. Without exclusive use to the tree segment by the updating process, other reading processes chance getting lost in the database when the index blocks are split, condensed, inserted, or deleted. While `fcntl()` is useful for many applications, it is not intended to be overly general and does not handle the bit-tree example well.

This facility is only required for regular files because it is not appropriate for many devices such as terminals and network connections.

Since `fcntl()` works with “any file descriptor associated with that file, however it is obtained”, the file descriptor may have been inherited through a `fork()` or `exec` operation and thus may affect a file that another process also has open.

The use of the open file description to identify what to lock requires extra calls and presents problems if several processes are sharing an open file description, but there are too many

implementations of the existing mechanism for this volume of POSIX.1-2008 to use different specifications.

Another consequence of this model is that closing any file descriptor for a given file (whether or not it is the same open file description that created the lock) causes the locks on that file to be relinquished for that process. Equivalently, any close for any file/process pair relinquishes the locks owned on that file for that process. But note that while an open file description may be shared through *fork()*, locks are not inherited through *fork()*. Yet locks may be inherited through one of the *exec* functions.

The identification of a machine in a network environment is outside the scope of this volume of POSIX.1-2008. Thus, an *l_sysid* member, such as found in System V, is not included in the locking structure.

Changing of lock types can result in a previously locked region being split into smaller regions.

Mandatory locking was a major feature of the 1984 /usr/group standard.

For advisory file record locking to be effective, all processes that have access to a file must cooperate and use the advisory mechanism before doing I/O on the file. Enforcement-mode record locking is important when it cannot be assumed that all processes are cooperating. For example, if one user uses an editor to update a file at the same time that a second user executes another process that updates the same file and if only one of the two processes is using advisory locking, the processes are not cooperating. Enforcement-mode record locking would protect against accidental collisions.

Secondly, advisory record locking requires a process using locking to bracket each I/O operation with lock (or test) and unlock operations. With enforcement-mode file and record locking, a process can lock the file once and unlock when all I/O operations have been completed. Enforcement-mode record locking provides a base that can be enhanced; for example, with sharable locks. That is, the mechanism could be enhanced to allow a process to lock a file so other processes could read it, but none of them could write it.

Mandatory locks were omitted for several reasons:

1. Mandatory lock setting was done by multiplexing the set-group-ID bit in most implementations; this was confusing, at best.
2. The relationship to file truncation as supported in 4.2 BSD was not well specified.
3. Any publicly readable file could be locked by anyone. Many historical implementations keep the password database in a publicly readable file. A malicious user could thus prohibit logins. Another possibility would be to hold open a long-distance telephone line.
4. Some demand-paged historical implementations offer memory mapped files, and enforcement cannot be done on that type of file.

Since sleeping on a region is interrupted with any signal, *alarm()* may be used to provide a timeout facility in applications requiring it. This is useful in deadlock detection. Since implementation of full deadlock detection is not always feasible, the [EDEADLK] error was made optional.

FUTURE DIRECTIONS

None.

SEE ALSO

alarm(), *close()*, *exec*, *open()*, *sigaction()*

XBD **<fcntl.h>**, **<signal.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX Threads Extension.

Large File Summit extensions are added.

Issue 6

In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- In the DESCRIPTION, sentences describing behavior when *l_len* is negative are now mandated, and the description of unlock (F_UNLOCK) when *l_len* is non-negative is mandated.
- In the ERRORS section, the [EINVAL] error condition has the case mandated when the *cmd* is invalid, and two [EOVERFLOW] error conditions are added.

The F_GETOWN and F_SETOWN values are added for sockets.

The following changes were made to align with the IEEE P1003.1a draft standard:

- Clarification is added that the extent of the bytes locked is determined prior to the blocking action.

The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that *fcntl()* results are unspecified for typed memory objects.

The normative text is updated to avoid use of the term “must” for application requirements.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/29 is applied, adding the example to the EXAMPLES section.

Issue 7

Austin Group Interpretation 1003.1-2001 #150 is applied, clarifying the file status flags returned when *cmd* is F_GETFL.

Austin Group Interpretation 1003.1-2001 #171 is applied, adding support to set the FD_CLOEXEC flag atomically at *open()*, and adding the F_DUPFD_CLOEXEC flag.

The optional **<unistd.h>** header is removed from this function, since **<fcntl.h>** now defines SEEK_SET, SEEK_CUR, and SEEK_END as part of the Base.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0116 [141] is applied.

+

27563 **NAME**27564 `fdatasync` — synchronize the data of a file (**REALTIME**)27565 **SYNOPSIS**

```
27566 SIO      #include <unistd.h>
27567          int fdatasync(int fildes);
```

27568 **DESCRIPTION**

27569 The `fdatasync()` function shall force all currently queued I/O operations associated with the file
 27570 indicated by file descriptor *fildes* to the synchronized I/O completion state.

27571 The functionality shall be equivalent to `fsync()` with the symbol `_POSIX_SYNCHRONIZED_IO`
 27572 defined, with the exception that all I/O operations shall be completed as defined for
 27573 synchronized I/O data integrity completion.

27574 **RETURN VALUE**

27575 If successful, the `fdatasync()` function shall return the value 0; otherwise, the function shall return
 27576 the value `-1` and set *errno* to indicate the error. If the `fdatasync()` function fails, outstanding I/O
 27577 operations are not guaranteed to have been completed.

27578 **ERRORS**

27579 The `fdatasync()` function shall fail if:

27580 [EBADF] The *fildes* argument is not a valid file descriptor open for writing.

27581 [EINVAL] This implementation does not support synchronized I/O for this file.

27582 In the event that any of the queued I/O operations fail, `fdatasync()` shall return the error
 27583 conditions defined for `read()` and `write()`.

27584 **EXAMPLES**

27585 None.

27586 **APPLICATION USAGE**

27587 None.

27588 **RATIONALE**

27589 None.

27590 **FUTURE DIRECTIONS**

27591 None.

27592 **SEE ALSO**

27593 [*aio_fsync\(\)*](#), [*fcntl\(\)*](#), [*fsync\(\)*](#), [*open\(\)*](#), [*read\(\)*](#), [*write\(\)*](#)

27595 **CHANGE HISTORY**

27596 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

27597 **Issue 6**

27598 The [ENOSYS] error condition has been removed as stubs need not be provided if an
 27599 implementation does not support the Synchronized Input and Output option.

27600 The `fdatasync()` function is marked as part of the Synchronized Input and Output option.

27601 **NAME**27602 fdetach — detach a name from a STREAMS-based file descriptor (**STREAMS**)27603 **SYNOPSIS**

```
27604 OB XSR #include <stropts.h>
27605 int fdetach(const char *path);
```

27606 **DESCRIPTION**

27607 The *fdetach()* function shall detach a STREAMS-based file from the file to which it was attached
 27608 by a previous call to *fattach()*. The *path* argument points to the pathname of the attached
 27609 STREAMS file. The process shall have appropriate privileges or be the owner of the file. A
 27610 successful call to *fdetach()* shall cause all pathnames that named the attached STREAMS file to
 27611 again name the file to which the STREAMS file was attached. All subsequent operations on *path*
 27612 shall operate on the underlying file and not on the STREAMS file.

27613 All open file descriptions established while the STREAMS file was attached to the file referenced
 27614 by *path* shall still refer to the STREAMS file after the *fdetach()* has taken effect.

27615 If there are no open file descriptors or other references to the STREAMS file, then a successful
 27616 call to *fdetach()* shall be equivalent to performing the last *close()* on the attached file.

27617 **RETURN VALUE**

27618 Upon successful completion, *fdetach()* shall return 0; otherwise, it shall return -1 and set *errno* to
 27619 indicate the error.

27620 **ERRORS**

27621 The *fdetach()* function shall fail if:

27622	[EACCES]	Search permission is denied on a component of the path prefix.
27623	[EINVAL]	The <i>path</i> argument names a file that is not currently attached.
27624	[ELOOP]	A loop exists in symbolic links encountered during resolution of the <i>path</i> argument.
27625		
27626	[ENAMETOOLONG]	
27627		The length of a component of a pathname is longer than {NAME_MAX}.
27628	[ENOENT]	A component of <i>path</i> does not name an existing file or <i>path</i> is an empty string.
27629	[ENOTDIR]	A component of the path prefix names an existing file that is neither a directory nor a symbolic link to a directory, or the <i>path</i> argument contains at least one non- <i><slash></i> character and ends with one or more trailing <i><slash></i> characters and the last pathname component names an existing file that is neither a directory nor a symbolic link to a directory.
27630		
27631		
27632		
27633		
27634	[EPERM]	The effective user ID is not the owner of <i>path</i> and the process does not have appropriate privileges.
27635		

27636 The *fdetach()* function may fail if:

27637	[ELOOP]	More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the <i>path</i> argument.
27638		
27639	[ENAMETOOLONG]	
27640		The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a symbolic link produced an intermediate result with a length that exceeds {PATH_MAX}.
27641		
27642		

27643 **EXAMPLES**27644 **Detaching a File**

27645 The following example detaches the STREAMS-based file **/tmp/named-STREAM** from the file to
 27646 which it was attached by a previous, successful call to *fattach()*. Subsequent calls to open this
 27647 file refer to the underlying file, not to the STREAMS file.

```
27648 #include <stropts.h>
27649 ...
27650 char *pathname = "/tmp/named-STREAM";
27651 int ret;
27652 ret = fdetach(pathname);
```

27653 **APPLICATION USAGE**

27654 None.

27655 **RATIONALE**

27656 None.

27657 **FUTURE DIRECTIONS**

27658 The *fdetach()* function may be removed in a future version.

27659 **SEE ALSO**

27660 *fattach()*

27661 XBD **<stropts.h>**

27662 **CHANGE HISTORY**

27663 First released in Issue 4, Version 2.

27664 **Issue 5**

27665 Moved from X/OPEN UNIX extension to BASE.

27666 **Issue 6**

27667 The normative text is updated to avoid use of the term “must” for application requirements.

27668 The wording of the mandatory [ELOOP] error condition is updated, and a second optional
 27669 [ELOOP] error condition is added.

27670 **Issue 7**

27671 Austin Group Interpretation 1003.1-2001 #143 is applied.

27672 The *fdetach()* function is marked obsolescent.

27673 The [ENOTDIR] error condition is clarified to cover the condition where the last component of a
 27674 pathname exists but is not a directory or a symbolic link to a directory.

27675 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0117 [324] and XSH/TC1-2008/0118 +
 27676 [291] are applied.

27677 **NAME**

27678 fdim, fdimf, fdiml — compute positive difference between two floating-point numbers

27679 **SYNOPSIS**

```
27680 #include <math.h>
27681 double fdim(double x, double y);
27682 float fdimf(float x, float y);
27683 long double fdiml(long double x, long double y);
```

27684 **DESCRIPTION**

27685 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 27686 conflict between the requirements described here and the ISO C standard is unintentional. This
 27687 volume of POSIX.1-2008 defers to the ISO C standard.

27688 These functions shall determine the positive difference between their arguments. If x is greater
 27689 than y , $x-y$ is returned. If x is less than or equal to y , +0 is returned.

27690 An application wishing to check for error situations should set *errno* to zero and call
 27691 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 27692 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 27693 zero, an error has occurred.

27694 **RETURN VALUE**

27695 Upon successful completion, these functions shall return the positive difference value.

27696 If $x-y$ is positive and overflows, a range error shall occur and *fdim*(), *fdimf*(), and *fdiml*() shall
 27697 return the value of the macro HUGE_VAL, HUGE_VALF, and HUGE_VALL, respectively.

27698 If the correct value would cause underflow, a range error may occur, and *fdim*(), *fdimf*(), and
 27699 MXX *fdiml*() shall return the correct value, or (if the IEC 60559 Floating-Point option is not
 27700 supported) an implementation-defined value no greater in magnitude than DBL_MIN,
 27701 FLT_MIN, and LDBL_MIN, respectively.

27702 MX If x or y is NaN, a NaN shall be returned.

27703 **ERRORS**

27704 The *fdim*() function shall fail if:

27705 Range Error The result overflows.

27706 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 27707 then *errno* shall be set to [ERANGE]. If the integer expression
 27708 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the overflow
 27709 floating-point exception shall be raised.

27710 The *fdim*() function may fail if:

27711 Range Error The result underflows.

27712 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 27713 then *errno* shall be set to [ERANGE]. If the integer expression
 27714 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the underflow
 27715 floating-point exception shall be raised.

27716 **EXAMPLES**

27717 None.

27718 **APPLICATION USAGE**

27719 On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* & -
27720 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

27721 **RATIONALE**

27722 None.

27723 **FUTURE DIRECTIONS**

27724 None.

27725 **SEE ALSO**27726 *feclearexcept()*, *fetestexcept()*, *fmax()*, *fmin()*

27727 Section 4.19 (on page 116), <math.h>

27728 **CHANGE HISTORY**

27729 First released in Issue 6. Derived from the ISO/IEC 9899: 1999 standard.

27730 **Issue 7**

27731 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0119 [68,428] and +
27732 XSH/TC1-2008/0120 [68,428] are applied.

27733 **NAME**

27734 fdopen — associate a stream with a file descriptor

27735 **SYNOPSIS**

```
27736 CX      #include <stdio.h>
27737 FILE *fdopen(int fil-des, const char *mode);
```

27738 **DESCRIPTION**27739 The *fdopen()* function shall associate a stream with a file descriptor.27740 The *mode* argument is a character string having one of the following values:27741 *r* or *rb* Open a file for reading.27742 *w* or *wb* Open a file for writing.27743 *a* or *ab* Open a file for writing at end-of-file.27744 *r+* or *rb+* or *r+b* Open a file for update (reading and writing).27745 *w+* or *wb+* or *w+b* Open a file for update (reading and writing).27746 *a+* or *ab+* or *a+b* Open a file for update (reading and writing) at end-of-file.27747 The meaning of these flags is exactly as specified in *fopen()*, except that modes beginning with *w*
27748 shall not cause truncation of the file.27749 Additional values for the *mode* argument may be supported by an implementation.

27750 The application shall ensure that the mode of the stream as expressed by the *mode* argument is
27751 allowed by the file access mode of the open file description to which *fil-des* refers. The file
27752 position indicator associated with the new stream is set to the position indicated by the file offset
27753 associated with the file descriptor.

27754 The error and end-of-file indicators for the stream shall be cleared. The *fdopen()* function may
27755 cause the last data access timestamp of the underlying file to be marked for update.

27756 SHM If *fil-des* refers to a shared memory object, the result of the *fdopen()* function is unspecified.27757 TYM If *fil-des* refers to a typed memory object, the result of the *fdopen()* function is unspecified.

27758 The *fdopen()* function shall preserve the offset maximum previously set for the open file
27759 description corresponding to *fil-des*.

27760 **RETURN VALUE**

27761 Upon successful completion, *fdopen()* shall return a pointer to a stream; otherwise, a null pointer
27762 shall be returned and *errno* set to indicate the error.

27763 **ERRORS**27764 The *fdopen()* function shall fail if:

27765 [EMFILE] {STREAM_MAX} streams are currently open in the calling process.

27766 The *fdopen()* function may fail if:27767 [EBADF] The *fil-des* argument is not a valid file descriptor.27768 [EINVAL] The *mode* argument is not a valid mode.

27769 [EMFILE] {FOPEN_MAX} streams are currently open in the calling process.

27770 [ENOMEM] Insufficient space to allocate a buffer.

27771 EXAMPLES

27772 None.

27773 APPLICATION USAGE

27774 File descriptors are obtained from calls like *open()*, *dup()*, *creat()*, or *pipe()*, which open files but
27775 do not return streams.

27776 RATIONALE

27777 The file descriptor may have been obtained from *open()*, *creat()*, *pipe()*, *dup()*, *fcntl()*, or *socket()*;
27778 inherited through *fork()*, *posix_spawn()*, or *exec*; or perhaps obtained by other means.

27779 The meanings of the *mode* arguments of *fdopen()* and *fopen()* differ. With *fdopen()*, open for write
27780 (*w* or *w+*) does not truncate, and append (*a* or *a+*) cannot create for writing. The *mode* argument
27781 formats that include a *b* are allowed for consistency with the ISO C standard function *fopen()*.
27782 The *b* has no effect on the resulting stream. Although not explicitly required by this volume of
27783 POSIX.1-2008, a good implementation of append (*a*) mode would cause the O_APPEND flag to
27784 be set.

27785 FUTURE DIRECTIONS

27786 None.

27791 CHANGE HISTORY

27792 First released in Issue 1. Derived from Issue 1 of the SVID.

27793 Issue 5

27794 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension.

27795 Large File Summit extensions are added.

27796 Issue 6

27797 The following new requirements on POSIX implementations derive from alignment with the
27798 Single UNIX Specification:

- 27799 • In the DESCRIPTION, the use and setting of the *mode* argument are changed to include
27800 binary streams.
- 27801 • In the DESCRIPTION, text is added for large file support to indicate setting of the offset
27802 maximum in the open file description.
- 27803 • All errors identified in the ERRORS section are added.
- 27804 • In the DESCRIPTION, text is added that the *fdopen()* function may cause *st_atime* to be
27805 updated.

27806 The following changes were made to align with the IEEE P1003.1a draft standard:

- 27807 • Clarification is added that it is the responsibility of the application to ensure that the mode
27808 is compatible with the open file descriptor.

27809 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that
27810 *fdopen()* results are unspecified for typed memory objects.

27811	IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/30 is applied, making corrections to the	
27812	RATIONALE.	
27813	Issue 7	
27814	SD5-XSH-ERN-149 is applied, adding the {STREAM_MAX} [EMFILE] error condition.	
27815	Changes are made related to support for finegrained timestamps.	
27816	POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0121 [409] is applied.	+

27817 **NAME**

27818 fdopendir, opendir — open directory associated with file descriptor

27819 **SYNOPSIS**

27820 #include <dirent.h>

27821 DIR *fdopendir(int *fd*);27822 DIR *opendir(const char **dirname*);27823 **DESCRIPTION**

27824 The *fdopendir()* function shall be equivalent to the *opendir()* function except that the directory is
 27825 specified by a file descriptor rather than by a name. The file offset associated with the file
 27826 descriptor at the time of the call determines which entries are returned.

27827 Upon successful return from *fdopendir()*, the file descriptor is under the control of the system,
 27828 and if any attempt is made to close the file descriptor, or to modify the state of the associated |
 27829 XSI description, other than by means of *closedir()*, *readdir()*, *readdir_r()*, *rewinddir()*, or *seekdir()*, the +
 27830 behavior is undefined. Upon calling *closedir()* the file descriptor shall be closed.

27831 It is unspecified whether the FD_CLOEXEC flag will be set on the file descriptor by a successful
 27832 call to *fdopendir()*.

27833 The *opendir()* function shall open a directory stream corresponding to the directory named by
 27834 the *dirname* argument. The directory stream is positioned at the first entry. If the type **DIR** is
 27835 implemented using a file descriptor, applications shall only be able to open up to a total of
 27836 {OPEN_MAX} files and directories.

27837 If the type **DIR** is implemented using a file descriptor, the descriptor shall be obtained as if the
 27838 O_DIRECTORY flag was passed to *open()*.

27839 **RETURN VALUE**

27840 Upon successful completion, these functions shall return a pointer to an object of type **DIR**.
 27841 Otherwise, these functions shall return a null pointer and set *errno* to indicate the error.

27842 **ERRORS**27843 The *fdopendir()* function shall fail if:27844 [EBADF] The *fd* argument is not a valid file descriptor open for reading.27845 [ENOTDIR] The descriptor *fd* is not associated with a directory.27846 The *opendir()* function shall fail if:

27847 [EACCES] Search permission is denied for the component of the path prefix of *dirname* or
 27848 read permission is denied for *dirname*.

27849 [ELOOP] A loop exists in symbolic links encountered during resolution of the *dirname*
 27850 argument.

27851 [ENAMETOOLONG]
 27852 The length of a component of a pathname is longer than {NAME_MAX}.

27853 [ENOENT] A component of *dirname* does not name an existing directory or *dirname* is an
 27854 empty string.

27855 [ENOTDIR] A component of *dirname* names an existing file that is neither a directory nor a |
 27856 symbolic link to a directory.

27857 The *opendir()* function may fail if:

27858 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
27859 resolution of the *dirname* argument.

27860 [EMFILE] All file descriptors available to the process are currently open.

27861 [ENAMETOOLONG]
27862 The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a
27863 symbolic link produced an intermediate result with a length that exceeds
27864 {PATH_MAX}.

27865 [ENFILE] Too many files are currently open in the system.

27866 EXAMPLES

27867 Open a Directory Stream

27868 The following program fragment demonstrates how the *opendir()* function is used.

```
27869 #include <dirent.h>
27870 ...
27871     DIR *dir;
27872     struct dirent *dp;
27873 ...
27874     if ((dir = opendir(".")) == NULL) {
27875         perror("Cannot open .");
27876         exit(1);
27877     }
27878     while ((dp = readdir(dir)) != NULL) {
27879 ...
```

27880 Find And Open a File

27881 The following program searches through a given directory looking for files whose name does
27882 not begin with a dot and whose size is larger than 1 MiB.

```
27883 #include <stdio.h>
27884 #include <dirent.h>
27885 #include <fcntl.h>
27886 #include <sys/stat.h>
27887 #include <stdint.h>
27888 #include <stdlib.h>
27889 #include <unistd.h>
27890

27905          * could be renamed between the readdir and the open */
27906         if ((ffd = openat(dfd, dp->d_name, O_RDONLY)) == -1) {
27907             perror(dp->d_name);
27908             continue;
27909         }
27910         if (fstat(ffd, &statbuf) == 0 && statbuf.st_size > (1024*1024)) {
27911             /* found it ... */
27912             printf("%s: %jdK\n", dp->d_name,
27913                 (intmax_t)(statbuf.st_size / 1024));
27914         }
27915         close(ffd);
27916     }
27917     closedir(d); // note this implicitly closes dfd
27918     return 0;
27919 }

```

APPLICATION USAGE

The *opendir()* function should be used in conjunction with *readdir()*, *closedir()*, and *rewinddir()* to examine the contents of the directory (see the EXAMPLES section in *readdir()*). This method is recommended for portability.

RATIONALE

The purpose of the *fdopendir()* function is to enable opening files in directories other than the current working directory without exposure to race conditions. Any part of the path of a file could be changed in parallel to a call to *opendir()*, resulting in unspecified behavior.

Based on historical implementations, the rules about file descriptors apply to directory streams as well. However, this volume of POSIX.1-2008 does not mandate that the directory stream be implemented using file descriptors. The description of *closedir()* clarifies that if a file descriptor is used for the directory stream, it is mandatory that *closedir()* deallocate the file descriptor. When a file descriptor is used to implement the directory stream, it behaves as if the *FD_CLOEXEC* had been set for the file descriptor.

The directory entries for dot and dot-dot are optional. This volume of POSIX.1-2008 does not provide a way to test *a priori* for their existence because an application that is portable must be written to look for (and usually ignore) those entries. Writing code that presumes that they are the first two entries does not always work, as many implementations permit them to be other than the first two entries, with a “normal” entry preceding them. There is negligible value in providing a way to determine what the implementation does because the code to deal with dot and dot-dot must be written in any case and because such a flag would add to the list of those flags (which has proven in itself to be objectionable) and might be abused.

Since the structure and buffer allocation, if any, for directory operations are defined by the implementation, this volume of POSIX.1-2008 imposes no portability requirements for erroneous program constructs, erroneous data, or the use of unspecified values such as the use or referencing of a *dirp* value or a **dirent** structure value after a directory stream has been closed or after a *fork()* or one of the *exec* function calls.

28003 **NAME**

28004 fegetenv, fesetenv — get and set current floating-point environment

28005 **SYNOPSIS**

```
28006 #include <fenv.h>
28007 int fegetenv(fenv_t *envp);
28008 int fesetenv(const fenv_t *envp);
```

28009 **DESCRIPTION**

28010 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 28011 conflict between the requirements described here and the ISO C standard is unintentional. This
 28012 volume of POSIX.1-2008 defers to the ISO C standard.

28013 The *fegetenv()* function shall attempt to store the current floating-point environment in the object
 28014 pointed to by *envp*.

28015 The *fesetenv()* function shall attempt to establish the floating-point environment represented by
 28016 the object pointed to by *envp*. The argument *envp* shall point to an object set by a call to
 28017 *fegetenv()* or *fehldexcept()*, or equal a floating-point environment macro. The *fesetenv()* function
 28018 does not raise floating-point exceptions, but only installs the state of the floating-point status
 28019 flags represented through its argument.

28020 **RETURN VALUE**

28021 If the representation was successfully stored, *fegetenv()* shall return zero. Otherwise, it shall
 28022 return a non-zero value. If the environment was successfully established, *fesetenv()* shall return
 28023 zero. Otherwise, it shall return a non-zero value.

28040 **NAME**

28041 fegetexceptflag, fesetexceptflag — get and set floating-point status flags

28042 **SYNOPSIS**

28043 #include <fenv.h>

28044 int fegetexceptflag(fexcept_t *flagp, int excepts);

28045 int fesetexceptflag(const fexcept_t *flagp, int excepts);

28046 **DESCRIPTION**

28047 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 28048 conflict between the requirements described here and the ISO C standard is unintentional. This
 28049 volume of POSIX.1-2008 defers to the ISO C standard.

28050 The *fegetexceptflag()* function shall attempt to store an implementation-defined representation of
 28051 the states of the floating-point status flags indicated by the argument *excepts* in the object
 28052 pointed to by the argument *flagp*.

28053 The *fesetexceptflag()* function shall attempt to set the floating-point status flags indicated by the
 28054 argument *excepts* to the states stored in the object pointed to by *flagp*. The value pointed to by
 28055 *flagp* shall have been set by a previous call to *fegetexceptflag()* whose second argument
 28056 represented at least those floating-point exceptions represented by the argument *excepts*. This
 28057 function does not raise floating-point exceptions, but only sets the state of the flags.

28058 **RETURN VALUE**

28059 If the representation was successfully stored, *fegetexceptflag()* shall return zero. Otherwise, it
 28060 shall return a non-zero value. If the *excepts* argument is zero or if all the specified exceptions
 28061 were successfully set, *fesetexceptflag()* shall return zero. Otherwise, it shall return a non-zero
 28062 value.

