DESCRIPTION

The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

These functions shall be equivalent to the *strtol()*, *strtoll()*, *strtoul()*, and *strtoull()* functions, except that the initial portion of the string shall be converted to **intmax_t** and **uintmax_t** representation, respectively.

RETURN VALUE

These functions shall return the converted value, if any.

If no conversion could be performed, zero shall be returned and *errno* may be set to [EINVAL].

If the value of *base* is not supported, 0 shall be returned and *errno* shall be set to [EINVAL].

If the correct value is outside the range of representable values, {INTMAX_MAX}, {INTMAX_MIN}, or {UINTMAX_MAX} shall be returned (according to the return type and sign of the value, if any), and *errno* shall be set to [ERANGE].

ERRORS

These functions shall fail if:

[EINVAL] The value of *base* is not supported.

[ERANGE] The value to be returned is not representable.

These functions may fail if:

[EINVAL] No conversion could be performed.

EXAMPLES

None.

APPLICATION USAGE

Since the value of **endptr* is unspecified if the value of *base* is not supported, applications should either ensure that *base* has a supported value (0 or between 2 and 36) before the call, or check for an [EINVAL] error before examining **endptr*.

RATIONALE

None.

FUTURE DIRECTIONS

None.

65682
65683 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0613 [453] and XSH/TC1-2008/0614 +
65684 [453] are applied.

65685 NAME

65686 strtok, strtok_r — split string into tokens

65687 SYNOPSIS

```
65688        #include <string.h>
65689        char *strtok(char *restrict s1, const char *restrict s2);
65690 CX       char *strtok_r(char *restrict s, const char *restrict sep,
65691                        char **restrict lasts);
```

65692 DESCRIPTION

65693 CX For *strtok()*: The functionality described on this reference page is aligned with the ISO C
65694 standard. Any conflict between the requirements described here and the ISO C standard is
65695 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

65696 A sequence of calls to *strtok()* breaks the string pointed to by *s1* into a sequence of tokens, each
65697 of which is delimited by a byte from the string pointed to by *s2*. The first call in the sequence
65698 has *s1* as its first argument, and is followed by calls with a null pointer as their first argument.
65699 The separator string pointed to by *s2* may be different from call to call.

65700 The first call in the sequence searches the string pointed to by *s1* for the first byte that is *not*
65701 contained in the current separator string pointed to by *s2*. If no such byte is found, then there
65702 are no tokens in the string pointed to by *s1* and *strtok()* shall return a null pointer. If such a byte
65703 is found, it is the start of the first token.

65704 The *strtok()* function then searches from there for a byte that *is* contained in the current separator
65705 string. If no such byte is found, the current token extends to the end of the string pointed to by
65706 *s1*, and subsequent searches for a token shall return a null pointer. If such a byte is found, it is
65707 overwritten by a NUL character, which terminates the current token. The *strtok()* function saves
65708 a pointer to the following byte, from which the next search for a token shall start.

65709 Each subsequent call, with a null pointer as the value of the first argument, starts searching from
65710 the saved pointer and behaves as described above.

65711 The implementation shall behave as if no function defined in this volume of POSIX.1-2008 calls
65712 *strtok()*.

65713 CX The *strtok()* function need not be thread-safe.

65714 The *strtok_r()* function considers the null-terminated string *s* as a sequence of zero or more text
65715 tokens separated by spans of one or more characters from the separator string *sep*. The
65716 argument *lasts* points to a user-provided pointer which points to stored information necessary
65717 for *strtok_r()* to continue scanning the same string.

65718 In the first call to *strtok_r()*, *s* points to a null-terminated string, *sep* to a null-terminated string of
65719 separator characters, and the value pointed to by *lasts* is ignored. The *strtok_r()* function shall
65720 return a pointer to the first character of the first token, write a null character into *s* immediately
65721 following the returned token, and update the pointer to which *lasts* points.

65722 In subsequent calls, *s* is a null pointer and *lasts* shall be unchanged from the previous call so that
65723 subsequent calls shall move through the string *s*, returning successive tokens until no tokens
65724 remain. The separator string *sep* may be different from call to call. When no token remains in *s*, a
65725 null pointer shall be returned.

65726 **RETURN VALUE**

65727 Upon successful completion, *strtok()* shall return a pointer to the first byte of a token. Otherwise,
 65728 if there is no token, *strtok()* shall return a null pointer.

65729 CX The *strtok_r()* function shall return a pointer to the token found, or a null pointer when no token
 65730 is found.

65731 **ERRORS**

65732 No errors are defined.

65733 **EXAMPLES**65734 **Searching for Word Separators**

65735 The following example searches for tokens separated by <space> characters.

```
65736 #include <string.h>
65737 ...
65738 char *token;
65739 char line[] = "LINE TO BE SEPARATED";
65740 char *search = " ";

65741 /* Token will point to "LINE". */
65742 token = strtok(line, search);

65743 /* Token will point to "TO". */
65744 token = strtok(NULL, search);
```

65745 **Find First two Fields in a Buffer**

65746 The following example uses *strtok()* to find two character strings (a key and data associated with
 65747 that key) separated by any combination of <space>, <tab>, or <newline> characters at the start
 65748 of the array of characters pointed to by *buffer*.

```
65749 #include <string.h>
65750 ...
65751 char    *buffer;
65752 ...
65753 struct element {
65754     char *key;
65755     char *data;
65756 } e;
65757 ...
65758 // Load the buffer...
65759 ...
65760 // Get the key and its data...
65761 e.key = strtok(buffer, " \t\n");
65762 e.data = strtok(NULL, " \t\n");
65763 // Process the rest of the contents of the buffer...
65764 ...
```

65765 **APPLICATION USAGE**

65766 The *strtok_r()* function is thread-safe and stores its state in a user-supplied buffer instead of
 65767 possibly using a static data area that may be overwritten by an unrelated call from another
 65768 thread.

RATIONALE

The *strtok()* function searches for a separator string within a larger string. It returns a pointer to the last substring between separator strings. This function uses static storage to keep track of the current string position between calls. The new function, *strtok_r()*, takes an additional argument, *lasts*, to keep track of the current position in the string.

FUTURE DIRECTIONS

None.

XBD [<string.h>](#)

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The *strtok_r()* function is included for alignment with the POSIX Threads Extension.

A note indicating that the *strtok()* function need not be reentrant is added to the DESCRIPTION.

Issue 6

Extensions beyond the ISO C standard are marked.

The *strtok_r()* function is marked as part of the Thread-Safe Functions option.

In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

The APPLICATION USAGE section is updated to include a note on the thread-safe function and its avoidance of possibly using a static data area.

The **restrict** keyword is added to the *strtok()* and *strtok_r()* prototypes for alignment with the ISO/IEC 9899:1999 standard.

Issue 7

Austin Group Interpretation 1003.1-2001 #156 is applied.

SD5-XSH-ERN-235 is applied, correcting an example.

The *strtok_r()* function is moved from the Thread-Safe Functions option to the Base.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0615 [177] is applied.

+

65796 NAME

65797 strtol, strtoll — convert a string to a long integer

65798 SYNOPSIS

65799 #include <stdlib.h>

65800 long strtol(const char *restrict str, char **restrict endptr, int base);

65801 long long strtoll(const char *restrict str, char **restrict endptr,

65802 int base)

65803 DESCRIPTION

65804 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 65805 conflict between the requirements described here and the ISO C standard is unintentional. This
 65806 volume of POSIX.1-2008 defers to the ISO C standard.

65807 These functions shall convert the initial portion of the string pointed to by *str* to a type **long** and
 65808 **long long** representation, respectively. First, they decompose the input string into three parts:

- 65809 1. An initial, possibly empty, sequence of white-space characters (as specified by *isspace()*)
- 65810 2. A subject sequence interpreted as an integer represented in some radix determined by the
 65811 value of *base*
- 65812 3. A final string of one or more unrecognized characters, including the terminating NUL
 65813 character of the input string.

65814 Then they shall attempt to convert the subject sequence to an integer, and return the result.

65815 If the value of *base* is 0, the expected form of the subject sequence is that of a decimal constant,
 65816 octal constant, or hexadecimal constant, any of which may be preceded by a '+' or '-' sign. A
 65817 decimal constant begins with a non-zero digit, and consists of a sequence of decimal digits. An
 65818 octal constant consists of the prefix '0' optionally followed by a sequence of the digits '0' to
 65819 '7' only. A hexadecimal constant consists of the prefix 0x or 0X followed by a sequence of the
 65820 decimal digits and letters 'a' (or 'A') to 'f' (or 'F') with values 10 to 15 respectively.

65821 If the value of *base* is between 2 and 36, the expected form of the subject sequence is a sequence
 65822 of letters and digits representing an integer with the radix specified by *base*, optionally preceded
 65823 by a '+' or '-' sign. The letters from 'a' (or 'A') to 'z' (or 'Z') inclusive are ascribed the
 65824 values 10 to 35; only letters whose ascribed values are less than that of *base* are permitted. If the
 65825 value of *base* is 16, the characters 0x or 0X may optionally precede the sequence of letters and
 65826 digits, following the sign if present.

65827 The subject sequence is defined as the longest initial subsequence of the input string, starting
 65828 with the first non-white-space character that is of the expected form. The subject sequence shall
 65829 contain no characters if the input string is empty or consists entirely of white-space characters,
 65830 or if the first non-white-space character is other than a sign or a permissible letter or digit.

65831 If the subject sequence has the expected form and the value of *base* is 0, the sequence of
 65832 characters starting with the first digit shall be interpreted as an integer constant. If the subject
 65833 sequence has the expected form and the value of *base* is between 2 and 36, it shall be used as the
 65834 base for conversion, ascribing to each letter its value as given above. If the subject sequence
 65835 begins with a minus-sign, the value resulting from the conversion shall be negated. A pointer to
 65836 the final string shall be stored in the object pointed to by *endptr*, provided that *endptr* is not a null
 65837 pointer.

65838 CX In other than the C or POSIX locales, other implementation-defined subject sequences may be
 65839 accepted.

65840 If the subject sequence is empty or does not have the expected form, no conversion is performed;

65841		the value of <i>str</i> shall be stored in the object pointed to by <i>endptr</i> , provided that <i>endptr</i> is not a	
65842		null pointer.	
65843		These functions shall not change the setting of <i>errno</i> if successful.	
65844		Since 0, {LONG_MIN} or {LLONG_MIN}, and {LONG_MAX} or {LLONG_MAX} are returned	
65845		on error and are also valid returns on success, an application wishing to check for error	
65846		situations should set <i>errno</i> to 0, then call <i>strtol()</i> or <i>strtoll()</i> , then check <i>errno</i> .	-
65847		RETURN VALUE	
65848		Upon successful completion, these functions shall return the converted value, if any. If no	
65849	CX	conversion could be performed, 0 shall be returned and <i>errno</i> may be set to [EINVAL].	
65850	CX	If the value of <i>base</i> is not supported, 0 shall be returned and <i>errno</i> shall be set to [EINVAL].	+
65851		If the correct value is outside the range of representable values, {LONG_MIN}, {LONG_MAX},	
65852		{LLONG_MIN}, or {LLONG_MAX} shall be returned (according to the sign of the value), and	
65853		<i>errno</i> set to [ERANGE].	
65854		ERRORS	
65855		These functions shall fail if:	
65856	CX	[EINVAL] The value of <i>base</i> is not supported.	-
65857		[ERANGE] The value to be returned is not representable.	+
65858		These functions may fail if:	+
65859		[EINVAL] No conversion could be performed.	
65860		EXAMPLES	
65861		None.	
65862		APPLICATION USAGE	
65863		Since the value of <i>*endptr</i> is unspecified if the value of <i>base</i> is not supported, applications should	
65864		either ensure that <i>base</i> has a supported value (0 or between 2 and 36) before the call, or check for	
65865		an [EINVAL] error before examining <i>*endptr</i> .

65900 #include <stdlib.h>

```
65901        long long strtoll(const char *restrict str, char **restrict endptr,
65902                          int base);
```

65903 **DESCRIPTION**65904 Refer to *strtol()*.

NAME

strtol, strtoull — convert a string to an unsigned long

SYNOPSIS

```
#include <stdlib.h>

unsigned long strtol(const char *restrict str,
    char **restrict endptr, int base);
unsigned long long strtoull(const char *restrict str,
    char **restrict endptr, int base);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

These functions shall convert the initial portion of the string pointed to by *str* to a type **unsigned long** and **unsigned long long** representation, respectively. First, they decompose the input string into three parts:

1. An initial, possibly empty, sequence of white-space characters (as specified by *isspace()*)
2. A subject sequence interpreted as an integer represented in some radix determined by the value of *base*
3. A final string of one or more unrecognized characters, including the terminating NUL character of the input string

Then they shall attempt to convert the subject sequence to an unsigned integer, and return the result.

If the value of *base* is 0, the expected form of the subject sequence is that of a decimal constant, octal constant, or hexadecimal constant, any of which may be preceded by a '+' or '-' sign. A decimal constant begins with a non-zero digit, and consists of a sequence of decimal digits. An octal constant consists of the prefix '0' optionally followed by a sequence of the digits '0' to '7' only. A hexadecimal constant consists of the prefix 0x or 0X followed by a sequence of the decimal digits and letters 'a' (or 'A') to 'f' (or 'F') with values 10 to 15 respectively.

If the value of *base* is between 2 and 36, the expected form of the subject sequence is a sequence of letters and digits representing an integer with the radix specified by *base*, optionally preceded by a '+' or '-' sign. The letters from 'a' (or 'A') to 'z' (or 'Z') inclusive are ascribed the values 10 to 35; only letters whose ascribed values are less than that of *base* are permitted. If the value of *base* is 16, the characters 0x or 0X may optionally precede the sequence of letters and digits, following the sign if present.

The subject sequence is defined as the longest initial subsequence of the input string, starting with the first non-white-space character that is of the expected form. The subject sequence shall contain no characters if the input string is empty or consists entirely of white-space characters, or if the first non-white-space character is other than a sign or a permissible letter or digit.

If the subject sequence has the expected form and the value of *base* is 0, the sequence of characters starting with the first digit shall be interpreted as an integer constant. If the subject sequence has the expected form and the value of *base* is between 2 and 36, it shall be used as the base for conversion, ascribing to each letter its value as given above. If the subject sequence begins with a minus-sign, the value resulting from the conversion shall be negated. A pointer to the final string shall be stored in the object pointed to by *endptr*, provided that *endptr* is not a null pointer.

65950 CX In other than the C or POSIX locales, other implementation-defined subject sequences may be
65951 accepted.

65952 If the subject sequence is empty or does not have the expected form, no conversion shall be
65953 performed; the value of *str* shall be stored in the object pointed to by *endptr*, provided that *endptr*
65954 is not a null pointer.

65955 These functions shall not change the setting of *errno* if successful. |

65956 Since 0, {ULONG_MAX}, and {ULLONG_MAX} are returned on error and are also valid returns
65957 on success, an application wishing to check for error situations should set *errno* to 0, then call
65958 *strtoul()* or *strtoull()*, then check *errno*. -

65959 RETURN VALUE

65960 Upon successful completion, these functions shall return the converted value, if any. If no
65961 CX conversion could be performed, 0 shall be returned and *errno* may be set to [EINVAL].

65962 CX If the value of *base* is not supported, 0 shall be returned and *errno* shall be set to [EINVAL]. +

65963 If the correct value is outside the range of representable values, {ULONG_MAX} or
65964 {ULLONG_MAX} shall be returned and *errno* set to [ERANGE].

65965 ERRORS

65966 These functions shall fail if:

65967 CX [EINVAL] The value of *base* is not supported.

65968 [ERANGE] The value to be returned is not representable.

65969 These functions may fail if:

65970 CX [EINVAL] No conversion could be performed.

65971 EXAMPLES

65972 None.

65973 APPLICATION USAGE

65974 Since the value of **endptr* is unspecified if the value of *base* is not supported, applications should |
65975 either ensure that *base* has a supported value (0 or between 2 and 36) before the call, or check for |
65976 an [EINVAL] error before examining **endptr*.

65977 RATIONALE

65978 None.

65979 FUTURE DIRECTIONS

65980 None.

65984 CHANGE HISTORY

65985 First released in Issue 4. Derived from the ANSI C standard.

65986 Issue 5

65987 The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.

65988 **Issue 6**

65989 Extensions beyond the ISO C standard are marked.

65990 The following new requirements on POSIX implementations derive from alignment with the
65991 Single UNIX Specification:

- 65992 • The [EINVAL] error condition is added for when the value of *base* is not supported.
- 65993 • In the RETURN VALUE and ERRORS sections, the [EINVAL] optional error condition is
65994 added if no conversion could be performed.

65995 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- 65996 • The *strtoul()* prototype is updated.
- 65997 • The *strtoull()* function is added.

65998 **Issue 7**

65999 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0621 [105], XSH/TC1-2008/0622 [453], +
66000 and XSH/TC1-2008/0623 [453] are applied.

66001 **NAME**

66002 strtoumax — convert a string to an integer type

66003 **SYNOPSIS**

66004 #include <inttypes.h>

```
66005       uintmax_t strtoumax(const char *restrict nptr, char **restrict endptr,
66006                           int base);
```

66007 **DESCRIPTION**66008 Refer to *strtoimax()*.

66009 **NAME**

66010 strxfrm, strxfrm_l — string transformation

66011 **SYNOPSIS**

```
66012 #include <string.h>
66013 size_t strxfrm(char *restrict s1, const char *restrict s2, size_t n);
66014 CX size_t strxfrm_l(char *restrict s1, const char *restrict s2,
66015 size_t n, locale_t locale);
```

66016 **DESCRIPTION**

66017 CX For *strxfrm()*: The functionality described on this reference page is aligned with the ISO C
 66018 standard. Any conflict between the requirements described here and the ISO C standard is
 66019 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

66020 CX The *strxfrm()* and *strxfrm_l()* functions shall transform the string pointed to by *s2* and place the
 66021 resulting string into the array pointed to by *s1*. The transformation is such that if *strcmp()* is
 66022 applied to two transformed strings, it shall return a value greater than, equal to, or less than 0,
 66023 CX corresponding to the result of *strcoll()* or *strcoll_l()*, respectively, applied to the same two
 66024 CX original strings with the same locale. No more than *n* bytes are placed into the resulting array
 66025 pointed to by *s1*, including the terminating NUL character. If *n* is 0, *s1* is permitted to be a null
 66026 pointer. If copying takes place between objects that overlap, the behavior is undefined.

66027 CX The *strxfrm()* and *strxfrm_l()* functions shall not change the setting of *errno* if successful.

66028 Since no return value is reserved to indicate an error, an application wishing to check for error
 66029 CX situations should set *errno* to 0, then call *strxfrm()* or *strxfrm_l()*, then check *errno*.

66030 CX The behavior is undefined if the *locale* argument to *strxfrm_l()* is the special locale object +
 66031 LC_GLOBAL_LOCALE or is not a valid locale object handle.

66032 **RETURN VALUE**

66033 CX Upon successful completion, *strxfrm()* and *strxfrm_l()* shall return the length of the
 66034 transformed string (not including the terminating NUL character). If the value returned is *n* or
 66035 more, the contents of the array pointed to by *s1* are unspecified.

66036 CX On error, *strxfrm()* and *strxfrm_l()* may set *errno* but no return value is reserved to indicate an
 66037 error.

66038 **ERRORS**

66039 These functions may fail if:

66040 CX [EINVAL] The string pointed to by the *s2* argument contains characters outside the
 66041 domain of the collating sequence.

66042 **EXAMPLES**

66043 None.

66044 **APPLICATION USAGE**

66045 The transformation function is such that two transformed strings can be ordered by *strcmp()* as
 66046 appropriate to collating sequence information in the current locale (category *LC_COLLATE*). |

66047 The fact that when *n* is 0 *s1* is permitted to be a null pointer is useful to determine the size of the
 66048 *s1* array prior to making the transformation.

66049 **RATIONALE**

66050 None.

66051 **FUTURE DIRECTIONS**

66052 None.

66053 **SEE ALSO**66054 *strcmp()*, *strcoll()*

66055 XBD <string.h>

66056 **CHANGE HISTORY**

66057 First released in Issue 3. Included for alignment with the ISO C standard.

66058 **Issue 5**66059 The DESCRIPTION is updated to indicate that *errno* does not change if the function is successful.66060 **Issue 6**

66061 Extensions beyond the ISO C standard are marked.

66062 The following new requirements on POSIX implementations derive from alignment with the
66063 Single UNIX Specification:

- 66064 • In the RETURN VALUE and ERRORS sections, the [EINVAL] optional error condition is
66065 added if no conversion could be performed.

66066 The *strxfrm()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.66067 **Issue 7**66068 The *strxfrm_l()* function is added from The Open Group Technical Standard, 2006, Extended API
66069 Set Part 4.66070 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0624 [283], XSH/TC1-2008/0625 [283], +
66071 and XSH/TC1-2008/0626 [302] are applied.

66072 **NAME**

66073 swab — swap bytes

66074 **SYNOPSIS**

```
66075 XSI      #include <unistd.h>
66076          void swab(const void *restrict src, void *restrict dest,
66077                   ssize_t nbytes);
```

66078 **DESCRIPTION**

66079 The *swab()* function shall copy *nbytes* bytes, which are pointed to by *src*, to the object pointed to
66080 by *dest*, exchanging adjacent bytes. The *nbytes* argument should be even. If *nbytes* is odd, *swab()*
66081 copies and exchanges *nbytes*–1 bytes and the disposition of the last byte is unspecified. If
66082 copying takes place between objects that overlap, the behavior is undefined. If *nbytes* is
66083 negative, *swab()* does nothing.

66084 **RETURN VALUE**

66085 None.

66086 **ERRORS**

66087 No errors are defined.

66088 **EXAMPLES**

66089 None.

66090 **APPLICATION USAGE**

66091 None.

66092 **RATIONALE**

66093 None.

66094 **FUTURE DIRECTIONS**

66095 None.

66096 **SEE ALSO**66097 XBD [<unistd.h>](#)66098 **CHANGE HISTORY**

66099 First released in Issue 1. Derived from Issue 1 of the SVID.

66100 **Issue 6**

66101 The **restrict** keyword is added to the *swab()* prototype for alignment with the
66102 ISO/IEC 9899:1999 standard.

66103 **NAME**

66104 swprintf — print formatted wide-character output

66105 **SYNOPSIS**

66106 #include <stdio.h>

66107 #include <wchar.h>

66108 int swprintf(wchar_t *restrict *ws*, size_t *n*,66109 const wchar_t *restrict *format*, ...);66110 **DESCRIPTION**66111 Refer to *fwprintf()*.

66112 **NAME**

66113 swscanf — convert formatted wide-character input

66114 **SYNOPSIS**

66115 #include <stdio.h>

66116 #include <wchar.h>

```
66117       int swscanf(const wchar_t *restrict ws,  
66118                   const wchar_t *restrict format, ...);
```

66119 **DESCRIPTION**66120 Refer to *fwscanf()*.

66121 **NAME**66122 `symlink`, `symlinkat` — make a symbolic link relative to directory file descriptor66123 **SYNOPSIS**66124 `#include <unistd.h>`66125 `int symlink(const char *path1, const char *path2);`66126 `int symlinkat(const char *path1, int fd, const char *path2);`66127 **DESCRIPTION**66128 The `symlink()` function shall create a symbolic link called *path2* that contains the string pointed to
66129 by *path1* (*path2* is the name of the symbolic link created, *path1* is the string contained in the
66130 symbolic link).66131 The string pointed to by *path1* shall be treated only as a character string and shall not be
66132 validated as a pathname.66133 If the `symlink()` function fails for any reason other than [EIO], any file named by *path2* shall be
66134 unaffected.66135 If *path2* names a symbolic link, `symlink()` shall fail and set *errno* to [EEXIST].

+

66136 The symbolic link's user ID shall be set to the process' effective user ID. The symbolic link's
66137 group ID shall be set to the group ID of the parent directory or to the effective group ID of the
66138 process. Implementations shall provide a way to initialize the symbolic link's group ID to the
66139 group ID of the parent directory. Implementations may, but need not, provide an
66140 implementation-defined way to initialize the symbolic link's group ID to the effective group ID
66141 of the calling process.66142 The values of the file mode bits for the created symbolic link are unspecified. All interfaces
66143 specified by POSIX.1-2008 shall behave as if the contents of symbolic links can always be read,
66144 except that the value of the file mode bits returned in the *st_mode* field of the **stat** structure is
66145 unspecified.66146 Upon successful completion, `symlink()` shall mark for update the last data access, last data
66147 modification, and last file status change timestamps of the symbolic link. Also, the last data
66148 modification and last file status change timestamps of the directory that contains the new entry
66149 shall be marked for update.66150 The `symlinkat()` function shall be equivalent to the `symlink()` function except in the case where
66151 *path2* specifies a relative path. In this case the symbolic link is created relative to the directory
66152 associated with the file descriptor *fd* instead of the current working directory. If the file
66153 descriptor was opened without O_SEARCH, the function shall check whether directory searches
66154 are permitted using the current permissions of the directory underlying the file descriptor. If the
66155 file descriptor was opened with O_SEARCH, the function shall not perform the check.66156 If `symlinkat()` is passed the special value AT_FDCWD in the *fd* parameter, the current working
66157 directory shall be used and the behavior shall be identical to a call to `symlink()`.

|

66158 **RETURN VALUE**66159 Upon successful completion, these functions shall return 0. Otherwise, these functions shall
66160 return -1 and set *errno* to indicate the error.66161 **ERRORS**

66162 These functions shall fail if:

66163 [EACCES] Write permission is denied in the directory where the symbolic link is being
66164 created, or search permission is denied for a component of the path prefix of
66165 *path2*.

66166	[EEXIST]	The <i>path2</i> argument names an existing file.	
66167	[EIO]	An I/O error occurs while reading from or writing to the file system.	
66168	[ELOOP]	A loop exists in symbolic links encountered during resolution of the <i>path2</i> argument.	
66169			
66170	[ENAMETOOLONG]		
66171		The length of a component of the pathname specified by the <i>path2</i> argument is longer than {NAME_MAX} or the length of the <i>path1</i> argument is longer than {SYMLINK_MAX}.	
66172			
66173			
66174	[ENOENT]	A component of the path prefix of <i>path2</i> does not name an existing file or <i>path2</i> is an empty string.	
66175			
66176	[ENOSPC]	The directory in which the entry for the new symbolic link is being placed cannot be extended because no space is left on the file system containing the directory, or the new symbolic link cannot be created because no space is left on the file system which shall contain the link, or the file system is out of file-allocation resources.	
66177			
66178			
66179			
66180			
66181	[ENOTDIR]	A component of the path prefix of <i>path2</i> names an existing file that is neither a directory nor a symbolic link to a directory.	
66182			
66183	[EROFS]	The new symbolic link would reside on a read-only file system.	
66184		The <i>symlinkat</i> () function shall fail if:	
66185	[EACCES]	<i>fd</i> was not opened with O_SEARCH and the permissions of the directory underlying <i>fd</i> do not permit directory searches.	
66186			
66187	[EBADF]	The <i>path2</i> argument does not specify an absolute path and the <i>fd</i> argument is neither AT_FDCWD nor a valid file descriptor open for reading or searching.	
66188			
66189	[ENOTDIR]	The <i>path2</i> argument is not an absolute path and <i>fd</i> is a file descriptor associated with a non-directory file.	+
66190			
66191		These functions may fail if:	
66192	[ELOOP]	More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the <i>path2</i> argument.	
66193			
66194	[ENAMETOOLONG]		
66195		The length of the <i>path2</i> argument exceeds {PATH_MAX} or pathname resolution of a symbolic link in the <i>path2</i> argument produced an intermediate result with a length that exceeds {PATH_MAX}.	
66196			
66197			

EXAMPLES

None.

APPLICATION USAGE

Like a hard link, a symbolic link allows a file to have multiple logical names. The presence of a hard link guarantees the existence of a file, even after the original name has been removed. A symbolic link provides no such assurance; in fact, the file named by the *path1* argument need not exist when the link is created. A symbolic link can cross file system boundaries.

Normal permission checks are made on each component of the symbolic link pathname during its resolution.

RATIONALE

The purpose of the *symlinkat()* function is to create symbolic links in directories other than the current working directory without exposure to race conditions. Any part of the path of a file could be changed in parallel to a call to *symlink()*, resulting in unspecified behavior. By opening a file descriptor for the target directory and using the *symlinkat()* function it can be guaranteed that the created symbolic link is located relative to the desired directory.

FUTURE DIRECTIONS

None.

XBD <unistd.h>

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Issue 6

The following changes were made to align with the IEEE P1003.1a draft standard:

- The DESCRIPTION text is updated.
- The [ELOOP] optional error condition is added.

Issue 7

Austin Group Interpretation 1003.1-2001 #143 is applied.

The *symlinkat()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 2.

Additions have been made describing how *symlink()* sets the user and group IDs and file mode of the symbolic link, and its effect on timestamps.

Changes are made to allow a directory to be opened for searching.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0627 [146,428], XSH/TC1-2008/0628 [461], XSH/TC1-2008/0629 [146,428], XSH/TC1-2008/0630 [146,428,436], XSH/TC1-2008/0631 [324], XSH/TC1-2008/0632 [278], XSH/TC1-2008/0633 [278], and XSH/TC1-2008/0634 [151] are applied.

66237 **NAME**

66238 sync — schedule file system updates

66239 **SYNOPSIS**

```
66240 XSI      #include <unistd.h>
66241          void sync(void);
```

66242 **DESCRIPTION**

66243 The *sync()* function shall cause all information in memory that updates file systems to be
66244 scheduled for writing out to all file systems.

66245 The writing, although scheduled, is not necessarily complete upon return from *sync()*.

66246 **RETURN VALUE**

66247 The *sync()* function shall not return a value.

66248 **ERRORS**

66249 No errors are defined.

66250 **EXAMPLES**

66251 None.

66252 **APPLICATION USAGE**

66253 None.

66265 **NAME**

66266 sysconf — get configurable system variables

66267 **SYNOPSIS**

66268 #include <unistd.h>

66269 long sysconf(int name);

66270 **DESCRIPTION**

66271 The *sysconf()* function provides a method for the application to determine the current value of a
 66272 configurable system limit or option (*variable*). The implementation shall support all of the
 66273 variables listed in the following table and may support others.

66274 The *name* argument represents the system variable to be queried. The following table lists the
 66275 minimal set of system variables from <limits.h> or <unistd.h> that can be returned by *sysconf()*,
 66276 and the symbolic constants defined in <unistd.h> that are the corresponding values used for
 66277 *name*.

RETURN VALUE

If *name* is an invalid value, *sysconf()* shall return `-1` and set *errno* to indicate the error. If the variable corresponding to *name* is described in **<limits.h>** as a maximum or minimum value and the variable has no limit, *sysconf()* shall return `-1` without changing the value of *errno*. Note that indefinite limits do not imply infinite limits; see **<limits.h>**.

Otherwise, *sysconf()* shall return the current variable value on the system. The value returned

shall not be more restrictive than the corresponding value described to the application when it was compiled with the implementation's `<limits.h>` or `<unistd.h>`. The value shall not change during the lifetime of the calling process, except that `sysconf(_SC_OPEN_MAX)` may return different values before and after a call to `setrlimit()` which changes the `RLIMIT_NOFILE` soft limit.

If the variable corresponding to *name* is dependent on an unsupported option, the results are unspecified.

ERRORS

The `sysconf()` function shall fail if:

[EINVAL] The value of the *name* argument is invalid.

EXAMPLES

None.

APPLICATION USAGE

As `-1` is a permissible return value in a successful situation, an application wishing to check for error situations should set `errno` to 0, then call `sysconf()`, and, if it returns `-1`, check to see if `errno` is non-zero.

Application developers should check whether an option, such as `_POSIX_TRACE`, is supported prior to obtaining and using values for related variables, such as `_POSIX_TRACE_NAME_MAX`.

RATIONALE

This functionality was added in response to requirements of application developers and of system vendors who deal with many international system configurations. It is closely related to `pathconf()` and `fpathconf()`.

Although a conforming application can run on all systems by never demanding more resources than the minimum values published in this volume of POSIX.1-2008, it is useful for that application to be able to use the actual value for the quantity of a resource available on any given system. To do this, the application makes use of the value of a symbolic constant in `<limits.h>` or `<unistd.h>`.

However, once compiled, the application must still be able to cope if the amount of resource available is increased. To that end, an application may need a means of determining the quantity of a resource, or the presence of an option, at execution time.

Two examples are offered:

1. Applications may wish to act differently on systems with or without job control. Applications vendors who wish to distribute only a single binary package to all instances of a computer architecture would be forced to assume job control is never available if it were to rely solely on the `<unistd.h>` value published in this volume of POSIX.1-2008.
2. International applications vendors occasionally require knowledge of the number of clock ticks per second. Without these facilities, they would be required to either distribute their applications partially in source form or to have 50 Hz and 60 Hz versions for the various countries in which they operate.

It is the knowledge that many applications are actually distributed widely in executable form that leads to this facility. If limited to the most restrictive values in the headers, such applications would have to be prepared to accept the most limited environments offered by the smallest microcomputers. Although this is entirely portable, there was a consensus that they should be able to take advantage of the facilities offered by large systems, without the restrictions associated with source and object distributions.

During the discussions of this feature, it was pointed out that it is almost always possible for an application to discern what a value might be at runtime by suitably testing the various functions themselves. And, in any event, it could always be written to adequately deal with error returns from the various functions. In the end, it was felt that this imposed an unreasonable level of complication and sophistication on the application developer.

This runtime facility is not meant to provide ever-changing values that applications have to check multiple times. The values are seen as changing no more frequently than once per system initialization, such as by a system administrator or operator with an automatic configuration program. This volume of POSIX.1-2008 specifies that they shall not change within the lifetime of the process.

Some values apply to the system overall and others vary at the file system or directory level. The latter are described in *fpathconf()*.

Note that all values returned must be expressible as integers. String values were considered, but the additional flexibility of this approach was rejected due to its added complexity of implementation and use.

Some values, such as {PATH_MAX}, are sometimes so large that they must not be used to, say, allocate arrays. The *sysconf()* function returns a negative value to show that this symbolic constant is not even defined in this case.

Similar to *pathconf()*, this permits the implementation not to have a limit. When one resource is infinite, returning an error indicating that some other resource limit has been reached is conforming behavior.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX Threads Extension.

The `_XBS_` variables and name values are added to the table of system variables in the DESCRIPTION. These are all marked EX.

Issue 6

The symbol `CLK_TCK` is obsolescent and removed. It is replaced with the phrase “clock ticks per second”.

The symbol {PASS_MAX} is removed.

The following changes were made to align with the IEEE P1003.1a draft standard:

- Table entries are added for the following variables: `_SC_REGEX`, `_SC_SHELL`, `_SC_REGEX_VERSION`, `_SC_SYMLINK_MAX`.

The following *sysconf()* variables and their associated names are added for alignment with IEEE Std 1003.1d-1999:

```

66502     _POSIX_ADVISORY_INFO
66503     _POSIX_CPUTIME
66504     _POSIX_SPAWN
66505     _POSIX_SPARADIC_SERVER
66506     _POSIX_THREAD_CPUTIME
66507     _POSIX_THREAD_SPARADIC_SERVER
66508     _POSIX_TIMEOUTS

```

66509 The following changes are made to the DESCRIPTION for alignment with IEEE Std 1003.1j-2000:

66510 • A statement expressing the dependency of support for some system variables on
66511 implementation options is added.

66512 • The following system variables are added:

```

66513     _POSIX_BARRIERS
66514     _POSIX_CLOCK_SELECTION
66515     _POSIX_MONOTONIC_CLOCK
66516     _POSIX_READER_WRITER_LOCKS
66517     _POSIX_SPIN_LOCKS
66518     _POSIX_TYPED_MEMORY_OBJECTS

```

66519 The following system variables are added for alignment with IEEE Std 1003.2d-1994:

```

66520     _POSIX2_PBS
66521     _POSIX2_PBS_ACCOUNTING
66522     _POSIX2_PBS_LOCATE
66523     _POSIX2_PBS_MESSAGE
66524     _POSIX2_PBS_TRACK

```

66525 The following *sysconf()* variables and their associated names are added for alignment with
66526 IEEE Std 1003.1q-2000:

```

66527     _POSIX_TRACE
66528     _POSIX_TRACE_EVENT_FILTER
66529     _POSIX_TRACE_INHERIT
66530     _POSIX_TRACE_LOG

```

66531 The macros associated with the *c89* programming models are marked LEGACY, and new
66532 equivalent macros associated with *c99* are introduced.

66533 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/62 is applied, updating the
66534 DESCRIPTION to denote that the *_PC** and *_SC** symbols are now required to be supported. A
66535 corresponding change has been made in the Base Definitions volume of POSIX.1-2008. The
66536 deletion in the second paragraph removes some duplicated text. Additional symbols that were
66537 erroneously omitted from this reference page have been added.

66538 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/63 is applied, making it clear in the
66539 RETURN VALUE section that the value returned for *sysconf(_SC_OPEN_MAX)* may change if a
66540 call to *setrlimit()* adjusts the RLIMIT_NOFILE soft limit.

66541 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/134 is applied, updating the
66542 DESCRIPTION to remove an erroneous entry for *_POSIX_SYMLINK_MAX*. This corrects an
66543 error in IEEE Std 1003.1-2001/Cor 1-2002.

66544 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/135 is applied, removing

66545 _POSIX_FILE_LOCKING, _POSIX_MULTI_PROCESS, _POSIX2_C_VERSION, and
66546 _XOPEN_XCU_VERSION (and their associated _SC_* variables) from the DESCRIPTION and
66547 APPLICATION USAGE sections.

66548 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/136 is applied, adding the following
66549 constants (and their associated _SC_* variables) to the DESCRIPTION:

66550 _POSIX_SS_REPL_MAX
66551 _POSIX_TRACE_EVENT_NAME_MAX
66552 _POSIX_TRACE_NAME_MAX
66553 _POSIX_TRACE_SYS_MAX
66554 _POSIX_TRACE_USER_EVENT_MAX

66555 The RETURN VALUE and APPLICATION USAGE sections are updated to note that if variables
66556 are dependent on unsupported options, the results are unspecified.

66557 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/137 is applied, removing
66558 _REGEX_VERSION and _SC_REGEX_VERSION.

66559 **Issue 7**

66560 Austin Group Interpretation 1003.1-2001 #160 is applied.

66561 SD5-XSH-ERN-166 is applied, changing “Maximum size” to “Initial size” for the “Maximum
66562 size of ...” entries in the table in the DESCRIPTION.

66563 The variables for the supported programming environments are updated to be V7 and the
66564 LEGACY variables are removed.

66565 The following constants are added:

66566 _POSIX_THREAD_ROBUST_PRIO_INHERIT
66567 _POSIX_THREAD_ROBUST_PRIO_PROTECT

66568 The _XOPEN_UUCP variable and its associated _SC_XOPEN_UUCP value is added to the table
66569 of system variables.

66570 **NAME**

66571 syslog — log a message

66572 **SYNOPSIS**

66573 XSI `#include <syslog.h>`

66574 `void syslog(int priority, const char *message, ... /* argument */);`

66575 **DESCRIPTION**

66576 Refer to *closelog()*.

66577 **NAME**

66578 system — issue a command

66579 **SYNOPSIS**

66580 #include <stdlib.h>

66581 int system(const char *command);

66582 **DESCRIPTION**

66583 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 66584 conflict between the requirements described here and the ISO C standard is unintentional. This
 66585 volume of POSIX.1-2008 defers to the ISO C standard.

66586 If *command* is a null pointer, the *system()* function shall determine whether the host environment
 66587 has a command processor. If *command* is not a null pointer, the *system()* function shall pass the
 66588 string pointed to by *command* to that command processor to be executed in an implementation-
 66589 defined manner; this might then cause the program calling *system()* to behave in a non-
 66590 conforming manner or to terminate.

66591 CX The *system()* function shall behave as if a child process were created using *fork()*, and the child
 66592 process invoked the *sh* utility using *execl()* as follows:

66593 execl(<shell path>, "sh", "-c", command, (char *)0);

66594 where <shell path> is an unspecified pathname for the *sh* utility. It is unspecified whether the
 66595 handlers registered with *pthread_atfork()* are called as part of the creation of the child process.

66596 The *system()* function shall ignore the SIGINT and SIGQUIT signals, and shall block the
 66597 SIGCHLD signal, while waiting for the command to terminate. If this might cause the
 66598 application to miss a signal that would have killed it, then the application should examine the
 66599 return value from *system()* and take whatever action is appropriate to the application if the
 66600 command terminated due to receipt of a signal.

66601 The *system()* function shall not affect the termination status of any child of the calling processes
 66602 other than the process or processes it itself creates.

66603 The *system()* function shall not return until the child process has terminated.66604 The *system()* function need not be thread-safe.66605 **RETURN VALUE**

66606 If *command* is a null pointer, *system()* shall return non-zero to indicate that a command processor
 66607 CX is available, or zero if none is available. The *system()* function shall always return non-zero
 66608 when *command* is NULL.

66609 CX If *command* is not a null pointer, *system()* shall return the termination status of the command
 66610 language interpreter in the format specified by *waitpid()*. The termination status shall be as
 66611 defined for the *sh* utility; otherwise, the termination status is unspecified. If some error prevents
 66612 the command language interpreter from executing after the child process is created, the return
 66613 value from *system()* shall be as if the command language interpreter had terminated using
 66614 *exit(127)* or *_exit(127)*. If a child process cannot be created, or if the termination status for the
 66615 command language interpreter cannot be obtained, *system()* shall return -1 and set *errno* to
 66616 indicate the error.

66617 **ERRORS**66618 CX The *system()* function may set *errno* values as described by *fork()*.

66619 In addition, *system()* may fail if:

66620 CX [ECHILD] The status of the child process created by *system()* is no longer available.

66621 EXAMPLES

66622 None.

66623 APPLICATION USAGE

66624 If the return value of *system()* is not `-1`, its value can be decoded through the use of the macros
66625 described in `<sys/wait.h>`. For convenience, these macros are also provided in `<stdlib.h>`.

66626 Note that, while *system()* must ignore `SIGINT` and `SIGQUIT` and block `SIGCHLD` while waiting
66627 for the child to terminate, the handling of signals in the executed command is as specified by
66628 *fork()* and *exec*. For example, if `SIGINT` is being caught or is set to `SIG_DFL` when *system()* is
66629 called, then the child is started with `SIGINT` handling set to `SIG_DFL`.

66630 Ignoring `SIGINT` and `SIGQUIT` in the parent process prevents coordination problems (two
66631 processes reading from the same terminal, for example) when the executed command ignores or
66632 catches one of the signals. It is also usually the correct action when the user has given a
66633 command to the application to be executed synchronously (as in the `'!'` command in many
66634 interactive applications). In either case, the signal should be delivered only to the child process,
66635 not to the application itself. There is one situation where ignoring the signals might have less
66636 than the desired effect. This is when the application uses *system()* to perform some task invisible
66637 to the user. If the user typed the interrupt character ("`^C`", for example) while *system()* is being
66638 used in this way, one would expect the application to be killed, but only the executed command
66639 is killed. Applications that use *system()* in this way should carefully check the return status from
66640 *system()* to see if the executed command was successful, and should take appropriate action
66641 when the command fails.

66642 Blocking `SIGCHLD` while waiting for the child to terminate prevents the application from
66643 catching the signal and obtaining status from *system()*'s child process before *system()* can get the
66644 status itself.

66645 The context in which the utility is ultimately executed may differ from that in which *system()*
66646 was called. For example, file descriptors that have the `FD_CLOEXEC` flag set are closed, and the
66647 process ID and parent process ID are different. Also, if the executed utility changes its
66648 environment variables or its current working directory, that change is not reflected in the caller's
66649 context.

66650 There is no defined way for an application to find the specific path for the shell. However,
66651 *confstr()* can provide a value for *PATH* that is guaranteed to find the *sh* utility.

66652 Using the *system()* function in more than one thread in a process or when the `SIGCHLD` signal is
66653 being manipulated by more than one thread in a process may produce unexpected results.

66654 RATIONALE

66655 The *system()* function should not be used by programs that have set user (or group) ID
66656 privileges. The *fork()* and *exec* family of functions (except *execlp()* and *execvp()*), should be used
66657 instead. This prevents any unforeseen manipulation of the environment of the user that could
66658 cause execution of commands not anticipated by the calling program.

66659 There are three levels of specification for the *system()* function. The ISO C standard gives the
66660 most basic. It requires that the function exists, and defines a way for an application to query
66661 whether a command language interpreter exists. It says nothing about the command language
66662 or the environment in which the command is interpreted.

66663 POSIX.1-2008 places additional restrictions on *system()*. It requires that if there is a command
66664 language interpreter, the environment must be as specified by *fork()* and *exec*. This ensures, for

example, that *close-on-exec* works, that file locks are not inherited, and that the process ID is different. It also specifies the return value from *system()* when the command line can be run, thus giving the application some information about the command's completion status.

Finally, POSIX.1-2008 requires the command to be interpreted as in the shell command language defined in the Shell and Utilities volume of POSIX.1-2008.

Note that, *system(NULL)* is required to return non-zero, indicating that there is a command language interpreter. At first glance, this would seem to conflict with the ISO C standard which allows *system(NULL)* to return zero. There is no conflict, however. A system must have a command language interpreter, and is non-conforming if none is present. It is therefore permissible for the *system()* function on such a system to implement the behavior specified by the ISO C standard as long as it is understood that the implementation does not conform to POSIX.1-2008 if *system(NULL)* returns zero.

It was explicitly decided that when *command* is *NULL*, *system()* should not be required to check to make sure that the command language interpreter actually exists with the correct mode, that there are enough processes to execute it, and so on. The call *system(NULL)* could, theoretically, check for such problems as too many existing child processes, and return zero. However, it would be inappropriate to return zero due to such a (presumably) transient condition. If some condition exists that is not under the control of this application and that would cause any *system()* call to fail, that system has been rendered non-conforming.

Early drafts required, or allowed, *system()* to return with *errno* set to [EINTR] if it was interrupted with a signal. This error return was removed, and a requirement that *system()* not return until the child has terminated was added. This means that if a *waitpid()* call in *system()* exits with *errno* set to [EINTR], *system()* must reissue the *waitpid()*. This change was made for two reasons:

1. There is no way for an application to clean up if *system()* returns [EINTR], short of calling *wait()*, and that could have the undesirable effect of returning the status of children other than the one started by *system()*.
2. While it might require a change in some historical implementations, those implementations already have to be changed because they use *wait()* instead of *waitpid()*.

Note that if the application is catching SIGCHLD signals, it will receive such a signal before a successful *system()* call returns.

To conform to POSIX.1-2008, *system()* must use *waitpid()*, or some similar function, instead of *wait()*.

The following code sample illustrates how *system()* might be implemented on an implementation conforming to POSIX.1-2008.

```
#include <signal.h>
int system(const char *cmd)
{
    int stat;
    pid_t pid;
    struct sigaction sa, savintr, savequit;
    sigset_t saveblock;
    if (cmd == NULL)
        return(1);
    sa.sa_handler = SIG_IGN;
    sigemptyset(&sa.sa_mask);
    sa.sa_flags = 0;
```

```

66712     sigemptyset(&saveintr.sa_mask);
66713     sigemptyset(&savequit.sa_mask);
66714     sigaction(SIGINT, &sa, &saveintr);
66715     sigaction(SIGQUIT, &sa, &savequit);
66716     sigaddset(&sa.sa_mask, SIGCHLD);
66717     sigprocmask(SIG_BLOCK, &sa.sa_mask, &saveblock);
66718     if ((pid = fork()) == 0) {
66719         sigaction(SIGINT, &saveintr, (struct sigaction *)0);
66720         sigaction(SIGQUIT, &savequit, (struct sigaction *)0);
66721         sigprocmask(SIG_SETMASK, &saveblock, (sigset_t *)0);
66722         execl("/bin/sh", "sh", "-c", cmd, (char *)0);
66723         _exit(127);
66724     }
66725     if (pid == -1) {
66726         stat = -1; /* errno comes from fork() */
66727     } else {
66728         while (waitpid(pid, &stat, 0) == -1) {
66729             if (errno != EINTR) {
66730                 stat = -1;
66731                 break;
66732             }
66733         }
66734     }
66735     sigaction(SIGINT, &saveintr, (struct sigaction *)0);
66736     sigaction(SIGQUIT, &savequit, (struct sigaction *)0);
66737     sigprocmask(SIG_SETMASK, &saveblock, (sigset_t *)0);
66738     return(stat);
66739 }

```

Note that, while a particular implementation of *system()* (such as the one above) can assume a particular path for the shell, such a path is not necessarily valid on another system. The above example is not portable, and is not intended to be.

One reviewer suggested that an implementation of *system()* might want to use an environment variable such as *SHELL* to determine which command interpreter to use. The supposed implementation would use the default command interpreter if the one specified by the environment variable was not available. This would allow a user, when using an application that prompts for command lines to be processed using *system()*, to specify a different command interpreter. Such an implementation is discouraged. If the alternate command interpreter did not follow the command line syntax specified in the Shell and Utilities volume of POSIX.1-2008, then changing *SHELL* would render *system()* non-conforming. This would affect applications that expected the specified behavior from *system()*, and since the Shell and Utilities volume of POSIX.1-2008 does not mention that *SHELL* affects *system()*, the application would not know that it needed to unset *SHELL*.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

66760 First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

66762 Extensions beyond the ISO C standard are marked.

Issue 7

66764 Austin Group Interpretation 1003.1-2001 #055 is applied, clarifying the thread-safety of this function and treatment of *at_fork()* handlers.

66765 Austin Group Interpretation 1003.1-2001 #156 is applied.

66766 SD5-XSH-ERN-30 is applied.

66769 **NAME**

66770 tan, tanf, tanl — tangent function

66771 **SYNOPSIS**

```
66772 #include <math.h>
66773 double tan(double x);
66774 float tanf(float x);
66775 long double tanl(long double x);
```

66776 **DESCRIPTION**

66777 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 66778 conflict between the requirements described here and the ISO C standard is unintentional. This
 66779 volume of POSIX.1-2008 defers to the ISO C standard.

66780 These functions shall compute the tangent of their argument x , measured in radians.

66781 An application wishing to check for error situations should set *errno* to zero and call
 66782 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 66783 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 66784 zero, an error has occurred.

66785 **RETURN VALUE**

66786 Upon successful completion, these functions shall return the tangent of x .

66787 MXX If the correct value would cause underflow, and is not representable, a range error may occur, |
 66788 MXX and *tan()*, *tanf()*, and *tanl()* shall return 0.0, or (if IEC 60559 Floating-Point is not supported) an |
 66789 implementation-defined value no greater in magnitude than DBL_MIN, FLT_MIN, and |
 66790 LDBL_MIN, respectively.

66791 MX If x is NaN, a NaN shall be returned.

66792 If x is ± 0 , x shall be returned.

66793 If x is subnormal, a range error may occur

66794 MXX and x should be returned.

66795 MX If x is not returned, *tan()*, *tanf()*, and *tanl()* shall return an implementation-defined value no +
 66796 greater in magnitude than DBL_MIN, FLT_MIN, and LDBL_MIN, respectively.

66797 If x is $\pm\text{Inf}$, a domain error shall occur, and either a NaN (if supported), or an implementation-
 66798 defined value shall be returned.

66799 MXX If the correct value would cause underflow, and is representable, a range error may occur and |
 66800 the correct value shall be returned.

66801 XSI If the correct value would cause overflow, a range error shall occur and *tan()*, *tanf()*, and *tanl()*
 66802 shall return $\pm\text{HUGE\_VAL}$, $\pm\text{HUGE\_VALF}$, and $\pm\text{HUGE\_VALL}$, respectively, with the same sign
 66803 as the correct value of the function.

66804 **ERRORS**

66805 These functions shall fail if:

66806 MX **Domain Error** The value of x is $\pm\text{Inf}$.

66807 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 66808 then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling*
 66809 & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
 66810 shall be raised.

66811 XSI **Range Error** The result overflows

66812 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,

66813 then *errno* shall be set to [ERANGE]. If the integer expression

66814 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the overflow

66815 floating-point exception shall be raised.

66816 These functions may fail if:

66817 MX **Range Error** The result underflows, or the value of *x* is subnormal.

66818 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,

66819 then *errno* shall be set to [ERANGE]. If the integer expression

66820 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the underflow

66821 floating-point exception shall be raised.

66822 EXAMPLES

66823 Taking the Tangent of a 45-Degree Angle

```
66824 #include <math.h>
66825 ...
66826 double radians = 45.0 * M_PI / 180;
66827 double result;
66828 ...
66829 result = tan (radians);
```

66830 APPLICATION USAGE

66831 There are no known floating-point representations such that for a normal argument, *tan(x)* is

66832 either overflow or underflow.

66833 These functions may lose accuracy when their argument is near a multiple of $\pi/2$ or is far from

66834 0.0.

66835 On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* &

66836 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

66837 RATIONALE

66838 None.

66839 FUTURE DIRECTIONS

66840 None.

66846 Issue 5

66847 The last two paragraphs of the DESCRIPTION were included as APPLICATION USAGE notes

66848 in previous issues.

66849 Issue 6

66850 The *tanf()* and *tanl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

66851 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are

66852 revised to align with the ISO/IEC 9899:1999 standard.

66853 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are
66854 marked.

66855 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/64 is applied, correcting the last
66856 paragraph in the RETURN VALUE section.

66857 **Issue 7**

66858 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0635 [68], XSH/TC1-2008/0636 [68], +
66859 and XSH/TC1-2008/0637 [68] are applied.

66860 **NAME**

66861 tanh, tanhf, tanhl — hyperbolic tangent functions

66862 **SYNOPSIS**

```
66863       #include <math.h>
66864       double tanh(double x);
66865       float tanhf(float x);
66866       long double tanhl(long double x);
```

66867 **DESCRIPTION**

66868 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 66869 conflict between the requirements described here and the ISO C standard is unintentional. This
 66870 volume of POSIX.1-2008 defers to the ISO C standard.

66871 These functions shall compute the hyperbolic tangent of their argument *x*.

66872 An application wishing to check for error situations should set *errno* to zero and call
 66873 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 66874 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 66875 zero, an error has occurred.

66876 **RETURN VALUE**

66877 Upon successful completion, these functions shall return the hyperbolic tangent of *x*.

66878 MX If *x* is NaN, a NaN shall be returned.

66879 If *x* is ± 0 , *x* shall be returned.

66880 If *x* is $\pm \text{Inf}$, ± 1 shall be returned.

66881 If *x* is subnormal, a range error may occur
 66882 MXX and *x* should be returned.

66883 MX If *x* is not returned, *tanh()*, *tanhf()*, and *tanhl()* shall return an implementation-defined value no
 66884 greater in magnitude than DBL_MIN, FLT_MIN, and LDBL_MIN, respectively.

66885 **ERRORS**

66886 These functions may fail if:

66887 MX Range Error The value of *x* is subnormal.

66888 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 66889 then *errno* shall be set to [ERANGE]. If the integer expression
 66890 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the underflow
 66891 floating-point exception shall be raised.

66892 **EXAMPLES**

66893 None.

66894 **APPLICATION USAGE**

66895 On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* &
 66896 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

66897 **RATIONALE**

66898 None.

66899 **FUTURE DIRECTIONS**

66900 None.

NAME

tcflow — suspend or restart the transmission or reception of data

SYNOPSIS

```
#include <termios.h>
```

```
int tcflow(int fildes, int action);
```

DESCRIPTION

The *tcflow()* function shall suspend or restart transmission or reception of data on the object referred to by *fildes*, depending on the value of *action*. The *fildes* argument is an open file descriptor associated with a terminal.

- If *action* is TCOOFF, output shall be suspended.
- If *action* is TCOON, suspended output shall be restarted.
- If *action* is TCIOFF and *fildes* refers to a terminal device, the system shall transmit a STOP character, which is intended to cause the terminal device to stop transmitting data to the system. If *fildes* is associated with a pseudo-terminal, the STOP character need not be transmitted.
- If *action* is TCION and *fildes* refers to a terminal device, the system shall transmit a START character, which is intended to cause the terminal device to start transmitting data to the system. If *fildes* is associated with a pseudo-terminal, the START character need not be transmitted.

The default on the opening of a terminal file is that neither its input nor its output are suspended.

Attempts to use *tcflow()* from a process which is a member of a background process group on a *fildes* associated with its controlling terminal, shall cause the process group to be sent a SIGTTOU signal. If the calling thread is blocking SIGTTOU signals or the process is ignoring SIGTTOU signals, the process shall be allowed to perform the operation, and no signal is sent.

RETURN VALUE

Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to indicate the error.

ERRORS

The *tcflow()* function shall fail if:

[EBADF]	The <i>fildes</i> argument is not a valid file descriptor.
[EINVAL]	The <i>action</i> argument is not a supported value.
[EIO]	The process group of the writing process is orphaned, the calling thread is not blocking SIGTTOU, and the process is not ignoring SIGTTOU.
[ENOTTY]	The file associated with <i>fildes</i> is not a terminal.

NAME

tcflush — flush non-transmitted output data, non-read input data, or both

SYNOPSIS

```
#include <termios.h>
```

```
int tcflush(int fildes, int queue_selector);
```

DESCRIPTION

Upon successful completion, *tcflush()* shall discard data written to the object referred to by *fildes* (an open file descriptor associated with a terminal) but not transmitted, or data received but not read, depending on the value of *queue_selector*:

- If *queue_selector* is TCIFLUSH, it shall flush data received but not read.
- If *queue_selector* is TCOFLUSH, it shall flush data written but not transmitted.
- If *queue_selector* is TCIOFLUSH, it shall flush both data received but not read and data written but not transmitted.

Attempts to use *tcflush()* from a process which is a member of a background process group on a *fildes* associated with its controlling terminal shall cause the process group to be sent a SIGTTOU signal. If the calling thread is blocking SIGTTOU signals or the process is ignoring SIGTTOU signals, the process shall be allowed to perform the operation, and no signal is sent.

RETURN VALUE

Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to indicate the error.

ERRORS

The *tcflush()* function shall fail if:

[EBADF]	The <i>fildes</i> argument is not a valid file descriptor.
[EINVAL]	The <i>queue_selector</i> argument is not a supported value.
[EIO]	The process group of the writing process is orphaned, the calling thread is not blocking SIGTTOU, and the process is not ignoring SIGTTOU.
[ENOTTY]	The file associated with <i>fildes</i> is not a terminal.

CHANGE HISTORY

First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

Issue 6

The Open Group Corrigendum U035/1 is applied. In the ERRORS and APPLICATION USAGE sections, references to *tcflow()* are replaced with *tcflush()*.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In the DESCRIPTION, the final paragraph is no longer conditional on _POSIX_JOB_CONTROL. This is a FIPS requirement.
- The [EIO] error is added.

Issue 7

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0645 [79], XSH/TC1-2008/0646 [79], + and XSH/TC1-2008/0647 [79] are applied.

NAME

tcgetattr — get the parameters associated with the terminal

SYNOPSIS

```
#include <termios.h>
```

```
int tcgetattr(int fildes, struct termios *termios_p);
```

DESCRIPTION

The *tcgetattr()* function shall get the parameters associated with the terminal referred to by *fildes* and store them in the **termios** structure referenced by *termios_p*. The *fildes* argument is an open file descriptor associated with a terminal.

The *termios_p* argument is a pointer to a **termios** structure.

The *tcgetattr()* operation is allowed from any process.

If the terminal device supports different input and output baud rates, the baud rates stored in the **termios** structure returned by *tcgetattr()* shall reflect the actual baud rates, even if they are equal. If differing baud rates are not supported, the rate returned as the output baud rate shall be the actual baud rate. If the terminal device does not support split baud rates, the input baud rate stored in the **termios** structure shall be the output rate (as one of the symbolic values).

RETURN VALUE

Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to indicate the error.

ERRORS

The *tcgetattr()* function shall fail if:

- [EBADF] The *fildes* argument is not a valid file descriptor.
- [ENOTTY] The file associated with *fildes* is not a terminal.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

Care must be taken when changing the terminal attributes. Applications should always do a *tcgetattr()*, save the **termios** structure values returned, and then do a *tcsetattr()*, changing only the necessary fields. The application should use the values saved from the *tcgetattr()* to reset the terminal state whenever it is done with the terminal. This is necessary because terminal attributes apply to the underlying port and not to each individual open instance; that is, all processes that have used the terminal see the latest attribute changes.

A program that uses these functions should be written to catch all signals and take other appropriate actions to ensure that when the program terminates, whether planned or not, the terminal device's state is restored to its original state.

Existing practice dealing with error returns when only part of a request can be honored is based on calls to the *ioctl()* function. In historical BSD and System V implementations, the corresponding *ioctl()* returns zero if the requested actions were semantically correct, even if some of the requested changes could not be made. Many existing applications assume this behavior and would no longer work correctly if the return value were changed from zero to -1 in this case.

Note that either specification has a problem. When zero is returned, it implies everything

67120 succeeded even if some of the changes were not made. When -1 is returned, it implies
67121 everything failed even though some of the changes were made.

67122 Applications that need all of the requested changes made to work properly should follow
67123 *tcsetattr()* with a call to *tcgetattr()* and compare the appropriate field values.

67124 **FUTURE DIRECTIONS**

67125 None.

67126 **SEE ALSO**

67127 *tcsetattr()*

67128 XBD [Chapter 11](#) (on page 199), [<termios.h>](#)

67129 **CHANGE HISTORY**

67130 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

67131 **Issue 6**

67132 In the DESCRIPTION, the rate returned as the input baud rate shall be the output rate.
67133 Previously, the number zero was also allowed but was obsolescent.

NAME

tcgetpgrp — get the foreground process group ID

SYNOPSIS

```
#include <unistd.h>
```

```
pid_t tcgetpgrp(int fildes);
```

DESCRIPTION

The *tcgetpgrp()* function shall return the value of the process group ID of the foreground process group associated with the terminal.

If there is no foreground process group, *tcgetpgrp()* shall return a value greater than 1 that does not match the process group ID of any existing process group.

The *tcgetpgrp()* function is allowed from a process that is a member of a background process group; however, the information may be subsequently changed by a process that is a member of a foreground process group.

RETURN VALUE

Upon successful completion, *tcgetpgrp()* shall return the value of the process group ID of the foreground process associated with the terminal. Otherwise, *-1* shall be returned and *errno* set to indicate the error.

ERRORS

The *tcgetpgrp()* function shall fail if:

[EBADF]	The <i>fildes</i> argument is not a valid file descriptor.
[ENOTTY]	The calling process does not have a controlling terminal, or the file is not the controlling terminal.

EXAMPLES

None.

APPLICATION USAGE

None.

+

67215 **NAME**

67216 tcsendbreak — send a break for a specific duration

67217 **SYNOPSIS**

67218 #include <termios.h>

67219 int tcsendbreak(int *fildes*, int *duration*);67220 **DESCRIPTION**

67221 If the terminal is using asynchronous serial data transmission, *tcsendbreak()* shall cause
 67222 transmission of a continuous stream of zero-valued bits for a specific duration. If *duration* is 0, it
 67223 shall cause transmission of zero-valued bits for at least 0.25 seconds, and not more than 0.5
 67224 seconds. If *duration* is not 0, it shall send zero-valued bits for an implementation-defined period
 67225 of time.

67226 The *fildes* argument is an open file descriptor associated with a terminal.

67227 If the terminal is not using asynchronous serial data transmission, it is implementation-defined
 67228 whether *tcsendbreak()* sends data to generate a break condition or returns without taking any
 67229 action.

67230 Attempts to use *tcsendbreak()* from a process which is a member of a background process group
 67231 on a *fildes* associated with its controlling terminal shall cause the process group to be sent a
 67232 SIGTTOU signal. If the calling thread is blocking SIGTTOU signals or the process is ignoring
 67233 SIGTTOU signals, the process shall be allowed to perform the operation, and no signal is sent.

67234 **RETURN VALUE**

67235 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to
 67236 indicate the error.

67237 **ERRORS**

67238 The *tcsendbreak()* function shall fail if:

67239 [EBADF] The *fildes* argument is not a valid file descriptor.

67240 [EIO] The process group of the writing process is orphaned, the calling thread is not
 67241 blocking SIGTTOU, and the process is not ignoring SIGTTOU.

67242 [ENOTTY] The file associated with *fildes* is not a terminal.

Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In the DESCRIPTION, text previously conditional on _POSIX_JOB_CONTROL is now mandated. This is a FIPS requirement.
- The [EIO] error is added.

Issue 7

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0649 [79], XSH/TC1-2008/0650 [79], + and XSH/TC1-2008/0651 [79] are applied.

NAME

tcsetattr — set the parameters associated with the terminal

SYNOPSIS

```
#include <termios.h>
```

```
int tcsetattr(int fildes, int optional_actions,
              const struct termios *termios_p);
```

DESCRIPTION

The *tcsetattr()* function shall set the parameters associated with the terminal referred to by the open file descriptor *fildes* (an open file descriptor associated with a terminal) from the **termios** structure referenced by *termios_p* as follows:

- If *optional_actions* is TCSANOW, the change shall occur immediately.
- If *optional_actions* is TCSADRAIN, the change shall occur after all output written to *fildes* is transmitted. This function should be used when changing parameters that affect output.
- If *optional_actions* is TCSAFLUSH, the change shall occur after all output written to *fildes* is transmitted, and all input so far received but not read shall be discarded before the change is made.

If the output baud rate stored in the **termios** structure pointed to by *termios_p* is the zero baud rate, B0, the modem control lines shall no longer be asserted. Normally, this shall disconnect the line.

If the input baud rate stored in the **termios** structure pointed to by *termios_p* is 0, the input baud rate given to the hardware is the same as the output baud rate stored in the **termios** structure.

The *tcsetattr()* function shall return successfully if it was able to perform any of the requested actions, even if some of the requested actions could not be performed. It shall set all the attributes that the implementation supports as requested and leave all the attributes not supported by the implementation unchanged. If no part of the request can be honored, it shall return -1 and set *errno* to [EINVAL]. If the input and output baud rates differ and are a combination that is not supported, neither baud rate shall be changed. A subsequent call to *tcgetattr()* shall return the actual state of the terminal device (reflecting both the changes made and not made in the previous *tcsetattr()* call). The *tcsetattr()* function shall not change the values found in the **termios** structure under any circumstances.

The effect of *tcsetattr()* is undefined if the value of the **termios** structure pointed to by *termios_p* was not derived from the result of a call to *tcgetattr()* on *fildes*; an application should modify only fields and flags defined by this volume of POSIX.1-2008 between the call to *tcgetattr()* and *tcsetattr()*, leaving all other fields and flags unmodified.

No actions defined by this volume of POSIX.1-2008, other than a call to *tcsetattr()*, a close of the last file descriptor in the system associated with this terminal device, or an open of the first file descriptor in the system associated with this terminal device (using the O_TTY_INIT flag if it is non-zero and the device is not a pseudo-terminal), shall cause any of the terminal attributes defined by this volume of POSIX.1-2008 to change.

If *tcsetattr()* is called from a process which is a member of a background process group on a *fildes* associated with its controlling terminal:

- If the calling thread is blocking SIGTTOU signals or the process is ignoring SIGTTOU signals, the operation completes normally and no signal is sent.

- Otherwise, a SIGTTOU signal shall be sent to the process group.

RETURN VALUE

Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to indicate the error.

ERRORS

The *tcsetattr()* function shall fail if:

[EBADF]	The <i>fildev</i> argument is not a valid file descriptor.
[EINTR]	A signal interrupted <i>tcsetattr()</i> .
[EINVAL]	The <i>optional_actions</i> argument is not a supported value, or an attempt was made to change an attribute represented in the termios structure to an unsupported value.
[EIO]	The process group of the writing process is orphaned, the calling thread is not blocking SIGTTOU, and the process is not ignoring SIGTTOU.
[ENOTTY]	The file associated with <i>fildev</i> is not a terminal.

EXAMPLES

None.

APPLICATION USAGE

If trying to change baud rates, applications should call *tcsetattr()* then call *tcgetattr()* in order to determine what baud rates were actually selected.

In general, there are two reasons for an application to change the parameters associated with a terminal device:

1. The device already has working parameter settings but the application needs a different behavior, such as non-canonical mode instead of canonical mode. The application sets (or clears) only a few flags or *c_cc[]* values. Typically, the terminal device in this case is either the controlling terminal for the process or a pseudo-terminal.
2. The device is a modem or similar piece of equipment connected by a serial line, and it was not open before the application opened it. In this case, the application needs to initialize all of the parameter settings “from scratch”. However, since the **termios** structure may include both standard and non-standard parameters, the application cannot just initialize the whole structure in an arbitrary way (e.g., using *memset()*) as this may cause some of the non-standard parameters to be set incorrectly, resulting in non-conforming behavior of the terminal device. Conversely, the application cannot just set the standard parameters, assuming that the non-standard parameters will already have suitable values, as the device might previously have been used with non-conforming parameter settings (and some implementations retain the settings from one use to the next). The solution is to open the terminal device using the O_TTY_INIT flag to initialize the terminal device to have conforming parameter settings, obtain those settings using *tcgetattr()*, and then set all of the standard parameters to the desired settings.

RATIONALE

The *tcsetattr()* function can be interrupted in the following situations:

- It is interrupted while waiting for output to drain.
- It is called from a process in a background process group and SIGTTOU is caught.

See also the RATIONALE section in *tcgetattr()*.

FUTURE DIRECTIONS

Using an input baud rate of 0 to set the input rate equal to the output rate may not necessarily be supported in a future version of this volume of POSIX.1-2008.

CHANGE HISTORY

First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In the DESCRIPTION, text previously conditional on `_POSIX_JOB_CONTROL` is now mandated. This is a FIPS requirement.
- The [EIO] error is added.

In the DESCRIPTION, the text describing use of *tcsetattr()* from a process which is a member of a background process group is clarified.

Issue 7

Austin Group Interpretation 1003.1-2001 #144 is applied.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0652 [79], XSH/TC1-2008/0653 [79], + and XSH/TC1-2008/0654 [79] are applied.

67370 **NAME**

67371 tcsetpgrp — set the foreground process group ID

67372 **SYNOPSIS**

67373 #include <unistd.h>

67374 int tcsetpgrp(int *fildes*, pid_t *pgid_id*);67375 **DESCRIPTION**

67376 If the process has a controlling terminal, *tcsetpgrp()* shall set the foreground process group ID
 67377 associated with the terminal to *pgid_id*. The application shall ensure that the file associated with
 67378 *fildes* is the controlling terminal of the calling process and the controlling terminal is currently
 67379 associated with the session of the calling process. The application shall ensure that the value of
 67380 *pgid_id* matches a process group ID of a process in the same session as the calling process.

67381 Attempts to use *tcsetpgrp()* from a process which is a member of a background process group on
 67382 a *fildes* associated with its controlling terminal shall cause the process group to be sent a
 67383 SIGTTOU signal. If the calling thread is blocking SIGTTOU signals or the process is ignoring
 67384 SIGTTOU signals, the process shall be allowed to perform the operation, and no signal is sent.

67385 **RETURN VALUE**

67386 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to
 67387 indicate the error.

67388 **ERRORS**67389 The *tcsetpgrp()* function shall fail if:67390 [EBADF] The *fildes* argument is not a valid file descriptor.67391 [EINVAL] This implementation does not support the value in the *pgid_id* argument.

67392 [EIO] The process group of the writing process is orphaned, the calling thread is not
 67393 blocking SIGTTOU, and the process is not ignoring SIGTTOU.

67394 [ENOTTY] The calling process does not have a controlling terminal, or the file is not the
 67395 controlling terminal, or the controlling terminal is no longer associated with
 67396 the session of the calling process.

67397 [EPERM] The value of *pgid_id* is a value supported by the implementation, but does not
 67398 match the process group ID of a process in the same session as the calling
 67399 process.

CHANGE HISTORY

67411 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

Issue 6

67413 In the SYNOPSIS, the inclusion of `<sys/types.h>` is no longer required.

67415 The following new requirements on POSIX implementations derive from alignment with the
67416 Single UNIX Specification:

67417 • The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was
67418 required for conforming implementations of previous POSIX specifications, it was not
67419 required for UNIX applications.

67420 • In the DESCRIPTION and ERRORS sections, text previously conditional on
67421 `_POSIX_JOB_CONTROL` is now mandated. This is a FIPS requirement.

67422 The normative text is updated to avoid use of the term “must” for application requirements.

67423 The Open Group Corrigendum U047/4 is applied.

Issue 7

67426

NAME

tdelete, tfind, tsearch, twalk — manage a binary search tree

SYNOPSIS

```
#include <search.h>

void *tdelete(const void *restrict key, void **restrict rootp,
              int (*compar)(const void *, const void *));
void *tfind(const void *key, void *const *rootp,
            int (*compar)(const void *, const void *));
void *tsearch(const void *key, void **rootp,
              int (*compar)(const void *, const void *));
void twalk(const void *root,
           void (*action)(const void *, VISIT, int));
```

DESCRIPTION

The *tdelete()*, *tfind()*, *tsearch()*, and *twalk()* functions manipulate binary search trees. Comparisons are made with a user-supplied routine, the address of which is passed as the *compar* argument. This routine is called with two arguments, which are the pointers to the elements being compared. The application shall ensure that the user-supplied routine returns an integer less than, equal to, or greater than 0, according to whether the first argument is to be considered less than, equal to, or greater than the second argument. The comparison function need not compare every byte, so arbitrary data may be contained in the elements in addition to the values being compared.

The *tsearch()* function shall build and access the tree. The *key* argument is a pointer to an element to be accessed or stored. If there is a node in the tree whose element is equal to the value pointed to by *key*, a pointer to this found node shall be returned. Otherwise, the value pointed to by *key* shall be inserted (that is, a new node is created and the value of *key* is copied to this node), and a pointer to this node returned. Only pointers are copied, so the application shall ensure that the calling routine stores the data. The *rootp* argument points to a variable that points to the root node of the tree. A null pointer value for the variable pointed to by *rootp* denotes an empty tree; in this case, the variable shall be set to point to the node which shall be at the root of the new tree.

Like *tsearch()*, *tfind()* shall search for a node in the tree, returning a pointer to it if found. However, if it is not found, *tfind()* shall return a null pointer. The arguments for *tfind()* are the same as for *tsearch()*.

The *tdelete()* function shall delete a node from a binary search tree. The arguments are the same as for *tsearch()*. The variable pointed to by *rootp* shall be changed if the deleted node was the root of the tree. The *tdelete()* function shall return a pointer to the parent of the deleted node, or an unspecified non-null pointer if the deleted node was the root node, or a null pointer if the node is not found.

If *tsearch()* adds an element to a tree, or *tdelete()* successfully deletes an element from a tree, the concurrent use of that tree in another thread, or use of pointers produced by a previous call to *tfind()* or *tsearch()*, produces undefined results.

The *twalk()* function shall traverse a binary search tree. The *root* argument is a pointer to the root node of the tree to be traversed. (Any node in a tree may be used as the root for a walk below that node.) The argument *action* is the name of a routine to be invoked at each node. This routine is, in turn, called with three arguments. The first argument shall be the address of the node being visited. The structure pointed to by this argument is unspecified and shall not be modified by the application, but it shall be possible to cast a pointer-to-node into a pointer-to-pointer-to-

element to access the element stored in the node. The second argument shall be a value from an enumeration data type:

```
typedef enum { preorder, postorder, endorder, leaf } VISIT;
```

(defined in `<search.h>`), depending on whether this is the first, second, or third time that the node is visited (during a depth-first, left-to-right traversal of the tree), or whether the node is a leaf. The third argument shall be the level of the node in the tree, with the root being level 0.

If the calling function alters the pointer to the root, the result is undefined.

If the functions pointed to by *action* or *compar* (for any of these binary search functions) change the tree, the results are undefined.

These functions are thread-safe only as long as multiple threads do not access the same tree.

RETURN VALUE

If the node is found, both *tsearch()* and *tfind()* shall return a pointer to it. If not, *tfind()* shall return a null pointer, and *tsearch()* shall return a pointer to the inserted item.

A null pointer shall be returned by *tsearch()* if there is not enough space available to create a new node.

A null pointer shall be returned by *tdelete()*, *tfind()*, and *tsearch()* if *rootp* is a null pointer on entry.

The *tdelete()* function shall return a pointer to the parent of the deleted node, or an unspecified non-null pointer if the deleted node was the root node, or a null pointer if the node is not found.

The *twalk()* function shall not return a value.

ERRORS

No errors are defined.

EXAMPLES

The following code reads in strings and stores structures containing a pointer to each string and a count of its length. It then walks the tree, printing out the stored strings and their lengths in alphabetical order.

```
#include <search.h>
#include <string.h>
#include <stdio.h>

#define STRSZ    10000
#define NODSZ    500

struct node {      /* Pointers to these are stored in the tree. */
    char    *string;
    int     length;
};

char    string_space[STRSZ]; /* Space to store strings. */
struct node nodes[NODSZ];   /* Nodes to store. */
void    *root = NULL;       /* This points to the root. */

int main(int argc, char *argv[])
{
    char    *strptr = string_space;
    struct node *nodeptr = nodes;
    void    print_node(const void *, VISIT, int);
```

```

67517         int    i = 0, node_compare(const void *, const void *);
67518         while (gets(strptr) != NULL && i++ < NODSZ) {
67519             /* Set node. */
67520             nodeptr->string = strptr;
67521             nodeptr->length = strlen(strptr);
67522             /* Put node into the tree. */
67523             (void) tsearch((void *)nodeptr, (void **)&root,
67524                 node_compare);
67525             /* Adjust pointers, so we do not overwrite tree. */
67526             strptr += nodeptr->length + 1;
67527             nodeptr++;
67528         }
67529         twalk(root, print_node);
67530         return 0;
67531     }
67532     /*
67533     * This routine compares two nodes, based on an
67534     * alphabetical ordering of the string field.
67535     */
67536     int
67537     node_compare(const void *node1, const void *node2)
67538     {
67539         return strcmp(((const struct node *) node1)->string,
67540             ((const struct node *) node2)->string);
67541     }
67542     /*
67543     * This routine prints out a node, the second time
67544     * twalk encounters it or if it is a leaf.
67545     */
67546     void
67547     print_node(const void *ptr, VISIT order, int level)
67548     {
67549         const struct node *p = *(const struct node **) ptr;
67550         if (order == postorder || order == leaf) {
67551             (void) printf("string = %s, length = %d\n",
67552                 p->string, p->length);
67553         }
67554     }

```

APPLICATION USAGE

The *root* argument to *twalk()* is one level of indirection less than the *rootp* arguments to *tdelete()* and *tsearch()*.

There are two nomenclatures used to refer to the order in which tree nodes are visited. The *tsearch()* function uses **preorder**, **postorder**, and **endorder** to refer respectively to visiting a node before any of its children, after its left child and before its right, and after both its children. The alternative nomenclature uses **preorder**, **inorder**, and **postorder** to refer to the same visits, which could result in some confusion over the meaning of **postorder**.

Since the return value of *tdelete()* is an unspecified non-null pointer in the case that the root of the tree has been deleted, applications should only use the return value of *tdelete()* as indication

67565 of success or failure and should not assume it can be dereferenced. Some implementations in this
67566 case will return a pointer to the new root of the tree (or to an empty tree if the deleted root node
67567 was the only node in the tree); other implementations return arbitrary non-null pointers.

NAME

tempnam — create a name for a temporary file

SYNOPSIS

```
#include <stdio.h>
```

```
char *tempnam(const char *dir, const char *pfx);
```

DESCRIPTION

The *tempnam()* function shall generate a pathname that may be used for a temporary file.

The *tempnam()* function allows the user to control the choice of a directory. The *dir* argument points to the name of the directory in which the file is to be created. If *dir* is a null pointer or points to a string which is not a name for an appropriate directory, the path prefix defined as *P_tmpdir* in the *<stdio.h>* header shall be used. If that directory is not accessible, an implementation-defined directory may be used.

Many applications prefer their temporary files to have certain initial letter sequences in their names. The *pfx* argument should be used for this. This argument may be a null pointer or point to a string of up to five bytes to be used as the beginning of the filename.

Some implementations of *tempnam()* may use *tmpnam()* internally. On such implementations, if called more than {TMP_MAX} times in a single process, the behavior is implementation-defined.

RETURN VALUE

Upon successful completion, *tempnam()* shall allocate space for a string, put the generated pathname in that space, and return a pointer to it. The pointer shall be suitable for use in a subsequent call to *free()*. Otherwise, it shall return a null pointer and set *errno* to indicate the error.

ERRORS

The *tempnam()* function shall fail if:

[ENOMEM] Insufficient storage space is available.

EXAMPLES**Generating a Pathname**

The following example generates a pathname for a temporary file in directory */tmp*, with the prefix *file*. After the pathname has been created, the call to *free()* deallocates the space used to store the pathname.

```
#include <stdio.h>
#include <stdlib.h>
```

```
...
const char *directory = "/tmp";
const char *fileprefix = "file";
char *file;
```

```
file = tempnam(directory, fileprefix);
free(file);
```

APPLICATION USAGE

This function only creates pathnames. It is the application's responsibility to create and remove the files. Between the time a pathname is created and the file is opened, it is possible for some other process to create a file with the same name. Applications may find *tmpfile()* more useful.

Applications should use the *tmpfile()*, *mkdtemp()*, or *mkstemp()* functions instead of the

67661 obsolescent *tempnam()* function.

67662 **RATIONALE**

67663 None.

67664 **FUTURE DIRECTIONS**

67665 The *tempnam()* function may be removed in a future version.

67666 **SEE ALSO**

67667 *fopen()*, *free()*, *mkdtemp()*, *open()*, *tmpfile()*, *tmpnam()*, *unlink()*

67668 XBD <stdio.h>

67669 **CHANGE HISTORY**

67670 First released in Issue 1. Derived from Issue 1 of the SVID.

67671 **Issue 5**

67672 The last paragraph of the DESCRIPTION was included as an APPLICATION USAGE note in
67673 previous issues.

67674 **Issue 7**

67675 The *tempnam()* function is marked obsolescent.

67676 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0657 [291], XSH/TC1-2008/0658 [137], +
67677 and XSH/TC1-2008/0659 [137] are applied.

67678 **NAME**

67679 tfind — search binary search tree

67680 **SYNOPSIS**

```
67681 XSI      #include <search.h>
67682          void *tfind(const void *key, void *const *rootp,
67683                     int (*compar)(const void *, const void *));
```

67684 **DESCRIPTION**67685 Refer to *tdelete()*.

67686 **NAME**

67687 tgamma, tgammaf, tgammal — compute gamma() function

67688 **SYNOPSIS**

```
67689       #include <math.h>

67690       double tgamma(double x);
67691       float tgammaf(float x);
67692       long double tgammal(long double x);
```

67693 **DESCRIPTION**

67694 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 67695 conflict between the requirements described here and the ISO C standard is unintentional. This
 67696 volume of POSIX.1-2008 defers to the ISO C standard.

67697 These functions shall compute the *gamma()* function of *x*.

67698 An application wishing to check for error situations should set *errno* to zero and call
 67699 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 67700 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 67701 zero, an error has occurred.

67702 **RETURN VALUE**

67703 Upon successful completion, these functions shall return *Gamma(x)*.

67704 CX If *x* is a negative integer, a domain error may occur and either a NaN (if supported) or an
 67705 MX implementation-defined value shall be returned. On systems that support the IEC 60559
 67706 Floating-Point option, a domain error shall occur and a NaN shall be returned.

67707 If *x* is ± 0 , *tgamma()*, *tgammaf()*, and *tgammal()* shall return $\pm\text{HUGE\_VAL}$, $\pm\text{HUGE\_VALF}$, and
 67708 MX $\pm\text{HUGE\_VALL}$, respectively. On systems that support the IEC 60559 Floating-Point option, a
 67709 CX pole error shall occur; otherwise, a pole error may occur.

67710 If the correct value would cause overflow, a range error shall occur and *tgamma()*, *tgammaf()*,
 67711 and *tgammal()* shall return $\pm\text{HUGE\_VAL}$, $\pm\text{HUGE\_VALF}$, or $\pm\text{HUGE\_VALL}$, respectively, with
 67712 the same sign as the correct value of the function.

67713 MXX If the correct value would cause underflow, and is not representable, a range error may occur, +
 67714 MXX and *tgamma()*, *tgammaf()*, and *tgammal()* shall return 0.0, or (if IEC 60559 Floating-Point is not +
 67715 supported) an implementation-defined value no greater in magnitude than DBL_MIN, +
 67716 FLT_MIN, and LDBL_MIN, respectively. +

67717 MXX If the correct value would cause underflow, and is representable, a range error may occur and +
 67718 the correct value shall be returned. +

67719 MX If *x* is NaN, a NaN shall be returned.

67720 If *x* is +Inf, *x* shall be returned.

67721 If *x* is -Inf, a domain error shall occur, and a NaN shall be returned.

67722 **ERRORS**

67723 These functions shall fail if:

67724	MX	Domain Error	The value of <i>x</i> is a negative integer, or <i>x</i> is -Inf.
67725			If the integer expression (<i>math_errhandling</i> & MATH_ERRNO) is non-zero,
67726			then <i>errno</i> shall be set to [EDOM]. If the integer expression (<i>math_errhandling</i>
67727			& MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
67728			shall be raised.

67729	MX	Pole Error	The value of x is zero.	
67730			If the integer expression (<i>math_errhandling</i> & MATH_ERRNO) is non-zero,	
67731			then <i>errno</i> shall be set to [ERANGE]. If the integer expression	
67732			(<i>math_errhandling</i> & MATH_ERREXCEPT) is non-zero, then the divide-by-zero	
67733			floating-point exception shall be raised.	
67734		Range Error	The value overflows.	
67735			If the integer expression (<i>math_errhandling</i> & MATH_ERRNO) is non-zero,	
67736			then <i>errno</i> shall be set to [ERANGE]. If the integer expression	
67737			(<i>math_errhandling</i> & MATH_ERREXCEPT) is non-zero, then the overflow	
67738			floating-point exception shall be raised.	
67739		These functions may fail if:		
67740		Domain Error	The value of x is a negative integer.	
67741			If the integer expression (<i>math_errhandling</i> & MATH_ERRNO) is non-zero,	
67742			then <i>errno</i> shall be set to [EDOM]. If the integer expression (<i>math_errhandling</i>	
67743			& MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception	
67744			shall be raised.	
67745		Pole Error	The value of x is zero.	
67746			If the integer expression (<i>math_errhandling</i> & MATH_ERRNO) is non-zero,	
67747			then <i>errno</i> shall be set to [ERANGE]. If the integer expression	
67748			(<i>math_errhandling</i> & MATH_ERREXCEPT) is non-zero, then the divide-by-zero	
67749			floating-point exception shall be raised.	
67750		Range Error	The result underflows.	+

CHANGE HISTORY

67770 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

67771
67772 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/65 is applied, correcting the third
67773 paragraph in the RETURN VALUE section.

Issue 7

67774 ISO/IEC 9899:1999 standard, Technical Corrigendum 2 #52 (SD5-XSH-ERN-85) is applied.

67775
67776 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0660 [68], XSH/TC1-2008/0661 [320], +
67777 and XSH/TC1-2008/0662 [68] are applied.

67778 **NAME**

67779 time — get time

67780 **SYNOPSIS**

67781 #include <time.h>

67782 time_t time(time_t *tloc);

67783 **DESCRIPTION**

67784 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 67785 conflict between the requirements described here and the ISO C standard is unintentional. This
 67786 volume of POSIX.1-2008 defers to the ISO C standard.

67787 CX The *time()* function shall return the value of time in seconds since the Epoch.

67788 The *tloc* argument points to an area where the return value is also stored. If *tloc* is a null pointer,
 67789 no value is stored.

67790 **RETURN VALUE**

67791 Upon successful completion, *time()* shall return the value of time. Otherwise, (**time_t**)−1 shall be
 67792 returned.

67793 **ERRORS**

67794 The *time()* function may fail if:

67795 CX [**EOverflow**] The number of seconds since the Epoch will not fit in an object of type **time_t**.

67796

67797 **EXAMPLES**67798 **Getting the Current Time**

67799 The following example uses the *time()* function to calculate the time elapsed, in seconds, since
 67800 the Epoch, *localtime()* to convert that value to a broken-down time, and *asctime()* to convert the
 67801 broken-down time values into a printable string.

67802 #include <stdio.h>

67803 #include <time.h>

67804 int main(void)

67805 {

67806 time_t result;

67807 result = time(NULL);

67808 printf("%s%ju secs since the Epoch\n",

67809 asctime(localtime(&result)),

67810 (uintmax_t)result);

67811 return(0);

67812 }

67813 This example writes the current time to *stdout* in a form like this:

67814 Wed Jun 26 10:32:15 1996

67815 835810335 secs since the Epoch

Timing an Event

The following example gets the current time, prints it out in the user's format, and prints the number of minutes to an event being timed.

```
#include <time.h>
#include <stdio.h>
...
time_t now;
int minutes_to_event;
...
time(&now);
minutes_to_event = ...;
printf("The time is ");
puts(asctime(localtime(&now)));
printf("There are %d minutes to the event.\n",
      minutes_to_event);
...
```

APPLICATION USAGE

None.

RATIONALE

The *time()* function returns a value in seconds while *clock_gettime()* and *gettimeofday()* return a **struct timespec** (seconds and nanoseconds) and **struct timeval** (seconds and microseconds), respectively, and are therefore capable of returning more precise times. The *times()* function is also capable of more precision than *time()* as it returns a value in clock ticks, although it returns the elapsed time since an arbitrary point such as system boot time, not since the epoch.

Implementations in which **time_t** is a 32-bit signed integer (many historical implementations) fail in the year 2038. POSIX.1-2008 does not address this problem. However, the use of the **time_t** type is mandated in order to ease the eventual fix.

On some systems the *time()* function is implemented using a system call that does not return an error condition in addition to the return value. On these systems it is impossible to differentiate between valid and invalid return values and hence overflow conditions cannot be reliably detected.

The use of the **<time.h>** header instead of **<sys/types.h>** allows compatibility with the ISO C standard.

Many historical implementations (including Version 7) and the 1984 /usr/group standard use **long** instead of **time_t**. This volume of POSIX.1-2008 uses the latter type in order to agree with the ISO C standard.

FUTURE DIRECTIONS

In a future version of this volume of POSIX.1-2008, **time_t** is likely to be required to be capable of representing times far in the future. Whether this will be mandated as a 64-bit type or a requirement that a specific date in the future be representable (for example, 10000 AD) is not yet determined. Systems purchased after the approval of this volume of POSIX.1-2008 should be evaluated to determine whether their lifetime will extend past 2038.

67871 NAME

67872 timer_create — create a per-process timer

67873 SYNOPSIS

```

67874 CX      #include <signal.h>
67875          #include <time.h>
67876
67876          int timer_create(clockid_t clockid, struct sigevent *restrict evp,
67877                          timer_t *restrict timerid);

```

67878 DESCRIPTION

67879 The *timer_create()* function shall create a per-process timer using the specified clock, *clock_id*, as
 67880 the timing base. The *timer_create()* function shall return, in the location referenced by *timerid*, a
 67881 timer ID of type **timer_t** used to identify the timer in timer requests. This timer ID shall be
 67882 unique within the calling process until the timer is deleted. The particular clock, *clock_id*, is
 67883 defined in **<time.h>**. The timer whose ID is returned shall be in a disarmed state upon return
 67884 from *timer_create()*.

67885 The *evp* argument, if non-NULL, points to a **sigevent** structure. This structure, allocated by the
 67886 application, defines the asynchronous notification to occur as specified in [Section 2.4.1](#) (on page
 67887 488) when the timer expires. If the *evp* argument is NULL, the effect is as if the *evp* argument
 67888 pointed to a **sigevent** structure with the *sigev_notify* member having the value SIGEV_SIGNAL,
 67889 the *sigev_signo* having a default signal number, and the *sigev_value* member having the value of
 67890 the timer ID.

67891 Each implementation shall define a set of clocks that can be used as timing bases for per-process
 67892 MON timers. All implementations shall support a *clock_id* of CLOCK_REALTIME. If the Monotonic
 67893 Clock option is supported, implementations shall support a *clock_id* of CLOCK_MONOTONIC.

67894 Per-process timers shall not be inherited by a child process across a *fork()* and shall be disarmed
 67895 and deleted by an *exec*.

67896 CPT If _POSIX_CPUTIME is defined, implementations shall support *clock_id* values representing the
 67897 CPU-time clock of the calling process.

67898 TCT If _POSIX_THREAD_CPUTIME is defined, implementations shall support *clock_id* values
 67899 representing the CPU-time clock of the calling thread.

67900 CPT|TCT It is implementation-defined whether a *timer_create()* function will succeed if the value defined
 67901 by *clock_id* corresponds to the CPU-time clock of a process or thread different from the process
 67902 or thread invoking the function.

67903 TSA If *evp->sigev_sigev_notify* is SIGEV_THREAD and *sev->sigev_notify_attributes* is not NULL, if the
 67904 attribute pointed to by *sev->sigev_notify_attributes* has a thread stack address specified by a call
 67905 to *pthread_attr_setstack()*, the results are unspecified if the signal is generated more than once.

67906 RETURN VALUE

67907 If the call succeeds, *timer_create()* shall return zero and update the location referenced by *timerid*
 67908 to a **timer_t**, which can be passed to the per-process timer calls. If an error occurs, the function
 67909 shall return a value of -1 and set *errno* to indicate the error. The value of *timerid* is undefined if
 67910 an error occurs.

67911 ERRORS

67912 The *timer_create()* function shall fail if:

67913 [EAGAIN] The system lacks sufficient signal queuing resources to honor the request.

67914	[EAGAIN]	The calling process has already created all of the timers it is allowed by this implementation.
67915		
67916	[EINVAL]	The specified clock ID is not defined.
67917	CPT TCT [ENOTSUP]	The implementation does not support the creation of a timer attached to the CPU-time clock that is specified by <i>clock_id</i> and associated with a process or thread different from the process or thread invoking <i>timer_create()</i> .
67918		
67919		

EXAMPLES

None.

APPLICATION USAGE

If a timer is created which has *evp->sigev_sigev_notify* set to SIGEV_THREAD and the attribute pointed to by *evp->sigev_notify_attributes* has a thread stack address specified by a call to *pthread_attr_setstack()*, the memory dedicated as a thread stack cannot be recovered. The reason for this is that the threads created in response to a timer expiration are created detached, or in an unspecified way if the thread attribute's *detachstate* is PTHREAD_CREATE_JOINABLE. In neither case is it valid to call *pthread_join()*, which makes it impossible to determine the lifetime of the created thread which thus means the stack memory cannot be reused.

RATIONALE**Periodic Timer Overrun and Resource Allocation**

The specified timer facilities may deliver realtime signals (that is, queued signals) on implementations that support this option. Since realtime applications cannot afford to lose notifications of asynchronous events, like timer expirations or asynchronous I/O completions, it must be possible to ensure that sufficient resources exist to deliver the signal when the event occurs. In general, this is not a difficulty because there is a one-to-one correspondence between a request and a subsequent signal generation. If the request cannot allocate the signal delivery resources, it can fail the call with an [EAGAIN] error.

Periodic timers are a special case. A single request can generate an unspecified number of signals. This is not a problem if the requesting process can service the signals as fast as they are generated, thus making the signal delivery resources available for delivery of subsequent periodic timer expiration signals. But, in general, this cannot be assured—processing of periodic timer signals may “overrun”; that is, subsequent periodic timer expirations may occur before the currently pending signal has been delivered.

Also, for signals, according to the POSIX.1-1990 standard, if subsequent occurrences of a pending signal are generated, it is implementation-defined whether a signal is delivered for each occurrence. This is not adequate for some realtime applications. So a mechanism is required to allow applications to detect how many timer expirations were delayed without requiring an indefinite amount of system resources to store the delayed expirations.

The specified facilities provide for an overrun count. The overrun count is defined as the number of extra timer expirations that occurred between the time a timer expiration signal is generated and the time the signal is delivered. The signal-catching function, if it is concerned with overruns, can retrieve this count on entry. With this method, a periodic timer only needs one “signal queuing resource” that can be allocated at the time of the *timer_create()* function call.

A function is defined to retrieve the overrun count so that an application need not allocate static storage to contain the count, and an implementation need not update this storage asynchronously on timer expirations. But, for some high-frequency periodic applications, the overhead of an additional system call on each timer expiration may be prohibitive. The functions, as defined, permit an implementation to maintain the overrun count in user space,

associated with the *timerid*. The *timer_getoverrun()* function can then be implemented as a macro that uses the *timerid* argument (which may just be a pointer to a user space structure containing the counter) to locate the overrun count with no system call overhead. Other implementations, less concerned with this class of applications, can avoid the asynchronous update of user space by maintaining the count in a system structure at the cost of the extra system call to obtain it.

Timer Expiration Signal Parameters

The Realtime Signals Extension option supports an application-specific datum that is delivered to the extended signal handler. This value is explicitly specified by the application, along with the signal number to be delivered, in a **sigevent** structure. The type of the application-defined value can be either an integer constant or a pointer. This explicit specification of the value, as opposed to always sending the timer ID, was selected based on existing practice.

It is common practice for realtime applications (on non-POSIX systems or realtime extended POSIX systems) to use the parameters of event handlers as the case label of a switch statement or as a pointer to an application-defined data structure. Since *timer_ids* are dynamically allocated by the *timer_create()* function, they can be used for neither of these functions without additional application overhead in the signal handler; for example, to search an array of saved timer IDs to associate the ID with a constant or application data structure.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6

The *timer_create()* function is marked as part of the Timers option.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Timers option.

CPU-time clocks are added for alignment with IEEE Std 1003.1d-1999.

The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by adding the requirement for the CLOCK_MONOTONIC clock under the Monotonic Clock option.

The **restrict** keyword is added to the *timer_create()* prototype for alignment with the ISO/IEC 9899:1999 standard.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/138 is applied, updating the DESCRIPTION and APPLICATION USAGE sections to describe the case when a timer is created with the notification method set to SIGEV_THREAD.

Issue 7

The *timer_create()* function is moved from the Timers option to the Base.

67998 **NAME**

67999 timer_delete — delete a per-process timer

68000 **SYNOPSIS**

```
68001 CX      #include <time.h>
68002          int timer_delete(timer_t timerid);
```

68003 **DESCRIPTION**

68004 The *timer_delete()* function deletes the specified timer, *timerid*, previously created by the
 68005 *timer_create()* function. If the timer is armed when *timer_delete()* is called, the behavior shall be
 68006 as if the timer is automatically disarmed before removal. The disposition of pending signals for
 68007 the deleted timer is unspecified.

68008 **RETURN VALUE**

68009 If successful, the *timer_delete()* function shall return a value of zero. Otherwise, the function shall
 68010 return a value of -1 and set *errno* to indicate the error.

68011 **ERRORS**

68012 The *timer_delete()* function may fail if:

68013 [EINVAL] The timer ID specified by *timerid* is not a valid timer ID.

68014 **EXAMPLES**

68015 None.

68016 **APPLICATION USAGE**

68017 None.

68018 **RATIONALE**

68019 None.

68020 **FUTURE DIRECTIONS**

68025 **CHANGE HISTORY**

68026 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

68027 **Issue 6**

68028 The *timer_delete()* function is marked as part of the Timers option.

68029 The [ENOSYS] error condition has been removed as stubs need not be provided if an
 68030 implementation does not support the Timers option.

68031 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/139 is applied, updating the ERRORS
 68032 section so that the [EINVAL] error becomes optional.

68033 **Issue 7**

68034 The *timer_delete()* function is moved from the Timers option to the Base.

NAME

timer_getoverrun, timer_gettime, timer_settime — per-process timers

SYNOPSIS

```
#include <time.h>

int timer_getoverrun(timer_t timerid);
int timer_gettime(timer_t timerid, struct itimerspec *value);
int timer_settime(timer_t timerid, int flags,
    const struct itimerspec *restrict value,
    struct itimerspec *restrict ovalue);
```

DESCRIPTION

The *timer_gettime()* function shall store the amount of time until the specified timer, *timerid*, expires and the reload value of the timer into the space pointed to by the *value* argument. The *it_value* member of this structure shall contain the amount of time before the timer expires, or zero if the timer is disarmed. This value is returned as the interval until timer expiration, even if the timer was armed with absolute time. The *it_interval* member of *value* shall contain the reload value last set by *timer_settime()*.

The *timer_settime()* function shall set the time until the next expiration of the timer specified by *timerid* from the *it_value* member of the *value* argument and arm the timer if the *it_value* member of *value* is non-zero. If the specified timer was already armed when *timer_settime()* is called, this call shall reset the time until next expiration to the *value* specified. If the *it_value* member of *value* is zero, the timer shall be disarmed. The effect of disarming or resetting a timer with pending expiration notifications is unspecified.

If the flag *TIMER_ABSTIME* is not set in the argument *flags*, *timer_settime()* shall behave as if the time until next expiration is set to be equal to the interval specified by the *it_value* member of *value*. That is, the timer shall expire in *it_value* nanoseconds from when the call is made. If the flag *TIMER_ABSTIME* is set in the argument *flags*, *timer_settime()* shall behave as if the time until next expiration is set to be equal to the difference between the absolute time specified by the *it_value* member of *value* and the current value of the clock associated with *timerid*. That is, the timer shall expire when the clock reaches the value specified by the *it_value* member of *value*. If the specified time has already passed, the function shall succeed and the expiration notification shall be made.

The reload value of the timer shall be set to the value specified by the *it_interval* member of *value*. When a timer is armed with a non-zero *it_interval*, a periodic (or repetitive) timer is specified.

Time values that are between two consecutive non-negative integer multiples of the resolution of the specified timer shall be rounded up to the larger multiple of the resolution. Quantization error shall not cause the timer to expire earlier than the rounded time value.

If the argument *ovalue* is not NULL, the *timer_settime()* function shall store, in the location referenced by *ovalue*, a value representing the previous amount of time before the timer would have expired, or zero if the timer was disarmed, together with the previous timer reload value. Timers shall not expire before their scheduled time.

Only a single signal shall be queued to the process for a given timer at any point in time. When a timer for which a signal is still pending expires, no signal shall be queued, and a timer overrun shall occur. When a timer expiration signal is delivered to or accepted by a process, the *timer_getoverrun()* function shall return the timer expiration overrun count for the specified timer. The overrun count returned contains the number of extra timer expirations that occurred between the time the signal was generated (queued) and when it was delivered or accepted, up

to but not including an implementation-defined maximum of {DELAYTIMER_MAX}. If the number of such extra expirations is greater than or equal to {DELAYTIMER_MAX}, then the overrun count shall be set to {DELAYTIMER_MAX}. The value returned by *timer_getoverrun()* shall apply to the most recent expiration signal delivery or acceptance for the timer. If no expiration signal has been delivered for the timer, the return value of *timer_getoverrun()* is unspecified.

RETURN VALUE

If the *timer_getoverrun()* function succeeds, it shall return the timer expiration overrun count as explained above.

If the *timer_gettime()* or *timer_settime()* functions succeed, a value of 0 shall be returned.

If an error occurs for any of these functions, the value -1 shall be returned, and *errno* set to indicate the error.

ERRORS

The *timer_settime()* function shall fail if:

[EINVAL] A *value* structure specified a nanosecond value less than zero or greater than or equal to 1 000 million, and the *it_value* member of that structure did not specify zero seconds and nanoseconds.

These functions may fail if:

[EINVAL] The *timerid* argument does not correspond to an ID returned by *timer_create()* but not yet deleted by *timer_delete()*.

The *timer_settime()* function may fail if:

[EINVAL] The *it_interval* member of *value* is not zero and the timer was created with notification by creation of a new thread (*sigev_sigev_notify* was SIGEV_THREAD) and a fixed stack address has been set in the thread attribute pointed to by *sigev_notify_attributes*.

EXAMPLES

None.

APPLICATION USAGE

Using fixed stack addresses is problematic when timer expiration is signaled by the creation of a new thread. Since it cannot be assumed that the thread created for one expiration is finished before the next expiration of the timer, it could happen that two threads use the same memory as a stack at the same time. This is invalid and produces undefined results.

RATIONALE

Practical clocks tick at a finite rate, with rates of 100 hertz and 1 000 hertz being common. The inverse of this tick rate is the clock resolution, also called the clock granularity, which in either case is expressed as a time duration, being 10 milliseconds and 1 millisecond respectively for these common rates. The granularity of practical clocks implies that if one reads a given clock twice in rapid succession, one may get the same time value twice; and that timers must wait for the next clock tick after the theoretical expiration time, to ensure that a timer never returns too soon. Note also that the granularity of the clock may be significantly coarser than the resolution of the data format used to set and get time and interval values. Also note that some implementations may choose to adjust time and/or interval values to exactly match the ticks of the underlying clock.

This volume of POSIX.1-2008 defines functions that allow an application to determine the implementation-supported resolution for the clocks and requires an implementation to

document the resolution supported for timers and *nanosleep()* if they differ from the supported clock resolution. This is more of a procurement issue than a runtime application issue.

FUTURE DIRECTIONS

None.

XBD <time.h>

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6

The *timer_getoverrun()*, *timer_gettime()*, and *timer_settime()* functions are marked as part of the Timers option.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Timers option.

The [EINVAL] error condition is updated to include the following: “and the *it_value* member of that structure did not specify zero seconds and nanoseconds.” This change is for IEEE PASC Interpretation 1003.1 #89.

The DESCRIPTION for *timer_getoverrun()* is updated to clarify that “If no expiration signal has been delivered for the timer, or if the Realtime Signals Extension is not supported, the return value of *timer_getoverrun()* is unspecified”.

The **restrict** keyword is added to the *timer_settime()* prototype for alignment with the ISO/IEC 9899:1999 standard.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/140 is applied, updating the ERRORS section so that the mandatory [EINVAL] error (“The *timerid* argument does not correspond to an ID returned by *timer_create()* but not yet deleted by *timer_delete()*”) becomes optional.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/141 is applied, updating the ERRORS section to include an optional [EINVAL] error for the case when a timer is created with the notification method set to SIGEV_THREAD. APPLICATION USAGE text is also added.

Issue 7

The *timer_getoverrun()*, *timer_gettime()*, and *timer_settime()* functions are moved from the Timers option to the Base.

Functionality relating to the Realtime Signals Extension option is moved to the Base.

NAME

times — get process and waited-for child process times

SYNOPSIS

```
#include <sys/times.h>

clock_t times(struct tms *buffer);
```

DESCRIPTION

The *times()* function shall fill the **tms** structure pointed to by *buffer* with time-accounting information. The **tms** structure is defined in **<sys/times.h>**.

All times are measured in terms of the number of clock ticks used.

The times of a terminated child process shall be included in the *tms_cutime* and *tms_cstime* elements of the parent when *wait()*, *waitid()*, or *waitpid()* returns the process ID of this terminated child. If a child process has not waited for its children, their times shall not be included in its times.

- The *tms_utime* structure member is the CPU time charged for the execution of user instructions of the calling process.
- The *tms_stime* structure member is the CPU time charged for execution by the system on behalf of the calling process.
- The *tms_cutime* structure member is the sum of the *tms_utime* and *tms_cutime* times of the child processes.
- The *tms_cstime* structure member is the sum of the *tms_stime* and *tms_cstime* times of the child processes.

RETURN VALUE

Upon successful completion, *times()* shall return the elapsed real time, in clock ticks, since an arbitrary point in the past (for example, system start-up time). This point does not change from one invocation of *times()* within the process to another. The return value may overflow the possible range of type **clock_t**. If *times()* fails, **(clock_t)-1** shall be returned and *errno* set to indicate the error.

ERRORS

No errors are defined.

EXAMPLES**Timing a Database Lookup**

The following example defines two functions, *start_clock()* and *end_clock()*, that are used to time a lookup. It also defines variables of type **clock_t** and **tms** to measure the duration of transactions. The *start_clock()* function saves the beginning times given by the *times()* function. The *end_clock()* function gets the ending times and prints the difference between the two times.

```
#include <sys/times.h>
#include <stdio.h>
...
void start_clock(void);
void end_clock(char *msg);
...
static clock_t st_time;
static clock_t en_time;
static struct tms st_cpu;
```

```

68203     static struct tms en_cpu;
68204     ...
68205     void
68206     start_clock()
68207     {
68208         st_time = times(&st_cpu);
68209     }

68210     /* This example assumes that the result of each subtraction
68211        is within the range of values that can be represented in
68212        an integer type. */
68213     void
68214     end_clock(char *msg)
68215     {
68216         en_time = times(&en_cpu);
68217         fputs(msg, stdout);
68218         printf("Real Time: %jd, User Time %jd, System Time %jd\n",
68219             (intmax_t)(en_time - st_time),
68220             (intmax_t)(en_cpu.tms_utime - st_cpu.tms_utime),
68221             (intmax_t)(en_cpu.tms_stime - st_cpu.tms_stime));
68222     }

```

APPLICATION USAGE

Applications should use `sysconf(_SC_CLK_TCK)` to determine the number of clock ticks per second as it may vary from system to system.

RATIONALE

The accuracy of the times reported is intentionally left unspecified to allow implementations flexibility in design, from uniprocessor to multi-processor networks.

The inclusion of times of child processes is recursive, so that a parent process may collect the total times of all of its descendants. But the times of a child are only added to those of its parent when its parent successfully waits on the child. Thus, it is not guaranteed that a parent process can always see the total times of all its descendants; see also the discussion of the term “realtime” in [alarm\(\)](#).

If the type `clock_t` is defined to be a signed 32-bit integer, it overflows in somewhat more than a year if there are 60 clock ticks per second, or less than a year if there are 100. There are individual systems that run continuously for longer than that. This volume of POSIX.1-2008 permits an implementation to make the reference point for the returned value be the start-up time of the process, rather than system start-up time.

The term “charge” in this context has nothing to do with billing for services. The operating system accounts for time used in this way. That information must be correct, regardless of how that information is used.

FUTURE DIRECTIONS

None.

68248

CHANGE HISTORY
First released in Issue 1. Derived from Issue 1 of the SVID.

68249 NAME

68250 timezone — difference from UTC and local standard time

68251 SYNOPSIS

```
68252 XSI      #include <time.h>
68253          extern long timezone;
```

68254 DESCRIPTION

68255 Refer to *tzset()*.

68256 **NAME**

68257 tmpfile — create a temporary file

68258 **SYNOPSIS**

68259 #include <stdio.h>

68260 FILE *tmpfile(void);

68261 **DESCRIPTION**

68262 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 68263 conflict between the requirements described here and the ISO C standard is unintentional. This
 68264 volume of POSIX.1-2008 defers to the ISO C standard.

68265 The *tmpfile()* function shall create a temporary file and open a corresponding stream. The file
 68266 shall be automatically deleted when all references to the file are closed. The file is opened as in
 68267 *fopen()* for update (*w+*), except that implementations may restrict the permissions, either by
 68268 clearing the file mode bits or setting them to the value *S_IRUSR* | *S_IWUSR*.

68269 CX In some implementations, a permanent file may be left behind if the process calling *tmpfile()* is
 68270 killed while it is processing a call to *tmpfile()*.

68271 An error message may be written to standard error if the stream cannot be opened.

68272 **RETURN VALUE**

68273 Upon successful completion, *tmpfile()* shall return a pointer to the stream of the file that is
 68274 CX created. Otherwise, it shall return a null pointer and set *errno* to indicate the error.

68275 **ERRORS**68276 The *tmpfile()* function shall fail if:

68277 CX [EINTR] A signal was caught during *tmpfile()*.

68278 CX [EMFILE] All file descriptors available to the process are currently open.

68279 CX [EMFILE] {STREAM_MAX} streams are currently open in the calling process.

68280 CX [ENFILE] The maximum allowable number of files is currently open in the system.

68281 CX [ENOSPC] The directory or file system which would contain the new file cannot be
 68282 expanded.

68283 CX [EOVERFLOW] The file is a regular file and the size of the file cannot be represented correctly
 68284 in an object of type *off_t*.

68285 The *tmpfile()* function may fail if:

68286 CX [EMFILE] {FOPEN_MAX} streams are currently open in the calling process.

68287 CX [ENOMEM] Insufficient storage space is available.

68288 **EXAMPLES**68289 **Creating a Temporary File**

68290 The following example creates a temporary file for update, and returns a pointer to a stream for
 68291 the created file in the *fp* variable.

68292 #include <stdio.h>

68293 ...

68294 FILE *fp;

68295 fp = tmpfile ();

APPLICATION USAGE

It should be possible to open at least {TMP_MAX} temporary files during the lifetime of the program (this limit may be shared with *tmpnam()*) and there should be no limit on the number simultaneously open other than this limit and any limit on the number of open file descriptors or streams ({OPEN_MAX}, {FOPEN_MAX}, {STREAM_MAX}).

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

Section 2.5 (on page 495), *fopen()*, *mkdtemp()*, *tmpnam()*, *unlink()*

XBD <stdio.h>

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

Large File Summit extensions are added.

The last two paragraphs of the DESCRIPTION were included as APPLICATION USAGE notes in previous issues.

Issue 6

Extensions beyond the ISO C standard are marked.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In the ERRORS section, the [EOVERFLOW] condition is added. This change is to support large files.
- The [EMFILE] optional error condition is added.

The APPLICATION USAGE section is added for alignment with the ISO/IEC 9899:1999 standard.

Issue 7

Austin Group Interpretation 1003.1-2001 #025 is applied, clarifying that implementations may restrict the permissions of the file created.

SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.

SD5-XSH-ERN-149 is applied, adding the mandatory [EMFILE] error condition for {STREAM_MAX} streams open.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0668 [14] is applied.

+

68330 **NAME**

68331 tmpnam — create a name for a temporary file

68332 **SYNOPSIS**

```
68333 OB      #include <stdio.h>
68334      char *tmpnam(char *s);
```

68335 **DESCRIPTION**

68336 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 68337 conflict between the requirements described here and the ISO C standard is unintentional. This
 68338 volume of POSIX.1-2008 defers to the ISO C standard.

68339 The *tmpnam()* function shall generate a string that is a valid pathname that does not name an
 68340 existing file. The function is potentially capable of generating {TMP_MAX} different strings, but
 68341 any or all of them may already be in use by existing files and thus not be suitable return values.

68342 The *tmpnam()* function generates a different string each time it is called from the same process,
 68343 up to {TMP_MAX} times. If it is called more than {TMP_MAX} times, the behavior is
 68344 implementation-defined.

68345 The implementation shall behave as if no function defined in this volume of POSIX.1-2008,
 68346 except *tmpnam()*, calls *tmpnam()*.

68347 CX The *tmpnam()* function need not be thread-safe if called with a NULL parameter.

68348 **RETURN VALUE**

68349 Upon successful completion, *tmpnam()* shall return a pointer to a string. If no suitable string can
 68350 be generated, the *tmpnam()* function shall return a null pointer.

68351 If the argument *s* is a null pointer, *tmpnam()* shall leave its result in an internal static object and
 68352 return a pointer to that object. Subsequent calls to *tmpnam()* may modify the same object. If the
 68353 argument *s* is not a null pointer, it is presumed to point to an array of at least L_tmpnam **chars**;
 68354 *tmpnam()* shall write its result in that array and shall return the argument as its value.

68355 **ERRORS**

68356 No errors are defined.

68357 **EXAMPLES**68358 **Generating a Pathname**

68359 The following example generates a unique pathname and stores it in the array pointed to by *ptr*.

```
68360 #include <stdio.h>
68361 ...
68362 char pathname[L_tmpnam+1];
68363 char *ptr;
68364 ptr = tmpnam(pathname);
```

68365 **APPLICATION USAGE**

68366 This function only creates pathnames. It is the application's responsibility to create and remove
 68367 the files.

68368 Between the time a pathname is created and the file is opened, it is possible for some other
 68369 process to create a file with the same name. Applications may find *tmpfile()* more useful.

68370 Applications should use the *tmpfile()*, *mkstemp()*, or *mkdtemp()* functions instead of the
 68371 obsolescent *tmpnam()* function.

68372 **RATIONALE**

68373 None.

68374 **FUTURE DIRECTIONS**68375 The *tmpnam()* function may be removed in a future version.68376 **SEE ALSO**68377 *fopen()*, *open()*, *mkdtemp()*, *tempnam()*, *tmpfile()*, *unlink()*

68378 XBD <stdio.h>

68379 **CHANGE HISTORY**

68380 First released in Issue 1. Derived from Issue 1 of the SVID.

68381 **Issue 5**

68382 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

68383 **Issue 6**

68384 Extensions beyond the ISO C standard are marked.

68385 The normative text is updated to avoid use of the term “must” for application requirements.

68386 The DESCRIPTION is expanded for alignment with the ISO/IEC 9899:1999 standard.

68387 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/142 is applied, updating the
68388 DESCRIPTION to allow implementations of the *tempnam()* function to call *tmpnam()*.68389 **Issue 7**68390 Austin Group Interpretation 1003.1-2001 #148 is applied, clarifying that the *tmpnam()* function
68391 need not be thread-safe if called with a NULL parameter.68392 The *tmpnam()* function is marked obsolescent.68393 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0669 [291] and XSH/TC1-2008/0670 +
68394 [291,429] are applied.

68395 NAME

68396 toascii — translate an integer to a 7-bit ASCII character

68397 SYNOPSIS

```
68398 OB XSI  #include <ctype.h>
68399         int toascii(int c);
```

68400 DESCRIPTION

68401 The *toascii()* function shall convert its argument into a 7-bit ASCII character.

68402 RETURN VALUE

68403 The *toascii()* function shall return the value (*c* &0x7f).

68404 ERRORS

68405 No errors are returned.

68406 EXAMPLES

68407 None.

68408 APPLICATION USAGE

68409 The *toascii()* function cannot be used portably in a localized application.

68410 RATIONALE

68411 None.

68412 FUTURE DIRECTIONS

68413 The *toascii()* function may be removed in a future version.

68414 SEE ALSO

68415 *isascii()*

68416 XBD <ctype.h>

68417 CHANGE HISTORY

68418 First released in Issue 1. Derived from Issue 1 of the SVID.

68419 Issue 7

68420 The *toascii()* function is marked obsolescent.

68421 **NAME**

68422 tolower, tolower_l — transliterate uppercase characters to lowercase

68423 **SYNOPSIS**

68424 #include <ctype.h>

68425 int tolower(int c);

68426 CX int tolower_l(int c, locale_t locale);

68427 **DESCRIPTION**

68428 CX For *tolower()*: The functionality described on this reference page is aligned with the ISO C
 68429 standard. Any conflict between the requirements described here and the ISO C standard is
 68430 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

68431 CX The *tolower()* and *tolower_l()* functions have as a domain a type **int**, the value of which is
 68432 representable as an **unsigned char** or the value of EOF. If the argument has any other value, the
 68433 CX behavior is undefined. If the argument of *tolower()* or *tolower_l()* represents an uppercase letter,
 68434 and there exists a corresponding lowercase letter as defined by character type information in the
 68435 CX current locale or in the locale represented by *locale*, respectively (category *LC_CTYPE*), the
 68436 result shall be the corresponding lowercase letter. All other arguments in the domain are
 68437 returned unchanged.

68438 CX The behavior is undefined if the *locale* argument to *tolower_l()* is the special locale object
 68439 LC_GLOBAL_LOCALE or is not a valid locale object handle.

68440 **RETURN VALUE**

68441 CX Upon successful completion, the *tolower()* and *tolower_l()* functions shall return the lowercase
 68442 letter corresponding to the argument passed; otherwise, they shall return the argument
 68443 unchanged.

68444 **ERRORS**

68445 No errors are defined.

68446 **EXAMPLES**

68447 None.

68448 **APPLICATION USAGE**

68449 None.

68450 **RATIONALE**

68451 None.

68452 **FUTURE DIRECTIONS**

68453 None.

68456 XBD Chapter 7 (on page 135), <ctype.h>, <locale.h>

68457 **CHANGE HISTORY**

68458 First released in Issue 1. Derived from Issue 1 of the SVID.

68459 **Issue 6**

68460 Extensions beyond the ISO C standard are marked.

68461 **Issue 7**

68462 The *tolower_l()* function is added from The Open Group Technical Standard, 2006, Extended API
68463 Set Part 4.

68464 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0671 [283] and XSH/TC1-2008/0672 +
68465 [283] are applied.

68466 **NAME**

68467 toupper, toupper_l — transliterate lowercase characters to uppercase

68468 **SYNOPSIS**

```
68469       #include <ctype.h>
68470       int toupper(int c);
68471 CX     int toupper_l(int c, locale_t locale);
```

68472 **DESCRIPTION**

68473 CX For *toupper()*: The functionality described on this reference page is aligned with the ISO C
68474 standard. Any conflict between the requirements described here and the ISO C standard is
68475 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

68476 CX The *toupper()* and *toupper_l()* functions have as a domain a type **int**, the value of which is
68477 representable as an **unsigned char** or the value of EOF. If the argument has any other value, the
68478 behavior is undefined.

68479 CX If the argument of *toupper()* or *toupper_l()* represents a lowercase letter, and there exists a
68480 CX corresponding uppercase letter as defined by character type information in the current locale or
68481 in the locale represented by *locale*, respectively (category *LC_CTYPE*), the result shall be the
68482 corresponding uppercase letter.

68483 All other arguments in the domain are returned unchanged.

68484 CX The behavior is undefined if the *locale* argument to *toupper_l()* is the special locale object +
68485 LC_GLOBAL_LOCALE or is not a valid locale object handle.

68486 **RETURN VALUE**

68487 CX Upon successful completion, *toupper()* and *toupper_l()* shall return the uppercase letter
68488 corresponding to the argument passed; otherwise, they shall return the argument unchanged.

68489 **ERRORS**

68490 No errors are defined.

68491 **EXAMPLES**

68492 None.

68493 **APPLICATION USAGE**

68494 None.

68495 **RATIONALE**

68496 None.

68497 **FUTURE DIRECTIONS**

68498 None.

68499 **SEE ALSO**

68500 *setlocale()*, *uselocale()*
68501 XBD Chapter 7 (on page 135), *<ctype.h>*, *<locale.h>*

68502 **CHANGE HISTORY**

68503 First released in Issue 1. Derived from Issue 1 of the SVID.

68504 **Issue 6**

68505 Extensions beyond the ISO C standard are marked.

Issue 7

SD5-XSH-ERN-181 is applied, clarifying the RETURN VALUE section.

The *toupper_1()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0673 [283] and XSH/TC1-2008/0674 + [283] are applied.

68512 **NAME**

68513 towctrans, towctrans_l — wide-character transliteration

68514 **SYNOPSIS**

```
68515 #include <wctype.h>
68516 wint_t towctrans(wint_t wc, wctrans_t desc);
68517 CX wint_t towctrans_l(wint_t wc, wctrans_t desc,
68518 locale_t locale);
```

68519 **DESCRIPTION**

68520 CX For *towctrans()*: The functionality described on this reference page is aligned with the ISO C
 68521 standard. Any conflict between the requirements described here and the ISO C standard is
 68522 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

68523 CX The *towctrans()* and *towctrans_l()* functions shall transliterate the wide-character code *wc* using
 68524 the mapping described by *desc*.

68525 CX The current setting of the *LC_CTYPE* category in the current locale or in the locale represented
 68526 CX by *locale*, respectively, should be the same as during the call to *wctrans()* or *wctrans_l()* that
 68527 returned the value *desc*.

68528 If the value of *desc* is invalid (that is, not obtained by a call to *wctrans()* or *desc* is invalidated by a
 68529 subsequent call to *setlocale()* that has affected category *LC_CTYPE*), the result is unspecified.

68530 CX If the value of *desc* is invalid (that is, not obtained by a call to *wctrans_l()* with the same locale
 68531 object *locale*) the result is unspecified.

68532 CX An application wishing to check for error situations should set *errno* to 0 before calling
 68533 *towctrans()* or *towctrans_l()*.

68534 If *errno* is non-zero on return, an error has occurred.

68535 The behavior is undefined if the *locale* argument to *towctrans_l()* is the special locale object +
 68536 *LC_GLOBAL_LOCALE* or is not a valid locale object handle.

68537 **RETURN VALUE**

68538 CX If successful, the *towctrans()* and *towctrans_l()* functions shall return the mapped value of *wc*
 68539 using the mapping described by *desc*. Otherwise, they shall return *wc* unchanged.

68540 **ERRORS**

68541 These functions may fail if:

68542 CX [EINVAL] *desc* contains an invalid transliteration descriptor.

68543 **EXAMPLES**

68544 None.

68545 **APPLICATION USAGE**

68546 The strings "tolower" and "toupper" are reserved for the standard mapping names. In the
 68547 table below, the functions in the left column are equivalent to the functions in the right column.

68548 tolower(<i>wc</i>)	towctrans(<i>wc</i> , wctrans("tolower"))
68549 tolower_l(<i>wc</i> , <i>locale</i>)	towctrans_l(<i>wc</i> , wctrans("tolower"), <i>locale</i>)
68550 toupper(<i>wc</i>)	towctrans(<i>wc</i> , wctrans("toupper"))
68551 toupper_l(<i>wc</i> , <i>locale</i>)	towctrans_l(<i>wc</i> , wctrans("toupper"), <i>locale</i>)

68552 RATIONALE

68553 None.

68554 FUTURE DIRECTIONS

68555 None.

68558 XBD **<wctype.h>**

68559 CHANGE HISTORY

68560 First released in Issue 5. Derived from ISO/IEC 9899:1990/Amendment 1:1995 (E).

68561 Issue 6

68562 Extensions beyond the ISO C standard are marked.

68563 Issue 7

68564 The *towctrans_l()* function is added from The Open Group Technical Standard, 2006, Extended
68565 API Set Part 4.

68566 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0675 [302], XSH/TC1-2008/0676 [283], +
68567 and XSH/TC1-2008/0677 [283] are applied.

68568 **NAME**

68569 **towlower, towlower_l** — transliterate uppercase wide-character code to lowercase

68570 **SYNOPSIS**

68571 `#include <wctype.h>`

68572 `wint_t towlower(wint_t wc);`

68573 CX `wint_t towlower_l(wint_t wc, locale_t locale);`

68574 **DESCRIPTION**

68575 CX For *towlower()*: The functionality described on this reference page is aligned with the ISO C
68576 standard. Any conflict between the requirements described here and the ISO C standard is
68577 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

68578 CX The *towlower()* and *towlower_l()* functions have as a domain a type **wint_t**, the value of which
68579 the application shall ensure is a character representable as a **wchar_t**, and a wide-character code
68580 corresponding to a valid character in the current locale or the value of WEOF. If the argument
68581 CX has any other value, the behavior is undefined. If the argument of *towlower()* or *towlower_l()*
68582 represents an uppercase wide-character code, and there exists a corresponding lowercase wide-
68583 CX character code as defined by character type information in the current locale or in the locale
68584 represented by *locale*, respectively (category *LC_CTYPE*), the result shall be the corresponding
68585 lowercase wide-character code. All other arguments in the domain are returned unchanged.

68586 CX The behavior is undefined if the *locale* argument to *towlower_l()* is the special locale object
68587 *LC_GLOBAL_LOCALE* or is not a valid locale object handle.

68588 **RETURN VALUE**

68589 CX Upon successful completion, the *towlower()* and *towlower_l()* functions shall return the
68590 lowercase letter corresponding to the argument passed; otherwise, they shall return the
68591 argument unchanged.

68592 **ERRORS**

68593 No errors are defined.

68594 **EXAMPLES**

68595 None.

68596 **APPLICATION USAGE**

68597 None.

68598 **RATIONALE**

68599 None.

68600 **FUTURE DIRECTIONS**

68601 None.

68602 **SEE ALSO**

68603 *setlocale()*, *uselocale()*

68604 XBD Chapter 7 (on page 135), *<locale.h>*, *<wctype.h>*

68605 **CHANGE HISTORY**

68606 First released in Issue 4.

68607 **Issue 5**

68608 The following change has been made in this version for alignment with
68609 ISO/IEC 9899:1990/Amendment 1:1995 (E):

- 68610 • The SYNOPSIS has been changed to indicate that this function and associated data types
68611 are now made visible by inclusion of the **<wctype.h>** header rather than **<wchar.h>**.

68612 **Issue 6**

68613 The normative text is updated to avoid use of the term “must” for application requirements.

68614 **Issue 7**

68615 The *tolower_l()* function is added from The Open Group Technical Standard, 2006, Extended
68616 API Set Part 4.

68617 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0678 [302], XSH/TC1-2008/0679 [283], +
68618 and XSH/TC1-2008/0680 [283] are applied.

68619 **NAME**

68620 towupper, towupper_l — transliterate lowercase wide-character code to uppercase

68621 **SYNOPSIS**

68622 #include <wctype.h>

68623 wint_t towupper(wint_t wc);

68624 CX wint_t towupper_l(wint_t wc, locale_t locale);

68625 **DESCRIPTION**

68626 CX For *towupper()*: The functionality described on this reference page is aligned with the ISO C
 68627 standard. Any conflict between the requirements described here and the ISO C standard is
 68628 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

68629 CX The *towupper()* and *towupper_l()* functions have as a domain a type **wint_t**, the value of which
 68630 the application shall ensure is a character representable as a **wchar_t**, and a wide-character code
 68631 corresponding to a valid character in the current locale or the value of WEOF. If the argument
 68632 CX has any other value, the behavior is undefined. If the argument of *towupper()* or *towupper_l()*
 68633 represents a lowercase wide-character code, and there exists a corresponding uppercase wide-
 68634 CX character code as defined by character type information in the current locale or in the locale
 68635 represented by *locale*, respectively (category *LC_CTYPE*), the result shall be the corresponding
 68636 uppercase wide-character code. All other arguments in the domain are returned unchanged.

68637 CX The behavior is undefined if the *locale* argument to *towupper_l()* is the special locale object
 68638 LC_GLOBAL_LOCALE or is not a valid locale object handle.

68639 **RETURN VALUE**

68640 CX Upon successful completion, the *towupper()* and *towupper_l()* functions shall return the
 68641 uppercase letter corresponding to the argument passed. Otherwise, they shall return the
 68642 argument unchanged.

68643 **ERRORS**

68644 No errors are defined.

68645 **EXAMPLES**

68646 None.

68647 **APPLICATION USAGE**

68648 None.

68649 **RATIONALE**

68650 None.

68651 **FUTURE DIRECTIONS**

68652 None.

68653 **SEE ALSO**68654 *setlocale()*, *uselocale()*

68655 XBD Chapter 7 (on page 135), <locale.h>, <wctype.h>

68656 **CHANGE HISTORY**

68657 First released in Issue 4.

68658 **Issue 5**

68659 The following change has been made in this version for alignment with
68660 ISO/IEC 9899:1990/Amendment 1:1995 (E):

- 68661 • The SYNOPSIS has been changed to indicate that this function and associated data types
68662 are now made visible by inclusion of the **<wctype.h>** header rather than **<wchar.h>**.

68663 **Issue 6**

68664 The normative text is updated to avoid use of the term “must” for application requirements.

68665 **Issue 7**

68666 The *towupper_l()* function is added from The Open Group Technical Standard, 2006, Extended
68667 API Set Part 4.

68668 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0681 [302], XSH/TC1-2008/0682 [283], +
68669 and XSH/TC1-2008/0683 [283] are applied.

68670 **NAME**

68671 trunc, truncf, trunc1 — round to truncated integer value

68672 **SYNOPSIS**

```
68673     #include <math.h>
68674     double trunc(double x);
68675     float truncf(float x);
68676     long double trunc1(long double x);
```

68677 **DESCRIPTION**

68678 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 68679 conflict between the requirements described here and the ISO C standard is unintentional. This
 68680 volume of POSIX.1-2008 defers to the ISO C standard.

68681 These functions shall round their argument to the integer value, in floating format, nearest to but
 68682 no larger in magnitude than the argument.

68683 **RETURN VALUE**

68684 Upon successful completion, these functions shall return the truncated integer value.

68685 MX The result shall have the same sign as *x*.

+

68686 MX If *x* is NaN, a NaN shall be returned.

68687 If *x* is ± 0 or $\pm \text{Inf}$, *x* shall be returned.

68688 **ERRORS**

68689 No errors are defined.

68690 **EXAMPLES**

68691 None.

68692 **APPLICATION USAGE**

68693 The integral value returned by these functions need not be expressible as an **intmax_t**. The
 68694 return value should be tested before assigning it to an integer type to avoid the undefined
 68695 results of an integer overflow.

68696 These functions may raise the inexact floating-point exception if the result differs in value from
 68697 the argument.

68698 **RATIONALE**

68699 None.

68700 **FUTURE DIRECTIONS**

68701 None.

68702 **SEE ALSO**

68703 XBD [<math.h>](#)

68704 **CHANGE HISTORY**

68705 First released in Issue 6. Derived from the ISO/IEC 9899: 1999 standard.

68706 **Issue 7**

68707 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0684 [346] is applied.

+

68708 **NAME**

68709 truncate — truncate a file to a specified length

68710 **SYNOPSIS**

68711 #include <unistd.h>

68712 int truncate(const char *path, off_t length);

68713 **DESCRIPTION**68714 The *truncate()* function shall cause the regular file named by *path* to have a size which shall be
68715 equal to *length* bytes.68716 If the file previously was larger than *length*, the extra data is discarded. If the file was previously
68717 shorter than *length*, its size is increased, and the extended area appears as if it were zero-filled.

68718 The application shall ensure that the process has write permission for the file.

68719 XSI If the request would cause the file size to exceed the soft file size limit for the process, the
68720 request shall fail and the implementation shall generate the SIGXFSZ signal for the process.68721 The *truncate()* function shall not modify the file offset for any open file descriptions associated
68722 with the file. Upon successful completion, if the file size is changed, *truncate()* shall mark for
68723 update the last data modification and last file status change timestamps of the file, and the
68724 S_ISUID and S_ISGID bits of the file mode may be cleared.68725 **RETURN VALUE**68726 Upon successful completion, *truncate()* shall return 0. Otherwise, -1 shall be returned, and *errno*
68727 set to indicate the error.68728 **ERRORS**68729 The *truncate()* function shall fail if:

68730 [EINTR] A signal was caught during execution.

68731 [EINVAL] The *length* argument was less than 0.

68732 [EFBIG] or [EINVAL]

68733 The *length* argument was greater than the maximum file size.

68734 [EIO] An I/O error occurred while reading from or writing to a file system.

68735 [EACCES] A component of the path prefix denies search permission, or write permission
68736 is denied on the file.

68737 [EISDIR] The named file is a directory.

68738 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*
68739 argument.

68740 [ENAMETOOLONG]

68741 The length of a component of a pathname is longer than {NAME_MAX}.

68742 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.68743 [ENOTDIR] A component of the path prefix names an existing file that is neither a |
68744 directory nor a symbolic link to a directory, or the *path* argument contains at
68745 least one non-*<slash>* character and ends with one or more trailing *<slash>*
68746 characters and the last pathname component names an existing file that is
68747 neither a directory nor a symbolic link to a directory.

68748 [EROFS] The named file resides on a read-only file system.

68749 The *truncate()* function may fail if:

68750 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
68751 resolution of the *path* argument.

68752 [ENAMETOOLONG]
68753 The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a
68754 symbolic link produced an intermediate result with a length that exceeds
68755 {PATH_MAX}.

68767 CHANGE HISTORY

68768 First released in Issue 4, Version 2.

68769 Issue 5

68770 Moved from X/OPEN UNIX extension to BASE.

68771 Large File Summit extensions are added.

68772 Issue 6

68773 This reference page is split out from the *ftruncate()* reference page.

68774 The normative text is updated to avoid use of the term “must” for application requirements.

68775 The wording of the mandatory [ELOOP] error condition is updated, and a second optional
68776 [ELOOP] error condition is added.

68777 Issue 7

68778 Austin Group Interpretation 1003.1-2001 #143 is applied.

68779 The *truncate()* function is moved from the XSI option to the Base.

68780 Changes are made related to support for finegrained timestamps.

68781 The [ENOTDIR] error condition is clarified to cover the condition where the last component of a
68782 pathname exists but is not a directory or a symbolic link to a directory.

68783 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0685 [324] is applied.

+

68784 **NAME**

68785 truncf, trunc — round to truncated integer value

68786 **SYNOPSIS**

68787 #include <math.h>

68788 float truncf(float x);

68789 long double trunc1(long double x);

68790 **DESCRIPTION**68791 Refer to *trunc()*.

68792 **NAME**

68793 tsearch — search a binary search tree

68794 **SYNOPSIS**

```
68795 XSI      #include <search.h>
68796          void *tsearch(const void *key, void **rootp,
68797                        int (*compar)(const void *, const void *));
```

68798 **DESCRIPTION**68799 Refer to *tdelete()*.

NAME

68801 `ttyname, ttyname_r` — find the pathname of a terminal

SYNOPSIS

68803 `#include <unistd.h>`

68804 `char *ttyname(int fildes);`

68805 `int ttyname_r(int fildes, char *name, size_t namesize);`

DESCRIPTION

68807 The `ttyname()` function shall return a pointer to a string containing a null-terminated pathname
 68808 of the terminal associated with file descriptor *fildes*. The application shall not modify the string
 68809 returned. The returned pointer might be invalidated or the string content might be overwritten
 68810 by a subsequent call to `ttyname()`.

68811 The `ttyname()` function need not be thread-safe.

68812 The `ttyname_r()` function shall store the null-terminated pathname of the terminal associated
 68813 with the file descriptor *fildes* in the character array referenced by *name*. The array is *namesize*
 68814 characters long and should have space for the name and the terminating null character. The
 68815 maximum length of the terminal name shall be {TTY_NAME_MAX}.

RETURN VALUE

68817 Upon successful completion, `ttyname()` shall return a pointer to a string. Otherwise, a null
 68818 pointer shall be returned and *errno* set to indicate the error.

68819 If successful, the `ttyname_r()` function shall return zero. Otherwise, an error number shall be
 68820 returned to indicate the error.

ERRORS

68822 The `ttyname()` function may fail if:

68823 [EBADF] The *fildes* argument is not a valid file descriptor.

68824 [ENOTTY] The file associated with the *fildes* argument is not a terminal.

68825 The `ttyname_r()` function may fail if:

68826 [EBADF] The *fildes* argument is not a valid file descriptor.

68827 [ENOTTY] The file associated with the *fildes* argument is not a terminal.

68828 [ERANGE] The value of *namesize* is smaller than the length of the string to be returned
 68829 including the terminating null character.

EXAMPLES

68831 None.

APPLICATION USAGE

68833 None.

RATIONALE

68835 The term “terminal” is used instead of the historical term “terminal device” in order to avoid a
 68836 reference to an undefined term.

68837 The thread-safe version places the terminal name in a user-supplied buffer and returns a non-
 68838 zero value if it fails. The non-thread-safe version may return the name in a static data area that
 68839 may be overwritten by each call.

68840 FUTURE DIRECTIONS

68841 None.

68842 SEE ALSO

68843 XBD <unistd.h>

68844 CHANGE HISTORY

68845 First released in Issue 1. Derived from Issue 1 of the SVID.

68846 Issue 5

68847 The *ttyname_r()* function is included for alignment with the POSIX Threads Extension.

68848 A note indicating that the *ttyname()* function need not be reentrant is added to the
68849 DESCRIPTION.

68850 Issue 6

68851 The *ttyname_r()* function is marked as part of the Thread-Safe Functions option.

68852 The following new requirements on POSIX implementations derive from alignment with the
68853 Single UNIX Specification:

- 68854 • The statement that *errno* is set on error is added.
- 68855 • The [EBADF] and [ENOTTY] optional error conditions are added.

68856 Issue 7

68857 Austin Group Interpretation 1003.1-2001 #156 is applied.

68858 SD5-XSH-ERN-100 is applied, correcting the definition of the [ENOTTY] error condition.

68859 The *ttyname_r()* function is moved from the Thread-Safe Functions option to the Base.

68860 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0686 [75] is applied.

+

68861 **NAME**

68862 twalk — traverse a binary search tree

68863 **SYNOPSIS**

```
68864 XSI      #include <search.h>
68865          void twalk(const void *root,
68866                   void (*action)(const void *, VISIT, int ));
```

68867 **DESCRIPTION**68868 Refer to *tdelete()*.

NAME

daylight, timezone, tzname, tzset — set timezone conversion information

SYNOPSIS

```
#include <time.h>
```

```
XSI    extern int daylight;
        extern long timezone;
CX     extern char *tzname[2];
        void tzset(void);
```

DESCRIPTION

The `tzset()` function shall use the value of the environment variable `TZ` to set time conversion information used by `ctime()`, `localtime()`, `mktime()`, and `strftime()`. If `TZ` is absent from the environment, implementation-defined default timezone information shall be used.

The `tzset()` function shall set the external variable `tzname` as follows:

```
tzname[0] = "std";
tzname[1] = "dst";
```

where `std` and `dst` are as described in XBD Chapter 8 (on page 173).

XSI The `tzset()` function also shall set the external variable `daylight` to 0 if Daylight Savings Time conversions should never be applied for the timezone in use; otherwise, non-zero. The external variable `timezone` shall be set to the difference, in seconds, between Coordinated Universal Time (UTC) and local standard time.

RETURN VALUE

The `tzset()` function shall not return a value.

ERRORS

No errors are defined.

EXAMPLES

Example `TZ` variables and their timezone differences are given in the table below:

<i>TZ</i>	<i>timezone</i>
EST5EDT	5*60*60
GMT0	0*60*60
JST-9	-9*60*60
MET-1MEST	-1*60*60
MST7MDT	7*60*60
PST8PDT	8*60*60

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

68915 **NAME**

68916 ulimit — get and set process limits

68917 **SYNOPSIS**

```
68918 OB XSI #include <ulimit.h>
68919 long ulimit(int cmd, ...);
```

68920 **DESCRIPTION**

68921 The *ulimit()* function shall control process limits. The process limits that can be controlled by
 68922 this function include the maximum size of a single file that can be written (this is equivalent to
 68923 using *setrlimit()* with RLIMIT_FSIZE). The *cmd* values, defined in **<ulimit.h>**, include:

68924 **UL_GETFSIZE** Return the file size limit (RLIMIT_FSIZE) of the process. The limit shall be in
 68925 units of 512-byte blocks and shall be inherited by child processes. Files of any
 68926 size can be read. The return value shall be the integer part of the soft file size
 68927 limit divided by 512. If the result cannot be represented as a **long**, the result is
 68928 unspecified.

68929 **UL_SETFSIZE** Set the file size limit for output operations of the process to the value of the
 68930 second argument, taken as a **long**, multiplied by 512. If the result would
 68931 overflow an **rlim_t**, the actual value set is unspecified. Any process may
 68932 decrease its own limit, but only a process with appropriate privileges may
 68933 increase the limit. The return value shall be the integer part of the new file size
 68934 limit divided by 512.

68935 The *ulimit()* function shall not change the setting of *errno* if successful.

68936 As all return values are permissible in a successful situation, an application wishing to check for
 68937 error situations should set *errno* to 0, then call *ulimit()*, and, if it returns -1, check to see if *errno* is
 68938 non-zero.

68939 **RETURN VALUE**

68940 Upon successful completion, *ulimit()* shall return the value of the requested limit. Otherwise, -1
 68941 shall be returned and *errno* set to indicate the error.

68942 **ERRORS**

68943 The *ulimit()* function shall fail and the limit shall be unchanged if:

68944	[EINVAL]	The <i>cmd</i> argument is not valid.
68945	[EPERM]	A process not having appropriate privileges attempts to increase its file size limit.
68946		

68947 **EXAMPLES**

68948 None.

68949 **APPLICATION USAGE**

68950 Since the *ulimit()* function uses type **long** rather than **rlim_t**, this function is not sufficient for file
 68951 sizes on many current systems. Applications should use the *getrlimit()* or *setrlimit()* functions
 68952 instead of the obsolescent *ulimit()* function.

68953 **RATIONALE**

68954 None.

68955 FUTURE DIRECTIONS

68956 The *ulimit()* function may be removed in a future version.

68957 SEE ALSO

68958 *exec*, *getrlimit()*, *write()*

68959 XBD <ulimit.h>

68960 CHANGE HISTORY

68961 First released in Issue 1. Derived from Issue 1 of the SVID.

68962 Issue 5

68963 In the description of UL_SETFSIZE, the text is corrected to refer to **rlim_t** rather than the
68964 spurious **rlimit_t**.

68965 The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.

68966 Issue 7

68967 The *ulimit()* function is marked obsolescent.

NAME

umask — set and get the file mode creation mask

SYNOPSIS

```
#include <sys/stat.h>
```

```
mode_t umask(mode_t cmask);
```

DESCRIPTION

The *umask()* function shall set the file mode creation mask of the process to *cmask* and return the previous value of the mask. Only the file permission bits of *cmask* (see <sys/stat.h>) are used; the meaning of the other bits is implementation-defined.

The file mode creation mask of the process is used to turn off permission bits in the *mode* argument supplied during calls to the following functions:

- *open()*, *openat()*, *creat()*, *mkdir()*, *mkdirat()*, *mkfifo()*, and *mkfifoat()*
- *mknod()*, *mknodat()*
- *mq_open()*
- *sem_open()*

Bit positions that are set in *cmask* are cleared in the mode of the created file.

RETURN VALUE

The file permission bits in the value returned by *umask()* shall be the previous value of the file mode creation mask. The state of any other bits in that value is unspecified, except that a subsequent call to *umask()* with the returned value as *cmask* shall leave the state of the mask the same as its state before the first call, including any unspecified use of those bits.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

Unsigned argument and return types for *umask()* were proposed. The return type and the argument were both changed to **mode_t**.

Historical implementations have made use of additional bits in *cmask* for their implementation-defined purposes. The addition of the text that the meaning of other bits of the field is implementation-defined permits these implementations to conform to this volume of POSIX.1-2008.

FUTURE DIRECTIONS

None.

SEE ALSO

creat(), *exec*, *mkdir()*, *mkfifo()*, *mknod()*, *mq_open()*, *open()*, *sem_open()*

XBD <sys/stat.h>, <sys/types.h>

69007 **CHANGE HISTORY**

69008 First released in Issue 1. Derived from Issue 1 of the SVID.

69009 **Issue 6**

69010 In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.

69011 The following new requirements on POSIX implementations derive from alignment with the
69012 Single UNIX Specification:

- 69013 • The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was
69014 required for conforming implementations of previous POSIX specifications, it was not
69015 required for UNIX applications.

69016 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/143 is applied, adding the *mknod()*,
69017 *mq_open()*, and *sem_open()* functions to the DESCRIPTION and SEE ALSO sections.

69018 **NAME**69019 **uname** — get the name of the current system69020 **SYNOPSIS**

69021 #include <sys/utsname.h>

69022 int uname(struct utsname *name);

69023 **DESCRIPTION**69024 The *uname()* function shall store information identifying the current system in the structure pointed to by *name*.69026 The *uname()* function uses the **utsname** structure defined in <sys/utsname.h>.

69027 The *uname()* function shall return a string naming the current system in the character array *sysname*. Similarly, *nodename* shall contain the name of this node within an implementation-defined communications network. The arrays *release* and *version* shall further identify the operating system. The array *machine* shall contain a name that identifies the hardware that the system is running on.

69032 The format of each member is implementation-defined.

69033 **RETURN VALUE**

69034 Upon successful completion, a non-negative value shall be returned. Otherwise, -1 shall be returned and *errno* set to indicate the error.

69036 **ERRORS**

69037 No errors are defined.

69038 **EXAMPLES**

69039 None.

69040 **APPLICATION USAGE**

69041 The inclusion of the *nodename* member in this structure does not imply that it is sufficient information for interfacing to communications networks.

69043 **RATIONALE**

69044 The values of the structure members are not constrained to have any relation to the version of this volume of POSIX.1-2008 implemented in the operating system. An application should instead depend on `_POSIX_VERSION` and related constants defined in <unistd.h>.

69047 This volume of POSIX.1-2008 does not define the sizes of the members of the structure and permits them to be of different sizes, although most implementations define them all to be the same size: eight bytes plus one byte for the string terminator. That size for *nodename* is not enough for use with many networks.

69051 The *uname()* function originated in System III, System V, and related implementations, and it does not exist in Version 7 or 4.3 BSD. The values it returns are set at system compile time in those historical implementations.

69054 4.3 BSD has *gethostname()* and *gethostid()*, which return a symbolic name and a numeric value, respectively. There are related *sethostname()* and *sethostid()* functions that are used to set the values the other two functions return. The former functions are included in this specification, the latter are not.

69058 **FUTURE DIRECTIONS**

69059 None.

NAME

ungetc — push byte back into input stream

SYNOPSIS

```
#include <stdio.h>
```

```
int ungetc(int c, FILE *stream);
```

DESCRIPTION

The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

The *ungetc()* function shall push the byte specified by *c* (converted to an **unsigned char**) back onto the input stream pointed to by *stream*. The pushed-back bytes shall be returned by subsequent reads on that stream in the reverse order of their pushing. A successful intervening call (with the stream pointed to by *stream*) to a file-positioning function (*fseek()*, *fseeko()*, *fsetpos()*, or *rewind()*) or *fflush()* shall discard any pushed-back bytes for the stream. The external storage corresponding to the stream shall be unchanged.

One byte of push-back shall be provided. If *ungetc()* is called too many times on the same stream without an intervening read or file-positioning operation on that stream, the operation may fail.

If the value of *c* equals that of the macro EOF, the operation shall fail and the input stream shall be left unchanged.

A successful call to *ungetc()* shall clear the end-of-file indicator for the stream. The value of the file-position indicator for the stream after all pushed-back bytes have been read, or discarded by calling *fseek()*, *fseeko()*, *fsetpos()*, or *rewind()* (but not *fflush()*), shall be the same as it was before the bytes were pushed back. The file-position indicator is decremented by each successful call to *ungetc()*; if its value was 0 before a call, its value is unspecified after the call.

RETURN VALUE

Upon successful completion, *ungetc()* shall return the byte pushed back after conversion. Otherwise, it shall return EOF.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

69106	Issue 7	
69107		POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0687 [87,93], XSH/TC1-2008/0688 +
69108		[87], and XSH/TC1-2008/0689 [14] are applied.

69109 **NAME**

69110 ungetwc — push wide-character code back into the input stream

69111 **SYNOPSIS**

```
69112 #include <stdio.h>
69113 #include <wchar.h>
69114 wint_t ungetwc(wint_t wc, FILE *stream);
```

69115 **DESCRIPTION**

69116 CX The functionality described on this reference page is aligned with the ISO C standard. Any
69117 conflict between the requirements described here and the ISO C standard is unintentional. This
69118 volume of POSIX.1-2008 defers to the ISO C standard.

69119 The *ungetwc()* function shall push the character corresponding to the wide-character code
69120 specified by *wc* back onto the input stream pointed to by *stream*. The pushed-back characters
69121 shall be returned by subsequent reads on that stream in the reverse order of their pushing. A
69122 successful intervening call (with the stream pointed to by *stream*) to a file-positioning function
69123 CX (*fseek()*, *fseeko()*, *fsetpos()*, or *rewind()*) or *fflush()* shall discard any pushed-back characters for
69124 the stream. The external storage corresponding to the stream is unchanged.

69125 At least one character of push-back shall be provided. If *ungetwc()* is called too many times on
69126 the same stream without an intervening read or file-positioning operation on that stream, the
69127 operation may fail.

69128 If the value of *wc* equals that of the macro WEOF, the operation shall fail and the input stream
69129 shall be left unchanged.

69130 A successful call to *ungetwc()* shall clear the end-of-file indicator for the stream. The value of the
69131 file-position indicator for the stream after all pushed-back characters have been read, or
69132 CX discarded by calling *fseek()*, *fseeko()*, *fsetpos()*, or *rewind()* (but not *fflush()*), shall be the same as
69133 it was before the characters were pushed back. The file-position indicator is decremented (by
69134 one or more) by each successful call to *ungetwc()*; if its value was 0 before a call, its value is
69135 unspecified after the call.

69136 **RETURN VALUE**

69137 Upon successful completion, *ungetwc()* shall return the wide-character code corresponding to
69138 the pushed-back character. Otherwise, it shall return WEOF.

69139 **ERRORS**

69140 The *ungetwc()* function may fail if:

69141 CX [EILSEQ] An invalid character sequence is detected, or a wide-character code does not
69142 correspond to a valid character.

69143 **EXAMPLES**

69144 None.

69145 **APPLICATION USAGE**

69146 None.

69147 **RATIONALE**

69148 None.

69149 **FUTURE DIRECTIONS**

69150 None.

CHANGE HISTORY

First released in Issue 4. Derived from the MSE working draft.

Issue 5

The Optional Header (OH) marking is removed from **<stdio.h>**.

Issue 6

The [EILSEQ] optional error condition is marked CX.

Issue 7

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0690 [87,93], XSH/TC1-2008/0691 + [87], and XSH/TC1-2008/0692 [14] are applied.

NAME

unlink, unlinkat — remove a directory entry relative to directory file descriptor

SYNOPSIS

```
#include <unistd.h>

int unlink(const char *path);
int unlinkat(int fd, const char *path, int flag);
```

DESCRIPTION

The *unlink()* function shall remove a link to a file. If *path* names a symbolic link, *unlink()* shall remove the symbolic link named by *path* and shall not affect any file or directory named by the contents of the symbolic link. Otherwise, *unlink()* shall remove the link named by the pathname pointed to by *path* and shall decrement the link count of the file referenced by the link.

When the file's link count becomes 0 and no process has the file open, the space occupied by the file shall be freed and the file shall no longer be accessible. If one or more processes have the file open when the last link is removed, the link shall be removed before *unlink()* returns, but the removal of the file contents shall be postponed until all references to the file are closed.

The *path* argument shall not name a directory unless the process has appropriate privileges and the implementation supports using *unlink()* on directories.

Upon successful completion, *unlink()* shall mark for update the last data modification and last file status change timestamps of the parent directory. Also, if the file's link count is not 0, the last file status change timestamp of the file shall be marked for update.

The *unlinkat()* function shall be equivalent to the *unlink()* or *rmdir()* function except in the case where *path* specifies a relative path. In this case the directory entry to be removed is determined relative to the directory associated with the file descriptor *fd* instead of the current working directory. If the file descriptor was opened without *O_SEARCH*, the function shall check whether directory searches are permitted using the current permissions of the directory underlying the file descriptor. If the file descriptor was opened with *O_SEARCH*, the function shall not perform the check.

Values for *flag* are constructed by a bitwise-inclusive OR of flags from the following list, defined in *<fcntl.h>*:

AT_REMOVEDIR

Remove the directory entry specified by *fd* and *path* as a directory, not a normal file.

If *unlinkat()* is passed the special value *AT_FDCWD* in the *fd* parameter, the current working directory shall be used and the behavior shall be identical to a call to *unlink()* or *rmdir()* respectively, depending on whether or not the *AT_REMOVEDIR* bit is set in *flag*.

RETURN VALUE

Upon successful completion, these functions shall return 0. Otherwise, these functions shall return -1 and set *errno* to indicate the error. If -1 is returned, the named file shall not be changed.

ERRORS

These functions shall fail and shall not unlink the file if:

[EACCES]	Search permission is denied for a component of the path prefix, or write permission is denied on the directory containing the directory entry to be removed.
[EBUSY]	The file named by the <i>path</i> argument cannot be unlinked because it is being used by the system or another process and the implementation considers this an error.

69208		[ELOOP]	A loop exists in symbolic links encountered during resolution of the <i>path</i> argument.
69209			
69210		[ENAMETOOLONG]	
69211			The length of a component of a pathname is longer than {NAME_MAX}.
69212		[ENOENT]	A component of <i>path</i> does not name an existing file or <i>path</i> is an empty string.
69213		[ENOTDIR]	A component of the <i>path</i> prefix names an existing file that is neither a directory nor a symbolic link to a directory, or the <i>path</i> argument contains at least one non- <code><slash></code> character and ends with one or more trailing <code><slash></code> characters and the last pathname component names an existing file that is neither a directory nor a symbolic link to a directory.
69214			
69215			
69216			
69217			
69218		[EPERM]	The file named by <i>path</i> is a directory, and either the calling process does not have appropriate privileges, or the implementation prohibits using <i>unlink()</i> on directories.
69219			
69220			
69221	XSI	[EPERM] or [EACCES]	
69222			The S_ISVTX flag is set on the directory containing the file referred to by the <i>path</i> argument and the process does not satisfy the criteria specified in XBD Section 4.2 (on page 107).
69223			
69224			
69225		[EROFS]	The directory entry to be unlinked is part of a read-only file system.
69226			The <i>unlinkat()</i> function shall fail if:
69227		[EACCES]	<i>fd</i> was not opened with O_SEARCH and the permissions of the directory underlying <i>fd</i> do not permit directory searches.
69228			
69229		[EBADF]	The <i>path</i> argument does not specify an absolute path and the <i>fd</i> argument is neither AT_FDCWD nor a valid file descriptor open for reading or searching.
69230			
69231		[ENOTDIR]	The <i>path</i> argument is not an absolute path and <i>fd</i> is a file descriptor associated with a non-directory file.
69232			
69233		[EEXIST] or [ENOTEMPTY]	
69234			The <i>flag</i> parameter has the AT_REMOVEDIR bit set and the <i>path</i> argument names a directory that is not an empty directory, or there are hard links to the directory other than dot or a single entry in dot-dot.
69235			
69236			
69237		[ENOTDIR]	The <i>flag</i> parameter has the AT_REMOVEDIR bit set and <i>path</i> does not name a directory.
69238			
69239			These functions may fail and not unlink the file if:
69240	XSI	[EBUSY]	The file named by <i>path</i> is a named STREAM.
69241		[ELOOP]	More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the <i>path</i> argument.
69242			
69243		[ENAMETOOLONG]	
69244			The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a symbolic link produced an intermediate result with a length that exceeds {PATH_MAX}.
69245			
69246			
69247		[ETXTBSY]	The entry to be unlinked is the last directory entry to a pure procedure (shared text) file that is being executed.
69248			

69249 The *unlinkat()* function may fail if:
 69250 [EINVAL] The value of the *flag* argument is not valid. -

69251 EXAMPLES

69252 Removing a Link to a File

69253 The following example shows how to remove a link to a file named */home/cnd/mod1* by
 69254 removing the entry named */modules/pass1*.

```
69255 #include <unistd.h>
69256 char *path = "/modules/pass1";
69257 int status;
69258 ...
69259 status = unlink(path);
```

69260 Checking for an Error

69261 The following example fragment creates a temporary password lock file named **LOCKFILE**,
 69262 which is defined as */etc/ptmp*, and gets a file descriptor for it. If the file cannot be opened for
 69263 writing, *unlink()* is used to remove the link between the file descriptor and **LOCKFILE**.

```
69264 #include <sys/types.h>
69265 #include <stdio.h>
69266 #include <fcntl.h>
69267 #include <errno.h>
69268 #include <unistd.h>
69269 #include <sys/stat.h>
69270 #define LOCKFILE "/etc/ptmp"
69271 int pfd; /* Integer for file descriptor returned by open call. */
69272 FILE *fpfd; /* File pointer for use in putpwent(). */
69273 ...
69274 /* Open password Lock file. If it exists, this is an error. */
69275 if ((pfd = open(LOCKFILE, O_WRONLY | O_CREAT | O_EXCL, S_IRUSR
69276 | S_IWUSR | S_IRGRP | S_IROTH)) == -1) {
69277     fprintf(stderr, "Cannot open /etc/ptmp. Try again later.\n");
69278     exit(1);
69279 }
69280 /* Lock file created; proceed with fdopen of lock file so that
69281 putpwent() can be used.
69282 */
69283 if ((fpfd = fdopen(pfd, "w")) == NULL) {
69284     close(pfd);
69285     unlink(LOCKFILE);
69286     exit(1);
69287 }
```

Replacing Files

The following example fragment uses *unlink()* to discard links to files, so that they can be replaced with new versions of the files. The first call removes the link to **LOCKFILE** if an error occurs. Successive calls remove the links to **SAVEFILE** and **PASSWDFILE** so that new links can be created, then removes the link to **LOCKFILE** when it is no longer needed.

```
#include <sys/types.h>
#include <stdio.h>
#include <fcntl.h>
#include <errno.h>
#include <unistd.h>
#include <sys/stat.h>

#define LOCKFILE "/etc/ptmp"
#define PASSWDFILE "/etc/passwd"
#define SAVEFILE "/etc/opasswd"
...
/* If no change was made, assume error and leave passwd unchanged. */
if (!valid_change) {
    fprintf(stderr, "Could not change password for user %s\n", user);
    unlink(LOCKFILE);
    exit(1);
}

/* Change permissions on new password file. */
chmod(LOCKFILE, S_IRUSR | S_IRGRP | S_IROTH);

/* Remove saved password file. */
unlink(SAVEFILE);

/* Save current password file. */
link(PASSWDFILE, SAVEFILE);

/* Remove current password file. */
unlink(PASSWDFILE);

/* Save new password file as current password file. */
link(LOCKFILE, PASSWDFILE);

/* Remove lock file. */
unlink(LOCKFILE);

exit(0);
```

APPLICATION USAGE

Applications should use *rmdir()* to remove a directory.

RATIONALE

Unlinking a directory is restricted to the superuser in many historical implementations for reasons given in *link()* (see also *rename()*).

The meaning of [EBUSY] in historical implementations is “mount point busy”. Since this volume of POSIX.1-2008 does not cover the system administration concepts of mounting and unmounting, the description of the error was changed to “resource busy”. (This meaning is used by some device drivers when a second process tries to open an exclusive use device.) The wording is also intended to allow implementations to refuse to remove a directory if it is the root or current working directory of any process.

The standard developers reviewed TR 24715-2006 and noted that LSB-conforming implementations may return [EISDIR] instead of [EPERM] when unlinking a directory. A change to permit this behavior by changing the requirement for [EPERM] to [EPERM] or [EISDIR] was considered, but decided against since it would break existing strictly conforming and conforming applications. Applications written for portability to both POSIX.1-2008 and the LSB should be prepared to handle either error code.

The purpose of the *unlinkat()* function is to remove directory entries in directories other than the current working directory without exposure to race conditions. Any part of the path of a file could be changed in parallel to a call to *unlink()*, resulting in unspecified behavior. By opening a file descriptor for the target directory and using the *unlinkat()* function it can be guaranteed that the removed directory entry is located relative to the desired directory.

FUTURE DIRECTIONS

None.

XBD Section 4.2 (on page 107), *<fcntl.h>*, *<unistd.h>*

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The [EBUSY] error is added to the optional part of the ERRORS section.

Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In the DESCRIPTION, the effect is specified if *path* specifies a symbolic link.
- The [ELOOP] mandatory error condition is added.
- A second [ENAMETOOLONG] is added as an optional error condition.
- The [ETXTBSY] optional error condition is added.

The following changes were made to align with the IEEE P1003.1a draft standard:

- The [ELOOP] optional error condition is added.

The normative text is updated to avoid use of the term “must” for application requirements.

Issue 7

Austin Group Interpretation 1003.1-2001 #143 is applied.

Austin Group Interpretation 1003.1-2001 #181 is applied, updating the requirements for operations when the S_ISVTX bit is set.

Text arising from the LSB Conflicts TR is added to the RATIONALE about the use of [EPERM] and [EISDIR].

The *unlinkat()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 2.

Changes are made related to support for finegrained timestamps.

Changes are made to allow a directory to be opened for searching.

69373 The [ENOTDIR] error condition is clarified to cover the condition where the last component of a
69374 pathname exists but is not a directory or a symbolic link to a directory.

69375 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0693 [461], XSH/TC1-2008/0694 [324], +
69376 XSH/TC1-2008/0695 [278], and XSH/TC1-2008/0696 [278] are applied.

69377 **NAME**

69378 unlockpt — unlock a pseudo-terminal master/slave pair

69379 **SYNOPSIS**

```
69380 XSI      #include <stdlib.h>
69381          int unlockpt(int filides);
```

69382 **DESCRIPTION**

69383 The *unlockpt()* function shall unlock the slave pseudo-terminal device associated with the master
69384 to which *filides* refers.

69385 Conforming applications shall ensure that they call *unlockpt()* before opening the slave side of a
69386 pseudo-terminal device.

69387 **RETURN VALUE**

69388 Upon successful completion, *unlockpt()* shall return 0. Otherwise, it shall return -1 and set *errno*
69389 to indicate the error.

69390 **ERRORS**

69391 The *unlockpt()* function may fail if:

69392 [EBADF] The *filides* argument is not a file descriptor open for writing.

69393 [EINVAL] The *filides* argument is not associated with a master pseudo-terminal device.

69394 **EXAMPLES**

69395 None.

69396 **APPLICATION USAGE**

69397 None.

69398 **RATIONALE**

69412 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0697 [96] is applied.

NAME

unsetenv — remove an environment variable

SYNOPSIS

```
CX      #include <stdlib.h>
int unsetenv(const char *name);
```

DESCRIPTION

The *unsetenv()* function shall remove an environment variable from the environment of the calling process. The *name* argument points to a string, which is the name of the variable to be removed. The named argument shall not contain an '=' character. If the named variable does not exist in the current environment, the environment shall be unchanged and the function is considered to have completed successfully.

The *unsetenv()* function shall update the list of pointers to which *environ* points.

The *unsetenv()* function need not be thread-safe.

RETURN VALUE

Upon successful completion, zero shall be returned. Otherwise, -1 shall be returned, *errno* set to indicate the error, and the environment shall be unchanged.

ERRORS

The *unsetenv()* function shall fail if:

[EINVAL]	The <i>name</i> argument points to an empty string, or points to a string containing an '=' character.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

Refer to the RATIONALE section in *setenv()*.

CHANGE HISTORY

First released in Issue 6. Derived from the IEEE P1003.1a draft standard.

Issue 7

Austin Group Interpretation 1003.1-2001 #156 is applied.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0698 [167] and XSH/TC1-2008/0699 + [185] are applied.

NAME

uselocale — use locale in current thread

SYNOPSIS

```
CX      #include <locale.h>
      locale_t uselocale(locale_t newloc);
```

DESCRIPTION

The *uselocale()* function shall set the current locale for the current thread to the locale represented by *newloc*.

The value for the *newloc* argument shall be one of the following:

1. A value returned by the *newlocale()* or *duplocale()* functions
2. The special locale object descriptor LC_GLOBAL_LOCALE
3. (**locale_t**)0

Once the *uselocale()* function has been called to install a thread-local locale, the behavior of every interface using data from the current locale shall be affected for the calling thread. The current locale for other threads shall remain unchanged.

If the *newloc* argument is (**locale_t**)0, the object returned is the current locale or LC_GLOBAL_LOCALE if there has been no previous call to *uselocale()* for the current thread.

If the *newloc* argument is LC_GLOBAL_LOCALE, the thread shall use the global locale determined by the *setlocale()* function.

RETURN VALUE

Upon successful completion, the *uselocale()* function shall return the locale handle from the previous call for the current thread, or LC_GLOBAL_LOCALE if there was no such previous call. Otherwise, *uselocale()* shall return (**locale_t**)0 and set *errno* to indicate the error.

ERRORS

The *uselocale()* function may fail if:

[EINVAL] *locale* is not a valid locale object.

EXAMPLES

None.

APPLICATION USAGE

Unlike the *setlocale()* function, the *uselocale()* function does not allow replacing some locale categories only. Applications that need to install a locale which differs only in a few categories must use *newlocale()* to change a locale object equivalent to the currently used locale and install it.

RATIONALE

None.

FUTURE DIRECTIONS

69493 [334] are applied.

NAME

utime — set file access and modification times

SYNOPSIS

```
#include <utime.h>

int utime(const char *path, const struct utimbuf *times);
```

DESCRIPTION

The *utime()* function shall set the access and modification times of the file named by the *path* argument.

If *times* is a null pointer, the access and modification times of the file shall be set to the current time. The effective user ID of the process shall match the owner of the file, or the process has write permission to the file or has appropriate privileges, to use *utime()* in this manner.

If *times* is not a null pointer, *times* shall be interpreted as a pointer to a **utimbuf** structure and the access and modification times shall be set to the values contained in the designated structure. Only a process with the effective user ID equal to the user ID of the file or a process with appropriate privileges may use *utime()* this way.

The **utimbuf** structure is defined in the **<utime.h>** header. The times in the structure **utimbuf** are measured in seconds since the Epoch.

Upon successful completion, the *utime()* function shall mark the last file status change timestamp for update; see **<sys/stat.h>**.

RETURN VALUE

Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* shall be set to indicate the error, and the file times shall not be affected.

ERRORS

The *utime()* function shall fail if:

[EACCES] Search permission is denied by a component of the path prefix; or the *times* argument is a null pointer and the effective user ID of the process does not match the owner of the file, the process does not have write permission for the file, and the process does not have appropriate privileges.

[ELOOP] A loop exists in symbolic links encountered during resolution of the *path* argument.

[ENAMETOOLONG] The length of a component of a pathname is longer than {NAME_MAX}.

[ENOENT] A component of *path* does not name an existing file or *path* is an empty string.

[ENOTDIR] A component of the path prefix names an existing file that is neither a directory nor a symbolic link to a directory, or the *path* argument contains at least one non-**<slash>** character and ends with one or more trailing **<slash>** characters and the last pathname component names an existing file that is neither a directory nor a symbolic link to a directory.

[EPERM] The *times* argument is not a null pointer and the effective user ID of the calling process does not match the owner of the file and the calling process does not have appropriate privileges.

69535 [EROFS] The file system containing the file is read-only.
 69536 The *utime()* function may fail if:
 69537 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
 69538 resolution of the *path* argument.
 69539 [ENAMETOOLONG]
 69540 The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a
 69541 symbolic link produced an intermediate result with a length that exceeds
 69542 {PATH_MAX}.

69543 EXAMPLES

69544 None.

69545 APPLICATION USAGE

69546 Since the **utimbuf** structure only contains **time_t** variables and is not accurate to fractions of a
 69547 second, applications should use the *utimensat()* function instead of the obsolescent *utime()*
 69548 function.

69549 RATIONALE

69550 The *actime* structure member must be present so that an application may set it, even though an
 69551 implementation may ignore it and not change the last data access timestamp on the file. If an
 69552 application intends to leave one of the times of a file unchanged while changing the other, it
 69553 should use *stat()* or *fstat()* to retrieve the file's *st_atim* and *st_mtim* parameters, set *actime* and
 69554 *modtime* in the buffer, and change one of them before making the *utime()* call.

69555 FUTURE DIRECTIONS

69556 The *utime()* function may be removed in a future version.

69557 SEE ALSO

69558 *fstat()*, *fstatat()*, *futimens()*
 69559 XBD <sys/stat.h>, <utime.h>

69560 CHANGE HISTORY

69561 First released in Issue 1. Derived from Issue 1 of the SVID.

69562 Issue 6

69563 The following new requirements on POSIX implementations derive from alignment with the
 69564 Single UNIX Specification:

- 69565 • The requirement to include <sys/types.h> has been removed. Although <sys/types.h> was
 69566 required for conforming implementations of previous POSIX specifications, it was not
 69567 required for UNIX applications.
- 69568 • The [ELOOP] mandatory error condition is added.
- 69569 • A second [ENAMETOOLONG] is added as an optional error condition.

69570 The following changes were made to align with the IEEE P1003.1a draft standard:

- 69571 • The [ELOOP] optional error condition is added.

69572 The normative text is updated to avoid use of the term “must” for application requirements.

69573 Issue 7

69574 Austin Group Interpretation 1003.1-2001 #143 is applied.

69575 The *utime()* function is marked obsolescent.

69576 Changes are made related to support for finegrained timestamps.

 69577

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0702 [324] is applied.

NAME

vfwscanf, vswscanf, wscanf — wide-character formatted input of a stdarg argument list

SYNOPSIS

```
#include <stdarg.h>
#include <stdio.h>
#include <wchar.h>

int vfwscanf(FILE *restrict stream, const wchar_t *restrict format,
             va_list arg);
int vswscanf(const wchar_t *restrict ws, const wchar_t *restrict format,
             va_list arg);
int vwscanf(const wchar_t *restrict format, va_list arg);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

The *vfwscanf()*, *vswscanf()*, and *vwscanf()* functions shall be equivalent to the *fwscanf()*, *swscanf()*, and *wscanf()* functions, respectively, except that instead of being called with a variable number of arguments, they are called with an argument list as defined in the **<stdarg.h>** header. These functions shall not invoke the *va_end* macro. As these functions invoke the *va_arg* macro, the value of *ap* after the return is unspecified.