28063 **ERRORS**

28064 No errors are defined.

NAME

fegetround, fesetround — get and set current rounding direction

SYNOPSIS

```
#include <fenv.h>

int fegetround(void);
int fesetround(int round);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

The *fegetround()* function shall get the current rounding direction.

The *fesetround()* function shall establish the rounding direction represented by its argument *round*. If the argument is not equal to the value of a rounding direction macro, the rounding direction is not changed.

RETURN VALUE

The *fegetround()* function shall return the value of the rounding direction macro representing the current rounding direction or a negative value if there is no such rounding direction macro or the current rounding direction is not determinable.

The *fesetround()* function shall return a zero value if and only if the requested rounding direction was established.

ERRORS

No errors are defined.

EXAMPLES

The following example saves, sets, and restores the rounding direction, reporting an error and aborting if setting the rounding direction fails:

```
#include <fenv.h>
#include <assert.h>
void f(int round_dir)
{
    #pragma STDC FENV_ACCESS ON
    int save_round;
    int setround_ok;
    save_round = fegetround();
    setround_ok = fesetround(round_dir);
    assert(setround_ok == 0);
    /* ... */
    fesetround(save_round);
    /* ... */
}
```

APPLICATION USAGE

None.

RATIONALE

None.

28122 FUTURE DIRECTIONS

28123 None.

28124 SEE ALSO

28125 XBD [<fenv.h>](#)

28126 CHANGE HISTORY

28127 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

28128 ISO/IEC 9899:1999 standard, Technical Corrigendum 1 is incorporated.

28129 **NAME**

28130 feholdexcept — save current floating-point environment

28131 **SYNOPSIS**

28132 #include <fenv.h>

28133 int feholdexcept(fenv_t *envp);

28134 **DESCRIPTION**

28135 CX The functionality described on this reference page is aligned with the ISO C standard. Any
28136 conflict between the requirements described here and the ISO C standard is unintentional. This
28137 volume of POSIX.1-2008 defers to the ISO C standard.

28138 The *feholdexcept()* function shall save the current floating-point environment in the object
28139 pointed to by *envp*, clear the floating-point status flags, and then install a non-stop (continue on
28140 floating-point exceptions) mode, if available, for all floating-point exceptions.

28141 **RETURN VALUE**

28142 The *feholdexcept()* function shall return zero if and only if non-stop floating-point exception
28143 handling was successfully installed.

28144 **ERRORS**

28145 No errors are defined.

28146 **EXAMPLES**

28147 None.

28148 **APPLICATION USAGE**

28149 None.

28150 **RATIONALE**

28151 The *feholdexcept()* function should be effective on typical IEC 60559:1989 standard
28152 implementations which have the default non-stop mode and at least one other mode for trap
28153 handling or aborting. If the implementation provides only the non-stop mode, then installing the
28154 non-stop mode is trivial.

28155 **FUTURE DIRECTIONS**

28156 None.

28162 **NAME**

28163 feof — test end-of-file indicator on a stream

28164 **SYNOPSIS**

28165 #include <stdio.h>

28166 int feof(FILE *stream);

28167 **DESCRIPTION**

28168 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 28169 conflict between the requirements described here and the ISO C standard is unintentional. This
 28170 volume of POSIX.1-2008 defers to the ISO C standard.

28171 The *feof()* function shall test the end-of-file indicator for the stream pointed to by *stream*.28172 CX The *feof()* function shall not change the setting of *errno* if *stream* is valid.

+

28173 **RETURN VALUE**28174 The *feof()* function shall return non-zero if and only if the end-of-file indicator is set for *stream*.28175 **ERRORS**

28176 No errors are defined.

28177 **EXAMPLES**

28178 None.

28179 **APPLICATION USAGE**

28180 None.

28181 **RATIONALE**

28182 None.

28183 **FUTURE DIRECTIONS**

28184 None.

28185 **SEE ALSO**28186 *clearerr()*, *ferror()*, *fopen()*

28187 XBD <stdio.h>

28188 **CHANGE HISTORY**

28189 First released in Issue 1. Derived from Issue 1 of the SVID.

28190 **Issue 7**

28191 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0124 [401] is applied.

+

28192 **NAME**28193 `feraiseexcept` — raise floating-point exception28194 **SYNOPSIS**28195 `#include <fenv.h>`28196 `int fraiseexcept(int excepts);`28197 **DESCRIPTION**

28198 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 28199 conflict between the requirements described here and the ISO C standard is unintentional. This
 28200 volume of POSIX.1-2008 defers to the ISO C standard.

28201 The `feraiseexcept()` function shall attempt to raise the supported floating-point exceptions
 28202 represented by the argument *excepts*. The order in which these floating-point exceptions are
 28203 raised is unspecified. Whether the `feraiseexcept()` function additionally raises the inexact floating-
 28204 point exception whenever it raises the overflow or underflow floating-point exception is
 28205 implementation-defined.

28206 **RETURN VALUE**

28207 If the argument is zero or if all the specified exceptions were successfully raised, `feraiseexcept()`
 28208 shall return zero. Otherwise, it shall return a non-zero value.

28209 **ERRORS**

28210 No errors are defined.

28211 **EXAMPLES**

28212 None.

28213 **APPLICATION USAGE**

28214 The effect is intended to be similar to that of floating-point exceptions raised by arithmetic
 28215 operations. Hence, enabled traps for floating-point exceptions raised by this function are taken.

28216 **RATIONALE**

28217 Raising overflow or underflow is allowed to also raise inexact because on some architectures the
 28218 only practical way to raise an exception is to execute an instruction that has the exception as a
 28219 side-effect. The function is not restricted to accept only valid coincident expressions for atomic
 28220 operations, so the function can be used to raise exceptions accrued over several operations.

28221 **FUTURE DIRECTIONS**

28271 **DESCRIPTION**28272 Refer to *fegetexceptflag()*.

28273 **NAME**

28274 fesetround — set current rounding direction

28275 **SYNOPSIS**

28276 #include <fenv.h>

28277 int fesetround(int *round*);

28278 **DESCRIPTION**

28279 Refer to *fegetround()*.

28280 **NAME**

28281 fetestexcept — test floating-point exception flags

28282 **SYNOPSIS**

28283 #include <fenv.h>

28284 int fetestexcept(int *excepts*);28285 **DESCRIPTION**

28286 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 28287 conflict between the requirements described here and the ISO C standard is unintentional. This
 28288 volume of POSIX.1-2008 defers to the ISO C standard.

28289 The *fetestexcept()* function shall determine which of a specified subset of the floating-point
 28290 exception flags are currently set. The *excepts* argument specifies the floating-point status flags to
 28291 be queried.

28292 **RETURN VALUE**

28293 The *fetestexcept()* function shall return the value of the bitwise-inclusive OR of the floating-point
 28294 exception macros corresponding to the currently set floating-point exceptions included in
 28295 *excepts*.

28296 **ERRORS**

28297 No errors are defined.

28298 **EXAMPLES**

28299 The following example calls function *f()* if an invalid exception is set, and then function *g()* if an
 28300 overflow exception is set:

```
28301 #include <fenv.h>
28302 /* ... */
28303 {
28304     #pragma STDC FENV_ACCESS ON
28305     int set_excepts;
28306     feclearexcept(FE_INVALID | FE_OVERFLOW);
28307     // maybe raise exceptions
28308     set_excepts = fetestexcept(FE_INVALID | FE_OVERFLOW);
28309     if (set_excepts & FE_INVALID) f();
28310     if (set_excepts & FE_OVERFLOW) g();
28311     /* ... */
28312 }
```

28313 **APPLICATION USAGE**

28314 None.

28315 **RATIONALE**

28316 None.

28321 XBD <fenv.h>

28322	CHANGE HISTORY
28323	First released in Issue 6. Derived from the ISO/IEC 9899: 1999 standard.

28324 **NAME**

28325 feupdateenv — update floating-point environment

28326 **SYNOPSIS**

28327 #include <fenv.h>

28328 int feupdateenv(const fenv_t *envp);

28329 **DESCRIPTION**

28330 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 28331 conflict between the requirements described here and the ISO C standard is unintentional. This
 28332 volume of POSIX.1-2008 defers to the ISO C standard.

28333 The *feupdateenv()* function shall attempt to save the currently raised floating-point exceptions in
 28334 its automatic storage, attempt to install the floating-point environment represented by the object
 28335 pointed to by *envp*, and then attempt to raise the saved floating-point exceptions. The argument
 28336 *envp* shall point to an object set by a call to *feholdexcept()* or *fegetenv()*, or equal a floating-point
 28337 environment macro.

28338 **RETURN VALUE**

28339 The *feupdateenv()* function shall return a zero value if and only if all the required actions were
 28340 successfully carried out.

28341 **ERRORS**

28342 No errors are defined.

28343 **EXAMPLES**

28344 The following example shows sample code to hide spurious underflow floating-point
 28345 exceptions:

```

CHANGE HISTORY

- 28368
- 28369 First released in Issue 6. Derived from the ISO/IEC 9899: 1999 standard.
- 28370 ISO/IEC 9899: 1999 standard, Technical Corrigendum 1 is incorporated.

28371 **NAME**

28372 fexecve — execute a file

28373 **SYNOPSIS**

28374 #include <unistd.h>

28375 int fexecve(int *fd*, char *const *argv*[], char *const *envp*[]);28376 **DESCRIPTION**28377 Refer to *exec*.

28378 **NAME**

28379 fflush — flush a stream

28380 **SYNOPSIS**

28381 #include <stdio.h>

28382 int fflush(FILE *stream);

28383 **DESCRIPTION**

28384 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 28385 conflict between the requirements described here and the ISO C standard is unintentional. This
 28386 volume of POSIX.1-2008 defers to the ISO C standard.

28387 If *stream* points to an output stream or an update stream in which the most recent operation was
 28388 CX not input, *fflush()* shall cause any unwritten data for that stream to be written to the file, and the
 28389 last data modification and last file status change timestamps of the underlying file shall be
 28390 marked for update.

28391 If *stream* is a null pointer, *fflush()* shall perform this flushing action on all streams for which the
 28392 behavior is defined above.

28393 CX For a stream open for reading, if the file is not already at EOF, and the file is one capable of
 28394 seeking, the file offset of the underlying open file description shall be set to the file position of
 28395 the stream, and any characters pushed back onto the stream by *ungetc()* or *ungetwc()* that have
 28396 not subsequently been read from the stream shall be discarded (without further changing the file
 28397 offset).

28398 **RETURN VALUE**

28399 Upon successful completion, *fflush()* shall return 0; otherwise, it shall set the error indicator for
 28400 CX the stream, return EOF, and set *errno* to indicate the error.

28401 **ERRORS**28402 The *fflush()* function shall fail if:

28403 CX [EAGAIN] The O_NONBLOCK flag is set for the file descriptor underlying *stream* and
 28404 the thread would be delayed in the write operation.

28405 CX [EBADF] The file descriptor underlying *stream* is not valid.

28406 CX [EFBIG] An attempt was made to write a file that exceeds the maximum file size.

28407 XSI [EFBIG] An attempt was made to write a file that exceeds the file size limit of the
 28408 process.

28409 CX [EFBIG] The file is a regular file and an attempt was made to write at or beyond the
 28410 offset maximum associated with the corresponding stream.

28411 CX [EINTR] The *fflush()* function was interrupted by a signal.

28412 CX [EIO] The process is a member of a background process group attempting to write to
 28413 its controlling terminal, TOSTOP is set, the calling thread is not blocking
 28414 SIGTTOU, the process is not ignoring SIGTTOU, and the process group of the
 28415 process is orphaned. This error may also be returned under implementation-
 28416 defined conditions.

28417 CX [ENOMEM] The underlying stream was created by *open_memstream()* or
 28418 *open_wmemstream()* and insufficient memory is available.

28419 CX [ENOSPC] There was no free space remaining on the device containing the file or in the
 28420 buffer used by the *fmemopen()* function.

28421 CX [EPIPE] An attempt is made to write to a pipe or FIFO that is not open for reading by
 28422 any process. A SIGPIPE signal shall also be sent to the thread.

28423 The *fflush()* function may fail if:

28424 CX [ENXIO] A request was made of a nonexistent device, or the request was outside the
 28425 capabilities of the device.

28426 EXAMPLES

28427 Sending Prompts to Standard Output

28428 The following example uses *printf()* calls to print a series of prompts for information the user
 28429 must enter from standard input. The *fflush()* calls force the output to standard output. The
 28430 *fflush()* function is used because standard output is usually buffered and the prompt may not
 28431 immediately be printed on the output or terminal. The *getline()* function calls read strings from
 28432 standard input and place the results in variables, for use later in the program.

```

28433 char *user;
28434 char *oldpasswd;
28435 char *newpasswd;
28436 ssize_t llen;
28437 size_t blen;
28438 struct termios term;
28439 tcflag_t saveflag;

28440 printf("User name: ");
28441 fflush(stdout);
28442 blen = 0;
28443 llen = getline(&user, &blen, stdin);
28444 user[llen-1] = 0;
28445 tcgetattr(fileno(stdin), &term);
28446 saveflag = term.c_lflag;
28447 term.c_lflag &= ~ECHO;
28448 tcsetattr(fileno(stdin), TCSANOW, &term);
28449 printf("Old password: ");
28450 fflush(stdout);
28451 blen = 0;
28452 llen = getline(&oldpasswd, &blen, stdin);
28453 oldpasswd[llen-1] = 0;

28454 printf("\nNew password: ");
28455 fflush(stdout);
28456 blen = 0;
28457 llen = getline(&newpasswd, &blen, stdin);
28458 newpasswd[llen-1] = 0;
28459 term.c_lflag = saveflag;
28460 tcsetattr(fileno(stdin), TCSANOW, &term);
28461 free(user);
28462 free(oldpasswd);
28463 free(newpasswd);

```

28464 **APPLICATION USAGE**

28465 None.

28466 **RATIONALE**

28467 Data buffered by the system may make determining the validity of the position of the current
 28468 file descriptor impractical. Thus, enforcing the repositioning of the file descriptor after *fflush()*
 28469 on streams open for *read()* is not mandated by POSIX.1-2008.

28470 **FUTURE DIRECTIONS**

28471 None.

28472 **SEE ALSO**28473 [Section 2.5](#) (on page 495), *fmemopen()*, *getrlimit()*, *open_memstream()*, *ulimit()*28474 XBD [<stdio.h>](#)28475 **CHANGE HISTORY**

28476 First released in Issue 1. Derived from Issue 1 of the SVID.

28477 **Issue 5**

28478 Large File Summit extensions are added.

28479 **Issue 6**

28480 Extensions beyond the ISO C standard are marked.

28481 The following new requirements on POSIX implementations derive from alignment with the
 28482 Single UNIX Specification:

- 28483 • The [EFBIG] error is added as part of the large file support extensions.
- 28484 • The [ENXIO] optional error condition is added.

28485 The RETURN VALUE section is updated to note that the error indicator shall be set for the
 28486 stream. This is for alignment with the ISO/IEC 9899:1999 standard.

28487 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/31 is applied, updating the [EAGAIN]
 28488 error in the ERRORS section from “the process would be delayed” to “the thread would be
 28489 delayed”.

28490 **Issue 7**

28491 Austin Group Interpretation 1003.1-2001 #002 is applied, clarifying the interaction of file
 28492 descriptors and streams.

28493 The [ENOSPC] error condition is updated and the [ENOMEM] error is added from The Open
 28494 Group Technical Standard, 2006, Extended API Set Part 1.

28495 The EXAMPLES section is revised.

28496 Changes are made related to support for finegrained timestamps.

28497 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0126 [87], XSH/TC1-2008/0127 [79], +
 28498 and XSH/TC1-2008/0128 [14] are applied.

28499 NAME

28500 ffs — find first set bit

28501 SYNOPSIS

```
28502 XSI        #include <strings.h>  
28503        int ffs(int i);
```

28504 DESCRIPTION

28505 The *ffs()* function shall find the first bit set (beginning with the least significant bit) in *i*, and
28506 return the index of that bit. Bits are numbered starting at one (the least significant bit).

28507 RETURN VALUE

28508 The *ffs()* function shall return the index of the first bit set. If *i* is 0, then *ffs()* shall return 0.

28509 ERRORS

28510 No errors are defined.

28511 EXAMPLES

28512 None.

28513 APPLICATION USAGE

28521 CHANGE HISTORY

28522 First released in Issue 4, Version 2.

28523 Issue 5

28524 Moved from X/OPEN UNIX extension to BASE.

28525 **NAME**

28526 fgetc — get a byte from a stream

28527 **SYNOPSIS**

28528 #include <stdio.h>

28529 int fgetc(FILE *stream);

28530 **DESCRIPTION**

28531 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 28532 conflict between the requirements described here and the ISO C standard is unintentional. This
 28533 volume of POSIX.1-2008 defers to the ISO C standard.

28534 If the end-of-file indicator for the input stream pointed to by *stream* is not set and a next byte is
 28535 present, the *fgetc()* function shall obtain the next byte as an **unsigned char** converted to an **int**,
 28536 from the input stream pointed to by *stream*, and advance the associated file position indicator for
 28537 the stream (if defined). Since *fgetc()* operates on bytes, reading a character consisting of multiple
 28538 bytes (or “a multi-byte character”) may require multiple calls to *fgetc()*.

28539 CX The *fgetc()* function may mark the last data access timestamp of the file associated with *stream*
 28540 for update. The last data access timestamp shall be marked for update by the first successful
 28541 execution of *fgetc()*, *fgets()*, *fread()*, *fscanf()*, *getc()*, *getchar()*, *getdelim()*, *getline()*, *gets()*, or
 28542 *scanf()* using *stream* that returns data not supplied by a prior call to *ungetc()*.

28543 **RETURN VALUE**

28544 Upon successful completion, *fgetc()* shall return the next byte from the input stream pointed to
 28545 by *stream*. If the end-of-file indicator for the stream is set, or if the stream is at end-of-file, the
 28546 end-of-file indicator for the stream shall be set and *fgetc()* shall return EOF. If a read error occurs,
 28547 CX the error indicator for the stream shall be set, *fgetc()* shall return EOF, and shall set *errno* to
 28548 indicate the error.

28549 **ERRORS**28550 The *fgetc()* function shall fail if data needs to be read and:

28551 CX [EAGAIN] The O_NONBLOCK flag is set for the file descriptor underlying *stream* and
 28552 the thread would be delayed in the *fgetc()* operation.

28553 CX [EBADF] The file descriptor underlying *stream* is not a valid file descriptor open for
 28554 reading.

28555 CX [EINTR] The read operation was terminated due to the receipt of a signal, and no data
 28556 was transferred.

28557 CX [EIO] A physical I/O error has occurred, or the process is in a background process
 28558 group attempting to read from its controlling terminal, and either the calling
 28559 thread is blocking SIGTTIN or the process is ignoring SIGTTIN or the process
 28560 group of the process is orphaned. This error may also be generated for
 28561 implementation-defined reasons.

28562 CX [EOVERFLOW] The file is a regular file and an attempt was made to read at or beyond the
 28563 offset maximum associated with the corresponding stream.

28564 The *fgetc()* function may fail if:

28565 CX [ENOMEM] Insufficient storage space is available.

28566 CX [ENXIO] A request was made of a nonexistent device, or the request was outside the
 28567 capabilities of the device.

EXAMPLES

None.

APPLICATION USAGE

If the integer value returned by *fgetc()* is stored into a variable of type **char** and then compared against the integer constant EOF, the comparison may never succeed, because sign-extension of a variable of type **char** on widening to integer is implementation-defined.

The *ferror()* or *feof()* functions must be used to distinguish between an error condition and an end-of-file condition.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

Large File Summit extensions are added.

Issue 6

Extensions beyond the ISO C standard are marked.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The [EIO] and [EOVERFLOW] mandatory error conditions are added.
- The [ENOMEM] and [ENXIO] optional error conditions are added.

The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- The DESCRIPTION is updated to clarify the behavior when the end-of-file indicator for the input stream is not set.
- The RETURN VALUE section is updated to note that the error indicator shall be set for the stream.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/32 is applied, updating the [EAGAIN] error in the ERRORS section from “the process would be delayed” to “the thread would be delayed”.

Issue 7

Austin Group Interpretation 1003.1-2001 #051 is applied, updating the list of functions that mark the last data access timestamp for update.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0129 [79] and XSH/TC1-2008/0130 + [14] are applied.

28606 **NAME**28607 `fgetpos` — get current file position information28608 **SYNOPSIS**28609 `#include <stdio.h>`28610 `int fgetpos(FILE *restrict stream, fpos_t *restrict pos);`28611 **DESCRIPTION**

28612 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 28613 conflict between the requirements described here and the ISO C standard is unintentional. This
 28614 volume of POSIX.1-2008 defers to the ISO C standard.

28615 The `fgetpos()` function shall store the current values of the parse state (if any) and file position
 28616 indicator for the stream pointed to by *stream* in the object pointed to by *pos*. The value stored
 28617 contains unspecified information usable by `fsetpos()` for repositioning the stream to its position
 28618 at the time of the call to `fgetpos()`.

28619 The `fgetpos()` function shall not change the setting of *errno* if successful.

+

28620 **RETURN VALUE**

28621 Upon successful completion, `fgetpos()` shall return 0; otherwise, it shall return a non-zero value
 28622 and set *errno* to indicate the error.

28623 **ERRORS**28624 The `fgetpos()` function shall fail if:

28625 CX [EBADF] The file descriptor underlying *stream* is not valid.

-

28626 CX [EOVERFLOW] The current value of the file position cannot be represented correctly in an
 28627 object of type `fpos_t`.

+

28628 CX [ESPIPE] The file descriptor underlying *stream* is associated with a pipe, FIFO, or socket.

28629 **EXAMPLES**

28630 None.

28631 **APPLICATION USAGE**

28632 None.

28633 **RATIONALE**

28634 None.

28635 **FUTURE DIRECTIONS**

28636 None.

28637 **SEE ALSO**28638 [Section 2.5](#) (on page 495), `fopen()`, `ftell()`, `rewind()`, `ungetc()`28639 XBD `<stdio.h>`28640 **CHANGE HISTORY**

28641 First released in Issue 4. Derived from the ISO C standard.

28642 **Issue 5**

28643 Large File Summit extensions are added.

Issue 6

Extensions beyond the ISO C standard are marked.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The [EBADF] and [ESPIPE] optional error conditions are added.

An additional [ESPIPE] error condition is added for sockets.

The prototype for *fgetpos()* is changed for alignment with the ISO/IEC 9899:1999 standard.

Issue 7

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0131 [105], XSH/TC1-2008/0132 [122], + and XSH/TC1-2008/0133 [14] are applied.

28654 **NAME**28655 `fgets` — get a string from a stream28656 **SYNOPSIS**28657 `#include <stdio.h>`28658 `char *fgets(char *restrict s, int n, FILE *restrict stream);`28659 **DESCRIPTION**

28660 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 28661 conflict between the requirements described here and the ISO C standard is unintentional. This
 28662 volume of POSIX.1-2008 defers to the ISO C standard.

28663 The `fgets()` function shall read bytes from *stream* into the array pointed to by *s*, until *n*−1 bytes
 28664 are read, or a <newline> is read and transferred to *s*, or an end-of-file condition is encountered.
 28665 The string is then terminated with a null byte.

28666 CX The `fgets()` function may mark the last data access timestamp of the file associated with *stream*
 28667 for update. The last data access timestamp shall be marked for update by the first successful
 28668 execution of `fgetc()`, `fgets()`, `fread()`, `fscanf()`, `getc()`, `getchar()`, `getdelim()`, `getline()`, `gets()`, or
 28669 `scanf()` using *stream* that returns data not supplied by a prior call to `ungetc()`.

28670 **RETURN VALUE**

28671 Upon successful completion, `fgets()` shall return *s*. If the stream is at end-of-file, the end-of-file
 28672 indicator for the stream shall be set and `fgets()` shall return a null pointer. If a read error occurs,
 28673 CX the error indicator for the stream shall be set, `fgets()` shall return a null pointer, and shall set
 28674 `errno` to indicate the error.

28675 **ERRORS**28676 Refer to `fgetc()`.28677 **EXAMPLES**28678 **Reading Input**

28679 The following example uses `fgets()` to read lines of input. It assumes that the file it is reading is a
 28680 text file and that lines in this text file are no longer than 16384 (or {LINE_MAX} if it is less than
 28681 16384 on the implementation where it is running) bytes long. (Note that the standard utilities
 28682 have no line length limit if `sysconf(_SC_LINE_MAX)` returns −1 without setting `errno`. This
 28683 example assumes that `sysconf(_SC_LINE_MAX)` will not fail.)

```

28684 #include <limits.h>
28685 #include <stdio.h>
28686 #include <unistd.h>
28687 #define MYLIMIT 16384
28688
28688 char *line;
28689 int line_max;
28690 if (LINE_MAX >= MYLIMIT) {
28691     // Use maximum line size of MYLIMIT. If LINE_MAX is
28692     // bigger than our limit, sysconf() can't report a
28693     // smaller limit.
28694     line_max = MYLIMIT;
28695 } else {
28696     long limit = sysconf(_SC_LINE_MAX);
28697     line_max = (limit < 0 || limit > MYLIMIT) ? MYLIMIT : (int)limit;
28698 }
```

```

28699 // line_max + 1 leaves room for the null byte added by fgets().
28700 line = malloc(line_max + 1);
28701 if (line == NULL) {
28702     // out of space
28703     ...
28704     return error;
28705 }
28706 while (fgets(line, line_max + 1, fp) != NULL) {
28707     // Verify that a full line has been read ...
28708     // If not, report an error or prepare to treat the
28709     // next time through the loop as a read of a
28710     // continuation of the current line.
28711     ...
28712     // Process line ...
28713     ...
28714 }
28715 free(line);
28716 ...

```

28717 **APPLICATION USAGE**
28718 None.

28736 [14] are applied.

28737 **NAME**

28738 fgetwc — get a wide-character code from a stream

28739 **SYNOPSIS**

28740 #include <stdio.h>

28741 #include <wchar.h>

28742 wint_t fgetwc(FILE *stream);

28743 **DESCRIPTION**

28744 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 28745 conflict between the requirements described here and the ISO C standard is unintentional. This
 28746 volume of POSIX.1-2008 defers to the ISO C standard.