RETURN VALUE

Refer to *fwscanf()*.

ERRORS

Refer to *fwscanf()*.

EXAMPLES

None.

APPLICATION USAGE

Applications using these functions should call *va_end(ap)* afterwards to clean up.

RATIONALE

None.

FUTURE DIRECTIONS

None.

69823 vwprintf — wide-character formatted output of a stdarg argument list

69824 **SYNOPSIS**

69825 #include <stdarg.h>

69826 #include <stdio.h>

69827 #include <wchar.h>

69828 int vwprintf(const wchar_t *restrict *format*, va_list *arg*);69829 **DESCRIPTION**69830 Refer to *vwprintf()*.

69831 **NAME**

69832 vwscanf — wide-character formatted input of a stdarg argument list

69833 **SYNOPSIS**

69834 #include <stdarg.h>

69835 #include <stdio.h>

69836 #include <wchar.h>

69837 int vwscanf(const wchar_t *restrict *format*, va_list *arg*);69838 **DESCRIPTION**69839 Refer to *vwscanf()*.

69840 **NAME**69841 `wait, waitpid` — wait for a child process to stop or terminate69842 **SYNOPSIS**69843 `#include <sys/wait.h>`69844 `pid_t wait(int *stat_loc);`69845 `pid_t waitpid(pid_t pid, int *stat_loc, int options);`69846 **DESCRIPTION**

69847 The `wait()` and `waitpid()` functions shall obtain status information pertaining to one of the
 69848 caller's child processes. Various options permit status information to be obtained for child
 69849 processes that have terminated or stopped. If status information is available for two or more
 69850 child processes, the order in which their status is reported is unspecified.

69851 The `wait()` function shall suspend execution of the calling thread until status information for one
 69852 of the terminated child processes of the calling process is available, or until delivery of a signal
 69853 whose action is either to execute a signal-catching function or to terminate the process. If more
 69854 than one thread is suspended in `wait()` or `waitpid()` awaiting termination of the same process,
 69855 exactly one thread shall return the process status at the time of the target process termination. If
 69856 status information is available prior to the call to `wait()`, return shall be immediate.

69857 The `waitpid()` function shall be equivalent to `wait()` if the `pid` argument is `(pid_t)-1` and the
 69858 `options` argument is 0. Otherwise, its behavior shall be modified by the values of the `pid` and
 69859 `options` arguments.

69860 The `pid` argument specifies a set of child processes for which `status` is requested. The `waitpid()`
 69861 function shall only return the status of a child process from this set:

- 69862 • If `pid` is equal to `(pid_t)-1`, `status` is requested for any child process. In this respect,
 69863 `waitpid()` is then equivalent to `wait()`.
- 69864 • If `pid` is greater than 0, it specifies the process ID of a single child process for which `status` is
 69865 requested.
- 69866 • If `pid` is 0, `status` is requested for any child process whose process group ID is equal to that
 69867 of the calling process.
- 69868 • If `pid` is less than `(pid_t)-1`, `status` is requested for any child process whose process group
 69869 ID is equal to the absolute value of `pid`.

69870 The `options` argument is constructed from the bitwise-inclusive OR of zero or more of the
 69871 following flags, defined in the `<sys/wait.h>` header:

69872 XSI **WCONTINUED** The `waitpid()` function shall report the status of any continued child process
 69873 specified by `pid` whose status has not been reported since it continued from a
 69874 job control stop.

69875 **WNOHANG** The `waitpid()` function shall not suspend execution of the calling thread if
 69876 `status` is not immediately available for one of the child processes specified by
 69877 `pid`.

69878 **WUNTRACED** The status of any child processes specified by `pid` that are stopped, and whose
 69879 status has not yet been reported since they stopped, shall also be reported to
 69880 the requesting process.

69881 XSI If the calling process has `SA_NOCLDWAIT` set or has `SIGCHLD` set to `SIG_IGN`, and the process
 69882 has no unwaited-for children that were transformed into zombie processes, the calling thread
 69883 shall block until all of the children of the process containing the calling thread terminate, and
 69884 `wait()` and `waitpid()` shall fail and set `errno` to `[ECHILD]`.

If *wait()* or *waitpid()* return because the status of a child process is available, these functions shall return a value equal to the process ID of the child process. In this case, if the value of the argument *stat_loc* is not a null pointer, information shall be stored in the location pointed to by *stat_loc*. The value stored at the location pointed to by *stat_loc* shall be 0 if and only if the status returned is from a terminated child process that terminated by one of the following means:

1. The process returned 0 from *main()*.
2. The process called *_exit()* or *exit()* with a *status* argument of 0.
3. The process was terminated because the last thread in the process terminated.

Regardless of its value, this information may be interpreted using the following macros, which are defined in **<sys/wait.h>** and evaluate to integral expressions; the *stat_val* argument is the integer value pointed to by *stat_loc*.

WIFEXITED(*stat_val*)

Evaluates to a non-zero value if *status* was returned for a child process that terminated normally.

WEXITSTATUS(*stat_val*)

If the value of WIFEXITED(*stat_val*) is non-zero, this macro evaluates to the low-order 8 bits of the *status* argument that the child process passed to *_exit()* or *exit()*, or the value the child process returned from *main()*.

WIFSIGNALED(*stat_val*)

Evaluates to a non-zero value if *status* was returned for a child process that terminated due to the receipt of a signal that was not caught (see **<signal.h>**).

WTERMSIG(*stat_val*)

If the value of WIFSIGNALED(*stat_val*) is non-zero, this macro evaluates to the number of the signal that caused the termination of the child process.

WIFSTOPPED(*stat_val*)

Evaluates to a non-zero value if *status* was returned for a child process that is currently stopped.

WSTOPSIG(*stat_val*)

If the value of WIFSTOPPED(*stat_val*) is non-zero, this macro evaluates to the number of the signal that caused the child process to stop.

WIFCONTINUED(*stat_val*)

Evaluates to a non-zero value if *status* was returned for a child process that has continued from a job control stop.

It is unspecified whether the *status* value returned by calls to *wait()* or *waitpid()* for processes created by *posix_spawn()* or *posix_spawnnp()* can indicate a WIFSTOPPED(*stat_val*) before subsequent calls to *wait()* or *waitpid()* indicate WIFEXITED(*stat_val*) as the result of an error detected before the new process image starts executing.

It is unspecified whether the *status* value returned by calls to *wait()* or *waitpid()* for processes created by *posix_spawn()* or *posix_spawnnp()* can indicate a WIFSIGNALED(*stat_val*) if a signal is sent to the parent's process group after *posix_spawn()* or *posix_spawnnp()* is called.

If the information pointed to by *stat_loc* was stored by a call to *waitpid()* that specified the WUNTRACED flag and did not specify the WCONTINUED flag, exactly one of the macros WIFEXITED(**stat_loc*), WIFSIGNALED(**stat_loc*), and WIFSTOPPED(**stat_loc*) shall evaluate to a non-zero value.

69929 If the information pointed to by *stat_loc* was stored by a call to *waitpid()* that specified the
 69930 XSI WUNTRACED and WCONTINUED flags, exactly one of the macros WIFEXITED(**stat_loc*),
 69931 XSI WIFSIGNALED(**stat_loc*), WIFSTOPPED(**stat_loc*), and WIFCONTINUED(**stat_loc*) shall
 69932 evaluate to a non-zero value.

69933 If the information pointed to by *stat_loc* was stored by a call to *waitpid()* that did not specify the
 69934 XSI WUNTRACED or WCONTINUED flags, or by a call to the *wait()* function, exactly one of the
 69935 macros WIFEXITED(**stat_loc*) and WIFSIGNALED(**stat_loc*) shall evaluate to a non-zero value.

69936 If the information pointed to by *stat_loc* was stored by a call to *waitpid()* that did not specify the
 69937 XSI WUNTRACED flag and specified the WCONTINUED flag, or by a call to the *wait()* function,
 69938 XSI exactly one of the macros WIFEXITED(**stat_loc*), WIFSIGNALED(**stat_loc*), and
 69939 WIFCONTINUED(**stat_loc*) shall evaluate to a non-zero value.

69940 If _POSIX_REALTIME_SIGNALS is defined, and the implementation queues the SIGCHLD
 69941 signal, then if *wait()* or *waitpid()* returns because the status of a child process is available, any
 69942 pending SIGCHLD signal associated with the process ID of the child process shall be discarded.
 69943 Any other pending SIGCHLD signals shall remain pending.

69944 Otherwise, if SIGCHLD is blocked, if *wait()* or *waitpid()* return because the status of a child
 69945 process is available, any pending SIGCHLD signal shall be cleared unless the status of another
 69946 child process is available.

69947 For all other conditions, it is unspecified whether child *status* will be available when a SIGCHLD
 69948 signal is delivered.

69949 There may be additional implementation-defined circumstances under which *wait()* or *waitpid()*
 69950 report *status*. This shall not occur unless the calling process or one of its child processes
 69951 explicitly makes use of a non-standard extension. In these cases the interpretation of the
 69952 reported *status* is implementation-defined.

69953 If a parent process terminates without waiting for all of its child processes to terminate, the
 69954 remaining child processes shall be assigned a new parent process ID corresponding to an
 69955 implementation-defined system process.

69956 RETURN VALUE

69957 If *wait()* or *waitpid()* returns because the status of a child process is available, these functions
 69958 shall return a value equal to the process ID of the child process for which *status* is reported. If
 69959 *wait()* or *waitpid()* returns due to the delivery of a signal to the calling process, -1 shall be
 69960 returned and *errno* set to [EINTR]. If *waitpid()* was invoked with WNOHANG set in *options*, it
 69961 has at least one child process specified by *pid* for which *status* is not available, and *status* is not
 69962 available for any process specified by *pid*, 0 is returned. Otherwise, -1 shall be returned, and
 69963 *errno* set to indicate the error.

69964 ERRORS

69965 The *wait()* function shall fail if:

69966 [ECHILD] The calling process has no existing unwaited-for child processes.

69967 [EINTR] The function was interrupted by a signal. The value of the location pointed to
 69968 by *stat_loc* is undefined.

69969 The *waitpid()* function shall fail if:

69970 [ECHILD] The process specified by *pid* does not exist or is not a child of the calling
 69971 process, or the process group specified by *pid* does not exist or does not have
 69972 any member process that is a child of the calling process.

69973 [EINTR] The function was interrupted by a signal. The value of the location pointed to
 69974 by *stat_loc* is undefined.

69975 [EINVAL] The *options* argument is not valid.

69976 EXAMPLES

69977 Waiting for a Child Process and then Checking its Status

69978 The following example demonstrates the use of *waitpid()*, *fork()*, and the macros used to
 69979 interpret the status value returned by *waitpid()* (and *wait()*). The code segment creates a child
 69980 process which does some unspecified work. Meanwhile the parent loops performing calls to
 69981 *waitpid()* to monitor the status of the child. The loop terminates when child termination is
 69982 detected.

```

69983 #include <stdio.h>
69984 #include <stdlib.h>
69985 #include <unistd.h>
69986 #include <sys/wait.h>
69987 ...
69988 pid_t child_pid, wpid;
69989 int status;
69990
69991 child_pid = fork();
69992 if (child_pid == -1) {          /* fork() failed */
69993     perror("fork");
69994     exit(EXIT_FAILURE);
69995 }
69996
69997 if (child_pid == 0) {          /* This is the child */
69998     /* Child does some work and then terminates */
69999     ...
70000 } else {                      /* This is the parent */
70001     do {
70002         wpid = waitpid(child_pid, &status, WUNTRACED
70003 #ifdef WCONTINUED             /* Not all implementations support this */
70004         | WCONTINUED
70005 #endif
70006         );
70007         if (wpid == -1) {
70008             perror("waitpid");
70009             exit(EXIT_FAILURE);
70010         }
70011         if (WIFEXITED(status)) {
70012             printf("child exited, status=%d\n", WEXITSTATUS(status));
70013         } else if (WIFSIGNALED(status)) {
70014             printf("child killed (signal %d)\n", WTERMSIG(status));
70015         } else if (WIFSTOPPED(status)) {
70016             printf("child stopped (signal %d)\n", WSTOPSIG(status));
70017 #ifdef WIFCONTINUED           /* Not all implementations support this */
70018         } else if (WIFCONTINUED(status)) {
70019             printf("child continued\n");

```

```

70018     #endif
70019         } else { /* Non-standard case -- may never happen */
70020             printf("Unexpected status (0x%x)\n", status);
70021         }
70022     } while (!WIFEXITED(status) && !WIFSIGNALED(status));
70023 }

```

Waiting for a Child Process in a Signal Handler for SIGCHLD

The following example demonstrates how to use *waitpid()* in a signal handler for SIGCHLD without passing -1 as the *pid* argument. (See the APPLICATION USAGE section below for the reasons why passing a *pid* of -1 is not recommended.) The method used here relies on the standard behavior of *waitpid()* when SIGCHLD is blocked. On historical non-conforming systems, the status of some child processes might not be reported.

```

70030 #include <stdlib.h>
70031 #include <stdio.h>
70032 #include <signal.h>
70033 #include <sys/types.h>
70034 #include <sys/wait.h>
70035 #include <unistd.h>
70036
70037 #define CHILDREN 10
70038
70039 static void
70040 handle_sigchld(int signum, siginfo_t *sinfo, void *unused)
70041 {
70042     int sav_errno = errno;
70043     int status;
70044
70045     /*
70046      * Obtain status information for the child which
70047      * caused the SIGCHLD signal and write its exit code
70048      * to stdout.
70049      */
70050     if (sinfo->si_code != CLD_EXITED)
70051     {
70052         static char msg[] = "wrong si_code\n";
70053         write(2, msg, sizeof msg - 1);
70054     }
70055     else if (waitpid(sinfo->si_pid, &status, 0) == -1)
70056     {
70057         static char msg[] = "waitpid() failed\n";
70058         write(2, msg, sizeof msg - 1);
70059     }
70060     else if (!WIFEXITED(status))
70061     {
70062         static char msg[] = "WIFEXITED was false\n";
70063         write(2, msg, sizeof msg - 1);
70064     }
70065     else
70066     {
70067         int code = WEXITSTATUS(status);
70068         char buf[2];

```

```

70066         buf[0] = '0' + code;
70067         buf[1] = '\n';
70068         write(1, buf, 2);
70069     }
70070     errno = sav_errno;
70071 }
70072
70073 int
70074 main(void)
70075 {
70076     int i;
70077     pid_t pid;
70078     struct sigaction sa;
70079
70080     sa.sa_flags = SA_SIGINFO;
70081     sa.sa_sigaction = handle_sigchld;
70082     sigemptyset(&sa.sa_mask);

70093             case -1:
70094                 perror("fork");
70095                 exit(EXIT_FAILURE);
70096             case 0:
70097                 sleep(2);
70098                 _exit(i);
70099             }
70100     }
70101
70102     /* Wait for all the SIGCHLD signals, then terminate on SIGALRM */
70103     alarm(3);
70104     for (;;)
70105         pause();
70106
70107     return 0; /* NOTREACHED */
70108 }

```

APPLICATION USAGE

Calls to *wait()* will collect information about any child process. This may result in interactions with other interfaces that may be waiting for their own children (such as by use of *system()*). For this and other reasons it is recommended that portable applications not use *wait()*, but instead use *waitpid()*. For these same reasons, the use of *waitpid()* with a *pid* argument of *-1*, and the use of *waitid()* with the *idtype* argument set to *P_ALL*, are also not recommended for portable applications.

RATIONALE

A call to the *wait()* or *waitpid()* function only returns *status* on an immediate child process of the calling process; that is, a child that was produced by a single *fork()* call (perhaps followed by an *exec* or other function calls) from the parent. If a child produces grandchildren by further use of *fork()*, none of those grandchildren nor any of their descendants affect the behavior of a *wait()* from the original parent process. Nothing in this volume of POSIX.1-2008 prevents an implementation from providing extensions that permit a process to get *status* from a grandchild or any other process, but a process that does not use such extensions must be guaranteed to see *status* from only its direct children.

The *waitpid()* function is provided for three reasons:

1. To support job control
2. To permit a non-blocking version of the *wait()* function
3. To permit a library routine, such as *system()* or *pclose()*, to wait for its children without interfering with other terminated children for which the process has not waited

The first two of these facilities are based on the *wait3()* function provided by 4.3 BSD. The function uses the *options* argument, which is equivalent to an argument to *wait3()*. The WUNTRACED flag is used only in conjunction with job control on systems supporting job control. Its name comes from 4.3 BSD and refers to the fact that there are two types of stopped processes in that implementation: processes being traced via the *ptrace()* debugging facility and (untraced) processes stopped by job control signals. Since *ptrace()* is not part of this volume of POSIX.1-2008, only the second type is relevant. The name WUNTRACED was retained because its usage is the same, even though the name is not intuitively meaningful in this context.

The third reason for the *waitpid()* function is to permit independent sections of a process to spawn and wait for children without interfering with each other. For example, the following problem occurs in developing a portable shell, or command interpreter:

```
stream = popen("/bin/true");
(void) system("sleep 100");
(void) pclose(stream);
```

On all historical implementations, the final *pclose()* fails to reap the *wait()* *status* of the *popen()*.

The status values are retrieved by macros, rather than given as specific bit encodings as they are in most historical implementations (and thus expected by existing programs). This was necessary to eliminate a limitation on the number of signals an implementation can support that was inherent in the traditional encodings. This volume of POSIX.1-2008 does require that a *status* value of zero corresponds to a process calling *_exit(0)*, as this is the most common encoding expected by existing programs. Some of the macro names were adopted from 4.3 BSD.

These macros syntactically operate on an arbitrary integer value. The behavior is undefined unless that value is one stored by a successful call to *wait()* or *waitpid()* in the location pointed to by the *stat_loc* argument. An early proposal attempted to make this clearer by specifying each argument as **stat_loc* rather than *stat_val*. However, that did not follow the conventions of other specifications in this volume of POSIX.1-2008 or traditional usage. It also could have implied that the argument to the macro must literally be **stat_loc*; in fact, that value can be stored or passed as an argument to other functions before being interpreted by these macros.

The extension that affects *wait()* and *waitpid()* and is common in historical implementations is the *ptrace()* function. It is called by a child process and causes that child to stop and return a *status* that appears identical to the *status* indicated by WIFSTOPPED. The *status* of *ptrace()* children is traditionally returned regardless of the WUNTRACED flag (or by the *wait()*)

function). Most applications do not need to concern themselves with such extensions because they have control over what extensions they or their children use. However, applications, such as command interpreters, that invoke arbitrary processes may see this behavior when those arbitrary processes misuse such extensions.

Implementations that support **core** file creation or other implementation-defined actions on termination of some processes traditionally provide a bit in the *status* returned by *wait()* to indicate that such actions have occurred.

Allowing the *wait()* family of functions to discard a pending SIGCHLD signal that is associated with a successfully waited-for child process puts them into the *sigwait()* and *sigwaitinfo()* category with respect to SIGCHLD.

This definition allows implementations to treat a pending SIGCHLD signal as accepted by the process in *wait()*, with the same meaning of “accepted” as when that word is applied to the *sigwait()* family of functions.

Allowing the *wait()* family of functions to behave this way permits an implementation to be able to deal precisely with SIGCHLD signals.

In particular, an implementation that does accept (discard) the SIGCHLD signal can make the following guarantees regardless of the queuing depth of signals in general (the list of waitable children can hold the SIGCHLD queue):

1. If a SIGCHLD signal handler is established via *sigaction()* without the SA_RESETHAND flag, SIGCHLD signals can be accurately counted; that is, exactly one SIGCHLD signal will be delivered to or accepted by the process for every child process that terminates.
2. A single *wait()* issued from a SIGCHLD signal handler can be guaranteed to return immediately with status information for a child process.
3. When SA_SIGINFO is requested, the SIGCHLD signal handler can be guaranteed to receive a non-null pointer to a **siginfo_t** structure that describes a child process for which a wait via *waitpid()* or *waitid()* will not block or fail.
4. The *system()* function will not cause the SIGCHLD handler of a process to be called as a result of the *fork()/exec* executed within *system()* because *system()* will accept the SIGCHLD signal when it performs a *waitpid()* for its child process. This is a desirable behavior of *system()* so that it can be used in a library without causing side-effects to the application linked with the library.

An implementation that does not permit the *wait()* family of functions to accept (discard) a pending SIGCHLD signal associated with a successfully waited-for child, cannot make the guarantees described above for the following reasons:

Guarantee #1

Although it might be assumed that reliable queuing of all SIGCHLD signals generated by the system can make this guarantee, the counter-example is the case of a process that blocks SIGCHLD and performs an indefinite loop of *fork()/wait()* operations. If the implementation supports queued signals, then eventually the system will run out of memory for the queue. The guarantee cannot be made because there must be some limit to the depth of queuing.

Guarantees #2 and #3

These cannot be guaranteed unless the *wait()* family of functions accepts the SIGCHLD signal. Otherwise, a *fork()/wait()* executed while SIGCHLD is blocked (as in the *system()* function) will result in an invocation of the handler when SIGCHLD is unblocked, after the process has disappeared.

Guarantee #4

Although possible to make this guarantee, *system()* would have to set the SIGCHLD handler to SIG_DFL so that the SIGCHLD signal generated by its *fork()* would be discarded (the SIGCHLD default action is to be ignored), then restore it to its previous setting. This would have the undesirable side-effect of discarding all SIGCHLD signals pending to the process.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.

The following changes were made to align with the IEEE P1003.1a draft standard:

- The processing of the SIGCHLD signal and the [ECHILD] error is clarified.

The semantics of *WIFSTOPPED(stat_val)*, *WIFEXITED(stat_val)*, and *WIFSIGNALED(stat_val)* are defined with respect to *posix_spawn()* or *posix_spawnnp()* for alignment with IEEE Std 1003.1d-1999.

The DESCRIPTION is updated for alignment with the ISO/IEC 9899:1999 standard.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/145 is applied, adding the example to the EXAMPLES section.

Issue 7

SD5-XSH-ERN-202 is applied.

APPLICATION USAGE is added, recommending that the *wait()* function not be used.

An additional example for *waitpid()* is added.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0707 [421], XSH/TC1-2008/0708 [166], + XSH/TC1-2008/0709 [166], and XSH/TC1-2008/0710 [69] are applied.

NAME

waitid — wait for a child process to change state

SYNOPSIS

```
#include <sys/wait.h>
```

```
int waitid(idtype_t idtype, id_t id, siginfo_t *infop, int options);
```

DESCRIPTION

The *waitid()* function shall suspend the calling thread until one child of the process containing the calling thread changes state. It records the current state of a child in the structure pointed to by *infop*. The fields of the structure pointed to by *infop* are filled in as described for the SIGCHLD signal in **<signal.h>**. If a child process changed state prior to the call to *waitid()*, *waitid()* shall return immediately. If more than one thread is suspended in *wait()*, *waitid()*, or *waitpid()* waiting for termination of the same process, exactly one thread shall return the process status at the time of the target process termination.

The *idtype* and *id* arguments are used to specify which children *waitid()* waits for.

If *idtype* is P_PID, *waitid()* shall wait for the child with a process ID equal to (**pid_t**)*id*.

If *idtype* is P_PGID, *waitid()* shall wait for any child with a process group ID equal to (**pid_t**)*id*.

If *idtype* is P_ALL, *waitid()* shall wait for any children and *id* is ignored.

The *options* argument is used to specify which state changes *waitid()* shall wait for. It is formed by OR'ing together the following flags:

WCONTINUED	Status shall be returned for any continued child process whose status either has not been reported since it continued from a job control stop or has been reported only by calls to <i>waitid()</i> with the WNOWAIT flag set.	

WEXITED	Wait for processes that have exited.	

WNOHANG	Do not hang if no status is available; return immediately.	

WNOWAIT	Keep the process whose status is returned in <i>infop</i> in a waitable state. This shall not affect the state of the process; the process may be waited for again after this call completes.	

WSTOPPED	Status shall be returned for any child that has stopped upon receipt of a signal, and whose status either has not been reported since it stopped or has been reported only by calls to <i>waitid()</i> with the WNOWAIT flag set.	

Applications shall specify at least one of the flags WEXITED, WSTOPPED, or WCONTINUED to be OR'ed in with the *options* argument.

The application shall ensure that the *infop* argument points to a **siginfo_t** structure. If *waitid()* returns because a child process was found that satisfied the conditions indicated by the arguments *idtype* and *options*, then the structure pointed to by *infop* shall be filled in by the system with the status of the process; the *si_signo* member shall be set equal to SIGCHLD. If *waitid()* returns because WNOHANG was specified and status is not available for any process specified by *idtype* and *id*, then the *si_signo* and *si_pid* members of the structure pointed to by *infop* shall be set to zero and the values of other members of the structure are unspecified.

RETURN VALUE

If WNOHANG was specified and status is not available for any process specified by *idtype* and *id*, 0 shall be returned. If *waitid()* returns due to the change of state of one of its children, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to indicate the error.

ERRORS

The *waitid()* function shall fail if:

- [ECHILD] The calling process has no existing unwaited-for child processes.
- [EINTR] The *waitid()* function was interrupted by a signal.
- [EINVAL] An invalid value was specified for *options*, or *idtype* and *id* specify an invalid set of processes.

EXAMPLES

None.

APPLICATION USAGE

Calls to *waitid()* with *idtype* equal to P_ALL will collect information about any child process. This may result in interactions with other interfaces that may be waiting for their own children (such as by use of *system()*). For this reason it is recommended that portable applications not use *waitid()* with *idtype* of P_ALL. See also APPLICATION USAGE for *wait()*.

RATIONALE

None.

FUTURE DIRECTIONS

None.

70317 waitpid — wait for a child process to stop or terminate

70318 **SYNOPSIS**

70319 #include <sys/wait.h>

70320 pid_t waitpid(pid_t *pid*, int **stat_loc*, int *options*);

70321 **DESCRIPTION**

70322 Refer to *wait()*.

70323 **NAME**

70324 wcpcpy — copy a wide-character string, returning a pointer to its end

70325 **SYNOPSIS**

```
70326 CX       #include <wchar.h>  
70327       wchar_t *wcpcpy(wchar_t *restrict ws1, const wchar_t *restrict ws2);
```

70328 **DESCRIPTION**70329 Refer to *wcscpy()*.

70330 **NAME**

70331 wcpncpy — copy a fixed-size wide-character string, returning a pointer to its end

70332 **SYNOPSIS**

```
70333 CX      #include <wchar.h>
70334          wchar_t *wcpncpy(wchar_t restrict *ws1, const wchar_t *restrict ws2,
70335                          size_t n);
```

70336 **DESCRIPTION**70337 Refer to *wcsncpy()*.

70338 **NAME**70339 `wrtomb` — convert a wide-character code to a character (restartable)70340 **SYNOPSIS**70341 `#include <wchar.h>`70342 `size_t wrtomb(char *restrict s, wchar_t wc, mbstate_t *restrict ps);`70343 **DESCRIPTION**

70344 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 70345 conflict between the requirements described here and the ISO C standard is unintentional. This
 70346 volume of POSIX.1-2008 defers to the ISO C standard.

70347 If *s* is a null pointer, the `wrtomb()` function shall be equivalent to the call:70348 `wrtomb(buf, L'\0', ps)`70349 where *buf* is an internal buffer.

70350 If *s* is not a null pointer, the `wrtomb()` function shall determine the number of bytes needed to
 70351 represent the character that corresponds to the wide character given by *wc* (including any shift
 70352 sequences), and store the resulting bytes in the array whose first element is pointed to by *s*. At
 70353 most {MB_CUR_MAX} bytes are stored. If *wc* is a null wide character, a null byte shall be stored,
 70354 preceded by any shift sequence needed to restore the initial shift state. The resulting state
 70355 described shall be the initial conversion state.

70356 If *ps* is a null pointer, the `wrtomb()` function shall use its own internal **mbstate_t** object, which is
 70357 initialized at program start-up to the initial conversion state. Otherwise, the **mbstate_t** object
 70358 pointed to by *ps* shall be used to completely describe the current conversion state of the
 70359 associated character sequence. The implementation shall behave as if no function defined in this
 70360 volume of POSIX.1-2008 calls `wrtomb()`.

70361 CX The `wrtomb()` function need not be thread-safe if called with a NULL *ps* argument.70362 The behavior of this function shall be affected by the `LC_CTYPE` category of the current locale.70363 The `wrtomb()` function shall not change the setting of *errno* if successful.70364 **RETURN VALUE**

70365 The `wrtomb()` function shall return the number of bytes stored in the array object (including any
 70366 shift sequences). When *wc* is not a valid wide character, an encoding error shall occur. In this
 70367 case, the function shall store the value of the macro [EILSEQ] in *errno* and shall return (**size_t**)−1;
 70368 the conversion state shall be undefined.

70369 **ERRORS**70370 The `wrtomb()` function shall fail if:

70371 [EILSEQ] An invalid wide-character code is detected.

70372 The `wrtomb()` function may fail if:70373 CX [EINVAL] *ps* points to an object that contains an invalid conversion state.

70385 **CHANGE HISTORY**70386 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995
70387 (E).70388 **Issue 6**

70389 In the DESCRIPTION, a note on using this function in a threaded application is added.

70390 Extensions beyond the ISO C standard are marked.

70391 The normative text is updated to avoid use of the term “must” for application requirements.

70392 The *wcr tomb()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.70393 **Issue 7**70394 Austin Group Interpretation 1003.1-2001 #148 is applied, clarifying that the *wcr tomb()* function
70395 need not be thread-safe if called with a NULL *ps* argument.

70396 Austin Group Interpretation 1003.1-2001 #170 is applied.

70397 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0714 [88] and XSH/TC1-2008/0715 +
70398 [105] are applied.

NAME

`wcscasecmp`, `wcscasecmp_l`, `wcsncasecmp`, `wcsncasecmp_l` — case-insensitive wide-character string comparison

SYNOPSIS

```
CX #include <wchar.h>

int wcscasecmp(const wchar_t *ws1, const wchar_t *ws2);
int wcscasecmp_l(const wchar_t *ws1, const wchar_t *ws2,
    locale_t locale);
int wcsncasecmp(const wchar_t *ws1, const wchar_t *ws2, size_t n);
int wcsncasecmp_l(const wchar_t *ws1, const wchar_t *ws2,
    size_t n, locale_t locale);
```

DESCRIPTION

The `wcscasecmp()` and `wcsncasecmp()` functions are the wide-character equivalent of the `strcasecmp()` and `strncasecmp()` functions, respectively.

The `wcscasecmp()` and `wcscasecmp_l()` functions shall compare, while ignoring differences in case, the wide-character string pointed to by `ws1` to the wide-character string pointed to by `ws2`.

The `wcsncasecmp()` and `wcsncasecmp_l()` functions shall compare, while ignoring differences in case, not more than `n` wide-characters from the wide-character string pointed to by `ws1` to the wide-character string pointed to by `ws2`.

The `wcscasecmp()` and `wcsncasecmp()` functions use the current locale to determine the case of the wide characters. +

The `wcscasecmp_l()` and `wcsncasecmp_l()` functions use the locale represented by `locale` to determine the case of the wide characters. +

When the `LC_CTIME` category of the locale being used is from the POSIX locale, these functions shall behave as if the wide-character strings had been converted to lowercase and then a comparison of wide-character codes performed. Otherwise, the results are unspecified. |

The information for `wcscasecmp_l()` and `wcsncasecmp_l()` about the case of the characters comes from the locale represented by `locale`.

The behavior is undefined if the `locale` argument to `wcscasecmp_l()` or `wcsncasecmp_l()` is the special locale object `LC_GLOBAL_LOCALE` or is not a valid locale object handle. +

RETURN VALUE

Upon completion, the `wcscasecmp()` and `wcscasecmp_l()` functions shall return an integer greater than, equal to, or less than 0 if the wide-character string pointed to by `ws1` is, ignoring case, greater than, equal to, or less than the wide-character string pointed to by `ws2`, respectively.

Upon completion, the `wcsncasecmp()` and `wcsncasecmp_l()` functions shall return an integer greater than, equal to, or less than 0 if the possibly null wide-character terminated string pointed to by `ws1` is, ignoring case, greater than, equal to, or less than the possibly null wide-character terminated string pointed to by `ws2`, respectively.

No return values are reserved to indicate an error.

ERRORS

No errors are defined. |

70486 **Issue 6**

70487 The Open Group Corrigendum U040/2 is applied. In the RETURN VALUE section, *s1* is
70488 changed to *ws1*.

70489 The *wscat()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

70490 **NAME**

70491 wcschr — wide-character string scanning operation

70492 **SYNOPSIS**

70493 #include <wchar.h>

70494 wchar_t *wcschr(const wchar_t *ws, wchar_t wc);

70495 **DESCRIPTION**

70496 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any
70497 conflict between the requirements described here and the ISO C standard is unintentional. This
70498 volume of POSIX.1-2008 defers to the ISO C standard.

70499 The *wcschr()* function shall locate the first occurrence of *wc* in the wide-character string pointed
70500 to by *ws*. The application shall ensure that the value of *wc* is a character representable as a type
70501 **wchar_t** and a wide-character code corresponding to a valid character in the current locale. The
70502 terminating null wide-character code is considered to be part of the wide-character string.

70503 **RETURN VALUE**

70504 Upon completion, *wcschr()* shall return a pointer to the wide-character code, or a null pointer if
70505 the wide-character code is not found.

70506 **ERRORS**

70507 No errors are defined.

NAME

wscoll, wscoll_l — wide-character string comparison using collating information

SYNOPSIS

```
#include <wchar.h>
```

```
int wscoll(const wchar_t *ws1, const wchar_t *ws2);
```

```
CX int wscoll_l(const wchar_t *ws1, const wchar_t *ws2,  
    locale_t locale);
```

DESCRIPTION

CX For *wscoll()*: The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

CX The *wscoll()* and *wscoll_l()* functions shall compare the wide-character string pointed to by *ws1* to the wide-character string pointed to by *ws2*, both interpreted as appropriate to the LC_COLLATE category of the current locale, or the locale represented by *locale*, respectively.

CX The *wscoll()* and *wscoll_l()* functions shall not change the setting of *errno* if successful.

CX An application wishing to check for error situations should set *errno* to 0 before calling *wscoll()* or *wscoll_l()*. If *errno* is non-zero on return, an error has occurred.

CX The behavior is undefined if the *locale* argument to *wscoll_l()* is the special locale object LC_GLOBAL_LOCALE or is not a valid locale object handle.

RETURN VALUE

CX Upon successful completion, *wscoll()* and *wscoll_l()* shall return an integer greater than, equal to, or less than 0, according to whether the wide-character string pointed to by *ws1* is greater than, equal to, or less than the wide-character string pointed to by *ws2*, when both are interpreted as appropriate to the current locale, or to the locale represented by *locale*, respectively. On error, *wscoll()* and *wscoll_l()* shall set *errno*, but no return value is reserved to indicate an error.

ERRORS

These functions may fail if:

CX [EINVAL] The *ws1* or *ws2* arguments contain wide-character codes outside the domain of the collating sequence.

EXAMPLES

None.

APPLICATION USAGE

The *wcsxfrm()* and *wscmp()* functions should be used for sorting large lists.

RATIONALE

None.

FUTURE DIRECTIONS

None.

70596 **CHANGE HISTORY**

70597 First released in Issue 4. Derived from the MSE working draft.

70598 **Issue 5**

70599 Moved from ENHANCED I18N to BASE and the [ENOSYS] error is removed.

70600 The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.

70601 **Issue 7**

70602 The *wcscoll_l()* function is added from The Open Group Technical Standard, 2006, Extended API
70603 Set Part 4.

70604 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0719 [302], XSH/TC1-2008/0720 [283], +
70605 and XSH/TC1-2008/0721 [283] are applied.

NAME

wcpcpy, wcscopy — copy a wide-character string, returning a pointer to its end

SYNOPSIS

```
#include <wchar.h>
```

```
CX      wchar_t *wcpcpy(wchar_t *restrict ws1, const wchar_t *restrict ws2);
        wchar_t *wcscopy(wchar_t *restrict ws1, const wchar_t *restrict ws2);
```

DESCRIPTION

CX For *wcscopy()*: The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

CX The *wcpcpy()* and *wcscopy()* functions shall copy the wide-character string pointed to by *ws2* (including the terminating null wide-character code) into the array pointed to by *ws1*.

The application shall ensure that there is room for at least *wcslen(ws2)+1* wide characters in the *ws1* array, and that the *ws2* and *ws1* arrays do not overlap.

If copying takes place between objects that overlap, the behavior is undefined.

RETURN VALUE

CX The *wcpcpy()* function shall return a pointer to the terminating null wide-character code copied into the *ws1* buffer.

The *wcscopy()* function shall return *ws1*.

No return values are reserved to indicate an error.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

None.

CHANGE HISTORY

First released in Issue 4. Derived from the MSE working draft.

Issue 6

The *wcscopy()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

Issue 7

The *wcpcpy()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 1.

70646 **NAME**

70647 wcscspn — get the length of a complementary wide substring

70648 **SYNOPSIS**

70649 #include <wchar.h>

70650 size_t wcscspn(const wchar_t *ws1, const wchar_t *ws2);

70651 **DESCRIPTION**

70652 CX The functionality described on this reference page is aligned with the ISO C standard. Any
70653 conflict between the requirements described here and the ISO C standard is unintentional. This
70654 volume of POSIX.1-2008 defers to the ISO C standard.

70655 The *wcscspn()* function shall compute the length (in wide characters) of the maximum initial
70656 segment of the wide-character string pointed to by *ws1* which consists entirely of wide-character
70657 codes *not* from the wide-character string pointed to by *ws2*.

70658 **RETURN VALUE**

70659 The *wcscspn()* function shall return the length of the initial substring of *ws1*; no return value is
70660 reserved to indicate an error.

70661 **ERRORS**

70662 No errors are defined.

70663 **EXAMPLES**

70664 None.

70665 **APPLICATION USAGE**

70666 None.

70667 **RATIONALE**

70668 None.

70675 First released in Issue 4. Derived from the MSE working draft.

70676 **Issue 5**

70677 The RETURN VALUE section is updated to indicate that *wcscspn()* returns the length of *ws1*,
70678 rather than *ws1* itself.

NAME

wcsdup — duplicate a wide-character string

SYNOPSIS

```
CX      #include <wchar.h>
      wchar_t *wcsdup(const wchar_t *string);
```

DESCRIPTION

The *wcsdup()* function is the wide-character equivalent of the *strdup()* function.

The *wcsdup()* function shall return a pointer to a new wide-character string, allocated as if by a call to *malloc()*, which is the duplicate of the wide-character string *string*. The returned pointer can be passed to *free()*. A null pointer is returned if the new wide-character string cannot be created.

RETURN VALUE

Upon successful completion, the *wcsdup()* function shall return a pointer to the newly allocated wide-character string. Otherwise, it shall return a null pointer and set *errno* to indicate the error.

ERRORS

The *wcsdup()* function shall fail if:

[ENOMEM] Memory large enough for the duplicate string could not be allocated.

EXAMPLES

None.

APPLICATION USAGE

For functions that allocate memory as if by *malloc()*, the application should release such memory when it is no longer required by a call to *free()*. For *wcsdup()*, this is the return value.

RATIONALE

None.

FUTURE DIRECTIONS

None.

First released in Issue 7.

NAME

wcsftime — convert date and time to a wide-character string

SYNOPSIS

```
#include <wchar.h>
```

```
size_t wcsftime(wchar_t *restrict wcs, size_t maxsize,
                const wchar_t *restrict format, const struct tm *restrict timeptr);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

The *wcsftime()* function shall be equivalent to the *strftime()* function, except that:

- The argument *wcs* points to the initial element of an array of wide characters into which the generated output is to be placed.
- The argument *maxsize* indicates the maximum number of wide characters to be placed in the output array.
- The argument *format* is a wide-character string and the conversion specifications are replaced by corresponding sequences of wide characters.
- The return value indicates the number of wide characters placed in the output array.

If copying takes place between objects that overlap, the behavior is undefined.

RETURN VALUE

If the total number of resulting wide-character codes including the terminating null wide-character code is no more than *maxsize*, *wcsftime()* shall return the number of wide-character codes placed into the array pointed to by *wcs*, not including the terminating null wide-character code. Otherwise, zero is returned and the contents of the array are unspecified.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

CHANGE HISTORY

First released in Issue 4.

70749 Issue 5

70750 Moved from ENHANCED I18N to BASE and the [ENOSYS] error is removed.

70751 Aligned with ISO/IEC 9899:1990/Amendment 1:1995 (E). Specifically, the type of the *format*
70752 argument is changed from **const char *** to **const wchar_t ***.

70753 Issue 6

70754 The *wcsftime()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

70755 **NAME**

70756 wcslen, wcsnlen — get length of a fixed-sized wide-character string

70757 **SYNOPSIS**

70758 #include <wchar.h>

70759 size_t wcslen(const wchar_t *ws);

70760 CX size_t wcsnlen(const wchar_t *ws, size_t maxlen);

70761 **DESCRIPTION**

70762 CX For *wcslen()*: The functionality described on this reference page is aligned with the ISO C
 70763 standard. Any conflict between the requirements described here and the ISO C standard is
 70764 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

70765 The *wcslen()* function shall compute the number of wide-character codes in the wide-character
 70766 string to which *ws* points, not including the terminating null wide-character code.

70767 CX The *wcsnlen()* function shall compute the smaller of the number of wide characters in the string
 70768 to which *ws* points, not including the terminating null wide-character code, and the value of
 70769 *maxlen*. The *wcsnlen()* function shall never examine more than the first *maxlen* characters of the
 70770 wide-character string pointed to by *ws*.

70771 **RETURN VALUE**70772 The *wcslen()* function shall return the length of *ws*.

70773 CX The *wcsnlen()* function shall return an integer containing the smaller of either the length of the
 70774 wide-character string pointed to by *ws* or *maxlen*.

70775 No return values are reserved to indicate an error.

NAME

wcsncmp — compare part of two wide-character strings

SYNOPSIS

```
#include <wchar.h>
```

```
int wcsncmp(const wchar_t *ws1, const wchar_t *ws2, size_t n);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

The *wcsncmp()* function shall compare not more than *n* wide-character codes (wide-character codes that follow a null wide-character code are not compared) from the array pointed to by *ws1* to the array pointed to by *ws2*.

The sign of a non-zero return value shall be determined by the sign of the difference between the values of the first pair of wide-character codes that differ in the objects being compared.

RETURN VALUE

Upon successful completion, *wcsncmp()* shall return an integer greater than, equal to, or less than 0, if the possibly null-terminated array pointed to by *ws1* is greater than, equal to, or less than the possibly null-terminated array pointed to by *ws2*, respectively.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 4. Derived from the MSE working draft.

70871 **NAME**

70872 wcpncpy, wcsncpy — copy a fixed-size wide-character string, returning a pointer to its end

70873 **SYNOPSIS**

70874 #include <wchar.h>

70875 CX wchar_t *wcpncpy(wchar_t restrict *ws1, const wchar_t *restrict ws2,
70876 size_t n);70877 wchar_t *wcsncpy(wchar_t *restrict ws1, const wchar_t *restrict ws2,
70878 size_t n);70879 **DESCRIPTION**70880 CX For *wcsncpy()*: The functionality described on this reference page is aligned with the ISO C
70881 standard. Any conflict between the requirements described here and the ISO C standard is
70882 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.70883 CX The *wcpncpy()* and *wcsncpy()* functions shall copy not more than *n* wide-character codes (wide-
70884 character codes that follow a null wide-character code are not copied) from the array pointed to
70885 by *ws2* to the array pointed to by *ws1*. If copying takes place between objects that overlap, the
70886 behavior is undefined.70887 If the array pointed to by *ws2* is a wide-character string that is shorter than *n* wide-character
70888 codes, null wide-character codes shall be appended to the copy in the array pointed to by *ws1*,
70889 until *n* wide-character codes in all are written.70890 **RETURN VALUE**70891 CX If any null wide-character codes were written into the destination, the *wcpncpy()* function shall
70892 return the address of the first such null wide-character code. Otherwise, it shall return *&ws1[n]*.70893 The *wcsncpy()* function shall return *ws1*.

70894 No return values are reserved to indicate an error.

70895 **ERRORS**

70896 No errors are defined.

70897 **EXAMPLES**

70898 None.

70899 **APPLICATION USAGE**70900 If there is no null wide-character code in the first *n* wide-character codes of the array pointed to
70901 by *ws2*, the result is not null-terminated.70902 **RATIONALE**

70903 None.

70904 **FUTURE DIRECTIONS**

70905 None.

70906 **SEE ALSO**70907 *strncpy()*, *wcscpy()*

70908 XBD <wchar.h>

70909 **CHANGE HISTORY**

70910 First released in Issue 4. Derived from the MSE working draft.

Issue 6

70911 The *wcsncpy()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

Issue 7

70913 The *wcpncpy()* function is added from The Open Group Technical Standard, 2006, Extended API
70914 Set Part 1.
70915

70916 **NAME**

70917 wcsnlen — get length of a fixed-sized wide-character string

70918 **SYNOPSIS**

```
70919 CX       #include <wchar.h>  
70920       size_t wcsnlen(const wchar_t *ws, size_t maxlen);
```

70921 **DESCRIPTION**70922 Refer to *wcslen()*.

70923 **NAME**

70924 wcsnrtombs — convert wide-character string to multi-byte string

70925 **SYNOPSIS**

```
70926 CX      #include <wchar.h>
70927          size_t wcsnrtombs(char *restrict dst, const wchar_t **restrict src,
70928                          size_t nwc, size_t len, mbstate_t *restrict ps);
```

70929 **DESCRIPTION**70930 Refer to *wcsrtombs()*.

70931 **NAME**

70932 wcpbrk — scan a wide-character string for a wide-character code

70933 **SYNOPSIS**

70934 #include <wchar.h>

70935 wchar_t *wcpbrk(const wchar_t *ws1, const wchar_t *ws2);

70936 **DESCRIPTION**

70937 CX The functionality described on this reference page is aligned with the ISO C standard. Any
70938 conflict between the requirements described here and the ISO C standard is unintentional. This
70939 volume of POSIX.1-2008 defers to the ISO C standard.

70940 The *wcpbrk()* function shall locate the first occurrence in the wide-character string pointed to by
70941 *ws1* of any wide-character code from the wide-character string pointed to by *ws2*.

70942 **RETURN VALUE**

70943 Upon successful completion, *wcpbrk()* shall return a pointer to the wide-character code or a null
70944 pointer if no wide-character code from *ws2* occurs in *ws1*.

70945 **ERRORS**

70946 No errors are defined.

70947 **EXAMPLES**

70948 None.

70949 **APPLICATION USAGE**

70950 None.

70951 **RATIONALE**

70952 None.

70953 **FUTURE DIRECTIONS**

70954 None.

70955 **SEE ALSO**70956 *wcschr()*, *wcsrchr()*

70957 XBD <wchar.h>

70958 **CHANGE HISTORY**

70959 First released in Issue 4. Derived from the MSE working draft.

70960 **NAME**

70961 wcsrchr — wide-character string scanning operation

70962 **SYNOPSIS**

70963 #include <wchar.h>

70964 wchar_t *wcsrchr(const wchar_t *ws, wchar_t wc);

70965 **DESCRIPTION**

70966 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any
70967 conflict between the requirements described here and the ISO C standard is unintentional. This
70968 volume of POSIX.1-2008 defers to the ISO C standard.

70969 The *wcsrchr()* function shall locate the last occurrence of *wc* in the wide-character string pointed
70970 to by *ws*. The application shall ensure that the value of *wc* is a character representable as a type
70971 **wchar_t** and a wide-character code corresponding to a valid character in the current locale. The
70972 terminating null wide-character code shall be considered to be part of the wide-character string.

70973 **RETURN VALUE**

70974 Upon successful completion, *wcsrchr()* shall return a pointer to the wide-character code or a null
70975 pointer if *wc* does not occur in the wide-character string.

70976 **ERRORS**

70977 No errors are defined.

70978 **EXAMPLES**

70979 None.

70980 **APPLICATION USAGE**

70981 None.

70991 **Issue 6**

70992 The normative text is updated to avoid use of the term “must” for application requirements.

70993 NAME

70994 wcsnrtombs, wcsrtombs — convert a wide-character string to a character string (restartable)

70995 SYNOPSIS

70996 #include <wchar.h>

```
70997 CX size_t wcsnrtombs(char *restrict dst, const wchar_t **restrict src,
70998 size_t nwc, size_t len, mbstate_t *restrict ps);
70999 size_t wcsrtombs(char *restrict dst, const wchar_t **restrict src,
71000 size_t len, mbstate_t *restrict ps);
```

71001 DESCRIPTION

71002 CX For *wcsrtombs()*: The functionality described on this reference page is aligned with the ISO C
 71003 standard. Any conflict between the requirements described here and the ISO C standard is
 71004 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

71005 The *wcsrtombs()* function shall convert a sequence of wide characters from the array indirectly
 71006 pointed to by *src* into a sequence of corresponding characters, beginning in the conversion state
 71007 described by the object pointed to by *ps*. If *dst* is not a null pointer, the converted characters
 71008 shall then be stored into the array pointed to by *dst*. Conversion continues up to and including a
 71009 terminating null wide character, which shall also be stored. Conversion shall stop earlier in the
 71010 following cases:

- 71011 • When a code is reached that does not correspond to a valid character
- 71012 • When the next character would exceed the limit of *len* total bytes to be stored in the array
- 71013 pointed to by *dst* (and *dst* is not a null pointer)

71014 Each conversion shall take place as if by a call to the *wcrtomb()* function.

71015 If *dst* is not a null pointer, the pointer object pointed to by *src* shall be assigned either a null
 71016 pointer (if conversion stopped due to reaching a terminating null wide character) or the address
 71017 just past the last wide character converted (if any). If conversion stopped due to reaching a
 71018 terminating null wide character, the resulting state described shall be the initial conversion state.

71019 If *ps* is a null pointer, the *wcsrtombs()* function shall use its own internal **mbstate_t** object, which
 71020 is initialized at program start-up to the initial conversion state. Otherwise, the **mbstate_t** object
 71021 pointed to by *ps* shall be used to completely describe the current conversion state of the
 71022 associated character sequence.

71023 CX The *wcsnrtombs()* and *wcsrtombs()* functions need not be thread-safe if called with a NULL *ps* |
 71024 argument.

71025 The *wcsnrtombs()* function shall be equivalent to the *wcsrtombs()* function, except that the
 71026 conversion is limited to the first *nwc* wide characters.

71027 The *wcsrtombs()* function shall not change the setting of *errno* if successful. +

71028 The behavior of these functions shall be affected by the *LC_CTYPE* category of the current locale.

71029 The implementation shall behave as if no function defined in System Interfaces volume of
 71030 POSIX.1-2008 calls these functions.

71031 RETURN VALUE

71032 If conversion stops because a code is reached that does not correspond to a valid character, an
 71033 encoding error occurs. In this case, these functions shall store the value of the macro [EILSEQ] in
 71034 *errno* and return (**size_t**)–1; the conversion state is undefined. Otherwise, these functions shall
 71035 return the number of bytes in the resulting character sequence, not including the terminating
 71036 null (if any).

71037 **ERRORS**

71038 These functions shall fail if:

71039 [EILSEQ] A wide-character code does not correspond to a valid character.

71040 These functions may fail if:

71041 CX [EINVAL] *ps* points to an object that contains an invalid conversion state.71042 **EXAMPLES**

71043 None.

71044 **APPLICATION USAGE**

71045 None.

71046 **RATIONALE**

71047 None.

71048 **FUTURE DIRECTIONS**

71049 None.

71050 **SEE ALSO**71051 *mbsinit()*, *wcrtomb()*

71052 XBD <wchar.h>

71053 **CHANGE HISTORY**71054 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995
71055 (E).71056 **Issue 6**

71057 In the DESCRIPTION, a note on using this function in a threaded application is added.

71058 Extensions beyond the ISO C standard are marked.

71059 The normative text is updated to avoid use of the term “must” for application requirements.

71060 The *wcsrtombs()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.71061 **Issue 7**71062 Austin Group Interpretation 1003.1-2001 #148 is applied, clarifying that the *wcsrtombs()* function
71063 need not be thread-safe if called with a NULL *ps* argument.

71064 Austin Group Interpretation 1003.1-2001 #170 is applied.

71065 The *wcnsrtombs()* function is added from The Open Group Technical Standard, 2006, Extended
71066 API Set Part 1.

71067 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0722 [109,105] is applied.

+

71068 **NAME**

71069 wcsspnp — get the length of a wide substring

71070 **SYNOPSIS**

71071 #include <wchar.h>

71072 size_t wcsspnp(const wchar_t *ws1, const wchar_t *ws2);

71073 **DESCRIPTION**

71074 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any
71075 conflict between the requirements described here and the ISO C standard is unintentional. This
71076 volume of POSIX.1-2008 defers to the ISO C standard.

71077 The *wcsspnp()* function shall compute the length (in wide characters) of the maximum initial
71078 segment of the wide-character string pointed to by *ws1* which consists entirely of wide-character
71079 codes from the wide-character string pointed to by *ws2*.

71080 **RETURN VALUE**

71081 The *wcsspnp()* function shall return the length of the initial substring of *ws1*; no return value is
71082 reserved to indicate an error.

71083 **ERRORS**

71084 No errors are defined.

71085 **EXAMPLES**

71086 None.

71087 **APPLICATION USAGE**

71088 None.

71089 **RATIONALE**

71090 None.

71091 **FUTURE DIRECTIONS**

71092 None.

71093 **SEE ALSO**71094 *wcscspnp()*

71095 XBD <wchar.h>

71096 **CHANGE HISTORY**

71097 First released in Issue 4. Derived from the MSE working draft.

71098 **Issue 5**

71099 The RETURN VALUE section is updated to indicate that *wcsspnp()* returns the length of *ws1*
71100 rather than *ws1* itself.

71101 **NAME**

71102 wcsstr — find a wide-character substring

71103 **SYNOPSIS**

71104 #include <wchar.h>

71105 wchar_t *wcsstr(const wchar_t *restrict ws1,
71106 const wchar_t *restrict ws2);71107 **DESCRIPTION**71108 CX The functionality described on this reference page is aligned with the ISO C standard. Any
71109 conflict between the requirements described here and the ISO C standard is unintentional. This
71110 volume of POSIX.1-2008 defers to the ISO C standard.71111 The *wcsstr()* function shall locate the first occurrence in the wide-character string pointed to by
71112 *ws1* of the sequence of wide characters (excluding the terminating null wide character) in the
71113 wide-character string pointed to by *ws2*.71114 **RETURN VALUE**71115 Upon successful completion, *wcsstr()* shall return a pointer to the located wide-character string,
71116 or a null pointer if the wide-character string is not found.71117 If *ws2* points to a wide-character string with zero length, the function shall return *ws1*.71118 **ERRORS**

71119 No errors are defined.

71120 **EXAMPLES**

71121 None.

71122 **APPLICATION USAGE**

71123 None.

71133 (E).71134 **Issue 6**71135 The *wcsstr()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

71136 NAME

71137 wcstod, wcstof, wcstold — convert a wide-character string to a double-precision number

71138 SYNOPSIS

71139 #include <wchar.h>

71140 double wcstod(const wchar_t *restrict nptr, wchar_t **restrict endptr);

71141 float wcstof(const wchar_t *restrict nptr, wchar_t **restrict endptr);

71142 long double wcstold(const wchar_t *restrict nptr,

71143 wchar_t **restrict endptr);

71144 DESCRIPTION

71145 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 71146 conflict between the requirements described here and the ISO C standard is unintentional. This
 71147 volume of POSIX.1-2008 defers to the ISO C standard.

71148 These functions shall convert the initial portion of the wide-character string pointed to by *nptr* to
 71149 **double**, **float**, and **long double** representation, respectively. First, they shall decompose the
 71150 input wide-character string into three parts:

- 71151 1. An initial, possibly empty, sequence of white-space wide-character codes (as specified by
 71152 *iswspace()*)
- 71153 2. A subject sequence interpreted as a floating-point constant or representing infinity or
 71154 NaN
- 71155 3. A final wide-character string of one or more unrecognized wide-character codes,
 71156 including the terminating null wide-character code of the input wide-character string

71157 Then they shall attempt to convert the subject sequence to a floating-point number, and return
 71158 the result.

71159 The expected form of the subject sequence is an optional '+' or '-' sign, then one of the
 71160 following:

- 71161 • A non-empty sequence of decimal digits optionally containing a radix character; then an
 71162 optional exponent part consisting of the wide character 'e' or the wide character 'E',
 71163 optionally followed by a '+' or '-' wide character, and then followed by one or more
 71164 decimal digits
- 71165 • A 0x or 0X, then a non-empty sequence of hexadecimal digits optionally containing a radix
 71166 character; then an optional binary exponent part consisting of the wide character 'p' or
 71167 the wide character 'P', optionally followed by a '+' or '-' wide character, and then
 71168 followed by one or more decimal digits
- 71169 • One of INF or INFINITY, or any other wide string equivalent except for case
- 71170 • One of NAN or NAN(*n-wchar-sequence_{opt}*), or any other wide string ignoring case in the
 71171 NAN part, where:

71172 n-wchar-sequence:

71173 digit

71174 nondigit

71175 n-wchar-sequence digit

71176 n-wchar-sequence nondigit

71177 The subject sequence is defined as the longest initial subsequence of the input wide string,
 71178 starting with the first non-white-space wide character, that is of the expected form. The subject
 71179 sequence contains no wide characters if the input wide string is not of the expected form.

If the subject sequence has the expected form for a floating-point number, the sequence of wide characters starting with the first digit or the radix character (whichever occurs first) shall be interpreted as a floating constant according to the rules of the C language, except that the radix character shall be used in place of a period, and that if neither an exponent part nor a radix character appears in a decimal floating-point number, or if a binary exponent part does not appear in a hexadecimal floating-point number, an exponent part of the appropriate type with value zero shall be assumed to follow the last digit in the string. If the subject sequence begins with a minus-sign, the sequence shall be interpreted as negated. A wide-character sequence INF or INFINITY shall be interpreted as an infinity, if representable in the return type, else as if it were a floating constant that is too large for the range of the return type. A wide-character sequence NAN or NAN(*n-wchar-sequence_{opt}*) shall be interpreted as a quiet NaN, if supported in the return type, else as if it were a subject sequence part that does not have the expected form; the meaning of the *n-wchar* sequences is implementation-defined. A pointer to the final wide string shall be stored in the object pointed to by *endptr*, provided that *endptr* is not a null pointer.

If the subject sequence has the hexadecimal form and FLT_RADIX is a power of 2, the conversion shall be rounded in an implementation-defined manner.

CX The radix character shall be as defined in the current locale (category *LC_NUMERIC*). In the POSIX locale, or in a locale where the radix character is not defined, the radix character shall default to a <period> ('.').

CX In other than the C or POSIX locales, other implementation-defined subject sequences may be accepted.

If the subject sequence is empty or does not have the expected form, no conversion shall be performed; the value of *nptr* shall be stored in the object pointed to by *endptr*, provided that *endptr* is not a null pointer.

These functions shall not change the setting of *errno* if successful.

Since 0 is returned on error and is also a valid return on success, an application wishing to check for error situations should set *errno* to 0, then call *wcstod()*, *wcstof()*, or *wcstold()*, then check *errno*.

71208 RETURN VALUE

Upon successful completion, these functions shall return the converted value. If no conversion could be performed, 0 shall be returned and *errno* may be set to [EINVAL].

If the correct value is outside the range of representable values, $\pm$ HUGE_VAL, $\pm$ HUGE_VALF, or $\pm$ HUGE_VALL shall be returned (according to the sign of the value), and *errno* shall be set to [ERANGE].

If the correct value would cause underflow, a value whose magnitude is no greater than the smallest normalized positive number in the return type shall be returned and *errno* set to [ERANGE].

71217 ERRORS

The *wcstod()* function shall fail if:

[ERANGE] The value to be returned would cause overflow or underflow.

The *wcstod()* function may fail if:

CX [EINVAL] No conversion could be performed.

EXAMPLES

None.

APPLICATION USAGE

If the subject sequence has the hexadecimal form and FLT_RADIX is not a power of 2, and the result is not exactly representable, the result should be one of the two numbers in the appropriate internal format that are adjacent to the hexadecimal floating source value, with the extra stipulation that the error should have a correct sign for the current rounding direction.

If the subject sequence has the decimal form and at most DECIMAL_DIG (defined in `<float.h>`) significant digits, the result should be correctly rounded. If the subject sequence *D* has the decimal form and more than DECIMAL_DIG significant digits, consider the two bounding, adjacent decimal strings *L* and *U*, both having DECIMAL_DIG significant digits, such that the values of *L*, *D*, and *U* satisfy "*L* <= *D* <= *U*". The result should be one of the (equal or adjacent) values that would be obtained by correctly rounding *L* and *U* according to the current rounding direction, with the extra stipulation that the error with respect to *D* should have a correct sign for the current rounding direction.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 4. Derived from the MSE working draft.

Issue 5

The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.

Issue 6

Extensions beyond the ISO C standard are marked.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In the RETURN VALUE and ERRORS sections, the [EINVAL] optional error condition is added if no conversion could be performed.

The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- The *wcstod()* prototype is updated.
- The *wcstof()* and *wcstold()* functions are added.
- If the correct value for *wcstod()* would cause underflow, the return value changed from 0 (as specified in Issue 5) to the smallest normalized positive number.
- The DESCRIPTION, RETURN VALUE, and APPLICATION USAGE sections are extensively updated.

ISO/IEC 9899:1999 standard, Technical Corrigendum 1 is incorporated.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/66 is applied, correcting the second paragraph in the RETURN VALUE section.

Issue 7

71265 Austin Group Interpretation 1003.1-2001 #015 is applied.

71266 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0723 [302] and XSH/TC1-2008/0724 +
71267 [105] are applied.

71268 **NAME**

71269 wcstoimax, wcstoumax — convert a wide-character string to an integer type

71270 **SYNOPSIS**

```
71271       #include <stddef.h>
71272       #include <inttypes.h>

71273       intmax_t wcstoimax(const wchar_t *restrict nptr,
71274                          wchar_t **restrict endptr, int base);
71275       uintmax_t wcstoumax(const wchar_t *restrict nptr,
71276                          wchar_t **restrict endptr, int base);
```

71277 **DESCRIPTION**

71278 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any
 71279 conflict between the requirements described here and the ISO C standard is unintentional. This
 71280 volume of POSIX.1-2008 defers to the ISO C standard.

71281 These functions shall be equivalent to the *wcstol()*, *wcstoll()*, *wcstoul()*, and *wcstoull()* functions,
 71282 respectively, except that the initial portion of the wide string shall be converted to **intmax_t** and
 71283 **uintmax_t** representation, respectively.

71284 **RETURN VALUE**

71285 These functions shall return the converted value, if any.

71286 If no conversion could be performed, zero shall be returned. If the correct value is outside the
 71287 range of representable values, {INTMAX_MAX}, {INTMAX_MIN}, or {UINTMAX_MAX} shall
 71288 be returned (according to the return type and sign of the value, if any), and *errno* shall be set to
 71289 [ERANGE].

71290 **ERRORS**

71291 These functions shall fail if:

71292 [EINVAL] The value of *base* is not supported.

71293 [ERANGE] The value to be returned is not representable.

71294 These functions may fail if:

71295 [EINVAL] No conversion could be performed.

71296 **EXAMPLES**

71297 None.

71298 **APPLICATION USAGE**

71299 None.

71300 **RATIONALE**

71301 None.

71302 **FUTURE DIRECTIONS**

71303 None.

71308 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

71309 **NAME**

71310 wcstok — split a wide-character string into tokens

71311 **SYNOPSIS**

71312 #include <wchar.h>

```
71313       wchar_t *wcstok(wchar_t *restrict ws1, const wchar_t *restrict ws2,
71314                      wchar_t **restrict ptr);
```

71315 **DESCRIPTION**

71316 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 71317 conflict between the requirements described here and the ISO C standard is unintentional. This
 71318 volume of POSIX.1-2008 defers to the ISO C standard.

71319 A sequence of calls to *wcstok()* shall break the wide-character string pointed to by *ws1* into a
 71320 sequence of tokens, each of which shall be delimited by a wide-character code from the wide-
 71321 character string pointed to by *ws2*. The *ptr* argument points to a caller-provided **wchar_t** pointer
 71322 into which the *wcstok()* function shall store information necessary for it to continue scanning the
 71323 same wide-character string.

71324 The first call in the sequence has *ws1* as its first argument, and is followed by calls with a null
 71325 pointer as their first argument. The separator string pointed to by *ws2* may be different from call
 71326 to call.

71327 The first call in the sequence shall search the wide-character string pointed to by *ws1* for the first
 71328 wide-character code that is *not* contained in the current separator string pointed to by *ws2*. If no
 71329 such wide-character code is found, then there are no tokens in the wide-character string pointed
 71330 to by *ws1* and *wcstok()* shall return a null pointer. If such a wide-character code is found, it shall
 71331 be the start of the first token.

71332 The *wcstok()* function shall then search from there for a wide-character code that *is* contained in
 71333 the current separator string. If no such wide-character code is found, the current token extends
 71334 to the end of the wide-character string pointed to by *ws1*, and subsequent searches for a token
 71335 shall return a null pointer. If such a wide-character code is found, it shall be overwritten by a
 71336 null wide character, which terminates the current token. The *wcstok()* function shall save a
 71337 pointer to the following wide-character code, from which the next search for a token shall start.

71338 Each subsequent call, with a null pointer as the value of the first argument, shall start searching
 71339 from the saved pointer and behave as described above.

71340 The implementation shall behave as if no function calls *wcstok()*.

71341 **RETURN VALUE**

71342 Upon successful completion, the *wcstok()* function shall return a pointer to the first wide-
 71343 character code of a token. Otherwise, if there is no token, *wcstok()* shall return a null pointer.

71344 **ERRORS**

71345 No errors are defined.

71346 **EXAMPLES**

71347 None.

71348 **APPLICATION USAGE**

71349 None.

71350 **RATIONALE**

71351 None.

71353 None.

71354 **SEE ALSO**71355 XBD [<wchar.h>](#)71356 **CHANGE HISTORY**

71357 First released in Issue 4.

71358 **Issue 5**

71359 Aligned with ISO/IEC 9899:1990/Amendment 1:1995 (E). Specifically, a third argument is
71360 added to the definition of *wcstok()* in the SYNOPSIS.

71361 **Issue 6**71362 The *wcstok()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

NAME

wcstol, wcstoll — convert a wide-character string to a long integer

SYNOPSIS

```
#include <wchar.h>

long wcstol(const wchar_t *restrict nptr, wchar_t **restrict endptr,
            int base);
long long wcstoll(const wchar_t *restrict nptr,
                  wchar_t **restrict endptr, int base);
```

DESCRIPTION

The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

These functions shall convert the initial portion of the wide-character string pointed to by *nptr* to **long** and **long long**, respectively. First, they shall decompose the input string into three parts:

1. An initial, possibly empty, sequence of white-space wide-character codes (as specified by *isspace()*)
2. A subject sequence interpreted as an integer represented in some radix determined by the value of *base*
3. A final wide-character string of one or more unrecognized wide-character codes, including the terminating null wide-character code of the input wide-character string

Then they shall attempt to convert the subject sequence to an integer, and return the result.

If *base* is 0, the expected form of the subject sequence is that of a decimal constant, octal constant, or hexadecimal constant, any of which may be preceded by a '+' or '-' sign. A decimal constant begins with a non-zero digit, and consists of a sequence of decimal digits. An octal constant consists of the prefix '0' optionally followed by a sequence of the digits '0' to '7' only. A hexadecimal constant consists of the prefix 0x or 0X followed by a sequence of the decimal digits and letters 'a' (or 'A') to 'f' (or 'F') with values 10 to 15 respectively.

If the value of *base* is between 2 and 36, the expected form of the subject sequence is a sequence of letters and digits representing an integer with the radix specified by *base*, optionally preceded by a '+' or '-' sign, but not including an integer suffix. The letters from 'a' (or 'A') to 'z' (or 'Z') inclusive are ascribed the values 10 to 35; only letters whose ascribed values are less than that of *base* shall be permitted. If the value of *base* is 16, the wide-character code representations of 0x or 0X may optionally precede the sequence of letters and digits, following the sign if present.

The subject sequence is defined as the longest initial subsequence of the input wide-character string, starting with the first non-white-space wide-character code that is of the expected form. The subject sequence contains no wide-character codes if the input wide-character string is empty or consists entirely of white-space wide-character code, or if the first non-white-space wide-character code is other than a sign or a permissible letter or digit.

If the subject sequence has the expected form and *base* is 0, the sequence of wide-character codes starting with the first digit shall be interpreted as an integer constant. If the subject sequence has the expected form and the value of *base* is between 2 and 36, it shall be used as the base for conversion, ascribing to each letter its value as given above. If the subject sequence begins with a minus-sign, the value resulting from the conversion shall be negated. A pointer to the final wide-character string shall be stored in the object pointed to by *endptr*, provided that *endptr* is not a null pointer.

71409 CX In other than the C or POSIX locales, other implementation-defined subject sequences may be
71410 accepted.

71411 If the subject sequence is empty or does not have the expected form, no conversion shall be
71412 performed; the value of *nptr* shall be stored in the object pointed to by *endptr*, provided that
71413 *endptr* is not a null pointer.

71414 These functions shall not change the setting of *errno* if successful. -

71415 Since 0, {LONG_MIN} or {LLONG_MIN} and {LONG_MAX} or {LLONG_MAX} are returned on
71416 error and are also valid returns on success, an application wishing to check for error situations
71417 should set *errno* to 0, then call *wcstol()* or *wcstoll()*, then check *errno*. -

71418 RETURN VALUE

71419 Upon successful completion, these functions shall return the converted value, if any. If no
71420 CX conversion could be performed, 0 shall be returned and *errno* may be set to indicate the error. If
71421 the correct value is outside the range of representable values, {LONG_MIN}, {LONG_MAX},
71422 {LLONG_MIN}, or {LLONG_MAX} shall be returned (according to the sign of the value), and
71423 *errno* set to [ERANGE].

71424 ERRORS

71425 These functions shall fail if:

71426 CX [EINVAL] The value of *base* is not supported.

71427 [ERANGE] The value to be returned is not representable.

71428 These functions may fail if:

71429 CX [EINVAL] No conversion could be performed.

71441 CHANGE HISTORY

71442 First released in Issue 4. Derived from the MSE working draft.

71443 Issue 5

71444 The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.

71445 Issue 6

71446 Extensions beyond the ISO C standard are marked.

71447 The following new requirements on POSIX implementations derive from alignment with the
71448 Single UNIX Specification:

- 71449 • In the RETURN VALUE and ERRORS sections, the [EINVAL] optional error condition is
71450 added if no conversion could be performed.

71451 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- 71452 • The *wcstol()* prototype is updated.
- 71453 • The *wcstoll()* function is added.

71454 **Issue 7**

71455 SD5-XSH-ERN-56 is applied, removing the reference to **unsigned long** and **unsigned long long**
71456 from the DESCRIPTION.

71457 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0725 [105] is applied.

+

71458 **NAME**

71459 wcstold — convert a wide-character string to a double-precision number

71460 **SYNOPSIS**

71461 #include <wchar.h>

71462 long double wcstold(const wchar_t *restrict *nptr*,
71463 wchar_t **restrict *endptr*);71464 **DESCRIPTION**71465 Refer to *wcstod()*.

71466 **NAME**

71467 wcstoll — convert a wide-character string to a long integer

71468 **SYNOPSIS**

71469 #include <wchar.h>

71470 long long wcstoll(const wchar_t *restrict *nptr*,
71471 wchar_t **restrict *endptr*, int *base*);71472 **DESCRIPTION**71473 Refer to *wcstol()*.

71474 **NAME**

71475 wcstombs — convert a wide-character string to a character string

71476 **SYNOPSIS**

71477 #include <stdlib.h>

71478 size_t wcstombs(char *restrict *s*, const wchar_t *restrict *pwcs*,
71479 size_t *n*);71480 **DESCRIPTION**71481 CX The functionality described on this reference page is aligned with the ISO C standard. Any
71482 conflict between the requirements described here and the ISO C standard is unintentional. This
71483 volume of POSIX.1-2008 defers to the ISO C standard.71484 The *wcstombs()* function shall convert the sequence of wide-character codes that are in the array
71485 pointed to by *pwcs* into a sequence of characters that begins in the initial shift state and store
71486 these characters into the array pointed to by *s*, stopping if a character would exceed the limit of *n*
71487 total bytes or if a null byte is stored. Each wide-character code shall be converted as if by a call to
71488 *wctomb()*, except that the shift state of *wctomb()* shall not be affected.71489 The behavior of this function shall be affected by the *LC_CTYPE* category of the current locale.71490 No more than *n* bytes shall be modified in the array pointed to by *s*. If copying takes place
71491 CX between objects that overlap, the behavior is undefined. If *s* is a null pointer, *wcstombs()* shall
71492 return the length required to convert the entire array regardless of the value of *n*, but no values
71493 are stored.71494 **RETURN VALUE**71495 If a wide-character code is encountered that does not correspond to a valid character (of one or
71496 more bytes each), *wcstombs()* shall return (**size_t**)−1. Otherwise, *wcstombs()* shall return the
71497 number of bytes stored in the character array, not including any terminating null byte. The array
71498 shall not be null-terminated if the value returned is *n*.71499 **ERRORS**71500 The *wcstombs()* function shall fail if:

71501 CX [EILSEQ] A wide-character code does not correspond to a valid character.

71502 **EXAMPLES**

71503 None.

71504 **APPLICATION USAGE**

71505 None.

71506 **RATIONALE**

71507 None.

71513 **CHANGE HISTORY**

71514 First released in Issue 4. Derived from the ISO C standard.

71515 **Issue 6**

71516 The following new requirements on POSIX implementations derive from alignment with the
71517 Single UNIX Specification:

- 71518 • The DESCRIPTION states the effect of when *s* is a null pointer.
- 71519 • The [EILSEQ] error condition is added.

71520 The *wcstombs()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

71521 **Issue 7**

71522 Austin Group Interpretations 1003.1-2001 #156 and #170 are applied.

71523 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0726 [109] is applied.

+

71524 **NAME**

71525 wcstoul, wcstoull — convert a wide-character string to an unsigned long

71526 **SYNOPSIS**

```
71527     #include <wchar.h>

71528     unsigned long wcstoul(const wchar_t *restrict nptr,
71529         wchar_t **restrict endptr, int base);
71530     unsigned long long wcstoull(const wchar_t *restrict nptr,
71531         wchar_t **restrict endptr, int base);
```

71532 **DESCRIPTION**

71533 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 71534 conflict between the requirements described here and the ISO C standard is unintentional. This
 71535 volume of POSIX.1-2008 defers to the ISO C standard.

71536 The *wcstoul()* and *wcstoull()* functions shall convert the initial portion of the wide-character
 71537 string pointed to by *nptr* to **unsigned long** and **unsigned long long** representation, respectively.
 71538 First, they shall decompose the input wide-character string into three parts:

- 71539 1. An initial, possibly empty, sequence of white-space wide-character codes (as specified by
 71540 *iswspace()*)
- 71541 2. A subject sequence interpreted as an integer represented in some radix determined by the
 71542 value of *base*
- 71543 3. A final wide-character string of one or more unrecognized wide-character codes,
 71544 including the terminating null wide-character code of the input wide-character string

71545 Then they shall attempt to convert the subject sequence to an unsigned integer, and return the
 71546 result.

71547 If *base* is 0, the expected form of the subject sequence is that of a decimal constant, octal constant,
 71548 or hexadecimal constant, any of which may be preceded by a '+' or '-' sign. A decimal
 71549 constant begins with a non-zero digit, and consists of a sequence of decimal digits. An octal
 71550 constant consists of the prefix '0' optionally followed by a sequence of the digits '0' to '7'
 71551 only. A hexadecimal constant consists of the prefix 0x or 0X followed by a sequence of the
 71552 decimal digits and letters 'a' (or 'A') to 'f' (or 'F') with values 10 to 15 respectively.

71553 If the value of *base* is between 2 and 36, the expected form of the subject sequence is a sequence
 71554 of letters and digits representing an integer with the radix specified by *base*, optionally preceded
 71555 by a '+' or '-' sign, but not including an integer suffix. The letters from 'a' (or 'A') to 'z'
 71556 (or 'Z') inclusive are ascribed the values 10 to 35; only letters whose ascribed values are less
 71557 than that of *base* shall be permitted. If the value of *base* is 16, the wide-character codes 0x or 0X
 71558 may optionally precede the sequence of letters and digits, following the sign if present.

71559 The subject sequence is defined as the longest initial subsequence of the input wide-character
 71560 string, starting with the first wide-character code that is not white space and is of the expected
 71561 form. The subject sequence contains no wide-character codes if the input wide-character string is
 71562 empty or consists entirely of white-space wide-character codes, or if the first wide-character
 71563 code that is not white space is other than a sign or a permissible letter or digit.

71564 If the subject sequence has the expected form and *base* is 0, the sequence of wide-character codes
 71565 starting with the first digit shall be interpreted as an integer constant. If the subject sequence has
 71566 the expected form and the value of *base* is between 2 and 36, it shall be used as the base for
 71567 conversion, ascribing to each letter its value as given above. If the subject sequence begins with a
 71568 minus-sign, the value resulting from the conversion shall be negated. A pointer to the final
 71569 wide-character string shall be stored in the object pointed to by *endptr*, provided that *endptr* is

71570 not a null pointer.

71571 CX In other than the C or POSIX locales, other implementation-defined subject sequences may be
71572 accepted.

71573 If the subject sequence is empty or does not have the expected form, no conversion shall be
71574 performed; the value of *nptr* shall be stored in the object pointed to by *endptr*, provided that
71575 *endptr* is not a null pointer.

71576 These functions shall not change the setting of *errno* if successful. |

71577 Since 0, {ULONG_MAX}, and {ULLONG_MAX} are returned on error and 0 is also a valid return
71578 on success, an application wishing to check for error situations should set *errno* to 0, then call
71579 *wcstoul()* or *wcstoull()*, then check *errno*. -

71580 **RETURN VALUE**

71581 Upon successful completion, the *wcstoul()* and *wcstoull()* functions shall return the converted
71582 CX value, if any. If no conversion could be performed, 0 shall be returned and *errno* may be set to
71583 indicate the error. If the correct value is outside the range of representable values,
71584 {ULONG_MAX} or {ULLONG_MAX} respectively shall be returned and *errno* set to [ERANGE].

71585 **ERRORS**

71586 These functions shall fail if:

71587 CX [EINVAL] The value of *base* is not supported.

71588 [ERANGE] The value to be returned is not representable.

71589 These functions may fail if:

71590 CX [EINVAL] No conversion could be performed.

71591 **EXAMPLES**

71592 None.

71593 **APPLICATION USAGE**

71594 None.

71595 **RATIONALE**

71596 None.

71597 **FUTURE DIRECTIONS**

71602 **CHANGE HISTORY**

71603 First released in Issue 4. Derived from the MSE working draft.

71604 **Issue 5**

71605 The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.

71606 **Issue 6**

71607 Extensions beyond the ISO C standard are marked.

71608 The following new requirements on POSIX implementations derive from alignment with the
71609 Single UNIX Specification:

- 71610 • The [EINVAL] error condition is added for when the value of *base* is not supported.

71611 In the RETURN VALUE and ERRORS sections, the [EINVAL] optional error condition is
71612 added if no conversion could be performed.

71613 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- 71614 • The *wcstoul()* prototype is updated.

- 71615 • The *wcstoull()* function is added.

71616 **Issue 7**

71617 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0727 [105] is applied.

+

71618 **NAME**

71619 wcstoumax — convert a wide-character string to an integer type

71620 **SYNOPSIS**

71621 #include <stddef.h>

71622 #include <inttypes.h>

71623 uintmax_t wcstoumax(const wchar_t *restrict *nptr*,71624 wchar_t **restrict *endptr*, int *base*);71625 **DESCRIPTION**71626 Refer to *wcstoimax()*.

71627 **NAME**

71628 wcswidth — number of column positions of a wide-character string

71629 **SYNOPSIS**

71630 XSI #include <wchar.h>

71631 int wcswidth(const wchar_t *pwcs, size_t n);

71632 **DESCRIPTION**

71633 The *wcswidth()* function shall determine the number of column positions required for *n* wide-
71634 character codes (or fewer than *n* wide-character codes if a null wide-character code is
71635 encountered before *n* wide-character codes are exhausted) in the string pointed to by *pwcs*.

71636 **RETURN VALUE**

71637 The *wcswidth()* function either shall return 0 (if *pwcs* points to a null wide-character code), or
71638 return the number of column positions to be occupied by the wide-character string pointed to by
71639 *pwcs*, or return -1 (if any of the first *n* wide-character codes in the wide-character string pointed
71640 to by *pwcs* is not a printable wide-character code).

71641 **ERRORS**

71642 No errors are defined.

71643 **EXAMPLES**

71644 None.

71645 **APPLICATION USAGE**

71646 This function was removed from the final ISO/IEC 9899:1990/Amendment 1:1995 (E), and the
71647 return value for a non-printable wide character is not specified.

71648 **RATIONALE**

71649 None.

71650 **FUTURE DIRECTIONS**

71651 None.

71659 **NAME**71660 `wcsxfrm`, `wcsxfrm_l` — wide-character string transformation71661 **SYNOPSIS**71662 `#include <wchar.h>`71663 `size_t wcsxfrm(wchar_t *restrict ws1, const wchar_t *restrict ws2,`
71664 `size_t n);`71665 CX `size_t wcsxfrm_l(wchar_t *restrict ws1, const wchar_t *restrict ws2,`
71666 `size_t n, locale_t locale);`71667 **DESCRIPTION**71668 CX For `wcsxfrm()`: The functionality described on this reference page is aligned with the ISO C
71669 standard. Any conflict between the requirements described here and the ISO C standard is
71670 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.71671 CX The `wcsxfrm()` and `wcsxfrm_l()` functions shall transform the wide-character string pointed to
71672 by `ws2` and place the resulting wide-character string into the array pointed to by `ws1`. The
71673 transformation shall be such that if `wcscmp()` is applied to two transformed wide strings, it shall
71674 CX return a value greater than, equal to, or less than 0, corresponding to the result of `wcscoll()` and
71675 `wcscoll_l()` applied to the same two original wide-character strings, and the same `LC_COLLATE`
71676 CX category of the current locale or the locale object `locale`, respectively. No more than `n` wide-
71677 character codes shall be placed into the resulting array pointed to by `ws1`, including the
71678 terminating null wide-character code. If `n` is 0, `ws1` is permitted to be a null pointer. If copying
71679 takes place between objects that overlap, the behavior is undefined.71680 CX The `wcsxfrm()` and `wcsxfrm_l()` functions shall not change the setting of `errno` if successful.71681 Since no return value is reserved to indicate an error, an application wishing to check for error
71682 situations should set `errno` to 0, then call `wcsxfrm()` or `wcsxfrm_l()`, then check `errno`.71683 The behavior is undefined if the `locale` argument to `wcsxfrm_l()` is the special locale object +
71684 `LC_GLOBAL_LOCALE` or is not a valid locale object handle.71685 **RETURN VALUE**71686 CX The `wcsxfrm()` and `wcsxfrm_l()` functions shall return the length of the transformed wide-
71687 character string (not including the terminating null wide-character code). If the value returned is
71688 `n` or more, the contents of the array pointed to by `ws1` are unspecified.71689 CX On error, the `wcsxfrm()` and `wcsxfrm_l()` functions may set `errno`, but no return value is reserved
71690 to indicate an error.71691 **ERRORS**

71692 These functions may fail if:

71693 CX [EINVAL] The wide-character string pointed to by `ws2` contains wide-character codes
71694 outside the domain of the collating sequence.

71695 **EXAMPLES**

71696 None.

71697 **APPLICATION USAGE**

71698 The transformation function is such that two transformed wide-character strings can be ordered
 71699 by *wscmp()* as appropriate to collating sequence information in the current locale (category
 71700 *LC_COLLATE*).

71701 The fact that when *n* is 0 *ws1* is permitted to be a null pointer is useful to determine the size of
 71702 the *ws1* array prior to making the transformation.

71703 **RATIONALE**

71704 None.

71705 **FUTURE DIRECTIONS**

71706 None.

71707 **SEE ALSO**71708 *wscmp()*, *wscoll()*

71709 XBD <wchar.h>

71710 **CHANGE HISTORY**

71711 First released in Issue 4. Derived from the MSE working draft.

71712 **Issue 5**

71713 Moved from ENHANCED I18N to BASE and the [ENOSYS] error is removed.

71714 The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.71715 **Issue 6**

71716 In earlier versions, this function was required to return -1 on error.

71717 Extensions beyond the ISO C standard are marked.

71718 The following new requirements on POSIX implementations derive from alignment with the
 71719 Single UNIX Specification:

- 71720 • In the RETURN VALUE and ERRORS sections, the [EINVAL] optional error condition is
 71721 added if no conversion could be performed.

71722 The *wcsxfrm()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.71723 **Issue 7**

71724 The *wcsxfrm_l()* function is added from The Open Group Technical Standard, 2006, Extended
 71725 API Set Part 4.

71726 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0728 [302], XSH/TC1-2008/0729 [283], +
 71727 XSH/TC1-2008/0730 [283], and XSH/TC1-2008/0731 [302] are applied.

71728 **NAME**

71729 wctob — wide-character to single-byte conversion

71730 **SYNOPSIS**

71731 #include <stdio.h>

71732 #include <wchar.h>

71733 int wctob(wint_t c);

71734 **DESCRIPTION**

71735 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 71736 conflict between the requirements described here and the ISO C standard is unintentional. This
 71737 volume of POSIX.1-2008 defers to the ISO C standard.

71738 The *wctob()* function shall determine whether *c* corresponds to a member of the extended
 71739 character set whose character representation is a single byte when in the initial shift state.

71740 The behavior of this function shall be affected by the *LC_CTYPE* category of the current locale.

71741 **RETURN VALUE**

71742 The *wctob()* function shall return EOF if *c* does not correspond to a character with length one in
 71743 the initial shift state. Otherwise, it shall return the single-byte representation of that character as
 71744 an **unsigned char** converted to **int**.

71745 **ERRORS**

71746 No errors are defined.

71747 **EXAMPLES**

71748 None.

71749 **APPLICATION USAGE**

71750 None.

71751 **RATIONALE**

71752 None.

71753 **FUTURE DIRECTIONS**

71754 None.

71755 **SEE ALSO**71756 *btowc()*

71757 XBD <stdio.h>, <wchar.h>

71758 **CHANGE HISTORY**

71759 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995
 71760 (E).

71761 **NAME**

71762 wctomb — convert a wide-character code to a character

71763 **SYNOPSIS**

71764 #include <stdlib.h>

71765 int wctomb(char *s, wchar_t wchar);

71766 **DESCRIPTION**

71767 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 71768 conflict between the requirements described here and the ISO C standard is unintentional. This
 71769 volume of POSIX.1-2008 defers to the ISO C standard.

71770 The *wctomb()* function shall determine the number of bytes needed to represent the character
 71771 corresponding to the wide-character code whose value is *wchar* (including any change in the
 71772 shift state). It shall store the character representation (possibly multiple bytes and any special
 71773 bytes to change shift state) in the array object pointed to by *s* (if *s* is not a null pointer). At most
 71774 {MB_CUR_MAX} bytes shall be stored. If *wchar* is 0, a null byte shall be stored, preceded by any
 71775 shift sequence needed to restore the initial shift state, and *wctomb()* shall be left in the initial shift
 71776 state.

71777 CX The behavior of this function is affected by the *LC_CTYPE* category of the current locale. For a
 71778 state-dependent encoding, this function shall be placed into its initial state by a call for which its
 71779 character pointer argument, *s*, is a null pointer. Subsequent calls with *s* as other than a null
 71780 pointer shall cause the internal state of the function to be altered as necessary. A call with *s* as a
 71781 null pointer shall cause this function to return a non-zero value if encodings have state
 71782 dependency, and 0 otherwise. Changing the *LC_CTYPE* category causes the shift state of this
 71783 function to be unspecified.

71784 The *wctomb()* function need not be thread-safe.

71785 The implementation shall behave as if no function defined in this volume of POSIX.1-2008 calls
 71786 *wctomb()*.

71787 **RETURN VALUE**

71788 If *s* is a null pointer, *wctomb()* shall return a non-zero or 0 value, if character encodings,
 71789 respectively, do or do not have state-dependent encodings. If *s* is not a null pointer, *wctomb()*
 71790 shall return -1 if the value of *wchar* does not correspond to a valid character, or return the
 71791 number of bytes that constitute the character corresponding to the value of *wchar*.

71792 In no case shall the value returned be greater than the value of the {MB_CUR_MAX} macro.

71793 **ERRORS**71794 The *wctomb()* function shall fail if:

71795 CX [EILSEQ] An invalid wide-character code is detected.

71796 **EXAMPLES**

71797 None.

71798 **APPLICATION USAGE**

71799 None.

71800 **RATIONALE**

71801 None.

71802 FUTURE DIRECTIONS

71803 None.

71807 CHANGE HISTORY

71808 First released in Issue 4. Derived from the ANSI C standard.

71809 Issue 6

71810 Extensions beyond the ISO C standard are marked.

71811 A note indicating that this function need not be reentrant is added to the DESCRIPTION.

71812 Issue 7

71813 Austin Group Interpretations 1003.1-2001 #156 and #170 are applied.

71814 **NAME**

71815 wctrans, wctrans_l — define character mapping

71816 **SYNOPSIS**

71817 #include <wctype.h>

71818 wctrans_t wctrans(const char *charclass);

71819 CX wctrans_t wctrans_l(const char *charclass, locale_t locale);

71820 **DESCRIPTION**

71821 CX For *wctrans()*: The functionality described on this reference page is aligned with the ISO C
 71822 standard. Any conflict between the requirements described here and the ISO C standard is
 71823 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

71824 CX The *wctrans()* and *wctrans_l()* functions are defined for valid character mapping names
 71825 identified in the current locale. The *charclass* is a string identifying a generic character mapping
 71826 name for which codeset-specific information is required. The following character mapping
 71827 names are defined in all locales: **tolower** and **toupper**.

71828 These functions shall return a value of type **wctrans_t**, which can be used as the second
 71829 CX argument to subsequent calls of *towctrans()* and *towctrans_l()*.

71830 CX The *wctrans()* and *wctrans_l()* functions shall determine values of **wctrans_t** according to the
 71831 CX rules of the coded character set defined by character mapping information in the current locale
 71832 or in the locale represented by *locale*, respectively (category *LC_CTYPE*).

71833 The values returned by *wctrans()* shall be valid until a call to *setlocale()* that modifies the
 71834 category *LC_CTYPE*.

71835 CX The values returned by *wctrans_l()* shall be valid only in calls to *towctrans_l()* with a locale
 71836 represented by *locale* with the same *LC_CTYPE* category value.

71837 The behavior is undefined if the *locale* argument to *wctrans_l()* is the special locale object +
 71838 *LC_GLOBAL_LOCALE* or is not a valid locale object handle.

71839 **RETURN VALUE**

71840 CX The *wctrans()* and *wctrans_l()* functions shall return 0 and may set *errno* to indicate the error if
 71841 the given character mapping name is not valid for the current locale (category *LC_CTYPE*);
 71842 otherwise, they shall return a non-zero object of type **wctrans_t** that can be used in calls to
 71843 CX *towctrans()* and *towctrans_l()*.

71844 **ERRORS**

71845 These functions may fail if:

71846 CX [EINVAL] The character mapping name pointed to by *charclass* is not valid in the current
 71847 locale.

71848 **EXAMPLES**

71849 None.

71850 **APPLICATION USAGE**

71851 None.

71852 **RATIONALE**

71853 None.

71854 **FUTURE DIRECTIONS**

71855 None.

71856 **SEE ALSO**71857 *towctrans()*71858 XBD <**wctype.h**>71859 **CHANGE HISTORY**

71860 First released in Issue 5. Derived from ISO/IEC 9899:1990/Amendment 1:1995 (E).

71861 **Issue 7**71862 The *wctrans_l()* function is added from The Open Group Technical Standard, 2006, Extended
71863 API Set Part 4.71864 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0732 [302], XSH/TC1-2008/0733 [289], +
71865 XSH/TC1-2008/0734 [283], and XSH/TC1-2008/0735 [283] are applied.

71866 **NAME**

71867 wctype, wctype_l — define character class

71868 **SYNOPSIS**

71869 #include <wctype.h>

71870 wctype_t wctype(const char *property);

71871 CX wctype_t wctype_l(const char *property, locale_t locale);

71872 **DESCRIPTION**

71873 CX For *wctype()*: The functionality described on this reference page is aligned with the ISO C
 71874 standard. Any conflict between the requirements described here and the ISO C standard is
 71875 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

71876 CX The *wctype()* and *wctype_l()* functions are defined for valid character class names as defined in
 71877 CX the current locale or in the locale represented by *locale*, respectively.

71878 The *property* argument is a string identifying a generic character class for which codeset-specific
 71879 type information is required. The following character class names shall be defined in all locales:

71880	alnum	digit	punct
71881	alpha	graph	space
71882	blank	lower	upper
71883	cntrl	print	xdigit

71884 Additional character class names defined in the locale definition file (category *LC_CTYPE*) can
 71885 also be specified.

71886 These functions shall return a value of type **wctype_t**, which can be used as the second
 71887 CX argument to subsequent calls of *iswctype()* and *iswctype_l()*.

71888 CX The *wctype()* and *wctype_l()* functions shall determine values of **wctype_t** according to the
 71889 CX rules of the coded character set defined by character type information in the current locale or in
 71890 the locale represented by *locale*, respectively (category *LC_CTYPE*).

71891 The values returned by *wctype()* shall be valid until a call to *setlocale()* that modifies the category
 71892 *LC_CTYPE*.

71893 CX The values returned by *wctype_l()* shall be valid only in calls to *iswctype_l()* with a locale
 71894 represented by *locale* with the same *LC_CTYPE* category value.

71895 The behavior is undefined if the *locale* argument to *wctype_l()* is the special locale object +
 71896 *LC_GLOBAL_LOCALE* or is not a valid locale object handle.

71897 **RETURN VALUE**

71898 CX The *wctype()* and *wctype_l()* functions shall return 0 if the given character class name is not
 71899 valid for the current locale (category *LC_CTYPE*); otherwise, they shall return an object of type
 71900 CX **wctype_t** that can be used in calls to *iswctype()* and *iswctype_l()*.

71901 **ERRORS**

71902 No errors are defined.

71903 **EXAMPLES**

71904 None.

71905 **APPLICATION USAGE**

71906 None.

71907 **RATIONALE**

71908 None.

71909 **FUTURE DIRECTIONS**

71910 None.

71911 **SEE ALSO**71912 *iswctype()*71913 XBD **<wctype.h>**71914 **CHANGE HISTORY**

71915 First released in Issue 4.

71916 **Issue 5**71917 The following change has been made in this version for alignment with
71918 ISO/IEC 9899:1990/Amendment 1:1995 (E):

- 71919
- The SYNOPSIS has been changed to indicate that this function and associated data types
71920 are now made visible by inclusion of the **<wctype.h>** header rather than **<wchar.h>**.

71921 **Issue 7**71922 The *wctype_l()* function is added from The Open Group Technical Standard, 2006, Extended API
71923 Set Part 4.71924 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0736 [302], XSH/TC1-2008/0737 [283], +
71925 and XSH/TC1-2008/0738 [283] are applied.

71926 **NAME**

71927 wctype — number of column positions of a wide-character code

71928 **SYNOPSIS**

```
71929 XSI      #include <wctype.h>
71930          int wctype(wctype_t wc);
```

71931 **DESCRIPTION**

71932 The *wctype()* function shall determine the number of column positions required for the wide
71933 character *wc*. The application shall ensure that the value of *wc* is a character representable as a
71934 *wctype_t*, and is a wide-character code corresponding to a valid character in the current locale.

71935 **RETURN VALUE**

71936 The *wctype()* function shall either return 0 (if *wc* is a null wide-character code), or return the
71937 number of column positions to be occupied by the wide-character code *wc*, or return -1 (if *wc*
71938 does not correspond to a printable wide-character code).

71939 **ERRORS**

71940 No errors are defined.

71941 **EXAMPLES**

71942 None.

71943 **APPLICATION USAGE**

71944 This function was removed from the final ISO/IEC 9899:1990/Amendment 1:1995 (E), and the
71945 return value for a non-printable wide character is not specified.

71946 **RATIONALE**

71947 None.

71948 **FUTURE DIRECTIONS**

71949 None.

71950 **SEE ALSO**71951 *wcsnwidth()*

71953 **CHANGE HISTORY**

71954 First released as a World-wide Portability Interface in Issue 4. Derived from the MSE working
71955 draft.

71956 **Issue 6**

71957 The Open Group Corrigendum U021/12 is applied. This function is marked as an extension.

71958 The normative text is updated to avoid use of the term “must” for application requirements.

NAME

wmemchr — find a wide character in memory

SYNOPSIS

```
#include <wchar.h>
```

```
wchar_t *wmemchr(const wchar_t *ws, wchar_t wc, size_t n);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

The *wmemchr()* function shall locate the first occurrence of *wc* in the initial *n* wide characters of the object pointed to by *ws*. This function shall not be affected by locale and all **wchar_t** values shall be treated identically. The null wide character and **wchar_t** values not corresponding to valid characters shall not be treated specially.

If *n* is zero, the application shall ensure that *ws* is a valid pointer and the function behaves as if no valid occurrence of *wc* is found.

RETURN VALUE

The *wmemchr()* function shall return a pointer to the located wide character, or a null pointer if the wide character does not occur in the object.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995 (E).

Issue 6

The normative text is updated to avoid use of the term “must” for application requirements.

71995 **NAME**

71996 wmemcmp — compare wide characters in memory

71997 **SYNOPSIS**

71998 #include <wchar.h>

71999 int wmemcmp(const wchar_t *ws1, const wchar_t *ws2, size_t n);

72000 **DESCRIPTION**

72001 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 72002 conflict between the requirements described here and the ISO C standard is unintentional. This
 72003 volume of POSIX.1-2008 defers to the ISO C standard.

72004 The *wmemcmp()* function shall compare the first *n* wide characters of the object pointed to by
 72005 *ws1* to the first *n* wide characters of the object pointed to by *ws2*. This function shall not be
 72006 affected by locale and all **wchar_t** values shall be treated identically. The null wide character and
 72007 **wchar_t** values not corresponding to valid characters shall not be treated specially.

72008 If *n* is zero, the application shall ensure that *ws1* and *ws2* are valid pointers, and the function
 72009 shall behave as if the two objects compare equal.

72010 **RETURN VALUE**

72011 The *wmemcmp()* function shall return an integer greater than, equal to, or less than zero,
 72012 respectively, as the object pointed to by *ws1* is greater than, equal to, or less than the object
 72013 pointed to by *ws2*.

72014 **ERRORS**

72015 No errors are defined.

72016 **EXAMPLES**

72017 None.

72062 XBD <wchar.h>

72063 **CHANGE HISTORY**72064 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995
72065 (E).72066 **Issue 6**

72067 The normative text is updated to avoid use of the term “must” for application requirements.

72068 The *wmemcpy()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

72069 **NAME**72070 `wmemmove` — copy wide characters in memory with overlapping areas72071 **SYNOPSIS**72072 `#include <wchar.h>`72073 `wchar_t *wmemmove(wchar_t *ws1, const wchar_t *ws2, size_t n);`72074 **DESCRIPTION**

72075 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any
 72076 conflict between the requirements described here and the ISO C standard is unintentional. This
 72077 volume of POSIX.1-2008 defers to the ISO C standard.

72078 The `wmemmove()` function shall copy *n* wide characters from the object pointed to by *ws2* to the
 72079 object pointed to by *ws1*. Copying shall take place as if the *n* wide characters from the object
 72080 pointed to by *ws2* are first copied into a temporary array of *n* wide characters that does not
 72081 overlap the objects pointed to by *ws1* or *ws2*, and then the *n* wide characters from the temporary
 72082 array are copied into the object pointed to by *ws1*.

72083 This function shall not be affected by locale and all **wchar_t** values shall be treated identically.
 72084 The null wide character and **wchar_t** values not corresponding to valid characters shall not be
 72085 treated specially.

72086 If *n* is zero, the application shall ensure that *ws1* and *ws2* are valid pointers, and the function
 72087 shall copy zero wide characters.

72088 **RETURN VALUE**72089 The `wmemmove()` function shall return the value of *ws1*.72090 **ERRORS**

72108 **NAME**

72109 wmemset — set wide characters in memory

72110 **SYNOPSIS**

72111 #include <wchar.h>

72112 wchar_t *wmemset(wchar_t *ws, wchar_t wc, size_t n);

72113 **DESCRIPTION**

72114 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 72115 conflict between the requirements described here and the ISO C standard is unintentional. This
 72116 volume of POSIX.1-2008 defers to the ISO C standard.

72117 The *wmemset()* function shall copy the value of *wc* into each of the first *n* wide characters of the
 72118 object pointed to by *ws*. This function shall not be affected by locale and all **wchar_t** values shall
 72119 be treated identically. The null wide character and **wchar_t** values not corresponding to valid
 72120 characters shall not be treated specially.

72121 If *n* is zero, the application shall ensure that *ws* is a valid pointer, and the function shall copy
 72122 zero wide characters.

72123 **RETURN VALUE**72124 The *wmemset()* functions shall return the value of *ws*.72125 **ERRORS**

72126 No errors are defined.

NAME

wordexp, wordfree — perform word expansions

SYNOPSIS

```
#include <wordexp.h>

int wordexp(const char *restrict words, wordexp_t *restrict pwordexp,
            int flags);
void wordfree(wordexp_t *pwordexp);
```

DESCRIPTION

The *wordexp()* function shall perform word expansions as described in XCU [Section 2.6](#) (on page 2327), subject to quoting as described in XCU [Section 2.2](#) (on page 2320), and place the list of expanded words into the structure pointed to by *pwordexp*.

The *words* argument is a pointer to a string containing one or more words to be expanded. The expansions shall be the same as would be performed by the command line interpreter if *words* were the part of a command line representing the arguments to a utility. Therefore, the application shall ensure that *words* does not contain an unquoted <newline> character or any of the unquoted shell special characters ' | ', ' & ', ' ; ', ' < ', ' > ' except in the context of command substitution as specified in XCU [Section 2.6.3](#) (on page 2331). It also shall not contain unquoted parentheses or braces, except in the context of command or variable substitution. The application shall ensure that every member of *words* which it expects to have expanded by *wordexp()* does not contain an unquoted initial comment character. The application shall also ensure that any words which it intends to be ignored (because they begin or continue a comment) are deleted from *words*. If the argument *words* contains an unquoted comment character (<number-sign>) that is the beginning of a token, *wordexp()* shall either treat the comment character as a regular character, or interpret it as a comment indicator and ignore the remainder of *words*.

The structure type **wordexp_t** is defined in the **<wordexp.h>** header and includes at least the following members:

Member Type	Member Name	Description
size_t	<i>we_wordc</i>	Count of words matched by <i>words</i> .
char **	<i>we_wordv</i>	Pointer to list of expanded words.
size_t	<i>we_offs</i>	Slots to reserve at the beginning of <i>pwordexp->we_wordv</i> .

The *wordexp()* function shall store the number of generated words into *pwordexp->we_wordc* and a pointer to a list of pointers to words in *pwordexp->we_wordv*. Each individual field created during field splitting (see XCU [Section 2.6.5](#), on page 2333) or pathname expansion (see XCU [Section 2.6.6](#), on page 2333) shall be a separate word in the *pwordexp->we_wordv* list. The words shall be in order as described in XCU [Section 2.6](#) (on page 2327). The first pointer after the last word pointer shall be a null pointer. The expansion of special parameters described in XCU [Section 2.5.2](#) (on page 2324) is unspecified.

It is the caller's responsibility to allocate the storage pointed to by *pwordexp*. The *wordexp()* function shall allocate other space as needed, including memory pointed to by *pwordexp->we_wordv*. The *wordfree()* function frees any memory associated with *pwordexp* from a previous call to *wordexp()*.

The *flags* argument is used to control the behavior of *wordexp()*. The value of *flags* is the bitwise-inclusive OR of zero or more of the following constants, which are defined in **<wordexp.h>**:

72188	WRDE_APPEND	Append words generated to the ones from a previous call to <i>wordexp()</i> .
72189	WRDE_DOOFFS	Make use of <i>pwordexp->we_offs</i> . If this flag is set, <i>pwordexp->we_offs</i> is used to specify how many null pointers to add to the beginning of <i>pwordexp->we_wordv</i> . In other words, <i>pwordexp->we_wordv</i> shall point to <i>pwordexp->we_offs</i> null pointers, followed by <i>pwordexp->we_wordc</i> word pointers, followed by a null pointer.
72190		
72191		
72192		
72193		
72194	WRDE_NOCMD	If the implementation supports the utilities defined in the Shell and Utilities volume of POSIX.1-2008, fail if command substitution, as specified in XCU Section 2.6.3 (on page 2331), is requested.
72195		
72196		
72197	WRDE_REUSE	The <i>pwordexp</i> argument was passed to a previous successful call to <i>wordexp()</i> , and has not been passed to <i>wordfree()</i> . The result shall be the same as if the application had called <i>wordfree()</i> and then called <i>wordexp()</i> without WRDE_REUSE.
72198		
72199		
72200		
72201	WRDE_SHOWERR	Do not redirect <i>stderr</i> to /dev/null .
72202	WRDE_UNDEF	Report error on an attempt to expand an undefined shell variable.
72203	The WRDE_APPEND flag can be used to append a new set of words to those generated by a	
72204	previous call to <i>wordexp()</i> . The following rules apply to applications when two or more calls to	
72205	<i>wordexp()</i> are made with the same value of <i>pwordexp</i> and without intervening calls to <i>wordfree()</i> :	
72206	1. The first such call shall not set WRDE_APPEND. All subsequent calls shall set it.	
72207	2. All of the calls shall set WRDE_DOOFFS, or all shall not set it.	
72208	3. After the second and each subsequent call, <i>pwordexp->we_wordv</i> shall point to a list	
72209	containing the following:	
72210	a. Zero or more null pointers, as specified by WRDE_DOOFFS and	
72211	<i>pwordexp->we_offs</i>	
72212	b. Pointers to the words that were in the <i>pwordexp->we_wordv</i> list before the call, in	
72213	the same order as before	
72214	c. Pointers to the new words generated by the latest call, in the specified order	
72215	4. The count returned in <i>pwordexp->we_wordc</i> shall be the total number of words from all of	
72216	the calls.	
72217	5. The application can change any of the fields after a call to <i>wordexp()</i> , but if it does it shall	
72218	reset them to the original value before a subsequent call, using the same <i>pwordexp</i> value,	
72219	to <i>wordfree()</i> or <i>wordexp()</i> with the WRDE_APPEND or WRDE_REUSE flag.	
72220	If the implementation supports the utilities defined in the Shell and Utilities volume of	
72221	POSIX.1-2008, and <i>words</i> contains an unquoted character—<newline>, ' ', ' & ', ' ; ', ' < ', ' > ',	
72222	' (', ') ', ' { ', ' } '—in an inappropriate context, <i>wordexp()</i> shall fail, and the number of	
72223	expanded words shall be 0.	
72224	Unless WRDE_SHOWERR is set in <i>flags</i> , <i>wordexp()</i> shall redirect <i>stderr</i> to /dev/null for any	
72225	utilities executed as a result of command substitution while expanding <i>words</i> . If	
72226	WRDE_SHOWERR is set, <i>wordexp()</i> may write messages to <i>stderr</i> if syntax errors are detected	
72227	while expanding <i>words</i> ; however, it is unspecified whether any write errors encountered while	
72228	outputting such messages will affect the <i>stderr</i> error indicator or the value of <i>errno</i> .	
72229	The application shall ensure that if WRDE_DOOFFS is set, then <i>pwordexp->we_offs</i> has the same	
72230	value for each <i>wordexp()</i> call and <i>wordfree()</i> call using a given <i>pwordexp</i> .	

72231 The following constants are defined as error return values:

72232	WRDE_BADCHAR	One of the unquoted characters—<newline>, ' ', ' & ', ' ; ', ' < ', ' > ', ' (', ') ', ' { ', ' } '—appears in <i>words</i> in an inappropriate context.
72233		
72234	WRDE_BADVAL	Reference to undefined shell variable when WRDE_UNDEF is set in <i>flags</i> .
72235	WRDE_CMDSUB	Command substitution requested when WRDE_NOCMD was set in <i>flags</i> .
72236	WRDE_NOSPACE	Attempt to allocate memory failed.
72237	WRDE_SYNTAX	Shell syntax error, such as unbalanced parentheses or unterminated string.
72238		

72239 RETURN VALUE

72240 Upon successful completion, *wordexp()* shall return 0. Otherwise, a non-zero value, as described
 72241 in <**wordexp.h**>, shall be returned to indicate an error. If *wordexp()* returns the value
 72242 WRDE_NOSPACE, then *pwordexp->we_wordc* and *pwordexp->we_wordv* shall be updated to
 72243 reflect any words that were successfully expanded. In other cases, they shall not be modified.

72244 The *wordfree()* function shall not return a value.

72245 ERRORS

72246 No errors are defined.

72247 EXAMPLES

72248 None.

72249 APPLICATION USAGE

72250 The *wordexp()* function is intended to be used by an application that wants to do all of the shell's
 72251 expansions on a word or words obtained from a user. For example, if the application prompts
 72252 for a pathname (or list of pathnames) and then uses *wordexp()* to process the input, the user
 72253 could respond with anything that would be valid as input to the shell.

72254 The WRDE_NOCMD flag is provided for applications that, for security or other reasons, want to
 72255 prevent a user from executing shell commands. Disallowing unquoted shell special characters
 72256 also prevents unwanted side-effects, such as executing a command or writing a file.

72257 POSIX.1-2008 does not require the *wordexp()* function to be thread-safe if passed an expression
 72258 referencing an environment variable while any other thread is concurrently modifying any
 72259 environment variable; see *exec* (on page 777).

72260 Even though the WRDE_SHOWERR flag allows the implementation to write messages to *stderr* +
 72261 during command substitution or syntax errors, this standard does not provide any way to detect +
 72262 write failures during the output of such messages.

72263 RATIONALE

72264 This function was included as an alternative to *glob()*. There had been continuing controversy
 72265 over exactly what features should be included in *glob()*. It is hoped that by providing *wordexp()*
 72266 (which provides all of the shell word expansions, but which may be slow to execute) and *glob()*
 72267 (which is faster, but which only performs pathname expansion, without tilde or parameter
 72268 expansion) this will satisfy the majority of applications.

72269 While *wordexp()* could be implemented entirely as a library routine, it is expected that most
 72270 implementations run a shell in a subprocess to do the expansion.

72271 Two different approaches have been proposed for how the required information might be
 72272 presented to the shell and the results returned. They are presented here as examples.

72273 One proposal is to extend the *echo* utility by adding a **-q** option. This option would cause *echo* to

add a <backslash> before each <backslash> and <blank> that occurs within an argument. The *wordexp()* function could then invoke the shell as follows:

```
(void) strcpy(buffer, "echo -q");
(void) strcat(buffer, words);
if ((flags & WRDE_SHOWERR) == 0)
    (void) strcat(buffer, "2>/dev/null");
f = popen(buffer, "r");
```

The *wordexp()* function would read the resulting output, remove unquoted <backslash> characters, and break into words at unquoted <blank> characters. If the WRDE_NOCMD flag was set, *wordexp()* would have to scan *words* before starting the subshell to make sure that there would be no command substitution. In any case, it would have to scan *words* for unquoted special characters.

Another proposal is to add the following options to *sh*:

-w *wordlist*

This option provides a wordlist expansion service to applications. The words in *wordlist* shall be expanded and the following written to standard output:

1. The count of the number of words after expansion, in decimal, followed by a null byte
2. The number of bytes needed to represent the expanded words (not including null separators), in decimal, followed by a null byte
3. The expanded words, each terminated by a null byte

If an error is encountered during word expansion, *sh* exits with a non-zero status after writing the former to report any words successfully expanded

-P Run in “protected” mode. If specified with the **-w** option, no command substitution shall be performed.

With these options, *wordexp()* could be implemented fairly simply by creating a subprocess using *fork()* and executing *sh* using the line:

```
execl(<shell path>, "sh", "-P", "-w", words, (char *)0);
```

after directing standard error to **/dev/null**.

It seemed objectionable for a library routine to write messages to standard error, unless explicitly requested, so *wordexp()* is required to redirect standard error to **/dev/null** to ensure that no messages are generated, even for commands executed for command substitution. The WRDE_SHOWERR flag can be specified to request that error messages be written.

The WRDE_REUSE flag allows the implementation to avoid the expense of freeing and reallocating memory, if that is possible. A minimal implementation can call *wordfree()* when WRDE_REUSE is set.

FUTURE DIRECTIONS

None.

72316 **CHANGE HISTORY**

72317 First released in Issue 4. Derived from the ISO POSIX-2 standard.

72318 **Issue 5**

72319 Moved from POSIX2 C-language Binding to BASE.

72320 **Issue 6**

72321 The normative text is updated to avoid use of the term “must” for application requirements.

72322 The **restrict** keyword is added to the *wordexp()* prototype for alignment with the
72323 ISO/IEC 9899:1999 standard.

72324 **Issue 7**

72325 Austin Group Interpretation 1003.1-2001 #148 is applied, adding APPLICATION USAGE.

72326 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0739 [460], XSH/TC1-2008/0740 [291], +
72327 and XSH/TC1-2008/0741 [460] are applied.

72328 **NAME**

72329 `wprintf` — print formatted wide-character output

72330 **SYNOPSIS**

72331 `#include <stdio.h>`

72332 `#include <wchar.h>`

72333 `int wprintf(const wchar_t *restrict format, ...);`

72334 **DESCRIPTION**

72335 Refer to *fwprintf()*.

72336 **NAME**72337 `pwrite, write` — write on a file72338 **SYNOPSIS**

```
72339 #include <unistd.h>
72340 ssize_t pwrite(int fildes, const void *buf, size_t nbyte,
72341               off_t offset);
72342 ssize_t write(int fildes, const void *buf, size_t nbyte);
```

72343 **DESCRIPTION**

72344 The `write()` function shall attempt to write *nbyte* bytes from the buffer pointed to by *buf* to the
 72345 file associated with the open file descriptor, *fildes*.

72346 Before any action described below is taken, and if *nbyte* is zero and the file is a regular file, the
 72347 `write()` function may detect and return errors as described below. In the absence of errors, or if
 72348 error detection is not performed, the `write()` function shall return zero and have no other results.
 72349 If *nbyte* is zero and the file is not a regular file, the results are unspecified.

72350 On a regular file or other file capable of seeking, the actual writing of data shall proceed from
 72351 the position in the file indicated by the file offset associated with *fildes*. Before successful return
 72352 from `write()`, the file offset shall be incremented by the number of bytes actually written. On a
 72353 regular file, if the position of the last byte written is greater than or equal to the length of the file,
 72354 the length of the file shall be set to this position plus one.

72355 On a file not capable of seeking, writing shall always take place starting at the current position.
 72356 The value of a file offset associated with such a device is undefined.

72357 If the `O_APPEND` flag of the file status flags is set, the file offset shall be set to the end of the file
 72358 prior to each write and no intervening file modification operation shall occur between changing
 72359 the file offset and the write operation.

72360 XSI If a `write()` requests that more bytes be written than there is room for (for example, the file size
 72361 limit of the process or the physical end of a medium), only as many bytes as there is room for
 72362 shall be written. For example, suppose there is space for 20 bytes more in a file before reaching a
 72363 limit. A write of 512 bytes will return 20. The next write of a non-zero number of bytes would
 72364 give a failure return (except as noted below).

72365 XSI If the request would cause the file size to exceed the soft file size limit for the process and there
 72366 is no room for any bytes to be written, the request shall fail and the implementation shall
 72367 generate the `SIGXFSZ` signal for the thread.

72368 If `write()` is interrupted by a signal before it writes any data, it shall return `-1` with *errno* set to
 72369 `[EINTR]`.

72370 If `write()` is interrupted by a signal after it successfully writes some data, it shall return the
 72371 number of bytes written.

72372 If the value of *nbyte* is greater than `{SSIZE_MAX}`, the result is implementation-defined.

72373 After a `write()` to a regular file has successfully returned:

- 72374 • Any successful `read()` from each byte position in the file that was modified by that write
 72375 shall return the data specified by the `write()` for that position until such byte positions are
 72376 again modified.
- 72377 • Any subsequent successful `write()` to the same byte position in the file shall overwrite that
 72378 file data.

72379 Write requests to a pipe or FIFO shall be handled in the same way as a regular file with the
72380 following exceptions:

- 72381 • There is no file offset associated with a pipe, hence each write request shall append to the
72382 end of the pipe.
- 72383 • Write requests of {PIPE_BUF} bytes or less shall not be interleaved with data from other
72384 processes doing writes on the same pipe. Writes of greater than {PIPE_BUF} bytes may
72385 have data interleaved, on arbitrary boundaries, with writes by other processes, whether or
72386 not the O_NONBLOCK flag of the file status flags is set.
- 72387 • If the O_NONBLOCK flag is clear, a write request may cause the thread to block, but on
72388 normal completion it shall return *nbyte*.
- 72389 • If the O_NONBLOCK flag is set, *write()* requests shall be handled differently, in the
72390 following ways:
 - 72391 — The *write()* function shall not block the thread.
 - 72392 — A write request for {PIPE_BUF} or fewer bytes shall have the following effect: if there
72393 is sufficient space available in the pipe, *write()* shall transfer all the data and return
72394 the number of bytes requested. Otherwise, *write()* shall transfer no data and return
72395 -1 with *errno* set to [EAGAIN].
 - 72396 — A write request for more than {PIPE_BUF} bytes shall cause one of the following:
 - 72397 — When at least one byte can be written, transfer what it can and return the
72398 number of bytes written. When all data previously written to the pipe is read, it
72399 shall transfer at least {PIPE_BUF} bytes.
 - 72400 — When no data can be written, transfer no data, and return -1 with *errno* set to
72401 [EAGAIN].

72402 When attempting to write to a file descriptor (other than a pipe or FIFO) that supports non-
72403 blocking writes and cannot accept the data immediately:

- 72404 • If the O_NONBLOCK flag is clear, *write()* shall block the calling thread until the data can
72405 be accepted.
- 72406 • If the O_NONBLOCK flag is set, *write()* shall not block the thread. If some data can be
72407 written without blocking the thread, *write()* shall write what it can and return the number
72408 of bytes written. Otherwise, it shall return -1 and set *errno* to [EAGAIN].

72409 Upon successful completion, where *nbyte* is greater than 0, *write()* shall mark for update the last
72410 data modification and last file status change timestamps of the file, and if the file is a regular file,
72411 the S_ISUID and S_ISGID bits of the file mode may be cleared.

72412 For regular files, no data transfer shall occur past the offset maximum established in the open
72413 file description associated with *filides*.

72414 If *filides* refers to a socket, *write()* shall be equivalent to *send()* with no flags set.

72415 SIO If the O_DSYNC bit has been set, write I/O operations on the file descriptor shall complete as
72416 defined by synchronized I/O data integrity completion.

72417 If the O_SYNC bit has been set, write I/O operations on the file descriptor shall complete as
72418 defined by synchronized I/O file integrity completion.

72419 SHM If *filides* refers to a shared memory object, the result of the *write()* function is unspecified.

72420	TYM	If <i>fildes</i> refers to a typed memory object, the result of the <i>write()</i> function is unspecified.
72421	OB XSR	If <i>fildes</i> refers to a STREAM, the operation of <i>write()</i> shall be determined by the values of the minimum and maximum <i>nbyte</i> range (packet size) accepted by the STREAM. These values are determined by the topmost STREAM module. If <i>nbyte</i> falls within the packet size range, <i>nbyte</i> bytes shall be written. If <i>nbyte</i> does not fall within the range and the minimum packet size value is 0, <i>write()</i> shall break the buffer into maximum packet size segments prior to sending the data downstream (the last segment may contain less than the maximum packet size). If <i>nbyte</i> does not fall within the range and the minimum value is non-zero, <i>write()</i> shall fail with <i>errno</i> set to [ERANGE]. Writing a zero-length buffer (<i>nbyte</i> is 0) to a STREAMS device sends 0 bytes with 0 returned. However, writing a zero-length buffer to a STREAMS-based pipe or FIFO sends no message and 0 is returned. The process may issue <code>I_SWROPT ioctl()</code> to enable zero-length messages to be sent across the pipe or FIFO. When writing to a STREAM, data messages are created with a priority band of 0. When writing to a STREAM that is not a pipe or FIFO: • If <code>O_NONBLOCK</code> is clear, and the STREAM cannot accept data (the STREAM write queue is full due to internal flow control conditions), <i>write()</i> shall block until data can be accepted. • If <code>O_NONBLOCK</code> is set and the STREAM cannot accept data, <i>write()</i> shall return -1 and set <i>errno</i> to [EAGAIN]. • If <code>O_NONBLOCK</code> is set and part of the buffer has been written while a condition in which the STREAM cannot accept additional data occurs, <i>write()</i> shall terminate and return the number of bytes written. In addition, <i>write()</i> shall fail if the STREAM head has processed an asynchronous error before the call. In this case, the value of <i>errno</i> does not reflect the result of <i>write()</i>, but reflects the prior error. The <i>pwrite()</i> function shall be equivalent to <i>write()</i>, except that it writes into a given position and does not change the file offset (regardless of whether <code>O_APPEND</code> is set). The first three arguments to <i>pwrite()</i> are the same as <i>write()</i> with the addition of a fourth argument <i>offset</i> for the desired position inside the file. An attempt to perform a <i>pwrite()</i> on a file that is incapable of seeking shall result in an error.

72436		
72437		
72438		
72439		
72440		
72441		
72442		
72443		
72444		
72445		The <i>pwrite()</i> function shall be equivalent to <i>write()</i> , except that it writes into a given position and does not change the file offset (regardless of whether <code>O_APPEND</code> is set). The first three arguments to <i>pwrite()</i> are the same as <i>write()</i> with the addition of a fourth argument <i>offset</i> for the desired position inside the file. An attempt to perform a <i>pwrite()</i> on a file that is incapable of seeking shall result in an error.
72446		
72447		
72448		
72449		
72450	RETURN VALUE	Upon successful completion, these functions shall return the number of bytes actually written to the file associated with <i>fildes</i> . This number shall never be greater than <i>nbyte</i> . Otherwise, -1 shall be returned and <i>errno</i> set to indicate the error.
72451		
72452		
72453		
72454	ERRORS	These functions shall fail if: [EAGAIN] The file is neither a pipe, nor a FIFO, nor a socket, the <code>O_NONBLOCK</code> flag is set for the file descriptor, and the thread would be delayed in the <i>write()</i> operation. [EBADF] The <i>fildes</i> argument is not a valid file descriptor open for writing. [EFBIG] An attempt was made to write a file that exceeds the implementation-defined maximum file size <u>or the file size limit of the process</u>, and there was no room for any bytes to be written.
72455		
72456		
72457		
72458		
72459		
72460		
72461	XSI	
72462		

72463		[EFBIG]	The file is a regular file, <i>nbyte</i> is greater than 0, and the starting position is greater than or equal to the offset maximum established in the open file description associated with <i>fildest</i> .	
72464				
72465				
72466		[EINTR]	The write operation was terminated due to the receipt of a signal, and no data was transferred.	
72467				
72468		[EIO]	The process is a member of a background process group attempting to write to its controlling terminal, TOSTOP is set, the calling thread is not blocking SIGTTOU, the process is not ignoring SIGTTOU, and the process group of the process is orphaned. This error may also be returned under implementation-defined conditions.	
72469				
72470				
72471				
72472				
72473		[ENOSPC]	There was no free space remaining on the device containing the file.	-
72474	OB XSR	[ERANGE]	The transfer request size was outside the range supported by the STREAMS file associated with <i>fildest</i> .	
72475				
72476			The <i>pwrite()</i> function shall fail if:	+
72477		[EINVAL]	The file is a regular file or block special file, and the <i>offset</i> argument is negative. The file pointer shall remain unchanged.	+
72478				+
72479		[ESPIPE]	The file is a pipe, FIFO, or socket.	+
72480			The <i>write()</i> function shall fail if:	
72481		[EAGAIN]	The file is a pipe or FIFO, the O_NONBLOCK flag is set for the file descriptor, and the thread would be delayed in the write operation.	+
72482				
72483		[EAGAIN] or [EWOULDBLOCK]		
72484			The file is a socket, the O_NONBLOCK flag is set for the file descriptor, and the thread would be delayed in the write operation.	
72485				
72486		[ECONNRESET]	A write was attempted on a socket that is not connected.	
72487		[EPIPE]	An attempt is made to write to a pipe or FIFO that is not open for reading by any process, or that only has one end open. A SIGPIPE signal shall also be sent to the thread.	+
72488				+
72489				+
72490		[EPIPE]	A write was attempted on a socket that is shut down for writing, or is no longer connected. In the latter case, if the socket is of type SOCK_STREAM, a SIGPIPE signal shall also be sent to the thread.	
72491				
72492				
72493			These functions may fail if:	
72494	OB XSR	[EINVAL]	The STREAM or multiplexer referenced by <i>fildest</i> is linked (directly or indirectly) downstream from a multiplexer.	
72495				
72496		[EIO]	A physical I/O error has occurred.	
72497		[ENOBUFFS]	Insufficient resources were available in the system to perform the operation.	
72498		[ENXIO]	A request was made of a nonexistent device, or the request was outside the capabilities of the device.	
72499				
72500	OB XSR	[ENXIO]	A hangup occurred on the STREAM being written to.	
72501	OB XSR		A write to a STREAMS file may fail if an error message has been received at the STREAM head. In this case, <i>errno</i> is set to the value included in the error message.	
72502				

The `write()` function may fail if:

[EACCES] A write was attempted on a socket and the calling process does not have appropriate privileges.

[ENETDOWN] A write was attempted on a socket and the local network interface used to reach the destination is down.

[ENETUNREACH]

A write was attempted on a socket and no route to the network is present.

EXAMPLES

Writing from a Buffer

The following example writes data from the buffer pointed to by `buf` to the file associated with the file descriptor `fd`.

```
#include <sys/types.h>
#include <string.h>
...
char buf[20];
size_t nbytes;
ssize_t bytes_written;
int fd;
...
strcpy(buf, "This is a test\n");
nbytes = strlen(buf);

bytes_written = write(fd, buf, nbytes);
...
```

APPLICATION USAGE

None.

RATIONALE

See also the RATIONALE section in `read()`.

An attempt to write to a pipe or FIFO has several major characteristics:

- *Atomic/non-atomic*: A write is atomic if the whole amount written in one operation is not interleaved with data from any other process. This is useful when there are multiple writers sending data to a single reader. Applications need to know how large a write request can be expected to be performed atomically. This maximum is called `{PIPE_BUF}`. This volume of POSIX.1-2008 does not say whether write requests for more than `{PIPE_BUF}` bytes are atomic, but requires that writes of `{PIPE_BUF}` or fewer bytes shall be atomic.
- *Blocking/immediate*: Blocking is only possible with `O_NONBLOCK` clear. If there is enough space for all the data requested to be written immediately, the implementation should do so. Otherwise, the calling thread may block; that is, pause until enough space is available for writing. The effective size of a pipe or FIFO (the maximum amount that can be written in one operation without blocking) may vary dynamically, depending on the implementation, so it is not possible to specify a fixed value for it.
- *Complete/partial/deferred*: A write request:

```
int fildes;
size_t nbyte;
```

```

72547     ssize_t ret;
72548     char *buf;

72549     ret = write(fildes, buf, nbyte);

```

72550 may return:

72551 Complete *ret=nbyte*

72552 Partial *ret<nbyte*

72553 This shall never happen if *nbyte*≤{PIPE_BUF}. If it does happen (with
72554 *nbyte*>{PIPE_BUF}), this volume of POSIX.1-2008 does not guarantee
72555 atomicity, even if *ret*≤{PIPE_BUF}, because atomicity is guaranteed according
72556 to the amount *requested*, not the amount *written*.

72557 Deferred: *ret=-1, errno=[EAGAIN]*

72558 This error indicates that a later request may succeed. It does not indicate that
72559 it *shall* succeed, even if *nbyte*≤{PIPE_BUF}, because if no process reads from
72560 the pipe or FIFO, the write never succeeds. An application could usefully
72561 count the number of times [EAGAIN] is caused by a particular value of
72562 *nbyte*>{PIPE_BUF} and perhaps do later writes with a smaller value, on the
72563 assumption that the effective size of the pipe may have decreased.

72564 Partial and deferred writes are only possible with O_NONBLOCK set.

72565 The relations of these properties are shown in the following tables:

72566 **Write to a Pipe or FIFO with O_NONBLOCK clear**

72567 Immediately Writable:	None	Some	<i>nbyte</i>
72568 <i>nbyte</i> ≤{PIPE_BUF}	Atomic blocking 72569 <i>nbyte</i>	Atomic blocking 72569 <i>nbyte</i>	Atomic immediate 72569 <i>nbyte</i>
72570 <i>nbyte</i> >{PIPE_BUF}	Blocking <i>nbyte</i>	Blocking <i>nbyte</i>	Blocking <i>nbyte</i>

72571 If the O_NONBLOCK flag is clear, a write request shall block if the amount writable
72572 immediately is less than that requested. If the flag is set (by *fcntl()*), a write request shall never
72573 block.

72574 **Write to a Pipe or FIFO with O_NONBLOCK set**

72575 Immediately Writable:	None	Some	<i>nbyte</i>
72576 <i>nbyte</i> ≤{PIPE_BUF}	-1, [EAGAIN]	-1, [EAGAIN]	Atomic <i>nbyte</i>
72577 <i>nbyte</i> >{PIPE_BUF}	-1, [EAGAIN]	< <i>nbyte</i> or -1, 72578 [EAGAIN]	≤ <i>nbyte</i> or -1, [EAGAIN]

72579 There is no exception regarding partial writes when O_NONBLOCK is set. With the exception
72580 of writing to an empty pipe, this volume of POSIX.1-2008 does not specify exactly when a partial
72581 write is performed since that would require specifying internal details of the implementation.
72582 Every application should be prepared to handle partial writes when O_NONBLOCK is set and
72583 the requested amount is greater than {PIPE_BUF}, just as every application should be prepared
72584 to handle partial writes on other kinds of file descriptors.

72585 The intent of forcing writing at least one byte if any can be written is to assure that each write
72586 makes progress if there is any room in the pipe. If the pipe is empty, {PIPE_BUF} bytes must be
72587 written; if not, at least some progress must have been made.

72588 Where this volume of POSIX.1-2008 requires -1 to be returned and *errno* set to [EAGAIN], most

historical implementations return zero (with the `O_NDELAY` flag set, which is the historical predecessor of `O_NONBLOCK`, but is not itself in this volume of POSIX.1-2008). The error indications in this volume of POSIX.1-2008 were chosen so that an application can distinguish these cases from end-of-file. While `write()` cannot receive an indication of end-of-file, `read()` can, and the two functions have similar return values. Also, some existing systems (for example, Eighth Edition) permit a write of zero bytes to mean that the reader should get an end-of-file indication; for those systems, a return value of zero from `write()` indicates a successful write of an end-of-file indication.

Implementations are allowed, but not required, to perform error checking for `write()` requests of zero bytes.

The concept of a `{PIPE_MAX}` limit (indicating the maximum number of bytes that can be written to a pipe in a single operation) was considered, but rejected, because this concept would unnecessarily limit application writing.

See also the discussion of `O_NONBLOCK` in `read()`.

Writes can be serialized with respect to other reads and writes. If a `read()` of file data can be proven (by any means) to occur after a `write()` of the data, it must reflect that `write()`, even if the calls are made by different processes. A similar requirement applies to multiple write operations to the same file position. This is needed to guarantee the propagation of data from `write()` calls to subsequent `read()` calls. This requirement is particularly significant for networked file systems, where some caching schemes violate these semantics.

Note that this is specified in terms of `read()` and `write()`. The XSI extensions `readv()` and `writew()` also obey these semantics. A new “high-performance” write analog that did not follow these serialization requirements would also be permitted by this wording. This volume of POSIX.1-2008 is also silent about any effects of application-level caching (such as that done by `stdio`).

This volume of POSIX.1-2008 does not specify the value of the file offset after an error is returned; there are too many cases. For programming errors, such as `[EBADF]`, the concept is meaningless since no file is involved. For errors that are detected immediately, such as `[EAGAIN]`, clearly the pointer should not change. After an interrupt or hardware error, however, an updated value would be very useful and is the behavior of many implementations.

This volume of POSIX.1-2008 does not specify behavior of concurrent writes to a file from multiple processes. Applications should use some form of concurrency control.

This volume of POSIX.1-2008 intentionally does not specify any `pwrite()` errors related to pipes, + FIFOs, and sockets other than `[ESPIPE]`.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX Threads Extension.

Large File Summit extensions are added.

72634 The *pwrite()* function is added.

72635 Issue 6

72636 The DESCRIPTION states that the *write()* function does not block the thread. Previously this
72637 said “process” rather than “thread”.

72638 The DESCRIPTION and ERRORS sections are updated so that references to STREAMS are
72639 marked as part of the XSI STREAMS Option Group.

72640 The following new requirements on POSIX implementations derive from alignment with the
72641 Single UNIX Specification:

- 72642 • The DESCRIPTION now states that if *write()* is interrupted by a signal after it has
- 72643 successfully written some data, it returns the number of bytes written. In the POSIX.1-1988
- 72644 standard, it was optional whether *write()* returned the number of bytes written, or whether
- 72645 it returned `-1` with *errno* set to `[EINTR]`. This is a FIPS requirement.
- 72646 • The following changes are made to support large files:
 - 72647 — For regular files, no data transfer occurs past the offset maximum established in the
 - 72648 open file description associated with the *files*.
 - 72649 — A second `[EFBIG]` error condition is added.
- 72650 • The `[EIO]` error condition is added.
- 72651 • The `[EPIPE]` error condition is added for when a pipe has only one end open.
- 72652 • The `[ENXIO]` optional error condition is added.

72653 Text referring to sockets is added to the DESCRIPTION.

72654 The following changes were made to align with the IEEE P1003.1a draft standard:

- 72655 • The effect of reading zero bytes is clarified.

72656 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that
72657 *write()* results are unspecified for typed memory objects.

72658 The following error conditions are added for operations on sockets: `[EAGAIN]`,
72659 `[EWOULDBLOCK]`, `[ECONNRESET]`, `[ENOTCONN]`, and `[EPIPE]`.

72660 The `[EIO]` error is made optional.

72661 The `[ENOBUFFS]` error is added for sockets.

72662 The following error conditions are added for operations on sockets: `[EACCES]`, `[ENETDOWN]`,
72663 and `[ENETUNREACH]`.

72664 The *writenv()* function is split out into a separate reference page.

72665 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/146 is applied, updating text in the
72666 ERRORS section from “a SIGPIPE signal is generated to the calling process” to “a SIGPIPE
72667 signal shall also be sent to the thread”.

72668 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/147 is applied, making a correction to the
72669 RATIONALE.

72670 Issue 7

72671 The *pwrite()* function is moved from the XSI option to the Base.

72672 Functionality relating to the XSI STREAMS option is marked obsolescent.

72673 SD5-XSH-ERN-160 is applied, updating the DESCRIPTION to clarify the requirements for the

72674 *pwrite()* function, and to change the use of the phrase “file pointer” to “file offset”.

72675 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0742 [219], XSH/TC1-2008/0743 [215], +

72676 XSH/TC1-2008/0744 [79], and XSH/TC1-2008/0745 [215] are applied.

NAME

writev — write a vector

SYNOPSISXSI `#include <sys/uio.h>``ssize_t writev(int filides, const struct iovec *iov, int iovcnt);`**DESCRIPTION**

The *writev()* function shall be equivalent to *write()*, except as described below. The *writev()* function shall gather output data from the *iovcnt* buffers specified by the members of the *iov* array: *iov*[0], *iov*[1], ..., *iov*[*iovcnt*−1]. The *iovcnt* argument is valid if greater than 0 and less than or equal to {IOV_MAX}, as defined in **<limits.h>**.

Each *iovec* entry specifies the base address and length of an area in memory from which data should be written. The *writev()* function shall always write a complete area before proceeding to the next.

If *filides* refers to a regular file and all of the *iov_len* members in the array pointed to by *iov* are 0, *writev()* shall return 0 and have no other effect. For other file types, the behavior is unspecified.

If the sum of the *iov_len* values is greater than {SSIZE_MAX}, the operation shall fail and no data shall be transferred.

RETURN VALUE

Upon successful completion, *writev()* shall return the number of bytes actually written. Otherwise, it shall return a value of −1, the file-pointer shall remain unchanged, and *errno* shall be set to indicate an error.

ERRORS

Refer to *write()*.

In addition, the *writev()* function shall fail if:

[EINVAL] The sum of the *iov_len* values in the *iov* array would overflow an **ssize_t**.

The *writev()* function may fail and set *errno* to:

[EINVAL] The *iovcnt* argument was less than or equal to 0, or greater than {IOV_MAX}.

EXAMPLES**Writing Data from an Array**

The following example writes data from the buffers specified by members of the *iov* array to the file associated with the file descriptor *fd*.

```
#include <sys/types.h>
#include <sys/uio.h>
#include <unistd.h>
...
ssize_t bytes_written;
int fd;
char *buf0 = "short string\n";
char *buf1 = "This is a longer string\n";
char *buf2 = "This is the longest string in this example\n";
int iocnt;
struct iovec iov[3];
```

```
72719         iov[0].iov_base = buf0;
72720         iov[0].iov_len = strlen(buf0);
72721         iov[1].iov_base = buf1;
72722         iov[1].iov_len = strlen(buf1);
72723         iov[2].iov_base = buf2;
72724         iov[2].iov_len = strlen(buf2);
72725         ...
72726         iovcnt = sizeof(iov) / sizeof(struct iovec);
72727         bytes_written = writev(fd, iov, iovcnt);
72728         ...
```

72729 APPLICATION USAGE

72730 None.

72731 RATIONALE

72732 Refer to *write()*.

72733 FUTURE DIRECTIONS

72734 None.

72738 CHANGE HISTORY

72739 First released in Issue 4, Version 2.

72740 Issue 6

72741 Split out from the *write()* reference page.

72742 **NAME**

72743 wscanf — convert formatted wide-character input

72744 **SYNOPSIS**

72745 #include <stdio.h>

72746 #include <wchar.h>

72747 int wscanf(const wchar_t *restrict *format*, ...);72748 **DESCRIPTION**72749 Refer to *fwscanf()*.

72750 **NAME**

72751 y0, y1, yn — Bessel functions of the second kind

72752 **SYNOPSIS**

```
72753 XSI      #include <math.h>
72754          double y0(double x);
72755          double y1(double x);
72756          double yn(int n, double x);
```

72757 **DESCRIPTION**

72758 The *y0()*, *y1()*, and *yn()* functions shall compute Bessel functions of *x* of the second kind of
 72759 orders 0, 1, and *n*, respectively.

72760 An application wishing to check for error situations should set *errno* to zero and call
 72761 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 72762 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 72763 zero, an error has occurred.

72764 **RETURN VALUE**

72765 Upon successful completion, these functions shall return the relevant Bessel value of *x* of the
 72766 second kind.

72767 MXC If *x* is NaN, NaN shall be returned.

72768 If the *x* argument to these functions is negative, *-HUGE_VAL* or NaN shall be returned, and a
 72769 domain error may occur.

72770 If *x* is 0.0, *-HUGE_VAL* shall be returned and a pole error may occur.

72771 If the correct result would cause underflow, 0.0 shall be returned and a range error may occur.

72772 If the correct result would cause overflow, *-HUGE_VAL* or 0.0 shall be returned and a range
 72773 error may occur.

72774 **ERRORS**

72775 These functions may fail if:

72776 Domain Error The value of *x* is negative.

72777 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 72778 then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling*
 72779 & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
 72780 shall be raised.

72781 Pole Error The value of *x* is zero.

72782 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 72783 then *errno* shall be set to [ERANGE]. If the integer expression
 72784 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the divide-by-zero
 72785 floating-point exception shall be raised.

72786 Range Error The correct result would cause overflow.

72787 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 72788 then *errno* shall be set to [ERANGE]. If the integer expression
 72789 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the overflow
 72790 floating-point exception shall be raised.

72791 Range Error The value of x is too large in magnitude, or the correct result would cause
72792 underflow.

72793 If the integer expression $(\text{math\_errhandling} \ \& \ \text{MATH\_ERRNO})$ is non-zero,
72794 then *errno* shall be set to [ERANGE]. If the integer expression
72795 $(\text{math\_errhandling} \ \& \ \text{MATH\_ERREXCEPT})$ is non-zero, then the underflow
72796 floating-point exception shall be raised.

72797 EXAMPLES

72798 None.

72799 APPLICATION USAGE

72800 On error, the expressions $(\text{math\_errhandling} \ \& \ \text{MATH\_ERRNO})$ and $(\text{math\_errhandling} \ \& \ \text{MATH\_ERREXCEPT})$
72801 are independent of each other, but at least one of them must be non-zero.

72802 RATIONALE

72803 None.

72804 FUTURE DIRECTIONS

72805 None.

72809 CHANGE HISTORY

72810 First released in Issue 1. Derived from Issue 1 of the SVID.

72811 Issue 5

72812 The DESCRIPTION is updated to indicate how an application should check for an error. This
72813 text was previously published in the APPLICATION USAGE section.

72814 Issue 6

72815 The normative text is updated to avoid use of the term “must” for application requirements.

72816 The RETURN VALUE and ERRORS sections are reworked for alignment of the error handling
72817 with the ISO/IEC 9899:1999 standard.

72818 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/148 is applied, updating the RETURN
72819 VALUE and ERRORS sections. The changes are made for consistency with the general rules
72820 stated in “Treatment of Error Conditions for Mathematical Functions” in the Base Definitions
72821 volume of POSIX.1-2008.

72822 Issue 7

72823 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0746 [68] is applied.

1.1.1 System Interfaces

72835

72836

72837

72838

72839

72840

This subsection describes some of the features provided by the System Interfaces volume of POSIX.1-2008 that are assumed to be globally available on all systems conforming to this volume of POSIX.1-2008. This subsection does not attempt to detail all of the features defined in the System Interfaces volume of POSIX.1-2008 that are required by all of the utilities defined in this volume of POSIX.1-2008; the utility and function descriptions point out additional functionality required to provide the corresponding specific features needed by each.

72841

72842

72843

The following subsections describe frequently used concepts. Many of these concepts are described in the Base Definitions volume of POSIX.1-2008. Utility and function description statements override these defaults when appropriate.

72844

1.1.1.1 Process Attributes

72845

72846

The following process attributes, as described in the System Interfaces volume of POSIX.1-2008, are assumed to be supported for all processes in this volume of POSIX.1-2008:

72847

72848

72849

72850

72851

72852

72853

72854

Controlling Terminal	Real Group ID
Current Working Directory	Real User ID
Effective Group ID	Root Directory
Effective User ID	Saved Set-Group-ID
File Descriptors	Saved Set-User-ID
File Mode Creation Mask	Session Membership
Process Group ID	Supplementary Group IDs
Process ID	

72855

A conforming implementation may include additional process attributes.

72856

1.1.1.2 Concurrent Execution of Processes

72857

72858

The following functionality of the *fork()* function defined in the System Interfaces volume of POSIX.1-2008 shall be available on all systems conforming to this volume of POSIX.1-2008:

72859

72860

1. Independent processes shall be capable of executing independently without either process terminating.

72861 2. A process shall be able to create a new process with all of the attributes referenced in
 72862 [Section 1.1.1.1](#) (on page 2301), determined according to the semantics of a call to the *fork()*
 72863 function defined in the System Interfaces volume of POSIX.1-2008 followed by a call in
 72864 the child process to one of the *exec* functions defined in the System Interfaces volume of
 72865 POSIX.1-2008.

72866 1.1.1.3 File Access Permissions

72867 The file access control mechanism described by XBD [Section 4.4](#) (on page 108) shall apply to all
 72868 files on an implementation conforming to this volume of POSIX.1-2008.

72869 1.1.1.4 File Read, Write, and Creation

72870 If a file that does not exist is to be written, it shall be created as described below, unless the
 72871 utility description states otherwise.

72872 When a file that does not exist is created, the following features defined in the System Interfaces
 72873 volume of POSIX.1-2008 shall apply unless the utility or function description states otherwise:

- 72874 1. The user ID of the file shall be set to the effective user ID of the calling process.
- 72875 2. The group ID of the file shall be set to the effective group ID of the calling process or the
 72876 group ID of the directory in which the file is being created.
- 72877 3. If the file is a regular file, the permission bits of the file shall be set to:

72878 S_IROTH | S_IWOTH | S_IRGRP | S_IWGRP | S_IRUSR | S_IWUSR

72879 (see the description of *File Modes* in XBD [Chapter 13](#) (on page 219), `<sys/stat.h>`) except
 72880 that the bits specified by the file mode creation mask of the process shall be cleared. If the
 72881 file is a directory, the permission bits shall be set to:

72882 S_IRWXU | S_IRWXG | S_IRWXO

72883 except that the bits specified by the file mode creation mask of the process shall be
 72884 cleared.

- 72885 4. The last data access, last data modification, and last file status change timestamps of the
 72886 file shall be updated as specified in XBD [Section 4.8](#) (on page 109).
- 72887 5. If the file is a directory, it shall be an empty directory; otherwise, the file shall have length
 72888 zero.
- 72889 6. If the file is a symbolic link, the effect shall be undefined unless the {POSIX2_SYMLINKS}
 72890 variable is in effect for the directory in which the symbolic link would be created.
- 72891 7. Unless otherwise specified, the file created shall be a regular file.

72892 When an attempt is made to create a file that already exists, the utility shall take the action
 72893 indicated in [Table 1-1](#) (on page 2303) corresponding to the type of the file the utility is trying to
 72894 create and the type of the existing file, unless the utility description states otherwise.

Table 1-1 Actions when Creating a File that Already Exists

Existing Type	New Type												Function
	B	C	D	F	L	M	P	Q	R	S	T	Creating New	
A <i>fattach()</i> -ed STREAM	F	F	F	F	F	—	—	—	OF	—	U	N/A	
B Block Special	F	F	F	F	F	U	U	U	OF	U	U	<i>mknod()</i> **	
C Character Special	F	F	F	F	F	U	U	U	OF	U	U	<i>mknod()</i> **	
D Directory	F	F	F	F	F	—	—	—	F	—	U	<i>mkdir()</i>	
F FIFO Special File	F	F	F	F	F	—	—	—	O	—	U	<i>mkfifo()</i>	
L Symbolic Link	F	F	F	F	F	—	—	—	FL	—	U	<i>symlink()</i>	
M Shared Memory	F	F	F	F	F	—	—	—	—	—	U	<i>shm_open()</i>	
P Semaphore	F	F	F	F	F	—	—	—	—	—	U	<i>sem_open()</i>	
Q Message Queue	F	F	F	F	F	—	—	—	—	—	U	<i>mq_open()</i>	
R Regular File	F	F	F	F	F	—	—	—	RF	—	U	<i>open()</i>	
S Socket	F	F	F	F	F	—	—	—	—	—	U	<i>bind()</i>	
T Typed Memory	F	F	F	F	F	U	U	U	U	U	U	*	

The following codes are used in [Table 1-1](#):

F Fail. The attempt to create the new file shall fail and the utility shall either continue with its operation or exit immediately with a non-zero exit status, depending on the description of the utility.

FL Follow link. Unless otherwise specified, the symbolic link shall be followed as specified for pathname resolution, and the operation performed shall be as if the target of the symbolic link (after all resolution) had been named. If the target of the symbolic link does not exist, it shall be as if that nonexistent target had been named directly.

O Open FIFO. When attempting to create a regular file, and the existing file is a FIFO special file:

1. If the FIFO is not already open for reading, the attempt shall block until the FIFO is opened for reading.
2. Once the FIFO is open for reading, the utility shall open the FIFO for writing and continue with its operation.

OF The named file shall be opened with the consequences defined for that file type.

RF Regular file. When attempting to create a regular file, and the existing file is a regular file:

1. The user ID, group ID, and permission bits of the file shall not be changed.
2. The file shall be truncated to zero length.
3. The last data modification and last file status change timestamps shall be marked for update.

— The effect is implementation-defined unless specified by the utility description.

U The effect is unspecified unless specified by the utility description.

***** There is no portable way to create a file of this type.

****** Not portable.

When a file is to be appended, the file shall be opened in a manner equivalent to using the `O_APPEND` flag, without the `O_TRUNC` flag, in the *open()* function defined in the System Interfaces volume of POSIX.1-2008.

72937 When a file is to be read or written, the file shall be opened with an access mode corresponding
 72938 to the operation to be performed. If file access permissions deny access, the requested operation
 72939 shall fail.

72940 1.1.1.5 File Removal

72941 When a directory that is the root directory or current working directory of any process is
 72942 removed, the effect is implementation-defined. If file access permissions deny access, the
 72943 requested operation shall fail. Otherwise, when a file is removed:

- 72944 1. Its directory entry shall be removed from the file system.
- 72945 2. The link count of the file shall be decremented.
- 72946 3. If the file is an empty directory (see XBD [Section 3.144](#), on page 56):
 - 72947 a. If no process has the directory open, the space occupied by the directory shall be
 72948 freed and the directory shall no longer be accessible.
 - 72949 b. If one or more processes have the directory open, the directory contents shall be
 72950 preserved until all references to the file have been closed.
- 72951 4. If the file is a directory that is not empty, the last file status change timestamp shall be
 72952 marked for update.
- 72953 5. If the file is not a directory:
 - 72954 a. If the link count becomes zero:
 - 72955 i. If no process has the file open, the space occupied by the file shall be freed
 72956 and the file shall no longer be accessible.
 - 72957 ii. If one or more processes have the file open, the file contents shall be
 72958 preserved until all references to the file have been closed.
 - 72959 b. If the link count is not reduced to zero, the last file status change timestamp shall
 72960 be marked for update.
- 72961 6. The last data modification and last file status change timestamps of the containing
 72962 directory shall be marked for update.

72963 1.1.1.6 File Time Values

72964 All files shall have the three time values described by XBD [Section 4.8](#) (on page 109).

72965 1.1.1.7 File Contents

72966 When a reference is made to the contents of a file, *pathname*, this means the equivalent of all of
 72967 the data placed in the space pointed to by *buf* when performing the *read()* function calls in the
 72968 following operations defined in the System Interfaces volume of POSIX.1-2008:

```
72969 while (read (fildes, buf, nbytes) > 0)
72970     ;
```

72971 If the file is indicated by a *pathname* *pathname*, the file descriptor shall be determined by the
 72972 equivalent of the following operation defined in the System Interfaces volume of POSIX.1-2008:

```
72973 fildes = open (pathname, O_RDONLY);
```

72974 The value of *nbytes* in the above sequence is unspecified; if the file is of a type where the data

72975 returned by *read()* would vary with different values, the value shall be one that results in the
 72976 most data being returned.

72977 If the *read()* function calls would return an error, it is unspecified whether the contents of the file
 72978 are considered to include any data from offsets in the file beyond where the error would be
 72979 returned.

72980 1.1.1.8 Pathname Resolution

72981 The pathname resolution algorithm, described by XBD [Section 4.12](#) (on page 111), shall be used
 72982 by implementations conforming to this volume of POSIX.1-2008; see also XBD [Section 4.5](#) (on
 72983 page 108).

72984 1.1.1.9 Changing the Current Working Directory

72985 When the current working directory (see XBD [Section 3.122](#), on page 53) is to be changed, unless
 72986 the utility or function description states otherwise, the operation shall succeed unless a call to
 72987 the *chdir()* function defined in the System Interfaces volume of POSIX.1-2008 would fail when
 72988 invoked with the new working directory pathname as its argument.

72989 1.1.1.10 Establish the Locale

72990 The functionality of the *setlocale()* function defined in the System Interfaces volume of
 72991 POSIX.1-2008 shall be available on all systems conforming to this volume of POSIX.1-2008; that
 72992 is, utilities that require the capability of establishing an international operating environment
 72993 shall be permitted to set the specified category of the international environment.

72994 1.1.1.11 Actions Equivalent to Functions

72995 Some utility descriptions specify that a utility performs actions equivalent to a function defined
 72996 in the System Interfaces volume of POSIX.1-2008. Such specifications require only that the
 72997 external effects be equivalent, not that any effect within the utility and visible only to the utility
 72998 be equivalent.

72999 1.1.2 Concepts Derived from the ISO C Standard

73000 Some of the standard utilities perform complex data manipulation using their own procedure
 73001 and arithmetic languages, as defined in their EXTENDED DESCRIPTION or OPERANDS
 73002 sections. Unless otherwise noted, the arithmetic and semantic concepts (precision, type
 73003 conversion, control flow, and so on) shall be equivalent to those defined in the ISO C standard,
 73004 as described in the following sections. Note that there is no requirement that the standard
 73005 utilities be implemented in any particular programming language.

73006 1.1.2.1 Arithmetic Precision and Operations

73007 Integer variables and constants, including the values of operands and option-arguments, used
 73008 by the standard utilities listed in this volume of POSIX.1-2008 shall be implemented as
 73009 equivalent to the ISO C standard **signed long** data type; floating point shall be implemented as
 73010 equivalent to the ISO C standard **double** type. Conversions between types shall be as described
 73011 in the ISO C standard. All variables shall be initialized to zero if they are not otherwise assigned
 73012 by the input to the application.

Arithmetic operators and control flow keywords shall be implemented as equivalent to those in the cited ISO C standard section, as listed in [Table 1-2](#).

Table 1-2 Selected ISO C Standard Operators and Control Flow Keywords

Operation	ISO C Standard Equivalent Reference
()	Section 6.5.1, Primary Expressions
postfix ++ postfix --	Section 6.5.2, Postfix Operators
unary + unary - prefix ++ prefix -- ~ ! sizeof()	Section 6.5.3, Unary Operators
* / %	Section 6.5.5, Multiplicative Operators
+ -	Section 6.5.6, Additive Operators
<< >>	Section 6.5.7, Bitwise Shift Operators
<, <= >, >=	Section 6.5.8, Relational Operators
= = !=	Section 6.5.9, Equality Operators
&	Section 6.5.10, Bitwise AND Operator
^	Section 6.5.11, Bitwise Exclusive OR Operator
	Section 6.5.12, Bitwise Inclusive OR Operator
&&	Section 6.5.13, Logical AND Operator
	Section 6.5.14, Logical OR Operator
expr?expr:expr	Section 6.5.15, Conditional Operator
=, *=, /=, % =, +=, -= <<=, >>=, &=, ^=, =	Section 6.5.16, Assignment Operators
if () if () ... else switch ()	Section 6.8.4, Selection Statements
while () do ... while () for ()	Section 6.8.5, Iteration Statements
goto continue break return	Section 6.8.6, Jump Statements

73056 The evaluation of arithmetic expressions shall be equivalent to that described in Section 6.5,
73057 Expressions, of the ISO C standard.

73058 1.1.2.2 Mathematical Functions

73059 Any mathematical functions with the same names as those in the following sections of the ISO C
73060 standard:

- 73061 • Section 7.12, Mathematics, `<math.h>`
- 73062 • Section 7.20.2, Pseudo-Random Sequence Generation Functions

73063 shall be implemented to return the results equivalent to those returned from a call to the
73064 corresponding function described in the ISO C standard.

73065 1.2 Utility Limits

73066 This section lists magnitude limitations imposed by a specific implementation. The braces
73067 notation, {LIMIT}, is used in this volume of POSIX.1-2008 to indicate these values, but the braces
73068 are not part of the name.

73069 **Table 1-3** Utility Limit Minimum Values

Name	Description	Value
{POSIX2_BC_BASE_MAX}	The maximum <i>obase</i> value allowed by the <i>bc</i> utility.	99
{POSIX2_BC_DIM_MAX}	The maximum number of elements permitted in an array by the <i>bc</i> utility.	2 048
{POSIX2_BC_SCALE_MAX}	The maximum <i>scale</i> value allowed by the <i>bc</i> utility.	99
{POSIX2_BC_STRING_MAX}	The maximum length of a string constant accepted by the <i>bc</i> utility.	1 000
{POSIX2_COLL_WEIGHTS_MAX}	The maximum number of weights that can be assigned to an entry of the <i>LC_COLLATE</i> order keyword in the locale definition file; see the border_start keyword in XBD Section 7.3.2 (on page 147).	2
{POSIX2_EXPR_NEST_MAX}	The maximum number of expressions that can be nested within parentheses by the <i>expr</i> utility.	32
{POSIX2_LINE_MAX}	Unless otherwise noted, the maximum length, in bytes, of the input line of a utility (either standard input or another file), when the utility is described as processing text files. The length includes room for the trailing <code><newline></code> .	2 048
{POSIX2_RE_DUP_MAX}	The maximum number of repeated occurrences of a BRE permitted when using the interval notation <code>\{m,n\}</code> ; see XBD Section 9.3.6 (on page 186).	255

73095 The values specified in [Table 1-3](#) represent the lowest values conforming implementations shall
73096 provide and, consequently, the largest values on which an application can rely without further

enquiries, as described below. These values shall be accessible to applications via the *getconf* utility (see *getconf*, on page 2796).

Implementations may provide more liberal, or less restrictive, values than shown in [Table 1-3](#) (on page 2307). These possibly more liberal values are accessible using the symbols in [Table 1-4](#).

The *sysconf()* function defined in the System Interfaces volume of POSIX.1-2008 or the *getconf* utility return the value of each symbol on each specific implementation. The value so retrieved is the largest, or most liberal, value that is available throughout the session lifetime, as determined at session creation. The literal names shown in the table apply only to the *getconf* utility; the high-level language binding describes the exact form of each name to be used by the interfaces in that binding.

All numeric limits defined by the System Interfaces volume of POSIX.1-2008, such as {PATH_MAX}, shall also apply to this volume of POSIX.1-2008. All the utilities defined by this volume of POSIX.1-2008 are implicitly limited by these values, unless otherwise noted in the utility descriptions.

It is not guaranteed that the application can actually reach the specified limit of an implementation in any given case, or at all, as a lack of virtual memory or other resources may prevent this. The limit value indicates only that the implementation does not specifically impose any arbitrary, more restrictive limit.

Table 1-4 Symbolic Utility Limits

Name	Description	Minimum Value
{BC_BASE_MAX}	The maximum <i>obase</i> value allowed by the <i>bc</i> utility.	{POSIX2_BC_BASE_MAX}
{BC_DIM_MAX}	The maximum number of elements permitted in an array by the <i>bc</i> utility.	{POSIX2_BC_DIM_MAX}
{BC_SCALE_MAX}	The maximum <i>scale</i> value allowed by the <i>bc</i> utility.	{POSIX2_BC_SCALE_MAX}
{BC_STRING_MAX}	The maximum length of a string constant accepted by the <i>bc</i> utility.	{POSIX2_BC_STRING_MAX}
{COLL_WEIGHTS_MAX}	The maximum number of weights that can be assigned to an entry of the <i>LC_COLLATE</i> order keyword in the locale definition file; see the order_start keyword in XBD Section 7.3.2 (on page 147).	{POSIX2_COLL_WEIGHTS_MAX}
{EXPR_NEST_MAX}	The maximum number of expressions that can be nested within parentheses by the <i>expr</i> utility.	{POSIX2_EXPR_NEST_MAX}

Name	Description	Minimum Value
{LINE_MAX}	Unless otherwise noted, the maximum length, in bytes, of the input line of a utility (either standard input or another file), when the utility is described as processing text files. The length includes room for the trailing <newline>.	{POSIX2_LINE_MAX}
{RE_DUP_MAX}	The maximum number of repeated occurrences of a BRE permitted when using the interval notation $\{m,n\}$; see XBD Section 9.3.6 (on page 186).	{POSIX2_RE_DUP_MAX}

The following value may be a constant within an implementation or may vary from one pathname to another.

{POSIX2_SYMLINKS}

When referring to a directory, the system supports the creation of symbolic links within that directory; for non-directory files, the meaning of {POSIX2_SYMLINKS} is undefined.

1.3 Grammar Conventions

Portions of this volume of POSIX.1-2008 are expressed in terms of a special grammar notation. It is used to portray the complex syntax of certain program input. The grammar is based on the syntax used by the *yacc* utility. However, it does not represent fully functional *yacc* input, suitable for program use; the lexical processing and all semantic requirements are described only in textual form. The grammar is not based on source used in any traditional implementation and has not been tested with the semantic code that would normally be required to accompany it. Furthermore, there is no implication that the partial *yacc* code presented represents the most efficient, or only, means of supporting the complex syntax within the utility. Implementations may use other programming languages or algorithms, as long as the syntax supported is the same as that represented by the grammar.

The following typographical conventions are used in the grammar; they have no significance except to aid in reading.

- The identifiers for the reserved words of the language are shown with a leading capital letter. (These are terminals in the grammar; for example, **While**, **Case**.)
- The identifiers for terminals in the grammar are all named with uppercase letters and underscores; for example, **NEWLINE**, **ASSIGN_OP**, **NAME**.
- The identifiers for non-terminals are all lowercase.

1.4 Utility Description Defaults

This section describes all of the subsections used within the utility descriptions, including:

- Intended usage of the section
- Global defaults that affect all the standard utilities
- The meanings of notations used in this volume of POSIX.1-2008 that are specific to individual utility sections

NAME

This section gives the name or names of the utility and briefly states its purpose.

SYNOPSIS

The SYNOPSIS section summarizes the syntax of the calling sequence for the utility, including options, option-arguments, and operands. Standards for utility naming are described in XBD [Section 12.2](#) (on page 215); for describing the utility's arguments in XBD [Section 12.1](#) (on page 213).

DESCRIPTION

The DESCRIPTION section describes the actions of the utility. If the utility has a very complex set of subcommands or its own procedural language, an EXTENDED DESCRIPTION section is also provided. Most explanations of optional functionality are omitted here, as they are usually explained in the OPTIONS section.

As stated in [Section 1.1.1.11](#) (on page 2305), some functions are described in terms of equivalent functionality. When specific functions are cited, the implementation shall provide equivalent functionality including side-effects associated with successful execution of the function. The treatment of errors and intermediate results from the individual functions cited is generally not specified by this volume of POSIX.1-2008. See the utility's EXIT STATUS and CONSEQUENCES OF ERRORS sections for all actions associated with errors encountered by the utility.

OPTIONS

The OPTIONS section describes the utility options and option-arguments, and how they modify the actions of the utility. Standard utilities that have options either fully comply with XBD [Section 12.2](#) (on page 215) or describe all deviations. Apparent disagreements between functionality descriptions in the OPTIONS and DESCRIPTION (or EXTENDED DESCRIPTION) sections are always resolved in favor of the OPTIONS section.

Each OPTIONS section that uses the phrase “The ... utility shall conform to the Utility Syntax Guidelines ...” refers only to the use of the utility as specified by this volume of POSIX.1-2008; implementation extensions should also conform to the guidelines, but may allow exceptions for historical practice.

Unless otherwise stated in the utility description, when given an option unrecognized by the implementation, or when a required option-argument is not provided, standard utilities shall issue a diagnostic message to standard error and exit with a non-zero exit status.

All utilities in this volume of POSIX.1-2008 shall be capable of processing arguments using eight-bit transparency.

Default Behavior: When this section is listed as “None.”, it means that the implementation need not support any options. Standard utilities that do not accept options, but that do accept operands, shall recognize “--” as a first argument to be discarded.

The requirement for recognizing "--" is because conforming applications need a way to shield their operands from any arbitrary options that the implementation may provide as an extension. For example, if the standard utility *foo* is listed as taking no options, and the application needed to give it a pathname with a leading <hyphen>, it could safely do it as:

```
foo -- -myfile
```

and avoid any problems with **-m** used as an extension.

OPERANDS

The OPERANDS section describes the utility operands, and how they affect the actions of the utility. Apparent disagreements between functionality descriptions in the OPERANDS and DESCRIPTION (or EXTENDED DESCRIPTION) sections shall be resolved in favor of the OPERANDS section.

If an operand naming a file can be specified as '-', which means to use the standard input instead of a named file, this is explicitly stated in this section. Unless otherwise stated, the use of multiple instances of '-' to mean standard input in a single command produces unspecified results.

Unless otherwise stated, the standard utilities that accept operands shall process those operands in the order specified in the command line.

Default Behavior: When this section is listed as "None.", it means that the implementation need not support any operands.

STDIN

The STDIN section describes the standard input of the utility. This section is frequently merely a reference to the following section, as many utilities treat standard input and input files in the same manner. Unless otherwise stated, all restrictions described in the INPUT FILES section shall apply to this section as well.

Use of a terminal for standard input can cause any of the standard utilities that read standard input to stop when used in the background. For this reason, applications should not use interactive features in scripts to be placed in the background.

The specified standard input format of the standard utilities shall not depend on the existence or value of the environment variables defined in this volume of POSIX.1-2008, except as provided by this volume of POSIX.1-2008.

Default Behavior: When this section is listed as "Not used.", it means that the standard input shall not be read when the utility is used as described by this volume of POSIX.1-2008.

INPUT FILES

The INPUT FILES section describes the files, other than the standard input, used as input by the utility. It includes files named as operands and option-arguments as well as other files that are referred to, such as start-up and initialization files, databases, and so on. Commonly-used files are generally described in one place and cross-referenced by other utilities.

All utilities in this volume of POSIX.1-2008 shall be capable of processing input files using eight-bit transparency.

When a standard utility reads a seekable input file and terminates without an error before it reaches end-of-file, the utility shall ensure that the file offset in the open file description is properly positioned just past the last byte processed by the utility. For files that are not seekable, the state of the file offset in the open file description for that

file is unspecified. A conforming application shall not assume that the following three commands are equivalent:

```
tail -n +2 file
(sed -n 1q; cat) < file
cat file | (sed -n 1q; cat)
```

The second command is equivalent to the first only when the file is seekable. The third command leaves the file offset in the open file description in an unspecified state. Other utilities, such as *head*, *read*, and *sh*, have similar properties.

Some of the standard utilities, such as filters, process input files a line or a block at a time and have no restrictions on the maximum input file size. Some utilities may have size limitations that are not as obvious as file space or memory limitations. Such limitations should reflect resource limitations of some sort, not arbitrary limits set by implementors. Implementations shall document those utilities that are limited by constraints other than file system space, available memory, and other limits specifically cited by this volume of POSIX.1-2008, and identify what the constraint is and indicate a way of estimating when the constraint would be reached. Similarly, some utilities descend the directory tree (recursively). Implementations shall also document any limits that they may have in descending the directory tree that are beyond limits cited by this volume of POSIX.1-2008.

When an input file is described as a “text file”, the utility produces undefined results if given input that is not from a text file, unless otherwise stated. Some utilities (for example, *make*, *read*, *sh*) allow for continued input lines using an escaped <newline> convention; unless otherwise stated, the utility need not be able to accumulate more than {LINE_MAX} bytes from a set of multiple, continued input lines. Thus, for a conforming application the total of all the continued lines in a set cannot exceed {LINE_MAX}. If a utility using the escaped <newline> convention detects an end-of-file condition immediately after an escaped <newline>, the results are unspecified.

Record formats are described in a notation similar to that used by the C-language function, *printf()*. See XBD Chapter 5 (on page 121) for a description of this notation. The format description is intended to be sufficiently rigorous to allow other applications to generate these input files. However, since <blank>s can legitimately be included in some of the fields described by the standard utilities, particularly in locales other than the POSIX locale, this intent is not always realized.

Default Behavior: When this section is listed as “None.”, it means that no input files are required to be supplied when the utility is used as described by this volume of POSIX.1-2008.

ENVIRONMENT VARIABLES

The ENVIRONMENT VARIABLES section lists what variables affect the utility’s execution.

The entire manner in which environment variables described in this volume of POSIX.1-2008 affect the behavior of each utility is described in the ENVIRONMENT VARIABLES section for that utility, in conjunction with the global effects of the *LANG*, *LC_ALL*, and *NLSPATH* environment variables described in XBD Chapter 8 (on page 173). The existence or value of environment variables described in this volume of POSIX.1-2008 shall not otherwise affect the specified behavior of the standard utilities. Any effects of the existence or value of environment variables not described by this volume of POSIX.1-2008 upon the standard utilities are unspecified.

For those standard utilities that use environment variables as a means for selecting a

utility to execute (such as CC in *make*), the string provided to the utility is subjected to the path search described for *PATH* in XBD [Chapter 8](#) (on page 173).

All utilities in this volume of POSIX.1-2008 shall be capable of processing environment variable names and values using eight-bit transparency.

Default Behavior: When this section is listed as “None.”, it means that the behavior of the utility is not directly affected by environment variables described by this volume of POSIX.1-2008 when the utility is used as described by this volume of POSIX.1-2008.

ASYNCHRONOUS EVENTS

The ASYNCHRONOUS EVENTS section lists how the utility reacts to such events as signals and what signals are caught.

Default Behavior: When this section is listed as “Default.”, or it refers to “the standard action for all other signals; see [Section 1.4](#) (on page 2310)” it means that the action taken as a result of the signal shall be one of the following:

1. The action shall be that inherited from the parent according to the rules of inheritance of signal actions defined in the System Interfaces volume of POSIX.1-2008.
2. When no action has been taken to change the default, the default action shall be that specified by the System Interfaces volume of POSIX.1-2008.
3. The result of the utility’s execution is as if default actions had been taken.

A utility is permitted to catch a signal, perform some additional processing (such as deleting temporary files), restore the default signal action (or action inherited from the parent process), and resignal itself.

STDOUT

The STDOUT section completely describes the standard output of the utility. This section is frequently merely a reference to the following section, OUTPUT FILES, because many utilities treat standard output and output files in the same manner.

Use of a terminal for standard output may cause any of the standard utilities that write standard output to stop when used in the background. For this reason, applications should not use interactive features in scripts to be placed in the background.

Record formats are described in a notation similar to that used by the C-language function, *printf()*. See XBD [Chapter 5](#) (on page 121) for a description of this notation.

The specified standard output of the standard utilities shall not depend on the existence or value of the environment variables defined in this volume of POSIX.1-2008, except as provided by this volume of POSIX.1-2008.

Some of the standard utilities describe their output using the verb *display*, defined in XBD [Section 3.133](#) (on page 54). Output described in the STDOUT sections of such utilities may be produced using means other than standard output. When standard output is directed to a terminal, the output described shall be written directly to the terminal. Otherwise, the results are undefined.

Default Behavior: When this section is listed as “Not used.”, it means that the standard output shall not be written when the utility is used as described by this volume of POSIX.1-2008.

STDERR

The STDERR section describes the standard error output of the utility. Only those messages that are purposely sent by the utility are described.

73363 Use of a terminal for standard error may cause any of the standard utilities that write
 73364 standard error output to stop when used in the background. For this reason,
 73365 applications should not use interactive features in scripts to be placed in the
 73366 background.

73367 The format of diagnostic messages for most utilities is unspecified, but the language
 73368 and cultural conventions of diagnostic and informative messages whose format is
 73369 unspecified by this volume of POSIX.1-2008 should be affected by the setting of
 73370 XSI `LC_MESSAGES` and `NLSPATH`.

73371 The specified standard error output of standard utilities shall not depend on the
 73372 existence or value of the environment variables defined in this volume of POSIX.1-2008,
 73373 except as provided by this volume of POSIX.1-2008.

73374 **Default Behavior:** When this section is listed as “The standard error shall be used only
 73375 for diagnostic messages.”, it means that, unless otherwise stated, the diagnostic
 73376 messages shall be sent to the standard error only when the exit status indicates that an
 73377 error occurred and the utility is used as described by this volume of POSIX.1-2008.

73378 When this section is listed as “Not used.”, it means that the standard error shall not be
 73379 used when the utility is used as described in this volume of POSIX.1-2008.

73380 OUTPUT FILES

73381 The OUTPUT FILES section completely describes the files created or modified by the
 73382 utility. Temporary or system files that are created for internal usage by this utility or
 73383 other parts of the implementation (for example, spool, log, and audit files) are not
 73384 described in this, or any, section. The utilities creating such files and the names of such
 73385 files are unspecified. If applications are written to use temporary or intermediate files,
 73386 they should use the `TMPDIR` environment variable, if it is set and represents an
 73387 accessible directory, to select the location of temporary files.

73388 Implementations shall ensure that temporary files, when used by the standard utilities,
 73389 are named so that different utilities or multiple instances of the same utility can operate
 73390 simultaneously without regard to their working directories, or any other process
 73391 characteristic other than process ID. There are two exceptions to this rule:

- 73392 1. Resources for temporary files other than the name space (for example, disk
 73393 space, available directory entries, or number of processes allowed) are not
 73394 guaranteed.
- 73395 2. Certain standard utilities generate output files that are intended as input for
 73396 other utilities (for example, *lex* generates `lex.yy.c`), and these cannot have unique
 73397 names. These cases are explicitly identified in the descriptions of the respective
 73398 utilities.

73399 Any temporary file created by the implementation shall be removed by the
 73400 implementation upon a utility’s successful exit, exit because of errors, or before
 73401 termination by any of the `SIGHUP`, `SIGINT`, or `SIGTERM` signals, unless specified
 73402 otherwise by the utility description.

73403 Receipt of the `SIGQUIT` signal should generally cause termination (unless in some
 73404 debugging mode) that would bypass any attempted recovery actions.

73405 Record formats are described in a notation similar to that used by the C-language
 73406 function, `printf()`; see XBD [Chapter 5](#) (on page 121) for a description of this notation.

73407 **Default Behavior:** When this section is listed as “None.”, it means that no files are
 73408 created or modified as a consequence of direct action on the part of the utility when the
 73409 utility is used as described by this volume of POSIX.1-2008. However, the utility may

create or modify system files, such as log files, that are outside the utility's normal execution environment.

EXTENDED DESCRIPTION

The EXTENDED DESCRIPTION section provides a place for describing the actions of very complicated utilities, such as text editors or language processors, which typically have elaborate command languages.

Default Behavior: When this section is listed as "None.", no further description is necessary.

EXIT STATUS

The EXIT STATUS section describes the values the utility shall return to the calling program, or shell, and the conditions that cause these values to be returned. Usually, utilities return zero for successful completion and values greater than zero for various error conditions. If specific numeric values are listed in this section, the system shall use those values for the errors described. In some cases, status values are listed more loosely, such as >0. A strictly conforming application shall not rely on any specific value in the range shown and shall be prepared to receive any value in the range.

For example, a utility may list zero as a successful return, 1 as a failure for a specific reason, and >1 as "an error occurred". In this case, unspecified conditions may cause a 2 or 3, or other value, to be returned. A conforming application should be written so that it tests for successful exit status values (zero in this case), rather than relying upon the single specific error value listed in this volume of POSIX.1-2008. In that way, it has maximum portability, even on implementations with extensions.

Unspecified error conditions may be represented by specific values not listed in this volume of POSIX.1-2008.

CONSEQUENCES OF ERRORS

The CONSEQUENCES OF ERRORS section describes the effects on the environment, file systems, process state, and so on, when error conditions occur. It does not describe error messages produced or exit status values used.

The many reasons for failure of a utility are generally not specified by the utility descriptions. Utilities may terminate prematurely if they encounter: invalid usage of options, arguments, or environment variables; invalid usage of the complex syntaxes expressed in EXTENDED DESCRIPTION sections; difficulties accessing, creating, reading, or writing files; or difficulties associated with the privileges of the process.

The following shall apply to each utility, unless otherwise stated:

- If the requested action cannot be performed on an operand representing a file, directory, user, process, and so on, the utility shall issue a diagnostic message to standard error and continue processing the next operand in sequence, but the final exit status shall be returned as non-zero.

For a utility that recursively traverses a file hierarchy (such as *find* or *chown -R*), if the requested action cannot be performed on a file or directory encountered in the hierarchy, the utility shall issue a diagnostic message to standard error and continue processing the remaining files in the hierarchy, but the final exit status shall be returned as non-zero.

- If the requested action characterized by an option or option-argument cannot be performed, the utility shall issue a diagnostic message to standard error and the exit status returned shall be non-zero.

- When an unrecoverable error condition is encountered, the utility shall exit with a non-zero exit status.
- A diagnostic message shall be written to standard error whenever an error condition occurs.

When a utility encounters an error condition several actions are possible, depending on the severity of the error and the state of the utility. Included in the possible actions of various utilities are: deletion of temporary or intermediate work files; deletion of incomplete files; validity checking of the file system or directory.

Default Behavior: When this section is listed as “Default.”, it means that any changes to the environment, file systems, process state, and so on are unspecified.

APPLICATION USAGE

This section is informative.

The APPLICATION USAGE section gives advice to the application programmer or user about the way the utility should be used.

EXAMPLES

This section is informative.

The EXAMPLES section gives one or more examples of usage, where appropriate. In the event of conflict between an example and a normative part of the specification, the normative material is to be taken as correct.

In all examples, quoting has been used, showing how sample commands (utility names combined with arguments) could be passed correctly to a shell (see *sh*) or as a string to the *system()* function defined in the System Interfaces volume of POSIX.1-2008. Such quoting would not be used if the utility is invoked using one of the *exec* functions defined in the System Interfaces volume of POSIX.1-2008.

RATIONALE

This section is informative.

This section contains historical information concerning the contents of this volume of POSIX.1-2008 and why features were included or discarded by the standard developers.

FUTURE DIRECTIONS

This section is informative.

The FUTURE DIRECTIONS section should be used as a guide to current thinking; there is not necessarily a commitment to implement all of these future directions in their entirety.

SEE ALSO

This section is informative.

The SEE ALSO section lists related entries.

CHANGE HISTORY

This section is informative.

This section shows the derivation of the entry and any significant changes that have been made to it.

Certain of the standard utilities describe how they can invoke other utilities or applications, such as by passing a command string to the command interpreter. The external influences (STDIN, ENVIRONMENT VARIABLES, and so on) and external effects (STDOUT, CONSEQUENCES OF

73500 ERRORS, and so on) of such invoked utilities are not described in the section concerning the
 73501 standard utility that invokes them.

73502 1.5 Considerations for Utilities in Support of Files of Arbitrary Size

73503 The following utilities support files of any size up to the maximum that can be created by the
 73504 implementation. This support includes correct writing of file size-related values (such as file
 73505 sizes and offsets, line numbers, and block counts) and correct interpretation of command line
 73506 arguments that contain such values.

73507	<i>basename</i>	Return non-directory portion of pathname.
73508	<i>cat</i>	Concatenate and print files.
73509	<i>cd</i>	Change working directory.
73510	<i>chgrp</i>	Change file group ownership.
73511	<i>chmod</i>	Change file modes.
73512	<i>chown</i>	Change file ownership.
73513	<i>cksum</i>	Write file checksums and sizes.
73514	<i>cmp</i>	Compare two files.
73515	<i>cp</i>	Copy files.
73516	<i>dd</i>	Convert and copy a file.
73517	<i>df</i>	Report free disk space.
73518	<i>dirname</i>	Return directory portion of pathname.
73519	<i>du</i>	Estimate file space usage.
73520	<i>find</i>	Find files.
73521	<i>ln</i>	Link files.
73522	<i>ls</i>	List directory contents.
73523	<i>mkdir</i>	Make directories.
73524	<i>mv</i>	Move files.
73525	<i>pathchk</i>	Check pathnames.
73526	<i>pwd</i>	Return working directory name.
73527	<i>rm</i>	Remove directory entries.
73528	<i>rmdir</i>	Remove directories.
73529	<i>sh</i>	Shell, the standard command language interpreter.
73530	<i>sum</i>	Print checksum and block or byte count of a file.
73531	<i>test</i>	Evaluate expression.
73532	<i>touch</i>	Change file access and modification times.
73533	<i>ulimit</i>	Set or report file size limit.

- Exceptions to the requirement that utilities support files of any size up to the maximum are as follows:
1. Uses of files as command scripts, or for configuration or control, are exempt. For example, it is not required that *sh* be able to read an arbitrarily large **.profile**.
 2. Shell input and output redirection are exempt. For example, it is not required that the redirections *sum < file* or *echo foo > file* succeed for an arbitrarily large existing file.

1.6 Built-In Utilities

Any of the standard utilities may be implemented as regular built-in utilities within the command language interpreter. This is usually done to increase the performance of frequently used utilities or to achieve functionality that would be more difficult in a separate environment. The utilities named in [Table 1-5](#) are frequently provided in built-in form. All of the utilities named in the table have special properties in terms of command search order within the shell, as described in [Section 2.9.1.1](#) (on page 2339).

Table 1-5 Regular Built-In Utilities

<i>alias</i>	<i>false</i>	<i>jobs</i>	<i>read</i>	<i>wait</i>
<i>bg</i>	<i>fc</i>	<i>kill</i>	<i>true</i>	
<i>cd</i>	<i>fg</i>	<i>newgrp</i>	<i>umask</i>	
<i>command</i>	<i>getopts</i>	<i>pwd</i>	<i>unalias</i>	

However, all of the standard utilities, including the regular built-ins in the table, but not the special built-ins described in [Section 2.14](#) (on page 2356), shall be implemented in a manner so that they can be accessed via the *exec* family of functions as defined in the System Interfaces volume of POSIX.1-2008 and can be invoked directly by those standard utilities that require it (*env*, *find*, *nice*, *nohup*, *time*, *xargs*).

Shell Command Language

This chapter contains the definition of the Shell Command Language.

2.1 Shell Introduction

The shell is a command language interpreter. This chapter describes the syntax of that command language as it is used by the *sh* utility and the *system()* and *popen()* functions defined in the System Interfaces volume of POSIX.1-2008.

The shell operates according to the following general overview of operations. The specific details are included in the cited sections of this chapter.

1. The shell reads its input from a file (see *sh*), from the `-c` option or from the *system()* and *popen()* functions defined in the System Interfaces volume of POSIX.1-2008. If the first line of a file of shell commands starts with the characters "#!", the results are unspecified.

2. The shell breaks the input into tokens: words and operators; see [Section 2.3](#).

3. The shell parses the input into simple commands (see [Section 2.9.1](#)) and compound commands (see [Section 2.9.4](#)).

4. The shell performs various expansions (separately) on different parts of each command, resulting in a list of pathnames and fields to be treated as a command and arguments; see [Section 2.6](#).

5. The shell performs redirection (see [Section 2.7](#)) and removes redirection operators and their operands from the parameter list.

6. The shell executes a function (see [Section 2.9.5](#)), built-in (see [Section 2.14](#)), executable file, or script, giving the names of the arguments as positional parameters numbered 1 to *n*, and the name of the command (or in the case of a function within a script, the name of the script) as the positional parameter numbered 0 (see [Section 2.9.1.1](#)).

7. The shell optionally waits for the command to complete and collects the exit status (see [Section 2.8.2](#)).

2.2 Quoting

Quoting is used to remove the special meaning of certain characters or words to the shell. Quoting can be used to preserve the literal meaning of the special characters in the next paragraph, prevent reserved words from being recognized as such, and prevent parameter expansion and command substitution within here-document processing (see [Section 2.7.4](#)).

The application shall quote the following characters if they are to represent themselves:

| & ; < > () \$ ` \ " ' <space> <tab> <newline>

and the following may need to be quoted under certain circumstances. That is, these characters may be special depending on conditions described elsewhere in this volume of POSIX.1-2008:

* ? [# ~ = %

The various quoting mechanisms are the escape character, single-quotes, and double-quotes. The here-document represents another form of quoting; see [Section 2.7.4](#).

2.2.1 Escape Character (Backslash)

A <backslash> that is not quoted shall preserve the literal value of the following character, with the exception of a <newline>. If a <newline> follows the <backslash>, the shell shall interpret this as line continuation. The <backslash> and <newline> shall be removed before splitting the input into tokens. Since the escaped <newline> is removed entirely from the input and is not replaced by any white space, it cannot serve as a token separator.

2.2.2 Single-Quotes

Enclosing characters in single-quotes (' ') shall preserve the literal value of each character within the single-quotes. A single-quote cannot occur within single-quotes.

2.2.3 Double-Quotes

Enclosing characters in double-quotes (" ") shall preserve the literal value of all characters within the double-quotes, with the exception of the characters backquote, <dollar-sign>, and <backslash>, as follows:

\$ The <dollar-sign> shall retain its special meaning introducing parameter expansion (see [Section 2.6.2](#)), a form of command substitution (see [Section 2.6.3](#)), and arithmetic expansion (see [Section 2.6.4](#)).

The input characters within the quoted string that are also enclosed between "\$ (" and the matching ') ' shall not be affected by the double-quotes, but rather shall define that command whose output replaces the "\$ (. . .) " when the word is expanded. The tokenizing rules in [Section 2.3](#), not including the alias substitutions in [Section 2.3.1](#), shall be applied recursively to find the matching ') '.

Within the string of characters from an enclosed "\$ { " to the matching ' } ' , an even number of unescaped double-quotes or single-quotes, if any, shall occur. A preceding <backslash> character shall be used to escape a literal ' { ' or ' } ' . The rule in [Section 2.6.2](#) shall be used to determine the matching ' } ' .

73621 ``` The backquote shall retain its special meaning introducing the other form of command
 73622 substitution (see [Section 2.6.3](#)). The portion of the quoted string from the initial backquote
 73623 and the characters up to the next backquote that is not preceded by a `<backslash>`, having
 73624 escape characters removed, defines that command whose output replaces `"`...`"` when
 73625 the word is expanded. Either of the following cases produces undefined results:

- 73626 • A single-quoted or double-quoted string that begins, but does not end, within the
 73627 `"`...`"` sequence
- 73628 • A `"`...`"` sequence that begins, but does not end, within the same double-quoted
 73629 string

73630 `\` The `<backslash>` shall retain its special meaning as an escape character (see [Section 2.2.1](#))
 73631 only when followed by one of the following characters when considered special:

73632 `$    ` " \ <newline>`

73633 The application shall ensure that a double-quote is preceded by a `<backslash>` to be included
 73634 within double-quotes. The parameter `'@'` has special meaning inside double-quotes and is
 73635 described in [Section 2.5.2](#).

73636 2.3 Token Recognition

73637 The shell shall read its input in terms of lines from a file, from a terminal in the case of an
 73638 interactive shell, or from a string in the case of `sh -c` or `system()`. The input lines can be of
 73639 unlimited length. These lines shall be parsed using two major modes: ordinary token recognition
 73640 and processing of here-documents.

73641 When an `io_here` token has been recognized by the grammar (see [Section 2.10](#)), one or more of
 73642 the subsequent lines immediately following the next `NEWLINE` token form the body of one or
 73643 more here-documents and shall be parsed according to the rules of [Section 2.7.4](#).

73644 When it is not processing an `io_here`, the shell shall break its input into tokens by applying the
 73645 first applicable rule below to the next character in its input. The token shall be from the current
 73646 position in the input until a token is delimited according to one of the rules below; the characters
 73647 forming the token are exactly those in the input, including any quoting characters. If it is
 73648 indicated that a token is delimited, and no characters have been included in a token, processing
 73649 shall continue until an actual token is delimited.

- 73650 1. If the end of input is recognized, the current token shall be delimited. If there is no
 73651 current token, the end-of-input indicator shall be returned as the token.
- 73652 2. If the previous character was used as part of an operator and the current character is not
 73653 quoted and can be used with the current characters to form an operator, it shall be used as
 73654 part of that (operator) token.
- 73655 3. If the previous character was used as part of an operator and the current character cannot
 73656 be used with the current characters to form an operator, the operator containing the
 73657 previous character shall be delimited.
- 73658 4. If the current character is `<backslash>`, single-quote, or double-quote and it is not quoted,
 73659 it shall affect quoting for subsequent characters up to the end of the quoted text. The rules
 73660 for quoting are as described in [Section 2.2](#). During token recognition no substitutions
 73661 shall be actually performed, and the result token shall contain exactly the characters that
 73662 appear in the input (except for `<newline>` joining), unmodified, including any embedded
 73663 or enclosing quotes or substitution operators, between the `<quotation-mark>` and the end
 73664 of the quoted text. The token shall not be delimited by the end of the quoted field.

5. If the current character is an unquoted ' \$ ' or ' ` ', the shell shall identify the start of any candidates for parameter expansion ([Section 2.6.2](#)), command substitution ([Section 2.6.3](#)), or arithmetic expansion ([Section 2.6.4](#)) from their introductory unquoted character sequences: ' \$ ' or "\$ {", "\$ (" or ' ` ', and "\$ ((", respectively. The shell shall read sufficient input to determine the end of the unit to be expanded (as explained in the cited sections). While processing the characters, if instances of expansions or quoting are found nested within the substitution, the shell shall recursively process them in the manner specified for the construct that is found. The characters found from the beginning of the substitution to its end, allowing for any recursion necessary to recognize embedded constructs, shall be included unmodified in the result token, including any embedded or enclosing substitution operators or quotes. The token shall not be delimited by the end of the substitution.
 6. If the current character is not quoted and can be used as the first character of a new operator, the current token (if any) shall be delimited. The current character shall be used as the beginning of the next (operator) token.
 7. If the current character is an unquoted <newline>, the current token shall be delimited.
 8. If the current character is an unquoted <blank>, any token containing the previous character is delimited and the current character shall be discarded.
 9. If the previous character was part of a word, the current character shall be appended to that word.
 10. If the current character is a ' # ', it and all subsequent characters up to, but excluding, the next <newline> shall be discarded as a comment. The <newline> that ends the line is not considered part of the comment.
 11. The current character is used as the start of a new word.
- Once a token is delimited, it is categorized as required by the grammar in [Section 2.10](#).

2.3.1 Alias Substitution

After a token has been delimited, but before applying the grammatical rules in [Section 2.10](#), a resulting word that is identified to be the command name word of a simple command shall be examined to determine whether it is an unquoted, valid alias name. However, reserved words in correct grammatical context shall not be candidates for alias substitution. A valid alias name (see [XBD Section 3.10](#)) shall be one that has been defined by the *alias* utility and not subsequently undefined using *unalias*. Implementations also may provide predefined valid aliases that are in effect when the shell is invoked. To prevent infinite loops in recursive aliasing, if the shell is not currently processing an alias of the same name, the word shall be replaced by the value of the alias; otherwise, it shall not be replaced.

If the value of the alias replacing the word ends in a <blank>, the shell shall check the next command word for alias substitution; this process shall continue until a word is found that is not a valid alias or an alias value does not end in a <blank>.

When used as specified by this volume of POSIX.1-2008, alias definitions shall not be inherited by separate invocations of the shell or by the utility execution environments invoked by the shell; see [Section 2.12](#).

2.4 Reserved Words

Reserved words are words that have special meaning to the shell; see [Section 2.9](#). The following words shall be recognized as reserved words:

!	do	esac	in
{	done	fi	then
}	elif	for	until
case	else	if	while

This recognition shall only occur when none of the characters is quoted and when the word is used as:

- The first word of a command
- The first word following one of the reserved words other than **case**, **for**, or **in**
- The third word in a **case** command (only **in** is valid in this case)
- The third word in a **for** command (only **in** and **do** are valid in this case)

See the grammar in [Section 2.10](#).

The following words may be recognized as reserved words on some implementations (when none of the characters are quoted), causing unspecified results:

[[	]]	function	select

Words that are the concatenation of a name and a <colon> (' : ') are reserved; their use produces unspecified results.

2.5 Parameters and Variables

A parameter can be denoted by a name, a number, or one of the special characters listed in [Section 2.5.2](#). A variable is a parameter denoted by a name.

A parameter is set if it has an assigned value (null is a valid value). Once a variable is set, it can only be unset by using the *unset* special built-in command.

2.5.1 Positional Parameters

A positional parameter is a parameter denoted by the decimal value represented by one or more digits, other than the single digit 0. The digits denoting the positional parameters shall always be interpreted as a decimal value, even if there is a leading zero. When a positional parameter with more than one digit is specified, the application shall enclose the digits in braces (see [Section 2.6.2](#)). Positional parameters are initially assigned when the shell is invoked (see *sh*), temporarily replaced when a shell function is invoked (see [Section 2.9.5](#)), and can be reassigned with the *set* special built-in command.

2.5.2 Special Parameters

Listed below are the special parameters and the values to which they shall expand. Only the values of the special parameters are listed; see [Section 2.6](#) for a detailed summary of all the stages involved in expanding words.

- @ Expands to the positional parameters, starting from one. When the expansion occurs within double-quotes, and where field splitting (see [Section 2.6.5](#)) is performed, each positional parameter shall expand as a separate field, with the provision that the expansion of the first parameter shall still be joined with the beginning part of the original word (assuming that the expanded parameter was embedded within a word), and the expansion of the last parameter shall still be joined with the last part of the original word. If there are no positional parameters, the expansion of '@' shall generate zero fields, even when '@' is double-quoted.
- * Expands to the positional parameters, starting from one. When the expansion occurs within a double-quoted string (see [Section 2.2.3](#)), it shall expand to a single field with the value of each parameter separated by the first character of the *IFS* variable, or by a <space> if *IFS* is unset. If *IFS* is set to a null string, this is not equivalent to unsetting it; its first character does not exist, so the parameter values are concatenated.
- # Expands to the decimal number of positional parameters. The command name (parameter 0) shall not be counted in the number given by '#' because it is a special parameter, not a positional parameter.
- ? Expands to the decimal exit status of the most recent pipeline (see [Section 2.9.2](#)).
- (Hyphen.) Expands to the current option flags (the single-letter option names concatenated into a string) as specified on invocation, by the *set* special built-in command, or implicitly by the shell.
- \$ Expands to the decimal process ID of the invoked shell. In a subshell (see [Section 2.12](#)), '\$' shall expand to the same value as that of the current shell.
- ! Expands to the decimal process ID of the most recent background command (see [Section 2.9.3](#)) executed from the current shell. (For example, background commands executed from subshells do not affect the value of "\$!" in the current shell environment.) For a pipeline, the process ID is that of the last command in the pipeline.
- 0 (Zero.) Expands to the name of the shell or shell script. See *sh* for a detailed description of how this name is derived.

See the description of the *IFS* variable in [Section 2.5.3](#).

2.5.3 Shell Variables

Variables shall be initialized from the environment (as defined by XBD [Chapter 8](#) and the *exec* function in the System Interfaces volume of POSIX.1-2008) and can be given new values with variable assignment commands. If a variable is initialized from the environment, it shall be marked for export immediately; see the *export* special built-in. New variables can be defined and initialized with variable assignments, with the *read* or *getopts* utilities, with the *name* parameter in a *for* loop, with the `${name=word}` expansion, or with other mechanisms provided as implementation extensions.

73779		The following variables shall affect the execution of the shell:
73780	UP	ENV The processing of the <i>ENV</i> shell variable shall be supported if the system supports the User Portability Utilities option.
73781		
73782		This variable, when and only when an interactive shell is invoked, shall be subjected to parameter expansion (see Section 2.6.2) by the shell and the resulting value shall be used as a pathname of a file containing shell commands to execute in the current environment. The file need not be executable. If the expanded value of <i>ENV</i> is not an absolute pathname, the results are unspecified. <i>ENV</i> shall be ignored if the user's real and effective user IDs or real and effective group IDs are different.
73783		
73784		
73785		
73786		
73787		
73788		
73789		HOME The pathname of the user's home directory. The contents of <i>HOME</i> are used in tilde expansion (see Section 2.6.1).
73790		
73791		IFS A string treated as a list of characters that is used for field splitting and to split lines into fields with the <i>read</i> command.
73792		
73793		If <i>IFS</i> is not set, it shall behave as normal for an unset variable, except that field splitting by the shell and line splitting by the <i>read</i> command shall be performed as if the value of <i>IFS</i> is <space><tab><newline>; see Section 2.6.5 .
73794		
73795		
73796		Implementations may ignore the value of <i>IFS</i> in the environment, or the absence of <i>IFS</i> from the environment, at the time the shell is invoked, in which case the shell shall set <i>IFS</i> to <space><tab><newline> when it is invoked.
73797		
73798		
73799		LANG Provide a default value for the internationalization variables that are unset or null. (See XBD Section 8.2 for the precedence of internationalization variables used to determine the values of locale categories.)
73800		
73801		
73802		LC_ALL The value of this variable overrides the <i>LC_*</i> variables and <i>LANG</i> , as described in XBD Chapter 8 .
73803		
73804		LC_COLLATE Determine the behavior of range expressions, equivalence classes, and multi-character collating elements within pattern matching.
73805		
73806		LC_CTYPE Determine the interpretation of sequences of bytes of text data as characters (for example, single-byte as opposed to multi-byte characters), which characters are defined as letters (character class alpha) and <blank> characters (character class blank), and the behavior of character classes within pattern matching. Changing the value of <i>LC_CTYPE</i> after the shell has started shall not affect the lexical processing of shell commands in the current shell execution environment or its subshells. Invoking a shell script or performing <i>exec sh</i> subjects the new shell to the changes in <i>LC_CTYPE</i> .
73807		
73808		
73809		
73810		
73811		
73812		
73813		
73814		LC_MESSAGES Determine the language in which messages should be written.
73815		
73816		LINENO Set by the shell to a decimal number representing the current sequential line number (numbered starting with 1) within a script or function before it executes each command. If the user unsets or resets <i>LINENO</i> , the variable may lose its special meaning for the life of the shell. If the shell is not currently executing a script or function, the value of <i>LINENO</i> is unspecified. This volume of POSIX.1-2008 specifies the effects of the variable only for systems supporting the User Portability Utilities option.
73817		
73818		
73819		
73820		
73821		
73822	XSI	NLSPATH Determine the location of message catalogs for the processing of <i>LC_MESSAGES</i> .
73823		

73824	<i>PATH</i>	A string formatted as described in XBD Chapter 8 , used to effect command interpretation; see Section 2.9.1.1 .
73825		
73826	<i>PPID</i>	Set by the shell to the decimal value of its parent process ID during initialization of the shell. In a subshell (see Section 2.12), <i>PPID</i> shall be set to the same value as that of the parent of the current shell. For example, <i>echo \$PPID</i> and (<i>echo \$PPID</i>) would produce the same value. This volume of POSIX.1-2008 specifies the effects of the variable only for systems supporting the User Portability Utilities option.
73827		
73828		
73829		
73830		
73831		
73832	<i>PS1</i>	Each time an interactive shell is ready to read a command, the value of this variable shall be subjected to parameter expansion and written to standard error. The default value shall be "\$ ". For users who have specific additional implementation-defined privileges, the default may be another, implementation-defined value. The shell shall replace each instance of the character '!' in <i>PS1</i> with the history file number of the next command to be typed. Escaping the '!' with another '!' (that is, "!!") shall place the literal character '!' in the prompt. This volume of POSIX.1-2008 specifies the effects of the variable only for systems supporting the User Portability Utilities option.
73833		
73834		
73835		
73836		
73837		
73838		
73839		
73840		
73841		
73842	<i>PS2</i>	Each time the user enters a <newline> prior to completing a command line in an interactive shell, the value of this variable shall be subjected to parameter expansion and written to standard error. The default value is "> ". This volume of POSIX.1-2008 specifies the effects of the variable only for systems supporting the User Portability Utilities option.
73843		
73844		
73845		
73846		
73847	<i>PS4</i>	When an execution trace (<i>set -x</i>) is being performed in an interactive shell, before each line in the execution trace, the value of this variable shall be subjected to parameter expansion and written to standard error. The default value is "+ ". This volume of POSIX.1-2008 specifies the effects of the variable only for systems supporting the User Portability Utilities option.
73848		
73849		
73850		
73851		
73852	<i>PWD</i>	Set by the shell and by the <i>cd</i> utility. In the shell the value shall be initialized from the environment as follows. If a value for <i>PWD</i> is passed to the shell in the environment when it is executed, the value is an absolute pathname of the current working directory that is no longer than {PATH_MAX} bytes including the terminating null byte, and the value does not contain any components that are dot or dot-dot, then the shell shall set <i>PWD</i> to the value from the environment. Otherwise, if a value for <i>PWD</i> is passed to the shell in the environment when it is executed, the value is an absolute pathname of the current working directory, and the value does not contain any components that are dot or dot-dot, then it is unspecified whether the shell sets <i>PWD</i> to the value from the environment or sets <i>PWD</i> to the pathname that would be output by <i>pwd -P</i> . Otherwise, the <i>sh</i> utility sets <i>PWD</i> to the pathname that would be output by <i>pwd -P</i> . In cases where <i>PWD</i> is set to the value from the environment, the value can contain components that refer to files of type symbolic link. In cases where <i>PWD</i> is set to the pathname that would be output by <i>pwd -P</i> , if there is insufficient permission on the current working directory, or on any parent of that directory, to determine what that pathname would be, the value of <i>PWD</i> is unspecified. Assignments to this variable may be ignored. If an application sets or unsets the value of <i>PWD</i> , the behaviors of the <i>cd</i> and <i>pwd</i> utilities are unspecified.
73853		
73854

73871		

2.6 Word Expansions

This section describes the various expansions that are performed on words. Not all expansions are performed on every word, as explained in the following sections.

Tilde expansions, parameter expansions, command substitutions, arithmetic expansions, and quote removals that occur within a single word expand to a single field. It is only field splitting or pathname expansion that can create multiple fields from a single word. The single exception to this rule is the expansion of the special parameter '@' within double-quotes, as described in [Section 2.5.2](#).

The order of word expansion shall be as follows:

1. Tilde expansion (see [Section 2.6.1](#)), parameter expansion (see [Section 2.6.2](#)), command substitution (see [Section 2.6.3](#)), and arithmetic expansion (see [Section 2.6.4](#)) shall be performed, beginning to end. See item 5 in [Section 2.3](#).
2. Field splitting (see [Section 2.6.5](#)) shall be performed on the portions of the fields generated by step 1, unless *IFS* is null.
3. Pathname expansion (see [Section 2.6.6](#)) shall be performed, unless *set -f* is in effect.
4. Quote removal (see [Section 2.6.7](#)) shall always be performed last.

The expansions described in this section shall occur in the same shell environment as that in which the command is executed.

If the complete expansion appropriate for a word results in an empty field, that empty field shall be deleted from the list of fields that form the completely expanded command, unless the original word contained single-quote or double-quote characters.

The '\$' character is used to introduce parameter expansion, command substitution, or arithmetic evaluation. If an unquoted '\$' is followed by a character that is not one of the following:

- A numeric character
- The name of one of the special parameters (see [Section 2.5.2](#))
- A valid first character of a variable name
- A <left-curly-bracket> ('{')
- A <left-parenthesis> '(')

the result is unspecified.

2.6.1 Tilde Expansion

A “tilde-prefix” consists of an unquoted <tilde> character at the beginning of a word, followed by all of the characters preceding the first unquoted <slash> in the word, or all the characters in the word if there is no <slash>. In an assignment (see [XBD Section 4.22](#)), multiple tilde-prefixes can be used: at the beginning of the word (that is, following the <equals-sign> of the assignment), following any unquoted <colon>, or both. A tilde-prefix in an assignment is terminated by the first unquoted <colon> or <slash>. If none of the characters in the tilde-prefix are quoted, the characters in the tilde-prefix following the <tilde> are treated as a possible login name from the user database. A portable login name cannot contain characters outside the set given in the description of the *LOGNAME* environment variable in [XBD Section 8.3](#). If the login name is null (that is, the tilde-prefix contains only the tilde), the tilde-prefix is replaced by the value of the variable *HOME*. If *HOME* is unset, the results are unspecified. Otherwise, the tilde-

prefix shall be replaced by a pathname of the initial working directory associated with the login name obtained using the `getpwnam()` function as defined in the System Interfaces volume of POSIX.1-2008. If the system does not recognize the login name, the results are undefined.

The pathname resulting from tilde expansion shall be treated as if quoted to prevent it being altered by field splitting and pathname expansion.

2.6.2 Parameter Expansion

The format for parameter expansion is as follows:

`${expression}`

where *expression* consists of all characters until the matching `'}'`. Any `'}'` escaped by a `<backslash>` or within a quoted string, and characters in embedded arithmetic expansions, command substitutions, and variable expansions, shall not be examined in determining the matching `'}'`.

The simplest form for parameter expansion is:

`${parameter}`

The value, if any, of *parameter* shall be substituted.

The parameter name or symbol can be enclosed in braces, which are optional except for positional parameters with more than one digit or when *parameter* is a name and is followed by a character that could be interpreted as part of the name. The matching closing brace shall be determined by counting brace levels, skipping over enclosed quoted strings, and command substitutions.

If the parameter is not enclosed in braces, and is a name, the expansion shall use the longest valid name (see XBD Section 3.231), whether or not the variable represented by that name exists. Otherwise, the parameter is a single-character symbol, and behavior is unspecified if that character is neither a digit nor one of the special parameters (see Section 2.5.2).

If a parameter expansion occurs inside double-quotes:

- Pathname expansion shall not be performed on the results of the expansion.
- Field splitting shall not be performed on the results of the expansion, with the exception of `'@'`; see Section 2.5.2.

In addition, a parameter expansion can be modified by using one of the following formats. In each case that a value of *word* is needed (based on the state of *parameter*, as described below), *word* shall be subjected to tilde expansion, parameter expansion, command substitution, and arithmetic expansion. If *word* is not needed, it shall not be expanded. The `'}'` character that delimits the following parameter expansion modifications shall be determined as described previously in this section and in Section 2.2.3. (For example, `${foo-bar}xyz` would result in the expansion of **foo** followed by the string **xyz** if **foo** is set, else the string `"barxyz"`).

`${parameter}:[word]` **Use Default Values.** If *parameter* is unset or null, the expansion of *word* (or an empty string if *word* is omitted) shall be substituted; otherwise, the value of *parameter* shall be substituted.

`${parameter}:= [word]` **Assign Default Values.** If *parameter* is unset or null, the expansion of *word* (or an empty string if *word* is omitted) shall be assigned to *parameter*. In all cases, the final value of *parameter* shall be substituted. Only variables, not positional parameters or special parameters, can be assigned in this way.

`${parameter}:[word]` **Indicate Error if Null or Unset.** If *parameter* is unset or null, the expansion of *word* (or a message indicating it is unset if *word* is omitted) shall be written to standard error and the shell exits with a non-zero exit status. Otherwise, the value of *parameter* shall be substituted. An interactive shell need not exit.

`${parameter}:[word]` **Use Alternative Value.** If *parameter* is unset or null, null shall be substituted; otherwise, the expansion of *word* (or an empty string if *word* is omitted) shall be substituted.

In the parameter expansions shown previously, use of the <colon> in the format shall result in a test for a parameter that is unset or null; omission of the <colon> shall result in a test for a parameter that is only unset. If *parameter* is '# ' and the colon is omitted, the application shall ensure that *word* is specified (this is necessary to avoid ambiguity with the string length expansion). The following table summarizes the effect of the <colon>:

	<i>parameter</i> Set and Not Null	<i>parameter</i> Set But Null	<i>parameter</i> Unset
<code>\${parameter:-word}</code>	substitute <i>parameter</i>	substitute <i>word</i>	substitute <i>word</i>
<code>\${parameter-word}</code>	substitute <i>parameter</i>	substitute null	substitute <i>word</i>
<code>\${parameter:=word}</code>	substitute <i>parameter</i>	assign <i>word</i>	assign <i>word</i>
<code>\${parameter=word}</code>	substitute <i>parameter</i>	substitute null	assign <i>word</i>
<code>\${parameter}?word}</code>	substitute <i>parameter</i>	error, exit	error, exit
<code>\${parameter?word}</code>	substitute <i>parameter</i>	substitute null	error, exit
<code>\${parameter:+word}</code>	substitute <i>word</i>	substitute null	substitute null
<code>\${parameter+word}</code>	substitute <i>word</i>	substitute <i>word</i>	substitute null

In all cases shown with “substitute”, the expression is replaced with the value shown. In all cases shown with “assign”, *parameter* is assigned that value, which also replaces the expression.

`${#parameter}` **String Length.** The length in characters of the value of *parameter* shall be substituted. If *parameter* is ' * ' or ' @ ' , the result of the expansion is unspecified. If *parameter* is unset and *set -u* is in effect, the expansion shall fail.

The following four varieties of parameter expansion provide for substring processing. In each case, pattern matching notation (see [Section 2.13](#)), rather than regular expression notation, shall be used to evaluate the patterns. If *parameter* is ' # ' , ' * ' , or ' @ ' , the result of the expansion is unspecified. If *parameter* is unset and *set -u* is in effect, the expansion shall fail. Enclosing the full parameter expansion string in double-quotes shall not cause the following four varieties of pattern characters to be quoted, whereas quoting characters within the braces shall have this effect. In each variety, if *word* is omitted, the empty pattern shall be used.

`${parameter}%[word]` **Remove Smallest Suffix Pattern.** The *word* shall be expanded to produce a pattern. The parameter expansion shall then result in *parameter*, with the smallest portion of the suffix matched by the *pattern* deleted. If present, *word* shall not begin with an unquoted ' % ' .

`${parameter}%%[word]` **Remove Largest Suffix Pattern.** The *word* shall be expanded to produce a pattern. The parameter expansion shall then result in *parameter*, with the largest portion of the suffix matched by the *pattern* deleted.

`${parameter}#[word]` **Remove Smallest Prefix Pattern.** The *word* shall be expanded to produce a pattern. The parameter expansion shall then result in *parameter*, with the smallest portion of the prefix matched by the *pattern* deleted. If present, *word* shall not begin with an unquoted ' # ' .

74004 `${parameter##[word]}` **Remove Largest Prefix Pattern.** The *word* shall be expanded to produce a
 74005 pattern. The parameter expansion shall then result in *parameter*, with the
 74006 largest portion of the prefix matched by the *pattern* deleted.

74007 Examples

74008 `${parameter}`

74009 In this example, the effects of omitting braces are demonstrated.

74010 `a=1`

74011 `set 2`

74012 `echo ${a}b-$ab-${1}0-${10}-${10}`

74013 **1b--20--20**

74014 `${parameter:-word}`

74015 In this example, *ls* is executed only if *x* is null or unset. (The `$(ls)` command substitution
 74016 notation is explained in [Section 2.6.3](#).)

74017 `${x:-$(ls)}`

74018 `${parameter:=word}`

74019 `unset X`

74020 `echo ${X:=abc}`

74021 **abc**

74022 `${parameter:?word}`

74023 `unset posix`

74024 `echo ${posix:?}`

74025 **sh: posix: parameter null or not set**

74026 `${parameter:+word}`

74027 `set a b c`

74028 `echo ${3:+posix}`

74029 **posix**

74030 `${#parameter}`

74031 `HOME=/usr/posix`

74032 `echo ${#HOME}`

74033 **10**

74034 `${parameter%word}`

74035 `x=file.c`

74036 `echo ${x%.c}.o`

74037 **file.o**

74038 `${parameter%%word}`

74039 `x=posix/src/std`

74040 `echo ${x%/*}`

74041 **posix**

74042 `${parameter#word}`

74043 `x=$HOME/src/cmd`

74044 `echo ${x#$HOME}`

74045 **/src/cmd**

74046 `${parameter###word}`

74047 `x=/one/two/three`

74048 `echo ${x###*/}`

three

The double-quoting of patterns is different depending on where the double-quotes are placed:

"\${x#*}" The <asterisk> is a pattern character.

\${x#"*"} The literal <asterisk> is quoted and not special.

2.6.3 Command Substitution

Command substitution allows the output of a command to be substituted in place of the command name itself. Command substitution shall occur when the command is enclosed as follows:

\$(*command*)

or (backquoted version):

`*command*`

The shell shall expand the command substitution by executing *command* in a subshell environment (see [Section 2.12](#)) and replacing the command substitution (the text of *command* plus the enclosing "\${()}" or backquotes) with the standard output of the command, removing sequences of one or more <newline> characters at the end of the substitution. Embedded <newline> characters before the end of the output shall not be removed; however, they may be treated as field delimiters and eliminated during field splitting, depending on the value of *IFS* and quoting that is in effect. If the output contains any null bytes, the behavior is unspecified.

Within the backquoted style of command substitution, <backslash> shall retain its literal meaning, except when followed by: '\$', '`', or <backslash>. The search for the matching backquote shall be satisfied by the first unquoted non-escaped backquote; during this search, if a non-escaped backquote is encountered within a shell comment, a here-document, an embedded command substitution of the \$(*command*) form, or a quoted string, undefined results occur. A single-quoted or double-quoted string that begins, but does not end, within the "`...`" sequence produces undefined results.

With the \$(*command*) form, all characters following the open parenthesis to the matching closing parenthesis constitute the *command*. Any valid shell script can be used for *command*, except a script consisting solely of redirections which produces unspecified results.

The results of command substitution shall not be processed for further tilde expansion, parameter expansion, command substitution, or arithmetic expansion. If a command substitution occurs inside double-quotes, field splitting and pathname expansion shall not be performed on the results of the substitution.

Command substitution can be nested. To specify nesting within the backquoted version, the application shall precede the inner backquotes with <backslash> characters; for example:

\`*command*\`

The syntax of the shell command language has an ambiguity for expansions beginning with "\${(", which can introduce an arithmetic expansion or a command substitution that starts with a subshell. Arithmetic expansion has precedence; that is, the shell shall first determine whether it can parse the expansion as an arithmetic expansion and shall only parse the expansion as a command substitution if it determines that it cannot parse the expansion as an arithmetic expansion. The shell need not evaluate nested expansions when performing this determination. If it encounters the end of input without already having determined that it cannot parse the expansion as an arithmetic expansion, the shell shall treat the expansion as an incomplete

arithmetic expansion and report a syntax error. A conforming application shall ensure that it separates the "\$ (" and ' (' into two tokens (that is, separate them with white space) in a command substitution that starts with a subshell. For example, a command substitution containing a single subshell could be written as:

```
$ ( (command) )
```

2.6.4 Arithmetic Expansion

Arithmetic expansion provides a mechanism for evaluating an arithmetic expression and substituting its value. The format for arithmetic expansion shall be as follows:

```
$ ((expression))
```

The expression shall be treated as if it were in double-quotes, except that a double-quote inside the expression is not treated specially. The shell shall expand all tokens in the expression for parameter expansion, command substitution, and quote removal.

Next, the shell shall treat this as an arithmetic expression and substitute the value of the expression. The arithmetic expression shall be processed according to the rules given in [Section 1.1.2.1](#), with the following exceptions:

- Only signed long integer arithmetic is required.
- Only the decimal-constant, octal-constant, and hexadecimal-constant constants specified in the ISO C standard, Section 6.4.4.1 are required to be recognized as constants.
- The `sizeof()` operator and the prefix and postfix "++" and "--" operators are not required.
- Selection, iteration, and jump statements are not supported.

All changes to variables in an arithmetic expression shall be in effect after the arithmetic expansion, as in the parameter expansion "\${x=value}".

If the shell variable *x* contains a value that forms a valid integer constant, optionally including a leading plus or minus sign, then the arithmetic expansions "\$ ((x))" and "\$ ((\$x))" shall return the same value.

As an extension, the shell may recognize arithmetic expressions beyond those listed. The shell may use a signed integer type with a rank larger than the rank of **signed long**. The shell may use a real-floating type instead of **signed long** as long as it does not affect the results in cases where there is no overflow. If the expression is invalid, or the contents of a shell variable used in the expression are not recognized by the shell, the expansion fails and the shell shall write a diagnostic message to standard error indicating the failure.

Examples

A simple example using arithmetic expansion:

```
# repeat a command 100 times
x=100
while [ $x -gt 0 ]
do
    command
    x=$((x-1))
done
```

2.6.5 Field Splitting

After parameter expansion (Section 2.6.2), command substitution (Section 2.6.3), and arithmetic expansion (Section 2.6.4), the shell shall scan the results of expansions and substitutions that did not occur in double-quotes for field splitting and multiple fields can result.

The shell shall treat each character of the *IFS* as a delimiter and use the delimiters as field terminators to split the results of parameter expansion and command substitution into fields.

1. If the value of *IFS* is a <space>, <tab>, and <newline>, or if it is unset, any sequence of <space>, <tab>, or <newline> characters at the beginning or end of the input shall be ignored and any sequence of those characters within the input shall delimit a field. For example, the input:

```
<newline><space><tab>foo<tab><tab>bar<space>
```

yields two fields, **foo** and **bar**.

2. If the value of *IFS* is null, no field splitting shall be performed.
3. Otherwise, the following rules shall be applied in sequence. The term “*IFS* white space” is used to mean any sequence (zero or more instances) of white-space characters that are in the *IFS* value (for example, if *IFS* contains <space>/<comma>/<tab>, any sequence of <space> and <tab> characters is considered *IFS* white space).
 - a. *IFS* white space shall be ignored at the beginning and end of the input.
 - b. Each occurrence in the input of an *IFS* character that is not *IFS* white space, along with any adjacent *IFS* white space, shall delimit a field, as described previously.
 - c. Non-zero-length *IFS* white space shall delimit a field.

2.6.6 Pathname Expansion

After field splitting, if *set -f* is not in effect, each field in the resulting command line shall be expanded using the algorithm described in Section 2.13, qualified by the rules in Section 2.13.3.

2.6.7 Quote Removal

The quote characters (<backslash>, single-quote, and double-quote) that were present in the original word shall be removed unless they have themselves been quoted.

2.7 Redirection

Redirection is used to open and close files for the current shell execution environment (see [Section 2.12](#)) or for any command. Redirection operators can be used with numbers representing file descriptors (see [XBD Section 3.166](#)) as described below.

The overall format used for redirection is:

```
[n]redir-op word
```

The number *n* is an optional decimal number designating the file descriptor number; the application shall ensure it is delimited from any preceding text and immediately precede the redirection operator *redir-op*. If *n* is quoted, the number shall not be recognized as part of the redirection expression. For example:

```
echo \2>a
```

writes the character 2 into file **a**. If any part of *redir-op* is quoted, no redirection expression is recognized. For example:

```
echo 2\>a
```

writes the characters 2>a to standard output. The optional number, redirection operator, and *word* shall not appear in the arguments provided to the command to be executed (if any).

Open files are represented by decimal numbers starting with zero. The largest possible value is implementation-defined; however, all implementations shall support at least 0 to 9, inclusive, for use by the application. These numbers are called “file descriptors”. The values 0, 1, and 2 have special meaning and conventional uses and are implied by certain redirection operations; they are referred to as *standard input*, *standard output*, and *standard error*, respectively. Programs usually take their input from standard input, and write output on standard output. Error messages are usually written on standard error. The redirection operators can be preceded by one or more digits (with no intervening <blank> characters allowed) to designate the file descriptor number.

If the redirection operator is "<<" or "<<=", the word that follows the redirection operator shall be subjected to quote removal; it is unspecified whether any of the other expansions occur. For the other redirection operators, the word that follows the redirection operator shall be subjected to tilde expansion, parameter expansion, command substitution, arithmetic expansion, and quote removal. Pathname expansion shall not be performed on the word by a non-interactive shell; an interactive shell may perform it, but shall do so only when the expansion would result in one word.

If more than one redirection operator is specified with a command, the order of evaluation is from beginning to end.

A failure to open or create a file shall cause a redirection to fail.

2.7.1 Redirecting Input

Input redirection shall cause the file whose name results from the expansion of *word* to be opened for reading on the designated file descriptor, or standard input if the file descriptor is not specified.

The general format for redirecting input is:

```
[n]<word
```

where the optional *n* represents the file descriptor number. If the number is omitted, the

74201 redirection shall refer to standard input (file descriptor 0).

74202 2.7.2 Redirecting Output

74203 The two general formats for redirecting output are:

74204 `[n]>word`

74205 `[n]>|word`

74206 where the optional *n* represents the file descriptor number. If the number is omitted, the
74207 redirection shall refer to standard output (file descriptor 1).

74208 Output redirection using the '`>`' format shall fail if the *noclobber* option is set (see the
74209 description of *set -C*) and the file named by the expansion of *word* exists and is a regular file.
74210 Otherwise, redirection using the '`>`' or '`>|`' formats shall cause the file whose name results
74211 from the expansion of *word* to be created and opened for output on the designated file
74212 descriptor, or standard output if none is specified. If the file does not exist, it shall be created;
74213 otherwise, it shall be truncated to be an empty file after being opened.

74214 2.7.3 Appending Redirected Output

74215 Appended output redirection shall cause the file whose name results from the expansion of
74216 *word* to be opened for output on the designated file descriptor. The file is opened as if the *open()*
74217 function as defined in the System Interfaces volume of POSIX.1-2008 was called with the
74218 *O_APPEND* flag. If the file does not exist, it shall be created.

74219 The general format for appending redirected output is as follows:

74220 `[n]>>word`

74221 where the optional *n* represents the file descriptor number. If the number is omitted, the
74222 redirection refers to standard output (file descriptor 1).

74223 2.7.4 Here-Document

74224 The redirection operators "`<<`" and "`<<-`" both allow redirection of lines contained in a shell
74225 input file, known as a "here-document", to the input of a command.

74226 The here-document shall be treated as a single word that begins after the next `<newline>` and
74227 continues until there is a line containing only the delimiter and a `<newline>`, with no `<blank>`
74228 characters in between. Then the next here-document starts, if there is one. The format is as
74229 follows:

74230 `[n]<<word`

74231 `here-document`

74232 `delimiter`

74233 where the optional *n* represents the file descriptor number. If the number is omitted, the here-
74234 document refers to standard input (file descriptor 0).

74235 If any character in *word* is quoted, the delimiter shall be formed by performing quote removal on
74236 *word*, and the here-document lines shall not be expanded. Otherwise, the delimiter shall be the
74237 *word* itself.

74238 If no characters in *word* are quoted, all lines of the here-document shall be expanded for
74239 parameter expansion, command substitution, and arithmetic expansion. In this case, the

<backslash> in the input behaves as the <backslash> inside double-quotes (see [Section 2.2.3](#)). However, the double-quote character ('"') shall not be treated specially within a here-document, except when the double-quote appears within "\$()", "\$`", or "\${ }".

If the redirection symbol is "<<-", all leading <tab> characters shall be stripped from input lines and the line containing the trailing delimiter. If more than one "<<" or "<<-" operator is specified on a line, the here-document associated with the first operator shall be supplied first by the application and shall be read first by the shell.

When a here-document is read from a terminal device and the shell is interactive, it shall write the contents of the variable *PS2*, processed as described in [Section 2.5.3](#), to standard error before reading each line of input until the delimiter has been recognized.

Examples

An example of a here-document follows:

```
cat <<eof1; cat <<eof2
Hi,
eof1
Helene.
eof2
```

2.7.5 Duplicating an Input File Descriptor

The redirection operator:

```
[n]<&word
```

shall duplicate one input file descriptor from another, or shall close one. If *word* evaluates to one or more digits, the file descriptor denoted by *n*, or standard input if *n* is not specified, shall be made to be a copy of the file descriptor denoted by *word*; if the digits in *word* do not represent a file descriptor already open for input, a redirection error shall result; see [Section 2.8.1](#). If *word* evaluates to '-', file descriptor *n*, or standard input if *n* is not specified, shall be closed. Attempts to close a file descriptor that is not open shall not constitute an error. If *word* evaluates to something else, the behavior is unspecified.

2.7.6 Duplicating an Output File Descriptor

The redirection operator:

```
[n]>&word
```

shall duplicate one output file descriptor from another, or shall close one. If *word* evaluates to one or more digits, the file descriptor denoted by *n*, or standard output if *n* is not specified, shall be made to be a copy of the file descriptor denoted by *word*; if the digits in *word* do not represent a file descriptor already open for output, a redirection error shall result; see [Section 2.8.1](#). If *word* evaluates to '-', file descriptor *n*, or standard output if *n* is not specified, is closed. Attempts to close a file descriptor that is not open shall not constitute an error. If *word* evaluates to something else, the behavior is unspecified.

2.7.7 Open File Descriptors for Reading and Writing

The redirection operator:

`[n] <>word`

shall cause the file whose name is the expansion of *word* to be opened for both reading and writing on the file descriptor denoted by *n*, or standard input if *n* is not specified. If the file does not exist, it shall be created.

2.8 Exit Status and Errors

2.8.1 Consequences of Shell Errors

For a non-interactive shell, an error condition encountered by a special built-in (see [Section 2.14](#)) or other type of utility shall cause the shell to write a diagnostic message to standard error and exit as shown in the following table:

Error	Special Built-In	Other Utilities
Shell language syntax error	Shall exit	Shall exit
Utility syntax error (option or operand error)	Shall exit	Shall not exit
Redirection error	Shall exit	Shall not exit
Variable assignment error	Shall exit	Shall not exit
Expansion error	Shall exit	Shall exit
Command not found	N/A	May exit
Dot script not found	Shall exit	N/A

An expansion error is one that occurs when the shell expansions defined in [Section 2.6](#) are carried out (for example, "`${x!y}`", because '`!`' is not a valid operator); an implementation may treat these as syntax errors if it is able to detect them during tokenization, rather than during expansion.

If any of the errors shown as “shall exit” or “(may) exit” occur in a subshell, the subshell shall (respectively may) exit with a non-zero status, but the script containing the subshell shall not exit because of the error.

In all of the cases shown in the table, an interactive shell shall write a diagnostic message to standard error without exiting.

2.8.2 Exit Status for Commands

Each command has an exit status that can influence the behavior of other shell commands. The exit status of commands that are not utilities is documented in this section. The exit status of the standard utilities is documented in their respective sections.

If a command is not found, the exit status shall be 127. If the command name is found, but it is not an executable utility, the exit status shall be 126. Applications that invoke utilities without using the shell should use these exit status values to report similar errors.

If a command fails during word expansion or redirection, its exit status shall be greater than zero.

Internally, for purposes of deciding whether a command exits with a non-zero exit status, the shell shall recognize the entire status value retrieved for the command by the equivalent of the `wait()` function WEXITSTATUS macro (as defined in the System Interfaces volume of POSIX.1-2008). When reporting the exit status with the special parameter `'?'`, the shell shall report the full eight bits of exit status available. The exit status of a command that terminated because it received a signal shall be reported as greater than 128.

2.9 Shell Commands

This section describes the basic structure of shell commands. The following command descriptions each describe a format of the command that is only used to aid the reader in recognizing the command type, and does not formally represent the syntax. Each description discusses the semantics of the command; for a formal definition of the command language, consult [Section 2.10](#).

A *command* is one of the following:

- Simple command (see [Section 2.9.1](#))
- Pipeline (see [Section 2.9.2](#))
- List compound-list (see [Section 2.9.3](#))
- Compound command (see [Section 2.9.4](#))
- Function definition (see [Section 2.9.5](#))

Unless otherwise stated, the exit status of a command shall be that of the last simple command executed by the command. There shall be no limit on the size of any shell command other than that imposed by the underlying system (memory constraints, {ARG_MAX}, and so on).

2.9.1 Simple Commands

A “simple command” is a sequence of optional variable assignments and redirections, in any sequence, optionally followed by words and redirections, terminated by a control operator.

When a given simple command is required to be executed (that is, when any conditional construct such as an AND-OR list or a **case** statement has not bypassed the simple command), the following expansions, assignments, and redirections shall all be performed from the beginning of the command text to the end:

1. The words that are recognized as variable assignments or redirections according to [Section 2.10.2](#) are saved for processing in steps 3 and 4.
2. The words that are not variable assignments or redirections shall be expanded. If any fields remain following their expansion, the first field shall be considered the command name and remaining fields are the arguments for the command.
3. Redirections shall be performed as described in [Section 2.7](#).
4. Each variable assignment shall be expanded for tilde expansion, parameter expansion, command substitution, arithmetic expansion, and quote removal prior to assigning the value.

In the preceding list, the order of steps 3 and 4 may be reversed if no command name results from step 2 or if the command name matches the name of a special built-in utility; see [Section 2.14](#).

If no command name results, or if the command name is a special built-in or function, variable assignments shall affect the current execution environment. Otherwise, the variable assignments shall be exported for the execution environment of the command and shall not affect the current execution environment except as a side-effect of the expansions performed in step 4. In this case it is unspecified:

- Whether or not the assignments are visible for subsequent expansions in step 4
- Whether variable assignments made as side-effects of these expansions are visible for subsequent expansions in step 4, or in the current shell execution environment, or both

If any of the variable assignments attempt to assign a value to a variable for which the *readonly* attribute is set in the current shell environment (regardless of whether the assignment is made in that environment), a variable assignment error shall occur. See [Section 2.8.1](#) for the consequences of these errors.

If there is no command name, any redirections shall be performed in a subshell environment; it is unspecified whether this subshell environment is the same one as that used for a command substitution within the command. (To affect the current execution environment, see the *exec* special built-in.) If any of the redirections performed in the current shell execution environment fail, the command shall immediately fail with an exit status greater than zero, and the shell shall write an error message indicating the failure. See [Section 2.8.1](#) for the consequences of these failures on interactive and non-interactive shells.

If there is a command name, execution shall continue as described in [Section 2.9.1.1](#). If there is no command name, but the command contained a command substitution, the command shall complete with the exit status of the last command substitution performed. Otherwise, the command shall complete with a zero exit status.

2.9.1.1 Command Search and Execution

If a simple command results in a command name and an optional list of arguments, the following actions shall be performed:

1. If the command name does not contain any <slash> characters, the first successful step in the following sequence shall occur:
 - a. If the command name matches the name of a special built-in utility, that special built-in utility shall be invoked.
 - b. If the command name matches the name of a function known to this shell, the function shall be invoked as described in [Section 2.9.5](#). If the implementation has provided a standard utility in the form of a function, it shall not be recognized at this point. It shall be invoked in conjunction with the path search in step 1d.
 - c. If the command name matches the name of a utility listed in the following table, that utility shall be invoked.

<i>alias</i>	<i>false</i>	<i>jobs</i>	<i>read</i>	<i>wait</i>
<i>bg</i>	<i>fc</i>	<i>kill</i>	<i>true</i>	
<i>cd</i>	<i>fg</i>	<i>newgrp</i>	<i>umask</i>	
<i>command</i>	<i>getopts</i>	<i>pwd</i>	<i>unalias</i>	

- d. Otherwise, the command shall be searched for using the *PATH* environment variable as described in XBD [Chapter 8](#):

- 74396 i. If the search is successful:
- 74397 a. If the system has implemented the utility as a regular built-in or as a
- 74398 shell function, it shall be invoked at this point in the path search.
- 74399 b. Otherwise, the shell executes the utility in a separate utility
- 74400 environment (see [Section 2.12](#)) with actions equivalent to calling the
- 74401 *execl()* function as defined in the System Interfaces volume of
- 74402 POSIX.1-2008 with the *path* argument set to the pathname resulting
- 74403 from the search, *arg0* set to the command name, and the remaining
- 74404 *execl()* arguments set to the command arguments (if any) and the
- 74405 null terminator.
- 74406 If the *execl()* function fails due to an error equivalent to the
- 74407 [ENOEXEC] error defined in the System Interfaces volume of
- 74408 POSIX.1-2008, the shell shall execute a command equivalent to
- 74409 having a shell invoked with the pathname resulting from the search
- 74410 as its first operand, with any remaining arguments passed to the new
- 74411 shell, except that the value of "\$0" in the new shell may be set to the
- 74412 command name. If the executable file is not a text file, the shell may
- 74413 bypass this command execution. In this case, it shall write an error
- 74414 message, and shall return an exit status of 126.
- 74415 It is unspecified whether environment variables that were passed to
- 74416 the shell when it was invoked, but were not used to initialize shell
- 74417 variables (see [Section 2.5.3](#)) because they had invalid names, are
- 74418 included in the environment passed to *execl()* and (if *execl()* fails as
- 74419 described above) to the new shell.
- 74420 Once a utility has been searched for and found (either as a result of this
- 74421 specific search or as part of an unspecified shell start-up activity), an
- 74422 implementation may remember its location and need not search for the
- 74423 utility again unless the *PATH* variable has been the subject of an assignment.
- 74424 If the remembered location fails for a subsequent invocation, the shell shall
- 74425 repeat the search to find the new location for the utility, if any.
- 74426 ii. If the search is unsuccessful, the command shall fail with an exit status of
- 74427 127 and the shell shall write an error message.
- 74428 2. If the command name contains at least one <slash>, the shell shall execute the utility in a
- 74429 separate utility environment with actions equivalent to calling the *execl()* function
- 74430 defined in the System Interfaces volume of POSIX.1-2008 with the *path* and *arg0*
- 74431 arguments set to the command name, and the remaining *execl()* arguments set to the
- 74432 command arguments (if any) and the null terminator.
- 74433 If the *execl()* function fails due to an error equivalent to the [ENOEXEC] error, the shell
- 74434 shall execute a command equivalent to having a shell invoked with the command name
- 74435 as its first operand, with any remaining arguments passed to the new shell. If the
- 74436 executable file is not a text file, the shell may bypass this command execution. In this case,
- 74437 it shall write an error message and shall return an exit status of 126.
- 74438 It is unspecified whether environment variables that were passed to the shell when it was
- 74439 invoked, but were not used to initialize shell variables (see [Section 2.5.3](#)) because they had
- 74440 invalid names, are included in the environment passed to *execl()* and (if *execl()* fails as
- 74441 described above) to the new shell.
- 74442 If the utility would be executed with file descriptor 0, 1, or 2 closed, implementations may
- 74443 execute the utility with the file descriptor open to an unspecified file. If a standard utility or a

conforming application is executed with file descriptor 0 not open for reading or with file descriptor 1 or 2 not open for writing, the environment in which the utility or application is executed shall be deemed non-conforming, and consequently the utility or application might not behave as described in this standard.

2.9.2 Pipelines

A *pipeline* is a sequence of one or more commands separated by the control operator '|'. For each command but the last, the shell shall connect the standard output of the command to the standard input of the next command as if by creating a pipe and passing the write end of the pipe as the standard output of the command and the read end of the pipe as the standard input of the next command.

The format for a pipeline is:

```
[!] command1 [ | command2 ...]
```

The standard output of *command1* shall be connected to the standard input of *command2*. The standard input, standard output, or both of a command shall be considered to be assigned by the pipeline before any redirection specified by redirection operators that are part of the command (see [Section 2.7](#)).

If the pipeline is not in the background (see [Section 2.9.3.1](#)), the shell shall wait for the last command specified in the pipeline to complete, and may also wait for all commands to complete.

Exit Status

If the pipeline does not begin with the ! reserved word, the exit status shall be the exit status of the last command specified in the pipeline. Otherwise, the exit status shall be the logical NOT of the exit status of the last command. That is, if the last command returns zero, the exit status shall be 1; if the last command returns greater than zero, the exit status shall be zero.

2.9.3 Lists

An *AND-OR list* is a sequence of one or more pipelines separated by the operators "&&" and "||".

A *list* is a sequence of one or more AND-OR lists separated by the operators ';' and '& '.

The operators "&&" and "||" shall have equal precedence and shall be evaluated with left associativity. For example, both of the following commands write solely **bar** to standard output:

```
false && echo foo || echo bar
true || echo foo && echo bar
```

A ';' separator or a '& ' or <newline> terminator shall cause the preceding AND-OR list to be executed sequentially; an '&' separator or terminator shall cause asynchronous execution of the preceding AND-OR list.

The term "compound-list" is derived from the grammar in [Section 2.10](#); it is equivalent to a sequence of *lists*, separated by <newline> characters, that can be preceded or followed by an arbitrary number of <newline> characters.

Examples

The following is an example that illustrates <newline> characters in compound-lists:

```
while
    # a couple of <newline>s
    # a list
    date && who || ls; cat file
    # a couple of <newline>s
    # another list
    wc file > output & true
do
    # 2 lists
    ls
    cat file
done
```

2.9.3.1 Asynchronous Lists

If a command is terminated by the control operator <ampersand> ('&'), the shell shall execute the command asynchronously in a subshell. This means that the shell shall not wait for the command to finish before executing the next command.

The format for running a command in the background is:

```
command1 & [command2 & ... ]
```

The standard input for an asynchronous list, before any explicit redirections are performed, shall be considered to be assigned to a file that has the same properties as **/dev/null**. If it is an interactive shell, this need not happen. In all cases, explicit redirection of standard input shall override this activity.

When an element of an asynchronous list (the portion of the list ended by an <ampersand>, such as *command1*, above) is started by the shell, the process ID of the last command in the asynchronous list element shall become known in the current shell execution environment; see [Section 2.12](#). This process ID shall remain known until:

1. The command terminates and the application waits for the process ID.
2. Another asynchronous list is invoked before "\$!" (corresponding to the previous asynchronous list) is expanded in the current execution environment.

The implementation need not retain more than the {CHILD_MAX} most recent entries in its list of known process IDs in the current shell execution environment.

Exit Status

The exit status of an asynchronous list shall be zero.

2.9.3.2 Sequential Lists

Commands that are separated by a <semicolon> (' ; ') shall be executed sequentially.

The format for executing commands sequentially shall be:

command1 [; *command2*] . . .

Each command shall be expanded and executed in the order specified.

Exit Status

The exit status of a sequential list shall be the exit status of the last command in the list.

2.9.3.3 AND Lists

The control operator "&&" denotes an AND list. The format shall be:

command1 [&& *command2*] . . .

First *command1* shall be executed. If its exit status is zero, *command2* shall be executed, and so on, until a command has a non-zero exit status or there are no more commands left to execute. The commands are expanded only if they are executed.

Exit Status

The exit status of an AND list shall be the exit status of the last command that is executed in the list.

2.9.3.4 OR Lists

The control operator "||" denotes an OR List. The format shall be:

command1 [|| *command2*] . . .

First, *command1* shall be executed. If its exit status is non-zero, *command2* shall be executed, and so on, until a command has a zero exit status or there are no more commands left to execute.

Exit Status

The exit status of an OR list shall be the exit status of the last command that is executed in the list.

2.9.4 Compound Commands

The shell has several programming constructs that are “compound commands”, which provide control flow for commands. Each of these compound commands has a reserved word or control operator at the beginning, and a corresponding terminator reserved word or operator at the end. In addition, each can be followed by redirections on the same line as the terminator. Each redirection shall apply to all the commands within the compound command that do not explicitly override that redirection.

74548 2.9.4.1 *Grouping Commands*

74549 The format for grouping commands is as follows:

74550 (*compound-list*) Execute *compound-list* in a subshell environment; see [Section 2.12](#).
 74551 Variable assignments and built-in commands that affect the environment
 74552 shall not remain in effect after the list finishes.

74553 If a character sequence beginning with "`(`" would be parsed by the shell +
 74554 as an arithmetic expansion if preceded by a '`$`', shells which implement +
 74555 an extension whereby "`(expression)`" is evaluated as an arithmetic +
 74556 expression may treat the "`(`" as introducing as an arithmetic evaluation +
 74557 instead of a grouping command. A conforming application shall ensure +
 74558 that it separates the two leading '`(`' characters with white space to +
 74559 prevent the shell from performing an arithmetic evaluation.

74560 { *compound-list*; } Execute *compound-list* in the current process environment. The semicolon
 74561 shown here is an example of a control operator delimiting the `}` reserved
 74562 word. Other delimiters are possible, as shown in [Section 2.10](#); a
 74563 `<newline>` is frequently used.

74564 **Exit Status**74565 The exit status of a grouping command shall be the exit status of *compound-list*.74566 2.9.4.2 *The for Loop*

74567 The **for** loop shall execute a sequence of commands for each member in a list of *items*. The **for**
 74568 loop requires that the reserved words **do** and **done** be used to delimit the sequence of
 74569 commands.

74570 The format for the **for** loop is as follows:

```
74571 for name [ in [word ... ] ]
74572 do
74573     compound-list
74574 done
```

74575 First, the list of words following **in** shall be expanded to generate a list of items. Then, the
 74576 variable *name* shall be set to each item, in turn, and the *compound-list* executed each time. If no
 74577 items result from the expansion, the *compound-list* shall not be executed. Omitting:

74578 `in word...`

74579 shall be equivalent to:

74580 `in "$@"`74581 **Exit Status**

74582 The exit status of a **for** command shall be the exit status of the last command that executes. If
 74583 there are no items, the exit status shall be zero.

74584 2.9.4.3 Case Conditional Construct

74585 The conditional construct **case** shall execute the *compound-list* corresponding to the first one of
 74586 several *patterns* (see [Section 2.13](#)) that is matched by the string resulting from the tilde
 74587 expansion, parameter expansion, command substitution, arithmetic expansion, and quote
 74588 removal of the given word. The reserved word **in** shall denote the beginning of the patterns to
 74589 be matched. Multiple patterns with the same *compound-list* shall be delimited by the '|'
 74590 symbol. The control operator ')' terminates a list of patterns corresponding to a given action.
 74591 The *compound-list* for each list of patterns, with the possible exception of the last, shall be
 74592 terminated with ';;'. The **case** construct terminates with the reserved word **esac** (**case**
 74593 reversed).

74594 The format for the **case** construct is as follows:

```
74595 case word in
74596     [(pattern1) compound-list;;
74597     [(pattern[ | pattern] ... ) compound-list;;] ...
74598     [(pattern[ | pattern] ... ) compound-list]
74599 esac
```

74600 The ";;" is optional for the last *compound-list*.

74601 In order from the beginning to the end of the **case** statement, each *pattern* that labels a *compound-*
 74602 *list* shall be subjected to tilde expansion, parameter expansion, command substitution, and
 74603 arithmetic expansion, and the result of these expansions shall be compared against the
 74604 expansion of *word*, according to the rules described in [Section 2.13](#) (which also describes the
 74605 effect of quoting parts of the pattern). After the first match, no more patterns shall be expanded,
 74606 and the *compound-list* shall be executed. The order of expansion and comparison of multiple
 74607 *patterns* that label a *compound-list* statement is unspecified.

74608 **Exit Status**

74609 The exit status of **case** shall be zero if no patterns are matched. Otherwise, the exit status shall be
 74610 the exit status of the last command executed in the *compound-list*.

74611 2.9.4.4 The if Conditional Construct

74612 The **if** command shall execute a *compound-list* and use its exit status to determine whether to
 74613 execute another *compound-list*.

74614 The format for the **if** construct is as follows:

```
74615 if compound-list
74616 then
74617     compound-list
74618 [elif compound-list
74619 then
74620     compound-list] ...
74621 [else
74622     compound-list]
74623 fi
```

74624 The **if** *compound-list* shall be executed; if its exit status is zero, the **then** *compound-list* shall be
 74625 executed and the command shall complete. Otherwise, each **elif** *compound-list* shall be executed,
 74626 in turn, and if its exit status is zero, the **then** *compound-list* shall be executed and the command
 74627 shall complete. Otherwise, the **else** *compound-list* shall be executed.

Exit Status

The exit status of the **if** command shall be the exit status of the **then** or **else** *compound-list* that was executed, or zero, if none was executed.

2.9.4.5 The while Loop

The **while** loop shall continuously execute one *compound-list* as long as another *compound-list* has a zero exit status.

The format of the **while** loop is as follows:

```
while compound-list-1
do
    compound-list-2
done
```

The *compound-list-1* shall be executed, and if it has a non-zero exit status, the **while** command shall complete. Otherwise, the *compound-list-2* shall be executed, and the process shall repeat.

Exit Status

The exit status of the **while** loop shall be the exit status of the last *compound-list-2* executed, or zero if none was executed.

2.9.4.6 The until Loop

The **until** loop shall continuously execute one *compound-list* as long as another *compound-list* has a non-zero exit status.

The format of the **until** loop is as follows:

```
until compound-list-1
do
    compound-list-2
done
```

The *compound-list-1* shall be executed, and if it has a zero exit status, the **until** command completes. Otherwise, the *compound-list-2* shall be executed, and the process repeats.

Exit Status

The exit status of the **until** loop shall be the exit status of the last *compound-list-2* executed, or zero if none was executed.

2.9.5 Function Definition Command

A function is a user-defined name that is used as a simple command to call a compound command with new positional parameters. A function is defined with a “function definition command”.

The format of a function definition command is as follows:

```
fname() compound-command[io-redirect ...]
```

The function is named *fname*; the application shall ensure that it is a name (see XBD [Section 3.231](#)) and that it is not the name of a special built-in utility. An implementation may allow other characters in a function name as an extension. The implementation shall maintain separate name

spaces for functions and variables.

The argument *compound-command* represents a compound command, as described in [Section 2.9.4](#).

When the function is declared, none of the expansions in [Section 2.6](#) shall be performed on the text in *compound-command* or *io-redirect*; all expansions shall be performed as normal each time the function is called. Similarly, the optional *io-redirect* redirections and any variable assignments within *compound-command* shall be performed during the execution of the function itself, not the function definition. See [Section 2.8.1](#) for the consequences of failures of these operations on interactive and non-interactive shells.

When a function is executed, it shall have the syntax-error and variable-assignment properties described for special built-in utilities in the enumerated list at the beginning of [Section 2.14](#).

The *compound-command* shall be executed whenever the function name is specified as the name of a simple command (see [Section 2.9.1.1](#)). The operands to the command temporarily shall become the positional parameters during the execution of the *compound-command*; the special parameter ' #' also shall be changed to reflect the number of operands. The special parameter 0 shall be unchanged. When the function completes, the values of the positional parameters and the special parameter ' #' shall be restored to the values they had before the function was executed. If the special built-in *return* (see [return](#)) is executed in the *compound-command*, the function completes and execution shall resume with the next command after the function call. +

Exit Status

The exit status of a function definition shall be zero if the function was declared successfully; otherwise, it shall be greater than zero. The exit status of a function invocation shall be the exit status of the last command executed by the function.

2.10 Shell Grammar

The following grammar defines the Shell Command Language. This formal syntax shall take precedence over the preceding text syntax description.

2.10.1 Shell Grammar Lexical Conventions

The input language to the shell must be first recognized at the character level. The resulting tokens shall be classified by their immediate context according to the following rules (applied in order). These rules shall be used to determine what a “token” is that is subject to parsing at the token level. The rules for token recognition in [Section 2.3](#) shall apply.

1. A <newline> shall be returned as the token identifier **NEWLINE**.
2. If the token is an operator, the token identifier for that operator shall result.
3. If the string consists solely of digits and the delimiter character is one of ' < ' or ' > ', the token identifier **IO_NUMBER** shall be returned.
4. Otherwise, the token identifier **TOKEN** results.

Further distinction on **TOKEN** is context-dependent. It may be that the same **TOKEN** yields **WORD**, a **NAME**, an **ASSIGNMENT**, or one of the reserved words below, dependent upon the context. Some of the productions in the grammar below are annotated with a rule number from the following list. When a **TOKEN** is seen where one of those annotated productions could be

used to reduce the symbol, the applicable rule shall be applied to convert the token identifier type of the **TOKEN** to a token identifier acceptable at that point in the grammar. The reduction shall then proceed based upon the token identifier type yielded by the rule applied. When more than one rule applies, the highest numbered rule shall apply (which in turn may refer to another rule). (Note that except in rule 7, the presence of an '=' in the token has no effect.)

The **WORD** tokens shall have the word expansion rules applied to them immediately before the associated command is executed, not at the time the command is parsed.

2.10.2 Shell Grammar Rules

1. [Command Name]

When the **TOKEN** is exactly a reserved word, the token identifier for that reserved word shall result. Otherwise, the token **WORD** shall be returned. Also, if the parser is in any state where only a reserved word could be the next correct token, proceed as above.

Note: Because at this point <quotation-mark> characters are retained in the token, quoted strings cannot be recognized as reserved words. This rule also implies that reserved words are not recognized except in certain positions in the input, such as after a <newline> or <semicolon>; the grammar presumes that if the reserved word is intended, it is properly delimited by the user, and does not attempt to reflect that requirement directly. Also note that line joining is done before tokenization, as described in [Section 2.2.1](#), so escaped <newline> characters are already removed at this point.

Rule 1 is not directly referenced in the grammar, but is referred to by other rules, or applies globally.

2. [Redirection to or from filename]

The expansions specified in [Section 2.7](#) shall occur. As specified there, exactly one field can result (or the result is unspecified), and there are additional requirements on pathname expansion.

3. [Redirection from here-document]

Quote removal shall be applied to the word to determine the delimiter that is used to find the end of the here-document that begins after the next <newline>.

4. [Case statement termination]

When the **TOKEN** is exactly the reserved word **esac**, the token identifier for **esac** shall result. Otherwise, the token **WORD** shall be returned.

5. [NAME in for]

When the **TOKEN** meets the requirements for a name (see XBD [Section 3.231](#)), the token identifier **NAME** shall result. Otherwise, the token **WORD** shall be returned.

6. [Third word of for and case]

a. [case only]

When the **TOKEN** is exactly the reserved word **in**, the token identifier for **in** shall result. Otherwise, the token **WORD** shall be returned.

b. [for only]

When the **TOKEN** is exactly the reserved word **in** or **do**, the token identifier for **in** or **do** shall result, respectively. Otherwise, the token **WORD** shall be returned.

(For a. and b.: As indicated in the grammar, a *linebreak* precedes the tokens **in** and **do**. If

74748 <newline> characters are present at the indicated location, it is the token after them that is
74749 treated in this fashion.)

74750 7. [Assignment preceding command name]

74751 a. [When the first word]

74752 If the **TOKEN** does not contain the character '=' , rule 1 is applied. Otherwise, 7b
74753 shall be applied.

74754 b. [Not the first word]

74755 If the **TOKEN** contains the <equals-sign> character:

74756 — If it begins with '=' , the token **WORD** shall be returned.

74757 — If all the characters preceding '=' form a valid name (see XBD [Section](#)
74758 [3.231](#)), the token **ASSIGNMENT_WORD** shall be returned. (Quoted
74759 characters cannot participate in forming a valid name.)

74760 — Otherwise, it is unspecified whether it is **ASSIGNMENT_WORD** or **WORD**
74761 that is returned.

74762 Assignment to the **NAME** shall occur as specified in [Section 2.9.1](#).

74763 8. [**NAME** in function]

74764 When the **TOKEN** is exactly a reserved word, the token identifier for that reserved word
74765 shall result. Otherwise, when the **TOKEN** meets the requirements for a name, the token
74766 identifier **NAME** shall result. Otherwise, rule 7 applies.

74767 9. [Body of function]

74768 Word expansion and assignment shall never occur, even when required by the rules
74769 above, when this rule is being parsed. Each **TOKEN** that might either be expanded or
74770 have assignment applied to it shall instead be returned as a single **WORD** consisting only
74771 of characters that are exactly the token described in [Section 2.3](#).

74948                   | ';'
74949                   ;
74950 separator           : separator_op linebreak
74951                   | newline_list
74952                   ;
74953 sequential_sep      : ';' linebreak
74954                   | newline_list
74955                   ;

```

74956 2.11 Signals and Error Handling

74957 When a command is in an asynchronous list, it shall inherit from the shell a signal action of
 74958 ignored (SIG_IGN) for the SIGQUIT and SIGINT signals, and may inherit a signal mask in
 74959 which SIGQUIT and SIGINT are blocked. Otherwise, the signal actions and signal mask
 74960 inherited by the command shall be the same as those inherited by the shell from its parent
 74961 unless a signal action is modified by the *trap* special built-in (see *trap*)

74962 When a signal for which a trap has been set is received while the shell is waiting for the
 74963 completion of a utility executing a foreground command, the trap associated with that signal
 74964 shall not be executed until after the foreground command has completed. When the shell is
 74965 waiting, by means of the *wait* utility, for asynchronous commands to complete, the reception of a
 74966 signal for which a trap has been set shall cause the *wait* utility to return immediately with an exit
 74967 status >128, immediately after which the trap associated with that signal shall be taken.

74968 If multiple signals are pending for the shell for which there are associated trap actions, the order
 74969 of execution of trap actions is unspecified.

74970 2.12 Shell Execution Environment

74971 A shell execution environment consists of the following:

- 74972 • Open files inherited upon invocation of the shell, plus open files controlled by *exec*
- 74973 • Working directory as set by *cd*
- 74974 • File creation mask set by *umask*
- 74975 • Current traps set by *trap*
- 74976 • Shell parameters that are set by variable assignment (see the *set* special built-in) or from
 74977 the System Interfaces volume of POSIX.1-2008 environment inherited by the shell when it
 74978 begins (see the *export* special built-in)
- 74979 • Shell functions; see [Section 2.9.5](#)
- 74980 • Options turned on at invocation or by *set*
- 74981 • Process IDs of the last commands in asynchronous lists known to this shell environment;
 74982 see [Section 2.9.3.1](#)
- 74983 • Shell aliases; see [Section 2.3.1](#)

74984 Utilities other than the special built-ins (see [Section 2.14](#)) shall be invoked in a separate
 74985 environment that consists of the following. The initial value of these objects shall be the same as

that for the parent shell, except as noted below.

- Open files inherited on invocation of the shell, open files controlled by the *exec* special built-in plus any modifications, and additions specified by any redirections to the utility
- Current working directory
- File creation mask
- If the utility is a shell script, traps caught by the shell shall be set to the default values and traps ignored by the shell shall be set to be ignored by the utility; if the utility is not a shell script, the trap actions (default or ignore) shall be mapped into the appropriate signal handling actions for the utility
- Variables with the *export* attribute, along with those explicitly exported for the duration of the command, shall be passed to the utility environment variables

The environment of the shell process shall not be changed by the utility unless explicitly specified by the utility description (for example, *cd* and *umask*).

A subshell environment shall be created as a duplicate of the shell environment, except that signal traps that are not being ignored shall be set to the default action. Changes made to the subshell environment shall not affect the shell environment. Command substitution, commands that are grouped with parentheses, and asynchronous lists shall be executed in a subshell environment. Additionally, each command of a multi-command pipeline is in a subshell environment; as an extension, however, any or all commands in a pipeline may be executed in the current environment. All other commands shall be executed in the current shell environment.

2.13 Pattern Matching Notation

The pattern matching notation described in this section is used to specify patterns for matching strings in the shell. Historically, pattern matching notation is related to, but slightly different from, the regular expression notation described in XBD [Chapter 9](#). For this reason, the description of the rules for this pattern matching notation are based on the description of regular expression notation, modified to account for the differences.

2.13.1 Patterns Matching a Single Character

The following patterns matching a single character shall match a single character: ordinary characters, special pattern characters, and pattern bracket expressions. The pattern bracket expression also shall match a single collating element. A `<backslash>` character shall escape the following character. The escaping `<backslash>` shall be discarded.

An ordinary character is a pattern that shall match itself. It can be any character in the supported character set except for NUL, those special shell characters in [Section 2.2](#) that require quoting, and the following three special pattern characters. Matching shall be based on the bit pattern used for encoding the character, not on the graphic representation of the character. If any character (ordinary, shell special, or pattern special) is quoted, that pattern shall match the character itself. The shell special characters always require quoting.

When unquoted and outside a bracket expression, the following three characters shall have special meaning in the specification of patterns:

- ? A <question-mark> is a pattern that shall match any character.
- * An <asterisk> is a pattern that shall match multiple characters, as described in [Section 2.13.2](#).
- [If an open bracket introduces a bracket expression as in XBD [Section 9.3.5](#), except that the <exclamation-mark> character ('!') shall replace the <circumflex> character ('^') in its role in a non-matching list in the regular expression notation, it shall introduce a pattern bracket expression. A bracket expression starting with an unquoted <circumflex> character produces unspecified results. Otherwise, '[' shall match the character itself.

When pattern matching is used where shell quote removal is not performed (such as in the argument to the *find -name* primary when *find* is being called using one of the *exec* functions as defined in the System Interfaces volume of POSIX.1-2008, or in the *pattern* argument to the *fnmatch()* function), special characters can be escaped to remove their special meaning by preceding them with a <backslash> character. This escaping <backslash> is discarded. The sequence "\\\" represents one literal <backslash>. All of the requirements and effects of quoting on ordinary, shell special, and special pattern characters shall apply to escaping in this context.

2.13.2 Patterns Matching Multiple Characters

The following rules are used to construct patterns matching multiple characters from patterns matching a single character:

1. The <asterisk> ('*') is a pattern that shall match any string, including the null string.
2. The concatenation of patterns matching a single character is a valid pattern that shall match the concatenation of the single characters or collating elements matched by each of the concatenated patterns.
3. The concatenation of one or more patterns matching a single character with one or more <asterisk> characters is a valid pattern. In such patterns, each <asterisk> shall match a string of zero or more characters, matching the greatest possible number of characters that still allows the remainder of the pattern to match the string.

2.13.3 Patterns Used for Filename Expansion

The rules described so far in [Section 2.13.1](#) and [Section 2.13.2](#) are qualified by the following rules that apply when pattern matching notation is used for filename expansion:

1. The <slash> character in a pathname shall be explicitly matched by using one or more <slash> characters in the pattern; it shall neither be matched by the <asterisk> or <question-mark> special characters nor by a bracket expression. <slash> characters in the pattern shall be identified before bracket expressions; thus, a <slash> cannot be included in a pattern bracket expression used for filename expansion. If a <slash> character is found following an unescaped <left-square-bracket> character before a corresponding <right-square-bracket> is found, the open bracket shall be treated as an ordinary character. For example, the pattern "a[b/c]d" does not match such pathnames as **abd** or **a/d**. It only matches a pathname of literally **a[b/c]d**.
2. If a filename begins with a <period> ('.'), the <period> shall be explicitly matched by using a <period> as the first character of the pattern or immediately following a <slash> character. The leading <period> shall not be matched by:

- The <asterisk> or <question-mark> special characters
- A bracket expression containing a non-matching list, such as "[!a]", a range expression, such as "[%–0]", or a character class expression, such as "[[:punct:]]"

It is unspecified whether an explicit <period> in a bracket expression matching list, such as "[.abc]", can match a leading <period> in a filename.

3. Specified patterns shall be matched against existing filenames and pathnames, as appropriate. Each component that contains a pattern character shall require read permission in the directory containing that component. Any component, except the last, that does not contain a pattern character shall require search permission. For example, given the pattern:

```
/foo/bar/x*/bam
```

search permission is needed for directories **/** and **foo**, search and read permissions are needed for directory **bar**, and search permission is needed for each **x*** directory. If the pattern matches any existing filenames or pathnames, the pattern shall be replaced with those filenames and pathnames, sorted according to the collating sequence in effect in the current locale.

If the pattern contains an open bracket ('[') that does not introduce a bracket expression as in XBD [Section 9.3.5](#), it is unspecified whether other unquoted pattern matching characters within the same slash-delimited component of the pattern retain their special meanings or are treated as ordinary characters. For example, the pattern "a*[/b*" may match all filenames beginning with 'b' in the directory "a*[or it may match all filenames beginning with 'b' in all directories with names beginning with 'a' and ending with '['.

If the pattern does not match any existing filenames or pathnames, the pattern string shall be left unchanged.

2.14 Special Built-In Utilities

The following “special built-in” utilities shall be supported in the shell command language. The output of each command, if any, shall be written to standard output, subject to the normal redirection and piping possible with all commands.

The term “built-in” implies that the shell can execute the utility directly and does not need to search for it. An implementation may choose to make any utility a built-in; however, the special built-in utilities described here differ from regular built-in utilities in two respects:

1. A syntax error in a special built-in utility may cause a shell executing that utility to abort, while a syntax error in a regular built-in utility shall not cause a shell executing that utility to abort. (See [Section 2.8.1](#) for the consequences of errors on interactive and non-interactive shells.) If a special built-in utility encountering a syntax error does not abort the shell, its exit value shall be non-zero.
2. Variable assignments specified with special built-in utilities remain in effect after the built-in completes; this shall not be the case with a regular built-in or other utility.

The special built-in utilities in this section need not be provided in a manner accessible via the *exec* family of functions defined in the System Interfaces volume of POSIX.1-2008.

Some of the special built-ins are described as conforming to XBD [Section 12.2](#). For those that are

75110 not, the requirement in [Section 1.4](#) that "--" be recognized as a first argument to be discarded
75111 does not apply and a conforming application shall not use that argument.

75112 **NAME**

75113 break — exit from for, while, or until loop

75114 **SYNOPSIS**75115 break [*n*]75116 **DESCRIPTION**

75117 The *break* utility shall exit from the smallest enclosing **for**, **while**, or **until** loop, if any; or from
75118 the *n*th enclosing loop if *n* is specified. The value of *n* is an unsigned decimal integer greater
75119 than or equal to 1. The default shall be equivalent to *n*=1. If *n* is greater than the number of
75120 enclosing loops, the outermost enclosing loop shall be exited. Execution shall continue with the
75121 command immediately following the loop.

75122 **OPTIONS**

75123 None.

75124 **OPERANDS**

75125 See the DESCRIPTION.

75126 **STDIN**

75127 Not used.

75128 **INPUT FILES**

75129 None.

75130 **ENVIRONMENT VARIABLES**

75131 None.

75132 **ASYNCHRONOUS EVENTS**

75133 Default.

75134 **STDOUT**

75135 Not used.

75136 **STDERR**

75137 The standard error shall be used only for diagnostic messages.

75138 **OUTPUT FILES**

75139 None.

75140 **EXTENDED DESCRIPTION**

75141 None.

75142 **EXIT STATUS**

75143 0 Successful completion.

75144 >0 The *n* value was not an unsigned decimal integer greater than or equal to 1.75145 **CONSEQUENCES OF ERRORS**

75146 Default.

APPLICATION USAGE

None.

EXAMPLES

```
for i in *
do
    if test -d "$i"
    then break
    fi
done
```

RATIONALE

In early proposals, consideration was given to expanding the syntax of *break* and *continue* to refer to a label associated with the appropriate loop as a preferable alternative to the *n* method. However, this volume of POSIX.1-2008 does reserve the name space of command names ending with a <colon>. It is anticipated that a future implementation could take advantage of this and provide something like:

```
outofloop: for i in a b c d e
do
    for j in 0 1 2 3 4 5 6 7 8 9
    do
        if test -r "${i}${j}"
        then break outofloop
        fi
    done
done
```

and that this might be standardized after implementation experience is achieved.

FUTURE DIRECTIONS

None.

[Section 2.14](#)

CHANGE HISTORY**Issue 6**

IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/5 is applied so that the reference page sections use terms as described in the Utility Description Defaults ([Section 1.4](#)). No change in behavior is intended.

75181 **NAME**

75182 colon — null utility

75183 **SYNOPSIS**75184 : [*argument...*]75185 **DESCRIPTION**

75186 This utility shall only expand command *arguments*. It is used when a command is needed, as in
75187 the **then** condition of an **if** command, but nothing is to be done by the command.

75188 **OPTIONS**

75189 None.

75190 **OPERANDS**

75191 See the DESCRIPTION.

75192 **STDIN**

75193 Not used.

75194 **INPUT FILES**

75195 None.

75196 **ENVIRONMENT VARIABLES**

75197 None.

75198 **ASYNCHRONOUS EVENTS**

75199 Default.

75200 **STDOUT**

75201 Not used.

75202 **STDERR**

75203 The standard error shall be used only for diagnostic messages.

75204 **OUTPUT FILES**

75205 None.

75206 **EXTENDED DESCRIPTION**

75207 None.

75208 **EXIT STATUS**

75209 Zero.

75210 **CONSEQUENCES OF ERRORS**

75211 Default.

75212 **APPLICATION USAGE**

75213 None.

75214 **EXAMPLES**

```
75215       : ${X=abc}  
75216       if       false  
75217       then     :  
75218       else     echo $X  
75219       fi  
75220       abc
```

75221 As with any of the special built-ins, the null utility can also have variable assignments and
75222 redirections associated with it, such as:

75223 x=y : > z

75224 which sets variable *x* to the value *y* (so that it persists after the null utility completes) and creates
75225 or truncates file *z*.

75226 **RATIONALE**

75227 None.

75228 **FUTURE DIRECTIONS**

75229 None.

75230 **SEE ALSO**

75231 [Section 2.14](#)

75233 **Issue 6**

75234 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/5 is applied so that the reference page
75235 sections use terms as described in the Utility Description Defaults ([Section 1.4](#)). No change in
75236 behavior is intended.

75237 **Issue 7**

75238 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

75239 **NAME**

75240 continue — continue for, while, or until loop

75241 **SYNOPSIS**75242 continue [*n*]75243 **DESCRIPTION**

75244 The *continue* utility shall return to the top of the smallest enclosing **for**, **while**, or **until** loop, or to
75245 the top of the *n*th enclosing loop, if *n* is specified. This involves repeating the condition list of a
75246 **while** or **until** loop or performing the next assignment of a **for** loop, and re-executing the loop if
75247 appropriate.

75248 The value of *n* is a decimal integer greater than or equal to 1. The default shall be equivalent to
75249 *n*=1. If *n* is greater than the number of enclosing loops, the outermost enclosing loop shall be
75250 used.

75251 **OPTIONS**

75252 None.

75253 **OPERANDS**

75254 See the DESCRIPTION.

75255 **STDIN**

75256 Not used.

75257 **INPUT FILES**

75258 None.

75259 **ENVIRONMENT VARIABLES**

75260 None.

75261 **ASYNCHRONOUS EVENTS**

75262 Default.

75263 **STDOUT**

75264 Not used.

75265 **STDERR**

75266 The standard error shall be used only for diagnostic messages.

75267 **OUTPUT FILES**

75268 None.

75269 **EXTENDED DESCRIPTION**

75270 None.

75271 **EXIT STATUS**

75272 0 Successful completion.

75273 >0 The *n* value was not an unsigned decimal integer greater than or equal to 1.75274 **CONSEQUENCES OF ERRORS**

75275 Default.

75276 **APPLICATION USAGE**

75277 None.

75278 **EXAMPLES**

```
75279     for i in *
75280     do
75281         if test -d "$i"
75282         then continue
75283         fi
75284         printf '"%s" is not a directory.\n' "$i"
75285     done
```

75286 **RATIONALE**

75287 None.

75288 **FUTURE DIRECTIONS**

75289 None.

75290 **SEE ALSO**75291 [Section 2.14](#)75292 **CHANGE HISTORY**75293 **Issue 6**

75294 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/5 is applied so that the reference page
75295 sections use terms as described in the Utility Description Defaults ([Section 1.4](#)). No change in
75296 behavior is intended.

75297 **Issue 7**75298 The example is changed to use the *printf* utility rather than *echo*.

75299 **NAME**

75300 dot — execute commands in the current environment

75301 **SYNOPSIS**75302 . *file*75303 **DESCRIPTION**75304 The shell shall execute commands from the *file* in the current environment.

75305 If *file* does not contain a <slash>, the shell shall use the search path specified by *PATH* to find the
75306 directory containing *file*. Unlike normal command search, however, the file searched for by the
75307 *dot* utility need not be executable. If no readable file is found, a non-interactive shell shall abort;
75308 an interactive shell shall write a diagnostic message to standard error, but this condition shall
75309 not be considered a syntax error.

75310 **OPTIONS**

75311 None.

75312 **OPERANDS**

75313 See the DESCRIPTION.

75314 **STDIN**

75315 Not used.

75316 **INPUT FILES**

75317 See the DESCRIPTION.

75318 **ENVIRONMENT VARIABLES**

75319 See the DESCRIPTION.

75320 **ASYNCHRONOUS EVENTS**

75321 Default.

75322 **STDOUT**

75323 Not used.

75324 **STDERR**

75325 The standard error shall be used only for diagnostic messages.

75326 **OUTPUT FILES**

75327 None.

75328 **EXTENDED DESCRIPTION**

75329 None.

75330 **EXIT STATUS**

75331 If no readable file was found or if the commands in the file could not be parsed, and the shell is |
75332 interactive (and therefore does not abort; see [Section 2.8.1](#)), the exit status shall be non-zero. |
75333 Otherwise, return the value of the last command executed, or a zero exit status if no command is |
75334 executed.

75335 **CONSEQUENCES OF ERRORS**

75336 Default.

75337 **APPLICATION USAGE**

75338 None.

75339 **EXAMPLES**

75340 cat foobar

75341 **foo=hello bar=world**

75342 . ./foobar

75343 echo \$foo \$bar

75344 **hello world**75345 **RATIONALE**

75346 Some older implementations searched the current directory for the *file*, even if the value of *PATH*
75347 disallowed it. This behavior was omitted from this volume of POSIX.1-2008 due to concerns
75348 about introducing the susceptibility to trojan horses that the user might be trying to avoid by
75349 leaving **dot** out of *PATH*.

75350 The KornShell version of *dot* takes optional arguments that are set to the positional parameters.
75351 This is a valid extension that allows a *dot* script to behave identically to a function.

75352 **FUTURE DIRECTIONS**

75353 None.

75354 **SEE ALSO**75355 [Section 2.14, *return*](#)75356 **CHANGE HISTORY**75357 **Issue 6**

75358 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/5 is applied so that the reference page
75359 sections use terms as described in the Utility Description Defaults ([Section 1.4](#)). No change in
75360 behavior is intended.

75361 **Issue 7**

75362 SD5-XCU-ERN-164 is applied.

75363 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0038 [114] and XCU/TC1-2008/0039 +
75364 [214] are applied.

75365 **NAME**

75366 eval — construct command by concatenating arguments

75367 **SYNOPSIS**75368 eval [*argument...*]75369 **DESCRIPTION**75370 The *eval* utility shall construct a command by concatenating *arguments* together, separating each
75371 with a <space> character. The constructed command shall be read and executed by the shell.75372 **OPTIONS**

75373 None.

75374 **OPERANDS**

75375 See the DESCRIPTION.

75376 **STDIN**

75377 Not used.

75378 **INPUT FILES**

75379 None.

75380 **ENVIRONMENT VARIABLES**

75381 None.

75382 **ASYNCHRONOUS EVENTS**

75383 Default.

75384 **STDOUT**

75385 Not used.

75386 **STDERR**

75387 The standard error shall be used only for diagnostic messages.

75388 **OUTPUT FILES**

75389 None.

75390 **EXTENDED DESCRIPTION**

75391 None.

75392 **EXIT STATUS**75393 If there are no *arguments*, or only null *arguments*, *eval* shall return a zero exit status; otherwise, it
75394 shall return the exit status of the command defined by the string of concatenated *arguments*
75395 separated by <space> characters, or a non-zero exit status if the concatenation could not be
75396 parsed as a command and the shell is interactive (and therefore did not abort).75397 **CONSEQUENCES OF ERRORS**

75398 Default.

75399 **APPLICATION USAGE**75400 Since *eval* is not required to recognize the "--" end of options delimiter, in cases where the
75401 argument(s) to *eval* might begin with '-' it is recommended that the first argument is prefixed
75402 by a string that will not alter the commands to be executed, such as a <space> character:

75403 eval " \$commands" |

75404 or: |

75405 eval " \$(some_command)" |

EXAMPLES

```
foo=10 x=foo
y=' $' $x
echo $y
$foo
eval y=' $' $x
echo $y
10
```

RATIONALE

This standard allows, but does not require, *eval* to recognize "--". Although this means applications cannot use "--" to protect against options supported as an extension (or errors reported for unsupported options), the nature of the *eval* utility is such that other means can be used to provide this protection (see APPLICATION USAGE above).

FUTURE DIRECTIONS

None.

SEE ALSO

CHANGE HISTORY**Issue 6**

IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/5 is applied so that the reference page sections use terms as described in the Utility Description Defaults ([Section 1.4](#)). No change in behavior is intended.

Issue 7

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0040 [114], XCU/TC1-2008/0041 [163], + and XCU/TC1-2008/0042 [163] are applied.

75432 **NAME**

75433 exec — execute commands and open, close, or copy file descriptors

75434 **SYNOPSIS**75435 exec [*command* [*argument...*]]75436 **DESCRIPTION**75437 The *exec* utility shall open, close, and/or copy file descriptors as specified by any redirections as
75438 part of the command.75439 If *exec* is specified without *command* or *arguments*, and any file descriptors with numbers greater
75440 than 2 are opened with associated redirection statements, it is unspecified whether those file
75441 descriptors remain open when the shell invokes another utility. Scripts concerned that child
75442 shells could misuse open file descriptors can always close them explicitly, as shown in one of the
75443 following examples.75444 If *exec* is specified with *command*, it shall replace the shell with *command* without creating a new
75445 process. If *arguments* are specified, they shall be arguments to *command*. Redirection affects the
75446 current shell execution environment.75447 **OPTIONS**

75448 None.

75449 **OPERANDS**

75450 See the DESCRIPTION.

75451 **STDIN**

75452 Not used.

75453 **INPUT FILES**

75454 None.

75455 **ENVIRONMENT VARIABLES**

75456 None.

75457 **ASYNCHRONOUS EVENTS**

75458 Default.

75459 **STDOUT**

75460 Not used.

75461 **STDERR**

75462 The standard error shall be used only for diagnostic messages.

75463 **OUTPUT FILES**

75464 None.

75465 **EXTENDED DESCRIPTION**

75466 None.

75467 **EXIT STATUS**75468 If *command* is specified, *exec* shall not return to the shell; rather, the exit status of the process shall
75469 be the exit status of the program implementing *command*, which overlaid the shell. If *command* is
75470 not found, the exit status shall be 127. If *command* is found, but it is not an executable utility, the
75471 exit status shall be 126. If a redirection error occurs (see [Section 2.8.1](#)), the shell shall exit with a
75472 value in the range 1–125. Otherwise, *exec* shall return a zero exit status.

CONSEQUENCES OF ERRORS

Default.

APPLICATION USAGE

None.

EXAMPLES

Open *readfile* as file descriptor 3 for reading:

```
exec 3< readfile
```

Open *writefile* as file descriptor 4 for writing:

```
exec 4> writefile
```

Make file descriptor 5 a copy of file descriptor 0:

```
exec 5<&0
```

Close file descriptor 3:

```
exec 3<&-
```

Cat the file **maggie** by replacing the current shell with the *cat* utility:

```
exec cat maggie
```

RATIONALE

Most historical implementations were not conformant in that:

```
foo=bar exec cmd
```

did not pass **foo** to **cmd**.

FUTURE DIRECTIONS

None.

CHANGE HISTORY**Issue 6**

IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/5 is applied so that the reference page sections use terms as described in the Utility Description Defaults ([Section 1.4](#)). No change in behavior is intended.

Issue 7

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

75503 NAME

75504 exit — cause the shell to exit

75505 SYNOPSIS

75506 exit [*n*]

75507 DESCRIPTION

75508 The *exit* utility shall cause the shell to exit with the exit status specified by the unsigned decimal
75509 integer *n*. If *n* is specified, but its value is not between 0 and 255 inclusively, the exit status is
75510 undefined.

75511 A *trap* on **EXIT** shall be executed before the shell terminates, except when the *exit* utility is
75512 invoked in that *trap* itself, in which case the shell shall exit immediately.

75513 OPTIONS

75514 None.

75515 OPERANDS

75516 See the DESCRIPTION.

75517 STDIN

75518 Not used.

75519 INPUT FILES

75520 None.

75521 ENVIRONMENT VARIABLES

75522 None.

75523 ASYNCHRONOUS EVENTS

75524 Default.

75525 STDOUT

75526 Not used.

75527 STDERR

75528 The standard error shall be used only for diagnostic messages.

75529 OUTPUT FILES

75530 None.

75531 EXTENDED DESCRIPTION

75532 None.

75533 EXIT STATUS

75534 The exit status shall be *n*, if specified. Otherwise, the value shall be the exit value of the last
75535 command executed, or zero if no command was executed. When *exit* is executed in a *trap* action,
75536 the last command is considered to be the command that executed immediately preceding the
75537 *trap* action.

75538 CONSEQUENCES OF ERRORS

75539 Default.

75540 APPLICATION USAGE

75541 None.

75542 EXAMPLES

75543 Exit with a *true* value:

75544 `exit 0`

75545 Exit with a *false* value:

75546 `exit 1`

75547 RATIONALE

75548 As explained in other sections, certain exit status values have been reserved for special uses and
75549 should be used by applications only for those purposes:

75550 126 A file to be executed was found, but it was not an executable utility.

75551 127 A utility to be executed was not found.

75552 >128 A command was interrupted by a signal.

75553 FUTURE DIRECTIONS

75554 None.

75555 SEE ALSO

75556 [Section 2.14](#)

75557 CHANGE HISTORY**75558 Issue 6**

75559 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/5 is applied so that the reference page
75560 sections use terms as described in the Utility Description Defaults ([Section 1.4](#)). No change in
75561 behavior is intended.

75562 **NAME**

75563 export — set the export attribute for variables

75564 **SYNOPSIS**75565 export name[=*word*] . . .

75566 export -p

75567 **DESCRIPTION**

75568 The shell shall give the *export* attribute to the variables corresponding to the specified *names*,
 75569 which shall cause them to be in the environment of subsequently executed commands. If the
 75570 name of a variable is followed by =*word*, then the value of that variable shall be set to *word*.

75571 The *export* special built-in shall support XBD [Section 12.2](#).

75572 When -p is specified, *export* shall write to the standard output the names and values of all
 75573 exported variables, in the following format:

75574 "export %s=%s\n", <name>, <value>

75575 if *name* is set, and:

75576 "export %s\n", <name>

75577 if *name* is unset.

75578 The shell shall format the output, including the proper use of quoting, so that it is suitable for
 75579 reinput to the shell as commands that achieve the same exporting results, except:

- 75580 1. Read-only variables with values cannot be reset.
- 75581 2. Variables that were unset at the time they were output need not be reset to the unset state
 75582 if a value is assigned to the variable between the time the state was saved and the time at
 75583 which the saved output is reinput to the shell.

75584 When no arguments are given, the results are unspecified. If a variable assignment precedes the
 75585 command name of *export* but that variable is not also listed as an operand of *export*, then that
 75586 variable shall be set in the current shell execution environment after the completion of the *export*
 75587 command, but it is unspecified whether that variable is marked for export.

75588 **OPTIONS**

75589 See the DESCRIPTION.

75590 **OPERANDS**

75591 See the DESCRIPTION.

75592 **STDIN**

75593 Not used.

75594 **INPUT FILES**

75595 None.

75596 **ENVIRONMENT VARIABLES**

75597 None.

75598 **ASYNCHRONOUS EVENTS**

75599 Default.

75600 **STDOUT**

75601 See the DESCRIPTION.

75602 STDERR

75603 The standard error shall be used only for diagnostic messages.

75604 OUTPUT FILES

75605 None.

75606 EXTENDED DESCRIPTION

75607 None.

75608 EXIT STATUS

75609 Zero.

75610 CONSEQUENCES OF ERRORS

75611 Default.

75612 APPLICATION USAGE

75613 None.

75614 EXAMPLES

75615 Export *PWD* and *HOME* variables:

75616 `export PWD HOME`

75617 Set and export the *PATH* variable:

75618 `export PATH=/local/bin:$PATH`

75619 Save and restore all exported variables:

75620 `export -p > temp-file`

75621 `unset a lot of variables`

75622 `... processing`

75623 `. temp-file`

75624 RATIONALE

75625 Some historical shells use the no-argument case as the functional equivalent of what is required
75626 here with **-p**. This feature was left unspecified because it is not historical practice in all shells,
75627 and some scripts may rely on the now-unspecified results on their implementations. Attempts to
75628 specify the **-p** output as the default case were unsuccessful in achieving consensus. The **-p**
75629 option was added to allow portable access to the values that can be saved and then later restored
75630 using; for example, a *dot* script.

75631 FUTURE DIRECTIONS

75632 None.

75633 SEE ALSO

75634 [Section 2.14](#)

75635 [XBD Section 12.2](#)

75636 CHANGE HISTORY**75637 Issue 6**

75638 IEEE PASC Interpretation 1003.2 #203 is applied, clarifying the format when a variable is unset.

75639 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/5 is applied so that the reference page
75640 sections use terms as described in the Utility Description Defaults ([Section 1.4](#)). No change in
75641 behavior is intended.

75642 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/6 is applied, adding the following text to
75643 the end of the first paragraph of the DESCRIPTION: "If the name of a variable is followed by

75644 =*word*, then the value of that variable shall be set to *word*.". The reason for this change is that the
75645 SYNOPSIS for *export* includes:

75646 `export name[=word] . . .`

75647 but the meaning of the optional "*=word*" is never explained in the text.

75648 **Issue 7**

75649 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0043 [352] is applied.

+

75650 **NAME**

75651 readonly — set the readonly attribute for variables

75652 **SYNOPSIS**75653 readonly name[=*word*] . . .

75654 readonly -p

75655 **DESCRIPTION**

75656 The variables whose *names* are specified shall be given the *readonly* attribute. The values of
 75657 variables with the *readonly* attribute cannot be changed by subsequent assignment, nor can those
 75658 variables be unset by the *unset* utility. If the name of a variable is followed by =*word*, then the
 75659 value of that variable shall be set to *word*.

75660 The *readonly* special built-in shall support XBD [Section 12.2](#).

75661 When -p is specified, *readonly* writes to the standard output the names and values of all read-
 75662 only variables, in the following format:

75663 "readonly %s=%s\n", <*name*>, <*value*>75664 if *name* is set, and75665 "readonly %s\n", <*name*>75666 if *name* is unset.

75667 The shell shall format the output, including the proper use of quoting, so that it is suitable for
 75668 reinput to the shell as commands that achieve the same value and *readonly* attribute-setting
 75669 results in a shell execution environment in which:

- 75670 1. Variables with values at the time they were output do not have the *readonly* attribute set.
- 75671 2. Variables that were unset at the time they were output do not have a value at the time at
 75672 which the saved output is reinput to the shell.

75673 When no arguments are given, the results are unspecified.

75674 **OPTIONS**

75675 See the DESCRIPTION.

75676 **OPERANDS**

75677 See the DESCRIPTION.

75678 **STDIN**

75679 Not used.

75680 **INPUT FILES**

75681 None.

75682 **ENVIRONMENT VARIABLES**

75684 **ASYNCHRONOUS EVENTS**

75685 Default.

75686 **STDOUT**

75687 See the DESCRIPTION.

75688 **STDERR**

75689 The standard error shall be used only for diagnostic messages.

75690 **OUTPUT FILES**

75691 None.

75692 **EXTENDED DESCRIPTION**

75693 None.

75694 **EXIT STATUS**

75695 Zero.

75696 **CONSEQUENCES OF ERRORS**

75697 Default.

75698 **APPLICATION USAGE**

75699 None.

75700 **EXAMPLES**

75701 readonly HOME PWD

75702 **RATIONALE**

75703 Some historical shells preserve the *readonly* attribute across separate invocations. This volume of
75704 POSIX.1-2008 allows this behavior, but does not require it.

75705 The **-p** option allows portable access to the values that can be saved and then later restored
75706 using, for example, a *dot* script. Also see the RATIONALE for *export* for a description of the no-
75707 argument and **-p** output cases and a related example.

75708 Read-only functions were considered, but they were omitted as not being historical practice or
75709 particularly useful. Furthermore, functions must not be read-only across invocations to preclude
75710 “spoofing” (spoofing is the term for the practice of creating a program that acts like a well-
75711 known utility with the intent of subverting the real intent of the user) of administrative or
75712 security-relevant (or security-conscious) shell scripts.

75713 **FUTURE DIRECTIONS**

75714 None.

75715 **SEE ALSO**

75716 [Section 2.14](#)

75717 XBD [Section 12.2](#)

75718 **CHANGE HISTORY**75719 **Issue 6**

75720 IEEE PASC Interpretation 1003.2 #203 is applied, clarifying the format when a variable is unset.

75721 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/5 is applied so that the reference page
75722 sections use terms as described in the Utility Description Defaults ([Section 1.4](#)). No change in
75723 behavior is intended.

75724 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/7 is applied, adding the following text to
75725 the end of the first paragraph of the DESCRIPTION: “If the name of a variable is followed by
75726 *=word*, then the value of that variable shall be set to *word*.”. The reason for this change is that the
75727 SYNOPSIS for *readonly* includes:

75728 `readonly name[=word] . . .`

75729 but the meaning of the optional “=*word*” is never explained in the text.

75730 **NAME**

75731 return — return from a function or dot script |

75732 **SYNOPSIS**75733 return [*n*]75734 **DESCRIPTION**

75735 The *return* utility shall cause the shell to stop executing the current function or *dot* script. If the
75736 shell is not currently executing a function or *dot* script, the results are unspecified.

75737 **OPTIONS**

75738 None.

75739 **OPERANDS**

75740 See the DESCRIPTION.

75741 **STDIN**

75742 Not used.

75743 **INPUT FILES**

75744 None.

75745 **ENVIRONMENT VARIABLES**

75746 None.

75747 **ASYNCHRONOUS EVENTS**

75748 Default.

75749 **STDOUT**

75750 Not used.

75751 **STDERR**

75752 The standard error shall be used only for diagnostic messages.

75753 **OUTPUT FILES**

75754 None.

75755 **EXTENDED DESCRIPTION**

75756 None.

75757 **EXIT STATUS**

75758 The value of the special parameter '?' shall be set to *n*, an unsigned decimal integer, or to the
75759 exit status of the last command executed if *n* is not specified. If the value of *n* is greater than 255,
75760 the results are undefined. When *return* is executed in a *trap* action, the last command is
75761 considered to be the command that executed immediately preceding the *trap* action.

75762 **CONSEQUENCES OF ERRORS**

75763 Default.

75764 **APPLICATION USAGE**

75765 None.

75766 **EXAMPLES**

75767 None.

75768 **RATIONALE**

75769 The behavior of *return* when not in a function or *dot* script differs between the System V shell
75770 and the KornShell. In the System V shell this is an error, whereas in the KornShell, the effect is
75771 the same as *exit*.

75772 The results of returning a number greater than 255 are undefined because of differing practices

75773 in the various historical implementations. Some shells AND out all but the low-order 8 bits;
75774 others allow larger values, but not of unlimited size.

75775 See the discussion of appropriate exit status values under *exit*.

75776 **FUTURE DIRECTIONS**

75777 None.

75778 **SEE ALSO**

75779 [Section 2.9.5](#), [Section 2.14](#), *dot*

75780 **CHANGE HISTORY**

75787 [214] are applied.

NAME

set — set or unset options and positional parameters

SYNOPSIS

set [-abCefhmnvux] [-o *option*] [*argument...*]

set [+abCefhmnvux] [+o *option*] [*argument...*]

set -- [*argument...*]

set -o

set +o

DESCRIPTION

If no *options* or *arguments* are specified, *set* shall write the names and values of all shell variables in the collation sequence of the current locale. Each *name* shall start on a separate line, using the format:

```
"%s=%s\n", <name>, <value>
```

The *value* string shall be written with appropriate quoting; see the description of shell quoting in [Section 2.2](#). The output shall be suitable for reinput to the shell, setting or resetting, as far as possible, the variables that are currently set; read-only variables cannot be reset.

When options are specified, they shall set or unset attributes of the shell, as described below. When *arguments* are specified, they cause positional parameters to be set or unset, as described below. Setting or unsetting attributes and positional parameters are not necessarily related actions, but they can be combined in a single invocation of *set*.

The *set* special built-in shall support XBD [Section 12.2](#) except that options can be specified with either a leading <hyphen> (meaning enable the option) or <plus-sign> (meaning disable it) unless otherwise specified.

Implementations shall support the options in the following list in both their <hyphen> and <plus-sign> forms. These options can also be specified as options to *sh*.

–a When this option is on, the *export* attribute shall be set for each variable to which an assignment is performed; see XBD [Section 4.22](#). If the assignment precedes a utility name in a command, the *export* attribute shall not persist in the current execution environment after the utility completes, with the exception that preceding one of the special built-in utilities causes the *export* attribute to persist after the built-in has completed. If the assignment does not precede a utility name in the command, or if the assignment is a result of the operation of the *getopts* or *read* utilities, the *export* attribute shall persist until the variable is unset.

–b This option shall be supported if the implementation supports the User Portability Utilities option. It shall cause the shell to notify the user asynchronously of background job completions. The following message is written to standard error:

```
"[%d]%c %s\n", <job-number>, <current>, <status>, <job-name>
```

where the fields shall be as follows:

<current>	The character '+' identifies the job that would be used as a default for the <i>fg</i> or <i>bg</i> utilities; this job can also be specified using the <i>job_id</i> "%+" or "%%". The character '-' identifies the job that would become the default if the current default job were to exit; this job can also be specified using the <i>job_id</i> "%-". For other jobs, this field is a <space>. At most one job can be identified with '+' and at most one job can be identified with '-'. If there is any suspended job, then the current job shall be a suspended

75832 job. If there are at least two suspended jobs, then the previous job also
75833 shall be a suspended job.

75834 *<job-number>* A number that can be used to identify the process group to the *wait*, *fg*, *bg*,
75835 and *kill* utilities. Using these utilities, the job can be identified by prefixing
75836 the job number with ' % '.

75837 *<status>* Unspecified.

75838 *<job-name>* Unspecified.

75839 When the shell notifies the user a job has been completed, it may remove the job's process
75840 ID from the list of those known in the current shell execution environment; see [Section](#)
75841 [2.9.3.1](#). Asynchronous notification shall not be enabled by default.

75842 **-C** (Uppercase C.) Prevent existing files from being overwritten by the shell's ' > ' redirection
75843 operator (see [Section 2.7.2](#)); the " > | " redirection operator shall override this *noclobber*
75844 option for an individual file.

75845 **-e** When this option is on, when any command fails (for any of the reasons listed in [Section](#) |
75846 [2.8.1](#) or by returning an exit status greater than zero), the shell immediately shall exit with |
75847 the following exceptions: |

75848 1. The failure of any individual command in a multi-command pipeline shall not cause |
75849 the shell to exit. Only the failure of the pipeline itself shall be considered. |

75850 2. The **-e** setting shall be ignored when executing the compound list following the |
75851 **while**, **until**, **if**, or **elif** reserved word, a pipeline beginning with the **!** reserved word, |
75852 or any command of an AND-OR list other than the last. |

75853 3. If the exit status of a compound command other than a subshell command was the |
75854 result of a failure while **-e** was being ignored, then **-e** shall not apply to this |
75855 command. |

75856 This requirement applies to the shell environment and each subshell environment |
75857 separately. For example, in: |

75858 `set -e; (false; echo one) | cat; echo two` |

75859 the *false* command causes the subshell to exit without executing `echo one`; however, `echo` |
75860 `two` is executed because the exit status of the pipeline `(false; echo one) | cat` is |
75861 zero. |

75862 **-f** The shell shall disable pathname expansion.

75863 **-h** Locate and remember utilities invoked by functions as those functions are defined (the
75864 utilities are normally located when the function is executed).

75865 **-m** This option shall be supported if the implementation supports the User Portability Utilities
75866 option. All jobs shall be run in their own process groups. Immediately before the shell issues
75867 a prompt after completion of the background job, a message reporting the exit status of the
75868 background job shall be written to standard error. If a foreground job stops, the shell shall
75869 write a message to standard error to that effect, formatted as described by the *jobs* utility. In
75870 addition, if a job changes status other than exiting (for example, if it stops for input or
75871 output or is stopped by a SIGSTOP signal), the shell shall write a similar message
75872 immediately prior to writing the next prompt. This option is enabled by default for
75873 interactive shells.

- 75874 **-n** The shell shall read commands but does not execute them; this can be used to check for
 75875 shell script syntax errors. An interactive shell may ignore this option.
- 75876 **-o** Write the current settings of the options to standard output in an unspecified format.
- 75877 **+o** Write the current option settings to standard output in a format that is suitable for reinput
 75878 to the shell as commands that achieve the same options settings.
- 75879 **-o option**
 75880 This option is supported if the system supports the User Portability Utilities option. It shall
 75881 set various options, many of which shall be equivalent to the single option letters. The
 75882 following values of *option* shall be supported:
- 75883 *allexport* Equivalent to **-a**.
- 75884 *errexit* Equivalent to **-e**.
- 75885 *ignoreeof* Prevent an interactive shell from exiting on end-of-file. This setting prevents
 75886 accidental logouts when <control>-D is entered. A user shall explicitly *exit* to
 75887 leave the interactive shell.
- 75888 *monitor* Equivalent to **-m**. This option is supported if the system supports the User
 75889 Portability Utilities option.
- 75890 *noclobber* Equivalent to **-C** (uppercase C).
- 75891 *noglob* Equivalent to **-f**.
- 75892 *noexec* Equivalent to **-n**.
- 75893 *nolog* Prevent the entry of function definitions into the command history; see
 75894 [Command History List](#).
- 75895 *notify* Equivalent to **-b**.
- 75896 *nounset* Equivalent to **-u**.
- 75897 *verbose* Equivalent to **-v**.
- 75898 *vi* Allow shell command line editing using the built-in *vi* editor. Enabling *vi*
 75899 mode shall disable any other command line editing mode provided as an
 75900 implementation extension.
- 75901 It need not be possible to set *vi* mode on for certain block-mode terminals.
- 75902 *xtrace* Equivalent to **-x**.
- 75903 **-u** When the shell tries to expand an unset parameter other than the '@' and '*' special
 75904 parameters, it shall write a message to standard error and shall not execute the command
 75905 containing the expansion, but for the purposes of setting the '?' special parameter and the
 75906 exit status of the shell the command shall be treated as having been executed and returned
 75907 an exit status of between 1 and 125 inclusive. A non-interactive shell shall immediately exit.
 75908 An interactive shell shall not exit.
- 75909 **-v** The shell shall write its input to standard error as it is read.
- 75910 **-x** The shell shall write to standard error a trace for each command after it expands the
 75911 command and before it executes it. It is unspecified whether the command that turns
 75912 tracing off is traced.
- 75913 The default for all these options shall be off (unset) unless stated otherwise in the description of
 75914 the option or unless the shell was invoked with them on; see *sh*.

75915 The remaining arguments shall be assigned in order to the positional parameters. The special
 75916 parameter '`#`' shall be set to reflect the number of positional parameters. All positional
 75917 parameters shall be unset before any new values are assigned.

75918 If the first argument is '`-`', the results are unspecified.

75919 The special argument "`--`" immediately following the *set* command name can be used to
 75920 delimit the arguments if the first argument begins with '`+`' or '`-`', or to prevent inadvertent
 75921 listing of all shell variables when there are no arguments. The command *set --* without *argument*
 75922 shall unset all positional parameters and set the special parameter '`#`' to zero.

75923 OPTIONS

75924 See the DESCRIPTION.

75925 OPERANDS

75926 See the DESCRIPTION.

75927 STDIN

75928 Not used.

75929 INPUT FILES

75930 None.

75931 ENVIRONMENT VARIABLES

75932 None.

75933 ASYNCHRONOUS EVENTS

75934 Default.

75935 STDOUT

75936 See the DESCRIPTION.

75937 STDERR

75938 The standard error shall be used only for diagnostic messages.

75939 OUTPUT FILES

75940 None.

75941 EXTENDED DESCRIPTION

75942 None.

75943 EXIT STATUS

75944 Zero.

75945 CONSEQUENCES OF ERRORS

75946 Default.

75947 APPLICATION USAGE

75948 Application writers should avoid relying on *set -e* within functions. For example, in the
 75949 following script:

```
75950 set -e
75951 start() {
75952     some_server
75953     echo some_server started successfully
75954 }
75955 start || echo >&2 some_server failed
```

75956 the *-e* setting is ignored within the function body (because the function is a command in an
 75957 AND-OR list other than the last). Therefore, if `some_server` fails, the function carries on to

echo "some_server started successfully", and the exit status of the function is zero (which means "some_server failed" is not output).

EXAMPLES

Write out all variables and their values:

```
set
```

Set \$1, \$2, and \$3 and set "\$#" to 3:

```
set c a b
```

Turn on the `-x` and `-v` options:

```
set -xv
```

Unset all positional parameters:

```
set --
```

Set \$1 to the value of *x*, even if it begins with `'-'` or `'+'`:

```
set -- "$x"
```

Set the positional parameters to the expansion of *x*, even if *x* expands with a leading `'-'` or `'+'`:

```
set -- $x
```

RATIONALE

The `set --` form is listed specifically in the SYNOPSIS even though this usage is implied by the Utility Syntax Guidelines. The explanation of this feature removes any ambiguity about whether the `set --` form might be misinterpreted as being equivalent to `set` without any options or arguments. The functionality of this form has been adopted from the KornShell. In System V, `set --` only unsets parameters if there is at least one argument; the only way to unset all parameters is to use *shift*. Using the KornShell version should not affect System V scripts because there should be no reason to issue it without arguments deliberately; if it were issued as, for example:

```
set -- "$@"
```

and there were in fact no arguments resulting from `"$@"`, unsetting the parameters would have no result.

The `set +` form in early proposals was omitted as being an unnecessary duplication of `set` alone and not widespread historical practice.

The *noclobber* option was changed to allow `set -C` as well as the `set -o noclobber` option. The single-letter version was added so that the historical `"$-"` paradigm would not be broken; see [Section 2.5.2](#).

The description of the `-e` option is intended to match the behavior of the 1988 version of the KornShell.

The `-h` flag is related to command name hashing. See [hash](#).

The following `set` flags were omitted intentionally with the following rationale:

-k The `-k` flag was originally added by the author of the Bourne shell to make it easier for users of pre-release versions of the shell. In early versions of the Bourne shell the construct `set name=value` had to be used to assign values to shell variables. The problem with `-k` is that the behavior affects parsing, virtually precluding writing any compilers. To explain the behavior of `-k`, it is necessary to describe the parsing algorithm, which is implementation-defined. For example:

75999 set -k; echo name=value

76000 and:

76001 set -k
76002 echo name=value

76003 behave differently. The interaction with functions is even more complex. What is more, the
76004 **-k** flag is never needed, since the command line could have been reordered.

76005 **-t** The **-t** flag is hard to specify and almost never used. The only known use could be done
76006 with here-documents. Moreover, the behavior with *ksh* and *sh* differs. The reference page
76007 says that it exits after reading and executing one command. What is one command? If the
76008 input is *date;date*, *sh* executes both *date* commands while *ksh* does only the first.

76009 Consideration was given to rewriting *set* to simplify its confusing syntax. A specific suggestion
76010 was that the *unset* utility should be used to unset options instead of using the non-*getopt()*-able
76011 +*option* syntax. However, the conclusion was reached that the historical practice of using +*option*
76012 was satisfactory and that there was no compelling reason to modify such widespread historical
76013 practice.

76014 The **-o** option was adopted from the KornShell to address user needs. In addition to its
76015 generally friendly interface, **-o** is needed to provide the *vi* command line editing mode, for
76016 which historical practice yields no single-letter option name. (Although it might have been
76017 possible to invent such a letter, it was recognized that other editing modes would be developed
76018 and **-o** provides ample name space for describing such extensions.)

76019 Historical implementations are inconsistent in the format used for **-o** option status reporting.
76020 The **+o** format without an option-argument was added to allow portable access to the options
76021 that can be saved and then later restored using, for instance, a dot script.

76022 Historically, *sh* did trace the command *set +x*, but *ksh* did not.

76023 The *ignoreeof* setting prevents accidental logouts when the end-of-file character (typically
76024 <control>-D) is entered. A user shall explicitly *exit* to leave the interactive shell.

76025 The *set -m* option was added to apply only to the UPE because it applies primarily to interactive
76026 use, not shell script applications.

76027 The ability to do asynchronous notification became available in the 1988 version of the
76028 KornShell. To have it occur, the user had to issue the command:

76029 trap "jobs -n" CLD

76030 The C shell provides two different levels of an asynchronous notification capability. The
76031 environment variable *notify* is analogous to what is done in *set -b* or *set -o notify*. When set, it
76032 notifies the user immediately of background job completions. When unset, this capability is
76033 turned off.

76034 The other notification ability comes through the built-in utility *notify*. The syntax is:

76035 notify [%job ...]

76036 By issuing *notify* with no operands, it causes the C shell to notify the user asynchronously when
76037 the state of the current job changes. If given operands, *notify* asynchronously informs the user of
76038 changes in the states of the specified jobs.

76039 To add asynchronous notification to the POSIX shell, neither the KornShell extensions to *trap*,
76040 nor the C shell *notify* environment variable seemed appropriate (*notify* is not a proper POSIX
76041 environment variable name).

76042	The <i>set</i> -b option was selected as a compromise.	
76043	The <i>notify</i> built-in was considered to have more functionality than was required for simple asynchronous notification.	
76044		
76045	Historically, some shells applied the -u option to all parameters including <code>\$@</code> and <code>\$*</code> . The standard developers felt that this was a misfeature since it is normal and common for <code>\$@</code> and <code>\$*</code> to be used in shell scripts regardless of whether they were passed any arguments. Treating these uses as an error when no arguments are passed reduces the value of -u for its intended purpose of finding spelling mistakes in variable names and uses of unset positional parameters.	+

76077 **NAME**

76078 shift — shift positional parameters

76079 **SYNOPSIS**76080 shift [*n*]76081 **DESCRIPTION**

76082 The positional parameters shall be shifted. Positional parameter 1 shall be assigned the value of
76083 parameter (1+*n*), parameter 2 shall be assigned the value of parameter (2+*n*), and so on. The
76084 parameters represented by the numbers "\$#" down to "\$#-*n*+1" shall be unset, and the
76085 parameter '#' is updated to reflect the new number of positional parameters.

76086 The value *n* shall be an unsigned decimal integer less than or equal to the value of the special
76087 parameter '#'. If *n* is not given, it shall be assumed to be 1. If *n* is 0, the positional and special
76088 parameters are not changed.

76089 **OPTIONS**

76135 **NAME**

76136 times — write process times

76137 **SYNOPSIS**

76138 times

76139 **DESCRIPTION**76140 The *times* utility shall write the accumulated user and system times for the shell and for all of its
76141 child processes, in the following POSIX locale format:

```
76142       "%dm%fs %dm%fs\n%dm%fs %dm%fs\n", <shell user minutes>,  
76143       <shell user seconds>, <shell system minutes>,  
76144       <shell system seconds>, <children user minutes>,  
76145       <children user seconds>, <children system minutes>,  
76146       <children system seconds>
```

76147 The four pairs of times shall correspond to the members of the **<sys/times.h> tms** structure
76148 (defined in XBD [Chapter 13](#)) as returned by *times()*: *tms_utime*, *tms_stime*, *tms_cutime*, and
76149 *tms_cstime*, respectively.76150 **OPTIONS**

76151 None.

76152 **OPERANDS**

76191 DESCRIPTION from: "Write the accumulated user and system times for the shell and for all of
76192 its child processes ..." to: "The *times* utility shall write the accumulated user and system times for
76193 the shell and for all of its child processes ...".

NAME

trap — trap signals

SYNOPSIS

```
trap n [condition...]
trap [action condition...]
```

DESCRIPTION

If the first operand is an unsigned decimal integer, the shell shall treat all operands as conditions, and shall reset each condition to the default value. Otherwise, if there are operands, the first is treated as an action and the remaining as conditions.

If *action* is `'-'`, the shell shall reset each *condition* to the default value. If *action* is null (`" "`), the shell shall ignore each specified *condition* if it arises. Otherwise, the argument *action* shall be read and executed by the shell when one of the corresponding conditions arises. The action of *trap* shall override a previous action (either default action or one explicitly set). The value of `"$?"` after the *trap* action completes shall be the value it had before *trap* was invoked.

The condition can be EXIT, 0 (equivalent to EXIT), or a signal specified using a symbolic name, without the SIG prefix, as listed in the tables of signal names in the `<signal.h>` header defined in XBD [Chapter 13](#); for example, HUP, INT, QUIT, TERM. Implementations may permit names with the SIG prefix or ignore case in signal names as an extension. Setting a trap for SIGKILL or SIGSTOP produces undefined results.

The environment in which the shell executes a *trap* on EXIT shall be identical to the environment immediately after the last command executed before the *trap* on EXIT was taken.

Each time *trap* is invoked, the *action* argument shall be processed in a manner equivalent to:

```
eval action
```

Signals that were ignored on entry to a non-interactive shell cannot be trapped or reset, although no error need be reported when attempting to do so. An interactive shell may reset or catch signals ignored on entry. Traps shall remain in place for a given shell until explicitly changed with another *trap* command.

When a subshell is entered, traps that are not being ignored shall be set to the default actions, except in the case of a command substitution containing only a single *trap* command, when the traps need not be altered. Implementations may check for this case using only lexical analysis; for example, if `'trap'` and `$( trap -- )` do not alter the traps in the subshell, cases such as assigning `var=trap` and then using `$( $var )` may still alter them. This does not imply that the *trap* command cannot be used within the subshell to set new traps.

The *trap* command with no operands shall write to standard output a list of commands associated with each condition. If the command is executed in a subshell, the implementation does not perform the optional check described above for a command substitution containing only a single *trap* command, and no *trap* commands with operands have been executed since entry to the subshell, the list shall contain the commands that were associated with each condition immediately before the subshell environment was entered. Otherwise, the list shall contain the commands currently associated with each condition. The format shall be:

```
"trap -- %s %s ...\n", <action>, <condition> ...
```

The shell shall format the output, including the proper use of quoting, so that it is suitable for reinput to the shell as commands that achieve the same trapping results. For example:

```
save_traps=$(trap)
...
eval "$save_traps"
```

76240 XSI XSI-conformant systems also allow numeric signal numbers for the conditions corresponding to
 76241 the following signal names:

76242 1 SIGHUP
 76243 2 SIGINT
 76244 3 SIGQUIT
 76245 6 SIGABRT
 76246 9 SIGKILL
 76247 14 SIGALRM
 76248 15 SIGTERM

76249 The *trap* special built-in shall conform to XBD [Section 12.2](#).

76250 OPTIONS

76251 None.

76252 OPERANDS

76253 See the DESCRIPTION.

76254 STDIN

76255 Not used.

76256 INPUT FILES

76257 None.

76258 ENVIRONMENT VARIABLES

76259 None.

76260 ASYNCHRONOUS EVENTS

76261 Default.

76262 STDOUT

76263 See the DESCRIPTION.

76264 STDERR

76265 The standard error shall be used only for diagnostic messages.

76266 OUTPUT FILES

76267 None.

76268 EXTENDED DESCRIPTION

76269 None.

76270 EXIT STATUS

76271 XSI If the trap name **or number** is invalid, a non-zero exit status shall be returned; otherwise, zero
 76272 XSI shall be returned. For both interactive and non-interactive shells, invalid signal names **or**
 76273 **numbers** shall not be considered a syntax error and do not cause the shell to abort.

76274 CONSEQUENCES OF ERRORS

76275 Default.

APPLICATION USAGE

None.

EXAMPLES

Write out a list of all traps and actions:

```
trap
```

Set a trap so the *logout* utility in the directory referred to by the *HOME* environment variable executes when the shell terminates:

```
trap '"$HOME"/logout' EXIT
```

or:

```
trap '"$HOME"/logout' 0
```

Unset traps on INT, QUIT, TERM, and EXIT:

```
trap - INT QUIT TERM EXIT
```

RATIONALE

Implementations may permit lowercase signal names as an extension. Implementations may also accept the names with the SIG prefix; no known historical shell does so. The *trap* and *kill* utilities in this volume of POSIX.1-2008 are now consistent in their omission of the SIG prefix for signal names. Some *kill* implementations do not allow the prefix, and *kill -l* lists the signals without prefixes.

Trapping SIGKILL or SIGSTOP is syntactically accepted by some historical implementations, but it has no effect. Portable POSIX applications cannot attempt to trap these signals.

The output format is not historical practice. Since the output of historical *trap* commands is not portable (because numeric signal values are not portable) and had to change to become so, an opportunity was taken to format the output in a way that a shell script could use to save and then later reuse a trap if it wanted.

The KornShell uses an **ERR** trap that is triggered whenever *set -e* would cause an exit. This is allowable as an extension, but was not mandated, as other shells have not used it.

The text about the environment for the EXIT trap invalidates the behavior of some historical versions of interactive shells which, for example, close the standard input before executing a trap on 0. For example, in some historical interactive shell sessions the following trap on 0 would always print "--":

```
trap 'read foo; echo "--$foo--" 0
```

The command:

```
trap 'eval " $cmd"' 0
```

causes the contents of the shell variable *cmd* to be executed as a command when the shell exits. Using:

```
trap '$cmd' 0
```

does not work correctly if *cmd* contains any special characters such as quoting or redirections. Using:

```
trap " $cmd" 0
```

also works (the leading <space> character protects against unlikely cases where *cmd* is a decimal integer or begins with '-'), but it expands the *cmd* variable when the *trap* command is executed,

76317 not when the exit action is executed.

76318 **FUTURE DIRECTIONS**

76319 None.

76320 **SEE ALSO**

76321 [Section 2.14](#)

76322 XBD [Section 12.2, <signal.h>](#)

76323 **CHANGE HISTORY**

76324 **Issue 6**

76325 XSI-conforming implementations provide the mapping of signal names to numbers given above
76326 (previously this had been marked obsolescent). Other implementations need not provide this
76327 optional mapping.

76328 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/5 is applied so that the reference page
76329 sections use terms as described in the Utility Description Defaults ([Section 1.4](#)). No change in
76330 behavior is intended.

76331 **Issue 7**

76332 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

76333 Austin Group Interpretation 1003.1-2001 #116 is applied.

76334 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0052 [53,268,440], +
76335 XCU/TC1-2008/0053 [53,268,440], XCU/TC1-2008/0054 [163], XCU/TC1-2008/0055 [163], and +
76336 XCU/TC1-2008/0056 [163] are applied.

76337 **NAME**

76338 unset — unset values and attributes of variables and functions

76339 **SYNOPSIS**76340 unset [-fv] *name*...76341 **DESCRIPTION**76342 Each variable or function specified by *name* shall be unset.76343 If **-v** is specified, *name* refers to a variable name and the shell shall unset it and remove it from
76344 the environment. Read-only variables cannot be unset.76345 If **-f** is specified, *name* refers to a function and the shell shall unset the function definition.76346 If neither **-f** nor **-v** is specified, *name* refers to a variable; if a variable by that name does not
76347 exist, it is unspecified whether a function by that name, if any, shall be unset.76348 Unsetting a variable or function that was not previously set shall not be considered an error and
76349 does not cause the shell to abort.76350 The *unset* special built-in shall support XBD [Section 12.2](#).

76351 Note that:

76352 VARIABLE=

76353 is not equivalent to an *unset* of **VARIABLE**; in the example, **VARIABLE** is set to " ". Also, the
76354 variables that can be *unset* should not be misinterpreted to include the special parameters (see
76355 [Section 2.5.2](#)).76356 **OPTIONS**

76357 See the DESCRIPTION.

76358 **OPERANDS**

76359 See the DESCRIPTION.

76360 **STDIN**

76361 Not used.

76362 **INPUT FILES**

76363 None.

76364 **ENVIRONMENT VARIABLES**

76365 None.

76366 **ASYNCHRONOUS EVENTS**

76367 Default.

76368 **STDOUT**

76369 Not used.

76370 **STDERR**

76371 The standard error shall be used only for diagnostic messages.

76372 **OUTPUT FILES**

76373 None.

76374 **EXTENDED DESCRIPTION**

76375 None.

76376 **EXIT STATUS**76377 0 All *name* operands were successfully unset.76378 >0 At least one *name* could not be unset.76379 **CONSEQUENCES OF ERRORS**

76380 Default.

76381 **APPLICATION USAGE**

76382 None.

76383 **EXAMPLES**76384 Unset *VISUAL* variable:

76385 unset -v VISUAL

76386 Unset the functions **foo** and **bar**:

76387 unset -f foo bar

76388 **RATIONALE**76389 Consideration was given to omitting the **-f** option in favor of an *unfunction* utility, but the
76390 standard developers decided to retain historical practice.76391 The **-v** option was introduced because System V historically used one name space for both
76392 variables and functions. When *unset* is used without options, System V historically unset either a
76393 function or a variable, and there was no confusion about which one was intended. A portable
76394 POSIX application can use *unset* without an option to unset a variable, but not a function; the **-f**
76395 option must be used.76396 **FUTURE DIRECTIONS**

76397 None.

76398 **SEE ALSO**76399 [Section 2.14](#)76400 XBD [Section 12.2](#)76401 **CHANGE HISTORY**76402 **Issue 6**76403 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/5 is applied so that the reference page
76404 sections use terms as described in the Utility Description Defaults ([Section 1.4](#)). No change in
76405 behavior is intended.76406 **Issue 7**

76407 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

Chapter 3
Batch Environment Services

76410 OB BE
76411
76412
76413
76414
76415

This chapter describes the services and utilities that shall be implemented on all systems that claim conformance to the Batch Environment Services and Utilities option. The functionality described in this section shall be provided on implementations that support the Batch Environment Services and Utilities option (and the rest of this section is not further shaded for this option).
Note that the Batch Environment Services and Utilities option is marked obsolescent in Issue 7.

76416 **3.1 General Concepts**

76417 **3.1.1 Batch Client-Server Interaction**

76418 Batch jobs are created and managed by batch servers. A batch client interacts with a batch server
76419 to access batch services on behalf of the user. In order to use batch services, a user must have
76420 access to a batch client.

76421 A batch server is a computational entity, such as a daemon process, that provides batch services.
76422 Batch servers route, queue, modify, and execute batch jobs on behalf of batch clients.

76423 The batch utilities described in this volume of POSIX.1-2008 (and listed in [Table 3-1](#)) are clients
76424 of batch services; they allow users to perform actions on the job such as creating, modifying, and
76425 deleting batch jobs from a shell command line. Although these batch utilities may be said to
76426 accomplish certain services, they actually obtain services on behalf of a user by means of
76427 requests to batch servers.

76428 **Table 3-1** Batch Utilities

76429	<i>qalter</i>	<i>qmove</i>	<i>qrls</i>	<i>qstat</i>
76430	<i>qdel</i>	<i>qmsg</i>	<i>qselect</i>	<i>qsub</i>
76431	<i>qhold</i>	<i>qrerun</i>	<i>qsig</i>	

76432 Client-server interaction takes place by means of the batch requests defined in this chapter.
76433 Because direct access to batch jobs and queues is limited to batch servers, clients and servers of
76434 different implementations can interoperate, since dependencies on private structures for batch
76435 jobs and queues are limited to batch servers. Also, batch servers may be clients of other batch
76436 servers.

3.1.2 Batch Queues

Two types of batch queue are described: routing queues and execution queues. When a batch job is placed in a routing queue, it is a candidate for routing. A batch job is removed from routing queues under the following conditions:

- The batch job has been routed to another queue.
- The batch job has been deleted from the batch queue.
- The batch job has been aborted.

When a batch job is placed in an execution queue, it is a candidate for execution.

A batch job is removed from an execution queue under the following conditions:

- The batch job has been executed and exited.
- The batch job has been aborted.
- The batch job has been deleted from the batch queue.
- The batch job has been moved to another queue.

Access to a batch queue is limited to the batch server that manages the batch queue. Clients never access a batch queue or a batch job directly, either to read or write information; all client access to batch queues or jobs takes place through batch servers.

3.1.3 Batch Job Creation

When a batch server creates a batch job on behalf of a client, it shall assign a batch job identifier to the job. A batch job identifier consists of both a sequence number that is unique among the sequence numbers issued by that server and the name of the server. Since the batch server name is unique within a name space, the job identifier is likewise unique within the name space.

The batch server that creates a batch job shall return the batch server-assigned job identifier to the client that requested the job creation. If the batch server routes or moves the job to another server, it sends the job identifier with the job. Once assigned, the job identifier of a batch job shall never change.

3.1.4 Batch Job Tracking

Since a batch job may be moved after creation, the batch server name component of the job identifier need not indicate the location of the job. An implementation may provide a batch job tracking mechanism, in which case the user generally does not need to know the location of the job. However, an implementation need not provide a batch job tracking mechanism, in which case the user must find routed jobs by probing the possible destinations.

3.1.5 Batch Job Routing

To route a batch job, a batch server either moves the job to some other queue that is managed by the batch server, or requests that some other batch server accept the job.

Each routing queue has one or more queues to which it can route batch jobs. The batch server administrator creates routing queues.

A batch server may route a batch job from a routing queue to another routing queue. Batch servers shall prevent or otherwise handle cases of circular routing paths. As a deferred service, a batch server routes jobs from the routing queues that it manages. The algorithm by which a batch server selects a batch queue to which to route a batch job is implementation-defined.

A batch job need not be eligible for routing to all the batch queues fed by the routing queue from which it is routed. A batch server that has been asked to accept the job may reject the request if the job requires resources that are unavailable to that batch server, or if the client is not authorized to access the batch server.

Batch servers may route high-priority jobs before low-priority jobs, but, on other than overloaded systems, the effect may be imperceptible to the user. If all the batch servers fed by a routing queue reject requests to accept the job for reasons that are permanent, the batch server that manages the job shall abort the job. If all or some rejections are temporary, the batch server should try to route the job again at some later point.

The reasons for rejecting a batch job are implementation-defined.

The reasons for which the routing should be retried later and the reasons for which the job should be aborted are also implementation-defined.

3.1.6 Batch Job Execution

To execute a batch job is to create a session leader (a process) that runs the shell program indicated by the *Shell_Path* attribute of the job. The script shall be passed to the program as its standard input. An implementation may pass the script to the program by other implementation-defined means. At the time a batch job begins execution, it is defined to enter the RUNNING state. The primary program that is executed by a batch job is typically, though not necessarily, a shell program.

A batch server shall execute eligible jobs as a deferred service—no client request is necessary once the batch job is created and eligible. However, the attributes of a batch job, such as the job hold type, may render the job ineligible. A batch server shall scan the execution queues that it manages for jobs that are eligible for execution. The algorithm by which the batch server selects eligible jobs for execution is implementation-defined.

As part of creating the process for the batch job, the batch server shall open the standard output and standard error streams of the session.

The attributes of a batch job may indicate that the batch server executing the job shall send mail to a list of users at the time it begins execution of the job.

76505 3.1.7 Batch Job Exit

76506 When the session leader of an executing job terminates, the job exits. As part of exiting a batch
76507 job, the batch server that manages the job shall remove the job from the batch queue in which it
76508 resides. The server shall transfer output files of the job to a location described by the attributes of
76509 the job.

76510 The attributes of a batch job may indicate that the batch server managing the job shall send mail
76511 to a list of users at the time the job exits.

76512 3.1.8 Batch Job Abort

76513 A batch server shall abort jobs for which a required deferred service cannot be performed. The
76514 attributes of a batch job may indicate that the batch server that aborts the job shall send mail to a
76515 list of users at the time it aborts the job.

76516 3.1.9 Batch Authorization

76517 Clients, such as the batch environment utilities (marked BE), access batch services by means of
76518 requests to one or more batch servers. To acquire the services of any given batch server, the user
76519 identifier under which the client runs must be authorized to use that batch server.

76520 The user with an associated user name that creates a batch job shall own the job and can perform
76521 actions such as read, modify, delete, and move.

76522 A user identifier of the same value at a different host need not be the same user. For example,
76523 user name *smith* at host **alpha** may or may not represent the same person as user name *smith* at
76524 host **beta**. Likewise, the same person may have access to different user names on different hosts.

76525 An implementation may optionally provide an authorization mechanism that permits one user
76526 name to access jobs under another user name.

76527 A process on a client host may be authorized to run processes under multiple user names at a
76528 batch server host. Where appropriate, the utilities defined in this volume of POSIX.1-2008
76529 provide a means for a user to choose from among such user names when creating or modifying
76530 a batch job.

76531 3.1.10 Batch Administration

76532 The processing of a batch job by a batch server is affected by the attributes of the job. The
76533 processing of a batch job may also be affected by the attributes of the batch queue in which the
76534 job resides and by the status of the batch server that manages the job. See also XBD [Chapter 3](#)
76535 (on page 33) for batch definitions.

3.1.11 Batch Notification

Whereas batch servers are persistent entities, clients are often transient. For example, the *qsub* utility creates a batch job and exits. For this reason, batch servers notify users of batch job events by sending mail to the user that owns the job, or to other designated users.

3.2 Batch Services

The presence of Batch Environment Services and Utilities option services is indicated by the configuration variable `POSIX2_PBS`. A conforming batch server provides services as defined in this section.

A batch server shall provide batch services in two ways:

1. The batch server provides a service at the request of a client.
2. The batch server provides a deferred service as a result of a change in conditions monitored by the batch server.

If a batch server cannot complete a request, it shall reject the request. If a batch server cannot complete a deferred service for a batch job, the batch server shall abort the batch job. [Table 3-2](#) is a summary of environment variables that shall be supported by an implementation of the batch server and utilities.

Table 3-2 Environment Variable Summary

Variable	Description
<i>PBS_DPREFIX</i>	Defines the directive prefix (see <i>qsub</i>)
<i>PBS_ENVIRONMENT</i>	Batch Job is batch or interactive (see Section 3.2.2.1)
<i>PBS_JOBID</i>	The <i>job_identifier</i> attribute of job (see Section 3.2.3.8)
<i>PBS_JOBNAME</i>	The <i>job_name</i> attribute of job (see Section 3.2.3.8)
<i>PBS_O_HOME</i>	Defines the <i>HOME</i> of the batch client (see <i>qsub</i>)
<i>PBS_O_HOST</i>	Defines the host name of the batch client (see <i>qsub</i>)
<i>PBS_O_LANG</i>	Defines the <i>LANG</i> of the batch client (see <i>qsub</i>)
<i>PBS_O_LOGNAME</i>	Defines the <i>LOGNAME</i> of the batch client (see <i>qsub</i>)
<i>PBS_O_MAIL</i>	Defines the <i>MAIL</i> of the batch client (see <i>qsub</i>)
<i>PBS_O_PATH</i>	Defines the <i>PATH</i> of the batch client (see <i>qsub</i>)
<i>PBS_O_QUEUE</i>	Defines the submit queue of the batch client (see <i>qsub</i>)
<i>PBS_O_SHELL</i>	Defines the <i>SHELL</i> of the batch client (see <i>qsub</i>)
<i>PBS_O_TZ</i>	Defines the <i>TZ</i> of the batch client (see <i>qsub</i>)
<i>PBS_O_WORKDIR</i>	Defines the working directory of the batch client (see <i>qsub</i>)
<i>PBS_QUEUE</i>	Defines the initial execution queue (see Section 3.2.2.1)

3.2.1 Batch Job States

A batch job shall always be in one of the following states: QUEUED, RUNNING, HELD, WAITING, EXITING, or TRANSITING. The state of a batch job determines the types of requests that the batch server that manages the batch job can accept for the batch job. A batch server shall change the state of a batch job either in response to service requests from clients or as a result of deferred services, such as job execution or job routing.

A batch job that is in the QUEUED state resides in a queue but is still pending either execution or routing, depending on the queue type.

A batch server that queues a batch job in a routing queue shall put the batch job in the QUEUED state. A batch server that puts a batch job in an execution queue, but has not yet executed the batch job, shall put the batch job in the QUEUED state. A batch job that resides in an execution queue and is executing is defined to be in the RUNNING state. While a batch job is in the RUNNING state, a session leader is associated with the batch job.

A batch job that resides in an execution queue, but is ineligible to run because of a hold attribute, is defined to be in the HELD state.

A batch job that is not held, but must wait until a future date and time before executing, is defined to be in the WAITING state.

When the session leader associated with a running job exits, the batch job shall be placed in the EXITING state.

A batch job for which the session leader has terminated is defined to be in the EXITING state, and the batch server that manages such a batch job cannot accept job modification requests that affect the batch job. While a batch job is in the EXITING state, the batch server that manages the batch job is staging output files and notifying clients of job completion. Once a batch job has exited, it no longer exists as an object managed by a batch server.

A batch job that is being moved from a routing queue to another queue is defined to be in the TRANSITING state.

When a batch job in a routing queue has been selected to be moved to a new destination, then the batch job shall be in either the QUEUED state or the TRANSITING state, depending on the batch server implementation.

Batch jobs with either an *Execution_Time* attribute value set in the future or a *Hold_Types* attribute of value not equal to NO_HOLD, or both, may be routed or held in the routing queue. The treatment of jobs with the *Execution_Time* or *Hold_Types* attributes in a routing queue is implementation-defined.

When a batch job in a routing queue has not been selected to be moved to a new destination and the batch job has a *Hold_Types* attribute value of other than NO_HOLD, then the job should be in the HELD state.

Note: The effect of a hold upon a batch job in a routing queue is implementation-defined. The implementation should use the state that matches whether the batch job can route with a hold or not.

When a batch job in a routing queue has not been selected to be moved to a new destination and the batch job has:

- A *Hold_Types* attribute value of NO_HOLD
- An *Execution_Time* attribute in the past

then the batch job shall be in the QUEUED state.

When a batch job in a routing queue has not been selected to be moved to a new destination and the batch job has:

- A *Hold_Types* attribute value of NO_HOLD
- An *Execution_Time* attribute in the future

then the batch job may be in the WAITING state.

Note: The effect of a future execution time upon a batch job in a routing queue is implementation-defined. The implementation should use the state that matches whether the batch job can route with a hold or not.

Table 3-3 describes the next state of a batch job, given the current state of the batch job and the type of request. Table 3-4 (on page 2405) describes the response of a batch server to a request, given the current state of the batch job and the type of request.

3.2.2 Deferred Batch Services

This section describes the deferred services performed by batch servers: job execution, job routing, job exit, job abort, and the rerunning of jobs after a restart.

3.2.2.1 Batch Job Execution

To execute a batch job is to create a session leader (a process) that runs the shell program indicated by the *Shell_Path_List* attribute of the batch job. The script is passed to the program as its standard input. An implementation may pass the script to the program by other implementation-defined means. At the time a batch job begins execution, it is defined to enter the RUNNING state.

Table 3-3 Next State Table

Request Type	Current State						
	X	Q	R	H	W	E	T
Queue Batch Job Request	Q	e	e	e	e	e	e
Modify Batch Job Request	e	Q	R	H	W	e	T
Delete Batch Job Request	e	X	E	X	X	E	X

76654 R RUNNING

76655 H HELD

76656 W WAITING

76657 E EXITING

76658 T TRANSITING

76659 e Error

76660 A batch server that has an execution queue containing jobs is said to own the queue and manage
 76661 the batch jobs in that queue. A batch server that has been started shall execute the batch jobs in
 76662 the execution queues owned by the batch server. The batch server shall schedule for execution
 76663 those jobs in the execution queues that are in the QUEUED state. The algorithm for scheduling
 76664 jobs is implementation-defined.

76665 A batch server that executes a batch job shall create, in the environment of the session leader of
 76666 the batch job, an environment variable named *PBS_ENVIRONMENT*, the value of which is the
 76667 string *PBS_BATCH* encoded in the portable character set.

76668 A batch server that executes a batch job shall create, in the environment of the session leader of
 76669 the batch job, an environment variable named *PBS_QUEUE*, the value of which is the name of
 76670 the execution queue of the batch job encoded in the portable character set.

76671 To rerun a batch job is to requeue a batch job that is currently executing and then kill the session
 76672 leader of the executing job by sending a SIGKILL prior to completion; see [Section 3.2.3.11](#) (on
 76673 page 2417). A batch server that reruns a batch job shall append the standard output and
 76674 standard error files of the batch job to the corresponding files of the previous execution, if they
 76675 exist, with appropriate annotation. If either file does not exist, that file shall be created as in
 76676 normal execution.

76696

O OK

76697

e Error message

76698

76699

The execution of a batch job by a batch server shall be controlled by job, queue, and server attributes, as defined in this section.

76700

Account_Name Attribute

76701

76702

76703

Batch accounting is an optional feature of batch servers. If a batch server implements accounting, the statements in this section apply and the configuration variable `POSIX2_PBS_ACCOUNTING` shall be set to 1.

76704

76705

A batch server that executes a batch job shall charge the account named in the *Account_Name* attribute of the batch job for resources consumed by the batch job.

76706

76707

If the *Account_Name* attribute of the batch job is absent from the batch job attribute list or is altered while the batch job is in execution, the batch server action is implementation-defined.

76708

Checkpoint Attribute

76709

76710

76711

Batch checkpointing is an optional feature of batch servers. If a batch server implements checkpointing, the statements in this section apply and the configuration variable `POSIX2_PBS_CHECKPOINT` shall be set to 1.