28747 The *fgetwc()* function shall obtain the next character (if present) from the input stream pointed to
 28748 by *stream*, convert that to the corresponding wide-character code, and advance the associated file
 28749 position indicator for the stream (if defined).

28750 If an error occurs, the resulting value of the file position indicator for the stream is unspecified.

28751 CX The *fgetwc()* function may mark the last data access timestamp of the file associated with *stream*
 28752 for update. The last data access timestamp shall be marked for update by the first successful
 28753 execution of *fgetwc()*, *fgetws()*, *fwscanf()*, *getwc()*, *getwchar()*, *vfwscanf()*, *vfwscanf()*, or *wscanf()*
 28754 using *stream* that returns data not supplied by a prior call to *ungetwc()*.

28755 The *fgetwc()* function shall not change the setting of *errno* if successful.

+

28756 **RETURN VALUE**

28757 Upon successful completion, the *fgetwc()* function shall return the wide-character code of the
 28758 character read from the input stream pointed to by *stream* converted to a type **wint_t**. If the end-
 28759 of-file indicator for the stream is set, or if the stream is at end-of-file, the end-of-file indicator for
 28760 the stream shall be set and *fgetwc()* shall return WEOF. If a read error occurs, the error indicator
 28761 CX for the stream shall be set, *fgetwc()* shall return WEOF, and shall set *errno* to indicate the error. If
 28762 an encoding error occurs, the error indicator for the stream shall be set, *fgetwc()* shall return
 28763 WEOF, and shall set *errno* to indicate the error.

28764 **ERRORS**

28765 The *fgetwc()* function shall fail if data needs to be read and:

28766 CX [EAGAIN] The O_NONBLOCK flag is set for the file descriptor underlying *stream* and
 28767 the thread would be delayed in the *fgetwc()* operation.

28768 CX [EBADF] The file descriptor underlying *stream* is not a valid file descriptor open for
 28769 reading.

28770 [EILSEQ] The data obtained from the input stream does not form a valid character.

28771 CX [EINTR] The read operation was terminated due to the receipt of a signal, and no data
 28772 was transferred.

28773 CX [EIO] A physical I/O error has occurred, or the process is in a background process
 28774 group attempting to read from its controlling terminal, and either the calling
 28775 thread is blocking SIGTTIN or the process is ignoring SIGTTIN or the process
 28776 group of the process is orphaned. This error may also be generated for
 28777 implementation-defined reasons.

28778 CX [EOVERFLOW] The file is a regular file and an attempt was made to read at or beyond the
 28779 offset maximum associated with the corresponding stream.

28780 The *fgetwc()* function may fail if:

28781 CX [ENOMEM] Insufficient storage space is available.

28782 CX [ENXIO] A request was made of a nonexistent device, or the request was outside the
28783 capabilities of the device.

28784 EXAMPLES

28785 None.

28786 APPLICATION USAGE

28787 The *ferror()* or *feof()* functions must be used to distinguish between an error condition and an
28788 end-of-file condition.

28789 RATIONALE

28790 None.

28791 FUTURE DIRECTIONS

28792 None.

28793 SEE ALSO

28796 CHANGE HISTORY

28797 First released in Issue 4. Derived from the MSE working draft.

28798 Issue 5

28799 The Optional Header (OH) marking is removed from [<stdio.h>](#).

28800 Large File Summit extensions are added.

28801 Issue 6

28802 Extensions beyond the ISO C standard are marked.

28803 The following new requirements on POSIX implementations derive from alignment with the
28804 Single UNIX Specification:

- 28805 • The [EIO] and [EOVERFLOW] mandatory error conditions are added.
- 28806 • The [ENOMEM] and [ENXIO] optional error conditions are added.

28807 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/33 is applied, updating the [EAGAIN]
28808 error in the ERRORS section from “the process would be delayed” to “the thread would be
28809 delayed”.

28810 Issue 7

28811 Austin Group Interpretation 1003.1-2001 #051 is applied, clarifying the RETURN VALUE section.

28812 Changes are made related to support for finegrained timestamps.

28813 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0136 [105], XSH/TC1-2008/0137 [79], +
28814 and XSH/TC1-2008/0138 [14] are applied.

28815 **NAME**

28816 fgetws — get a wide-character string from a stream

28817 **SYNOPSIS**

28818 #include <stdio.h>

28819 #include <wchar.h>

28820 wchar_t *fgetws(wchar_t *restrict ws, int n,

28821 FILE *restrict stream);

28822 **DESCRIPTION**

28823 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 28824 conflict between the requirements described here and the ISO C standard is unintentional. This
 28825 volume of POSIX.1-2008 defers to the ISO C standard.

28826 The *fgetws()* function shall read characters from the *stream*, convert these to the corresponding
 28827 wide-character codes, place them in the **wchar_t** array pointed to by *ws*, until *n*–1 characters are
 28828 read, or a <newline> is read, converted, and transferred to *ws*, or an end-of-file condition is
 28829 encountered. The wide-character string, *ws*, shall then be terminated with a null wide-character
 28830 code.

28831 If an error occurs, the resulting value of the file position indicator for the stream is unspecified.

28832 CX The *fgetws()* function may mark the last data access timestamp of the file associated with *stream*
 28833 for update. The last data access timestamp shall be marked for update by the first successful
 28834 execution of *fgetwc()*, *fgetws()*, *fwscanf()*, *getwc()*, *getwchar()*, *vfwscanf()*, *vwscanf()*, or *wscanf()*
 28835 using *stream* that returns data not supplied by a prior call to *ungetwc()*.

28836 **RETURN VALUE**

28837 Upon successful completion, *fgetws()* shall return *ws*. If the end-of-file indicator for the stream is
 28838 set, or if the stream is at end-of-file, the end-of-file indicator for the stream shall be set and
 28839 *fgetws()* shall return a null pointer. If a read error occurs, the error indicator for the stream shall
 28840 CX be set, *fgetws()* shall return a null pointer, and shall set *errno* to indicate the error.

28841 **ERRORS**28842 Refer to *fgetwc()*.28843 **EXAMPLES**

28844 None.

28845 **APPLICATION USAGE**

28846 None.

28847 **RATIONALE**

28848 None.

28849 **FUTURE DIRECTIONS**

28850 None.

28851 **SEE ALSO**28852 Section 2.5 (on page 495), *fopen()*, *fread()*

28853 XBD <stdio.h>, <wchar.h>

28854 **CHANGE HISTORY**

28855 First released in Issue 4. Derived from the MSE working draft.

28856 **Issue 5**

28857 The Optional Header (OH) marking is removed from `<stdio.h>`.

28858 **Issue 6**

28859 Extensions beyond the ISO C standard are marked.

28860 The prototype for `fgetws()` is changed for alignment with the ISO/IEC 9899:1999 standard.

28861 **Issue 7**

28862 Austin Group Interpretation 1003.1-2001 #051 is applied, clarifying the RETURN VALUE section.

28863 Changes are made related to support for finegrained timestamps.

28864 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0139 [14] is applied.

+

28865 **NAME**

28866 `fileno` — map a stream pointer to a file descriptor

28867 **SYNOPSIS**

```
28868 CX      #include <stdio.h>
28869          int fileno(FILE *stream);
```

28870 **DESCRIPTION**

28871 The `fileno()` function shall return the integer file descriptor associated with the stream pointed to
28872 by `stream`.

28873 **RETURN VALUE**

28874 Upon successful completion, `fileno()` shall return the integer value of the file descriptor
28875 associated with `stream`. Otherwise, the value `-1` shall be returned and `errno` set to indicate the
28876 error.

28877 **ERRORS**

28878 The `fileno()` function may fail if:

28879	[EBADF]	The <code>stream</code> argument is not a valid stream, or the stream is not associated with
28880		a file.

28881 **EXAMPLES**

28882 None.

28883 **APPLICATION USAGE**

28884 None.

28885 **RATIONALE**

28886 Without some specification of which file descriptors are associated with these streams, it is
28887 impossible for an application to set up the streams for another application it starts with `fork()`
28888 and `exec`. In particular, it would not be possible to write a portable version of the `sh` command
28889 interpreter (although there may be other constraints that would prevent that portability).

28890 **FUTURE DIRECTIONS**

28891 None.

28892 **SEE ALSO**

28893 [Section 2.5.1](#) (on page 496), [dirfd\(\)](#), [fdopen\(\)](#), [fopen\(\)](#), [stdin](#)
28894 XBD [<stdio.h>](#)

28895 **CHANGE HISTORY**

28896 First released in Issue 1. Derived from Issue 1 of the SVID.

28897 **Issue 6**

28898 The following new requirements on POSIX implementations derive from alignment with the
28899 Single UNIX Specification:

- 28900 • The [EBADF] optional error condition is added.

28901 **Issue 7**

28902 SD5-XBD-ERN-99 is applied, changing the definition of the [EBADF] error.

28903 **NAME**

28904 flockfile, ftrylockfile, funlockfile — stdio locking functions

28905 **SYNOPSIS**

```
28906 CX      #include <stdio.h>
28907          void flockfile(FILE *file);
28908          int ftrylockfile(FILE *file);
28909          void funlockfile(FILE *file);
```

28910 **DESCRIPTION**

28911 These functions shall provide for explicit application-level locking of stdio (**FILE ***) objects.
 28912 These functions can be used by a thread to delineate a sequence of I/O statements that are
 28913 executed as a unit.

28914 The *flockfile()* function shall acquire for a thread ownership of a (**FILE ***) object.

28915 The *ftrylockfile()* function shall acquire for a thread ownership of a (**FILE ***) object if the object is
 28916 available; *ftrylockfile()* is a non-blocking version of *flockfile()*.

28917 The *funlockfile()* function shall relinquish the ownership granted to the thread. The behavior is
 28918 undefined if a thread other than the current owner calls the *funlockfile()* function.

28919 The functions shall behave as if there is a lock count associated with each (**FILE ***) object. This
 28920 count is implicitly initialized to zero when the (**FILE ***) object is created. The (**FILE ***) object is
 28921 unlocked when the count is zero. When the count is positive, a single thread owns the (**FILE ***)
 28922 object. When the *flockfile()* function is called, if the count is zero or if the count is positive and
 28923 the caller owns the (**FILE ***) object, the count shall be incremented. Otherwise, the calling thread
 28924 shall be suspended, waiting for the count to return to zero. Each call to *funlockfile()* shall
 28925 decrement the count. This allows matching calls to *flockfile()* (or successful calls to *ftrylockfile()*)
 28926 and *funlockfile()* to be nested.

28927 All functions that reference (**FILE ***) objects, except those with names ending in *_unlocked*, shall
 28928 behave as if they use *flockfile()* and *funlockfile()* internally to obtain ownership of these (**FILE ***)
 28929 objects.

28930 **RETURN VALUE**

28931 None for *flockfile()* and *funlockfile()*.

28932 The *ftrylockfile()* function shall return zero for success and non-zero to indicate that the lock
 28933 cannot be acquired.

28934 **ERRORS**

28935 No errors are defined.

28936 **EXAMPLES**

28937 None.

28938 **APPLICATION USAGE**

28939 Applications using these functions may be subject to priority inversion, as discussed in XBD
 28940 [Section 3.287](#) (on page 79).

28941 **RATIONALE**

28942 The *flockfile()* and *funlockfile()* functions provide an orthogonal mutual-exclusion lock for each
 28943 **FILE**. The *ftrylockfile()* function provides a non-blocking attempt to acquire a file lock,
 28944 analogous to *pthread_mutex_trylock()*.

28945 These locks behave as if they are the same as those used internally by *stdio* for thread-safety.
 28946 This both provides thread-safety of these functions without requiring a second level of internal

locking and allows functions in *stdio* to be implemented in terms of other *stdio* functions.

Application developers and implementors should be aware that there are potential deadlock problems on **FILE** objects. For example, the line-buffered flushing semantics of *stdio* (requested via `{_IOLBF}`) require that certain input operations sometimes cause the buffered contents of implementation-defined line-buffered output streams to be flushed. If two threads each hold the lock on the other's **FILE**, deadlock ensues. This type of deadlock can be avoided by acquiring **FILE** locks in a consistent order. In particular, the line-buffered output stream deadlock can typically be avoided by acquiring locks on input streams before locks on output streams if a thread would be acquiring both.

In summary, threads sharing *stdio* streams with other threads can use *flockfile()* and *funlockfile()* to cause sequences of I/O performed by a single thread to be kept bundled. The only case where the use of *flockfile()* and *funlockfile()* is required is to provide a scope protecting uses of the **_unlocked* functions/macros. This moves the cost/performance tradeoff to the optimal point.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6

These functions are marked as part of the Thread-Safe Functions option.

Issue 7

The *flockfile()*, *ftrylockfile()*, and *funlockfile()* functions are moved from the Thread-Safe Functions option to the Base.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0140 [118] is applied.

+

28973 **NAME**

28974 floor, floorf, floorl — floor function

28975 **SYNOPSIS**

```
28976 #include <math.h>
28977 double floor(double x);
28978 float floorf(float x);
28979 long double floorl(long double x);
```

28980 **DESCRIPTION**

28981 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 28982 conflict between the requirements described here and the ISO C standard is unintentional. This
 28983 volume of POSIX.1-2008 defers to the ISO C standard.

28984 These functions shall compute the largest integral value not greater than x . -

28985 **RETURN VALUE**

28986 MX The result shall have the same sign as x . +

28987 Upon successful completion, these functions shall return the largest integral value not greater
 28988 than x , expressed as a **double**, **float**, or **long double**, as appropriate for the return type of the
 28989 function.

28990 MX If x is NaN, a NaN shall be returned.

28991 If x is ± 0 or $\pm \text{Inf}$, x shall be returned. -

28992 **ERRORS**

28993 No errors are defined. |

28994 **EXAMPLES**

28995 None.

28996 **APPLICATION USAGE**

28997 The integral value returned by these functions might not be expressible as an **intmax_t**. The
 28998 return value should be tested before assigning it to an integer type to avoid the undefined
 28999 results of an integer overflow.

29000 These functions may raise the inexact floating-point exception if the result differs in value from |
 29001 the argument.

29002 **RATIONALE**

29003 None.

29004 **FUTURE DIRECTIONS**

29005 None.

29009 **CHANGE HISTORY**

29010 First released in Issue 1. Derived from Issue 1 of the SVID.

29011 **Issue 5**

29012 The DESCRIPTION is updated to indicate how an application should check for an error. This
 29013 text was previously published in the APPLICATION USAGE section.

29014	Issue 6	
29015	The <i>floorf()</i> and <i>floorl()</i> functions are added for alignment with the ISO/IEC 9899:1999 standard.	
29016	The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are	
29017	revised to align with the ISO/IEC 9899:1999 standard.	
29018	IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are	
29019	marked.	
29020	Issue 7	
29021	POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0141 [346] is applied.	+

29022 **NAME**29023 `fma, fmaf, fmal` — floating-point multiply-add29024 **SYNOPSIS**

```
29025 #include <math.h>
29026 double fma(double x, double y, double z);
29027 float fmaf(float x, float y, float z);
29028 long double fmal(long double x, long double y, long double z);
```

29029 **DESCRIPTION**

29030 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any
 29031 conflict between the requirements described here and the ISO C standard is unintentional. This
 29032 volume of POSIX.1-2008 defers to the ISO C standard.

29033 These functions shall compute $(x * y) + z$, rounded as one ternary operation: they shall compute
 29034 the value (as if) to infinite precision and round once to the result format, according to the
 29035 rounding mode characterized by the value of `FLT_ROUNDS`.

29036 An application wishing to check for error situations should set `errno` to zero and call
 29037 `feclearexcept(FE_ALL_EXCEPT)` before calling these functions. On return, if `errno` is non-zero or
 29038 `fetestexcept(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW)` is non-
 29039 zero, an error has occurred.

29040 **RETURN VALUE**

29041 Upon successful completion, these functions shall return $(x * y) + z$, rounded as one ternary
 29042 operation.

29043 **MX** If the result overflows or underflows, a range error may occur. On systems that support the IEC
 29044 60559 Floating-Point option, if the result overflows a range error shall occur.

29045 If x or y are NaN, a NaN shall be returned.

29046 If x multiplied by y is an exact infinity and z is also an infinity but with the opposite sign, a
 29047 domain error shall occur, and either a NaN (if supported), or an implementation-defined value
 29048 shall be returned.

29049 If one of x and y is infinite, the other is zero, and z is not a NaN, a domain error shall occur, and
 29050 either a NaN (if supported), or an implementation-defined value shall be returned.

29051 If one of x and y is infinite, the other is zero, and z is a NaN, a NaN shall be returned and a
 29052 domain error may occur.

29053 If $x*y$ is not $0*\text{Inf}$ nor $\text{Inf}*0$ and z is a NaN, a NaN shall be returned.

29054 **ERRORS**

29055 These functions shall fail if:

29056	MX	Domain Error	The value of $x*y+z$ is invalid, or the value $x*y$ is invalid and z is not a NaN. If the integer expression <code>(math_errhandling & MATH_ERRNO)</code> is non-zero, then <code>errno</code> shall be set to [EDOM]. If the integer expression <code>(math_errhandling & MATH_ERREXCEPT)</code> is non-zero, then the invalid floating-point exception shall be raised.

29061	MX	Range Error	The result overflows. If the integer expression <code>(math_errhandling & MATH_ERRNO)</code> is non-zero, then <code>errno</code> shall be set to [ERANGE]. If the integer expression <code>(math_errhandling & MATH_ERREXCEPT)</code> is non-zero, then the overflow floating-point exception shall be raised.

29066 These functions may fail if:

29067	MX	Domain Error	The value $x*y$ is invalid and z is a NaN.
29068			If the integer expression $(\text{math\_errhandling} \ \& \ \text{MATH\_ERRNO})$ is non-zero,
29069			then <i>errno</i> shall be set to [EDOM]. If the integer expression $(\text{math\_errhandling}$
29070			$\ \& \ \text{MATH\_ERREXCEPT})$ is non-zero, then the invalid floating-point exception
29071			shall be raised.
29072		Range Error	The result underflows.
29073			If the integer expression $(\text{math\_errhandling} \ \& \ \text{MATH\_ERRNO})$ is non-zero,
29074			then <i>errno</i> shall be set to [ERANGE]. If the integer expression
29075			$(\text{math\_errhandling} \ \& \ \text{MATH\_ERREXCEPT})$ is non-zero, then the underflow
29076			floating-point exception shall be raised.
29077		Range Error	The result overflows.
29078			If the integer expression $(\text{math\_errhandling} \ \& \ \text{MATH\_ERRNO})$ is non-zero,
29079			then <i>errno</i> shall be set to [ERANGE]. If the integer expression
29080			$(\text{math\_errhandling} \ \& \ \text{MATH\_ERREXCEPT})$ is non-zero, then the overflow
29081			floating-point exception shall be raised.

29082 EXAMPLES

29083 None.

29084 APPLICATION USAGE

29085 On error, the expressions $(\text{math\_errhandling} \ \& \ \text{MATH\_ERRNO})$ and $(\text{math\_errhandling} \ \& \ \text{MATH\_ERREXCEPT})$ are independent of each other, but at least one of them must be non-zero.

29087 RATIONALE

29088 In many cases, clever use of floating (*fused*) multiply-add leads to much improved code; but its
 29089 unexpected use by the compiler can undermine carefully written code. The FP_CONTRACT
 29090 macro can be used to disallow use of floating multiply-add; and the *fma()* function guarantees
 29091 its use where desired. Many current machines provide hardware floating multiply-add
 29092 instructions; software implementation can be used for others.

29093 FUTURE DIRECTIONS

29094 None.

29095 SEE ALSO

29096 [*feclearexcept\(\)*](#), [*fetestexcept\(\)*](#)

29097 XBD [Section 4.19](#) (on page 116), [**<math.h>**](#)

29098 CHANGE HISTORY

29099 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

29100 Issue 7

29101 ISO/IEC 9899:1999 standard, Technical Corrigendum 2 #57 (SD5-XSH-ERN-69) is applied,
 29102 adding a “may fail” range error for non-MX systems.

29103 **NAME**

29104 fmax, fmaxf, fmaxl — determine maximum numeric value of two floating-point numbers

29105 **SYNOPSIS**

29106 #include <math.h>

29107 double fmax(double x, double y);

29108 float fmaxf(float x, float y);

29109 long double fmaxl(long double x, long double y);

29110 **DESCRIPTION**

29111 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 29112 conflict between the requirements described here and the ISO C standard is unintentional. This
 29113 volume of POSIX.1-2008 defers to the ISO C standard.

29114 MX These functions shall determine the maximum numeric value of their arguments. NaN
 29115 arguments shall be treated as missing data: if one argument is a NaN and the other numeric,
 29116 then these functions shall choose the numeric value.

29117 **RETURN VALUE**

29118 Upon successful completion, these functions shall return the maximum numeric value of their
 29119 arguments.

29120 MX If just one argument is a NaN, the other argument shall be returned.

29121 If *x* and *y* are NaN, a NaN shall be returned.

29122 **ERRORS**

29123 No errors are defined.

29124 **EXAMPLES**

29125 None.

29126 **APPLICATION USAGE**

29127 None.

29129 None.

29130 **FUTURE DIRECTIONS**

29131 None.

29132 **SEE ALSO**29133 *fdim()*, *fmin()*

29134 XBD <math.h>

29135 **CHANGE HISTORY**

29136 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

29137 **Issue 7**

29138 Austin Group Interpretation 1003.1-2001 #007 is applied.

29139 **NAME**

29140 fmemopen — open a memory buffer stream

29141 **SYNOPSIS**

```
29142 CX      #include <stdio.h>
29143
29143      FILE *fmemopen(void *restrict buf, size_t size,
29144                     const char *restrict mode);
```

29145 **DESCRIPTION**

29146 The *fmemopen()* function shall associate the buffer given by the *buf* and *size* arguments with a
 29147 stream. The *buf* argument shall be either a null pointer or point to a buffer that is at least *size*
 29148 bytes long.

29149 The *mode* argument points to a string. If the string is one of the following, the stream shall be |
 29150 opened in the indicated mode. Otherwise, the behavior is undefined. |

29151 *r* Open the stream for reading.

29152 *w* Open the stream for writing.

29153 *a* Append; open the stream for writing at the first null byte.

29154 *r+* Open the stream for update (reading and writing).

29155 *w+* Open the stream for update (reading and writing). Truncate the buffer contents.

29156 *a+* Append; open the stream for update (reading and writing); the initial position is at the
 29157 first null byte.

29158 Implementations shall accept all mode strings allowed by *fopen()*, but the use of the character |
 29159 'b' shall produce implementation-defined results, where the resulting **FILE *** need not behave |
 29160 the same as if 'b' were omitted.

29161 If a null pointer is specified as the *buf* argument, *fmemopen()* shall allocate *size* bytes of memory
 29162 as if by a call to *malloc()*. This buffer shall be automatically freed when the stream is closed.
 29163 Because this feature is only useful when the stream is opened for updating (because there is no
 29164 way to get a pointer to the buffer) the *fmemopen()* call may fail if the *mode* argument does not
 29165 include a '+'.

29166 The stream shall maintain a current position in the buffer. This position shall be initially set to |
 29167 either the beginning of the buffer (for *r* and *w* modes) or to the first null byte in the buffer (for *a*
 29168 modes). If no null byte is found in append mode, the initial position shall be set to one byte after |
 29169 the end of the buffer.

29170 If *buf* is a null pointer, the initial position shall always be set to the beginning of the buffer.

29171 The stream shall also maintain the size of the current buffer contents; use of *fseek()* or *fseeko()* on |
 29172 the stream with *SEEK_END* shall seek relative to this size. For modes *r* and *r+* the size shall be |
 29173 set to the value given by the *size* argument. For modes *w* and *w+* the initial size shall be zero and |
 29174 for modes *a* and *a+* the initial size shall be either the position of the first null byte in the buffer or |
 29175 the value of the *size* argument if no null byte is found.

29176 A read operation on the stream shall not advance the current buffer position beyond the current |
 29177 buffer size. Reaching the buffer size in a read operation shall count as “end-of-file”. Null bytes in |
 29178 the buffer shall have no special meaning for reads. The read operation shall start at the current |
 29179 buffer position of the stream.

29180 A write operation shall start either at the current position of the stream (if *mode* has not specified |
 29181 'a' as the first character) or at the current size of the stream (if *mode* had 'a' as the first |

character). If the current position at the end of the write is larger than the current buffer size, the current buffer size shall be set to the current position. A write operation on the stream shall not advance the current buffer size beyond the size given in the *size* argument.

When a stream open for writing is flushed or closed, a null byte shall be written at the current position or at the end of the buffer, depending on the size of the contents. If a stream open for update is flushed or closed and the last write has advanced the current buffer size, a null byte shall be written at the end of the buffer if it fits.

An attempt to seek a memory buffer stream to a negative position or to a position larger than the buffer size given in the *size* argument shall fail.

RETURN VALUE

Upon successful completion, *fmemopen()* shall return a pointer to the object controlling the stream. Otherwise, a null pointer shall be returned, and *errno* shall be set to indicate the error.

ERRORS

The *fmemopen()* function shall fail if:

[EINVAL] The *size* argument specifies a buffer size of zero.

The *fmemopen()* function may fail if:

[EINVAL] The value of the *mode* argument is not valid.

[EINVAL] The *buf* argument is a null pointer and the *mode* argument does not include a '+' character.

[ENOMEM] The *buf* argument is a null pointer and the allocation of a buffer of length *size* has failed.

[EMFILE] {FOPEN_MAX} streams are currently open in the calling process.

EXAMPLES

```
#include <stdio.h>
#include <string.h>

static char buffer[] = "foobar";

int
main (void)
{
    int ch;
    FILE *stream;

    stream = fmemopen(buffer, strlen (buffer), "r");
    if (stream == NULL)
        /* handle error */;

    while ((ch = fgetc(stream)) != EOF)
        printf("Got %c\n", ch);

    fclose(stream);
    return (0);
}
```

This program produces the following output:

```
Got f
Got o
```

29224 Got o
29225 Got b
29226 Got a
29227 Got r

29228 APPLICATION USAGE

29229 None.

29230 RATIONALE

29231 This interface has been introduced to eliminate many of the errors encountered in the
29232 construction of strings, notably overflowing of strings. This interface prevents overflow.

29233 FUTURE DIRECTIONS

29234 A future revision of this standard may mandate specific behavior when the *mode* argument |
29235 includes 'b'.

29245 **NAME**

29246 fmin, fminf, fminl — determine minimum numeric value of two floating-point numbers

29247 **SYNOPSIS**

```
29248 #include <math.h>
29249 double fmin(double x, double y);
29250 float fminf(float x, float y);
29251 long double fminl(long double x, long double y);
```

29252 **DESCRIPTION**

29253 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 29254 conflict between the requirements described here and the ISO C standard is unintentional. This
 29255 volume of POSIX.1-2008 defers to the ISO C standard.

29256 MX These functions shall determine the minimum numeric value of their arguments. NaN
 29257 arguments shall be treated as missing data: if one argument is a NaN and the other numeric,
 29258 then these functions shall choose the numeric value.

29259 **RETURN VALUE**

29260 Upon successful completion, these functions shall return the minimum numeric value of their
 29261 arguments.

29262 MX If just one argument is a NaN, the other argument shall be returned.

29263 If *x* and *y* are NaN, a NaN shall be returned.

29264 **ERRORS**

29265 No errors are defined.

29266 **EXAMPLES**

29267 None.

29268 **APPLICATION USAGE**

29269 None.

29270 **RATIONALE**

29271 None.

29272 **FUTURE DIRECTIONS**

29273 None.

29280 Austin Group Interpretation 1003.1-2001 #008 is applied.

29281 **NAME**

29282 fmod, fmodf, fmodl — floating-point remainder value function

29283 **SYNOPSIS**

```
29284 #include <math.h>
29285 double fmod(double x, double y);
29286 float fmodf(float x, float y);
29287 long double fmodl(long double x, long double y);
```

29288 **DESCRIPTION**

29289 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 29290 conflict between the requirements described here and the ISO C standard is unintentional. This
 29291 volume of POSIX.1-2008 defers to the ISO C standard.

29292 These functions shall return the floating-point remainder of the division of x by y .

29293 An application wishing to check for error situations should set *errno* to zero and call
 29294 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 29295 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 29296 zero, an error has occurred.

29297 **RETURN VALUE**

29298 These functions shall return the value $x - i * y$, for some integer i such that, if y is non-zero, the
 29299 result has the same sign as x and magnitude less than the magnitude of y .

29300 MXX If the correct value would cause underflow, and is not representable, a range error may occur, |
 29301 MXX and *fmod*(), *modf*(), and *fmodl*() shall return 0.0, or (if the IEC 60559 Floating-Point option is not |
 29302 supported) an implementation-defined value no greater in magnitude than DBL_MIN, |
 29303 FLT_MIN, and LDBL_MIN, respectively.

29304 MX If x or y is NaN, a NaN shall be returned.

29305 If y is zero, a domain error shall occur, and a NaN shall be returned. |

29306 If x is infinite, a domain error shall occur, and a NaN shall be returned. |

29307 If x is ± 0 and y is not zero, ± 0 shall be returned.

29308 If x is not infinite and y is $\pm \text{Inf}$, x shall be returned.

29309 MXX If the correct value would cause underflow, and is representable, a range error may occur and
 29310 the correct value shall be returned.

29311 **ERRORS**

29312 These functions shall fail if:

29313 MX **Domain Error** The x argument is infinite or y is zero.

29314 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 29315 then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling*
 29316 & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
 29317 shall be raised.

29318 These functions may fail if:

29319 **Range Error** The result underflows.

29320 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 29321 then *errno* shall be set to [ERANGE]. If the integer expression
 29322 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the underflow
 29323 floating-point exception shall be raised.

29324 EXAMPLES

29325 None.

29326 APPLICATION USAGE

29327 On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* &
29328 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

29329 RATIONALE

29336 CHANGE HISTORY

29337 First released in Issue 1. Derived from Issue 1 of the SVID.

29338 Issue 5

29339 The DESCRIPTION is updated to indicate how an application should check for an error. This
29340 text was previously published in the APPLICATION USAGE section.

29341 Issue 6

29342 The behavior for when the *y* argument is zero is now defined.

29343 The *fmodf()* and *fmodl()* functions are added for alignment with the ISO/IEC 9899:1999
29344 standard.

29345 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are
29346 revised to align with the ISO/IEC 9899:1999 standard.

29347 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are
29348 marked.

29349 Issue 7

29350 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0151 [68], XSH/TC1-2008/0152 [320], +
29351 and XSH/TC1-2008/0153 [68] are applied.

NAME

fmtmsg — display a message in the specified format on standard error and/or a system console

SYNOPSIS

```
#include <fmtmsg.h>

int fmtmsg(long classification, const char *label, int severity,
           const char *text, const char *action, const char *tag);
```

DESCRIPTION

The *fmtmsg()* function shall display messages in a specified format instead of the traditional *printf()* function.

Based on a message's classification component, *fmtmsg()* shall write a formatted message either to standard error, to the console, or to both.

A formatted message consists of up to five components as defined below. The component *classification* is not part of a message displayed to the user, but defines the source of the message and directs the display of the formatted message.

classification Contains the sum of identifying values constructed from the constants defined below. Any one identifier from a subclass may be used in combination with a single identifier from a different subclass. Two or more identifiers from the same subclass should not be used together, with the exception of identifiers from the display subclass. (Both display subclass identifiers may be used so that messages can be displayed to both standard error and the system console.)

Major Classifications

Identifies the source of the condition. Identifiers are: MM_HARD (hardware), MM_SOFT (software), and MM_FIRM (firmware).

Message Source Subclassifications

Identifies the type of software in which the problem is detected. Identifiers are: MM_APPL (application), MM_UTIL (utility), and MM_OPSYS (operating system).

Display Subclassifications

Indicates where the message is to be displayed. Identifiers are: MM_PRINT to display the message on the standard error stream, MM_CONSOLE to display the message on the system console. One or both identifiers may be used.

Status Subclassifications

Indicates whether the application can recover from the condition. Identifiers are: MM_RECOVER (recoverable) and MM_NRECOV (non-recoverable).

An additional identifier, MM_NULLMC, indicates that no classification component is supplied for the message.

label Identifies the source of the message. The format is two fields separated by a <colon>. The first field is up to 10 bytes, the second is up to 14 bytes.

severity Indicates the seriousness of the condition. Identifiers for the levels of *severity* are:

29395		MM_HALT	Indicates that the application has encountered a severe fault and is halting. Produces the string "HALT".
29396			
29397		MM_ERROR	Indicates that the application has detected a fault. Produces the string "ERROR".
29398			
29399		MM_WARNING	Indicates a condition that is out of the ordinary, that might be a problem, and should be watched. Produces the string "WARNING".
29400			
29401			
29402		MM_INFO	Provides information about a condition that is not in error. Produces the string "INFO".
29403			
29404		MM_NOSEV	Indicates that no severity level is supplied for the message.
29405	<i>text</i>		Describes the error condition that produced the message. The character string is not limited to a specific size. If the character string is empty, then the text produced is unspecified.
29406			
29407			
29408	<i>action</i>		Describes the first step to be taken in the error-recovery process. The <i>fmtmsg()</i> function precedes the action string with the prefix: "TO FIX:". The <i>action</i> string is not limited to a specific size.
29409			
29410			
29411	<i>tag</i>		An identifier that references on-line documentation for the message. Suggested usage is that <i>tag</i> includes the <i>label</i> and a unique identifying number. A sample <i>tag</i> is "XSI:cat:146".
29412			
29413			

29414 The *MSGVERB* environment variable (for message verbosity) shall determine for *fmtmsg()*
 29415 which message components it is to select when writing messages to standard error. The value of
 29416 *MSGVERB* shall be a <colon>-separated list of optional keywords. Valid keywords are: *label*,
 29417 *severity*, *text*, *action*, and *tag*. If *MSGVERB* contains a keyword for a component and the
 29418 component's value is not the component's null value, *fmtmsg()* shall include that component in
 29419 the message when writing the message to standard error. If *MSGVERB* does not include a
 29420 keyword for a message component, that component shall not be included in the display of the
 29421 message. The keywords may appear in any order. If *MSGVERB* is not defined, if its value is the
 29422 null string, if its value is not of the correct format, or if it contains keywords other than the valid
 29423 ones listed above, *fmtmsg()* shall select all components.

29424 *MSGVERB* shall determine which components are selected for display to standard error. All
 29425 message components shall be included in console messages.

29426 RETURN VALUE

29427 The *fmtmsg()* function shall return one of the following values:

29428	MM_OK	The function succeeded.
29429	MM_NOTOK	The function failed completely.
29430	MM_NOMSG	The function was unable to generate a message on standard error, but otherwise succeeded.
29431		
29432	MM_NOCON	The function was unable to generate a console message, but otherwise succeeded.
29433		

29434 ERRORS

29435 None.

EXAMPLES

1. The following example of *fmtmsg()*:

```
fmtmsg(MM_PRINT, "XSI:cat", MM_ERROR, "illegal option",  
"refer to cat in user's reference manual", "XSI:cat:001")
```

produces a complete message in the specified message format:

```
XSI:cat: ERROR: illegal option  
TO FIX: refer to cat in user's reference manual XSI:cat:001
```

2. When the environment variable *MSGVERB* is set as follows:

```
MSGVERB=severity:text:action
```

and Example 1 is used, *fmtmsg()* produces:

```
ERROR: illegal option  
TO FIX: refer to cat in user's reference manual
```

APPLICATION USAGE

One or more message components may be systematically omitted from messages generated by an application by using the null value of the argument for that component.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

NAME

fnmatch — match a filename string or a pathname

SYNOPSIS

```
#include <fnmatch.h>
```

```
int fnmatch(const char *pattern, const char *string, int flags);
```

DESCRIPTION

The *fnmatch()* function shall match patterns as described in XCU [Section 2.13.1](#) (on page 2354) and [Section 2.13.2](#) (on page 2355). It checks the string specified by the *string* argument to see if it matches the pattern specified by the *pattern* argument.

The *flags* argument shall modify the interpretation of *pattern* and *string*. It is the bitwise-inclusive OR of zero or more of the flags defined in **<fnmatch.h>**. If the FNM_PATHNAME flag is set in *flags*, then a <slash> character (' / ') in *string* shall be explicitly matched by a <slash> in *pattern*; it shall not be matched by either the <asterisk> or <question-mark> special characters, nor by a bracket expression. If the FNM_PATHNAME flag is not set, the <slash> character shall be treated as an ordinary character.

If FNM_NOESCAPE is not set in *flags*, a <backslash> character in *pattern* followed by any other character shall match that second character in *string*. In particular, "\\\" shall match a <backslash> in *string*. If FNM_NOESCAPE is set, a <backslash> character shall be treated as an ordinary character.

If FNM_PERIOD is set in *flags*, then a leading <period> (' . ') in *string* shall match a <period> in *pattern*; as described by rule 2 in XCU [Section 2.13.3](#) (on page 2355) where the location of “leading” is indicated by the value of FNM_PATHNAME:

- If FNM_PATHNAME is set, a <period> is “leading” if it is the first character in *string* or if it immediately follows a <slash>.
- If FNM_PATHNAME is not set, a <period> is “leading” only if it is the first character of *string*.

If FNM_PERIOD is not set, then no special restrictions are placed on matching a period.

RETURN VALUE

If *string* matches the pattern specified by *pattern*, then *fnmatch()* shall return 0. If there is no match, *fnmatch()* shall return FNM_NOMATCH, which is defined in **<fnmatch.h>**. If an error occurs, *fnmatch()* shall return another non-zero value.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

The *fnmatch()* function has two major uses. It could be used by an application or utility that needs to read a directory and apply a pattern against each entry. The *find* utility is an example of this. It can also be used by the *pax* utility to process its *pattern* operands, or by applications that need to match strings in a similar manner.

The name *fnmatch()* is intended to imply *filename* match, rather than *pathname* match. The default action of this function is to match filename strings, rather than pathnames, since it gives no special significance to the <slash> character. With the FNM_PATHNAME flag, *fnmatch()* does match pathnames, but without tilde expansion, parameter expansion, or special treatment for a <period> at the beginning of a filename.

29507 RATIONALE

29508 This function replaced the REG_FILENAME flag of *regcomp()* in early proposals of this volume
29509 of POSIX.1-2008. It provides virtually the same functionality as the *regcomp()* and *regexexec()*
29510 functions using the REG_FILENAME and REG_FSLASH flags (the REG_FSLASH flag was
29511 proposed for *regcomp()*, and would have had the opposite effect from FNM_PATHNAME), but
29512 with a simpler function and less system overhead.

29513 FUTURE DIRECTIONS

29514 None.

29515 SEE ALSO

29518 CHANGE HISTORY

29519 First released in Issue 4. Derived from the ISO POSIX-2 standard.

29520 Issue 5

29521 Moved from POSIX2 C-language Binding to BASE.

29522 Issue 7

29523 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0154 [291] and XSH/TC1-2008/0155 +
29524 [291] are applied.

29525 **NAME**29526 `fopen` — open a stream29527 **SYNOPSIS**29528 `#include <stdio.h>`29529 `FILE *fopen(const char *restrict pathname, const char *restrict mode);` |29530 **DESCRIPTION**

29531 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 29532 conflict between the requirements described here and the ISO C standard is unintentional. This
 29533 volume of POSIX.1-2008 defers to the ISO C standard.

29534 The `fopen()` function shall open the file whose pathname is the string pointed to by `pathname`,
 29535 and associates a stream with it.

29536 The `mode` argument points to a string. If the string is one of the following, the file shall be opened
 29537 in the indicated mode. Otherwise, the behavior is undefined.

29538	<code>r</code> or <code>rb</code>	Open file for reading.
29539	<code>w</code> or <code>wb</code>	Truncate to zero length or create file for writing.
29540	<code>a</code> or <code>ab</code>	Append; open or create file for writing at end-of-file.
29541	<code>r+</code> or <code>rb+</code> or <code>r+b</code>	Open file for update (reading and writing).
29542	<code>w+</code> or <code>wb+</code> or <code>w+b</code>	Truncate to zero length or create file for update.
29543	<code>a+</code> or <code>ab+</code> or <code>a+b</code>	Append; open or create file for update, writing at end-of-file.

29544 CX The character '`b`' shall have no effect, but is allowed for ISO C standard conformance. Opening
 29545 a file with read mode (`r` as the first character in the `mode` argument) shall fail if the file does not
 29546 exist or cannot be read.

29547 Opening a file with append mode (`a` as the first character in the `mode` argument) shall cause all
 29548 subsequent writes to the file to be forced to the then current end-of-file, regardless of intervening
 29549 calls to `fseek()`.

29550 When a file is opened with update mode ('+' as the second or third character in the `mode`
 29551 argument), both input and output may be performed on the associated stream. However, the
 29552 application shall ensure that output is not directly followed by input without an intervening call
 29553 to `fflush()` or to a file positioning function (`fseek()`, `fsetpos()`, or `rewind()`), and input is not directly
 29554 followed by output without an intervening call to a file positioning function, unless the input
 29555 operation encounters end-of-file.

29556 When opened, a stream is fully buffered if and only if it can be determined not to refer to an
 29557 interactive device. The error and end-of-file indicators for the stream shall be cleared.

29558 CX If `mode` is `w`, `wb`, `a`, `ab`, `w+`, `wb+`, `w+b`, `a+`, `ab+`, or `a+b`, and the file did not previously exist, upon
 29559 successful completion, `fopen()` shall mark for update the last data access, last data modification,
 29560 and last file status change timestamps of the file and the last file status change and last data
 29561 modification timestamps of the parent directory.

29562 If `mode` is `w`, `wb`, `a`, `ab`, `w+`, `wb+`, `w+b`, `a+`, `ab+`, or `a+b`, and the file did not previously exist, the
 29563 `fopen()` function shall create a file as if it called the `creat()` function with a value appropriate for
 29564 the `path` argument interpreted from `pathname` and a value of `S_IRUSR` | `S_IWUSR` | `S_IRGRP` |
 29565 `S_IWGRP` | `S_IROTH` | `S_IWOTH` for the `mode` argument.

29566 If `mode` is `w`, `wb`, `w+`, `wb+`, or `w+b`, and the file did previously exist, upon successful completion,
 29567 `fopen()` shall mark for update the last data modification and last file status change timestamps of

the file.

After a successful call to the *fopen()* function, the orientation of the stream shall be cleared, the encoding rule shall be cleared, and the associated **mbstate_t** object shall be set to describe an initial conversion state.

The file descriptor associated with the opened stream shall be allocated and opened as if by a call to *open()* with the following flags:

<i>fopen()</i> Mode	<i>open()</i> Flags
<i>r</i> or <i>rb</i>	O_RDONLY
<i>w</i> or <i>wb</i>	O_WRONLY O_CREAT O_TRUNC
<i>a</i> or <i>ab</i>	O_WRONLY O_CREAT O_APPEND
<i>r+</i> or <i>rb+</i> or <i>r+b</i>	O_RDWR
<i>w+</i> or <i>wb+</i> or <i>w+b</i>	O_RDWR O_CREAT O_TRUNC
<i>a+</i> or <i>ab+</i> or <i>a+b</i>	O_RDWR O_CREAT O_APPEND

RETURN VALUE

Upon successful completion, *fopen()* shall return a pointer to the object controlling the stream.

Otherwise, a null pointer shall be returned, and *errno* shall be set to indicate the error.

ERRORS

The *fopen()* function shall fail if:

[EACCES] Search permission is denied on a component of the path prefix, or the file exists and the permissions specified by *mode* are denied, or the file does not exist and write permission is denied for the parent directory of the file to be created.

[EINTR] A signal was caught during *fopen()*.

[EISDIR] The named file is a directory and *mode* requires write access.

[ELOOP] A loop exists in symbolic links encountered during resolution of the *path* argument.

[EMFILE] All file descriptors available to the process are currently open.

[EMFILE] {STREAM_MAX} streams are currently open in the calling process.

[ENAMETOOLONG]

The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a symbolic link produced an intermediate result with a length that exceeds {PATH_MAX}.

[ENFILE] The maximum allowable number of files is currently open in the system.

[ENOENT] The *mode* string begins with 'r' and a component of *pathname* does not name an existing file, or *mode* begins with 'w' or 'a' and a component of the path prefix of *pathname* does not name an existing file, or *pathname* is an empty string.

[ENOENT] or [ENOTDIR]

The *pathname* argument contains at least one non-*<slash>* character and ends with one or more trailing *<slash>* characters. If *pathname* names an existing file, an [ENOENT] error shall not occur.

29609	CX	[ENOSPC]	The directory or file system that would contain the new file cannot be expanded, the file does not exist, and the file was to be created.
29610			
29611	CX	[ENOTDIR]	A component of the path prefix names an existing file that is neither a directory nor a symbolic link to a directory, or the <i>pathname</i> argument contains at least one non- <code><slash></code> character and ends with one or more trailing <code><slash></code> characters and the last <i>pathname</i> component names an existing file that is neither a directory nor a symbolic link to a directory.
29612			
29613			
29614			
29615			
29616	CX	[ENXIO]	The named file is a character special or block special file, and the device associated with this special file does not exist.
29617			
29618	CX	[EOVERFLOW]	The named file is a regular file and the size of the file cannot be represented correctly in an object of type <code>off_t</code> .
29619			
29620	CX	[EROFS]	The named file resides on a read-only file system and <i>mode</i> requires write access.
29621			
29622			The <i>fopen()</i> function may fail if:
29623	CX	[EINVAL]	The value of the <i>mode</i> argument is not valid.
29624	CX	[ELOOP]	More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the <i>path</i> argument.
29625			
29626	CX	[EMFILE]	{FOPEN_MAX} streams are currently open in the calling process.
29627	CX	[ENAMETOOLONG]	
29628			The length of a component of a <i>pathname</i> is longer than {NAME_MAX}.
29629	CX	[ENOMEM]	Insufficient storage space is available.
29630	CX	[ETXTBSY]	The file is a pure procedure (shared text) file that is being executed and <i>mode</i> requires write access.
29631			

29632 EXAMPLES

29633 Opening a File

29634 The following example tries to open the file named **file** for reading. The *fopen()* function returns
 29635 a file pointer that is used in subsequent *fgets()* and *fclose()* calls. If the program cannot open the
 29636 file, it just ignores it.

```

29637 #include <stdio.h>
29638 ...
29639 FILE *fp;
29640 ...
29641 void rgrep(const char *file)
29642 {
29643     ...
29644     if ((fp = fopen(file, "r")) == NULL)
29645         return;
29646     ...
29647 }
```

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

Large File Summit extensions are added.

Issue 6

Extensions beyond the ISO C standard are marked.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In the DESCRIPTION, text is added to indicate setting of the offset maximum in the open file description. This change is to support large files.
- In the ERRORS section, the [Eoverflow] condition is added. This change is to support large files.
- The [ELOOP] mandatory error condition is added.
- The [EINVAL], [EMFILE], [ENAMETOOLONG], [ENOMEM], and [ETXTBSY] optional error conditions are added.

The normative text is updated to avoid use of the term “must” for application requirements.

The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- The prototype for *fopen()* is updated.
- The DESCRIPTION is updated to note that if the argument *mode* points to a string other than those listed, then the behavior is undefined.

The wording of the mandatory [ELOOP] error condition is updated, and a second optional [ELOOP] error condition is added.

Issue 7

Austin Group Interpretation 1003.1-2001 #025 is applied, clarifying the file creation mode.

Austin Group Interpretation 1003.1-2001 #143 is applied.

Austin Group Interpretation 1003.1-2001 #159 is applied, clarifying requirements for the flags set on the open file description.

SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.

SD5-XSH-ERN-149 is applied, changing the {STREAM_MAX} [EMFILE] error condition from a “may fail” to a “shall fail”.

Changes are made related to support for finegrained timestamps.

29688
29689

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0156 [291,433], XSH/TC1-2008/0157 + [146,433], XSH/TC1-2008/0158 [324], and XSH/TC1-2008/0159 [14] are applied.

29690 **NAME**

29691 fork — create a new process

29692 **SYNOPSIS**

29693 #include <unistd.h>

29694 pid_t fork(void);

29695 **DESCRIPTION**

29696 The *fork()* function shall create a new process. The new process (child process) shall be an exact
 29697 copy of the calling process (parent process) except as detailed below:

- 29698 • The child process shall have a unique process ID.
- 29699 • The child process ID also shall not match any active process group ID.
- 29700 • The child process shall have a different parent process ID, which shall be the process ID of
 29701 the calling process.
- 29702 • The child process shall have its own copy of the parent's file descriptors. Each of the
 29703 child's file descriptors shall refer to the same open file description with the corresponding
 29704 file descriptor of the parent.
- 29705 • The child process shall have its own copy of the parent's open directory streams. Each
 29706 open directory stream in the child process may share directory stream positioning with the
 29707 corresponding directory stream of the parent.
- 29708 • The child process shall have its own copy of the parent's message catalog descriptors.
- 29709 • The child process values of *tms_utime*, *tms_stime*, *tms_cutime*, and *tms_cstime* shall be set to
 29710 0.
- 29711 • The time left until an alarm clock signal shall be reset to zero, and the alarm, if any, shall be
 29712 canceled; see *alarm()*.
- 29713 XSI • All *semadj* values shall be cleared.
- 29714 • File locks set by the parent process shall not be inherited by the child process.
- 29715 • The set of signals pending for the child process shall be initialized to the empty set.
- 29716 XSI • Interval timers shall be reset in the child process.
- 29717 • Any semaphores that are open in the parent process shall also be open in the child process.
- 29718 ML • The child process shall not inherit any address space memory locks established by the
 29719 parent process via calls to *mlockall()* or *mlock()*.
- 29720 • Memory mappings created in the parent shall be retained in the child process.
 29721 MAP_PRIVATE mappings inherited from the parent shall also be MAP_PRIVATE
 29722 mappings in the child, and any modifications to the data in these mappings made by the
 29723 parent prior to calling *fork()* shall be visible to the child. Any modifications to the data in
 29724 MAP_PRIVATE mappings made by the parent after *fork()* returns shall be visible only to
 29725 the parent. Modifications to the data in MAP_PRIVATE mappings made by the child shall
 29726 be visible only to the child.
- 29727 PS • For the SCHED_FIFO and SCHED_RR scheduling policies, the child process shall inherit
 29728 the policy and priority settings of the parent process during a *fork()* function. For other
 29729 scheduling policies, the policy and priority settings on *fork()* are implementation-defined.

- 29730 • Per-process timers created by the parent shall not be inherited by the child process.
- 29731 MSG • The child process shall have its own copy of the message queue descriptors of the parent.
 29732 Each of the message descriptors of the child shall refer to the same open message queue
 29733 description as the corresponding message descriptor of the parent.
- 29734 • No asynchronous input or asynchronous output operations shall be inherited by the child
 29735 process. Any use of asynchronous control blocks created by the parent produces undefined
 29736 behavior.
- 29737 • A process shall be created with a single thread. If a multi-threaded process calls *fork()*, the
 29738 new process shall contain a replica of the calling thread and its entire address space,
 29739 possibly including the states of mutexes and other resources. Consequently, to avoid
 29740 errors, the child process may only execute async-signal-safe operations until such time as
 29741 one of the *exec* functions is called. Fork handlers may be established by means of the
 29742 *pthread_atfork()* function in order to maintain application invariants across *fork()* calls.
- 29743 When the application calls *fork()* from a signal handler and any of the fork handlers
 29744 registered by *pthread_atfork()* calls a function that is not async-signal-safe, the behavior is
 29745 undefined.
- 29746 OB TRC TRI • If the Trace option and the Trace Inherit option are both supported:
 29747 If the calling process was being traced in a trace stream that had its inheritance policy set
 29748 to *POSIX_TRACE_INHERITED*, the child process shall be traced into that trace stream,
 29749 and the child process shall inherit the parent's mapping of trace event names to trace event
 29750 type identifiers. If the trace stream in which the calling process was being traced had its
 29751 inheritance policy set to *POSIX_TRACE_CLOSE_FOR_CHILD*, the child process shall not
 29752 be traced into that trace stream. The inheritance policy is set by a call to the
 29753 *posix_trace_attr_setinherited()* function.
- 29754 OB TRC • If the Trace option is supported, but the Trace Inherit option is not supported:
 29755 The child process shall not be traced into any of the trace streams of its parent process.
- 29756 OB TRC • If the Trace option is supported, the child process of a trace controller process shall not
 29757 control the trace streams controlled by its parent process.
- 29758 CPT • The initial value of the CPU-time clock of the child process shall be set to zero.
- 29759 TCT • The initial value of the CPU-time clock of the single thread of the child process shall be set
 29760 to zero.
- 29761 All other process characteristics defined by POSIX.1-2008 shall be the same in the parent and
 29762 child processes. The inheritance of process characteristics not defined by POSIX.1-2008 is
 29763 unspecified by POSIX.1-2008.
- 29764 After *fork()*, both the parent and the child processes shall be capable of executing independently
 29765 before either one terminates.
- 29766 **RETURN VALUE**
 29767 Upon successful completion, *fork()* shall return 0 to the child process and shall return the
 29768 process ID of the child process to the parent process. Both processes shall continue to execute
 29769 from the *fork()* function. Otherwise, -1 shall be returned to the parent process, no child process
 29770 shall be created, and *errno* shall be set to indicate the error.