76712

76713

76714

76715

76716

There are two attributes associated with the checkpointing feature: *Checkpoint* and *Minimum_Cpu_Interval*. *Checkpoint* is a batch job attribute, while *Minimum_Cpu_Interval* is a queue attribute. An implementation that does not support checkpointing shall support the *Checkpoint* job attribute to the extent that the batch server shall maintain and pass this attribute to other servers.

76717

76718

76719

The behavior of a batch server that executes a batch job for which the value of the *Checkpoint* attribute is `CHECKPOINT_UNSPECIFIED` is implementation-defined. A batch server that executes a batch job for which the value of the *Checkpoint* attribute is `NO_CHECKPOINT` shall

76720 not checkpoint the batch job.

76721 A batch server that executes a batch job for which the value of the *Checkpoint* attribute is
76722 CHECKPOINT_AT_SHUTDOWN shall checkpoint the batch job only when the batch server
76723 accepts a request to shut down during the time when the batch job is in the RUNNING state.

76724 A batch server that executes a batch job for which the value of the *Checkpoint* attribute is
76725 CHECKPOINT_AT_MIN_CPU_INTERVAL shall checkpoint the batch job at the interval
76726 specified by the *Minimum_Cpu_Interval* attribute of the queue for which the batch job has been
76727 selected. The *Minimum_Cpu_Interval* attribute shall be specified in units of CPU minutes.

76728 A batch server that executes a batch job for which the value of the *Checkpoint* attribute is an
76729 unsigned integer shall checkpoint the batch job at an interval that is the value of either the
76730 *Checkpoint* attribute, or the *Minimum_Cpu_Interval* attribute of the queue for which the batch job
76731 has been selected, whichever is greater. Both intervals shall be in units of CPU minutes. When
76732 the *Minimum_Cpu_Interval* attribute is greater than the *Checkpoint* attribute, the batch job shall
76733 write a warning message to the standard error stream of the batch job.

76734 **Error_Path Attribute**

76735 The *Error_Path* attribute of a running job cannot be changed by a *Modify Batch Job Request*. When
76736 the *Join_Path* attribute of the batch job is set to the value FALSE and the *Keep_Files* attribute of
76737 the batch job does not contain the value KEEP_STD_ERROR, a batch server that executes a batch
76738 job shall perform one of the following actions:

- 76739 • Set the standard error stream of the session leader of the batch job to the path described by
76740 the value of the *Error_Path* attribute of the batch job.
- 76741 • Buffer the standard error of the session leader of the batch job until completion of the batch
76742 job, and when the batch job exits return the contents to the destination described by the
76743 value of the *Error_Path* attribute of the batch job.

76744 Applications shall not rely on having access to the standard error of a batch job prior to the
76745 completion of the batch job.

76746 When the *Error_Path* attribute does not specify a host name, then the batch server shall retain the
76747 standard error of the batch job on the host of execution.

76748 When the *Error_Path* attribute does specify a host name and the *Keep_Files* attribute does not
76749 contain the value KEEP_STD_ERROR, then the final destination of the standard error of the
76750 batch job shall be on the host whose host name is specified.

76751 If the path indicated by the value of the *Error_Path* attribute of the batch job is a relative path, the
76752 batch server shall expand the path relative to the home directory of the user on the host to which
76753 the file is being returned.

76754 When the batch server buffers the standard error of the batch job and the file cannot be opened
76755 for write upon completion of the batch job, then the server shall place the standard error in an
76756 implementation-defined location and notify the user of the location via mail. It shall be possible
76757 for the user to process this mail using the *mailx* utility.

76758 If a batch server that does not buffer the standard error cannot open the standard error path of
76759 the batch job for write access, then the batch server shall abort the batch job.

Execution_Time Attribute

A batch server shall not execute a batch job before the time represented by the value of the *Execution_Time* attribute of the batch job. The *Execution_Time* attribute is defined in seconds since the Epoch.

Hold_Types Attribute

A batch server shall support the following hold types:

- s Can be set or released by a user with at least a privilege level of batch administrator (SYSTEM).
- o Can be set or released by a user with at least a privilege level of batch operator (OPERATOR).
- u Can be set or released by the user with at least a privilege level of user, where the user is defined in the *Job_Owner* attribute (USER).
- n Indicates that none of the *Hold_Types* attributes are set (NO_HOLD).

An implementation may define other hold types. Any additional hold types, how they are specified, their internal representation, their behavior, and how they affect the behavior of other utilities are implementation-defined.

The value of the *Hold_Types* attribute shall be the union of the valid hold types ('s', 'o', 'u', and any implementation-defined hold types), or 'n'.

A batch server shall not execute a batch job if the *Hold_Types* attribute of the batch job has a value other than NO_HOLD. If the *Hold_Types* attribute of the batch job has a value other than NO_HOLD, the batch job shall be in the HELD state.

Job_Owner Attribute

The *Job_Owner* attribute consists of a pair of user name and host name values of the form:

`username@hostname`

A batch server that accepts a *Queue Batch Job Request* shall set the *Job_Owner* attribute to a string that is the *username@hostname* of the user who submitted the job.

Join_Path Attribute

A batch server that executes a batch job for which the value of the *Join_Path* attribute is TRUE shall ignore the value of the *Error_Path* attribute and merge the standard error of the batch job with the standard output of the batch job.

Keep_Files Attribute

A batch server that executes a batch job for which the value of the *Keep_Files* attribute includes the value KEEP_STD_OUTPUT shall retain the standard output of the batch job on the host where execution occurs. The standard output shall be retained in the home directory of the user under whose user ID the batch job is executed and the filename shall be the default filename for the standard output as defined under the `-o` option of the *qsub* utility. The *Output_Path* attribute is not modified.

A batch server that executes a batch job for which the value of the *Keep_Files* attribute includes the value KEEP_STD_ERROR shall retain the standard error of the batch job on the host where execution occurs. The standard error shall be retained in the home directory of the user under whose user ID the batch job is executed and the filename shall be the default filename for

76801 standard error as defined under the `-e` option of the *qsub* utility. The *Error_Path* attribute is not
 76802 modified.

76803 A batch server that executes a batch job for which the value of the *Keep_Files* attribute includes
 76804 values other than `KEEP_STD_OUTPUT` and `KEEP_STD_ERROR` shall retain these other files on
 76805 the host where execution occurs. These files (with implementation-defined names) shall be
 76806 retained in the home directory of the user under whose user identifier the batch job is executed.

76807 **Mail_Points and Mail_Users Attributes**

76808 A batch server that executes a batch job for which one of the values of the *Mail_Points* attribute is
 76809 the value `MAIL_AT_BEGINNING` shall send a mail message to each user account listed in the
 76810 *Mail_Users* attribute of the batch job.

76811 The mail message shall contain at least the batch job identifier, queue, and server at which the
 76812 batch job currently resides, and the *Job_Owner* attribute.

76813 **Output_Path Attribute**

76814 The *Output_Path* attribute of a running job cannot be changed by a *Modify Batch Job Request*.
 76815 When the *Keep_Files* attribute of the batch job does not contain the value `KEEP_STD_OUTPUT`, a
 76816 batch server that executes a batch job shall either:

- 76817 • Set the standard output stream of the session leader of the batch job to the destination
 76818 described by the value of the *Output_Path* attribute of the batch job.

76819 or:

- 76820 • Buffer the standard output of the session leader of the batch job until completion of the
 76821 batch job, and when the batch job exits return the contents to the destination described by
 76822 the value of the *Output_Path* attribute of the batch job.

76823 When the *Output_Path* attribute does not specify a host name, then the batch server shall retain
 76824 the standard output of the batch job on the host of execution.

76825 When the *Keep_Files* attribute does not contain the value `KEEP_STD_OUTPUT` and the
 76826 *Output_Path* attribute does specify a host name, then the final destination of the standard output
 76827 of the batch job shall be on the host specified.

76828 If the path specified in the *Output_Path* attribute of the batch job is a relative path, the batch
 76829 server shall expand the path relative to the home directory of the user on the host to which the
 76830 file is being returned.

76831 Whether or not the batch server buffers the standard output of the batch job until completion of
 76832 the batch job is implementation-defined. Applications shall not rely on having access to the
 76833 standard output of a batch job prior to the completion of the batch job.

76834 When the batch server does buffer the standard output of the batch job and the file cannot be
 76835 opened for write upon completion of the batch job, then the batch server shall place the standard
 76836 output in an implementation-defined location and notify the user of the location via mail. It shall
 76837 be possible for the user to process this mail using the *mailx* utility.

76838 If a batch server that does not buffer the standard output cannot open the standard output path
 76839 of the batch job for write access, then the batch server shall abort the batch job.

Priority Attribute

A batch server implementation may choose to preferentially execute a batch job based on the *Priority* attribute. The interpretation of the batch job *Priority* attribute by a batch server is implementation-defined. If an implementation uses the *Priority* attribute, it shall interpret larger values of the *Priority* attribute to mean the batch job shall be preferentially selected for execution.

Rerunable Attribute

A batch job that began execution but did not complete, because the batch server either shut down or terminated abnormally, shall be requeued if the *Rerunable* attribute of the batch job has the value TRUE.

If a batch job, which was requeued after beginning execution but prior to completion, has a valid checkpoint file and the batch server supports checkpointing, then the batch job shall be restarted from the last valid checkpoint.

If the batch job cannot be restarted from a checkpoint, then when a batch job has a *Rerunable* attribute value of TRUE and was requeued after beginning execution but prior to completion, the batch server shall place the batch job into execution at the beginning of the job.

When a batch job has a *Rerunable* attribute value other than TRUE and was requeued after beginning execution but prior to completion, and the batch job cannot be restarted from a checkpoint, then the batch server shall abort the batch job.

Resource_List Attribute

A batch server that executes a batch job shall establish the resource limits of the session leader of the batch job according to the values of the *Resource_List* attribute of the batch job. Resource limits shall be enforced by an implementation-defined method.

Shell_Path_List Attribute

The *Shell_Path_List* job attribute consists of a list of pairs of pathname and host name values. The host name component can be omitted, in which case the pathname serves as the default pathname when a batch server cannot find the name of the host on which it is running in the list.

A batch server that executes a batch job shall select, from the value of the *Shell_Path_List* attribute of the batch job, a pathname where the shell to execute the batch job shall be found. The batch server shall select the pathname, in order of preference, according to the following methods:

- Select the pathname that contains the name of the host on which the batch server is running.
- Select the pathname for which the host name has been omitted.
- Select the pathname for the login shell of the user under which the batch job is to execute.

If the shell path value selected is an invalid pathname, the batch server shall abort the batch job.

If the value of the selected pathname from the *Shell_Path_List* attribute of the batch job represents a partial path, the batch server shall expand the path relative to a path that is implementation-defined.

The batch server that executes the batch job shall execute the program that was selected from the *Shell_Path_List* attribute of the batch job. The batch server shall pass the path to the script of the batch job as the first argument to the shell program.

User_List Attribute

The *User_List* job attribute consists of a list of pairs of user name and host name values. The host name component can be omitted, in which case the user name serves as a default when a batch server cannot find the name of the host on which it is running in the list.

A batch server that executes a batch job shall select, from the value of the *User_List* attribute of the batch job, a user name under which to create the session leader. The server shall select the user name, in order of preference, according to the following methods:

- Select the user name of a value that contains the name of the host on which the batch server executes.
- Select the user name of a value for which the host name has been omitted.
- Select the user name from the *Job_Owner* attribute of the batch job.

Variable_List Attribute

A batch server that executes a batch job shall create, in the environment of the session leader of the batch job, each environment variable listed in the *Variable_List* attribute of the batch job, and set the value of each such environment variable to that of the corresponding variable in the variable list.

3.2.2.2 Batch Job Routing

To route a batch job is to select a queue from a list and move the batch job to that queue.

A batch server that has routing queues, which have been started, shall route the jobs in the routing queues owned by the batch server. A batch server may delay the routing of a batch job. The algorithm for selecting a batch job and the queue to which it will be routed is implementation-defined.

When a routing queue has multiple possible destinations specified, then the precedence of the destinations is implementation-defined.

A batch server that routes a batch job to a queue at another server shall move the batch job into the target queue with a *Queue Batch Job Request*.

If the target server rejects the *Queue Batch Job Request*, the routing server shall retry routing the batch job or abort the batch job. A batch server that retries failed routings shall provide a means for the batch administrator to specify the number of retries and the minimum period of time between retries. The means by which an administrator specifies the number of retries and the delay between retries is implementation-defined. When the number of retries specified by the batch administrator has been exhausted, the batch server shall abort the batch job and perform the functions of *Batch Job Exit*; see [Section 3.2.2.3](#).

3.2.2.3 Batch Job Exit

For each job in the EXITING state, the batch server that exited the batch job shall perform the following deferred services in the order specified:

1. If buffering standard error, move that file into the location specified by the *Error_Path* attribute of the batch job.
2. If buffering standard output, move that file into the location specified by the *Output_Path* attribute of the batch job.

3. If the *Mail_Points* attribute of the batch job includes MAIL_AT_EXIT, send mail to the users listed in the *Mail_Users* attribute of the batch job. The mail message shall contain at least the batch job identifier, queue, and server at which the batch job currently resides, and the *Job_Owner* attribute.
4. Remove the batch job from the queue.

If a batch server that buffers the standard error output cannot return the standard error file to the standard error path at the time the batch job exits, the batch server shall do one of the following:

- Mail the standard error file to the batch job owner.
- Save the standard error file and mail the location and name of the file where the standard error is stored to the batch job owner.
- Save the standard error file and notify the user by other implementation-defined means.

If a batch server that buffers the standard output cannot return the standard output file to the standard output path at the time the batch job exits, the batch server shall do one of the following:

- Mail the standard output file to the batch job owner.
- Save the standard output file and mail the location and name of the file where the standard output is stored to the batch job owner.
- Save the standard output file and notify the user by other implementation-defined means.

At the conclusion of job exit processing, the batch job is no longer managed by a batch server.

3.2.2.4 Batch Server Restart

A batch server that has been either shutdown or terminated abnormally, and has returned to operation, is said to have “restarted”.

Upon restarting, a batch server shall requeue those jobs managed by the batch server that were in the RUNNING state at the time the batch server shut down and for which the *Rerunable* attribute of the batch job has the value TRUE.

Queues are defined to be non-volatile. A batch server shall store the content of queues that it controls in such a way that server and system shutdowns do not erase the content of the queues.

3.2.2.5 Batch Job Abort

A batch server that cannot perform a deferred service for a batch job shall abort the batch job.

A batch server that aborts a batch job shall perform the following services:

- Delete the batch job from the queue in which it resides.
- If the *Mail_Points* attribute of the batch job includes the value MAIL_AT_ABORT, send mail to the users listed in the value of the *Mail_Users* attribute of the job. The mail message shall contain at least the batch job identifier, queue, and server at which the batch job currently resides, the *Job_Owner* attribute, and the reason for the abort.
- If the batch job was in the RUNNING state, terminate the session leader of the executing job by sending the session leader a SIGKILL, place the batch job in the EXITING state, and perform the actions of *Batch Job Exit*.

3.2.3 Requested Batch Services

This section describes the services provided by batch servers in response to requests from clients. Table 3-5 summarizes the current set of batch service requests and for each gives its type (deferred or not) and whether it is an optional function.

Table 3-5 Batch Services Summary

Batch Service	Deferred	Optional
<i>Batch Job Execution</i>	Yes	No
<i>Batch Job Routing</i>	Yes	No
<i>Batch Job Exit</i>	Yes	No
<i>Batch Server Restart</i>	Yes	No
<i>Batch Job Abort</i>	Yes	No
<i>Delete Batch Job Request</i>	No	No
<i>Hold Batch Job Request</i>	No	No
<i>Batch Job Message Request</i>	No	Yes
<i>Batch Job Status Request</i>	No	No
<i>Locate Batch Job Request</i>	No	Yes
<i>Modify Batch Job Request</i>	No	No
<i>Move Batch Job Request</i>	No	No
<i>Queue Batch Job Request</i>	No	No
<i>Batch Queue Status Request</i>	No	No
<i>Release Batch Job Request</i>	No	No
<i>Rerun Batch Job Request</i>	No	No
<i>Select Batch Jobs Request</i>	No	No
<i>Server Shutdown Request</i>	No	No
<i>Server Status Request</i>	No	No
<i>Signal Batch Job Request</i>	No	No
<i>Track Batch Job Request</i>	No	Yes

If a request is rejected because the batch client is not authorized to perform the action, the batch server shall return the same status as when the batch job does not exist.

3.2.3.1 Delete Batch Job Request

A batch job is defined to have been deleted when it has been removed from the queue in which it resides and not instantiated in another queue. A client requests that the server that manages a batch job delete the batch job. Such a request is called a *Delete Batch Job Request*.

A batch server shall reject a *Delete Batch Job Request* if any of the following statements are true:

- The user of the batch client is not authorized to delete the designated job.
- The designated job is not managed by the batch server.
- The designated job is in a state inconsistent with the delete request.

A batch server may reject a *Delete Batch Job Request* for other implementation-defined reasons. The method used to determine whether the user of a client is authorized to perform the requested action is implementation-defined.

A batch server requested to delete a batch job shall delete the batch job if the batch job exists and is not in the EXITING state.

A batch server that deletes a batch job in the RUNNING state shall send a SIGKILL signal to the

77003 session leader of the batch job. It is implementation-defined whether additional signals are sent
77004 to the session leader of the job prior to sending the SIGKILL signal.

77005 A batch server that deletes a batch job in the RUNNING state shall place the batch job in the
77006 EXITING state after it has killed the session leader of the batch job and shall perform the actions
77007 of *Batch Job Exit*.

77008 3.2.3.2 *Hold Batch Job Request*

77009 A batch client can request that the batch server add one or more holds to a batch job. Such a
77010 request is called a *Hold Batch Job Request*.

77011 A batch server shall reject a *Hold Batch Job Request* if any of the following statements are true:

- 77012 • The batch server does not support one or more of the requested holds to be added to the
77013 batch job.
- 77014 • The user of the batch client is not authorized to add one or more of the requested holds to
77015 the batch job.
- 77016 • The batch server does not manage the specified job.
- 77017 • The designated job is in the EXITING state.

77018 A batch server may reject a *Hold Batch Job Request* for other implementation-defined reasons. The
77019 method used to determine whether the user of a client is authorized to perform the requested
77020 action is implementation-defined.

77021 A batch server that accepts a *Hold Batch Job Request* for a batch job in the RUNNING state shall
77022 place a hold on the batch job. The effects, if any, the hold will have on a batch job in the
77023 RUNNING state are implementation-defined.

77024 A batch server that accepts a *Hold Batch Job Request* shall add each type of hold listed in the *Hold*
77025 *Batch Job Request*, that is not already present, to the value of the *Hold_Types* attribute of the batch
77026 job.

77027 3.2.3.3 *Batch Job Message Request*

77028 *Batch Job Message Request* is an optional feature of batch servers. If an implementation supports
77029 *Batch Job Message Request*, the statements in this section apply and the configuration variable
77030 POSIX2_PBS_MESSAGE shall be set to 1.

77031 A batch client can request that a batch server write a message into certain output files of a batch
77032 job. Such a request is called a *Batch Job Message Request*.

77033 A batch server shall reject a *Batch Job Message Request* if any of the following statements are true:

- 77034 • The batch server does not support sending messages to jobs.
- 77035 • The user of the batch client is not authorized to post a message to the designated job.
- 77036 • The designated job does not exist on the batch server.
- 77037 • The designated job is not in the RUNNING state.

77038 A batch server may reject a *Batch Job Message Request* for other implementation-defined reasons.
77039 The method used to determine whether the user of a client is authorized to perform the
77040 requested action is implementation-defined.

77041 A batch server that accepts a *Batch Job Message Request* shall write the message sent by the batch
77042 client into the files indicated by the batch client.

77043 3.2.3.4 *Batch Job Status Request*

77044 A batch client can request that a batch server respond with the status and attributes of a batch
77045 job. Such a request is called a *Batch Job Status Request*.

77046 A batch server shall reject a *Batch Job Status Request* if any of the following statements are true:

- 77047 • The user of the batch client is not authorized to query the status of the designated job.
- 77048 • The designated job is not managed by the batch server.

77049 A batch server may reject a *Batch Job Status Request* for other implementation-defined reasons.
77050 The method used to determine whether the user of a client is authorized to perform the
77051 requested action is implementation-defined.

77052 A batch server that accepts a *Batch Job Status Request* shall return a *Batch Job Status Message* to the
77053 batch client.

77054 A batch server may return other information in response to a *Batch Job Status Request*.

77055 3.2.3.5 *Locate Batch Job Request*

77056 *Locate Batch Job Request* is an optional feature of batch servers. If an implementation supports
77057 *Locate Batch Job Request*, the statements in this section apply and the configuration variable
77058 POSIX2_PBS_LOCATE shall be set to 1.

77059 A batch client can ask a batch server to respond with the location of a batch job that was created
77060 by the batch server. Such a request is called a *Locate Batch Job Request*.

77061 A batch server that accepts a *Locate Batch Job Request* shall return a *Batch Job Location Message* to
77062 the batch client.

77063 A batch server may reject a *Locate Batch Job Request* for a batch job that was not created by that
77064 server.

77065 A batch server may reject a *Locate Batch Job Request* for a batch job that is no longer managed by
77066 that server; that is, for a batch job that is not in a queue owned by that server.

77067 A batch server may reject a *Locate Batch Job Request* for other implementation-defined reasons.

77068 3.2.3.6 *Modify Batch Job Request*

77069 Batch clients modify (alter) the attributes of a batch job by making a request to the server that
77070 manages the batch job. Such a request is called a *Modify Batch Job Request*.

77071 A batch server shall reject a *Modify Batch Job Request* if any of the following statements are true:

- 77072 • The user of the batch client is not authorized to make the requested modification to the
77073 batch job.
- 77074 • The designated job is not managed by the batch server.
- 77075 • The requested modification is inconsistent with the state of the batch job.
- 77076 • An unrecognized resource is requested for a batch job in an execution queue.

77077 A batch server may reject a *Modify Batch Job Request* for other implementation-defined reasons.
77078 The method used to determine whether the user of a client is authorized to perform the
77079 requested action is implementation-defined.

77080 A batch server that accepts a *Modify Batch Job Request* shall modify all the specified attributes of
77081 the batch job. A batch server that rejects a *Modify Batch Job Request* shall modify none of the

77082 attributes of the batch job.

77083 If the servicing by a batch server of an otherwise valid request would result in no change, then
77084 the batch server shall indicate successful completion of the request.

77085 3.2.3.7 *Move Batch Job Request*

77086 A batch client can request that a batch server move a batch job to another destination. Such a
77087 request is called a *Move Batch Job Request*.

77088 A batch server shall reject a *Move Batch Job Request* if any of the following statements are true:

- 77089 • The user of the batch client is not authorized to remove the designated job from the queue
77090 in which the batch job resides.
- 77091 • The user of the batch client is not authorized to move the designated job to the destination.
- 77092 • The designated job is not managed by the batch server.
- 77093 • The designated job is in the EXITING state.
- 77094 • The destination is inaccessible.

77095 A batch server can reject a *Move Batch Job Request* for other implementation-defined reasons. The
77096 method used to determine whether the user of a client is authorized to perform the requested
77097 action is implementation-defined.

77098 A batch server that accepts a *Move Batch Job Request* shall perform the following services:

- 77099 • Queue the designated job at the destination.
- 77100 • Remove the designated job from the queue in which the batch job resides.

77101 If the destination resides on another batch server, the batch server shall queue the batch job at
77102 the destination by sending a *Queue Batch Job Request* to the other server. If the *Queue Batch Job*
77103 *Request* fails, the batch server shall reject the *Move Batch Job Request*. If the *Queue Batch Job*
77104 *Request* succeeds, the batch server shall remove the batch job from its queue.

77105 The batch server shall not modify any attributes of the batch job.

77106 3.2.3.8 *Queue Batch Job Request*

77107 A batch queue is controlled by one and only one batch server. A batch server is said to own the
77108 queues that it controls. Batch clients make requests of batch servers to have jobs queued. Such a
77109 request is called a *Queue Batch Job Request*.

77110 A batch server requested to queue a batch job for which the queue is not specified shall select an
77111 implementation-defined queue for the batch job. Such a queue is called the “default queue” of
77112 the batch server. The implementation shall provide the means for a batch administrator to
77113 specify the default queue. The queue, whether specified or defaulted, is called the “target
77114 queue”.

77115 A batch server shall reject a *Queue Batch Job Request* if any of the following statements are true:

- 77116 • The client is not authorized to create a batch job in the target queue.
- 77117 • The request specifies a queue that does not exist on the batch server.
- 77118 • The target queue is an execution queue and the batch server cannot satisfy a resource
77119 requirement of the batch job.

- 77120 • The target queue is an execution queue and an unrecognized resource is requested.
- 77121 • The target queue is an execution queue, the batch server does not support checkpointing,
- 77122 and the value of the *Checkpoint* attribute of the batch job is not NO_CHECKPOINT.
- 77123 • The job requires access to a user identifier that the batch client is not authorized to access.

77124 A batch server may reject a *Queue Batch Job Request* for other implementation-defined reasons.

77125 A batch server that accepts a *Queue Batch Job Request* for a batch job for which the
 77126 PBS_O_QUEUE value is missing from the value of the *Variable_List* attribute of the batch job
 77127 shall add that variable to the list and set the value to the name of the target queue. Once set, no
 77128 server shall change the value of PBS_O_QUEUE, even if the batch job is moved to another
 77129 queue.

77130 A batch server that accepts a *Queue Batch Job Request* for a batch job for which the PBS_JOBID
 77131 value is missing from the value of the *Variable_List* attribute shall add that variable to the list and
 77132 set the value to the batch job identifier assigned by the server in the format:

77133 `sequence_number.server`

77134 A batch server that accepts a *Queue Batch Job Request* for a batch job for which the
 77135 PBS_JOBNAME value is missing from the value of the *Variable_List* attribute of the batch job
 77136 shall add that variable to the list and set the value to the *Job_Name* attribute of the batch job.

77137 3.2.3.9 *Batch Queue Status Request*

77138 A batch client can request that a batch server respond with the status and attributes of a queue.
 77139 Such a request is called a *Batch Queue Status Request*.

77140 A batch server shall reject a *Batch Queue Status Request* if any of the following statements are
 77141 true:

- 77142 • The user of the batch client is not authorized to query the status of the designated queue.
- 77143 • The designated queue does not exist on the batch server.

77144 A batch server may reject a *Batch Queue Status Request* for other implementation-defined reasons.
 77145 The method used to determine whether the user of a client is authorized to perform the
 77146 requested action is implementation-defined.

77147 A batch server that accepts a *Batch Queue Status Request* shall return a *Batch Queue Status Reply* to
 77148 the batch client.

77149 3.2.3.10 *Release Batch Job Request*

77150 A batch client can request that the server remove one or more holds from a batch job. Such a
 77151 request is called a *Release Batch Job Request*.

77152 A batch server shall reject a *Release Batch Job Request* if any of the following statements are true:

- 77153 • The user of the batch client is not authorized to remove one or more of the requested holds
- 77154 from the batch job.
- 77155 • The batch server does not manage the specified job.

77156 A batch server may reject a *Release Batch Job Request* for other implementation-defined reasons.
 77157 The method used to determine whether the user of a client is authorized to perform the
 77158 requested action is implementation-defined.

77159 A batch server that accepts a *Release Batch Job Request* shall remove each type of hold listed in the

77160 *Release Batch Job Request*, that is present, from the value of the *Hold_Types* attribute of the batch
77161 job.

77162 3.2.3.11 *Rerun Batch Job Request*

77163 To rerun a batch job is to kill the session leader of the batch job and leave the batch job eligible
77164 for re-execution. A batch client can request that a batch server rerun a batch job. Such a request
77165 is called *Rerun Batch Job Request*.

77166 A batch server shall reject a *Rerun Batch Job Request* if any of the following statements are true:

- 77167 • The user of the batch client is not authorized to rerun the designated job.
- 77168 • The *Rerunable* attribute of the designated job has the value FALSE.
- 77169 • The designated job is not in the RUNNING state.
- 77170 • The batch server does not manage the designated job.

77171 A batch server may reject a *Rerun Batch Job Request* for other implementation-defined reasons.
77172 The method used to determine whether the user of a client is authorized to perform the
77173 requested action is implementation-defined.

77174 A batch server that rejects a *Rerun Batch Job Request* shall in no way modify the execution of the
77175 batch job.

77176 A batch server that accepts a request to rerun a batch job shall perform the following services:

- 77177 • Requeue the batch job in the execution queue in which it was executing.
- 77178 • Send a SIGKILL signal to the process group of the session leader of the batch job.

77179 An implementation may indicate to the batch job owner that the batch job has been rerun.
77180 Whether and how the batch job owner is notified that a batch job is rerun is implementation-
77181 defined.

77182 A batch server that reruns a batch job may send other implementation-defined signals to the
77183 session leader of the batch job prior to sending the SIGKILL signal.

77184 A batch server may preferentially select a rerun job for execution. Whether rerun jobs shall be
77185 selected for execution before other jobs is implementation-defined.

77186 3.2.3.12 *Select Batch Jobs Request*

77187 A batch client can request from a batch server a list of jobs managed by that server that match a
77188 list of selection criteria. Such a request is called a *Select Batch Jobs Request*. All the batch jobs
77189 managed by the batch server that receives the request are candidates for selection.

77190 A batch server that accepts a *Select Batch Jobs Request* shall return a list of zero or more job
77191 identifiers that correspond to jobs that meet the selection criteria.

77192 If the batch client is not authorized to query the status of a batch job, the batch server shall not
77193 select the batch job.

77194 3.2.3.13 *Server Shutdown Request*

77195 A batch server is defined to have shut down when it does not respond to requests from clients
 77196 and does not perform deferred services for jobs. A batch client can request that a batch server
 77197 shut down. Such a request is called a *Server Shutdown Request*.

77198 A batch server shall reject a *Server Shutdown Request* from a client that is not authorized to shut
 77199 down the batch server. The method used to determine whether the user of a client is authorized
 77200 to perform the requested action is implementation-defined.

77201 A batch server may reject a *Server Shutdown Request* for other implementation-defined reasons.
 77202 The reasons for which a *Server Shutdown Request* may be rejected are implementation-defined.

77203 At server shutdown, a batch server shall do, in order of preference, one of the following:

- 77204 • If checkpointing is implemented and the batch job is checkpointable, then checkpoint the
 77205 batch job and requeue it.
- 77206 • If the batch job is rerunnable, then requeue the batch job to be rerun (restarted from the
 77207 beginning).
- 77208 • Abort the batch job.

77209 3.2.3.14 *Server Status Request*

77210 A batch client can request that a batch server respond with the status and attributes of the batch
 77211 server. Such a request is called a *Server Status Request*.

77212 A batch server shall reject a *Server Status Request* if the following statement is true:

- 77213 • The user of the batch client is not authorized to query the status of the designated server.

77214 A batch server may reject a *Server Status Request* for other implementation-defined reasons. The
 77215 method used to determine whether the user of a client is authorized to perform the requested
 77216 action is implementation-defined.

77217 A batch server that accepts a *Server Status Request* shall return a *Server Status Reply* to the batch
 77218 client.

77219 3.2.3.15 *Signal Batch Job Request*

77220 A batch client can request that a batch server signal the session leader of a batch job. Such a
 77221 request is called a *Signal Batch Job Request*.

77222 A batch server shall reject a *Signal Batch Job Request* if any of the following statements are true:

- 77223 • The user of the batch client is not authorized to signal the batch job.
- 77224 • The job is not in the RUNNING state.
- 77225 • The batch server does not manage the designated job.
- 77226 • The requested signal is not supported by the implementation.

77227 A batch server may reject a *Signal Batch Job Request* for other implementation-defined reasons.
 77228 The method used to determine whether the user of a client is authorized to perform the
 77229 requested action is implementation-defined.

77230 A batch server that accepts a request to signal a batch job shall send the signal requested by the
 77231 batch client to the process group of the session leader of the batch job.

77232 3.2.3.16 *Track Batch Job Request*

77233 *Track Batch Job Request* is an optional feature of batch servers. If an implementation supports
 77234 *Track Batch Job Request*, the statements in this section apply and the configuration variable
 77235 POSIX2_PBS_TRACK shall be set to 1.

77236 *Track Batch Job Request* provides a method for tracking the current location of a batch job. Clients
 77237 may use the tracking information to determine the batch server that should receive a batch
 77238 server request.

77239 If *Track Batch Job Request* is supported by a batch server, then when the batch server queues a
 77240 batch job as a result of a *Queue Batch Job Request*, and the batch server is not the batch server that
 77241 created the batch job, the batch server shall send a *Track Batch Job Request* to the batch server that
 77242 created the job.

77243 If *Track Batch Job Request* is supported by a batch server, then the *Track Batch Job Request* may also
 77244 be sent to other servers as a backup to the primary server. The method by which backup servers
 77245 are specified is implementation-defined.

77246 If *Track Batch Job Request* is supported by a batch server that receives a *Track Batch Job Request*,
 77247 then the batch server shall record the current location of the batch job as contained in the
 77248 request.

77249 **3.3 Common Behavior for Batch Environment Utilities**77250 **3.3.1 Batch Job Identifier**

77251 A utility shall recognize *job_identifiers* of the format:

77252 [sequence_number] [.server_name] [@server]

77253 where:

77254 *sequence_number* An integer that, when combined with *server_name*, provides a batch job
 77255 identifier that is unique within the batch system.

77256 *server_name* The name of the batch server to which the batch job was originally submitted.

77257 *server* The name of the batch server that is currently managing the batch job.

77258 If the application omits the batch *server_name* portion of a batch job identifier, a utility shall use
 77259 the name of a default batch server.

77260 If the application omits the batch *server* portion of a batch job identifier, a utility shall use:

- 77261 • The batch server indicated by *server_name*, if present
- 77262 • The name of the default batch server
- 77263 • The name of the batch server that is currently managing the batch job

77264 If only @*server* is specified, then the status of all jobs owned by the user on the requested server
 77265 is listed.

77266 The means by which a utility determines the default batch server is implementation-defined.

77267 If the application presents the batch *server* portion of a batch job identifier to a utility, the utility
 77268 shall send the request to the specified server.

A strictly conforming application shall use the syntax described for the job identifier. Whenever a batch job identifier is specified whose syntax is not recognized by an implementation, then a message for each error that occurs shall be written to standard error and the utility shall exit with an exit status greater than zero.

When a batch job identifier is supplied as an argument to a batch utility and the *server_name* portion of the batch job identifier is omitted, then the utility shall use the name of the default batch server.

When a batch job identifier is supplied as an argument to a batch utility and the batch *server* portion of the batch job identifier is omitted, then the utility shall use either:

- The name of the default batch server
- or:
- The name of the batch server that is currently managing the batch job

When a batch job identifier is supplied as an argument to a batch utility and the batch *server* portion of the batch job identifier is specified, then the utility shall send the required *Batch Server Request* to the specified server.

3.3.2 Destination

The utility shall recognize a *destination* of the format:

[*queue*] [*@server*]

where:

queue The name of a valid execution or routing queue at the batch server denoted by *@server*, defined as a string of up to 15 alphanumeric characters in the portable character set (see XBD [Section 6.1](#), on page 125) where the first character is alphabetic.

server The name of a batch server, defined as a string of alphanumeric characters in the portable character set.

If the application omits the batch *server* portion of a destination, then the utility shall use either:

- The name of the default batch server
- or:
- The name of the batch server that is currently managing the batch job

The means by which a utility determines the default batch server is implementation-defined.

If the application omits the *queue* portion of a destination, then the utility shall use the name of the default queue at the batch server chosen. The means by which a batch server determines its default queue is implementation-defined. If a destination is specified in the *queue@server* form, then the utility shall use the specified queue at the specified server.

A strictly conforming application shall use the syntax described for a destination. Whenever a destination is specified whose syntax is not recognized by an implementation, then a message shall be written to standard error and the utility shall exit with an exit status greater than zero.

3.3.3 Multiple Keyword-Value Pairs

For each option that can have multiple keyword-value pair arguments, the following rules shall apply. Examples of options that can have list-oriented option-arguments are `-u value@keyword` and `-l keyword=value`.

1. If a batch utility is presented with a list-oriented option-argument for which a keyword has a corresponding value that begins with a single or double-quote, then the utility shall stop interpreting the input stream for delimiters until a second single or double-quote, respectively, is encountered. This feature allows some flexibility for a <comma> (',') or <equals-sign> ('=') to be part of the value string for a particular keyword; for example:

```
keywd1='val1,val2',keywd2="val3,val4"
```

Note: This may require the user to escape the quotes as in the following command:

```
foo -xkeywd1=\'val1,val2\',keywd2=\"val3,val4\"
```

2. If a batch server is presented with a list-oriented attribute that has a keyword that was encountered earlier in the list, then the later entry for that keyword shall replace the earlier entry.
3. If a batch server is presented with a list-oriented attribute that has a keyword without any corresponding value of the form *keyword=* or *@keyword* and the same keyword was encountered earlier in the list, then the prior entry for that keyword shall be ignored by the batch server.
4. If a batch utility is expecting a list-oriented option-argument entry of the form *keyword=value*, but is presented with an entry of the form *keyword* without any corresponding *value*, then the entry shall be treated as though a default value of NULL was assigned (that is, *keyword=NULL*) for entry parsing purposes. The utility shall include only the keyword, not the NULL value, in the associated job attribute.
5. If a batch utility is expecting a list-oriented option-argument entry of the form *value@keyword*, but is presented with an entry of the form *value* without any corresponding *keyword*, then the entry shall be treated as though a keyword of NULL was assigned (that is, *value@NULL*) for entry parsing purposes. The utility shall include only the value, not the NULL keyword, in the associated job attribute.
6. A batch server shall accept a list-oriented attribute that has multiple occurrences of the same keyword, interpreting the keywords, in order, with the last value encountered taking precedence over prior instances of the same keyword. This rule allows, but does not require, a batch utility to preprocess the attribute to remove duplicate keywords.
7. If a batch utility is presented with multiple list-oriented option-arguments on the command line or in script directives, or both, for a single option, then the utility shall concatenate, in order, any command line keyword and value pairs to the end of any directive keyword and value pairs separated by a single <comma> to produce a single string that is an equivalent, valid option-argument. The resulting string shall be assigned to the associated attribute of the batch job (after optionally removing duplicate entries as described in item 6).

77346

Chapter 4

77347

Utilities

77348

This chapter contains the definitions of the utilities, as follows:

77349

- Mandatory utilities that are present on every conformant system

77350

- Optional utilities that are present only on systems supporting the associated option; see [Section 1.7.1](#) (on page 7) for information on the options in this volume of POSIX.1-2008

77351

NAME

admin — create and administer SCCS files (**DEVELOPMENT**)

SYNOPSIS

```

admin -i[name] [-n] [-a login] [-d flag] [-e login] [-f flag]
      [-m mrlist] [-r rel] [-t[name] [-y[comment]]] newfile

admin -n [-a login] [-d flag] [-e login] [-f flag] [-m mrlist]
      [-t[name]] [-y[comment]] newfile...

admin [-a login] [-d flag] [-m mrlist] [-r rel] [-t[name]] file...

admin -h file...

admin -z file...
```

DESCRIPTION

The *admin* utility shall create new SCCS files or change parameters of existing ones. If a named file does not exist, it shall be created, and its parameters shall be initialized according to the specified options. Parameters not initialized by an option shall be assigned a default value. If a named file does exist, parameters corresponding to specified options shall be changed, and other parameters shall be left as is.

All SCCS filenames supplied by the application shall be of the form *s.filename*. New SCCS files shall be given read-only permission mode. Write permission in the parent directory is required to create a file. All writing done by *admin* shall be to a temporary *x-file*, named *x.filename* (see *get*) created with read-only mode if *admin* is creating a new SCCS file, or created with the same mode as that of the SCCS file if the file already exists. After successful execution of *admin*, the SCCS file shall be removed (if it exists), and the *x-file* shall be renamed with the name of the SCCS file. This ensures that changes are made to the SCCS file only if no errors occur.

The *admin* utility shall also use a transient lock file (named *z.filename*), which is used to prevent simultaneous updates to the SCCS file; see *get*.

OPTIONS

The *admin* utility shall conform to XBD [Section 12.2](#) (on page 215), except that the *-i*, *-t*, and *-y* options have optional option-arguments. These optional option-arguments shall not be presented as separate arguments. The following options are supported:

- n** Create a new SCCS file. When *-n* is used without *-i*, the SCCS file shall be created with control information but without any file data.
- i[name]** Specify the *name* of a file from which the text for a new SCCS file shall be taken. The text constitutes the first delta of the file (see the *-r* option for the delta numbering scheme). If the *-i* option is used, but the *name* option-argument is omitted, the text shall be obtained by reading the standard input. If this option is omitted, the SCCS file shall be created with control information but without any file data. The *-i* option implies the *-n* option.
- r SID** Specify the SID of the initial delta to be inserted. This SID shall be a trunk SID; that is, the branch and sequence numbers shall be zero or missing. The level number is optional, and defaults to 1.
- t[name]** Specify the *name* of a file from which descriptive text for the SCCS file shall be taken. In the case of existing SCCS files (neither *-i* nor *-n* is specified):

77394		• A -t option without a <i>name</i> option-argument shall cause the removal of
77395		descriptive text (if any) currently in the SCCS file.
77396		• A -t option with a <i>name</i> option-argument shall cause the text (if any) in the
77397		named file to replace the descriptive text (if any) currently in the SCCS file.
77398	-f flag	Specify a <i>flag</i> , and, possibly, a value for the <i>flag</i> , to be placed in the SCCS file.
77399		Several -f options may be supplied on a single <i>admin</i> command line.
77400		Implementations shall recognize the following flags and associated values:
77401	b	Allow use of the -b option on a <i>get</i> command to create branch deltas.
77402	cceil	Specify the highest release (that is, ceiling), a number less than or equal to
77403		9999, which may be retrieved by a <i>get</i> command for editing. The default
77404		value for an unspecified c flag shall be 9999.
77405	ffloor	Specify the lowest release (that is, floor), a number greater than 0 but less
77406		than 9999, which may be retrieved by a <i>get</i> command for editing. The
77407		default value for an unspecified f flag shall be 1.
77408	dSID	Specify the default delta number (SID) to be used by a <i>get</i> command.
77409	istr	Treat the “No ID keywords” message issued by <i>get</i> or <i>delta</i> as a fatal error.
77410		In the absence of this flag, the message is only a warning. The message is
77411		issued if no SCCS identification keywords (see <i>get</i>) are found in the text
77412		retrieved or stored in the SCCS file. If a value is supplied, the application
77413		shall ensure that the keywords exactly match the given string; however,
77414		the string shall contain a keyword, and no embedded <newline>
77415		characters.
77416	j	Allow concurrent <i>get</i> commands for editing on the same SID of an SCCS
77417		file. This allows multiple concurrent updates to the same version of the
77418		SCCS file.
77419	llist	Specify a <i>list</i> of releases to which deltas can no longer be made (that is, <i>get</i>
77420		-e against one of these locked releases fails). Conforming applications
77421		shall use the following syntax to specify a <i>list</i> . Implementations may
77422		accept additional forms as an extension:
77423		<list> ::= a <range-list>
77424		<range-list> ::= <range> <range-list>, <range>
77425		<range> ::= <SID>
77426		The character <i>a</i> in the <i>list</i> shall be equivalent to specifying all releases for
77427		the named SCCS file. The non-terminal <SID> in range shall be the delta
77428		number of an existing delta associated with the SCCS file.
77429	n	Cause <i>delta</i> to create a null delta in each of those releases (if any) being
77430		skipped when a delta is made in a new release (for example, in making
77431		delta 5.1 after delta 2.7, releases 3 and 4 are skipped). These null deltas
77432		shall serve as anchor points so that branch deltas may later be created
77433		from them. The absence of this flag shall cause skipped releases to be
77434		nonexistent in the SCCS file, preventing branch deltas from being created
77435		from them in the future. During the initial creation of an SCCS file, the n
77436		flag may be ignored; that is, if the -r option is used to set the release
77437		number of the initial SID to a value greater than 1, null deltas need not be
77438		created for the “skipped” releases.

77439	qtext	Substitute user-definable <i>text</i> for all occurrences of the %Q% keyword in the SCCS file text retrieved by <i>get</i> .
77440		
77441	mmod	Specify the module name of the SCCS file substituted for all occurrences of the %M% keyword in the SCCS file text retrieved by <i>get</i> . If the m flag is not specified, the value assigned shall be the name of the SCCS file with the leading ' .' removed.
77442		
77443		
77444		
77445	ttype	Specify the <i>type</i> of module in the SCCS file substituted for all occurrences of the %Y% keyword in the SCCS file text retrieved by <i>get</i> .
77446		
77447	vpgm	Cause <i>delta</i> to prompt for modification request (MR) numbers as the reason for creating a delta. The optional value specifies the name of an MR number validation program. (If this flag is set when creating an SCCS file, the application shall ensure that the m option is also used even if its value is null.)
77448		
77449		
77450		
77451		
77452	-d flag	Remove (delete) the specified <i>flag</i> from an SCCS file. Several -d options may be supplied on a single <i>admin</i> command. See the -f option for allowable <i>flag</i> names. (The l list flag gives a <i>list</i> of releases to be unlocked. See the -f option for further description of the l flag and the syntax of a <i>list</i> .)
77453		
77454		
77455		
77456	-a login	Specify a <i>login</i> name, or numerical group ID, to be added to the list of users who may make deltas (changes) to the SCCS file. A group ID shall be equivalent to specifying all <i>login</i> names common to that group ID. Several -a options may be used on a single <i>admin</i> command line. As many <i>logins</i> , or numerical group IDs, as desired may be on the list simultaneously. If the list of users is empty, then anyone may add deltas. If <i>login</i> or group ID is preceded by a '!', the users so specified shall be denied permission to make deltas.
77457		
77458		
77459		
77460		
77461		
77462		
77463	-e login	Specify a <i>login</i> name, or numerical group ID, to be erased from the list of users allowed to make deltas (changes) to the SCCS file. Specifying a group ID is equivalent to specifying all <i>login</i> names common to that group ID. Several -e options may be used on a single <i>admin</i> command line.
77464		
77465		
77466		
77467	-y[comment]	Insert the <i>comment</i> text into the SCCS file as a comment for the initial delta in a manner identical to that of <i>delta</i> . In the POSIX locale, omission of the -y option shall result in a default comment line being inserted in the form:
77468		
77469		
77470		"date and time created %s %s by %s", <date>, <time>, <login>
77471		where <date> is expressed in the format of the <i>date</i> utility's %Y/%m/%d conversion specification, <time> in the format of the <i>date</i> utility's %T conversion specification format, and <login> is the login name of the user creating the file.
77472		
77473		
77474	-m mrlist	Insert the list of modification request (MR) numbers into the SCCS file as the reason for creating the initial delta in a manner identical to <i>delta</i> . The application shall ensure that the v flag is set and the MR numbers are validated if the v flag has a value (the name of an MR number validation program). A diagnostic message shall be written if the v flag is not set or MR validation fails.
77475		
77476		
77477		
77478		
77479	-h	Check the structure of the SCCS file and compare the newly computed checksum with the checksum that is stored in the SCCS file. If the newly computed checksum does not match the checksum in the SCCS file, a diagnostic message shall be written.
77480		
77481		
77482		

77483 **-z** Recompute the SCCS file checksum and store it in the first line of the SCCS file (see
 77484 the **-h** option above). Note that use of this option on a truly corrupted file may
 77485 prevent future detection of the corruption.

77486 OPERANDS

77487 The following operands shall be supported:

77488 *file* A pathname of an existing SCCS file or a directory. If *file* is a directory, the *admin*
 77489 utility shall behave as though each file in the directory were specified as a named
 77490 file, except that non-SCCS files (last component of the pathname does not begin
 77491 with **s**.) and unreadable files shall be silently ignored.

77492 *newfile* A pathname of an SCCS file to be created.

77493 If exactly one *file* or *newfile* operand appears, and it is **'-'**, the standard input shall be read; each
 77494 line of the standard input shall be taken to be the name of an SCCS file to be processed. Non-
 77495 SCCS files and unreadable files shall be silently ignored.

77496 STDIN

77497 The standard input shall be a text file used only if **-i** is specified without an option-argument or
 77498 if a *file* or *newfile* operand is specified as **'-'**. If the first character of any standard input line is
 77499 <SOH> in the POSIX locale, the results are unspecified.

77500 INPUT FILES

77501 The existing SCCS files shall be text files of an unspecified format.

77502 The application shall ensure that the file named by the **-i** option's *name* option-argument shall
 77503 be a text file; if the first character of any line in this file is <SOH> in the POSIX locale, the results
 77504 are unspecified. If this file contains more than 99 999 lines, the number of lines recorded in the
 77505 header for this file shall be 99 999 for this delta.

77506 ENVIRONMENT VARIABLES

77507 The following environment variables shall affect the execution of *admin*:

77508 **LANG** Provide a default value for the internationalization variables that are unset or null.
 77509 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization
 77510 variables used to determine the values of locale categories.)

77511 **LC_ALL** If set to a non-empty string value, override the values of all the other
 77512 internationalization variables.

77513 **LC_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as
 77514 characters (for example, single-byte as opposed to multi-byte characters in
 77515 arguments and input files).

77516 **LC_MESSAGES**

77517 Determine the locale that should be used to affect the format and contents of
 77518 diagnostic messages written to standard error and the contents of the default **-y**
 77519 comment.

77520 **NLSPATH** Determine the location of message catalogs for the processing of **LC_MESSAGES**.

77521 ASYNCHRONOUS EVENTS

77522 Default.

77523 STDOUT

77524 Not used.

77525 STDERR

77526 The standard error shall be used only for diagnostic messages.

77527 OUTPUT FILES

77528 Any SCCS files created shall be text files of an unspecified format. During processing of a *file*, a
77529 locking *z-file*, as described in *get* (on page 2788), may be created and deleted.

77530 EXTENDED DESCRIPTION

77531 None.

77532 EXIT STATUS

77533 The following exit values shall be returned:

77534 0 Successful completion.

77535 >0 An error occurred.

77536 CONSEQUENCES OF ERRORS

77537 Default.

77538 APPLICATION USAGE

77539 It is recommended that directories containing SCCS files be writable by the owner only, and that
77540 SCCS files themselves be read-only. The mode of the directories should allow only the owner to
77541 modify SCCS files contained in the directories. The mode of the SCCS files prevents any
77542 modification at all except by SCCS commands.

77543 EXAMPLES

77544 None.

77545 RATIONALE

77546 None.

77547 FUTURE DIRECTIONS

77548 None.

77552 CHANGE HISTORY

77553 First released in Issue 2.

77554 Issue 6

77555 The normative text is reworded to avoid use of the term “must” for application requirements,
77556 and to emphasize the term “shall” for implementation requirements.

77557 The grammar is updated.

77558 The Open Group Base Resolution bwg2001-007 is applied, adding new text to the INPUT FILES
77559 section warning that the maximum lines recorded in the file is 99 999.

77560 The Open Group Base Resolution bwg2001-009 is applied, amending the description of the **-h**
77561 option.

77562 **NAME**

77563 alias — define or display aliases

77564 **SYNOPSIS**77565 alias [*alias-name*[=*string*] . . .]77566 **DESCRIPTION**

77567 The *alias* utility shall create or redefine alias definitions or write the values of existing alias
 77568 definitions to standard output. An alias definition provides a string value that shall replace a
 77569 command name when it is encountered; see [Section 2.3.1](#) (on page 2322).

77570 An alias definition shall affect the current shell execution environment and the execution
 77571 environments of the subshells of the current shell. When used as specified by this volume of
 77572 POSIX.1-2008, the alias definition shall not affect the parent process of the current shell nor any
 77573 utility environment invoked by the shell; see [Section 2.12](#) (on page 2353).

77574 **OPTIONS**

77575 None.

77576 **OPERANDS**

77577 The following operands shall be supported:

77578 *alias-name* Write the alias definition to standard output.

77579 *alias-name=string*
 77580 Assign the value of *string* to the alias *alias-name*.

77581 If no operands are given, all alias definitions shall be written to standard output.

77582 **STDIN**

77583 Not used.

77584 **INPUT FILES**

77585 None.

77586 **ENVIRONMENT VARIABLES**77587 The following environment variables shall affect the execution of *alias*:

77588 *LANG* Provide a default value for the internationalization variables that are unset or null.
 77589 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization
 77590 variables used to determine the values of locale categories.)

77591 *LC_ALL* If set to a non-empty string value, override the values of all the other
 77592 internationalization variables.

77593 *LC_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as
 77594 characters (for example, single-byte as opposed to multi-byte characters in
 77595 arguments).

77596 *LC_MESSAGES*
 77597 Determine the locale that should be used to affect the format and contents of
 77598 diagnostic messages written to standard error.

77599 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC_MESSAGES*.77600 **ASYNCHRONOUS EVENTS**

77601 Default.

STDOUT

The format for displaying aliases (when no operands or only *name* operands are specified) shall be:

```
"%s=%s\n", name, value
```

The *value* string shall be written with appropriate quoting so that it is suitable for reinput to the shell. See the description of shell quoting in [Section 2.2](#) (on page 2320).

STDERR

The standard error shall be used only for diagnostic messages.

OUTPUT FILES

None.

EXTENDED DESCRIPTION

None.

EXIT STATUS

The following exit values shall be returned:

0 Successful completion.

>0 One of the *name* operands specified did not have an alias definition, or an error occurred.

CONSEQUENCES OF ERRORS

Default.

APPLICATION USAGE

None.

EXAMPLES

1. Create a short alias for a commonly used *ls* command:

```
alias lf="ls -CF"
```

2. Create a simple “redo” command to repeat previous entries in the command history file:

```
alias r='fc -s'
```

3. Use 1K units for *du*:

```
alias du=du\ -k
```

4. Set up *nohup* so that it can deal with an argument that is itself an alias name:

```
alias nohup="nohup "
```

RATIONALE

The *alias* description is based on historical KornShell implementations. Known differences exist between that and the C shell. The KornShell version was adopted to be consistent with all the other KornShell features in this volume of POSIX.1-2008, such as command line editing.

Since *alias* affects the current shell execution environment, it is generally provided as a shell regular built-in.

Historical versions of the KornShell have allowed aliases to be exported to scripts that are invoked by the same shell. This is triggered by the *alias -x* flag; it is allowed by this volume of POSIX.1-2008 only when an explicit extension such as *-x* is used. The standard developers considered that aliases were of use primarily to interactive users and that they should normally not affect shell scripts called by those users; functions are available to such scripts.

77642 Historical versions of the KornShell had not written aliases in a quoted manner suitable for
77643 reentry to the shell, but this volume of POSIX.1-2008 has made this a requirement for all similar
77644 output. Therefore, consistency was chosen over this detail of historical practice.

77645 **FUTURE DIRECTIONS**

77646 None.

77647 **SEE ALSO**

77648 [Section 2.9.5](#) (on page 2346)

77649 XBD [Chapter 8](#) (on page 173)

77650 **CHANGE HISTORY**

77651 First released in Issue 4.

77652 **Issue 6**

77653 This utility is marked as part of the User Portability Utilities option.

77654 The APPLICATION USAGE section is added.

77655 **Issue 7**

77656 The *alias* utility is moved from the User Portability Utilities option to the Base. User Portability
77657 Utilities is now an option for interactive utilities.

77658 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

77659 The first example is changed to remove the creation of an alias for a standard utility that alters
77660 its behavior to be non-conforming.

77661 NAME

77662 ar — create and maintain library archives

77663 SYNOPSIS

77664 SD ar -d [-v] archive file...

77665 XSI ar -m [-v] archive file...

77666 ar -m -a [-v] posname archive file...

77667 ar -m -b [-v] posname archive file...

77668 ar -m -i [-v] posname archive file...

77669 XSI ar -p [-v] [-s] archive [file...]

77670 XSI ar -q [-cv] archive file...

77671 ar -r [-cuv] archive file...

77672 XSI ar -r -a [-cuv] posname archive file...

77673 ar -r -b [-cuv] posname archive file...

77674 ar -r -i [-cuv] posname archive file...

77675 XSI ar -t [-v] [-s] archive [file...]

77676 XSI ar -x [-v] [-sCT] archive [file...]

77677 DESCRIPTION

77678 The *ar* utility is part of the Software Development Utilities option.

77679 The *ar* utility can be used to create and maintain groups of files combined into an archive. Once
 77680 an archive has been created, new files can be added, and existing files in an archive can be
 77681 extracted, deleted, or replaced. When an archive consists entirely of valid object files, the
 77682 implementation shall format the archive so that it is usable as a library for link editing (see *c99*
 77683 and *fort77*). When some of the archived files are not valid object files, the suitability of the
 77684 XSI archive for library use is undefined. If an archive consists entirely of printable files, the entire
 77685 archive shall be printable.

77686 When *ar* creates an archive, it creates administrative information indicating whether a symbol
 77687 table is present in the archive. When there is at least one object file that *ar* recognizes as such in
 77688 the archive, an archive symbol table shall be created in the archive and maintained by *ar*; it is
 77689 used by the link editor to search the archive. Whenever the *ar* utility is used to create or update
 77690 the contents of such an archive, the symbol table shall be rebuilt. The *-s* option shall force the
 77691 symbol table to be rebuilt.

77692 All *file* operands can be pathnames. However, files within archives shall be named by a filename,
 77693 which is the last component of the pathname used when the file was entered into the archive.
 77694 The comparison of *file* operands to the names of files in archives shall be performed by
 77695 comparing the last component of the operand to the name of the file in the archive.

77696 It is unspecified whether multiple files in the archive may be identically named. In the case of
 77697 XSI such files, however, each *file* and *posname* operand shall match only the first file in the archive
 77698 having a name that is the same as the last component of the operand.

77699 OPTIONS

77700 The *ar* utility shall conform to XBD [Section 12.2](#) (on page 215), except for Guideline 9.

77701 The following options shall be supported:

77702	XSI	-a	Position new files in the archive after the file named by the <i>posname</i> operand.
77703	XSI	-b	Position new files in the archive before the file named by the <i>posname</i> operand.
77704		-c	Suppress the diagnostic message that is written to standard error by default when the archive <i>archive</i> is created.
77706	XSI	-C	Prevent extracted files from replacing like-named files in the file system. This option is useful when -T is also used, to prevent truncated filenames from replacing files with the same prefix.
77708			
77709		-d	Delete one or more <i>files</i> from <i>archive</i> .
77710	XSI	-i	Position new files in the archive before the file in the archive named by the <i>posname</i> operand (equivalent to -b).
77711			
77712	XSI	-m	Move the named files in the archive. The -a , -b , or -i options with the <i>posname</i> operand indicate the position; otherwise, move the names files in the archive to the end of the archive.
77713			
77714			
77715		-p	Write the contents of the <i>files</i> in the archive named by <i>file</i> operands from <i>archive</i> to the standard output. If no <i>file</i> operands are specified, the contents of all files in the archive shall be written in the order of the archive.
77716			
77717			
77718	XSI	-q	Append the named files to the end of the archive. In this case <i>ar</i> does not check whether the added files are already in the archive. This is useful to bypass the searching otherwise done when creating a large archive piece by piece.
77719			
77720			
77721		-r	Replace or add <i>files</i> to <i>archive</i> . If the archive named by <i>archive</i> does not exist, a new archive shall be created and a diagnostic message shall be written to standard error (unless the -c option is specified). If no <i>files</i> are specified and the <i>archive</i> exists, the results are undefined. Files that replace existing files in the archive shall not change the order of the archive. Files that do not replace existing files in the archive shall be appended to the archive unless a -a , -b , or -i option specifies another position.
77722			
77723			
77724			
77725			
77726	XSI		
77727	XSI	-s	Force the regeneration of the archive symbol table even if <i>ar</i> is not invoked with an option that modifies the archive contents. This option is useful to restore the archive symbol table after it has been stripped; see <i>strip</i> .
77728			
77729			
77730		-t	Write a table of contents of <i>archive</i> to the standard output. Only the files specified by the <i>file</i> operands shall be included in the written list. If no <i>file</i> operands are specified, all files in <i>archive</i> shall be included in the order of the archive.
77731			
77732			
77733	XSI	-T	Allow filename truncation of extracted files whose archive names are longer than the file system can support. By default, extracting a file with a name that is too long shall be an error; a diagnostic message shall be written and the file shall not be extracted.
77734			
77735			
77736			
77737		-u	Update older files in the archive. When used with the -r option, files in the archive shall be replaced only if the corresponding <i>file</i> has a modification time that is at least as new as the modification time of the file in the archive.
77738			
77739			

77740 **-v** Give verbose output. When used with the option characters **-d**, **-r**, or **-x**, write a
 77741 detailed file-by-file description of the archive creation and maintenance activity, as
 77742 described in the STDOUT section.

77743 When used with **-p**, write the name of the file in the archive to the standard output
 77744 before writing the file in the archive itself to the standard output, as described in
 77745 the STDOUT section.

77746 When used with **-t**, include a long listing of information about the files in the
 77747 archive, as described in the STDOUT section.

77748 **-x** Extract the files in the archive named by the *file* operands from *archive*. The
 77749 contents of the archive shall not be changed. If no *file* operands are given, all files
 77750 in the archive shall be extracted. The modification time of each file extracted shall
 77751 be set to the time the file is extracted from the archive.

77752 OPERANDS

77753 The following operands shall be supported:

77754 *archive* A pathname of the archive.

77755 *file* A pathname. Only the last component shall be used when comparing against the
 77756 names of files in the archive. If two or more *file* operands have the same last
 77757 pathname component (basename), the results are unspecified. The
 77758 implementation's archive format shall not truncate valid filenames of files added
 77759 to or replaced in the archive.

77760 XSI *posname* The name of a file in the archive, used for relative positioning; see options **-m** and
 77761 **-r**.

77762 STDIN

77763 Not used.

77764 INPUT FILES

77765 The archive named by *archive* shall be a file in the format created by *ar -r*.

77766 ENVIRONMENT VARIABLES

77767 The following environment variables shall affect the execution of *ar*:

77768 *LANG* Provide a default value for the internationalization variables that are unset or null.
 77769 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization
 77770 variables used to determine the values of locale categories.)

77771 *LC_ALL* If set to a non-empty string value, override the values of all the other
 77772 internationalization variables.

77773 *LC_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as
 77774 characters (for example, single-byte as opposed to multi-byte characters in
 77775 arguments and input files).

77776 *LC_MESSAGES*

77777 Determine the locale that should be used to affect the format and contents of
 77778 diagnostic messages written to standard error.

77779 *LC_TIME* Determine the format and content for date and time strings written by *ar -tv*.

77780 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC_MESSAGES*.

77781 *TMPPDIR* Determine the pathname that overrides the default directory for temporary files, if
77782 any.

77783 *TZ* Determine the timezone used to calculate date and time strings written by *ar -tv*.
77784 If *TZ* is unset or null, an unspecified default timezone shall be used.

77785 ASYNCHRONOUS EVENTS

77786 Default.

77787 STDOUT

77788 If the *-d* option is used with the *-v* option, the standard output format shall be:

77789 "d - %s\n", <file>

77790 where *file* is the operand specified on the command line.

77791 If the *-p* option is used with the *-v* option, *ar* shall precede the contents of each file with:

77792 "\n<%s>\n\n", <file>

77793 where *file* is the operand specified on the command line, if *file* operands were specified, and the
77794 name of the file in the archive if they were not.

77795 If the *-r* option is used with the *-v* option:

- 77796 • If *file* is already in the archive, the standard output format shall be:

77797 "r - %s\n", <file>

77798 where <file> is the operand specified on the command line.

- 77799 • If *file* is not already in the archive, the standard output format shall be:

77800 "a - %s\n", <file>

77801 where <file> is the operand specified on the command line.

77802 If the *-t* option is used, *ar* shall write the names of the files in the archive to the standard output
77803 in the format:

77804 "%s\n", <file>

77805 where *file* is the operand specified on the command line, if *file* operands were specified, or the
77806 name of the file in the archive if they were not.

77807 If the *-t* option is used with the *-v* option, the standard output format shall be:

77808 "%s %u/%u %u %s %d %d:%d %d %s\n", <member mode>, <user ID>,
77809 <group ID>, <number of bytes in member>,
77810 <abbreviated month>, <day-of-month>, <hour>,
77811 <minute>, <year>, <file>

77812 where:

77813 <file> Shall be the operand specified on the command line, if *file* operands were specified,
77814 or the name of the file in the archive if they were not.

77815 <member mode>

77816 Shall be formatted the same as the <file mode> string defined in the STDOUT
77817 section of *ls*, except that the first character, the <entry type>, is not used; the string
77818 represents the file mode of the file in the archive at the time it was added to or
77819 replaced in the archive.

77820 The following represent the last-modification time of a file when it was most recently added to
77821 or replaced in the archive:

77822 *<abbreviated month>*

77823 Equivalent to the format of the %b conversion specification format in *date*.

77824 *<day-of-month>*

77825 Equivalent to the format of the %e conversion specification format in *date*.

77826 *<hour>* Equivalent to the format of the %H conversion specification format in *date*.

77827 *<minute>* Equivalent to the format of the %M conversion specification format in *date*.

77828 *<year>* Equivalent to the format of the %Y conversion specification format in *date*.

77829 When *LC_TIME* does not specify the POSIX locale, a different format and order of presentation
77830 of these fields relative to each other may be used in a format appropriate in the specified locale.

77831 If the *-x* option is used with the *-v* option, the standard output format shall be:

77832 "x - %s\n", *<file>*

77833 where *file* is the operand specified on the command line, if *file* operands were specified, or the
77834 name of the file in the archive if they were not.

77835 **STDERR**

77836 The standard error shall be used only for diagnostic messages. The diagnostic message about
77837 creating a new archive when *-c* is not specified shall not modify the exit status.

77838 **OUTPUT FILES**

77839 Archives are files with unspecified formats.

77840 **EXTENDED DESCRIPTION**

77841 None.

77842 **EXIT STATUS**

77843 The following exit values shall be returned:

77844 0 Successful completion.

77845 >0 An error occurred.

77846 **CONSEQUENCES OF ERRORS**

77847 Default.

77848 **APPLICATION USAGE**

77849 None.

77850 **EXAMPLES**

77851 None.

77852 **RATIONALE**

77853 The archive format is not described. It is recognized that there are several known *ar* formats,
77854 which are not compatible. The *ar* utility is included, however, to allow creation of archives that
77855 are intended for use only on one machine. The archive is specified as a file, and it can be moved
77856 as a file. This does allow an archive to be moved from one machine to another machine that uses
77857 the same implementation of *ar*.

77858 Utilities such as *pax* (and its forebears *tar* and *cpio*) also provide portable “archives”. This is a not
77859 a duplication; the *ar* utility is included to provide an interface primarily for *make* and the
77860 compilers, based on a historical model.

In historical implementations, the **-q** option (available on XSI-conforming systems) is known to execute quickly because *ar* does not check on whether the added members are already in the archive. This is useful to bypass the searching otherwise done when creating a large archive piece-by-piece. These remarks may but need not remain true for a brand new implementation of this utility; hence, these remarks have been moved into the RATIONALE.

BSD implementations historically required applications to provide the **-s** option whenever the archive was supposed to contain a symbol table. As in this volume of POSIX.1-2008, System V historically creates or updates an archive symbol table whenever an object file is removed from, added to, or updated in the archive.

The OPERANDS section requires what might seem to be true without specifying it: the archive cannot truncate the filenames below [NAME_MAX]. Some historical implementations do so, however, causing unexpected results for the application. Therefore, this volume of POSIX.1-2008 makes the requirement explicit to avoid misunderstandings.

According to the System V documentation, the options **-dmpqrtx** are not required to begin with a <hyphen> ('-'). This volume of POSIX.1-2008 requires that a conforming application use the leading <hyphen>.

The archive format used by the 4.4 BSD implementation is documented in this RATIONALE as an example:

A file created by *ar* begins with the “magic” string “!**<arch>**\n”. The rest of the archive is made up of objects, each of which is composed of a header for a file, a possible filename, and the file contents. The header is portable between machine architectures, and, if the file contents are printable, the archive is itself printable.

The header is made up of six ASCII fields, followed by a two-character trailer. The fields are the object name (16 characters), the file last modification time (12 characters), the user and group IDs (each 6 characters), the file mode (8 characters), and the file size (10 characters). All numeric fields are in decimal, except for the file mode, which is in octal.

The modification time is the file *st_mtime* field. The user and group IDs are the file *st_uid* and *st_gid* fields. The file mode is the file *st_mode* field. The file size is the file *st_size* field. The two-byte trailer is the string “**<newline>**”.

Only the name field has any provision for overflow. If any filename is more than 16 characters in length or contains an embedded space, the string “**#1/**” followed by the ASCII length of the name is written in the name field. The file size (stored in the archive header) is incremented by the length of the name. The name is then written immediately following the archive header.

Any unused characters in any of these fields are written as <space> characters. If any fields are their particular maximum number of characters in length, there is no separation between the fields.

Objects in the archive are always an even number of bytes long; files that are an odd number of bytes long are padded with a <newline>, although the size in the header does not reflect this.

The *ar* utility description requires that (when all its members are valid object files) *ar* produce an object code library, which the linkage editor can use to extract object modules. If the linkage editor needs a symbol table to permit random access to the archive, *ar* must provide it; however, *ar* does not require a symbol table.

The BSD **-o** option was omitted. It is a rare conforming application that uses *ar* to extract object

code from a library with concern for its modification time, since this can only be of importance to *make*. Hence, since this functionality is not deemed important for applications portability, the modification time of the extracted files is set to the current time.

There is at least one known implementation (for a small computer) that can accommodate only object files for that system, disallowing mixed object and other files. The ability to handle any type of file is not only historical practice for most implementations, but is also a reasonable expectation.

Consideration was given to changing the output format of *ar -tv* to the same format as the output of *ls -l*. This would have made parsing the output of *ar* the same as that of *ls*. This was rejected in part because the current *ar* format is commonly used and changes would break historical usage. Second, *ar* gives the user ID and group ID in numeric format separated by a `<slash>`. Changing this to be the user name and group name would not be correct if the archive were moved to a machine that contained a different user database. Since *ar* cannot know whether the archive was generated on the same machine, it cannot tell what to report.

The text on the *-ur* option combination is historical practice—since one filename can easily represent two different files (for example, */a/foo* and */b/foo*), it is reasonable to replace the file in the archive even when the modification time in the archive is identical to that in the file system.

FUTURE DIRECTIONS

None.

XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215), [<unistd.h>](#), description of `{POSIX_NO_TRUNC}`

CHANGE HISTORY

First released in Issue 2.

Issue 5

The FUTURE DIRECTIONS section is added.

Issue 6

This utility is marked as part of the Software Development Utilities option.

The STDOUT description is changed for the *-v* option to align with the IEEE P1003.2b draft standard.

The normative text is reworded to avoid use of the term “must” for application requirements.

The *TZ* entry is added to the ENVIRONMENT VARIABLES section.

IEEE PASC Interpretation 1003.2 #198 is applied, changing the description to consistently use “file” to refer to a file in the file system hierarchy, “archive” to refer to the archive being operated upon by the *ar* utility, and “file in the archive” to refer to a copy of a file that is contained in the archive.

IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/10 is applied, making corrections to the SYNOPSIS. The change was needed since the *-a*, *-b*, and *-i* options are mutually-exclusive, and *posname* is required if any of these options is specified.

IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/11 is applied, correcting the description of the two-byte trailer in RATIONALE which had missed out a backquote. The correct trailer is a backquote followed by a `<newline>`.

77949 **Issue 7**

77950 SD5-XCU-ERN-6 is applied, clarifying that Guideline 9 of the Utility Syntax Guidelines does not
77951 apply.

77952 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

77953 The description of the `-t` option is changed to say “Only the files specified ...”.

77954 **NAME**

77955 asa — interpret carriage-control characters

77956 **SYNOPSIS**77957 FR asa [*file...*]77958 **DESCRIPTION**77959 The *asa* utility shall write its input files to standard output, mapping carriage-control characters
77960 from the text files to line-printer control sequences in an implementation-defined manner.77961 The first character of every line shall be removed from the input, and the following actions are
77962 performed.

77963 If the character removed is:

77964 <space> The rest of the line is output without change.

77965 0 A <newline> is output, then the rest of the input line.

77966 1 One or more implementation-defined characters that causes an advance to the next
77967 page shall be output, followed by the rest of the input line.77968 + The <newline> of the previous line shall be replaced with one or more
77969 implementation-defined characters that causes printing to return to column
77970 position 1, followed by the rest of the input line. If the '+' is the first character in
77971 the input, it shall be equivalent to <space>.77972 The action of the *asa* utility is unspecified upon encountering any character other than those
77973 listed above as the first character in a line.77974 **OPTIONS**

77975 None.

77976 **OPERANDS**77977 *file* A pathname of a text file used for input. If no *file* operands are specified, the
77978 standard input shall be used.77979 **STDIN**77980 The standard input shall be used if no *file* operands are specified, and shall be used if a *file*
77981 operand is '-' and the implementation treats the '-' as meaning standard input. Otherwise,
77982 the standard input shall not be used. See the INPUT FILES section.77983 **INPUT FILES**

77984 The input files shall be text files.

77985 **ENVIRONMENT VARIABLES**77986 The following environment variables shall affect the execution of *asa*:77987 LANG Provide a default value for the internationalization variables that are unset or null.
77988 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization
77989 variables used to determine the values of locale categories.)77990 LC_ALL If set to a non-empty string value, override the values of all the other
77991 internationalization variables.77992 LC_CTYPE Determine the locale for the interpretation of sequences of bytes of text data as
77993 characters (for example, single-byte as opposed to multi-byte characters in
77994 arguments and input files).

77995 **LC_MESSAGES**
 77996 Determine the locale that should be used to affect the format and contents of
 77997 diagnostic messages written to standard error.

77998 XSI **NLSPATH** Determine the location of message catalogs for the processing of *LC_MESSAGES*.

77999 **ASYNCHRONOUS EVENTS**
 78000 Default.

78001 **STDOUT**
 78002 The standard output shall be the text from the input file modified as described in the
 78003 DESCRIPTION section.

78004 **STDERR**
 78005 None.

78006 **OUTPUT FILES**
 78007 None.

78008 **EXTENDED DESCRIPTION**
 78009 None.

78010 **EXIT STATUS**
 78011 The following exit values shall be returned:
 78012 0 All input files were output successfully.
 78013 >0 An error occurred.

78014 **CONSEQUENCES OF ERRORS**
 78015 Default.

78016 **APPLICATION USAGE**
 78017 None.

78018 **EXAMPLES**

78019 1. The following command:
 78020 *asa file*
 78021 permits the viewing of *file* (created by a program using FORTRAN-style carriage-control
 78022 characters) on a terminal.

78023 2. The following command:
 78024 *a.out | asa | lp*
 78025 formats the FORTRAN output of **a.out** and directs it to the printer.

78026 **RATIONALE**
 78027 The *asa* utility is needed to map “standard” FORTRAN 77 output into a form acceptable to
 78028 contemporary printers. Usually, *asa* is used to pipe data to the *lp* utility; see *lp*.

78029 This utility is generally used only by FORTRAN programs. The standard developers decided to
 78030 retain *asa* to avoid breaking the historical large base of FORTRAN applications that put carriage-
 78031 control characters in their output files. There is no requirement that a system have a FORTRAN
 78032 compiler in order to run applications that need *asa*.

78033 Historical implementations have used an ASCII <form-feed> in response to a 1 and an ASCII
 78034 <carriage-return> in response to a '+'. It is suggested that implementations treat characters
 78035 other than 0, 1, and '+' as <space> in the absence of any compelling reason to do otherwise.

78036 However, the action is listed here as “unspecified”, permitting an implementation to provide
78037 extensions to access fast multiple-line slewing and channel seeking in a non-portable manner.

78038 **FUTURE DIRECTIONS**

78039 None.

78040 **SEE ALSO**

78041 *fort77, lp*

78042 XBD [Chapter 8](#) (on page 173)

78043 **CHANGE HISTORY**

78044 First released in Issue 4.

78045 **Issue 6**

78046 This utility is marked as part of the FORTRAN Runtime Utilities option.

78047 The normative text is reworded to avoid use of the term “must” for application requirements.

78048 **Issue 7**

78049 Austin Group Interpretation 1003.1-2001 #092 is applied.

78050 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

78051 NAME

78052 at — execute commands at a later time

78053 SYNOPSIS

78054 at [-m] [-f file] [-q queueName] -t time_arg

78055 at [-m] [-f file] [-q queueName] timespec...

78056 at -r at_job_id...

78057 at -l -q queueName

78058 at -l [at_job_id...]

78059 DESCRIPTION

78060 The *at* utility shall read commands from standard input and group them together as an *at-job*, to
78061 be executed at a later time.78062 The *at-job* shall be executed in a separate invocation of the shell, running in a separate process
78063 group with no controlling terminal, except that the environment variables, current working
78064 directory, file creation mask, and other implementation-defined execution-time attributes in
78065 effect when the *at* utility is executed shall be retained and used when the *at-job* is executed.78066 When the *at-job* is submitted, the *at_job_id* and scheduled time shall be written to standard error.
78067 The *at_job_id* is an identifier that shall be a string consisting solely of alphanumeric characters
78068 and the <period> character. The *at_job_id* shall be assigned by the system when the job is
78069 scheduled such that it uniquely identifies a particular job.78070 User notification and the processing of the job's standard output and standard error are
78071 described under the **-m** option.78072 XSI Users shall be permitted to use *at* if their name appears in the file **at.allow** which is located in an
78073 implementation-defined directory. If that file does not exist, the file **at.deny**, which is located in
78074 an implementation-defined directory, shall be checked to determine whether the user shall be
78075 denied access to *at*. If neither file exists, only a process with appropriate privileges shall be
78076 allowed to submit a job. If only **at.deny** exists and is empty, global usage shall be permitted. The
78077 **at.allow** and **at.deny** files shall consist of one user name per line.

78078 OPTIONS

78079 The *at* utility shall conform to XBD [Section 12.2](#) (on page 215).

78080 The following options shall be supported:

78081 **-f file** Specify the pathname of a file to be used as the source of the *at-job*, instead of
78082 standard input.78083 **-l** (The letter ell.) Report all jobs scheduled for the invoking user if no *at_job_id*
78084 operands are specified. If *at_job_ids* are specified, report only information for these
78085 jobs. The output shall be written to standard output.78086 **-m** Send mail to the invoking user after the *at-job* has run, announcing its completion.
78087 Standard output and standard error produced by the *at-job* shall be mailed to the
78088 user as well, unless redirected elsewhere. Mail shall be sent even if the job
78089 produces no output.78090 If **-m** is not used, the job's standard output and standard error shall be provided to
78091 the user by means of mail, unless they are redirected elsewhere; if there is no such
78092 output to provide, the implementation need not notify the user of the job's
78093 completion.

78094	-q <i>queuename</i>	
78095		Specify in which queue to schedule a job for submission. When used with the -l
78096		option, limit the search to that particular queue. By default, at-jobs shall be
78097		scheduled in queue <i>a</i> . In contrast, queue <i>b</i> shall be reserved for batch jobs; see
78098		<i>batch</i> . The meanings of all other <i>queuenames</i> are implementation-defined. If -q is
78099		specified along with either of the -t <i>time_arg</i> or <i>timespec</i> arguments, the results are
78100		unspecified.
78101	-r	Remove the jobs with the specified <i>at_job_id</i> operands that were previously
78102		scheduled by the <i>at</i> utility.
78103	-t <i>time_arg</i>	Submit the job to be run at the time specified by the <i>time</i> option-argument, which
78104		the application shall ensure has the format as specified by the <i>touch -t time</i> utility.

OPERANDS

78105	The following operands shall be supported:	
78106		
78107	<i>at_job_id</i>	The name reported by a previous invocation of the <i>at</i> utility at the time the job was
78108		scheduled.
78109	<i>timespec</i>	Submit the job to be run at the date and time specified. All of the <i>timespec</i> operands
78110		are interpreted as if they were separated by <space> characters and concatenated,
78111		and shall be parsed as described in the grammar at the end of this section. The date
78112		and time shall be interpreted as being in the timezone of the user (as determined
78113		by the <i>TZ</i> variable), unless a timezone name appears as part of <i>time</i> , below.
78114		In the POSIX locale, the following describes the three parts of the time specification
78115		string. All of the values from the <i>LC_TIME</i> categories in the POSIX locale shall be
78116		recognized in a case-insensitive manner.
78117	<i>time</i>	The time can be specified as one, two, or four digits. One-digit and
78118		two-digit numbers shall be taken to be hours; four-digit numbers to
78119		be hours and minutes. The time can alternatively be specified as two
78120		numbers separated by a <colon>, meaning <i>hour:minute</i> . An AM/PM
78121		indication (one of the values from the am_pm keywords in the
78122		<i>LC_TIME</i> locale category) can follow the time; otherwise, a 24-hour
78123		clock time shall be understood. A timezone name can also follow to
78124		further qualify the time. The acceptable timezone names are
78125		implementation-defined, except that they shall be case-insensitive
78126		and the string utc is supported to indicate the time is in Coordinated
78127		Universal Time. In the POSIX locale, the <i>time</i> field can also be one of
78128		the following tokens:
78129	midnight	Indicates the time 12:00 am (00:00).
78130	noon	Indicates the time 12:00 pm.
78131	now	Indicates the current day and time. Invoking <i>at <now></i>
78132		shall submit an at-job for potentially immediate
78133		execution (that is, subject only to unspecified
78134		scheduling delays).
78135	<i>date</i>	An optional <i>date</i> can be specified as either a month name (one of the
78136		values from the mon or abmon keywords in the <i>LC_TIME</i> locale
78137		category) followed by a day number (and possibly year number
78138		preceded by a comma), or a day of the week (one of the values from
78139		the day or abday keywords in the <i>LC_TIME</i> locale category). In the

78140 POSIX locale, two special days shall be recognized:

78141 **today** Indicates the current day.

78142 **tomorrow** Indicates the day following the current day.

78143 If no *date* is given, **today** shall be assumed if the given time is greater
 78144 than the current time, and **tomorrow** shall be assumed if it is less. If
 78145 the given month is less than the current month (and no year is given),
 78146 next year shall be assumed.

78147 *increment* The optional *increment* shall be a number preceded by a <plus-sign>
 78148 ('+') and suffixed by one of the following: **minutes**, **hours**, **days**,
 78149 **weeks**, **months**, or **years**. (The singular forms shall also be accepted.)
 78150 The keyword **next** shall be equivalent to an increment number of +1.
 78151 For example, the following are equivalent commands:

78152 at 2pm + 1 week
 78153 at 2pm next week

78154 The following grammar describes the precise format of *timespec* in the POSIX locale. The general
 78155 conventions for this style of grammar are described in [Section 1.3](#) (on page 2309). This formal
 78156 syntax shall take precedence over the preceding text syntax description. The longest possible
 78157 token or delimiter shall be recognized at a given point. When used in a *timespec*, white space
 78158 shall also delimit tokens.

```

78159 %token hr24clock_hr_min
78160 %token hr24clock_hour
78161 /*
78162     An hr24clock_hr_min is a one, two, or four-digit number. A one-digit
78163     or two-digit number constitutes an hr24clock_hour. An hr24clock_hour
78164     may be any of the single digits [0,9], or may be double digits, ranging
78165     from [00,23]. If an hr24clock_hr_min is a four-digit number, the
78166     first two digits shall be a valid hr24clock_hour, while the last two
78167     represent the number of minutes, from [00,59].
78168 */
78169 %token wallclock_hr_min

78261                       ;

```

78262 STDIN

78263 The standard input shall be a text file consisting of commands acceptable to the shell command
 78264 language described in [Chapter 2](#) (on page 2319). The standard input shall only be used if no `-f`
 78265 *file* option is specified.

78266 INPUT FILES

78267 See the STDIN section.

78268 XSI The text files **at.allow** and **at.deny**, which are located in an implementation-defined directory,
 78269 shall contain zero or more user names, one per line, of users who are, respectively, authorized or
 78270 denied access to the *at* and *batch* utilities.

78271 ENVIRONMENT VARIABLES

78272 The following environment variables shall affect the execution of *at*:

78273 78274 78275	LANG	Provide a default value for the internationalization variables that are unset or null. (See XBD Section 8.2 (on page 174) for the precedence of internationalization variables used to determine the values of locale categories.)
78276 78277	LC_ALL	If set to a non-empty string value, override the values of all the other internationalization variables.
78278 78279 78280	LC_CTYPE	Determine the locale for the interpretation of sequences of bytes of text data as characters (for example, single-byte as opposed to multi-byte characters in arguments and input files).

78281		<i>LC_MESSAGES</i>	
78282			Determine the locale that should be used to affect the format and contents of
78283			diagnostic messages written to standard error and informative messages written to
78284			standard output.
78285	XSI	<i>NLSPATH</i>	Determine the location of message catalogs for the processing of <i>LC_MESSAGES</i> .
78286		<i>LC_TIME</i>	Determine the format and contents for date and time strings written and accepted
78287			by <i>at</i> .
78288		<i>SHELL</i>	Determine a name of a command interpreter to be used to invoke the at-job. If the
78289			variable is unset or null, <i>sh</i> shall be used. If it is set to a value other than a name for
78290			<i>sh</i> , the implementation shall do one of the following: use that shell; use <i>sh</i> ; use the
78291			login shell from the user database; or any of the preceding accompanied by a
78292			warning diagnostic about which was chosen.
78293		<i>TZ</i>	Determine the timezone. The job shall be submitted for execution at the time
78294			specified by <i>timespec</i> or <i>-t time</i> relative to the timezone specified by the <i>TZ</i>
78295			variable. If <i>timespec</i> specifies a timezone, it shall override <i>TZ</i> . If <i>timespec</i> does not
78296			specify a timezone and <i>TZ</i> is unset or null, an unspecified default timezone shall
78297			be used.
78298		ASYNCHRONOUS EVENTS	
78299			Default.
78300		STDOUT	
78301			When standard input is a terminal, prompts of unspecified format for each line of the user input
78302			described in the STDIN section may be written to standard output.
78303			In the POSIX locale, the following shall be written to the standard output for each job when jobs
78304			are listed in response to the <i>-l</i> option:
78305			"%s\t%s\n", <i>at_job_id</i> , < <i>date</i> >
78306			where <i>date</i> shall be equivalent in format to the output of:
78307			date +"%a %b %e %T %Y"
78308			The date and time written shall be adjusted so that they appear in the timezone of the user (as
78309			determined by the <i>TZ</i> variable).
78310		STDERR	
78311			In the POSIX locale, the following shall be written to standard error when a job has been
78312			successfully submitted:
78313			"job %s at %s\n", <i>at_job_id</i> , < <i>date</i> >
78314			where <i>date</i> has the same format as that described in the STDOUT section. Neither this, nor
78315			warning messages concerning the selection of the command interpreter, shall be considered a
78316			diagnostic that changes the exit status.
78317			Diagnostic messages, if any, shall be written to standard error.
78318		OUTPUT FILES	
78319			None.
78320		EXTENDED DESCRIPTION	
78321			None.

EXIT STATUS

The following exit values shall be returned:

- 0 The *at* utility successfully submitted, removed, or listed a job or jobs.
- >0 An error occurred.

CONSEQUENCES OF ERRORS

The job shall not be scheduled, removed, or listed.

APPLICATION USAGE

The format of the *at* command line shown here is guaranteed only for the POSIX locale. Other cultures may be supported with substantially different interfaces, although implementations are encouraged to provide comparable levels of functionality.

Since the commands run in a separate shell invocation, running in a separate process group with no controlling terminal, open file descriptors, traps, and priority inherited from the invoking environment are lost.

Some implementations do not allow substitution of different shells using *SHELL*. System V systems, for example, have used the login shell value for the user in */etc/passwd*. To select reliably another command interpreter, the user must include it as part of the script, such as:

```
$ at 1800
myshell myscript
EOT
job ... at ...
$
```

EXAMPLES

1. This sequence can be used at a terminal:

```
at -m 0730 tomorrow
sort < file >outfile
EOT
```

2. This sequence, which demonstrates redirecting standard error to a pipe, is useful in a command procedure (the sequence of output redirection specifications is significant):

```
at now + 1 hour <<!
diff file1 file2 2>&1 >outfile | mailx mygroup
!
```

3. To have a job reschedule itself, *at* can be invoked from within the at-job. For example, this daily processing script named **my.daily** runs every day (although *crontab* is a more appropriate vehicle for such work):

```
# my.daily runs every day
daily processing
at now tomorrow < my.daily
```

4. The spacing of the three portions of the POSIX locale *timespec* is quite flexible as long as there are no ambiguities. Examples of various times and operand presentation include:

```
at 0815am Jan 24
at 8 :15amjan24
at now "+ 1day"
at 5 pm FRIday
at '17
```

```
78366         utc+
78367         30minutes'
```

78368 RATIONALE

78369 The *at* utility reads from standard input the commands to be executed at a later time. It may be
 78370 useful to redirect standard output and standard error within the specified commands.

78371 The **-t** *time* option was added as a new capability to support an internationalized way of
 78372 specifying a time for execution of the submitted job.

78373 Early proposals added a “jobname” concept as a way of giving submitted jobs names that are
 78374 meaningful to the user submitting them. The historical, system-specified *at_job_id* gives no
 78375 indication of what the job is. Upon further reflection, it was decided that the benefit of this was
 78376 not worth the change in historical interface. The *at* functionality is useful in simple
 78377 environments, but in large or complex situations, the functionality provided by the Batch
 78378 Services option is more suitable.

78379 The **-q** option historically has been an undocumented option, used mainly by the *batch* utility.

78380 The System V **-m** option was added to provide a method for informing users that an at-job had
 78381 completed. Otherwise, users are only informed when output to standard error or standard
 78382 output are not redirected.

78383 The behavior of *at* **<now>** was changed in an early proposal from being unspecified to
 78384 submitting a job for potentially immediate execution. Historical BSD *at* implementations support
 78385 this. Historical System V implementations give an error in that case, but a change to the System
 78386 V versions should have no backwards-compatibility ramifications.

78387 On BSD-based systems, a **-u** *user* option has allowed those with appropriate privileges to access
 78388 the work of other users. Since this is primarily a system administration feature and is not
 78389 universally implemented, it has been omitted. Similarly, a specification for the output format for
 78390 a user with appropriate privileges viewing the queues of other users has been omitted.

78391 The **-f** *file* option from System V is used instead of the BSD method of using the last operand as
 78392 the pathname. The BSD method is ambiguous—does:

```
78393 at 1200 friday
```

78394 mean the same thing if there is a file named **friday** in the current directory?

78395 The *at_job_id* is composed of a limited character set in historical practice, and it is mandated here
 78396 to invalidate systems that might try using characters that require shell quoting or that could not
 78397 be easily parsed by shell scripts.

78398 The *at* utility varies between System V and BSD systems in the way timezones are used. On
 78399 System V systems, the *TZ* variable affects the at-job submission times and the times displayed
 78400 for the user. On BSD systems, *TZ* is not taken into account. The BSD behavior is easily achieved
 78401 with the current specification. If the user wishes to have the timezone default to that of the
 78402 system, they merely need to issue the *at* command immediately following an unsetting or null
 78403 assignment to *TZ*. For example:

```
78404 TZ= at noon ...
```

78405 gives the desired BSD result.

78406 While the *yacc*-like grammar specified in the OPERANDS section is lexically unambiguous with
 78407 respect to the digit strings, a lexical analyzer would probably be written to look for and return
 78408 digit strings in those cases. The parser could then check whether the digit string returned is a
 78409 valid *day_number*, *year_number*, and so on, based on the context.

78410 **FUTURE DIRECTIONS**

78411 None.

78412 **SEE ALSO**78413 *batch*, *crontab*78414 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)78415 **CHANGE HISTORY**

78416 First released in Issue 2.

78417 **Issue 6**

78418 This utility is marked as part of the User Portability Utilities option.

78419 The following new requirements on POSIX implementations derive from alignment with the
78420 Single UNIX Specification:

- 78421
- If **-m** is not used, the job's standard output and standard error are provided to the user by
-
- 78422 mail.

78423 The effects of using the **-q** and **-t** options as defined in the IEEE P1003.2b draft standard are
78424 specified.

78425 The normative text is reworded to avoid use of the term “must” for application requirements.

78426 **Issue 7**78427 The *at* utility is moved from the User Portability Utilities option to the Base. User Portability
78428 Utilities is now an option for interactive utilities.78429 SD5-XCU-ERN-95 is applied, removing the references to fixed locations for the files referenced
78430 by the *at* utility.

78431 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

78432 **NAME**

78433 awk — pattern scanning and processing language

78434 **SYNOPSIS**78435 awk [-F *sepstring*] [-v *assignment*]... *program* [*argument*...] |78436 awk [-F *sepstring*] -f *progfile* [-f *progfile*]... [-v *assignment*]... |78437 [*argument*...]78438 **DESCRIPTION**

78439 The *awk* utility shall execute programs written in the *awk* programming language, which is
 78440 specialized for textual data manipulation. An *awk* program is a sequence of patterns and
 78441 corresponding actions. When input is read that matches a pattern, the action associated with that
 78442 pattern is carried out.

78443 Input shall be interpreted as a sequence of records. By default, a record is a line, less its
 78444 terminating <newline>, but this can be changed by using the **RS** built-in variable. Each record of
 78445 input shall be matched in turn against each pattern in the program. For each pattern matched,
 78446 the associated action shall be executed.

78447 The *awk* utility shall interpret each input record as a sequence of fields where, by default, a field
 78448 is a string of non-<blank> non-<newline> characters. This default <blank> and <newline> field
 78449 delimiter can be changed by using the **FS** built-in variable or the **-F *sepstring*** option. The *awk*
 78450 utility shall denote the first field in a record \$1, the second \$2, and so on. The symbol \$0 shall
 78451 refer to the entire record; setting any other field causes the re-evaluation of \$0. Assigning to \$0
 78452 shall reset the values of all other fields and the **NF** built-in variable.

78453 **OPTIONS**78454 The *awk* utility shall conform to XBD [Section 12.2](#) (on page 215).

78455 The following options shall be supported:

78456 **-F *sepstring*** Define the input field separator. This option shall be equivalent to: |78457 **-v FS=*sepstring*** |

78458 except that if **-F *sepstring*** and **-v FS=*sepstring*** are both used, it is unspecified |
 78459 whether the **FS** assignment resulting from **-F *sepstring*** is processed in command |
 78460 line order or is processed after the last **-v FS=*sepstring***. See the description of the |
 78461 **FS** built-in variable, and how it is used, in the EXTENDED DESCRIPTION section.

78462 **-f *progfile*** Specify the pathname of the file *progfile* containing an *awk* program. A pathname of |
 78463 '-' shall denote the standard input. If multiple instances of this option are |
 78464 specified, the concatenation of the files specified as *progfile* in the order specified
 78465 shall be the *awk* program. The *awk* program can alternatively be specified in the
 78466 command line as a single argument.

78467 **-v *assignment***

78468 The application shall ensure that the *assignment* argument is in the same form as an
 78469 *assignment* operand. The specified variable assignment shall occur prior to
 78470 executing the *awk* program, including the actions associated with **BEGIN** patterns
 78471 (if any). Multiple occurrences of this option can be specified.

78472 **OPERANDS**

78473 The following operands shall be supported:

78474 *program* If no **-f** option is specified, the first operand to *awk* shall be the text of the *awk*
 78475 program. The application shall supply the *program* operand as a single argument to
 78476 *awk*. If the text does not end in a <newline>, *awk* shall interpret the text as if it did.

78477 *argument* Either of the following two types of *argument* can be intermixed:

78478 *file* A pathname of a file that contains the input to be read, which is

78479 matched against the set of patterns in the program. If no *file* operands

78480 are specified, or if a *file* operand is *'-'*, the standard input shall be

78481 used.

78482 *assignment* An operand that begins with an <underscore> or alphabetic

78483 character from the portable character set (see the table in XBD [Section](#)

78484 [6.1](#), on page 125), followed by a sequence of underscores, digits, and

78485 alphabetic characters from the portable character set, followed by the *'='*

78486 character, shall specify a variable assignment rather than a pathname.

78487 The characters before the *'='* represent the name of an *awk* variable;

78488 if that name is an *awk* reserved word (see [Grammar](#), on page 2470)

78489 the behavior is undefined. The characters following the <equals-

78490 sign> shall be interpreted as if they appeared in the *awk* program

78491 preceded and followed by a double-quote (*'"*) character, as a

78492 **STRING** token (see [Grammar](#), on page 2470), except that if the last

78493 character is an unescaped <backslash>, it shall be interpreted as a

78494 literal <backslash> rather than as the first character of the sequence

78495 *"\"*". The variable shall be assigned the value of that **STRING**

78496 token and, if appropriate, shall be considered a *numeric string* (see

78497 [Expressions in awk](#), on page 2455), the variable shall also be assigned

78498 its numeric value. Each such variable assignment shall occur just

78499 prior to the processing of the following *file*, if any. Thus, an

78500 assignment before the first *file* argument shall be executed after the

78501 **BEGIN** actions (if any), while an assignment after the last *file*

78502 argument shall occur before the **END** actions (if any). If there are no

78503 *file* arguments, assignments shall be executed before processing the

78504 standard input.

78505 STDIN

78506 The standard input shall be used only if no *file* operands are specified, or if a *file* operand is *'-'*, +

78507 or if a *progfile* option-argument is *'-'*; see the INPUT FILES section. If the *awk* program contains

78508 no actions and no patterns, but is otherwise a valid *awk* program, standard input and any *file*

78509 operands shall not be read and *awk* shall exit with a return status of zero.

78510 INPUT FILES

78511 Input files to the *awk* program from any of the following sources shall be text files:

- 78512 • Any *file* operands or their equivalents, achieved by modifying the *awk* variables **ARGV**
- 78513 and **ARGC**
- 78514 • Standard input in the absence of any *file* operands
- 78515 • Arguments to the **getline** function

78516 Whether the variable **RS** is set to a value other than a <newline> or not, for these files,

78517 implementations shall support records terminated with the specified separator up to

78518 {**LINE_MAX**} bytes and may support longer records.

78519 If *-f progfile* is specified, the application shall ensure that the files named by each of the *progfile*

78520 option-arguments are text files and their concatenation, in the same order as they appear in the

78521 arguments, is an *awk* program.

78522 **ENVIRONMENT VARIABLES**78523 The following environment variables shall affect the execution of *awk*:

78524 **LANG** Provide a default value for the internationalization variables that are unset or null.
 78525 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization
 78526 variables used to determine the values of locale categories.)

78527 **LC_ALL** If set to a non-empty string value, override the values of all the other
 78528 internationalization variables.

78529 **LC_COLLATE**

78530 Determine the locale for the behavior of ranges, equivalence classes, and multi-
 78531 character collating elements within regular expressions and in comparisons of
 78532 string values.

78533 **LC_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as
 78534 characters (for example, single-byte as opposed to multi-byte characters in
 78535 arguments and input files), the behavior of character classes within regular
 78536 expressions, the identification of characters as letters, and the mapping of
 78537 uppercase and lowercase characters for the **toupper** and **tolower** functions.

78538 **LC_MESSAGES**

78539 Determine the locale that should be used to affect the format and contents of
 78540 diagnostic messages written to standard error.

78541 **LC_NUMERIC**

78542 Determine the radix character used when interpreting numeric input, performing
 78543 conversions between numeric and string values, and formatting numeric output.
 78544 Regardless of locale, the <period> character (the decimal-point character of the
 78545 POSIX locale) is the decimal-point character recognized in processing *awk*
 78546 programs (including assignments in command line arguments).

78547 XSI **NLSPATH** Determine the location of message catalogs for the processing of **LC_MESSAGES**.

78548 **PATH** Determine the search path when looking for commands executed by *system(expr)*,
 78549 or input and output pipes; see XBD [Chapter 8](#) (on page 173).

78550 In addition, all environment variables shall be visible via the *awk* variable **ENVIRON**.78551 **ASYNCHRONOUS EVENTS**

78552 Default.

78553 **STDOUT**78554 The nature of the output files depends on the *awk* program.78555 **STDERR**

78556 The standard error shall be used only for diagnostic messages.

78557 **OUTPUT FILES**78558 The nature of the output files depends on the *awk* program.

EXTENDED DESCRIPTION

Overall Program Structure

An *awk* program is composed of pairs of the form:

```
pattern { action }
```

Either the pattern or the action (including the enclosing brace characters) can be omitted.

A missing pattern shall match any record of input, and a missing action shall be equivalent to:

```
{ print }
```

Execution of the *awk* program shall start by first executing the actions associated with all **BEGIN** patterns in the order they occur in the program. Then each *file* operand (or standard input if no files were specified) shall be processed in turn by reading data from the file until a record separator is seen (<newline> by default). Before the first reference to a field in the record is evaluated, the record shall be split into fields, according to the rules in [Regular Expressions](#) (on page 2461), using the value of **FS** that was current at the time the record was read. Each pattern in the program then shall be evaluated in the order of occurrence, and the action associated with each pattern that matches the current record executed. The action for a matching pattern shall be executed before evaluating subsequent patterns. Finally, the actions associated with all **END** patterns shall be executed in the order they occur in the program.

Expressions in awk

Expressions describe computations used in *patterns* and *actions*. In the following table, valid expression operations are given in groups from highest precedence first to lowest precedence last, with equal-precedence operators grouped between horizontal lines. In expression evaluation, where the grammar is formally ambiguous, higher precedence operators shall be evaluated before lower precedence operators. In this table *expr*, *expr1*, *expr2*, and *expr3* represent any expression, while *lvalue* represents any entity that can be assigned to (that is, on the left side of an assignment operator). The precise syntax of expressions is given in [Grammar](#) (on page 2470).

Table 4-1 Expressions in Decreasing Precedence in *awk*

Syntax	Name	Type of Result	Associativity
(<i>expr</i>)	Grouping	Type of <i>expr</i>	N/A
<i>\$expr</i>	Field reference	String	N/A
<i>lvalue</i> ++	Post-increment	Numeric	N/A
<i>lvalue</i> --	Post-decrement	Numeric	N/A
++ <i>lvalue</i>	Pre-increment	Numeric	N/A
-- <i>lvalue</i>	Pre-decrement	Numeric	N/A
<i>expr</i> ^ <i>expr</i>	Exponentiation	Numeric	Right
! <i>expr</i>	Logical not	Numeric	N/A
+ <i>expr</i>	Unary plus	Numeric	N/A
- <i>expr</i>	Unary minus	Numeric	N/A
<i>expr</i> * <i>expr</i>	Multiplication	Numeric	Left
<i>expr</i> / <i>expr</i>	Division	Numeric	Left
<i>expr</i> % <i>expr</i>	Modulus	Numeric	Left

Syntax	Name	Type of Result	Associativity
<i>expr</i> + <i>expr</i>	Addition	Numeric	Left
<i>expr</i> - <i>expr</i>	Subtraction	Numeric	Left
<i>expr</i> <i>expr</i>	String concatenation	String	Left
<i>expr</i> < <i>expr</i>	Less than	Numeric	None
<i>expr</i> <= <i>expr</i>	Less than or equal to	Numeric	None
<i>expr</i> != <i>expr</i>	Not equal to	Numeric	None
<i>expr</i> == <i>expr</i>	Equal to	Numeric	None
<i>expr</i> > <i>expr</i>	Greater than	Numeric	None
<i>expr</i> >= <i>expr</i>	Greater than or equal to	Numeric	None
<i>expr</i> ~ <i>expr</i>	ERE match	Numeric	None
<i>expr</i> !~ <i>expr</i>	ERE non-match	Numeric	None
<i>expr</i> in array	Array membership	Numeric	Left
(<i>index</i>) in array	Multi-dimension array membership	Numeric	Left
<i>expr</i> && <i>expr</i>	Logical AND	Numeric	Left
<i>expr</i> <i>expr</i>	Logical OR	Numeric	Left
<i>expr1</i> ? <i>expr2</i> : <i>expr3</i>	Conditional expression	Type of selected <i>expr2</i> or <i>expr3</i>	Right
<i>lvalue</i> ^= <i>expr</i>	Exponentiation assignment	Numeric	Right
<i>lvalue</i> %= <i>expr</i>	Modulus assignment	Numeric	Right
<i>lvalue</i> *= <i>expr</i>	Multiplication assignment	Numeric	Right
<i>lvalue</i> /= <i>expr</i>	Division assignment	Numeric	Right
<i>lvalue</i> += <i>expr</i>	Addition assignment	Numeric	Right
<i>lvalue</i> -= <i>expr</i>	Subtraction assignment	Numeric	Right
<i>lvalue</i> = <i>expr</i>	Assignment	Type of <i>expr</i>	Right

Each expression shall have either a string value, a numeric value, or both. Except as stated for specific contexts, the value of an expression shall be implicitly converted to the type needed for the context in which it is used. A string value shall be converted to a numeric value either by the equivalent of the following calls to functions defined by the ISO C standard:

```
setlocale(LC_NUMERIC, "");
numeric_value = atof(string_value);
```

or by converting the initial portion of the string to type **double** representation as follows:

The input string is decomposed into two parts: an initial, possibly empty, sequence of white-space characters (as specified by *isspace()*) and a subject sequence interpreted as a floating-point constant.

The expected form of the subject sequence is an optional '+' or '-' sign, then a non-empty sequence of digits optionally containing a <period>, then an optional exponent part. An exponent part consists of 'e' or 'E', followed by an optional sign, followed by one or more decimal digits.

The sequence starting with the first digit or the <period> (whichever occurs first) is interpreted as a floating constant of the C language, and if neither an exponent part nor a <period> appears, a <period> is assumed to follow the last digit in the string. If the subject sequence begins with a minus-sign, the value resulting from the conversion is negated.

A numeric value that is exactly equal to the value of an integer (see [Section 1.1.2](#), on page 2305) shall be converted to a string by the equivalent of a call to the **sprintf** function (see [String](#)

Functions, on page 2467) with the string "%d" as the *fmt* argument and the numeric value being converted as the first and only *expr* argument. Any other numeric value shall be converted to a string by the equivalent of a call to the **sprintf** function with the value of the variable **CONVFMT** as the *fmt* argument and the numeric value being converted as the first and only *expr* argument. The result of the conversion is unspecified if the value of **CONVFMT** is not a floating-point format specification. This volume of POSIX.1-2008 specifies no explicit conversions between numbers and strings. An application can force an expression to be treated as a number by adding zero to it, or can force it to be treated as a string by concatenating the null string (" ") to it.

A string value shall be considered a *numeric string* if it comes from one of the following:

1. Field variables
2. Input from the *getline()* function
3. **FILENAME**
4. **ARGV** array elements
5. **ENVIRON** array elements
6. Array elements created by the *split()* function
7. A command line variable assignment
8. Variable assignment from another numeric string variable

and an implementation-dependent condition corresponding to either case (a) or (b) below is met.

- a. After the equivalent of the following calls to functions defined by the ISO C standard, *string_value_end* would differ from *string_value*, and any characters before the terminating null character in *string_value_end* would be <blank> characters:

```
char *string_value_end;
setlocale(LC_NUMERIC, "");
numeric_value = strtod (string_value, &string_value_end);
```

- b. After all the following conversions have been applied, the resulting string would lexically be recognized as a **NUMBER** token as described by the lexical conventions in **Grammar** (on page 2470):

- All leading and trailing <blank> characters are discarded.
- If the first non-<blank> is '+' or '-', it is discarded.
- Each occurrence of the decimal point character from the current locale is changed to a <period>.

In case (a) the numeric value of the *numeric string* shall be the value that would be returned by the *strtod()* call. In case (b) if the first non-<blank> is '-', the numeric value of the *numeric string* shall be the negation of the numeric value of the recognized **NUMBER** token; otherwise, the numeric value of the *numeric string* shall be the numeric value of the recognized **NUMBER** token. Whether or not a string is a *numeric string* shall be relevant only in contexts where that term is used in this section.

When an expression is used in a Boolean context, if it has a numeric value, a value of zero shall be treated as false and any other value shall be treated as true. Otherwise, a string value of the null string shall be treated as false and any other value shall be treated as true. A Boolean context shall be one of the following:

- The first subexpression of a conditional expression
- An expression operated on by logical NOT, logical AND, or logical OR
- The second expression of a **for** statement
- The expression of an **if** statement
- The expression of the **while** clause in either a **while** or **do...while** statement
- An expression used as a pattern (as in Overall Program Structure)

All arithmetic shall follow the semantics of floating-point arithmetic as specified by the ISO C standard (see [Section 1.1.2](#), on page 2305).

The value of the expression:

```
expr1 ^ expr2
```

shall be equivalent to the value returned by the ISO C standard function call:

```
pow(expr1, expr2)
```

The expression:

```
lvalue ^= expr
```

shall be equivalent to the ISO C standard expression:

```
lvalue = pow(lvalue, expr)
```

except that lvalue shall be evaluated only once. The value of the expression:

```
expr1 % expr2
```

shall be equivalent to the value returned by the ISO C standard function call:

```
fmod(expr1, expr2)
```

The expression:

```
lvalue %= expr
```

shall be equivalent to the ISO C standard expression:

```
lvalue = fmod(lvalue, expr)
```

except that lvalue shall be evaluated only once.

Variables and fields shall be set by the assignment statement:

```
lvalue = expression
```

and the type of *expression* shall determine the resulting variable type. The assignment includes the arithmetic assignments ("**+=**", "**-=**", "***=**", "**/=**", "**%=**", "**^=**", "**++**", "**--**") all of which shall produce a numeric result. The left-hand side of an assignment and the target of increment and decrement operators can be one of a variable, an array with index, or a field selector.

The *awk* language supplies arrays that are used for storing numbers or strings. Arrays need not be declared. They shall initially be empty, and their sizes shall change dynamically. The subscripts, or element identifiers, are strings, providing a type of associative array capability. An array name followed by a subscript within square brackets can be used as an lvalue and thus as an expression, as described in the grammar; see [Grammar](#) (on page 2470). Unsubscripted array names can be used in only the following contexts:

- A parameter in a function definition or function call
- The **NAME** token following any use of the keyword **in** as specified in the grammar (see [Grammar](#), on page 2470); if the name used in this context is not an array name, the behavior is undefined

A valid array *index* shall consist of one or more <comma>-separated expressions, similar to the way in which multi-dimensional arrays are indexed in some programming languages. Because *awk* arrays are really one-dimensional, such a <comma>-separated list shall be converted to a single string by concatenating the string values of the separate expressions, each separated from the other by the value of the **SUBSEP** variable. Thus, the following two index operations shall be equivalent:

```
var[expr1, expr2, ... exprn]
```

```
var[expr1 SUBSEP expr2 SUBSEP ... SUBSEP exprn]
```

The application shall ensure that a multi-dimensioned *index* used with the **in** operator is parenthesized. The **in** operator, which tests for the existence of a particular array element, shall not cause that element to exist. Any other reference to a nonexistent array element shall automatically create it.

Comparisons (with the '<', '<=', '!=', '==', '>', and '>=' operators) shall be made numerically if both operands are numeric, if one is numeric and the other has a string value that is a numeric string, or if one is numeric and the other has the uninitialized value. Otherwise, operands shall be converted to strings as required and a string comparison shall be made using the locale-specific collation sequence. The value of the comparison expression shall be 1 if the relation is true, or 0 if the relation is false.

Variables and Special Variables

Variables can be used in an *awk* program by referencing them. With the exception of function parameters (see [User-Defined Functions](#), on page 2469), they are not explicitly declared. Function parameter names shall be local to the function; all other variable names shall be global. The same name shall not be used as both a function parameter name and as the name of a function or a special *awk* variable. The same name shall not be used both as a variable name with global scope and as the name of a function. The same name shall not be used within the same scope both as a scalar variable and as an array. Uninitialized variables, including scalar variables, array elements, and field variables, shall have an uninitialized value. An uninitialized value shall have both a numeric value of zero and a string value of the empty string. Evaluation of variables with an uninitialized value, to either string or numeric, shall be determined by the context in which they are used.

Field variables shall be designated by a '\$' followed by a number or numerical expression. The effect of the field number *expression* evaluating to anything other than a non-negative integer is unspecified; uninitialized variables or string values need not be converted to numeric values in this context. New field variables can be created by assigning a value to them. References to nonexistent fields (that is, fields after **NF**), shall evaluate to the uninitialized value. Such references shall not create new fields. However, assigning to a nonexistent field (for example, **\$(NF+2)=5**) shall increase the value of **NF**; create any intervening fields with the uninitialized value; and cause the value of **\$0** to be recomputed, with the fields being separated by the value of **OFS**. Each field variable shall have a string value or an uninitialized value when created. Field variables shall have the uninitialized value when created from **\$0** using **FS** and the variable does not contain any characters. If appropriate, the field variable shall be considered a numeric string (see [Expressions in awk](#), on page 2455).

78772	Implementations shall support the following other special variables that are set by <i>awk</i> :	
78773	ARGC	The number of elements in the ARGV array.
78774	ARGV	An array of command line arguments, excluding options and the <i>program</i>
78775		argument, numbered from zero to ARGC –1.
78776		The arguments in ARGV can be modified or added to; ARGC can be altered. As
78777		each input file ends, <i>awk</i> shall treat the next non-null element of ARGV , up to the
78778		current value of ARGC –1, inclusive, as the name of the next input file. Thus,
78779		setting an element of ARGV to null means that it shall not be treated as an input
78780		file. The name '–' indicates the standard input. If an argument matches the format
78781		of an <i>assignment</i> operand, this argument shall be treated as an <i>assignment</i> rather
78782		than a <i>file</i> argument.
78783	CONVFMT	The printf format for converting numbers to strings (except for output statements,
78784		where OFMT is used); "% . 6g" by default.
78785	ENVIRON	An array representing the value of the environment, as described in the <i>exec</i>
78786		functions defined in the System Interfaces volume of POSIX.1-2008. The indices of
78787		the array shall be strings consisting of the names of the environment variables, and
78788		the value of each array element shall be a string consisting of the value of that
78789		variable. If appropriate, the environment variable shall be considered a <i>numeric</i>
78790		<i>string</i> (see Expressions in awk , on page 2455); the array element shall also have its
78791		numeric value.
78792		In all cases where the behavior of <i>awk</i> is affected by environment variables
78793		(including the environment of any commands that <i>awk</i> executes via the system
78794		function or via pipeline redirections with the print statement, the printf statement,
78795		or the getline function), the environment used shall be the environment at the time
78796		<i>awk</i> began executing; it is implementation-defined whether any modification of
78797		ENVIRON affects this environment.
78798	FILENAME	A pathname of the current input file. Inside a BEGIN action the value is
78799		undefined. Inside an END action the value shall be the name of the last input file
78800		processed.
78801	FNR	The ordinal number of the current record in the current file. Inside a BEGIN action
78802		the value shall be zero. Inside an END action the value shall be the number of the
78803		last record processed in the last file processed.
78804	FS	Input field separator regular expression; a <space> by default.
78805	NF	The number of fields in the current record. Inside a BEGIN action, the use of NF is
78806		undefined unless a getline function without a <i>var</i> argument is executed previously.
78807		Inside an END action, NF shall retain the value it had for the last record read,
78808		unless a subsequent, redirected, getline function without a <i>var</i> argument is
78809		performed prior to entering the END action.
78810	NR	The ordinal number of the current record from the start of input. Inside a BEGIN
78811		action the value shall be zero. Inside an END action the value shall be the number
78812		of the last record processed.
78813	OFMT	The printf format for converting numbers to strings in output statements (see
78814		Output Statements , on page 2465); "% . 6g" by default. The result of the conversion
78815		is unspecified if the value of OFMT is not a floating-point format specification.

78816	OFS	The print statement output field separator; <space> by default.
78817	ORS	The print statement output record separator; a <newline> by default.
78818	RLENGTH	The length of the string matched by the match function.
78819	RS	The first character of the string value of RS shall be the input record separator; a <newline> by default. If RS contains more than one character, the results are unspecified. If RS is null, then records are separated by sequences consisting of a <newline> plus one or more blank lines, leading or trailing blank lines shall not result in empty records at the beginning or end of the input, and a <newline> shall always be a field separator, no matter what the value of FS is.
78820		
78821		
78822		
78823		
78824		
78825	RSTART	The starting position of the string matched by the match function, numbering from 1. This shall always be equivalent to the return value of the match function.
78826		
78827	SUBSEP	The subscript separator string for multi-dimensional arrays; the default value is implementation-defined.
78828		

78829 **Regular Expressions**

78830 The *awk* utility shall make use of the extended regular expression notation (see XBD [Section 9.4](#),
 78831 on page 188) except that it shall allow the use of C-language conventions for escaping special
 78832 characters within the EREs, as specified in the table in XBD [Chapter 5](#) (on page 121) ('\\',
 78833 '\\a', '\\b', '\\f', '\\n', '\\r', '\\t', '\\v') and the following table; these escape sequences
 78834 shall be recognized both inside and outside bracket expressions. Note that records need not be
 78835 separated by <newline> characters and string constants can contain <newline> characters, so
 78836 even the "\\n" sequence is valid in *awk* EREs. Using a <slash> character within an ERE requires
 78837 the escaping shown in the following table.

Table 4-2 Escape Sequences in *awk*

Escape Sequence	Description	Meaning
\ "	<backslash> <quotation-mark>	<quotation-mark> character
\ /	<backslash> <slash>	<slash> character
\ ddd	A <backslash> character followed by the longest sequence of one, two, or three octal-digit characters (01234567). If all of the digits are 0 (that is, representation of the NUL character), the behavior is undefined.	The character whose encoding is represented by the one, two, or three-digit octal integer. Multi-byte characters require multiple, concatenated escape sequences of this type, including the leading <backslash> for each byte.
\ c	A <backslash> character followed by any character not described in this table or in the table in XBD Chapter 5 (on page 121) ('\\', '\a', '\b', '\f', '\n', '\r', '\t', '\v').	Undefined

A regular expression can be matched against a specific field or string by using one of the two regular expression matching operators, `'~'` and `"!~"`. These operators shall interpret their right-hand operand as a regular expression and their left-hand operand as a string. If the regular expression matches the string, the `'~'` expression shall evaluate to a value of 1, and the `"!~"` expression shall evaluate to a value of 0. (The regular expression matching operation is as defined by the term `matched` in XBD Section 9.1 (on page 181), where a match occurs on any part of the string unless the regular expression is limited with the <circumflex> or <dollar-sign> special characters.) If the regular expression does not match the string, the `'~'` expression shall evaluate to a value of 0, and the `"!~"` expression shall evaluate to a value of 1. If the right-hand operand is any expression other than the lexical token **ERE**, the string value of the expression shall be interpreted as an extended regular expression, including the escape conventions described above. Note that these same escape conventions shall also be applied in determining the value of a string literal (the lexical token **STRING**), and thus shall be applied a second time when a string literal is used in this context.

When an **ERE** token appears as an expression in any context other than as the right-hand of the `'~'` or `"!~"` operator or as one of the built-in function arguments described below, the value of the resulting expression shall be the equivalent of:

```
$0 ~ /ere/
```

The *ere* argument to the **gsub**, **match**, **sub** functions, and the *fs* argument to the **split** function (see [String Functions](#), on page 2467) shall be interpreted as extended regular expressions. These can be either **ERE** tokens or arbitrary expressions, and shall be interpreted in the same manner as the right-hand side of the `'~'` or `"!~"` operator.

An extended regular expression can be used to separate fields by assigning a string containing the expression to the built-in variable **FS**, either directly or as a consequence of using the `-F sepstring` option. The default value of the **FS** variable shall be a single <space>. The following describes **FS** behavior:

1. If **FS** is a null string, the behavior is unspecified.

2. If **FS** is a single character:

- a. If **FS** is <space>, skip leading and trailing <blank> and <newline> characters; fields shall be delimited by sets of one or more <blank> or <newline> characters.
- b. Otherwise, if **FS** is any other character *c*, fields shall be delimited by each single occurrence of *c*.

3. Otherwise, the string value of **FS** shall be considered to be an extended regular expression. Each occurrence of a sequence matching the extended regular expression shall delimit fields.

Except for the '`~`' and '`!~`' operators, and in the **gsub**, **match**, **split**, and **sub** built-in functions, ERE matching shall be based on input records; that is, record separator characters (the first character of the value of the variable **RS**, <newline> by default) cannot be embedded in the expression, and no expression shall match the record separator character. If the record separator is not <newline>, <newline> characters embedded in the expression can be matched. For the '`~`' and '`!~`' operators, and in those four built-in functions, ERE matching shall be based on text strings; that is, any character (including <newline> and the record separator) can be embedded in the pattern, and an appropriate pattern shall match any character. However, in all *awk* ERE matching, the use of one or more NUL characters in the pattern, input record, or text string produces undefined results.

Patterns

A *pattern* is any valid *expression*, a range specified by two expressions separated by a comma, or one of the two special patterns **BEGIN** or **END**.

Special Patterns

The *awk* utility shall recognize two special patterns, **BEGIN** and **END**. Each **BEGIN** pattern shall be matched once and its associated action executed before the first record of input is read—except possibly by use of the **getline** function (see [Input/Output and General Functions](#), on page 2468) in a prior **BEGIN** action—and before command line assignment is done. Each **END** pattern shall be matched once and its associated action executed after the last record of input has been read. These two patterns shall have associated actions.

BEGIN and **END** shall not combine with other patterns. Multiple **BEGIN** and **END** patterns shall be allowed. The actions associated with the **BEGIN** patterns shall be executed in the order specified in the program, as are the **END** actions. An **END** pattern can precede a **BEGIN** pattern in a program.

If an *awk* program consists of only actions with the pattern **BEGIN**, and the **BEGIN** action contains no **getline** function, *awk* shall exit without reading its input when the last statement in the last **BEGIN** action is executed. If an *awk* program consists of only actions with the pattern **END** or only actions with the patterns **BEGIN** and **END**, the input shall be read before the statements in the **END** actions are executed.

Expression Patterns

An expression pattern shall be evaluated as if it were an expression in a Boolean context. If the result is true, the pattern shall be considered to match, and the associated action (if any) shall be executed. If the result is false, the action shall not be executed.

Pattern Ranges

A pattern range consists of two expressions separated by a comma; in this case, the action shall be performed for all records between a match of the first expression and the following match of the second expression, inclusive. At this point, the pattern range can be repeated starting at input records subsequent to the end of the matched range.

Actions

An action is a sequence of statements as shown in the grammar in [Grammar](#) (on page 2470). Any single statement can be replaced by a statement list enclosed in curly braces. The application shall ensure that statements in a statement list are separated by <newline> or <semicolon> characters. Statements in a statement list shall be executed sequentially in the order that they appear.

The *expression* acting as the conditional in an **if** statement shall be evaluated and if it is non-zero or non-null, the following statement shall be executed; otherwise, if **else** is present, the statement following the **else** shall be executed.

The **if**, **while**, **do...while**, **for**, **break**, and **continue** statements are based on the ISO C standard (see [Section 1.1.2](#), on page 2305), except that the Boolean expressions shall be treated as described in [Expressions in awk](#) (on page 2455), and except in the case of:

```
for (variable in array)
```

which shall iterate, assigning each *index* of *array* to *variable* in an unspecified order. The results of adding new elements to *array* within such a **for** loop are undefined. If a **break** or **continue** statement occurs outside of a loop, the behavior is undefined.

The **delete** statement shall remove an individual array element. Thus, the following code deletes an entire array:

```
for (index in array)
    delete array[index]
```

The **next** statement shall cause all further processing of the current input record to be abandoned. The behavior is undefined if a **next** statement appears or is invoked in a **BEGIN** or **END** action.

The **exit** statement shall invoke all **END** actions in the order in which they occur in the program source and then terminate the program without reading further input. An **exit** statement inside an **END** action shall terminate the program without further execution of **END** actions. If an expression is specified in an **exit** statement, its numeric value shall be the exit status of *awk*, unless subsequent errors are encountered or a subsequent **exit** statement with an expression is executed.

Output Statements

Both **print** and **printf** statements shall write to standard output by default. The output shall be written to the location specified by *output_redirection* if one is supplied, as follows:

```
> expression
>> expression
| expression
```

In all cases, the *expression* shall be evaluated to produce a string that is used as a pathname into which to write (for '**>**' or '**>>**') or as a command to be executed (for '**|**'). Using the first two forms, if the file of that name is not currently open, it shall be opened, creating it if necessary and using the first form, truncating the file. The output then shall be appended to the file. As long as the file remains open, subsequent calls in which *expression* evaluates to the same string value shall simply append output to the file. The file remains open until the **close** function (see [Input/Output and General Functions](#), on page 2468) is called with an expression that evaluates to the same string value.

The third form shall write output onto a stream piped to the input of a command. The stream shall be created if no stream is currently open with the value of *expression* as its command name. The stream created shall be equivalent to one created by a call to the *popen()* function defined in the System Interfaces volume of POSIX.1-2008 with the value of *expression* as the *command* argument and a value of *w* as the *mode* argument. As long as the stream remains open, subsequent calls in which *expression* evaluates to the same string value shall write output to the existing stream. The stream shall remain open until the **close** function (see [Input/Output and General Functions](#), on page 2468) is called with an expression that evaluates to the same string value. At that time, the stream shall be closed as if by a call to the *pclose()* function defined in the System Interfaces volume of POSIX.1-2008.

As described in detail by the grammar in [Grammar](#) (on page 2470), these output statements shall take a <comma>-separated list of *expressions* referred to in the grammar by the non-terminal symbols **expr_list**, **print_expr_list**, or **print_expr_list_opt**. This list is referred to here as the *expression list*, and each member is referred to as an *expression argument*.

The **print** statement shall write the value of each expression argument onto the indicated output stream separated by the current output field separator (see variable **OFS** above), and terminated by the output record separator (see variable **ORS** above). All expression arguments shall be taken as strings, being converted if necessary; this conversion shall be as described in [Expressions in awk](#) (on page 2455), with the exception that the **printf** format in **OFMT** shall be used instead of the value in **CONVFMT**. An empty expression list shall stand for the whole input record (\$0).

The **printf** statement shall produce output based on a notation similar to the File Format Notation used to describe file formats in this volume of POSIX.1-2008 (see XBD [Chapter 5](#), on page 121). Output shall be produced as specified with the first *expression* argument as the string *format* and subsequent *expression* arguments as the strings *arg1* to *argn*, inclusive, with the following exceptions:

1. The *format* shall be an actual character string rather than a graphical representation. Therefore, it cannot contain empty character positions. The <space> in the *format* string, in any context other than a *flag* of a conversion specification, shall be treated as an ordinary character that is copied to the output.
2. If the character set contains a '**Δ**' character and that character appears in the *format* string, it shall be treated as an ordinary character that is copied to the output.

3. The *escape sequences* beginning with a <backslash> character shall be treated as sequences of ordinary characters that are copied to the output. Note that these same sequences shall be interpreted lexically by *awk* when they appear in literal strings, but they shall not be treated specially by the **printf** statement.
4. A *field width* or *precision* can be specified as the ' * ' character instead of a digit string. In this case the next argument from the expression list shall be fetched and its numeric value taken as the field width or precision.
5. The implementation shall not precede or follow output from the *d* or *u* conversion specifier characters with <blank> characters not specified by the *format* string.
6. The implementation shall not precede output from the *o* conversion specifier character with leading zeros not specified by the *format* string.
7. For the *c* conversion specifier character: if the argument has a numeric value, the character whose encoding is that value shall be output. If the value is zero or is not the encoding of any character in the character set, the behavior is undefined. If the argument does not have a numeric value, the first character of the string value shall be output; if the string does not contain any characters, the behavior is undefined.
8. For each conversion specification that consumes an argument, the next expression argument shall be evaluated. With the exception of the *c* conversion specifier character, the value shall be converted (according to the rules specified in [Expressions in awk](#), on page 2455) to the appropriate type for the conversion specification.
9. If there are insufficient expression arguments to satisfy all the conversion specifications in the *format* string, the behavior is undefined.
10. If any character sequence in the *format* string begins with a ' % ' character, but does not form a valid conversion specification, the behavior is unspecified.

Both **print** and **printf** can output at least {LINE_MAX} bytes.

Functions

The *awk* language has a variety of built-in functions: arithmetic, string, input/output, and general.

Arithmetic Functions

The arithmetic functions, except for **int**, shall be based on the ISO C standard (see [Section 1.1.2](#), on page 2305). The behavior is undefined in cases where the ISO C standard specifies that an error be returned or that the behavior is undefined. Although the grammar (see [Grammar](#), on page 2470) permits built-in functions to appear with no arguments or parentheses, unless the argument or parentheses are indicated as optional in the following list (by displaying them within the " [] " brackets), such use is undefined.

atan2 (<i>y</i> , <i>x</i>)	Return arctangent of <i>y</i> / <i>x</i> in radians in the range $[-\pi, \pi]$.
cos (<i>x</i>)	Return cosine of <i>x</i> , where <i>x</i> is in radians.
sin (<i>x</i>)	Return sine of <i>x</i> , where <i>x</i> is in radians.
exp (<i>x</i>)	Return the exponential function of <i>x</i> .
log (<i>x</i>)	Return the natural logarithm of <i>x</i> .

79043 **sqrt**(*x*) Return the square root of *x*.

79044 **int**(*x*) Return the argument truncated to an integer. Truncation shall be toward 0 when
79045 *x*>0.

79046 **rand**() Return a random number *n*, such that $0 \leq n < 1$.

79047 **srand**([*expr*]) Set the seed value for *rand* to *expr* or use the time of day if *expr* is omitted. The
79048 previous seed value shall be returned.

79049 **String Functions**

79050 The string functions in the following list shall be supported. Although the grammar (see
79051 [Grammar](#), on page 2470) permits built-in functions to appear with no arguments or parentheses,
79052 unless the argument or parentheses are indicated as optional in the following list (by displaying
79053 them within the " [] " brackets), such use is undefined.

79054 **gsub**(*ere*, *repl* [, *in*])
79055 Behave like **sub** (see below), except that it shall replace all occurrences of the
79056 regular expression (like the *ed* utility global substitute) in *\$0* or in the *in* argument,
79057 when specified.

79058 **index**(*s*, *t*) Return the position, in characters, numbering from 1, in string *s* where string *t* first
79059 occurs, or zero if it does not occur at all.

79060 **length**[(*[s]*)] Return the length, in characters, of its argument taken as a string, or of the whole
79061 record, *\$0*, if there is no argument.

79062 **match**(*s*, *ere*) Return the position, in characters, numbering from 1, in string *s* where the
79063 extended regular expression *ere* occurs, or zero if it does not occur at all. RSTART
79064 shall be set to the starting position (which is the same as the returned value), zero
79065 if no match is found; RLENGTH shall be set to the length of the matched string, -1
79066 if no match is found.

79067 **split**(*s*, *a* [, *fs*])
79068 Split the string *s* into array elements *a*[1], *a*[2], ..., *a*[*n*], and return *n*. All elements
79069 of the array shall be deleted before the split is performed. The separation shall be
79070 done with the ERE *fs* or with the field separator **FS** if *fs* is not given. Each array
79071 element shall have a string value when created and, if appropriate, the array
79072 element shall be considered a numeric string (see [Expressions in awk](#), on page
79073 2455). The effect of a null string as the value of *fs* is unspecified.

79074 **sprintf**(*fnt*, *expr*, *expr*, ...)
79075 Format the expressions according to the **printf** format given by *fnt* and return the
79076 resulting string.

79077 **sub**(*ere*, *repl* [, *in*])
79078 Substitute the string *repl* in place of the first instance of the extended regular
79079 expression *ERE* in string *in* and return the number of substitutions. An
79080 <ampersand> (' & ') appearing in the string *repl* shall be replaced by the string
79081 from *in* that matches the ERE. An <ampersand> preceded with a <backslash> shall
79082 be interpreted as the literal <ampersand> character. An occurrence of two
79083 consecutive <backslash> characters shall be interpreted as just a single literal
79084 <backslash> character. Any other occurrence of a <backslash> (for example,
79085 preceding any other character) shall be treated as a literal <backslash> character.
79086 Note that if *repl* is a string literal (the lexical token **STRING**; see [Grammar](#), on page
79087 2470), the handling of the <ampersand> character occurs after any lexical

processing, including any lexical <backslash>-escape sequence processing. If *in* is specified and it is not an lvalue (see [Expressions in awk](#), on page 2455), the behavior is undefined. If *in* is omitted, *awk* shall use the current record (\$0) in its place.

substr(*s*, *m* [, *n*])

Return the at most *n*-character substring of *s* that begins at position *m*, numbering from 1. If *n* is omitted, or if *n* specifies more characters than are left in the string, the length of the substring shall be limited by the length of the string *s*.

tolower(*s*) Return a string based on the string *s*. Each character in *s* that is an uppercase letter specified to have a **tolower** mapping by the *LC_CTYPE* category of the current locale shall be replaced in the returned string by the lowercase letter specified by the mapping. Other characters in *s* shall be unchanged in the returned string.

toupper(*s*) Return a string based on the string *s*. Each character in *s* that is a lowercase letter specified to have a **toupper** mapping by the *LC_CTYPE* category of the current locale is replaced in the returned string by the uppercase letter specified by the mapping. Other characters in *s* are unchanged in the returned string.

All of the preceding functions that take *ERE* as a parameter expect a pattern or a string valued expression that is a regular expression as defined in [Regular Expressions](#) (on page 2461).

Input/Output and General Functions

The input/output and general functions are:

close(*expression*)

Close the file or pipe opened by a **print** or **printf** statement or a call to **getline** with the same string-valued *expression*. The limit on the number of open *expression* arguments is implementation-defined. If the close was successful, the function shall return zero; otherwise, it shall return non-zero.

expression | **getline** [*var*]

Read a record of input from a stream piped from the output of a command. The stream shall be created if no stream is currently open with the value of *expression* as its command name. The stream created shall be equivalent to one created by a call to the *popen*() function with the value of *expression* as the *command* argument and a value of *r* as the *mode* argument. As long as the stream remains open, subsequent calls in which *expression* evaluates to the same string value shall read subsequent records from the stream. The stream shall remain open until the **close** function is called with an expression that evaluates to the same string value. At that time, the stream shall be closed as if by a call to the *pclose*() function. If *var* is omitted, \$0 and **NF** shall be set; otherwise, *var* shall be set and, if appropriate, it shall be considered a numeric string (see [Expressions in awk](#), on page 2455).

The **getline** operator can form ambiguous constructs when there are unparenthesized operators (including concatenate) to the left of the ' | ' (to the beginning of the expression containing **getline**). In the context of the ' \$ ' operator, ' | ' shall behave as if it had a lower precedence than ' \$ '. The result of evaluating other operators is unspecified, and conforming applications shall parenthesize properly all such usages.

getline Set \$0 to the next input record from the current input file. This form of **getline** shall set the **NF**, **NR**, and **FNR** variables.

getline *var* Set variable *var* to the next input record from the current input file and, if appropriate, *var* shall be considered a numeric string (see [Expressions in awk](#), on page 2455). This form of **getline** shall set the **FNR** and **NR** variables.

getline [*var*] < *expression*

Read the next record of input from a named file. The *expression* shall be evaluated to produce a string that is used as a pathname. If the file of that name is not currently open, it shall be opened. As long as the stream remains open, subsequent calls in which *expression* evaluates to the same string value shall read subsequent records from the file. The file shall remain open until the **close** function is called with an expression that evaluates to the same string value. If *var* is omitted, **\$0** and **NF** shall be set; otherwise, *var* shall be set and, if appropriate, it shall be considered a numeric string (see [Expressions in awk](#), on page 2455).

The **getline** operator can form ambiguous constructs when there are unparenthesized binary operators (including concatenate) to the right of the '**<**' (up to the end of the expression containing the **getline**). The result of evaluating such a construct is unspecified, and conforming applications shall parenthesize properly all such usages.

system(*expression*)

Execute the command given by *expression* in a manner equivalent to the *system()* function defined in the System Interfaces volume of POSIX.1-2008 and return the exit status of the command.

All forms of **getline** shall return 1 for successful input, zero for end-of-file, and -1 for an error.

Where strings are used as the name of a file or pipeline, the application shall ensure that the strings are textually identical. The terminology “same string value” implies that “equivalent strings”, even those that differ only by <space> characters, represent different files.

User-Defined Functions

The *awk* language also provides user-defined functions. Such functions can be defined as:

```
function name([parameter, ...]) { statements }
```

A function can be referred to anywhere in an *awk* program; in particular, its use can precede its definition. The scope of a function is global.

Function parameters, if present, can be either scalars or arrays; the behavior is undefined if an array name is passed as a parameter that the function uses as a scalar, or if a scalar expression is passed as a parameter that the function uses as an array. Function parameters shall be passed by value if scalar and by reference if array name.

The number of parameters in the function definition need not match the number of parameters in the function call. Excess formal parameters can be used as local variables. If fewer arguments are supplied in a function call than are in the function definition, the extra parameters that are used in the function body as scalars shall evaluate to the uninitialized value until they are otherwise initialized, and the extra parameters that are used in the function body as arrays shall be treated as uninitialized arrays where each element evaluates to the uninitialized value until otherwise initialized.

When invoking a function, no white space can be placed between the function name and the opening parenthesis. Function calls can be nested and recursive calls can be made upon functions. Upon return from any nested or recursive function call, the values of all of the calling function's parameters shall be unchanged, except for array parameters passed by reference. The

return statement can be used to return a value. If a **return** statement appears outside of a function definition, the behavior is undefined.

In the function definition, <newline> characters shall be optional before the opening brace and after the closing brace. Function definitions can appear anywhere in the program where a *pattern-action* pair is allowed.

Grammar

The grammar in this section and the lexical conventions in the following section shall together describe the syntax for *awk* programs. The general conventions for this style of grammar are described in [Section 1.3](#) (on page 2309). A valid program can be represented as the non-terminal symbol *program* in the grammar. This formal syntax shall take precedence over the preceding text syntax description.

```

This grammar has several ambiguities that shall be resolved as follows:

- Operator precedence and associativity shall be as described in [Table 4-1](#) (on page 2455).
- In case of ambiguity, an **else** shall be associated with the most immediately preceding **if** that would satisfy the grammar.
- In some contexts, a `<slash>` (`'/'`) that is used to surround an ERE could also be the division operator. This shall be resolved in such a way that wherever the division operator could appear, a `<slash>` is assumed to be the division operator. (There is no unary division operator.)

Each expression in an *awk* program shall conform to the precedence and associativity rules, even when this is not needed to resolve an ambiguity. For example, because `'$'` has higher precedence than `'++'`, the string `"$x++--"` is not a valid *awk* expression, even though it is unambiguously parsed by the grammar as `"$(x++)--"`.

One convention that might not be obvious from the formal grammar is where `<newline>` characters are acceptable. There are several obvious placements such as terminating a statement, and a `<backslash>` can be used to escape `<newline>` characters between any lexical tokens. In addition, `<newline>` characters without `<backslash>` characters can follow a comma, an open brace, logical AND operator (`"&&"`), logical OR operator (`"||"`), the **do** keyword, the **else** keyword, and the closing parenthesis of an **if**, **for**, or **while** statement. For example:

```

79490 { print $1,
79491       $2 }

```

Lexical Conventions

The lexical conventions for *awk* programs, with respect to the preceding grammar, shall be as follows:

1. Except as noted, *awk* shall recognize the longest possible token or delimiter beginning at a given point.
2. A comment shall consist of any characters beginning with the `<number-sign>` character and terminated by, but excluding the next occurrence of, a `<newline>`. Comments shall have no effect, except to delimit lexical tokens.
3. The `<newline>` shall be recognized as the token **NEWLINE**.
4. A `<backslash>` character immediately followed by a `<newline>` shall have no effect.
5. The token **STRING** shall represent a string constant. A string constant shall begin with the character `'`. Within a string constant, a `<backslash>` character shall be considered to begin an escape sequence as specified in the table in [XBD Chapter 5](#) (on page 121) (`'\'`, `'\a'`, `'\b'`, `'\f'`, `'\n'`, `'\r'`, `'\t'`, `'\v'`). In addition, the escape sequences in [Table 4-2](#) (on page 2462) shall be recognized. A `<newline>` shall not occur within a string constant. A string constant shall be terminated by the first unescaped occurrence of the character `'` after the one that begins the string constant. The value of the string

shall be the sequence of all unescaped characters and values of escape sequences between, but not including, the two delimiting ' " ' characters.

6. The token **ERE** represents an extended regular expression constant. An ERE constant shall begin with the <slash> character. Within an ERE constant, a <backslash> character shall be considered to begin an escape sequence as specified in the table in XBD [Chapter 5](#) (on page 121). In addition, the escape sequences in [Table 4-2](#) (on page 2462) shall be recognized. The application shall ensure that a <newline> does not occur within an ERE constant. An ERE constant shall be terminated by the first unescaped occurrence of the <slash> character after the one that begins the ERE constant. The extended regular expression represented by the ERE constant shall be the sequence of all unescaped characters and values of escape sequences between, but not including, the two delimiting <slash> characters.

7. A <blank> shall have no effect, except to delimit lexical tokens or within **STRING** or **ERE** tokens.

8. The token **NUMBER** shall represent a numeric constant. Its form and numeric value shall either be equivalent to the **decimal-floating-constant** token as specified by the ISO C standard, or it shall be a sequence of decimal digits and shall be evaluated as an integer constant in decimal. In addition, implementations may accept numeric constants with the form and numeric value equivalent to the **hexadecimal-constant** and **hexadecimal-floating-constant** tokens as specified by the ISO C standard.

If the value is too large or too small to be representable (see [Section 1.1.2](#), on page 2305), the behavior is undefined.

9. A sequence of underscores, digits, and alphabetic characters from the portable character set (see XBD [Section 6.1](#), on page 125), beginning with an <underscore> or alphabetic character, shall be considered a word.

10. The following words are keywords that shall be recognized as individual tokens; the name of the token is the same as the keyword:

BEGIN	delete	END	function	in	printf
break	do	exit	getline	next	return
continue	else	for	if	print	while

11. The following words are names of built-in functions and shall be recognized as the token **BUILTIN_FUNC_NAME**:

atan2	gsub	log	split	sub	toupper
close	index	match	sprintf	substr	
cos	int	rand	sqrt	system	
exp	length	sin	srand	tolower	

The above-listed keywords and names of built-in functions are considered reserved words.

12. The token **NAME** shall consist of a word that is not a keyword or a name of a built-in function and is not followed immediately (without any delimiters) by the ' (' character.
13. The token **FUNC_NAME** shall consist of a word that is not a keyword or a name of a built-in function, followed immediately (without any delimiters) by the ' (' character. The ' (' character shall not be included as part of the token.

14. The following two-character sequences shall be recognized as the named tokens:

Token Name	Sequence	Token Name	Sequence
ADD_ASSIGN	+=	NO_MATCH	!~
SUB_ASSIGN	-=	EQ	==
MUL_ASSIGN	*=	LE	<=
DIV_ASSIGN	/=	GE	>=
MOD_ASSIGN	%=	NE	!=
POW_ASSIGN	^=	INCR	++
OR		DECR	--
AND	&&	APPEND	>>

15. The following single characters shall be recognized as tokens whose names are the character:

<newline> { } () [] , ; + - * % ^ ! > < | ? : ~ \$ =

There is a lexical ambiguity between the token **ERE** and the tokens **'/'** and **DIV_ASSIGN**. When an input sequence begins with a <slash> character in any syntactic context where the token **'/'** or **DIV_ASSIGN** could appear as the next token in a valid program, the longer of those two tokens that can be recognized shall be recognized. In any other syntactic context where the token **ERE** could appear as the next token in a valid program, the token **ERE** shall be recognized.

EXIT STATUS

The following exit values shall be returned:

- 0 All input files were processed successfully.
- >0 An error occurred.

The exit status can be altered within the program by using an **exit** expression.

CONSEQUENCES OF ERRORS

If any *file* operand is specified and the named file cannot be accessed, *awk* shall write a diagnostic message to standard error and terminate without any further action.

If the program specified by either the *program* operand or a *progfile* operand is not a valid *awk* program (as specified in the EXTENDED DESCRIPTION section), the behavior is undefined.

APPLICATION USAGE

The **index**, **length**, **match**, and **substr** functions should not be confused with similar functions in the ISO C standard; the *awk* versions deal with characters, while the ISO C standard deals with bytes.

Because the concatenation operation is represented by adjacent expressions rather than an explicit operator, it is often necessary to use parentheses to enforce the proper evaluation precedence.

EXAMPLES

The *awk* program specified in the command line is most easily specified within single-quotes (for example, *'program'*) for applications using *sh*, because *awk* programs commonly contain characters that are special to the shell, including double-quotes. In the cases where an *awk* program contains single-quote characters, it is usually easiest to specify most of the program as strings within single-quotes concatenated by the shell with quoted single-quote characters. For example:

```
awk '/'\''/' { print "quote:", $0 }'
```

prints all lines from the standard input containing a single-quote character, prefixed with *quote*..

The following are examples of simple *awk* programs:

1. Write to the standard output all input lines for which field 3 is greater than 5:

```
$3 > 5
```

2. Write every tenth line:

```
(NR % 10) == 0
```

3. Write any line with a substring matching the regular expression:

```
/(G|D)(2[0-9][[:alpha:]]*)/
```

4. Print any line with a substring containing a 'G' or 'D', followed by a sequence of digits and characters. This example uses character classes **digit** and **alpha** to match language-independent digit and alphabetic characters respectively:

```
/(G|D)([[:digit:]][[:alpha:]]*)/
```

5. Write any line in which the second field matches the regular expression and the fourth field does not:

```
$2 ~ /xyz/ && $4 !~ /xyz/
```

6. Write any line in which the second field contains a <backslash>:

```
$2 ~ /\
```

7. Write any line in which the second field contains a <backslash>. Note that <backslash>-escapes are interpreted twice; once in lexical processing of the string and once in processing the regular expression:

```
$2 ~ "\\
```

8. Write the second to the last and the last field in each line. Separate the fields by a <colon>:

```
{OFS=":";print $(NF-1), $NF}
```

9. Write the line number and number of fields in each line. The three strings representing the line number, the <colon>, and the number of fields are concatenated and that string is written to standard output:

```
{print NR ":" NF}
```

10. Write lines longer than 72 characters:

```
length($0) > 72
```

11. Write the first two fields in opposite order separated by **OFS**:

```
{ print $2, $1 }
```

12. Same, with input fields separated by a <comma> or <space> and <tab> characters, or both:

```
BEGIN { FS = ",[ \t]*|[ \t]+" }
{ print $2, $1 }
```

13. Add up the first column, print sum, and average:

```
{s += $1 }
END {print "sum is ", s, " average is", s/NR}
```

14. Write fields in reverse order, one per line (many lines out for each line in):
- ```
{ for (i = NF; i > 0; --i) print $i }
```
15. Write all lines between occurrences of the strings **start** and **stop**:
- ```
/start/, /stop/
```
16. Write all lines whose first field is different from the previous one:
- ```
$1 != prev { print; prev = $1 }
```
17. Simulate *echo*:
- ```
BEGIN {
    for (i = 1; i < ARGV; ++i)
        printf("%s%s", ARGV[i], i==ARGC-1?"\n":" ")
}
```
18. Write the path prefixes contained in the *PATH* environment variable, one per line:
- ```
BEGIN {
 n = split (ENVIRON["PATH"], path, ":")
 for (i = 1; i <= n; ++i)
 print path[i]
}
```
19. If there is a file named **input** containing page headers of the form:
- ```
Page #
```
- and a file named **program** that contains:
- ```
/Page/ { $2 = n++; }
 { print }
```
- then the command line:
- ```
awk -f program n=5 input
```
- prints the file **input**, filling in page numbers starting at 5.

RATIONALE

This description is based on the new *awk*, “nawk”, (see the referenced *The AWK Programming Language*), which introduced a number of new features to the historical *awk*:

1. New keywords: **delete**, **do**, **function**, **return**
2. New built-in functions: **atan2**, **close**, **cos**, **gsub**, **match**, **rand**, **sin**, **srand**, **sub**, **system**
3. New predefined variables: **FNR**, **ARGC**, **ARGV**, **RSTART**, **RLENGTH**, **SUBSEP**
4. New expression operators: **?**, **:**, **..**, **^**
5. The **FS** variable and the third argument to **split**, now treated as extended regular expressions.
6. The operator precedence, changed to more closely match the C language. Two examples of code that operate differently are:

```
while ( n /= 10 > 1) ...
if (!"wk" ~ /bwk/) ...
```

Several features have been added based on newer implementations of *awk*:

- Multiple instances of `-f progfile` are permitted.
- The new option `-v assignment`.
- The new predefined variable `ENVIRON`.
- New built-in functions `toupper` and `tolower`.
- More formatting capabilities are added to `printf` to match the ISO C standard.

The overall *awk* syntax has always been based on the C language, with a few features from the shell command language and other sources. Because of this, it is not completely compatible with any other language, which has caused confusion for some users. It is not the intent of the standard developers to address such issues. A few relatively minor changes toward making the language more compatible with the ISO C standard were made; most of these changes are based on similar changes in recent implementations, as described above. There remain several C-language conventions that are not in *awk*. One of the notable ones is the `<comma>` operator, which is commonly used to specify multiple expressions in the C language `for` statement. Also, there are various places where *awk* is more restrictive than the C language regarding the type of expression that can be used in a given context. These limitations are due to the different features that the *awk* language does provide.

Regular expressions in *awk* have been extended somewhat from historical implementations to make them a pure superset of extended regular expressions, as defined by POSIX.1-2008 (see XBD Section 9.4, on page 188). The main extensions are internationalization features and interval expressions. Historical implementations of *awk* have long supported `<backslash>`-escape sequences as an extension to extended regular expressions, and this extension has been retained despite inconsistency with other utilities. The number of escape sequences recognized in both extended regular expressions and strings has varied (generally increasing with time) among implementations. The set specified by POSIX.1-2008 includes most sequences known to be supported by popular implementations and by the ISO C standard. One sequence that is not supported is hexadecimal value escapes beginning with `'\x'`. This would allow values expressed in more than 9 bits to be used within *awk* as in the ISO C standard. However, because this syntax has a non-deterministic length, it does not permit the subsequent character to be a hexadecimal digit. This limitation can be dealt with in the C language by the use of lexical string concatenation. In the *awk* language, concatenation could also be a solution for strings, but not for extended regular expressions (either lexical ERE tokens or strings used dynamically as regular expressions). Because of this limitation, the feature has not been added to POSIX.1-2008.

When a string variable is used in a context where an extended regular expression normally appears (where the lexical token ERE is used in the grammar) the string does not contain the literal `<slash>` characters.

Some versions of *awk* allow the form:

```
func name(args, ... ) { statements }
```

This has been deprecated by the authors of the language, who asked that it not be specified.

Historical implementations of *awk* produce an error if a **next** statement is executed in a **BEGIN** action, and cause *awk* to terminate if a **next** statement is executed in an **END** action. This behavior has not been documented, and it was not believed that it was necessary to standardize it.

The specification of conversions between string and numeric values is much more detailed than in the documentation of historical implementations or in the referenced *The AWK Programming Language*. Although most of the behavior is designed to be intuitive, the details are necessary to

ensure compatible behavior from different implementations. This is especially important in relational expressions since the types of the operands determine whether a string or numeric comparison is performed. From the perspective of an application developer, it is usually sufficient to expect intuitive behavior and to force conversions (by adding zero or concatenating a null string) when the type of an expression does not obviously match what is needed. The intent has been to specify historical practice in almost all cases. The one exception is that, in historical implementations, variables and constants maintain both string and numeric values after their original value is converted by any use. This means that referencing a variable or constant can have unexpected side-effects. For example, with historical implementations the following program:

```
{
    a = "+2"
    b = 2
    if (NR % 2)
        c = a + b
    if (a == b)
        print "numeric comparison"
    else
        print "string comparison"
}
```

would perform a numeric comparison (and output numeric comparison) for each odd-numbered line, but perform a string comparison (and output string comparison) for each even-numbered line. POSIX.1-2008 ensures that comparisons will be numeric if necessary. With historical implementations, the following program:

```
BEGIN {
    OFMT = "%e"
    print 3.14
    OFMT = "%f"
    print 3.14
}
```

would output "3.140000e+00" twice, because in the second **print** statement the constant "3.14" would have a string value from the previous conversion. POSIX.1-2008 requires that the output of the second **print** statement be "3.140000". The behavior of historical implementations was seen as too unintuitive and unpredictable.

It was pointed out that with the rules contained in early drafts, the following script would print nothing:

```
BEGIN {
    y[1.5] = 1
    OFMT = "%e"
    print y[1.5]
}
```

Therefore, a new variable, **CONVFMT**, was introduced. The **OFMT** variable is now restricted to affecting output conversions of numbers to strings and **CONVFMT** is used for internal conversions, such as comparisons or array indexing. The default value is the same as that for **OFMT**, so unless a program changes **CONVFMT** (which no historical program would do), it will receive the historical behavior associated with internal string conversions.

The POSIX *awk* lexical and syntactic conventions are specified more formally than in other sources. Again the intent has been to specify historical practice. One convention that may not be

obvious from the formal grammar as in other verbal descriptions is where <newline> characters are acceptable. There are several obvious placements such as terminating a statement, and a <backslash> can be used to escape <newline> characters between any lexical tokens. In addition, <newline> characters without <backslash> characters can follow a comma, an open brace, a logical AND operator ("&&"), a logical OR operator ("||"), the **do** keyword, the **else** keyword, and the closing parenthesis of an **if**, **for**, or **while** statement. For example:

```
{ print $1,
    $2 }
```

The requirement that *awk* add a trailing <newline> to the program argument text is to simplify the grammar, making it match a text file in form. There is no way for an application or test suite to determine whether a literal <newline> is added or whether *awk* simply acts as if it did.

POSIX.1-2008 requires several changes from historical implementations in order to support internationalization. Probably the most subtle of these is the use of the decimal-point character, defined by the *LC_NUMERIC* category of the locale, in representations of floating-point numbers. This locale-specific character is used in recognizing numeric input, in converting between strings and numeric values, and in formatting output. However, regardless of locale, the <period> character (the decimal-point character of the POSIX locale) is the decimal-point character recognized in processing *awk* programs (including assignments in command line arguments). This is essentially the same convention as the one used in the ISO C standard. The difference is that the C language includes the *setlocale()* function, which permits an application to modify its locale. Because of this capability, a C application begins executing with its locale set to the C locale, and only executes in the environment-specified locale after an explicit call to *setlocale()*. However, adding such an elaborate new feature to the *awk* language was seen as inappropriate for POSIX.1-2008. It is possible to execute an *awk* program explicitly in any desired locale by setting the environment in the shell.

The undefined behavior resulting from NULs in extended regular expressions allows future extensions for the GNU *gawk* program to process binary data.

The behavior in the case of invalid *awk* programs (including lexical, syntactic, and semantic errors) is undefined because it was considered overly limiting on implementations to specify. In most cases such errors can be expected to produce a diagnostic and a non-zero exit status. However, some implementations may choose to extend the language in ways that make use of certain invalid constructs. Other invalid constructs might be deemed worthy of a warning, but otherwise cause some reasonable behavior. Still other constructs may be very difficult to detect in some implementations. Also, different implementations might detect a given error during an initial parsing of the program (before reading any input files) while others might detect it when executing the program after reading some input. Implementors should be aware that diagnosing errors as early as possible and producing useful diagnostics can ease debugging of applications, and thus make an implementation more usable.

The unspecified behavior from using multi-character **RS** values is to allow possible future extensions based on extended regular expressions used for record separators. Historical implementations take the first character of the string and ignore the others.

Unspecified behavior when *split(string,array,<null>)* is used is to allow a proposed future extension that would split up a string into an array of individual characters.

In the context of the **getline** function, equally good arguments for different precedences of the **|** and **<** operators can be made. Historical practice has been that:

```
getline < "a" "b"
```

is parsed as:

```
79814 ( getline < "a" ) "b"
```

79815 although many would argue that the intent was that the file **ab** should be read. However:

```
79816 getline < "x" + 1
```

79817 parses as:

```
79818 getline < ( "x" + 1 )
```

79819 Similar problems occur with the **|** version of **getline**, particularly in combination with **\$**. For
79820 example:

```
79821 $"echo hi" | getline
```

79822 (This situation is particularly problematic when used in a **print** statement, where the **|getline**
79823 part might be a redirection of the **print**.)

79824 Since in most cases such constructs are not (or at least should not) be used (because they have a
79825 natural ambiguity for which there is no conventional parsing), the meaning of these constructs
79826 has been made explicitly unspecified. (The effect is that a conforming application that runs into
79827 the problem must parenthesize to resolve the ambiguity.) There appeared to be few if any actual
79828 uses of such constructs.

79829 Grammars can be written that would cause an error under these circumstances. Where
79830 backwards-compatibility is not a large consideration, implementors may wish to use such
79831 grammars.

79832 Some historical implementations have allowed some built-in functions to be called without an
79833 argument list, the result being a default argument list chosen in some “reasonable” way. Use of
79834 **length** as a synonym for **length(\$0)** is the only one of these forms that is thought to be widely
79835 known or widely used; this particular form is documented in various places (for example, most
79836 historical *awk* reference pages, although not in the referenced *The AWK Programming Language*) as
79837 legitimate practice. With this exception, default argument lists have always been undocumented
79838 and vaguely defined, and it is not at all clear how (or if) they should be generalized to user-
79839 defined functions. They add no useful functionality and preclude possible future extensions that
79840 might need to name functions without calling them. Not standardizing them seems the simplest
79841 course. The standard developers considered that **length** merited special treatment, however,
79842 since it has been documented in the past and sees possibly substantial use in historical
79843 programs. Accordingly, this usage has been made legitimate, but Issue 5 removed the
79844 obsolescent marking for XSI-conforming implementations and many otherwise conforming
79845 applications depend on this feature.

79846 In **sub** and **gsub**, if *repl* is a string literal (the lexical token **STRING**), then two consecutive
79847 <backslash> characters should be used in the string to ensure a single <backslash> will precede
79848 the <ampersand> when the resultant string is passed to the function. (For example, to specify
79849 one literal <ampersand> in the replacement string, use **gsub(ERE, "\\&")**.)

79850 Historically, the only special character in the *repl* argument of **sub** and **gsub** string functions was
79851 the <ampersand> (**'&'**) character and preceding it with the <backslash> character was used to
79852 turn off its special meaning.

79853 The description in the ISO POSIX-2:1993 standard introduced behavior such that the
79854 <backslash> character was another special character and it was unspecified whether there were
79855 any other special characters. This description introduced several portability problems, some of
79856 which are described below, and so it has been replaced with the more historical description.
79857 Some of the problems include:

- Historically, to create the replacement string, a script could use `gsub(ERE, "\\&")`, but with the ISO POSIX-2:1993 standard wording, it was necessary to use `gsub(ERE, "\\\&")`. The `<backslash>` characters are doubled here because all string literals are subject to lexical analysis, which would reduce each pair of `<backslash>` characters to a single `<backslash>` before being passed to `gsub`.
- Since it was unspecified what the special characters were, for portable scripts to guarantee that characters are printed literally, each character had to be preceded with a `<backslash>`. (For example, a portable script had to use `gsub(ERE, "\\h\\i")` to produce a replacement string of `"hi"`.)

The description for comparisons in the ISO POSIX-2:1993 standard did not properly describe historical practice because of the way numeric strings are compared as numbers. The current rules cause the following code:

```
if (0 == "000")
    print "strange, but true"
else
    print "not true"
```

to do a numeric comparison, causing the `if` to succeed. It should be intuitively obvious that this is incorrect behavior, and indeed, no historical implementation of *awk* actually behaves this way.

To fix this problem, the definition of *numeric string* was enhanced to include only those values obtained from specific circumstances (mostly external sources) where it is not possible to determine unambiguously whether the value is intended to be a string or a numeric.

Variables that are assigned to a numeric string shall also be treated as a numeric string. (For example, the notion of a numeric string can be propagated across assignments.) In comparisons, all variables having the uninitialized value are to be treated as a numeric operand evaluating to the numeric value zero.

Uninitialized variables include all types of variables including scalars, array elements, and fields. The definition of an uninitialized value in [Variables and Special Variables](#) (on page 2459) is necessary to describe the value placed on uninitialized variables and on fields that are valid (for example, `< $NF`) but have no characters in them and to describe how these variables are to be used in comparisons. A valid field, such as `$1`, that has no characters in it can be obtained from an input line of `"\t\t"` when `FS='\t'`. Historically, the comparison (`$1<10`) was done numerically after evaluating `$1` to the value zero.

The phrase "... also shall have the numeric value of the numeric string" was removed from several sections of the ISO POSIX-2:1993 standard because it specifies an unnecessary implementation detail. It is not necessary for POSIX.1-2008 to specify that these objects be assigned two different values. It is only necessary to specify that these objects may evaluate to two different values depending on context.

Historical implementations of *awk* did not parse hexadecimal integer or floating constants like `"0xa"` and `"0xap0"`. Due to an oversight, the 2001 through 2004 editions of this standard required support for hexadecimal floating constants. This was due to the reference to `atof()`. This version of the standard allows but does not require implementations to use `atof()` and includes a description of how floating-point numbers are recognized as an alternative to match historic behavior. The intent of this change is to allow implementations to recognize floating-point constants according to either the ISO/IEC 9899:1990 standard or ISO/IEC 9899:1999 standard, and to allow (but not require) implementations to recognize hexadecimal integer constants.

Historical implementations of *awk* did not support floating-point infinities and NaNs in *numeric*

strings; e.g., `"-INF"` and `"NaN"`. However, implementations that use the `atof()` or `strtod()` functions to do the conversion picked up support for these values if they used a ISO/IEC 9899:1999 standard version of the function instead of a ISO/IEC 9899:1990 standard version. Due to an oversight, the 2001 through 2004 editions of this standard did not allow support for infinities and NaNs, but in this revision support is allowed (but not required). This is a silent change to the behavior of *awk* programs; for example, in the POSIX locale the expression:

```
("-INF" + 0 < 0)
```

formerly had the value 0 because `"-INF"` converted to 0, but now it may have the value 0 or 1.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 2.

Issue 5

The FUTURE DIRECTIONS section is added.

Issue 6

The *awk* utility is aligned with the IEEE P1003.2b draft standard.

The normative text is reworded to avoid use of the term “must” for application requirements.

IEEE PASC Interpretation 1003.2 #211 is applied, adding the sentence “An occurrence of two consecutive `<backslash>` characters shall be interpreted as just a single literal `<backslash>` character.” into the description of the **sub** string function.

Issue 7

PASC Interpretation 1003.2-1992 #107 (SD5-XCU-ERN-73) is applied, updating the description of the **OFS** variable.

Austin Group Interpretation 1003.1-2001 #189 is applied.

Austin Group Interpretation 1003.1-2001 #201 is applied, permitting implementations to support infinities and NaNs.

SD5-XCU-ERN-79 is applied, restoring the horizontal lines to [Table 4-1](#) (on page 2455), and SD5-XCU-ERN-80 is applied, changing the order of some table entries.

SD5-XCU-ERN-87 is applied, updating the descriptive text of the Grammar.

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

The EXTENDED DESCRIPTION is changed to make the support of hexadecimal integer and floating constants optional.

POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0057 [224], XCU/TC1-2008/0058 [454], XCU/TC1-2008/0059 [224], XCU/TC1-2008/0060 [224], XCU/TC1-2008/0061 [254], XCU/TC1-2008/0062 [254], XCU/TC1-2008/0063 [224], and XCU/TC1-2008/0064 [454] are applied.

79946 **NAME**79947 **basename** — return non-directory portion of a pathname79948 **SYNOPSIS**79949 **basename** *string* [*suffix*]79950 **DESCRIPTION**

79951 The *string* operand shall be treated as a pathname, as defined in XBD [Section 3.267](#) (on page 75).
 79952 The string *string* shall be converted to the filename corresponding to the last pathname
 79953 component in *string* and then the suffix string *suffix*, if present, shall be removed. This shall be
 79954 done by performing actions equivalent to the following steps in order:

- 79955 1. If *string* is a null string, it is unspecified whether the resulting string is ' .' or a null
 79956 string. In either case, skip steps 2 through 6.
- 79957 2. If *string* is "/", it is implementation-defined whether steps 3 to 6 are skipped or
 79958 processed.
- 79959 3. If *string* consists entirely of <slash> characters, *string* shall be set to a single <slash>
 79960 character. In this case, skip steps 4 to 6.
- 79961 4. If there are any trailing <slash> characters in *string*, they shall be removed.
- 79962 5. If there are any <slash> characters remaining in *string*, the prefix of *string* up to and
 79963 including the last <slash> character in *string* shall be removed.
- 79964 6. If the *suffix* operand is present, is not identical to the characters remaining in *string*, and is
 79965 identical to a suffix of the characters remaining in *string*, the suffix *suffix* shall be removed
 79966 from *string*. Otherwise, *string* is not modified by this step. It shall not be considered an
 79967 error if *suffix* is not found in *string*.

79968 The resulting string shall be written to standard output.

79969 **OPTIONS**

79970 None.

79971 **OPERANDS**

79972 The following operands shall be supported:

79973 *string* A string.79974 *suffix* A string.79975 **STDIN**

79976 Not used.

79977 **INPUT FILES**

79978 None.

79979 **ENVIRONMENT VARIABLES**79980 The following environment variables shall affect the execution of *basename*:

79981 **LANG** Provide a default value for the internationalization variables that are unset or null.
 79982 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization
 79983 variables used to determine the values of locale categories.)

79984 **LC_ALL** If set to a non-empty string value, override the values of all the other
 79985 internationalization variables.

79986 **LC_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as
 79987 characters (for example, single-byte as opposed to multi-byte characters in
 79988 arguments).