ERRORS

The *fork()* function shall fail if:

[EAGAIN] The system lacked the necessary resources to create another process, or the system-imposed limit on the total number of processes under execution system-wide or by a single user {CHILD_MAX} would be exceeded.

The *fork()* function may fail if:

[ENOMEM] Insufficient storage space is available.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

Many historical implementations have timing windows where a signal sent to a process group (for example, an interactive SIGINT) just prior to or during execution of *fork()* is delivered to the parent following the *fork()* but not to the child because the *fork()* code clears the child's set of pending signals. This volume of POSIX.1-2008 does not require, or even permit, this behavior. However, it is pragmatic to expect that problems of this nature may continue to exist in implementations that appear to conform to this volume of POSIX.1-2008 and pass available verification suites. This behavior is only a consequence of the implementation failing to make the interval between signal generation and delivery totally invisible. From the application's perspective, a *fork()* call should appear atomic. A signal that is generated prior to the *fork()* should be delivered prior to the *fork()*. A signal sent to the process group after the *fork()* should be delivered to both parent and child. The implementation may actually initialize internal data structures corresponding to the child's set of pending signals to include signals sent to the process group during the *fork()*. Since the *fork()* call can be considered as atomic from the application's perspective, the set would be initialized as empty and such signals would have arrived after the *fork()*; see also <signal.h>.

One approach that has been suggested to address the problem of signal inheritance across *fork()* is to add an [EINTR] error, which would be returned when a signal is detected during the call. While this is preferable to losing signals, it was not considered an optimal solution. Although it is not recommended for this purpose, such an error would be an allowable extension for an implementation.

The [ENOMEM] error value is reserved for those implementations that detect and distinguish such a condition. This condition occurs when an implementation detects that there is not enough memory to create the process. This is intended to be returned when [EAGAIN] is inappropriate because there can never be enough memory (either primary or secondary storage) to perform the operation. Since *fork()* duplicates an existing process, this must be a condition where there is sufficient memory for one such process, but not for two. Many historical implementations actually return [ENOMEM] due to temporary lack of memory, a case that is not generally distinct from [EAGAIN] from the perspective of a conforming application.

Part of the reason for including the optional error [ENOMEM] is because the SVID specifies it and it should be reserved for the error condition specified there. The condition is not applicable on many implementations.

IEEE Std 1003.1-1988 neglected to require concurrent execution of the parent and child of *fork()*. A system that single-threads processes was clearly not intended and is considered an unacceptable "toy implementation" of this volume of POSIX.1-2008. The only objection anticipated to the phrase "executing independently" is testability, but this assertion should be

testable. Such tests require that both the parent and child can block on a detectable action of the other, such as a write to a pipe or a signal. An interactive exchange of such actions should be possible for the system to conform to the intent of this volume of POSIX.1-2008.

The [EAGAIN] error exists to warn applications that such a condition might occur. Whether it occurs or not is not in any practical sense under the control of the application because the condition is usually a consequence of the user's use of the system, not of the application's code. Thus, no application can or should rely upon its occurrence under any circumstances, nor should the exact semantics of what concept of "user" is used be of concern to the application developer. Validation writers should be cognizant of this limitation.

There are two reasons why POSIX programmers call *fork()*. One reason is to create a new thread of control within the same program (which was originally only possible in POSIX by creating a new process); the other is to create a new process running a different program. In the latter case, the call to *fork()* is soon followed by a call to one of the *exec* functions.

The general problem with making *fork()* work in a multi-threaded world is what to do with all of the threads. There are two alternatives. One is to copy all of the threads into the new process. This causes the programmer or implementation to deal with threads that are suspended on system calls or that might be about to execute system calls that should not be executed in the new process. The other alternative is to copy only the thread that calls *fork()*. This creates the difficulty that the state of process-local resources is usually held in process memory. If a thread that is not calling *fork()* holds a resource, that resource is never released in the child process because the thread whose job it is to release the resource does not exist in the child process.

When a programmer is writing a multi-threaded program, the first described use of *fork()*, creating new threads in the same program, is provided by the *pthread_create()* function. The *fork()* function is thus used only to run new programs, and the effects of calling functions that require certain resources between the call to *fork()* and the call to an *exec* function are undefined.

The addition of the *forkall()* function to the standard was considered and rejected. The *forkall()* function lets all the threads in the parent be duplicated in the child. This essentially duplicates the state of the parent in the child. This allows threads in the child to continue processing and allows locks and the state to be preserved without explicit *pthread_atfork()* code. The calling process has to ensure that the threads processing state that is shared between the parent and child (that is, file descriptors or MAP_SHARED memory) behaves properly after *forkall()*. For example, if a thread is reading a file descriptor in the parent when *forkall()* is called, then two threads (one in the parent and one in the child) are reading the file descriptor after the *forkall()*. If this is not desired behavior, the parent process has to synchronize with such threads before calling *forkall()*.

While the *fork()* function is async-signal-safe, there is no way for an implementation to determine whether the fork handlers established by *pthread_atfork()* are async-signal-safe. The fork handlers may attempt to execute portions of the implementation that are not async-signal-safe, such as those that are protected by mutexes, leading to a deadlock condition. It is therefore undefined for the fork handlers to execute functions that are not async-signal-safe when *fork()* is called from a signal handler.

When *forkall()* is called, threads, other than the calling thread, that are in functions that can return with an [EINTR] error may have those functions return [EINTR] if the implementation cannot ensure that the function behaves correctly in the parent and child. In particular, *pthread_cond_wait()* and *pthread_cond_timedwait()* need to return in order to ensure that the condition has not changed. These functions can be awakened by a spurious condition wakeup rather than returning [EINTR].

29872 First released in Issue 1. Derived from Issue 1 of the SVID.

29873 **Issue 5**29874 The DESCRIPTION is changed for alignment with the POSIX Realtime Extension and the POSIX
29875 Threads Extension.29876 **Issue 6**29877 The following new requirements on POSIX implementations derive from alignment with the
29878 Single UNIX Specification:

- 29879
- The requirement to include [<sys/types.h>](#) has been removed. Although [<sys/types.h>](#) was
29880 required for conforming implementations of previous POSIX specifications, it was not
29881 required for UNIX applications.

29882 The following changes were made to align with the IEEE P1003.1a draft standard:

- 29883
- The effect of *fork()* on a pending alarm call in the child process is clarified.

29884 The description of CPU-time clock semantics is added for alignment with IEEE Std 1003.1d-1999.

29885 The description of tracing semantics is added for alignment with IEEE Std 1003.1q-2000.

29886 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/17 is applied, adding text to the
29887 DESCRIPTION and RATIONALE relating to fork handlers registered by the *pthread_atfork()*
29888 function and async-signal safety.29889 **Issue 7**29890 Austin Group Interpretation 1003.1-2001 #080 is applied, clarifying the status of asynchronous
29891 input and asynchronous output operations and asynchronous control lists in the DESCRIPTION.29892 Functionality relating to the Asynchronous Input and Output, Memory Mapped Files, Timers,
29893 and Threads options is moved to the Base.

29894 Functionality relating to message catalog descriptors is moved from the XSI option to the Base.

29895 **NAME**

29896 fpathconf, pathconf — get configurable pathname variables

29897 **SYNOPSIS**

29898 #include <unistd.h>

29899 long fpathconf(int *fildes*, int *name*);29900 long pathconf(const char **path*, int *name*);29901 **DESCRIPTION**29902 The *fpathconf()* and *pathconf()* functions shall determine the current value of a configurable limit
29903 or option (*variable*) that is associated with a file or directory.29904 For *pathconf()*, the *path* argument points to the pathname of a file or directory.29905 For *fpathconf()*, the *fildes* argument is an open file descriptor.29906 The *name* argument represents the variable to be queried relative to that file or directory.
29907 Implementations shall support all of the variables listed in the following table and may support
29908 others. The variables in the following table come from <limits.h> or <unistd.h> and the
29909 symbolic constants, defined in <unistd.h>, are the corresponding values used for *name*.

Variable	Value of <i>name</i>	Requirements
{FILESIZEBITS}	_PC_FILESIZEBITS	4,7
{LINK_MAX}	_PC_LINK_MAX	1
{MAX_CANON}	_PC_MAX_CANON	2
{MAX_INPUT}	_PC_MAX_INPUT	2
{NAME_MAX}	_PC_NAME_MAX	3,4
{PATH_MAX}	_PC_PATH_MAX	4,5
{PIPE_BUF}	_PC_PIPE_BUF	6
{POSIX2_SYMLINKS}	_PC_2_SYMLINKS	4
{POSIX_ALLOC_SIZE_MIN}	_PC_ALLOC_SIZE_MIN	10
{POSIX_REC_INCR_XFER_SIZE}	_PC_REC_INCR_XFER_SIZE	10
{POSIX_REC_MAX_XFER_SIZE}	_PC_REC_MAX_XFER_SIZE	10
{POSIX_REC_MIN_XFER_SIZE}	_PC_REC_MIN_XFER_SIZE	10
{POSIX_REC_XFER_ALIGN}	_PC_REC_XFER_ALIGN	10
{SYMLINK_MAX}	_PC_SYMLINK_MAX	4,9
_POSIX_CHOWN_RESTRICTED	_PC_CHOWN_RESTRICTED	7
_POSIX_NO_TRUNC	_PC_NO_TRUNC	3,4
_POSIX_VDISABLE	_PC_VDISABLE	2
_POSIX_ASYNC_IO	_PC_ASYNC_IO	8
_POSIX_PRIO_IO	_PC_PRIO_IO	8
_POSIX_SYNC_IO	_PC_SYNC_IO	8
_POSIX_TIMESTAMP_RESOLUTION	_PC_TIMESTAMP_RESOLUTION	1

29932 **Requirements**

- 29933 1. If *path* or *fildes* refers to a directory, the value returned shall apply to the directory itself.
- 29934 2. If *path* or *fildes* does not refer to a terminal file, it is unspecified whether an
29935 implementation supports an association of the variable name with the specified file.
- 29936 3. If *path* or *fildes* refers to a directory, the value returned shall apply to filenames within the
29937 directory.

4. If *path* or *fildes* does not refer to a directory, it is unspecified whether an implementation supports an association of the variable name with the specified file.
5. If *path* or *fildes* refers to a directory, the value returned shall be the maximum length of a relative pathname that would not cross any mount points when the specified directory is the working directory.
6. If *path* refers to a FIFO, or *fildes* refers to a pipe or FIFO, the value returned shall apply to the referenced object. If *path* or *fildes* refers to a directory, the value returned shall apply to any FIFO that exists or can be created within the directory. If *path* or *fildes* refers to any other type of file, it is unspecified whether an implementation supports an association of the variable name with the specified file.
7. If *path* or *fildes* refers to a directory, the value returned shall apply to any files, other than directories, that exist or can be created within the directory.
8. If *path* or *fildes* refers to a directory, it is unspecified whether an implementation supports an association of the variable name with the specified file.
9. If *path* or *fildes* refers to a directory, the value returned shall be the maximum length of the string that a symbolic link in that directory can contain.
10. If *path* or *fildes* does not refer to a regular file, it is unspecified whether an implementation supports an association of the variable name with the specified file. If an implementation supports such an association for other than a regular file, the value returned is unspecified.

RETURN VALUE

If *name* is an invalid value, both *pathconf()* and *fpathconf()* shall return `-1` and set *errno* to indicate the error.

If the variable corresponding to *name* is described in `<limits.h>` as a maximum or minimum value and the variable has no limit for the path or file descriptor, both *pathconf()* and *fpathconf()* shall return `-1` without changing *errno*. Note that indefinite limits do not imply infinite limits; see `<limits.h>`.

If the implementation needs to use *path* to determine the value of *name* and the implementation does not support the association of *name* with the file specified by *path*, or if the process did not have appropriate privileges to query the file specified by *path*, or *path* does not exist, *pathconf()* shall return `-1` and set *errno* to indicate the error.

If the implementation needs to use *fildes* to determine the value of *name* and the implementation does not support the association of *name* with the file specified by *fildes*, or if *fildes* is an invalid file descriptor, *fpathconf()* shall return `-1` and set *errno* to indicate the error.

Otherwise, *pathconf()* or *fpathconf()* shall return the current variable value for the file or directory without changing *errno*. The value returned shall not be more restrictive than the corresponding value available to the application when it was compiled with the implementation's `<limits.h>` or `<unistd.h>`.

If the variable corresponding to *name* is dependent on an unsupported option, the results are unspecified.

ERRORS

The *pathconf()* function shall fail if:

[EINVAL] The value of *name* is not valid.

29981	[ELOOP]	A loop exists in symbolic links encountered during resolution of the <i>path</i> argument.
29982		
29983	[EOVERFLOW]	The value of <i>name</i> is <code>_PC_TIMESTAMP_RESOLUTION</code> and the resolution is larger than <code>{LONG_MAX}</code> .
29984		
29985	The <i>fpathconf()</i> function may fail if:	
29986	[EACCES]	Search permission is denied for a component of the path prefix.
29987	[EINVAL]	The implementation does not support an association of the variable <i>name</i> with the specified file.
29988		
29989	[ELOOP]	More than <code>{SYMLOOP_MAX}</code> symbolic links were encountered during resolution of the <i>path</i> argument.
29990		
29991	[ENAMETOOLONG]	
29992		The length of a component of a pathname is longer than <code>{NAME_MAX}</code> .
29993	[ENAMETOOLONG]	
29994		The length of a pathname exceeds <code>{PATH_MAX}</code> , or pathname resolution of a symbolic link produced an intermediate result with a length that exceeds <code>{PATH_MAX}</code> .
29995		
29996		
29997	[ENOENT]	A component of <i>path</i> does not name an existing file or <i>path</i> is an empty string.
29998	[ENOTDIR]	A component of the path prefix names an existing file that is neither a directory nor a symbolic link to a directory, or the <i>path</i> argument contains at least one non- <code><slash></code> character and ends with one or more trailing <code><slash></code> characters and the last pathname component names an existing file that is neither a directory nor a symbolic link to a directory.
29999		
30000		
30001		
30002		
30003	The <i>fpathconf()</i> function shall fail if:	
30004	[EINVAL]	The value of <i>name</i> is not valid.
30005	[EOVERFLOW]	The value of <i>name</i> is <code>_PC_TIMESTAMP_RESOLUTION</code> and the resolution is larger than <code>{LONG_MAX}</code> .
30006		
30007	The <i>fpathconf()</i> function may fail if:	
30008	[EBADF]	The <i>fildev</i> argument is not a valid file descriptor.
30009	[EINVAL]	The implementation does not support an association of the variable <i>name</i> with the specified file.
30010		

EXAMPLES

None.

APPLICATION USAGE

Application developers should check whether an option, such as `_POSIX_ADVISORY_INFO`, is supported prior to obtaining and using values for related variables such as `{POSIX_ALLOC_SIZE_MIN}`.

RATIONALE

The *fpathconf()* function was proposed immediately after the *sysconf()* function when it was realized that some configurable values may differ across file system, directory, or device boundaries.

For example, `{NAME_MAX}` frequently changes between System V and BSD-based file systems; System V uses a maximum of 14, BSD 255. On an implementation that provides both types of file

systems, an application would be forced to limit all pathname components to 14 bytes, as this would be the value specified in `<limits.h>` on such a system.

Therefore, various useful values can be queried on any pathname or file descriptor, assuming that appropriate privileges are in place.

The value returned for the variable `{PATH_MAX}` indicates the longest relative pathname that could be given if the specified directory is the current working directory of the process. A process may not always be able to generate a name that long and use it if a subdirectory in the pathname crosses into a more restrictive file system. Note that implementations are allowed to accept pathnames longer than `{PATH_MAX}` bytes long, but are not allowed to return pathnames longer than this unless the user specifies a larger buffer using a function that provides a buffer size argument.

The value returned for the variable `_POSIX_CHOWN_RESTRICTED` also applies to directories that do not have file systems mounted on them. The value may change when crossing a mount point, so applications that need to know should check for each directory. (An even easier check is to try the `chown()` function and look for an error in case it happens.)

Unlike the values returned by `sysconf()`, the pathname-oriented variables are potentially more volatile and are not guaranteed to remain constant throughout the lifetime of the process. For example, in between two calls to `pathconf()`, the file system in question may have been unmounted and remounted with different characteristics.

Also note that most of the errors are optional. If one of the variables always has the same value on an implementation, the implementation need not look at *path* or *fildev* to return that value and is, therefore, not required to detect any of the errors except the meaning of `[EINVAL]` that indicates that the value of *name* is not valid for that variable.

If the value of any of the limits is unspecified (logically infinite), they will not be defined in `<limits.h>` and the `pathconf()` and `fpathconf()` functions return `-1` without changing *errno*. This can be distinguished from the case of giving an unrecognized *name* argument because *errno* is set to `[EINVAL]` in this case.

Since `-1` is a valid return value for the `pathconf()` and `fpathconf()` functions, applications should set *errno* to zero before calling them and check *errno* only if the return value is `-1`.

For the case of `{SYMLINK_MAX}`, since both `pathconf()` and `open()` follow symbolic links, there is no way that *path* or *fildev* could refer to a symbolic link.

It was the intention of IEEE Std 1003.1d-1999 that the following variables:

```
{POSIX_ALLOC_SIZE_MIN}
{POSIX_REC_INCR_XFER_SIZE}
{POSIX_REC_MAX_XFER_SIZE}
{POSIX_REC_MIN_XFER_SIZE}
{POSIX_REC_XFER_ALIGN}
```

only applied to regular files, but Note 10 also permits implementation of the advisory semantics on other file types unique to an implementation (for example, a character special device).

The `[EOVERFLOW]` error for `_PC_TIMESTAMP_RESOLUTION` cannot occur on POSIX-compliant file systems because POSIX requires a timestamp resolution no larger than one second. Even on 32-bit systems, this can be represented without overflow.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Realtime Extension.

Large File Summit extensions are added.

Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The DESCRIPTION is updated to include {FILESIZEBITS}.
- The [ELOOP] mandatory error condition is added.
- A second [ENAMETOOLONG] is added as an optional error condition.

The following changes were made to align with the IEEE P1003.1a draft standard:

- The _PC_SYMLINK_MAX entry is added to the table in the DESCRIPTION.

The following *pathconf()* variables and their associated names are added for alignment with IEEE Std 1003.1d-1999:

```
{POSIX_ALLOC_SIZE_MIN}
{POSIX_REC_INCR_XFER_SIZE}
{POSIX_REC_MAX_XFER_SIZE}
{POSIX_REC_MIN_XFER_SIZE}
{POSIX_REC_XFER_ALIGN}
```

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/18 is applied, changing the fourth paragraph of the DESCRIPTION and removing shading and margin markers from the table. This change is needed since implementations are required to support all of these symbols.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/34 is applied, adding the table entry for POSIX2_SYMLINKS in the DESCRIPTION.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/35 is applied, updating the DESCRIPTION and RATIONALE sections to clarify behavior for the following variables:

```
{POSIX_ALLOC_SIZE_MIN}
{POSIX_REC_INCR_XFER_SIZE}
{POSIX_REC_MAX_XFER_SIZE}
{POSIX_REC_MIN_XFER_SIZE}
{POSIX_REC_XFER_ALIGN}
```

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/36 is applied, updating the RETURN VALUE and APPLICATION USAGE sections to state that the results are unspecified if a variable is dependent on an unsupported option, and advising application developers to check for

- 30106 supported options prior to obtaining and using such values.
- 30107 **Issue 7**
- 30108 Austin Group Interpretations 1003.1-2001 #143 and #160 are applied.
- 30109 Changes are made related to support for finegrained timestamps.
- 30110 The [ENOTDIR] error condition is clarified to cover the condition where the last component of a
30111 pathname exists but is not a directory or a symbolic link to a directory.
- 30112 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0160 [256,428], XSH/TC1-2008/0161 +
30113 [256,428], and XSH/TC1-2008/0162 [324] are applied.

30114 **NAME**

30115 fpclassify — classify real floating type

30116 **SYNOPSIS**

30117 #include <math.h>

30118 int fpclassify(real-floating x);

30119 **DESCRIPTION**

30120 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 30121 conflict between the requirements described here and the ISO C standard is unintentional. This
 30122 volume of POSIX.1-2008 defers to the ISO C standard.

30123 The *fpclassify()* macro shall classify its argument value as NaN, infinite, normal, subnormal,
 30124 zero, or into another implementation-defined category. First, an argument represented in a
 30125 format wider than its semantic type is converted to its semantic type. Then classification is based
 30126 on the type of the argument.

30127 **RETURN VALUE**

30128 The *fpclassify()* macro shall return the value of the number classification macro appropriate to
 30129 the value of its argument.

30130 **ERRORS**

30131 No errors are defined.

30132 **EXAMPLES**

30133 None.

30134 **APPLICATION USAGE**

30135 None.

30136 **RATIONALE**

30137 None.

30138 **FUTURE DIRECTIONS**

30139 None.

30142 XBD <math.h>

30143 **CHANGE HISTORY**

30144 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

30145 NAME

30146 `dprintf, fprintf, printf, snprintf, sprintf` — print formatted output

30147 SYNOPSIS

30148 `#include <stdio.h>`

```
30149 CX int dprintf(int filides, const char *restrict format, ...);
30150 int fprintf(FILE *restrict stream, const char *restrict format, ...);
30151 int printf(const char *restrict format, ...);
30152 int snprintf(char *restrict s, size_t n,
30153             const char *restrict format, ...);
30154 int sprintf(char *restrict s, const char *restrict format, ...);
```

30155 DESCRIPTION

30156 CX Excluding *dprintf()*: The functionality described on this reference page is aligned with the ISO C
 30157 standard. Any conflict between the requirements described here and the ISO C standard is
 30158 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

30159 The *fprintf()* function shall place output on the named output *stream*. The *printf()* function shall
 30160 place output on the standard output stream *stdout*. The *sprintf()* function shall place output
 30161 followed by the null byte, '`\0`', in consecutive bytes starting at *s*; it is the user's responsibility
 30162 to ensure that enough space is available.

30163 CX The *dprintf()* function shall be equivalent to the *fprintf()* function, except that *dprintf()* shall
 30164 write output to the file associated with the file descriptor specified by the *filides* argument rather
 30165 than place output on a stream.

30166 The *snprintf()* function shall be equivalent to *sprintf()*, with the addition of the *n* argument
 30167 which states the size of the buffer referred to by *s*. If *n* is zero, nothing shall be written and *s*
 30168 may be a null pointer. Otherwise, output bytes beyond the *n*-1st shall be discarded instead of
 30169 being written to the array, and a null byte is written at the end of the bytes actually written into
 30170 the array.

30171 If copying takes place between objects that overlap as a result of a call to *sprintf()* or *snprintf()*,
 30172 the results are undefined.

30173 Each of these functions converts, formats, and prints its arguments under control of the *format*.
 30174 The *format* is a character string, beginning and ending in its initial shift state, if any. The *format* is
 30175 composed of zero or more directives: *ordinary characters*, which are simply copied to the output
 30176 stream, and *conversion specifications*, each of which shall result in the fetching of zero or more
 30177 arguments. The results are undefined if there are insufficient arguments for the *format*. If the
 30178 *format* is exhausted while arguments remain, the excess arguments shall be evaluated but are
 30179 otherwise ignored.

30180 CX Conversions can be applied to the *n*th argument after the *format* in the argument list, rather than
 30181 to the next unused argument. In this case, the conversion specifier character `%` (see below) is
 30182 replaced by the sequence "`%n$`", where *n* is a decimal integer in the range `[1, {NL_ARGMAX}]`,
 30183 giving the position of the argument in the argument list. This feature provides for the definition
 30184 of format strings that select arguments in an order appropriate to specific languages (see the
 30185 EXAMPLES section).

30186 The *format* can contain either numbered argument conversion specifications (that is, "`%n$`" and
 30187 "`*m$`"), or unnumbered argument conversion specifications (that is, `%` and `*`), but not both. The
 30188 only exception to this is that `%%` can be mixed with the "`%n$`" form. The results of mixing
 30189 numbered and unnumbered argument specifications in a *format* string are undefined. When
 30190 numbered argument specifications are used, specifying the *N*th argument requires that all the
 30191 leading arguments, from the first to the (*N*-1)th, are specified in the format string.

30192 In format strings containing the "%n\$" form of conversion specification, numbered arguments
 30193 in the argument list can be referenced from the format string as many times as required.

30194 In format strings containing the % form of conversion specification, each conversion specification
 30195 uses the first unused argument in the argument list.

30196 CX All forms of the *fprintf()* functions allow for the insertion of a language-dependent radix
 30197 character in the output string. The radix character is defined in the current locale (category
 30198 LC_NUMERIC). In the POSIX locale, or in a locale where the radix character is not defined, the
 30199 radix character shall default to a <period> ('.').

30200 CX Each conversion specification is introduced by the '%' character or by the character sequence
 30201 "%n\$", after which the following appear in sequence:

- 30202 • Zero or more *flags* (in any order), which modify the meaning of the conversion
 30203 specification.
- 30204 • An optional minimum *field width*. If the converted value has fewer bytes than the field
 30205 width, it shall be padded with <space> characters by default on the left; it shall be padded
 30206 on the right if the left-adjustment flag ('-'), described below, is given to the field width.
 30207 The field width takes the form of an <asterisk> ('*'), described below, or a decimal
 30208 integer.
- 30209 • An optional *precision* that gives the minimum number of digits to appear for the d, i, o, u,
 30210 x, and X conversion specifiers; the number of digits to appear after the radix character for
 30211 the a, A, e, E, f, and F conversion specifiers; the maximum number of significant digits for
 30212 the g and G conversion specifiers; or the maximum number of bytes to be printed from a
 30213 XSI string in the s and S conversion specifiers. The precision takes the form of a <period>
 30214 ('.') followed either by an <asterisk> ('*'), described below, or an optional decimal digit
 30215 string, where a null digit string is treated as zero. If a precision appears with any other
 30216 conversion specifier, the behavior is undefined.
- 30217 • An optional length modifier that specifies the size of the argument.
- 30218 • A *conversion specifier* character that indicates the type of conversion to be applied.

30219 A field width, or precision, or both, may be indicated by an <asterisk> ('*'). In this case an
 30220 argument of type *int* supplies the field width or precision. Applications shall ensure that
 30221 arguments specifying field width, or precision, or both appear in that order before the argument,
 30222 if any, to be converted. A negative field width is taken as a '-' flag followed by a positive field
 30223 CX width. A negative precision is taken as if the precision were omitted. In *format* strings
 30224 containing the "%n\$" form of a conversion specification, a field width or precision may be
 30225 indicated by the sequence "%m\$", where *m* is a decimal integer in the range [1,{NL_ARGMAX}]
 30226 giving the position in the argument list (after the *format* argument) of an integer argument
 30227 containing the field width or precision, for example:

30228 `printf("%1$d:%2$.*3$d:%4$.*3$d\n", hour, min, precision, sec);`

30229 The flag characters and their meanings are:

- 30230 CX ' (The <apostrophe>.) The integer portion of the result of a decimal conversion (%i, %d,
 30231 %u, %f, %F, %g, or %G) shall be formatted with thousands' grouping characters. For
 30232 other conversions the behavior is undefined. The non-monetary grouping character is
 30233 used.
- 30234 - The result of the conversion shall be left-justified within the field. The conversion is
 30235 right-justified if this flag is not specified.

30236 + The result of a signed conversion shall always begin with a sign ('+' or '-'). The
 30237 conversion shall begin with a sign only when a negative value is converted if this flag is
 30238 not specified.

30239 <space> If the first character of a signed conversion is not a sign or if a signed conversion results
 30240 in no characters, a <space> shall be prefixed to the result. This means that if the
 30241 <space> and '+' flags both appear, the <space> flag shall be ignored.

30242 # Specifies that the value is to be converted to an alternative form. For o conversion, it
 30243 increases the precision (if necessary) to force the first digit of the result to be zero. For x
 30244 or X conversion specifiers, a non-zero result shall have 0x (or 0X) prefixed to it. For a, A,
 30245 e, E, f, F, g, and G conversion specifiers, the result shall always contain a radix
 30246 character, even if no digits follow the radix character. Without this flag, a radix
 30247 character appears in the result of these conversions only if a digit follows it. For g and G
 30248 conversion specifiers, trailing zeros shall *not* be removed from the result as they
 30249 normally are. For other conversion specifiers, the behavior is undefined.

30250 0 For d, i, o, u, x, X, a, A, e, E, f, F, g, and G conversion specifiers, leading zeros
 30251 (following any indication of sign or base) are used to pad to the field width rather than
 30252 performing space padding, except when converting an infinity or NaN. If the '0' and
 30253 '-' flags both appear, the '0' flag is ignored. For d, i, o, u, x, and X conversion
 30254 CX specifiers, if a precision is specified, the '0' flag shall be ignored. If the '0' and
 30255 <apostrophe> flags both appear, the grouping characters are inserted before zero
 30256 padding. For other conversions, the behavior is undefined.

30257 The length modifiers and their meanings are:

30258 hh Specifies that a following d, i, o, u, x, or X conversion specifier applies to a **signed char**
 30259 or **unsigned char** argument (the argument will have been promoted according to the
 30260 integer promotions, but its value shall be converted to **signed char** or **unsigned char**
 30261 before printing); or that a following n conversion specifier applies to a pointer to a
 30262 **signed char** argument.

30263 h Specifies that a following d, i, o, u, x, or X conversion specifier applies to a **short** or
 30264 **unsigned short** argument (the argument will have been promoted according to the
 30265 integer promotions, but its value shall be converted to **short** or **unsigned short** before
 30266 printing); or that a following n conversion specifier applies to a pointer to a **short**
 30267 argument.

30268 l (ell) Specifies that a following d, i, o, u, x, or X conversion specifier applies to a **long** or
 30269 **unsigned long** argument; that a following n conversion specifier applies to a pointer to
 30270 a **long** argument; that a following c conversion specifier applies to a **wint_t** argument;
 30271 that a following s conversion specifier applies to a pointer to a **wchar_t** argument; or
 30272 has no effect on a following a, A, e, E, f, F, g, or G conversion specifier.

30273 ll (ell-ell) Specifies that a following d, i, o, u, x, or X conversion specifier applies to a **long long**
 30274 or **unsigned long long** argument; or that a following n conversion specifier applies to a
 30275 pointer to a **long long** argument.

30277 j Specifies that a following d, i, o, u, x, or X conversion specifier applies to an **intmax_t**
 30278 or **uintmax_t** argument; or that a following n conversion specifier applies to a pointer
 30279 to an **intmax_t** argument.

30280 z Specifies that a following d, i, o, u, x, or X conversion specifier applies to a **size_t** or the
 30281 corresponding signed integer type argument; or that a following n conversion specifier
 30282 applies to a pointer to a signed integer type corresponding to a **size_t** argument.

30283	t	Specifies that a following d, i, o, u, x, or X conversion specifier applies to a ptrdiff_t or the corresponding unsigned type argument; or that a following n conversion specifier applies to a pointer to a ptrdiff_t argument.
30284		
30285		
30286	L	Specifies that a following a, A, e, E, f, F, g, or G conversion specifier applies to a long double argument.
30287		
30288		If a length modifier appears with any conversion specifier other than as specified above, the behavior is undefined.
30289		
30290		The conversion specifiers and their meanings are:
30291	d, i	The int argument shall be converted to a signed decimal in the style "[−] dddd". The precision specifies the minimum number of digits to appear; if the value being converted can be represented in fewer digits, it shall be expanded with leading zeros. The default precision is 1. The result of converting zero with an explicit precision of zero shall be no characters.
30292		
30293		
30294		
30295		
30296	o	The unsigned argument shall be converted to unsigned octal format in the style "ddd". The precision specifies the minimum number of digits to appear; if the value being converted can be represented in fewer digits, it shall be expanded with leading zeros. The default precision is 1. The result of converting zero with an explicit precision of zero shall be no characters.
30297		
30298		
30299		
30300		
30301	u	The unsigned argument shall be converted to unsigned decimal format in the style "ddd". The precision specifies the minimum number of digits to appear; if the value being converted can be represented in fewer digits, it shall be expanded with leading zeros. The default precision is 1. The result of converting zero with an explicit precision of zero shall be no characters.
30302		
30303		
30304		
30305		
30306	x	The unsigned argument shall be converted to unsigned hexadecimal format in the style "ddd"; the letters "abcdef" are used. The precision specifies the minimum number of digits to appear; if the value being converted can be represented in fewer digits, it shall be expanded with leading zeros. The default precision is 1. The result of converting zero with an explicit precision of zero shall be no characters.
30307		
30308		
30309		
30310		
30311	X	Equivalent to the x conversion specifier, except that letters "ABCDEF" are used instead of "abcdef".
30312		
30313	f, F	The double argument shall be converted to decimal notation in the style "[−] ddd.ddd", where the number of digits after the radix character is equal to the precision specification. If the precision is missing, it shall be taken as 6; if the precision is explicitly zero and no '#' flag is present, no radix character shall appear. If a radix character appears, at least one digit appears before it. The low-order digit shall be rounded in an implementation-defined manner.
30314		
30315		
30316		
30317		
30318		
30319		A double argument representing an infinity shall be converted in one of the styles "[−]inf" or "[−]infinity"; which style is implementation-defined. A double argument representing a NaN shall be converted in one of the styles "[−]nan(<i>n-char-sequence</i>)" or "[−]nan"; which style, and the meaning of any <i>n-char-sequence</i> , is implementation-defined. The F conversion specifier produces "INF", "INFINITY", or "NAN" instead of "inf", "infinity", or "nan", respectively.
30320		
30321		
30322		
30323		
30324		
30325	e, E	The double argument shall be converted in the style "[−] d.ddde±dd", where there is one digit before the radix character (which is non-zero if the argument is non-zero) and the number of digits after it is equal to the precision; if the precision is missing, it shall be taken as 6; if the precision is zero and no '#' flag is present, no radix character shall
30326		
30327		
30328		

30329		appear. The low-order digit shall be rounded in an implementation-defined manner.
30330		The E conversion specifier shall produce a number with ' E ' instead of ' e '
30331		introducing the exponent. The exponent shall always contain at least two digits. If the
30332		value is zero, the exponent shall be zero.
30333		A double argument representing an infinity or NaN shall be converted in the style of
30334		an f or F conversion specifier.
30335	g, G	The double argument representing a floating-point number shall be converted in the
30336		style f or e (or in the style F or E in the case of a G conversion specifier), depending on
30337		the value converted and the precision. Let P equal the precision if non-zero, 6 if the
30338		precision is omitted, or 1 if the precision is zero. Then, if a conversion with style E
30339		would have an exponent of X :
30340		— If $P > X \geq -4$, the conversion shall be with style f (or F) and precision $P - (X + 1)$.
30341		— Otherwise, the conversion shall be with style e (or E) and precision $P - 1$.
30342		Finally, unless the ' # ' flag is used, any trailing zeros shall be removed from the
30343		fractional portion of the result and the decimal-point character shall be removed if there
30344		is no fractional portion remaining.
30345		A double argument representing an infinity or NaN shall be converted in the style of
30346		an f or F conversion specifier.
30347	a, A	A double argument representing a floating-point number shall be converted in the
30348		style "[-]0x <h>.hhhhp±d", where there is one hexadecimal digit (which shall be non-</h>
30349		zero if the argument is a normalized floating-point number and is otherwise
30350		unspecified) before the decimal-point character and the number of hexadecimal digits
30351		after it is equal to the precision; if the precision is missing and FLT_RADIX is a power
30352		of 2, then the precision shall be sufficient for an exact representation of the value; if the
30353		precision is missing and FLT_RADIX is not a power of 2, then the precision shall be
30354		sufficient to distinguish values of type double , except that trailing zeros may be
30355		omitted; if the precision is zero and the ' # ' flag is not specified, no decimal-point
30356		character shall appear. The letters "abcdef" shall be used for a conversion and the
30357		letters "ABCDEF" for A conversion. The A conversion specifier produces a number with
30358		' X ' and ' P ' instead of ' x ' and ' p '. The exponent shall always contain at least one
30359		digit, and only as many more digits as necessary to represent the decimal exponent of
30360		2. If the value is zero, the exponent shall be zero.
30361		A double argument representing an infinity or NaN shall be converted in the style of
30362		an f or F conversion specifier.
30363	c	The int argument shall be converted to an unsigned char , and the resulting byte shall
30364		be written.
30365		If an l (ell) qualifier is present, the wint_t argument shall be converted as if by an ls
30366		conversion specification with no precision and an argument that points to a two-
30367		element array of type wchar_t , the first element of which contains the wint_t argument
30368		to the ls conversion specification and the second element contains a null wide
30369		character.
30370	s	The argument shall be a pointer to an array of char . Bytes from the array shall be
30371		written up to (but not including) any terminating null byte. If the precision is specified,
30372		no more than that many bytes shall be written. If the precision is not specified or is
30373		greater than the size of the array, the application shall ensure that the array contains a
30374		null byte.

30375			If an <code>l</code> (ell) qualifier is present, the argument shall be a pointer to an array of type wchar_t . Wide characters from the array shall be converted to characters (each as if by a call to the <i>wcrtomb()</i> function, with the conversion state described by an mbstate_t object initialized to zero before the first wide character is converted) up to and including a terminating null wide character. The resulting characters shall be written up to (but not including) the terminating null character (byte). If no precision is specified, the application shall ensure that the array contains a null wide character. If a precision is specified, no more than that many characters (bytes) shall be written (including shift sequences, if any), and the array shall contain a null wide character if, to equal the character sequence length given by the precision, the function would need to access a wide character one past the end of the array. In no case shall a partial character be written.
30376			
30377			
30378			
30379			
30380			
30381			
30382			
30383			
30384			
30385			
30386			
30387		<code>p</code>	The argument shall be a pointer to void . The value of the pointer is converted to a sequence of printable characters, in an implementation-defined manner.
30388			
30389		<code>n</code>	The argument shall be a pointer to an integer into which is written the number of bytes written to the output so far by this call to one of the <i>fprintf()</i> functions. No argument is converted.
30390			
30391			
30392	XSI	C	Equivalent to <code>lc</code> .
30393	XSI	S	Equivalent to <code>ls</code> .
30394		<code>%</code>	Print a <code>'%'</code> character; no argument is converted. The complete conversion specification shall be <code>%%</code> .
30395			
30396			If a conversion specification does not match one of the above forms, the behavior is undefined. If any argument is not the correct type for the corresponding conversion specification, the behavior is undefined.
30397			
30398			
30399			In no case shall a nonexistent or small field width cause truncation of a field; if the result of a conversion is wider than the field width, the field shall be expanded to contain the conversion result. Characters generated by <i>fprintf()</i> and <i>printf()</i> are printed as if <i>fputc()</i> had been called.
30400			
30401			
30402			For the <code>a</code> and <code>A</code> conversion specifiers, if <code>FLT_RADIX</code> is a power of 2, the value shall be correctly rounded to a hexadecimal floating number with the given precision.
30403			
30404			For <code>a</code> and <code>A</code> conversions, if <code>FLT_RADIX</code> is not a power of 2 and the result is not exactly representable in the given precision, the result should be one of the two adjacent numbers in hexadecimal floating style with the given precision, with the extra stipulation that the error should have a correct sign for the current rounding direction.
30405			
30406			
30407			
30408			For the <code>e</code> , <code>E</code> , <code>f</code> , <code>F</code> , <code>g</code> , and <code>G</code> conversion specifiers, if the number of significant decimal digits is at most <code>DECIMAL_DIG</code> , then the result should be correctly rounded. If the number of significant decimal digits is more than <code>DECIMAL_DIG</code> but the source value is exactly representable with <code>DECIMAL_DIG</code> digits, then the result should be an exact representation with trailing zeros. Otherwise, the source value is bounded by two adjacent decimal strings $L < U$, both having <code>DECIMAL_DIG</code> significant digits; the value of the resultant decimal string D should satisfy $L \leq D \leq U$, with the extra stipulation that the error should have a correct sign for the current rounding direction.
30409			
30410			
30411			
30412			
30413			
30414			
30415			
30416	CX		The last data modification and last file status change timestamps of the file shall be marked for update:
30417			
30418			1. Between the call to a successful execution of <i>fprintf()</i> or <i>printf()</i> and the next successful completion of a call to <i>fflush()</i> or <i>fclose()</i> on the same stream or a call to <i>exit()</i> or <i>abort()</i>
30419			

2. Upon successful completion of a call to *dprintf()*

RETURN VALUE

Upon successful completion, the *dprintf()*, *fprintf()*, and *printf()* functions shall return the number of bytes transmitted.

Upon successful completion, the *sprintf()* function shall return the number of bytes written to *s*, excluding the terminating null byte.

Upon successful completion, the *snprintf()* function shall return the number of bytes that would be written to *s* had *n* been sufficiently large excluding the terminating null byte.

If an output error was encountered, these functions shall return a negative value and set *errno* to indicate the error.

If the value of *n* is zero on a call to *snprintf()*, nothing shall be written, the number of bytes that would have been written had *n* been sufficiently large excluding the terminating null shall be returned, and *s* may be a null pointer.

ERRORS

For the conditions under which *dprintf()*, *fprintf()*, and *printf()* fail and may fail, refer to *fputc()* or *fputwc()*.

In addition, all forms of *fprintf()* shall fail if:

[EILSEQ] A wide-character code that does not correspond to a valid character has been detected.

[EOVERFLOW] The value to be returned is greater than {INT_MAX}.

In addition, all forms of *fprintf()* may fail if:

[EINVAL] There are insufficient arguments.

The *dprintf()* function may fail if:

[EBADF] The *fildest* argument is not a valid file descriptor.

The *dprintf()*, *fprintf()*, and *printf()* functions may fail if:

[ENOMEM] Insufficient storage space is available.

The *snprintf()* function shall fail if:

[EOVERFLOW] The value of *n* is greater than {INT_MAX}.

EXAMPLES

Printing Language-Independent Date and Time

The following statement can be used to print date and time using a language-independent format:

```
printf(format, weekday, month, day, hour, min);
```

For American usage, *format* could be a pointer to the following string:

```
"%s, %s %d, %d:%.2d\n"
```

This example would produce the following message:

```
Sunday, July 3, 10:02
```

For German usage, *format* could be a pointer to the following string:

```
"%1$s, %3$d. %2$s, %4$d:%5$.2d\n"
```

This definition of *format* would produce the following message:

```
Sonntag, 3. Juli, 10:02
```

Printing File Information

The following example prints information about the type, permissions, and number of links of a specific file in a directory.

The first two calls to *printf()* use data decoded from a previous *stat()* call. The user-defined *strperm()* function shall return a string similar to the one at the beginning of the output for the following command:

```
ls -l
```

The next call to *printf()* outputs the owner's name if it is found using *getpwuid()*; the *getpwuid()* function shall return a **passwd** structure from which the name of the user is extracted. If the user name is not found, the program instead prints out the numeric value of the user ID.

The next call prints out the group name if it is found using *getgrgid()*; *getgrgid()* is very similar to *getpwuid()* except that it shall return group information based on the group number. Once again, if the group is not found, the program prints the numeric value of the group for the entry.

The final call to *printf()* prints the size of the file.

```
#include <stdio.h>
#include <sys/types.h>
#include <pwd.h>
#include <grp.h>

char *strperm (mode_t);
...
struct stat statbuf;
struct passwd *pwd;
struct group *grp;
...
printf("%10.10s", strperm (statbuf.st_mode));
printf("%4d", statbuf.st_nlink);

if ((pwd = getpwuid(statbuf.st_uid)) != NULL)
    printf(" %-8.8s", pwd->pw_name);
else
    printf(" %-8ld", (long) statbuf.st_uid);

if ((grp = getgrgid(statbuf.st_gid)) != NULL)
    printf(" %-8.8s", grp->gr_name);
else
    printf(" %-8ld", (long) statbuf.st_gid);

printf("%9jd", (intmax_t) statbuf.st_size);
...
```

Printing a Localized Date String

The following example gets a localized date string. The `nl_langinfo()` function shall return the localized date string, which specifies the order and layout of the date. The `strftime()` function takes this information and, using the `tm` structure for values, places the date and time information into *datestring*. The `printf()` function then outputs *datestring* and the name of the entry.

```
#include <stdio.h>
#include <time.h>
#include <langinfo.h>
...
struct dirent *dp;
struct tm *tm;
char datestring[256];
...
strftime(datestring, sizeof(datestring), nl_langinfo (D_T_FMT), tm);
printf(" %s %s\n", datestring, dp->d_name);
...
```

Printing Error Information

The following example uses `fprintf()` to write error information to standard error.

In the first group of calls, the program tries to open the password lock file named **LOCKFILE**. If the file already exists, this is an error, as indicated by the `O_EXCL` flag on the `open()` function. If the call fails, the program assumes that someone else is updating the password file, and the program exits.

The next group of calls saves a new password file as the current password file by creating a link between **LOCKFILE** and the new password file **PASSWDFILE**.

```
#include <sys/types.h>
#include <sys/stat.h>
#include <fcntl.h>
#include <stdio.h>
#include <stdlib.h>
#include <unistd.h>
#include <string.h>
#include <errno.h>

#define LOCKFILE "/etc/ptmp"
#define PASSWDFILE "/etc/passwd"
...
int pfd;
...
if ((pfd = open(LOCKFILE, O_WRONLY | O_CREAT | O_EXCL,
    S_IRUSR | S_IWUSR | S_IRGRP | S_IROTH)) == -1)
{
    fprintf(stderr, "Cannot open /etc/ptmp. Try again later.\n");
    exit(1);
}
...
if (link(LOCKFILE, PASSWDFILE) == -1) {
```

```

30543         fprintf(stderr, "Link error: %s\n", strerror(errno));
30544         exit(1);
30545     }
30546     ...

```

Printing Usage Information

The following example checks to make sure the program has the necessary arguments, and uses *fprintf()* to print usage information if the expected number of arguments is not present.

```

30550 #include <stdio.h>
30551 #include <stdlib.h>
30552 ...
30553 char *Options = "hdbtl";
30554 ...
30555 if (argc < 2) {
30556     fprintf(stderr, "Usage: %s -%s <file\n", argv[0], Options); exit(1);
30557 }
30558 ...

```

Formatting a Decimal String

The following example prints a key and data pair on *stdout*. Note use of the <asterisk> ('*') in the format string; this ensures the correct number of decimal places for the element based on the number of elements requested.

```

30563 #include <stdio.h>
30564 ...
30565 long i;
30566 char *keystr;
30567 int elementlen, len;
30568 ...
30569 while (len < elementlen) {
30570     ...
30571     printf("%s Element%0*ld\n", keystr, elementlen, i);
30572     ...
30573 }

```

Creating a Pathname

The following example creates a pathname using information from a previous *getpwnam()* | function that returned the password database entry of the user.

```

30577 #include <stdint.h> +
30578 #include <stdio.h> +
30579 #include <stdlib.h> +
30580 #include <string.h> +
30581 #include <sys/types.h>
30582 #include <unistd.h>
30583 ...
30584 char *pathname; |
30585 struct passwd *pw;
30586 size_t len; +

```

```

30587     ...
30588     // digits required for pid_t is number of bits times
30589     // log2(10) = approx 10/33
30590     len = strlen(pw->pw_dir) + 1 + 1+(sizeof(pid_t)*80+32)/33 +
30591         sizeof ".out";
30592     pathname = malloc(len);
30593     if (pathname != NULL)
30594     {
30595         snprintf(pathname, len, "%s/%jd.out", pw->pw_dir,
30596             (intmax_t) getpid());
30597         ...
30598     }

```

Reporting an Event

The following example loops until an event has timed out. The *pause()* function waits forever unless it receives a signal. The *fprintf()* statement should never occur due to the possible return values of *pause()*.

```

30603     #include <stdio.h>
30604     #include <unistd.h>
30605     #include <string.h>
30606     #include <errno.h>
30607     ...
30608     while (!event_complete) {
30609     ...
30610         if (pause() != -1 || errno != EINTR)
30611             fprintf(stderr, "pause: unknown error: %s\n", strerror(errno));
30612     }
30613     ...

```

Printing Monetary Information

The following example uses *strfmon()* to convert a number and store it as a formatted monetary string named *convbuf*. If the first number is printed, the program prints the format and the description; otherwise, it just prints the number.

```

30618     #include <monetary.h>
30619     #include <stdio.h>
30620     ...
30621     struct tblfmt {
30622         char *format;
30623         char *description;
30624     };
30625     struct tblfmt table[] = {
30626         { "%n", "default formatting" },
30627         { "%11n", "right align within an 11 character field" },
30628         { "%#5n", "aligned columns for values up to 99999" },
30629         { "%=*#5n", "specify a fill character" },
30630         { "%=0#5n", "fill characters do not use grouping" },
30631         { "%^#5n", "disable the grouping separator" },
30632         { "%^#5.0n", "round off to whole units" },

```

```

30633         { "%^#5.4n", "increase the precision" },
30634         { "%(#5n", "use an alternative pos/neg style" },
30635         { "%!(#5n", "disable the currency symbol" },
30636     };
30637     ...
30638     float input[3];
30639     int i, j;
30640     char convbuf[100];
30641     ...
30642     strfmon(convbuf, sizeof(convbuf), table[i].format, input[j]);
30643
30644     if (j == 0) {
30645         printf("%s%s%s\n", table[i].format,
30646             convbuf, table[i].description);
30647     }
30648     else {
30649         printf("%s\n", convbuf);
30650     }
30651     ...

```

Printing Wide Characters

The following example prints a series of wide characters. Suppose that "L`@`" expands to three bytes:

```

30654     wchar_t wz [3] = L"@@";           // Zero-terminated
30655     wchar_t wn [3] = L"@@";           // Unterminated
30656
30657     fprintf (stdout, "%ls", wz);        // Outputs 6 bytes
30658     fprintf (stdout, "%ls", wn);        // Undefined because wn has no terminator
30659     fprintf (stdout, "%4ls", wz);       // Outputs 3 bytes
30660     fprintf (stdout, "%4ls", wn);       // Outputs 3 bytes; no terminator needed
30661     fprintf (stdout, "%9ls", wz);       // Outputs 6 bytes
30662     fprintf (stdout, "%9ls", wn);       // Outputs 9 bytes; no terminator needed
30663     fprintf (stdout, "%10ls", wz);      // Outputs 6 bytes
30664     fprintf (stdout, "%10ls", wn);      // Undefined because wn has no terminator

```

In the last line of the example, after processing three characters, nine bytes have been output. The fourth character must then be examined to determine whether it converts to one byte or more. If it converts to more than one byte, the output is only nine bytes. Since there is no fourth character in the array, the behavior is undefined.

APPLICATION USAGE

If the application calling *fprintf()* has any objects of type **wint_t** or **wchar_t**, it must also include the **<wchar.h>** header to have these objects defined.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

Aligned with ISO/IEC 9899:1990/Amendment 1:1995 (E). Specifically, the `l` (ell) qualifier can now be used with `c` and `s` conversion specifiers.

The *snprintf()* function is new in Issue 5.

Issue 6

Extensions beyond the ISO C standard are marked.

The normative text is updated to avoid use of the term “must” for application requirements.

The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- The prototypes for *fprintf()*, *printf()*, *snprintf()*, and *sprintf()* are updated, and the XSI shading is removed from *snprintf()*.
- The description of *snprintf()* is aligned with the ISO C standard. Note that this supersedes the *snprintf()* description in The Open Group Base Resolution bwg98-006, which changed the behavior from Issue 5.
- The DESCRIPTION is updated.

The DESCRIPTION is updated to use the terms “conversion specifier” and “conversion specification” consistently.

ISO/IEC 9899:1999 standard, Technical Corrigendum 1 is incorporated.

An example of printing wide characters is added.

Issue 7

Austin Group Interpretation 1003.1-2001 #161 is applied, updating the DESCRIPTION of the `0` flag.

Austin Group Interpretation 1003.1-2001 #170 is applied.

ISO/IEC 9899:1999 standard, Technical Corrigendum 2 #68 (SD5-XSH-ERN-70) is applied, revising the description of `g` and `G`.

SD5-XSH-ERN-174 is applied.

The *dprintf()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 1.

Functionality relating to the `%n$` form of conversion specification and the `<apostrophe>` flag is moved from the XSI option to the Base.

Changes are made related to support for finegrained timestamps.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0163 [302], XSH/TC1-2008/0164 [316], XSH/TC1-2008/0165 [316], XSH/TC1-2008/0166 [451,291], and XSH/TC1-2008/0167 [14] are applied.

30713 **NAME**

30714 fputc — put a byte on a stream

30715 **SYNOPSIS**

30716 #include <stdio.h>

30717 int fputc(int *c*, FILE **stream*);30718 **DESCRIPTION**

30719 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 30720 conflict between the requirements described here and the ISO C standard is unintentional. This
 30721 volume of POSIX.1-2008 defers to the ISO C standard.

30722 The *fputc()* function shall write the byte specified by *c* (converted to an **unsigned char**) to the
 30723 output stream pointed to by *stream*, at the position indicated by the associated file-position
 30724 indicator for the stream (if defined), and shall advance the indicator appropriately. If the file
 30725 cannot support positioning requests, or if the stream was opened with append mode, the byte
 30726 shall be appended to the output stream.

30727 CX The last data modification and last file status change timestamps of the file shall be marked for
 30728 update between the successful execution of *fputc()* and the next successful completion of a call
 30729 to *fflush()* or *fclose()* on the same stream or a call to *exit()* or *abort()*.

30730 **RETURN VALUE**

30731 Upon successful completion, *fputc()* shall return the value it has written. Otherwise, it shall
 30732 CX return EOF, the error indicator for the stream shall be set, and *errno* shall be set to indicate the
 30733 error.

30734 **ERRORS**

30735 The *fputc()* function shall fail if either the *stream* is unbuffered or the *stream*'s buffer needs to be
 30736 flushed, and:

30737 CX [EAGAIN] The O_NONBLOCK flag is set for the file descriptor underlying *stream* and
 30738 the thread would be delayed in the write operation.

30739 CX [EBADF] The file descriptor underlying *stream* is not a valid file descriptor open for
 30740 writing.

30741 CX [EFBIG] An attempt was made to write to a file that exceeds the maximum file size.

30742 XSI [EFBIG] An attempt was made to write to a file that exceeds the file size limit of the
 30743 process.

30744 CX [EFBIG] The file is a regular file and an attempt was made to write at or beyond the
 30745 offset maximum.

30746 CX [EINTR] The write operation was terminated due to the receipt of a signal, and no data
 30747 was transferred.

30748 CX [EIO] A physical I/O error has occurred, or the process is a member of a background
 30749 process group attempting to write to its controlling terminal, TOSTOP is set,
 30750 the calling thread is not blocking SIGTTOU, the process is not ignoring
 30751 SIGTTOU, and the process group of the process is orphaned. This error may
 30752 also be returned under implementation-defined conditions.

30753 CX [ENOSPC] There was no free space remaining on the device containing the file.

30754 CX [EPIPE] An attempt is made to write to a pipe or FIFO that is not open for reading by
 30755 any process. A SIGPIPE signal shall also be sent to the thread.

30756 The *fputc()* function may fail if:

30757 CX [ENOMEM] Insufficient storage space is available.

30758 CX [ENXIO] A request was made of a nonexistent device, or the request was outside the
30759 capabilities of the device.

30770 XBD <stdio.h>

30771 CHANGE HISTORY

30772 First released in Issue 1. Derived from Issue 1 of the SVID.

30773 Issue 5

30774 Large File Summit extensions are added.

30775 Issue 6

30776 Extensions beyond the ISO C standard are marked.

30777 The following new requirements on POSIX implementations derive from alignment with the
30778 Single UNIX Specification:

- 30779 • The [EIO] and [EFBIG] mandatory error conditions are added.
- 30780 • The [ENOMEM] and [ENXIO] optional error conditions are added.

30781 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/37 is applied, updating the [EAGAIN]
30782 error in the ERRORS section from “the process would be delayed” to “the thread would be
30783 delayed”.

30784 Issue 7

30785 Changes are made related to support for finegrained timestamps.

30786 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0168 [79] and XSH/TC1-2008/0169 +
30787 [14] are applied.

30788 **NAME**

30789 fputs — put a string on a stream

30790 **SYNOPSIS**

30791 #include <stdio.h>

30792 int fputs(const char *restrict *s*, FILE *restrict *stream*);30793 **DESCRIPTION**

30794 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 30795 conflict between the requirements described here and the ISO C standard is unintentional. This
 30796 volume of POSIX.1-2008 defers to the ISO C standard.

30797 The *fputs()* function shall write the null-terminated string pointed to by *s* to the stream pointed
 30798 to by *stream*. The terminating null byte shall not be written.

30799 CX The last data modification and last file status change timestamps of the file shall be marked for
 30800 update between the successful execution of *fputs()* and the next successful completion of a call
 30801 to *fflush()* or *fclose()* on the same stream or a call to *exit()* or *abort()*.

30802 **RETURN VALUE**

30803 Upon successful completion, *fputs()* shall return a non-negative number. Otherwise, it shall
 30804 CX return EOF, set an error indicator for the stream, and set *errno* to indicate the error.

30805 **ERRORS**30806 Refer to *fputc()*.30807 **EXAMPLES**30808 **Printing to Standard Output**

30809 The following example gets the current time, converts it to a string using *localtime()* and
 30810 *asctime()*, and prints it to standard output using *fputs()*. It then prints the number of minutes to
 30811 an event for which it is waiting.

```
30812 #include <time.h>
30813 #include <stdio.h>
30814 ...
30815 time_t now;
30816 int minutes_to_event;
30817 ...
30818 time(&now);
30819 printf("The time is ");
30820 fputs(asctime(localtime(&now)), stdout);
30821 printf("There are still %d minutes to the event.\n",
30822      minutes_to_event);
30823 ...
```

30824 **APPLICATION USAGE**30825 The *puts()* function appends a <newline> while *fputs()* does not.

30826 This volume of POSIX.1-2008 requires that successful completion simply return a non-negative +
 30827 integer. There are at least three known different implementation conventions for this +
 30828 requirement: +

- 30829 • Return a constant value. +

30830	• Return the last character written.	+
30831	• Return the number of bytes written. Note that this implementation convention cannot be	+
30832	adhered to for strings longer than {INT_MAX} bytes as the value would not be	+
30833	representable in the return type of the function. For backwards-compatibility,	+
30834	implementations can return the number of bytes for strings of up to {INT_MAX} bytes, and	+
30835	return {INT_MAX} for all longer strings.	+
30836	RATIONALE	
30837	The <i>fputs()</i> function is one whose source code was specified in the referenced <i>The C Programming</i>	
30838	<i>Language</i> . In the original edition, the function had no defined return value, yet many practical	
30839	implementations would, as a side-effect, return the value of the last character written as that was	
30840	the value remaining in the accumulator used as a return value. In the second edition of the book,	
30841	either the fixed value 0 or EOF would be returned depending upon the return value of <i>ferror()</i> ;	
30842	however, for compatibility with extant implementations, several implementations would, upon	
30843	success, return a positive value representing the last byte written.	
30844	FUTURE DIRECTIONS	
30845	None.	
30846	SEE ALSO	
30847	Section 2.5 (on page 495), <i>fopen()</i> , <i>putc()</i> , <i>puts()</i>

30849	CHANGE HISTORY	
30850	First released in Issue 1. Derived from Issue 1 of the SVID.	
30851	Issue 6	
30852	Extensions beyond the ISO C standard are marked.	
30853	The <i>fputs()</i> prototype is updated for alignment with the ISO/IEC 9899:1999 standard.	
30854	Issue 7	
30855	Changes are made related to support for finegrained timestamps.	
30856	POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0170 [174,412], XSH/TC1-2008/0171	+
30857	[412], and XSH/TC1-2008/0172 [14] are applied.	

30858 **NAME**30859 `fputwc` — put a wide-character code on a stream30860 **SYNOPSIS**30861 `#include <stdio.h>`30862 `#include <wchar.h>`30863 `wint_t fputwc(wchar_t wc, FILE *stream);`30864 **DESCRIPTION**

30865 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 30866 conflict between the requirements described here and the ISO C standard is unintentional. This
 30867 volume of POSIX.1-2008 defers to the ISO C standard.

30868 The `fputwc()` function shall write the character corresponding to the wide-character code *wc* to
 30869 the output stream pointed to by *stream*, at the position indicated by the associated file-position
 30870 indicator for the stream (if defined), and advances the indicator appropriately. If the file cannot
 30871 support positioning requests, or if the stream was opened with append mode, the character is
 30872 appended to the output stream. If an error occurs while writing the character, the shift state of
 30873 the output file is left in an undefined state.

30874 CX The last data modification and last file status change timestamps of the file shall be marked for
 30875 update between the successful execution of `fputwc()` and the next successful completion of a call
 30876 to `fflush()` or `fclose()` on the same stream or a call to `exit()` or `abort()`.

30877 The `fputwc()` function shall not change the setting of `errno` if successful.

+

30878 **RETURN VALUE**

30879 Upon successful completion, `fputwc()` shall return *wc*. Otherwise, it shall return WEOF, the error
 30880 CX indicator for the stream shall be set, and `errno` shall be set to indicate the error.

30881 **ERRORS**

30882 The `fputwc()` function shall fail if either the stream is unbuffered or data in the *stream*'s buffer
 30883 needs to be written, and:

30884 CX [EAGAIN] The O_NONBLOCK flag is set for the file descriptor underlying *stream* and
 30885 the thread would be delayed in the write operation.

30886 CX [EBADF] The file descriptor underlying *stream* is not a valid file descriptor open for
 30887 writing.

30888 CX [EFBIG] An attempt was made to write to a file that exceeds the maximum file size or
 30889 the file size limit of the process.

30890 CX [EFBIG] The file is a regular file and an attempt was made to write at or beyond the
 30891 offset maximum associated with the corresponding stream.

30892 [EILSEQ] The wide-character code *wc* does not correspond to a valid character.

30893 CX [EINTR] The write operation was terminated due to the receipt of a signal, and no data
 30894 was transferred.

30895 CX [EIO] A physical I/O error has occurred, or the process is a member of a background
 30896 process group attempting to write to its controlling terminal, TOSTOP is set,
 30897 the calling thread is not blocking SIGTTOU, the process is not ignoring
 30898 SIGTTOU, and the process group of the process is orphaned. This error may
 30899 also be returned under implementation-defined conditions.

30900 CX [ENOSPC] There was no free space remaining on the device containing the file.

30901 CX [EPIPE] An attempt is made to write to a pipe or FIFO that is not open for reading by
30902 any process. A SIGPIPE signal shall also be sent to the thread.

30903 The *fputc()* function may fail if:

30904 CX [ENOMEM] Insufficient storage space is available.

30905 CX [ENXIO] A request was made of a nonexistent device, or the request was outside the
30906 capabilities of the device.

30918 CHANGE HISTORY

30919 First released in Issue 4. Derived from the MSE working draft.

30920 Issue 5

30921 Aligned with ISO/IEC 9899:1990/Amendment 1:1995 (E). Specifically, the type of argument *wc*
30922 is changed from **wint_t** to **wchar_t**.

30923 The Optional Header (OH) marking is removed from <stdio.h>.

30924 Large File Summit extensions are added.

30925 Issue 6

30926 Extensions beyond the ISO C standard are marked.

30927 The following new requirements on POSIX implementations derive from alignment with the
30928 Single UNIX Specification:

- 30929 • The [EFBIG] and [EIO] mandatory error conditions are added.
- 30930 • The [ENOMEM] and [ENXIO] optional error conditions are added.

30931 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/38 is applied, updating the [EAGAIN]
30932 error in the ERRORS section from “the process would be delayed” to “the thread would be
30933 delayed”.

30934 Issue 7

30935 Changes are made related to support for finegrained timestamps.

30936 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0173 [105], XSH/TC1-2008/0174 [79], +
30937 and XSH/TC1-2008/0175 [14] are applied.

30938 **NAME**30939 `fputws` — put a wide-character string on a stream30940 **SYNOPSIS**30941 `#include <stdio.h>`30942 `#include <wchar.h>`30943 `int fputws(const wchar_t *restrict ws, FILE *restrict stream);`30944 **DESCRIPTION**

30945 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 30946 conflict between the requirements described here and the ISO C standard is unintentional. This
 30947 volume of POSIX.1-2008 defers to the ISO C standard.

30948 The `fputws()` function shall write a character string corresponding to the (null-terminated) wide-
 30949 character string pointed to by `ws` to the stream pointed to by `stream`. No character corresponding
 30950 to the terminating null wide-character code shall be written.

30951 CX The last data modification and last file status change timestamps of the file shall be marked for
 30952 update between the successful execution of `fputws()` and the next successful completion of a call
 30953 to `fflush()` or `fclose()` on the same stream or a call to `exit()` or `abort()`.

30954 **RETURN VALUE**

30955 Upon successful completion, `fputws()` shall return a non-negative number. Otherwise, it shall
 30956 CX return `-1`, set an error indicator for the stream, and set `errno` to indicate the error.

30957 **ERRORS**30958 Refer to `fputwc()`.30959 **EXAMPLES**

30960 None.

30961 **APPLICATION USAGE**30962 The `fputws()` function does not append a `<newline>`.

30963 This volume of POSIX.1-2008 requires that successful completion simply return a non-negative +
 30964 integer. There are at least three known different implementation conventions for this +
 30965 requirement: +

- 30966 • Return a constant value. +
- 30967 • Return the last character written. +
- 30968 • Return the number of bytes written. Note that this implementation convention cannot be +
 30969 adhered to for strings longer than `{INT_MAX}` bytes as the value would not be +
 30970 representable in the return type of the function. For backwards-compatibility, +
 30971 implementations can return the number of bytes for strings of up to `{INT_MAX}` bytes, and +
 30972 return `{INT_MAX}` for all longer strings. +

30990 [14] are applied.

30991 NAME

30992 fread — binary input

30993 SYNOPSIS

```
30994 #include <stdio.h>
30995 size_t fread(void *restrict ptr, size_t size, size_t nitems,
30996 FILE *restrict stream);
```

30997 DESCRIPTION

30998 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 30999 conflict between the requirements described here and the ISO C standard is unintentional. This
 31000 volume of POSIX.1-2008 defers to the ISO C standard.

31001 The *fread()* function shall read into the array pointed to by *ptr* up to *nitems* elements whose size
 31002 is specified by *size* in bytes, from the stream pointed to by *stream*. For each object, *size* calls shall
 31003 be made to the *fgetc()* function and the results stored, in the order read, in an array of **unsigned**
 31004 **char** exactly overlaying the object. The file position indicator for the stream (if defined) shall be
 31005 advanced by the number of bytes successfully read. If an error occurs, the resulting value of the
 31006 file position indicator for the stream is unspecified. If a partial element is read, its value is
 31007 unspecified.

31008 CX The *fread()* function may mark the last data access timestamp of the file associated with *stream*
 31009 for update. The last data access timestamp shall be marked for update by the first successful
 31010 execution of *fgetc()*, *fgets()*, *fread()*, *fscanf()*, *getc()*, *getchar()*, *getdelim()*, *getline()*, *gets()*, or
 31011 *scanf()* using *stream* that returns data not supplied by a prior call to *ungetc()*.

31012 RETURN VALUE

31013 Upon successful completion, *fread()* shall return the number of elements successfully read which
 31014 is less than *nitems* only if a read error or end-of-file is encountered. If *size* or *nitems* is 0, *fread()*
 31015 shall return 0 and the contents of the array and the state of the stream remain unchanged.
 31016 CX Otherwise, if a read error occurs, the error indicator for the stream shall be set, and *errno* shall
 31017 be set to indicate the error.

31018 ERRORS

31019 Refer to *fgetc()*.

31020 EXAMPLES

31021 Reading from a Stream

31022 The following example reads a single element from the *fp* stream into the array pointed to by
 31023 *buf*.

```
31024 #include <stdio.h>
31025 ...
31026 size_t elements_read;
31027 char buf[100];
31028 FILE *fp;
31029 ...
31030 elements_read = fread(buf, sizeof(buf), 1, fp);
31031 ...
```

31032 If a read error occurs, *elements_read* will be zero but the number of bytes read from the stream
 31033 could be anything from zero to *sizeof(buf)*-1.

31034 The following example reads multiple single-byte elements from the *fp* stream into the array
 31035 pointed to by *buf*.

31036	#include <stdio.h>	+
31037	...	+
31038	size_t bytes_read;	
31039	char buf[100];	
31040	FILE *fp;	
31041	...	
31042	bytes_read = fread(buf, 1, sizeof(buf), fp);	
31043	...	
31044	If a read error occurs, <i>bytes_read</i> will contain the number of bytes read from the stream.	+
31045	APPLICATION USAGE	
31046	The <i>ferror()</i> or <i>feof()</i> functions must be used to distinguish between an error condition and an	
31047	end-of-file condition.	
31048	Because of possible differences in element length and byte ordering, files written using <i>fwrite()</i>	
31049	are application-dependent, and possibly cannot be read using <i>fread()</i> by a different application	
31050	or by the same application on a different processor.	
31051	RATIONALE	
31052	None.	
31053	FUTURE DIRECTIONS	
31054	None.	
31055	SEE ALSO	
31056	Section 2.5 (on page 495), feof() , ferror() , fgetc() , fopen() , fscanf() , getc() , gets()	
31057	XBD <stdio.h>	
31058	CHANGE HISTORY	
31059	First released in Issue 1. Derived from Issue 1 of the SVID.	
31060	Issue 6	
31061	Extensions beyond the ISO C standard are marked.	
31062	The following changes are made for alignment with the ISO/IEC 9899:1999 standard:	
31063	• The <i>fread()</i> prototype is updated.	
31064	• The DESCRIPTION is updated to describe how the bytes from a call to <i>fgetc()</i> are stored.	
31065	Issue 7	
31066	Changes are made related to support for finegrained timestamps.	
31067	POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0178 [232] and XSH/TC1-2008/0179	+
31068	[14] are applied.	

31069 **NAME**

31070 free — free allocated memory

31071 **SYNOPSIS**

31072 #include <stdlib.h>

31073 void free(void *ptr);

31074 **DESCRIPTION**

31075 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 31076 conflict between the requirements described here and the ISO C standard is unintentional. This
 31077 volume of POSIX.1-2008 defers to the ISO C standard.

31078 The *free()* function shall cause the space pointed to by *ptr* to be deallocated; that is, made
 31079 available for further allocation. If *ptr* is a null pointer, no action shall occur. Otherwise, if the
 31080 argument does not match a pointer earlier returned by a function in POSIX.1-2008 that allocates
 31081 memory as if by *malloc()*, or if the space has been deallocated by a call to *free()* or *realloc()*, the
 31082 behavior is undefined.

31083 Any use of a pointer that refers to freed space results in undefined behavior.

31084 **RETURN VALUE**31085 The *free()* function shall not return a value.31086 **ERRORS**

31087 No errors are defined.

31088 **EXAMPLES**

31089 None.

31090 **APPLICATION USAGE**

31091 There is now no requirement for the implementation to support the inclusion of <malloc.h>.

31092 **RATIONALE**

31093 None.

31094 **FUTURE DIRECTIONS**

31095 None.

31096 **SEE ALSO**31097 *calloc()*, *malloc()*, *posix_memalign()*, *realloc()*

31098 XBD <stdlib.h>

31099 **CHANGE HISTORY**

31100 First released in Issue 1. Derived from Issue 1 of the SVID.

31101 **Issue 6**31102 Reference to the *valloc()* function is removed.31103 **Issue 7**

31104 The DESCRIPTION is updated to clarify that if the pointer returned is not by a function that
 31105 allocates memory as if by *malloc()*, then the behavior is undefined.

31106 **NAME**

31107 freeaddrinfo, getaddrinfo — get address information

31108 **SYNOPSIS**

```

31109 #include <sys/socket.h>
31110 #include <netdb.h>

31111 void freeaddrinfo(struct addrinfo *ai);
31112 int getaddrinfo(const char *restrict nodename,
31113                const char *restrict servname,
31114                const struct addrinfo *restrict hints,
31115                struct addrinfo **restrict res);

```

31116 **DESCRIPTION**

31117 The *freeaddrinfo()* function shall free one or more **addrinfo** structures returned by *getaddrinfo()*,
 31118 along with any additional storage associated with those structures. If the *ai_next* field of the
 31119 structure is not null, the entire list of structures shall be freed. The *freeaddrinfo()* function shall
 31120 support the freeing of arbitrary sublists of an **addrinfo** list originally returned by *getaddrinfo()*.

31121 The *getaddrinfo()* function shall translate the name of a service location (for example, a host
 31122 name) and/or a service name and shall return a set of socket addresses and associated
 31123 information to be used in creating a socket with which to address the specified service.

31124 **Note:** In many cases it is implemented by the Domain Name System, as documented in RFC 1034,
 31125 RFC 1035, and RFC 1886.

31126 The *freeaddrinfo()* and *getaddrinfo()* functions shall be thread-safe.

31127 The *nodename* and *servname* arguments are either null pointers or pointers to null-terminated
 31128 strings. One or both of these two arguments shall be supplied by the application as a non-null
 31129 pointer.

31130 The format of a valid name depends on the address family or families. If a specific family is not
 31131 given and the name could be interpreted as valid within multiple supported families, the
 31132 implementation shall attempt to resolve the name in all supported families and, in absence of
 31133 errors, one or more results shall be returned.

31134 If the *nodename* argument is not null, it can be a descriptive name or can be an address string. If
 31135 IP6 the specified address family is AF_INET, AF_INET6, or AF_UNSPEC, valid descriptive names
 31136 include host names. If the specified address family is AF_INET or AF_UNSPEC, address strings
 31137 using Internet standard dot notation as specified in *inet_addr()* are valid.

31138 IP6 If the specified address family is AF_INET6 or AF_UNSPEC, standard IPv6 text forms described
 31139 in *inet_ntop()* are valid.

31140 If *nodename* is not null, the requested service location is named by *nodename*; otherwise, the
 31141 requested service location is local to the caller.

31142 If *servname* is null, the call shall return network-level addresses for the specified *nodename*. If
 31143 *servname* is not null, it is a null-terminated character string identifying the requested service.
 31144 This can be either a descriptive name or a numeric representation suitable for use with the
 31145 IP6 address family or families. If the specified address family is AF_INET, AF_INET6, or
 31146 AF_UNSPEC, the service can be specified as a string specifying a decimal port number.

31147 If the *hints* argument is not null, it refers to a structure containing input values that directs the
 31148 operation by providing options and by limiting the returned information to a specific socket
 31149 type, address family, and/or protocol, as described below. In this *hints* structure every member
 31150 other than *ai_flags*, *ai_family*, *ai_socktype*, and *ai_protocol* shall be set to zero or a null pointer. A
 31151 value of AF_UNSPEC for *ai_family* means that the caller shall accept any address family. A value

of zero for *ai_socktype* means that the caller shall accept any socket type. A value of zero for *ai_protocol* means that the caller shall accept any protocol. If *hints* is a null pointer, the behavior shall be as if it referred to a structure containing the value zero for the *ai_flags*, *ai_socktype*, and *ai_protocol* fields, and AF_UNSPEC for the *ai_family* field.

The *ai_flags* field to which the *hints* parameter points shall be set to zero or be the bitwise-inclusive OR of one or more of the values AI_PASSIVE, AI_CANONNAME, AI_NUMERICHOST, AI_NUMERICSERV, AI_V4MAPPED, AI_ALL, and AI_ADDRCONFIG.

If the AI_PASSIVE flag is specified, the returned address information shall be suitable for use in binding a socket for accepting incoming connections for the specified service. In this case, if the *nodename* argument is null, then the IP address portion of the socket address structure shall be set to INADDR_ANY for an IPv4 address or IN6ADDR_ANY_INIT for an IPv6 address. If the AI_PASSIVE flag is not specified, the returned address information shall be suitable for a call to *connect()* (for a connection-mode protocol) or for a call to *connect()*, *sendto()*, or *sendmsg()* (for a connectionless protocol). In this case, if the *nodename* argument is null, then the IP address portion of the socket address structure shall be set to the loopback address. The AI_PASSIVE flag shall be ignored if the *nodename* argument is not null.

If the AI_CANONNAME flag is specified and the *nodename* argument is not null, the function shall attempt to determine the canonical name corresponding to *nodename* (for example, if *nodename* is an alias or shorthand notation for a complete name).

Note: Since different implementations use different conceptual models, the terms “canonical name” and “alias” cannot be precisely defined for the general case. However, Domain Name System implementations are expected to interpret them as they are used in RFC 1034.

A numeric host address string is not a “name”, and thus does not have a “canonical name” form; no address to host name translation is performed. See below for handling of the case where a canonical name cannot be obtained.

If the AI_NUMERICHOST flag is specified, then a non-null *nodename* string supplied shall be a numeric host address string. Otherwise, an [EAI_NONAME] error is returned. This flag shall prevent any type of name resolution service (for example, the DNS) from being invoked.

If the AI_NUMERICSERV flag is specified, then a non-null *servname* string supplied shall be a numeric port string. Otherwise, an [EAI_NONAME] error shall be returned. This flag shall prevent any type of name resolution service (for example, NIS+) from being invoked.

If the AI_V4MAPPED flag is specified along with an *ai_family* of AF_INET6, then *getaddrinfo()* shall return IPv4-mapped IPv6 addresses on finding no matching IPv6 addresses (*ai_addrlen* shall be 16). The AI_V4MAPPED flag shall be ignored unless *ai_family* equals AF_INET6. If the AI_ALL flag is used with the AI_V4MAPPED flag, then *getaddrinfo()* shall return all matching IPv6 and IPv4 addresses. The AI_ALL flag without the AI_V4MAPPED flag is ignored.

If the AI_ADDRCONFIG flag is specified, IPv4 addresses shall be returned only if an IPv4 address is configured on the local system, and IPv6 addresses shall be returned only if an IPv6 address is configured on the local system.

The *ai_socktype* field to which argument *hints* points specifies the socket type for the service, as defined in *socket()*. If a specific socket type is not given (for example, a value of zero) and the service name could be interpreted as valid with multiple supported socket types, the implementation shall attempt to resolve the service name for all supported socket types and, in the absence of errors, all possible results shall be returned. A non-zero socket type value shall limit the returned information to values with the specified socket type.

If the *ai_family* field to which *hints* points has the value AF_UNSPEC, addresses shall be returned for use with any address family that can be used with the specified *nodename* and/or

servname. Otherwise, addresses shall be returned for use only with the specified address family. If *ai_family* is not AF_UNSPEC and *ai_protocol* is not zero, then addresses shall be returned for use only with the specified address family and protocol; the value of *ai_protocol* shall be interpreted as in a call to the *socket()* function with the corresponding values of *ai_family* and *ai_protocol*.

RETURN VALUE

A zero return value for *getaddrinfo()* indicates successful completion; a non-zero return value indicates failure. The possible values for the failures are listed in the ERRORS section.

Upon successful return of *getaddrinfo()*, the location to which *res* points shall refer to a linked list of **addrinfo** structures, each of which shall specify a socket address and information for use in creating a socket with which to use that socket address. The list shall include at least one **addrinfo** structure. The *ai_next* field of each structure contains a pointer to the next structure on the list, or a null pointer if it is the last structure on the list. Each structure on the list shall include values for use with a call to the *socket()* function, and a socket address for use with the *connect()* function or, if the AI_PASSIVE flag was specified, for use with the *bind()* function. The fields *ai_family*, *ai_socktype*, and *ai_protocol* shall be usable as the arguments to the *socket()* function to create a socket suitable for use with the returned address. The fields *ai_addr* and *ai_addrlen* are usable as the arguments to the *connect()* or *bind()* functions with such a socket, according to the AI_PASSIVE flag.

If *nodename* is not null, and if requested by the AI_CANONNAME flag, the *ai_canonname* field of the first returned **addrinfo** structure shall point to a null-terminated string containing the canonical name corresponding to the input *nodename*; if the canonical name is not available, then *ai_canonname* shall refer to the *nodename* argument or a string with the same contents. The contents of the *ai_flags* field of the returned structures are undefined.

All fields in socket address structures returned by *getaddrinfo()* that are not filled in through an explicit argument (for example, *sin6_flowinfo*) shall be set to zero.

Note: This makes it easier to compare socket address structures.

ERRORS

The *getaddrinfo()* function shall fail and return the corresponding error value if:

[EAI_AGAIN] The name could not be resolved at this time. Future attempts may succeed.

[EAI_BADFLAGS]

The *flags* parameter had an invalid value.

[EAI_FAIL] A non-recoverable error occurred when attempting to resolve the name.

[EAI_FAMILY] The address family was not recognized.

[EAI_MEMORY] There was a memory allocation failure when trying to allocate storage for the return value.

[EAI_NONAME] The name does not resolve for the supplied parameters.

Neither *nodename* nor *servname* were supplied. At least one of these shall be supplied.

[EAI_SERVICE] The service passed was not recognized for the specified socket type.

[EAI_SOCKTYPE]

The intended socket type was not recognized.

31241 [EAI_SYSTEM] A system error occurred; the error code can be found in *errno*.

31242 EXAMPLES

31243 The following (incomplete) program demonstrates the use of *getaddrinfo()* to obtain the socket
31244 address structure(s) for the service named in the program's command-line argument. The
31245 program then loops through each of the address structures attempting to create and bind a
31246 socket to the address, until it performs a successful *bind()*.

```

31247 #include <stdio.h>
31248 #include <stdlib.h>
31249 #include <unistd.h>
31250 #include <string.h>
31251 #include <sys/socket.h>
31252 #include <netdb.h>

31253 int
31254 main(int argc, char *argv[])
31255 {
31256     struct addrinfo *result, *rp;
31257     int sfd, s;

31258     if (argc != 2) {
31259         fprintf(stderr, "Usage: %s port\n", argv[0]);
31260         exit(EXIT_FAILURE);
31261     }

31262     struct addrinfo hints = {};
31263     hints.ai_family = AF_UNSPEC;
31264     hints.ai_socktype = SOCK_DGRAM;
31265     hints.ai_flags = AI_PASSIVE;
31266     hints.ai_protocol = 0;

31267     s = getaddrinfo(NULL, argv[1], &hints, &result);
31268     if (s != 0) {
31269         fprintf(stderr, "getaddrinfo: %s\n", gai_strerror(s));
31270         exit(EXIT_FAILURE);
31271     }

31272     /* getaddrinfo() returns a list of address structures.
31273        Try each address until a successful bind().
31274        If socket(2) (or bind(2)) fails, close the socket
31275        and try the next address. */

31276     for (rp = result; rp != NULL; rp = rp->ai_next) {
31277         sfd = socket(rp->ai_family, rp->ai_socktype,
31278                     rp->ai_protocol);
31279         if (sfd == -1)
31280             continue;

31281         if (bind(sfd, rp->ai_addr, rp->ai_addrlen) == 0)
31282             break; /* Success */

31283         close(sfd);
31284     }

31285     if (rp == NULL) { /* No address succeeded */
31286         fprintf(stderr, "Could not bind\n");

```

```

31287         exit(EXIT_FAILURE);
31288     }
31289     freeaddrinfo(result);    /* No longer needed */
31290     /* ... use socket bound to sfd ... */
31291 }

```

APPLICATION USAGE

If the caller handles only TCP and not UDP, for example, then the *ai_protocol* member of the *hints* structure should be set to IPPROTO_TCP when *getaddrinfo()* is called.

If the caller handles only IPv4 and not IPv6, then the *ai_family* member of the *hints* structure should be set to AF_INET when *getaddrinfo()* is called.

The term “canonical name” is misleading; it is taken from the Domain Name System (RFC 2181). It should be noted that the canonical name is a result of alias processing, and not necessarily a unique attribute of a host, address, or set of addresses. See RFC 2181 for more discussion of this in the Domain Name System context.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

The **restrict** keyword is added to the *getaddrinfo()* prototype for alignment with the ISO/IEC 9899:1999 standard.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/19 is applied, adding three notes to the DESCRIPTION and adding text to the APPLICATION USAGE related to the term “canonical name”. A reference to RFC 2181 is also added to the Informative References.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/20 is applied, making changes for alignment with IPv6. These include the following:

- Adding AI_V4MAPPED, AI_ALL, and AI_ADDRCONFIG to the allowed values for the *ai_flags* field
- Adding a description of AI_ADDRCONFIG
- Adding a description of the consequences of ignoring the AI_PASSIVE flag.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/39 is applied, changing “corresponding value” to “corresponding error value” in the ERRORS section.

Issue 7

Austin Group Interpretation 1003.1-2001 #013 is applied.

Austin Group Interpretation 1003.1-2001 #146 is applied, updating the DESCRIPTION.

An example is added.

31327 **NAME**

31328 freelocale — free resources allocated for a locale object

31329 **SYNOPSIS**

```
31330 CX      #include <locale.h>
31331          void freelocale(locale_t locobj);
```

31332 **DESCRIPTION**

31333 The *freelocale()* function shall cause the resources allocated for a locale object returned by a call
 31334 to the *newlocale()* or *duplocale()* functions to be released.

31335 The behavior is undefined if the *locobj* argument is the special locale object `LC_GLOBAL_LOCALE` or is not a valid locale object handle. +
 31336 +

31337 Any use of a locale object that has been freed results in undefined behavior.

31338 **RETURN VALUE**

31339 None.

31340 **ERRORS**

31341 None.

31342 **EXAMPLES**31343 **Freeing Up a Locale Object**31344 The following example shows a code fragment to free a locale object created by *newlocale()*:

```
31345      #include <locale.h>
31346      ...
31347      /* Every locale object allocated with newlocale() should be
31348       * freed using freelocale():
31349       */
31350      locale_t loc;
31351      /* Get the locale. */
31352      loc = newlocale (LC_CTYPE_MASK | LC_TIME_MASK, "locname", NULL);
31353      /* ... Use the locale object ... */
31354      ...
31355      /* Free the locale object resources. */
31356      freelocale (loc);
```

31357 **APPLICATION USAGE**

31358 None.

31359 **RATIONALE**

31360 None.

31361 **FUTURE DIRECTIONS**

31362 None.

31366	CHANGE HISTORY	
31367	First released in Issue 7.	
31368	POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0180 [283] is applied.	+

31369 **NAME**

31370 freopen — open a stream

31371 **SYNOPSIS**

31372 #include <stdio.h>

```
31373 FILE *freopen(const char *restrict pathname, const char *restrict mode, |
31374 FILE *restrict stream);
```

31375 **DESCRIPTION**

31376 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 31377 conflict between the requirements described here and the ISO C standard is unintentional. This
 31378 volume of POSIX.1-2008 defers to the ISO C standard.

31379 The *freopen()* function shall first attempt to flush the stream associated with *stream* as if by a call
 31380 to *fflush(stream)*. Failure to flush the stream successfully shall be ignored. If *pathname* is not a
 31381 null pointer, *freopen()* shall close any file descriptor associated with *stream*. Failure to close the
 31382 file descriptor successfully shall be ignored. The error and end-of-file indicators for the stream
 31383 shall be cleared.

31384 The *freopen()* function shall open the file whose pathname is the string pointed to by *pathname*
 31385 and associate the stream pointed to by *stream* with it. The *mode* argument shall be used just as in
 31386 *fopen()*.

31387 The original stream shall be closed regardless of whether the subsequent open succeeds.

31388 If *pathname* is a null pointer, the *freopen()* function shall attempt to change the mode of the
 31389 stream to that specified by *mode*, as if the name of the file currently associated with the stream
 31390 had been used. In this case, the file descriptor associated with the stream need not be closed if
 31391 the call to *freopen()* succeeds. It is implementation-defined which changes of mode are permitted
 31392 (if any), and under what circumstances.

31393 XSI After a successful call to the *freopen()* function, the orientation of the stream shall be cleared, the
 31394 encoding rule shall be cleared, and the associated **mbstate_t** object shall be set to describe an
 31395 initial conversion state.

31396 CX If *pathname* is not a null pointer, or if *pathname* is a null pointer and the specified mode change
 31397 necessitates the file descriptor associated with the stream to be closed and reopened, the file
 31398 descriptor associated with the reopened stream shall be allocated and opened as if by a call to
 31399 *open()* with the following flags:

<i>freopen()</i> Mode	<i>open()</i> Flags
<i>r</i> or <i>rb</i>	O_RDONLY
<i>w</i> or <i>wb</i>	O_WRONLY O_CREAT O_TRUNC
<i>a</i> or <i>ab</i>	O_WRONLY O_CREAT O_APPEND
<i>r+</i> or <i>rb+</i> or <i>r+b</i>	O_RDWR
<i>w+</i> or <i>wb+</i> or <i>w+b</i>	O_RDWR O_CREAT O_TRUNC
<i>a+</i> or <i>ab+</i> or <i>a+b</i>	O_RDWR O_CREAT O_APPEND

31407 **RETURN VALUE**

31408 Upon successful completion, *freopen()* shall return the value of *stream*. Otherwise, a null pointer
 31409 CX shall be returned, and *errno* shall be set to indicate the error.

31410 **ERRORS**31411 The *freopen()* function shall fail if:

31412 CX [EACCES] Search permission is denied on a component of the path prefix, or the file
 31413 exists and the permissions specified by *mode* are denied, or the file does not
 31414 exist and write permission is denied for the parent directory of the file to be
 31415 created.

31416 CX [EBADF] The file descriptor underlying the stream is not a valid file descriptor when
 31417 *pathname* is a null pointer.

31418 CX [EINTR] A signal was caught during *freopen()*.

31419 CX [EISDIR] The named file is a directory and *mode* requires write access.

31420 CX [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*
 31421 argument.

31422 CX [EMFILE] All file descriptors available to the process are currently open.

31423 CX [ENAMETOOLONG]

31424 The length of a component of a pathname is longer than {NAME_MAX}.

31425 CX [ENFILE] The maximum allowable number of files is currently open in the system.

31426 CX [ENOENT] The *mode* string begins with 'r' and a component of *pathname* does not name
 31427 an existing file, or *mode* begins with 'w' or 'a' and a component of the path
 31428 prefix of *pathname* does not name an existing file, or *pathname* is an empty
 31429 string.

31430 CX [ENOENT] or [ENOTDIR]

31431 The *pathname* argument contains at least one non-*<slash>* character and ends
 31432 with one or more trailing *<slash>* characters. If *pathname* names an existing
 31433 file, an [ENOENT] error shall not occur. +

31434 CX [ENOSPC] The directory or file system that would contain the new file cannot be
 31435 expanded, the file does not exist, and it was to be created.

31436 CX [ENOTDIR] A component of the path prefix names an existing file that is neither a
 31437 directory nor a symbolic link to a directory, or the *pathname* argument contains
 31438 at least one non-*<slash>* character and ends with one or more trailing *<slash>*
 31439 characters and the last pathname component names an existing file that is
 31440 neither a directory nor a symbolic link to a directory. |

31441 CX [ENXIO] The named file is a character special or block special file, and the device
 31442 associated with this special file does not exist.

31443 CX [EOVERFLOW] The named file is a regular file and the size of the file cannot be represented
 31444 correctly in an object of type *off_t*.

31445 CX [EROFS] The named file resides on a read-only file system and *mode* requires write
 31446 access.

31447 The *freopen()* function may fail if:

31448 CX [EBADF] The mode with which the file descriptor underlying the stream was opened
 31449 does not support the requested mode when *pathname* is a null pointer.

31450 CX [EINVAL] The value of the *mode* argument is not valid.

31451	CX	[ELOOP]	More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the <i>path</i> argument.
31452			
31453	CX	[ENAMETOOLONG]	
31454			The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a symbolic link produced an intermediate result with a length that exceeds {PATH_MAX}.
31455			
31456			
31457	CX	[ENOMEM]	Insufficient storage space is available.
31458	CX	[ENXIO]	A request was made of a nonexistent device, or the request was outside the capabilities of the device.
31459			
31460	CX	[ETXTBSY]	The file is a pure procedure (shared text) file that is being executed and <i>mode</i> requires write access.
31461			

31462 EXAMPLES

31463 Directing Standard Output to a File

31464 The following example logs all standard output to the */tmp/logfile* file.

```
31465 #include <stdio.h>
31466 ...
31467 FILE *fp;
31468 ...
31469 fp = freopen ("/tmp/logfile", "a+", stdout);
31470 ...
```

31471 APPLICATION USAGE

31472 The *freopen()* function is typically used to attach the pre-opened *streams* associated with *stdin*,
31473 *stdout*, and *stderr* to other files.

31474 Since implementations are not required to support any stream mode changes when the *pathname*
31475 argument is NULL, portable applications cannot rely on the use of *freopen()* to change the stream
31476 mode, and use of this feature is discouraged. The feature was originally added to the ISO C
31477 standard in order to facilitate changing *stdin* and *stdout* to binary mode. Since a 'b' character in
31478 the mode has no effect on POSIX systems, this use of the feature is unnecessary in POSIX
31479 applications. However, even though the 'b' is ignored, a successful call to *freopen*(NULL, "wb",
31480 *stdout*) does have an effect. In particular, for regular files it truncates the file and sets the file-
31481 position indicator for the stream to the start of the file. It is possible that these side-effects are an
31482 unintended consequence of the way the feature is specified in the ISO/IEC 9899:1999 standard,
31483 but unless or until the ISO C standard is changed, applications which successfully call
31484 *freopen*(NULL, "wb", *stdout*) will behave in unexpected ways on conforming systems in situations
31485 such as:

```
31486 { appl file1; appl file2; } > file3
```

31487 which will result in *file3* containing only the output from the second invocation of *appl*.

31488 RATIONALE

31489 None.

31490 FUTURE DIRECTIONS

31491 None.

XBD <stdio.h>

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated to indicate that the orientation of the stream is cleared and the conversion state of the stream is set to an initial conversion state by a successful call to the *freopen()* function.

Large File Summit extensions are added.

Issue 6

Extensions beyond the ISO C standard are marked.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In the DESCRIPTION, text is added to indicate setting of the offset maximum in the open file description. This change is to support large files.
- In the ERRORS section, the [Eoverflow] condition is added. This change is to support large files.
- The [ELOOP] mandatory error condition is added.
- A second [ENAMETOOLONG] is added as an optional error condition.
- The [EINVAL], [ENOMEM], [ENXIO], and [ETXTBSY] optional error conditions are added.

The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- The *freopen()* prototype is updated.
- The DESCRIPTION is updated.

The wording of the mandatory [ELOOP] error condition is updated, and a second optional [ELOOP] error condition is added.

The DESCRIPTION is updated regarding failure to close, changing the “file” to “file descriptor”.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/40 is applied, adding the following sentence to the DESCRIPTION: “In this case, the file descriptor associated with the stream need not be closed if the call to *freopen()* succeeds.”.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/41 is applied, adding an mandatory [EBADF] error, and an optional [EBADF] error to the ERRORS section.

Issue 7

Austin Group Interpretation 1003.1-2001 #043 is applied, clarifying that the *freopen()* function allocates a file descriptor as per *open()*.

Austin Group Interpretation 1003.1-2001 #143 is applied.

Austin Group Interpretation 1003.1-2001 #159 is applied, clarifying requirements for the flags set on the open file description.

SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.

31532	SD5-XSH-ERN-150 and SD5-XSH-ERN-219 are applied.
31533	POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0181 [291,433], XSH/TC1-2008/0182 +
31534	[146,433], XSH/TC1-2008/0183 [324], and XSH/TC1-2008/0184 [14] are applied.

31535 **NAME**

31536 frexp, frexpf, frexpl — extract mantissa and exponent from a double precision number

31537 **SYNOPSIS**

```
31538 #include <math.h>
31539 double frexp(double num, int *exp);
31540 float frexpf(float num, int *exp);
31541 long double frexpl(long double num, int *exp);
```

31542 **DESCRIPTION**

31543 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 31544 conflict between the requirements described here and the ISO C standard is unintentional. This
 31545 volume of POSIX.1-2008 defers to the ISO C standard.

31546 These functions shall break a floating-point number *num* into a normalized fraction and an
 31547 integral power of 2. The integer exponent shall be stored in the **int** object pointed to by *exp*.

31548 **RETURN VALUE**

31549 For finite arguments, these functions shall return the value *x*, such that *x* has a magnitude in the
 31550 interval $[\frac{1}{2}, 1)$ or 0, and *num* equals *x* times 2 raised to the power **exp*.

31551 MX If *num* is NaN, a NaN shall be returned, and the value of **exp* is unspecified.

31552 If *num* is ± 0 , ± 0 shall be returned, and the value of **exp* shall be 0.

31553 If *num* is $\pm \text{Inf}$, *num* shall be returned, and the value of **exp* is unspecified.

31554 **ERRORS**

31555 No errors are defined.

31556 **EXAMPLES**

31557 None.

31558 **APPLICATION USAGE**

31559 None.

31560 **RATIONALE**

31561 None.

31562 **FUTURE DIRECTIONS**

31563 None.

31564 **SEE ALSO**

31565 *isnan()*, *ldexp()*, *modf()*

31566 XBD **<math.h>**

31567 **CHANGE HISTORY**

31568 First released in Issue 1. Derived from Issue 1 of the SVID.

31569 **Issue 5**

31570 The DESCRIPTION is updated to indicate how an application should check for an error. This
 31571 text was previously published in the APPLICATION USAGE section.

31572 **Issue 6**

31573 The *frexpf()* and *frexpl()* functions are added for alignment with the ISO/IEC 9899:1999
31574 standard.

31575 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are
31576 revised to align with the ISO/IEC 9899:1999 standard.

31577 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are
31578 marked.

31579 **NAME**

31580 fscanf, scanf, sscanf — convert formatted input

31581 **SYNOPSIS**

31582 #include <stdio.h>

31583 int fscanf(FILE *restrict *stream*, const char *restrict *format*, ...);31584 int scanf(const char *restrict *format*, ...);31585 int sscanf(const char *restrict *s*, const char *restrict *format*, ...);31586 **DESCRIPTION**

31587 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 31588 conflict between the requirements described here and the ISO C standard is unintentional. This
 31589 volume of POSIX.1-2008 defers to the ISO C standard.

31590 The *fscanf()* function shall read from the named input *stream*. The *scanf()* function shall read
 31591 from the standard input stream *stdin*. The *sscanf()* function shall read from the string *s*. Each
 31592 function reads bytes, interprets them according to a format, and stores the results in its
 31593 arguments. Each expects, as arguments, a control string *format* described below, and a set of
 31594 *pointer* arguments indicating where the converted input should be stored. The result is
 31595 undefined if there are insufficient arguments for the format. If the format is exhausted while
 31596 arguments remain, the excess arguments shall be evaluated but otherwise ignored.

31597 CX Conversions can be applied to the *n*th argument after the *format* in the argument list, rather than
 31598 to the next unused argument. In this case, the conversion specifier character % (see below) is
 31599 replaced by the sequence "%*n*\$", where *n* is a decimal integer in the range [1,{NL_ARGMAX}].
 31600 This feature provides for the definition of format strings that select arguments in an order
 31601 appropriate to specific languages. In format strings containing the "%*n*\$" form of conversion
 31602 specifications, it is unspecified whether numbered arguments in the argument list can be
 31603 referenced from the format string more than once.

31604 The *format* can contain either form of a conversion specification—that is, % or "%*n*\$"—but the
 31605 two forms cannot be mixed within a single *format* string. The only exception to this is that %% or
 31606 %* can be mixed with the "%*n*\$" form. When numbered argument specifications are used,
 31607 specifying the *N*th argument requires that all the leading arguments, from the first to the
 31608 (*N*–1)th, are pointers.

31609 The *fscanf()* function in all its forms shall allow detection of a language-dependent radix
 31610 character in the input string. The radix character is defined in the current locale (category
 31611 LC_NUMERIC). In the POSIX locale, or in a locale where the radix character is not defined, the
 31612 radix character shall default to a <period> ('.').

31613 The format is a character string, beginning and ending in its initial shift state, if any, composed
 31614 of zero or more directives. Each directive is composed of one of the following: one or more
 31615 white-space characters (<space>, <tab>, <newline>, <vertical-tab>, or <form-feed>); an ordinary
 31616 character (neither '%' nor a white-space character); or a conversion specification. Each
 31617 CX conversion specification is introduced by the character '%' or the character sequence "%*n*\$",
 31618 after which the following appear in sequence:

- 31619 • An optional assignment-suppressing character '*'.
- 31620 • An optional non-zero decimal integer that specifies the maximum field width.
- 31621 CX • An optional assignment-allocation character 'm'.
- 31622 • An option length modifier that specifies the size of the receiving object.

- A *conversion specifier* character that specifies the type of conversion to be applied. The valid conversion specifiers are described below.

The *fscanf()* functions shall execute each directive of the format in turn. If a directive fails, as detailed below, the function shall return. Failures are described as input failures (due to the unavailability of input bytes) or matching failures (due to inappropriate input).

A directive composed of one or more white-space characters shall be executed by reading input until no more valid input can be read, or up to the first byte which is not a white-space character, which remains unread.

A directive that is an ordinary character shall be executed as follows: the next byte shall be read from the input and compared with the byte that comprises the directive; if the comparison shows that they are not equivalent, the directive shall fail, and the differing and subsequent bytes shall remain unread. Similarly, if end-of-file, an encoding error, or a read error prevents a character from being read, the directive shall fail.

A directive that is a conversion specification defines a set of matching input sequences, as described below for each conversion character. A conversion specification shall be executed in the following steps.

Input white-space characters (as specified by *isspace()*) shall be skipped, unless the conversion specification includes a *[], c, C, or n* conversion specifier.

An item shall be read from the input, unless the conversion specification includes an *n* conversion specifier. An input item shall be defined as the longest sequence of input bytes (up to any specified maximum field width, which may be measured in characters or bytes dependent on the conversion specifier) which is an initial subsequence of a matching sequence. The first byte, if any, after the input item shall remain unread. If the length of the input item is 0, the execution of the conversion specification shall fail; this condition is a matching failure, unless end-of-file, an encoding error, or a read error prevented input from the stream, in which case it is an input failure.

Except in the case of a *%* conversion specifier, the input item (or, in the case of a *%n* conversion specification, the count of input bytes) shall be converted to a type appropriate to the conversion character. If the input item is not a matching sequence, the execution of the conversion specification fails; this condition is a matching failure. Unless assignment suppression was indicated by a *'*'*, the result of the conversion shall be placed in the object pointed to by the first argument following the *format* argument that has not already received a conversion result if the conversion specification is introduced by *%*, or in the *n*th argument if introduced by the character sequence *"%n\$"*. If this object does not have an appropriate type, or if the result of the conversion cannot be represented in the space provided, the behavior is undefined.

The *%c*, *%s*, and *[%* conversion specifiers shall accept an optional assignment-allocation character *'m'*, which shall cause a memory buffer to be allocated to hold the string converted including a terminating null character. In such a case, the argument corresponding to the conversion specifier should be a reference to a pointer variable that will receive a pointer to the allocated buffer. The system shall allocate a buffer as if *malloc()* had been called. The application shall be responsible for freeing the memory after usage. If there is insufficient memory to allocate a buffer, the function shall set *errno* to [ENOMEM] and a conversion error shall result. If the function returns EOF, any memory successfully allocated for parameters using assignment-allocation character *'m'* by this call shall be freed before the function returns.

31667	The length modifiers and their meanings are:	
31668	hh	Specifies that a following d, i, o, u, x, X, or n conversion specifier applies to an argument with type pointer to signed char or unsigned char .
31669		
31670	h	Specifies that a following d, i, o, u, x, X, or n conversion specifier applies to an argument with type pointer to short or unsigned short .
31671