```

79989      LC_MESSAGES
79990          Determine the locale that should be used to affect the format and contents of
79991          diagnostic messages written to standard error.
79992 XSI      NLSPATH      Determine the location of message catalogs for the processing of LC_MESSAGES.
79993 ASYNCHRONOUS EVENTS
79994      Default.
79995 STDOUT
79996      The basename utility shall write a line to the standard output in the following format:
79997      "%s\n", <resulting string>
79998 STDERR
79999      The standard error shall be used only for diagnostic messages.
80000 OUTPUT FILES
80001      None.
80002 EXTENDED DESCRIPTION
80003      None.
80004 EXIT STATUS
80005      The following exit values shall be returned:
80006      0    Successful completion.
80007      >0   An error occurred.
80008 CONSEQUENCES OF ERRORS
80009      Default.
80010 APPLICATION USAGE
80011      The definition of pathname specifies implementation-defined behavior for pathnames starting
80012      with two <slash> characters. Therefore, applications shall not arbitrarily add <slash> characters
80013      to the beginning of a pathname unless they can ensure that there are more or less than two or are
80014      prepared to deal with the implementation-defined consequences.
80015 EXAMPLES
80016      If the string string is a valid pathname:
80017      $(basename -- "string")
80018      produces a filename that could be used to open the file named by string in the directory returned
80019      by:
80020      $(dirname -- "string")
80021      If the string string is not a valid pathname, the same algorithm is used, but the result need not be
80022      a valid filename. The basename utility is not expected to make any judgements about the validity
80023      of string as a pathname; it just follows the specified algorithm to produce a result string.
80024      The following shell script compiles /usr/src/cmd/cat.c and moves the output to a file named cat
80025      in the current directory when invoked with the argument /usr/src/cmd/cat or with the argument
80026      /usr/src/cmd/cat.c:
80027      c99 -- "$(dirname -- "$1")/$(basename -- "$1" .c) .c" &&
80028      mv a.out "$(basename -- "$1" .c)"

```

80029 **RATIONALE**

80030 The behaviors of *basename* and *dirname* have been coordinated so that when *string* is a valid
 80031 pathname:

80032 `$(basename -- "string")` |

80033 would be a valid filename for the file in the directory:

80034 `$(dirname -- "string")` |

80035 This would not work for the early proposal versions of these utilities due to the way it specified
 80036 handling of trailing <slash> characters.

80037 Since the definition of *pathname* specifies implementation-defined behavior for pathnames
 80038 starting with two <slash> characters, this volume of POSIX.1-2008 specifies similar
 80039 implementation-defined behavior for the *basename* and *dirname* utilities.

80040 **FUTURE DIRECTIONS**

80041 None.

80042 **SEE ALSO**

80043 [Section 2.5](#) (on page 2323), *dirname*

80044 XBD [Section 3.267](#) (on page 75), [Chapter 8](#) (on page 173)

80045 **CHANGE HISTORY**

80046 First released in Issue 2.

80047 **Issue 6**

80048 IEEE PASC Interpretation 1003.2 #164 is applied.

80049 The normative text is reworded to avoid use of the term “must” for application requirements.

80050 **Issue 7**

80051 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0065 [192,538], XCU/TC1-2008/0066 +
 80052 [192,538], and XCU/TC1-2008/0067 [192,430,538] are applied.

80053 **NAME**

80054 batch — schedule commands to be executed in a batch queue

80055 **SYNOPSIS**80056 *batch*80057 **DESCRIPTION**80058 The *batch* utility shall read commands from standard input and schedule them for execution in a
80059 batch queue. It shall be the equivalent of the command:

80060 at -q b -m now

80061 where queue *b* is a special *at* queue, specifically for batch jobs. Batch jobs shall be submitted to
80062 the batch queue with no time constraints and shall be run by the system using algorithms, based
80063 on unspecified factors, that may vary with each invocation of *batch*.80064 XSI Users shall be permitted to use *batch* if their name appears in the file **at.allow** which is located in
80065 an implementation-defined directory. If that file does not exist, the file **at.deny**, which is located
80066 in an implementation-defined directory, shall be checked to determine whether the user shall be
80067 denied access to *batch*. If neither file exists, only a process with appropriate privileges shall be
80068 allowed to submit a job. If only **at.deny** exists and is empty, global usage shall be permitted. The
80069 **at.allow** and **at.deny** files shall consist of one user name per line.80070 **OPTIONS**

80071 None.

80072 **OPERANDS**

80073 None.

80074 **STDIN**80075 The standard input shall be a text file consisting of commands acceptable to the shell command
80076 language described in [Chapter 2](#) (on page 2319).80077 **INPUT FILES**80078 XSI The text files **at.allow** and **at.deny**, which are located in an implementation-defined directory,
80079 shall contain zero or more user names, one per line, of users who are, respectively, authorized or
80080 denied access to the *at* and *batch* utilities.80081 **ENVIRONMENT VARIABLES**80082 The following environment variables shall affect the execution of *batch*:80083 **LANG** Provide a default value for the internationalization variables that are unset or null.
80084 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization
80085 variables used to determine the values of locale categories.)80086 **LC_ALL** If set to a non-empty string value, override the values of all the other
80087 internationalization variables.80088 **LC_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as
80089 characters (for example, single-byte as opposed to multi-byte characters in
80090 arguments and input files).80091 **LC_MESSAGES**80092 Determine the locale that should be used to affect the format and contents of
80093 diagnostic messages written to standard error and informative messages written to
80094 standard output.80095 **LC_TIME** Determine the format and contents for date and time strings written by *batch*.

80096	XSI	NLSPATH	Determine the location of message catalogs for the processing of <i>LC_MESSAGES</i> .
80097		SHELL	Determine the name of a command interpreter to be used to invoke the at-job. If the variable is unset or null, <i>sh</i> shall be used. If it is set to a value other than a name for <i>sh</i> , the implementation shall do one of the following: use that shell; use <i>sh</i> ; use the login shell from the user database; any of the preceding accompanied by a warning diagnostic about which was chosen.
80098			
80099			
80100			
80101			
80102		TZ	Determine the timezone. The job shall be submitted for execution at the time specified by <i>timespec</i> or <i>-t time</i> relative to the timezone specified by the <i>TZ</i> variable. If <i>timespec</i> specifies a timezone, it overrides <i>TZ</i> . If <i>timespec</i> does not specify a timezone and <i>TZ</i> is unset or null, an unspecified default timezone shall be used.
80103			
80104			
80105			
80106			
80107		ASYNCHRONOUS EVENTS	
80108			Default.
80109		STDOUT	
80110			When standard input is a terminal, prompts of unspecified format for each line of the user input described in the STDIN section may be written to standard output.
80111			
80112		STDERR	
80113			The following shall be written to standard error when a job has been successfully submitted:
80114			"job %s at %s\n", <i>at_job_id</i> , < <i>date</i> >
80115			where <i>date</i> shall be equivalent in format to the output of:
80116			date +"%a %b %e %T %Y"
80117			The date and time written shall be adjusted so that they appear in the timezone of the user (as determined by the <i>TZ</i> variable).
80118			
80119			Neither this, nor warning messages concerning the selection of the command interpreter, are considered a diagnostic that changes the exit status.
80120			
80121			Diagnostic messages, if any, shall be written to standard error.
80122		OUTPUT FILES	
80123			None.
80124		EXTENDED DESCRIPTION	
80125			None.
80126		EXIT STATUS	
80127			The following exit values shall be returned:
80128			0 Successful completion.
80129			>0 An error occurred.
80130		CONSEQUENCES OF ERRORS	
80131			The job shall not be scheduled.

APPLICATION USAGE

It may be useful to redirect standard output within the specified commands.

EXAMPLES

1. This sequence can be used at a terminal:

```
batch
sort < file >outfile
EOT
```

2. This sequence, which demonstrates redirecting standard error to a pipe, is useful in a command procedure (the sequence of output redirection specifications is significant):

```
batch <<!
diff file1 file2 2>&1 >outfile | mailx mygroup
!
```

RATIONALE

Early proposals described *batch* in a manner totally separated from *at*, even though the historical model treated it almost as a synonym for *at -qb*. A number of features were added to list and control batch work separately from those in *at*. Upon further reflection, it was decided that the benefit of this did not merit the change to the historical interface.

The *-m* option was included on the equivalent *at* command because it is historical practice to mail results to the submitter, even if all job-produced output is redirected. As explained in the RATIONALE for *at*, the **now** keyword submits the job for immediate execution (after scheduling delays), despite some historical systems where *at now* would have been considered an error.

FUTURE DIRECTIONS

None.

SEE ALSO

at

XBD [Chapter 8](#) (on page 173)

CHANGE HISTORY

First released in Issue 2.

Issue 6

This utility is marked as part of the User Portability Utilities option.

The NAME is changed to align with the IEEE P1003.2b draft standard.

The normative text is reworded to avoid use of the term “must” for application requirements.

Issue 7

The *batch* utility is moved from the User Portability Utilities option to the Base. User Portability Utilities is now an option for interactive utilities.

SD5-XCU-ERN-95 is applied, removing the references to fixed locations for the files referenced by the *batch* utility.

80169 **NAME**80170 `bc` — arbitrary-precision arithmetic language80171 **SYNOPSIS**80172 `bc [-l] [file...]`80173 **DESCRIPTION**

80174 The `bc` utility shall implement an arbitrary precision calculator. It shall take input from any files
 80175 given, then read from the standard input. If the standard input and standard output to `bc` are
 80176 attached to a terminal, the invocation of `bc` shall be considered to be *interactive*, causing
 80177 behavioral constraints described in the following sections.

80178 **OPTIONS**80179 The `bc` utility shall conform to XBD [Section 12.2](#) (on page 215).

80180 The following option shall be supported:

80181 `-l` (The letter ell.) Define the math functions and initialize *scale* to 20, instead of the
 80182 default zero; see the EXTENDED DESCRIPTION section.

80183 **OPERANDS**

80184 The following operand shall be supported:

80185 *file* A pathname of a text file containing `bc` program statements. After all *files* have
 80186 been read, `bc` shall read the standard input.

80187 **STDIN**

80188 See the INPUT FILES section.

80189 **INPUT FILES**

80190 Input files shall be text files containing a sequence of comments, statements, and function
 80191 definitions that shall be executed as they are read.

80192 **ENVIRONMENT VARIABLES**80193 The following environment variables shall affect the execution of `bc`:

80194 *LANG* Provide a default value for the internationalization variables that are unset or null.
 80195 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization
 80196 variables used to determine the values of locale categories.)

80197 *LC_ALL* If set to a non-empty string value, override the values of all the other
 80198 internationalization variables.

80199 *LC_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as
 80200 characters (for example, single-byte as opposed to multi-byte characters in
 80201 arguments and input files).

80202 *LC_MESSAGES*

80203 Determine the locale that should be used to affect the format and contents of
 80204 diagnostic messages written to standard error.

80205 *XSI* *NLSPATH* Determine the location of message catalogs for the processing of *LC_MESSAGES*.

80206 **ASYNCHRONOUS EVENTS**

80207 Default.

80208 **STDOUT**

80209 The output of the `bc` utility shall be controlled by the program read, and consist of zero or more
 80210 lines containing the value of all executed expressions without assignments. The radix and
 80211 precision of the output shall be controlled by the values of the **obase** and **scale** variables; see the
 80212 EXTENDED DESCRIPTION section.

80213 **STDERR**

80214 The standard error shall be used only for diagnostic messages.

80215 **OUTPUT FILES**

80216 None.

80217 **EXTENDED DESCRIPTION**80218 **Grammar**

80219 The grammar in this section and the lexical conventions in the following section shall together
 80220 describe the syntax for *bc* programs. The general conventions for this style of grammar are
 80221 described in [Section 1.3](#) (on page 2309). A valid program can be represented as the non-terminal
 80222 symbol **program** in the grammar. This formal syntax shall take precedence over the text syntax
 80223 description.

```

80325 Lexical Conventions in bc

80326 The lexical conventions for *bc* programs, with respect to the preceding grammar, shall be as
 80327 follows:

- 80328 1. Except as noted, *bc* shall recognize the longest possible token or delimiter beginning at a
 80329 given point.
- 80330 2. A comment shall consist of any characters beginning with the two adjacent characters
 80331 `"/*"` and terminated by the next occurrence of the two adjacent characters `"*/"`.
 80332 Comments shall have no effect except to delimit lexical tokens.
- 80333 3. The <newline> shall be recognized as the token **NEWLINE**.
- 80334 4. The token **STRING** shall represent a string constant; it shall consist of any characters
 80335 beginning with the double-quote character (`'"`) and terminated by another occurrence
 80336 of the double-quote character. The value of the string is the sequence of all characters
 80337 between, but not including, the two double-quote characters. All characters shall be taken
 80338 literally from the input, and there is no way to specify a string containing a double-quote
 80339 character. The length of the value of each string shall be limited to {BC_STRING_MAX}
 80340 bytes.
- 80341 5. A <blank> shall have no effect except as an ordinary character if it appears within a
 80342 **STRING** token, or to delimit a lexical token other than **STRING**.
- 80343 6. The combination of a <backslash> character immediately followed by a <newline> shall
 80344 have no effect other than to delimit lexical tokens with the following exceptions:

- 80345 • It shall be interpreted as the character sequence "\<newline>" in **STRING** tokens.
- 80346 • It shall be ignored as part of a multi-line **NUMBER** token.
- 80347 7. The token **NUMBER** shall represent a numeric constant. It shall be recognized by the
- 80348 following grammar:
- ```

80349 NUMBER : integer
80350 | '.' integer
80351 | integer '.'
80352 | integer '.' integer
80353 ;

80354 integer : digit
80355 | integer digit
80356 ;

80357 digit : 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7
80358 | 8 | 9 | A | B | C | D | E | F
80359 ;

```
- 80360       8. The value of a **NUMBER** token shall be interpreted as a numeral in the base specified by
- 80361       the value of the internal register **ibase** (described below). Each of the **digit** characters
- 80362       shall have the value from 0 to 15 in the order listed here, and the <period> character shall
- 80363       represent the radix point. The behavior is undefined if digits greater than or equal to the
- 80364       value of **ibase** appear in the token. However, note the exception for single-digit values
- 80365       being assigned to **ibase** and **obase** themselves, in [Operations in bc](#) (on page 2498).
- 80366       9. The following keywords shall be recognized as tokens:
- ```

80367       auto       ibase       length   return   while
80368       break      if        obase     scale
80369       define     for       quit      sqrt

```
- 80370 10. Any of the following characters occurring anywhere except within a keyword shall be
- 80371 recognized as the token **LETTER**:
- ```

80372 a b c d e f g h i j k l m n o p q r s t u v w x y z

```
- 80373       11. The following single-character and two-character sequences shall be recognized as the
- 80374       token **ASSIGN\_OP**:
- ```

80375       =   +=   -=   *=   /=   %=   ^=

```
- 80376 12. If an '=' character, as the beginning of a token, is followed by a '-' character with no
- 80377 intervening delimiter, the behavior is undefined.
- 80378 13. The following single-characters shall be recognized as the token **MUL_OP**:
- ```

80379 * / %

```
- 80380       14. The following single-character and two-character sequences shall be recognized as the
- 80381       token **REL\_OP**:
- ```

80382       ==   <=   >=   !=   <   >

```
- 80383 15. The following two-character sequences shall be recognized as the token **INCR_DECR**:
- ```

80384 ++ --

```

16. The following single characters shall be recognized as tokens whose names are the character:

<newline> ( ) , + - ; [ ] ^ { }

17. The token **EOF** is returned when the end of input is reached.

### Operations in bc

There are three kinds of identifiers: ordinary identifiers, array identifiers, and function identifiers. All three types consist of single lowercase letters. Array identifiers shall be followed by square brackets ("[]"). An array subscript is required except in an argument or auto list. Arrays are singly dimensioned and can contain up to {BC\_DIM\_MAX} elements. Indexing shall begin at zero so an array is indexed from 0 to {BC\_DIM\_MAX}-1. Subscripts shall be truncated to integers. The application shall ensure that function identifiers are followed by parentheses, possibly enclosing arguments. The three types of identifiers do not conflict.

The following table summarizes the rules for precedence and associativity of all operators. Operators on the same line shall have the same precedence; rows are in order of decreasing precedence.

**Table 4-3** Operators in *bc*

| Operator                  | Associativity |
|---------------------------|---------------|
| ++, --                    | N/A           |
| unary -                   | N/A           |
| ^                         | Right to left |
| *, /, %                   | Left to right |
| +, binary -               | Left to right |
| =, +=, -=, *=, /=, %=, ^= | Right to left |
| ==, <=, >=, !=, <, >      | None          |

Each expression or named expression has a *scale*, which is the number of decimal digits that shall be maintained as the fractional portion of the expression.

*Named expressions* are places where values are stored. Named expressions shall be valid on the left side of an assignment. The value of a named expression shall be the value stored in the place named. Simple identifiers and array elements are named expressions; they have an initial value of zero and an initial scale of zero.

The internal registers **scale**, **ibase**, and **obase** are all named expressions. The scale of an expression consisting of the name of one of these registers shall be zero; values assigned to any of these registers are truncated to integers. The **scale** register shall contain a global value used in computing the scale of expressions (as described below). The value of the register **scale** is limited to  $0 \leq \text{scale} \leq \{\text{BC\_SCALE\_MAX}\}$  and shall have a default value of zero. The **ibase** and **obase** registers are the input and output number radix, respectively. The value of **ibase** shall be limited to:

$$2 \leq \text{ibase} \leq 16$$

The value of **obase** shall be limited to:

$$2 \leq \text{obase} \leq \{\text{BC\_BASE\_MAX}\}$$

When either **ibase** or **obase** is assigned a single **digit** value from the list in [Lexical Conventions in bc](#) (on page 2496), the value shall be assumed in hexadecimal. (For example, **ibase=A** sets to base ten, regardless of the current **ibase** value.) Otherwise, the behavior is undefined when

digits greater than or equal to the value of **ibase** appear in the input. Both **ibase** and **obase** shall have initial values of 10.

Internal computations shall be conducted as if in decimal, regardless of the input and output bases, to the specified number of decimal digits. When an exact result is not achieved (for example, **scale**=0; 3.2/1), the result shall be truncated.

For all values of **obase** specified by this volume of POSIX.1-2008, *bc* shall output numeric values by performing each of the following steps in order:

1. If the value is less than zero, a <hyphen> ( ' - ' ) character shall be output.
2. One of the following is output, depending on the numerical value:
  - If the absolute value of the numerical value is greater than or equal to one, the integer portion of the value shall be output as a series of digits appropriate to **obase** (as described below), most significant digit first. The most significant non-zero digit shall be output next, followed by each successively less significant digit.
  - If the absolute value of the numerical value is less than one but greater than zero and the scale of the numerical value is greater than zero, it is unspecified whether the character 0 is output.
  - If the numerical value is zero, the character 0 shall be output.
3. If the scale of the value is greater than zero and the numeric value is not zero, a <period> character shall be output, followed by a series of digits appropriate to **obase** (as described below) representing the most significant portion of the fractional part of the value. If *s* represents the scale of the value being output, the number of digits output shall be *s* if **obase** is 10, less than or equal to *s* if **obase** is greater than 10, or greater than or equal to *s* if **obase** is less than 10. For **obase** values other than 10, this should be the number of digits needed to represent a precision of  $10^s$ .

For **obase** values from 2 to 16, valid digits are the first **obase** of the single characters:

0 1 2 3 4 5 6 7 8 9 A B C D E F

which represent the values zero to 15, inclusive, respectively.

For bases greater than 16, each digit shall be written as a separate multi-digit decimal number. Each digit except the most significant fractional digit shall be preceded by a single <space>. For bases from 17 to 100, *bc* shall write two-digit decimal numbers; for bases from 101 to 1 000, three-digit decimal strings, and so on. For example, the decimal number 1 024 in base 25 would be written as:

Δ01Δ15Δ24

and in base 125, as:

Δ008Δ024

Very large numbers shall be split across lines with 70 characters per line in the POSIX locale; other locales may split at different character boundaries. Lines that are continued shall end with a <backslash>.

A function call shall consist of a function name followed by parentheses containing a <comma>-separated list of expressions, which are the function arguments. A whole array passed as an argument shall be specified by the array name followed by empty square brackets. All function arguments shall be passed by value. As a result, changes made to the formal parameters shall have no effect on the actual arguments. If the function terminates by executing

80471 a **return** statement, the value of the function shall be the value of the expression in the  
 80472 parentheses of the **return** statement or shall be zero if no expression is provided or if there is no  
 80473 **return** statement.

80474 The result of **sqrt**(*expression*) shall be the square root of the expression. The result shall be  
 80475 truncated in the least significant decimal place. The scale of the result shall be the scale of the  
 80476 expression or the value of **scale**, whichever is larger.

80477 The result of **length**(*expression*) shall be the total number of significant decimal digits in the  
 80478 expression. The scale of the result shall be zero.

80479 The result of **scale**(*expression*) shall be the scale of the expression. The scale of the result shall be  
 80480 zero.

80481 A numeric constant shall be an expression. The scale shall be the number of digits that follow the  
 80482 radix point in the input representing the constant, or zero if no radix point appears.

80483 The sequence ( *expression* ) shall be an expression with the same value and scale as *expression*.  
 80484 The parentheses can be used to alter the normal precedence.

80485 The semantics of the unary and binary operators are as follows:

80486 *-expression*  
 80487 The result shall be the negative of the *expression*. The scale of the result shall be the scale of  
 80488 *expression*.

80489 The unary increment and decrement operators shall not modify the scale of the named  
 80490 expression upon which they operate. The scale of the result shall be the scale of that named  
 80491 expression.

80492 *++named-expression*  
 80493 The named expression shall be incremented by one. The result shall be the value of the  
 80494 named expression after incrementing.

80495 *--named-expression*  
 80496 The named expression shall be decremented by one. The result shall be the value of the  
 80497 named expression after decrementing.

80498 *named-expression++*  
 80499 The named expression shall be incremented by one. The result shall be the value of the  
 80500 named expression before incrementing.

80501 *named-expression--*  
 80502 The named expression shall be decremented by one. The result shall be the value of the  
 80503 named expression before decrementing.

80504 The exponentiation operator, <circumflex> ( ' ^ ' ), shall bind right to left.

80505 *expression^expression*  
 80506 The result shall be the first *expression* raised to the power of the second *expression*. If the  
 80507 second expression is not an integer, the behavior is undefined. If *a* is the scale of the left  
 80508 expression and *b* is the absolute value of the right expression, the scale of the result shall be:  
 80509 if *b* >= 0 min(*a* \* *b*, max(scale, *a*)) if *b* < 0 scale

80510 The multiplicative operators ( ' \* ' , ' / ' , ' % ' ) shall bind left to right.

80511 *expression\*expression*  
 80512 The result shall be the product of the two expressions. If *a* and *b* are the scales of the two  
 80513 expressions, then the scale of the result shall be:

80514  $\min(a+b, \max(\text{scale}, a, b))$

80515 *expression*/*expression*

80516 The result shall be the quotient of the two expressions. The scale of the result shall be the  
80517 value of **scale**.

80518 *expression*%*expression*

80519 For expressions *a* and *b*, *a*%*b* shall be evaluated equivalent to the steps:

80520 1. Compute *a*/*b* to current scale.

80521 2. Use the result to compute:

80522  $a - (a / b) * b$

80523 to scale:

80524  $\max(\text{scale} + \text{scale}(b), \text{scale}(a))$

80525 The scale of the result shall be:

80526  $\max(\text{scale} + \text{scale}(b), \text{scale}(a))$

80527 When **scale** is zero, the '**%**' operator is the mathematical remainder operator.

80528 The additive operators ('+', '-') shall bind left to right.

80529 *expression*+*expression*

80530 The result shall be the sum of the two expressions. The scale of the result shall be the  
80531 maximum of the scales of the expressions.

80532 *expression*-*expression*

80533 The result shall be the difference of the two expressions. The scale of the result shall be the  
80534 maximum of the scales of the expressions.

80535 The assignment operators ('=', '+=', '==', '\*=', '/=', '%=', '^=') shall bind right to left.

80536 *named-expression*=*expression*

80537 This expression shall result in assigning the value of the expression on the right to the  
80538 named expression on the left. The scale of both the named expression and the result shall be  
80539 the scale of *expression*.

80540 The compound assignment forms:

80541 *named-expression* <operator>= *expression*

80542 shall be equivalent to:

80543 *named-expression*=*named-expression* <operator> *expression*

80544 except that the *named-expression* shall be evaluated only once.

80545 Unlike all other operators, the relational operators ('<', '>', '<=', '>=', '==', '!=') shall be  
80546 only valid as the object of an **if**, **while**, or inside a **for** statement.

80547 *expression1*<*expression2*

80548 The relation shall be true if the value of *expression1* is strictly less than the value of  
80549 *expression2*.

80550 *expression1*>*expression2*

80551 The relation shall be true if the value of *expression1* is strictly greater than the value of  
80552 *expression2*.

80553 *expression1* <= *expression2*  
 80554     The relation shall be true if the value of *expression1* is less than or equal to the value of  
 80555     *expression2*.

80556 *expression1* >= *expression2*  
 80557     The relation shall be true if the value of *expression1* is greater than or equal to the value of  
 80558     *expression2*.

80559 *expression1* = *expression2*  
 80560     The relation shall be true if the values of *expression1* and *expression2* are equal.

80561 *expression1* != *expression2*  
 80562     The relation shall be true if the values of *expression1* and *expression2* are unequal.

80563 There are only two storage classes in *bc*: global and automatic (local). Only identifiers that are  
 80564 local to a function need be declared with the **auto** command. The arguments to a function shall  
 80565 be local to the function. All other identifiers are assumed to be global and available to all  
 80566 functions. All identifiers, global and local, have initial values of zero. Identifiers declared as auto  
 80567 shall be allocated on entry to the function and released on returning from the function. They  
 80568 therefore do not retain values between function calls. Auto arrays shall be specified by the array  
 80569 name followed by empty square brackets. On entry to a function, the old values of the names  
 80570 that appear as parameters and as automatic variables shall be pushed onto a stack. Until the  
 80571 function returns, reference to these names shall refer only to the new values.

80572 References to any of these names from other functions that are called from this function also  
 80573 refer to the new value until one of those functions uses the same name for a local variable.

80574 When a statement is an expression, unless the main operator is an assignment, execution of the  
 80575 statement shall write the value of the expression followed by a <newline>.

80576 When a statement is a string, execution of the statement shall write the value of the string.

80577 Statements separated by <semicolon> or <newline> characters shall be executed sequentially. In  
 80578 an interactive invocation of *bc*, each time a <newline> is read that satisfies the grammatical  
 80579 production:

80580 `input_item : semicolon_list NEWLINE`

80581 the sequential list of statements making up the **semicolon\_list** shall be executed immediately  
 80582 and any output produced by that execution shall be written without any delay due to buffering.

80583 In an **if** statement (**if**(*relation*) *statement*), the *statement* shall be executed if the relation is true.

80584 The **while** statement (**while**(*relation*) *statement*) implements a loop in which the *relation* is tested;  
 80585 each time the *relation* is true, the *statement* shall be executed and the *relation* retested. When the  
 80586 *relation* is false, execution shall resume after *statement*.

80587 A **for** statement(**for**(*expression*; *relation*; *expression*) *statement*) shall be the same as:

80588 `first-expression`  
 80589 `while (relation) {`  
 80590     `statement`  
 80591     `last-expression`  
 80592 `}`

80593 The application shall ensure that all three expressions are present.

80594 The **break** statement shall cause termination of a **for** or **while** statement.

80595 The **auto** statement (**auto** *identifier* [*identifier*] ...) shall cause the values of the identifiers to be

pushed down. The identifiers can be ordinary identifiers or array identifiers. Array identifiers shall be specified by following the array name by empty square brackets. The application shall ensure that the **auto** statement is the first statement in a function definition.

A **define** statement:

```
define LETTER (opt_parameter_list) {
 opt_auto_define_list
 statement_list
}
```

defines a function named **LETTER**. If a function named **LETTER** was previously defined, the **define** statement shall replace the previous definition. The expression:

```
LETTER (opt_argument_list)
```

shall invoke the function named **LETTER**. The behavior is undefined if the number of arguments in the invocation does not match the number of parameters in the definition. Functions shall be defined before they are invoked. A function shall be considered to be defined within its own body, so recursive calls are valid. The values of numeric constants within a function shall be interpreted in the base specified by the value of the **ibase** register when the function is invoked.

The **return** statements (**return** and **return(expression)**) shall cause termination of a function, popping of its auto variables, and specification of the result of the function. The first form shall be equivalent to **return(0)**. The value and scale of the result returned by the function shall be the value and scale of the expression returned.

The **quit** statement (**quit**) shall stop execution of a *bc* program at the point where the statement occurs in the input, even if it occurs in a function definition, or in an **if**, **for**, or **while** statement.

The following functions shall be defined when the **-l** option is specified:

```
s(expression)
 Sine of argument in radians.

c(expression)
 Cosine of argument in radians.

a(expression)
 Arctangent of argument.

l(expression)
 Natural logarithm of argument.

e(expression)
 Exponential function of argument.

j(expression, expression)
 Bessel function of integer order.
```

The scale of the result returned by these functions shall be the value of the **scale** register at the time the function is invoked. The value of the **scale** register after these functions have completed their execution shall be the same value it had upon invocation. The behavior is undefined if any of these functions is invoked with an argument outside the domain of the mathematical function.

**EXIT STATUS**

The following exit values shall be returned:

0 All input files were processed successfully.

*unspecified* An error occurred.

**CONSEQUENCES OF ERRORS**

If any *file* operand is specified and the named file cannot be accessed, *bc* shall write a diagnostic message to standard error and terminate without any further action.

In an interactive invocation of *bc*, the utility should print an error message and recover following any error in the input. In a non-interactive invocation of *bc*, invalid input causes undefined behavior.

**APPLICATION USAGE**

Automatic variables in *bc* do not work in exactly the same way as in either C or PL/1.

For historical reasons, the exit status from *bc* cannot be relied upon to indicate that an error has occurred. Returning zero after an error is possible. Therefore, *bc* should be used primarily by interactive users (who can react to error messages) or by application programs that can somehow validate the answers returned as not including error messages.

The *bc* utility always uses the <period> ( ' . ' ) character to represent a radix point, regardless of any decimal-point character specified as part of the current locale. In languages like C or *awk*, the <period> character is used in program source, so it can be portable and unambiguous, while the locale-specific character is used in input and output. Because there is no distinction between source and input in *bc*, this arrangement would not be possible. Using the locale-specific character in *bc*'s input would introduce ambiguities into the language; consider the following example in a locale with a <comma> as the decimal-point character:

```
define f(a,b) {
 ...
}
...
f(1,2,3)
```

Because of such ambiguities, the <period> character is used in input. Having input follow different conventions from output would be confusing in either pipeline usage or interactive usage, so the <period> is also used in output.

**EXAMPLES**

In the shell, the following assigns an approximation of the first ten digits of '  $\pi$  ' to the variable *x*:

```
x=$(printf "%s\n" 'scale = 10; 104348/33215' | bc)
```

The following *bc* program prints the same approximation of '  $\pi$  ', with a label, to standard output:

```
scale = 10
"pi equals "
104348 / 33215
```

The following defines a function to compute an approximate value of the exponential function (note that such a function is predefined if the *-l* option is specified):

```
scale = 20
define e(x){
 auto a, b, c, i, s
```

```

80681 a = 1
80682 b = 1
80683 s = 1
80684 for (i = 1; 1 == 1; i++){
80685 a = a*x
80686 b = b*i
80687 c = a/b
80688 if (c == 0) {
80689 return(s)
80690 }
80691 s = s+c
80692 }
80693 }

```

80694 The following prints approximate values of the exponential function of the first ten integers:

```

80695 for (i = 1; i <= 10; ++i) {
80696 e(i)
80697 }

```

## 80698 RATIONALE

80699 The *bc* utility is implemented historically as a front-end processor for *dc*; *dc* was not selected to  
80700 be part of this volume of POSIX.1-2008 because *bc* was thought to have a more intuitive  
80701 programmatic interface. Current implementations that implement *bc* using *dc* are expected to be  
80702 compliant.

80703 The exit status for error conditions has been left unspecified for several reasons:

- 80704 • The *bc* utility is used in both interactive and non-interactive situations. Different exit codes  
80705 may be appropriate for the two uses.
- 80706 • It is unclear when a non-zero exit should be given; divide-by-zero, undefined functions,  
80707 and syntax errors are all possibilities.
- 80708 • It is not clear what utility the exit status has.
- 80709 • In the 4.3 BSD, System V, and Ninth Edition implementations, *bc* works in conjunction with  
80710 *dc*. The *dc* utility is the parent, *bc* is the child. This was done to cleanly terminate *bc* if *dc*  
80711 aborted.

80712 The decision to have *bc* exit upon encountering an inaccessible input file is based on the belief  
80713 that *bc file1 file2* is used most often when at least *file1* contains data/function  
80714 declarations/initializations. Having *bc* continue with prerequisite files missing is probably not  
80715 useful. There is no implication in the CONSEQUENCES OF ERRORS section that *bc* must check  
80716 all its files for accessibility before opening any of them.

80717 There was considerable debate on the appropriateness of the language accepted by *bc*. Several  
80718 reviewers preferred to see either a pure subset of the C language or some changes to make the  
80719 language more compatible with C. While the *bc* language has some obvious similarities to C, it  
80720 has never claimed to be compatible with any version of C. An interpreter for a subset of C might  
80721 be a very worthwhile utility, and it could potentially make *bc* obsolete. However, no such utility  
80722 is known in historical practice, and it was not within the scope of this volume of POSIX.1-2008 to  
80723 define such a language and utility. If and when they are defined, it may be appropriate to  
80724 include them in a future version of this standard. This left the following alternatives:

1. Exclude any calculator language from this volume of POSIX.1-2008.

The consensus of the standard developers was that a simple programmatic calculator language is very useful for both applications and interactive users. The only arguments for excluding any calculator were that it would become obsolete if and when a C-compatible one emerged, or that the absence would encourage the development of such a C-compatible one. These arguments did not sufficiently address the needs of current application developers.

2. Standardize the historical *dc*, possibly with minor modifications.

The consensus of the standard developers was that *dc* is a fundamentally less usable language and that that would be far too severe a penalty for avoiding the issue of being similar to but incompatible with C.

3. Standardize the historical *bc*, possibly with minor modifications.

This was the approach taken. Most of the proponents of changing the language would not have been satisfied until most or all of the incompatibilities with C were resolved. Since most of the changes considered most desirable would break historical applications and require significant modification to historical implementations, almost no modifications were made. The one significant modification that was made was the replacement of the historical *bc* assignment operators "*=+*", and so on, with the more modern "*+=*", and so on. The older versions are considered to be fundamentally flawed because of the lexical ambiguity in uses like *a=-1*.

In order to permit implementations to deal with backwards-compatibility as they see fit, the behavior of this one ambiguous construct was made undefined. (At least three implementations have been known to support this change already, so the degree of change involved should not be great.)

The '*%*' operator is the mathematical remainder operator when **scale** is zero. The behavior of this operator for other values of **scale** is from historical implementations of *bc*, and has been maintained for the sake of historical applications despite its non-intuitive nature.

Historical implementations permit setting **ibase** and **obase** to a broader range of values. This includes values less than 2, which were not seen as sufficiently useful to standardize. These implementations do not interpret input properly for values of **ibase** that are greater than 16. This is because numeric constants are recognized syntactically, rather than lexically, as described in this volume of POSIX.1-2008. They are built from lexical tokens of single hexadecimal digits and <period> characters. Since <blank> characters between tokens are not visible at the syntactic level, it is not possible to recognize the multi-digit "digits" used in the higher bases properly. The ability to recognize input in these bases was not considered useful enough to require modifying these implementations. Note that the recognition of numeric constants at the syntactic level is not a problem with conformance to this volume of POSIX.1-2008, as it does not impact the behavior of conforming applications (and correct *bc* programs). Historical implementations also accept input with all of the digits '*0*'–'*9*' and '*A*'–'*F*' regardless of the value of **ibase**; since digits with value greater than or equal to **ibase** are not really appropriate, the behavior when they appear is undefined, except for the common case of:

```
ibase=8;
/* Process in octal base. */
...
ibase=A
/* Restore decimal base. */
```

In some historical implementations, if the expression to be written is an uninitialized array

80772 element, a leading <space> and/or up to four leading 0 characters may be output before the  
80773 character zero. This behavior is considered a bug; it is unlikely that any currently conforming  
80774 application relies on:

80775 `echo 'b[3]' | bc`

80776 returning 00000 rather than 0.

80777 Exact calculation of the number of fractional digits to output for a given value in a base other  
80778 than 10 can be computationally expensive. Historical implementations use a faster  
80779 approximation, and this is permitted. Note that the requirements apply only to values of **obase**  
80780 that this volume of POSIX.1-2008 requires implementations to support (in particular, not to 1, 0,  
80781 or negative bases, if an implementation supports them as an extension).

80782 Historical implementations of *bc* did not allow array parameters to be passed as the last  
80783 parameter to a function. New implementations are encouraged to remove this restriction even  
80784 though it is not required by the grammar.

#### 80785 **FUTURE DIRECTIONS**

80786 None.

#### 80787 **SEE ALSO**

80788 [Section 1.3](#) (on page 2309), *awk*

80789 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)

#### 80790 **CHANGE HISTORY**

80791 First released in Issue 4.

#### 80792 **Issue 5**

80793 The FUTURE DIRECTIONS section is added.

#### 80794 **Issue 6**

80795 Updated to align with the IEEE P1003.2b draft standard, which included resolution of several  
80796 interpretations of the ISO POSIX-2: 1993 standard.

80797 The normative text is reworded to avoid use of the term “must” for application requirements.

#### 80798 **Issue 7**

80799 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

80800 **NAME**

80801           bg — run jobs in the background

80802 **SYNOPSIS**80803 UP       bg [*job\_id*...]80804 **DESCRIPTION**

80805       If job control is enabled (see the description of *set -m*), the *bg* utility shall resume suspended jobs  
 80806       from the current environment (see [Section 2.12](#), on page 2353) by running them as background  
 80807       jobs. If the job specified by *job\_id* is already a running background job, the *bg* utility shall have  
 80808       no effect and shall exit successfully.

80809       Using *bg* to place a job into the background shall cause its process ID to become “known in the  
 80810       current shell execution environment”, as if it had been started as an asynchronous list; see  
 80811       [Section 2.9.3.1](#) (on page 2342).

80812 **OPTIONS**

80813       None.

80814 **OPERANDS**

80815       The following operand shall be supported:

80816       *job\_id*       Specify the job to be resumed as a background job. If no *job\_id* operand is given,  
 80817       the most recently suspended job shall be used. The format of *job\_id* is described in  
 80818       XBD [Section 3.204](#) (on page 65).

80819 **STDIN**

80820       Not used.

80821 **INPUT FILES**

80822       None.

80823 **ENVIRONMENT VARIABLES**80824       The following environment variables shall affect the execution of *bg*:

80825       *LANG*       Provide a default value for the internationalization variables that are unset or null.  
 80826       (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 80827       variables used to determine the values of locale categories.)

80828       *LC\_ALL*       If set to a non-empty string value, override the values of all the other  
 80829       internationalization variables.

80830       *LC\_CTYPE*   Determine the locale for the interpretation of sequences of bytes of text data as  
 80831       characters (for example, single-byte as opposed to multi-byte characters in  
 80832       arguments).

80833       *LC\_MESSAGES*

80834       Determine the locale that should be used to affect the format and contents of  
 80835       diagnostic messages written to standard error.

80836 XSI       *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

80837 **ASYNCHRONOUS EVENTS**

80838       Default.

80839 **STDOUT**80840       The output of *bg* shall consist of a line in the format:80841       "[*%d*] *%s*\n", <*job-number*>, <*command*>

80842 where the fields are as follows:

80843 <job-number> A number that can be used to identify the job to the *wait*, *fg*, and *kill* utilities. Using  
80844 these utilities, the job can be identified by prefixing the job number with ' % '.

80845 <command> The associated command that was given to the shell.

#### 80846 **STDERR**

80847 The standard error shall be used only for diagnostic messages.

#### 80848 **OUTPUT FILES**

80849 None.

#### 80850 **EXTENDED DESCRIPTION**

80851 None.

#### 80852 **EXIT STATUS**

80853 The following exit values shall be returned:

80854 0 Successful completion.

80855 >0 An error occurred.

#### 80856 **CONSEQUENCES OF ERRORS**

80857 If job control is disabled, the *bg* utility shall exit with an error and no job shall be placed in the  
80858 background.

#### 80859 **APPLICATION USAGE**

80860 A job is generally suspended by typing the SUSP character (<control>-Z on most systems); see  
80861 XBD [Chapter 11](#) (on page 199). At that point, *bg* can put the job into the background. This is  
80862 most effective when the job is expecting no terminal input and its output has been redirected to  
80863 non-terminal files. A background job can be forced to stop when it has terminal output by  
80864 issuing the command:

80865 `stty tostop`

80866 A background job can be stopped with the command:

80867 `kill -s stop job ID`

80868 The *bg* utility does not work as expected when it is operating in its own utility execution  
80869 environment because that environment has no suspended jobs. In the following examples:

80870 `... | xargs bg`  
80871 `(bg)`

80872 each *bg* operates in a different environment and does not share its parent shell's understanding  
80873 of jobs. For this reason, *bg* is generally implemented as a shell regular built-in.

#### 80874 **EXAMPLES**

80875 None.

#### 80876 **RATIONALE**

80877 The extensions to the shell specified in this volume of POSIX.1-2008 have mostly been based on  
80878 features provided by the KornShell. The job control features provided by *bg*, *fg*, and *jobs* are also  
80879 based on the KornShell. The standard developers examined the characteristics of the C shell  
80880 versions of these utilities and found that differences exist. Despite widespread use of the C shell,  
80881 the KornShell versions were selected for this volume of POSIX.1-2008 to maintain a degree of  
80882 uniformity with the rest of the KornShell features selected (such as the very popular command  
80883 line editing features).

80884 The *bg* utility is expected to wrap its output if the output exceeds the number of display  
80885 columns.

80886 **FUTURE DIRECTIONS**

80887 None.

80888 **SEE ALSO**

80889 [Section 2.9.3.1](#) (on page 2342), *fg*, *kill*, *jobs*, *wait*

80890 XBD [Section 3.204](#) (on page 65), [Chapter 8](#) (on page 173), [Chapter 11](#) (on page 199)

80891 **CHANGE HISTORY**

80892 First released in Issue 4.

80893 **Issue 6**

80894 This utility is marked as part of the User Portability Utilities option.

80895 The JC margin marker on the SYNOPSIS is removed since support for Job Control is mandatory  
80896 in this version. This is a FIPS requirement.

80897 **Issue 7**

80898 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

**NAME**

c99 — compile standard C programs

**SYNOPSIS**

```
CD c99 [options...] pathname [[pathname] [-I directory]
 [-L directory] [-l library]]...
```

**DESCRIPTION**

The *c99* utility is an interface to the standard C compilation system; it shall accept source code conforming to the ISO C standard. The system conceptually consists of a compiler and link editor. The input files referenced by *pathname* operands and *-I* option-arguments shall be compiled and linked to produce an executable file. (It is unspecified whether the linking occurs entirely within the operation of *c99*; some implementations may produce objects that are not fully resolved until the file is executed.)

If the *-c* option is specified, for all *pathname* operands of the form *file.c*, the files:

```
$(basename pathname .c).o
```

shall be created as the result of successful compilation. If the *-c* option is not specified, it is unspecified whether such *.o* files are created or deleted for the *file.c* operands.

If there are no options that prevent link editing (such as *-c* or *-E*), and all input files compile and link without error, the resulting executable file shall be written according to the *-o outfile* option (if present) or to the file *a.out*.

The executable file shall be created as specified in [Section 1.1.1.4](#) (on page 2302), except that the file permission bits shall be set to:

```
S_IRWXO | S_IRWXG | S_IRWXU
```

and the bits specified by the *umask* of the process shall be cleared.

**OPTIONS**

The *c99* utility shall conform to XBD [Section 12.2](#) (on page 215), except that:

- Options can be interspersed with operands.
- The order of specifying the *-L* and *-I* options, and the order of specifying *-l* options with respect to *pathname* operands is significant.
- Conforming applications shall specify each option separately; that is, grouping option letters (for example, *-cO*) need not be recognized by all implementations.

The following options shall be supported:

**-c** Suppress the link-edit phase of the compilation, and do not remove any object files that are produced.

**-D name[=value]**

Define *name* as if by a C-language **#define** directive. If no *=value* is given, a value of 1 shall be used. The *-D* option has lower precedence than the *-U* option. That is, if *name* is used in both a *-U* and a *-D* option, *name* shall be undefined regardless of the order of the options. Additional implementation-defined *names* may be provided by the compiler. Implementations shall support at least 2 048 bytes of *-D* definitions and 256 *names*.

- 80939        **-E**            Copy C-language source files to standard output, expanding all preprocessor  
80940 directives; no compilation shall be performed. If any operand is not a text file, the  
80941 effects are unspecified.
- 80942        **-g**            Produce symbolic information in the object or executable files; the nature of this  
80943 information is unspecified, and may be modified by implementation-defined  
80944 interactions with other options.
- 80945        **-I *directory***    Change the algorithm for searching for headers whose names are not absolute  
80946 pathnames to look in the directory named by the *directory* pathname before looking  
80947 in the usual places. Thus, headers whose names are enclosed in double-quotes ("")  
80948 shall be searched for first in the directory of the file with the **#include** line, then in  
80949 directories named in **-I** options, and last in the usual places. For headers whose  
80950 names are enclosed in angle brackets ("*< >*"), the header shall be searched for only  
80951 in directories named in **-I** options and then in the usual places. Directories named  
80952 in **-I** options shall be searched in the order specified. If the **-I** option is used to  
80953 specify a directory that is one of the usual places searched by default, the results  
80954 are unspecified. Implementations shall support at least ten instances of this option  
80955 in a single *c99* command invocation.
- 80956        **-L *directory***    Change the algorithm of searching for the libraries named in the **-l** objects to look  
80957 in the directory named by the *directory* pathname before looking in the usual  
80958 places. Directories named in **-L** options shall be searched in the order specified. If  
80959 the **-L** option is used to specify a directory that is one of the usual places searched  
80960 by default, the results are unspecified. Implementations shall support at least ten  
80961 instances of this option in a single *c99* command invocation. If a directory specified  
80962 by a **-L** option contains files with names starting with any of the strings "*libc.*",  
80963 "*libl.*", "*libpthread.*", "*libm.*", "*librt.*", "*libtrace.*", "*libxnet.*",  
80964 or "*liby.*", the results are unspecified.
- 80965        **-l *library***    Search the library named **liblibrary.a**. A library shall be searched when its name is  
80966 encountered, so the placement of a **-l** option is significant. Several standard  
80967 libraries can be specified in this manner, as described in the EXTENDED  
80968 DESCRIPTION section. Implementations may recognize implementation-defined  
80969 suffixes other than **.a** as denoting libraries.
- 80970        **-O *optlevel***    Specify the level of code optimization. If the *optlevel* option-argument is the digit  
80971 '*0*', all special code optimizations shall be disabled. If it is the digit '*1*', the  
80972 nature of the optimization is unspecified. If the **-O** option is omitted, the nature of  
80973 the system's default optimization is unspecified. It is unspecified whether code  
80974 generated in the presence of the **-O 0** option is the same as that generated when  
80975 **-O** is omitted. Other *optlevel* values may be supported.
- 80976        **-o *outfile***    Use the pathname *outfile*, instead of the default **a.out**, for the executable file  
80977 produced. If the **-o** option is present with **-c** or **-E**, the result is unspecified.
- 80978        **-s**            Produce object or executable files, or both, from which symbolic and other  
80979 information not required for proper execution using the *exec* family defined in the  
80980 System Interfaces volume of POSIX.1-2008 has been removed (stripped). If both **-g**  
80981 and **-s** options are present, the action taken is unspecified.
- 80982        **-U *name***        Remove any initial definition of *name*.
- 80983        Multiple instances of the **-D**, **-I**, **-L**, **-l**, and **-U** options can be specified.

**OPERANDS**

The application shall ensure that at least one *pathname* operand is specified. The following forms for *pathname* operands shall be supported:

*file.c* A C-language source file to be compiled and optionally linked. The application shall ensure that the operand is of this form if the `-c` option is used.

*file.a* A library of object files typically produced by the *ar* utility, and passed directly to the link editor. Implementations may recognize implementation-defined suffixes other than *.a* as denoting object file libraries.

*file.o* An object file produced by *c99 -c* and passed directly to the link editor. Implementations may recognize implementation-defined suffixes other than *.o* as denoting object files.

The processing of other files is implementation-defined.

**STDIN**

Not used.

**INPUT FILES**

Each input file shall be one of the following: a text file containing a C-language source program, an object file in the format produced by *c99 -c*, or a library of object files, in the format produced by archiving zero or more object files, using *ar*. Implementations may supply additional utilities that produce files in these formats. Additional input file formats are implementation-defined.

**ENVIRONMENT VARIABLES**

The following environment variables shall affect the execution of *c99*:

*LANG* Provide a default value for the internationalization variables that are unset or null. (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization variables used to determine the values of locale categories.)

*LC\_ALL* If set to a non-empty string value, override the values of all the other internationalization variables.

*LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as characters (for example, single-byte as opposed to multi-byte characters in arguments and input files).

*LC\_MESSAGES*

Determine the locale that should be used to affect the format and contents of diagnostic messages written to standard error.

*NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

*TMPDIR* Provide a pathname that should override the default directory for temporary files, if any. On XSI-conforming systems, provide a pathname that shall override the default directory for temporary files, if any.

**ASYNCHRONOUS EVENTS**

Default.

**STDOUT**

If more than one *pathname* operand ending in *.c* (or possibly other unspecified suffixes) is given, for each such file:

"%s:\n", *<pathname>*

may be written. These messages, if written, shall precede the processing of each input file; they

81027 shall not be written to the standard output if they are written to the standard error, as described  
81028 in the STDERR section.

81029 If the **-E** option is specified, the standard output shall be a text file that represents the results of  
81030 the preprocessing stage of the language; it may contain extra information appropriate for  
81031 subsequent compilation passes.

## 81032 **STDERR**

81033 The standard error shall be used only for diagnostic messages. If more than one *pathname*  
81034 operand ending in **.c** (or possibly other unspecified suffixes) is given, for each such file:

81035 `"%s:\n", <pathname>`

81036 may be written to allow identification of the diagnostic and warning messages with the  
81037 appropriate input file. These messages, if written, shall precede the processing of each input file;  
81038 they shall not be written to the standard error if they are written to the standard output, as  
81039 described in the STDOUT section.

81040 This utility may produce warning messages about certain conditions that do not warrant  
81041 returning an error (non-zero) exit value.

## 81042 **OUTPUT FILES**

81043 Object files or executable files or both are produced in unspecified formats. If the pathname of  
81044 an object file or executable file to be created by *c99* resolves to an existing directory entry for a  
81045 file that is not a regular file, it is unspecified whether *c99* shall attempt to create the file or shall  
81046 issue a diagnostic and exit with a non-zero exit status.

## 81047 **EXTENDED DESCRIPTION**

### 81048 **Standard Libraries**

81049 The *c99* utility shall recognize the following **-l** options for standard libraries:

81050 **-l c** This option shall make available all interfaces referenced in the System Interfaces  
81051 volume of POSIX.1-2008, with the possible exception of those interfaces listed as  
81052 residing in **<aio.h>**, **<arpa/inet.h>**, **<complex.h>**, **<fenv.h>**, **<math.h>**,  
81053 **<mqueue.h>**, **<netdb.h>**, **<net/if.h>**, **<netinet/in.h>**, **<pthread.h>**, **<sched.h>**,  
81054 **<semaphore.h>**, **<spawn.h>**, **<sys/socket.h>**, *pthread\_kill()*, and *pthread\_sigmask()*  
81055 in **<signal.h>**, **<trace.h>**, interfaces marked as optional in **<sys/mman.h>**,  
81056 interfaces marked as ADV (Advisory Information) in **<fcntl.h>**, and interfaces  
81057 beginning with the prefix *clock\_* or *time\_* in **<time.h>**. This option shall not be  
81058 required to be present to cause a search of this library.

81059 **-l l** This option shall make available all interfaces required by the C-language output  
81060 of *lex* that are not made available through the **-l c** option.

81061 **-l pthread** This option shall make available all interfaces referenced in **<pthread.h>** and  
81062 *pthread\_kill()* and *pthread\_sigmask()* referenced in **<signal.h>**. An implementation  
81063 may search this library in the absence of this option.

81064 **-l m** This option shall make available all interfaces referenced in **<math.h>**,  
81065 **<complex.h>**, and **<fenv.h>**. An implementation may search this library in the  
81066 absence of this option.

81067 **-l rt** This option shall make available all interfaces referenced in **<aio.h>**, **<mqueue.h>**,  
81068 **<sched.h>**, **<semaphore.h>**, and **<spawn.h>**, interfaces marked as optional in  
81069 **<sys/mman.h>**, interfaces marked as ADV (Advisory Information) in **<fcntl.h>**,  
81070 and interfaces beginning with the prefix *clock\_* and *time\_* in **<time.h>**. An

81071 implementation may search this library in the absence of this option.

81072 OB **-l trace** This option shall make available all interfaces referenced in **<trace.h>**. An  
 81073 implementation may search this library in the absence of this option.

81074 **-l xnet** This option shall make available all interfaces referenced in **<arpa/inet.h>**,  
 81075 **<netdb.h>**, **<net/if.h>**, **<netinet/in.h>**, and **<sys/socket.h>**. An implementation  
 81076 may search this library in the absence of this option.

81077 **-l y** This option shall make available all interfaces required by the C-language output  
 81078 of *yacc* that are not made available through the **-l c** option.

81079 In the absence of options that inhibit invocation of the link editor, such as **-c** or **-E**, the *c99* utility  
 81080 shall cause the equivalent of a **-l c** option to be passed to the link editor after the last *pathname*  
 81081 operand or **-l** option, causing it to be searched after all other object files and libraries are loaded.

81082 OB It is unspecified whether the libraries **libc.a**, **libl.a**, **libm.a**, **libpthread.a**, **librt.a**, **libtrace.a**,  
 81083 **libxnet.a**, or **liby.a** exist as regular files. The implementation may accept as **-l** option-arguments  
 81084 names of objects that do not exist as regular files.

## 81085 External Symbols

81086 The C compiler and link editor shall support the significance of external symbols up to a length  
 81087 of at least 31 bytes; the action taken upon encountering symbols exceeding the implementation-  
 81088 defined maximum symbol length is unspecified.

81089 The compiler and link editor shall support a minimum of 511 external symbols per source or  
 81090 object file, and a minimum of 4095 external symbols in total. A diagnostic message shall be  
 81091 written to the standard output if the implementation-defined limit is exceeded; other actions are  
 81092 unspecified.

## 81093 Header Search

81094 If a file with the same name as one of the standard headers defined in XBD Chapter 13 (on page +  
 81095 219), not provided as part of the implementation, is placed in any of the usual places that are +  
 81096 searched by default for headers, the results are unspecified.

## 81097 Programming Environments

81098 All implementations shall support one of the following programming environments as a default.  
 81099 Implementations may support more than one of the following programming environments.  
 81100 Applications can use *sysconf()* or *getconf* to determine which programming environments are  
 81101 supported.

Table 4-4 Programming Environments: Type Sizes

| Programming Environment<br><i>getconf</i> Name | Bits in<br>int | Bits in<br>long | Bits in<br>pointer | Bits in<br>off_t |
|------------------------------------------------|----------------|-----------------|--------------------|------------------|
| _POSIX_V7_ILP32_OFF32                          | 32             | 32              | 32                 | 32               |
| _POSIX_V7_ILP32_OFFBIG                         | 32             | 32              | 32                 | ≥64              |
| _POSIX_V7_LP64_OFF64                           | 32             | 64              | 64                 | 64               |
| _POSIX_V7_LP64_OFFBIG                          | ≥32            | ≥64             | ≥64                | ≥64              |

All implementations shall support one or more environments where the widths of the following types are no greater than the width of type **long**:

|                  |                    |                 |
|------------------|--------------------|-----------------|
| <b>blksize_t</b> | <b>ptrdiff_t</b>   | <b>tcflag_t</b> |
| <b>cc_t</b>      | <b>size_t</b>      | <b>wchar_t</b>  |
| <b>mode_t</b>    | <b>speed_t</b>     | <b>wint_t</b>   |
| <b>nfds_t</b>    | <b>ssize_t</b>     |                 |
| <b>pid_t</b>     | <b>suseconds_t</b> |                 |

The executable files created when these environments are selected shall be in a proper format for execution by the *exec* family of functions. Each environment may be one of the ones in Table 4-4, or it may be another environment. The names for the environments that meet this requirement shall be output by a *getconf* command using the `_POSIX_V7_WIDTH_RESTRICTED_ENVS` argument, as a <newline>-separated list of names suitable for use with the *getconf* `-v` option. If more than one environment meets the requirement, the names of all such environments shall be output on separate lines. Any of these names can then be used in a subsequent *getconf* command to obtain the flags specific to that environment with the following suffixes added as appropriate:

`_CFLAGS` To get the C compiler flags.

`_LDFLAGS` To get the linker/loader flags.

`_LIBS` To get the libraries.

This requirement may be removed in a future version.

When this utility processes a file containing a function called *main()*, it shall be defined with a return type equivalent to **int**. Using return from the initial call to *main()* shall be equivalent (other than with respect to language scope issues) to calling *exit()* with the returned value. Reaching the end of the initial call to *main()* shall be equivalent to calling *exit(0)*. The implementation shall not declare a prototype for this function.

Implementations provide configuration strings for C compiler flags, linker/loader flags, and libraries for each supported environment. When an application needs to use a specific programming environment rather than the implementation default programming environment while compiling, the application shall first verify that the implementation supports the desired environment. If the desired programming environment is supported, the application shall then invoke *c99* with the appropriate C compiler flags as the first options for the compile, the appropriate linker/loader flags after any other options except `-l` but before any operands or `-l` options, and the appropriate libraries at the end of the operands and `-l` options.

Conforming applications shall not attempt to link together object files compiled for different programming models. Applications shall also be aware that binary data placed in shared memory or in files might not be recognized by applications built for other programming models.

**Table 4-5** Programming Environments: *c99* Arguments

| Programming Environment<br><i>getconf</i> Name | Use                                                  | <i>c99</i> Arguments<br><i>getconf</i> Name                                                 |
|------------------------------------------------|------------------------------------------------------|---------------------------------------------------------------------------------------------|
| _POSIX_V7_ILP32_OFF32                          | C Compiler Flags<br>Linker/Loader Flags<br>Libraries | POSIX_V7_ILP32_OFF32_CFLAGS<br>POSIX_V7_ILP32_OFF32_LDFLAGS<br>POSIX_V7_ILP32_OFF32_LIBS    |
| _POSIX_V7_ILP32_OFFBIG                         | C Compiler Flags<br>Linker/Loader Flags<br>Libraries | POSIX_V7_ILP32_OFFBIG_CFLAGS<br>POSIX_V7_ILP32_OFFBIG_LDFLAGS<br>POSIX_V7_ILP32_OFFBIG_LIBS |
| _POSIX_V7_LP64_OFF64                           | C Compiler Flags<br>Linker/Loader Flags<br>Libraries | POSIX_V7_LP64_OFF64_CFLAGS<br>POSIX_V7_LP64_OFF64_LDFLAGS<br>POSIX_V7_LP64_OFF64_LIBS       |
| _POSIX_V7_LPBIG_OFFBIG                         | C Compiler Flags<br>Linker/Loader Flags<br>Libraries | POSIX_V7_LPBIG_OFFBIG_CFLAGS<br>POSIX_V7_LPBIG_OFFBIG_LDFLAGS<br>POSIX_V7_LPBIG_OFFBIG_LIBS |

In addition to the type size programming environments above, all implementations also support a multi-threaded programming environment that is orthogonal to all of the programming environments listed above. The *getconf* utility can be used to get flags for the threaded programming environment, as indicated in [Table 4-6](#).

**Table 4-6** Threaded Programming Environment: *c99* Arguments

| Programming Environment<br><i>getconf</i> Name | Use                                     | <i>c99</i> Arguments<br><i>getconf</i> Name         |
|------------------------------------------------|-----------------------------------------|-----------------------------------------------------|
| _POSIX_THREADS                                 | C Compiler Flags<br>Linker/Loader Flags | POSIX_V7_THREADS_CFLAGS<br>POSIX_V7_THREADS_LDFLAGS |

These programming environment flags may be used in conjunction with any of the type size programming environments supported by the implementation.

**EXIT STATUS**

The following exit values shall be returned:

0 Successful compilation or link edit.

>0 An error occurred.

**CONSEQUENCES OF ERRORS**

When *c99* encounters a compilation error that causes an object file not to be created, it shall write a diagnostic to standard error and continue to compile other source code operands, but it shall not perform the link phase and return a non-zero exit status. If the link edit is unsuccessful, a diagnostic message shall be written to standard error and *c99* exits with a non-zero status. A conforming application shall rely on the exit status of *c99*, rather than on the existence or mode of the executable file.

## APPLICATION USAGE

Since the *c99* utility usually creates files in the current directory during the compilation process, it is typically necessary to run the *c99* utility in a directory in which a file can be created.

On systems providing POSIX Conformance (see XBD [Chapter 2](#), on page 15), *c99* is required only with the C-Language Development option; XSI-conformant systems always provide *c99*.

Some historical implementations have created *.o* files when *-c* is not specified and more than one source file is given. Since this area is left unspecified, the application cannot rely on *.o* files being created, but it also must be prepared for any related *.o* files that already exist being deleted at the completion of the link edit.

There is the possible implication that if a user supplies versions of the standard functions (before they would be encountered by an implicit *-l c* or explicit *-l m*), that those versions would be used in place of the standard versions. There are various reasons this might not be true (functions defined as macros, manipulations for clean name space, and so on), so the existence of files named in the same manner as the standard libraries within the *-L* directories is explicitly stated to produce unspecified behavior.

All of the functions specified in the System Interfaces volume of POSIX.1-2008 may be made visible by implementations when the Standard C Library is searched. Conforming applications must explicitly request searching the other standard libraries when functions made visible by those libraries are used.

In the ISO C standard the mapping from physical source characters to the C source character set is implementation-defined. Implementations may strip white-space characters before the terminating *<newline>* of a (physical) line as part of this mapping and, as a consequence of this, one or more white-space characters (and no other characters) between a *<backslash>* character and the *<newline>* character that terminates the line produces implementation-defined results. Portable applications should not use such constructs.

Some *c99* compilers not conforming to POSIX.1-2008 do not support trigraphs by default.

## EXAMPLES

1. The following usage example compiles **foo.c** and creates the executable file **foo**:

```
c99 -o foo foo.c
```

The following usage example compiles **foo.c** and creates the object file **foo.o**:

```
c99 -c foo.c
```

The following usage example compiles **foo.c** and creates the executable file **a.out**:

```
c99 foo.c
```

The following usage example compiles **foo.c**, links it with **bar.o**, and creates the executable file **a.out**. It may also create and leave **foo.o**:

```
c99 foo.c bar.o
```

2. The following example shows how an application using threads interfaces can test for support of and use a programming environment supporting 32-bit **int**, **long**, and **pointer** types and an **off\_t** type using at least 64 bits:

```
offbig_env=$(getconf _POSIX_V7_ILP32_OFFBIG)
if [$offbig_env != "-1"] && [$offbig_env != "undefined"]
then
 c99 $(getconf POSIX_V7_ILP32_OFFBIG_CFLAGS) \
```

```

81224 $(getconf POSIX_V7_THREADS_CFLAGS) -D_XOPEN_SOURCE=700 \
81225 $(getconf POSIX_V7_ILP32_OFFBIG_LDFLAGS) \
81226 $(getconf POSIX_V7_THREADS_LDFLAGS) foo.c -o foo \
81227 $(getconf POSIX_V7_ILP32_OFFBIG_LIBS) \
81228 -l pthread
81229 else
81230 echo ILP32_OFFBIG programming environment not supported
81231 exit 1
81232 fi

```

3. The following examples clarify the use and interactions of **-L** and **-l** options.

Consider the case in which module **a.c** calls function *f()* in library **libQ.a**, and module **b.c** calls function *g()* in library **libp.a**. Assume that both libraries reside in **/a/b/c**. The command line to compile and link in the desired way is:

```
c99 -L /a/b/c main.o a.c -l Q b.c -l p
```

In this case the **-L** option need only precede the first **-l** option, since both **libQ.a** and **libp.a** reside in the same directory.

Multiple **-L** options can be used when library name collisions occur. Building on the previous example, suppose that the user wants to use a new **libp.a**, in **/a/a/a**, but still wants *f()* from **/a/b/c/libQ.a**:

```
c99 -L /a/a/a -L /a/b/c main.o a.c -l Q b.c -l p
```

In this example, the linker searches the **-L** options in the order specified, and finds **/a/a/a/libp.a** before **/a/b/c/libp.a** when resolving references for **b.c**. The order of the **-l** options is still important, however.

4. The following example shows how an application can use a programming environment where the widths of the following types:

**blksize\_t**, **cc\_t**, **mode\_t**, **nfds\_t**, **pid\_t**, **ptrdiff\_t**, **size\_t**, **speed\_t**, **ssize\_t**, **suseconds\_t**, **tcflag\_t**, **wchar\_t**, **wint\_t**

are no greater than the width of type **long**:

```

81251 # First choose one of the listed environments ...
81252
81253 # ... if there are no additional constraints, the first one will do:
81254 CENV=$(getconf POSIX_V7_WIDTH_RESTRICTED_ENVS | head -n 1)
81255
81256 # ... or, if an environment that supports large files is preferred,
81257 # look for names that contain "OFF64" or "OFFBIG". (This chooses
81258 # the last one in the list if none match.)
81259 for CENV in $(getconf POSIX_V7_WIDTH_RESTRICTED_ENVS)
81260 do
81261 case $CENV in
81262 *OFF64*|*OFFBIG*) break ;;
81263 esac
81264 done
81265
81266 # The chosen environment name can now be used like this:
81267
81268 c99 $(getconf ${CENV}_CFLAGS) -D _POSIX_C_SOURCE=200809L \
81269 $(getconf ${CENV}_LDFLAGS) foo.c -o foo \
81270 $(getconf ${CENV}_LIBS)

```

**RATIONALE**

The *c99* utility is based on the *c89* utility originally introduced in the ISO POSIX-2:1993 standard.

Some of the changes from *c89* include the ability to intersperse options and operands (which many *c89* implementations allowed despite it not being specified), the description of **-l** as an option instead of an operand, and the modification to the contents of the Standard Libraries section to account for new headers and options; for example, **<spawn.h>** added to the description of **-l rt**, and **-l trace** added for the Tracing option.

POSIX.1-2008 specifies that the *c99* utility must be able to use regular files for **\*.o** files and for **a.out** files. Implementations are free to overwrite existing files of other types when attempting to create object files and executable files, but are not required to do so. If something other than a regular file is specified and using it fails for any reason, *c99* is required to issue a diagnostic message and exit with a non-zero exit status. But for some file types, the problem may not be noticed for a long time. For example, if a FIFO named **a.out** exists in the current directory, *c99* may attempt to open **a.out** and will hang in the *open()* call until another process opens the FIFO for reading. Then *c99* may write most of the **a.out** to the FIFO and fail when it tries to seek back close to the start of the file to insert a timestamp (FIFOs are not seekable files). The *c99* utility is also allowed to issue a diagnostic immediately if it encounters an **a.out** or **\*.o** file that is not a regular file. For portable use, applications should ensure that any **a.out**, **-o** option-argument, or **\*.o** files corresponding to any **\*.c** files do not conflict with names already in use that are not regular files or symbolic links that point to regular files.

On many systems, multi-threaded applications run in a programming environment that is distinct from that used by single-threaded applications. This multi-threaded programming environment (in addition to needing to specify **-l pthread** at link time) may require additional flags to be set when headers are processed at compile time (**-D\_REENTRANT** being common). This programming environment is orthogonal to the type size programming environments discussed above and listed in [Table 4-4](#) (on page 2516). This version of the standard adds *getconf* utility calls to provide the C compiler flags and linker/loader flags needed to support multi-threaded applications. Note that on a system where single-threaded applications are a special case of a multi-threaded application, both of these *getconf* calls may return NULL strings; on other implementations both of these strings may be non-NULL strings.

The C standardization committee invented trigraphs (e.g., "??!" to represent ' | ') to address character portability problems in development environments based on national variants of the 7-bit ISO/IEC 646:1991 standard character set. However, these environments were already obsolete by the time the first ISO C standard was published, and in practice trigraphs have not been used for their intended purpose, and usually are intended to have their original meaning in K&R C. For example, in practice a C-language source string like "What??!" is usually intended to end in two <question-mark> characters and an <exclamation-mark>, not in ' | '.

**FUTURE DIRECTIONS**

**CHANGE HISTORY**

First released in Issue 6. Included for alignment with the ISO/IEC 9899:1999 standard.

IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/12 is applied, correcting the EXTENDED DESCRIPTION of **-l c** and **-l m**. Previously, the text did not take into account the presence of the *c99* math headers.

IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/13 is applied, changing the reference to the **libxnet** library to **libxnet.a**.

IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/5 is applied, updating the OPTIONS section, so that the names of files contained in the directory specified by the **-L** option are not assumed to end in the **.a** suffix. The set of library prefixes is also updated.

IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/6 is applied, removing the lead underscore from the `POSIX_V6_WIDTH_RESTRICTED_ENVS` variable in the EXTENDED DESCRIPTION and the EXAMPLES sections.

**Issue 7**

Austin Group Interpretation 1003.1-2001 #020 (SD5-XCU-ERN-10) is applied, adding to the OUTPUT FILES section and also adding associated RATIONALE.

Austin Group Interpretation 1003.1-2001 #095 is applied, clarifying the **-l library** operand.

Austin Group Interpretation 1003.1-2001 #166 is applied.

Austin Group Interpretation 1003.1-2001 #190 is applied, clarifying the handling of trailing white-space characters.

Austin Group Interpretation 1003.1-2001 #191 is applied, adding APPLICATION USAGE and RATIONALE regarding C-language trigraphs.

SD5-XCU-ERN-6 is applied, clarifying that Guideline 9 of the Utility Syntax Guidelines does not apply (options can be interspersed with operands).

SD5-XCU-ERN-11 is applied, adding the **<net/if.h>** header to the descriptions of **-l c** and **-l xnet**.

SD5-XCU-ERN-65 is applied, updating the EXAMPLES section.

SD5-XCU-ERN-67 and SD5-XCU-ERN-97 are applied, updating the SYNOPSIS.

SD5-XCU-ERN-133 is applied, updating the EXTENDED DESCRIPTION.

The *getconf* variables for the supported programming environments are updated to be V7.

The **-l trace** operand is marked obsolescent.

The *c99* reference page is rewritten to describe **-l** as an option rather than an operand.

POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0068 [129], XCU/TC1-2008/0069 + [187], XCU/TC1-2008/0070 [187], XCU/TC1-2008/0071 [131], XCU/TC1-2008/0072 [187], and + XCU/TC1-2008/0073 [364,430] are applied.

81347 **NAME**

81348 cal — print a calendar

81349 **SYNOPSIS**81350 XSI cal **[** [*month*] *year* **]**81351 **DESCRIPTION**

81352 The *cal* utility shall write a calendar to standard output using the Julian calendar for dates from  
 81353 January 1, 1 through September 2, 1752 and the Gregorian calendar for dates from September 14,  
 81354 1752 through December 31, 9999 as though the Gregorian calendar had been adopted on  
 81355 September 14, 1752.

81356 If no operands are given, *cal* shall produce a one-month calendar for the current month in the +  
 81357 current year. If only the *year* operand is given, *cal* shall produce a calendar for all twelve months +  
 81358 in the given calendar year. If both *month* and *year* operands are given, *cal* shall produce a one- +  
 81359 month calendar for the given month in the given year.

81360 **OPTIONS**

81361 None.

81362 **OPERANDS**

81363 The following operands shall be supported:

81364 *month* Specify the month to be displayed, represented as a decimal integer from 1 |  
 81365 (January) to 12 (December).

81366 *year* Specify the year for which the calendar is displayed, represented as a decimal |  
 81367 integer from 1 to 9999.

81368 **STDIN**

81369 Not used.

81370 **INPUT FILES**

81371 None.

81372 **ENVIRONMENT VARIABLES**81373 The following environment variables shall affect the execution of *cal*:

81374 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 81375 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 81376 variables used to determine the values of locale categories.)

81377 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 81378 internationalization variables.

81379 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 81380 characters (for example, single-byte as opposed to multi-byte characters in  
 81381 arguments).

81382 *LC\_MESSAGES*

81383 Determine the locale that should be used to affect the format and contents of  
 81384 diagnostic messages written to standard error, and informative messages written  
 81385 to standard output.

81386 *LC\_TIME* Determine the format and contents of the calendar.

81387 *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

81388            *TZ*            Determine the timezone used to calculate the value of the current month.

81389    **ASYNCHRONOUS EVENTS**

81390            Default.

81391    **STDOUT**

81392            The standard output shall be used to display the calendar, in an unspecified format.

81393    **STDERR**

81394            The standard error shall be used only for diagnostic messages.

81395    **OUTPUT FILES**

81396            None.

81397    **EXTENDED DESCRIPTION**

81398            None.

81399    **EXIT STATUS**

81400            The following exit values shall be returned:

81401            0    Successful completion.

81402            >0   An error occurred.

81403    **CONSEQUENCES OF ERRORS**

81404            Default.

81405    **APPLICATION USAGE**

81406            Note that:

81407            `cal 83`

81408            refers to A.D. 83, not 1983.

81409    **EXAMPLES**

81410            None.

81411    **RATIONALE**

81412            Earlier versions of this standard incorrectly required that the command:

81413            `cal 2000`

81414            write a one-month calendar for the current calendar month (no matter what the current year is)

81415            in the year 2000 to standard output. This did not match historic practice in any known version of

81416            the *cal* utility. The description has been updated to match historic practice. When only the *year*

81417            operand is given, *cal* writes a twelve-month calendar for the specified year.

81418    **FUTURE DIRECTIONS**

81419            A future version of this standard may support locale-specific recognition of the date of adoption

81420            of the Gregorian calendar.

81421    **SEE ALSO**

81422            XBD [Chapter 8](#) (on page 173)

81423    **CHANGE HISTORY**

81424            First released in Issue 2.

81425    **Issue 6**

81426            The DESCRIPTION is updated to allow for traditional behavior for years before the adoption of

81427            the Gregorian calendar.

81428 **Issue 7**

81429 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

81430 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0074 [56] and XCU/TC1-2008/0075 +  
81431 [56] are applied.

81432 **NAME**

81433       cat — concatenate and print files

81434 **SYNOPSIS**81435       cat [-u] [*file*...]81436 **DESCRIPTION**81437       The *cat* utility shall read files in sequence and shall write their contents to the standard output in  
81438       the same sequence.81439 **OPTIONS**81440       The *cat* utility shall conform to XBD [Section 12.2](#) (on page 215).

81441       The following option shall be supported:

81442       -u           Write bytes from the input file to the standard output without delay as each is  
81443       read.81444 **OPERANDS**

81445       The following operand shall be supported:

81446       *file*        A pathname of an input file. If no *file* operands are specified, the standard input  
81447       shall be used. If a *file* is '-', the *cat* utility shall read from the standard input at  
81448       that point in the sequence. The *cat* utility shall not close and reopen standard input  
81449       when it is referenced in this way, but shall accept multiple occurrences of '-' as a  
81450       *file* operand.81451 **STDIN**81452       The standard input shall be used only if no *file* operands are specified, or if a *file* operand is '-'.  
81453       See the INPUT FILES section.81454 **INPUT FILES**

81455       The input files can be any file type.

81456 **ENVIRONMENT VARIABLES**81457       The following environment variables shall affect the execution of *cat*:81458       LANG        Provide a default value for the internationalization variables that are unset or null.  
81459       (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
81460       variables used to determine the values of locale categories.)81461       LC\_ALL      If set to a non-empty string value, override the values of all the other  
81462       internationalization variables.81463       LC\_CTYPE    Determine the locale for the interpretation of sequences of bytes of text data as  
81464       characters (for example, single-byte as opposed to multi-byte characters in  
81465       arguments).

81466       LC\_MESSAGES

81467       Determine the locale that should be used to affect the format and contents of  
81468       diagnostic messages written to standard error.

81469 XSI       NLSPATH   Determine the location of message catalogs for the processing of LC\_MESSAGES.

81470 **ASYNCHRONOUS EVENTS**

81471       Default.

**81472 STDOUT**

81473 The standard output shall contain the sequence of bytes read from the input files. Nothing else  
81474 shall be written to the standard output.

**81475 STDERR**

81476 The standard error shall be used only for diagnostic messages.

**81477 OUTPUT FILES**

81478 None.

**81479 EXTENDED DESCRIPTION**

81480 None.

**81481 EXIT STATUS**

81482 The following exit values shall be returned:

81483 0 All input files were output successfully.

81484 >0 An error occurred.

**81485 CONSEQUENCES OF ERRORS**

81486 Default.

**81487 APPLICATION USAGE**

81488 The **-u** option has value in prototyping non-blocking reads from FIFOs. The intent is to support  
81489 the following sequence:

```
81490 mkfifo foo
81491 cat -u foo > /dev/tty13 &
81492 cat -u > foo
```

81493 It is unspecified whether standard output is or is not buffered in the default case. This is  
81494 sometimes of interest when standard output is associated with a terminal, since buffering may  
81495 delay the output. The presence of the **-u** option guarantees that unbuffered I/O is available. It is  
81496 implementation-defined whether the *cat* utility buffers output if the **-u** option is not specified.  
81497 Traditionally, the **-u** option is implemented using the equivalent of the *setvbuf()* function  
81498 defined in the System Interfaces volume of POSIX.1-2008.

**81499 EXAMPLES**

81500 The following command:

```
81501 cat myfile
```

81502 writes the contents of the file **myfile** to standard output.

81503 The following command:

```
81504 cat doc1 doc2 > doc.all
```

81505 concatenates the files **doc1** and **doc2** and writes the result to **doc.all**.

81506 Because of the shell language mechanism used to perform output redirection, a command such  
81507 as this:

```
81508 cat doc doc.end > doc
```

81509 causes the original data in **doc** to be lost.

81510 The command:

```
81511 cat start - middle - end > file
```

81512 when standard input is a terminal, gets two arbitrary pieces of input from the terminal with a

single invocation of *cat*. Note, however, that if standard input is a regular file, this would be equivalent to the command:

```
cat start - middle /dev/null end > file
```

because the entire contents of the file would be consumed by *cat* the first time '-' was used as a *file* operand and an end-of-file condition would be detected immediately when '-' was referenced the second time.

## RATIONALE

Historical versions of the *cat* utility include the *-e*, *-t*, and *-v*, options which permit the ends of lines, <tab> characters, and invisible characters, respectively, to be rendered visible in the output. The standard developers omitted these options because they provide too fine a degree of control over what is made visible, and similar output can be obtained using a command such as:

```
sed -n l pathname
```

The latter also has the advantage that its output is unambiguous, whereas the output of historical *cat -etv* is not.

The *-s* option was omitted because it corresponds to different functions in BSD and System V-based systems. The BSD *-s* option to squeeze blank lines can be accomplished by the shell script shown in the following example:

```
sed -n '
Write non-empty lines.
./ {
 p
 d
}
Write a single empty line, then look for more empty lines.
/^$/ p
Get next line, discard the held <newline> (empty line),
and look for more empty lines.
:Empty
/^$/ {
 N
 s/./ /
 b Empty
}
Write the non-empty line before going back to search
for the first in a set of empty lines.
p
'
```

The System V *-s* option to silence error messages can be accomplished by redirecting the standard error. Note that the BSD documentation for *cat* uses the term "blank line" to mean the same as the POSIX "empty line": a line consisting only of a <newline>.

The BSD *-n* option was omitted because similar functionality can be obtained from the *-n* option of the *pr* utility.

## FUTURE DIRECTIONS

None.

81557 **SEE ALSO**81558 [more](#)81559 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)81560 XSH [setvbuf\(\)](#)81561 **CHANGE HISTORY**

81562 First released in Issue 2.

81563 **Issue 7**

81564 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

81565 SD5-XCU-ERN-174 is applied, changing the RATIONALE.

**NAME**

cd — change the working directory

**SYNOPSIS**

cd [-L|-P] [*directory*]

cd -

**DESCRIPTION**

The *cd* utility shall change the working directory of the current shell execution environment (see [Section 2.12](#), on page 2353) by executing the following steps in sequence. (In the following steps, the symbol **curpath** represents an intermediate value used to simplify the description of the algorithm used by *cd*. There is no requirement that **curpath** be made visible to the application.)

1. If no *directory* operand is given and the *HOME* environment variable is empty or undefined, the default behavior is implementation-defined and no further steps shall be taken.
2. If no *directory* operand is given and the *HOME* environment variable is set to a non-empty value, the *cd* utility shall behave as if the directory named in the *HOME* environment variable was specified as the *directory* operand.
3. If the *directory* operand begins with a <slash> character, set **curpath** to the operand and proceed to step 7.
4. If the first component of the *directory* operand is dot or dot-dot, proceed to step 6.
5. Starting with the first pathname in the <colon>-separated pathnames of *CDPATH* (see the ENVIRONMENT VARIABLES section) if the pathname is non-null, test if the concatenation of that pathname, a <slash> character if that pathname did not end with a <slash> character, and the *directory* operand names a directory. If the pathname is null, test if the concatenation of dot, a <slash> character, and the operand names a directory. In either case, if the resulting string names an existing directory, set **curpath** to that string and proceed to step 7. Otherwise, repeat this step with the next pathname in *CDPATH* until all pathnames have been tested.
6. Set **curpath** to the *directory* operand.
7. If the *-P* option is in effect, proceed to step 10. If **curpath** does not begin with a <slash> character, set **curpath** to the string formed by the concatenation of the value of *PWD*, a <slash> character if the value of *PWD* did not end with a <slash> character, and **curpath**.
8. The **curpath** value shall then be converted to canonical form as follows, considering each component from beginning to end, in sequence:
  - a. Dot components and any <slash> characters that separate them from the next component shall be deleted.
  - b. For each dot-dot component, if there is a preceding component and it is neither root nor dot-dot, then:
    - i. If the preceding component does not refer (in the context of pathname resolution with symbolic links followed) to a directory, then the *cd* utility shall display an appropriate error message and no further steps shall be taken.
    - ii. The preceding component, all <slash> characters separating the preceding component from dot-dot, dot-dot, and all <slash> characters separating dot-dot from the following component (if any) shall be deleted.

- 81610 c. An implementation may further simplify **curpath** by removing any trailing  
 81611 <slash> characters that are not also leading <slash> characters, replacing multiple  
 81612 non-leading consecutive <slash> characters with a single <slash>, and replacing  
 81613 three or more leading <slash> characters with a single <slash>. If, as a result of  
 81614 this canonicalization, the **curpath** variable is null, no further steps shall be taken.
- 81615 9. If **curpath** is longer than {PATH\_MAX} bytes (including the terminating null) and the  
 81616 *directory* operand was not longer than {PATH\_MAX} bytes (including the terminating  
 81617 null), then **curpath** shall be converted from an absolute pathname to an equivalent  
 81618 relative pathname if possible. This conversion shall always be considered possible if the  
 81619 value of *PWD*, with a trailing <slash> added if it does not already have one, is an initial  
 81620 substring of **curpath**. Whether or not it is considered possible under other circumstances  
 81621 is unspecified. Implementations may also apply this conversion if **curpath** is not longer  
 81622 than {PATH\_MAX} bytes or the *directory* operand was longer than {PATH\_MAX} bytes.
- 81623 10. The *cd* utility shall then perform actions equivalent to the *chdir()* function called with  
 81624 **curpath** as the *path* argument. If these actions fail for any reason, the *cd* utility shall  
 81625 display an appropriate error message and the remainder of this step shall not be  
 81626 executed. If the **-P** option is not in effect, the *PWD* environment variable shall be set to  
 81627 the value that **curpath** had on entry to step 9 (i.e., before conversion to a relative  
 81628 pathname). If the **-P** option is in effect, the *PWD* environment variable shall be set to the  
 81629 string that would be output by *pwd -P*. If there is insufficient permission on the new  
 81630 directory, or on any parent of that directory, to determine the current working directory,  
 81631 the value of the *PWD* environment variable is unspecified.

81632 If, during the execution of the above steps, the *PWD* environment variable is set, the *OLDPWD* |  
 81633 environment variable shall also be set to the value of the old working directory (that is the  
 81634 current working directory immediately prior to the call to *cd*).

## 81635 OPTIONS

81636 The *cd* utility shall conform to XBD [Section 12.2](#) (on page 215).

81637 The following options shall be supported by the implementation:

- 81638 **-L** Handle the operand dot-dot logically; symbolic link components shall not be  
 81639 resolved before dot-dot components are processed (see steps 8. and 9. in the  
 81640 DESCRIPTION).
- 81641 **-P** Handle the operand dot-dot physically; symbolic link components shall be  
 81642 resolved before dot-dot components are processed (see step 7. in the  
 81643 DESCRIPTION).

81644 If both **-L** and **-P** options are specified, the last of these options shall be used and all others  
 81645 ignored. If neither **-L** nor **-P** is specified, the operand shall be handled dot-dot logically; see the  
 81646 DESCRIPTION.

## 81647 OPERANDS

81648 The following operands shall be supported:

- 81649 *directory* An absolute or relative pathname of the directory that shall become the new  
 81650 working directory. The interpretation of a relative pathname by *cd* depends on the  
 81651 **-L** option and the *CDPATH* and *PWD* environment variables. If *directory* is an  
 81652 empty string, the results are unspecified.
- 81653 **-** When a <hyphen> is used as the operand, this shall be equivalent to the command:  
 81654 `cd "$OLDPWD" && pwd`

81655 which changes to the previous working directory and then writes its name.

#### 81656 STDIN

81657 Not used.

#### 81658 INPUT FILES

81659 None.

#### 81660 ENVIRONMENT VARIABLES

81661 The following environment variables shall affect the execution of *cd*:

81662 *CDPATH* A <colon>-separated list of pathnames that refer to directories. The *cd* utility shall  
81663 use this list in its attempt to change the directory, as described in the  
81664 DESCRIPTION. An empty string in place of a directory pathname represents the  
81665 current directory. If *CDPATH* is not set, it shall be treated as if it were an empty  
81666 string.

81667 *HOME* The name of the directory, used when no *directory* operand is specified.

81668 *LANG* Provide a default value for the internationalization variables that are unset or null.  
81669 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
81670 variables used to determine the values of locale categories.)

81671 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
81672 internationalization variables.

81673 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
81674 characters (for example, single-byte as opposed to multi-byte characters in  
81675 arguments).

81676 *LC\_MESSAGES*

81677 Determine the locale that should be used to affect the format and contents of  
81678 diagnostic messages written to standard error.

81679 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

81680 *OLDPWD* A pathname of the previous working directory, used by *cd -*.

81681 *PWD* This variable shall be set as specified in the DESCRIPTION. If an application sets  
81682 or unsets the value of *PWD*, the behavior of *cd* is unspecified.

#### 81683 ASYNCHRONOUS EVENTS

81684 Default.

#### 81685 STDOUT

81686 If a non-empty directory name from *CDPATH* is used, or if *cd -* is used, an absolute pathname of  
81687 the new working directory shall be written to the standard output as follows:

81688 "%s\n", <new directory>

81689 Otherwise, there shall be no output.

#### 81690 STDERR

81691 The standard error shall be used only for diagnostic messages.

#### 81692 OUTPUT FILES

81693 None.

81694 **EXTENDED DESCRIPTION**

81695 None.

81696 **EXIT STATUS**

81697 The following exit values shall be returned:

81698 0 The directory was successfully changed.

81699 &gt;0 An error occurred.

81700 **CONSEQUENCES OF ERRORS**

81701 The working directory shall remain unchanged.

81702 **APPLICATION USAGE**81703 Since *cd* affects the current shell execution environment, it is always provided as a shell regular  
81704 built-in. If it is called in a subshell or separate utility execution environment, such as one of the  
81705 following:81706 (cd /tmp)  
81707 nohup cd  
81708 find . -exec cd {} \;

81709 it does not affect the working directory of the caller's environment.

81710 The user must have execute (search) permission in *directory* in order to change to it.81711 **EXAMPLES**81712 The following template can be used to perform processing in the directory specified by *location* |  
81713 and end up in the current working directory in use before the first *cd* command was issued: |81714 cd *location* |  
81715 if [ \$? -ne 0 ] |  
81716 then |  
81717 print error message |  
81718 exit 1 |  
81719 fi |  
81720 ... do whatever is desired as long as the OLDPWD environment variable |  
81721 is not modified |  
81722 cd - |81723 **RATIONALE**81724 The use of the *CDPATH* was introduced in the System V shell. Its use is analogous to the use of  
81725 the *PATH* variable in the shell. The BSD C shell used a shell parameter *cdpath* for this purpose.81726 A common extension when *HOME* is undefined is to get the login directory from the user  
81727 database for the invoking user. This does not occur on System V implementations.81728 Some historical shells, such as the KornShell, took special actions when the directory name  
81729 contained a dot-dot component, selecting the logical parent of the directory, rather than the  
81730 actual parent directory; that is, it moved up one level toward the '/' in the pathname,  
81731 remembering what the user typed, rather than performing the equivalent of:

81732 chdir("../");

81733 In such a shell, the following commands would not necessarily produce equivalent output for all  
81734 directories:

81735 cd .. &amp;&amp; ls ls ..

81736 This behavior is now the default. It is not consistent with the definition of dot-dot in most

81737 historical practice; that is, while this behavior has been optionally available in the KornShell,  
 81738 other shells have historically not supported this functionality. The logical pathname is stored in  
 81739 the *PWD* environment variable when the *cd* utility completes and this value is used to construct  
 81740 the next directory name if *cd* is invoked with the *-L* option.

#### 81741 FUTURE DIRECTIONS

81742 None.

#### 81743 SEE ALSO

81744 [Section 2.12](#) (on page 2353), *pwd*

81745 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)

81746 XSH *chdir()*

#### 81747 CHANGE HISTORY

81748 First released in Issue 2.

#### 81749 Issue 6

81750 The following new requirements on POSIX implementations derive from alignment with the  
 81751 Single UNIX Specification:

- 81752 • The *cd* *-* operand, *PWD*, and *OLDPWD* are added.

81753 The *-L* and *-P* options are added to align with the IEEE P1003.2b draft standard. This also  
 81754 includes the introduction of a new description to include the effect of these options.

81755 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/14 is applied, changing the SYNOPSIS to  
 81756 make it clear that the *-L* and *-P* options are mutually-exclusive.

#### 81757 Issue 7

81758 Austin Group Interpretation 1003.1-2001 #037 is applied.

81759 Austin Group Interpretation 1003.1-2001 #199 is applied, clarifying how the *cd* utility handles  
 81760 concatenation of two pathnames when the first pathname ends in a <slash> character.

81761 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

81762 Step 7 of the processing performed by *cd* is revised to refer to **curpath** instead of “the operand”.

81763 Changes to the *pwd* utility and *PWD* environment variable have been made to match the  
 81764 changes to the *getcwd()* function made for Austin Group Interpretation 1003.1-2001 #140.

81765 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0076 [230], XCU/TC1-2008/0077 +  
 81766 [240], XCU/TC1-2008/0078 [240], and XCU/TC1-2008/0079 [123] are applied.

81767 **NAME**81768 cflow — generate a C-language flowgraph (**DEVELOPMENT**)81769 **SYNOPSIS**

```
81770 XSI cflow [-r] [-d num] [-D name[=def]]... [-i incl] [-I dir]...
81771 [-U dir]... file...
```

81772 **DESCRIPTION**

81773 The *cflow* utility shall analyze a collection of object files or assembler, C-language, *lex*, or *yacc*  
 81774 source files, and attempt to build a graph, written to standard output, charting the external  
 81775 references.

81776 **OPTIONS**

81777 The *cflow* utility shall conform to XBD [Section 12.2](#) (on page 215), except that the order of the **-D**,  
 81778 **-I**, and **-U** options (which are identical to their interpretation by *c99*) is significant.

81779 The following options shall be supported:

- 81780 **-d num** Indicate the depth at which the flowgraph is cut off. The application shall ensure  
 81781 that the argument *num* is a decimal integer. By default this is a very large number  
 81782 (typically greater than 32 000). Attempts to set the cut-off depth to a non-positive  
 81783 integer shall be ignored.
- 81784 **-i incl** Increase the number of included symbols. The *incl* option-argument is one of the  
 81785 following characters:
- 81786 *x* Include external and static data symbols. The default shall be to include only  
 81787 functions in the flowgraph.
- 81788 *\_* (Underscore) Include names that begin with an <underscore>. The default  
 81789 shall be to exclude these functions (and data if **-i x** is used).
- 81790 **-r** Reverse the caller: callee relationship, producing an inverted listing showing the  
 81791 callers of each function. The listing shall also be sorted in lexicographical order by  
 81792 callee.

81793 **OPERANDS**

81794 The following operand is supported:

- 81795 *file* The pathname of a file for which a graph is to be generated. Filenames suffixed by  
 81796 **.l** shall be taken to be *lex* input, **.y** as *yacc* input, **.c** as *c99* input, and **.i** as the  
 81797 output of *c99* **-E**. Such files shall be processed as appropriate, determined by their  
 81798 suffix.
- 81799 Files suffixed by **.s** (conventionally assembler source) may have more limited  
 81800 information extracted from them.

81801 **STDIN**

81802 Not used.

81803 **INPUT FILES**

81804 The input files shall be object files or assembler, C-language, *lex*, or *yacc* source files.

81805 **ENVIRONMENT VARIABLES**

81806 The following environment variables shall affect the execution of *cflow*:

- 81807 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 81808 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 81809 variables used to determine the values of locale categories.)

81810 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 81811 internationalization variables.

81812 *LC\_COLLATE*  
 81813 Determine the locale for the ordering of the output when the *-r* option is used.

81814 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 81815 characters (for example, single-byte as opposed to multi-byte characters in  
 81816 arguments and input files).

81817 *LC\_MESSAGES*  
 81818 Determine the locale that should be used to affect the format and contents of  
 81819 diagnostic messages written to standard error.

81820 *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

81821 **ASYNCHRONOUS EVENTS**  
 81822 Default.

81823 **STDOUT**  
 81824 The flowgraph written to standard output shall be formatted as follows:  
 81825 "%d %s:%s\n", <reference number>, <global>, <definition>

81826 Each line of output begins with a reference (that is, line) number, followed by indentation of at  
 81827 least one column position per level. This is followed by the name of the global, a <colon>, and  
 81828 its definition. Normally globals are only functions not defined as an external or beginning with  
 81829 an <underscore>; see the **OPTIONS** section for the *-i* inclusion option. For information extracted  
 81830 from C-language source, the definition consists of an abstract type declaration (for example, **char**  
 81831 \*) and, delimited by angle brackets, the name of the source file and the line number where the  
 81832 definition was found. Definitions extracted from object files indicate the filename and location  
 81833 counter under which the symbol appeared (for example, *text*).

81834 Once a definition of a name has been written, subsequent references to that name contain only  
 81835 the reference number of the line where the definition can be found. For undefined references,  
 81836 only "<>" shall be written.

81837 **STDERR**  
 81838 The standard error shall be used only for diagnostic messages.

81839 **OUTPUT FILES**  
 81840 None.

81841 **EXTENDED DESCRIPTION**  
 81842 None.

81843 **EXIT STATUS**  
 81844 The following exit values shall be returned:  
 81845 0 Successful completion.  
 81846 >0 An error occurred.

81847 **CONSEQUENCES OF ERRORS**  
 81848 Default.

**APPLICATION USAGE**

Files produced by *lex* and *yacc* cause the reordering of line number declarations, and this can confuse *cflow*. To obtain proper results, the input of *yacc* or *lex* must be directed to *cflow*.

**EXAMPLES**

Given the following in **file.c**:

```
int i;
int f();
int g();
int h();
int
main()
{
 f();
 g();
 f();
}
int
f()
{
 i = h();
}
```

The command:

```
cflow -i x file.c
```

produces the output:

```
1 main: int(), <file.c 6>
2 f: int(), <file.c 13>
3 h: <>
4 i: int, <file.c 1>
5 g: <>
```

**RATIONALE**

None.

**FUTURE DIRECTIONS**

None.

XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)

**CHANGE HISTORY**

First released in Issue 2.

**Issue 6**

The normative text is reworded to avoid use of the term “must” for application requirements.

**Issue 7**

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

81891 **NAME**

81892       chgrp — change the file group ownership

81893 **SYNOPSIS**

81894       chgrp [-h] group file...

81895       chgrp -R [-H|-L|-P] group file...

81896 **DESCRIPTION**81897       The *chgrp* utility shall set the group ID of the file named by each *file* operand to the group ID  
81898       specified by the *group* operand.81899       For each *file* operand, or, if the **-R** option is used, each file encountered while walking the  
81900       directory trees specified by the *file* operands, the *chgrp* utility shall perform actions equivalent to  
81901       the *chown()* function defined in the System Interfaces volume of POSIX.1-2008, called with the  
81902       following arguments:

- 81903
- The *file* operand shall be used as the *path* argument.
  - 81904       • The user ID of the file shall be used as the *owner* argument.
  - 81905       • The specified group ID shall be used as the *group* argument.

81906       Unless *chgrp* is invoked by a process with appropriate privileges, the set-user-ID and set-group-  
81907       ID bits of a regular file shall be cleared upon successful completion; the set-user-ID and set-  
81908       group-ID bits of other file types may be cleared.81909 **OPTIONS**81910       The *chgrp* utility shall conform to XBD [Section 12.2](#) (on page 215).

81911       The following options shall be supported by the implementation:

- 81912
- h**
- For each
- file*
- operand that names a file of type symbolic link,
- chgrp*
- shall attempt to |
- 
- 81913       set the group ID of the symbolic link instead of the file referenced by the symbolic |
- 
- 81914       link.
- 
- 81915
- H**
- If the
- R**
- option is specified and a symbolic link referencing a file of type directory
- 
- 81916       is specified on the command line,
- chgrp*
- shall change the group of the directory
- 
- 81917       referenced by the symbolic link and all files in the file hierarchy below it.
- 
- 81918
- L**
- If the
- R**
- option is specified and a symbolic link referencing a file of type directory
- 
- 81919       is specified on the command line or encountered during the traversal of a file
- 
- 81920       hierarchy,
- chgrp*
- shall change the group of the directory referenced by the symbolic
- 
- 81921       link and all files in the file hierarchy below it.
- 
- 81922
- P**
- If the
- R**
- option is specified and a symbolic link is specified on the command line
- 
- 81923       or encountered during the traversal of a file hierarchy,
- chgrp*
- shall change the group |
- 
- 81924       ID of the symbolic link. The
- chgrp*
- utility shall not follow the symbolic link to any
- 
- 81925       other part of the file hierarchy.
- 
- 81926
- R**
- Recursively change file group IDs. For each
- file*
- operand that names a directory,
- 
- 81927
- chgrp*
- shall change the group of the directory and all files in the file hierarchy
- 
- 81928       below it. Unless a
- H**
- ,
- L**
- , or
- P**
- option is specified, it is unspecified which of these
- 
- 81929       options will be used as the default.

81930       Specifying more than one of the mutually-exclusive options **-H**, **-L**, and **-P** shall not be  
81931       considered an error. The last option specified shall determine the behavior of the utility.

81932 **OPERANDS**

81933 The following operands shall be supported:

81934 *group* A group name from the group database or a numeric group ID. Either specifies a  
 81935 group ID to be given to each file named by one of the *file* operands. If a numeric  
 81936 *group* operand exists in the group database as a group name, the group ID number  
 81937 associated with that group name is used as the group ID.

81938 *file* A pathname of a file whose group ID is to be modified.

81939 **STDIN**

81940 Not used.

81941 **INPUT FILES**

81942 None.

81943 **ENVIRONMENT VARIABLES**81944 The following environment variables shall affect the execution of *chgrp*:

81945 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 81946 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 81947 variables used to determine the values of locale categories.)

81948 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 81949 internationalization variables.

81950 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 81951 characters (for example, single-byte as opposed to multi-byte characters in  
 81952 arguments).

81953 *LC\_MESSAGES*

81954 Determine the locale that should be used to affect the format and contents of  
 81955 diagnostic messages written to standard error.

81956 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

81957 **ASYNCHRONOUS EVENTS**

81958 Default.

81959 **STDOUT**

81960 Not used.

81961 **STDERR**

81962 The standard error shall be used only for diagnostic messages.

81963 **OUTPUT FILES**

81964 None.

81965 **EXTENDED DESCRIPTION**

81966 None.

81967 **EXIT STATUS**

81968 The following exit values shall be returned:

81969 0 The utility executed successfully and all requested changes were made.

81970 &gt;0 An error occurred.

81971 **CONSEQUENCES OF ERRORS**

81972 Default.

81973 **APPLICATION USAGE**81974 Only the owner of a file or the user with appropriate privileges may change the owner or group  
81975 of a file.81976 Some implementations restrict the use of *chgrp* to a user with appropriate privileges when the  
81977 *group* specified is not the effective group ID or one of the supplementary group IDs of the calling  
81978 process.81979 **EXAMPLES**

81980 None.

81981 **RATIONALE**81982 The System V and BSD versions use different exit status codes. Some implementations used the  
81983 exit status as a count of the number of errors that occurred; this practice is unworkable since it  
81984 can overflow the range of valid exit status values. The standard developers chose to mask these  
81985 by specifying only 0 and >0 as exit values.81986 The functionality of *chgrp* is described substantially through references to *chown()*. In this way,  
81987 there is no duplication of effort required for describing the interactions of permissions, multiple  
81988 groups, and so on.81989 **FUTURE DIRECTIONS**

81990 None.

81991 **SEE ALSO**81992 *chmod*, *chown*81993 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)81994 XSH *chown()*81995 **CHANGE HISTORY**

81996 First released in Issue 2.

81997 **Issue 6**81998 New options **-H**, **-L**, and **-P** are added to align with the IEEE P1003.2b draft standard. These  
81999 options affect the processing of symbolic links.82000 IEEE PASC Interpretation 1003.2 #172 is applied, changing the CONSEQUENCES OF ERRORS  
82001 section to "Default."82002 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/15 is applied, changing the SYNOPSIS to  
82003 make it clear that **-h** and **-R** are optional.82004 **Issue 7**82005 SD5-XCU-ERN-8 is applied, removing the **-R** from the first line of the SYNOPSIS.

82006 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

82007 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0080 [237,341] is applied.

+

82008 **NAME**

82009        chmod — change the file modes

82010 **SYNOPSIS**

82011        chmod [-R] *mode file...*

82012 **DESCRIPTION**

82013        The *chmod* utility shall change any or all of the file mode bits of the file named by each *file*  
82014        operand in the way specified by the *mode* operand.

82015        It is implementation-defined whether and how the *chmod* utility affects any alternate or  
82016        additional file access control mechanism (see XBD [Section 4.4](#), on page 108) being used for the  
82017        specified file.

82018        Only a process whose effective user ID matches the user ID of the file, or a process with  
82019        appropriate privileges, shall be permitted to change the file mode bits of a file.

82020        Upon successfully changing the file mode bits of a file, the *chmod* utility shall mark for update  
82021        the last file status change timestamp of the file.

82022 **OPTIONS**

82023        The *chmod* utility shall conform to XBD [Section 12.2](#) (on page 215).

82024        The following option shall be supported:

82025        **-R**        Recursively change file mode bits. For each *file* operand that names a directory,  
82026        *chmod* shall change the file mode bits of the directory and all files in the file  
82027        hierarchy below it.

82028 **OPERANDS**

82029        The following operands shall be supported:

82030        *mode*        Represents the change to be made to the file mode bits of each file named by one of  
82031        the *file* operands; see the EXTENDED DESCRIPTION section.

82032        *file*        A pathname of a file whose file mode bits shall be modified.

82033 **STDIN**

82034        Not used.

82035 **INPUT FILES**

82036        None.

82037 **ENVIRONMENT VARIABLES**

82038        The following environment variables shall affect the execution of *chmod*:

82039        *LANG*        Provide a default value for the internationalization variables that are unset or null.  
82040        (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
82041        variables used to determine the values of locale categories.)

82042        *LC\_ALL*        If set to a non-empty string value, override the values of all the other  
82043        internationalization variables.

82044        *LC\_CTYPE*     Determine the locale for the interpretation of sequences of bytes of text data as  
82045        characters (for example, single-byte as opposed to multi-byte characters in  
82046        arguments).

82047        *LC\_MESSAGES*

82048        Determine the locale that should be used to affect the format and contents of  
82049        diagnostic messages written to standard error.

|       |     |                             |                                                                                                                                                        |
|-------|-----|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 82050 | XSI | <b>NLSPATH</b>              | Determine the location of message catalogs for the processing of <i>LC_MESSAGES</i> .                                                                  |
| 82051 |     | <b>ASYNCHRONOUS EVENTS</b>  |                                                                                                                                                        |
| 82052 |     |                             | Default.                                                                                                                                               |
| 82053 |     | <b>STDOUT</b>               |                                                                                                                                                        |
| 82054 |     |                             | Not used.                                                                                                                                              |
| 82055 |     | <b>STDERR</b>               |                                                                                                                                                        |
| 82056 |     |                             | The standard error shall be used only for diagnostic messages.                                                                                         |
| 82057 |     | <b>OUTPUT FILES</b>         |                                                                                                                                                        |
| 82058 |     |                             | None.                                                                                                                                                  |
| 82059 |     | <b>EXTENDED DESCRIPTION</b> |                                                                                                                                                        |
| 82060 |     |                             | The <i>mode</i> operand shall be either a <i>symbolic_mode</i> expression or a non-negative octal integer. The                                         |
| 82061 |     |                             | <i>symbolic_mode</i> form is described by the grammar later in this section.                                                                           |
| 82062 |     |                             | Each <b>clause</b> shall specify an operation to be performed on the current file mode bits of each <i>file</i> .                                      |
| 82063 |     |                             | The operations shall be performed on each <i>file</i> in the order in which the <b>clauses</b> are specified.                                          |
| 82064 |     |                             | The <b>who</b> symbols <b>u</b> , <b>g</b> , and <b>o</b> shall specify the <i>user</i> , <i>group</i> , and <i>other</i> parts of the file mode bits, |
| 82065 |     |                             | respectively. A <b>who</b> consisting of the symbol <b>a</b> shall be equivalent to <b>ugo</b> .                                                       |
| 82066 |     |                             | The <b>perm</b> symbols <b>r</b> , <b>w</b> , and <b>x</b> represent the <i>read</i> , <i>write</i> , and <i>execute/search</i> portions of file mode  |
| 82067 |     |                             | bits, respectively. The <b>perm</b> symbol <b>s</b> shall represent the <i>set-user-ID-on-execution</i> (when <b>who</b>                               |
| 82068 |     |                             | contains or implies <b>u</b> ) and <i>set-group-ID-on-execution</i> (when <b>who</b> contains or implies <b>g</b> ) bits.                              |
| 82069 |     |                             | The <b>perm</b> symbol <b>X</b> shall represent the execute/search portion of the file mode bits if the file is a                                      |
| 82070 |     |                             | directory or if the current (unmodified) file mode bits have at least one of the execute bits                                                          |
| 82071 |     |                             | (S_IXUSR, S_IXGRP, or S_IXOTH) set. It shall be ignored if the file is not a directory and none of                                                     |
| 82072 |     |                             | the execute bits are set in the current file mode bits.                                                                                                |
| 82073 |     |                             | The <b>permcop</b> symbols <b>u</b> , <b>g</b> , and <b>o</b> shall represent the current permissions associated with the                              |
| 82074 |     |                             | user, group, and other parts of the file mode bits, respectively. For the remainder of this section,                                                   |
| 82075 |     |                             | <b>perm</b> refers to the non-terminals <b>perm</b> and <b>permcop</b> in the grammar.                                                                 |
| 82076 |     |                             | If multiple <b>actionlists</b> are grouped with a single <b>wholist</b> in the grammar, each <b>actionlist</b> shall be                                |
| 82077 |     |                             | applied in the order specified with that <b>wholist</b> . The <i>op</i> symbols shall represent the operation                                          |
| 82078 |     |                             | performed, as follows:                                                                                                                                 |
| 82079 |     | +                           | If <b>perm</b> is not specified, the '+' operation shall not change the file mode bits.                                                                |
| 82080 |     |                             | If <b>who</b> is not specified, the file mode bits represented by <b>perm</b> for the owner, group, and                                                |
| 82081 |     |                             | other permissions, except for those with corresponding bits in the file mode creation mask                                                             |
| 82082 |     |                             | of the invoking process, shall be set.                                                                                                                 |
| 82083 |     |                             | Otherwise, the file mode bits represented by the specified <b>who</b> and <b>perm</b> values shall be set.                                             |
| 82084 |     | -                           | If <b>perm</b> is not specified, the '-' operation shall not change the file mode bits.                                                                |
| 82085 |     |                             | If <b>who</b> is not specified, the file mode bits represented by <b>perm</b> for the owner, group, and                                                |
| 82086 |     |                             | other permissions, except for those with corresponding bits in the file mode creation mask                                                             |
| 82087 |     |                             | of the invoking process, shall be cleared.                                                                                                             |
| 82088 |     |                             | Otherwise, the file mode bits represented by the specified <b>who</b> and <b>perm</b> values shall be                                                  |
| 82089 |     |                             | cleared.                                                                                                                                               |
| 82090 |     | =                           | Clear the file mode bits specified by the <b>who</b> value, or, if no <b>who</b> value is specified, all of the                                        |
| 82091 |     |                             | file mode bits specified in this volume of POSIX.1-2008.                                                                                               |

If **perm** is not specified, the '=' operation shall make no further modifications to the file mode bits.

If **who** is not specified, the file mode bits represented by **perm** for the owner, group, and other permissions, except for those with corresponding bits in the file mode creation mask of the invoking process, shall be set.

Otherwise, the file mode bits represented by the specified **who** and **perm** values shall be set.

When using the symbolic mode form on a regular file, it is implementation-defined whether or not:

- Requests to set the set-user-ID-on-execution or set-group-ID-on-execution bit when all execute bits are currently clear and none are being set are ignored.
- Requests to clear all execute bits also clear the set-user-ID-on-execution and set-group-ID-on-execution bits.
- Requests to clear the set-user-ID-on-execution or set-group-ID-on-execution bits when all execute bits are currently clear are ignored. However, if the command *ls -l file* writes an *s* in the position indicating that the set-user-ID-on-execution or set-group-ID-on-execution is set, the commands *chmod u-s file* or *chmod g-s file*, respectively, shall not be ignored.

When using the symbolic mode form on other file types, it is implementation-defined whether or not requests to set or clear the set-user-ID-on-execution or set-group-ID-on-execution bits are honored.

If the **who** symbol **o** is used in conjunction with the **perm** symbol **s** with no other **who** symbols being specified, the set-user-ID-on-execution and set-group-ID-on-execution bits shall not be modified. It shall not be an error to specify the **who** symbol **o** in conjunction with the **perm** symbol **s**.

The **perm** symbol **t** shall specify the S\_ISVTX bit. When used with a file of type directory, it can be used with the **who** symbol **a**, or with no **who** symbol. It shall not be an error to specify a **who** symbol of **u**, **g**, or **o** in conjunction with the **perm** symbol **t**, but the meaning of these combinations is unspecified. The effect when using the **perm** symbol **t** with any file type other than directory is unspecified.

For an octal integer *mode* operand, the file mode bits shall be set absolutely.

For each bit set in the octal number, the corresponding file permission bit shown in the following table shall be set; all other file permission bits shall be cleared. For regular files, for each bit set in the octal number corresponding to the set-user-ID-on-execution or the set-group-ID-on-execution, bits shown in the following table shall be set; if these bits are not set in the octal number, they are cleared. For other file types, it is implementation-defined whether or not requests to set or clear the set-user-ID-on-execution or set-group-ID-on-execution bits are honored.

| Octal | Mode Bit | Octal | Mode Bit | Octal | Mode Bit | Octal | Mode Bit |
|-------|----------|-------|----------|-------|----------|-------|----------|
| 4000  | S_ISUID  | 0400  | S_IRUSR  | 0040  | S_IRGRP  | 0004  | S_IROTH  |
| 2000  | S_ISGID  | 0200  | S_IWUSR  | 0020  | S_IWGRP  | 0002  | S_IWOTH  |
| 1000  | S_ISVTX  | 0100  | S_IXUSR  | 0010  | S_IXGRP  | 0001  | S_IXOTH  |

When bits are set in the octal number other than those listed in the table above, the behavior is unspecified.

82134 **Grammar for chmod**

82135 The grammar and lexical conventions in this section describe the syntax for the *symbolic\_mode*  
 82136 operand. The general conventions for this style of grammar are described in [Section 1.3](#) (on page  
 82137 2309). A valid *symbolic\_mode* can be represented as the non-terminal symbol *symbolic\_mode* in  
 82138 the grammar. This formal syntax shall take precedence over the preceding text syntax  
 82139 description.

82140 The lexical processing is based entirely on single characters. Implementations need not allow  
 82141 <blank> characters within the single argument being processed.

82142 %start symbolic\_mode

82143 %%

82144 symbolic\_mode : clause  
 82145 | symbolic\_mode ',' clause  
 82146 ;

82147 clause : actionlist  
 82148 | wholist actionlist  
 82149 ;

82150 wholist : who  
 82151 | wholist who  
 82152 ;

82153 who : 'u' | 'g' | 'o' | 'a'  
 82154 ;

82155 actionlist : action  
 82156 | actionlist action  
 82157 ;

82158 action : op  
 82159 | op permlist  
 82160 | op permcopy  
 82161 ;

82162 permcopy : 'u' | 'g' | 'o'  
 82163 ;

82164 op : '+' | '-' | '='  
 82165 ;

82166 permlist : perm  
 82167 | perm permlist  
 82168 ;

82169 XSI perm : 'r' | 'w' | 'x' | 'X' | 's' | 't'  
 82170 ;

82171 **EXIT STATUS**

82172 The following exit values shall be returned:

82173 0 The utility executed successfully and all requested changes were made.

82174 >0 An error occurred.

## CONSEQUENCES OF ERRORS

Default.

## APPLICATION USAGE

Some implementations of the *chmod* utility change the mode of a directory before the files in the directory when performing a recursive (**-R** option) change; others change the directory mode after the files in the directory. If an application tries to remove read or search permission for a file hierarchy, the removal attempt fails if the directory is changed first; on the other hand, trying to re-enable permissions to a restricted hierarchy fails if directories are changed last. Users should not try to make a hierarchy inaccessible to themselves.

Some implementations of *chmod* never used the *umask* of the process when changing modes; systems conformant with this volume of POSIX.1-2008 do so when **who** is not specified. Note the difference between:

```
chmod a-w file
```

which removes all write permissions, and:

```
chmod -- -w file
```

which removes write permissions that would be allowed if **file** was created with the same *umask*.

Conforming applications should never assume that they know how the set-user-ID and set-group-ID bits on directories are interpreted.

## EXAMPLES

| Mode         | Results                                                                                            |
|--------------|----------------------------------------------------------------------------------------------------|
| <i>a+=</i>   | Equivalent to <i>a+,a=</i> ; clears all file mode bits.                                            |
| <i>go+-w</i> | Equivalent to <i>go+,go-w</i> ; clears group and other write bits.                                 |
| <i>g=o-w</i> | Equivalent to <i>g=o,g-w</i> ; sets group bit to match other bits and then clears group write bit. |
| <i>g-r+w</i> | Equivalent to <i>g-r,g+w</i> ; clears group read bit and sets group write bit.                     |
| <i>uo=g</i>  | Sets owner bits to match group bits and sets other bits to match group bits.                       |

## RATIONALE

The functionality of *chmod* is described substantially through references to concepts defined in the System Interfaces volume of POSIX.1-2008. In this way, there is less duplication of effort required for describing the interactions of permissions. However, the behavior of this utility is not described in terms of the *chmod()* function from the System Interfaces volume of POSIX.1-2008 because that specification requires certain side-effects upon alternate file access control mechanisms that might not be appropriate, depending on the implementation.

Implementations that support mandatory file and record locking as specified by the 1984 /usr/group standard historically used the combination of set-group-ID bit set and group execute bit clear to indicate mandatory locking. This condition is usually set or cleared with the symbolic mode **perm** symbol **l** instead of the **perm** symbols **s** and **x** so that the mandatory locking mode is not changed without explicit indication that that was what the user intended. Therefore, the details on how the implementation treats these conditions must be defined in the documentation. This volume of POSIX.1-2008 does not require mandatory locking (nor does the System Interfaces volume of POSIX.1-2008), but does allow it as an extension. However, this volume of POSIX.1-2008 does require that the *ls* and *chmod* utilities work consistently in this

area. If *ls -l file* indicates that the set-group-ID bit is set, *chmod g-s file* must clear it (assuming appropriate privileges exist to change modes).

The System V and BSD versions use different exit status codes. Some implementations used the exit status as a count of the number of errors that occurred; this practice is unworkable since it can overflow the range of valid exit status values. This problem is avoided here by specifying only 0 and >0 as exit values.

The System Interfaces volume of POSIX.1-2008 indicates that implementation-defined restrictions may cause the S\_ISUID and S\_ISGID bits to be ignored. This volume of POSIX.1-2008 allows the *chmod* utility to choose to modify these bits before calling *chmod()* (or some function providing equivalent capabilities) for non-regular files. Among other things, this allows implementations that use the set-user-ID and set-group-ID bits on directories to enable extended features to handle these extensions in an intelligent manner.

The **X perm** symbol was adopted from BSD-based systems because it provides commonly desired functionality when doing recursive (**-R** option) modifications. Similar functionality is not provided by the *find* utility. Historical BSD versions of *chmod*, however, only supported **X** with *op+*; it has been extended in this volume of POSIX.1-2008 because it is also useful with *op=*. (It has also been added for *op-* even though it duplicates **x**, in this case, because it is intuitive and easier to explain.)

The grammar was extended with the *permcopy* non-terminal to allow historical-practice forms of symbolic modes like **o=u -g** (that is, set the “other” permissions to the permissions of “owner” minus the permissions of “group”).

## FUTURE DIRECTIONS

None.

## CHANGE HISTORY

First released in Issue 2.

## Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- Octal modes have been kept and made mandatory despite being marked obsolescent in the ISO POSIX-2: 1993 standard.

IEEE PASC Interpretation 1003.2 #172 is applied, changing the CONSEQUENCES OF ERRORS section to “Default.”.

The Open Group Base Resolution bwg2001-010 is applied, adding the description of the S\_ISVTX bit and the **t perm** symbol as part of the XSI option.

IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/16 is applied, changing the XSI shaded text in the EXTENDED DESCRIPTION from:

“The **perm** symbol **t** shall specify the S\_ISVTX bit and shall apply to directories only. The effect when using it with any other file type is unspecified. It can be used with the **who** symbols **o**, **a**, or with no **who** symbol. It shall not be an error to specify a **who** symbol of **u** or **g** in conjunction with the **perm** symbol **t**; it shall be ignored for **u** and **g**.”

82265 to:  
82266 “The **perm** symbol **t** shall specify the S\_ISVTX bit. When used with a file of type directory,  
82267 it can be used with the **who** symbol **a**, or with no **who** symbol. It shall not be an error to  
82268 specify a **who** symbol of **u**, **g**, or **o** in conjunction with the **perm** symbol **t**, but the meaning  
82269 of these combinations is unspecified. The effect when using the **perm** symbol **t** with any  
82270 file type other than directory is unspecified.”

82271 This change is to permit historical behavior.

82272 **Issue 7**

82273 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

82274 Austin Group Interpretation 1003.1-2001 #130 is applied, adding text to the DESCRIPTION  
82275 about about marking for update the last file status change timestamp of the file.

82276 **NAME**82277 **chown** — change the file ownership82278 **SYNOPSIS**82279 `chown [-h] owner[:group] file...`82280 `chown -R [-H|-L|-P] owner[:group] file...`82281 **DESCRIPTION**82282 The *chown* utility shall set the user ID of the file named by each *file* operand to the user ID  
82283 specified by the *owner* operand.82284 For each *file* operand, or, if the **-R** option is used, each file encountered while walking the  
82285 directory trees specified by the *file* operands, the *chown* utility shall perform actions equivalent to  
82286 the *chown()* function defined in the System Interfaces volume of POSIX.1-2008, called with the  
82287 following arguments:

- 82288 1. The *file* operand shall be used as the *path* argument.
- 82289 2. The user ID indicated by the *owner* portion of the first operand shall be used as the *owner*  
82290 argument.
- 82291 3. If the *group* portion of the first operand is given, the group ID indicated by it shall be used  
82292 as the *group* argument; otherwise, the group ownership shall not be changed.

82293 Unless *chown* is invoked by a process with appropriate privileges, the set-user-ID and set-group-  
82294 ID bits of a regular file shall be cleared upon successful completion; the set-user-ID and set-  
82295 group-ID bits of other file types may be cleared.82296 **OPTIONS**82297 The *chown* utility shall conform to XBD [Section 12.2](#) (on page 215).

82298 The following options shall be supported by the implementation:

- 82299 **-h** For each file operand that names a file of type symbolic link, *chown* shall attempt to  
82300 set the user ID of the symbolic link. If a group ID was specified, for each file  
82301 operand that names a file of type symbolic link, *chown* shall attempt to set the  
82302 group ID of the symbolic link.
- 82303 **-H** If the **-R** option is specified and a symbolic link referencing a file of type directory  
82304 is specified on the command line, *chown* shall change the user ID (and group ID, if  
82305 specified) of the directory referenced by the symbolic link and all files in the file  
82306 hierarchy below it.
- 82307 **-L** If the **-R** option is specified and a symbolic link referencing a file of type directory  
82308 is specified on the command line or encountered during the traversal of a file  
82309 hierarchy, *chown* shall change the user ID (and group ID, if specified) of the  
82310 directory referenced by the symbolic link and all files in the file hierarchy below it.
- 82311 **-P** If the **-R** option is specified and a symbolic link is specified on the command line  
82312 or encountered during the traversal of a file hierarchy, *chown* shall change the  
82313 owner ID (and group ID, if specified) of the symbolic link. The *chown* utility shall  
82314 not follow the symbolic link to any other part of the file hierarchy.
- 82315 **-R** Recursively change file user and group IDs. For each *file* operand that names a  
82316 directory, *chown* shall change the user ID (and group ID, if specified) of the  
82317 directory and all files in the file hierarchy below it. Unless a **-H**, **-L**, or **-P** option is  
82318 specified, it is unspecified which of these options will be used as the default.

82319 Specifying more than one of the mutually-exclusive options **-H**, **-L**, and **-P** shall not be

82320 considered an error. The last option specified shall determine the behavior of the utility.

#### 82321 OPERANDS

82322 The following operands shall be supported:

82323 *owner[:group]* A user ID and optional group ID to be assigned to *file*. The *owner* portion of this  
 82324 operand shall be a user name from the user database or a numeric user ID. Either  
 82325 specifies a user ID which shall be given to each file named by one of the *file*  
 82326 operands. If a numeric *owner* operand exists in the user database as a user name,  
 82327 the user ID number associated with that user name shall be used as the user ID.  
 82328 Similarly, if the *group* portion of this operand is present, it shall be a group name  
 82329 from the group database or a numeric group ID. Either specifies a group ID which  
 82330 shall be given to each file. If a numeric group operand exists in the group database  
 82331 as a group name, the group ID number associated with that group name shall be  
 82332 used as the group ID.

82333 *file* A pathname of a file whose user ID is to be modified.

#### 82334 STDIN

82335 Not used.

#### 82336 INPUT FILES

82337 None.

#### 82338 ENVIRONMENT VARIABLES

82339 The following environment variables shall affect the execution of *chown*:

82340 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 82341 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 82342 variables used to determine the values of locale categories.)

82343 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 82344 internationalization variables.

82345 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 82346 characters (for example, single-byte as opposed to multi-byte characters in  
 82347 arguments).

82348 *LC\_MESSAGES*

82349 Determine the locale that should be used to affect the format and contents of  
 82350 diagnostic messages written to standard error.

82351 *XSI* *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

#### 82352 ASYNCHRONOUS EVENTS

82353 Default.

#### 82354 STDOUT

82355 Not used.

#### 82356 STDERR

82357 The standard error shall be used only for diagnostic messages.

#### 82358 OUTPUT FILES

82359 None.

**82360 EXTENDED DESCRIPTION**

82361 None.

**82362 EXIT STATUS**

82363 The following exit values shall be returned:

82364 0 The utility executed successfully and all requested changes were made.

82365 >0 An error occurred.

**82366 CONSEQUENCES OF ERRORS**

82367 Default.

**82368 APPLICATION USAGE**

82369 Only the owner of a file or the user with appropriate privileges may change the owner or group  
82370 of a file.

82371 Some implementations restrict the use of *chown* to a user with appropriate privileges.

**82372 EXAMPLES**

82373 None.

**82374 RATIONALE**

82375 The System V and BSD versions use different exit status codes. Some implementations used the  
82376 exit status as a count of the number of errors that occurred; this practice is unworkable since it  
82377 can overflow the range of valid exit status values. These are masked by specifying only 0 and >0  
82378 as exit values.

82379 The functionality of *chown* is described substantially through references to functions in the  
82380 System Interfaces volume of POSIX.1-2008. In this way, there is no duplication of effort required  
82381 for describing the interactions of permissions, multiple groups, and so on.

82382 The 4.3 BSD method of specifying both owner and group was included in this volume of  
82383 POSIX.1-2008 because:

- 82384 • There are cases where the desired end condition could not be achieved using the *chgrp* and  
82385 *chown* (that only changed the user ID) utilities. (If the current owner is not a member of the  
82386 desired group and the desired owner is not a member of the current group, the *chown()*  
82387 function could fail unless both owner and group are changed at the same time.)
- 82388 • Even if they could be changed independently, in cases where both are being changed, there  
82389 is a 100% performance penalty caused by being forced to invoke both utilities.

82390 The BSD syntax *user[.group]* was changed to *user[:group]* in this volume of POSIX.1-2008 because  
82391 the <period> is a valid character in login names (as specified by the Base Definitions volume of  
82392 POSIX.1-2008, login names consist of characters in the portable filename character set). The  
82393 <colon> character was chosen as the replacement for the <period> character because it would  
82394 never be allowed as a character in a user name or group name on historical implementations.

82395 The **-R** option is considered by some observers as an undesirable departure from the historical  
82396 UNIX system tools approach; since a tool, *find*, already exists to recurse over directories, there  
82397 seemed to be no good reason to require other tools to have to duplicate that functionality.  
82398 However, the **-R** option was deemed an important user convenience, is far more efficient than  
82399 forking a separate process for each element of the directory hierarchy, and is in widespread  
82400 historical use.

82401 **FUTURE DIRECTIONS**

82402 None.

82403 **SEE ALSO**82404 *chgrp, chmod*82405 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)82406 XSH *chown()*82407 **CHANGE HISTORY**

82408 First released in Issue 2.

82409 **Issue 6**82410 New options **-h**, **-H**, **-L**, and **-P** are added to align with the IEEE P1003.2b draft standard. These  
82411 options affect the processing of symbolic links.

82412 The normative text is reworded to avoid use of the term “must” for application requirements.

82413 IEEE PASC Interpretation 1003.2 #172 is applied, changing the CONSEQUENCES OF ERRORS  
82414 section to “Default.”.82415 The “otherwise, ...” text in item 3. of the DESCRIPTION is changed to “otherwise, the group  
82416 ownership shall not be changed”.82417 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/17 is applied, changing the SYNOPSIS to  
82418 make it clear that **-h** and **-R** are optional.82419 **Issue 7**82420 SD5-XCU-ERN-9 is applied, removing the **-R** from the first line of the SYNOPSIS.

82421 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

82422 The description of the **-h** and **-P** options is revised.

82423 **NAME**

82424 cksum — write file checksums and sizes

82425 **SYNOPSIS**82426 cksum [*file*...]82427 **DESCRIPTION**

82428 The *cksum* utility shall calculate and write to standard output a cyclic redundancy check (CRC)  
 82429 for each input file, and also write to standard output the number of octets in each file. The CRC  
 82430 used is based on the polynomial used for CRC error checking in the ISO/IEC 8802-3:1996  
 82431 standard (Ethernet).

82432 The encoding for the CRC checksum is defined by the generating polynomial:

$$82433 G(x) = x^{32} + x^{26} + x^{23} + x^{22} + x^{16} + x^{12} + x^{11} + x^{10} + x^8 + x^7 + x^5 + x^4 + x^2 + x + 1$$

82434 Mathematically, the CRC value corresponding to a given file shall be defined by the following  
 82435 procedure:

- 82436 1. The *n* bits to be evaluated are considered to be the coefficients of a mod 2 polynomial  
 82437  $M(x)$  of degree  $n-1$ . These *n* bits are the bits from the file, with the most significant bit  
 82438 being the most significant bit of the first octet of the file and the last bit being the least  
 82439 significant bit of the last octet, padded with zero bits (if necessary) to achieve an integral  
 82440 number of octets, followed by one or more octets representing the length of the file as a  
 82441 binary value, least significant octet first. The smallest number of octets capable of  
 82442 representing this integer shall be used.
- 82443 2.  $M(x)$  is multiplied by  $x^{32}$  (that is, shifted left 32 bits) and divided by  $G(x)$  using mod 2  
 82444 division, producing a remainder  $R(x)$  of degree  $\leq 31$ .
- 82445 3. The coefficients of  $R(x)$  are considered to be a 32-bit sequence.
- 82446 4. The bit sequence is complemented and the result is the CRC.

82447 **OPTIONS**

82448 None.

82449 **OPERANDS**

82450 The following operand shall be supported:

82451 *file* A pathname of a file to be checked. If no *file* operands are specified, the standard  
 82452 input shall be used.

82453 **STDIN**

82454 The standard input shall be used if no *file* operands are specified, and shall be used if a *file*  
 82455 operand is '-' and the implementation treats the '-' as meaning standard input. Otherwise,  
 82456 the standard input shall not be used. See the INPUT FILES section.

82457 **INPUT FILES**

82458 The input files can be any file type.

82459 **ENVIRONMENT VARIABLES**82460 The following environment variables shall affect the execution of *cksum*:

- 82461 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 82462 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
 82463 variables used to determine the values of locale categories.)
- 82464 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 82465 internationalization variables.

82466 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 82467 characters (for example, single-byte as opposed to multi-byte characters in  
 82468 arguments).

82469 *LC\_MESSAGES*  
 82470 Determine the locale that should be used to affect the format and contents of  
 82471 diagnostic messages written to standard error.

82472 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

82473 **ASYNCHRONOUS EVENTS**  
 82474 Default.

82475 **STDOUT**  
 82476 For each file processed successfully, the *cksum* utility shall write in the following format:  
 82477 "%u %d %s\n", <checksum>, <# of octets>, <pathname>  
 82478 If no *file* operand was specified, the pathname and its leading <space> shall be omitted.

82479 **STDERR**  
 82480 The standard error shall be used only for diagnostic messages.

82481 **OUTPUT FILES**  
 82482 None.

82483 **EXTENDED DESCRIPTION**  
 82484 None.

82485 **EXIT STATUS**  
 82486 The following exit values shall be returned:  
 82487 0 All files were processed successfully.  
 82488 >0 An error occurred.

82489 **CONSEQUENCES OF ERRORS**  
 82490 Default.

82491 **APPLICATION USAGE**  
 82492 The *cksum* utility is typically used to quickly compare a suspect file against a trusted version of  
 82493 the same, such as to ensure that files transmitted over noisy media arrive intact. However, this  
 82494 comparison cannot be considered cryptographically secure. The chances of a damaged file  
 82495 producing the same CRC as the original are small; deliberate deception is difficult, but probably  
 82496 not impossible.

82497 Although input files to *cksum* can be any type, the results need not be what would be expected  
 82498 on character special device files or on file types not described by the System Interfaces volume of  
 82499 POSIX.1-2008. Since this volume of POSIX.1-2008 does not specify the block size used when  
 82500 doing input, checksums of character special files need not process all of the data in those files.

82501 The algorithm is expressed in terms of a bitstream divided into octets. If a file is transmitted  
 82502 between two systems and undergoes any data transformation (such as changing little-endian  
 82503 byte ordering to big-endian), identical CRC values cannot be expected. Implementations  
 82504 performing such transformations may extend *cksum* to handle such situations.

82505 **EXAMPLES**  
 82506 None.

**RATIONALE**

The following C-language program can be used as a model to describe the algorithm. It assumes that a **char** is one octet. It also assumes that the entire file is available for one pass through the function. This was done for simplicity in demonstrating the algorithm, rather than as an implementation model.

82583 }

82584 return ~s;
82585 }

```

The historical practice of writing the number of “blocks” has been changed to writing the number of octets, since the latter is not only more useful, but also since historical implementations have not been consistent in defining what a “block” meant.

The algorithm used was selected to increase the operational robustness of *cksum*. Neither the System V nor BSD *sum* algorithm was selected. Since each of these was different and each was the default behavior on those systems, no realistic compromise was available if either were selected—some set of historical applications would break. Therefore, the name was changed to *cksum*. Although the historical *sum* commands will probably continue to be provided for many years, programs designed for portability across systems should use the new name.

The algorithm selected is based on that used by the ISO/IEC 8802-3:1996 standard (Ethernet) for the frame check sequence field. The algorithm used does not match the technical definition of a *checksum*; the term is used for historical reasons. The length of the file is included in the CRC calculation because this parallels inclusion of a length field by Ethernet in its CRC, but also because it guards against inadvertent collisions between files that begin with different series of zero octets. The chance that two different files produce identical CRCs is much greater when their lengths are not considered. Keeping the length and the checksum of the file itself separate would yield a slightly more robust algorithm, but historical usage has always been that a single number (the checksum as printed) represents the signature of the file. It was decided that historical usage was the more important consideration.

Early proposals contained modifications to the Ethernet algorithm that involved extracting table values whenever an intermediate result became zero. This was demonstrated to be less robust than the current method and mathematically difficult to describe or justify.

The calculation used is identical to that given in pseudo-code in the referenced Sarwate article. The pseudo-code rendition is:

```
X <- 0; Y <- 0;
for i <- m -1 step -1 until 0 do
 begin
 T <- X(1) ^ A[i];
 X(1) <- X(0); X(0) <- Y(1); Y(1) <- Y(0); Y(0) <- 0;
 comment: f[T] and f'[T] denote the T-th words in the
 table f and f' ;
 X <- X ^ f[T]; Y <- Y ^ f'[T];
 end
```

The pseudo-code is reproduced exactly as given; however, note that in the case of *cksum*, **A[i]** represents a byte of the file, the words **X** and **Y** are treated as a single 32-bit value, and the tables **f** and **f'** are a single table containing 32-bit values.

The referenced Sarwate article also discusses generating the table.

82633 **NAME**

82634 cmp — compare two files

82635 **SYNOPSIS**82636 cmp [-l|-s] *file1 file2*82637 **DESCRIPTION**

82638 The *cmp* utility shall compare two files. The *cmp* utility shall write no output if the files are the  
 82639 same. Under default options, if they differ, it shall write to standard output the byte and line  
 82640 number at which the first difference occurred. Bytes and lines shall be numbered beginning with  
 82641 1.

82642 **OPTIONS**82643 The *cmp* utility shall conform to XBD [Section 12.2](#) (on page 215).

82644 The following options shall be supported:

82645 -l (Lowercase ell.) Write the byte number (decimal) and the differing bytes (octal) for  
 82646 each difference.

82647 -s Write nothing for differing files; return exit status only.

82648 **OPERANDS**

82649 The following operands shall be supported:

82650 *file1* A pathname of the first file to be compared. If *file1* is '-', the standard input shall  
 82651 be used.

82652 *file2* A pathname of the second file to be compared. If *file2* is '-', the standard input  
 82653 shall be used.

82654 If both *file1* and *file2* refer to standard input or refer to the same FIFO special, block special, or  
 82655 character special file, the results are undefined.

82656 **STDIN**

82657 The standard input shall be used only if the *file1* or *file2* operand refers to standard input. See the  
 82658 INPUT FILES section.

82659 **INPUT FILES**

82660 The input files can be any file type.

82661 **ENVIRONMENT VARIABLES**82662 The following environment variables shall affect the execution of *cmp*:

82663 LANG Provide a default value for the internationalization variables that are unset or null.  
 82664 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 82665 variables used to determine the values of locale categories.)

82666 LC\_ALL If set to a non-empty string value, override the values of all the other  
 82667 internationalization variables.

82668 LC\_CTYPE Determine the locale for the interpretation of sequences of bytes of text data as  
 82669 characters (for example, single-byte as opposed to multi-byte characters in  
 82670 arguments).

82671 LC\_MESSAGES

82672 Determine the locale that should be used to affect the format and contents of  
 82673 diagnostic messages written to standard error and informative messages written to  
 82674 standard output.

82675 XSI **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

82676 **ASYNCHRONOUS EVENTS**

82677 Default.

82678 **STDOUT**

82679 In the POSIX locale, results of the comparison shall be written to standard output. When no

82680 options are used, the format shall be:

82681 "%s %s differ: char %d, line %d\n", *file1*, *file2*,

82682 <*byte number*>, <*line number*>

82683 When the **-l** option is used, the format shall be:

82684 "%d %o %o\n", <*byte number*>, <*differing byte*>,

82685 <*differing byte*>

82686 for each byte that differs. The first <*differing byte*> number is from *file1* while the second is from

82687 *file2*. In both cases, <*byte number*> shall be relative to the beginning of the file, beginning with 1.

82688 No output shall be written to standard output when the **-s** option is used.

82689 **STDERR**

82690 The standard error shall be used only for diagnostic messages. If the **-l** option is used and *file1*

82691 and *file2* differ in length, or if the **-s** option is not used and *file1* and *file2* are identical for the

82692 entire length of the shorter file, in the POSIX locale the following diagnostic message shall be

82693 written:

82694 "cmp: EOF on %s%s\n", <*name of shorter file*>, <*additional info*>

82695 The <*additional info*> field shall either be null or a string that starts with a <blank> and contains

82696 no <newline> characters. Some implementations report on the number of lines in this case.

82697 **OUTPUT FILES**

82698 None.

82699 **EXTENDED DESCRIPTION**

82700 None.

82701 **EXIT STATUS**

82702 The following exit values shall be returned:

82703 0 The files are identical.

82704 1 The files are different; this includes the case where one file is identical to the first part of the

82705 other.

82706 >1 An error occurred.

82707 **CONSEQUENCES OF ERRORS**

82708 Default.

**APPLICATION USAGE**

Although input files to *cmp* can be any type, the results might not be what would be expected on character special device files or on file types not described by the System Interfaces volume of POSIX.1-2008. Since this volume of POSIX.1-2008 does not specify the block size used when doing input, comparisons of character special files need not compare all of the data in those files.

For files which are not text files, line numbers simply reflect the presence of a <newline>, without any implication that the file is organized into lines.

**EXAMPLES**

None.

**RATIONALE**

The global language in [Section 1.4](#) (on page 2310) indicates that using two mutually-exclusive options together produces unspecified results. Some System V implementations consider the option usage:

```
cmp -l -s ...
```

to be an error. They also treat:

```
cmp -s -l ...
```

as if no options were specified. Both of these behaviors are considered bugs, but are allowed.

The word **char** in the standard output format comes from historical usage, even though it is actually a byte number. When *cmp* is supported in other locales, implementations are encouraged to use the word *byte* or its equivalent in another language. Users should not interpret this difference to indicate that the functionality of the utility changed between locales.

Some implementations report on the number of lines in the identical-but-shorter file case. This is allowed by the inclusion of the <additional info> fields in the output format. The restriction on having a leading <blank> and no <newline> characters is to make parsing for the filename easier. It is recognized that some filenames containing white-space characters make parsing difficult anyway, but the restriction does aid programs used on systems where the names are predominantly well behaved.

**FUTURE DIRECTIONS**

None.

**CHANGE HISTORY**

First released in Issue 2.

**Issue 7**

SD5-XCU-ERN-96 is applied, updating the STDERR section.

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

82746 **NAME**

82747       comm — select or reject lines common to two files

82748 **SYNOPSIS**82749       comm [-123] *file1 file2*82750 **DESCRIPTION**

82751       The *comm* utility shall read *file1* and *file2*, which should be ordered in the current collating sequence, and produce three text columns as output: lines only in *file1*, lines only in *file2*, and lines in both files.

82754       If the lines in both files are not ordered according to the collating sequence of the current locale, the results are unspecified.

82756 **OPTIONS**82757       The *comm* utility shall conform to XBD [Section 12.2](#) (on page 215).

82758       The following options shall be supported:

82759       -1       Suppress the output column of lines unique to *file1*.82760       -2       Suppress the output column of lines unique to *file2*.82761       -3       Suppress the output column of lines duplicated in *file1* and *file2*.82762 **OPERANDS**

82763       The following operands shall be supported:

82764       *file1*       A pathname of the first file to be compared. If *file1* is '-', the standard input shall be used.

82766       *file2*       A pathname of the second file to be compared. If *file2* is '-', the standard input shall be used.

82768       If both *file1* and *file2* refer to standard input or to the same FIFO special, block special, or character special file, the results are undefined.

82770 **STDIN**

82771       The standard input shall be used only if one of the *file1* or *file2* operands refers to standard input. See the INPUT FILES section.

82773 **INPUT FILES**

82774       The input files shall be text files.

82775 **ENVIRONMENT VARIABLES**82776       The following environment variables shall affect the execution of *comm*:

82777       LANG       Provide a default value for the internationalization variables that are unset or null. (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization variables used to determine the values of locale categories.)

82780       LC\_ALL       If set to a non-empty string value, override the values of all the other internationalization variables.

82782       LC\_COLLATE

82783       Determine the locale for the collating sequence *comm* expects to have been used when the input files were sorted.

82785       LC\_CTYPE       Determine the locale for the interpretation of sequences of bytes of text data as characters (for example, single-byte as opposed to multi-byte characters in arguments and input files).

82788 *LC\_MESSAGES*  
 82789 Determine the locale that should be used to affect the format and contents of  
 82790 diagnostic messages written to standard error.

82791 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

82792 **ASYNCHRONOUS EVENTS**  
 82793 Default.

82794 **STDOUT**  
 82795 The *comm* utility shall produce output depending on the options selected. If the **-1**, **-2**, and **-3**  
 82796 options are all selected, *comm* shall write nothing to standard output.

82797 If the **-1** option is not selected, lines contained only in *file1* shall be written using the format:  
 82798 "%s\n", <line in file1>

82799 If the **-2** option is not selected, lines contained only in *file2* are written using the format:  
 82800 "%s%s\n", <lead>, <line in file2>

82801 where the string <lead> is as follows:  
 82802 <tab> The **-1** option is not selected.  
 82803 null string The **-1** option is selected.

82804 If the **-3** option is not selected, lines contained in both files shall be written using the format:  
 82805 "%s%s\n", <lead>, <line in both>

82806 where the string <lead> is as follows:  
 82807 <tab><tab> Neither the **-1** nor the **-2** option is selected.  
 82808 <tab> Exactly one of the **-1** and **-2** options is selected.  
 82809 null string Both the **-1** and **-2** options are selected.

82810 If the input files were ordered according to the collating sequence of the current locale, the lines  
 82811 written shall be in the collating sequence of the original lines.

82812 **STDERR**  
 82813 The standard error shall be used only for diagnostic messages.

82814 **OUTPUT FILES**  
 82815 None.

82816 **EXTENDED DESCRIPTION**  
 82817 None.

82818 **EXIT STATUS**  
 82819 The following exit values shall be returned:  
 82820 0 All input files were successfully output as specified.  
 82821 >0 An error occurred.

82822 **CONSEQUENCES OF ERRORS**  
 82823 Default.

**APPLICATION USAGE**

If the input files are not properly presorted, the output of *comm* might not be useful.

**EXAMPLES**

If a file named **xcu** contains a sorted list of the utilities in this volume of POSIX.1-2008, a file named **xpg3** contains a sorted list of the utilities specified in the X/Open Portability Guide, Issue 3, and a file named **svid89** contains a sorted list of the utilities in the System V Interface Definition Third Edition:

```
comm -23 xcu xpg3 | comm -23 - svid89
```

would print a list of utilities in this volume of POSIX.1-2008 not specified by either of the other documents:

```
comm -12 xcu xpg3 | comm -12 - svid89
```

would print a list of utilities specified by all three documents, and:

```
comm -12 xpg3 svid89 | comm -23 - xcu
```

would print a list of utilities specified by both XPG3 and the SVID, but not specified in this volume of POSIX.1-2008.

XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)

**CHANGE HISTORY**

First released in Issue 2.

**Issue 6**

The normative text is reworded to avoid use of the term “must” for application requirements.

**NAME**

`command` — execute a simple command

**SYNOPSIS**

`command` [`-p`] *command\_name* [*argument...*]

`command` [`-p`] [`-v`|`-V`] *command\_name*

**DESCRIPTION**

The *command* utility shall cause the shell to treat the arguments as a simple command, suppressing the shell function lookup that is described in [Section 2.9.1.1](#) (on page 2339), item 1b.

If the *command\_name* is the same as the name of one of the special built-in utilities, the special properties in the enumerated list at the beginning of [Section 2.14](#) (on page 2356) shall not occur. In every other respect, if *command\_name* is not the name of a function, the effect of *command* (with no options) shall be the same as omitting *command*.

When the `-v` or `-V` option is used, the *command* utility shall provide information concerning how a command name is interpreted by the shell.

**OPTIONS**

The *command* utility shall conform to XBD [Section 12.2](#) (on page 215).

The following options shall be supported:

**-p** Perform the command search using a default value for *PATH* that is guaranteed to find all of the standard utilities.

**-v** Write a string to standard output that indicates the pathname or command that will be used by the shell, in the current shell execution environment (see [Section 2.12](#), on page 2353), to invoke *command\_name*, but do not invoke *command\_name*.

- Utilities, regular built-in utilities, *command\_names* including a `<slash>` character, and any implementation-defined functions that are found using the *PATH* variable (as described in [Section 2.9.1.1](#), on page 2339), shall be written as absolute pathnames.
- Shell functions, special built-in utilities, regular built-in utilities not associated with a *PATH* search, and shell reserved words shall be written as just their names.
- An alias shall be written as a command line that represents its alias definition.
- Otherwise, no output shall be written and the exit status shall reflect that the name was not found.

**-V** Write a string to standard output that indicates how the name given in the *command\_name* operand will be interpreted by the shell, in the current shell execution environment (see [Section 2.12](#), on page 2353), but do not invoke *command\_name*. Although the format of this string is unspecified, it shall indicate in which of the following categories *command\_name* falls and shall include the information stated:

- Utilities, regular built-in utilities, and any implementation-defined functions that are found using the *PATH* variable (as described in [Section 2.9.1.1](#), on page 2339), shall be identified as such and include the absolute pathname in the string.

- 82893 • Other shell functions shall be identified as functions.
- 82894 • Aliases shall be identified as aliases and their definitions included in the
- 82895 string.
- 82896 • Special built-in utilities shall be identified as special built-in utilities.
- 82897 • Regular built-in utilities not associated with a *PATH* search shall be identified
- 82898 as regular built-in utilities. (The term “regular” need not be used.)
- 82899 • Shell reserved words shall be identified as reserved words.

## 82900 OPERANDS

82901 The following operands shall be supported:

82902 *argument* One of the strings treated as an argument to *command\_name*.

82903 *command\_name*

82904 The name of a utility or a special built-in utility.

## 82905 STDIN

82906 Not used.

## 82907 INPUT FILES

82908 None.

## 82909 ENVIRONMENT VARIABLES

82910 The following environment variables shall affect the execution of *command*:

82911 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 82912 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 82913 variables used to determine the values of locale categories.)

82914 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 82915 internationalization variables.

82916 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 82917 characters (for example, single-byte as opposed to multi-byte characters in  
 82918 arguments).

82919 *LC\_MESSAGES*

82920 Determine the locale that should be used to affect the format and contents of  
 82921 diagnostic messages written to standard error and informative messages written to  
 82922 standard output.

82923 *XSI* *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

82924 *PATH* Determine the search path used during the command search described in [Section](#)  
 82925 [2.9.1.1](#) (on page 2339), except as described under the **-p** option.

## 82926 ASYNCHRONOUS EVENTS

82927 Default.

## 82928 STDOUT

82929 When the **-v** option is specified, standard output shall be formatted as:

82930 "%s\n", <pathname or command>

82931 When the **-V** option is specified, standard output shall be formatted as:

82932 "%s\n", <unspecified>

82933 **STDERR**

82934 The standard error shall be used only for diagnostic messages.

82935 **OUTPUT FILES**

82936 None.

82937 **EXTENDED DESCRIPTION**

82938 None.

82939 **EXIT STATUS**82940 When the `-v` or `-V` options are specified, the following exit values shall be returned:

82941 0 Successful completion.

82942 >0 The *command\_name* could not be found or an error occurred.

82943 Otherwise, the following exit values shall be returned:

82944 126 The utility specified by *command\_name* was found but could not be invoked.82945 127 An error occurred in the *command* utility or the utility specified by *command\_name* could not  
82946 be found.82947 Otherwise, the exit status of *command* shall be that of the simple command specified by the  
82948 arguments to *command*.82949 **CONSEQUENCES OF ERRORS**

82950 Default.

82951 **APPLICATION USAGE**82952 The order for command search allows functions to override regular built-ins and path searches.  
82953 This utility is necessary to allow functions that have the same name as a utility to call the utility  
82954 (instead of a recursive call to the function).82955 The system default path is available using *getconf*; however, since *getconf* may need to have the  
82956 *PATH* set up before it can be called itself, the following can be used:82957 `command -p getconf PATH`82958 There are some advantages to suppressing the special characteristics of special built-ins on  
82959 occasion. For example:82960 `command exec > unwritable-file`82961 does not cause a non-interactive script to abort, so that the output status can be checked by the  
82962 script.82963 The *command*, *env*, *nohup*, *time*, and *xargs* utilities have been specified to use exit code 127 if an  
82964 error occurs so that applications can distinguish “failure to find a utility” from “invoked utility  
82965 exited with an error indication”. The value 127 was chosen because it is not commonly used for  
82966 other meanings; most utilities use small values for “normal error conditions” and the values  
82967 above 128 can be confused with termination due to receipt of a signal. The value 126 was chosen  
82968 in a similar manner to indicate that the utility could be found, but not invoked. Some scripts  
82969 produce meaningful error messages differentiating the 126 and 127 cases. The distinction  
82970 between exit codes 126 and 127 is based on KornShell practice that uses 127 when all attempts to  
82971 *exec* the utility fail with [ENOENT], and uses 126 when any attempt to *exec* the utility fails for  
82972 any other reason.82973 Since the `-v` and `-V` options of *command* produce output in relation to the current shell execution  
82974 environment, *command* is generally provided as a shell regular built-in. If it is called in a subshell  
82975 or separate utility execution environment, such as one of the following:

```
82976 (PATH=foo command -v)
82977 nohup command -v
```

82978 it does not necessarily produce correct results. For example, when called with *nohup* or an *exec*  
 82979 function, in a separate utility execution environment, most implementations are not able to  
 82980 identify aliases, functions, or special built-ins.

82981 Two types of regular built-ins could be encountered on a system and these are described  
 82982 separately by *command*. The description of command search in [Section 2.9.1.1](#) (on page 2339)  
 82983 allows for a standard utility to be implemented as a regular built-in as long as it is found in the  
 82984 appropriate place in a *PATH* search. So, for example, *command -v true* might yield */bin/true* or  
 82985 some similar pathname. Other implementation-defined utilities that are not defined by this  
 82986 volume of POSIX.1-2008 might exist only as built-ins and have no pathname associated with  
 82987 them. These produce output identified as (regular) built-ins. Applications encountering these are  
 82988 not able to count on *execing* them, using them with *nohup*, overriding them with a different  
 82989 *PATH*, and so on.

## 82990 EXAMPLES

- 82991 1. Make a version of *cd* that always prints out the new working directory exactly once:

```
82992 cd() {
82993 command cd "$@" >/dev/null
82994 pwd
82995 }
```

- 82996 2. Start off a “secure shell script” in which the script avoids being spoofed by its parent:

```
82997 IFS='
82998 '
82999 # The preceding value should be <space><tab><newline>.
83000 # Set IFS to its default value.
83001 \unalias -a
83002 # Unset all possible aliases.
83003 # Note that unalias is escaped to prevent an alias
83004 # being used for unalias.
83005 unset -f command
83006 # Ensure command is not a user function.
83007 PATH="$(command -p getconf PATH):$PATH"
83008 # Put on a reliable PATH prefix.
83009 # ...
```

83010 At this point, given correct permissions on the directories called by *PATH*, the script has  
 83011 the ability to ensure that any utility it calls is the intended one. It is being very cautious  
 83012 because it assumes that implementation extensions may be present that would allow user  
 83013 functions to exist when it is invoked; this capability is not specified by this volume of  
 83014 POSIX.1-2008, but it is not prohibited as an extension. For example, the *ENV* variable  
 83015 precedes the invocation of the script with a user start-up script. Such a script could define  
 83016 functions to spoof the application.

## 83017 RATIONALE

83018 Since *command* is a regular built-in utility it is always found prior to the *PATH* search.

83019 There is nothing in the description of *command* that implies the command line is parsed any  
 83020 differently from that of any other simple command. For example:

command a | b ; c

is not parsed in any special way that causes ' | ' or ' ; ' to be treated other than a pipe operator or <semicolon> or that prevents function lookup on **b** or **c**.

The *command* utility is somewhat similar to the Eighth Edition shell *builtin* command, but since *command* also goes to the file system to search for utilities, the name *builtin* would not be intuitive.

The *command* utility is most likely to be provided as a regular built-in. It is not listed as a special built-in for the following reasons:

- The removal of exportable functions made the special precedence of a special built-in unnecessary.
- A special built-in has special properties (see [Section 2.14](#), on page 2356) that were inappropriate for invoking other utilities. For example, two commands such as:

```
date > unwritable-file
```

```
command date > unwritable-file
```

would have entirely different results; in a non-interactive script, the former would continue to execute the next command, the latter would abort. Introducing this semantic difference along with suppressing functions was seen to be non-intuitive.

The **-p** option is present because it is useful to be able to ensure a safe path search that finds all the standard utilities. This search might not be identical to the one that occurs through one of the *exec* functions (as defined in the System Interfaces volume of POSIX.1-2008) when *PATH* is unset. At the very least, this feature is required to allow the script to access the correct version of *getconf* so that the value of the default path can be accurately retrieved.

The *command* **-v** and **-V** options were added to satisfy requirements from users that are currently accomplished by three different historical utilities: *type* in the System V shell, *whence* in the KornShell, and *which* in the C shell. Since there is no historical agreement on how and what to accomplish here, the POSIX *command* utility was enhanced and the historical utilities were left unmodified. The C shell *which* merely conducts a path search. The KornShell *whence* is more elaborate—in addition to the categories required by POSIX, it also reports on tracked aliases, exported aliases, and undefined functions.

The output format of **-V** was left mostly unspecified because human users are its only audience. Applications should not be written to care about this information; they can use the output of **-v** to differentiate between various types of commands, but the additional information that may be emitted by the more verbose **-V** is not needed and should not be arbitrarily constrained in its verbosity or localization for application parsing reasons.

## FUTURE DIRECTIONS

None.

83061 **CHANGE HISTORY**

83062 First released in Issue 4.

83063 **Issue 7**83064 Austin Group Interpretation 1003.1-2001 #196 is applied, changing the SYNOPSIS to allow **-p** to  
83065 be used with **-v** (or **-V**).

83066 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

83067 The *command* utility is moved from the User Portability Utilities option to the Base. User  
83068 Portability Utilities is now an option for interactive utilities.83069 The APPLICATION USAGE and EXAMPLES are revised to replace the non-standard  
83070 *getconf\_CS\_PATH* with *getconf PATH*.

## 83071 NAME

83072 compress — compress data

## 83073 SYNOPSIS

83074 XSI `compress [-fv] [-b bits] [file...]`83075 `compress [-cfv] [-b bits] [file]`

## 83076 DESCRIPTION

83077 The *compress* utility shall attempt to reduce the size of the named files by using adaptive Lempel-  
83078 Ziv coding algorithm.83079 **Note:** Lempel-Ziv is US Patent 4464650, issued to William Eastman, Abraham Lempel, Jacob Ziv,  
83080 Martin Cohn on August 7th, 1984, and assigned to Sperry Corporation.83081 Lempel-Ziv-Welch compression is covered by US Patent 4558302, issued to Terry A. Welch on  
83082 December 10th, 1985, and assigned to Sperry Corporation.83083 On systems not supporting adaptive Lempel-Ziv coding algorithm, the input files shall not be  
83084 changed and an error value greater than two shall be returned. Except when the output is to the  
83085 standard output, each file shall be replaced by one with the extension **.Z**. If the invoking process  
83086 has appropriate privileges, the ownership, modes, access time, and modification time of the  
83087 original file are preserved. If appending the **.Z** to the filename would make the name exceed  
83088 {NAME\_MAX} bytes, the command shall fail. If no files are specified, the standard input shall be  
83089 compressed to the standard output.

## 83090 OPTIONS

83091 The *compress* utility shall conform to XBD [Section 12.2](#) (on page 215).

83092 The following options shall be supported:

83093 **-b *bits*** Specify the maximum number of bits to use in a code. For a conforming  
83094 application, the *bits* argument shall be:83095  $9 \leq bits \leq 14$ 83096 The implementation may allow *bits* values of greater than 14. The default is 14, 15,  
83097 or 16.83098 **-c** Cause *compress* to write to the standard output; the input file is not changed, and  
83099 no **.Z** files are created.83100 **-f** Force compression of *file*, even if it does not actually reduce the size of the file, or if  
83101 the corresponding *file.Z* file already exists. If the **-f** option is not given, and the  
83102 process is not running in the background, the user is prompted as to whether an  
83103 existing *file.Z* file should be overwritten. If the response is affirmative, the existing  
83104 file will be overwritten.83105 **-v** Write the percentage reduction of each file to standard error.

## 83106 OPERANDS

83107 The following operand shall be supported:

83108 *file* A pathname of a file to be compressed.

## 83109 STDIN

83110 The standard input shall be used only if no *file* operands are specified, or if a *file* operand is **'-'**.

83111 **INPUT FILES**83112 If *file* operands are specified, the input files contain the data to be compressed.83113 **ENVIRONMENT VARIABLES**83114 The following environment variables shall affect the execution of *compress*:

83115 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 83116 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 83117 variables used to determine the values of locale categories.)

83118 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 83119 internationalization variables.

83120 *LC\_COLLATE*

83121 Determine the locale for the behavior of ranges, equivalence classes, and multi-  
 83122 character collating elements used in the extended regular expression defined for  
 83123 the **yesexpr** locale keyword in the *LC\_MESSAGES* category.

83124 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 83125 characters (for example, single-byte as opposed to multi-byte characters in  
 83126 arguments), the behavior of character classes used in the extended regular  
 83127 expression defined for the **yesexpr** locale keyword in the *LC\_MESSAGES* category.

83128 *LC\_MESSAGES*

83129 Determine the locale used to process affirmative responses, and the locale used to  
 83130 affect the format and contents of diagnostic messages, prompts, and the output  
 83131 from the **-v** option written to standard error.

83132 *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

83133 **ASYNCHRONOUS EVENTS**

83134 Default.

83135 **STDOUT**

83136 If no *file* operands are specified, or if a *file* operand is **'-'**, or if the **-c** option is specified, the  
 83137 standard output contains the compressed output.

83138 **STDERR**

83139 The standard error shall be used only for diagnostic and prompt messages and the output from  
 83140 **-v**.

83141 **OUTPUT FILES**

83142 The output files shall contain the compressed output. The format of compressed files is  
 83143 unspecified and interchange of such files between implementations (including access via  
 83144 unspecified file sharing mechanisms) is not required by POSIX.1-2008.

83145 **EXTENDED DESCRIPTION**

83146 None.

83147 **EXIT STATUS**

83148 The following exit values shall be returned:

83149 0 Successful completion.

83150 1 An error occurred.

83151 2 One or more files were not compressed because they would have increased in size (and the  
 83152 **-f** option was not specified).

83153           >2   An error occurred.

83154   **CONSEQUENCES OF ERRORS**

83155           The input file shall remain unmodified.

83156   **APPLICATION USAGE**

83157           The amount of compression obtained depends on the size of the input, the number of *bits* per  
83158           code, and the distribution of common substrings. Typically, text such as source code or English is  
83159           reduced by 50-60%. Compression is generally much better than that achieved by Huffman  
83160           coding or adaptive Huffman coding (*compact*), and takes less time to compute.

83161           Although *compress* strictly follows the default actions upon receipt of a signal or when an error  
83162           occurs, some unexpected results may occur. In some implementations it is likely that a partially  
83163           compressed file is left in place, alongside its uncompressed input file. Since the general  
83164           operation of *compress* is to delete the uncompressed file only after the *.Z* file has been  
83165           successfully filled, an application should always carefully check the exit status of *compress* before  
83166           arbitrarily deleting files that have like-named neighbors with *.Z* suffixes.

83167           The limit of 14 on the *bits* option-argument is to achieve portability to all systems (within the  
83168           restrictions imposed by the lack of an explicit published file format). Some implementations  
83169           based on 16-bit architectures cannot support 15 or 16-bit uncompression.

83170   **EXAMPLES**

83171           None.

83172   **RATIONALE**

83173           None.

83174   **FUTURE DIRECTIONS**

83175           None.

83176   **SEE ALSO**

83177           *uncompress*, *zcat*

83178           XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)

83179   **CHANGE HISTORY**

83180           First released in Issue 4.

83181   **Issue 6**

83182           The normative text is reworded to avoid use of the term “must” for application requirements.

83183           An error case is added for systems not supporting adaptive Lempel-Ziv coding.

83184   **Issue 7**

83185           SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

83186           Austin Group Interpretation 1003.1-2001 #125 is applied, revising the ENVIRONMENT  
83187           VARIABLES section.

83188 **NAME**83189 **cp** — copy files83190 **SYNOPSIS**83191 **cp** [-Pfip] *source\_file* *target\_file*83192 **cp** [-Pfip] *source\_file*... *target*83193 **cp** -R [-H|-L|-P] [-fip] *source\_file*... *target*83194 **DESCRIPTION**

83195 The first synopsis form is denoted by two operands, neither of which are existing files of type  
 83196 directory. The *cp* utility shall copy the contents of *source\_file* (or, if *source\_file* is a file of type  
 83197 symbolic link, the contents of the file referenced by *source\_file*) to the destination path named by  
 83198 *target\_file*.

83199 The second synopsis form is denoted by two or more operands where the **-R** option is not  
 83200 specified and the first synopsis form is not applicable. It shall be an error if any *source\_file* is a file  
 83201 of type directory, if *target* does not exist, or if *target* does not name a directory. The *cp* utility shall  
 83202 copy the contents of each *source\_file* (or, if *source\_file* is a file of type symbolic link, the contents of  
 83203 the file referenced by *source\_file*) to the destination path named by the concatenation of *target*, a  
 83204 single <slash> character if *target* did not end in a <slash>, and the last component of *source\_file*.

83205 The third synopsis form is denoted by two or more operands where the **-R** option is specified.  
 83206 The *cp* utility shall copy each file in the file hierarchy rooted in each *source\_file* to a destination  
 83207 path named as follows:

- 83208 • If *target* exists and names an existing directory, the name of the corresponding destination  
 83209 path for each file in the file hierarchy shall be the concatenation of *target*, a single <slash>  
 83210 character if *target* did not end in a <slash>, and the pathname of the file relative to the  
 83211 directory containing *source\_file*.
- 83212 • If *target* does not exist and two operands are specified, the name of the corresponding  
 83213 destination path for *source\_file* shall be *target*; the name of the corresponding destination  
 83214 path for all other files in the file hierarchy shall be the concatenation of *target*, a <slash>  
 83215 character, and the pathname of the file relative to *source\_file*.

83216 It shall be an error if *target* does not exist and more than two operands are specified, or if *target*  
 83217 exists and does not name a directory.

83218 In the following description, the term *dest\_file* refers to the file named by the destination path.  
 83219 The term *source\_file* refers to the file that is being copied, whether specified as an operand or a  
 83220 file in a file hierarchy rooted in a *source\_file* operand. If *source\_file* is a file of type symbolic link:

- 83221 • If the **-R** option was not specified, *cp* shall take actions based on the type and contents of  
 83222 the file referenced by the symbolic link, and not by the symbolic link itself, unless the **-P**  
 83223 option was specified.
- 83224 • If the **-R** option was specified:
  - 83225 — If none of the options **-H**, **-L**, nor **-P** were specified, it is unspecified which of **-H**,  
 83226 **-L**, or **-P** will be used as a default.
  - 83227 — If the **-H** option was specified, *cp* shall take actions based on the type and contents of  
 83228 the file referenced by any symbolic link specified as a *source\_file* operand.
  - 83229 — If the **-L** option was specified, *cp* shall take actions based on the type and contents of  
 83230 the file referenced by any symbolic link specified as a *source\_file* operand or any  
 83231 symbolic links encountered during traversal of a file hierarchy.

- If the **-P** option was specified, *cp* shall copy any symbolic link specified as a *source\_file* operand and any symbolic links encountered during traversal of a file hierarchy, and shall not follow any symbolic links.

For each *source\_file*, the following steps shall be taken:

1. If *source\_file* references the same file as *dest\_file*, *cp* may write a diagnostic message to standard error; it shall do nothing more with *source\_file* and shall go on to any remaining files.
2. If *source\_file* is of type directory, the following steps shall be taken:
  - a. If the **-R** option was not specified, *cp* shall write a diagnostic message to standard error, do nothing more with *source\_file*, and go on to any remaining files.
  - b. If *source\_file* was not specified as an operand and *source\_file* is dot or dot-dot, *cp* shall do nothing more with *source\_file* and go on to any remaining files.
  - c. If *dest\_file* exists and it is a file type not specified by the System Interfaces volume of POSIX.1-2008, the behavior is implementation-defined.
  - d. If *dest\_file* exists and it is not of type directory, *cp* shall write a diagnostic message to standard error, do nothing more with *source\_file* or any files below *source\_file* in the file hierarchy, and go on to any remaining files.
  - e. If the directory *dest\_file* does not exist, it shall be created with file permission bits set to the same value as those of *source\_file*, modified by the file creation mask of the user if the **-p** option was not specified, and then bitwise-inclusively OR'ed with S\_IRWXU. If *dest\_file* cannot be created, *cp* shall write a diagnostic message to standard error, do nothing more with *source\_file*, and go on to any remaining files. It is unspecified if *cp* attempts to copy files in the file hierarchy rooted in *source\_file*.
  - f. The files in the directory *source\_file* shall be copied to the directory *dest\_file*, taking the four steps (1 to 4) listed here with the files as *source\_files*.
  - g. If *dest\_file* was created, its file permission bits shall be changed (if necessary) to be the same as those of *source\_file*, modified by the file creation mask of the user if the **-p** option was not specified.
  - h. The *cp* utility shall do nothing more with *source\_file* and go on to any remaining files.
3. If *source\_file* is of type regular file, the following steps shall be taken:
  - a. The behavior is unspecified if *dest\_file* exists and was written by a previous step. Otherwise, if *dest\_file* exists, the following steps shall be taken:
    - i. If the **-i** option is in effect, the *cp* utility shall write a prompt to the standard error and read a line from the standard input. If the response is not affirmative, *cp* shall do nothing more with *source\_file* and go on to any remaining files.
    - ii. A file descriptor for *dest\_file* shall be obtained by performing actions equivalent to the *open()* function defined in the System Interfaces volume of POSIX.1-2008 called using *dest\_file* as the *path* argument, and the bitwise-inclusive OR of O\_WRONLY and O\_TRUNC as the *oflag* argument.
    - iii. If the attempt to obtain a file descriptor fails and the **-f** option is in effect, *cp* shall attempt to remove the file by performing actions equivalent to the *unlink()* function defined in the System Interfaces volume of POSIX.1-2008

- 83276 called using *dest\_file* as the *path* argument. If this attempt succeeds, *cp* shall  
83277 continue with step 3b.
- 83278 b. If *dest\_file* does not exist, a file descriptor shall be obtained by performing actions  
83279 equivalent to the *open()* function defined in the System Interfaces volume of  
83280 POSIX.1-2008 called using *dest\_file* as the *path* argument, and the bitwise-inclusive  
83281 OR of *O\_WRONLY* and *O\_CREAT* as the *oflag* argument. The file permission bits  
83282 of *source\_file* shall be the *mode* argument.
- 83283 c. If the attempt to obtain a file descriptor fails, *cp* shall write a diagnostic message to  
83284 standard error, do nothing more with *source\_file*, and go on to any remaining files.
- 83285 d. The contents of *source\_file* shall be written to the file descriptor. Any write errors  
83286 shall cause *cp* to write a diagnostic message to standard error and continue to step  
83287 3e.
- 83288 e. The file descriptor shall be closed.
- 83289 f. The *cp* utility shall do nothing more with *source\_file*. If a write error occurred in  
83290 step 3d, it is unspecified if *cp* continues with any remaining files. If no write error  
83291 occurred in step 3d, *cp* shall go on to any remaining files.
- 83292 4. Otherwise, the **-R** option was specified, and the following steps shall be taken:
- 83293 a. The *dest\_file* shall be created with the same file type as *source\_file*.
- 83294 b. If *source\_file* is a file of type FIFO, the file permission bits shall be the same as those  
83295 of *source\_file*, modified by the file creation mask of the user if the **-p** option was not  
83296 specified. Otherwise, the permissions, owner ID, and group ID of *dest\_file* are  
83297 implementation-defined.
- 83298 If this creation fails for any reason, *cp* shall write a diagnostic message to standard  
83299 error, do nothing more with *source\_file*, and go on to any remaining files.
- 83300 c. If *source\_file* is a file of type symbolic link, and the options require the symbolic link  
83301 itself to be acted upon, the pathname contained in *dest\_file* shall be the same as the  
83302 pathname contained in *source\_file*.
- 83303 If this fails for any reason, *cp* shall write a diagnostic message to standard error, do  
83304 nothing more with *source\_file*, and go on to any remaining files.
- 83305 If the implementation provides additional or alternate access control mechanisms (see XBD  
83306 [Section 4.4](#), on page 108), their effect on copies of files is implementation-defined.

## 83307 OPTIONS

83308 The *cp* utility shall conform to XBD [Section 12.2](#) (on page 215).

83309 The following options shall be supported:

- 83310 **-f** If a file descriptor for a destination file cannot be obtained, as described in step  
83311 3.a.ii., attempt to unlink the destination file and proceed.
- 83312 **-H** Take actions based on the type and contents of the file referenced by any symbolic  
83313 link specified as a *source\_file* operand.
- 83314 **-i** Write a prompt to standard error before copying to any existing non-directory  
83315 destination file. If the response from the standard input is affirmative, the copy  
83316 shall be attempted; otherwise, it shall not.

|       |                              |                                                                                                                                                                                                                                      |
|-------|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 83317 | <b>-L</b>                    | Take actions based on the type and contents of the file referenced by any symbolic link specified as a <i>source_file</i> operand or any symbolic links encountered during traversal of a file hierarchy.                            |
| 83318 |                              |                                                                                                                                                                                                                                      |
| 83319 |                              |                                                                                                                                                                                                                                      |
| 83320 | <b>-P</b>                    | Take actions on any symbolic link specified as a <i>source_file</i> operand or any symbolic link encountered during traversal of a file hierarchy.                                                                                   |
| 83321 |                              |                                                                                                                                                                                                                                      |
| 83322 | <b>-p</b>                    | Duplicate the following characteristics of each source file in the corresponding destination file:                                                                                                                                   |
| 83323 |                              |                                                                                                                                                                                                                                      |
| 83324 |                              | 1. The time of last data modification and time of last access. If this duplication fails for any reason, <i>cp</i> shall write a diagnostic message to standard error.                                                               |
| 83325 |                              |                                                                                                                                                                                                                                      |
| 83326 |                              | 2. The user ID and group ID. If this duplication fails for any reason, it is unspecified whether <i>cp</i> writes a diagnostic message to standard error.                                                                            |
| 83327 |                              |                                                                                                                                                                                                                                      |
| 83328 |                              | 3. The file permission bits and the S_ISUID and S_ISGID bits. Other, implementation-defined, bits may be duplicated as well. If this duplication fails for any reason, <i>cp</i> shall write a diagnostic message to standard error. |
| 83329 |                              |                                                                                                                                                                                                                                      |
| 83330 |                              |                                                                                                                                                                                                                                      |
| 83331 |                              | If the user ID or the group ID cannot be duplicated, the file permission bits S_ISUID and S_ISGID shall be cleared. If these bits are present in the source file but                                                                 |
| 83332 |                              | are not duplicated in the destination file, it is unspecified whether <i>cp</i> writes a                                                                                                                                             |
| 83333 |                              | diagnostic message to standard error.                                                                                                                                                                                                |
| 83334 |                              |                                                                                                                                                                                                                                      |
| 83335 |                              | The order in which the preceding characteristics are duplicated is unspecified. The                                                                                                                                                  |
| 83336 |                              | <i>dest_file</i> shall not be deleted if these characteristics cannot be preserved.                                                                                                                                                  |
| 83337 | <b>-R</b>                    | Copy file hierarchies.                                                                                                                                                                                                               |
| 83338 |                              | Specifying more than one of the mutually-exclusive options <b>-H</b> , <b>-L</b> , and <b>-P</b> shall not be                                                                                                                        |
| 83339 |                              | considered an error. The last option specified shall determine the behavior of the utility.                                                                                                                                          |
| 83340 | <b>OPERANDS</b>              |                                                                                                                                                                                                                                      |
| 83341 |                              | The following operands shall be supported:                                                                                                                                                                                           |
| 83342 | <i>source_file</i>           | A pathname of a file to be copied. If a <i>source_file</i> operand is '-', it shall refer to a                                                                                                                                       |
| 83343 |                              | file named -; implementations shall not treat it as meaning standard input.                                                                                                                                                          |
| 83344 | <i>target_file</i>           | A pathname of an existing or nonexistent file, used for the output when a single                                                                                                                                                     |
| 83345 |                              | file is copied. If a <i>target_file</i> operand is '-', it shall refer to a file named -;                                                                                                                                            |
| 83346 |                              | implementations shall not treat it as meaning standard output.                                                                                                                                                                       |
| 83347 | <i>target</i>                | A pathname of a directory to contain the copied files.                                                                                                                                                                               |
| 83348 | <b>STDIN</b>                 |                                                                                                                                                                                                                                      |
| 83349 |                              | The standard input shall be used to read an input line in response to each prompt specified in                                                                                                                                       |
| 83350 |                              | the STDERR section. Otherwise, the standard input shall not be used.                                                                                                                                                                 |

| 83393 |                               |                                                                                                                                                                                                                                                                                                                                                          |

**APPLICATION USAGE**

The set-user-ID and set-group-ID bits are explicitly cleared when files are created. This is to prevent users from creating programs that are set-user-ID or set-group-ID to them when copying files or to make set-user-ID or set-group-ID files accessible to new groups of users. For example, if a file is set-user-ID and the copy has a different group ID than the source, a new group of users has execute permission to a set-user-ID program than did previously. In particular, this is a problem for superusers copying users' trees.

**EXAMPLES**

None.

**RATIONALE**

The `-i` option exists on BSD systems, giving applications and users a way to avoid accidentally removing files when copying. Although the 4.3 BSD version does not prompt if the standard input is not a terminal, the standard developers decided that use of `-i` is a request for interaction, so when the destination path exists, the utility takes instructions from whatever responds on standard input.

The exact format of the interactive prompts is unspecified. Only the general nature of the contents of prompts are specified because implementations may desire more descriptive prompts than those used on historical implementations. Therefore, an application using the `-i` option relies on the system to provide the most suitable dialog directly with the user, based on the behavior specified.

The `-p` option is historical practice on BSD systems, duplicating the time of last data modification and time of last access. This volume of POSIX.1-2008 extends it to preserve the user and group IDs, as well as the file permissions. This requirement has obvious problems in that the directories are almost certainly modified after being copied. This volume of POSIX.1-2008 requires that the modification times be preserved. The statement that the order in which the characteristics are duplicated is unspecified is to permit implementations to provide the maximum amount of security for the user. Implementations should take into account the obvious security issues involved in setting the owner, group, and mode in the wrong order or creating files with an owner, group, or mode different from the final value.

It is unspecified whether `cp` writes diagnostic messages when the user and group IDs cannot be set due to the widespread practice of users using `-p` to duplicate some portion of the file characteristics, indifferent to the duplication of others. Historic implementations only write diagnostic messages on errors other than [EPERM].

Earlier versions of this standard included support for the `-r` option to copy file hierarchies. The `-r` option is historical practice on BSD and BSD-derived systems. This option is no longer specified by POSIX.1-2008 but may be present in some implementations. The `-R` option was added as a close synonym to the `-r` option, selected for consistency with all other options in this volume of POSIX.1-2008 that do recursive directory descent.

The difference between `-R` and the removed `-r` option is in the treatment by `cp` of file types other than regular and directory. It was implementation-defined how the `-` option treated special files to allow both historical implementations and those that chose to support `-r` with the same abilities as `-R` defined by this volume of POSIX.1-2008. The original `-r` flag, for historic reasons, did not handle special files any differently from regular files, but always read the file and copied its contents. This had obvious problems in the presence of special file types; for example, character devices, FIFOs, and sockets.

When a failure occurs during the copying of a file hierarchy, `cp` is required to attempt to copy files that are on the same level in the hierarchy or above the file where the failure occurred. It is unspecified if `cp` shall attempt to copy files below the file where the failure occurred (which

cannot succeed in any case).

Permissions, owners, and groups of created special file types have been deliberately left as implementation-defined. This is to allow systems to satisfy special requirements (for example, allowing users to create character special devices, but requiring them to be owned by a certain group). In general, it is strongly suggested that the permissions, owner, and group be the same as if the user had run the historical *mknod*, *ln*, or other utility to create the file. It is also probable that additional privileges are required to create block, character, or other implementation-defined special file types.

Additionally, the **-p** option explicitly requires that all set-user-ID and set-group-ID permissions be discarded if any of the owner or group IDs cannot be set. This is to keep users from unintentionally giving away special privilege when copying programs.

When creating regular files, historical versions of *cp* use the mode of the source file as modified by the file mode creation mask. Other choices would have been to use the mode of the source file unmodified by the creation mask or to use the same mode as would be given to a new file created by the user (plus the execution bits of the source file) and then modify it by the file mode creation mask. In the absence of any strong reason to change historic practice, it was in large part retained.

When creating directories, historical versions of *cp* use the mode of the source directory, plus read, write, and search bits for the owner, as modified by the file mode creation mask. This is done so that *cp* can copy trees where the user has read permission, but the owner does not. A side-effect is that if the file creation mask denies the owner permissions, *cp* fails. Also, once the copy is done, historical versions of *cp* set the permissions on the created directory to be the same as the source directory, unmodified by the file creation mask.

This behavior has been modified so that *cp* is always able to create the contents of the directory, regardless of the file creation mask. After the copy is done, the permissions are set to be the same as the source directory, as modified by the file creation mask. This latter change from historical behavior is to prevent users from accidentally creating directories with permissions beyond those they would normally set and for consistency with the behavior of *cp* in creating files.

It is not a requirement that *cp* detect attempts to copy a file to itself; however, implementations are strongly encouraged to do so. Historical implementations have detected the attempt in most cases.

There are two methods of copying subtrees in this volume of POSIX.1-2008. The other method is described as part of the *pax* utility (see *pax*). Both methods are historical practice. The *cp* utility provides a simpler, more intuitive interface, while *pax* offers a finer granularity of control. Each provides additional functionality to the other; in particular, *pax* maintains the hard-link structure of the hierarchy, while *cp* does not. It is the intention of the standard developers that the results be similar (using appropriate option combinations in both utilities). The results are not required to be identical; there seemed insufficient gain to applications to balance the difficulty of implementations having to guarantee that the results would be exactly identical.

The wording allowing *cp* to copy a directory to implementation-defined file types not specified by the System Interfaces volume of POSIX.1-2008 is provided so that implementations supporting symbolic links are not required to prohibit copying directories to symbolic links. Other extensions to the System Interfaces volume of POSIX.1-2008 file types may need to use this loophole as well.

83493 First released in Issue 2.

83494 **Issue 6**83495 The **-r** option is marked obsolescent.83496 The new options **-H**, **-L**, and **-P** are added to align with the IEEE P1003.2b draft standard. These  
83497 options affect the processing of symbolic links.83498 IEEE PASC Interpretation 1003.2 #194 is applied, adding a description of the **-P** option.83499 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/18 is applied, correcting an error in the  
83500 SEE ALSO section.83501 **Issue 7**83502 Austin Group Interpretation 1003.1-2001 #126 is applied, changing the description of the  
83503 *LC\_MESSAGES* environment variable.

83504 Austin Group Interpretations 1003.1-2001 #092, #164, #165, and #168 are applied.

83505 SD5-XCU-ERN-31 and SD5-XCU-ERN-42 are applied, updating the DESCRIPTION.

83506 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

83507 SD5-XCU-ERN-102 is applied, clarifying the **-i** option within the OPTIONS section.83508 The obsolescent **-r** option is removed.83509 The **-P** option is added to the SYNOPSIS and to the DESCRIPTION with respect to the **-R**  
83510 option.

83511 **NAME**

83512 crontab — schedule periodic background work

83513 **SYNOPSIS**83514 crontab [*file*]83515 UP crontab [**-e** | **-l** | **-r**]83516 **DESCRIPTION**

83517 UP The *crontab* utility shall create, replace, or edit a user's crontab entry; a crontab entry is a list of  
 83518 commands and the times at which they shall be executed. The new crontab entry can be input by  
 83519 UP specifying *file* or input from standard input if no *file* operand is specified, or by using an editor,  
 83520 if **-e** is specified.

83521 Upon execution of a command from a crontab entry, the implementation shall supply a default  
 83522 environment, defining at least the following environment variables:

83523 *HOME* A pathname of the user's home directory.

83524 *LOGNAME* The user's login name.

83525 *PATH* A string representing a search path guaranteed to find all of the standard utilities.

83526 *SHELL* A pathname of the command interpreter. When *crontab* is invoked as specified by  
 83527 this volume of POSIX.1-2008, the value shall be a pathname for *sh*.

83528 The values of these variables when *crontab* is invoked as specified by this volume of  
 83529 POSIX.1-2008 shall not affect the default values provided when the scheduled command is run.

83530 If standard output and standard error are not redirected by commands executed from the  
 83531 crontab entry, any generated output or errors shall be mailed, via an implementation-defined  
 83532 method, to the user.

83533 XSI Users shall be permitted to use *crontab* if their names appear in the file **cron.allow** which is  
 83534 located in an implementation-defined directory. If that file does not exist, the file **cron.deny**,  
 83535 which is located in an implementation-defined directory, shall be checked to determine whether  
 83536 the user shall be denied access to *crontab*. If neither file exists, only a process with appropriate  
 83537 privileges shall be allowed to submit a job. If only **cron.deny** exists and is empty, global usage  
 83538 shall be permitted. The **cron.allow** and **cron.deny** files shall consist of one user name per line.

83539 **OPTIONS**83540 The *crontab* utility shall conform to XBD [Section 12.2](#) (on page 215).

83541 The following options shall be supported:

83542 UP **-e** Edit a copy of the invoking user's crontab entry, or create an empty entry to edit if  
 83543 the crontab entry does not exist. When editing is complete, the entry shall be  
 83544 installed as the user's crontab entry.

83545 **-l** (The letter ell.) List the invoking user's crontab entry.

83546 **-r** Remove the invoking user's crontab entry.

83547 **OPERANDS**

83548 The following operand shall be supported:

83549 *file* The pathname of a file that contains specifications, in the format defined in the  
 83550 INPUT FILES section, for crontab entries.

83551 **STDIN**

83552 See the INPUT FILES section.

83553 **INPUT FILES**

83554 In the POSIX locale, the user or application shall ensure that a crontab entry is a text file  
 83555 consisting of lines of six fields each. The fields shall be separated by <blank> characters. The  
 83556 first five fields shall be integer patterns that specify the following:

- 83557 1. Minute [0,59]
- 83558 2. Hour [0,23]
- 83559 3. Day of the month [1,31]
- 83560 4. Month of the year [1,12]
- 83561 5. Day of the week ([0,6] with 0=Sunday)

83562 Each of these patterns can be either an <asterisk> (meaning all valid values), an element, or a list  
 83563 of elements separated by <comma> characters. An element shall be either a number or two  
 83564 numbers separated by a <hyphen> (meaning an inclusive range). The specification of days can  
 83565 be made by two fields (day of the month and day of the week). If month, day of month, and day  
 83566 of week are all <asterisk> characters, every day shall be matched. If either the month or day of  
 83567 month is specified as an element or list, but the day of week is an <asterisk>, the month and day  
 83568 of month fields shall specify the days that match. If both month and day of month are specified  
 83569 as an <asterisk>, but day of week is an element or list, then only the specified days of the week  
 83570 match. Finally, if either the month or day of month is specified as an element or list, and the day  
 83571 of week is also specified as an element or list, then any day matching either the month and day  
 83572 of month, or the day of week, shall be matched.

83573 The sixth field of a line in a crontab entry is a string that shall be executed by *sh* at the specified  
 83574 times. A <percent-sign> character in this field shall be translated to a <newline>. Any character  
 83575 preceded by a <backslash> (including the ' % ' ) shall cause that character to be treated literally.  
 83576 Only the first line (up to a ' % ' or end-of-line) of the command field shall be executed by the  
 83577 command interpreter. The other lines shall be made available to the command as standard input.

83578 Blank lines and those whose first non-<blank> is ' # ' shall be ignored.

83579 XSI The text files **cron.allow** and **cron.deny**, which are located in an implementation-defined  
 83580 directory, shall contain zero or more user names, one per line, of users who are, respectively,  
 83581 authorized or denied access to the service underlying the *crontab* utility.

83582 **ENVIRONMENT VARIABLES**

83583 The following environment variables shall affect the execution of *crontab*:

- |       |                 |                                                                                                                                                                                                                                                    |
|-------|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 83584 | <i>EDITOR</i>   | Determine the editor to be invoked when the <b>-e</b> option is specified. The default editor shall be <i>vi</i> .                                                                                                                                 |
| 83585 |                 |                                                                                                                                                                                                                                                    |
| 83586 | <i>LANG</i>     | Provide a default value for the internationalization variables that are unset or null. (See XBD <a href="#">Section 8.2</a> (on page 174) for the precedence of internationalization variables used to determine the values of locale categories.) |
| 83587 |                 |                                                                                                                                                                                                                                                    |
| 83588 |                 |                                                                                                                                                                                                                                                    |
| 83589 | <i>LC_ALL</i>   | If set to a non-empty string value, override the values of all the other internationalization variables.                                                                                                                                           |
| 83590 |                 |                                                                                                                                                                                                                                                    |
| 83591 | <i>LC_CTYPE</i> | Determine the locale for the interpretation of sequences of bytes of text data as characters (for example, single-byte as opposed to multi-byte characters in arguments and input files).                                                          |
| 83592 |                 |                                                                                                                                                                                                                                                    |
| 83593 |                 |                                                                                                                                                                                                                                                    |

83594 **LC\_MESSAGES**  
 83595 Determine the locale that should be used to affect the format and contents of  
 83596 diagnostic messages written to standard error.

83597 XSI **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

83598 **ASYNCHRONOUS EVENTS**  
 83599 Default.

83600 **STDOUT**  
 83601 If the `-l` option is specified, the crontab entry shall be written to the standard output.

83602 **STDERR**  
 83603 The standard error shall be used only for diagnostic messages.

83604 **OUTPUT FILES**  
 83605 None.

83606 **EXTENDED DESCRIPTION**  
 83607 None.

83608 **EXIT STATUS**  
 83609 The following exit values shall be returned:  
 83610 0 Successful completion.  
 83611 >0 An error occurred.

83612 **CONSEQUENCES OF ERRORS**  
 83613 UP The user's crontab entry is not submitted, removed, **edited**, or listed.

83614 **APPLICATION USAGE**  
 83615 The format of the crontab entry shown here is guaranteed only for the POSIX locale. Other  
 83616 cultures may be supported with substantially different interfaces, although implementations are  
 83617 encouraged to provide comparable levels of functionality.

83618 The default settings of the *HOME*, *LOGNAME*, *PATH*, and *SHELL* variables that are given to the  
 83619 scheduled job are not affected by the settings of those variables when *crontab* is run; as stated,  
 83620 they are defaults. The text about "invoked as specified by this volume of POSIX.1-2008" means  
 83621 that the implementation may provide extensions that allow these variables to be affected at  
 83622 runtime, but that the user has to take explicit action in order to access the extension, such as give  
 83623 a new option flag or modify the format of the crontab entry.

83624 A typical user error is to type only *crontab*; this causes the system to wait for the new crontab  
 83625 entry on standard input. If end-of-file is typed (generally <control>-D), the crontab entry is  
 83626 replaced by an empty file. In this case, the user should type the interrupt character, which  
 83627 prevents the crontab entry from being replaced.

83628 **EXAMPLES**  
 83629 1. Clean up **core** files every weekday morning at 3:15 am:  
 83630 15 3 \* \* 1-5 find "\$HOME" -name core -exec rm -f {} + 2>/dev/null  
 83631 2. Mail a birthday greeting:  
 83632 0 12 14 2 \* mailx john%Happy Birthday!%Time for lunch.  
 83633 3. As an example of specifying the two types of days:  
 83634 0 0 1,15 \* 1

83635 would run a command on the first and fifteenth of each month, as well as on every  
83636 Monday. To specify days by only one field, the other field should be set to `'*'`; for  
83637 example:

83638 0 0 \* \* 1

83639 would run a command only on Mondays.

#### 83640 RATIONALE

83641 All references to a *cron* daemon and to *cron files* have been omitted. Although historical  
83642 implementations have used this arrangement, there is no reason to limit future implementations.

83643 This description of *crontab* is designed to support only users with normal privileges. The format  
83644 of the input is based on the System V *crontab*; however, there is no requirement here that the  
83645 actual system database used by the *cron* daemon (or a similar mechanism) use this format  
83646 internally. For example, systems derived from BSD are likely to have an additional field  
83647 appended that indicates the user identity to be used when the job is submitted.

83648 The `-e` option was adopted from the SVID as a user convenience, although it does not exist in all  
83649 historical implementations.

#### 83650 FUTURE DIRECTIONS

83651 None.

#### 83652 SEE ALSO

83653 *at*

83654 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)

#### 83655 CHANGE HISTORY

83656 First released in Issue 2.

#### 83657 Issue 6

83658 This utility is marked as part of the User Portability Utilities option.

83659 The normative text is reworded to avoid use of the term “must” for application requirements.

#### 83660 Issue 7

83661 The *crontab* utility (except for the `-e` option) is moved from the User Portability Utilities option  
83662 to the Base. User Portability Utilities is now an option for interactive utilities.

83663 SD5-XCU-ERN-95 is applied, removing the references to fixed locations for the files referenced  
83664 by the *crontab* utility.

83665 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

83666 The first example is changed to remove the unreliable use of *find* | *xargs*.

83667 **NAME**

83668       csplit — split files based on context

83669 **SYNOPSIS**83670       csplit [-ks] [-f *prefix*] [-n *number*] *file arg...*83671 **DESCRIPTION**83672       The *csplit* utility shall read the file named by the *file* operand, write all or part of that file into  
83673       other files as directed by the *arg* operands, and write the sizes of the files.83674 **OPTIONS**83675       The *csplit* utility shall conform to XBD [Section 12.2](#) (on page 215).

83676       The following options shall be supported:

83677       **-f *prefix***     Name the created files *prefix00*, *prefix01*, ..., *prefixn*. The default is *xx00* ... *xxn*. If  
83678       the *prefix* argument would create a filename exceeding {NAME\_MAX} bytes, an  
83679       error shall result, *csplit* shall exit with a diagnostic message, and no files shall be  
83680       created.83681       **-k**            Leave previously created files intact. By default, *csplit* shall remove created files if  
83682       an error occurs.83683       **-n *number***    Use *number* decimal digits to form filenames for the file pieces. The default shall be  
83684       2.83685       **-s**            Suppress the output of file size messages.83686 **OPERANDS**

83687       The following operands shall be supported:

83688       *file*           The pathname of a text file to be split. If *file* is '-', the standard input shall be  
83689       used.83690       Each *arg* operand can be one of the following:83691       /*regexp*/[*offset*]83692       A file shall be created using the content of the lines from the current line up to, but  
83693       not including, the line that results from the evaluation of the regular expression  
83694       with *offset*, if any, applied. The regular expression *regexp* shall follow the rules for  
83695       basic regular expressions described in XBD [Section 9.3](#) (on page 183). The  
83696       application shall use the sequence "\/" to specify a <slash> character within the  
83697       *regexp*. The optional offset shall be a positive or negative integer value representing a  
83698       number of lines. A positive integer value can be preceded by '+'. If the selection  
83699       of lines from an *offset* expression of this type would create a file with zero lines, or  
83700       one with greater than the number of lines left in the input file, the results are  
83701       unspecified. After the section is created, the current line shall be set to the line that  
83702       results from the evaluation of the regular expression with any offset applied. If the  
83703       current line is the first line in the file and a regular expression operation has not yet  
83704       been performed, the pattern match of *regexp* shall be applied from the current line to  
83705       the end of the file. Otherwise, the pattern match of *regexp* shall be applied from the  
83706       line following the current line to the end of the file.83707       %*regexp*%[*offset*]83708       Equivalent to /*regexp*/[*offset*], except that no file shall be created for the selected  
83709       section of the input file. The application shall use the sequence "\%" to specify a  
83710       <percent-sign> character within the *regexp*.

83711 *line\_no* Create a file from the current line up to (but not including) the line number *line\_no*.  
 83712 Lines in the file shall be numbered starting at one. The current line becomes  
 83713 *line\_no*.

83714 {*num*} Repeat operand. This operand can follow any of the operands described  
 83715 previously. If it follows a *rexp* type operand, that operand shall be applied *num*  
 83716 more times. If it follows a *line\_no* operand, the file shall be split every *line\_no* lines,  
 83717 *num* times, from that point.

83718 An error shall be reported if an operand does not reference a line between the current position  
 83719 and the end of the file.

83720 **STDIN**

83721 See the INPUT FILES section.

83722 **INPUT FILES**

83723 The input file shall be a text file.

83724 **ENVIRONMENT VARIABLES**

83725 The following environment variables shall affect the execution of *csplit*:

83726 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 83727 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 83728 variables used to determine the values of locale categories.)

83729 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 83730 internationalization variables.

83731 *LC\_COLLATE*  
 83732 Determine the locale for the behavior of ranges, equivalence classes, and multi-  
 83733 character collating elements within regular expressions.

83734 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 83735 characters (for example, single-byte as opposed to multi-byte characters in  
 83736 arguments and input files) and the behavior of character classes within regular  
 83737 expressions.

83738 *LC\_MESSAGES*  
 83739 Determine the locale that should be used to affect the format and contents of  
 83740 diagnostic messages written to standard error.

83741 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

83742 **ASYNCHRONOUS EVENTS**

83743 If the *-k* option is specified, created files shall be retained. Otherwise, the default action occurs.

83744 **STDOUT**

83745 Unless the *-s* option is used, the standard output shall consist of one line per file created, with a  
 83746 format as follows:

83747 "%d\n", <*file size in bytes*>

83748 **STDERR**

83749 The standard error shall be used only for diagnostic messages.

83750 **OUTPUT FILES**

83751 The output files shall contain portions of the original input file; otherwise, unchanged.

83752 **EXTENDED DESCRIPTION**

83753 None.

83754 **EXIT STATUS**

83755 The following exit values shall be returned:

83756 0 Successful completion.

83757 &gt;0 An error occurred.

83758 **CONSEQUENCES OF ERRORS**

83759 By default, created files shall be removed if an error occurs. When the **-k** option is specified,  
 83760 created files shall not be removed if an error occurs.

83761 **APPLICATION USAGE**

83762 None.

83763 **EXAMPLES**83764 1. This example creates four files, **cobol00** ... **cobol03**:83765 `csplit -f cobol file '/procedure division/' /par5./ /par16./`

83766 After editing the split files, they can be recombined as follows:

83767 `cat cobol0[0-3] > file`

83768 Note that this example overwrites the original file.

83769 2. This example would split the file after the first 99 lines, and every 100 lines thereafter, up  
 83770 to 9999 lines; this is because lines in the file are numbered from 1 rather than zero, for  
 83771 historical reasons:

83772 `csplit -k file 100 {99}`

83773 3. Assuming that **prog.c** follows the C-language coding convention of ending routines with  
 83774 a `' } '` at the beginning of the line, this example creates a file containing each separate C  
 83775 routine (up to 21) in **prog.c**:

83776 `csplit -k prog.c '%main(%' '/^}'+1' {20}`83777 **RATIONALE**83778 The **-n** option was added to extend the range of filenames that could be handled.

83779 Consideration was given to adding a **-a** flag to use the alphabetic filename generation used by  
 83780 the historical *split* utility, but the functionality added by the **-n** option was deemed to make  
 83781 alphabetic naming unnecessary.

83782 **FUTURE DIRECTIONS**

83783 None.

83784 **SEE ALSO**83785 *sed*, *split*83786 XBD [Chapter 8](#) (on page 173), [Section 9.3](#) (on page 183), [Section 12.2](#) (on page 215)83787 **CHANGE HISTORY**

83788 First released in Issue 2.

**83789 Issue 5**

83790 The FUTURE DIRECTIONS section is added.

**83791 Issue 6**

83792 This utility is marked as part of the User Portability Utilities option.

83793 The APPLICATION USAGE section is added.

83794 The description of regular expression operands is changed to align with the IEEE P1003.2b draft  
83795 standard.

83796 The normative text is reworded to avoid use of the term “must” for application requirements.

**83797 Issue 7**

83798 The *csplit* utility is moved from the User Portability Utilities option to the Base. User Portability  
83799 Utilities is now an option for interactive utilities.

83800 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

83801 The SYNOPSIS and OPERANDS sections are revised to use a single *arg* to split a file into two  
83802 pieces.

83803 **NAME**83804 `ctags` — create a tags file (**DEVELOPMENT**, **FORTTRAN**)83805 **SYNOPSIS**83806 SD `ctags [-a] [-f tagsfile] pathname...`83807 `ctags -x pathname...`83808 **DESCRIPTION**

83809 The *ctags* utility shall be provided on systems that support the the Software Development  
 83810 Utilities option, and either or both of the C-Language Development Utilities option and  
 83811 FORTRAN Development Utilities option. On other systems, it is optional.

83812 The *ctags* utility shall write a *tagsfile* or an index of objects from C-language or FORTRAN source  
 83813 files specified by the *pathname* operands. The *tagsfile* shall list the locators of language-specific  
 83814 objects within the source files. A locator consists of a name, *pathname*, and either a search  
 83815 pattern or a line number that can be used in searching for the object definition. The objects that  
 83816 shall be recognized are specified in the EXTENDED DESCRIPTION section.

83817 **OPTIONS**83818 The *ctags* utility shall conform to XBD [Section 12.2](#) (on page 215).

83819 The following options shall be supported:

83820 **-a** Append to *tagsfile*.

83821 **-f** *tagsfile* Write the object locator lists into *tagsfile* instead of the default file named **tags** in the  
 83822 current directory.

83823 **-x** Produce a list of object names, the line number, and filename in which each is  
 83824 defined, as well as the text of that line, and write this to the standard output. A  
 83825 *tagsfile* shall not be created when **-x** is specified.

83826 **OPERANDS**83827 The following *pathname* operands are supported:

83828 *file.c* Files with basenames ending with the **.c** suffix shall be treated as C-language  
 83829 source code. Such files that are not valid input to *c99* produce unspecified results.

83830 *file.h* Files with basenames ending with the **.h** suffix shall be treated as C-language  
 83831 source code. Such files that are not valid input to *c99* produce unspecified results.

83832 *file.f* Files with basenames ending with the **.f** suffix shall be treated as FORTRAN-  
 83833 language source code. Such files that are not valid input to *fort77* produce  
 83834 unspecified results.

83835 The handling of other files is implementation-defined.

83836 **STDIN**

83837 See the INPUT FILES section.

83838 **INPUT FILES**

83839 The input files shall be text files containing source code in the language indicated by the  
 83840 operand filename suffixes.

83841 **ENVIRONMENT VARIABLES**83842 The following environment variables shall affect the execution of *ctags*:

83843 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 83844 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 83845 variables used to determine the values of locale categories.)

83846 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 83847 internationalization variables.

83848 *LC\_COLLATE*

83849 Determine the order in which output is sorted for the *-x* option. The POSIX locale  
 83850 determines the order in which the *tagsfile* is written.

83851 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 83852 characters (for example, single-byte as opposed to multi-byte characters in  
 83853 arguments and input files). When processing C-language source code, if the locale  
 83854 is not compatible with the C locale described by the ISO C standard, the results are  
 83855 unspecified.

83856 *LC\_MESSAGES*

83857 Determine the locale that should be used to affect the format and contents of  
 83858 diagnostic messages written to standard error.

83859 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

83860 **ASYNCHRONOUS EVENTS**

83861 Default.

83862 **STDOUT**

83863 The list of object name information produced by the *-x* option shall be written to standard  
 83864 output in the following format:

83865 "%s %d %s %s", <object-name>, <line-number>, <filename>, <text>

83866 where <text> is the text of line <line-number> of file <filename>.

83867 **STDERR**

83868 The standard error shall be used only for diagnostic messages.

83869 **OUTPUT FILES**83870 When the *-x* option is not specified, the format of the output file shall be:

83871 "%s\t%s\t/%s/\n", <identifier>, <filename>, <pattern>

83872 where <pattern> is a search pattern that could be used by an editor to find the defining instance  
 83873 of <identifier> in <filename> (where *defining instance* is indicated by the declarations listed in the  
 83874 EXTENDED DESCRIPTION).

83875 An optional <circumflex> ('*^*') can be added as a prefix to <pattern>, and an optional <dollar-  
 83876 sign> can be appended to <pattern> to indicate that the pattern is anchored to the beginning  
 83877 (end) of a line of text. Any <slash> or <backslash> characters in <pattern> shall be preceded by a  
 83878 <backslash> character. The anchoring <circumflex>, <dollar-sign>, and escaping <backslash>  
 83879 characters shall not be considered part of the search pattern. All other characters in the search  
 83880 pattern shall be considered literal characters.

An alternative format is:

```
"%s\t%s\t%s?\n", <identifier>, <filename>, <pattern>
```

which is identical to the first format except that <slash> characters in <pattern> shall not be preceded by escaping <backslash> characters, and <question-mark> characters in <pattern> shall be preceded by <backslash> characters.

A second alternative format is:

```
"%s\t%s\t%d\n", <identifier>, <filename>, <lineno>
```

where <lineno> is a decimal line number that could be used by an editor to find <identifier> in <filename>.

Neither alternative format shall be produced by *ctags* when it is used as described by POSIX.1-2008, but the standard utilities that process tags files shall be able to process those formats as well as the first format.

In any of these formats, the file shall be sorted by identifier, based on the collation sequence in the POSIX locale.

## EXTENDED DESCRIPTION

If the operand identifies C-language source, the *ctags* utility shall attempt to produce an output line for each of the following objects:

- Function definitions
- Type definitions
- Macros with arguments

It may also produce output for any of the following objects:

- Function prototypes
- Structures
- Unions
- Global variable definitions
- Enumeration types
- Macros without arguments
- **#define** statements
- **#line** statements

Any **#if** and **#ifdef** statements shall produce no output. The tag **main** is treated specially in C programs. The tag formed shall be created by prefixing **M** to the name of the file, with the trailing **.c**, and leading pathname components (if any) removed.

On systems that do not support the C-Language Development Utilities option, *ctags* produces unspecified results for C-language source code files. It should write to standard error a message identifying this condition and cause a non-zero exit status to be produced.

If the operand identifies FORTRAN source, the *ctags* utility shall produce an output line for each function definition. It may also produce output for any of the following objects:

- Subroutine definitions

- 83919 • COMMON statements
- 83920 • PARAMETER statements
- 83921 • DATA and BLOCK DATA statements
- 83922 • Statement numbers

83923 On systems that do not support the FORTRAN Development Utilities option, *ctags* produces  
 83924 unspecified results for FORTRAN source code files. It should write to standard error a message  
 83925 identifying this condition and cause a non-zero exit status to be produced.

83926 It is implementation-defined what other objects (including duplicate identifiers) produce output.

## 83927 EXIT STATUS

83928 The following exit values shall be returned:

- 83929 0 Successful completion.
- 83930 >0 An error occurred.

## 83931 CONSEQUENCES OF ERRORS

83932 Default.

## 83933 APPLICATION USAGE

83934 The output with *-x* is meant to be a simple index that can be written out as an off-line readable  
 83935 function index. If the input files to *ctags* (such as *.c* files) were not created using the same locale  
 83936 as that in effect when *ctags -x* is run, results might not be as expected.

83937 The description of C-language processing says “attempts to” because the C language can be  
 83938 greatly confused, especially through the use of *#defines*, and this utility would be of no use if  
 83939 the real C preprocessor were run to identify them. The output from *ctags* may be fooled and  
 83940 incorrect for various constructs.

## 83941 EXAMPLES

83942 None.

## 83943 RATIONALE

83944 The option list was significantly reduced from that provided by historical implementations. The  
 83945 *-F* option was omitted as redundant, since it is the default. The *-B* option was omitted as being  
 83946 of very limited usefulness. The *-t* option was omitted since the recognition of *typedefs* is now  
 83947 required for C source files. The *-u* option was omitted because the update function was judged  
 83948 to be not only inefficient, but also rarely needed.

83949 An early proposal included a *-w* option to suppress warning diagnostics. Since the types of such  
 83950 diagnostics could not be described, the option was omitted as being not useful.

83951 The text for *LC\_CTYPE* about compatibility with the C locale acknowledges that the ISO C  
 83952 standard imposes requirements on the locale used to process C source. This could easily be a  
 83953 superset of that known as “the C locale” by way of implementation extensions, or one of a few  
 83954 alternative locales for systems supporting different codesets. No statement is made for  
 83955 FORTRAN because the ANSI X3.9-1978 standard (FORTRAN 77) does not (yet) define a similar  
 83956 locale concept. However, a general rule in this volume of POSIX.1-2008 is that any time that  
 83957 locales do not match (preparing a file for one locale and processing it in another), the results are  
 83958 suspect.

83959 The collation sequence of the tags file is not affected by *LC\_COLLATE* because it is typically not  
 83960 used by human readers, but only by programs such as *vi* to locate the tag within the source files.  
 83961 Using the POSIX locale eliminates some of the problems of coordinating locales between the  
 83962 *ctags* file creator and the *vi* file reader.

Historically, the tags file has been used only by *ex* and *vi*. However, the format of the tags file has been published to encourage other programs to use the tags in new ways. The format allows either patterns or line numbers to find the identifiers because the historical *vi* recognizes either. The *ctags* utility does not produce the format using line numbers because it is not useful following any source file changes that add or delete lines. The documented search patterns match historical practice. It should be noted that literal leading `<circumflex>` or trailing `<dollar-sign>` characters in the search pattern will only behave correctly if anchored to the beginning of the line or end of the line by an additional `<circumflex>` or `<dollar-sign>` character.

Historical implementations also understand the objects used by the languages Pascal and sometimes LISP, and they understand the C source output by *lex* and *yacc*. The *ctags* utility is not required to accommodate these languages, although implementors are encouraged to do so.

The following historical option was not specified, as *vgrind* is not included in this volume of POSIX.1-2008:

**-v** If the **-v** flag is given, an index of the form expected by *vgrind* is produced on the standard output. This listing contains the function name, filename, and page number (assuming 64-line pages). Since the output is sorted into lexicographic order, it may be desired to run the output through *sort -f*. Sample use:

```
ctags -v files | sort -f > index vgrind -x index
```

The special treatment of the tag **main** makes the use of *ctags* practical in directories with more than one program.

## FUTURE DIRECTIONS

None.

XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)

## CHANGE HISTORY

First released in Issue 4.

### Issue 5

The FUTURE DIRECTIONS section is added.

### Issue 6

This utility is marked as part of the User Portability Utilities option.

The OUTPUT FILES section is changed to align with the IEEE P1003.2b draft standard.

The normative text is reworded to avoid use of the term “must” for application requirements.

IEEE PASC Interpretation 1003.2 #168 is applied, changing “create” to “write” in the DESCRIPTION.

### Issue 7

The *ctags* utility is no longer dependent on support for the User Portability Utilities option.

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

84001 **NAME**

84002       cut — cut out selected fields of each line of a file

84003 **SYNOPSIS**84004       cut -b *list* [-n] [*file...*]84005       cut -c *list* [*file...*]84006       cut -f *list* [-d *delim*] [-s] [*file...*]84007 **DESCRIPTION**

84008       The *cut* utility shall cut out bytes (**-b** option), characters (**-c** option), or character-delimited fields  
 84009       (**-f** option) from each line in one or more files, concatenate them, and write them to standard  
 84010       output.

84011 **OPTIONS**84012       The *cut* utility shall conform to XBD [Section 12.2](#) (on page 215).

84013       The application shall ensure that the option-argument *list* (see options **-b**, **-c**, and **-f** below) is a  
 84014       <comma>-separated list or <blank>-separated list of positive numbers and ranges. Ranges can  
 84015       be in three forms. The first is two positive numbers separated by a <hyphen> (*low-high*), which  
 84016       represents all fields from the first number to the second number. The second is a positive  
 84017       number preceded by a <hyphen> (*-high*), which represents all fields from field number 1 to that  
 84018       number. The third is a positive number followed by a <hyphen> (*low-*), which represents that  
 84019       number to the last field, inclusive. The elements in *list* can be repeated, can overlap, and can be  
 84020       specified in any order, but the bytes, characters, or fields selected shall be written in the order of  
 84021       the input data. If an element appears in the selection list more than once, it shall be written  
 84022       exactly once.

84023       The following options shall be supported:

84024       **-b list**       Cut based on a *list* of bytes. Each selected byte shall be output unless the **-n** option  
 84025       is also specified. It shall not be an error to select bytes not present in the input line.

84026       **-c list**       Cut based on a *list* of characters. Each selected character shall be output. It shall  
 84027       not be an error to select characters not present in the input line.

84028       **-d delim**      Set the field delimiter to the character *delim*. The default is the <tab>.

84029       **-f list**       Cut based on a *list* of fields, assumed to be separated in the file by a delimiter  
 84030       character (see **-d**). Each selected field shall be output. Output fields shall be  
 84031       separated by a single occurrence of the field delimiter character. Lines with no field  
 84032       delimiters shall be passed through intact, unless **-s** is specified. It shall not be an  
 84033       error to select fields not present in the input line.

84034       **-n**           Do not split characters. When specified with the **-b** option, each element in *list* of  
 84035       the form *low-high* (<hyphen>-separated numbers) shall be modified as follows:

- 84036           • If the byte selected by *low* is not the first byte of a character, *low* shall be  
 84037           decremented to select the first byte of the character originally selected by *low*.  
 84038           If the byte selected by *high* is not the last byte of a character, *high* shall be  
 84039           decremented to select the last byte of the character prior to the character  
 84040           originally selected by *high*, or zero if there is no prior character. If the  
 84041           resulting range element has *high* equal to zero or *low* greater than *high*, the list  
 84042           element shall be dropped from *list* for that input line without causing an  
 84043           error.

84044       Each element in *list* of the form *low-* shall be treated as above with *high* set to the  
 84045       number of bytes in the current line, not including the terminating <newline>. Each

84046 element in *list* of the form *-high* shall be treated as above with *low* set to 1. Each  
 84047 element in *list* of the form *num* (a single number) shall be treated as above with *low*  
 84048 set to *num* and *high* set to *num*.

84049 **-s** Suppress lines with no delimiter characters, when used with the *-f* option. Unless  
 84050 specified, lines with no delimiters shall be passed through untouched.

## 84051 OPERANDS

84052 The following operand shall be supported:

84053 *file* A pathname of an input file. If no *file* operands are specified, or if a *file* operand is  
 84054 '*-*', the standard input shall be used.

## 84055 STDIN

84056 The standard input shall be used only if no *file* operands are specified, or if a *file* operand is '*-*'.  
 84057 See the INPUT FILES section.

## 84058 INPUT FILES

84059 The input files shall be text files, except that line lengths shall be unlimited.

## 84060 ENVIRONMENT VARIABLES

84061 The following environment variables shall affect the execution of *cut*:

84062 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 84063 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 84064 variables used to determine the values of locale categories.)

84065 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 84066 internationalization variables.

84067 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 84068 characters (for example, single-byte as opposed to multi-byte characters in  
 84069 arguments and input files).

84070 *LC\_MESSAGES*

84071 Determine the locale that should be used to affect the format and contents of  
 84072 diagnostic messages written to standard error.

84073 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

## 84074 ASYNCHRONOUS EVENTS

84075 Default.

## 84076 STDOUT

84077 The *cut* utility output shall be a concatenation of the selected bytes, characters, or fields (one of  
 84078 the following):

84079 "%s\n", <concatenation of bytes>

84080 "%s\n", <concatenation of characters>

84081 "%s\n", <concatenation of fields and field delimiters>

## 84082 STDERR

84083 The standard error shall be used only for diagnostic messages.

## 84084 OUTPUT FILES

84085 None.

## 84086 EXTENDED DESCRIPTION

84087 None.

## 84088 EXIT STATUS

84089 The following exit values shall be returned:

84090 0 All input files were output successfully.

84091 &gt;0 An error occurred.

## 84092 CONSEQUENCES OF ERRORS

84093 Default.

## 84094 APPLICATION USAGE

84095 The *cut* and *fold* utilities can be used to create text files out of files with arbitrary line lengths.  
 84096 The *cut* utility should be used when the number of lines (or records) needs to remain constant.  
 84097 The *fold* utility should be used when the contents of long lines need to be kept contiguous.

84098 Earlier versions of the *cut* utility worked in an environment where bytes and characters were  
 84099 considered equivalent (modulo <backspace> and <tab> processing in some implementations). In  
 84100 the extended world of multi-byte characters, the new **-b** option has been added. The **-n** option  
 84101 (used with **-b**) allows it to be used to act on bytes rounded to character boundaries. The  
 84102 algorithm specified for **-n** guarantees that:

84103 `cut -b 1-500 -n file > file1`84104 `cut -b 501- -n file > file2`

84105 ends up with all the characters in **file** appearing exactly once in **file1** or **file2**. (There is,  
 84106 however, a <newline> in both **file1** and **file2** for each <newline> in **file**.)

## 84107 EXAMPLES

84108 Examples of the option qualifier list:

84109 1,4,7 Select the first, fourth, and seventh bytes, characters, or fields and field delimiters.

84110 1-3,8 Equivalent to 1,2,3,8.

84111 -5,10 Equivalent to 1,2,3,4,5,10.

84112 3- Equivalent to third to last, inclusive.

84113 The *low-high* forms are not always equivalent when used with **-b** and **-n** and multi-byte  
 84114 characters; see the description of **-n**.

84115 The following command:

84116 `cut -d : -f 1,6 /etc/passwd`

84117 reads the System V password file (user database) and produces lines of the form:

84118 `<user ID>:<home directory>`

84119 Most utilities in this volume of POSIX.1-2008 work on text files. The *cut* utility can be used to  
 84120 turn files with arbitrary line lengths into a set of text files containing the same data. The *paste*  
 84121 utility can be used to create (or recreate) files with arbitrary line lengths. For example, if **file**  
 84122 contains long lines:

84123 `cut -b 1-500 -n file > file1`84124 `cut -b 501- -n file > file2`

84125 creates **file1** (a text file) with lines no longer than 500 bytes (plus the <newline>) and **file2** that  
 84126 contains the remainder of the data from **file**. (Note that **file2** is not a text file if there are lines in

**file** that are longer than 500 + {LINE\_MAX} bytes.) The original file can be recreated from **file1** and **file2** using the command:

```
paste -d "\0" file1 file2 > file
```

## RATIONALE

Some historical implementations do not count <backspace> characters in determining character counts with the **-c** option. This may be useful for using *cut* for processing *nroff* output. It was deliberately decided not to have the **-c** option treat either <backspace> or <tab> characters in any special fashion. The *fold* utility does treat these characters specially.

Unlike other utilities, some historical implementations of *cut* exit after not finding an input file, rather than continuing to process the remaining *file* operands. This behavior is prohibited by this volume of POSIX.1-2008, where only the exit status is affected by this problem.

The behavior of *cut* when provided with either mutually-exclusive options or options that do not work logically together has been deliberately left unspecified in favor of global wording in [Section 1.4](#) (on page 2310).

The OPTIONS section was changed in response to IEEE PASC Interpretation 1003.2 #149. The change represents historical practice on all known systems. The original standard was ambiguous on the nature of the output.

The *list* option-arguments are historically used to select the portions of the line to be written, but do not affect the order of the data. For example:

```
echo abcdefghi | cut -c6,2,4-7,1
```

yields "abdefg".

A proposal to enhance *cut* with the following option:

**-o** Preserve the selected field order. When this option is specified, each byte, character, or field (or ranges of such) shall be written in the order specified by the *list* option-argument, even if this requires multiple outputs of the same bytes, characters, or fields.

was rejected because this type of enhancement is outside the scope of the IEEE P1003.2b draft standard.

## FUTURE DIRECTIONS

None.

## CHANGE HISTORY

First released in Issue 2.

### Issue 6

The OPTIONS section is changed to align with the IEEE P1003.2b draft standard.

The normative text is reworded to avoid use of the term “must” for application requirements.

### Issue 7

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

SD5-XCU-ERN-171 is applied, adding APPLICATION USAGE.

84167 **NAME**84168 cxref — generate a C-language program cross-reference table (**DEVELOPMENT**)84169 **SYNOPSIS**

```
84170 XSI cxref [-cs] [-o file] [-w num] [-D name[=def]]... [-I dir]...
84171 [-U name]... file...
```

84172 **DESCRIPTION**

84173 The *cxref* utility shall analyze a collection of C-language *files* and attempt to build a cross-  
 84174 reference table. Information from **#define** lines shall be included in the symbol table. A sorted  
 84175 listing shall be written to standard output of all symbols (auto, static, and global) in each *file*  
 84176 separately, or with the **-c** option, in combination. Each symbol shall contain an <asterisk> before  
 84177 the declaring reference.

84178 **OPTIONS**

84179 The *cxref* utility shall conform to XBD [Section 12.2](#) (on page 215), except that the order of the **-D**,  
 84180 **-I**, and **-U** options (which are identical to their interpretation by *c99*) is significant. The  
 84181 following options shall be supported:

- 84182 **-c** Write a combined cross-reference of all input files.
- 84183 **-s** Operate silently; do not print input filenames.
- 84184 **-o file** Direct output to named *file*.
- 84185 **-w num** Format output no wider than *num* (decimal) columns. This option defaults to 80 if  
 84186 *num* is not specified or is less than 51.
- 84187 **-D** Equivalent to *c99*.
- 84188 **-I** Equivalent to *c99*.
- 84189 **-U** Equivalent to *c99*.

84190 **OPERANDS**

84191 The following operand shall be supported:

- 84192 *file* A pathname of a C-language source file.

84193 **STDIN**

84194 Not used.

84195 **INPUT FILES**

84196 The input files are C-language source files.

84197 **ENVIRONMENT VARIABLES**

84198 The following environment variables shall affect the execution of *cxref*:

- 84199 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 84200 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 84201 variables used to determine the values of locale categories.)
- 84202 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 84203 internationalization variables.
- 84204 **LC\_COLLATE**  
 84205 Determine the locale for the ordering of the output.
- 84206 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 84207 characters (for example, single-byte as opposed to multi-byte characters in  
 84208 arguments and input files).

**84209 LC\_MESSAGES**

84210 Determine the locale that should be used to affect the format and contents of  
84211 diagnostic messages written to standard error.

84212 **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

**84213 ASYNCHRONOUS EVENTS**

84214 Default.

**84215 STDOUT**

84216 The standard output shall be used for the cross-reference listing, unless the **-o** option is used to  
84217 select a different output file.

84218 The format of standard output is unspecified, except that the following information shall be  
84219 included:

- 84220 • If the **-c** option is not specified, each portion of the listing shall start with the name of the  
84221 input file on a separate line.
- 84222 • The name line shall be followed by a sorted list of symbols, each with its associated  
84223 location pathname, the name of the function in which it appears (if it is not a function  
84224 name itself), and line number references.
- 84225 • Each line number may be preceded by an <asterisk> ('\*') flag, meaning that this is the  
84226 declaring reference. Other single-character flags, with implementation-defined meanings,  
84227 may be included.

**84228 STDERR**

84229 The standard error shall be used only for diagnostic messages.

**84230 OUTPUT FILES**

84231 The output file named by the **-o** option shall be used instead of standard output.

**84232 EXTENDED DESCRIPTION**

84233 None.

**84234 EXIT STATUS**

84235 The following exit values shall be returned:

- 84236 0 Successful completion.
- 84237 >0 An error occurred.

**84238 CONSEQUENCES OF ERRORS**

84239 Default.

**84240 APPLICATION USAGE**

84241 None.

**84242 EXAMPLES**

84243 None.

**84244 RATIONALE**

84245 None.

**84246 FUTURE DIRECTIONS**

84247 None.

84248 **SEE ALSO**84249 [c99](#)84250 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)84251 **CHANGE HISTORY**

84252 First released in Issue 2.

84253 **Issue 5**84254 In the SYNOPSIS, `[-U dir]` is changed to `[-U name]`.84255 **Issue 6**

84256 The APPLICATION USAGE section is added.

84257 **Issue 7**

84258 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

84259 **NAME**84260 `date` — write the date and time84261 **SYNOPSIS**84262 `date [-u] [+format]`84263 XSI `date [-u] mmddhhmm[[cc]yy]`84264 **DESCRIPTION**

84265 XSI The *date* utility shall write the date and time to standard output or attempt to set the system  
 84266 *date and time*. By default, the current date and time shall be written. If an operand beginning  
 84267 with '+' is specified, the output format of *date* shall be controlled by the conversion  
 84268 specifications and other text in the operand.

84269 **OPTIONS**84270 The *date* utility shall conform to XBD [Section 12.2](#) (on page 215).

84271 The following option shall be supported:

84272 **-u** Perform operations as if the *TZ* environment variable was set to the string "UTC0",  
 84273 or its equivalent historical value of "GMT0". Otherwise, *date* shall use the timezone  
 84274 indicated by the *TZ* environment variable or the system default if that variable is  
 84275 unset or null.

84276 **OPERANDS**

84277 The following operands shall be supported:

84278 **+format** When the format is specified, each conversion specifier shall be replaced in the  
 84279 standard output by its corresponding value. All other characters shall be copied to  
 84280 the output without change. The output shall always be terminated with a  
 84281 <newline>.

84282 **Conversion Specifications**

84283 %a Locale's abbreviated weekday name.  
 84284 %A Locale's full weekday name.  
 84285 %b Locale's abbreviated month name.  
 84286 %B Locale's full month name.  
 84287 %c Locale's appropriate date and time representation.  
 84288 %C Century (a year divided by 100 and truncated to an integer) as a decimal  
 84289 number [00,99].  
 84290 %d Day of the month as a decimal number [01,31].  
 84291 %D Date in the format *mm/dd/yy*.  
 84292 %e Day of the month as a decimal number [1,31] in a two-digit field with  
 84293 leading <space> character fill.  
 84294 %h A synonym for %b.  
 84295 %H Hour (24-hour clock) as a decimal number [00,23].  
 84296 %I Hour (12-hour clock) as a decimal number [01,12].

|       |    |                                                                                                                                                                                                                                                                                               |
|-------|----|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 84297 | %j | Day of the year as a decimal number [001,366].                                                                                                                                                                                                                                                |
| 84298 | %m | Month as a decimal number [01,12].                                                                                                                                                                                                                                                            |
| 84299 | %M | Minute as a decimal number [00,59].                                                                                                                                                                                                                                                           |
| 84300 | %n | A <newline>.                                                                                                                                                                                                                                                                                  |
| 84301 | %p | Locale's equivalent of either AM or PM.                                                                                                                                                                                                                                                       |
| 84302 | %r | 12-hour clock time [01,12] using the AM/PM notation; in the POSIX locale, this shall be equivalent to %I:%M:%S %p.                                                                                                                                                                            |
| 84303 |    |                                                                                                                                                                                                                                                                                               |
| 84304 | %S | Seconds as a decimal number [00,60].                                                                                                                                                                                                                                                          |
| 84305 | %t | A <tab>.                                                                                                                                                                                                                                                                                      |
| 84306 | %T | 24-hour clock time [00,23] in the format <i>HH:MM:SS</i> .                                                                                                                                                                                                                                    |
| 84307 | %u | Weekday as a decimal number [1,7] (1=Monday).                                                                                                                                                                                                                                                 |
| 84308 | %U | Week of the year (Sunday as the first day of the week) as a decimal number [00,53]. All days in a new year preceding the first Sunday shall be considered to be in week 0.                                                                                                                    |
| 84309 |    |                                                                                                                                                                                                                                                                                               |
| 84310 |    |                                                                                                                                                                                                                                                                                               |
| 84311 | %V | Week of the year (Monday as the first day of the week) as a decimal number [01,53]. If the week containing January 1 has four or more days in the new year, then it shall be considered week 1; otherwise, it shall be the last week of the previous year, and the next week shall be week 1. |
| 84312 |    |                                                                                                                                                                                                                                                                                               |
| 84313 |    |                                                                                                                                                                                                                                                                                               |
| 84314 |    |                                                                                                                                                                                                                                                                                               |
| 84315 | %w | Weekday as a decimal number [0,6] (0=Sunday).                                                                                                                                                                                                                                                 |
| 84316 | %W | Week of the year (Monday as the first day of the week) as a decimal number [00,53]. All days in a new year preceding the first Monday shall be considered to be in week 0.                                                                                                                    |
| 84317 |    |                                                                                                                                                                                                                                                                                               |

See XBD [Section 7.3.5](#) (on page 159) for the conversion specifier values in the POSIX locale.

### Modified Conversion Specifications

Some conversion specifiers can be modified by the **E** and **O** modifier characters to indicate a different format or specification as specified in the *LC\_TIME* locale description (see XBD [Section 7.3.5](#), on page 159). If the corresponding keyword (see **era**, **era\_year**, **era\_d\_fmt**, and **alt\_digits** in XBD [Section 7.3.5](#), on page 159) is not specified or not supported for the current locale, the unmodified conversion specifier value shall be used.

| 84360 |              | Attempt to set the system date and time from the value given in the operand. This is only possible if the user has appropriate privileges and the system permits the setting of the system date and time. The first <i>mm</i> is the month (number); <i>dd</i> is the day (number); <i>hh</i> is the hour (number, 24-hour system); the second <i>mm</i> is the minute (number); <i>cc</i> is the century and is the first two digits of the year (this is optional); <i>yy</i> is the last two digits of the year and is optional. If century is not specified, then values in the range [69,99] shall refer to years 1969 to 1999 inclusive, and values in the range [00,68] shall refer to years 2000 to 2068 inclusive. The current year is the default if <i>yy</i> is omitted. |

| 84366 |              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 84367 |              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 84368 |              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 84369 |              | <b>Note:</b> It is expected that in a future version of this standard the default century inferred from a 2-digit year will change. (This would apply to all commands accepting a 2-digit year as input.)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 84370 |              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 84371 |              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 84372 | <b>STDIN</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 84373 |              | Not used.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

84374 **INPUT FILES**

84375 None.

84376 **ENVIRONMENT VARIABLES**84377 The following environment variables shall affect the execution of *date*:

84378 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 84379 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 84380 variables used to determine the values of locale categories.)

84381 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 84382 internationalization variables.

84383 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 84384 characters (for example, single-byte as opposed to multi-byte characters in  
 84385 arguments).

84386 *LC\_MESSAGES*

84387 Determine the locale that should be used to affect the format and contents of  
 84388 diagnostic messages written to standard error.

84389 *LC\_TIME* Determine the format and contents of date and time strings written by *date*.

84390 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

84391 *TZ* Determine the timezone in which the time and date are written, unless the *-u*  
 84392 option is specified. If the *TZ* variable is unset or null and *-u* is not specified, an  
 84393 unspecified system default timezone is used.

84394 **ASYNCHRONOUS EVENTS**

84395 Default.

84396 **STDOUT**

84397 When no formatting operand is specified, the output in the POSIX locale shall be equivalent to  
 84398 specifying:

84399 *date* "+%a %b %e %H:%M:%S %Z %Y"84400 **STDERR**

84401 The standard error shall be used only for diagnostic messages.

84402 **OUTPUT FILES**

84403 None.

84404 **EXTENDED DESCRIPTION**

84405 None.

84406 **EXIT STATUS**

84407 The following exit values shall be returned:

84408 0 The date was written successfully.

84409 &gt;0 An error occurred.

84410 **CONSEQUENCES OF ERRORS**

84411 Default.

## APPLICATION USAGE

Conversion specifiers are of unspecified format when not in the POSIX locale. Some of them can contain <newline> characters in some locales, so it may be difficult to use the format shown in standard output for parsing the output of *date* in those locales.

The range of values for %S extends from 0 to 60 seconds to accommodate the occasional leap second.

Although certain of the conversion specifiers in the POSIX locale (such as the name of the month) are shown with initial capital letters, this need not be the case in other locales. Programs using these fields may need to adjust the capitalization if the output is going to be used at the beginning of a sentence.

The date string formatting capabilities are intended for use in Gregorian-style calendars, possibly with a different starting year (or years). The %x and %c conversion specifications, however, are intended for local representation; these may be based on a different, non-Gregorian calendar.

The %C conversion specification was introduced to allow a fallback for the %EC (alternative year format base year); it can be viewed as the base of the current subdivision in the Gregorian calendar. The century number is calculated as the year divided by 100 and truncated to an integer; it should not be confused with the use of ordinal numbers for centuries (for example, “twenty-first century”). Both the %EY and %Y can then be viewed as the offset from %EC and %C, respectively.

The E and O modifiers modify the traditional conversion specifiers, so that they can always be used, even if the implementation (or the current locale) does not support the modifier.

The E modifier supports alternative date formats, such as the Japanese Emperor’s Era, as long as these are based on the Gregorian calendar system. Extending the E modifiers to other date elements may provide an implementation-defined extension capable of supporting other calendar systems, especially in combination with the O modifier.

The O modifier supports time and date formats using the locale’s alternative numerical symbols, such as Kanji or Hindi digits or ordinal number representation.

Non-European locales, whether they use Latin digits in computational items or not, often have local forms of the digits for use in date formats. This is not totally unknown even in Europe; a variant of dates uses Roman numerals for the months: the third day of September 1991 would be written as 3.IX.1991. In Japan, Kanji digits are regularly used for dates; in Arabic-speaking countries, Hindi digits are used. The %d, %e, %H, %I, %m, %S, %U, %w, %W, and %Y conversion specifications always return the date and time field in Latin digits (that is, 0 to 9). The %O modifier was introduced to support the use for display purposes of non-Latin digits. In the LC\_TIME category in *localedef*, the optional **alt\_digits** keyword is intended for this purpose. As an example, assume the following (partial) *localedef* source:

```
alt_digits " "; "I"; "II"; "III"; "IV"; "V"; "VI"; "VII"; "VIII" \
 "IX"; "X"; "XI"; "XII"
d_fmt "%e.%Om.%Y"
```

With the above date, the command:

```
date "+%x"
```

would yield 3.IX.1991. With the same **d\_fmt**, but without the **alt\_digits**, the command would yield 3.9.1991.

## EXAMPLES

1. The following are input/output examples of *date* used at arbitrary times in the POSIX locale:

```
$ date
Tue Jun 26 09:58:10 PDT 1990

$ date "+DATE: %m/%d/%y%nTIME: %H:%M:%S"
DATE: 11/02/91
TIME: 13:36:16

$ date "+TIME: %r"
TIME: 01:36:32 PM
```

2. Examples for Denmark, where the default date and time format is %a %d %b %Y %T %Z:

```
$ LANG=da_DK.iso_8859-1 date
ons 02 okt 1991 15:03:32 CET

$ LANG=da_DK.iso_8859-1 \
date "+DATO: %A den %e. %B %Y%nKLOKKEN: %H:%M:%S"
DATO: onsdag den 2. oktober 1991
KLOKKEN: 15:03:56
```

3. Examples for Germany, where the default date and time format is %a %d.%h.%Y, %T %Z:

```
$ LANG=De_DE.88591 date
Mi 02.Okt.1991, 15:01:21 MEZ

$ LANG=De_DE.88591 date "+DATUM: %A, %d. %B %Y%nZEIT: %H:%M:%S"
DATUM: Mittwoch, 02. Oktober 1991
ZEIT: 15:02:02
```

4. Examples for France, where the default date and time format is %a %d %h %Y %Z %T:

```
$ LANG=Fr_FR.88591 date
Mer 02 oct 1991 MET 15:03:32

$ LANG=Fr_FR.88591 date "+JOUR: %A %d %B %Y%nHEURE: %H:%M:%S"
JOUR: Mercredi 02 octobre 1991
HEURE: 15:03:56
```

## RATIONALE

Some of the new options for formatting are from the ISO C standard. The **-u** option was introduced to allow portable access to Coordinated Universal Time (UTC). The string "GMT0" is allowed as an equivalent TZ value to be compatible with all of the systems using the BSD implementation, where this option originated.

The %e format conversion specification (adopted from System V) was added because the ISO C standard conversion specifications did not provide any way to produce the historical default *date* output during the first nine days of any month.

There are two varieties of day and week numbering supported (in addition to any others created with the locale-dependent %E and %O modifier characters):

- The historical variety in which Sunday is the first day of the week and the weekdays preceding the first Sunday of the year are considered week 0. These are represented by %w and %U. A variant of this is %W, using Monday as the first day of the week, but still referring to week 0. This view of the calendar was retained because so many historical

## 84527 NAME

84528 dd — convert and copy a file

## 84529 SYNOPSIS

84530 dd [*operand*...]

## 84531 DESCRIPTION

84532 The *dd* utility shall copy the specified input file to the specified output file with possible  
 84533 conversions using specific input and output block sizes. It shall read the input one block at a  
 84534 time, using the specified input block size; it shall then process the block of data actually  
 84535 returned, which could be smaller than the requested block size. It shall apply any conversions  
 84536 that have been specified and write the resulting data to the output in blocks of the specified  
 84537 output block size. If the **bs=expr** operand is specified and no conversions other than **sync**,  
 84538 **noerror**, or **notrunc** are requested, the data returned from each input block shall be written as a  
 84539 separate output block; if the read returns less than a full block and the **sync** conversion is not  
 84540 specified, the resulting output block shall be the same size as the input block. If the **bs=expr**  
 84541 operand is not specified, or a conversion other than **sync**, **noerror**, or **notrunc** is requested, the  
 84542 input shall be processed and collected into full-sized output blocks until the end of the input is  
 84543 reached.

84544 The processing order shall be as follows:

- 84545 1. An input block is read.
- 84546 2. If the input block is shorter than the specified input block size and the **sync** conversion is  
 84547 specified, null bytes shall be appended to the input data up to the specified size. (If either  
 84548 **block** or **unblock** is also specified, <space> characters shall be appended instead of null  
 84549 bytes.) The remaining conversions and output shall include the pad characters as if they  
 84550 had been read from the input.
- 84551 3. If the **bs=expr** operand is specified and no conversion other than **sync** or **noerror** is  
 84552 requested, the resulting data shall be written to the output as a single block, and the  
 84553 remaining steps are omitted.
- 84554 4. If the **swab** conversion is specified, each pair of input data bytes shall be swapped. If  
 84555 there is an odd number of bytes in the input block, the last byte in the input record shall  
 84556 not be swapped.
- 84557 5. Any remaining conversions (**block**, **unblock**, **lcase**, and **ucase**) shall be performed. These  
 84558 conversions shall operate on the input data independently of the input blocking; an input  
 84559 or output fixed-length record may span block boundaries.
- 84560 6. The data resulting from input or conversion or both shall be aggregated into output  
 84561 blocks of the specified size. After the end of input is reached, any remaining output shall  
 84562 be written as a block without padding if **conv=sync** is not specified; thus, the final output  
 84563 block may be shorter than the output block size.

## 84564 OPTIONS

84565 None.

## 84566 OPERANDS

84567 All of the operands shall be processed before any input is read. The following operands shall be  
 84568 supported:

- 84569 **if=file** Specify the input pathname; the default is standard input.
- 84570 **of=file** Specify the output pathname; the default is standard output. If the **seek=expr**  
 84571 conversion is not also specified, the output file shall be truncated before the copy  
 84572 begins if an explicit **of=file** operand is specified, unless **conv=notrunc** is specified.

|       |                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 84573 |                               | If <b>seek=expr</b> is specified, but <b>conv=notrunc</b> is not, the effect of the copy shall be to preserve the blocks in the output file over which <i>dd</i> seeks, but no other portion of the output file shall be preserved. (If the size of the seek plus the size of the input file is less than the previous size of the output file, the output file shall be shortened by the copy. If the input file is empty and either the size of the seek is greater than the previous size of the output file or the output file did not previously exist, the size of the output file shall be set to the file offset after the seek.)                          |
| 84574 |                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 84575 |                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| 84616 |                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 84617 |                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

|       |                |                                                                                    |
|-------|----------------|------------------------------------------------------------------------------------|
| 84618 |                | to the largest number of characters that fit into that size; the number of         |
| 84619 |                | truncated lines shall be reported (see the STDERR section).                        |
| 84620 |                | The <b>block</b> and <b>unblock</b> values are mutually-exclusive.                 |
| 84621 | <b>unblock</b> | Convert fixed-length records to variable length. Read a number of bytes            |
| 84622 |                | equal to the conversion block size (or the number of bytes remaining in            |
| 84623 |                | the input, if less than the conversion block size), delete all trailing            |
| 84624 |                | <space> characters, and append a <newline>.                                        |
| 84625 | <b>lcase</b>   | Map uppercase characters specified by the <i>LC_CTYPE</i> keyword                  |
| 84626 |                | <b>tolower</b> to the corresponding lowercase character. Characters for which      |
| 84627 |                | no mapping is specified shall not be modified by this conversion.                  |
| 84628 |                | The <b>lcase</b> and <b>ucase</b> symbols are mutually-exclusive.                  |
| 84629 | <b>ucase</b>   | Map lowercase characters specified by the <i>LC_CTYPE</i> keyword                  |
| 84630 |                | <b>toupper</b> to the corresponding uppercase character. Characters for            |
| 84631 |                | which no mapping is specified shall not be modified by this conversion.            |
| 84632 | <b>swab</b>    | Swap every pair of input bytes.                                                    |
| 84633 | <b>noerror</b> | Do not stop processing on an input error. When an input error occurs, a            |
| 84634 |                | diagnostic message shall be written on standard error, followed by the             |
| 84635 |                | current input and output block counts in the same format as used at                |
| 84636 |                | completion (see the STDERR section). If the <b>sync</b> conversion is              |
| 84637 |                | specified, the missing input shall be replaced with null bytes and                 |
| 84638 |                | processed normally; otherwise, the input block shall be omitted from               |
| 84639 |                | the output.                                                                        |
| 84640 | <b>notrunc</b> | Do not truncate the output file. Preserve blocks in the output file not            |
| 84641 |                | explicitly written by this invocation of the <i>dd</i> utility. (See also the      |
| 84642 |                | preceding <b>of=file</b> operand.)                                                 |
| 84643 | <b>sync</b>    | Pad every input block to the size of the <b>ibs=</b> buffer, appending null        |
| 84644 |                | bytes. (If either <b>block</b> or <b>unblock</b> is also specified, append <space> |
| 84645 |                | characters, rather than null bytes.)                                               |

The behavior is unspecified if operands other than **conv=** are specified more than once.

For the **bs=**, **cbs=**, **ibs=**, and **obs=** operands, the application shall supply an expression specifying a size in bytes. The expression, *expr*, can be:

1. A positive decimal number
2. A positive decimal number followed by *k*, specifying multiplication by 1 024
3. A positive decimal number followed by *b*, specifying multiplication by 512
4. Two or more positive decimal numbers (with or without *k* or *b*) separated by *x*, specifying the product of the indicated values

All of the operands are processed before any input is read.

XSI

The following two tables display the octal number character values used for the **ascii** and **ebcdic** conversions (first table) and for the **ibm** conversion (second table). In both tables, the ASCII values are the row and column headers and the EBCDIC values are found at their intersections. For example, ASCII 0012 (LF) is the second row, third column, yielding 0045 in EBCDIC. The inverted tables (for EBCDIC to ASCII conversion) are not shown, but are in one-to-one correspondence with these tables. The differences between the two tables are highlighted by

84661

small boxes drawn around five entries.

84662

| 0370 | 0356 |     | 0357 |     | 0372 | I   | 0373 |     | 0374 |     | 0375 |     | 0376 |     | 0377 | EO  |

84664 **STDIN**84665 If no **if=** operand is specified, the standard input shall be used. See the INPUT FILES section.84666 **INPUT FILES**

84667 The input file can be any file type.

84668 **ENVIRONMENT VARIABLES**84669 The following environment variables shall affect the execution of *dd*:

84670 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 84671 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 84672 variables used to determine the values of locale categories.)

84673 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 84674 internationalization variables.

84675 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 84676 characters (for example, single-byte as opposed to multi-byte characters in  
 84677 arguments and input files), the classification of characters as uppercase or  
 84678 lowercase, and the mapping of characters from one case to the other.

84679 **LC\_MESSAGES**

84680 Determine the locale that should be used to affect the format and contents of  
 84681 diagnostic messages written to standard error and informative messages written to  
 84682 standard output.

84683 **XSI NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

84684 **ASYNCHRONOUS EVENTS**

84685 For SIGINT, the *dd* utility shall interrupt its current processing, write status information to  
 84686 standard error, and exit as though terminated by SIGINT. It shall take the standard action for all  
 84687 other signals; see the ASYNCHRONOUS EVENTS section in [Section 1.4](#) (on page 2310).

84688 **STDOUT**

84689 If no **of=** operand is specified, the standard output shall be used. The nature of the output  
 84690 depends on the operands selected.

84691 **STDERR**

84692 On completion, *dd* shall write the number of input and output blocks to standard error. In the  
 84693 POSIX locale the following formats shall be used:

84694 "%u+%u records in\n", <number of whole input blocks>,  
 84695 <number of partial input blocks>

84696 "%u+%u records out\n", <number of whole output blocks>,  
 84697 <number of partial output blocks>

84698 A partial input block is one for which *read()* returned less than the input block size. A partial  
 84699 output block is one that was written with fewer bytes than specified by the output block size.

84700 In addition, when there is at least one truncated block, the number of truncated blocks shall be  
 84701 written to standard error. In the POSIX locale, the format shall be:

84702 "%u truncated %s\n", <number of truncated blocks>, "record" (if  
 84703 <number of truncated blocks> is one) "records" (otherwise)

84704 Diagnostic messages may also be written to standard error.

**OUTPUT FILES**

If the **of=** operand is used, the output shall be the same as described in the STDOUT section.

**EXTENDED DESCRIPTION**

None.

**EXIT STATUS**

The following exit values shall be returned:

0 The input file was copied successfully.

>0 An error occurred.

**CONSEQUENCES OF ERRORS**

If an input error is detected and the **noerror** conversion has not been specified, any partial output block shall be written to the output file, a diagnostic message shall be written, and the copy operation shall be discontinued. If some other error is detected, a diagnostic message shall be written and the copy operation shall be discontinued.

**APPLICATION USAGE**

The input and output block size can be specified to take advantage of raw physical I/O.

There are many different versions of the EBCDIC codesets. The ASCII and EBCDIC conversions specified for the *dd* utility perform conversions for the version specified by the tables.

**EXAMPLES**

The following command:

```
dd if=/dev/rmt0h of=/dev/rmt1h
```

copies from tape drive 0 to tape drive 1, using a common historical device naming convention.

The following command:

```
dd ibs=10 skip=1
```

strips the first 10 bytes from standard input.

This example reads an EBCDIC tape blocked ten 80-byte EBCDIC card images per block into the ASCII file *x*:

```
dd if=/dev/tape of=x ibs=800 cbs=80 conv=ascii,lcase
```

**RATIONALE**

The **OPTIONS** section is listed as “None” because there are no options recognized by historical *dd* utilities. Certainly, many of the operands could have been designed to use the Utility Syntax Guidelines, which would have resulted in the classic hyphenated option letters. In this version of this volume of POSIX.1-2008, *dd* retains its curious JCL-like syntax due to the large number of applications that depend on the historical implementation.

A suggested implementation technique for **conv=noerror, sync** is to zero (or <space>-fill, if **blocking** or **unblocking**) the input buffer before each read and to write the contents of the input buffer to the output even after an error. In this manner, any data transferred to the input buffer before the error was detected is preserved. Another point is that a failed read on a regular file or a disk generally does not increment the file offset, and *dd* must then seek past the block on which the error occurred; otherwise, the input error occurs repetitively. When the input is a magnetic tape, however, the tape normally has passed the block containing the error when the error is reported, and thus no seek is necessary.

The default **ibs=** and **obs=** sizes are specified as 512 bytes because there are historical (largely portable) scripts that assume these values. If they were left unspecified, unusual results could

occur if an implementation chose an odd block size.

Historical implementations of *dd* used *creat()* when processing *of=file*. This makes the **seek=** operand unusable except on special files. The **conv=notrunc** feature was added because more recent BSD-based implementations use *open()* (without *O\_TRUNC*) instead of *creat()*, but they fail to delete output file contents after the data copied.

The *w* multiplier (historically meaning *word*), is used in System V to mean 2 and in 4.2 BSD to mean 4. Since *word* is inherently non-portable, its use is not supported by this volume of POSIX.1-2008.

Standard EBCDIC does not have the characters ' [ ' and ' ] '. The values used in the table are taken from a common print train that does contain them. Other than those characters, the print train values are not filled in, but appear to provide some of the motivation for the historical choice of translations reflected here.

The Standard EBCDIC table provides a 1:1 translation for all 256 bytes.

The IBM EBCDIC table does not provide such a translation. The marked cells in the tables differ in such a way that:

1. EBCDIC 0112 ( ' ¢ ' ) and 0152 (broken pipe) do not appear in the table.
2. EBCDIC 0137 ( ' ¬ ' ) translates to/from ASCII 0236 ( ' ^ ' ). In the standard table, EBCDIC 0232 (no graphic) is used.
3. EBCDIC 0241 ( ' ~ ' ) translates to/from ASCII 0176 ( ' ¨ ' ). In the standard table, EBCDIC 0137 ( ' ¬ ' ) is used.
4. 0255 ( ' [ ' ) and 0275 ( ' ] ' ) appear twice, once in the same place as for the standard table and once in place of 0112 ( ' ¢ ' ) and 0241 ( ' ~ ' ).

In net result:

EBCDIC 0275 ( ' ] ' ) displaced EBCDIC 0241 ( ' ~ ' ) in cell 0345.

That displaced EBCDIC 0137 ( ' ¬ ' ) in cell 0176.

That displaced EBCDIC 0232 (no graphic) in cell 0136.

That replaced EBCDIC 0152 (broken pipe) in cell 0313.

EBCDIC 0255 ( ' [ ' ) replaced EBCDIC 0112 ( ' ¢ ' ).

This translation, however, reflects historical practice that (ASCII) ' ~ ' and ' ¬ ' were often mapped to each other, as were ' [ ' and ' ¢ ' ; and ' ] ' and (EBCDIC) ' ~ ' .

The **cbs** operand is required if any of the **ascii**, **ebcdic**, or **ibm** operands are specified. For the **ascii** operand, the input is handled as described for the **unblock** operand except that characters are converted to ASCII before the trailing <space> characters are deleted. For the **ebcdic** and **ibm** operands, the input is handled as described for the **block** operand except that the characters are converted to EBCDIC or IBM EBCDIC after the trailing <space> characters are added.

The **block** and **unblock** keywords are from historical BSD practice.

The consistent use of the word **record** in standard error messages matches most historical practice. An earlier version of System V used **block**, but this has been updated in more recent releases.

Early proposals only allowed two numbers separated by *x* to be used in a product when specifying **bs=**, **cbs=**, **ibs=**, and **obs=** sizes. This was changed to reflect the historical practice of

- 84789 allowing multiple numbers in the product as provided by Version 7 and all releases of System V  
84790 and BSD.
- 84791 A change to the **swab** conversion is required to match historical practice and is the result of IEEE  
84792 PASC Interpretations 1003.2 #03 and #04, submitted for the ISO POSIX-2: 1993 standard.
- 84793 A change to the handling of SIGINT is required to match historical practice and is the result of  
84794 IEEE PASC Interpretation 1003.2 #06 submitted for the ISO POSIX-2: 1993 standard.
- 84795 **FUTURE DIRECTIONS**
- 84796 None.
- 84797 **SEE ALSO**
- 84798 [Section 1.4](#) (on page 2310), [sed](#), [tr](#)
- 84799 XBD [Chapter 8](#) (on page 173)
- 84800 **CHANGE HISTORY**
- 84801 First released in Issue 2.
- 84802 **Issue 5**
- 84803 The second paragraph of the **cbs=** description is reworded and marked EX.
- 84804 The FUTURE DIRECTIONS section is added.
- 84805 **Issue 6**
- 84806 Changes are made to **swab** conversion and SIGINT handling to align with the IEEE P1003.2b  
84807 draft standard.
- 84808 The normative text is reworded to avoid use of the term “must” for application requirements.
- 84809 IEEE PASC Interpretation 1003.2 #209 is applied, clarifying the interaction between **dd of=file** and  
84810 **conv=notrunc**.
- 84811 **Issue 7**
- 84812 Austin Group Interpretation 1003.1-2001 #102 is applied.
- 84813 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

84814 **NAME**84815       delta — make a delta (change) to an SCCS file (**DEVELOPMENT**)84816 **SYNOPSIS**84817 XSI       delta [-nps] [-g *list*] [-m *mrlist*] [-r *SID*] [-y[*comment*]] *file...*84818 **DESCRIPTION**84819       The *delta* utility shall be used to permanently introduce into the named SCCS files changes that  
84820       were made to the files retrieved by *get* (called the *g-files*, or generated files).84821 **OPTIONS**84822       The *delta* utility shall conform to XBD [Section 12.2](#) (on page 215), except that the *-y* option has an  
84823       optional option-argument. This optional option-argument shall not be presented as a separate  
84824       argument.

84825       The following options shall be supported:

84826       *-r SID*       Uniquely identify which delta is to be made to the SCCS file. The use of this option  
84827       shall be necessary only if two or more outstanding *get* commands for editing (*get*  
84828       *-e*) on the same SCCS file were done by the same person (login name). The *SID*  
84829       value specified with the *-r* option can be either the *SID* specified on the *get*  
84830       command line or the *SID* to be made as reported by the *get* utility; see *get* (on page  
84831       2788).84832       *-s*           Suppress the report to standard output of the activity associated with each *file*. See  
84833       the STDOUT section.84834       *-n*           Specify retention of the edited *g-file* (normally removed at completion of delta  
84835       processing).84836       *-g list*       Specify a *list* (see *get* for the definition of *list*) of deltas that shall be ignored when  
84837       the file is accessed at the change level (*SID*) created by this delta.84838       *-m mrlist*   Specify a modification request (MR) number that the application shall supply as  
84839       the reason for creating the new delta. This shall be used if the SCCS file has the *v*  
84840       flag set; see *admin*.84841       If *-m* is not used and '*-*' is not specified as a file argument, and the standard  
84842       input is a terminal, the prompt described in the STDOUT section shall be written  
84843       to standard output before the standard input is read; if the standard input is not a  
84844       terminal, no prompt shall be issued.84845       MRs in a list shall be separated by <blank> characters or escaped <newline>  
84846       characters. An unescaped <newline> shall terminate the MR list. The escape  
84847       character is <backslash>.84848       If the *v* flag has a value, it shall be taken to be the name of a program which  
84849       validates the correctness of the MR numbers. If a non-zero exit status is returned  
84850       from the MR number validation program, the *delta* utility shall terminate. (It is  
84851       assumed that the MR numbers were not all valid.)84852       *-y[comment]* Describe the reason for making the delta. The *comment* shall be an arbitrary group  
84853       of lines that would meet the definition of a text file. Implementations shall support  
84854       *comments* from zero to 512 bytes and may support longer values. A null string  
84855       (specified as either *-y*, *-y*"", or in response to a prompt for a comment) shall be  
84856       considered a valid *comment*.84857       If *-y* is not specified and '*-*' is not specified as a file argument, and the standard

84858 input is a terminal, the prompt described in the STDOUT section shall be written  
 84859 to standard output before the standard input is read; if the standard input is not a  
 84860 terminal, no prompt shall be issued. An unescaped <newline> shall terminate the  
 84861 comment text. The escape character is <backslash>.

84862 The `-y` option shall be required if the *file* operand is specified as `'-'`.

84863 **-p** Write (to standard output) the SCCS file differences before and after the delta is  
 84864 applied in *diff* format; see *diff*.

## 84865 OPERANDS

84866 The following operand shall be supported:

84867 *file* A pathname of an existing SCCS file or a directory. If *file* is a directory, the *delta*  
 84868 utility shall behave as though each file in the directory were specified as a named  
 84869 file, except that non-SCCS files (last component of the pathname does not begin  
 84870 with *s.*) and unreadable files shall be silently ignored.

84871 If exactly one *file* operand appears, and it is `'-'`, the standard input shall be read;  
 84872 each line of the standard input shall be taken to be the name of an SCCS file to be  
 84873 processed. Non-SCCS files and unreadable files shall be silently ignored.

## 84874 STDIN

84875 The standard input shall be a text file used only in the following cases:

- 84876 • To read an *mrlist* or a *comment* (see the `-m` and `-y` options).
- 84877 • A *file* operand shall be specified as `'-'`. In this case, the `-y` option must be used to specify  
 84878 the comment, and if the SCCS file has the *v* flag set, the `-m` option must also be used to  
 84879 specify the MR list.

## 84880 INPUT FILES

84881 Input files shall be text files whose data is to be included in the SCCS files. If the first character of  
 84882 any line of an input file is <SOH> in the POSIX locale, the results are unspecified. If this file  
 84883 contains more than 99 999 lines, the number of lines recorded in the header for this file shall be  
 84884 99 999 for this delta.

## 84885 ENVIRONMENT VARIABLES

84886 The following environment variables shall affect the execution of *delta*:

84887 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 84888 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 84889 variables used to determine the values of locale categories.)

84890 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 84891 internationalization variables.

84892 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 84893 characters (for example, single-byte as opposed to multi-byte characters in  
 84894 arguments and input files).

84895 *LC\_MESSAGES*

84896 Determine the locale that should be used to affect the format and contents of  
 84897 diagnostic messages written to standard error, and informative messages written  
 84898 to standard output.

84899 *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

84900 **TZ** Determine the timezone in which the time and date are written in the SCCS file. If  
 84901 the *TZ* variable is unset or NULL, an unspecified system default timezone is used.

#### 84902 **ASYNCHRONOUS EVENTS**

84903 If SIGINT is caught, temporary files shall be cleaned up and *delta* shall exit with a non-zero exit  
 84904 code. The standard action shall be taken for all other signals; see [Section 1.4](#) (on page 2310).

#### 84905 **STDOUT**

84906 The standard output shall be used only for the following messages in the POSIX locale:

- 84907 • Prompts (see the **-m** and **-y** options) in the following formats:

84908 "MRs? "

84909 "comments? "

84910 The MR prompt, if written, shall always precede the comments prompt.

- 84911 • A report of each file's activities (unless the **-s** option is specified) in the following format:

84912 "%s\n%d inserted\n%d deleted\n%d unchanged\n", <New SID>,  
 84913 <number of lines inserted>, <number of lines deleted>,  
 84914 <number of lines unchanged>

#### 84915 **STDERR**

84916 The standard error shall be used only for diagnostic messages.

#### 84917 **OUTPUT FILES**

84918 Any SCCS files updated shall be files of an unspecified format.

#### 84919 **EXTENDED DESCRIPTION**

##### 84920 **System Date and Time**

84921 When a delta is added to an SCCS file, the system date and time shall be recorded for the new  
 84922 delta. If a *get* is performed using an SCCS file with a date recorded apparently in the future, the  
 84923 behavior is unspecified.

#### 84924 **EXIT STATUS**

84925 The following exit values shall be returned:

84926 0 Successful completion.

84927 >0 An error occurred.

#### 84928 **CONSEQUENCES OF ERRORS**

84929 Default.

#### 84930 **APPLICATION USAGE**

84931 Problems can arise if the system date and time have been modified (for example, put forward  
 84932 and then back again, or unsynchronized clocks across a network) and can also arise when  
 84933 different values of the *TZ* environment variable are used.

84934 Problems of a similar nature can also arise for the operation of the *get* utility, which records the  
 84935 date and time in the file body.

#### 84936 **EXAMPLES**

84937 None.

84938 **RATIONALE**

84939 None.

84940 **FUTURE DIRECTIONS**

84941 None.

84942 **SEE ALSO**84943 [Section 1.4](#) (on page 2310), *admin*, *diff*, *get*, *prs*, *rmdel*84944 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)84945 **CHANGE HISTORY**

84946 First released in Issue 2.

84947 **Issue 5**

84948 The output format description in the STDOUT section is corrected.

84949 **Issue 6**

84950 The APPLICATION USAGE section is added.

84951 The normative text is reworded to avoid use of the term “must” for application requirements.

84952 The Open Group Base Resolution bwg2001-007 is applied as follows:

- 84953 • The use of ‘-’ as a file argument is clarified.
- 84954 • The use of STDIN is added.
- 84955 • The ASYNCHRONOUS EVENTS section is updated to remove the implicit requirement that implementations re-signal themselves when catching a normally fatal signal.
- 84956
- 84957 • New text is added to the INPUT FILES section warning that the maximum lines recorded
- 84958 in the file is 99 999.

84959 New text is added to the EXTENDED DESCRIPTION and APPLICATION USAGE sections  
84960 regarding how the system date and time may be taken into account, and the TZ environment  
84961 variable is added to the ENVIRONMENT VARIABLES section as per The Open Group Base  
84962 Resolution bwg2001-007.

84963 **Issue 7**

84964 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

84965 **NAME**

84966           df — report free disk space

84967 **SYNOPSIS**84968 XSI       df [-k] [-P|-t] [*file...*]84969 **DESCRIPTION**

84970 XSI       The *df* utility shall write the amount of available space and file slots for file systems on which  
 84971 the invoking user has appropriate read access. File systems shall be specified by the *file*  
 84972 operands; when none are specified, information shall be written for all file systems. The format  
 84973 of the default output from *df* is unspecified, but all space figures are reported in 512-byte units,  
 84974 unless the **-k** option is specified. This output shall contain at least the file system names, amount  
 84975 XSI of available space on each of these file systems, and, if no options other than **-t** are specified, the  
 84976 number of free file slots, or *inodes*, available; when **-t** is specified, the output shall contain the  
 84977 total allocated space as well.

84978 **OPTIONS**84979           The *df* utility shall conform to XBD [Section 12.2](#) (on page 215).

84980           The following options shall be supported:

84981           **-k**           Use 1024-byte units, instead of the default 512-byte units, when writing space  
 84982 figures.

84983           **-P**           Produce output in the format described in the STDOUT section.

84984 XSI       **-t**           Include total allocated-space figures in the output.

84985 **OPERANDS**

84986           The following operand shall be supported:

84987           *file*       A pathname of a file within the hierarchy of the desired file system. If a file other  
 84988 XSI than a FIFO, a regular file, a directory, or a special file representing the device  
 84989 containing the file system (for example, */dev/dsk/0s1*) is specified, the results are  
 84990 unspecified. If the *file* operand names a file other than a special file containing a file  
 84991 system, *df* shall write the amount of free space in the file system containing the  
 84992 XSI specified *file* operand. Otherwise, *df* shall write the amount of free space in that  
 84993 file system.

84994 **STDIN**

84995           Not used.

84996 **INPUT FILES**

84997           None.

84998 **ENVIRONMENT VARIABLES**84999           The following environment variables shall affect the execution of *df*:

85000           **LANG**       Provide a default value for the internationalization variables that are unset or null.  
 85001 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 85002 variables used to determine the values of locale categories.)

85003           **LC\_ALL**      If set to a non-empty string value, override the values of all the other  
 85004 internationalization variables.

85005           **LC\_CTYPE**   Determine the locale for the interpretation of sequences of bytes of text data as  
 85006 characters (for example, single-byte as opposed to multi-byte characters in  
 85007 arguments).

85008 *LC\_MESSAGES*

85009 Determine the locale that should be used to affect the format and contents of

85010 diagnostic messages written to standard error and informative messages written to

85011 standard output.

85012 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

85013 **ASYNCHRONOUS EVENTS**

85014 Default.

85015 **STDOUT**

85016 When both the **-k** and **-P** options are specified, the following header line shall be written (in the

85017 POSIX locale):

85018 "Filesystem 1024-blocks Used Available Capacity Mounted on\n"

85019 When the **-P** option is specified without the **-k** option, the following header line shall be written

85020 (in the POSIX locale):

85021 "Filesystem 512-blocks Used Available Capacity Mounted on\n"

85022 The implementation may adjust the spacing of the header line and the individual data lines so

85023 that the information is presented in orderly columns.

85024 The remaining output with **-P** shall consist of one line of information for each specified file

85025 system. These lines shall be formatted as follows:

85026 "%s %d %d %d %d%% %s\n", <file system name>, <total space>,  
85027 <space used>, <space free>, <percentage used>,  
85028 <file system root>

85029 In the following list, all quantities expressed in 512-byte units (1 024-byte when **-k** is specified)

85030 shall be rounded up to the next higher unit. The fields are:

85031 <file system name>

85032 The name of the file system, in an implementation-defined format.

85033 <total space> The total size of the file system in 512-byte units. The exact meaning of this figure

85034 is implementation-defined, but should include <space used>, <space free>, plus any

85035 space reserved by the system not normally available to a user.

85036 <space used> The total amount of space allocated to existing files in the file system, in 512-byte

85037 units.

85038 <space free> The total amount of space available within the file system for the creation of new

85039 files by unprivileged users, in 512-byte units. When this figure is less than or equal

85040 to zero, it shall not be possible to create any new files on the file system without

85041 first deleting others, unless the process has appropriate privileges. The figure

85042 written may be less than zero.

85043 <percentage used>

85044 The percentage of the normally available space that is currently allocated to all files

85045 on the file system. This shall be calculated using the fraction:

85046 
$$\frac{\text{<space used>}}{(\text{<space used>} + \text{<space free>})}$$

85047 expressed as a percentage. This percentage may be greater than 100 if <space free>

85048 is less than zero. The percentage value shall be expressed as a positive integer, with

85049 any fractional result causing it to be rounded to the next highest integer.

85050 <file system root>

85051 The directory below which the file system hierarchy appears.

85052 XSI The output format is unspecified when **-t** is used.

## 85053 STDERR

85054 The standard error shall be used only for diagnostic messages.

## 85055 OUTPUT FILES

85056 None.

## 85057 EXTENDED DESCRIPTION

85058 None.

## 85059 EXIT STATUS

85060 The following exit values shall be returned:

85061 0 Successful completion.

85062 >0 An error occurred.

## 85063 CONSEQUENCES OF ERRORS

85064 Default.

## 85065 APPLICATION USAGE

85066 On most systems, the “name of the file system, in an implementation-defined format” is the  
85067 special file on which the file system is mounted.

85068 On large file systems, the calculation specified for percentage used can create huge rounding  
85069 errors.

## 85070 EXAMPLES

85071 1. The following example writes portable information about the **/usr** file system:

85072 `df -P /usr`

85073 2. Assuming that **/usr/src** is part of the **/usr** file system, the following produces the same  
85074 output as the previous example:

85075 `df -P /usr/src`

## 85076 RATIONALE

85077 The behavior of *df* with the **-P** option is the default action of the 4.2 BSD *df* utility. The uppercase  
85078 **-P** was selected to avoid collision with a known industry extension using **-p**.

85079 Historical *df* implementations vary considerably in their default output. It was therefore  
85080 necessary to describe the default output in a loose manner to accommodate all known historical  
85081 implementations and to add a portable option (**-P**) to provide information in a portable format.

85082 The use of 512-byte units is historical practice and maintains compatibility with *ls* and other  
85083 utilities in this volume of POSIX.1-2008. This does not mandate that the file system itself be  
85084 based on 512-byte blocks. The **-k** option was added as a compromise measure. It was agreed by  
85085 the standard developers that 512 bytes was the best default unit because of its complete  
85086 historical consistency on System V (*versus* the mixed 512/1024-byte usage on BSD systems), and  
85087 that a **-k** option to switch to 1024-byte units was a good compromise. Users who prefer the  
85088 more logical 1024-byte quantity can easily alias *df* to *df -k* without breaking many historical  
85089 scripts relying on the 512-byte units.

85090 It was suggested that *df* and the various related utilities be modified to access a *BLOCKSIZE*  
85091 environment variable to achieve consistency and user acceptance. Since this is not historical

85092 practice on any system, it is left as a possible area for system extensions and will be re-evaluated  
 85093 in a future version if it is widely implemented.

#### 85094 **FUTURE DIRECTIONS**

85095 None.

#### 85096 **SEE ALSO**

85097 *find*

85098 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)

#### 85099 **CHANGE HISTORY**

85100 First released in Issue 2.

#### 85101 **Issue 6**

85102 This utility is marked as part of the User Portability Utilities option.

#### 85103 **Issue 7**

85104 Austin Group Interpretation 1003.1-2001 #099 is applied.

85105 The *df* utility is removed from the User Portability Utilities option. User Portability Utilities is  
 85106 now an option for interactive utilities.

85107 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

85108 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0082 [156] is applied.

+

85109 **NAME**85110 `diff` — compare two files85111 **SYNOPSIS**85112 `diff [-c|-e|-f|-u|-C n|-U n] [-br] file1 file2`85113 **DESCRIPTION**

85114 The *diff* utility shall compare the contents of *file1* and *file2* and write to standard output a list of  
 85115 changes necessary to convert *file1* into *file2*. This list should be minimal. No output shall be  
 85116 produced if the files are identical.

85117 **OPTIONS**85118 The *diff* utility shall conform to XBD [Section 12.2](#) (on page 215).

85119 The following options shall be supported:

85120 **-b** Cause any amount of white space at the end of a line to be treated as a single  
 85121 <newline> (that is, the white-space characters preceding the <newline> are  
 85122 ignored) and other strings of white-space characters, not including <newline>  
 85123 characters, to compare equal.

85124 **-c** Produce output in a form that provides three lines of copied context.

85125 **-C n** Produce output in a form that provides *n* lines of copied context (where *n* shall be  
 85126 interpreted as a positive decimal integer).

85127 **-e** Produce output in a form suitable as input for the *ed* utility, which can then be used  
 85128 to convert *file1* into *file2*.

85129 **-f** Produce output in an alternative form, similar in format to **-e**, but not intended to  
 85130 be suitable as input for the *ed* utility, and in the opposite order.

85131 **-r** Apply *diff* recursively to files and directories of the same name when *file1* and *file2*  
 85132 are both directories.

85133 The *diff* utility shall detect infinite loops; that is, entering a previously visited  
 85134 directory that is an ancestor of the last file encountered. When it detects an infinite  
 85135 loop, *diff* shall write a diagnostic message to standard error and shall either recover  
 85136 its position in the hierarchy or terminate.

85137 **-u** Produce output in a form that provides three lines of unified context.

85138 **-U n** Produce output in a form that provides *n* lines of unified context (where *n* shall be  
 85139 interpreted as a non-negative decimal integer).

85140 **OPERANDS**

85141 The following operands shall be supported:

85142 *file1, file2* A pathname of a file to be compared. If either the *file1* or *file2* operand is `'-'`, the  
 85143 standard input shall be used in its place.

85144 If both *file1* and *file2* are directories, *diff* shall not compare block special files, character special  
 85145 files, or FIFO special files to any files and shall not compare regular files to directories. Further  
 85146 details are as specified in [Diff Directory Comparison Format](#) (on page 2624). The behavior of *diff*  
 85147 on other file types is implementation-defined when found in directories.

85148 If only one of *file1* and *file2* is a directory, *diff* shall be applied to the non-directory file and the file  
 85149 contained in the directory file with a filename that is the same as the last component of the non-  
 85150 directory file.

85151 **STDIN**

85152 The standard input shall be used only if one of the *file1* or *file2* operands references standard  
 85153 input. See the INPUT FILES section.

85154 **INPUT FILES**

85155 The input files may be of any type.

85156 **ENVIRONMENT VARIABLES**

85157 The following environment variables shall affect the execution of *diff*:

85158 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 85159 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 85160 variables used to determine the values of locale categories.)

85161 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 85162 internationalization variables.

85163 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 85164 characters (for example, single-byte as opposed to multi-byte characters in  
 85165 arguments and input files).

85166 *LC\_MESSAGES*

85167 Determine the locale that should be used to affect the format and contents of  
 85168 diagnostic messages written to standard error and informative messages written to  
 85169 standard output.

85170 *LC\_TIME* Determine the locale for affecting the format of file timestamps written with the *-C*  
 85171 and *-c* options.

85172 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

85173 *TZ* Determine the timezone used for calculating file timestamps written with a context  
 85174 format. If *TZ* is unset or null, an unspecified default timezone shall be used.

85175 **ASYNCHRONOUS EVENTS**

85176 Default.

85177 **STDOUT**85178 **Diff Directory Comparison Format**

85179 If both *file1* and *file2* are directories, the following output formats shall be used.

85180 In the POSIX locale, each file that is present in only one directory shall be reported using the  
 85181 following format:

85182 "Only in %s: %s\n", <directory pathname>, <filename>

85183 In the POSIX locale, subdirectories that are common to the two directories may be reported with  
 85184 the following format:

85185 "Common subdirectories: %s and %s\n", <directory1 pathname>,  
 85186 <directory2 pathname>

85187 For each file common to the two directories, if the two files are not to be compared: if the two  
 85188 files have the same device ID and file serial number, or are both block special files that refer to  
 85189 the same device, or are both character special files that refer to the same device, in the POSIX  
 85190 locale the output format is unspecified. Otherwise, in the POSIX locale an unspecified format  
 85191 shall be used that contains the pathnames of the two files.

85192 For each file common to the two directories, if the files are compared and are identical, no

85193 output shall be written. If the two files differ, the following format is written:

85194 "diff %s %s %s\n", <diff\_options>, <filename1>, <filename2>

85195 where <diff\_options> are the options as specified on the command line.

85196 All directory pathnames listed in this section shall be relative to the original command line  
85197 arguments. All other names of files listed in this section shall be filenames (pathname  
85198 components).

### 85199 **Diff Binary Output Format**

85200 In the POSIX locale, if one or both of the files being compared are not text files, it is  
85201 implementation-defined whether *diff* uses the binary file output format or the other formats as  
85202 specified below. The binary file output format shall contain the pathnames of two files being  
85203 compared and the string "differ".

85204 If both files being compared are text files, depending on the options specified, one of the  
85205 following formats shall be used to write the differences.

### 85206 **Diff Default Output Format**

85207 The default (without **-e**, **-f**, **-c**, **-C**, **-u**, or **-U** options) *diff* utility output shall contain lines of  
85208 these forms:

85209 "%da%d\n", <num1>, <num2>

85210 "%da%d,%d\n", <num1>, <num2>, <num3>

85211 "%dd%d\n", <num1>, <num2>

85212 "%d,%dd%d\n", <num1>, <num2>, <num3>

85213 "%dc%d\n", <num1>, <num2>

85214 "%d,%dc%d\n", <num1>, <num2>, <num3>

85215 "%dc%d,%d\n", <num1>, <num2>, <num3>

85216 "%d,%dc%d,%d\n", <num1>, <num2>, <num3>, <num4>

85217 These lines resemble *ed* subcommands to convert *file1* into *file2*. The line numbers before the  
85218 action letters shall pertain to *file1*; those after shall pertain to *file2*. Thus, by exchanging *a* for *d*  
85219 and reading the line in reverse order, one can also determine how to convert *file2* into *file1*. As in  
85220 *ed*, identical pairs (where *num1*=*num2*) are abbreviated as a single number.

85221 Following each of these lines, *diff* shall write to standard output all lines affected in the first file  
85222 using the format:

85223 "<Δ%s", <line>

85224 and all lines affected in the second file using the format:

85225 ">Δ%s", <line>

85226 If there are lines affected in both *file1* and *file2* (as with the **c** subcommand), the changes are  
85227 separated with a line consisting of three <hyphen> characters:

85228 "---\n"

**Diff -e Output Format**

With the **-e** option, a script shall be produced that shall, when provided as input to *ed*, along with an appended **w** (write) command, convert *file1* into *file2*. Only the **a** (append), **c** (change), **d** (delete), **i** (insert), and **s** (substitute) commands of *ed* shall be used in this script. Text lines, except those consisting of the single character <period> ('.'), shall be output as they appear in the file.

**Diff -f Output Format**

With the **-f** option, an alternative format of script shall be produced. It is similar to that produced by **-e**, with the following differences:

1. It is expressed in reverse sequence; the output of **-e** orders changes from the end of the file to the beginning; the **-f** from beginning to end.
2. The command form <lines> <command-letter> used by **-e** is reversed. For example, 10c with **-e** would be c10 with **-f**.
3. The form used for ranges of line numbers is <space>-separated, rather than <comma>-separated.

**Diff -c or -C Output Format**

With the **-c** or **-C** option, the output format shall consist of affected lines along with surrounding lines of context. The affected lines shall show which ones need to be deleted or changed in *file1*, and those added from *file2*. With the **-c** option, three lines of context, if available, shall be written before and after the affected lines. With the **-C** option, the user can specify how many lines of context are written. The exact format follows.

The name and last modification time of each file shall be output in the following format:

```
*** %s %s\n", file1, <file1 timestamp>
--- %s %s\n", file2, <file2 timestamp>
```

Each <file> field shall be the pathname of the corresponding file being compared. The pathname written for standard input is unspecified.

In the POSIX locale, each <timestamp> field shall be equivalent to the output from the following command:

```
date "+%a %b %e %T %Y"
```

without the trailing <newline>, executed at the time of last modification of the corresponding file (or the current time, if the file is standard input).

Then, the following output formats shall be applied for every set of changes.

First, a line shall be written in the following format:

```
*****\n"
```

Next, the range of lines in *file1* shall be written in the following format if the range contains two or more lines:

```
*** %d,%d *****\n", <beginning line number>, <ending line number>
```

and the following format otherwise:

```
*** %d *****\n", <ending line number>
```

The ending line number of an empty range shall be the number of the preceding line, or 0 if the

85269 range is at the start of the file.

85270 Next, the affected lines along with lines of context (unaffected lines) shall be written. Unaffected  
85271 lines shall be written in the following format:

85272 " $\Delta\Delta$ %s", <unaffected\_line>

85273 Deleted lines shall be written as:

85274 " $-\Delta$ %s", <deleted\_line>

85275 Changed lines shall be written as:

85276 " $!\Delta$ %s", <changed\_line>

85277 Next, the range of lines in *file2* shall be written in the following format if the range contains two  
85278 or more lines:

85279 "--- %d,%d ----\n", <beginning line number>, <ending line number>

85280 and the following format otherwise:

85281 "--- %d ----\n", <ending line number>

85282 Then, lines of context and changed lines shall be written as described in the previous formats.  
85283 Lines added from *file2* shall be written in the following format:

85284 "+ $\Delta$ %s", <added\_line>

#### 85285 **Diff -u or -U Output Format**

85286 The -u or -U options behave like the -c or -C options, except that the context lines are not  
85287 repeated; instead, the context, deleted, and added lines are shown together, interleaved. The  
85288 exact format follows.

85289 The name and last modification time of each file shall be output in the following format:

85290 "--- $\Delta$ %s%s% $\Delta$ %s0, file1, <file1 timestamp>, <file1 frac>, <file1 zone>  
85291 "+++ $\Delta$ %s%s% $\Delta$ %s0, file2, <file2 timestamp>, <file2 frac>, <file2 zone>

85292 Each <file> field shall be the pathname of the corresponding file being compared, or the single  
85293 character '-' if standard input is being compared. However, if the pathname contains a <tab>  
85294 or a <newline>, or if it does not consist entirely of characters taken from the portable character  
85295 set, the behavior is implementation-defined.

85296 Each <timestamp> field shall be equivalent to the output from the following command:

85297 date '+%Y-%m-%d $\Delta$ %H:%M:%S'

85298 without the trailing <newline>, executed at the time of last modification of the corresponding  
85299 file (or the current time, if the file is standard input).

85300 Each <frac> field shall be either empty, or a decimal point followed by at least one decimal digit,  
85301 indicating the fractional-seconds part (if any) of the file timestamp. The number of fractional  
85302 digits shall be at least the number needed to represent the file's timestamp without loss of  
85303 information.

85304 Each <zone> field shall be of the form "shhmm", where "shh" is a signed two-digit decimal  
85305 number in the range -24 through +25, and "mm" is an unsigned two-digit decimal number in the  
85306 range 00 through 59. It represents the timezone of the timestamp as the number of hours (hh)  
85307 and minutes (mm) east (+) or west (-) of UTC for the timestamp. If the hours and minutes are  
85308 both zero, the sign shall be '+'. However, if the timezone is not an integral number of minutes

85309 away from UTC, the `<zone>` field is implementation-defined.

85310 Then, the following output formats shall be applied for every set of changes.

85311 First, the range of lines in each file shall be written in the following format:

85312 `"@@Δ-%sΔ+%sΔ@@", <file1 range>, <file2 range>`

85313 Each `<range>` field shall be of the form:

85314 `"%ld", <beginning line number>`

85315 if the range contains exactly one line, and:

85316 `"%ld,%ld", <beginning line number>, <number of lines>`

85317 otherwise. If a range is empty, its beginning line number shall be the number of the line just

85318 before the range, or 0 if the empty range starts the file.

85319 Next, the affected lines along with lines of context shall be written. Each non-empty unaffected

85320 line shall be written in the following format:

85321 `"Δ%s", <unaffected_line>`

85322 where the contents of the unaffected line shall be taken from *file1*. It is implementation-defined

85323 whether an empty unaffected line is written as an empty line or a line containing a single

85324 `<space>` character. This line also represents the same line of *file2*, even though *file2*'s line may

85325 contain different contents due to the `-b`. Deleted lines shall be written as:

85326 `"- %s", <deleted_line>`

85327 Added lines shall be written as:

85328 `"+ %s", <added_line>`

85329 The order of lines written shall be the same as that of the corresponding file. A deleted line shall

85330 never be written immediately after an added line.

85331 If `-U n` is specified, the output shall contain no more than *n* consecutive unaffected lines; and if

85332 the output contains an affected line and this line is adjacent to up to *n* consecutive unaffected

85333 lines in the corresponding file, the output shall contain these unaffected lines. `-u` shall act like

85334 `-U3`.

85335 **STDERR**

85336 The standard error shall be used only for diagnostic messages.

85337 **OUTPUT FILES**

85338 None.

85339 **EXTENDED DESCRIPTION**

85340 None.

85341 **EXIT STATUS**

85342 The following exit values shall be returned:

85343 0 No differences were found.

85344 1 Differences were found.

85345 >1 An error occurred.

## CONSEQUENCES OF ERRORS

Default.

## APPLICATION USAGE

If lines at the end of a file are changed and other lines are added, *diff* output may show this as a delete and add, as a change, or as a change and add; *diff* is not expected to know which happened and users should not care about the difference in output as long as it clearly shows the differences between the files.

## EXAMPLES

If **dir1** is a directory containing a directory named **x**, **dir2** is a directory containing a directory named **x**, **dir1/x** and **dir2/x** both contain files named **date.out**, and **dir2/x** contains a file named **y**, the command:

```
diff -r dir1 dir2
```

could produce output similar to:

```
Common subdirectories: dir1/x and dir2/x
Only in dir2/x: y
diff -r dir1/x/date.out dir2/x/date.out
1c1
< Mon Jul 2 13:12:16 PDT 1990

> Tue Jun 19 21:41:39 PDT 1990
```

## RATIONALE

The **-h** option was omitted because it was insufficiently specified and does not add to applications portability.

Historical implementations employ algorithms that do not always produce a minimum list of differences; the current language about making every effort is the best this volume of POSIX.1-2008 can do, as there is no metric that could be employed to judge the quality of implementations against any and all file contents. The statement “This list should be minimal” clearly implies that implementations are not expected to provide the following output when comparing two 100-line files that differ in only one character on a single line:

```
1,100c1,100
all 100 lines from file1 preceded with "< "

all 100 lines from file2 preceded with "> "
```

The “Only in” messages required when the **-r** option is specified are not used by most historical implementations if the **-e** option is also specified. It is required here because it provides useful information that must be provided to update a target directory hierarchy to match a source hierarchy. The “Common subdirectories” messages are written by System V and 4.3 BSD when the **-r** option is specified. They are allowed here but are not required because they are reporting on something that is the same, not reporting a difference, and are not needed to update a target hierarchy.

The **-c** option, which writes output in a format using lines of context, has been included. The format is useful for a variety of reasons, among them being much improved readability and the ability to understand difference changes when the target file has line numbers that differ from another similar, but slightly different, copy. The *patch* utility is most valuable when working with difference listings using a context format. The BSD version of **-c** takes an optional argument specifying the amount of context. Rather than overloading **-c** and breaking the Utility Syntax Guidelines for *diff*, the standard developers decided to add a separate option for

specifying a context diff with a specified amount of context (`-C`). Also, the format for context *diffs* was extended slightly in 4.3 BSD to allow multiple changes that are within context lines from each other to be merged together. The output format contains an additional four `<asterisk>` characters after the range of affected lines in the first filename. This was to provide a flag for old programs (like old versions of *patch*) that only understand the old context format. The version of context described here does not require that multiple changes within context lines be merged, but it does not prohibit it either. The extension is upwards-compatible, so any vendors that wish to retain the old version of *diff* can do so by adding the extra four `<asterisk>` characters (that is, utilities that currently use *diff* and understand the new merged format will also understand the old unmerged format, but not *vice versa*).

The `-u` and `-U` options of GNU *diff* have been included. Their output format, designed by Wayne Davison, takes up less space than `-c` and `-C` format, and in many cases is easier to read. The format's timestamps do not vary by locale, so `LC_TIME` does not affect it. The format's line numbers are rendered with the `%ld` format, not `%d`, because the file format notation rules would allow extra `<blank>` characters to appear around the numbers.

The substitute command was added as an additional format for the `-e` option. This was added to provide implementations with a way to fix the classic "dot alone on a line" bug present in many versions of *diff*. Since many implementations have fixed this bug, the standard developers decided not to standardize broken behavior, but rather to provide the necessary tool for fixing the bug. One way to fix this bug is to output two periods whenever a lone period is needed, then terminate the append command with a period, and then use the substitute command to convert the two periods into one period.

The BSD-derived `-r` option was added to provide a mechanism for using *diff* to compare two file system trees. This behavior is useful, is standard practice on all BSD-derived systems, and is not easily reproducible with the *find* utility.

The requirement that *diff* not compare files in some circumstances, even though they have the same name, is based on the actual output of historical implementations. The specified behavior precludes the problems arising from running into FIFOs and other files that would cause *diff* to hang waiting for input with no indication to the user that *diff* was hung. An earlier version of this standard specified the output format more precisely, but in practice this requirement was widely ignored and the benefit of standardization seemed small, so it is now unspecified. In most common usage, *diff -r* should indicate differences in the file hierarchies, not the difference of contents of devices pointed to by the hierarchies.

Many early implementations of *diff* require seekable files. Since the System Interfaces volume of POSIX.1-2008 supports named pipes, the standard developers decided that such a restriction was unreasonable. Note also that the allowed filename – almost always refers to a pipe.

No directory search order is specified for *diff*. The historical ordering is, in fact, not optimal, in that it prints out all of the differences at the current level, including the statements about all common subdirectories before recursing into those subdirectories.

The message:

```
"diff %s %s %s\n", <diff_options>, <filename1>, <filename2>
```

does not vary by locale because it is the representation of a command, not an English sentence.

## FUTURE DIRECTIONS

None.

85437 **SEE ALSO**85438 *cmp, comm, ed, find*85439 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)85440 **CHANGE HISTORY**

85441 First released in Issue 2.

85442 **Issue 5**

85443 The FUTURE DIRECTIONS section is added.

85444 **Issue 6**85445 The following new requirements on POSIX implementations derive from alignment with the  
85446 Single UNIX Specification:

- 85447
- The `-f` option is added.

85448 The output format for `-c` or `-C` format is changed to align with changes to the IEEE P1003.2b  
85449 draft standard resulting from IEEE PASC Interpretation 1003.2 #71.

85450 The normative text is reworded to avoid use of the term “must” for application requirements.

85451 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/20 is applied, changing the STDOUT  
85452 section. This changes the specification of *diff* `-c` so that it agrees with existing practice when  
85453 contexts contain zero lines or one line.85454 **Issue 7**

85455 Austin Group Interpretations 1003.1-2001 #115 and #114 are applied.

85456 Austin Group Interpretation 1003.1-2001 #192 is applied, clarifying the behavior if both files are  
85457 non-text files.

85458 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

85459 SD5-XCU-ERN-103 and SD5-XCU-ERN-120 are applied, adding the `-u` option.

**NAME**

dirname — return the directory portion of a pathname

**SYNOPSIS**

dirname *string*

**DESCRIPTION**

The *string* operand shall be treated as a pathname, as defined in XBD [Section 3.267](#) (on page 75). The string *string* shall be converted to the name of the directory containing the filename corresponding to the last pathname component in *string*, performing actions equivalent to the following steps in order:

1. If *string* is *//*, skip steps 2 to 5.
2. If *string* consists entirely of <slash> characters, *string* shall be set to a single <slash> character. In this case, skip steps 3 to 8.
3. If there are any trailing <slash> characters in *string*, they shall be removed.
4. If there are no <slash> characters remaining in *string*, *string* shall be set to a single <period> character. In this case, skip steps 5 to 8.
5. If there are any trailing non-<slash> characters in *string*, they shall be removed.
6. If the remaining *string* is *//*, it is implementation-defined whether steps 7 and 8 are skipped or processed.
7. If there are any trailing <slash> characters in *string*, they shall be removed.
8. If the remaining *string* is empty, *string* shall be set to a single <slash> character.

The resulting string shall be written to standard output.

**OPTIONS**

None.

**OPERANDS**

The following operand shall be supported:

*string*            A string.

**STDIN**

Not used.

**INPUT FILES**

None.

**ENVIRONMENT VARIABLES**

The following environment variables shall affect the execution of *dirname*:

- |                 |                                                                                                                                                                                                                                                    |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>LANG</b>     | Provide a default value for the internationalization variables that are unset or null. (See XBD <a href="#">Section 8.2</a> (on page 174) for the precedence of internationalization variables used to determine the values of locale categories.) |
| <b>LC_ALL</b>   | If set to a non-empty string value, override the values of all the other internationalization variables.                                                                                                                                           |
| <b>LC_CTYPE</b> | Determine the locale for the interpretation of sequences of bytes of text data as characters (for example, single-byte as opposed to multi-byte characters in arguments).                                                                          |

85500 **LC\_MESSAGES**  
 85501 Determine the locale that should be used to affect the format and contents of  
 85502 diagnostic messages written to standard error.

85503 XSI **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

85504 **ASYNCHRONOUS EVENTS**  
 85505 Default.

85506 **STDOUT**  
 85507 The *dirname* utility shall write a line to the standard output in the following format:  
 85508 "%s\n", <resulting string>

85509 **STDERR**  
 85510 The standard error shall be used only for diagnostic messages.

85511 **OUTPUT FILES**  
 85512 None.

85513 **EXTENDED DESCRIPTION**  
 85514 None.

85515 **EXIT STATUS**  
 85516 The following exit values shall be returned:  
 85517 0 Successful completion.  
 85518 >0 An error occurred.

85519 **CONSEQUENCES OF ERRORS**  
 85520 Default.

85521 **APPLICATION USAGE**  
 85522 The definition of *pathname* specifies implementation-defined behavior for pathnames starting  
 85523 with two <slash> characters. Therefore, applications shall not arbitrarily add <slash> characters  
 85524 to the beginning of a pathname unless they can ensure that there are more or less than two or are  
 85525 prepared to deal with the implementation-defined consequences.

## 85526 EXAMPLES

| Command                 | Results     |
|-------------------------|-------------|
| <i>dirname</i> /        | /           |
| <i>dirname</i> //       | / or //     |
| <i>dirname</i> /a/b/    | /a          |
| <i>dirname</i> //a//b// | //a         |
| <i>dirname</i>          | Unspecified |
| <i>dirname</i> a        | . (\$? = 0) |
| <i>dirname</i> ""       | . (\$? = 0) |
| <i>dirname</i> /a       | /           |
| <i>dirname</i> /a/b     | /a          |
| <i>dirname</i> a/b      | a           |

85538 See also the examples for the *basename* utility.

+

85539 **RATIONALE**  
 85540 The *dirname* utility originated in System III. It has evolved through the System V releases to a  
 85541 version that matches the requirements specified in this description in System V Release 3. 4.3  
 85542 BSD and earlier versions did not include *dirname*.

85543 The behaviors of *basename* and *dirname* in this volume of POSIX.1-2008 have been coordinated so  
85544 that when *string* is a valid pathname:

85545 `$ (basename -- "string")` |

85546 would be a valid filename for the file in the directory:

85547 `$ (dirname -- "string")` |

85548 This would not work for the versions of these utilities in early proposals due to the way  
85549 processing of trailing <slash> characters was specified. Consideration was given to leaving  
85550 processing unspecified if there were trailing <slash> characters, but this cannot be done; XBD  
85551 [Section 3.267](#) (on page 75) allows trailing <slash> characters. The *basename* and *dirname* utilities  
85552 have to specify consistent handling for all valid pathnames.

#### 85553 FUTURE DIRECTIONS

85554 None.

#### 85555 SEE ALSO

#### 85558 CHANGE HISTORY

85559 First released in Issue 2.

#### 85560 Issue 7

85561 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0083 [192,430], XCU/TC1-2008/0084 +  
85562 [192], and XCU/TC1-2008/0085 [192] are applied.

85563 **NAME**85564 `du` — estimate file space usage85565 **SYNOPSIS**85566 `du [-a|-s] [-kx] [-H|-L] [file...]`85567 **DESCRIPTION**

85568 By default, the *du* utility shall write to standard output the size of the file space allocated to, and  
 85569 the size of the file space allocated to each subdirectory of, the file hierarchy rooted in each of the  
 85570 specified files. By default, when a symbolic link is encountered on the command line or in the  
 85571 file hierarchy, *du* shall count the size of the symbolic link (rather than the file referenced by the  
 85572 link), and shall not follow the link to another portion of the file hierarchy. The size of the file  
 85573 space allocated to a file of type directory shall be defined as the sum total of space allocated to  
 85574 all files in the file hierarchy rooted in the directory plus the space allocated to the directory itself.

85575 When *du* cannot *stat()* files or *stat()* or read directories, it shall report an error condition and the  
 85576 final exit status is affected. Files with multiple links shall be counted and written for only one  
 85577 entry. The directory entry that is selected in the report is unspecified. By default, file sizes shall  
 85578 be written in 512-byte units, rounded up to the next 512-byte unit.

85579 **OPTIONS**85580 The *du* utility shall conform to XBD [Section 12.2](#) (on page 215).

85581 The following options shall be supported:

85582 **-a** In addition to the default output, report the size of each file not of type directory in  
 85583 the file hierarchy rooted in the specified file. Regardless of the presence of the **-a**  
 85584 option, non-directories given as *file* operands shall always be listed.

85585 **-H** If a symbolic link is specified on the command line, *du* shall count the size of the  
 85586 file or file hierarchy referenced by the link.

85587 **-k** Write the files sizes in units of 1 024 bytes, rather than the default 512-byte units.

85588 **-L** If a symbolic link is specified on the command line or encountered during the  
 85589 traversal of a file hierarchy, *du* shall count the size of the file or file hierarchy  
 85590 referenced by the link.

85591 **-s** Instead of the default output, report only the total sum for each of the specified  
 85592 files.

85593 **-x** When evaluating file sizes, evaluate only those files that have the same device as  
 85594 the file specified by the *file* operand.

85595 Specifying more than one of the mutually-exclusive options **-H** and **-L** shall not be considered  
 85596 an error. The last option specified shall determine the behavior of the utility.

85597 **OPERANDS**

85598 The following operand shall be supported:

85599 *file* The pathname of a file whose size is to be written. If no *file* is specified, the current  
 85600 directory shall be used.

85601 **STDIN**

85602 Not used.

85603 **INPUT FILES**

85604 None.

85605 **ENVIRONMENT VARIABLES**85606 The following environment variables shall affect the execution of *du*:

85607 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 85608 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 85609 variables used to determine the values of locale categories.)

85610 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 85611 internationalization variables.

85612 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 85613 characters (for example, single-byte as opposed to multi-byte characters in  
 85614 arguments).

85615 *LC\_MESSAGES*

85616 Determine the locale that should be used to affect the format and contents of  
 85617 diagnostic messages written to standard error.

85618 *XSI* *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

85619 **ASYNCHRONOUS EVENTS**

85620 Default.

85621 **STDOUT**

85622 The output from *du* shall consist of the amount of space allocated to a file and the name of the  
 85623 file, in the following format:

85624 "%d %s\n", &lt;size&gt;, &lt;pathname&gt;

85625 **STDERR**

85626 The standard error shall be used only for diagnostic messages.

85627 **OUTPUT FILES**

85628 None.

85629 **EXTENDED DESCRIPTION**

85630 None.

85631 **EXIT STATUS**

85632 The following exit values shall be returned:

85633 0 Successful completion.

85634 &gt;0 An error occurred.

85635 **CONSEQUENCES OF ERRORS**

85636 Default.

85637 **APPLICATION USAGE**

85638 None.

85639 **EXAMPLES**

85640 None.

85641 **RATIONALE**

85642 The use of 512-byte units is historical practice and maintains compatibility with *ls* and other  
 85643 utilities in this volume of POSIX.1-2008. This does not mandate that the file system itself be  
 85644 based on 512-byte blocks. The *-k* option was added as a compromise measure. It was agreed by  
 85645 the standard developers that 512 bytes was the best default unit because of its complete  
 85646 historical consistency on System V (*versus* the mixed 512/1024-byte usage on BSD systems), and  
 85647 that a *-k* option to switch to 1024-byte units was a good compromise. Users who prefer the

1 024-byte quantity can easily alias *du* to *du -k* without breaking the many historical scripts relying on the 512-byte units.

The **-b** option was added to an early proposal to provide a resolution to the situation where System V and BSD systems give figures for file sizes in *blocks*, which is an implementation-defined concept. (In common usage, the block size is 512 bytes for System V and 1 024 bytes for BSD systems.) However, **-b** was later deleted, since the default was eventually decided as 512-byte units.

Historical file systems provided no way to obtain exact figures for the space allocation given to files. There are two known areas of inaccuracies in historical file systems: cases of *indirect blocks* being used by the file system or *sparse* files yielding incorrectly high values. An indirect block is space used by the file system in the storage of the file, but that need not be counted in the space allocated to the file. A *sparse* file is one in which an *lseek()* call has been made to a position beyond the end of the file and data has subsequently been written at that point. A file system need not allocate all the intervening zero-filled blocks to such a file. It is up to the implementation to define exactly how accurate its methods are.

The **-a** and **-s** options were mutually-exclusive in the original version of *du*. The POSIX Shell and Utilities description is implied by the language in the SVID where **-s** is described as causing “only the grand total” to be reported. Some systems may produce output for **-sa**, but a Strictly Conforming POSIX Shell and Utilities Application cannot use that combination.

The **-a** and **-s** options were adopted from the SVID except that the System V behavior of not listing non-directories explicitly given as operands, unless the **-a** option is specified, was considered a bug; the BSD-based behavior (report for all operands) is mandated. The default behavior of *du* in the SVID with regard to reporting the failure to read files (it produces no messages) was considered counter-intuitive, and thus it was specified that the POSIX Shell and Utilities default behavior shall be to produce such messages. These messages can be turned off with shell redirection to achieve the System V behavior.

The **-x** option is historical practice on recent BSD systems. It has been adopted by this volume of POSIX.1-2008 because there was no other historical method of limiting the *du* search to a single file hierarchy. This limitation of the search is necessary to make it possible to obtain file space usage information about a file system on which other file systems are mounted, without having to resort to a lengthy *find* and *awk* script.

## FUTURE DIRECTIONS

None.

## CHANGE HISTORY

First released in Issue 2.

## Issue 6

This utility is marked as part of the User Portability Utilities option.

The APPLICATION USAGE section is added.

The obsolescent **-r** option is removed.

The Open Group Corrigendum U025/3 is applied. The *du* utility is reinstated, as it had incorrectly been marked LEGACY in Issue 5.

85693 The **-H** and **-L** options for symbolic links are added as described in the IEEE P1003.2b draft  
85694 standard.

85695 **Issue 7**

85696 The *du* utility is moved from the User Portability Utilities option to the Base. User Portability  
85697 Utilities is now an option for interactive utilities.

85698 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

85699 **NAME**85700 `echo` — write arguments to standard output85701 **SYNOPSIS**85702 `echo` [*string*...]85703 **DESCRIPTION**85704 The *echo* utility writes its arguments to standard output, followed by a <newline>. If there are  
85705 no arguments, only the <newline> is written.85706 **OPTIONS**85707 The *echo* utility shall not recognize the "--" argument in the manner specified by Guideline 10  
85708 of XBD [Section 12.2](#) (on page 215); "--" shall be recognized as a string operand.

85709 Implementations shall not support any options.

85710 **OPERANDS**

85711 The following operands shall be supported:

85712 *string* A string to be written to standard output. If the first operand is `-n`, or if any of the  
85713 operands contain a <backslash> character, the results are implementation-defined.85714 XSI On XSI-conformant systems, if the first operand is `-n`, it shall be treated as a string,  
85715 not an option. The following character sequences shall be recognized on XSI-  
85716 conformant systems within any of the arguments:

|       |                    |                                                                                    |
|-------|--------------------|------------------------------------------------------------------------------------|
| 85717 | <code>\a</code>    | Write an <alert>.                                                                  |
| 85718 | <code>\b</code>    | Write a <backspace>.                                                               |
| 85719 | <code>\c</code>    | Suppress the <newline> that otherwise follows the final argument in the            |
| 85720 |                    | output. All characters following the ' <code>\c</code> ' in the arguments shall be |
| 85721 |                    | ignored.                                                                           |
| 85722 | <code>\f</code>    | Write a <form-feed>.                                                               |
| 85723 | <code>\n</code>    | Write a <newline>.                                                                 |
| 85724 | <code>\r</code>    | Write a <carriage-return>.                                                         |
| 85725 | <code>\t</code>    | Write a <tab>.                                                                     |
| 85726 | <code>\v</code>    | Write a <vertical-tab>.                                                            |
| 85727 | <code>\\</code>    | Write a <backslash> character.                                                     |
| 85728 | <code>\0num</code> | Write an 8-bit value that is the zero, one, two, or three-digit octal number       |
| 85729 |                    | <i>num</i> .                                                                       |

85730 **STDIN**

85731 Not used.

85732 **INPUT FILES**

85733 None.

85734 **ENVIRONMENT VARIABLES**85735 The following environment variables shall affect the execution of *echo*:85736 *LANG* Provide a default value for the internationalization variables that are unset or null.  
85737 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
85738 variables used to determine the values of locale categories.)

85739 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 85740 internationalization variables.

85741 XSI *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 85742 characters (for example, single-byte as opposed to multi-byte characters in  
 85743 arguments).

85744 *LC\_MESSAGES*  
 85745 Determine the locale that should be used to affect the format and contents of  
 85746 diagnostic messages written to standard error.

85747 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

85748 **ASYNCHRONOUS EVENTS**  
 85749 Default.

85750 **STDOUT**  
 85751 The *echo* utility arguments shall be separated by single <space> characters and a <newline>  
 85752 XSI character shall follow the last argument. Output transformations shall occur based on the  
 85753 escape sequences in the input. See the OPERANDS section.

85754 **STDERR**  
 85755 The standard error shall be used only for diagnostic messages.

85756 **OUTPUT FILES**  
 85757 None.

85758 **EXTENDED DESCRIPTION**  
 85759 None.

85760 **EXIT STATUS**  
 85761 The following exit values shall be returned:  
 85762 0 Successful completion.  
 85763 >0 An error occurred.

85764 **CONSEQUENCES OF ERRORS**  
 85765 Default.

85766 **APPLICATION USAGE**  
 85767 It is not possible to use *echo* portably across all POSIX systems unless both *-n* (as the first  
 85768 argument) and escape sequences are omitted.

85769 The *printf* utility can be used portably to emulate any of the traditional behaviors of the *echo*  
 85770 utility as follows (assuming that *IFS* has its standard value or is unset):

- 85771 • The historic System V *echo* and the requirements on XSI implementations in this volume of  
 85772 POSIX.1-2008 are equivalent to:

```
85773 printf "%b\n" "$*"
85774
```

- 85774 • The BSD *echo* is equivalent to:

```
85775 if ["X$1" = "X-n"]
85776 then
85777 shift
85778 printf "%s" "$*"
85779 else
85780 printf "%s\n" "$*"
85781 fi
```

85782 New applications are encouraged to use *printf* instead of *echo*.

85783 **EXAMPLES**

85784 None.

85785 **RATIONALE**

85786 The *echo* utility has not been made obsolescent because of its extremely widespread use in  
85787 historical applications. Conforming applications that wish to do prompting without <newline>  
85788 characters or that could possibly be expecting to echo a **-n**, should use the *printf* utility derived  
85789 from the Ninth Edition system.

85790 As specified, *echo* writes its arguments in the simplest of ways. The two different historical  
85791 versions of *echo* vary in fatally incompatible ways.

85792 The BSD *echo* checks the first argument for the string **-n** which causes it to suppress the  
85793 <newline> that would otherwise follow the final argument in the output.

85794 The System V *echo* does not support any options, but allows escape sequences within its  
85795 operands, as described for XSI implementations in the OPERANDS section.

85796 The *echo* utility does not support Utility Syntax Guideline 10 because historical applications  
85797 depend on *echo* to echo *all* of its arguments, except for the **-n** option in the BSD version.

85798 **FUTURE DIRECTIONS**

85799 None.

85800 **SEE ALSO**

85801 *printf*

85802 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)

85803 **CHANGE HISTORY**

85804 First released in Issue 2.

85805 **Issue 5**

85806 In the OPTIONS section, the last sentence is changed to indicate that implementations “do not”  
85807 support any options; in the previous issue this said “need not”.

85808 **Issue 6**

85809 The following new requirements on POSIX implementations derive from alignment with the  
85810 Single UNIX Specification:

- 85811 • A set of character sequences is defined as *string* operands.
- 85812 • *LC\_CTYPE* is added to the list of environment variables affecting *echo*.
- 85813 • In the OPTIONS section, implementations shall not support any options.

85814 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/21 is applied, so that the *echo* utility can  
85815 accommodate historical BSD behavior.

85816 **Issue 7**

85817 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

85818 **NAME**

85819           ed — edit text

85820 **SYNOPSIS**85821           ed [-p *string*] [-s] [*file*]85822 **DESCRIPTION**

85823           The *ed* utility is a line-oriented text editor that uses two modes: *command mode* and *input mode*. In  
 85824           command mode the input characters shall be interpreted as commands, and in input mode they  
 85825           shall be interpreted as text. See the EXTENDED DESCRIPTION section.

85826           If an operand is *'-'*, the results are unspecified.85827 **OPTIONS**

85828           The *ed* utility shall conform to XBD [Section 12.2](#) (on page 215), except for the unspecified usage  
 85829           of *'-'*.

85830           The following options shall be supported:

85831           -p *string*    Use *string* as the prompt string when in command mode. By default, there shall be  
 85832                           no prompt string.

85833           -s            Suppress the writing of byte counts by **e**, **E**, **r**, and **w** commands and of the *'!'*  
 85834                           prompt after a *!command*.

85835 **OPERANDS**

85836           The following operand shall be supported:

85837           *file*        If the *file* argument is given, *ed* shall simulate an **e** command on the file named by  
 85838                           the pathname, *file*, before accepting commands from the standard input.

85839 **STDIN**

85840           The standard input shall be a text file consisting of commands, as described in the EXTENDED  
 85841           DESCRIPTION section.

85842 **INPUT FILES**

85843           The input files shall be text files.

85844 **ENVIRONMENT VARIABLES**85845           The following environment variables shall affect the execution of *ed*:

85846           HOME        Determine the pathname of the user's home directory.

85847           LANG        Provide a default value for the internationalization variables that are unset or null.  
 85848                           (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 85849                           variables used to determine the values of locale categories.)

85850           LC\_ALL       If set to a non-empty string value, override the values of all the other  
 85851                           internationalization variables.

85852           LC\_COLLATE

85853                           Determine the locale for the behavior of ranges, equivalence classes, and multi-  
 85854                           character collating elements within regular expressions.

85855           LC\_CTYPE    Determine the locale for the interpretation of sequences of bytes of text data as  
 85856                           characters (for example, single-byte as opposed to multi-byte characters in  
 85857                           arguments and input files) and the behavior of character classes within regular  
 85858                           expressions.

|       |                             |                                                                                                                                                                         |
|-------|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 85859 | <i>LC_MESSAGES</i>          |                                                                                                                                                                         |
| 85860 |                             | Determine the locale that should be used to affect the format and contents of                                                                                           |
| 85861 |                             | diagnostic messages written to standard error and informative messages written to                                                                                       |
| 85862 |                             | standard output.                                                                                                                                                        |
| 85863 | XSI                         | <i>NLSPATH</i> Determine the location of message catalogs for the processing of <i>LC_MESSAGES</i> .                                                                    |
| 85864 | <b>ASYNCHRONOUS EVENTS</b>  |                                                                                                                                                                         |
| 85865 |                             | The <i>ed</i> utility shall take the standard action for all signals (see the ASYNCHRONOUS EVENTS                                                                       |

| 85867 | SIGINT                      | The <i>ed</i> utility shall interrupt its current activity, write the string "?\n" to standard                                                                          |
| 85868 |                             | output, and return to command mode (see the EXTENDED DESCRIPTION                                                                                                        |
| 85869 |                             | section).                                                                                                                                                               |
| 85870 | SIGHUP                      | If the buffer is not empty and has changed since the last write, the <i>ed</i> utility shall                                                                            |
| 85871 |                             | attempt to write a copy of the buffer in a file. First, the file named <b>ed.hup</b> in the                                                                             |
| 85872 |                             | current directory shall be used; if that fails, the file named <b>ed.hup</b> in the directory                                                                           |
| 85873 |                             | named by the <i>HOME</i> environment variable shall be used. In any case, the <i>ed</i> utility                                                                         |
| 85874 |                             | shall exit without writing the file to the currently remembered pathname and                                                                                            |
| 85875 |                             | without returning to command mode.                                                                                                                                      |
| 85876 | SIGQUIT                     | The <i>ed</i> utility shall ignore this event.                                                                                                                          |
| 85877 | <b>STDOUT</b>               |                                                                                                                                                                         |
| 85878 |                             | Various editing commands and the prompting feature (see <b>-p</b> ) write to standard output, as                                                                        |
| 85879 |                             | described in the EXTENDED DESCRIPTION section.                                                                                                                          |
| 85880 | <b>STDERR</b>               |                                                                                                                                                                         |
| 85881 |                             | The standard error shall be used only for diagnostic messages.                                                                                                          |
| 85882 | <b>OUTPUT FILES</b>         |                                                                                                                                                                         |
| 85883 |                             | The output files shall be text files whose formats are dependent on the editing commands given.                                                                         |
| 85884 | <b>EXTENDED DESCRIPTION</b> |                                                                                                                                                                         |
| 85885 |                             | The <i>ed</i> utility shall operate on a copy of the file it is editing; changes made to the copy shall have                                                            |
| 85886 |                             | no effect on the file until a <b>w</b> (write) command is given. The copy of the text is called the <i>buffer</i> .                                                     |
| 85887 |                             | Commands to <i>ed</i> have a simple and regular structure: zero, one, or two <i>addresses</i> followed by a                                                             |
| 85888 |                             | single-character <i>command</i> , possibly followed by parameters to that command. These addresses                                                                      |
| 85889 |                             | specify one or more lines in the buffer. Every command that requires addresses has default                                                                              |
| 85890 |                             | addresses, so that the addresses very often can be omitted. If the <b>-p</b> option is specified, the                                                                   |
| 85891 |                             | prompt string shall be written to standard output before each command is read.                                                                                          |
| 85892 |                             | In general, only one command can appear on a line. Certain commands allow text to be input.                                                                             |
| 85893 |                             | This text is placed in the appropriate place in the buffer. While <i>ed</i> is accepting text, it is said to be                                                         |
| 85894 |                             | in <i>input mode</i> . In this mode, no commands shall be recognized; all input is merely collected.                                                                    |
| 85895 |                             | Input mode is terminated by entering a line consisting of two characters: a <period> ('.') followed by a <newline>. This line is not considered part of the input text. |
| 85896 |                             |                                                                                                                                                                         |

## Regular Expressions in ed

The *ed* utility shall support basic regular expressions, as described in XBD [Section 9.3](#) (on page 183). Since regular expressions in *ed* are always matched against single lines (excluding the terminating <newline> characters), never against any larger section of text, there is no way for a regular expression to match a <newline>.

A null RE shall be equivalent to the last RE encountered.

Regular expressions are used in addresses to specify lines, and in some commands (for example, the **s** substitute command) to specify portions of a line to be substituted.

## Addresses in ed

Addressing in *ed* relates to the current line. Generally, the current line is the last line affected by a command. The current line number is the address of the current line. If the edit buffer is not empty, the initial value for the current line shall be the last line in the edit buffer; otherwise, zero.

Addresses shall be constructed as follows:

1. The <period> character ( ' . ' ) shall address the current line.
2. The <dollar-sign> character ( ' \$ ' ) shall address the last line of the edit buffer.
3. The positive decimal number *n* shall address the *n*th line of the edit buffer.
4. The <apostrophe>-*x* character pair ( " ' *x* " ) shall address the line marked with the mark name character *x*, which shall be a lowercase letter from the portable character set. It shall be an error if the character has not been set to mark a line or if the line that was marked is not currently present in the edit buffer.
5. A BRE enclosed by <slash> characters ( ' / ' ) shall address the first line found by searching forwards from the line following the current line toward the end of the edit buffer and stopping at the first line for which the line excluding the terminating <newline> matches the BRE. The BRE consisting of a null BRE delimited by a pair of <slash> characters shall address the next line for which the line excluding the terminating <newline> matches the last BRE encountered. In addition, the second <slash> can be omitted at the end of a command line. Within the BRE, a <backslash>-<slash> pair ( " \ / " ) shall represent a literal <slash> instead of the BRE delimiter. If necessary, the search shall wrap around to the beginning of the buffer and continue up to and including the current line, so that the entire buffer is searched.
6. A BRE enclosed by <question-mark> characters ( ' ? ' ) shall address the first line found by searching backwards from the line preceding the current line toward the beginning of the edit buffer and stopping at the first line for which the line excluding the terminating <newline> matches the BRE. The BRE consisting of a null BRE delimited by a pair of <question-mark> characters ( " ? ? " ) shall address the previous line for which the line excluding the terminating <newline> matches the last BRE encountered. In addition, the second <question-mark> can be omitted at the end of a command line. Within the BRE, a <backslash>-<question-mark> pair ( " \ ? " ) shall represent a literal <question-mark> instead of the BRE delimiter. If necessary, the search shall wrap around to the end of the buffer and continue up to and including the current line, so that the entire buffer is searched.
7. A <plus-sign> ( ' + ' ) or <hyphen> character ( ' - ' ) followed by a decimal number shall address the current line plus or minus the number. A <plus-sign> or <hyphen> character not followed by a decimal number shall address the current line plus or minus 1.

Addresses can be followed by zero or more address offsets, optionally <blank>-separated. Address offsets are constructed as follows:

- A <plus-sign> or <hyphen> character followed by a decimal number shall add or subtract, respectively, the indicated number of lines to or from the address. A <plus-sign> or <hyphen> character not followed by a decimal number shall add or subtract 1 to or from the address.
- A decimal number shall add the indicated number of lines to the address.

It shall not be an error for an intermediate address value to be less than zero or greater than the last line in the edit buffer. It shall be an error for the final address value to be less than zero or greater than the last line in the edit buffer. It shall be an error if a search for a BRE fails to find a matching line.

Commands accept zero, one, or two addresses. If more than the required number of addresses are provided to a command that requires zero addresses, it shall be an error. Otherwise, if more than the required number of addresses are provided to a command, the addresses specified first shall be evaluated and then discarded until the maximum number of valid addresses remain, for the specified command.

Addresses shall be separated from each other by a <comma> (',' ) or <semicolon> character (';'). In the case of a <semicolon> separator, the current line ('.') shall be set to the first address, and only then will the second address be calculated. This feature can be used to determine the starting line for forwards and backwards searches; see rules 5. and 6.

Addresses can be omitted on either side of the <comma> or <semicolon> separator, in which case the resulting address pairs shall be as follows:

| Specified | Resulting   |
|-----------|-------------|
| ,         | 1 , \$      |
| , addr    | 1 , addr    |
| addr ,    | addr , addr |
| ;         | . ; \$      |
| ; addr    | . ; addr    |
| addr ;    | addr ; addr |

Any <blank> characters included between addresses, address separators, or address offsets shall be ignored.

### Commands in ed

In the following list of *ed* commands, the default addresses are shown in parentheses. The number of addresses shown in the default shall be the number expected by the command. The parentheses are not part of the address; they show that the given addresses are the default.

It is generally invalid for more than one command to appear on a line. However, any command (except **e**, **E**, **f**, **q**, **Q**, **r**, **w**, and **!**) can be suffixed by the letter **l**, **n**, or **p**; in which case, except for the **l**, **n**, and **p** commands, the command shall be executed and then the new current line shall be written as described below under the **l**, **n**, and **p** commands. When an **l**, **n**, or **p** suffix is used with an **l**, **n**, or **p** command, the command shall write to standard output as described below, but it is unspecified whether the suffix writes the current line again in the requested format or whether the suffix has no effect. For example, the **pl** command (base **p** command with an **l** suffix) shall either write just the current line or write it twice—once as specified for **p** and once as specified for **l**. Also, the **g**, **G**, **v**, and **V** commands shall take a command as a parameter.

Each address component can be preceded by zero or more <blank> characters. The command

letter can be preceded by zero or more <blank> characters. If a suffix letter (**l**, **n**, or **p**) is given, the application shall ensure that it immediately follows the command.

The **e**, **E**, **f**, **r**, and **w** commands shall take an optional *file* parameter, separated from the command letter by one or more <blank> characters.

If changes have been made in the buffer since the last **w** command that wrote the entire buffer, *ed* shall warn the user if an attempt is made to destroy the editor buffer via the **e** or **q** commands. The *ed* utility shall write the string:

"?\n"

(followed by an explanatory message if *help mode* has been enabled via the **H** command) to standard output and shall continue in command mode with the current line number unchanged. If the **e** or **q** command is repeated with no intervening command, it shall take effect.

If a terminal disconnect (see XBD [Chapter 11](#) (on page 199), Modem Disconnect and Closing a Device Terminal), is detected:

- If accompanied by a SIGHUP signal, the *ed* utility shall operate as described in the ASYNCHRONOUS EVENTS section for a SIGHUP signal.
- If not accompanied by a SIGHUP signal, the *ed* utility shall act as if an end-of-file had been detected on standard input.

If an end-of-file is detected on standard input:

- If the *ed* utility is in input mode, *ed* shall terminate input mode and return to command mode. It is unspecified if any partially entered lines (that is, input text without a terminating <newline>) are discarded from the input text.
- If the *ed* utility is in command mode, it shall act as if a **q** command had been entered.

If the closing delimiter of an RE or of a replacement string (for example, ' / ' ) in a **g**, **G**, **s**, **v**, or **V** command would be the last character before a <newline>, that delimiter can be omitted, in which case the addressed line shall be written. For example, the following pairs of commands are equivalent:

```
s/s1/s2 s/s1/s2/p
g/s1 g/s1/p
?s1 ?s1?
```

If an invalid command is entered, *ed* shall write the string:

"?\n"

(followed by an explanatory message if *help mode* has been enabled via the **H** command) to standard output and shall continue in command mode with the current line number unchanged.

## Append Command

*Synopsis:*     ( . ) a  
              <text>  
              .

The **a** command shall read the given text and append it after the addressed line; the current line number shall become the address of the last inserted line or, if there were none, the addressed line. Address 0 shall be valid for this command; it shall cause the appended text to be placed at the beginning of the buffer.

**Change Command**

*Synopsis:*     ( . , . ) c  
                   <text>  
                   .

The **c** command shall delete the addressed lines, then accept input text that replaces these lines; the current line shall be set to the address of the last line input; or, if there were none, at the line after the last line deleted; if the lines deleted were originally at the end of the buffer, the current line number shall be set to the address of the new last line; if no lines remain in the buffer, the current line number shall be set to zero. Address 0 shall be valid for this command; it shall be interpreted as if address 1 were specified.

**Delete Command**

*Synopsis:*     ( . , . ) d

The **d** command shall delete the addressed lines from the buffer. The address of the line after the last line deleted shall become the current line number; if the lines deleted were originally at the end of the buffer, the current line number shall be set to the address of the new last line; if no lines remain in the buffer, the current line number shall be set to zero.

**Edit Command**

*Synopsis:*     e [*file*]

The **e** command shall delete the entire contents of the buffer and then read in the file named by the pathname *file*. The current line number shall be set to the address of the last line of the buffer. If no pathname is given, the currently remembered pathname, if any, shall be used (see the **f** command). The number of bytes read shall be written to standard output, unless the **-s** option was specified, in the following format:

"%d\n", <number of bytes read>

The name *file* shall be remembered for possible use as a default pathname in subsequent **e**, **E**, **r**, and **w** commands. If *file* is replaced by **'!'**, the rest of the line shall be taken to be a shell command line whose output is to be read. Such a shell command line shall not be remembered as the current *file*. All marks shall be discarded upon the completion of a successful **e** command. If the buffer has changed since the last time the entire buffer was written, the user shall be warned, as described previously.

**Edit Without Checking Command**

*Synopsis:*     E [*file*]

The **E** command shall possess all properties and restrictions of the **e** command except that the editor shall not check to see whether any changes have been made to the buffer since the last **w** command.

## Filename Command

*Synopsis:*     **f** [*file*]

If *file* is given, the **f** command shall change the currently remembered pathname to *file*; whether the name is changed or not, it shall then write the (possibly new) currently remembered pathname to the standard output in the following format:

"%s\n", <pathname>

The current line number shall be unchanged.

## Global Command

*Synopsis:*     (1, \$) **g**/RE/command list

In the **g** command, the first step shall be to mark every line for which the line excluding the terminating <newline> matches the given RE. Then, going sequentially from the beginning of the file to the end of the file, the given *command list* shall be executed for each marked line, with the current line number set to the address of that line. Any line modified by the *command list* shall be unmarked. When the **g** command completes, the current line number shall have the value assigned by the last command in the *command list*. If there were no matching lines, the current line number shall not be changed. A single command or the first of a list of commands shall appear on the same line as the global command. All lines of a multi-line list except the last line shall be ended with a <backslash> preceding the terminating <newline>; the **a**, **i**, and **c** commands and associated input are permitted. The ' .' terminating input mode can be omitted if it would be the last line of the *command list*. An empty *command list* shall be equivalent to the **p** command. The use of the **g**, **G**, **v**, **V**, and **!** commands in the *command list* produces undefined results. Any character other than <space> or <newline> can be used instead of a <slash> to delimit the RE. Within the RE, the RE delimiter itself can be used as a literal character if it is preceded by a <backslash>.

## Interactive Global Command

*Synopsis:*     (1, \$) **G**/RE/

In the **G** command, the first step shall be to mark every line for which the line excluding the terminating <newline> matches the given RE. Then, for every such line, that line shall be written, the current line number shall be set to the address of that line, and any one command (other than one of the **a**, **c**, **i**, **g**, **G**, **v**, and **V** commands) shall be read and executed. A <newline> shall act as a null command (causing no action to be taken on the current line); an ' & ' shall cause the re-execution of the most recent non-null command executed within the current invocation of **G**. Note that the commands input as part of the execution of the **G** command can address and affect any lines in the buffer. Any line modified by the command shall be unmarked. The final value of the current line number shall be the value set by the last command successfully executed. (Note that the last command successfully executed shall be the **G** command itself if a command fails or the null command is specified.) If there were no matching lines, the current line number shall not be changed. The **G** command can be terminated by a SIGINT signal. Any character other than <space> or <newline> can be used instead of a <slash> to delimit the RE and the replacement. Within the RE, the RE delimiter itself can be used as a literal character if it is preceded by a <backslash>.

**Help Command**

*Synopsis:*     h

The **h** command shall write a short message to standard output that explains the reason for the most recent ' ? ' notification. The current line number shall be unchanged.

**Help-Mode Command**

*Synopsis:*     H

The **H** command shall cause *ed* to enter a mode in which help messages (see the **h** command) shall be written to standard output for all subsequent ' ? ' notifications. The **H** command alternately shall turn this mode on and off; it is initially off. If the help-mode is being turned on, the **H** command also explains the previous ' ? ' notification, if there was one. The current line number shall be unchanged.

**Insert Command**

*Synopsis:*     ( . ) i  
                  <text>  
                  .

The **i** command shall insert the given text before the addressed line; the current line is set to the last inserted line or, if there was none, to the addressed line. This command differs from the **a** command only in the placement of the input text. Address 0 shall be valid for this command; it shall be interpreted as if address 1 were specified.

**Join Command**

*Synopsis:*     ( . , . +1 ) j

The **j** command shall join contiguous lines by removing the appropriate <newline> characters. If exactly one address is given, this command shall do nothing. If lines are joined, the current line number shall be set to the address of the joined line; otherwise, the current line number shall be unchanged.

**Mark Command**

*Synopsis:*     ( . ) k x

The **k** command shall mark the addressed line with name *x*, which the application shall ensure is a lowercase letter from the portable character set. The address "' x" shall then refer to this line; the current line number shall be unchanged.

**List Command**

*Synopsis:*     ( . , . ) l

The **l** command shall write to standard output the addressed lines in a visually unambiguous form. The characters listed in XBD Table 5-1 (on page 121) ('\\', '\a', '\b', '\f', '\r', '\t', '\v') shall be written as the corresponding escape sequence; the '\n' in that table is not applicable. Non-printable characters not in the table shall be written as one three-digit octal number (with a preceding <backslash> character) for each byte in the character (most significant byte first).

Long lines shall be folded, with the point of folding indicated by <newline> preceded by a <backslash>; the length at which folding occurs is unspecified, but should be appropriate for the

output device. The end of each line shall be marked with a '\$', and '\$' characters within the text shall be written with a preceding <backslash>. An **l** command can be appended to any other command other than **e**, **E**, **f**, **q**, **Q**, **r**, **w**, or **!**. The current line number shall be set to the address of the last line written.

### Move Command

*Synopsis:* ( , . ) *m* *address*

The **m** command shall reposition the addressed lines after the line addressed by *address*. Address 0 shall be valid for *address* and cause the addressed lines to be moved to the beginning of the buffer. It shall be an error if *address* falls within the range of moved lines. The current line number shall be set to the address of the last line moved.

### Number Command

*Synopsis:* ( , . ) *n*

The **n** command shall write to standard output the addressed lines, preceding each line by its line number and a <tab>; the current line number shall be set to the address of the last line written. The **n** command can be appended to any command other than **e**, **E**, **f**, **q**, **Q**, **r**, **w**, or **!**.

### Print Command

*Synopsis:* ( , . ) *p*

The **p** command shall write to standard output the addressed lines; the current line number shall be set to the address of the last line written. The **p** command can be appended to any command other than **e**, **E**, **f**, **q**, **Q**, **r**, **w**, or **!**.

### Prompt Command

*Synopsis:* *P*

The **P** command shall cause *ed* to prompt with an <asterisk> ('\*') (or *string*, if **-p** is specified) for all subsequent commands. The **P** command alternatively shall turn this mode on and off; it shall be initially on if the **-p** option is specified; otherwise, off. The current line number shall be unchanged.

### Quit Command

*Synopsis:* *q*

The **q** command shall cause *ed* to exit. If the buffer has changed since the last time the entire buffer was written, the user shall be warned, as described previously.

### Quit Without Checking Command

*Synopsis:* *Q*

The **Q** command shall cause *ed* to exit without checking whether changes have been made in the buffer since the last **w** command.

**Read Command**

*Synopsis:*        (\$)**r** [*file*]

The **r** command shall read in the file named by the pathname *file* and append it after the addressed line. If no *file* argument is given, the currently remembered pathname, if any, shall be used (see the **e** and **f** commands). The currently remembered pathname shall not be changed unless there is no remembered pathname. Address 0 shall be valid for **r** and shall cause the file to be read at the beginning of the buffer. If the read is successful, and **-s** was not specified, the number of bytes read shall be written to standard output in the following format:

"%d\n", <number of bytes read>

The current line number shall be set to the address of the last line read in. If *file* is replaced by '!', the rest of the line shall be taken to be a shell command line whose output is to be read. Such a shell command line shall not be remembered as the current pathname.

**Substitute Command**

*Synopsis:*        (.,.)**s**/*RE/replacement/flags*

The **s** command shall search each addressed line for an occurrence of the specified RE and replace either the first or all (non-overlapped) matched strings with the *replacement*; see the following description of the **g** suffix. It is an error if the substitution fails on every addressed line. Any character other than <space> or <newline> can be used instead of a <slash> to delimit the RE and the replacement. Within the RE, the RE delimiter itself can be used as a literal character if it is preceded by a <backslash>. The current line shall be set to the address of the last line on which a substitution occurred.

An <ampersand> ('&') appearing in the *replacement* shall be replaced by the string matching the RE on the current line. The special meaning of '&' in this context can be suppressed by preceding it by <backslash>. As a more general feature, the characters '\n', where *n* is a digit, shall be replaced by the text matched by the corresponding back-reference expression. If the corresponding back-reference expression does not match, then the characters '\n' shall be replaced by the empty string. When the character '%' is the only character in the *replacement*, the *replacement* used in the most recent substitute command shall be used as the *replacement* in the current substitute command; if there was no previous substitute command, the use of '%' in this manner shall be an error. The '%' shall lose its special meaning when it is in a replacement string of more than one character or is preceded by a <backslash>. For each <backslash> encountered in scanning *replacement* from beginning to end, the following character shall lose its special meaning (if any). It is unspecified what special meaning is given to any character other than <backslash>, '&', '%', or digits.

A line can be split by substituting a <newline> into it. The application shall ensure it escapes the <newline> in the *replacement* by preceding it by <backslash>. Such substitution cannot be done as part of a **g** or **v** *command list*. The current line number shall be set to the address of the last line on which a substitution is performed. If no substitution is performed, the current line number shall be unchanged. If a line is split, a substitution shall be considered to have been performed on each of the new lines for the purpose of determining the new current line number. A substitution shall be considered to have been performed even if the replacement string is identical to the string that it replaces.

The application shall ensure that the value of *flags* is zero or more of:

*count*        Substitute for the *count*th occurrence only of the RE found on each addressed line.

- 86221 **g** Globally substitute for all non-overlapping instances of the RE rather than just the first  
 86222 one. If both **g** and *count* are specified, the results are unspecified.
- 86223 **l** Write to standard output the final line in which a substitution was made. The line shall  
 86224 be written in the format specified for the **l** command.
- 86225 **n** Write to standard output the final line in which a substitution was made. The line shall  
 86226 be written in the format specified for the **n** command.
- 86227 **p** Write to standard output the final line in which a substitution was made. The line shall  
 86228 be written in the format specified for the **p** command.

### 86229 Copy Command

86230 *Synopsis:* `(. , .) t address`

86231 The **t** command shall be equivalent to the **m** command, except that a copy of the addressed lines  
 86232 shall be placed after address *address* (which can be 0); the current line number shall be set to the  
 86233 address of the last line added.

### 86234 Undo Command

86235 *Synopsis:* `u`

86236 The **u** command shall nullify the effect of the most recent command that modified anything in  
 86237 the buffer, namely the most recent **a**, **c**, **d**, **g**, **i**, **j**, **m**, **r**, **s**, **t**, **u**, **v**, **G**, or **V** command. All changes  
 86238 made to the buffer by a **g**, **G**, **v**, or **V** global command shall be undone as a single change; if no  
 86239 changes were made by the global command (such as with **g**/RE/**p**), the **u** command shall have  
 86240 no effect. The current line number shall be set to the value it had immediately before the  
 86241 command being undone started.

### 86242 Global Non-Matched Command

86243 *Synopsis:* `(1, $) v/RE/command list`

86244 This command shall be equivalent to the global command **g** except that the lines that are marked  
 86245 during the first step shall be those for which the line excluding the terminating <newline> does  
 86246 not match the RE.

### 86247 Interactive Global Not-Matched Command

86248 *Synopsis:* `(1, $) V/RE/`

86249 This command shall be equivalent to the interactive global command **G** except that the lines that  
 86250 are marked during the first step shall be those for which the line excluding the terminating  
 86251 <newline> does not match the RE.

### 86252 Write Command

86253 *Synopsis:* `(1, $) w [file]`

86254 The **w** command shall write the addressed lines into the file named by the pathname *file*. The  
 86255 command shall create the file, if it does not exist, or shall replace the contents of the existing file.  
 86256 The currently remembered pathname shall not be changed unless there is no remembered  
 86257 pathname. If no pathname is given, the currently remembered pathname, if any, shall be used  
 86258 (see the **e** and **f** commands); the current line number shall be unchanged. If the command is  
 86259 successful, the number of bytes written shall be written to standard output, unless the **-s** option  
 86260 was specified, in the following format:

86261 "%d\n", <number of bytes written>

86262 If *file* begins with '!', the rest of the line shall be taken to be a shell command line whose  
 86263 standard input shall be the addressed lines. Such a shell command line shall not be remembered  
 86264 as the current pathname. This usage of the write command with '!' shall not be considered as a  
 86265 "last **w** command that wrote the entire buffer", as described previously; thus, this alone shall  
 86266 not prevent the warning to the user if an attempt is made to destroy the editor buffer via the **e** or  
 86267 **q** commands.

## 86268 **Line Number Command**

86269 *Synopsis:* (\$) =

86270 The line number of the addressed line shall be written to standard output in the following  
 86271 format:

86272 "%d\n", <line number>

86273 The current line number shall be unchanged by this command.

## 86274 **Shell Escape Command**

86275 *Synopsis:* !*command*

86276 The remainder of the line after the '!' shall be sent to the command interpreter to be  
 86277 interpreted as a shell command line. Within the text of that shell command line, the unescaped  
 86278 character '%' shall be replaced with the remembered pathname; if a '!' appears as the first  
 86279 character of the command, it shall be replaced with the text of the previous shell command  
 86280 executed via '!'. Thus, "!!" shall repeat the previous !*command*. If any replacements of '%' or  
 86281 '!' are performed, the modified line shall be written to the standard output before *command* is  
 86282 executed. The ! command shall write:

86283 "!\n"

86284 to standard output upon completion, unless the -s option is specified. The current line number  
 86285 shall be unchanged.

## 86286 **Null Command**

86287 *Synopsis:* (.+1)

86288 An address alone on a line shall cause the addressed line to be written. A <newline> alone shall  
 86289 be equivalent to "+1p". The current line number shall be set to the address of the written line.

## 86290 **EXIT STATUS**

86291 The following exit values shall be returned:

86292 0 Successful completion without any file or command errors.

86293 >0 An error occurred.

## 86294 **CONSEQUENCES OF ERRORS**

86295 When an error in the input script is encountered, or when an error is detected that is a  
 86296 consequence of the data (not) present in the file or due to an external condition such as a read or  
 86297 write error:

- 86298 • If the standard input is a terminal device file, all input shall be flushed, and a new  
 86299 command read.

- If the standard input is a regular file, *ed* shall terminate with a non-zero exit status.

## 86301 APPLICATION USAGE

86302 Because of the extremely terse nature of the default error messages, the prudent script writer  
86303 begins the *ed* input commands with an **H** command, so that if any errors do occur at least some  
86304 clue as to the cause is made available.

86305 In earlier versions of this standard, an obsolescent `–` option was described. This is no longer  
86306 specified. Applications should use the `–s` option. Using `–` as a *file* operand now produces  
86307 unspecified results. This allows implementations to continue to support the former required  
86308 behavior.

## 86309 EXAMPLES

86310 None.

## 86311 RATIONALE

86312 The initial description of this utility was adapted from the SVID. It contains some features not  
86313 found in Version 7 or BSD-derived systems. Some of the differences between the POSIX and  
86314 BSD *ed* utilities include, but need not be limited to:

- 86315 • The BSD `–` option does not suppress the `'!'` prompt after a `!` command.
- 86316 • BSD does not support the special meanings of the `'%'` and `'!'` characters within a `!`  
86317 command.
- 86318 • BSD does not support the *addresses* `' ; '` and `' , '`.
- 86319 • BSD allows the command/suffix pairs **pp**, **ll**, and so on, which are unspecified in this  
86320 volume of POSIX.1-2008.
- 86321 • BSD does not support the `'!'` character part of the **e**, **r**, or **w** commands.
- 86322 • A failed **g** command in BSD sets the line number to the last line searched if there are no  
86323 matches.
- 86324 • BSD does not default the *command list* to the **p** command.
- 86325 • BSD does not support the **G**, **h**, **H**, **n**, or **V** commands.
- 86326 • On BSD, if there is no inserted text, the insert command changes the current line to the  
86327 referenced line `–1`; that is, the line before the specified line.
- 86328 • On BSD, the *join* command with only a single address changes the current line to that  
86329 address.
- 86330 • BSD does not support the **P** command; moreover, in BSD it is synonymous with the **p**  
86331 command.
- 86332 • BSD does not support the *undo* of the commands **j**, **m**, **r**, **s**, or **t**.
- 86333 • The Version 7 *ed* command **W**, and the BSD *ed* commands **W**, **wq**, and **z** are not present in  
86334 this volume of POSIX.1-2008.

86335 The `–s` option was added to allow the functionality of the removed `–` option in a manner  
86336 compatible with the Utility Syntax Guidelines.

86337 In early proposals there was a limit, {ED\_FILE\_MAX}, that described the historical limitations of  
86338 some *ed* utilities in their handling of large files; some of these have had problems with files  
86339 larger than 100 000 bytes. It was this limitation that prompted much of the desire to include a  
86340 *split* command in this volume of POSIX.1-2008. Since this limit was removed, this volume of  
86341 POSIX.1-2008 requires that implementations document the file size limits imposed by *ed* in the

conformance document. The limit {ED\_LINE\_MAX} was also removed; therefore, the global limit {LINE\_MAX} is used for input and output lines.

The manner in which the **l** command writes non-printable characters was changed to avoid the historical backspace-overstrike method. On video display terminals, the overstrike is ambiguous because most terminals simply replace overstruck characters, making the **l** format not useful for its intended purpose of unambiguously understanding the content of the line. The historical <backslash>-escapes were also ambiguous. (The string "a\0011" could represent a line containing those six characters or a line containing the three characters 'a', a byte with a binary value of 1, and a 1.) In the format required here, a <backslash> appearing in the line is written as "\\ " so that the output is truly unambiguous. The method of marking the ends of lines was adopted from the *ex* editor and is required for any line ending in <space> characters; the '\$' is placed on all lines so that a real '\$' at the end of a line cannot be misinterpreted.

Earlier versions of this standard allowed for implementations with bytes other than eight bits, but this has been modified in this version.

The description of how a NUL is written was removed. The NUL character cannot be in text files, and this volume of POSIX.1-2008 should not dictate behavior in the case of undefined, erroneous input.

Unlike some of the other editing utilities, the filenames accepted by the **E**, **e**, **R**, and **r** commands are not patterns.

Early proposals stated that the **-p** option worked only when standard input was associated with a terminal device. This has been changed to conform to historical implementations, thereby allowing applications to interpose themselves between a user and the *ed* utility.

The form of the substitute command that uses the **n** suffix was limited in some historical documentation (where this was described incorrectly as "backreferencing"). This limit has been omitted because there is no reason why an editor processing lines of {LINE\_MAX} length should have this restriction. The command **s/x/X/2047** should be able to substitute the 2047th occurrence of 'x' on a line.

The use of printing commands with printing suffixes (such as **pn**, **lp**, and so on) was made unspecified because BSD-based systems allow this, whereas System V does not.

Some BSD-based systems exit immediately upon receipt of end-of-file if all of the lines in the file have been deleted. Since this volume of POSIX.1-2008 refers to the **q** command in this instance, such behavior is not allowed.

Some historical implementations returned exit status zero even if command errors had occurred; this is not allowed by this volume of POSIX.1-2008.

Some historical implementations contained a bug that allowed a single <period> to be entered in input mode as <backslash> <period> <newline>. This is not allowed by *ed* because there is no description of escaping any of the characters in input mode; <backslash> characters are entered into the buffer exactly as typed. The typical method of entering a single <period> has been to precede it with another character and then use the substitute command to delete that character.

It is difficult under some modes of some versions of historical operating system terminal drivers to distinguish between an end-of-file condition and terminal disconnect. POSIX.1-2008 does not require implementations to distinguish between the two situations, which permits historical implementations of the *ed* utility on historical platforms to conform. Implementations are encouraged to distinguish between the two, if possible, and take appropriate action on terminal disconnect.

Historically, *ed* accepted a zero address for the **a** and **r** commands in order to insert text at the

start of the edit buffer. When the buffer was empty the command `.=` returned zero. POSIX.1-2008 requires conformance to historical practice.

For consistency with the `a` and `r` commands and better user functionality, the `i` and `c` commands must also accept an address of 0, in which case `0i` is treated as `1i` and likewise for the `c` command.

All of the following are valid addresses:

```
+++ Three lines after the current line.
/pattern/- One line before the next occurrence of pattern.
-2 Two lines before the current line.
3 ---- 2 Line one (note the intermediate negative address).
1 2 3 Line six.
```

Any number of addresses can be provided to commands taking addresses; for example, `"1,2,3,4,5p"` prints lines 4 and 5, because two is the greatest valid number of addresses accepted by the `print` command. This, in combination with the `<semicolon>` delimiter, permits users to create commands based on ordered patterns in the file. For example, the command `"3;/foo/;+2p"` will display the first line after line 3 that contains the pattern `foo`, plus the next two lines. Note that the address `"3;"` must still be evaluated before being discarded, because the search origin for the `"/foo/"` command depends on this.

Historically, `ed` disallowed address chains, as discussed above, consisting solely of `<comma>` or `<semicolon>` separators; for example, `",,,,"` or `";;;"` were considered an error. For consistency of address specification, this restriction is removed. The following table lists some of the address forms now possible:

| Address | Addr1 | Addr2 | Status     | Comment               |
|---------|-------|-------|------------|-----------------------|
| 7,      | 7     | 7     | Historical | Valid, but erroneous. |
| 7,5,    | 5     | 5     | Historical |                       |
| 7,5,9   | 5     | 9     | Historical |                       |
| 7,9     | 7     | 9     | Historical |                       |
| 7,+     | 7     | 8     | Historical |                       |
| ,       | 1     | \$    | Historical |                       |
| ,7      | 1     | 7     | Extension  |                       |
| ,,      | \$    | \$    | Extension  |                       |
| ,;      | \$    | \$    | Extension  |                       |
| 7;      | 7     | 7     | Historical |                       |
| 7;5;    | 5     | 5     | Historical |                       |
| 7;5;9   | 5     | 9     | Historical |                       |
| 7;5,9   | 5     | 9     | Historical |                       |
| 7;\$;4  | \$    | 4     | Historical |                       |
| 7;9     | 7     | 9     | Historical |                       |
| 7;+     | 7     | 8     | Historical |                       |
| ;       | .     | \$    | Historical |                       |
| ;7      | .     | 7     | Extension  |                       |
| ;;      | \$    | \$    | Extension  |                       |

Historically, `ed` accepted the `'^'` character as an address, in which case it was identical to the `<hyphen>` character. POSIX.1-2008 does not require or prohibit this behavior.

**86433 FUTURE DIRECTIONS**

86434 None.

**86435 SEE ALSO**

86436 [Section 1.4](#) (on page 2310), *ex*, *sed*, *sh*, *vi*

86437 XBD [Table 5-1](#) (on page 121), [Chapter 8](#) (on page 173), [Section 9.3](#) (on page 183), [Chapter 11](#) (on  
86438 page 199), [Section 12.2](#) (on page 215)

**86439 CHANGE HISTORY**

86440 First released in Issue 2.

**86441 Issue 5**

86442 In the OPTIONS section, the meaning of `-s` and `-` is clarified.

86443 A second FUTURE DIRECTION is added.

**86444 Issue 6**

86445 The obsolescent single-minus form is removed.

86446 A second APPLICATION USAGE note is added.

86447 The Open Group Corrigendum U025/2 is applied, correcting the description of the Edit section.

86448 The *ed* utility is updated to align with the IEEE P1003.2b draft standard. This includes addition  
86449 of the treatment of the SIGQUIT signal, changes to *ed* addressing, and changes to processing  
86450 when end-of-file is detected and when terminal disconnect is detected.

86451 The normative text is reworded to avoid use of the term “must” for application requirements.

86452 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/22 is applied, adding the text: “Any line  
86453 modified by the *command list* shall be unmarked.” to the **G** command. This change corresponds  
86454 to a similar change made to the **g** command in the first version of this standard.

86455 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/7 is applied, removing text describing  
86456 behavior on systems with bytes consisting of more than eight bits.

**86457 Issue 7**

86458 Austin Group Interpretation 1003.1-2001 #027 is applied, clarifying the behavior if an operand is  
86459 ‘-’.

86460 Austin Group Interpretation 1003.1-2001 #036 is applied, clarifying the behavior for BREs.

86461 SD5-XCU-ERN-94 is applied, updating text in the EXTENDED DESCRIPTION where a terminal  
86462 disconnect is detected (in Commands in *ed*).

86463 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

86464 SD5-XCU-ERN-135 is applied, removing some RATIONALE text that is no longer applicable.

86465 **NAME**86466 `env` — set the environment for command invocation86467 **SYNOPSIS**86468 `env [-i] [name=value]... [utility [argument...]]`86469 **DESCRIPTION**86470 The *env* utility shall obtain the current environment, modify it according to its arguments, then  
86471 invoke the utility named by the *utility* operand with the modified environment.86472 Optional arguments shall be passed to *utility*.86473 If no *utility* operand is specified, the resulting environment shall be written to the standard  
86474 output, with one *name=value* pair per line.86475 If the first argument is `'-'`, the results are unspecified.86476 **OPTIONS**86477 The *env* utility shall conform to XBD [Section 12.2](#) (on page 215), except for the unspecified usage  
86478 of `'-'`.

86479 The following options shall be supported:

86480 **-i** Invoke *utility* with exactly the environment specified by the arguments; the  
86481 inherited environment shall be ignored completely.86482 **OPERANDS**

86483 The following operands shall be supported:

86484 *name=value* Arguments of the form *name=value* shall modify the execution environment, and  
86485 shall be placed into the inherited environment before the *utility* is invoked.86486 *utility* The name of the utility to be invoked. If the *utility* operand names any of the  
86487 special built-in utilities in [Section 2.14](#) (on page 2356), the results are undefined.86488 *argument* A string to pass as an argument for the invoked utility.86489 **STDIN**

86490 Not used.

86491 **INPUT FILES**

86492 None.

86493 **ENVIRONMENT VARIABLES**86494 The following environment variables shall affect the execution of *env*:86495 *LANG* Provide a default value for the internationalization variables that are unset or null.  
86496 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
86497 variables used to determine the values of locale categories.)86498 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
86499 internationalization variables.86500 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
86501 characters (for example, single-byte as opposed to multi-byte characters in  
86502 arguments).86503 *LC\_MESSAGES*86504 Determine the locale that should be used to affect the format and contents of  
86505 diagnostic messages written to standard error.

| 86512 |     | <b>STDOUT</b>                 |                                                                                                                                                     |
| 86513 |     |                               | If no <i>utility</i> operand is specified, each <i>name=value</i> pair in the resulting environment shall be                                        |
| 86514 |     |                               | written in the form:                                                                                                                                |
| 86515 |     |                               | "%s=%s\n", < <i>name</i> >, < <i>value</i> >                                                                                                        |
| 86516 |     |                               | If the <i>utility</i> operand is specified, the <i>env</i> utility shall not write to standard output.                                              |
| 86517 |     | <b>STDERR</b>                 |                                                                                                                                                     |
| 86518 |     |                               | The standard error shall be used only for diagnostic messages.                                                                                      |
| 86519 |     | <b>OUTPUT FILES</b>           |                                                                                                                                                     |
| 86520 |     |                               | None.                                                                                                                                               |
| 86521 |     | <b>EXTENDED DESCRIPTION</b>   |                                                                                                                                                     |
| 86522 |     |                               | None.                                                                                                                                               |
| 86523 |     | <b>EXIT STATUS</b>            |                                                                                                                                                     |
| 86524 |     |                               | If <i>utility</i> is invoked, the exit status of <i>env</i> shall be the exit status of <i>utility</i> ; otherwise, the <i>env</i>                  |
| 86525 |     |                               | utility shall exit with one of the following values:                                                                                                |
| 86526 |     | 0                             | The <i>env</i> utility completed successfully.                                                                                                      |
| 86527 |     | 1–125                         | An error occurred in the <i>env</i> utility.                                                                                                        |
| 86528 |     | 126                           | The utility specified by <i>utility</i> was found but could not be invoked.                                                                         |
| 86529 |     | 127                           | The utility specified by <i>utility</i> could not be found.                                                                                         |
| 86530 |     | <b>CONSEQUENCES OF ERRORS</b> |                                                                                                                                                     |
| 86531 |     |                               | Default.                                                                                                                                            |
| 86532 |     | <b>APPLICATION USAGE</b>      |                                                                                                                                                     |
| 86533 |     |                               | The <i>command</i> , <i>env</i> , <i>nice</i> , <i>nohup</i> , <i>time</i> , and <i>xargs</i> utilities have been specified to use exit code 127 if |
| 86534 |     |                               | an error occurs so that applications can distinguish “failure to find a utility” from “invoked                                                      |
| 86535 |     |                               | utility exited with an error indication”. The value 127 was chosen because it is not commonly                                                       |
| 86536 |     |                               | used for other meanings; most utilities use small values for “normal error conditions” and the                                                      |
| 86537 |     |                               | values above 128 can be confused with termination due to receipt of a signal. The value 126 was                                                     |
| 86538 |     |                               | chosen in a similar manner to indicate that the utility could be found, but not invoked. Some                                                       |
| 86539 |     |                               | scripts produce meaningful error messages differentiating the 126 and 127 cases. The distinction                                                    |
| 86540 |     |                               | between exit codes 126 and 127 is based on KornShell practice that uses 127 when all attempts to                                                    |
| 86541 |     |                               | <i>exec</i> the utility fail with [ENOENT], and uses 126 when any attempt to <i>exec</i> the utility fails for                                      |
| 86542 |     |                               | any other reason.                                                                                                                                   |
| 86543 |     |                               | Historical implementations of the <i>env</i> utility use the <i>execvp()</i> or <i>execlp()</i> functions defined in the                            |
| 86544 |     |                               | System Interfaces volume of POSIX.1-2008 to invoke the specified utility; this provides better                                                      |
| 86545 |     |                               | performance and keeps users from having to escape characters with special meaning to the shell.                                                     |
| 86546 |     |                               | Therefore, shell functions, special built-ins, and built-ins that are only provided by the shell are                                                |
| 86547 |     |                               | not found.                                                                                                                                          |

**EXAMPLES**

The following command:

```
env -i PATH=/mybin:"$PATH" $(getconf V7_ENV) mygrep xyz myfile
```

invokes the command *mygrep* with a new *PATH* value as the only entry in its environment other than any variables required by the implementation for conformance. In this case, *PATH* is used to locate *mygrep*, which is expected to reside in */mybin*.

**RATIONALE**

As with all other utilities that invoke other utilities, this volume of POSIX.1-2008 only specifies what *env* does with standard input, standard output, standard error, input files, and output files. If a utility is executed, it is not constrained by the specification of input and output by *env*.

The *-i* option was added to allow the functionality of the removed *-* option in a manner compatible with the Utility Syntax Guidelines. It is possible to create a non-conforming environment using the *-i* option, as it may remove environment variables required by the implementation for conformance. The following will preserve these environment variables as well as preserve the *PATH* for conforming utilities:

```
IFS='
The preceding value should be <space><tab><newline>.
Set IFS to its default value.

set -f
disable pathname expansion

\unalias -a
Unset all possible aliases.
Note that unalias is escaped to prevent an alias
being used for unalias.
This step is not strictly necessary, since aliases are not inherited,
and the ENV environment variable is only used by interactive shells,
the only way any aliases can exist in a script is if it defines them
itself.

unset -f env getconf
Ensure env and getconf are not user functions.

env -i $(getconf V7_ENV) PATH="$(getconf PATH)" command
```

Some have suggested that *env* is redundant since the same effect is achieved by:

```
name=value ... utility [argument ...]
```

The example is equivalent to *env* when an environment variable is being added to the environment of the command, but not when the environment is being set to the given value. The *env* utility also writes out the current environment if invoked without arguments. There is sufficient functionality beyond what the example provides to justify inclusion of *env*.

**FUTURE DIRECTIONS**

None.

**86591 CHANGE HISTORY**

86592 First released in Issue 2.

**86593 Issue 7**

86594 Austin Group Interpretation 1003.1-2001 #027 is applied, clarifying the behavior if the first  
86595 argument is `'-'`.

86596 Austin Group Interpretation 1003.1-2001 #047 is applied, providing RATIONALE on how to use  
86597 the `env` utility to preserve a conforming environment.

86598 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

86599 The EXAMPLES section is revised to change the use of `env -i`.

## 86600 NAME

86601 ex — text editor

## 86602 SYNOPSIS

86603 UP `ex [-rR] [-s|-v] [-c command] [-t tagstring] [-w size] [file...]`

## 86604 DESCRIPTION

86605 The *ex* utility is a line-oriented text editor. There are two other modes of the editor—open and  
 86606 visual—in which screen-oriented editing is available. This is described more fully by the *ex* **open**  
 86607 and **visual** commands and in *vi*.

86608 If an operand is *'-'*, the results are unspecified.

86609 This section uses the term *edit buffer* to describe the current working text. No specific  
 86610 implementation is implied by this term. All editing changes are performed on the edit buffer,  
 86611 and no changes to it shall affect any file until an editor command writes the file.

86612 Certain terminals do not have all the capabilities necessary to support the complete *ex* definition,  
 86613 such as the full-screen editing commands (*visual mode* or *open mode*). When these commands  
 86614 cannot be supported on such terminals, this condition shall not produce an error message such  
 86615 as “not an editor command” or report a syntax error. The implementation may either accept the  
 86616 commands and produce results on the screen that are the result of an unsuccessful attempt to  
 86617 meet the requirements of this volume of POSIX.1-2008 or report an error describing the terminal-  
 86618 related deficiency.

## 86619 OPTIONS

86620 The *ex* utility shall conform to XBD [Section 12.2](#) (on page 215), except for the unspecified usage  
 86621 of *'-'*, and that *'+'* may be recognized as an option delimiter as well as *'-'*.

86622 The following options shall be supported:

86623 **-c *command*** Specify an initial command to be executed in the first edit buffer loaded from an  
 86624 existing file (see the EXTENDED DESCRIPTION section). Implementations may  
 86625 support more than a single **-c** option. In such implementations, the specified  
 86626 commands shall be executed in the order specified on the command line.

86627 **-r** Recover the named files (see the EXTENDED DESCRIPTION section). Recovery  
 86628 information for a file shall be saved during an editor or system crash (for example,  
 86629 when the editor is terminated by a signal which the editor can catch), or after the  
 86630 use of an *ex* **preserve** command.

86631 A *crash* in this context is an unexpected failure of the system or utility that requires  
 86632 restarting the failed system or utility. A system crash implies that any utilities  
 86633 running at the time also crash. In the case of an editor or system crash, the number  
 86634 of changes to the edit buffer (since the most recent **preserve** command) that will be  
 86635 recovered is unspecified.

86636 If no *file* operands are given and the **-t** option is not specified, all other options, the  
 86637 *EXINIT* variable, and any **.exrc** files shall be ignored; a list of all recoverable files  
 86638 available to the invoking user shall be written, and the editor shall exit normally  
 86639 without further action.

86640 **-R** Set **readonly** edit option.

86641 **-s** Prepare *ex* for batch use by taking the following actions:

- 86642 • Suppress writing prompts and informational (but not diagnostic) messages.
- 86643 • Ignore the value of *TERM* and any implementation default terminal type and
- 86644 assume the terminal is a type incapable of supporting open or visual modes;
- 86645 see the **visual** command and the description of *vi*.
- 86646 • Suppress the use of the *EXINIT* environment variable and the reading of any
- 86647 **.exrc** file; see the EXTENDED DESCRIPTION section.
- 86648 • Suppress autoindentation, ignoring the value of the **autoindent** edit option.
- 86649 **-t tagstring** Edit the file containing the specified *tagstring*; see *ctags*. The tags feature
- 86650 represented by **-t tagstring** and the **tag** command is optional. It shall be provided
- 86651 on any system that also provides a conforming implementation of *ctags*; otherwise,
- 86652 the use of **-t** produces undefined results. On any system, it shall be an error to
- 86653 specify more than a single **-t** option.
- 86654 **-v** Begin in visual mode (see *vi*).
- 86655 **-w size** Set the value of the *window* editor option to *size*.

## 86656 OPERANDS

86657 The following operand shall be supported:

86658 *file* A pathname of a file to be edited.

## 86659 STDIN

86660 The standard input consists of a series of commands and input text, as described in the

86661 EXTENDED DESCRIPTION section. The implementation may limit each line of standard input

86662 to a length of {LINE\_MAX}.

86663 If the standard input is not a terminal device, it shall be as if the **-s** option had been specified.

86664 If a read from the standard input returns an error, or if the editor detects an end-of-file condition

86665 from the standard input, it shall be equivalent to a SIGHUP asynchronous event.

## 86666 INPUT FILES

86667 Input files shall be text files or files that would be text files except for an incomplete last line that

86668 is not longer than {LINE\_MAX}-1 bytes in length and contains no NUL characters. By default,

86669 any incomplete last line shall be treated as if it had a trailing <newline>. The editing of other

86670 forms of files may optionally be allowed by *ex* implementations.

86671 The **.exrc** files and source files shall be text files consisting of *ex* commands; see the EXTENDED

86672 DESCRIPTION section.

86673 By default, the editor shall read lines from the files to be edited without interpreting any of those

86674 lines as any form of editor command.

## 86675 ENVIRONMENT VARIABLES

86676 The following environment variables shall affect the execution of *ex*:

86677 **COLUMNS** Override the system-selected horizontal screen size. See XBD Chapter 8 (on page

86678 173) for valid values and results when it is unset or null.

86679 **EXINIT** Determine a list of *ex* commands that are executed on editor start-up. See the

86680 EXTENDED DESCRIPTION section for more details of the initialization phase.

86681 **HOME** Determine a pathname of a directory that shall be searched for an editor start-up

86682 file named **.exrc**; see the EXTENDED DESCRIPTION section.

|       |                                                                                                              |                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------|--------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 86683 | <i>LANG</i>                                                                                                  | Provide a default value for the internationalization variables that are unset or null. (See XBD <a href="#">Section 8.2</a> (on page 174) for the precedence of internationalization variables used to determine the values of locale categories.)                                                                                                                                                |
| 86684 |                                                                                                              |                                                                                                                                                                                                                                                                                                                                                                                                   |
| 86685 |                                                                                                              |                                                                                                                                                                                                                                                                                                                                                                                                   |
| 86686 | <i>LC_ALL</i>                                                                                                | If set to a non-empty string value, override the values of all the other internationalization variables.                                                                                                                                                                                                                                                                                          |
| 86687 |                                                                                                              |                                                                                                                                                                                                                                                                                                                                                                                                   |
| 86688 | <i>LC_COLLATE</i>                                                                                            |                                                                                                                                                                                                                                                                                                                                                                                                   |
| 86689 |                                                                                                              | Determine the locale for the behavior of ranges, equivalence classes, and multi-character collating elements within regular expressions.                                                                                                                                                                                                                                                          |
| 86690 |                                                                                                              |                                                                                                                                                                                                                                                                                                                                                                                                   |
| 86691 | <i>LC_CTYPE</i>                                                                                              | Determine the locale for the interpretation of sequences of bytes of text data as characters (for example, single-byte as opposed to multi-byte characters in arguments and input files), the behavior of character classes within regular expressions, the classification of characters as uppercase or lowercase letters, the case conversion of letters, and the detection of word boundaries. |
| 86692 |                                                                                                              |                                                                                                                                                                                                                                                                                                                                                                                                   |
| 86693 |                                                                                                              |                                                                                                                                                                                                                                                                                                                                                                                                   |

| 86724 |                                                                                                              | Otherwise:                                                                                                                                                                                                                                                                                                                                                                                        |

- 86725 1. If executing an *ex* text input mode command, all input lines that have been  
86726 completely entered shall be resolved into the edit buffer, and any partially  
86727 entered line shall be discarded.
- 86728 2. If there is a currently executing command, it shall be aborted and a message  
86729 displayed. Unless otherwise specified by the *ex* or *vi* command descriptions,  
86730 it is unspecified whether any lines modified by the executing command  
86731 appear modified, or as they were before being modified by the executing  
86732 command, in the buffer.
- 86733 If the currently executing command was a motion command, its associated  
86734 command shall be discarded.
- 86735 3. If in open or visual command mode, the terminal shall be alerted.
- 86736 4. The editor shall then return to command mode.
- 86737 SIGCONT The screen shall be refreshed if in open or visual mode.
- 86738 SIGHUP If the edit buffer has been modified since the last complete write, *ex* shall attempt  
86739 to save the edit buffer so that it can be recovered later using the **-r** option or the *ex*  
86740 **recover** command. The editor shall not write the file or return to command or text  
86741 input mode, and shall terminate with a non-zero exit status.
- 86742 SIGTERM Refer to SIGHUP.
- 86743 The action taken for all other signals is unspecified.
- 86744 **STDOUT**
- 86745 The standard output shall be used only for writing prompts to the user, for informational  
86746 messages, and for writing lines from the file.
- 86747 **STDERR**
- 86748 The standard error shall be used only for diagnostic messages.
- 86749 **OUTPUT FILES**
- 86750 The output from *ex* shall be text files.
- 86751 **EXTENDED DESCRIPTION**
- 86752 Only the *ex* mode of the editor is described in this section. See *vi* for additional editing  
86753 capabilities available in *ex*.
- 86754 When an error occurs, *ex* shall write a message. If the terminal supports a standout mode (such  
86755 as inverse video), the message shall be written in standout mode. If the terminal does not  
86756 support a standout mode, and the edit option **errorbells** is set, an alert action shall precede the  
86757 error message.
- 86758 By default, *ex* shall start in command mode, which shall be indicated by a **:** prompt; see the  
86759 **prompt** command. Text input mode can be entered by the **append**, **insert**, or **change** commands;  
86760 it can be exited (and command mode re-entered) by typing a **<period>** (**'.'**) alone at the  
86761 beginning of a line.

## Initialization in ex and vi

The following symbols are used in this and following sections to specify locations in the edit buffer:

### *alternate and current pathnames*

Two pathnames, named *current* and *alternate*, are maintained by the editor. Any *ex* commands that take filenames as arguments shall set them as follows:

1. If a *file* argument is specified to the *ex* **edit**, **ex**, or **recover** commands, or if an *ex* **tag** command replaces the contents of the edit buffer.
  - a. If the command replaces the contents of the edit buffer, the current pathname shall be set to the *file* argument or the file indicated by the tag, and the alternate pathname shall be set to the previous value of the current pathname.
  - b. Otherwise, the alternate pathname shall be set to the *file* argument.
2. If a *file* argument is specified to the *ex* **next** command:
  - a. If the command replaces the contents of the edit buffer, the current pathname shall be set to the first *file* argument, and the alternate pathname shall be set to the previous value of the current pathname.
3. If a *file* argument is specified to the *ex* **file** command, the current pathname shall be set to the *file* argument, and the alternate pathname shall be set to the previous value of the current pathname.
4. If a *file* argument is specified to the *ex* **read** and **write** commands (that is, when reading or writing a file, and not to the program named by the **shell** edit option), or a *file* argument is specified to the *ex* **xit** command:
  - a. If the current pathname has no value, the current pathname shall be set to the *file* argument.
  - b. Otherwise, the alternate pathname shall be set to the *file* argument.

If the alternate pathname is set to the previous value of the current pathname when the current pathname had no previous value, then the alternate pathname shall have no value as a result.

### *current line*

The line of the edit buffer referenced by the cursor. Each command description specifies the current line after the command has been executed, as the *current line value*. When the edit buffer contains no lines, the current line shall be zero; see [Addressing in ex](#) (on page 2668).

### *current column*

The current display line column occupied by the cursor. (The columns shall be numbered beginning at 1.) Each command description specifies the current column after the command has been executed, as the *current column value*. This column is an *ideal* column that is remembered over the lifetime of the editor. The actual display line column upon which the cursor rests may be different from the current column; see the cursor positioning discussion in [Command Descriptions in vi](#) (on page 3337).

### *set to non-<blank>*

A description for a current column value, meaning that the current column shall be set to the last display line column on which is displayed any part of the first non-<blank> of the line. If the line has no non-<blank> non-<newline> characters, the current column shall be set to the last display line column on which is displayed any part of the last non-<newline>

86806 character in the line. If the line is empty, the current column shall be set to column position  
86807 1.

86808 The length of lines in the edit buffer may be limited to {LINE\_MAX} bytes. In open and visual  
86809 mode, the length of lines in the edit buffer may be limited to the number of characters that will  
86810 fit in the display. If either limit is exceeded during editing, an error message shall be written. If  
86811 either limit is exceeded by a line read in from a file, an error message shall be written and the  
86812 edit session may be terminated.

86813 If the editor stops running due to any reason other than a user command, and the edit buffer has  
86814 been modified since the last complete write, it shall be equivalent to a SIGHUP asynchronous  
86815 event. If the system crashes, it shall be equivalent to a SIGHUP asynchronous event.

86816 During initialization (before the first file is copied into the edit buffer or any user commands  
86817 from the terminal are processed) the following shall occur:

- 86818 1. If the environment variable *EXINIT* is set, the editor shall execute the *ex* commands  
86819 contained in that variable.
- 86820 2. If the *EXINIT* variable is not set, and all of the following are true:
  - 86821 a. The *HOME* environment variable is not null and not empty.
  - 86822 b. The file **.exrc** in the directory referred to by the *HOME* environment variable:
    - 86823 i. Exists
    - 86824 ii. Is owned by the same user ID as the real user ID of the process or the  
86825 process has appropriate privileges
    - 86826 iii. Is not writable by anyone other than the owner

86827 the editor shall execute the *ex* commands contained in that file.

- 86828 3. If and only if all of the following are true:
  - 86829 a. The current directory is not referred to by the *HOME* environment variable.
  - 86830 b. A command in the *EXINIT* environment variable or a command in the **.exrc** file in  
86831 the directory referred to by the *HOME* environment variable sets the editor option  
86832 **exrc**.
  - 86833 c. The **.exrc** file in the current directory:
    - 86834 i. Exists
    - 86835 ii. Is owned by the same user ID as the real user ID of the process, or by one of  
86836 a set of implementation-defined user IDs
    - 86837 iii. Is not writable by anyone other than the owner

86838 the editor shall attempt to execute the *ex* commands contained in that file.

86839 Lines in any **.exrc** file that are blank lines shall be ignored. If any **.exrc** file exists, but is not read  
86840 for ownership or permission reasons, it shall be an error.

86841 After the *EXINIT* variable and any **.exrc** files are processed, the first file specified by the user  
86842 shall be edited, as follows:

- 86843 1. If the user specified the **-t** option, the effect shall be as if the *ex tag* command was entered  
86844 with the specified argument, with the exception that if tag processing does not result in a  
86845 file to edit, the effect shall be as described in step 3. below.

2. Otherwise, if the user specified any command line *file* arguments, the effect shall be as if the *ex* **edit** command was entered with the first of those arguments as its *file* argument.
3. Otherwise, the effect shall be as if the *ex* **edit** command was entered with a nonexistent filename as its *file* argument. It is unspecified whether this action shall set the current pathname. In an implementation where this action does not set the current pathname, any editor command using the current pathname shall fail until an editor command sets the current pathname.

If the **-r** option was specified, the first time a file in the initial argument list or a file specified by the **-t** option is edited, if recovery information has previously been saved about it, that information shall be recovered and the editor shall behave as if the contents of the edit buffer have already been modified. If there are multiple instances of the file to be recovered, the one most recently saved shall be recovered, and an informational message that there are previous versions of the file that can be recovered shall be written. If no recovery information about a file is available, an informational message to this effect shall be written, and the edit shall proceed as usual.

If the **-c** option was specified, the first time a file that already exists (including a file that might not exist but for which recovery information is available, when the **-r** option is specified) replaces or initializes the contents of the edit buffer, the current line shall be set to the last line of the edit buffer, the current column shall be set to non-`<blank>`, and the *ex* commands specified with the **-c** option shall be executed. In this case, the current line and current column shall not be set as described for the command associated with the replacement or initialization of the edit buffer contents. However, if the **-t** option or a **tag** command is associated with this action, the **-c** option commands shall be executed and then the movement to the tag shall be performed.

The current argument list shall initially be set to the filenames specified by the user on the command line. If no filenames are specified by the user, the current argument list shall be empty. If the **-t** option was specified, it is unspecified whether any filename resulting from tag processing shall be prepended to the current argument list. In the case where the filename is added as a prefix to the current argument list, the current argument list reference shall be set to that filename. In the case where the filename is not added as a prefix to the current argument list, the current argument list reference shall logically be located before the first of the filenames specified on the command line (for example, a subsequent *ex* **next** command shall edit the first filename from the command line). If the **-t** option was not specified, the current argument list reference shall be to the first of the filenames on the command line.

### Addressing in *ex*

Addressing in *ex* relates to the current line and the current column; the address of a line is its 1-based line number, the address of a column is its 1-based count from the beginning of the line. Generally, the current line is the last line affected by a command. The current line number is the address of the current line. In each command description, the effect of the command on the current line number and the current column is described.

Addresses are constructed as follows:

1. The character `'.'` (period) shall address the current line.
2. The character `'$'` shall address the last line of the edit buffer.
3. The positive decimal number *n* shall address the *n*th line of the edit buffer.
4. The address `"'x"` refers to the line marked with the mark name character `'x'`, which shall be a lowercase letter from the portable character set, the backquote character, or the single-quote character. It shall be an error if the line that was marked is not currently

present in the edit buffer or the mark has not been set. Lines can be marked with the *ex mark* or *k* commands, or the *vi m* command.

5. A regular expression enclosed by <slash> characters ('/') shall address the first line found by searching forwards from the line following the current line toward the end of the edit buffer and stopping at the first line for which the line excluding the terminating <newline> matches the regular expression. As stated in [Regular Expressions in ex](#) (on page 2699), an address consisting of a null regular expression delimited by <slash> characters ("/") shall address the next line for which the line excluding the terminating <newline> matches the last regular expression encountered. In addition, the second <slash> can be omitted at the end of a command line. If the **wrapscan** edit option is set, the search shall wrap around to the beginning of the edit buffer and continue up to and including the current line, so that the entire edit buffer is searched. Within the regular expression, the sequence "\/" shall represent a literal <slash> instead of the regular expression delimiter.
6. A regular expression enclosed in <question-mark> characters ('?') shall address the first line found by searching backwards from the line preceding the current line toward the beginning of the edit buffer and stopping at the first line for which the line excluding the terminating <newline> matches the regular expression. An address consisting of a null regular expression delimited by <question-mark> characters ("??") shall address the previous line for which the line excluding the terminating <newline> matches the last regular expression encountered. In addition, the second <question-mark> can be omitted at the end of a command line. If the **wrapscan** edit option is set, the search shall wrap around from the beginning of the edit buffer to the end of the edit buffer and continue up to and including the current line, so that the entire edit buffer is searched. Within the regular expression, the sequence "\?" shall represent a literal <question-mark> instead of the RE delimiter.
7. A <plus-sign> ('+') or a minus-sign ('-') followed by a decimal number shall address the current line plus or minus the number. A '+' or '-' not followed by a decimal number shall address the current line plus or minus 1.

Addresses can be followed by zero or more address offsets, optionally <blank>-separated. Address offsets are constructed as follows:

1. A '+' or '-' immediately followed by a decimal number shall add (subtract) the indicated number of lines to (from) the address. A '+' or '-' not followed by a decimal number shall add (subtract) 1 to (from) the address.
2. A decimal number shall add the indicated number of lines to the address.

It shall not be an error for an intermediate address value to be less than zero or greater than the last line in the edit buffer. It shall be an error for the final address value to be less than zero or greater than the last line in the edit buffer.

Commands take zero, one, or two addresses; see the descriptions of *1addr* and *2addr* in [Command Descriptions in ex](#) (on page 2675). If more than the required number of addresses are provided to a command that requires zero addresses, it shall be an error. Otherwise, if more than the required number of addresses are provided to a command, the addresses specified first shall be evaluated and then discarded until the maximum number of valid addresses remain.

Addresses shall be separated from each other by a <comma> (',') or a <semicolon> (';'). If no address is specified before or after a <comma> or <semicolon> separator, it shall be as if the address of the current line was specified before or after the separator. In the case of a <semicolon> separator, the current line ('.') shall be set to the first address, and only then will

the next address be calculated. This feature can be used to determine the starting line for forwards and backwards searches (see rules 5. and 6.).

A <percent-sign> ( ' % ' ) shall be equivalent to entering the two addresses "1, \$".

Any delimiting <blank> characters between addresses, address separators, or address offsets shall be discarded.

### Command Line Parsing in ex

The following symbol is used in this and following sections to describe parsing behavior:

*escape* If a character is referred to as "<backslash>-escaped" or "<control>-V-escaped", it shall mean that the character acquired or lost a special meaning by virtue of being preceded, respectively, by a <backslash> or <control>-V character. Unless otherwise specified, the escaping character shall be discarded at that time and shall not be further considered for any purpose.

Command-line parsing shall be done in the following steps. For each step, characters already evaluated shall be ignored; that is, the phrase "leading character" refers to the next character that has not yet been evaluated.

1. Leading <colon> characters shall be skipped.
2. Leading <blank> characters shall be skipped.
3. If the leading character is a double-quote character, the characters up to and including the next non-<backslash>-escaped <newline> shall be discarded, and any subsequent characters shall be parsed as a separate command.
4. Leading characters that can be interpreted as addresses shall be evaluated; see [Addressing in ex](#) (on page 2668).
5. Leading <blank> characters shall be skipped.
6. If the next character is a <vertical-line> character or a <newline>:
  - a. If the next character is a <newline>:
    - i. If *ex* is in open or visual mode, the current line shall be set to the last address specified, if any.
    - ii. Otherwise, if the last command was terminated by a <vertical-line> character, no action shall be taken; for example, the command "||<newline>" shall execute two implied commands, not three.
    - iii. Otherwise, step 6.b. shall apply.
  - b. Otherwise, the implied command shall be the **print** command. The last #, **p**, and **l** flags specified to any *ex* command shall be remembered and shall apply to this implied command. Executing the *ex* **number**, **print**, or **list** command shall set the remembered flags to #, nothing, and **l**, respectively, plus any other flags specified for that execution of the **number**, **print**, or **list** command.

If *ex* is not currently performing a **global** or **v** command, and no address or count is specified, the current line shall be incremented by 1 before the command is executed. If incrementing the current line would result in an address past the last line in the edit buffer, the command shall fail, and the increment shall not happen.

- c. The <newline> or <vertical-line> character shall be discarded and any subsequent characters shall be parsed as a separate command.
7. The command name shall be comprised of the next character (if the character is not alphabetic), or the next character and any subsequent alphabetic characters (if the character is alphabetic), with the following exceptions:
- a. Commands that consist of any prefix of the characters in the command name **delete**, followed immediately by any of the characters 'l', 'p', '+', '-', or '#' shall be interpreted as a **delete** command, followed by a <blank>, followed by the characters that were not part of the prefix of the **delete** command. The maximum number of characters shall be matched to the command name **delete**; for example, "del" shall not be treated as "de" followed by the flag l.
  - b. Commands that consist of the character 'k', followed by a character that can be used as the name of a mark, shall be equivalent to the mark command followed by a <blank>, followed by the character that followed the 'k'.
  - c. Commands that consist of the character 's', followed by characters that could be interpreted as valid options to the s command, shall be the equivalent of the s command, without any pattern or replacement values, followed by a <blank>, followed by the characters after the 's'.
8. The command name shall be matched against the possible command names, and a command name that contains a prefix matching the characters specified by the user shall be the executed command. In the case of commands where the characters specified by the user could be ambiguous, the executed command shall be as follows:

|    |        |    |       |    |       |
|----|--------|----|-------|----|-------|
| a  | append | n  | next  | t  | t     |
| c  | change | p  | print | u  | undo  |
| ch | change | pr | print | un | undo  |
| e  | edit   | r  | read  | v  | v     |
| m  | move   | re | read  | w  | write |
| ma | mark   | s  | s     |    |       |

- Implementation extensions with names causing similar ambiguities shall not be checked for a match until all possible matches for commands specified by POSIX.1-2008 have been checked.
9. If the command is a ! command, or if the command is a **read** command followed by zero or more <blank> characters and a !, or if the command is a **write** command followed by one or more <blank> characters and a !, the rest of the command shall include all characters up to a non-<backslash>-escaped <newline>. The <newline> shall be discarded and any subsequent characters shall be parsed as a separate *ex* command.
10. Otherwise, if the command is an **edit**, **ex**, or **next** command, or a **visual** command while in open or visual mode, the next part of the command shall be parsed as follows:
- a. Any '!' character immediately following the command shall be skipped and be part of the command.
  - b. Any leading <blank> characters shall be skipped and be part of the command.
  - c. If the next character is a '+', characters up to the first non-<backslash>-escaped <newline> or non-<backslash>-escaped <blank> shall be skipped and be part of the command.

- 87023 d. The rest of the command shall be determined by the steps specified in paragraph  
87024 12.
- 87025 11. Otherwise, if the command is a **global**, **open**, **s**, or **v** command, the next part of the  
87026 command shall be parsed as follows:
- 87027 a. Any leading <blank> characters shall be skipped and be part of the command.
- 87028 b. If the next character is not an alphanumeric, double-quote, <newline>,  
87029 <backslash>, or <vertical-line> character:
- 87030 i. The next character shall be used as a command delimiter.
- 87031 ii. If the command is a **global**, **open**, or **v** command, characters up to the first  
87032 non-<backslash>-escaped <newline>, or first non-<backslash>-escaped  
87033 delimiter character, shall be skipped and be part of the command.
- 87034 iii. If the command is an **s** command, characters up to the first  
87035 non-<backslash>-escaped <newline>, or second non-<backslash>-escaped  
87036 delimiter character, shall be skipped and be part of the command.
- 87037 c. If the command is a **global** or **v** command, characters up to the first  
87038 non-<backslash>-escaped <newline> shall be skipped and be part of the  
87039 command.
- 87040 d. Otherwise, the rest of the command shall be determined by the steps specified in  
87041 paragraph 12.
- 87042 12. Otherwise:
- 87043 a. If the command was a **map**, **unmap**, **abbreviate**, or **unabbreviate** command,  
87044 characters up to the first non-<control>-V-escaped <newline>, <vertical-line>, or  
87045 double-quote character shall be skipped and be part of the command.
- 87046 b. Otherwise, characters up to the first non-<backslash>-escaped <newline>,  
87047 <vertical-line>, or double-quote character shall be skipped and be part of the  
87048 command.
- 87049 c. If the command was an **append**, **change**, or **insert** command, and the step 12.b.  
87050 ended at a <vertical-line> character, any subsequent characters, up to the next  
87051 non-<backslash>-escaped <newline> shall be used as input text to the command.
- 87052 d. If the command was ended by a double-quote character, all subsequent characters,  
87053 up to the next non-<backslash>-escaped <newline>, shall be discarded.
- 87054 e. The terminating <newline> or <vertical-line> character shall be discarded and any  
87055 subsequent characters shall be parsed as a separate *ex* command.

87056 Command arguments shall be parsed as described by the Synopsis and Description of each  
87057 individual *ex* command. This parsing shall not be <blank>-sensitive, except for the **!** argument,  
87058 which must follow the command name without intervening <blank> characters, and where it  
87059 would otherwise be ambiguous. For example, *count* and *flag* arguments need not be  
87060 <blank>-separated because "d22p" is not ambiguous, but *file* arguments to the *ex* **next**  
87061 command must be separated by one or more <blank> characters. Any <blank> in command  
87062 arguments for the **abbreviate**, **unabbreviate**, **map**, and **unmap** commands can be  
87063 <control>-V-escaped, in which case the <blank> shall not be used as an argument delimiter. Any  
87064 <blank> in the command argument for any other command can be <backslash>-escaped, in  
87065 which case that <blank> shall not be used as an argument delimiter.

87066 Within command arguments for the **abbreviate**, **unabbreviate**, **map**, and **unmap** commands,

any character can be <control>-V-escaped. All such escaped characters shall be treated literally and shall have no special meaning. Within command arguments for all other *ex* commands that are not regular expressions or replacement strings, any character that would otherwise have a special meaning can be <backslash>-escaped. Escaped characters shall be treated literally, without special meaning as shell expansion characters or '!', '%', and '#' expansion characters. See [Regular Expressions in ex](#) (on page 2699) and [Replacement Strings in ex](#) (on page 2700) for descriptions of command arguments that are regular expressions or replacement strings.

Non-<backslash>-escaped '%' characters appearing in *file* arguments to any *ex* command shall be replaced by the current pathname; unescaped '#' characters shall be replaced by the alternate pathname. It shall be an error if '%' or '#' characters appear unescaped in an argument and their corresponding values are not set.

Non-<backslash>-escaped '!' characters in the arguments to either the *ex* ! command or the open and visual mode ! command, or in the arguments to the *ex* **read** command, where the first non-<blank> after the command name is a '!' character, or in the arguments to the *ex* **write** command where the command name is followed by one or more <blank> characters and the first non-<blank> after the command name is a '!' character, shall be replaced with the arguments to the last of those three commands as they appeared after all unescaped '%', '#', and '!' characters were replaced. It shall be an error if '!' characters appear unescaped in one of these commands and there has been no previous execution of one of these commands.

If an error occurs during the parsing or execution of an *ex* command:

- An informational message to this effect shall be written. Execution of the *ex* command shall stop, and the cursor (for example, the current line and column) shall not be further modified.
- If the *ex* command resulted from a map expansion, all characters from that map expansion shall be discarded, except as otherwise specified by the **map** command.
- Otherwise, if the *ex* command resulted from the processing of an *EXINIT* environment variable, a **.exrc** file, a **:source** command, a **-c** option, or a **+command** specified to an *ex* **edit**, **ex**, **next**, or **visual** command, no further commands from the source of the commands shall be executed.
- Otherwise, if the *ex* command resulted from the execution of a buffer or a **global** or **v** command, no further commands caused by the execution of the buffer or the **global** or **v** command shall be executed.
- Otherwise, if the *ex* command was not terminated by a <newline>, all characters up to and including the next non-<backslash>-escaped <newline> shall be discarded.

## Input Editing in ex

The following symbol is used in this and the following sections to specify command actions:

*word* In the POSIX locale, a word consists of a maximal sequence of letters, digits, and underscores, delimited at both ends by characters other than letters, digits, or underscores, or by the beginning or end of a line or the edit buffer.

When accepting input characters from the user, in either *ex* command mode or *ex* text input mode, *ex* shall enable canonical mode input processing, as defined in the System Interfaces volume of POSIX.1-2008.

87110 If in *ex* text input mode:

- 87111 1. If the **number** edit option is set, *ex* shall prompt for input using the line number that  
87112 would be assigned to the line if it is entered, in the format specified for the *ex* **number**  
87113 command.
- 87114 2. If the **autoindent** edit option is set, *ex* shall prompt for input using **autoindent** characters,  
87115 as described by the **autoindent** edit option. **autoindent** characters shall follow the line  
87116 number, if any.

87117 If in *ex* command mode:

- 87118 1. If the **prompt** edit option is set, input shall be prompted for using a single ' : ' character;  
87119 otherwise, there shall be no prompt.

87120 The input characters in the following sections shall have the following effects on the input line.

## 87121 Scroll

87122 *Synopsis:*      `eof`

87123 See the description of the *stty* `eof` character in *stty*.

87124 If in *ex* command mode:

87125 If the `eof` character is the first character entered on the line, the line shall be evaluated as if  
87126 it contained two characters: a <control>-D and a <newline>.

87127 Otherwise, the `eof` character shall have no special meaning.

87128 If in *ex* text input mode:

87129 If the cursor follows an **autoindent** character, the **autoindent** characters in the line shall be  
87130 modified so that a part of the next text input character will be displayed on the first  
87131 column in the line after the previous **shiftwidth** edit option column boundary, and the  
87132 user shall be prompted again for input for the same line.

87133 Otherwise, if the cursor follows a ' 0 ', which follows an **autoindent** character, and the ' 0 '  
87134 was the previous text input character, the ' 0 ' and all **autoindent** characters in the line  
87135 shall be discarded, and the user shall be prompted again for input for the same line.

87136 Otherwise, if the cursor follows a ' ^ ', which follows an **autoindent** character, and the ' ^ '  
87137 was the previous text input character, the ' ^ ' and all **autoindent** characters in the line  
87138 shall be discarded, and the user shall be prompted again for input for the same line. In  
87139 addition, the **autoindent** level for the next input line shall be derived from the same line  
87140 from which the **autoindent** level for the current input line was derived.

87141 Otherwise, if there are no **autoindent** or text input characters in the line, the `eof` character  
87142 shall be discarded.

87143 Otherwise, the `eof` character shall have no special meaning.

87144        **<newline>**

87145        *Synopsis:*        <newline>  
 87146                    <control>-J

87147        If in *ex* command mode:

87148                    Cause the command line to be parsed; <control>-J shall be mapped to the <newline> for  
 87149                    this purpose.

87150        If in *ex* text input mode:

87151                    Terminate the current line. If there are no characters other than **autoindent** characters on  
 87152                    the line, all characters on the line shall be discarded.

87153                    Prompt for text input on a new line after the current line. If the **autoindent** edit option is  
 87154                    set, an appropriate number of **autoindent** characters shall be added as a prefix to the line  
 87155                    as described by the *ex* **autoindent** edit option.

87156        **<backslash>**

87157        *Synopsis:*        <backslash>

87158        Allow the entry of a subsequent <newline> or <control>-J as a literal character, removing any  
 87159        special meaning that it may have to the editor during text input mode. The <backslash>  
 87160        character shall be retained and evaluated when the command line is parsed, or retained and  
 87161        included when the input text becomes part of the edit buffer.

87162        **<control>-V**

87163        *Synopsis:*        <control>-V

87164        Allow the entry of any subsequent character as a literal character, removing any special meaning  
 87165        that it may have to the editor during text input mode. The <control>-V character shall be  
 87166        discarded before the command line is parsed or the input text becomes part of the edit buffer.

87167        If the “literal next” functionality is performed by the underlying system, it is implementation-  
 87168        defined whether a character other than <control>-V performs this function.

87169        **<control>-W**

87170        *Synopsis:*        <control>-W

87171        Discard the <control>-W, and the word previous to it in the input line, including any <blank>  
 87172        characters following the word and preceding the <control>-W. If the “word erase” functionality  
 87173        is performed by the underlying system, it is implementation-defined whether a character other  
 87174        than <control>-W performs this function.

87175        **Command Descriptions in ex**

87176        The following symbols are used in this section to represent command modifiers. Some of these  
 87177        modifiers can be omitted, in which case the specified defaults shall be used.

87178        *laddr*        A single line address, given in any of the forms described in [Addressing in ex](#) (on  
 87179        page 2668); the default shall be the current line (‘.’), unless otherwise specified.

87180        If the line address is zero, it shall be an error, unless otherwise specified in the  
 87181        following command descriptions.

|       |               |                                                                                                                                                |
|-------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| 87182 |               | If the edit buffer is empty, and the address is specified with a command other than                                                            |
| 87183 |               | <b>=</b> , <b>append</b> , <b>insert</b> , <b>open</b> , <b>put</b> , <b>read</b> , or <b>visual</b> , or the address is not zero, it shall be |
| 87184 |               | an error.                                                                                                                                      |
| 87185 | <i>2addr</i>  | Two addresses specifying an inclusive range of lines. If no addresses are specified,                                                           |
| 87186 |               | the default for <i>2addr</i> shall be the current line only (" . , . "), unless otherwise                                                      |
| 87187 |               | specified in the following command descriptions. If one address is specified, <i>2addr</i>                                                     |
| 87188 |               | shall specify that line only, unless otherwise specified in the following command                                                              |
| 87189 |               | descriptions.                                                                                                                                  |
| 87190 |               | It shall be an error if the first address is greater than the second address.                                                                  |
| 87191 |               | If the edit buffer is empty, and the two addresses are specified with a command                                                                |
| 87192 |               | other than the <b>!</b> , <b>write</b> , <b>wq</b> , or <b>xit</b> commands, or either address is not zero, it shall                           |
| 87193 |               | be an error.                                                                                                                                   |
| 87194 | <i>count</i>  | A positive decimal number. If <i>count</i> is specified, it shall be equivalent to specifying                                                  |
| 87195 |               | an additional address to the command, unless otherwise specified by the following                                                              |
| 87196 |               | command descriptions. The additional address shall be equal to the last address                                                                |
| 87197 |               | specified to the command (either explicitly or by default) plus <i>count</i> –1.                                                               |
| 87198 |               | If this would result in an address greater than the last line of the edit buffer, it shall                                                     |
| 87199 |               | be corrected to equal the last line of the edit buffer.                                                                                        |
| 87200 | <i>flags</i>  | One or more of the characters <b>' + '</b> , <b>' - '</b> , <b>' # '</b> , <b>' p '</b> , or <b>' l '</b> (ell). The flag characters           |
| 87201 |               | can be <blank>-separated, and in any order or combination. The characters <b>' # '</b> ,                                                       |
| 87202 |               | <b>' p '</b> , and <b>' l '</b> shall cause lines to be written in the format specified by the <b>print</b>                                    |
| 87203 |               | command with the specified <i>flags</i> .                                                                                                      |
| 87204 |               | The lines to be written are as follows:                                                                                                        |
| 87205 |               | 1. All edit buffer lines written during the execution of the <i>ex</i> <b>&amp;</b> , <b>~</b> , <b>list</b> , <b>number</b> ,                 |
| 87206 |               | <b>open</b> , <b>print</b> , <b>s</b> , <b>visual</b> , and <b>z</b> commands shall be written as specified by <i>flags</i> .                  |
| 87207 |               | 2. After the completion of an <i>ex</i> command with a flag as an argument, the                                                                |
| 87208 |               | current line shall be written as specified by <i>flags</i> , unless the current line was                                                       |
| 87209 |               | the last line written by the command.                                                                                                          |
| 87210 |               | The characters <b>' + '</b> and <b>' - '</b> cause the value of the current line after the execution                                           |
| 87211 |               | of the <i>ex</i> command to be adjusted by the offset address as described in <a href="#">Addressing</a>                                       |
| 87212 |               | <a href="#">in ex</a> (on page 2668). This adjustment shall occur before the current line is written                                           |
| 87213 |               | as described in 2. above.                                                                                                                      |
| 87214 |               | The default for <i>flags</i> shall be none.                                                                                                    |
| 87215 | <i>buffer</i> | One of a number of named areas for holding text. The named buffers are specified                                                               |
| 87216 |               | by the alphanumeric characters of the POSIX locale. There shall also be one                                                                    |
| 87217 |               | "unnamed" buffer. When no buffer is specified for editor commands that use a                                                                   |
| 87218 |               | buffer, the unnamed buffer shall be used. Commands that store text into buffers                                                                |
| 87219 |               | shall store the text as it was before the command took effect, and shall store text                                                            |
| 87220 |               | occurring earlier in the file before text occurring later in the file, regardless of how                                                       |
| 87221 |               | the text region was specified. Commands that store text into buffers shall store the                                                           |
| 87222 |               | text into the unnamed buffer as well as any specified buffer.                                                                                  |
| 87223 |               | In <i>ex</i> commands, buffer names are specified as the name by itself. In open or visual                                                     |
| 87224 |               | mode commands the name is preceded by a double-quote ( <b>' "</b> ) character.                                                                 |
| 87225 |               | If the specified buffer name is an uppercase character, and the buffer contents are                                                            |
| 87226 |               | to be modified, the buffer shall be appended to rather than being overwritten. If                                                              |

the buffer is not being modified, specifying the buffer name in lowercase and uppercase shall have identical results.

There shall also be buffers named by the numbers 1 through 9. In open and visual mode, if a region of text including characters from more than a single line is being modified by the *vi* **c** or **d** commands, the motion character associated with the **c** or **d** commands specifies that the buffer text shall be in line mode, or the commands **%**, **'**, **/**, **?**, **(**, **)**, **N**, **n**, **{**, or **}** are used to define a region of text for the **c** or **d** commands, the contents of buffers 1 through 8 shall be moved into the buffer named by the next numerically greater value, the contents of buffer 9 shall be discarded, and the region of text shall be copied into buffer 1. This shall be in addition to copying the text into a user-specified buffer or unnamed buffer, or both. Numeric buffers can be specified as a source buffer for open and visual mode commands; however, specifying a numeric buffer as the write target of an open or visual mode command shall have unspecified results.

The text of each buffer shall have the characteristic of being in either line or character mode. Appending text to a non-empty buffer shall set the mode to match the characteristic of the text being appended. Appending text to a buffer shall cause the creation of at least one additional line in the buffer. All text stored into buffers by *ex* commands shall be in line mode. The *ex* commands that use buffers as the source of text specify individually how buffers of different modes are handled. Each open or visual mode command that uses buffers for any purpose specifies individually the mode of the text stored into the buffer and how buffers of different modes are handled.

*file* Command text used to derive a pathname. The default shall be the current pathname, as defined previously, in which case, if no current pathname has yet been established it shall be an error, except where specifically noted in the individual command descriptions that follow. If the command text contains any of the characters **~**, **{**, **[**, **\***, **?**, **\$**, **"**, backquote, single-quote, and **<backslash>**, it shall be subjected to the process of "shell expansions", as described below; if more than a single pathname results and the command expects only one, it shall be an error.

The process of shell expansions in the editor shall be done as follows. The *ex* utility shall pass two arguments to the program named by the shell edit option; the first shall be **-c**, and the second shall be the string **"echo"** and the command text as a single argument. The standard output and standard error of that command shall replace the command text.

**!** A character that can be appended to the command name to modify its operation, as detailed in the individual command descriptions. With the exception of the *ex* **read**, **write**, and **!** commands, the **'!'** character shall only act as a modifier if there are no **<blank>** characters between it and the command name.

*remembered search direction*

The *vi* commands **N** and **n** begin searching in a forwards or backwards direction in the edit buffer based on a remembered search direction, which is initially unset, and is set by the *ex* **global**, **v**, **s**, and **tag** commands, and the *vi* **/** and **?** commands.

## Abbreviate

*Synopsis:*     ab[*breviate*] [*lhs rhs*]

If *lhs* and *rhs* are not specified, write the current list of abbreviations and do nothing more.

Implementations may restrict the set of characters accepted in *lhs* or *rhs*, except that printable characters and <blank> characters shall not be restricted. Additional restrictions shall be implementation-defined.

In both *lhs* and *rhs*, any character may be escaped with a <control>-V, in which case the character shall not be used to delimit *lhs* from *rhs*, and the escaping <control>-V shall be discarded.

In open and visual text input mode, if a non-word or <ESC> character that is not escaped by a <control>-V character is entered after a word character, a check shall be made for a set of characters matching *lhs*, in the text input entered during this command. If it is found, the effect shall be as if *rhs* was entered instead of *lhs*.

The set of characters that are checked is defined as follows:

1. If there are no characters inserted before the word and non-word or <ESC> characters that triggered the check, the set of characters shall consist of the word character.
2. If the character inserted before the word and non-word or <ESC> characters that triggered the check is a word character, the set of characters shall consist of the characters inserted immediately before the triggering characters that are word characters, plus the triggering word character.
3. If the character inserted before the word and non-word or <ESC> characters that triggered the check is not a word character, the set of characters shall consist of the characters that were inserted before the triggering characters that are neither <blank> characters nor word characters, plus the triggering word character.

It is unspecified whether the *lhs* argument entered for the *ex* **abbreviate** and **unabbreviate** commands is replaced in this fashion. Regardless of whether or not the replacement occurs, the effect of the command shall be as if the replacement had not occurred.

*Current line:* Unchanged.

*Current column:* Unchanged.

## Append

*Synopsis:*     [*laddr*] a[*ppend*][!]

Enter *ex* text input mode; the input text shall be placed after the specified line. If line zero is specified, the text shall be placed at the beginning of the edit buffer.

This command shall be affected by the **number** and **autoindent** edit options; following the command name with '!' shall cause the **autoindent** edit option setting to be toggled for the duration of this command only.

*Current line:* Set to the last input line; if no lines were input, set to the specified line, or to the first line of the edit buffer if a line of zero was specified, or zero if the edit buffer is empty.

*Current column:* Set to non-<blank>.

**Arguments**

*Synopsis:*     ar[gs]

Write the current argument list, with the current argument-list entry, if any, between ' [' and ' ] ' characters.

*Current line:* Unchanged.

*Current column:* Unchanged.

**Change**

*Synopsis:*     [2addr] c[hange] [!] [count]

Enter *ex* text input mode; the input text shall replace the specified lines. The specified lines shall be copied into the unnamed buffer, which shall become a line mode buffer.

This command shall be affected by the **number** and **autoindent** edit options; following the command name with ' ! ' shall cause the **autoindent** edit option setting to be toggled for the duration of this command only.

*Current line:* Set to the last input line; if no lines were input, set to the line before the first address, or to the first line of the edit buffer if there are no lines preceding the first address, or to zero if the edit buffer is empty.

*Current column:* Set to non-<blank>.

**Change Directory**

*Synopsis:*     chd[ir] [!] [directory]  
              cd[!] [directory]

Change the current working directory to *directory*.

If no *directory* argument is specified, and the *HOME* environment variable is set to a non-null and non-empty value, *directory* shall default to the value named in the *HOME* environment variable. If the *HOME* environment variable is empty or is undefined, the default value of *directory* is implementation-defined.

If no ' ! ' is appended to the command name, and the edit buffer has been modified since the last complete write, and the current pathname does not begin with a ' / ', it shall be an error.

*Current line:* Unchanged.

*Current column:* Unchanged.

**Copy**

*Synopsis:*     [2addr] co[py] laddr [flags]  
              [2addr] t laddr [flags]

Copy the specified lines after the specified destination line; line zero specifies that the lines shall be placed at the beginning of the edit buffer.

*Current line:* Set to the last line copied.

*Current column:* Set to non-<blank>.

**Delete**

*Synopsis:*     `[2addr] d[ele]te [buffer] [count] [flags]`

Delete the specified lines into a buffer (defaulting to the unnamed buffer), which shall become a line-mode buffer.

Flags can immediately follow the command name; see [Command Line Parsing in ex](#) (on page 2670).

*Current line:* Set to the line following the deleted lines, or to the last line in the edit buffer if that line is past the end of the edit buffer, or to zero if the edit buffer is empty.

*Current column:* Set to non-<blank>.

**Edit**

*Synopsis:*     `e[dit] [!] [+command] [file]`  
               `ex [!] [+command] [file]`

If no '!' is appended to the command name, and the edit buffer has been modified since the last complete write, it shall be an error.

If *file* is specified, replace the current contents of the edit buffer with the current contents of *file*, and set the current pathname to *file*. If *file* is not specified, replace the current contents of the edit buffer with the current contents of the file named by the current pathname. If for any reason the current contents of the file cannot be accessed, the edit buffer shall be empty.

The *+command* option shall be <blank>-delimited; <blank> characters within the *+command* can be escaped by preceding them with a <backslash> character. The *+command* shall be interpreted as an *ex* command immediately after the contents of the edit buffer have been replaced and the current line and column have been set.

If the edit buffer is empty:

*Current line:* Set to 0.

*Current column:* Set to 1.

Otherwise, if executed while in *ex* command mode or if the *+command* argument is specified:

*Current line:* Set to the last line of the edit buffer.

*Current column:* Set to non-<blank>.

Otherwise, if *file* is omitted or results in the current pathname:

*Current line:* Set to the first line of the edit buffer.

*Current column:* Set to non-<blank>.

Otherwise, if *file* is the same as the last file edited, the line and column shall be set as follows; if the file was previously edited, the line and column may be set as follows:

*Current line:* Set to the last value held when that file was last edited. If this value is not a valid line in the new edit buffer, set to the first line of the edit buffer.

*Current column:* If the current line was set to the last value held when the file was last edited, set to the last value held when the file was last edited. Otherwise, or if the last value is not a valid column in the new edit buffer, set to non-<blank>.

Otherwise:

*Current line*: Set to the first line of the edit buffer.

*Current column*: Set to non-<blank>.

## File

*Synopsis:*     *f*[*file*][*file*]

If a *file* argument is specified, the alternate pathname shall be set to the current pathname, and the current pathname shall be set to *file*.

Write an informational message. If the file has a current pathname, it shall be included in this message; otherwise, the message shall indicate that there is no current pathname. If the edit buffer contains lines, the current line number and the number of lines in the edit buffer shall be included in this message; otherwise, the message shall indicate that the edit buffer is empty. If the edit buffer has been modified since the last complete write, this fact shall be included in this message. If the **readonly** edit option is set, this fact shall be included in this message. The message may contain other unspecified information.

*Current line*: Unchanged.

*Current column*: Unchanged.

## Global

*Synopsis:*     [*2addr*] *g*[*lobal*] /*pattern*/ [*commands*]  
                   [*2addr*] *v* /*pattern*/ [*commands*]

The optional **'!'** character after the **global** command shall be the same as executing the **v** command.

If *pattern* is empty (for example, *"/"*) or not specified, the last regular expression used in the editor command shall be used as the *pattern*. The *pattern* can be delimited by <slash> characters (shown in the Synopsis), as well as any non-alphanumeric or non-<blank> other than <backslash>, <vertical-line>, <newline>, or double-quote.

If no lines are specified, the lines shall default to the entire file.

The **global** and **v** commands are logically two-pass operations. First, mark the lines within the specified lines for which the line excluding the terminating <newline> matches (**global**) or does not match (**v** or **global!**) the specified pattern. Second, execute the *ex* commands given by *commands*, with the current line (**'.'**) set to each marked line. If an error occurs during this process, or the contents of the edit buffer are replaced (for example, by the *ex* **:edit** command) an error message shall be written and no more commands resulting from the execution of this command shall be processed.

Multiple *ex* commands can be specified by entering multiple commands on a single line using a <vertical-line> to delimit them, or one per line, by escaping each <newline> with a <backslash>.

If no commands are specified:

1. If in *ex* command mode, it shall be as if the **print** command were specified.
2. Otherwise, no command shall be executed.

For the **append**, **change**, and **insert** commands, the input text shall be included as part of the command, and the terminating <period> can be omitted if the command ends the list of commands. The **open** and **visual** commands can be specified as one of the commands, in which

case each marked line shall cause the editor to enter open or visual mode. If open or visual mode is exited using the *vi* **Q** command, the current line shall be set to the next marked line, and open or visual mode reentered, until the list of marked lines is exhausted.

The **global**, **v**, and **undo** commands cannot be used in *commands*. Marked lines may be deleted by commands executed for lines occurring earlier in the file than the marked lines. In this case, no commands shall be executed for the deleted lines.

If the remembered search direction is not set, the **global** and **v** commands shall set it to forward.

The **autoprint** and **autoindent** edit options shall be inhibited for the duration of the **g** or **v** command.

*Current line*: If no commands executed, set to the last marked line. Otherwise, as specified for the executed *ex* commands.

*Current column*: If no commands are executed, set to non-<blank>; otherwise, as specified for the individual *ex* commands.

## Insert

*Synopsis*:     [*laddr*] i[nsert][!]

Enter *ex* text input mode; the input text shall be placed before the specified line. If the line is zero or 1, the text shall be placed at the beginning of the edit buffer.

This command shall be affected by the **number** and **autoindent** edit options; following the command name with '!' shall cause the **autoindent** edit option setting to be toggled for the duration of this command only.

*Current line*: Set to the last input line; if no lines were input, set to the line before the specified line, or to the first line of the edit buffer if there are no lines preceding the specified line, or zero if the edit buffer is empty.

*Current column*: Set to non-<blank>.

## Join

*Synopsis*:     [*2addr*] j[oin][!][*count*][*flags*]

If *count* is specified:

If no address was specified, the **join** command shall behave as if *2addr* were the current line and the current line plus *count* (*.*, *.* + *count*).

If one address was specified, the **join** command shall behave as if *2addr* were the specified address and the specified address plus *count* (*addr*, *addr* + *count*).

If two addresses were specified, the **join** command shall behave as if an additional address, equal to the last address plus *count* - 1 (*addr1*, *addr2*, *addr2* + *count* - 1), was specified.

If this would result in a second address greater than the last line of the edit buffer, it shall be corrected to be equal to the last line of the edit buffer.

If no *count* is specified:

87461 If no address was specified, the **join** command shall behave as if *2addr* were the current  
87462 line and the next line (*.*, *.* +1).

87463 If one address was specified, the **join** command shall behave as if *2addr* were the specified  
87464 address and the next line (*addr,addr* +1).

87465 Join the text from the specified lines together into a single line, which shall replace the specified  
87466 lines.

87467 If a '!' character is appended to the command name, the **join** shall be without modification of  
87468 any line, independent of the current locale.

87469 Otherwise, in the POSIX locale, set the current line to the first of the specified lines, and then, for  
87470 each subsequent line, proceed as follows:

- 87471 1. Discard leading <space> characters from the line to be joined.
- 87472 2. If the line to be joined is now empty, delete it, and skip steps 3 through 5.
- 87473 3. If the current line ends in a <blank>, or the first character of the line to be joined is a ' ) ' character, join the lines without further modification.
- 87474 3. If the current line ends in a <blank>, or the first character of the line to be joined is a ' ) ' character, join the lines without further modification.
- 87475 4. If the last character of the current line is a ' . ' , join the lines with two <space> characters  
87476 between them.
- 87477 5. Otherwise, join the lines with a single <space> between them.

87478 *Current line*: Set to the first line specified.

87479 *Current column*: Set to non-<blank>.

## 87480 List

87481 *Synopsis:*     [*2addr*] l[ist] [count] [flags]

87482 This command shall be equivalent to the *ex* command:

87483 [*2addr*] p[rint] [count] l[ist] [flags]

87484 See [Print](#) (on page 2687).

## 87485 Map

87486 *Synopsis:*     map[!] [*lhs rhs*]

87487 If *lhs* and *rhs* are not specified:

- 87488 1. If '!' is specified, write the current list of text input mode maps.
- 87489 2. Otherwise, write the current list of command mode maps.
- 87490 3. Do nothing more.

87491 Implementations may restrict the set of characters accepted in *lhs* or *rhs*, except that printable  
87492 characters and <blank> characters shall not be restricted. Additional restrictions shall be  
87493 implementation-defined. In both *lhs* and *rhs*, any character can be escaped with a <control>-V, in  
87494 which case the character shall not be used to delimit *lhs* from *rhs*, and the escaping <control>-V  
87495 shall be discarded.

87496 If the character '!' is appended to the **map** command name, the mapping shall be effective  
87497 during open or visual text input mode rather than **open** or **visual** command mode. This allows  
87498 *lhs* to have two different **map** definitions at the same time: one for command mode and one for

87499 text input mode.

87500 For command mode mappings:

87501 When the *lhs* is entered as any part of a *vi* command in open or visual mode (but not as

87502 part of the arguments to the command), the action shall be as if the corresponding *rhs* had

87503 been entered.

87504 If any character in the command, other than the first, is escaped using a <control>-V

87505 character, that character shall not be part of a match to an *lhs*.

87506 It is unspecified whether implementations shall support **map** commands where the *lhs* is

87507 more than a single character in length, where the first character of the *lhs* is printable.

87508 If *lhs* contains more than one character and the first character is '#', followed by a

87509 sequence of digits corresponding to a numbered function key, then when this function key

87510 is typed it shall be mapped to *rhs*. Characters other than digits following a '#' character

87511 also represent the function key named by the characters in the *lhs* following the '#' and

87512 may be mapped to *rhs*. It is unspecified how function keys are named or what function

87513 keys are supported.

87514 For text input mode mappings:

87515 When the *lhs* is entered as any part of text entered in open or visual text input modes, the

87516 action shall be as if the corresponding *rhs* had been entered.

87517 If any character in the input text is escaped using a <control>-V character, that character

87518 shall not be part of a match to an *lhs*.

87519 It is unspecified whether the *lhs* text entered for subsequent **map** or **unmap** commands is

87520 replaced with the *rhs* text for the purposes of the screen display; regardless of whether or

87521 not the display appears as if the corresponding *rhs* text was entered, the effect of the

87522 command shall be as if the *lhs* text was entered.

87523 If only part of the *lhs* is entered, it is unspecified how long the editor will wait for additional,

87524 possibly matching characters before treating the already entered characters as not matching the

87525 *lhs*.

87526 The *rhs* characters shall themselves be subject to remapping, unless otherwise specified by the

87527 **remap** edit option, except that if the characters in *lhs* occur as prefix characters in *rhs*, those

87528 characters shall not be remapped.

87529 On block-mode terminals, the mapping need not occur immediately (for example, it may occur

87530 after the terminal transmits a group of characters to the system), but it shall achieve the same

87531 results as if it occurred immediately.

87532 *Current line*: Unchanged.

87533 *Current column*: Unchanged.

**Mark**

*Synopsis:*     [*laddr*] *ma*[*rk*] *character*  
                   [*laddr*] *k* *character*

Implementations shall support *character* values of a single lowercase letter of the POSIX locale and the backquote and single-quote characters; support of other characters is implementation-defined.

If executing the *vi m* command, set the specified mark to the current line and 1-based numbered character referenced by the current column, if any; otherwise, column position 1.

Otherwise, set the specified mark to the specified line and 1-based numbered first non-<blank> non-<newline> in the line, if any; otherwise, the last non-<newline> in the line, if any; otherwise, column position 1.

The mark shall remain associated with the line until the mark is reset or the line is deleted. If a deleted line is restored by a subsequent **undo** command, any marks previously associated with the line, which have not been reset, shall be restored as well. Any use of a mark not associated with a current line in the edit buffer shall be an error.

The marks ' and ' shall be set as described previously, immediately before the following events occur in the editor:

1. The use of ' \$ ' as an *ex* address
2. The use of a positive decimal number as an *ex* address
3. The use of a search command as an *ex* address
4. The use of a mark reference as an *ex* address
5. The use of the following open and visual mode commands: <control>-], %, (, ), [, ], {, }
6. The use of the following open and visual mode commands: ', **G**, **H**, **L**, **M**, **z** if the current line will change as a result of the command
7. The use of the open and visual mode commands: /, ?, **N**, ', **n** if the current line or column will change as a result of the command
8. The use of the *ex* mode commands: **z**, **undo**, **global**, **v**

For rules 1., 2., 3., and 4., the ' and ' marks shall not be set if the *ex* command is parsed as specified by rule 6.a. in [Command Line Parsing in ex](#) (on page 2670).

For rules 5., 6., and 7., the ' and ' marks shall not be set if the commands are used as motion commands in open and visual mode.

For rules 1., 2., 3., 4., 5., 6., 7., and 8., the ' and ' marks shall not be set if the command fails.

The ' and ' marks shall be set as described previously, each time the contents of the edit buffer are replaced (including the editing of the initial buffer), if in open or visual mode, or if in **ex** mode and the edit buffer is not empty, before any commands or movements (including commands or movements specified by the **-c** or **-t** options or the **+command** argument) are executed on the edit buffer. If in open or visual mode, the marks shall be set as if executing the *vi m* command; otherwise, as if executing the *ex mark* command.

When changing from **ex** mode to open or visual mode, if the ' and ' marks are not already set, the ' and ' marks shall be set as described previously.

*Current line:* Unchanged.

87575 *Current column:* Unchanged.

## 87576 **Move**

87577 *Synopsis:*     [*2addr*] m[ove] *laddr* [*flags*]

87578 Move the specified lines after the specified destination line. A destination of line zero specifies  
87579 that the lines shall be placed at the beginning of the edit buffer. It shall be an error if the  
87580 destination line is within the range of lines to be moved.

87581 *Current line:* Set to the last of the moved lines.

87582 *Current column:* Set to non-<blank>.

## 87583 **Next**

87584 *Synopsis:*     n[ext] [!] [+*command*] [*file* ...]

87585 If no '!' is appended to the command name, and the edit buffer has been modified since the  
87586 last complete write, it shall be an error, unless the file is successfully written as specified by the  
87587 **autowrite** option.

87588 If one or more files is specified:

- 87589     1. Set the argument list to the specified filenames.
- 87590     2. Set the current argument list reference to be the first entry in the argument list.
- 87591     3. Set the current pathname to the first filename specified.

87592 Otherwise:

- 87593     1. It shall be an error if there are no more filenames in the argument list after the filename  
87594       currently referenced.
- 87595     2. Set the current pathname and the current argument list reference to the filename after the  
87596       filename currently referenced in the argument list.

87597 Replace the contents of the edit buffer with the contents of the file named by the current  
87598 pathname. If for any reason the contents of the file cannot be accessed, the edit buffer shall be  
87599 empty.

87600 This command shall be affected by the **autowrite** and **writeany** edit options.

87601 The +*command* option shall be <blank>-delimited; <blank> characters can be escaped by  
87602 preceding them with a <backslash> character. The +*command* shall be interpreted as an *ex*  
87603 command immediately after the contents of the edit buffer have been replaced and the current  
87604 line and column have been set.

87605 *Current line:* Set as described for the **edit** command.

87606 *Current column:* Set as described for the **edit** command.

**Number**

*Synopsis:*     [2addr] nu[mber] [count] [flags]  
                   [2addr] #[count] [flags]

These commands shall be equivalent to the *ex* command:

[2addr] p[rint] [count] #[flags]

See [Print](#).

**Open**

*Synopsis:*     [laddr] o[pen] /pattern/ [flags]

This command need not be supported on block-mode terminals or terminals with insufficient capabilities. If standard input, standard output, or standard error are not terminal devices, the results are unspecified.

Enter open mode.

The trailing delimiter can be omitted from *pattern* at the end of the command line. If *pattern* is empty (for example, *"/"/*) or not specified, the last regular expression used in the editor shall be used as the pattern. The pattern can be delimited by <slash> characters (shown in the Synopsis), as well as any alphanumeric, or non-<blank> other than <backslash>, <vertical-line>, <newline>, or double-quote.

*Current line:* Set to the specified line.

*Current column:* Set to non-<blank>.

**Preserve**

*Synopsis:*     pre[serve]

Save the edit buffer in a form that can later be recovered by using the *-r* option or by using the *ex* **recover** command. After the file has been preserved, a mail message shall be sent to the user. This message shall be readable by invoking the *mailx* utility. The message shall contain the name of the file, the time of preservation, and an *ex* command that could be used to recover the file. Additional information may be included in the mail message.

*Current line:* Unchanged.

*Current column:* Unchanged.

**Print**

*Synopsis:*     [2addr] p[rint] [count] [flags]

Write the addressed lines. The behavior is unspecified if the number of columns on the display is less than the number of columns required to write any single character in the lines being written.

Non-printable characters, except for the <tab>, shall be written as implementation-defined multi-character sequences.

If the # flag is specified or the **number** edit option is set, each line shall be preceded by its line number in the following format:

"%6dΔΔ", <line number>

If the l flag is specified or the **list** edit option is set:

1. The characters listed in XBD [Table 5-1](#) (on page 121) shall be written as the corresponding escape sequence.
2. Non-printable characters not in XBD [Table 5-1](#) (on page 121) shall be written as one three-digit octal number (with a preceding <backslash>) for each byte in the character (most significant byte first).
3. The end of each line shall be marked with a ' \$ ', and literal ' \$ ' characters within the line shall be written with a preceding <backslash>.

Long lines shall be folded; the length at which folding occurs is unspecified, but should be appropriate for the output terminal, considering the number of columns of the terminal.

If a line is folded, and the **l** flag is not specified and the **list** edit option is not set, it is unspecified whether a multi-column character at the folding position is separated; it shall not be discarded.

*Current line*: Set to the last written line.

*Current column*: Unchanged if the current line is unchanged; otherwise, set to non-<blank>.

## Put

*Synopsis*:     [*laddr*] pu[t] [*buffer*]

Append text from the specified buffer (by default, the unnamed buffer) to the specified line; line zero specifies that the text shall be placed at the beginning of the edit buffer. Each portion of a line in the buffer shall become a new line in the edit buffer, regardless of the mode of the buffer.

*Current line*: Set to the last line entered into the edit buffer.

*Current column*: Set to non-<blank>.

## Quit

*Synopsis*:     q[uit] [!]

If no ' ! ' is appended to the command name:

1. If the edit buffer has been modified since the last complete write, it shall be an error.
2. If there are filenames in the argument list after the filename currently referenced, and the last command was not a **quit**, **wq**, **xit**, or **ZZ** (see [Exit](#), on page 3371) command, it shall be an error.

Otherwise, terminate the editing session.

## Read

*Synopsis*:     [*laddr*] r[ead] [!]*[file]*

If ' ! ' is not the first non-<blank> to follow the command name, a copy of the specified file shall be appended into the edit buffer after the specified line; line zero specifies that the copy shall be placed at the beginning of the edit buffer. The number of lines and bytes read shall be written. If no *file* is named, the current pathname shall be the default. If there is no current pathname, then *file* shall become the current pathname. If there is no current pathname or *file* operand, it shall be an error. Specifying a *file* that is not of type regular shall have unspecified results.

Otherwise, if *file* is preceded by ' ! ', the rest of the line after the ' ! ' shall have ' % ', ' # ', and ' ! ' characters expanded as described in [Command Line Parsing in ex](#) (on page 2670).

The *ex* utility shall then pass two arguments to the program named by the shell edit option; the

first shall be **-c** and the second shall be the expanded arguments to the **read** command as a single argument. The standard input of the program shall be set to the standard input of the *ex* program when it was invoked. The standard error and standard output of the program shall be appended into the edit buffer after the specified line.

Each line in the copied file or program output (as delimited by <newline> characters or the end of the file or output if it is not immediately preceded by a <newline>), shall be a separate line in the edit buffer. Any occurrences of <carriage-return> and <newline> pairs in the output shall be treated as single <newline> characters.

The special meaning of the **' ! '** following the **read** command can be overridden by escaping it with a <backslash> character.

*Current line*: If no lines are added to the edit buffer, unchanged. Otherwise, if in open or visual mode, set to the first line entered into the edit buffer. Otherwise, set to the last line entered into the edit buffer.

*Current column*: Set to non-<blank>.

## Recover

*Synopsis:*     **rec[over] [!] file**

If no **' ! '** is appended to the command name, and the edit buffer has been modified since the last complete write, it shall be an error.

If no *file* operand is specified, then the current pathname shall be used. If there is no current pathname or *file* operand, it shall be an error.

If no recovery information has previously been saved about *file*, the **recover** command shall behave identically to the **edit** command, and an informational message to this effect shall be written.

Otherwise, set the current pathname to *file*, and replace the current contents of the edit buffer with the recovered contents of *file*. If there are multiple instances of the file to be recovered, the one most recently saved shall be recovered, and an informational message that there are previous versions of the file that can be recovered shall be written. The editor shall behave as if the contents of the edit buffer have already been modified.

*Current file*: Set as described for the **edit** command.

*Current column*: Set as described for the **edit** command.

## Rewind

*Synopsis:*     **rew[ind] [!]**

If no **' ! '** is appended to the command name, and the edit buffer has been modified since the last complete write, it shall be an error, unless the file is successfully written as specified by the **autowrite** option.

If the argument list is empty, it shall be an error.

The current argument list reference and the current pathname shall be set to the first filename in the argument list.

Replace the contents of the edit buffer with the contents of the file named by the current pathname. If for any reason the contents of the file cannot be accessed, the edit buffer shall be empty.

This command shall be affected by the **autowrite** and **writeany** edit options.

*Current line*: Set as described for the **edit** command.

*Current column*: Set as described for the **edit** command.

## Set

*Synopsis*:     `se[t][option[=[value]] ...][nooption ...][option? ...][all]`

When no arguments are specified, write the value of the **term** edit option and those options whose values have been changed from the default settings; when the argument *all* is specified, write all of the option values.

Giving an option name followed by the character '?' shall cause the current value of that option to be written. The '?' can be separated from the option name by zero or more <blank> characters. The '?' shall be necessary only for Boolean valued options. Boolean options can be given values by the form **set option** to turn them on or **set nooption** to turn them off; string and numeric options can be assigned by the form **set option=value**. Any <blank> characters in strings can be included as is by preceding each <blank> with an escaping <backslash>. More than one option can be set or listed by a single set command by specifying multiple arguments, each separated from the next by one or more <blank> characters.

See [Edit Options in ex](#) (on page 2700) for details about specific options.

*Current line*: Unchanged.

*Current column*: Unchanged.

## Shell

*Synopsis*:     `sh[ell]`

Invoke the program named in the **shell** edit option with the single argument **-i** (interactive mode). Editing shall be resumed when the program exits.

*Current line*: Unchanged.

*Current column*: Unchanged.

## Source

*Synopsis*:     `so[urce] file`

Read and execute *ex* commands from *file*. Lines in the file that are blank lines shall be ignored.

*Current line*: As specified for the individual *ex* commands.

*Current column*: As specified for the individual *ex* commands.

## Substitute

*Synopsis*:     `[2addr] s[ubstitute][/pattern/repl][options][count][flags]]`  
               `[2addr] &[options][count][flags]]`  
               `[2addr] ~[options][count][flags]]`

Replace the first instance of the pattern *pattern* by the string *repl* on each specified line. (See [Regular Expressions in ex](#) (on page 2699) and [Replacement Strings in ex](#) (on page 2700).) Any non-alphabetic, non-<blank> delimiter other than <backslash>, '|', <newline>, or double-quote can be used instead of '/'. <backslash> characters can be used to escape delimiters, <backslash> characters, and other special characters.

87764 The trailing delimiter can be omitted from *pattern* or from *repl* at the end of the command line. If  
 87765 both *pattern* and *repl* are not specified or are empty (for example, `"/ /"`), the last `s` command  
 87766 shall be repeated. If only *pattern* is not specified or is empty, the last regular expression used in  
 87767 the editor shall be used as the pattern. If only *repl* is not specified or is empty, the pattern shall be  
 87768 replaced by nothing. If the entire replacement pattern is `' % '`, the last replacement pattern to an  
 87769 `s` command shall be used.

87770 Entering a <carriage-return> in *repl* (which requires an escaping <backslash> in *ex* mode and an  
 87771 escaping <control>-V in open or *vi* mode) shall split the line at that point, creating a new line in  
 87772 the edit buffer. The <carriage-return> shall be discarded.

87773 If *options* includes the letter `' g '` (**global**), all non-overlapping instances of the pattern in the line  
 87774 shall be replaced.

87775 If *options* includes the letter `' c '` (**confirm**), then before each substitution the line shall be written;  
 87776 the written line shall reflect all previous substitutions. On the following line, <space> characters  
 87777 shall be written beneath the characters from the line that are before the *pattern* to be replaced,  
 87778 and `' ^ '` characters written beneath the characters included in the *pattern* to be replaced. The *ex*  
 87779 utility shall then wait for a response from the user. An affirmative response shall cause the  
 87780 substitution to be done, while any other input shall not make the substitution. An affirmative  
 87781 response shall consist of a line with the affirmative response (as defined by the current locale) at  
 87782 the beginning of the line. This line shall be subject to editing in the same way as the *ex* command  
 87783 line.

87784 If interrupted (see the ASYNCHRONOUS EVENTS section), any modifications confirmed by the  
 87785 user shall be preserved in the edit buffer after the interrupt.

87786 If the remembered search direction is not set, the `s` command shall set it to forward.

87787 In the second Synopsis, the `&` command shall repeat the previous substitution, as if the `&`  
 87788 command were replaced by:

87789 `s/pattern/repl/`

87790 where *pattern* and *repl* are as specified in the previous `s`, `&`, or `~` command.

87791 In the third Synopsis, the `~` command shall repeat the previous substitution, as if the `' ^ '` were  
 87792 replaced by:

87793 `s/pattern/repl/`

87794 where *pattern* shall be the last regular expression specified to the editor, and *repl* shall be from  
 87795 the previous substitution (including `&` and `~`) command.

87796 These commands shall be affected by the `LC_MESSAGES` environment variable.

87797 *Current line*: Set to the last line in which a substitution occurred, or, unchanged if no substitution  
 87798 occurred.

87799 *Current column*: Set to non-<blank>.

## Suspend

*Synopsis:*     su[spend] [!]  
              st[op] [!]

Allow control to return to the invoking process; *ex* shall suspend itself as if it had received the SIGTSTP signal. The suspension shall occur only if job control is enabled in the invoking shell (see the description of *set -m*).

These commands shall be affected by the **autowrite** and **writeany** edit options.

The current **susp** character (see *stty*) shall be equivalent to the **suspend** command.

## Tag

*Synopsis:*     ta[g] [!] *tagstring*

The results are unspecified if the format of a tags file is not as specified by the *ctags* utility (see *ctags*) description.

The **tag** command shall search for *tagstring* in the tag files referred to by the **tag** edit option, in the order they are specified, until a reference to *tagstring* is found. Files shall be searched from beginning to end. If no reference is found, it shall be an error and an error message to this effect shall be written. If the reference is not found, or if an error occurs while processing a file referred to in the **tag** edit option, it shall be an error, and an error message shall be written at the first occurrence of such an error.

Otherwise, if the tags file contained a pattern, the pattern shall be treated as a regular expression used in the editor; for example, for the purposes of the **s** command.

If the *tagstring* is in a file with a different name than the current pathname, set the current pathname to the name of that file, and replace the contents of the edit buffer with the contents of that file. In this case, if no '!' is appended to the command name, and the edit buffer has been modified since the last complete write, it shall be an error, unless the file is successfully written as specified by the **autowrite** option.

This command shall be affected by the **autowrite**, **tag**, **taglength**, and **writeany** edit options.

*Current line:* If the tags file contained a line number, set to that line number. If the line number is larger than the last line in the edit buffer, an error message shall be written and the current line shall be set as specified for the **edit** command.

If the tags file contained a pattern, set to the first occurrence of the pattern in the file. If no matching pattern is found, an error message shall be written and the current line shall be set as specified for the **edit** command.

*Current column:* If the tags file contained a line-number reference and that line-number was not larger than the last line in the edit buffer, or if the tags file contained a pattern and that pattern was found, set to non-<blank>. Otherwise, set as specified for the **edit** command.

**Unabbreviate**

*Synopsis:*     una[bbrev] lhs

If *lhs* is not an entry in the current list of abbreviations (see [Abbreviate](#), on page 2678), it shall be an error. Otherwise, delete *lhs* from the list of abbreviations.

*Current line:* Unchanged.

*Current column:* Unchanged.

**Undo**

*Synopsis:*     u[ndo]

Reverse the changes made by the last command that modified the contents of the edit buffer, including **undo**. For this purpose, the **global**, **v**, **open**, and **visual** commands, and commands resulting from buffer executions and mapped character expansions, are considered single commands.

If no action that can be undone preceded the **undo** command, it shall be an error.

If the **undo** command restores lines that were marked, the mark shall also be restored unless it was reset subsequent to the deletion of the lines.

*Current line:*

1. If lines are added or changed in the file, set to the first line added or changed.
2. Set to the line before the first line deleted, if it exists.
3. Set to 1 if the edit buffer is not empty.
4. Set to zero.

*Current column:* Set to non-<blank>.

**Unmap**

*Synopsis:*     unm[ap][!] lhs

If '!' is appended to the command name, and if *lhs* is not an entry in the list of text input mode map definitions, it shall be an error. Otherwise, delete *lhs* from the list of text input mode map definitions.

If no '!' is appended to the command name, and if *lhs* is not an entry in the list of command mode map definitions, it shall be an error. Otherwise, delete *lhs* from the list of command mode map definitions.

*Current line:* Unchanged.

*Current column:* Unchanged.

**Version**

*Synopsis:*     `ve[rsion]`

Write a message containing version information for the editor. The format of the message is unspecified.

*Current line:* Unchanged.

*Current column:* Unchanged.

**Visual**

*Synopsis:*     `[laddr] vi[sual] [type] [count] [flags]`

If *ex* is currently in open or visual mode, the Synopsis and behavior of the visual command shall be the same as the **edit** command, as specified by **Edit** (on page 2680).

Otherwise, this command need not be supported on block-mode terminals or terminals with insufficient capabilities. If standard input, standard output, or standard error are not terminal devices, the results are unspecified.

If *count* is specified, the value of the **window** edit option shall be set to *count* (as described in **window**, on page 2707). If the `'^'` type character was also specified, the **window** edit option shall be set before being used by the type character.

Enter visual mode. If *type* is not specified, it shall be as if a *type* of `'+'` was specified. The *type* shall cause the following effects:

- + Place the beginning of the specified line at the top of the display.
- Place the end of the specified line at the bottom of the display.
- . Place the beginning of the specified line in the middle of the display.
- ^ If the specified line is less than or equal to the value of the **window** edit option, set the line to 1; otherwise, decrement the line by the value of the **window** edit option minus 1. Place the beginning of this line as close to the bottom of the displayed lines as possible, while still displaying the value of the **window** edit option number of lines.

*Current line:* Set to the specified line.

*Current column:* Set to non-<blank>.

**Write**

*Synopsis:*     `[2addr] w[rite] [!] [>>] [file]`  
                   `[2addr] w[rite] [!] [file]`  
                   `[2addr] wq[!] [>>] [file]`

If no lines are specified, the lines shall default to the entire file.

The command **wq** shall be equivalent to a **write** command followed by a **quit** command; **wq!** shall be equivalent to **write!** followed by **quit**. In both cases, if the **write** command fails, the **quit** shall not be attempted.

If the command name is not followed by one or more <blank> characters, or *file* is not preceded by a `'!'` character, the **write** shall be to a file.

1. If the `>>` argument is specified, and the file already exists, the lines shall be appended to the file instead of replacing its contents. If the `>>` argument is specified, and the file does not already exist, it is unspecified whether the write shall proceed as if the `>>` argument

- 87906 had not been specified or if the **write** shall fail.
- 87907 2. If the **readonly** edit option is set (see [readonly](#), on page 2704), the **write** shall fail.
- 87908 3. If *file* is specified, and is not the current pathname, and the file exists, the **write** shall fail.
- 87909 4. If *file* is not specified, the current pathname shall be used. If there is no current pathname,
- 87910 the **write** command shall fail.
- 87911 5. If the current pathname is used, and the current pathname has been changed by the **file**
- 87912 or **read** commands, and the file exists, the **write** shall fail. If the **write** is successful,
- 87913 subsequent **writes** shall not fail for this reason (unless the current pathname is changed
- 87914 again).
- 87915 6. If the whole edit buffer is not being written, and the file to be written exists, the **write**
- 87916 shall fail.

87917 For rules 1., 2., 3., and 5., the **write** can be forced by appending the character '!' to the

87918 command name.

87919 For rules 2., 3., and 5., the **write** can be forced by setting the **writeany** edit option.

87920 Additional, implementation-defined tests may cause the **write** to fail.

87921 If the edit buffer is empty, a file without any contents shall be written.

87922 An informational message shall be written noting the number of lines and bytes written.

87923 Otherwise, if the command is followed by one or more <blank> characters, and the file is

87924 preceded by '!', the rest of the line after the '!' shall have '%', '#', and '!' characters

87925 expanded as described in [Command Line Parsing in ex](#) (on page 2670).

87926 The *ex* utility shall then pass two arguments to the program named by the **shell** edit option; the

87927 first shall be **-c** and the second shall be the expanded arguments to the **write** command as a

87928 single argument. The specified lines shall be written to the standard input of the command. The

87929 standard error and standard output of the program, if any, shall be written as described for the

87930 **print** command. If the last character in that output is not a <newline>, a <newline> shall be

87931 written at the end of the output.

87932 The special meaning of the '!' following the **write** command can be overridden by escaping it

87933 with a <backslash> character.

87934 *Current line*: Unchanged.

87935 *Current column*: Unchanged.

## 87936 Write and Exit

87937 *Synopsis:*     [*2addr*] x[*it*][!][*file*]

87938 If the edit buffer has not been modified since the last complete **write**, **xit** shall be equivalent to

87939 the **quit** command, or if a '!' is appended to the command name, to **quit!**.

87940 Otherwise, **xit** shall be equivalent to the **wq** command, or if a '!' is appended to the command

87941 name, to **wq!**.

87942 *Current line*: Unchanged.

87943 *Current column*: Unchanged.

**Yank**

*Synopsis:*     `[2addr] ya[nk] [buffer] [count]`

Copy the specified lines to the specified buffer (by default, the unnamed buffer), which shall become a line-mode buffer.

*Current line:* Unchanged.

*Current column:* Unchanged.

**Adjust Window**

*Synopsis:*     `[laddr] z[!][type ...] [count] [flags]`

If no line is specified, the current line shall be the default; if *type* is omitted as well, the current line value shall first be incremented by 1. If incrementing the current line would cause it to be greater than the last line in the edit buffer, it shall be an error.

If there are <blank> characters between the *type* argument and the preceding *z* command name or optional '!' character, it shall be an error.

If *count* is specified, the value of the **window** edit option shall be set to *count* (as described in **window**, on page 2707). If *count* is omitted, it shall default to 2 times the value of the **scroll** edit option, or if ! was specified, the number of lines in the display minus 1.

If *type* is omitted, then *count* lines starting with the specified line shall be written. Otherwise, *count* lines starting with the line specified by the *type* argument shall be written.

The *type* argument shall change the lines to be written. The possible values of *type* are as follows:

- The specified line shall be decremented by the following value:

$((\text{number of ``-'' characters}) \times \text{count}) - 1$

If the calculation would result in a number less than 1, it shall be an error. Write lines from the edit buffer, starting at the new value of line, until *count* lines or the last line in the edit buffer has been written.

- + The specified line shall be incremented by the following value:

$((\text{number of ``+'' characters}) - 1) \times \text{count} + 1$

If the calculation would result in a number greater than the last line in the edit buffer, it shall be an error. Write lines from the edit buffer, starting at the new value of line, until *count* lines or the last line in the edit buffer has been written.

**=,.** If more than a single ' .' or '=' is specified, it shall be an error. The following steps shall be taken:

1. If *count* is zero, nothing shall be written.
2. Write as many of the *N* lines before the current line in the edit buffer as exist. If *count* or '!' was specified, *N* shall be:

$(\text{count} - 1) / 2$

Otherwise, *N* shall be:

$(\text{count} - 3) / 2$

If *N* is a number less than 3, no lines shall be written.

- 87982 3. If '=' was specified as the type character, write a line consisting of the smaller of the  
87983 number of columns in the display divided by two, or 40 '-' characters.
- 87984 4. Write the current line.
- 87985 5. Repeat step 3.
- 87986 6. Write as many of the *N* lines after the current line in the edit buffer as exist. *N* shall  
87987 be defined as in step 2. If *N* is a number less than 3, no lines shall be written. If *count*  
87988 is less than 3, no lines shall be written.

87989 ^ The specified line shall be decremented by the following value:

87990  $((\text{number of ``^`` characters}) + 1) \times \text{count} - 1$

87991 If the calculation would result in a number less than 1, it shall be an error. Write lines from  
87992 the edit buffer, starting at the new value of line, until *count* lines or the last line in the edit  
87993 buffer has been written.

87994 *Current line*: Set to the last line written, unless the type is =, in which case, set to the specified  
87995 line.

87996 *Current column*: Set to non-<blank>.

## 87997 Escape

87998 *Synopsis:*     ! *command*  
87999               [*addr*] ! *command*

88000 The contents of the line after the '!' shall have '%', '#', and '!' characters expanded as  
88001 described in [Command Line Parsing in ex](#) (on page 2670). If the expansion causes the text of the  
88002 line to change, it shall be redisplayed, preceded by a single '!' character.

88003 The *ex* utility shall execute the program named by the **shell** edit option. It shall pass two  
88004 arguments to the program; the first shall be -c, and the second shall be the expanded arguments  
88005 to the ! command as a single argument.

88006 If no lines are specified, the standard input, standard output, and standard error of the program  
88007 shall be set to the standard input, standard output, and standard error of the *ex* program when it  
88008 was invoked. In addition, a warning message shall be written if the edit buffer has been  
88009 modified since the last complete write, and the **warn** edit option is set.

88010 If lines are specified, they shall be passed to the program as standard input, and the standard  
88011 output and standard error of the program shall replace those lines in the edit buffer. Each line in  
88012 the program output (as delimited by <newline> characters or the end of the output if it is not  
88013 immediately preceded by a <newline>), shall be a separate line in the edit buffer. Any  
88014 occurrences of <carriage-return> and <newline> pairs in the output shall be treated as single  
88015 <newline> characters. The specified lines shall be copied into the unnamed buffer before they  
88016 are replaced, and the unnamed buffer shall become a line-mode buffer.

88017 If in *ex* mode, a single '!' character shall be written when the program completes.

88018 This command shall be affected by the **shell** and **warn** edit options. If no lines are specified, this  
88019 command shall be affected by the **autowrite** and **writeany** edit options. If lines are specified, this  
88020 command shall be affected by the **autoprint** edit option.

88021 *Current line:*

- 88022 1. If no lines are specified, unchanged.
- 88023 2. Otherwise, set to the last line read in, if any lines are read in.
- 88024 3. Otherwise, set to the line before the first line of the lines specified, if that line exists.
- 88025 4. Otherwise, set to the first line of the edit buffer if the edit buffer is not empty.
- 88026 5. Otherwise, set to zero.

88027 *Current column:* If no lines are specified, unchanged. Otherwise, set to non-<blank>.

## 88028 **Shift Left**

88029 *Synopsis:* `[2addr] <[< ...] [count] [flags]`

88030 Shift the specified lines to the start of the line; the number of column positions to be shifted shall  
 88031 be the number of command characters times the value of the **shiftwidth** edit option. Only  
 88032 leading <blank> characters shall be deleted or changed into other <blank> characters in shifting;  
 88033 other characters shall not be affected.

88034 Lines to be shifted shall be copied into the unnamed buffer, which shall become a line-mode  
 88035 buffer.

88036 This command shall be affected by the **autoprint** edit option.

88037 *Current line:* Set to the last line in the lines specified.

88038 *Current column:* Set to non-<blank>.

## 88039 **Shift Right**

88040 *Synopsis:* `[2addr] >[> ...] [count] [flags]`

88041 Shift the specified lines away from the start of the line; the number of column positions to be  
 88042 shifted shall be the number of command characters times the value of the **shiftwidth** edit  
 88043 option. The shift shall be accomplished by adding <blank> characters as a prefix to the line or  
 88044 changing leading <blank> characters into other <blank> characters. Empty lines shall not be  
 88045 changed.

88046 Lines to be shifted shall be copied into the unnamed buffer, which shall become a line-mode  
 88047 buffer.

88048 This command shall be affected by the **autoprint** edit option.

88049 *Current line:* Set to the last line in the lines specified.

88050 *Current column:* Set to non-<blank>.

## 88051 **<control>-D**

88052 *Synopsis:* `<control>-D`

88053 Write the next *n* lines, where *n* is the minimum of the values of the **scroll** edit option and the  
 88054 number of lines after the current line in the edit buffer. If the current line is the last line of the  
 88055 edit buffer it shall be an error.

88056 *Current line:* Set to the last line written.

88057 *Current column:* Set to non-<blank>.

**Write Line Number**

*Synopsis:*     [*laddr*] = [*flags*]

If *line* is not specified, it shall default to the last line in the edit buffer. Write the line number of the specified line.

*Current line:* Unchanged.

*Current column:* Unchanged.

**Execute**

*Synopsis:*     [*2addr*] @ *buffer*  
                 [*2addr*] \* *buffer*

If no *buffer* is specified or is specified as '@' or '\*', the last *buffer* executed shall be used. If no previous *buffer* has been executed, it shall be an error.

For each line specified by the addresses, set the current line ('.') to the specified line, and execute the contents of the named *buffer* (as they were at the time the @ command was executed) as *ex* commands. For each line of a line-mode *buffer*, and all but the last line of a character-mode *buffer*, the *ex* command parser shall behave as if the line was terminated by a <newline>.

If an error occurs during this process, or a line specified by the addresses does not exist when the current line would be set to it, or more than a single line was specified by the addresses, and the contents of the edit buffer are replaced (for example, by the *ex* :edit command) an error message shall be written, and no more commands resulting from the execution of this command shall be processed.

*Current line:* As specified for the individual *ex* commands.

*Current column:* As specified for the individual *ex* commands.

**Regular Expressions in ex**

The *ex* utility shall support regular expressions that are a superset of the basic regular expressions described in XBD [Section 9.3](#) (on page 183). A null regular expression ("/ /") shall be equivalent to the last regular expression encountered.

Regular expressions can be used in addresses to specify lines and, in some commands (for example, the **substitute** command), to specify portions of a line to be substituted.

The following constructs can be used to enhance the basic regular expressions:

\< Match the beginning of a *word*. (See the definition of *word* at the beginning of [Command Descriptions in ex](#) (on page 2675).)

\> Match the end of a *word*.

~ Match the replacement part of the last **substitute** command. The <tilde> ('~') character can be escaped in a regular expression to become a normal character with no special meaning. The <backslash> shall be discarded.

When the editor option **magic** is not set, the only characters with special meanings shall be '^' at the beginning of a pattern, '\$' at the end of a pattern, and <backslash>. The characters '.', '\*', '[', and '~' shall be treated as ordinary characters unless preceded by a <backslash>; when preceded by a <backslash> they shall regain their special meaning, or in the case of <backslash>, be handled as a single <backslash>. <backslash> characters used to escape other characters shall be discarded.

## Replacement Strings in ex

The character `'&'` (`'\&'` if the editor option **magic** is not set) in the replacement string shall stand for the text matched by the pattern to be replaced. The character `'~'` (`'\~'` if **magic** is not set) shall be replaced by the replacement part of the previous **substitute** command. The sequence `'\n'`, where *n* is an integer, shall be replaced by the text matched by the corresponding back-reference expression. If the corresponding back-reference expression does not match, then the characters `'\n'` shall be replaced by the empty string.

The strings `'\l'`, `'\u'`, `'\L'`, and `'\U'` can be used to modify the case of elements in the replacement string (using the `'\&'` or `"\"digit`) notation. The string `'\l'` (`'\u'`) shall cause the character that follows to be converted to lowercase (uppercase). The string `'\L'` (`'\U'`) shall cause all characters subsequent to it to be converted to lowercase (uppercase) as they are inserted by the substitution until the string `'\e'` or `'\E'`, or the end of the replacement string, is encountered.

Otherwise, any character following a `<backslash>` shall be treated as that literal character, and the escaping `<backslash>` shall be discarded.

An example of case conversion with the **s** command is as follows:

```
:p
The cat sat on the mat.
:s/\<.at\>/\u&/gp
The Cat Sat on the Mat.
:s/S\(.*\)M/S\U\1\eM/p
The Cat SAT ON THE Mat.
```

## Edit Options in ex

The *ex* utility has a number of options that modify its behavior. These options have default settings, which can be changed using the **set** command.

Options are Boolean unless otherwise specified.

### autoindent, ai

[Default *unset*]

If **autoindent** is set, each line in input mode shall be indented (using first as many `<tab>` characters as possible, as determined by the editor option **tabstop**, and then using `<space>` characters) to align with another line, as follows:

1. If in open or visual mode and the text input is part of a line-oriented command (see the EXTENDED DESCRIPTION in *vi*), align to the first column.
2. Otherwise, if in open or visual mode, indentation for each line shall be set as follows:
  - a. If a line was previously inserted as part of this command, it shall be set to the indentation of the last inserted line by default, or as otherwise specified for the `<control>-D` character in *Input Mode Commands* in *vi* (on page 3371).
  - b. Otherwise, it shall be set to the indentation of the previous current line, if any; otherwise, to the first column.
3. For the *ex* **a**, **i**, and **c** commands, indentation for each line shall be set as follows:

- 88139 a. If a line was previously inserted as part of this command, it shall be set to the
- 88140 indentation of the last inserted line by default, or as otherwise specified for the *eof*
- 88141 character in [Scroll](#) (on page 2674).
- 88142 b. Otherwise, if the command is the *ex a* command, it shall be set to the line
- 88143 appended after, if any; otherwise to the first column.
- 88144 c. Otherwise, if the command is the *ex i* command, it shall be set to the line inserted
- 88145 before, if any; otherwise to the first column.
- 88146 d. Otherwise, if the command is the *ex c* command, it shall be set to the indentation of
- 88147 the line replaced.

#### 88148 **autoprint, ap**

88149 [Default *set*]

88150 If **autoprint** is set, the current line shall be written after each *ex* command that modifies the

88151 contents of the current edit buffer, and after each **tag** command for which the tag search pattern

88152 was found or tag line number was valid, unless:

- 88153 1. The command was executed while in open or visual mode.
- 88154 2. The command was executed as part of a **global** or **v** command or **@** buffer execution.
- 88155 3. The command was the form of the **read** command that reads a file into the edit buffer.
- 88156 4. The command was the **append**, **change**, or **insert** command.
- 88157 5. The command was not terminated by a <newline>.
- 88158 6. The current line shall be written by a flag specified to the command; for example, **delete #**
- 88159 shall write the current line as specified for the flag modifier to the **delete** command, and
- 88160 not as specified by the **autoprint** edit option.

#### 88161 **autowrite, aw**

88162 [Default *unset*]

88163 If **autowrite** is set, and the edit buffer has been modified since it was last completely written to

88164 any file, the contents of the edit buffer shall be written as if the *ex write* command had been

88165 specified without arguments, before each command affected by the **autowrite** edit option is

88166 executed. Appending the character '!' to the command name of any of the *ex* commands

88167 except '!' shall prevent the write. If the write fails, it shall be an error and the command shall

88168 not be executed.

#### 88169 **beautify, bf**

88170 XSI [Default *unset*]

88171 If **beautify** is set, all non-printable characters, other than <tab>, <newline>, and <form-feed>

88172 characters, shall be discarded from text read in from files.

88173        **directory, dir**  
88174        [Default *implementation-defined*]  
88175        The value of this option specifies the directory in which the editor buffer is to be placed. If this  
88176        directory is not writable by the user, the editor shall quit.

88177        **edcompatible, ed**  
88178        [Default *unset*]  
88179        Causes the presence of **g** and **c** suffixes on substitute commands to be remembered, and toggled  
88180        by repeating the suffixes.

88181        **errorbells, eb**  
88182        [Default *unset*]  
88183        If the editor is in *ex* mode, and the terminal does not support a standout mode (such as inverse  
88184        video), and **errorbells** is set, error messages shall be preceded by alerting the terminal.

88185        **exrc**  
88186        [Default *unset*]  
88187        If **exrc** is set, *ex* shall access any **.exrc** file in the current directory, as described in [Initialization in](#)  
88188        [ex and vi](#) (on page 2666). If **exrc** is not set, *ex* shall ignore any **.exrc** file in the current directory  
88189        during initialization, unless the current directory is that named by the *HOME* environment  
88190        variable.

88191        **ignorecase, ic**  
88192        [Default *unset*]  
88193        If **ignorecase** is set, characters that have uppercase and lowercase representations shall have  
88194        those representations considered as equivalent for purposes of regular expression comparison.  
88195        The **ignorecase** edit option shall affect all remembered regular expressions; for example,  
88196        unsetting the **ignorecase** edit option shall cause a subsequent *vi n* command to search for the  
88197        last basic regular expression in a case-sensitive fashion.

88198        **list**  
88199        [Default *unset*]  
88200        If **list** is set, edit buffer lines written while in *ex* command mode shall be written as specified for  
88201        the **print** command with the **l** flag specified. In open or visual mode, each edit buffer line shall  
88202        be displayed as specified for the *ex print* command with the **l** flag specified. In open or visual  
88203        text input mode, when the cursor does not rest on any character in the line, it shall rest on the  
88204        ' **\$** ' marking the end of the line.

88205 **magic**88206 [Default *set*]

88207 If **magic** is set, modify the interpretation of characters in regular expressions and substitution  
 88208 replacement strings (see [Regular Expressions in ex](#) (on page 2699) and [Replacement Strings in](#)  
 88209 [ex](#), on page 2700).

88210 **mesg**88211 [Default *set*]

88212 If **mesg** is set, the permission for others to use the **write** or **talk** commands to write to the  
 88213 terminal shall be turned on while in open or visual mode. The shell-level command *mesg n* shall  
 88214 take precedence over any setting of the *ex mesg* option; that is, if **mesg y** was issued before the  
 88215 editor started (or in a shell escape), such as:

88216 `:!mesg y`

88217 the **mesg** option in *ex* shall suppress incoming messages, but the **mesg** option shall not enable  
 88218 incoming messages if **mesg n** was issued.

88219 **number, nu**88220 [Default *unset*]

88221 If **number** is set, edit buffer lines written while in *ex* command mode shall be written with line  
 88222 numbers, in the format specified by the **print** command with the **#** flag specified. In *ex* text input  
 88223 mode, each line shall be preceded by the line number it will have in the file.

88224 In open or visual mode, each edit buffer line shall be displayed with a preceding line number, in  
 88225 the format specified by the *ex print* command with the **#** flag specified. This line number shall  
 88226 not be considered part of the line for the purposes of evaluating the current column; that is,  
 88227 column position 1 shall be the first column position after the format specified by the **print**  
 88228 command.

88229 **paragraphs, para**88230 [Default in the POSIX locale `IPLPPPQPP LIpplpipbp`]

88231 The **paragraphs** edit option shall define additional paragraph boundaries for the open and  
 88232 visual mode commands. The **paragraphs** edit option can be set to a character string consisting of  
 88233 zero or more character pairs. It shall be an error to set it to an odd number of characters.

88234 **prompt**88235 [Default *set*]

88236 If **prompt** is set, *ex* command mode input shall be prompted for with a <colon> (':'); when  
 88237 unset, no prompt shall be written.

**readonly**[Default *see text*]

If the **readonly** edit option is set, read-only mode shall be enabled (see **Write**, on page 2694). The **readonly** edit option shall be initialized to set if either of the following conditions are true:

- The command-line option **-R** was specified.
- Performing actions equivalent to the *access()* function called with the following arguments indicates that the file lacks write permission:
  1. The current pathname is used as the *path* argument.
  2. The constant **W\_OK** is used as the *amode* argument.

The **readonly** edit option may be initialized to set for other, implementation-defined reasons. The **readonly** edit option shall not be initialized to unset based on any special privileges of the user or process. The **readonly** edit option shall be reinitialized each time that the contents of the edit buffer are replaced (for example, by an **edit** or **next** command) unless the user has explicitly set it, in which case it shall remain set until the user explicitly unsets it. Once unset, it shall again be reinitialized each time that the contents of the edit buffer are replaced.

**redraw**[Default *unset*]

The editor simulates an intelligent terminal on a dumb terminal. (Since this is likely to require a large amount of output to the terminal, it is useful only at high transmission speeds.)

**remap**[Default *set*]

If **remap** is set, map translation shall allow for maps defined in terms of other maps; translation shall continue until a final product is obtained. If unset, only a one-step translation shall be done.

**report**

[Default 5]

The value of this **report** edit option specifies what number of lines being added, copied, deleted, or modified in the edit buffer will cause an informational message to be written to the user. The following conditions shall cause an informational message. The message shall contain the number of lines added, copied, deleted, or modified, but is otherwise unspecified.

- An *ex* or *vi* editor command, other than **open**, **undo**, or **visual**, that modifies at least the value of the **report** edit option number of lines, and which is not part of an *ex* **global** or **v** command, or *ex* or *vi* buffer execution, shall cause an informational message to be written.
- An *ex* **yank** or *vi* **y** or **Y** command, that copies at least the value of the **report** edit option plus 1 number of lines, and which is not part of an *ex* **global** or **v** command, or *ex* or *vi* buffer execution, shall cause an informational message to be written.
- An *ex* **global**, **v**, **open**, **undo**, or **visual** command or *ex* or *vi* buffer execution, that adds or deletes a total of at least the value of the **report** edit option number of lines, and which is not part of an *ex* **global** or **v** command, or *ex* or *vi* buffer execution, shall cause an informational message to be written. (For example, if 3 lines were added and 8 lines deleted during an *ex* **visual** command, 5 would be the number compared against the

88279 **report** edit option after the command completed.)

88280 **scroll, scr**

88281 [Default (number of lines in the display -1)/2]

88282 The value of the **scroll** edit option shall determine the number of lines scrolled by the *ex*  
88283 <control>-D and **z** commands. For the *vi* <control>-D and <control>-U commands, it shall be the  
88284 initial number of lines to scroll when no previous <control>-D or <control>-U command has  
88285 been executed.

88286 **sections**

88287 [Default in the POSIX locale `NHSHH HUnhsh`]

88288 The **sections** edit option shall define additional section boundaries for the open and visual mode  
88289 commands. The **sections** edit option can be set to a character string consisting of zero or more  
88290 character pairs; it shall be an error to set it to an odd number of characters.

88291 **shell, sh**

88292 [Default from the environment variable *SHELL*]

88293 The value of this option shall be a string. The default shall be taken from the *SHELL*  
88294 environment variable. If the *SHELL* environment variable is null or empty, the *sh* (see *sh*) utility  
88295 shall be the default.

88296 **shiftwidth, sw**

88297 [Default 8]

88298 The value of this option shall give the width in columns of an indentation level used during  
88299 autoindentation and by the shift commands (< and >).

88300 **showmatch, sm**

88301 [Default *unset*]

88302 The functionality described for the **showmatch** edit option need not be supported on block-  
88303 mode terminals or terminals with insufficient capabilities.

88304 If **showmatch** is set, in open or visual mode, when a ' ) ' or ' } ' is typed, if the matching ' ( ' or  
88305 ' { ' is currently visible on the display, the matching ' ( ' or ' { ' shall be flagged moving the  
88306 cursor to its location for an unspecified amount of time.

88307 **showmode**

88308 [Default *unset*]

88309 If **showmode** is set, in open or visual mode, the current mode that the editor is in shall be  
88310 displayed on the last line of the display. Command mode and text input mode shall be  
88311 differentiated; other unspecified modes and implementation-defined information may be  
88312 displayed.

**slowopen**

[Default *unset*]

If **slowopen** is set during open and visual text input modes, the editor shall not update portions of the display other than those display line columns that display the characters entered by the user (see [Input Mode Commands in vi](#), on page 3371).

**tabstop, ts**

[Default 8]

The value of this edit option shall specify the column boundary used by a <tab> in the display (see [autoprint, ap](#) (on page 2701) and [Input Mode Commands in vi](#), on page 3371).

**taglength, tl**

[Default zero]

The value of this edit option shall specify the maximum number of characters that are considered significant in the user-specified tag name and in the tag name from the tags file. If the value is zero, all characters in both tag names shall be significant.

**tags**

[Default *see text*]

The value of this edit option shall be a string of <blank>-delimited pathnames of files used by the **tag** command. The default value is unspecified.

**term**

[Default from the environment variable *TERM*]

The value of this edit option shall be a string. The default shall be taken from the *TERM* variable in the environment. If the *TERM* environment variable is empty or null, the default is unspecified. The editor shall use the value of this edit option to determine the type of the display device.

The results are unspecified if the user changes the value of the term edit option after editor initialization.

**terse**

[Default *unset*]

If **terse** is set, error messages may be less verbose. However, except for this caveat, error messages are unspecified. Furthermore, not all error messages need change for different settings of this option.

**warn**[Default *set*]

If **warn** is set, and the contents of the edit buffer have been modified since they were last completely written, the editor shall write a warning message before certain ! commands (see [Escape](#), on page 2697).

**window**[Default *see text*]

A value used in open and visual mode, by the <control>-B and <control>-F commands, and, in visual mode, to specify the number of lines displayed when the screen is repainted.

If the **-w** command-line option is not specified, the default value shall be set to the value of the *LINES* environment variable. If the *LINES* environment variable is empty or null, the default shall be the number of lines in the display minus 1.

Setting the **window** edit option to zero or to a value greater than the number of lines in the display minus 1 (either explicitly or based on the **-w** option or the *LINES* environment variable) shall cause the **window** edit option to be set to the number of lines in the display minus 1.

The baud rate of the terminal line may change the default in an implementation-defined manner.

**wrapmargin, wm**

[Default 0]

If the value of this edit option is zero, it shall have no effect.

If not in the POSIX locale, the effect of this edit option is implementation-defined.

Otherwise, it shall specify a number of columns from the ending margin of the terminal.

During open and visual text input modes, for each character for which any part of the character is displayed in a column that is less than **wrapmargin** columns from the ending margin of the display line, the editor shall behave as follows:

1. If the character triggering this event is a <blank>, it, and all immediately preceding <blank> characters on the current line entered during the execution of the current text input command, shall be discarded, and the editor shall behave as if the user had entered a single <newline> instead. In addition, if the next user-entered character is a <space>, it shall be discarded as well.
2. Otherwise, if there are one or more <blank> characters on the current line immediately preceding the last group of inserted non-<blank> characters which was entered during the execution of the current text input command, the <blank> characters shall be replaced as if the user had entered a single <newline> instead.

If the **autoindent** edit option is set, and the events described in 1. or 2. are performed, any <blank> characters at or after the cursor in the current line shall be discarded.

The ending margin shall be determined by the system or overridden by the user, as described for *COLUMNS* in the ENVIRONMENT VARIABLES section and XBD [Chapter 8](#) (on page 173).

88381 **wrapsan, ws**

88382 [Default *set*]

88383 If **wrapsan** is set, searches (the *ex* / or ? addresses, or open and visual mode /, ?, N, and n  
88384 commands) shall wrap around the beginning or end of the edit buffer; when unset, searches  
88385 shall stop at the beginning or end of the edit buffer.

88386 **writeany, wa**

88387 [Default *unset*]

88388 If **writeany** is set, some of the checks performed when executing the *ex* **write** commands shall be  
88389 inhibited, as described in editor option **autowrite**.

## 88390 EXIT STATUS

88391 The following exit values shall be returned:

88392 0 Successful completion.

88393 >0 An error occurred.

## 88394 CONSEQUENCES OF ERRORS

88395 When any error is encountered and the standard input is not a terminal device file, *ex* shall not  
88396 write the file or return to command or text input mode, and shall terminate with a non-zero exit  
88397 status.

88398 Otherwise, when an unrecoverable error is encountered, it shall be equivalent to a SIGHUP  
88399 asynchronous event.

88400 Otherwise, when an error is encountered, the editor shall behave as specified in [Command Line](#)  
88401 [Parsing in ex](#) (on page 2670).

## 88402 APPLICATION USAGE

88403 If a SIGSEGV signal is received while *ex* is saving a file, the file might not be successfully saved.

88404 The **next** command can accept more than one file, so usage such as:

88405 `next `ls [abc]*``

88406 is valid; it would not be valid for the **edit** or **read** commands, for example, because they expect  
88407 only one file and unspecified results occur.

## 88408 EXAMPLES

88409 None.

## 88410 RATIONALE

88411 The *ex/vi* specification is based on the historical practice found in the 4 BSD and System V  
88412 implementations of *ex* and *vi*.

88413 A *restricted editor* (both the historical *red* utility and modifications to *ex*) were considered and  
88414 rejected for inclusion. Neither option provided the level of security that users might expect.

88415 It is recognized that *ex* visual mode and related features would be difficult, if not impossible, to  
88416 implement satisfactorily on a block-mode terminal, or a terminal without any form of cursor  
88417 addressing; thus, it is not a mandatory requirement that such features should work on all  
88418 terminals. It is the intention, however, that an *ex* implementation should provide the full set of  
88419 capabilities on all terminals capable of supporting them.

## Options

The `-c` replacement for `+command` was inspired by the `-e` option of `sed`. Historically, all such commands (see `edit` and `next` as well) were executed from the last line of the edit buffer. This meant, for example, that `"/pattern"` would fail unless the `wrapsan` option was set. POSIX.1-2008 requires conformance to historical practice. The `+command` option is no longer specified by POSIX.1-2008 but may be present in some implementations. Historically, some implementations restricted the `ex` commands that could be listed as part of the command line arguments. For consistency, POSIX.1-2008 does not permit these restrictions.

In historical implementations of the editor, the `-R` option (and the `readonly` edit option) only prevented overwriting of files; appending to files was still permitted, mapping loosely into the `cs` `noclobber` variable. Some implementations, however, have not followed this semantic, and `readonly` does not permit appending either. POSIX.1-2008 follows the latter practice, believing that it is a more obvious and intuitive meaning of `readonly`.

The `-s` option suppresses all interactive user feedback and is useful for editing scripts in batch jobs. The list of specific effects is historical practice. The terminal type "incapable of supporting open and visual modes" has historically been named "dumb".

The `-t` option was required because the `ctags` utility appears in POSIX.1-2008 and the option is available in all historical implementations of `ex`.

Historically, the `ex` and `vi` utilities accepted a `-x` option, which did encryption based on the algorithm found in the historical `crypt` utility. The `-x` option for encryption, and the associated `crypt` utility, were omitted because the algorithm used was not specifiable and the export control laws of some nations make it difficult to export cryptographic technology. In addition, it did not historically provide the level of security that users might expect.

## Standard Input

An end-of-file condition is not equivalent to an end-of-file character. A common end-of-file character, `<control>-D`, is historically an `ex` command.

There was no maximum line length in historical implementations of `ex`. Specifically, as it was parsed in chunks, the addresses had a different maximum length than the filenames. Further, the maximum line buffer size was declared as `BUFSIZ`, which was different lengths on different systems. This version selected the value of `{LINE_MAX}` to impose a reasonable restriction on portable usage of `ex` and to aid test suite writers in their development of realistic tests that exercise this limit.

## Input Files

It was an explicit decision by the standard developers that a `<newline>` be added to any file lacking one. It was believed that this feature of `ex` and `vi` was relied on by users in order to make text files lacking a trailing `<newline>` more portable. It is recognized that this will require a user-specified option or extension for implementations that permit `ex` and `vi` to edit files of type other than text if such files are not otherwise identified by the system. It was agreed that the ability to edit files of arbitrary type can be useful, but it was not considered necessary to mandate that an `ex` or `vi` implementation be required to handle files other than text files.

The paragraph in the INPUT FILES section, "By default, ...", is intended to close a long-standing security problem in `ex` and `vi`; that of the "modeline" or "modelines" edit option. This feature allows any line in the first or last five lines of the file containing the strings `"ex:"` or `"vi:"` (and, apparently, `"ei:"` or `"vx:"`) to be a line containing editor commands, and `ex` interprets all the text up to the next `':'` or `<newline>` as a command. Consider the

consequences, for example, of an unsuspecting user using *ex* or *vi* as the editor when replying to a mail message in which a line such as:

```
ex:! rm -rf :
```

appeared in the signature lines. The standard developers believed strongly that an editor should not by default interpret any lines of a file. Vendors are strongly urged to delete this feature from their implementations of *ex* and *vi*.

### Asynchronous Events

The intention of the phrase “complete write” is that the entire edit buffer be written to stable storage. The note regarding temporary files is intended for implementations that use temporary files to back edit buffers unnamed by the user.

Historically, SIGQUIT was ignored by *ex*, but was the equivalent of the **Q** command in visual mode; that is, it exited visual mode and entered *ex* mode. POSIX.1-2008 permits, but does not require, this behavior. Historically, SIGINT was often used by *vi* users to terminate text input mode (<control>-C is often easier to enter than <ESC>). Some implementations of *vi* alerted the terminal on this event, and some did not. POSIX.1-2008 requires that SIGINT behave identically to <ESC>, and that the terminal not be alerted.

Historically, suspending the *ex* editor during text input mode was similar to SIGINT, as completed lines were retained, but any partial line discarded, and the editor returned to command mode. POSIX.1-2008 is silent on this issue; implementations are encouraged to follow historical practice, where possible.

Historically, the *vi* editor did not treat SIGTSTP as an asynchronous event, and it was therefore impossible to suspend the editor in visual text input mode. There are two major reasons for this. The first is that SIGTSTP is a broadcast signal on UNIX systems, and the chain of events where the shell *execs* an application that then *execs vi* usually caused confusion for the terminal state if SIGTSTP was delivered to the process group in the default manner. The second was that most implementations of the UNIX *curses* package did not handle SIGTSTP safely, and the receipt of SIGTSTP at the wrong time would cause them to crash. POSIX.1-2008 is silent on this issue; implementations are encouraged to treat suspension as an asynchronous event if possible.

Historically, modifications to the edit buffer made before SIGINT interrupted an operation were retained; that is, anywhere from zero to all of the lines to be modified might have been modified by the time the SIGINT arrived. These changes were not discarded by the arrival of SIGINT. POSIX.1-2008 permits this behavior, noting that the **undo** command is required to be able to undo these partially completed commands.

The action taken for signals other than SIGINT, SIGCONT, SIGHUP, and SIGTERM is unspecified because some implementations attempt to save the edit buffer in a useful state when other signals are received.

### Standard Error

For *ex/vi*, diagnostic messages are those messages reported as a result of a failed attempt to invoke *ex* or *vi*, such as invalid options or insufficient resources, or an abnormal termination condition. Diagnostic messages should not be confused with the error messages generated by inappropriate or illegal user commands.

## Initialization in *ex* and *vi*

If an *ex* command (other than **cd**, **chdir**, or **source**) has a filename argument, one or both of the alternate and current pathnames will be set. Informally, they are set as follows:

1. If the *ex* command is one that replaces the contents of the edit buffer, and it succeeds, the current pathname will be set to the filename argument (the first filename argument in the case of the **next** command) and the alternate pathname will be set to the previous current pathname, if there was one.
2. In the case of the file read/write forms of the **read** and **write** commands, if there is no current pathname, the current pathname will be set to the filename argument.
3. Otherwise, the alternate pathname will be set to the filename argument.

For example, **:edit foo** and **:recover foo**, when successful, set the current pathname, and, if there was a previous current pathname, the alternate pathname. The commands **:write**, **!command**, and **:edit** set neither the current or alternate pathnames. If the **:edit foo** command were to fail for some reason, the alternate pathname would be set. The **read** and **write** commands set the alternate pathname to their *file* argument, unless the current pathname is not set, in which case they set the current pathname to their *file* arguments. The alternate pathname was not historically set by the **:source** command. POSIX.1-2008 requires conformance to historical practice. Implementations adding commands that take filenames as arguments are encouraged to set the alternate pathname as described here.

Historically, *ex* and *vi* read the **.exrc** file in the *\$HOME* directory twice, if the editor was executed in the *\$HOME* directory. POSIX.1-2008 prohibits this behavior.

Historically, the 4 BSD *ex* and *vi* read the *\$HOME* and local **.exrc** files if they were owned by the real ID of the user, or the **sourceany** option was set, regardless of other considerations. This was a security problem because it is possible to put normal UNIX system commands inside a **.exrc** file. POSIX.1-2008 does not specify the **sourceany** option, and historical implementations are encouraged to delete it.

The **.exrc** files must be owned by the real ID of the user, and not writable by anyone other than the owner. The appropriate privileges exception is intended to permit users to acquire special privileges, but continue to use the **.exrc** files in their home directories.

System V Release 3.2 and later *vi* implementations added the option **[no]exrc**. The behavior is that local **.exrc** files are read-only if the **exrc** option is set. The default for the **exrc** option was off, so by default, local **.exrc** files were not read. The problem this was intended to solve was that System V permitted users to give away files, so there is no possible ownership or writeability test to ensure that the file is safe. This is still a security problem on systems where users can give away files, but there is nothing additional that POSIX.1-2008 can do. The implementation-defined exception is intended to permit groups to have local **.exrc** files that are shared by users, by creating pseudo-users to own the shared files.

POSIX.1-2008 does not mention system-wide *ex* and *vi* start-up files. While they exist in several implementations of *ex* and *vi*, they are not present in any implementations considered historical practice by POSIX.1-2008. Implementations that have such files should use them only if they are owned by the real user ID or an appropriate user (for example, root on UNIX systems) and if they are not writable by any user other than their owner. System-wide start-up files should be read before the *EXINIT* variable, *\$HOME/.exrc*, or local **.exrc** files are evaluated.

Historically, any *ex* command could be entered in the *EXINIT* variable or the **.exrc** file, although ones requiring that the edit buffer already contain lines of text generally caused historical implementations of the editor to drop **core**. POSIX.1-2008 requires that any *ex* command be

permitted in the *EXINIT* variable and *.exrc* files, for simplicity of specification and consistency, although many of them will obviously fail under many circumstances.

The initialization of the contents of the edit buffer uses the phrase “the effect shall be” with regard to various *ex* commands. The intent of this phrase is that edit buffer contents loaded during the initialization phase not be lost; that is, loading the edit buffer should fail if the *.exrc* file read in the contents of a file and did not subsequently write the edit buffer. An additional intent of this phrase is to specify that the initial current line and column is set as specified for the individual *ex* commands.

Historically, the *-t* option behaved as if the tag search were a *+command*; that is, it was executed from the last line of the file specified by the tag. This resulted in the search failing if the pattern was a forward search pattern and the **wrapsan** edit option was not set. POSIX.1-2008 does not permit this behavior, requiring that the search for the tag pattern be performed on the entire file, and, if not found, that the current line be set to a more reasonable location in the file.

Historically, the empty edit buffer presented for editing when a file was not specified by the user was unnamed. This is permitted by POSIX.1-2008; however, implementations are encouraged to provide users a temporary filename for this buffer because it permits them the use of *ex* commands that use the current pathname during temporary edit sessions.

Historically, the file specified using the *-t* option was not part of the current argument list. This practice is permitted by POSIX.1-2008; however, implementations are encouraged to include its name in the current argument list for consistency.

Historically, the *-c* command was generally not executed until a file that already exists was edited. POSIX.1-2008 requires conformance to this historical practice. Commands that could cause the *-c* command to be executed include the *ex* commands **edit**, **next**, **recover**, **rewind**, and **tag**, and the *vi* commands *<control>-^* and *<control>-]*. Historically, reading a file into an edit buffer did not cause the *-c* command to be executed (even though it might set the current pathname) with the exception that it did cause the *-c* command to be executed if: the editor was in *ex* mode, the edit buffer had no current pathname, the edit buffer was empty, and no read commands had yet been attempted. For consistency and simplicity of specification, POSIX.1-2008 does not permit this behavior.

Historically, the *-r* option was the same as a normal edit session if there was no recovery information available for the file. This allowed users to enter:

```
vi -r *.c
```

and recover whatever files were recoverable. In some implementations, recovery was attempted only on the first file named, and the file was not entered into the argument list; in others, recovery was attempted for each file named. In addition, some historical implementations ignored *-r* if *-t* was specified or did not support command line *file* arguments with the *-t* option. For consistency and simplicity of specification, POSIX.1-2008 disallows these special cases, and requires that recovery be attempted the first time each file is edited.

Historically, *vi* initialized the ‘ and ’ marks, but *ex* did not. This meant that if the first command in *ex* mode was **visual** or if an *ex* command was executed first (for example, *vi +10 file*), *vi* was entered without the marks being initialized. Because the standard developers believed the marks to be generally useful, and for consistency and simplicity of specification, POSIX.1-2008 requires that they always be initialized if in open or visual mode, or if in *ex* mode and the edit buffer is not empty. Not initializing it in *ex* mode if the edit buffer is empty is historical practice; however, it has always been possible to set (and use) marks in empty edit buffers in open and visual mode edit sessions.

## Addressing

Historically, *ex* and *vi* accepted the additional addressing forms '`\/'` and '`\?'`'. They were equivalent to '`//'`' and '`??`', respectively. They are not required by POSIX.1-2008, mostly because nobody can remember whether they ever did anything different historically.

Historically, *ex* and *vi* permitted an address of zero for several commands, and permitted the % address in empty files for others. For consistency, POSIX.1-2008 requires support for the former in the few commands where it makes sense, and disallows it otherwise. In addition, because POSIX.1-2008 requires that % be logically equivalent to '`1,$`', it is also supported where it makes sense and disallowed otherwise.

Historically, the % address could not be followed by further addresses. For consistency and simplicity of specification, POSIX.1-2008 requires that additional addresses be supported.

All of the following are valid *addresses*:

```
+++ Three lines after the current line.
/re/- One line before the next occurrence of re.
-2 Two lines before the current line.
3 ---- 2 Line one (note intermediate negative address).
1 2 3 Line six.
```

Any number of addresses can be provided to commands taking addresses; for example, '`1,2,3,4,5p`' prints lines 4 and 5, because two is the greatest valid number of addresses accepted by the **print** command. This, in combination with the <semicolon> delimiter, permits users to create commands based on ordered patterns in the file. For example, the command **3;/foo/;+2print** will display the first line after line 3 that contains the pattern *foo*, plus the next two lines. Note that the address **3;** must be evaluated before being discarded because the search origin for the **/foo/** command depends on this.

Historically, values could be added to addresses by including them after one or more <blank> characters; for example, **3 - 5p** wrote the seventh line of the file, and **/foo/ 5** was the same as **/foo/+5**. However, only absolute values could be added; for example, **5 /foo/** was an error. POSIX.1-2008 requires conformance to historical practice. Address offsets are separately specified from addresses because they could historically be provided to visual mode search commands.

Historically, any missing addresses defaulted to the current line. This was true for leading and trailing <comma>-delimited addresses, and for trailing <semicolon>-delimited addresses. For consistency, POSIX.1-2008 requires it for leading <semicolon> addresses as well.

Historically, *ex* and *vi* accepted the '`^`' character as both an address and as a flag offset for commands. In both cases it was identical to the '`-`' character. POSIX.1-2008 does not require or prohibit this behavior.

Historically, the enhancements to basic regular expressions could be used in addressing; for example, '`~'`', '`\<`', and '`\>`'. POSIX.1-2008 requires conformance to historical practice; that is, that regular expression usage be consistent, and that regular expression enhancements be supported wherever regular expressions are used.

## Command Line Parsing in ex

Historical *ex* command parsing was even more complex than that described here. POSIX.1-2008 requires the subset of the command parsing that the standard developers believed was documented and that users could reasonably be expected to use in a portable fashion, and that was historically consistent between implementations. (The discarded functionality is obscure, at best.) Historical implementations will require changes in order to comply with POSIX.1-2008; however, users are not expected to notice any of these changes. Most of the complexity in *ex* parsing is to handle three special termination cases:

1. The **!**, **global**, **v**, and the filter versions of the **read** and **write** commands are delimited by `<newline>` characters (they can contain `<vertical-line>` characters that are usually shell pipes).
2. The **ex**, **edit**, **next**, and **visual** in open and visual mode commands all take *ex* commands, optionally containing `<vertical-line>` characters, as their first arguments.
3. The **s** command takes a regular expression as its first argument, and uses the delimiting characters to delimit the command.

Historically, `<vertical-line>` characters in the `+command` argument of the **ex**, **edit**, **next**, **vi**, and **visual** commands, and in the *pattern* and *replacement* parts of the **s** command, did not delimit the command, and in the filter cases for **read** and **write**, and the **!**, **global**, and **v** commands, they did not delimit the command at all. For example, the following commands are all valid:

```
:edit +25 | s/abc/ABC/ file.c
:s/ | /PIPE/
:read !spell % | columnate
:global/pattern/p | l
:s/a/b/ | s/c/d | set
```

Historically, empty or `<blank>` filled lines in **.exrc** files and **sourced** files (as well as *EXINIT* variables and *ex* command scripts) were treated as default commands; that is, **print** commands. POSIX.1-2008 specifically requires that they be ignored when encountered in **.exrc** and **sourced** files to eliminate a common source of new user error.

Historically, *ex* commands with multiple adjacent (or `<blank>`-separated) vertical lines were handled oddly when executed from *ex* mode. For example, the command `l | l <carriage-return>`, when the cursor was on line 1, displayed lines 2, 3, and 5 of the file. In addition, the command `l` would only display the line after the next line, instead of the next two lines. The former worked more logically when executed from *vi* mode, and displayed lines 2, 3, and 4. POSIX.1-2008 requires the *vi* behavior; that is, a single default command and line number increment for each command separator, and trailing `<newline>` characters after `<vertical-line>` separators are discarded.

Historically, *ex* permitted a single extra `<colon>` as a leading command character; for example, **:g/pattern/:p** was a valid command. POSIX.1-2008 generalizes this to require that any number of leading `<colon>` characters be stripped.

Historically, any prefix of the **delete** command could be followed without intervening `<blank>` characters by a flag character because in the command **d p**, *p* is interpreted as the buffer *p*. POSIX.1-2008 requires conformance to historical practice.

Historically, the **k** command could be followed by the mark name without intervening `<blank>` characters. POSIX.1-2008 requires conformance to historical practice.

Historically, the **s** command could be immediately followed by flag and option characters; for example, **s/e/E/|s|sgc3p** was a valid command. However, flag characters could not stand alone;

for example, the commands **sp** and **s l** would fail, while the command **sgp** and **s gl** would succeed. (Obviously, the '#' flag character was used as a delimiter character if it followed the command.) Another issue was that option characters had to precede flag characters even when the command was fully specified; for example, the command **s/e/E/pg** would fail, while the command **s/e/E/gp** would succeed. POSIX.1-2008 requires conformance to historical practice.

Historically, the first command name that had a prefix matching the input from the user was the executed command; for example, **ve**, **ver**, and **vers** all executed the **version** command. Commands were in a specific order, however, so that **a** matched **append**, not **abbreviate**. POSIX.1-2008 requires conformance to historical practice. The restriction on command search order for implementations with extensions is to avoid the addition of commands such that the historical prefixes would fail to work portably.

Historical implementations of *ex* and *vi* did not correctly handle multiple *ex* commands, separated by <vertical-line> characters, that entered or exited visual mode or the editor. Because implementations of *vi* exist that do not exhibit this failure mode, POSIX.1-2008 does not permit it.

The requirement that alphabetic command names consist of all following alphabetic characters up to the next non-alphabetic character means that alphabetic command names must be separated from their arguments by one or more non-alphabetic characters, normally a <blank> or '!' character, except as specified for the exceptions, the **delete**, **k**, and **s** commands.

Historically, the repeated execution of the *ex* default **print** commands (<control>-D, *eof*, <newline>, <carriage-return>) erased any prompting character and displayed the next lines without scrolling the terminal; that is, immediately below any previously displayed lines. This provided a cleaner presentation of the lines in the file for the user. POSIX.1-2008 does not require this behavior because it may be impossible in some situations; however, implementations are strongly encouraged to provide this semantic if possible.

Historically, it was possible to change files in the middle of a command, and have the rest of the command executed in the new file; for example:

```
:edit +25 file.c | s/abc/ABC/ | 1
```

was a valid command, and the substitution was attempted in the newly edited file. POSIX.1-2008 requires conformance to historical practice. The following commands are examples that exercise the *ex* parser:

```
echo 'foo | bar' > file1; echo 'foo/bar' > file2;
vi
:edit +1 | s/|/PIPE/ | w file1 | e file2 | 1 | s/\\//SLASH/ | wq
```

Historically, there was no protection in editor implementations to avoid *ex* **global**, **v**, **@**, or **\*** commands changing edit buffers during execution of their associated commands. Because this would almost invariably result in catastrophic failure of the editor, and implementations exist that do exhibit these problems, POSIX.1-2008 requires that changing the edit buffer during a **global** or **v** command, or during a **@** or **\*** command for which there will be more than a single execution, be an error. Implementations supporting multiple edit buffers simultaneously are strongly encouraged to apply the same semantics to switching between buffers as well.

The *ex* command quoting required by POSIX.1-2008 is a superset of the quoting in historical implementations of the editor. For example, it was not historically possible to escape a <blank> in a filename; for example, **:edit foo\\\ bar** would report that too many filenames had been entered for the edit command, and there was no method of escaping a <blank> in the first argument of an **edit**, **ex**, **next**, or **visual** command at all. POSIX.1-2008 extends historical practice, requiring that quoting behavior be made consistent across all *ex* commands, except for

the **map**, **unmap**, **abbreviate**, and **unabbreviate** commands, which historically used <control>-V instead of <backslash> characters for quoting. For those four commands, POSIX.1-2008 requires conformance to historical practice.

Backslash quoting in *ex* is non-intuitive. <backslash>-escapes are ignored unless they escape a special character; for example, when performing *file* argument expansion, the string "\\%" is equivalent to '\%', not "\<current pathname>". This can be confusing for users because <backslash> is usually one of the characters that causes shell expansion to be performed, and therefore shell quoting rules must be taken into consideration. Generally, quoting characters are only considered if they escape a special character, and a quoting character must be provided for each layer of parsing for which the character is special. As another example, only a single <backslash> is necessary for the '\1' sequence in substitute replacement patterns, because the character '1' is not special to any parsing layer above it.

<control>-V quoting in *ex* is slightly different from backslash quoting. In the four commands where <control>-V quoting applies (**abbreviate**, **unabbreviate**, **map**, and **unmap**), any character may be escaped by a <control>-V whether it would have a special meaning or not. POSIX.1-2008 requires conformance to historical practice.

Historical implementations of the editor did not require delimiters within character classes to be escaped; for example, the command :s/[/] on the string "xxx/yyy" would delete the '/' from the string. POSIX.1-2008 disallows this historical practice for consistency and because it places a large burden on implementations by requiring that knowledge of regular expressions be built into the editor parser.

Historically, quoting <newline> characters in *ex* commands was handled inconsistently. In most cases, the <newline> character always terminated the command, regardless of any preceding escape character, because <backslash> characters did not escape <newline> characters for most *ex* commands. However, some *ex* commands (for example, **s**, **map**, and **abbreviation**) permitted <newline> characters to be escaped (although in the case of **map** and **abbreviation**, <control>-V characters escaped them instead of <backslash> characters). This was true in not only the command line, but also **.exrc** and **sourced** files. For example, the command:

```
map = foo<control-V><newline>bar
```

would succeed, although it was sometimes difficult to get the <control>-V and the inserted <newline> passed to the *ex* parser. For consistency and simplicity of specification, POSIX.1-2008 requires that it be possible to escape <newline> characters in *ex* commands at all times, using <backslash> characters for most *ex* commands, and using <control>-V characters for the **map** and **abbreviation** commands. For example, the command **print<newline>list** is required to be parsed as the single command **print<newline>list**. While this differs from historical practice, POSIX.1-2008 developers believed it unlikely that any script or user depended on the historical behavior.

Historically, an error in a command specified using the **-c** option did not cause the rest of the **-c** commands to be discarded. POSIX.1-2008 disallows this for consistency with mapped keys, the **@**, **global**, **source**, and **v** commands, the *EXINIT* environment variable, and the **.exrc** files.

## Input Editing in ex

One of the common uses of the historical *ex* editor is over slow network connections. Editors that run in canonical mode can require far less traffic to and from, and far less processing on, the host machine, as well as more easily supporting block-mode terminals. For these reasons, POSIX.1-2008 requires that *ex* be implemented using canonical mode input processing, as was done historically.

POSIX.1-2008 does not require the historical 4 BSD input editing characters “word erase” or “literal next”. For this reason, it is unspecified how they are handled by *ex*, although they must have the required effect. Implementations that resolve them after the line has been ended using a <newline> or <control>-M character, and implementations that rely on the underlying system terminal support for this processing, are both conforming. Implementations are strongly urged to use the underlying system functionality, if at all possible, for compatibility with other system text input interfaces.

Historically, when the *eof* character was used to decrement the **autoindent** level, the cursor moved to display the new end of the **autoindent** characters, but did not move the cursor to a new line, nor did it erase the <control>-D character from the line. POSIX.1-2008 does not specify that the cursor remain on the same line or that the rest of the line is erased; however, implementations are strongly encouraged to provide the best possible user interface; that is, the cursor should remain on the same line, and any <control>-D character on the line should be erased.

POSIX.1-2008 does not require the historical 4 BSD input editing character “reprint”, traditionally <control>-R, which redisplayed the current input from the user. For this reason, and because the functionality cannot be implemented after the line has been terminated by the user, POSIX.1-2008 makes no requirements about this functionality. Implementations are strongly urged to make this historical functionality available, if possible.

Historically, <control>-Q did not perform a literal next function in *ex*, as it did in *vi*. POSIX.1-2008 requires conformance to historical practice to avoid breaking historical *ex* scripts and **.exrc** files.

## eof

Whether the *eof* character immediately modifies the **autoindent** characters in the prompt is left unspecified so that implementations can conform in the presence of systems that do not support this functionality. Implementations are encouraged to modify the line and redisplay it immediately, if possible.

The specification of the handling of the *eof* character differs from historical practice only in that *eof* characters are not discarded if they follow normal characters in the text input. Historically, they were always discarded.

## Command Descriptions in ex

Historically, several commands (for example, **global**, **v**, **visual**, **s**, **write**, **wq**, **yank**, **!**, **<**, **>**, **&**, and **~**) were executable in empty files (that is, the default address(es) were 0), or permitted explicit addresses of 0 (for example, 0 was a valid address, or 0,0 was a valid range). Addresses of 0, or command execution in an empty file, make sense only for commands that add new text to the edit buffer or write commands (because users may wish to write empty files). POSIX.1-2008 requires this behavior for such commands and disallows it otherwise, for consistency and simplicity of specification.

A count to an *ex* command has been historically corrected to be no greater than the last line in a

file; for example, in a five-line file, the command **1,6print** would fail, but the command **1print300** would succeed. POSIX.1-2008 requires conformance to historical practice.

Historically, the use of flags in *ex* commands could be obscure. General historical practice was as described by POSIX.1-2008, but there were some special cases. For instance, the **list**, **number**, and **print** commands ignored trailing address offsets; for example, **3p +++#** would display line 3, and 3 would be the current line after the execution of the command. The **open** and **visual** commands ignored both the trailing offsets and the trailing flags. Also, flags specified to the **open** and **visual** commands interacted badly with the **list** edit option, and setting and then unsetting it during the open/visual session would cause *vi* to stop displaying lines in the specified format. For consistency and simplicity of specification, POSIX.1-2008 does not permit any of these exceptions to the general rule.

POSIX.1-2008 uses the word *copy* in several places when discussing buffers. This is not intended to imply implementation.

Historically, *ex* users could not specify numeric buffers because of the ambiguity this would cause; for example, in the command **3 delete 2**, it is unclear whether 2 is a buffer name or a *count*. POSIX.1-2008 requires conformance to historical practice by default, but does not preclude extensions.

Historically, the contents of the unnamed buffer were frequently discarded after commands that did not explicitly affect it; for example, when using the **edit** command to switch files. For consistency and simplicity of specification, POSIX.1-2008 does not permit this behavior.

The *ex* utility did not historically have access to the numeric buffers, and, furthermore, deleting lines in *ex* did not modify their contents. For example, if, after doing a delete in *vi*, the user switched to *ex*, did another delete, and then switched back to *vi*, the contents of the numeric buffers would not have changed. POSIX.1-2008 requires conformance to historical practice. Numeric buffers are described in the *ex* utility in order to confine the description of buffers to a single location in POSIX.1-2008.

The metacharacters that trigger shell expansion in *file* arguments match historical practice, as does the method for doing shell expansion. Implementations wishing to provide users with the flexibility to alter the set of metacharacters are encouraged to provide a **shellmeta** string edit option.

Historically, *ex* commands executed from *vi* refreshed the screen when it did not strictly need to do so; for example, **!date > /dev/null** does not require a screen refresh because the output of the UNIX *date* command requires only a single line of the screen. POSIX.1-2008 requires that the screen be refreshed if it has been overwritten, but makes no requirements as to how an implementation should make that determination. Implementations may prompt and refresh the screen regardless.

## Abbreviate

Historical practice was that characters that were entered as part of an abbreviation replacement were subject to **map** expansions, the **showmatch** edit option, further abbreviation expansions, and so on; that is, they were logically pushed onto the terminal input queue, and were not a simple replacement. POSIX.1-2008 requires conformance to historical practice. Historical practice was that whenever a non-word character (that had not been escaped by a <control>-V) was entered after a word character, *vi* would check for abbreviations. The check was based on the type of the character entered before the word character of the word/non-word pair that triggered the check. The word character of the word/non-word pair that triggered the check and all characters entered before the trigger pair that were of that type were included in the check, with the exception of <blank> characters, which always delimited the abbreviation.

This means that, for the abbreviation to work, the *lhs* must end with a word character, there can be no transitions from word to non-word characters (or *vice versa*) other than between the last and next-to-last characters in the *lhs*, and there can be no <blank> characters in the *lhs*. In addition, because of the historical quoting rules, it was impossible to enter a literal <control>-V in the *lhs*. POSIX.1-2008 requires conformance to historical practice. Historical implementations did not inform users when abbreviations that could never be used were entered; implementations are strongly encouraged to do so.

For example, the following abbreviations will work:

```
:ab (p REPLACE
:ab p REPLACE
:ab ((p REPLACE
```

The following abbreviations will not work:

```
:ab (REPLACE
:ab (pp REPLACE
```

Historical practice is that words on the *vi* colon command line were subject to abbreviation expansion, including the arguments to the **abbrev** (and more interestingly) the **unabbrev** command. Because there are implementations that do not do abbreviation expansion for the first argument to those commands, this is permitted, but not required, by POSIX.1-2008. However, the following sequence:

```
:ab foo bar
:ab foo baz
```

resulted in the addition of an abbreviation of "baz" for the string "bar" in historical *ex/vi*, and the sequence:

```
:ab foo1 bar
:ab foo2 bar
:unabbreviate foo2
```

deleted the abbreviation "foo1", not "foo2". These behaviors are not permitted by POSIX.1-2008 because they clearly violate the expectations of the user.

It was historical practice that <control>-V, not <backslash>, characters be interpreted as escaping subsequent characters in the **abbreviate** command. POSIX.1-2008 requires conformance to historical practice; however, it should be noted that an abbreviation containing a <blank> will never work.

## Append

Historically, any text following a <vertical-line> command separator after an **append**, **change**, or **insert** command became part of the insert text. For example, in the command:

```
:g/pattern/append|stuff1
```

a line containing the text "stuff1" would be appended to each line matching pattern. It was also historically valid to enter:

```
:append|stuff1
stuff2
.
```

and the text on the *ex* command line would be appended along with the text inserted after it. There was an historical bug, however, that the user had to enter two terminating lines (the ' . '

lines) to terminate text input mode in this case. POSIX.1-2008 requires conformance to historical practice, but disallows the historical need for multiple terminating lines.

### Change

See the RATIONALE for the **append** command. Historical practice for cursor positioning after the change command when no text is input, is as described in POSIX.1-2008. However, one System V implementation is known to have been modified such that the cursor is positioned on the first address specified, and not on the line before the first address. POSIX.1-2008 disallows this modification for consistency.

Historically, the **change** command did not support buffer arguments, although some implementations allow the specification of an optional buffer. This behavior is neither required nor disallowed by POSIX.1-2008.

### Change Directory

A common extension in *ex* implementations is to use the elements of a **cdpath** edit option as prefix directories for *path* arguments to **chdir** that are relative pathnames and that do not have `'.'` or `".."` as their first component. Elements in the **cdpath** edit option are `<colon>`-separated. The initial value of the **cdpath** edit option is the value of the shell *CDPATH* environment variable. This feature was not included in POSIX.1-2008 because it does not exist in any of the implementations considered historical practice.

### Copy

Historical implementations of *ex* permitted copies to lines inside of the specified range; for example, **:2,5copy3** was a valid command. POSIX.1-2008 requires conformance to historical practice.

### Delete

POSIX.1-2008 requires support for the historical parsing of a **delete** command followed by flags, without any intervening `<blank>` characters. For example:

**1dp** Deletes the first line and prints the line that was second.

**1delep** As for **1dp**.

**1d** Deletes the first line, saving it in buffer *p*.

**1d p1l** (Pee-one-ell.) Deletes the first line, saving it in buffer *p*, and listing the line that was second.

### Edit

Historically, any *ex* command could be entered as a *+command* argument to the **edit** command, although some (for example, **insert** and **append**) were known to confuse historical implementations. For consistency and simplicity of specification, POSIX.1-2008 requires that any command be supported as an argument to the **edit** command.

Historically, the command argument was executed with the current line set to the last line of the file, regardless of whether the **edit** command was executed from visual mode or not. POSIX.1-2008 requires conformance to historical practice.

Historically, the *+command* specified to the **edit** and **next** commands was delimited by the first `<blank>`, and there was no way to quote them. For consistency, POSIX.1-2008 requires that the usual *ex* backslash quoting be provided.

Historically, specifying the *+command* argument to the edit command required a filename to be specified as well; for example, **:edit +100** would always fail. For consistency and simplicity of specification, POSIX.1-2008 does not permit this usage to fail for that reason.

Historically, only the cursor position of the last file edited was remembered by the editor. POSIX.1-2008 requires that this be supported; however, implementations are permitted to remember and restore the cursor position for any file previously edited.

## File

Historical versions of the *ex* editor **file** command displayed a current line and number of lines in the edit buffer of 0 when the file was empty, while the *vi* <control>-G command displayed a current line and number of lines in the edit buffer of 1 in the same situation. POSIX.1-2008 does not permit this discrepancy, instead requiring that a message be displayed indicating that the file is empty.

## Global

The two-pass operation of the **global** and **v** commands is not intended to imply implementation, only the required result of the operation.

The current line and column are set as specified for the individual *ex* commands. This requirement is cumulative; that is, the current line and column must track across all the commands executed by the **global** or **v** commands.

## Insert

See the RATIONALE for the **append** command.

Historically, **insert** could not be used with an address of zero; that is, not when the edit buffer was empty. POSIX.1-2008 requires that this command behave consistently with the **append** command.

## Join

The action of the **join** command in relation to the special characters is only defined for the POSIX locale because the correct amount of white space after a period varies; in Japanese none is required, in French only a single space, and so on.

## List

The historical output of the **list** command was potentially ambiguous. The standard developers believed correcting this to be more important than adhering to historical practice, and POSIX.1-2008 requires unambiguous output.

## Map

Historically, command mode maps only applied to command names; for example, if the character 'x' was mapped to 'y', the command **fx** searched for the 'x' character, not the 'y' character. POSIX.1-2008 requires this behavior. Historically, entering <control>-V as the first character of a *vi* command was an error. Several implementations have extended the semantics of *vi* such that <control>-V means that the subsequent command character is not mapped. This is permitted, but not required, by POSIX.1-2008. Regardless, using <control>-V to escape the second or later character in a sequence of characters that might match a **map** command, or any character in text input mode, is historical practice, and stops the entered keys from matching a map. POSIX.1-2008 requires conformance to historical practice.

Historical implementations permitted digits to be used as a **map** command *lhs*, but then ignored the map. POSIX.1-2008 requires that the mapped digits not be ignored.

The historical implementation of the **map** command did not permit **map** commands that were more than a single character in length if the first character was printable. This behavior is permitted, but not required, by POSIX.1-2008.

Historically, mapped characters were remapped unless the **remap** edit option was not set, or the prefix of the mapped characters matched the mapping characters; for example, in the **map**:

```
:map ab abcd
```

the characters "ab" were used as is and were not remapped, but the characters "cd" were mapped if appropriate. This can cause infinite loops in the *vi* mapping mechanisms. POSIX.1-2008 requires conformance to historical practice, and that such loops be interruptible.

Text input maps had the same problems with expanding the *lhs* for the **ex map!** and **unmap!** command as did the **ex abbreviate** and **unabbreviate** commands. See the RATIONALE for the **ex abbreviate** command. POSIX.1-2008 requires similar modification of some historical practice for the **map** and **unmap** commands, as described for the **abbreviate** and **unabbreviate** commands.

Historically, **maps** that were subsets of other **maps** behaved differently depending on the order in which they were defined. For example:

```
:map! ab short
:map! abc long
```

would always translate the characters "ab" to "short", regardless of how fast the characters "abc" were entered. If the entry order was reversed:

```
:map! abc long
:map! ab short
```

the characters "ab" would cause the editor to pause, waiting for the completing 'c' character, and the characters might never be mapped to "short". For consistency and simplicity of specification, POSIX.1-2008 requires that the shortest match be used at all times.

The length of time the editor spends waiting for the characters to complete the *lhs* is unspecified because the timing capabilities of systems are often inexact and variable, and it may depend on other factors such as the speed of the connection. The time should be long enough for the user to be able to complete the sequence, but not long enough for the user to have to wait. Some implementations of *vi* have added a **keytime** option, which permits users to set the number of 0,1 seconds the editor waits for the completing characters. Because mapped terminal function and cursor keys tend to start with an <ESC> character, and <ESC> is the key ending *vi* text input mode, **maps** starting with <ESC> characters are generally exempted from this timeout period, or, at least timed out differently.

## Mark

Historically, users were able to set the "previous context" marks explicitly. In addition, the **ex** commands **"** and **"** and the *vi* commands **"**, **"**, **"**, and **"** all referred to the same mark. In addition, the previous context marks were not set if the command, with which the address setting the mark was associated, failed. POSIX.1-2008 requires conformance to historical practice. Historically, if marked lines were deleted, the mark was also deleted, but would reappear if the change was undone. POSIX.1-2008 requires conformance to historical practice.

The description of the special events that set the ' and ' marks matches historical practice. For example, historically the command **/a/** did not set the ' and ' marks, but the command

89032        **/a/,/b/delete** did.

## 89033        **Next**

89034        Historically, any *ex* command could be entered as a *+command* argument to the **next** command,  
89035        although some (for example, **insert** and **append**) were known to confuse historical  
89036        implementations. POSIX.1-2008 requires that any command be permitted and that it behave as  
89037        specified. The **next** command can accept more than one file, so usage such as:

89038        `next `ls [abc] ``

89039        is valid; it need not be valid for the **edit** or **read** commands, for example, because they expect  
89040        only one filename.

89041        Historically, the **next** command behaved differently from the **:rewind** command in that it  
89042        ignored the force flag if the **autowrite** flag was set. For consistency, POSIX.1-2008 does not  
89043        permit this behavior.

89044        Historically, the **next** command positioned the cursor as if the file had never been edited before,  
89045        regardless. POSIX.1-2008 does not permit this behavior, for consistency with the **edit** command.

89046        Implementations wanting to provide a counterpart to the **next** command that edited the  
89047        previous file have used the command **prev[ious]**, which takes no *file* argument. POSIX.1-2008  
89048        does not require this command.

## 89049        **Open**

89050        Historically, the **open** command would fail if the **open** edit option was not set. POSIX.1-2008  
89051        does not mention the **open** edit option and does not require this behavior. Some historical  
89052        implementations do not permit entering open mode from open or visual mode, only from *ex*  
89053        mode. For consistency, POSIX.1-2008 does not permit this behavior.

89054        Historically, entering open mode from the command line (that is, *vi +open*) resulted in  
89055        anomalous behaviors; for example, the *ex* file and *set* commands, and the *vi* command  
89056        <control>-G did not work. For consistency, POSIX.1-2008 does not permit this behavior.

89057        Historically, the **open** command only permitted ' / ' characters to be used as the search pattern  
89058        delimiter. For consistency, POSIX.1-2008 requires that the search delimiters used by the **s**, **global**,  
89059        and **v** commands be accepted as well.

## 89060        **Preserve**

89061        The **preserve** command does not historically cause the file to be considered unmodified for the  
89062        purposes of future commands that may exit the editor. POSIX.1-2008 requires conformance to  
89063        historical practice.

89064        Historical documentation stated that mail was not sent to the user when preserve was executed;  
89065        however, historical implementations did send mail in this case. POSIX.1-2008 requires  
89066        conformance to the historical implementations.

## Print

The writing of NUL by the **print** command is not specified as a special case because the standard developers did not want to require *ex* to support NUL characters. Historically, characters were displayed using the ARPA standard mappings, which are as follows:

1. Printable characters are left alone.
2. Control characters less than \177 are represented as '^' followed by the character offset from the '@' character in the ASCII map; for example, \007 is represented as '^G'.
3. \177 is represented as '^?' followed by '?'.

The display of characters having their eighth bit set was less standard. Existing implementations use hex (0x00), octal (\000), and a meta-bit display. (The latter displayed bytes that had their eighth bit set as the two characters "M-" followed by the seven-bit display as described above.) The latter probably has the best claim to historical practice because it was used for the **-v** option of 4 BSD and 4 BSD-derived versions of the *cat* utility since 1980.

No specific display format is required by POSIX.1-2008.

Explicit dependence on the ASCII character set has been avoided where possible, hence the use of the phrase an "implementation-defined multi-character sequence" for the display of non-printable characters in preference to the historical usage of, for instance, "^I" for the <tab>. Implementations are encouraged to conform to historical practice in the absence of any strong reason to diverge.

Historically, all *ex* commands beginning with the letter 'p' could be entered using capitalized versions of the commands; for example, **P[rint]**, **Pre[serve]**, and **Pu[t]** were all valid command names. POSIX.1-2008 permits, but does not require, this historical practice because capital forms of the commands are used by some implementations for other purposes.

## Put

Historically, an *ex* **put** command, executed from open or visual mode, was the same as the open or visual mode **P** command, if the buffer was named and was cut in character mode, and the same as the **p** command if the buffer was named and cut in line mode. If the unnamed buffer was the source of the text, the entire line from which the text was taken was usually **put**, and the buffer was handled as if in line mode, but it was possible to get extremely anomalous behavior. In addition, using the **Q** command to switch into *ex* mode, and then doing a **put** often resulted in errors as well, such as appending text that was unrelated to the (supposed) contents of the buffer. For consistency and simplicity of specification, POSIX.1-2008 does not permit these behaviors. All *ex* **put** commands are required to operate in line mode, and the contents of the buffers are not altered by changing the mode of the editor.

## Read

Historically, an *ex* **read** command executed from open or visual mode, executed in an empty file, left an empty line as the first line of the file. For consistency and simplicity of specification, POSIX.1-2008 does not permit this behavior. Historically, a **read** in open or visual mode from a program left the cursor at the last line read in, not the first. For consistency, POSIX.1-2008 does not permit this behavior.

Historical implementations of *ex* were unable to undo **read** commands that read from the output of a program. For consistency, POSIX.1-2008 does not permit this behavior.

Historically, the *ex* and *vi* message after a successful **read** or **write** command specified "characters", not "bytes". POSIX.1-2008 requires that the number of bytes be displayed, not the

number of characters, because it may be difficult in multi-byte implementations to determine the number of characters read. Implementations are encouraged to clarify the message displayed to the user.

Historically, reads were not permitted on files other than type regular, except that FIFO files could be read (probably only because they did not exist when *ex* and *vi* were originally written). Because the historical *ex* evaluated **read!** and **read !** equivalently, there can be no optional way to force the read. POSIX.1-2008 permits, but does not require, this behavior.

### Recover

Some historical implementations of the editor permitted users to recover the edit buffer contents from a previous edit session, and then exit without saving those contents (or explicitly discarding them). The intent of POSIX.1-2008 in requiring that the edit buffer be treated as already modified is to prevent this user error.

### Rewind

Historical implementations supported the **rewind** command when the user was editing the first file in the list; that is, the file that the **rewind** command would edit. POSIX.1-2008 requires conformance to historical practice.

### Substitute

Historically, *ex* accepted an **r** option to the **s** command. The effect of the **r** option was to use the last regular expression used in any command as the pattern, the same as the **~** command. The **r** option is not required by POSIX.1-2008. Historically, the **c** and **g** options were toggled; for example, the command **:s/abc/def/** was the same as **s/abc/def/ccccgggg**. For simplicity of specification, POSIX.1-2008 does not permit this behavior.

The tilde command is often used to replace the last search RE. For example, in the sequence:

```
s/red/blue/
/green
~
```

the **~** command is equivalent to:

```
s/green/blue/
```

Historically, *ex* accepted all of the following forms:

```
s/abc/def/
s/abc/def
s/abc/
s/abc
```

POSIX.1-2008 requires conformance to this historical practice.

The **s** command presumes that the **'^'** character only occupies a single column in the display. Much of the *ex* and *vi* specification presumes that the **<space>** only occupies a single column in the display. There are no known character sets for which this is not true.

Historically, the final column position for the substitute commands was based on previous column movements; a search for a pattern followed by a substitution would leave the column position unchanged, while a **0** command followed by a substitution would change the column position to the first non-**<blank>**. For consistency and simplicity of specification, POSIX.1-2008 requires that the final column position always be set to the first non-**<blank>**.

## Set

Historical implementations redisplayed all of the options for each occurrence of the **all** keyword. POSIX.1-2008 permits, but does not require, this behavior.

## Tag

No requirement is made as to where *ex* and *vi* shall look for the file referenced by the tag entry. Historical practice has been to look for the path found in the **tags** file, based on the current directory. A useful extension found in some implementations is to look based on the directory containing the tags file that held the entry, as well. No requirement is made as to which reference for the tag in the tags file is used. This is deliberate, in order to permit extensions such as multiple entries in a tags file for a tag.

Because users often specify many different tags files, some of which need not be relevant or exist at any particular time, POSIX.1-2008 requires that error messages about problem tags files be displayed only if the requested tag is not found, and then, only once for each time that the **tag** edit option is changed.

The requirement that the current edit buffer be unmodified is only necessary if the file indicated by the tag entry is not the same as the current file (as defined by the current pathname). Historically, the file would be reloaded if the filename had changed, as well as if the filename was different from the current pathname. For consistency and simplicity of specification, POSIX.1-2008 does not permit this behavior, requiring that the name be the only factor in the decision.

Historically, *vi* only searched for tags in the current file from the current cursor to the end of the file, and therefore, if the **wrapsan** option was not set, tags occurring before the current cursor were not found. POSIX.1-2008 considers this a bug, and implementations are required to search for the first occurrence in the file, regardless.

## Undo

The **undo** description deliberately uses the word “modified”. The **undo** command is not intended to undo commands that replace the contents of the edit buffer, such as **edit**, **next**, **tag**, or **recover**.

Cursor positioning after the **undo** command was inconsistent in the historical *vi*, sometimes attempting to restore the original cursor position (**global**, **undo**, and **v** commands), and sometimes, in the presence of maps, placing the cursor on the last line added or changed instead of the first. POSIX.1-2008 requires a simplified behavior for consistency and simplicity of specification.

## Version

The **version** command cannot be exactly specified since there is no widely-accepted definition of what the version information should contain. Implementations are encouraged to do something reasonably intelligent.

## Write

Historically, the *ex* and *vi* message after a successful **read** or **write** command specified “characters”, not “bytes”. POSIX.1-2008 requires that the number of bytes be displayed, not the number of characters because it may be difficult in multi-byte implementations to determine the number of characters written. Implementations are encouraged to clarify the message displayed to the user.

Implementation-defined tests are permitted so that implementations can make additional checks; for example, for locks or file modification times.

Historically, attempting to append to a nonexistent file caused an error. It has been left unspecified in POSIX.1-2008 to permit implementations to let the **write** succeed, so that the append semantics are similar to those of the historical *csh*.

Historical *vi* permitted empty edit buffers to be written. However, since the way *vi* got around dealing with “empty” files was to always have a line in the edit buffer, no matter what, it wrote them as files of a single, empty line. POSIX.1-2008 does not permit this behavior.

Historically, *ex* restored standard output and standard error to their values as of when *ex* was invoked, before writes to programs were performed. This could disturb the terminal configuration as well as be a security issue for some terminals. POSIX.1-2008 does not permit this, requiring that the program output be captured and displayed as if by the *ex* **print** command.

## Adjust Window

Historically, the line count was set to the value of the **scroll** option if the type character was end-of-file. This feature was broken on most historical implementations long ago, however, and is not documented anywhere. For this reason, POSIX.1-2008 is resolutely silent.

Historically, the **z** command was <blank>-sensitive and **z +** and **z -** did different things than **z+** and **z-** because the type could not be distinguished from a flag. (The commands **z .** and **z =** were historically invalid.) POSIX.1-2008 requires conformance to this historical practice.

Historically, the **z** command was further <blank>-sensitive in that the *count* could not be <blank>-delimited; for example, the commands **z= 5** and **z- 5** were also invalid. Because the *count* is not ambiguous with respect to either the type character or the flags, this is not permitted by POSIX.1-2008.

## Escape

Historically, *ex* filter commands only read the standard output of the commands, letting standard error appear on the terminal as usual. The *vi* utility, however, read both standard output and standard error. POSIX.1-2008 requires the latter behavior for both *ex* and *vi*, for consistency.

## Shift Left and Shift Right

Historically, it was possible to add shift characters to increase the effect of the command; for example, <<< outdented (or >>> indented) the lines 3 levels of indentation instead of the default 1. POSIX.1-2008 requires conformance to historical practice.

**<control>-D**

Historically, the <control>-D command erased the prompt, providing the user with an unbroken presentation of lines from the edit buffer. This is not required by POSIX.1-2008; implementations are encouraged to provide it if possible. Historically, the <control>-D command took, and then ignored, a *count*. POSIX.1-2008 does not permit this behavior.

**Write Line Number**

Historically, the *ex* = command, when executed in *ex* mode in an empty edit buffer, reported 0, and from open or visual mode, reported 1. For consistency and simplicity of specification, POSIX.1-2008 does not permit this behavior.

**Execute**

Historically, *ex* did not correctly handle the inclusion of text input commands (that is, **append**, **insert**, and **change**) in executed buffers. POSIX.1-2008 does not permit this exclusion for consistency.

Historically, the logical contents of the buffer being executed did not change if the buffer itself were modified by the commands being executed; that is, buffer execution did not support self-modifying code. POSIX.1-2008 requires conformance to historical practice.

Historically, the @ command took a range of lines, and the @ buffer was executed once per line, with the current line ( ' . ' ) set to each specified line. POSIX.1-2008 requires conformance to historical practice.

Some historical implementations did not notice if errors occurred during buffer execution. This, coupled with the ability to specify a range of lines for the *ex* @ command, makes it trivial to cause them to drop **core**. POSIX.1-2008 requires that implementations stop buffer execution if any error occurs, if the specified line doesn't exist, or if the contents of the edit buffer itself are replaced (for example, the buffer executes the *ex* :**edit** command).

**Regular Expressions in ex**

Historical practice is that the characters in the replacement part of the last **s** command—that is, those matched by entering a ' ~ ' in the regular expression—were not further expanded by the regular expression engine. So, if the characters contained the string "a . , " they would match 'a' followed by " . , " and not 'a' followed by any character. POSIX.1-2008 requires conformance to historical practice.

**Edit Options in ex**

The following paragraphs describe the historical behavior of some edit options that were not, for whatever reason, included in POSIX.1-2008. Implementations are strongly encouraged to only use these names if the functionality described here is fully supported.

**extended** The **extended** edit option has been used in some implementations of *vi* to provide extended regular expressions instead of basic regular expressions. This option was omitted from POSIX.1-2008 because it is not widespread historical practice.

**flash** The **flash** edit option historically caused the screen to flash instead of beeping on error. This option was omitted from POSIX.1-2008 because it is not found in some historical implementations.

|       |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 89269 | <b>hardtabs</b>  | The <b>hardtabs</b> edit option historically defined the number of columns between hardware tab settings. This option was omitted from POSIX.1-2008 because it was believed to no longer be generally useful.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 89270 |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 89271 |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 89272 | <b>modeline</b>  | The <b>modeline</b> (sometimes named <b>modelines</b> ) edit option historically caused <i>ex</i> or <i>vi</i> to read the five first and last lines of the file for editor commands. This option is a security problem, and vendors are strongly encouraged to delete it from historical implementations.                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 89273 |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| 89291 | <b>timeout</b>   | The <b>timeout</b> edit option historically enabled the (now standard) feature of only waiting for a short period before returning keys that could be part of a macro. This feature was omitted from POSIX.1-2008 because its behavior is now standard, it is not widely useful, and it was rarely documented.                                                                                                                                                                                                                                                                                                                                                                                                               |
| 89292 |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| 89294 |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 89295 | <b>verbose</b>   | The <b>verbose</b> edit option has been used in some implementations of <i>vi</i> to cause <i>vi</i> to output error messages for common errors; for example, attempting to move the cursor past the beginning or end of the line instead of only alerting the screen. (The historical <i>vi</i> only alerted the terminal and presented no message for such errors. The historical editor option <b>terse</b> did not select when to present error messages, it only made existing error messages more or less verbose.) This option was omitted from POSIX.1-2008 because it is not widespread historical practice; however, implementors are encouraged to use it if they wish to provide error messages for naive users. |

| 89301 |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 89302 |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 89303 |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 89304 | <b>wraplen</b>   | The <b>wraplen</b> edit option has been used in some implementations of <i>vi</i> to specify an automatic margin measured from the left margin instead of from the right margin. This is useful when multiple screen sizes are being used to edit a single file. This option was omitted from POSIX.1-2008 because it is not widespread historical practice; however, implementors are encouraged to use it if they add this functionality.                                                                                                                                                                                                                                                                                  |
| 89305 |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 89306 |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 89307 |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 89308 |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 89309 |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

**autoindent, ai**

Historically, the command **0a** did not do any autoindentation, regardless of the current indentation of line 1. POSIX.1-2008 requires that any indentation present in line 1 be used.

**autoprint, ap**

Historically, the **autoprint** edit option was not completely consistent or based solely on modifications to the edit buffer. Exceptions were the **read** command (when reading from a file, but not from a filter), the **append**, **change**, **insert**, **global**, and **v** commands, all of which were not affected by **autoprint**, and the **tag** command, which was affected by **autoprint**. POSIX.1-2008 requires conformance to historical practice.

Historically, the **autoprint** option only applied to the last of multiple commands entered using <vertical-line> delimiters; for example, **delete** <newline> was affected by **autoprint**, but **delete | version** <newline> was not. POSIX.1-2008 requires conformance to historical practice.

**autowrite, aw**

Appending the '!' character to the *ex* **next** command to avoid performing an automatic write was not supported in historical implementations. POSIX.1-2008 requires that the behavior match the other *ex* commands for consistency.

**ignorecase, ic**

Historical implementations of case-insensitive matching (the **ignorecase** edit option) lead to counter-intuitive situations when uppercase characters were used in range expressions. Historically, the process was as follows:

1. Take a line of text from the edit buffer.
2. Convert uppercase to lowercase in text line.
3. Convert uppercase to lowercase in regular expressions, except in character class specifications.
4. Match regular expressions against text.

This would mean that, with **ignorecase** in effect, the text:

```
The cat sat on the mat
```

would be matched by

```
/^the/
```

but not by:

```
/^[A-Z]he/
```

For consistency with other commands implementing regular expressions, POSIX.1-2008 does not permit this behavior.

### paragraphs, para

The ISO POSIX-2:1993 standard made the default **paragraphs** and **sections** edit options implementation-defined, arguing they were historically oriented to the UNIX system *troff* text formatter, and a “portable user” could use the {, }, [[, ]], (, and ) commands in open or visual mode and have the cursor stop in unexpected places. POSIX.1-2008 specifies their values in the POSIX locale because the unusual grouping (they only work when grouped into two characters at a time) means that they cannot be used for general-purpose movement, regardless.

### readonly

Implementations are encouraged to provide the best possible information to the user as to the read-only status of the file, with the exception that they should not consider the current special privileges of the process. This provides users with a safety net because they must force the overwrite of read-only files, even when running with additional privileges.

The **readonly** edit option specification largely conforms to historical practice. The only difference is that historical implementations did not notice that the user had set the **readonly** edit option in cases where the file was already marked read-only for some reason, and would therefore reinitialize the **readonly** edit option the next time the contents of the edit buffer were replaced. This behavior is disallowed by POSIX.1-2008.

### report

The requirement that lines copied to a buffer interact differently than deleted lines is historical practice. For example, if the **report** edit option is set to 3, deleting 3 lines will cause a report to be written, but 4 lines must be copied before a report is written.

The requirement that the *ex* **global**, **v**, **open**, **undo**, and **visual** commands present reports based on the total number of lines added or deleted during the command execution, and that commands executed by the **global** and **v** commands not present reports, is historical practice. POSIX.1-2008 extends historical practice by requiring that buffer execution be treated similarly. The reasons for this are two-fold. Historically, only the report by the last command executed from the buffer would be seen by the user, as each new report would overwrite the last. In addition, the standard developers believed that buffer execution had more in common with **global** and **v** commands than it did with other *ex* commands, and should behave similarly, for consistency and simplicity of specification.

### showmatch, sm

The length of time the cursor spends on the matching character is unspecified because the timing capabilities of systems are often inexact and variable. The time should be long enough for the user to notice, but not long enough for the user to become annoyed. Some implementations of *vi* have added a **matchtime** option that permits users to set the number of 0.1 second intervals the cursor pauses on the matching character.

### showmode

The **showmode** option has been used in some historical implementations of *ex* and *vi* to display the current editing mode when in open or visual mode. The editing modes have generally included “command” and “input”, and sometimes other modes such as “replace” and “change”. The string was usually displayed on the bottom line of the screen at the far right-hand corner. In addition, a preceding ‘\*’ character often denoted whether the contents of the edit buffer had been modified. The latter display has sometimes been part of the **showmode** option, and sometimes based on another option. This option was not available in the 4 BSD historical

implementation of *vi*, but was viewed as generally useful, particularly to novice users, and is required by POSIX.1-2008.

The **smd** shorthand for the **showmode** option was not present in all historical implementations of the editor. POSIX.1-2008 requires it, for consistency.

Not all historical implementations of the editor displayed a mode string for command mode, differentiating command mode from text input mode by the absence of a mode string. POSIX.1-2008 permits this behavior for consistency with historical practice, but implementations are encouraged to provide a display string for both modes.

### slowopen

Historically, the **slowopen** option was automatically set if the terminal baud rate was less than 1 200 baud, or if the baud rate was 1 200 baud and the **redraw** option was not set. The **slowopen** option had two effects. First, when inserting characters in the middle of a line, characters after the cursor would not be pushed ahead, but would appear to be overwritten. Second, when creating a new line of text, lines after the current line would not be scrolled down, but would appear to be overwritten. In both cases, ending text input mode would cause the screen to be refreshed to match the actual contents of the edit buffer. Finally, terminals that were sufficiently intelligent caused the editor to ignore the **slowopen** option. POSIX.1-2008 permits most historical behavior, extending historical practice to require **slowopen** behaviors if the edit option is set by the user.

### tags

The default path for tags files is left unspecified as implementations may have their own **tags** implementations that do not correspond to the historical ones. The default **tags** option value should probably at least include the file **./tags**.

### term

Historical implementations of *ex* and *vi* ignored changes to the **term** edit option after the initial terminal information was loaded. This is permitted by POSIX.1-2008; however, implementations are encouraged to permit the user to modify their terminal type at any time.

### terse

Historically, the **terse** edit option optionally provided a shorter, less descriptive error message, for some error messages. This is permitted, but not required, by POSIX.1-2008. Historically, most common visual mode errors (for example, trying to move the cursor past the end of a line) did not result in an error message, but simply alerted the terminal. Implementations wishing to provide messages for novice users are urged to do so based on the **edit** option **verbose**, and not **terse**.

### window

In historical implementations, the default for the **window** edit option was based on the baud rate as follows:

1. If the baud rate was less than 1 200, the **edit** option **w300** set the window value; for example, the line:

```
set w300=12
```

would set the window option to 12 if the baud rate was less than 1 200.

2. If the baud rate was equal to 1 200, the **edit** option **w1200** set the window value.
3. If the baud rate was greater than 1 200, the **edit** option **w9600** set the window value.

The **w300**, **w1200**, and **w9600** options do not appear in POSIX.1-2008 because of their dependence on specific baud rates.

In historical implementations, the size of the window displayed by various commands was related to, but not necessarily the same as, the **window** edit option. For example, the size of the window was set by the *ex* command **visual 10**, but it did not change the value of the **window** edit option. However, changing the value of the **window** edit option did change the number of lines that were displayed when the screen was repainted. POSIX.1-2008 does not permit this behavior in the interests of consistency and simplicity of specification, and requires that all commands that change the number of lines that are displayed do it by setting the value of the **window** edit option.

#### **wrapmargin, wm**

Historically, the **wrapmargin** option did not affect maps inserting characters that also had associated *counts*; for example **:map K 5aABC DEF**. Unfortunately, there are widely used maps that depend on this behavior. For consistency and simplicity of specification, POSIX.1-2008 does not permit this behavior.

Historically, **wrapmargin** was calculated using the column display width of all characters on the screen. For example, an implementation using "**^I**" to represent <tab> characters when the **list** edit option was set, where '**^**' and '**I**' each took up a single column on the screen, would calculate the **wrapmargin** based on a value of 2 for each <tab>. The **number** edit option similarly changed the effective length of the line as well. POSIX.1-2008 requires conformance to historical practice.

Earlier versions of this standard allowed for implementations with bytes other than eight bits, but this has been modified in this version.

#### **FUTURE DIRECTIONS**

None.

#### **CHANGE HISTORY**

First released in Issue 2.

##### **Issue 5**

The FUTURE DIRECTIONS section is added.

##### **Issue 6**

This utility is marked as part of the User Portability Utilities option.

The obsolescent SYNOPSIS is removed, removing the *+command* and *-* options.

89467 The following new requirements on POSIX implementations derive from alignment with the  
89468 Single UNIX Specification:

- 89469 • In the **map** command description, the sequence *#digit* is added.
- 89470 • The **directory**, **edcompatible**, **redraw**, and **slowopen** edit options are added.

89471 The *ex* utility is extensively changed for alignment with the IEEE P1003.2b draft standard. This  
89472 includes changes as a result of the IEEE PASC Interpretations 1003.2 #31, #38, #49, #50, #51, #52,  
89473 #55, #56, #57, #61, #62, #63, #64, #65, and #78.

89474 The **-l** option is removed.

89475 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/23 is applied, correcting a URL.

89476 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/8 is applied, making an editorial  
89477 correction in the EXTENDED DESCRIPTION.

89478 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/9 is applied, removing text describing  
89479 behavior on systems with bytes consisting of more than eight bits.

#### 89480 Issue 7

89481 Austin Group Interpretation 1003.1-2001 #027 is applied, clarifying the behavior if an operand is  
89482 ' \_'.

89483 Austin Group Interpretation 1003.1-2001 #036 is applied, clarifying the behavior for BREs.

89484 Austin Group Interpretation 1003.1-2001 #121 is applied, clarifying the *ex* **write** command.

89485 Austin Group Interpretation 1003.1-2001 #156 is applied.

89486 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

89487 **NAME**

89488       expand — convert tabs to spaces

89489 **SYNOPSIS**89490       expand [-t *tablist*] [*file...*]89491 **DESCRIPTION**

89492       The *expand* utility shall write files or the standard input to the standard output with <tab>  
 89493       characters replaced with one or more <space> characters needed to pad to the next tab stop. Any  
 89494       <backspace> characters shall be copied to the output and cause the column position count for  
 89495       tab stop calculations to be decremented; the column position count shall not be decremented  
 89496       below zero.

89497 **OPTIONS**89498       The *expand* utility shall conform to XBD [Section 12.2](#) (on page 215).

89499       The following option shall be supported:

89500       -t *tablist*     Specify the tab stops. The application shall ensure that the argument *tablist* consists  
 89501       of either a single positive decimal integer or a list of tabstops. If a single number is  
 89502       given, tabs shall be set that number of column positions apart instead of the  
 89503       default 8.

89504       If a list of tabstops is given, the application shall ensure that it consists of a list of  
 89505       two or more positive decimal integers, separated by <blank> or <comma>  
 89506       characters, in ascending order. The <tab> characters shall be set at those specific  
 89507       column positions. Each tab stop *N* shall be an integer value greater than zero, and  
 89508       the list is in strictly ascending order. This is taken to mean that, from the start of a  
 89509       line of output, tabbing to position *N* shall cause the next character output to be in  
 89510       the (*N*+1)th column position on that line.

89511       In the event of *expand* having to process a <tab> at a position beyond the last of  
 89512       those specified in a multiple tab-stop list, the <tab> shall be replaced by a single  
 89513       <space> in the output.

89514 **OPERANDS**

89515       The following operand shall be supported:

89516       *file*           The pathname of a text file to be used as input.

89517 **STDIN**

89518       See the INPUT FILES section.

89519 **INPUT FILES**

89520       Input files shall be text files.

89521 **ENVIRONMENT VARIABLES**89522       The following environment variables shall affect the execution of *expand*:

89523       LANG            Provide a default value for the internationalization variables that are unset or null.  
 89524                       (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 89525                       variables used to determine the values of locale categories.)

89526       LC\_ALL          If set to a non-empty string value, override the values of all the other  
 89527                       internationalization variables.

89528       LC\_CTYPE        Determine the locale for the interpretation of sequences of bytes of text data as  
 89529                       characters (for example, single-byte as opposed to multi-byte characters in  
 89530                       arguments and input files), the processing of <tab> and <space> characters, and  
 89531                       for the determination of the width in column positions each character would

89532                    occupy on an output device.

89533            *LC\_MESSAGES*

89534                    Determine the locale that should be used to affect the format and contents of

89535                    diagnostic messages written to standard error.

89536 XSI            *NLSPATH*   Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

89537 **ASYNCHRONOUS EVENTS**

89538            Default.

89539 **STDOUT**

89540            The standard output shall be equivalent to the input files with <tab> characters converted into

89541            the appropriate number of <space> characters.

89542 **STDERR**

89543            The standard error shall be used only for diagnostic messages.

89544 **OUTPUT FILES**

89545            None.

89546 **EXTENDED DESCRIPTION**

89547            None.

89548 **EXIT STATUS**

89549            The following exit values shall be returned:

89550            0    Successful completion

89551            >0   An error occurred.

89552 **CONSEQUENCES OF ERRORS**

89553            The *expand* utility shall terminate with an error message and non-zero exit status upon

89554            encountering difficulties accessing one of the *file* operands.

89555 **APPLICATION USAGE**

89556            None.

89557 **EXAMPLES**

89558            None.

89559 **RATIONALE**

89560            The *expand* utility is useful for preprocessing text files (before sorting, looking at specific

89561            columns, and so on) that contain <tab> characters.

89562            See XBD [Section 3.103](#) (on page 50).

89563            The *tablist* option-argument consists of integers in ascending order. Utility Syntax Guideline 8

89564            mandates that *expand* shall accept the integers (within the single argument) separated using

89565            either <comma> or <blank> characters.

89566            Earlier versions of this standard allowed the following form in the SYNOPSIS:

89567            `expand [-tabstop] [-tab1,tab2,...,tabn] [file ...]`

89568            This form is no longer specified by POSIX.1-2008 but may be present in some implementations.

89569 **FUTURE DIRECTIONS**

89570            None.

89571 **SEE ALSO**89572 *tabs*, *unexpand*89573 XBD [Section 3.103](#) (on page 50), [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)89574 **CHANGE HISTORY**

89575 First released in Issue 4.

89576 **Issue 6**

89577 This utility is marked as part of the User Portability Utilities option.

89578 The APPLICATION USAGE section is added.

89579 The obsolescent SYNOPSIS is removed.

89580 The *LC\_CTYPE* environment variable description is updated to align with the IEEE P1003.2b draft standard.

89582 The normative text is reworded to avoid use of the term “must” for application requirements.

89583 **Issue 7**

89584 Austin Group Interpretation 1003.1-2001 #027 is applied.

89585 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

89586 The *expand* utility is moved from the User Portability Utilities option to the Base. User Portability Utilities is now an option for interactive utilities.

89588 **NAME**89589        *expr* — evaluate arguments as an expression89590 **SYNOPSIS**89591        *expr operand...*89592 **DESCRIPTION**89593        The *expr* utility shall evaluate an expression and write the result to standard output.89594 **OPTIONS**

89595        None.

89596 **OPERANDS**89597        The single expression evaluated by *expr* shall be formed from the *operand* operands, as described in the EXTENDED DESCRIPTION section. The application shall ensure that each of the expression operator symbols:

89600        (   )   |   &amp;   =   &gt;   &gt;=   &lt;   &lt;=   !=   +   -   \*   /   %   :

89601        and the symbols *integer* and *string* in the table are provided as separate arguments to *expr*.89602 **STDIN**

89603        Not used.

89604 **INPUT FILES**

89605        None.

89606 **ENVIRONMENT VARIABLES**89607        The following environment variables shall affect the execution of *expr*:89608        *LANG*        Provide a default value for the internationalization variables that are unset or null. (See XBD Section 8.2 (on page 174) for the precedence of internationalization variables used to determine the values of locale categories.)89611        *LC\_ALL*        If set to a non-empty string value, override the values of all the other internationalization variables.89613        *LC\_COLLATE*

89614                    Determine the locale for the behavior of ranges, equivalence classes, and multi-character collating elements within regular expressions and by the string comparison operators.

89617        *LC\_CTYPE*    Determine the locale for the interpretation of sequences of bytes of text data as characters (for example, single-byte as opposed to multi-byte characters in arguments) and the behavior of character classes within regular expressions.89620        *LC\_MESSAGES*

89621                    Determine the locale that should be used to affect the format and contents of diagnostic messages written to standard error.

89623        *XSI*        *NLSPATH*    Determine the location of message catalogs for the processing of *LC\_MESSAGES*.89624 **ASYNCHRONOUS EVENTS**

89625        Default.

89626 **STDOUT**89627        The *expr* utility shall evaluate the expression and write the result, followed by a <newline>, to standard output.

89629 **STDERR**

89630 The standard error shall be used only for diagnostic messages.

89631 **OUTPUT FILES**

89632 None.

89633 **EXTENDED DESCRIPTION**

89634 The formation of the expression to be evaluated is shown in the following table. The symbols  
 89635 *expr*, *expr1*, and *expr2* represent expressions formed from *integer* and *string* symbols and the  
 89636 expression operator symbols (all separate arguments) by recursive application of the constructs  
 89637 described in the table. The expressions are listed in order of increasing precedence, with equal-  
 89638 precedence operators grouped between horizontal lines. All of the operators shall be left-  
 89639 associative.

| Expression                                                                                                                                                                                | Description                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>expr1</i>   <i>expr2</i>                                                                                                                                                               | Returns the evaluation of <i>expr1</i> if it is neither null nor zero; otherwise, returns the evaluation of <i>expr2</i> if it is not null; otherwise, zero.                                                                                                                                                                                                                                               |
| <i>expr1</i> & <i>expr2</i>                                                                                                                                                               | Returns the evaluation of <i>expr1</i> if neither expression evaluates to null or zero; otherwise, returns zero.                                                                                                                                                                                                                                                                                           |

| <i>expr1</i> * <i>expr2</i><br><i>expr1</i> / <i>expr2</i><br><i>expr1</i> % <i>expr2</i>                                                                                                 | Multiplication of decimal integer-valued arguments.<br>Integer division of decimal integer-valued arguments, producing an integer result.<br>Remainder of integer division of decimal integer-valued arguments.                                                                                                                                                                                            |
| <i>expr1</i> : <i>expr2</i>                                                                                                                                                               | Matching expression; see below.                                                                                                                                                                                                                                                                                                                                                                            |
| ( <i>expr</i> )                                                                                                                                                                           | Grouping symbols. Any expression can be placed within parentheses. Parentheses can be nested to a depth of {EXPR_NEST_MAX}.                                                                                                                                                                                                                                                                                |
| <i>integer</i><br><i>string</i>                                                                                                                                                           | An argument consisting only of an (optional) unary minus followed by digits.<br>A string argument; see below.                                                                                                                                                                                                                                                                                              |

### Matching Expression

The `' : '` matching operator shall compare the string resulting from the evaluation of *expr1* with the regular expression pattern resulting from the evaluation of *expr2*. Regular expression syntax shall be that defined in XBD [Section 9.3](#) (on page 183), except that all patterns are anchored to the beginning of the string (that is, only sequences starting at the first character of a string are matched by the regular expression) and, therefore, it is unspecified whether `' ^ '` is a special character in that context. Usually, the matching operator shall return a string representing the number of characters matched (`' 0 '` on failure). Alternatively, if the pattern contains at least one regular expression subexpression `"[ \ ( . . . \ ) ]"`, the string matched by the back-reference expression `" \ 1 "` shall be returned. If the back-reference expression `" \ 1 "` does not match, then the null string shall be returned.

### String Operand

A string argument is an argument that cannot be identified as an *integer* argument or as one of the expression operator symbols shown in the OPERANDS section.

The use of string arguments **length**, **substr**, **index**, or **match** produces unspecified results.

### EXIT STATUS

The following exit values shall be returned:

- 0 The *expression* evaluates to neither null nor zero.
- 1 The *expression* evaluates to null or zero.
- 2 Invalid *expression*.
- >2 An error occurred.

### CONSEQUENCES OF ERRORS

Default.

### APPLICATION USAGE

After argument processing by the shell, *expr* is not required to be able to tell the difference between an operator and an operand except by the value. If `" $a "` is `' = '`, the command:

```
expr $a = '='
```

looks like:

```
expr = = =
```

as the arguments are passed to *expr* (and they all may be taken as the `' = '` operator). The following works reliably:

```
expr X$a = X=
```

Also note that this volume of POSIX.1-2008 permits implementations to extend utilities. The *expr* utility permits the integer arguments to be preceded with a unary minus. This means that an integer argument could look like an option. Therefore, the conforming application must employ the `"--"` construct of Guideline 10 of XBD [Section 12.2](#) (on page 215) to protect its operands if there is any chance the first operand might be a negative integer (or any string with a leading minus).

**EXAMPLES**

The *expr* utility has a rather difficult syntax:

- Many of the operators are also shell control operators or reserved words, so they have to be escaped on the command line.
- Each part of the expression is composed of separate arguments, so liberal usage of <blank> characters is required. For example:

| Invalid                 | Valid                        |
|-------------------------|------------------------------|
| <i>expr</i> 1+2         | <i>expr</i> 1 + 2            |
| <i>expr</i> "1 + 2"     | <i>expr</i> 1 + 2            |
| <i>expr</i> 1 + (2 * 3) | <i>expr</i> 1 + \( 2 \* 3 \) |

In many cases, the arithmetic and string features provided as part of the shell command language are easier to use than their equivalents in *expr*. Newly written scripts should avoid *expr* in favor of the new features within the shell; see [Section 2.5](#) (on page 2323) and [Section 2.6.4](#) (on page 2332).

The following command:

```
a=$(expr $a + 1)
```

adds 1 to the variable *a*.

The following command, for "*\$a*" equal to either */usr/abc/file* or just *file*:

```
expr $a : '.*\/(.*\)' \| $a
```

returns the last segment of a pathname (that is, *file*). Applications should avoid the character *'/'* used alone as an argument; *expr* may interpret it as the division operator.

The following command:

```
expr "//$a" : '.*\/(.*\)'
```

is a better representation of the previous example. The addition of the *"/"* characters eliminates any ambiguity about the division operator and simplifies the whole expression. Also note that pathnames may contain characters contained in the *IFS* variable and should be quoted to avoid having "*\$a*" expand into multiple arguments.

The following command:

```
expr "$VAR" : '.*'
```

returns the number of characters in *VAR*.

**RATIONALE**

In an early proposal, EREs were used in the matching expression syntax. This was changed to BREs to avoid breaking historical applications.

The use of a leading <circumflex> in the BRE is unspecified because many historical implementations have treated it as a special character, despite their system documentation. For example:

```
expr foo : ^foo expr ^foo : ^foo
```

return 3 and 0, respectively, on those systems; their documentation would imply the reverse. Thus, the anchoring condition is left unspecified to avoid breaking historical scripts relying on this undocumented feature.

89749 **FUTURE DIRECTIONS**

89750 None.

**CHANGE HISTORY**

89806  
89807 First released in Issue 2.

**Issue 6**

89808  
89809 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/24 is applied, changing the STDERR  
89810 section from “None.” to “Not used.” for alignment with [Section 1.4](#) (on page 2310).

89811 **NAME**89812 `fc` — process the command history list89813 **SYNOPSIS**

```
89814 UP fc [-r] [-e editor] [first [last]]
89815 fc -l [-nr] [first [last]]
89816 fc -s [old=new] [first]
```

89817 **DESCRIPTION**

89818 The `fc` utility shall list, or shall edit and re-execute, commands previously entered to an  
 89819 interactive `sh`.

89820 The command history list shall reference commands by number. The first number in the list is  
 89821 selected arbitrarily. The relationship of a number to its command shall not change except when  
 89822 the user logs in and no other process is accessing the list, at which time the system may reset the  
 89823 numbering to start the oldest retained command at another number (usually 1). When the  
 89824 number reaches an implementation-defined upper limit, which shall be no smaller than the  
 89825 value in `HISTSIZE` or 32767 (whichever is greater), the shell may wrap the numbers, starting the  
 89826 next command with a lower number (usually 1). However, despite this optional wrapping of  
 89827 numbers, `fc` shall maintain the time-ordering sequence of the commands. For example, if four  
 89828 commands in sequence are given the numbers 32766, 32767, 1 (wrapped), and 2 as they are  
 89829 executed, command 32767 is considered the command previous to 1, even though its number is  
 89830 higher.

89831 When commands are edited (when the `-l` option is not specified), the resulting lines shall be  
 89832 entered at the end of the history list and then re-executed by `sh`. The `fc` command that caused the  
 89833 editing shall not be entered into the history list. If the editor returns a non-zero exit status, this  
 89834 shall suppress the entry into the history list and the command re-execution. Any command line  
 89835 variable assignments or redirection operators used with `fc` shall affect both the `fc` command itself  
 89836 as well as the command that results; for example:

```
89837 fc -s -- -l 2>/dev/null
```

89838 reinvokes the previous command, suppressing standard error for both `fc` and the previous  
 89839 command.

89840 **OPTIONS**

89841 The `fc` utility shall conform to XBD [Section 12.2](#) (on page 215).

89842 The following options shall be supported:

- 89843 **-e editor** Use the editor named by *editor* to edit the commands. The *editor* string is a utility  
 89844 name, subject to search via the `PATH` variable (see XBD [Chapter 8](#), on page 173).  
 89845 The value in the `FCEDIT` variable shall be used as a default when `-e` is not  
 89846 specified. If `FCEDIT` is null or unset, `ed` shall be used as the editor.
- 89847 **-l** (The letter ell.) List the commands rather than invoking an editor on them. The  
 89848 commands shall be written in the sequence indicated by the *first* and *last* operands,  
 89849 as affected by `-r`, with each command preceded by the command number.
- 89850 **-n** Suppress command numbers when listing with `-l`.
- 89851 **-r** Reverse the order of the commands listed (with `-l`) or edited (with neither `-l` nor  
 89852 `-s`).

89853            **-s**            Re-execute the command without invoking an editor.

89854    **OPERANDS**

89855            The following operands shall be supported:

89856            *first, last*        Select the commands to list or edit. The number of previous commands that can be  
89857                                accessed shall be determined by the value of the *HISTSIZE* variable. The value of  
89858                                *first* or *last* or both shall be one of the following:

89859            **[+]number**        A positive number representing a command number; command  
89860                                numbers can be displayed with the **-l** option.

89861            **-number**            A negative decimal number representing the command that was  
89862                                executed *number* of commands previously. For example, **-1** is the  
89863                                immediately previous command.

89864            *string*             A string indicating the most recently entered command that begins  
89865                                with that string. If the *old=new* operand is not also specified with **-s**,  
89866                                the string form of the *first* operand cannot contain an embedded  
89867                                `<equals-sign>`.

89868            When the synopsis form with **-s** is used:

- 89869                        • If *first* is omitted, the previous command shall be used.

89870            For the synopsis forms without **-s**:

- 89871                        • If *last* is omitted, *last* shall default to the previous command when **-l** is  
89872                                specified; otherwise, it shall default to *first*.

- 89873                        • If *first* and *last* are both omitted, the previous 16 commands shall be listed or  
89874                                the previous single command shall be edited (based on the **-l** option).

- 89875                        • If *first* and *last* are both present, all of the commands from *first* to *last* shall be  
89876                                edited (without **-l**) or listed (with **-l**). Editing multiple commands shall be  
89877                                accomplished by presenting to the editor all of the commands at one time,  
89878                                each command starting on a new line. If *first* represents a newer command  
89879                                than *last*, the commands shall be listed or edited in reverse sequence,  
89880                                equivalent to using **-r**. For example, the following commands on the first  
89881                                line are equivalent to the corresponding commands on the second:

89882                        `fc -r 10 20        fc        30 40`  
89883                        `fc        20 10        fc -r 40 30`

- 89884                        • When a range of commands is used, it shall not be an error to specify *first* or  
89885                                *last* values that are not in the history list; *fc* shall substitute the value  
89886                                representing the oldest or newest command in the list, as appropriate. For  
89887                                example, if there are only ten commands in the history list, numbered 1 to 10:

89888                        `fc -l`  
89889                        `fc 1 99`

89890                        shall list and edit, respectively, all ten commands.

89891            *old=new*            Replace the first occurrence of string *old* in the commands to be re-executed by the  
89892                                string *new*.

89893 **STDIN**

89894 Not used.

89895 **INPUT FILES**

89896 None.

89897 **ENVIRONMENT VARIABLES**89898 The following environment variables shall affect the execution of *fc*:

89899 *FCEDIT* This variable, when expanded by the shell, shall determine the default value for  
 89900 the *-e editor* option's *editor* option-argument. If *FCEDIT* is null or unset, *ed* shall be  
 89901 used as the editor.

89902 *HISTFILE* Determine a pathname naming a command history file. If the *HISTFILE* variable is  
 89903 not set, the shell may attempt to access or create a file *.sh\_history* in the directory  
 89904 referred to by the *HOME* environment variable. If the shell cannot obtain both read  
 89905 and write access to, or create, the history file, it shall use an unspecified  
 89906 mechanism that allows the history to operate properly. (References to history "file"  
 89907 in this section shall be understood to mean this unspecified mechanism in such  
 89908 cases.) An implementation may choose to access this variable only when  
 89909 initializing the history file; this initialization shall occur when *fc* or *sh* first attempt  
 89910 to retrieve entries from, or add entries to, the file, as the result of commands issued  
 89911 by the user, the file named by the *ENV* variable, or implementation-defined system  
 89912 start-up files. In some historical shells, the history file is initialized just after the  
 89913 *ENV* file has been processed. Therefore, it is implementation-defined whether  
 89914 changes made to *HISTFILE* after the history file has been initialized are effective.  
 89915 Implementations may choose to disable the history list mechanism for users with  
 89916 appropriate privileges who do not set *HISTFILE*; the specific circumstances under  
 89917 which this occurs are implementation-defined. If more than one instance of the  
 89918 shell is using the same history file, it is unspecified how updates to the history file  
 89919 from those shells interact. As entries are deleted from the history file, they shall be  
 89920 deleted oldest first. It is unspecified when history file entries are physically  
 89921 removed from the history file.

89922 *HISTSIZE* Determine a decimal number representing the limit to the number of previous  
 89923 commands that are accessible. If this variable is unset, an unspecified default  
 89924 greater than or equal to 128 shall be used. The maximum number of commands in  
 89925 the history list is unspecified, but shall be at least 128. An implementation may  
 89926 choose to access this variable only when initializing the history file, as described  
 89927 under *HISTFILE*. Therefore, it is unspecified whether changes made to *HISTSIZE*  
 89928 after the history file has been initialized are effective.

89929 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 89930 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 89931 variables used to determine the values of locale categories.)

89932 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 89933 internationalization variables.

89934 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 89935 characters (for example, single-byte as opposed to multi-byte characters in  
 89936 arguments and input files).

89937 *LC\_MESSAGES*

89938 Determine the locale that should be used to affect the format and contents of  
 89939 diagnostic messages written to standard error.

89940 XSI **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

89941 **ASYNCHRONOUS EVENTS**

89942 Default.

89943 **STDOUT**

89944 When the **-l** option is used to list commands, the format of each command in the list shall be as

89945 follows:

89946 "%d\t%s\n", *<line number>*, *<command>*

89947 If both the **-l** and **-n** options are specified, the format of each command shall be:

89948 "\t%s\n", *<command>*

89949 If the *<command>* consists of more than one line, the lines after the first shall be displayed as:

89950 "\t%s\n", *<continued-command>*

89951 **STDERR**

89952 The standard error shall be used only for diagnostic messages.

89953 **OUTPUT FILES**

89954 None.

89955 **EXTENDED DESCRIPTION**

89956 None.

89957 **EXIT STATUS**

89958 The following exit values shall be returned:

89959 0 Successful completion of the listing.

89960 >0 An error occurred.

89961 Otherwise, the exit status shall be that of the commands executed by *fc*.

89962 **CONSEQUENCES OF ERRORS**

89963 Default.

89964 **APPLICATION USAGE**

89965 Since editors sometimes use file descriptors as integral parts of their editing, redirecting their file

89966 descriptors as part of the *fc* command can produce unexpected results. For example, if *vi* is the

89967 *FCEDIT* editor, the command:

89968 *fc -s | more*

89969 does not work correctly on many systems.

89970 Users on windowing systems may want to have separate history files for each window by

89971 setting *HISTFILE* as follows:

89972 *HISTFILE=\$HOME/.sh\_hist\$\$*

89973 **EXAMPLES**

89974 None.

89975 **RATIONALE**

89976 This utility is based on the *fc* built-in of the KornShell.

89977 An early proposal specified the **-e** option as [**-e** *editor* [*old= new* ]], which is not historical

89978 practice. Historical practice in *fc* of either [**-e** *editor*] or [**-e** - [*old= new* ]] is acceptable, but not

89979 both together. To clarify this, a new option **-s** was introduced replacing the [**-e** -]. This resolves

the conflict and makes *fc* conform to the Utility Syntax Guidelines.

**HISTFILE** Some implementations of the KornShell check for the superuser and do not create a history file unless *HISTFILE* is set. This is done primarily to avoid creating unlinked files in the root file system when logging in during single-user mode. *HISTFILE* must be set for the superuser to have history.

**HISTSIZE** Needed to limit the size of history files. It is the intent of the standard developers that when two shells share the same history file, commands that are entered in one shell shall be accessible by the other shell. Because of the difficulties of synchronization over a network, the exact nature of the interaction is unspecified.

The initialization process for the history file can be dependent on the system start-up files, in that they may contain commands that effectively preempt the settings the user has for *HISTFILE* and *HISTSIZE*. For example, function definition commands are recorded in the history file. If the system administrator includes function definitions in some system start-up file called before the *ENV* file, the history file is initialized before the user can influence its characteristics. In some historical shells, the history file is initialized just after the *ENV* file has been processed. Because of these situations, the text requires the initialization process to be implementation-defined.

Consideration was given to omitting the *fc* utility in favor of the command line editing feature in *sh*. For example, in *vi* editing mode, typing "<ESC> v" is equivalent to:

```
EDITOR=vi fc
```

However, the *fc* utility allows the user the flexibility to edit multiple commands simultaneously (such as *fc 10 20*) and to use editors other than those supported by *sh* for command line editing.

In the KornShell, the alias *r* ("re-do") is preset to *fc -e* – (equivalent to the POSIX *fc -s*). This is probably an easier command name to remember than *fc* ("fix command"), but it does not meet the Utility Syntax Guidelines. Renaming *fc* to *hist* or *redo* was considered, but since this description closely matches historical KornShell practice already, such a renaming was seen as gratuitous. Users are free to create aliases whenever odd historical names such as *fc*, *awk*, *cat*, *grep*, or *yacc* are standardized by POSIX.

Command numbers have no ordering effects; they are like serial numbers. The *-r* option and *-number* operand address the sequence of command execution, regardless of serial numbers. So, for example, if the command number wrapped back to 1 at some arbitrary point, there would be no ambiguity associated with traversing the wrap point. For example, if the command history were:

```
32766: echo 1
32767: echo 2
1: echo 3
```

the number *-2* refers to command 32767 because it is the second previous command, regardless of serial number.

## FUTURE DIRECTIONS

90029 “directory referred to by the *HOME* environment variable”.

**90030 Issue 7**

90031 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

90032 **NAME**90033 `fg` — run jobs in the foreground90034 **SYNOPSIS**90035 UP `fg [job_id]`90036 **DESCRIPTION**90037 If job control is enabled (see the description of `set -m`), the `fg` utility shall move a background job  
90038 from the current environment (see [Section 2.12](#), on page 2353) into the foreground.90039 Using `fg` to place a job into the foreground shall remove its process ID from the list of those  
90040 “known in the current shell execution environment”; see [Section 2.9.3.1](#) (on page 2342).90041 **OPTIONS**

90042 None.

90043 **OPERANDS**

90044 The following operand shall be supported:

90045 *job\_id* Specify the job to be run as a foreground job. If no *job\_id* operand is given, the  
90046 *job\_id* for the job that was most recently suspended, placed in the background, or  
90047 run as a background job shall be used. The format of *job\_id* is described in XBD  
90048 [Section 3.204](#) (on page 65).90049 **STDIN**

90050 Not used.

90051 **INPUT FILES**

90052 None.

90053 **ENVIRONMENT VARIABLES**90054 The following environment variables shall affect the execution of `fg`:90055 *LANG* Provide a default value for the internationalization variables that are unset or null.  
90056 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
90057 variables used to determine the values of locale categories.)90058 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
90059 internationalization variables.90060 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
90061 characters (for example, single-byte as opposed to multi-byte characters in  
90062 arguments).90063 *LC\_MESSAGES*90064 Determine the locale that should be used to affect the format and contents of  
90065 diagnostic messages written to standard error.90066 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.90067 **ASYNCHRONOUS EVENTS**

90068 Default.

90069 **STDOUT**90070 The `fg` utility shall write the command line of the job to standard output in the following format:90071 `"%s\n", <command>`

**90072 STDERR**

90073 The standard error shall be used only for diagnostic messages.

**90074 OUTPUT FILES**

90075 None.

**90076 EXTENDED DESCRIPTION**

90077 None.

**90078 EXIT STATUS**

90079 The following exit values shall be returned:

90080 0 Successful completion.

90081 >0 An error occurred.

**90082 CONSEQUENCES OF ERRORS**

90083 If job control is disabled, the *fg* utility shall exit with an error and no job shall be placed in the  
90084 foreground.

**90085 APPLICATION USAGE**

90086 The *fg* utility does not work as expected when it is operating in its own utility execution  
90087 environment because that environment has no applicable jobs to manipulate. See the  
90088 APPLICATION USAGE section for *bg*. For this reason, *fg* is generally implemented as a shell  
90089 regular built-in.

**90090 EXAMPLES**

90091 None.

**90092 RATIONALE**

90093 The extensions to the shell specified in this volume of POSIX.1-2008 have mostly been based on  
90094 features provided by the KornShell. The job control features provided by *bg*, *fg*, and *jobs* are also  
90095 based on the KornShell. The standard developers examined the characteristics of the C shell  
90096 versions of these utilities and found that differences exist. Despite widespread use of the C shell,  
90097 the KornShell versions were selected for this volume of POSIX.1-2008 to maintain a degree of  
90098 uniformity with the rest of the KornShell features selected (such as the very popular command  
90099 line editing features).

**90100 FUTURE DIRECTIONS**

90101 None.

**90102 SEE ALSO**

90103 [Section 2.9.3.1](#) (on page 2342), [Section 2.12](#) (on page 2353), *bg*, *kill*, *jobs*, *wait*

90104 XBD [Section 3.204](#) (on page 65), [Chapter 8](#) (on page 173)

**90105 CHANGE HISTORY**

90106 First released in Issue 4.

**90107 Issue 6**

90108 This utility is marked as part of the User Portability Utilities option.

90109 The APPLICATION USAGE section is added.

90110 The JC marking is removed from the SYNOPSIS since job control is mandatory in this version.

**NAME**

*file* — determine file type

**SYNOPSIS**

*file* [-dh] [-M *file*] [-m *file*] *file*...

*file* -i [-h] *file*...

**DESCRIPTION**

The *file* utility shall perform a series of tests in sequence on each specified *file* in an attempt to classify it:

1. If *file* does not exist, cannot be read, or its file status could not be determined, the output shall indicate that the file was processed, but that its type could not be determined.
2. If the file is not a regular file, its file type shall be identified. The file types directory, FIFO, socket, block special, and character special shall be identified as such. Other implementation-defined file types may also be identified. If *file* is a symbolic link, by default the link shall be resolved and *file* shall test the type of file referenced by the symbolic link. (See the **-h** and **-i** options below.)
3. If the length of *file* is zero, it shall be identified as an empty file.
4. The *file* utility shall examine an initial segment of *file* and shall make a guess at identifying its contents based on position-sensitive tests. (The answer is not guaranteed to be correct; see the **-d**, **-M**, and **-m** options below.)
5. The *file* utility shall examine *file* and make a guess at identifying its contents based on context-sensitive default system tests. (The answer is not guaranteed to be correct.)
6. The file shall be identified as a data file.

If *file* does not exist, cannot be read, or its file status could not be determined, the output shall indicate that the file was processed, but that its type could not be determined.

If *file* is a symbolic link, by default the link shall be resolved and *file* shall test the type of file referenced by the symbolic link.

**OPTIONS**

The *file* utility shall conform to XBD [Section 12.2](#) (on page 215), except that the order of the **-m**, **-d**, and **-M** options shall be significant.

The following options shall be supported by the implementation:

- |                       |                                                                                                                                                                                                                                                                                                              |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>-d</b>             | Apply any position-sensitive default system tests and context-sensitive default system tests to the file. This is the default if no <b>-M</b> or <b>-m</b> option is specified.                                                                                                                              |
| <b>-h</b>             | When a symbolic link is encountered, identify the file as a symbolic link. If <b>-h</b> is not specified and <i>file</i> is a symbolic link that refers to a nonexistent file, <i>file</i> shall identify the file as a symbolic link, as if <b>-h</b> had been specified.                                   |
| <b>-i</b>             | If a file is a regular file, do not attempt to classify the type of the file further, but identify the file as specified in the STDOUT section.                                                                                                                                                              |
| <b>-M <i>file</i></b> | Specify the name of a file containing position-sensitive tests that shall be applied to a file in order to classify it (see the EXTENDED DESCRIPTION). No position-sensitive default system tests nor context-sensitive default system tests shall be applied unless the <b>-d</b> option is also specified. |

90152        **-m file**        Specify the name of a file containing position-sensitive tests that shall be applied to  
 90153                                a file in order to classify it (see the EXTENDED DESCRIPTION).

90154        If the **-m** option is specified without specifying the **-d** option or the **-M** option, position-  
 90155        sensitive default system tests shall be applied after the position-sensitive tests specified by the  
 90156        **-m** option. If the **-M** option is specified with the **-d** option, the **-m** option, or both, or the **-m**  
 90157        option is specified with the **-d** option, the concatenation of the position-sensitive tests specified  
 90158        by these options shall be applied in the order specified by the appearance of these options. If a  
 90159        **-M** or **-m file** option-argument is **-**, the results are unspecified.

## 90160 OPERANDS

90161        The following operand shall be supported:

90162        *file*                A pathname of a file to be tested.

## 90163 STDIN

90164        The standard input shall be used if a *file* operand is **'-'** and the implementation treats the **'-'**  
 90165        as meaning standard input. Otherwise, the standard input shall not be used.

## 90166 INPUT FILES

90167        The *file* can be any file type.

## 90168 ENVIRONMENT VARIABLES

90169        The following environment variables shall affect the execution of *file*:

90170        *LANG*                Provide a default value for the internationalization variables that are unset or null.  
 90171                                (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 90172                                variables used to determine the values of locale categories.)

90173        *LC\_ALL*                If set to a non-empty string value, override the values of all the other  
 90174                                internationalization variables.

90175        *LC\_CTYPE*            Determine the locale for the interpretation of sequences of bytes of text data as  
 90176                                characters (for example, single-byte as opposed to multi-byte characters in  
 90177                                arguments and input files).

90178        *LC\_MESSAGES*

90179                                Determine the locale that should be used to affect the format and contents of  
 90180                                diagnostic messages written to standard error and informative messages written to  
 90181                                standard output.

90182        *XSI NLSPATH*        Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

## 90183 ASYNCHRONOUS EVENTS

90184        Default.

## 90185 STDOUT

90186        In the POSIX locale, the following format shall be used to identify each operand, *file* specified:

90187        "%s: %s\n", <file>, <type>

90188        The values for <type> are unspecified, except that in the POSIX locale, if *file* is identified as one  
 90189        of the types listed in the following table, <type> shall contain (but is not limited to) the  
 90190        corresponding string, unless the file is identified by a position-sensitive test specified by a **-M** or  
 90191        **-m** option. Each <space> shown in the strings shall be exactly one <space>.

90192

**Table 4-9** File Utility Output Strings

|       | <b>If <i>file</i> is:</b>                                    | <b>&lt;type&gt; shall contain the string:</b> | <b>Notes</b> |
|-------|--------------------------------------------------------------|-----------------------------------------------|--------------|
| 90193 | Nonexistent                                                  | cannot open                                   |              |
| 90194 | Block special                                                | block special                                 | 1            |
| 90195 | Character special                                            | character special                             | 1            |
| 90196 | Directory                                                    | directory                                     | 1            |
| 90197 | FIFO                                                         | fifo                                          | 1            |
| 90198 | Socket                                                       | socket                                        | 1            |
| 90199 | Symbolic link                                                | symbolic link to                              | 1            |
| 90200 | Regular file                                                 | regular file                                  | 1,2          |
| 90201 | Empty regular file                                           | empty                                         | 3            |
| 90202 | Regular file that cannot be read                             | cannot open                                   | 3            |
| 90203 | Executable binary                                            | executable                                    | 3,4,6        |
| 90204 | <i>ar</i> archive library (see <i>ar</i> )                   | archive                                       | 3,4,6        |
| 90205 | Extended <i>cpio</i> format (see <i>pax</i> )                | cpio archive                                  | 3,4,6        |
| 90206 | Extended <i>tar</i> format (see <b>ustar</b> in <i>pax</i> ) | tar archive                                   | 3,4,6        |
| 90207 | Shell script                                                 | commands text                                 | 3,5,6        |
| 90208 | C-language source                                            | c program text                                | 3,5,6        |
| 90209 | FORTRAN source                                               | fortran program text                          | 3,5,6        |
| 90210 | Regular file whose type cannot be determined                 | data                                          | 3            |

90212 **Notes:**

- 90213 1. This is a file type test.
- 90214 2. This test is applied only if the **-i** option is specified.
- 90215 3. This test is applied only if the **-i** option is not specified.
- 90216 4. This is a position-sensitive default system test.
- 90217 5. This is a context-sensitive default system test.
- 90218 6. Position-sensitive default system tests and context-sensitive default system tests are not
- 90219 applied if the **-M** option is specified unless the **-d** option is also specified.

90220 In the POSIX locale, if *file* is identified as a symbolic link (see the **-h** option), the following

90221 alternative output format shall be used:

90222 "%s: %s %s\n", <file>, <type>, <contents of link>"

90223 If the file named by the *file* operand does not exist, cannot be read, or the type of the file named

90224 by the *file* operand cannot be determined, this shall not be considered an error that affects the

90225 exit status.

90226 **STDERR**

90227 The standard error shall be used only for diagnostic messages.

90228 **OUTPUT FILES**

90229 None.

## EXTENDED DESCRIPTION

A file specified as an option-argument to the **-m** or **-M** options shall contain one position-sensitive test per line, which shall be applied to the file. If the test succeeds, the message field of the line shall be printed and no further tests shall be applied, with the exception that tests on immediately following lines beginning with a single '**>**' character shall be applied.

Each line shall be composed of the following four <tab>-separated fields. (Implementations may allow any combination of one or more white-space characters other than <newline> to act as field separators.)

*offset*      An unsigned number (optionally preceded by a single '**>**' character) specifying the *offset*, in bytes, of the value in the file that is to be compared against the *value* field of the line. If the file is shorter than the specified offset, the test shall fail.

If the *offset* begins with the character '**>**', the test contained in the line shall not be applied to the file unless the test on the last line for which the *offset* did not begin with a '**>**' was successful. By default, the *offset* shall be interpreted as an unsigned decimal number. With a leading 0x or 0X, the *offset* shall be interpreted as a hexadecimal number; otherwise, with a leading 0, the *offset* shall be interpreted as an octal number.

*type*      The type of the value in the file to be tested. The type shall consist of the type specification characters **d**, **s**, and **u**, specifying signed decimal, string, and unsigned decimal, respectively.

The *type* string shall be interpreted as the bytes from the file starting at the specified *offset* and including the same number of bytes specified by the *value* field. If insufficient bytes remain in the file past the *offset* to match the *value* field, the test shall fail.

The type specification characters **d** and **u** can be followed by an optional unsigned decimal integer that specifies the number of bytes represented by the type. The type specification characters **d** and **u** can be followed by an optional **C**, **S**, **I**, or **L**, indicating that the value is of type **char**, **short**, **int**, or **long**, respectively.

The default number of bytes represented by the type specifiers **d**, **f**, and **u** shall correspond to their respective C-language types as follows. If the system claims conformance to the C-Language Development Utilities option, those specifiers shall correspond to the default sizes used in the *c99* utility. Otherwise, the default sizes shall be implementation-defined.

For the type specifier characters **d** and **u**, the default number of bytes shall correspond to the size of a basic integer type of the implementation. For these specifier characters, the implementation shall support values of the optional number of bytes to be converted corresponding to the number of bytes in the C-language types **char**, **short**, **int**, or **long**. These numbers can also be specified by an application as the characters **C**, **S**, **I**, and **L**, respectively. The byte order used when interpreting numeric values is implementation-defined, but shall correspond to the order in which a constant of the corresponding type is stored in memory on the system.

All type specifiers, except for **s**, can be followed by a mask specifier of the form **&number**. The mask value shall be AND'ed with the value of the input file before the comparison with the *value* field of the line is made. By default, the mask shall be interpreted as an unsigned decimal number. With a leading 0x or 0X, the mask shall be interpreted as an unsigned hexadecimal number; otherwise, with a leading

|       |                   |                                                                                                                  |
|-------|-------------------|------------------------------------------------------------------------------------------------------------------|
| 90277 |                   | 0, the mask shall be interpreted as an unsigned octal number.                                                    |
| 90278 |                   | The strings <b>byte</b> , <b>short</b> , <b>long</b> , and <b>string</b> shall also be supported as type fields, |
| 90279 |                   | being interpreted as dC, dS, dL, and s, respectively.                                                            |
| 90280 | <i>value</i>      | The <i>value</i> to be compared with the value from the file.                                                    |
| 90281 |                   | If the specifier from the type field is s or <b>string</b> , then interpret the value as a string.               |
| 90282 |                   | Otherwise, interpret it as a number. If the value is a string, then the test shall                               |
| 90283 |                   | succeed only when a string value exactly matches the bytes from the file.                                        |
| 90284 |                   | If the <i>value</i> is a string, it can contain the following sequences:                                         |
| 90285 | <i>\character</i> | The <backslash>-escape sequences as specified in XBD Table 5-1                                                   |
| 90286 |                   | (on page 121) ('\\', '\a', '\b', '\f', '\n', '\r', '\t',                                                         |
| 90287 |                   | '\v'). In addition, the escape sequence '\ ' (the <backslash>                                                    |
| 90288 |                   | character followed by a <space> character) shall be recognized to                                                |
| 90289 |                   | represent a <space> character. The results of using any other                                                    |
| 90290 |                   | character, other than an octal digit, following the <backslash>                                                  |
| 90291 |                   | are unspecified.                                                                                                 |
| 90292 | <i>\octal</i>     | Octal sequences that can be used to represent characters with                                                    |
| 90293 |                   | specific coded values. An octal sequence shall consist of a                                                      |
| 90294 |                   | <backslash> followed by the longest sequence of one, two, or                                                     |
| 90295 |                   | three octal-digit characters (01234567).                                                                         |
| 90296 |                   | By default, any value that is not a string shall be interpreted as a signed decimal                              |
| 90297 |                   | number. Any such value, with a leading 0x or 0X, shall be interpreted as an                                      |
| 90298 |                   | unsigned hexadecimal number; otherwise, with a leading zero, the value shall be                                  |
| 90299 |                   | interpreted as an unsigned octal number.                                                                         |
| 90300 |                   | If the value is not a string, it can be preceded by a character indicating the                                   |
| 90301 |                   | comparison to be performed. Permissible characters and the comparisons they                                      |
| 90302 |                   | specify are as follows:                                                                                          |
| 90303 | =                 | The test shall succeed if the value from the file equals the <i>value</i> field.                                 |
| 90304 | <                 | The test shall succeed if the value from the file is less than the <i>value</i> field.                           |
| 90305 | >                 | The test shall succeed if the value from the file is greater than the <i>value</i> field.                        |
| 90306 | &                 | The test shall succeed if all of the set bits in the <i>value</i> field are set in the value                     |
| 90307 |                   | from the file.                                                                                                   |
| 90308 | ^                 | The test shall succeed if at least one of the set bits in the <i>value</i> field is not set in                   |
| 90309 |                   | the value from the file.                                                                                         |
| 90310 | x                 | The test shall succeed if the file is large enough to contain a value of the type                                |
| 90311 |                   | specified starting at the offset specified.                                                                      |
| 90312 | <i>message</i>    | The <i>message</i> to be printed if the test succeeds. The <i>message</i> shall be interpreted                   |
| 90313 |                   | using the notation for the <i>printf</i> formatting specification; see <i>printf</i> . If the <i>value</i>       |
| 90314 |                   | field was a string, then the value from the file shall be the argument for the <i>printf</i>                     |
| 90315 |                   | formatting specification; otherwise, the value from the file shall be the argument.                              |

**EXIT STATUS**

The following exit values shall be returned:

0 Successful completion.

>0 An error occurred.

**CONSEQUENCES OF ERRORS**

Default.

**APPLICATION USAGE**

The *file* utility can only be required to guess at many of the file types because only exhaustive testing can determine some types with certainty. For example, binary data on some implementations might match the initial segment of an executable or a *tar* archive.

Note that the table indicates that the output contains the stated string. Systems may add text before or after the string. For executables, as an example, the machine architecture and various facts about how the file was link-edited may be included. Note also that on systems that recognize shell script files starting with "#!" as executable files, these may be identified as executable binary files rather than as shell scripts.

**EXAMPLES**

Determine whether an argument is a binary executable file:

```
file -- "$1" | grep -q '.*executable' &&
 printf "%s is executable.\n" "$1"
```

**RATIONALE**

The *-f* option was omitted because the same effect can (and should) be obtained using the *xargs* utility.

Historical versions of the *file* utility attempt to identify the following types of files: symbolic link, directory, character special, block special, socket, *tar* archive, *cpio* archive, SCCS archive, archive library, empty, *compress* output, *pack* output, binary data, C source, FORTRAN source, assembler source, *nroff*/*troff*/*eqn*/*tbl* source *troff* output, shell script, C shell script, English text, ASCII text, various executables, APL workspace, compiled terminfo entries, and CURSES screen images. Only those types that are reasonably well specified in POSIX or are directly related to POSIX utilities are listed in the table.

Historical systems have used a “magic file” named */etc/magic* to help identify file types. Because it is generally useful for users and scripts to be able to identify special file types, the *-m* flag and a portable format for user-created magic files has been specified. No requirement is made that an implementation of *file* use this method of identifying files, only that users be permitted to add their own classifying tests.

In addition, three options have been added to historical practice. The *-d* flag has been added to permit users to cause their tests to follow any default system tests. The *-i* flag has been added to permit users to test portably for regular files in shell scripts. The *-M* flag has been added to permit users to ignore any default system tests.

The POSIX.1-2008 description of default system tests and the interaction between the *-d*, *-M*, and *-m* options did not clearly indicate that there were two types of “default system tests”. The “position-sensitive tests” determine file types by looking for certain string or binary values at specific offsets in the file being examined. These position-sensitive tests were implemented in historical systems using the magic file described above. Some of these tests are now built into the *file* utility itself on some implementations so the output can provide more detail than can be provided by magic files. For example, a magic file can easily identify a **core** file on most implementations, but cannot name the program file that dropped the core. A magic file could

produce output such as:

```
/home/dwc/core: ELF 32-bit MSB core file SPARC Version 1
```

but by building the test into the *file* utility, you could get output such as:

```
/home/dwc/core: ELF 32-bit MSB core file SPARC Version 1, from 'testprog'
```

These extended built-in tests are still to be treated as position-sensitive default system tests even if they are not listed in */etc/magic* or any other magic file.

The context-sensitive default system tests were always built into the *file* utility. These tests looked for language constructs in text files trying to identify shell scripts, C, FORTRAN, and other computer language source files, and even plain text files. With the addition of the *-m* and *-M* options the distinction between position-sensitive and context-sensitive default system tests became important because the order of testing is important. The context-sensitive system default tests should never be applied before any position-sensitive tests even if the *-d* option is specified before a *-m* option or *-M* option due to the high probability that the context-sensitive system default tests will incorrectly identify arbitrary text files as text files before position-sensitive tests specified by the *-m* or *-M* option would be applied to give a more accurate identification.

Leaving the meaning of *-M* – and *-m* – unspecified allows an existing prototype of these options to continue to work in a backwards-compatible manner. (In that implementation, *-M* – was roughly equivalent to *-d* in POSIX.1-2008.)

The historical *-c* option was omitted as not particularly useful to users or portable shell scripts. In addition, a reasonable implementation of the *file* utility would report any errors found each time the magic file is read.

The historical format of the magic file was the same as that specified by the Rationale in the ISO POSIX-2:1993 standard for the *offset*, *value*, and *message* fields; however, it used less precise type fields than the format specified by the current normative text. The new type field values are a superset of the historical ones.

The following is an example magic file:

```
0 short 070707 cpio archive
0 short 0143561 Byte-swapped cpio archive
0 string 070707 ASCII cpio archive
0 long 0177555 Very old archive
0 short 0177545 Old archive
0 short 017437 Old packed data
0 string \037\036 Packed data
0 string \377\037 Compacted data
0 string \037\235 Compressed data
>2 byte&0x80 >0 Block compressed
>2 byte&0x1f x %d bits
0 string \032\001 Compiled Termino Entry
0 short 0433 Curses screen image
0 short 0434 Curses screen image
0 string <ar> System V Release 1 archive
0 string !<arch>\n___.SYMDEF Archive random library
0 string !<arch> Archive
0 string ARF_BEGARF PHIGS clear text archive
0 long 0x137A2950 Scalable OpenFont binary
0 long 0x137A2951 Encrypted scalable OpenFont binary
```

- 90408 The use of a basic integer data type is intended to allow the implementation to choose a word  
90409 size commonly used by applications on that architecture.
- 90410 Earlier versions of this standard allowed for implementations with bytes other than eight bits,  
90411 but this has been modified in this version.
- 90412 **FUTURE DIRECTIONS**
- 90413 None.
- 90414 **SEE ALSO**
- 90415 *ar, ls, pax, printf*
- 90416 XBD [Table 5-1](#) (on page 121), [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)
- 90417 **CHANGE HISTORY**
- 90418 First released in Issue 4.
- 90419 **Issue 6**
- 90420 This utility is marked as part of the User Portability Utilities option.
- 90421 Options and an EXTENDED DESCRIPTION are added as specified in the IEEE P1003.2b draft  
90422 standard.
- 90423 IEEE PASC Interpretations 1003.2 #192 and #178 are applied.
- 90424 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/25 is applied, making major changes to  
90425 address ambiguities raised in defect reports.
- 90426 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/26 is applied, making it clear in the  
90427 OPTIONS section that the **-m**, **-d**, and **-M** options do not comply with Guideline 11 of the  
90428 Utility Syntax Guidelines.
- 90429 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/10 is applied, clarifying the specification  
90430 characters.
- 90431 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/11 is applied, allowing application  
90432 developers to create portable magic files that can match characters in strings, and allowing  
90433 common extensions found in existing implementations.
- 90434 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/12 is applied, removing text describing  
90435 behavior on systems with bytes consisting of more than eight bits.
- 90436 **Issue 7**
- 90437 Austin Group Interpretation 1003.1-2001 #092 is applied.
- 90438 SD5-XCU-ERN-4 is applied, adding further entries in the Notes column in [Table 4-9](#).
- 90439 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.
- 90440 The *file* utility is moved from the User Portability Utilities option to the Base. User Portability  
90441 Utilities is now an option for interactive utilities.
- 90442 The EXAMPLES section is revised to correct an error with the pathname "\$1".

90443 **NAME**90444 `find` — find files90445 **SYNOPSIS**90446 `find [-H|-L] path... [operand_expression...]`90447 **DESCRIPTION**

90448 The *find* utility shall recursively descend the directory hierarchy from each file specified by *path*,  
 90449 evaluating a Boolean expression composed of the primaries described in the OPERANDS section  
 90450 for each file encountered. Each *path* operand shall be evaluated unaltered as it was provided,  
 90451 including all trailing <slash> characters; all pathnames for other files encountered in the  
 90452 hierarchy shall consist of the concatenation of the current *path* operand, a <slash> if the current  
 90453 *path* operand did not end in one, and the filename relative to the *path* operand. The relative  
 90454 portion shall contain no dot or dot-dot components, no trailing <slash> characters, and only  
 90455 single <slash> characters between pathname components.

90456 The *find* utility shall be able to descend to arbitrary depths in a file hierarchy and shall not fail  
 90457 due to path length limitations (unless a *path* operand specified by the application exceeds  
 90458 {PATH\_MAX} requirements).

90459 The *find* utility shall detect infinite loops; that is, entering a previously visited directory that is an  
 90460 ancestor of the last file encountered. When it detects an infinite loop, *find* shall write a  
 90461 diagnostic message to standard error and shall either recover its position in the hierarchy or  
 90462 terminate.

90463 If a file is removed from or added to the directory hierarchy being searched it is unspecified +  
 90464 whether or not *find* includes that file in its search.

90465 **OPTIONS**90466 The *find* utility shall conform to XBD [Section 12.2](#) (on page 215).

90467 The following options shall be supported by the implementation:

90468 **-H** Cause the file information and file type evaluated for each symbolic link  
 90469 encountered as a *path* operand on the command line to be those of the file  
 90470 referenced by the link, and not the link itself. If the referenced file does not exist,  
 90471 the file information and type shall be for the link itself. File information and type  
 90472 for symbolic links encountered during the traversal of a file hierarchy shall be that  
 90473 of the link itself.

90474 **-L** Cause the file information and file type evaluated for each symbolic link  
 90475 encountered as a *path* operand on the command line or encountered during the  
 90476 traversal of a file hierarchy to be those of the file referenced by the link, and not the  
 90477 link itself. If the referenced file does not exist, the file information and type shall be  
 90478 for the link itself.

90479 Specifying more than one of the mutually-exclusive options **-H** and **-L** shall not be considered  
 90480 an error. The last option specified shall determine the behavior of the utility. If neither the **-H**  
 90481 nor the **-L** option is specified, then the file information and type for symbolic links encountered  
 90482 as a *path* operand on the command line or encountered during the traversal of a file hierarchy  
 90483 shall be that of the link itself.

90484 **OPERANDS**

90485 The following operands shall be supported:

90486 The first operand and subsequent operands up to but not including the first operand that starts  
 90487 with a `'-'`, or is a `'!'` or a `'('`, shall be interpreted as *path* operands. If the first operand starts  
 90488 with a `'-'`, or is a `'!'` or a `'('`, the behavior is unspecified. Each *path* operand is a pathname of

a starting point in the file hierarchy.

The first operand that starts with a `'-'`, or is a `'!'` or a `'('`, and all subsequent arguments shall be interpreted as an *expression* made up of the following primaries and operators. In the descriptions, wherever *n* is used as a primary argument, it shall be interpreted as a decimal integer optionally preceded by a plus (`'+'`) or minus-sign (`'-'`) sign, as follows:

`+n` More than *n*.

`n` Exactly *n*.

`-n` Less than *n*.

The following primaries shall be supported:

**-name *pattern***  
The primary shall evaluate as true if the basename of the current pathname matches *pattern* using the pattern matching notation described in [Section 2.13](#) (on page 2354). The additional rules in [Section 2.13.3](#) (on page 2355) do not apply as this is a matching operation, not an expansion.

**-path *pattern***  
The primary shall evaluate as true if the current pathname matches *pattern* using the pattern matching notation described in [Section 2.13](#) (on page 2354). The additional rules in [Section 2.13.3](#) (on page 2355) do not apply as this is a matching operation, not an expansion.

**-nouser** The primary shall evaluate as true if the file belongs to a user ID for which the `getpwuid()` function defined in the System Interfaces volume of POSIX.1-2008 (or equivalent) returns NULL.

**-nogroup** The primary shall evaluate as true if the file belongs to a group ID for which the `getgrgid()` function defined in the System Interfaces volume of POSIX.1-2008 (or equivalent) returns NULL.

**-xdev** The primary shall always evaluate as true; it shall cause *find* not to continue descending past directories that have a different device ID (*st\_dev*, see the `stat()` function defined in the System Interfaces volume of POSIX.1-2008). If any **-xdev** primary is specified, it shall apply to the entire expression even if the **-xdev** primary would not normally be evaluated.

**-prune** The primary shall always evaluate as true; it shall cause *find* not to descend the current pathname if it is a directory. If the **-depth** primary is specified, the **-prune** primary shall have no effect.

**-perm [*-*]*mode***  
The *mode* argument is used to represent file mode bits. It shall be identical in format to the *symbolic\_mode* operand described in *chmod*, and shall be interpreted as follows. To start, a template shall be assumed with all file mode bits cleared. An *op* symbol of `'+'` shall set the appropriate mode bits in the template; `'-'` shall clear the appropriate bits; `'='` shall set the appropriate mode bits, without regard to the contents of the file mode creation mask of the process. The *op* symbol of `'-'` cannot be the first character of *mode*; this avoids ambiguity with the optional leading `<hyphen>`. Since the initial mode is all bits off, there are not any symbolic modes that need to use `'-'` as the first character.

If the `<hyphen>` is omitted, the primary shall evaluate as true when the file permission bits exactly match the value of the resulting template.

90534 Otherwise, if *mode* is prefixed by a <hyphen>, the primary shall evaluate as true if  
 90535 at least all the bits in the resulting template are set in the file permission bits.

90536 **-perm** [-]*onum*  
 90537 If the <hyphen> is omitted, the primary shall evaluate as true when the file mode  
 90538 bits exactly match the value of the octal number *onum* (see the description of the  
 90539 octal *mode* in *chmod*). Otherwise, if *onum* is prefixed by a <hyphen>, the primary  
 90540 shall evaluate as true if at least all of the bits specified in *onum* are set. In both  
 90541 cases, the behavior is unspecified when *onum* exceeds 07777.

90542 **-type** *c* The primary shall evaluate as true if the type of the file is *c*, where *c* is 'b', 'c',  
 90543 'd', 'l', 'p', 'f', or 's' for block special file, character special file, directory,  
 90544 symbolic link, FIFO, regular file, or socket, respectively.

90545 **-links** *n* The primary shall evaluate as true if the file has *n* links.

90546 **-user** *uname* The primary shall evaluate as true if the file belongs to the user *uname*. If *uname* is  
 90547 a decimal integer and the *getpwnam*() (or equivalent) function does not return a  
 90548 valid user name, *uname* shall be interpreted as a user ID.

90549 **-group** *gname*  
 90550 The primary shall evaluate as true if the file belongs to the group *gname*. If *gname*  
 90551 is a decimal integer and the *getgrnam*() (or equivalent) function does not return a  
 90552 valid group name, *gname* shall be interpreted as a group ID.

90553 **-size** *n*[*c*] The primary shall evaluate as true if the file size in bytes, divided by 512 and  
 90554 rounded up to the next integer, is *n*. If *n* is followed by the character '*c*', the size  
 90555 shall be in bytes.

90556 **-atime** *n* The primary shall evaluate as true if the file access time subtracted from the  
 90557 initialization time, divided by 86 400 (with any remainder discarded), is *n*.

90558 **-ctime** *n* The primary shall evaluate as true if the time of last change of file status  
 90559 information subtracted from the initialization time, divided by 86 400 (with any  
 90560 remainder discarded), is *n*.

90561 **-mtime** *n* The primary shall evaluate as true if the file modification time subtracted from the  
 90562 initialization time, divided by 86 400 (with any remainder discarded), is *n*.

90563 **-exec** *utility\_name* [*argument* ...];  
 90564 **-exec** *utility\_name* [*argument* ...] {} +  
 90565 The end of the primary expression shall be punctuated by a <semicolon> or by a  
 90566 <plus-sign>. Only a <plus-sign> that immediately follows an argument  
 90567 containing only the two characters "{}" shall punctuate the end of the primary  
 90568 expression. Other uses of the <plus-sign> shall not be treated as special.

90569 If the primary expression is punctuated by a <semicolon>, the utility *utility\_name*  
 90570 shall be invoked once for each pathname and the primary shall evaluate as true if  
 90571 the utility returns a zero value as exit status. A *utility\_name* or *argument* containing  
 90572 only the two characters "{}" shall be replaced by the current pathname. If a  
 90573 *utility\_name* or *argument* string contains the two characters "{}", but not just the  
 90574 two characters "{}", it is implementation-defined whether *find* replaces those two  
 90575 characters or uses the string without change.

90576 If the primary expression is punctuated by a <plus-sign>, the primary shall always  
 90577 evaluate as true, and the pathnames for which the primary is evaluated shall be  
 90578 aggregated into sets. The utility *utility\_name* shall be invoked once for each set of  
 90579 aggregated pathnames. Each invocation shall begin after the last pathname in the

90580 set is aggregated, and shall be completed before the *find* utility exits and before the  
 90581 first pathname in the next set (if any) is aggregated for this primary, but it is  
 90582 otherwise unspecified whether the invocation occurs before, during, or after the  
 90583 evaluations of other primaries. If any invocation returns a non-zero value as exit  
 90584 status, the *find* utility shall return a non-zero exit status. An argument containing  
 90585 only the two characters "{}" shall be replaced by the set of aggregated  
 90586 pathnames, with each pathname passed as a separate argument to the invoked  
 90587 utility in the same order that it was aggregated. The size of any set of two or more  
 90588 pathnames shall be limited such that execution of the utility does not cause the  
 90589 system's {ARG\_MAX} limit to be exceeded. If more than one argument containing  
 90590 the two characters "{}" is present, the behavior is unspecified.

90591 The current directory for the invocation of *utility\_name* shall be the same as the  
 90592 current directory when the *find* utility was started. If the *utility\_name* names any of  
 90593 the special built-in utilities (see [Section 2.14](#), on page 2356), the results are  
 90594 undefined.

90595 **-ok** *utility\_name* [*argument* ...];  
 90596 The **-ok** primary shall be equivalent to **-exec**, except that the use of a <plus-sign>  
 90597 to punctuate the end of the primary expression need not be supported, and *find*  
 90598 shall request affirmation of the invocation of *utility\_name* using the current file as  
 90599 an argument by writing to standard error as described in the STDERR section. If  
 90600 the response on standard input is affirmative, the utility shall be invoked.  
 90601 Otherwise, the command shall not be invoked and the value of the **-ok** operand  
 90602 shall be false.

90603 **-print** The primary shall always evaluate as true; it shall cause the current pathname to  
 90604 be written to standard output.

90605 **-newer** *file* The primary shall evaluate as true if the modification time of the current file is  
 90606 more recent than the modification time of the file named by the pathname *file*.

90607 **-depth** The primary shall always evaluate as true; it shall cause descent of the directory  
 90608 hierarchy to be done so that all entries in a directory are acted on before the  
 90609 directory itself. If a **-depth** primary is not specified, all entries in a directory shall  
 90610 be acted on after the directory itself. If any **-depth** primary is specified, it shall  
 90611 apply to the entire expression even if the **-depth** primary would not normally be  
 90612 evaluated.

90613 The primaries can be combined using the following operators (in order of decreasing  
 90614 precedence):

90615 (*expression*) True if *expression* is true.

90616 **! expression** Negation of a primary; the unary NOT operator.

90617 *expression* [**-a**] *expression*  
 90618 Conjunction of primaries; the AND operator is implied by the juxtaposition of two  
 90619 primaries or made explicit by the optional **-a** operator. The second expression shall  
 90620 not be evaluated if the first expression is false.

90621 *expression* **-o** *expression*  
 90622 Alternation of primaries; the OR operator. The second expression shall not be  
 90623 evaluated if the first expression is true.

90624 If no *expression* is present, **-print** shall be used as the expression. Otherwise, if the given  
 90625 expression does not contain any of the primaries **-exec**, **-ok**, or **-print**, the given expression

90626 shall be effectively replaced by:

90627 ( *given\_expression* ) -print

90628 The **-user**, **-group**, and **-newer** primaries each shall evaluate their respective arguments only  
90629 once.

90630 When the file type evaluated for the current file is a symbolic link, the results of evaluating the  
90631 **-perm** primary are implementation-defined.

90632 **STDIN**

90633 If the **-ok** primary is used, the response shall be read from the standard input. An entire line  
90634 shall be read as the response. Otherwise, the standard input shall not be used.

90635 **INPUT FILES**

90636 None.

90637 **ENVIRONMENT VARIABLES**

90638 The following environment variables shall affect the execution of *find*:

90639 **LANG** Provide a default value for the internationalization variables that are unset or null.  
90640 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
90641 variables used to determine the values of locale categories.)

90642 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
90643 internationalization variables.

90644 **LC\_COLLATE**

90645 Determine the locale for the behavior of ranges, equivalence classes, and multi-  
90646 character collating elements used in the pattern matching notation for the **-n**  
90647 option and in the extended regular expression defined for the **yesexpr** locale  
90648 keyword in the *LC\_MESSAGES* category.

90649 **LC\_CTYPE** This variable determines the locale for the interpretation of sequences of bytes of  
90650 text data as characters (for example, single-byte as opposed to multi-byte  
90651 characters in arguments), the behavior of character classes within the pattern  
90652 matching notation used for the **-n** option, and the behavior of character classes  
90653 within regular expressions used in the extended regular expression defined for the  
90654 **yesexpr** locale keyword in the *LC\_MESSAGES* category.

90655 **LC\_MESSAGES**

90656 Determine the locale used to process affirmative responses, and the locale used to  
90657 affect the format and contents of diagnostic messages and prompts written to  
90658 standard error.

90659 XSI **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

90660 **PATH** Determine the location of the *utility\_name* for the **-exec** and **-ok** primaries, as  
90661 described in XBD [Chapter 8](#) (on page 173).

90662 **ASYNCHRONOUS EVENTS**

90663 Default.

90664 **STDOUT**

90665 The **-print** primary shall cause the current pathnames to be written to standard output. The  
90666 format shall be:

90667 "%s\n", <path>

90668 **STDERR**

90669 The **-ok** primary shall write a prompt to standard error containing at least the *utility\_name* to be  
 90670 invoked and the current pathname. In the POSIX locale, the last non-<blank> in the prompt shall  
 90671 be ' ? ' . The exact format used is unspecified.

90672 Otherwise, the standard error shall be used only for diagnostic messages.

90673 **OUTPUT FILES**

90674 None.

90675 **EXTENDED DESCRIPTION**

90676 None.

90677 **EXIT STATUS**

90678 The following exit values shall be returned:

90679 0 All *path* operands were traversed successfully.

90680 >0 An error occurred.

90681 **CONSEQUENCES OF ERRORS**

90682 Default.

90683 **APPLICATION USAGE**

90684 When used in operands, pattern matching notation, <semicolon>, <left-parenthesis>, and  
 90685 <right-parenthesis> characters are special to the shell and must be quoted (see [Section 2.2](#), on  
 90686 page 2320).

90687 The bit that is traditionally used for sticky (historically 01000) is specified in the **-perm** primary  
 90688 using the octal number argument form. Since this bit is not defined by this volume of  
 90689 POSIX.1-2008, applications must not assume that it actually refers to the traditional sticky bit.

90690 **EXAMPLES**

90691 1. The following commands are equivalent:

90692 find .  
 90693 find . -print

90694 They both write out the entire directory hierarchy from the current directory.

90695 2. The following command:

90696 find / \( -name tmp -o -name '\*.xx' \) -atime +7 -exec rm {} \;

90697 removes all files named **tmp** or ending in **.xx** that have not been accessed for seven or  
 90698 more 24-hour periods.

90699 3. The following command:

90700 find . -perm -o+w,+s

90701 prints (**-print** is assumed) the names of all files in or below the current directory, with all  
 90702 of the file permission bits S\_ISUID, S\_ISGID, and S\_IWOTH set.

90703 4. The following command:

90704 find . -name SCCS -prune -o -print

90705 recursively prints pathnames of all files in the current directory and below, but skips  
 90706 directories named SCCS and files in them.

5. The following command:

```
find . -print -name SCCS -prune
```

behaves as in the previous example, but prints the names of the SCCS directories.

6. The following command is roughly equivalent to the **-nt** extension to *test*:

```
if [-n "$(find file1 -prune -newer file2)"]; then
 printf %s\\n "file1 is newer than file2"
fi
```

7. The descriptions of **-atime**, **-ctime**, and **-mtime** use the terminology *n* “86 400 second periods (days)”. For example, a file accessed at 23:59 is selected by:

```
find . -atime -1 -print
```

at 00:01 the next day (less than 24 hours later, not more than one day ago); the midnight boundary between days has no effect on the 24-hour calculation.

8. The following command:

```
find . ! -name . -prune -name '*.old' -exec \
 sh -c 'mv "$@" ../old/' sh {} +
```

performs the same task as:

```
mv /*.old ../old /*.old ../old/
```

while avoiding an “Argument list too long” error if there are a large number of files ending with **.old** and without running *mv* if there are no such files (and avoiding “No such file or directory” errors if **../old** does not exist or no files match **/\*.old** or **../old**).

The alternative:

```
find . ! -name . -prune -name '*.old' -exec mv {} ../old/ \;
```

is less efficient if there are many files to move because it executes one *mv* command per file.

9. On systems configured to mount removable media on directories under **/media**, the following command searches the file hierarchy for files larger than 100 000 KB without searching any mounted removable media:

```
find / -path /media -prune -o -size +200000 -print
```

10. Except for the root directory, and **"/"** on implementations where **"/"** does not refer to the root directory, no pattern given to **-name** will match a **<slash>**, because trailing **<slash>** characters are ignored when computing the basename of the file under evaluation. Given two empty directories named **foo** and **bar**, the following command:

```
find foo/// bar/// -name foo -o -name 'bar?*'
```

prints only the line **foo///**.

## RATIONALE

The **-a** operator was retained as an optional operator for compatibility with historical shell scripts, even though it is redundant with expression concatenation.

The descriptions of the **'-'** modifier on the *mode* and *onum* arguments to the **-perm** primary agree with historical practice on BSD and System V implementations. System V and BSD documentation both describe it in terms of checking additional bits; in fact, it uses the same bits, but checks for having at least all of the matching bits set instead of having exactly the matching

bits set.

The exact format of the interactive prompts is unspecified. Only the general nature of the contents of prompts are specified because:

- Implementations may desire more descriptive prompts than those used on historical implementations.
- Since the historical prompt strings do not terminate with <newline> characters, there is no portable way for another program to interact with the prompts of this utility via pipes.

Therefore, an application using this prompting option relies on the system to provide the most suitable dialog directly with the user, based on the general guidelines specified.

The **-name** *file* operand was changed to use the shell pattern matching notation so that *find* is consistent with other utilities using pattern matching.

The **-size** operand refers to the size of a file, rather than the number of blocks it may occupy in the file system. The intent is that the *st\_size* field defined in the System Interfaces volume of POSIX.1-2008 should be used, not the *st\_blocks* found in historical implementations. There are at least two reasons for this:

1. In both System V and BSD, *find* only uses *st\_size* in size calculations for the operands specified by this volume of POSIX.1-2008. (BSD uses *st\_blocks* only when processing the **-ls** primary.)
2. Users usually think of file size in terms of bytes, which is also the unit used by the *ls* utility for the output from the **-l** option. (In both System V and BSD, *ls* uses *st\_size* for the **-l** option size field and uses *st\_blocks* for the *ls -s* calculations. This volume of POSIX.1-2008 does not specify *ls -s*.)

The descriptions of **-atime**, **-ctime**, and **-mtime** were changed from the SVID description of *n* “days” to *n* being the result of the integer division of the time difference in seconds by 86 400. The description is also different in terms of the exact timeframe for the *n* case (*versus* the *+n* or *-n*), but it matches all known historical implementations. It refers to one 86 400 second period in the past, not any time from the beginning of that period to the current time. For example, **-atime 2** is true if the file was accessed any time in the period from 72 hours to 48 hours ago.

Historical implementations do not modify “{ }” when it appears as a substring of an **-exec** or **-ok** *utility\_name* or argument string. There have been numerous user requests for this extension, so this volume of POSIX.1-2008 allows the desired behavior. At least one recent implementation does support this feature, but encountered several problems in managing memory allocation and dealing with multiple occurrences of “{ }” in a string while it was being developed, so it is not yet required behavior.

Assuming the presence of **-print** was added to correct a historical pitfall that plagues novice users, it is entirely upwards-compatible from the historical System V *find* utility. In its simplest form (*find directory*), it could be confused with the historical BSD fast *find*. The BSD developers agreed that adding **-print** as a default expression was the correct decision and have added the fast *find* functionality within a new utility called *locate*.

Historically, the **-L** option was implemented using the primary **-follow**. The **-H** and **-L** options were added for two reasons. First, they offer a finer granularity of control and consistency with other programs that walk file hierarchies. Second, the **-follow** primary always evaluated to true. As they were historically really global variables that took effect before the traversal began, some valid expressions had unexpected results. An example is the expression **-print -o -follow**. Because **-print** always evaluates to true, the standard order of evaluation implies that **-follow** would never be evaluated. This was never the case. Historical practice for the **-follow** primary,

however, is not consistent. Some implementations always follow symbolic links on the command line whether **-follow** is specified or not. Others follow symbolic links on the command line only if **-follow** is specified. Both behaviors are provided by the **-H** and **-L** options, but scripts using the current **-follow** primary would be broken if the **-follow** option is specified to work either way.

Since the **-L** option resolves all symbolic links and the **-type l** primary is true for symbolic links that still exist after symbolic links have been resolved, the command:

```
find -L . -type l
```

prints a list of symbolic links reachable from the current directory that do not resolve to accessible files.

A feature of SVR4's *find* utility was the **-exec** primary's **+** terminator. This allowed filenames containing special characters (especially <newline> characters) to be grouped together without the problems that occur if such filenames are piped to *xargs*. Other implementations have added other ways to get around this problem, notably a **-print0** primary that wrote filenames with a null byte terminator. This was considered here, but not adopted. Using a null terminator meant that any utility that was going to process *find*'s **-print0** output had to add a new option to parse the null terminators it would now be reading.

The **"-exec ... {} +"** syntax adopted was a result of IEEE PASC Interpretation 1003.2 #210. It should be noted that this is an incompatible change to IEEE Std 1003.2-1992. For example, the following command printed all files with a **'-'** after their name if they are regular files, and a **'+'** otherwise:

```
find / -type f -exec echo {} - ';' -o -exec echo {} + ';' -
```

The change invalidates usage like this. Even though the previous standard stated that this usage would work, in practice many did not support it and the standard developers felt it better to now state that this was not allowable.

## FUTURE DIRECTIONS

None.

## CHANGE HISTORY

First released in Issue 2.

### Issue 5

The FUTURE DIRECTIONS section is added.

### Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The **-perm** [**-l**onum primary is supported.

The *find* utility is aligned with the IEEE P1003.2b draft standard, to include processing of symbolic links and changes to the description of the **atime**, **ctime**, and **mtime** operands.

IEEE PASC Interpretation 1003.2 #210 is applied, extending the **-exec** operand.

90837 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/13 is applied, updating the RATIONALE  
90838 section to be consistent with the normative text.

90839 **Issue 7**

90840 Austin Group Interpretation 1003.1-2001 #126 is applied, changing the description of the  
90841 *LC\_MESSAGES* environment variable.

90842 Austin Group Interpretation 1003.1-2001 #127 is applied, rephrasing the description of the **-exec**  
90843 primary to be “immediately follows”.

90844 Austin Group Interpretation 1003.1-2001 #185 is applied, clarifying the requirements for the **-H**  
90845 and **-L** options.

90846 Austin Group Interpretation 1003.1-2001 #186 is applied, clarifying the requirements for the  
90847 evaluation of *path* operands.

90848 Austin Group Interpretation 1003.1-2001 #195 is applied, clarifying the interpretation of the first  
90849 operand.

90850 SD5-XCU-ERN-48 is applied, clarifying the **-L** option in the case that the referenced file does not  
90851 exist.

90852 SD5-XCU-ERN-89 is applied, updating the OPERANDS section.

90853 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

90854 SD5-XCU-ERN-117 is applied, clarifying the **-perm** operand.

90855 SD5-XCU-ERN-122 is applied, adding a new EXAMPLE.

90856 The description of the **-name** primary is revised and the **-path** primary is added (with a new  
90857 example).

90858 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0086 [365], XCU/TC1-2008/0087 +  
90859 [310], XCU/TC1-2008/0088 [309,310,430], XCU/TC1-2008/0089 [235], and XCU/TC1-2008/0090 +  
90860 [445] are applied.

90861 **NAME**

90862 fold — filter for folding lines

90863 **SYNOPSIS**90864 fold [-bs] [-w *width*] [*file...*]90865 **DESCRIPTION**

90866 The *fold* utility is a filter that shall fold lines from its input files, breaking the lines to have a  
 90867 maximum of *width* column positions (or bytes, if the **-b** option is specified). Lines shall be  
 90868 broken by the insertion of a <newline> such that each output line (referred to later in this section  
 90869 as a *segment*) is the maximum width possible that does not exceed the specified number of  
 90870 column positions (or bytes). A line shall not be broken in the middle of a character. The behavior  
 90871 is undefined if *width* is less than the number of columns any single character in the input would  
 90872 occupy.

90873 If the <carriage-return>, <backspace>, or <tab> characters are encountered in the input, and the  
 90874 **-b** option is not specified, they shall be treated specially:

90875 <backspace> The current count of line width shall be decremented by one, although the count  
 90876 never shall become negative. The *fold* utility shall not insert a <newline>  
 90877 immediately before or after any <backspace>, unless the following character has a  
 90878 width greater than 1 and would cause the line width to exceed *width*.

90879 <carriage-return>  
 90880 The current count of line width shall be set to zero. The *fold* utility shall not insert a  
 90881 <newline> immediately before or after any <carriage-return>.

90882 <tab> Each <tab> encountered shall advance the column position pointer to the next tab  
 90883 stop. Tab stops shall be at each column position *n* such that *n* modulo 8 equals 1.

90884 **OPTIONS**90885 The *fold* utility shall conform to XBD [Section 12.2](#) (on page 215).

90886 The following options shall be supported:

90887 **-b** Count *width* in bytes rather than column positions.

90888 **-s** If a segment of a line contains a <blank> within the first *width* column positions (or  
 90889 bytes), break the line after the last such <blank> meeting the width constraints. If  
 90890 there is no <blank> meeting the requirements, the **-s** option shall have no effect for  
 90891 that output segment of the input line.

90892 **-w *width*** Specify the maximum line length, in column positions (or bytes if **-b** is specified).  
 90893 The results are unspecified if *width* is not a positive decimal number. The default  
 90894 value shall be 80.

90895 **OPERANDS**

90896 The following operand shall be supported:

90897 *file* A pathname of a text file to be folded. If no *file* operands are specified, the standard  
 90898 input shall be used.

90899 **STDIN**

90900 The standard input shall be used if no *file* operands are specified, and shall be used if a *file*  
 90901 operand is '-' and the implementation treats the '-' as meaning standard input. Otherwise,  
 90902 the standard input shall not be used. See the INPUT FILES section.

90903 **INPUT FILES**

90904 If the **-b** option is specified, the input files shall be text files except that the lines are not limited  
 90905 to {LINE\_MAX} bytes in length. If the **-b** option is not specified, the input files shall be text files.

90906 **ENVIRONMENT VARIABLES**

90907 The following environment variables shall affect the execution of *fold*:

90908 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 90909 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 90910 variables used to determine the values of locale categories.)

90911 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 90912 internationalization variables.

90913 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 90914 characters (for example, single-byte as opposed to multi-byte characters in  
 90915 arguments and input files), and for the determination of the width in column  
 90916 positions each character would occupy on a constant-width font output device.

90917 **LC\_MESSAGES**  
 90918 Determine the locale that should be used to affect the format and contents of  
 90919 diagnostic messages written to standard error.

90920 XSI **NLSPATH** Determine the location of message catalogs for the processing of **LC\_MESSAGES**.

90921 **ASYNCHRONOUS EVENTS**

90922 Default.

90923 **STDOUT**

90924 The standard output shall be a file containing a sequence of characters whose order shall be  
 90925 preserved from the input files, possibly with inserted <newline> characters.

90926 **STDERR**

90927 The standard error shall be used only for diagnostic messages.

90928 **OUTPUT FILES**

90929 None.

90930 **EXTENDED DESCRIPTION**

90931 None.

90932 **EXIT STATUS**

90933 The following exit values shall be returned:

90934 0 All input files were processed successfully.

90935 >0 An error occurred.

90936 **CONSEQUENCES OF ERRORS**

90937 Default.

**APPLICATION USAGE**

The *cut* and *fold* utilities can be used to create text files out of files with arbitrary line lengths. The *cut* utility should be used when the number of lines (or records) needs to remain constant. The *fold* utility should be used when the contents of long lines need to be kept contiguous.

The *fold* utility is frequently used to send text files to printers that truncate, rather than fold, lines wider than the printer is able to print (usually 80 or 132 column positions).

**EXAMPLES**

An example invocation that submits a file of possibly long lines to the printer (under the assumption that the user knows the line width of the printer to be assigned by *lp*):

```
fold -w 132 bigfile | lp
```

**RATIONALE**

Although terminal input in canonical processing mode requires the erase character (frequently set to <backspace>) to erase the previous character (not byte or column position), terminal output is not buffered and is extremely difficult, if not impossible, to parse correctly; the interpretation depends entirely on the physical device that actually displays/prints/stores the output. In all known internationalized implementations, the utilities producing output for mixed column-width output assume that a <backspace> character backs up one column position and outputs enough <backspace> characters to return to the start of the character when <backspace> is used to provide local line motions to support underlining and emboldening operations. Since *fold* without the **-b** option is dealing with these same constraints, <backspace> is always treated as backing up one column position rather than backing up one character.

Historical versions of the *fold* utility assumed 1 byte was one character and occupied one column position when written out. This is no longer always true. Since the most common usage of *fold* is believed to be folding long lines for output to limited-length output devices, this capability was preserved as the default case. The **-b** option was added so that applications could *fold* files with arbitrary length lines into text files that could then be processed by the standard utilities. Note that although the width for the **-b** option is in bytes, a line is never split in the middle of a character. (It is unspecified what happens if a width is specified that is too small to hold a single character found in the input followed by a <newline>.)

The tab stops are hardcoded to be every eighth column to meet historical practice. No new method of specifying other tab stops was invented.

**FUTURE DIRECTIONS**

None.

**CHANGE HISTORY**

First released in Issue 4.

**Issue 6**

The normative text is reworded to avoid use of the term “must” for application requirements.

**Issue 7**

Austin Group Interpretation 1003.1-2001 #092 is applied.

90980  
90981  
90982

Austin Group Interpretation 1003.1-2001 #204 is applied, updating the DESCRIPTION to clarify when a <newline> can be inserted before or after a <backspace>.

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

90983 **NAME**90984 fort77 — FORTRAN compiler (**FORTRAN**)90985 **SYNOPSIS**

```
90986 FD fort77 [-c] [-g] [-L directory]... [-O optlevel] [-o outfile] [-s]
90987 [-w] operand...
```

90988 **DESCRIPTION**

90989 The *fort77* utility is the interface to the FORTRAN compilation system; it shall accept the full  
 90990 FORTRAN-77 language defined by the ANSI X3.9-1978 standard. The system conceptually  
 90991 consists of a compiler and link editor. The files referenced by *operands* are compiled and linked  
 90992 to produce an executable file. It is unspecified whether the linking occurs entirely within the  
 90993 operation of *fort77*; some implementations may produce objects that are not fully resolved until  
 90994 the file is executed.

90995 If the *-c* option is present, for all pathname operands of the form *file.f*, the files:

90996  $\$(\text{basename } \textit{pathname.f}) .o$

90997 shall be created or overwritten as the result of successful compilation. If the *-c* option is not  
 90998 specified, it is unspecified whether such *.o* files are created or deleted for the *file.f* operands.

90999 If there are no options that prevent link editing (such as *-c*) and all operands compile and link  
 91000 without error, the resulting executable file shall be written into the file named by the *-o* option  
 91001 (if present) or to the file **a.out**. The executable file shall be created as specified in the System  
 91002 Interfaces volume of POSIX.1-2008, except that the file permissions shall be set to:

91003  $S\_IRWXO \mid S\_IRWXG \mid S\_IRWXU$

91004 and that the bits specified by the *umask* of the process shall be cleared.

91005 **OPTIONS**

91006 The *fort77* utility shall conform to XBD [Section 12.2](#) (on page 215), except that:

- 91007 • The *-l library* operands have the format of options, but their position within a list of  
 91008 operands affects the order in which libraries are searched.
- 91009 • The order of specifying the multiple *-L* options is significant.
- 91010 • Conforming applications shall specify each option separately; that is, grouping option  
 91011 letters (for example, *-cg*) need not be recognized by all implementations.

91012 The following options shall be supported:

- |       |                   |                                                                                                                                                                                                                                                                                                                                               |
|-------|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 91013 | <b>-c</b>         | Suppress the link-edit phase of the compilation, and do not remove any object files that are produced.                                                                                                                                                                                                                                        |
| 91014 |                   |                                                                                                                                                                                                                                                                                                                                               |
| 91015 | <b>-g</b>         | Produce symbolic information in the object or executable files; the nature of this information is unspecified, and may be modified by implementation-defined interactions with other options.                                                                                                                                                 |
| 91016 |                   |                                                                                                                                                                                                                                                                                                                                               |
| 91017 |                   |                                                                                                                                                                                                                                                                                                                                               |
| 91018 | <b>-s</b>         | Produce object or executable files, or both, from which symbolic and other information not required for proper execution using the <i>exec</i> family of functions defined in the System Interfaces volume of POSIX.1-2008 has been removed (stripped). If both <i>-g</i> and <i>-s</i> options are present, the action taken is unspecified. |
| 91019 |                   |                                                                                                                                                                                                                                                                                                                                               |
| 91020 |                   |                                                                                                                                                                                                                                                                                                                                               |
| 91021 |                   |                                                                                                                                                                                                                                                                                                                                               |
| 91022 | <b>-o outfile</b> | Use the pathname <i>outfile</i> , instead of the default <b>a.out</b> , for the executable file produced. If the <i>-o</i> option is present with <i>-c</i> , the result is unspecified.                                                                                                                                                      |
| 91023 |                   |                                                                                                                                                                                                                                                                                                                                               |

- 91024        **-L *directory***    Change the algorithm of searching for the libraries named in **-I** operands to look in  
 91025        the directory named by the *directory* pathname before looking in the usual places.  
 91026        Directories named in **-L** options shall be searched in the specified order. At least  
 91027        ten instances of this option shall be supported in a single *fort77* command  
 91028        invocation. If a directory specified by a **-L** option contains a file named **libf.a**, the  
 91029        results are unspecified.
- 91030        **-O *optlevel***    Specify the level of code optimization. If the *optlevel* option-argument is the digit  
 91031        '0', all special code optimizations shall be disabled. If it is the digit '1', the  
 91032        nature of the optimization is unspecified. If the **-O** option is omitted, the nature of  
 91033        the system's default optimization is unspecified. It is unspecified whether code  
 91034        generated in the presence of the **-O 0** option is the same as that generated when  
 91035        **-O** is omitted. Other *optlevel* values may be supported.
- 91036        **-w**                Suppress warnings.
- 91037        Multiple instances of **-L** options can be specified.

## 91038 OPERANDS

- 91039        An *operand* is either in the form of a pathname or the form **-I *library***. At least one operand of the  
 91040        pathname form shall be specified. The following operands shall be supported:
- 91041        *file.f*            The pathname of a FORTRAN source file to be compiled and optionally passed to  
 91042        the link editor. The filename operand shall be of this form if the **-c** option is used.
- 91043        *file.a*            A library of object files typically produced by *ar*, and passed directly to the link  
 91044        editor. Implementations may recognize implementation-defined suffixes other  
 91045        than **.a** as denoting object file libraries.
- 91046        *file.o*            An object file produced by *fort77 -c* and passed directly to the link editor.  
 91047        Implementations may recognize implementation-defined suffixes other than **.o** as  
 91048        denoting object files.
- 91049        The processing of other files is implementation-defined.
- 91050        **-I *library***        (The letter ell.) Search the library named:
- 91051                *liblibrary.a*
- 91052                A library is searched when its name is encountered, so the placement of a **-I**  
 91053                operand is significant. Several standard libraries can be specified in this manner, as  
 91054                described in the EXTENDED DESCRIPTION section. Implementations may  
 91055                recognize implementation-defined suffixes other than **.a** as denoting libraries.

## 91056 STDIN

- 91057        Not used.

## 91058 INPUT FILES

- 91059        The input file shall be one of the following: a text file containing FORTRAN source code; an  
 91060        object file in the format produced by *fort77 -c*; or a library of object files, in the format produced  
 91061        by archiving zero or more object files, using *ar*. Implementations may supply additional utilities  
 91062        that produce files in these formats. Additional input files are implementation-defined.
- 91063        A <tab> encountered within the first six characters on a line of source code shall cause the  
 91064        compiler to interpret the following character as if it were the seventh character on the line (that  
 91065        is, in column 7).

91066 **ENVIRONMENT VARIABLES**91067 The following environment variables shall affect the execution of *fort77*:

91068 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 91069 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 91070 variables used to determine the values of locale categories.)

91071 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 91072 internationalization variables.

91073 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 91074 characters (for example, single-byte as opposed to multi-byte characters in  
 91075 arguments and input files).

91076 *LC\_MESSAGES*

91077 Determine the locale that should be used to affect the format and contents of  
 91078 diagnostic messages written to standard error.

91079 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

91080 *TMPDIR* Determine the pathname that should override the default directory for temporary  
 91081 files, if any.

91082 **ASYNCHRONOUS EVENTS**

91083 Default.

91084 **STDOUT**

91085 Not used.

91086 **STDERR**

91087 The standard error shall be used only for diagnostic messages. If more than one *file* operand  
 91088 ending in *.f* (or possibly other unspecified suffixes) is given, for each such file:

91089 "%s:\n", <*file*>

91090 may be written to allow identification of the diagnostic message with the appropriate input file.

91091 This utility may produce warning messages about certain conditions that do not warrant  
 91092 returning an error (non-zero) exit value.

91093 **OUTPUT FILES**

91094 Object files, listing files, and executable files shall be produced in unspecified formats.

91095 **EXTENDED DESCRIPTION**91096 **Standard Libraries**91097 The *fort77* utility shall recognize the following *-l* operand for the standard library:

91098 *-l f* This library contains all functions referenced in the ANSI X3.9-1978 standard. This  
 91099 operand shall not be required to be present to cause a search of this library.

91100 In the absence of options that inhibit invocation of the link editor, such as *-c*, the *fort77* utility  
 91101 shall cause the equivalent of a *-l f* operand to be passed to the link editor as the last *-l* operand,  
 91102 causing it to be searched after all other object files and libraries are loaded.

91103 It is unspecified whether the library *libf.a* exists as a regular file. The implementation may  
 91104 accept as *-l* operands names of objects that do not exist as regular files.

**External Symbols**

The FORTRAN compiler and link editor shall support the significance of external symbols up to a length of at least 31 bytes; case folding is permitted. The action taken upon encountering symbols exceeding the implementation-defined maximum symbol length is unspecified.

The compiler and link editor shall support a minimum of 511 external symbols per source or object file, and a minimum of 4095 external symbols total. A diagnostic message is written to standard output if the implementation-defined limit is exceeded; other actions are unspecified.

**EXIT STATUS**

The following exit values shall be returned:

0 Successful compilation or link edit.

>0 An error occurred.

**CONSEQUENCES OF ERRORS**

When *fort77* encounters a compilation error, it shall write a diagnostic to standard error and continue to compile other source code operands. It shall return a non-zero exit status, but it is implementation-defined whether an object module is created. If the link edit is unsuccessful, a diagnostic message shall be written to standard error, and *fort77* shall exit with a non-zero status.

**APPLICATION USAGE**

None.

**EXAMPLES**

The following usage example compiles **xyz.f** and creates the executable file **foo**:

```
fort77 -o foo xyz.f
```

The following example compiles **xyz.f** and creates the object file **xyz.o**:

```
fort77 -c xyz.f
```

The following example compiles **xyz.f** and creates the executable file **a.out**:

```
fort77 xyz.f
```

The following example compiles **xyz.f**, links it with **b.o**, and creates the executable **a.out**:

```
fort77 xyz.f b.o
```

**RATIONALE**

The name of this utility was chosen as *fort77* to parallel the renaming of the C compiler. The name *f77* was not chosen to avoid problems with historical implementations. The ANSI X3.9-1978 standard was selected as a normative reference because the ISO/IEC version of FORTRAN-77 has been superseded by the ISO/IEC 1539:1991 standard.

The file inclusion and symbol definition **#define** mechanisms used by the *c99* utility were not included in this volume of POSIX.1-2008—even though they are commonly implemented—since there is no requirement that the FORTRAN compiler use the C preprocessor.

The **-onetrip** option was not included in this volume of POSIX.1-2008, even though many historical compilers support it, because it is derived from FORTRAN-66; it is an anachronism that should not be perpetuated.

Some implementations produce compilation listings. This aspect of FORTRAN has been left unspecified because there was controversy concerning the various methods proposed for implementing it: a **-V** option overlapped with historical vendor practice and a naming convention of creating files with **.l** suffixes collided with historical *lex* file naming practice.

There is no **-I** option in this version of this volume of POSIX.1-2008 to specify a directory for file inclusion. An **INCLUDE** directive has been a part of the Fortran-90 discussions, but an interface supporting that standard is not in the current scope.

It is noted that many FORTRAN compilers produce an object module even when compilation errors occur; during a subsequent compilation, the compiler may patch the object module rather than recompiling all the code. Consequently, it is left to the implementor whether or not an object file is created.

A reference to MIL-STD-1753 was removed from an early proposal in response to a request from the POSIX FORTRAN-binding standard developers. It was not the intention of the standard developers to require certification of the FORTRAN compiler, and IEEE Std 1003.9-1992 does not specify the military standard or any special preprocessing requirements. Furthermore, use of that document would have been inappropriate for an international standard.

The specification of optimization has been subject to changes through early proposals. At one time, **-O** and **-N** were Booleans: optimize and do not optimize (with an unspecified default). Some historical practice led this to be changed to:

**-O 0**           No optimization.

**-O 1**           Some level of optimization.

**-O n**           Other, unspecified levels of optimization.

It is not always clear whether “good code generation” is the same thing as optimization. Simple optimizations of local actions do not usually affect the semantics of a program. The **-O 0** option has been included to accommodate the very particular nature of scientific calculations in a highly optimized environment; compilers make errors. Some degree of optimization is expected, even if it is not documented here, and the ability to shut it off completely could be important when porting an application. An implementation may treat **-O 0** as “do less than normal” if it wishes, but this is only meaningful if any of the operations it performs can affect the semantics of a program. It is highly dependent on the implementation whether doing less than normal is logical. It is not the intent of the **-O 0** option to ask for inefficient code generation, but rather to assure that any semantically visible optimization is suppressed.

The specification of standard library access is consistent with the C compiler specification. Implementations are not required to have **/usr/lib/libf.a**, as many historical implementations do, but if not they are required to recognize **f** as a token.

External symbol size limits are in normative text; conforming applications need to know these limits. However, the minimum maximum symbol length should be taken as a constraint on a conforming application, not on an implementation, and consequently the action taken for a symbol exceeding the limit is unspecified. The minimum size for the external symbol table was added for similar reasons.

The CONSEQUENCES OF ERRORS section clearly specifies the behavior of the compiler when compilation or link-edit errors occur. The behavior of several historical implementations was examined, and the choice was made to be silent on the status of the executable, or **a.out**, file in the face of compiler or linker errors. If a linker writes the executable file, then links it on disk with *lseek()*s and *write()*s, the partially linked executable file can be left on disk and its execute bits turned off if the link edit fails. However, if the linker links the image in memory before writing the file to disk, it need not touch the executable file (if it already exists) because the link edit fails. Since both approaches are historical practice, a conforming application shall rely on the exit status of *fort77*, rather than on the existence or mode of the executable file.

The **-g** and **-s** options are not specified as mutually-exclusive. Historically, these two options

91193 have been mutually-exclusive, but because both are so loosely specified, it seemed appropriate  
91194 to leave their interaction unspecified.

91195 The requirement that conforming applications specify compiler options separately is to reserve  
91196 the multi-character option name space for vendor-specific compiler options, which are known to  
91197 exist in many historical implementations. Implementations are not required to recognize, for  
91198 example, `-gc` as if it were `-g -c`; nor are they forbidden from doing so. The SYNOPSIS shows all  
91199 of the options separately to highlight this requirement on applications.

91200 Echoing filenames to standard error is considered a diagnostic message because it would  
91201 otherwise be difficult to associate an error message with the erring file. They are described with  
91202 “may” to allow implementations to use other methods of identifying files and to parallel the  
91203 description in *c99*.

#### 91204 FUTURE DIRECTIONS

91205 A compilation system based on the ISO/IEC 1539:1991 standard may be considered for a future  
91206 version; it may have a different utility name from *fort77*.

#### 91211 CHANGE HISTORY

91212 First released in Issue 4.

#### 91213 Issue 6

91214 This utility is marked as part of the FORTRAN Development Utilities option.

91215 The normative text is reworded to avoid use of the term “must” for application requirements.

#### 91216 Issue 7

91217 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

91218 **NAME**91219 **fuser** — list process IDs of all processes that have one or more files open91220 **SYNOPSIS**91221 XSI `fuser [-cfu] file...`91222 **DESCRIPTION**

91223 The *fuser* utility shall write to standard output the process IDs of processes running on the local  
 91224 system that have one or more named files open. For block special devices, all processes using  
 91225 any file on that device are listed.

91226 The *fuser* utility shall write to standard error additional information about the named files  
 91227 indicating how the file is being used.

91228 Any output for processes running on remote systems that have a named file open is unspecified.

91229 A user may need appropriate privileges to invoke the *fuser* utility.

91230 **OPTIONS**

91231 The *fuser* utility shall conform to XBD [Section 12.2](#) (on page 215).

91232 The following options shall be supported:

91233 **-c** The file is treated as a mount point and the utility shall report on any files open in  
 91234 the file system.

91235 **-f** The report shall be only for the named files.

91236 **-u** The user name, in parentheses, associated with each process ID written to standard  
 91237 output shall be written to standard error.

91238 **OPERANDS**

91239 The following operand shall be supported:

91240 *file* A pathname on which the file or file system is to be reported.

91241 **STDIN**

91242 Not used.

91243 **INPUT FILES**

91244 The user database.

91245 **ENVIRONMENT VARIABLES**

91246 The following environment variables shall affect the execution of *fuser*:

91247 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 91248 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 91249 variables used to determine the values of locale categories.)

91250 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 91251 internationalization variables.

91252 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 91253 characters (for example, single-byte as opposed to multi-byte characters in  
 91254 arguments).

91255 **LC\_MESSAGES**

91256 Determine the locale that should be used to affect the format and contents of  
 91257 diagnostic messages written to standard error.

91258 *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

91259 **ASYNCHRONOUS EVENTS**

91260 Default.

91261 **STDOUT**

91262 The *fuser* utility shall write the process ID for each process using each file given as an operand to

91263 standard output in the following format:

91264 "%d", <*process\_id*>

91265 **STDERR**

91266 The *fuser* utility shall write diagnostic messages to standard error.

91267 The *fuser* utility also shall write the following to standard error:

91268 • The pathname of each named file is written followed immediately by a <colon>.

91269 • For each process ID written to standard output, the character 'c' shall be written to

91270 standard error if the process is using the file as its current directory and the character 'r'

91271 shall be written to standard error if the process is using the file as its root directory.

91272 Implementations may write other alphabetic characters to indicate other uses of files.

91273 • When the *-u* option is specified, characters indicating the use of the file shall be followed

91274 immediately by the user name, in parentheses, corresponding to the real user ID of the

91275 process. If the user name cannot be resolved from the real user ID of the process, the real

91276 user ID of the process shall be written instead of the user name.

91277 When standard output and standard error are directed to the same file, the output shall be

91278 interleaved so that the filename appears at the start of each line, followed by the process ID and

91279 characters indicating the use of the file. Then, if the *-u* option is specified, the user name or user

91280 ID for each process using that file shall be written.

91281 A <newline> shall be written to standard error after the last output described above for each *file*

91282 operand.

91283 **OUTPUT FILES**

91284 None.

91285 **EXTENDED DESCRIPTION**

91286 None.

91287 **EXIT STATUS**

91288 The following exit values shall be returned:

91289 0 Successful completion.

91290 >0 An error occurred.

91291 **CONSEQUENCES OF ERRORS**

91292 Default.

**APPLICATION USAGE**

None.

**EXAMPLES**

The command:

```
fuser -fu .
```

writes to standard output the process IDs of processes that are using the current directory and writes to standard error an indication of how those processes are using the directory and the user names associated with the processes that are using the current directory.

```
fuser -c <mount point>
```

writes to standard output the process IDs of processes that are using any file in the file system which is mounted on <mount point> and writes to standard error an indication of how those processes are using the files.

```
fuser <mount point>
```

writes to standard output the process IDs of processes that are using the file which is named by <mount point> and writes to standard error an indication of how those processes are using the file.

```
fuser <block device>
```

writes to standard output the process IDs of processes that are using any file which is on the device named by <block device> and writes to standard error an indication of how those processes are using the file.

```
fuser -f <block device>
```

writes to standard output the process IDs of processes that are using the file <block device> itself and writes to standard error an indication of how those processes are using the file.

**RATIONALE**

The definition of the *fuser* utility follows existing practice.

**FUTURE DIRECTIONS**

None.

**SEE ALSO**

XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)

**CHANGE HISTORY**

First released in Issue 5.

**Issue 7**

SD5-XCU-ERN-90 is applied, updating the EXAMPLES section.

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

91327 **NAME**

91328       gencat — generate a formatted message catalog

91329 **SYNOPSIS**91330       gencat *catfile* *msgfile*...91331 **DESCRIPTION**

91332       The *gencat* utility shall merge the message text source file *msgfile* into a formatted message  
 91333       catalog *catfile*. The file *catfile* shall be created if it does not already exist. If *catfile* does exist, its  
 91334       messages shall be included in the new *catfile*. If set and message numbers collide, the new  
 91335       message text defined in *msgfile* shall replace the old message text currently contained in *catfile*.

91336 **OPTIONS**

91337       None.

91338 **OPERANDS**

91339       The following operands shall be supported:

91340       *catfile*       A pathname of the formatted message catalog. If '-' is specified, standard output  
 91341       shall be used. The format of the message catalog produced is unspecified.

91342       *msgfile*       A pathname of a message text source file. If '-' is specified for an instance of  
 91343       *msgfile*, standard input shall be used. The format of message text source files is  
 91344       defined in the EXTENDED DESCRIPTION section.

91345 **STDIN**91346       The standard input shall not be used unless a *msgfile* operand is specified as '-'.91347 **INPUT FILES**

91348       The input files shall be text files.

91349 **ENVIRONMENT VARIABLES**91350       The following environment variables shall affect the execution of *gencat*:

91351       *LANG*       Provide a default value for the internationalization variables that are unset or null.  
 91352       (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 91353       variables used to determine the values of locale categories.)

91354       *LC\_ALL*       If set to a non-empty string value, override the values of all the other  
 91355       internationalization variables.

91356       *LC\_CTYPE*   Determine the locale for the interpretation of sequences of bytes of text data as  
 91357       characters (for example, single-byte as opposed to multi-byte characters in  
 91358       arguments and input files).

91359       *LC\_MESSAGES*

91360       Determine the locale that should be used to affect the format and contents of  
 91361       diagnostic messages written to standard error.

91362       *NLSPATH*   Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

91363 **ASYNCHRONOUS EVENTS**

91364       Default.

91365 **STDOUT**91366       The standard output shall not be used unless the *catfile* operand is specified as '-'.

91367 **STDERR**

91368 The standard error shall be used only for diagnostic messages.

91369 **OUTPUT FILES**

91370 None.

91371 **EXTENDED DESCRIPTION**

91372 The content of a message text file shall be in the format defined as follows. Note that the fields of  
 91373 a message text source line are separated by a single <blank> character. Any other <blank>  
 91374 characters are considered to be part of the subsequent field.

91375 **\$set** *n comment*

91376 This line specifies the set identifier of the following messages until the next **\$set** or  
 91377 end-of-file appears. The *n* denotes the set identifier, which is defined as a number  
 91378 in the range [1, {NL\_SETMAX}] (see the <limits.h> header defined in the Base  
 91379 Definitions volume of POSIX.1-2008). The application shall ensure that set  
 91380 identifiers are presented in ascending order within a single source file, but need  
 91381 not be contiguous. Any string following the set identifier shall be treated as a  
 91382 comment. If no **\$set** directive is specified in a message text source file, all messages  
 91383 shall be located in an implementation-defined default message set NL\_SETD (see  
 91384 the <nl\_types.h> header defined in the Base Definitions volume of POSIX.1-2008).

91385 **\$delset** *n comment*

91386 This line deletes message set *n* from an existing message catalog. The *n* denotes the  
 91387 set number [1, {NL\_SETMAX}]. Any string following the set number shall be  
 91388 treated as a comment.

91389 **\$ comment** A line beginning with ' \$ ' followed by a <blank> shall be treated as a comment.

91390 *m message-text*

91391 The *m* denotes the message identifier, which is defined as a number in the range [1,  
 91392 {NL\_MSGMAX}] (see the <limits.h> header). The *message-text* shall be stored in the  
 91393 message catalog with the set identifier specified by the last **\$set** directive, and with  
 91394 message identifier *m*. If the *message-text* is empty, and a <blank> field separator is  
 91395 present, an empty string shall be stored in the message catalog. If a message source  
 91396 line has a message number, but neither a field separator nor *message-text*, the  
 91397 existing message with that number (if any) shall be deleted from the catalog. The  
 91398 application shall ensure that message identifiers are in ascending order within a  
 91399 single set, but need not be contiguous. The application shall ensure that the length  
 91400 of *message-text* is in the range [0, {NL\_TEXTMAX}] (see the <limits.h> header).

91401 **\$quote** *n* This line specifies an optional quote character *c*, which can be used to surround  
 91402 *message-text* so that trailing <space> characters or null (empty) messages are visible  
 91403 in a message source line. By default, or if an empty **\$quote** directive is supplied, no  
 91404 quoting of *message-text* shall be recognized.

91405 Empty lines in a message text source file shall be ignored. The effects of lines starting with any  
 91406 character other than those defined above are implementation-defined.

91407 Text strings can contain the special characters and escape sequences defined in the following  
 91408 table:

91409  
91410  
91411  
91412  
91413  
91414  
91415  
91416  
91417  
  
91418  
91419  
91420  
  
91421  
91422  
  
91423  
91424  
  
91425  
  
91426  
  
91427  
91428  
91429  
91430  
  
91431  
91432  
  
91433  
91434  
91435  
91436  
  
91437  
91438  
  
91439  
91440  
  
91441  
91442  
  
91443  
91444  
  
91445  
  
91446  
91447  
  
91448  
91449

| Description       | Symbol | Sequence |
|-------------------|--------|----------|
| <newline>         | NL(LF) | \n       |
| Horizontal-tab    | HT     | \t       |
| <vertical-tab>    | VT     | \v       |
| <backspace>       | BS     | \b       |
| <carriage-return> | CR     | \r       |
| <form-feed>       | FF     | \f       |
| Backslash         | \      | \\       |
| Bit pattern       | ddd    | \ddd     |

The escape sequence "\ddd" consists of <backslash> followed by one, two, or three octal digits, which shall be taken to specify the value of the desired character. If the character following a <backslash> is not one of those specified, the <backslash> shall be ignored.

A <backslash> followed by a <newline> is also used to continue a string on the following line. Thus, the following two lines describe a single message string:

```
1 This line continues \
to the next line
```

which shall be equivalent to:

```
1 This line continues to the next line
```

**EXIT STATUS**

The following exit values shall be returned:

- 0 Successful completion.
- >0 An error occurred.

**CONSEQUENCES OF ERRORS**

Default.

**APPLICATION USAGE**

Message catalogs produced by *gencat* are binary encoded, meaning that their portability cannot be guaranteed between different types of machine. Thus, just as C programs need to be recompiled for each type of machine, so message catalogs must be recreated via *gencat*.

**EXAMPLES**

None.

**RATIONALE**

None.

**FUTURE DIRECTIONS**

None.

**SEE ALSO**

*iconv*

**CHANGE HISTORY**

First released in Issue 3.

**Issue 6**

The normative text is reworded to avoid use of the term “must” for application requirements.

91450 **Issue 7**  
91451

The *gencat* utility is moved from the XSI option to the Base.

## 91452 NAME

91453 get — get a version of an SCCS file (**DEVELOPMENT**)

## 91454 SYNOPSIS

91455 xsi `get [-begkmnlLpst] [-c cutoff] [-i list] [-r SID] [-x list] file...`

## 91456 DESCRIPTION

91457 The *get* utility shall generate a text file from each named SCCS *file* according to the specifications  
91458 given by its options.91459 The generated text shall normally be written into a file called the **g-file** whose name is derived  
91460 from the SCCS filename by simply removing the leading "s.". 

## 91461 OPTIONS

91462 The *get* utility shall conform to XBD [Section 12.2](#) (on page 215).

91463 The following options shall be supported:

91464 **-r *SID*** Indicate the SCCS Identification String (SID) of the version (delta) of an SCCS file  
91465 to be retrieved. The table shows, for the most useful cases, what version of an  
91466 SCCS file is retrieved (as well as the SID of the version to be eventually created by  
91467 *delta* if the **-e** option is also used), as a function of the SID specified.91468 **-c *cutoff*** Indicate the *cutoff* date-time, in the form:91469 `YY[MM[DD[HH[MM[SS]]]]]`91470 For the YY component, values in the range [69,99] shall refer to years 1969 to 1999  
91471 inclusive, and values in the range [00,68] shall refer to years 2000 to 2068 inclusive.91472 **Note:** It is expected that in a future version of this standard the default century inferred  
91473 from a 2-digit year will change. (This would apply to all commands accepting a  
91474 2-digit year as input.)91475 No changes (deltas) to the SCCS file that were created after the specified *cutoff*  
91476 date-time shall be included in the generated text file. Units omitted from the date-  
91477 time default to their maximum possible values; for example, **-c 7502** is equivalent  
91478 to **-c 750228235959**.91479 Any number of non-numeric characters may separate the various 2-digit pieces of  
91480 the *cutoff* date-time. This feature allows the user to specify a *cutoff* date in the form:  
91481 **-c "77/2/2 9:22:25"**.91482 **-e** Indicate that the *get* is for the purpose of editing or making a change (delta) to the  
91483 SCCS file via a subsequent use of *delta*. The **-e** option used in a *get* for a particular  
91484 version (SID) of the SCCS file shall prevent further *get* commands from editing on  
91485 the same SID until *delta* is executed or the **j** (joint edit) flag is set in the SCCS file.  
91486 Concurrent use of *get -e* for different SIDs is always allowed.91487 If the **g-file** generated by *get* with a **-e** option is accidentally ruined in the process  
91488 of editing, it may be regenerated by re-executing the *get* command with the **-k**  
91489 option in place of the **-e** option.91490 SCCS file protection specified via the ceiling, floor, and authorized user list stored  
91491 in the SCCS file shall be enforced when the **-e** option is used.91492 **-b** Use with the **-e** option to indicate that the new delta should have an SID in a new  
91493 branch as shown in the table below. This option shall be ignored if the **b** flag is not  
91494 present in the file or if the retrieved delta is not a leaf delta. (A leaf delta is one that  
91495 has no successors on the SCCS file tree.)

|       |                |                                                                                                                                                                        |
|-------|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 91496 |                | <b>Note:</b> A branch delta may always be created from a non-leaf delta.                                                                                               |
| 91497 | <b>-i list</b> | Indicate a <i>list</i> of deltas to be included (forced to be applied) in the creation of the generated file. The <i>list</i> has the following syntax:                |
| 91498 |                |                                                                                                                                                                        |
| 91499 |                | <code>&lt;list&gt; ::= &lt;range&gt;   &lt;list&gt; , &lt;range&gt;</code>                                                                                             |
| 91500 |                | <code>&lt;range&gt; ::= SID   SID - SID</code>                                                                                                                         |
| 91501 |                | SID, the SCCS Identification of a delta, may be in any form shown in the "SID Specified" column of the table in the EXTENDED DESCRIPTION section, except               |
| 91502 |                | that the result of supplying a partial SID is unspecified. A diagnostic message shall                                                                                  |
| 91503 |                | be written if the first SID in the range is not an ancestor of the second SID in the                                                                                   |
| 91504 |                | range.                                                                                                                                                                 |
| 91505 |                |                                                                                                                                                                        |
| 91506 | <b>-x list</b> | Indicate a <i>list</i> of deltas to be excluded (forced not to be applied) in the creation of the generated file. See the <b>-i</b> option for the <i>list</i> format. |
| 91507 |                |                                                                                                                                                                        |
| 91508 | <b>-k</b>      | Suppress replacement of identification keywords (see below) in the retrieved text by their value. The <b>-k</b> option shall be implied by the <b>-e</b> option.       |
| 91509 |                |                                                                                                                                                                        |
| 91510 | <b>-l</b>      | Write a delta summary into an <b>l-file</b> .                                                                                                                          |
| 91511 | <b>-L</b>      | Write a delta summary to standard output. All informative output that normally is                                                                                      |
| 91512 |                | written to standard output shall be written to standard error instead, unless the <b>-s</b>                                                                            |
| 91513 |                | option is used, in which case it shall be suppressed.                                                                                                                  |
| 91514 | <b>-p</b>      | Write the text retrieved from the SCCS file to the standard output. No <b>g-file</b> shall                                                                             |
| 91515 |                | be created. All informative output that normally goes to the standard output shall                                                                                     |
| 91516 |                | go to standard error instead, unless the <b>-s</b> option is used, in which case it shall                                                                              |
| 91517 |                | disappear.                                                                                                                                                             |
| 91518 | <b>-s</b>      | Suppress all informative output normally written to standard output. However,                                                                                          |
| 91519 |                | fatal error messages (which shall always be written to the standard error) shall                                                                                       |
| 91520 |                | remain unaffected.                                                                                                                                                     |
| 91521 | <b>-m</b>      | Precede each text line retrieved from the SCCS file by the SID of the delta that                                                                                       |
| 91522 |                | inserted the text line in the SCCS file. The format shall be:                                                                                                          |
| 91523 |                | <code>"%s\t%s", &lt;SID&gt;, &lt;text line&gt;</code>                                                                                                                  |
| 91524 | <b>-n</b>      | Precede each generated text line with the <b>%M%</b> identification keyword value (see                                                                                 |
| 91525 |                | below). The format shall be:                                                                                                                                           |
| 91526 |                | <code>"%s\t%s", &lt;%M% value&gt;, &lt;text line&gt;</code>                                                                                                            |
| 91527 |                | When both the <b>-m</b> and <b>-n</b> options are used, the <code>&lt;text line&gt;</code> shall be replaced by the                                                    |
| 91528 |                | <b>-m</b> option-generated format.                                                                                                                                     |
| 91529 | <b>-g</b>      | Suppress the actual retrieval of text from the SCCS file. It is primarily used to                                                                                      |
| 91530 |                | generate an <b>l-file</b> , or to verify the existence of a particular SID.                                                                                            |
| 91531 | <b>-t</b>      | Use to access the most recently created (top) delta in a given release (for example,                                                                                   |
| 91532 |                | <b>-r 1</b> ), or release and level (for example, <b>-r 1.2</b> ).                                                                                                     |

91533 **OPERANDS**

91534 The following operands shall be supported:

91535 *file* A pathname of an existing SCCS file or a directory. If *file* is a directory, the *get*  
 91536 utility shall behave as though each file in the directory were specified as a named  
 91537 file, except that non-SCCS files (last component of the pathname does not begin  
 91538 with **s**.) and unreadable files shall be silently ignored.

91539 If exactly one *file* operand appears, and it is **'-'**, the standard input shall be read;  
 91540 each line of the standard input is taken to be the name of an SCCS file to be  
 91541 processed. Non-SCCS files and unreadable files shall be silently ignored.

91542 **STDIN**

91543 The standard input shall be a text file used only if the *file* operand is specified as **'-'**. Each line  
 91544 of the text file shall be interpreted as an SCCS pathname.

91545 **INPUT FILES**

91546 The SCCS files shall be files of an unspecified format.

91547 **ENVIRONMENT VARIABLES**91548 The following environment variables shall affect the execution of *get*:

91549 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 91550 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 91551 variables used to determine the values of locale categories.)

91552 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 91553 internationalization variables.

91554 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 91555 characters (for example, single-byte as opposed to multi-byte characters in  
 91556 arguments and input files).

91557 *LC\_MESSAGES*

91558 Determine the locale that should be used to affect the format and contents of  
 91559 diagnostic messages written to standard error, and informative messages written  
 91560 to standard output (or standard error, if the **-p** option is used).

91561 *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

91562 *TZ* Determine the timezone in which the times and dates written in the SCCS file are  
 91563 evaluated. If the *TZ* variable is unset or NULL, an unspecified system default  
 91564 timezone is used.

91565 **ASYNCHRONOUS EVENTS**

91566 Default.

91567 **STDOUT**

91568 For each file processed, *get* shall write to standard output the SID being accessed and the  
 91569 number of lines retrieved from the SCCS file, in the following format:

91570 "%s\n%d lines\n", &lt;SID&gt;, &lt;number of lines&gt;

91571 If the **-e** option is used, the SID of the delta to be made shall appear after the SID accessed and  
 91572 before the number of lines generated, in the POSIX locale:

91573 "%s\nnew delta %s\n%d lines\n", <SID accessed>,  
 91574 <SID to be made>, <number of lines>

91575 If there is more than one named file or if a directory or standard input is named, each pathname

91576 shall be written before each of the lines shown in one of the preceding formats:

91577 `"\n%s:\n", <pathname>`

91578 If the `-L` option is used, a delta summary shall be written following the format specified below  
91579 for **l-files**.

91580 If the `-i` option is used, included deltas shall be listed following the notation, in the POSIX  
91581 locale:

91582 `"Included:\n"`

91583 If the `-x` option is used, excluded deltas shall be listed following the notation, in the POSIX  
91584 locale:

91585 `"Excluded:\n"`

91586 If the `-p` or `-L` options are specified, the standard output shall consist of the text retrieved from  
91587 the SCCS file.

## 91588 STDERR

91589 The standard error shall be used only for diagnostic messages, except if the `-p` or `-L` options are  
91590 specified, it shall include all informative messages normally sent to standard output.

## 91591 OUTPUT FILES

91592 Several auxiliary files may be created by *get*. These files are known generically as the **g-file**, **l-**  
91593 **file**, **p-file**, and **z-file**. The letter before the <hyphen> is called the *tag*. An auxiliary filename  
91594 shall be formed from the SCCS filename: the application shall ensure that the last component of  
91595 all SCCS filenames is of the form *s.module-name*; the auxiliary files shall be named by replacing  
91596 the leading *s* with the tag. The **g-file** shall be an exception to this scheme: the **g-file** is named by  
91597 removing the *s.* prefix. For example, for *s.xyz.c*, the auxiliary filenames would be *xyz.c*, *l.xyz.c*,  
91598 *p.xyz.c*, and *z.xyz.c*, respectively.

91599 The **g-file**, which contains the generated text, shall be created in the current directory (unless the  
91600 `-p` option is used). A **g-file** shall be created in all cases, whether or not any lines of text were  
91601 generated by the *get*. It shall be owned by the real user. If the `-k` option is used or implied, the  
91602 **g-file** shall be writable by the owner only (read-only for everyone else); otherwise, it shall be  
91603 read-only. Only the real user need have write permission in the current directory.

91604 The **l-file** shall contain a table showing which deltas were applied in generating the retrieved  
91605 text. The **l-file** shall be created in the current directory if the `-l` option is used; it shall be read-  
91606 only and it is owned by the real user. Only the real user need have write permission in the  
91607 current directory.

91608 Lines in the **l-file** shall have the following format:

91609 `"%c%c%cΔ%s\t%sΔ%s\n", <code1>, <code2>, <code3>,  
91610 <SID>, <date-time>, <login>`

91611 where the entries are:

91612 `<code1>` A <space> if the delta was applied; ' \* ' otherwise.

91613 `<code2>` A <space> if the delta was applied or was not applied and ignored; ' \* ' if the delta  
91614 was not applied and was not ignored.

91615 `<code3>` A character indicating a special reason why the delta was or was not applied:

91616 **I** Included.

91617                   X   Excluded.

91618                   C   Cut off (by a `-c` option).

91619       <date-time>   Date and time (using the format of the *date* utility's `%Y/%m/%d %T` conversion  
91620                   specification format) of creation.

91621       <login>       Login name of person who created *delta*.

91622       The comments and MR data shall follow on subsequent lines, indented one <tab>. A blank line  
91623       shall terminate each entry.

91624       The **p-file** shall be used to pass information resulting from a *get* with a `-e` option along to *delta*.  
91625       Its contents shall also be used to prevent a subsequent execution of *get* with a `-e` option for the  
91626       same SID until *delta* is executed or the joint edit flag, *j*, is set in the SCCS file. The **p-file** shall be  
91627       created in the directory containing the SCCS file and the application shall ensure that the  
91628       effective user has write permission in that directory. It shall be writable by owner only, and  
91629       owned by the effective user. Each line in the **p-file** shall have the following format:

91630       "%sΔ%sΔ%sΔ%s%s\n", <g-file SID>,  
91631                <SID of new delta>, <login-name of real user>,  
91632                <date-time>, <i-value>, <x-value>

91633       where <i-value> uses the format " " if no `-i` option was specified, and shall use the format:

91634       "Δ-i%s", <-i option option-argument>

91635       if a `-i` option was specified and <x-value> uses the format " " if no `-x` option was specified, and  
91636       shall use the format:

91637       "Δ-x%s", <-x option option-argument>

91638       if a `-x` option was specified. There can be an arbitrary number of lines in the **p-file** at any time;  
91639       no two lines shall have the same new delta SID.

91640       The **z-file** shall serve as a lock-out mechanism against simultaneous updates. Its contents shall  
91641       be the binary process ID of the command (that is, *get*) that created it. The **z-file** shall be created  
91642       in the directory containing the SCCS file for the duration of *get*. The same protection restrictions  
91643       as those for the **p-file** shall apply for the **z-file**. The **z-file** shall be created read-only.

## 91644 EXTENDED DESCRIPTION

| Determination of SCCS Identification String |                    |                                             |               |                            |  |
|---------------------------------------------|--------------------|---------------------------------------------|---------------|----------------------------|--|
| SID* Specified                              | -b Keyletter Used† | Other Conditions                            | SID Retrieved | SID of Delta to be Created |  |
| none‡                                       | no                 | R defaults to mR                            | mR.mL         | mR.(mL+1)                  |  |
| none‡                                       | yes                | R defaults to mR                            | mR.mL         | mR.mL.(mB+1).1             |  |

| R                                           | yes                | R > mR                                      | mR.mL         | mR.mL.(mB+1).1             |  |
| R                                           | yes                | R = mR                                      | mR.mL         | mR.mL.(mB+1).1             |  |
| R                                           | –                  | R < mR and R does not exist                 | hR.mL**       | hR.mL.(mB+1).1             |  |
| R                                           | –                  | Trunk successor in release > R and R exists | R.mL          | R.mL.(mB+1).1              |  |
| R.L                                         | no                 | No trunk successor                          | R.L           | R.(L+1)                    |  |
| R.L                                         | yes                | No trunk successor                          | R.L           | R.L.(mB+1).1               |  |
| R.L                                         | –                  | Trunk successor in release ≥ R              | R.L           | R.L.(mB+1).1               |  |
| R.L.B                                       | no                 | No branch successor                         | R.L.B.mS      | R.L.B.(mS+1)               |  |
| R.L.B                                       | yes                | No branch successor                         | R.L.B.mS      | R.L.(mB+1).1               |  |
| R.L.B.S                                     | no                 | No branch successor                         | R.L.B.S       | R.L.B.(S+1)                |  |
| R.L.B.S                                     | yes                | No branch successor                         | R.L.B.S       | R.L.(mB+1).1               |  |
| R.L.B.S                                     | –                  | Branch successor                            | R.L.B.S       | R.L.(mB+1).1               |  |

91667 \* R, L, B, and S are the release, level, branch, and sequence components of the SID, respectively; m means maximum. Thus, for example, R.mL means “the maximum level number within release R”; R.L.(mB+1).1 means “the first sequence number on the new branch (that is, maximum branch number plus one) of level L within release R”. Note that if the SID specified is of the form R.L, R.L.B, or R.L.B.S, each of the specified components shall exist.

91673 \*\* hR is the highest existing release that is lower than the specified, nonexistent, release R.

91674 \*\*\* This is used to force creation of the first delta in a new release.

91675 † The -b option is effective only if the b flag is present in the file. An entry of ‘–’ means “irrelevant”.

91677 ‡ This case applies if the d (default SID) flag is not present in the file. If the d flag is present in the file, then the SID obtained from the d flag is interpreted as if it had been specified on the command line. Thus, one of the other cases in this table applies.

## 91680 System Date and Time

91681 When a **g-file** is generated, the creation time of deltas in the SCCS file may be taken into  
 91682 account. If any of these times are apparently in the future, the behavior is unspecified.

## 91683 Identification Keywords

91684 Identifying information shall be inserted into the text retrieved from the SCCS file by replacing  
 91685 identification keywords with their value wherever they occur. The following keywords may be  
 91686 used in the text stored in an SCCS file:

|       |     |                                                                                               |
|-------|-----|-----------------------------------------------------------------------------------------------|
| 91687 | %M% | Module name: either the value of the <b>m</b> flag in the file, or if absent, the name of the |
| 91688 |     | SCCS file with the leading <b>s.</b> removed.                                                 |
| 91689 | %I% | SCCS identification (SID) (%R%.%L% or %R%.%L%.%B%.%S%) of the retrieved                       |
| 91690 |     | text.                                                                                         |
| 91691 | %R% | Release.                                                                                      |
| 91692 | %L% | Level.                                                                                        |
| 91693 | %B% | Branch.                                                                                       |
| 91694 | %S% | Sequence.                                                                                     |
| 91695 | %D% | Current date (YY/MM/DD).                                                                      |
| 91696 | %H% | Current date (MM/DD/YY).                                                                      |
| 91697 | %T% | Current time (HH:MM:SS).                                                                      |
| 91698 | %E% | Date newest applied delta was created (YY/MM/DD).                                             |
| 91699 | %G% | Date newest applied delta was created (MM/DD/YY).                                             |
| 91700 | %U% | Time newest applied delta was created (HH:MM:SS).                                             |
| 91701 | %Y% | Module type: value of the <b>t</b> flag in the SCCS file.                                     |
| 91702 | %F% | SCCS filename.                                                                                |
| 91703 | %P% | SCCS absolute pathname.                                                                       |
| 91704 | %Q% | The value of the <b>q</b> flag in the file.                                                   |
| 91705 | %C% | Current line number. This keyword is intended for identifying messages output by              |
| 91706 |     | the program, such as “this should not have happened” type errors. It is not                   |
| 91707 |     | intended to be used on every line to provide sequence numbers.                                |
| 91708 | %Z% | The four-character string "@ (# )" recognizable by <i>what</i> .                              |
| 91709 | %W% | A shorthand notation for constructing <i>what</i> strings:                                    |
| 91710 |     | %W%=%Z%%M%<tab>%I%                                                                            |
| 91711 | %A% | Another shorthand notation for constructing <i>what</i> strings:                              |
| 91712 |     | %A%=%Z%%Y%%M%%I%%Z%                                                                           |

## 91713 EXIT STATUS

91714 The following exit values shall be returned:

91715 0 Successful completion.

91716 >0 An error occurred.

## 91717 CONSEQUENCES OF ERRORS

91718 Default.

## 91719 APPLICATION USAGE

91720 Problems can arise if the system date and time have been modified (for example, put forward  
91721 and then back again, or unsynchronized clocks across a network) and can also arise when  
91722 different values of the *TZ* environment variable are used.

91723 Problems of a similar nature can also arise for the operation of the *delta* utility, which compares  
91724 the previous file body against the working file as part of its normal operation.

## 91725 EXAMPLES

91726 None.

## 91727 RATIONALE

91728 None.

## 91729 FUTURE DIRECTIONS

91730 None.

## 91731 SEE ALSO

## 91734 CHANGE HISTORY

91735 First released in Issue 2.

### 91736 Issue 5

91737 A correction is made to the first format string in STDOUT.

91738 The interpretation of the *YY* component of the *-c cutoff* argument is noted.

### 91739 Issue 6

91740 The obsolescent SYNOPSIS is removed, removing the *-lp* option.

91741 The normative text is reworded to avoid use of the term “must” for application requirements.

91742 The Open Group Corrigendum U025/5 is applied, correcting text in the OPTIONS section.

91743 The Open Group Corrigendum U048/1 is applied.

91744 The Open Group Interpretation PIN4C.00014 is applied.

91745 The Open Group Base Resolution bwg2001-007 is applied as follows:

- 91746 • The EXTENDED DESCRIPTION section is updated to make partial SID handling
- 91747 unspecified, reflecting common usage, and to clarify SID ranges.
- 91748 • New text is added to the EXTENDED DESCRIPTION and APPLICATION USAGE sections
- 91749 regarding how the system date and time may be taken into account.
- 91750 • The *TZ* environment variable is added to the ENVIRONMENT VARIABLES section.

### 91751 Issue 7

91752 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

**NAME**

getconf — get configuration values

**SYNOPSIS**

getconf [-v *specification*] *system\_var*

getconf [-v *specification*] *path\_var pathname*

**DESCRIPTION**

In the first synopsis form, the *getconf* utility shall write to the standard output the value of the variable specified by the *system\_var* operand.

In the second synopsis form, the *getconf* utility shall write to the standard output the value of the variable specified by the *path\_var* operand for the path specified by the *pathname* operand.

The value of each configuration variable shall be determined as if it were obtained by calling the function from which it is defined to be available by this volume of POSIX.1-2008 or by the System Interfaces volume of POSIX.1-2008 (see the OPERANDS section). The value shall reflect conditions in the current operating environment.

**OPTIONS**

The *getconf* utility shall conform to XBD [Section 12.2](#) (on page 215).

The following option shall be supported:

**-v *specification***

Indicate a specific specification and version for which configuration variables shall be determined. If this option is not specified, the values returned correspond to an implementation default conforming compilation environment.

If the command:

```
getconf _POSIX_V7_ILP32_OFF32
```

does not write "-1\n" or "undefined\n" to standard output, then commands of the form:

```
getconf -v POSIX_V7_ILP32_OFF32 ...
```

determine values for configuration variables corresponding to the POSIX\_V7\_ILP32\_OFF32 compilation environment specified in [c99](#), the EXTENDED DESCRIPTION.

If the command:

```
getconf _POSIX_V7_ILP32_OFFBIG
```

does not write "-1\n" or "undefined\n" to standard output, then commands of the form:

```
getconf -v POSIX_V7_ILP32_OFFBIG ...
```

determine values for configuration variables corresponding to the POSIX\_V7\_ILP32\_OFFBIG compilation environment specified in [c99](#), the EXTENDED DESCRIPTION.

If the command:

```
getconf _POSIX_V7_LP64_OFF64
```

does not write "-1\n" or "undefined\n" to standard output, then commands of the form:

91794 `getconf -v POSIX_V7_LP64_OFF64 ...`  
 91795 determine values for configuration variables corresponding to the  
 91796 POSIX\_V7\_LP64\_OFF64 compilation environment specified in [c99](#), the  
 91797 EXTENDED DESCRIPTION.

91798 If the command:

91799 `getconf _POSIX_V7_LPBIG_OFFBIG`

91800 does not write "-1\n" or "undefined\n" to standard output, then commands of  
 91801 the form:

91802 `getconf -v POSIX_V7_LPBIG_OFFBIG ...`

91803 determine values for configuration variables corresponding to the  
 91804 POSIX\_V7\_LPBIG\_OFFBIG compilation environment specified in [c99](#), the  
 91805 EXTENDED DESCRIPTION.

## 91806 OPERANDS

91807 The following operands shall be supported:

91808 *path\_var* A name of a configuration variable. All of the variables in the Variable column of  
 91809 the table in the DESCRIPTION of the *fpathconf()* function defined in the System  
 91810 Interfaces volume of POSIX.1-2008, without the enclosing braces, shall be  
 91811 supported. The implementation may add other local variables.

91812 *pathname* A pathname for which the variable specified by *path\_var* is to be determined.

91813 *system\_var* A name of a configuration variable. All of the following variables shall be  
 91814 supported:

- 91815 • The names in the Variable column of the table in the DESCRIPTION of the
- 91816 *sysconf()* function in the System Interfaces volume of POSIX.1-2008, except
- 91817 for the entries corresponding to `_SC_CLK_TCK`, `_SC_GETGR_R_SIZE_MAX`,
- 91818 and `_SC_GETPW_R_SIZE_MAX`, without the enclosing braces.

91819 For compatibility with earlier versions, the following variable names shall  
 91820 also be supported:

91821 `POSIX2_C_BIND`  
 91822 `POSIX2_C_DEV`  
 91823 `POSIX2_CHAR_TERM`  
 91824 `POSIX2_FORT_DEV`  
 91825 `POSIX2_FORT_RUN`  
 91826 `POSIX2_LOCALEDEF`  
 91827 `POSIX2_SW_DEV`  
 91828 `POSIX2_UPE`  
 91829 `POSIX2_VERSION`

91830 and shall be equivalent to the same name prefixed with an <underscore>.  
 91831 This requirement may be removed in a future version.

- 91832 • The names of the symbolic constants used as the *name* argument of the
- 91833 *confstr()* function in the System Interfaces volume of POSIX.1-2008, without
- 91834 the `_CS_` prefix.

91835 • The names of the symbolic constants listed under the headings “Maximum  
 91836 Values” and “Minimum Values” in the description of the `<limits.h>` header  
 91837 in the Base Definitions volume of POSIX.1-2008, without the enclosing  
 91838 braces.

91839 For compatibility with earlier versions, the following variable names shall  
 91840 also be supported:

91841 POSIX2\_BC\_BASE\_MAX  
 91842 POSIX2\_BC\_DIM\_MAX  
 91843 POSIX2\_BC\_SCALE\_MAX  
 91844 POSIX2\_BC\_STRING\_MAX  
 91845 POSIX2\_COLL\_WEIGHTS\_MAX  
 91846 POSIX2\_EXPR\_NEST\_MAX  
 91847 POSIX2\_LINE\_MAX  
 91848 POSIX2\_RE\_DUP\_MAX

91849 and shall be equivalent to the same name prefixed with an `<underscore>`.  
 91850 This requirement may be removed in a future version.

91851 The implementation may add other local values.

## 91852 STDIN

91853 Not used.

## 91854 INPUT FILES

91855 None.

## 91856 ENVIRONMENT VARIABLES

91857 The following environment variables shall affect the execution of *getconf*:

91858 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 91859 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 91860 variables used to determine the values of locale categories.)

91861 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 91862 internationalization variables.

91863 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 91864 characters (for example, single-byte as opposed to multi-byte characters in  
 91865 arguments).

91866 *LC\_MESSAGES*

91867 Determine the locale that should be used to affect the format and contents of  
 91868 diagnostic messages written to standard error.

91869 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

## 91870 ASYNCHRONOUS EVENTS

91871 Default.

## 91872 STDOUT

91873 If the specified variable is defined on the system and its value is described to be available from  
 91874 the *confstr()* function defined in the System Interfaces volume of POSIX.1-2008, its value shall be  
 91875 written in the following format:

91876 "%s\n", *<value>*

91877 Otherwise, if the specified variable is defined on the system, its value shall be written in the

91878 following format:

91879 "%d\n", <value>

91880 If the specified variable is valid, but is undefined on the system, *getconf* shall write using the

91881 following format:

91882 "undefined\n"

91883 If the variable name is invalid or an error occurs, nothing shall be written to standard output.

91884 **STDERR**

91885 The standard error shall be used only for diagnostic messages.

91886 **OUTPUT FILES**

91887 None.

91888 **EXTENDED DESCRIPTION**

91889 None.

91890 **EXIT STATUS**

91891 The following exit values shall be returned:

91892 0 The specified variable is valid and information about its current state was written

91893 successfully.

91894 >0 An error occurred.

91895 **CONSEQUENCES OF ERRORS**

91896 Default.

91897 **APPLICATION USAGE**

91898 None.

91899 **EXAMPLES**

91900 The following example illustrates the value of {NGROUPS\_MAX}:

91901 `getconf NGROUPS_MAX`

91902 The following example illustrates the value of {NAME\_MAX} for a specific directory:

91903 `getconf NAME_MAX /usr`

91904 The following example shows how to deal more carefully with results that might be unspecified:

91905 `if value=$(getconf PATH_MAX /usr); then`

91906 `if [ "$value" = "undefined" ]; then`

91907 `echo PATH_MAX in /usr is indeterminate.`

91908 `else`

91909 `echo PATH_MAX in /usr is $value.`

91910 `fi`

91911 `else`

91912 `echo Error in getconf.`

91913 `fi`

91914 **RATIONALE**

91915 The original need for this utility, and for the *confstr()* function, was to provide a way of finding

91916 the configuration-defined default value for the *PATH* environment variable. Since *PATH* can be

91917 modified by the user to include directories that could contain utilities replacing the standard

91918 utilities, shell scripts need a way to determine the system-supplied *PATH* environment variable

91919 value that contains the correct search path for the standard utilities. It was later suggested that

access to the other variables described in this volume of POSIX.1-2008 could also be useful to applications.

This functionality of *getconf* would not be adequately subsumed by another command such as:

```
grep var /etc/conf
```

because such a strategy would provide correct values for neither those variables that can vary at runtime, nor those that can vary depending on the path.

Early proposal versions of *getconf* specified exit status 1 when the specified variable was valid, but not defined on the system. The output string "undefined" is now used to specify this case with exit code 0 because so many things depend on an exit code of zero when an invoked utility is successful.

## FUTURE DIRECTIONS

None.

## SEE ALSO

*c99*

XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215), [<limits.h>](#)

## CHANGE HISTORY

First released in Issue 4.

### Issue 5

In the OPERANDS section:

- {NL\_MAX} is changed to {NL\_NMAX}.
- Entries beginning NL\_ are deleted from the list of standard configuration variables.
- The list of variables previously marked UX is merged with the list marked EX.
- Operands are added to support new Option Groups.
- Operands are added so that *getconf* can determine supported programming environments.

### Issue 6

The Open Group Corrigendum U029/4 is applied, correcting the example command in the last paragraph of the OPTIONS section.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- Operands are added to determine supported programming environments.

This reference page is updated for alignment with the ISO/IEC 9899:1999 standard. Specifically, new macros for *c99* programming environments are introduced.

XSI marked *system\_var* (XBS5\_\*) values are marked LEGACY.

IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/27 is applied, correcting the descriptions of *path\_var* and *system\_var* in the OPERANDS section.

### Issue 7

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

The EXAMPLES section is corrected.

 91959

POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0091 [125] is applied.

+ 

91960 **NAME**

91961       getopts — parse utility options

91962 **SYNOPSIS**91963       getopts *optstring name* [*arg...*]91964 **DESCRIPTION**

91965       The *getopts* utility shall retrieve options and option-arguments from a list of parameters. It shall  
 91966       support the Utility Syntax Guidelines 3 to 10, inclusive, described in XBD [Section 12.2](#) (on page  
 91967       215).

91968       Each time it is invoked, the *getopts* utility shall place the value of the next option in the shell  
 91969       variable specified by the *name* operand and the index of the next argument to be processed in the  
 91970       shell variable *OPTIND*. Whenever the shell is invoked, *OPTIND* shall be initialized to 1.

91971       When the option requires an option-argument, the *getopts* utility shall place it in the shell  
 91972       variable *OPTARG*. If no option was found, or if the option that was found does not have an  
 91973       option-argument, *OPTARG* shall be unset.

91974       If an option character not contained in the *optstring* operand is found where an option character  
 91975       is expected, the shell variable specified by *name* shall be set to the <question-mark> ('?')  
 91976       character. In this case, if the first character in *optstring* is a <colon> (':'), the shell variable  
 91977       *OPTARG* shall be set to the option character found, but no output shall be written to standard  
 91978       error; otherwise, the shell variable *OPTARG* shall be unset and a diagnostic message shall be  
 91979       written to standard error. This condition shall be considered to be an error detected in the way  
 91980       arguments were presented to the invoking application, but shall not be an error in *getopts*  
 91981       processing.

91982       If an option-argument is missing:

- 91983       • If the first character of *optstring* is a <colon>, the shell variable specified by *name* shall be  
 91984       set to the <colon> character and the shell variable *OPTARG* shall be set to the option  
 91985       character found.
- 91986       • Otherwise, the shell variable specified by *name* shall be set to the <question-mark>  
 91987       character, the shell variable *OPTARG* shall be unset, and a diagnostic message shall be  
 91988       written to standard error. This condition shall be considered to be an error detected in the  
 91989       way arguments were presented to the invoking application, but shall not be an error in  
 91990       *getopts* processing; a diagnostic message shall be written as stated, but the exit status shall  
 91991       be zero.

91992       When the end of options is encountered, the *getopts* utility shall exit with a return value greater  
 91993       than zero; the shell variable *OPTIND* shall be set to the index of the first operand, or the value  
 91994       "\$#"+1 if there are no operands; the *name* variable shall be set to the <question-mark> character. |  
 91995       Any of the following shall identify the end of options: the first "--" argument that is not an |  
 91996       option-argument, finding an argument that is not an option-argument and does not begin with a  
 91997       '-' , or encountering an error.

91998       The shell variables *OPTIND* and *OPTARG* shall be local to the caller of *getopts* and shall not be  
 91999       exported by default.

92000       The shell variable specified by the *name* operand, *OPTIND*, and *OPTARG* shall affect the current  
 92001       shell execution environment; see [Section 2.12](#) (on page 2353).

92002       If the application sets *OPTIND* to the value 1, a new set of parameters can be used: either the  
 92003       current positional parameters or new *arg* values. Any other attempt to invoke *getopts* multiple  
 92004       times in a single shell execution environment with parameters (positional parameters or *arg*  
 92005       operands) that are not the same in all invocations, or with an *OPTIND* value modified to be a

92006 value other than 1, produces unspecified results.

## 92007 OPTIONS

92008 None.

## 92009 OPERANDS

92010 The following operands shall be supported:

92011 *optstring* A string containing the option characters recognized by the utility invoking *getopts*.  
 92012 If a character is followed by a <colon>, the option shall be expected to have an  
 92013 argument, which should be supplied as a separate argument. Applications should  
 92014 specify an option character and its option-argument as separate arguments, but  
 92015 *getopts* shall interpret the characters following an option character requiring  
 92016 arguments as an argument whether or not this is done. An explicit null option-  
 92017 argument need not be recognized if it is not supplied as a separate argument when  
 92018 *getopts* is invoked. (See also the *getopt()* function defined in the System Interfaces  
 92019 volume of POSIX.1-2008.) The characters <question-mark> and <colon> shall not  
 92020 be used as option characters by an application. The use of other option characters  
 92021 that are not alphanumeric produces unspecified results. If the option-argument is  
 92022 not supplied as a separate argument from the option character, the value in  
 92023 *OPTARG* shall be stripped of the option character and the '-'. The first character  
 92024 in *optstring* determines how *getopts* behaves if an option character is not known or  
 92025 an option-argument is missing.

92026 *name* The name of a shell variable that shall be set by the *getopts* utility to the option  
 92027 character that was found.

92028 The *getopts* utility by default shall parse positional parameters passed to the invoking shell  
 92029 procedure. If *args* are given, they shall be parsed instead of the positional parameters.

## 92030 STDIN

92031 Not used.

## 92032 INPUT FILES

92033 None.

## 92034 ENVIRONMENT VARIABLES

92035 The following environment variables shall affect the execution of *getopts*:

92036 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 92037 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 92038 variables used to determine the values of locale categories.)

92039 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 92040 internationalization variables.

92041 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 92042 characters (for example, single-byte as opposed to multi-byte characters in  
 92043 arguments and input files).

92044 *LC\_MESSAGES*

92045 Determine the locale that should be used to affect the format and contents of  
 92046 diagnostic messages written to standard error.

92047 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

92048 *OPTIND* This variable shall be used by the *getopts* utility as the index of the next argument  
 92049 to be processed.

92050 **ASYNCHRONOUS EVENTS**

92051 Default.

92052 **STDOUT**

92053 Not used.

92054 **STDERR**

92055 Whenever an error is detected and the first character in the *optstring* operand is not a <colon>  
 92056 (' : '), a diagnostic message shall be written to standard error with the following information in  
 92057 an unspecified format:

- 92058 • The invoking program name shall be identified in the message. The invoking program  
 92059 name shall be the value of the shell special parameter 0 (see [Section 2.5.2](#), on page 2324) at  
 92060 the time the *getopts* utility is invoked. A name equivalent to:

92061 `basename "$0"`

92062 may be used.

- 92063 • If an option is found that was not specified in *optstring*, this error is identified and the  
 92064 invalid option character shall be identified in the message.

- 92065 • If an option requiring an option-argument is found, but an option-argument is not found,  
 92066 this error shall be identified and the invalid option character shall be identified in the  
 92067 message.

92068 **OUTPUT FILES**

92069 None.

92070 **EXTENDED DESCRIPTION**

92071 None.

92072 **EXIT STATUS**

92073 The following exit values shall be returned:

92074 `0` An option, specified or unspecified by *optstring*, was found.92075 `>0` The end of options was encountered or an error occurred.92076 **CONSEQUENCES OF ERRORS**

92077 Default.

92078 **APPLICATION USAGE**

92079 Since *getopts* affects the current shell execution environment, it is generally provided as a shell  
 92080 regular built-in. If it is called in a subshell or separate utility execution environment, such as one  
 92081 of the following:

92082 `(getopts abc value "$@")`92083 `nohup getopts ...`92084 `find . -exec getopts ... \;`

92085 it does not affect the shell variables in the caller's environment.

92086 Note that shell functions share *OPTIND* with the calling shell even though the positional  
 92087 parameters are changed. If the calling shell and any of its functions uses *getopts* to parse  
 92088 arguments, the results are unspecified.

**EXAMPLES**

The following example script parses and displays its arguments:

```
aflag=
bflag=
while getopts ab: name
do
 case $name in
 a) aflag=1;;
 b) bflag=1
 bval="$OPTARG";;
 ?) printf "Usage: %s: [-a] [-b value] args\n" $0
 exit 2;;
 esac
done
if [! -z "$aflag"]; then
 printf "Option -a specified\n"
fi
if [! -z "$bflag"]; then
 printf 'Option -b "%s" specified\n' "$bval"
fi
shift $(($OPTIND - 1))
printf "Remaining arguments are: %s\n" "$@"
```

**RATIONALE**

The *getopts* utility was chosen in preference to the System V *getopt* utility because *getopts* handles option-arguments containing <blank> characters.

The *OPTARG* variable is not mentioned in the ENVIRONMENT VARIABLES section because it does not affect the execution of *getopts*; it is one of the few “output-only” variables used by the standard utilities.

The <colon> is not allowed as an option character because that is not historical behavior, and it violates the Utility Syntax Guidelines. The <colon> is now specified to behave as in the KornShell version of the *getopts* utility; when used as the first character in the *optstring* operand, it disables diagnostics concerning missing option-arguments and unexpected option characters. This replaces the use of the *OPTERR* variable that was specified in an early proposal.

The formats of the diagnostic messages produced by the *getopts* utility and the *getopt()* function are not fully specified because implementations with superior (“friendlier”) formats objected to the formats used by some historical implementations. The standard developers considered it important that the information in the messages used be uniform between *getopts* and *getopt()*. Exact duplication of the messages might not be possible, particularly if a utility is built on another system that has a different *getopt()* function, but the messages must have specific information included so that the program name, invalid option character, and type of error can be distinguished by a user.

Only a rare application program intercepts a *getopts* standard error message and wants to parse it. Therefore, implementations are free to choose the most usable messages they can devise. The following formats are used by many historical implementations:

```
%s: illegal option -- %c\n", <program name>, <option character>

%s: option requires an argument -- %c\n", <program name>, \
 <option character>
```

92136 Historical shells with built-in versions of *getopt()* or *getopts* have used different formats,  
92137 frequently not even indicating the option character found in error.

92138 **FUTURE DIRECTIONS**

92139 None.

92140 **SEE ALSO**

92141 [Section 2.5.2](#) (on page 2324)

92143 XSH *getopt()*

92144 **CHANGE HISTORY**

92145 First released in Issue 4.

92146 **Issue 6**

92147 The normative text is reworded to avoid use of the term “must” for application requirements.

92148 **Issue 7**

92149 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0092 [159] is applied.

+

**NAME**

grep — search a file for a pattern

**SYNOPSIS**

```
grep [-E|-F] [-c|-l|-q] [-insvx] -e pattern_list
 [-e pattern_list]... [-f pattern_file]... [file...]

grep [-E|-F] [-c|-l|-q] [-insvx] [-e pattern_list]...
 -f pattern_file [-f pattern_file]... [file...]

grep [-E|-F] [-c|-l|-q] [-insvx] pattern_list [file...]
```

**DESCRIPTION**

The *grep* utility shall search the input files, selecting lines matching one or more patterns; the types of patterns are controlled by the options specified. The patterns are specified by the **-e** option, **-f** option, or the *pattern\_list* operand. The *pattern\_list*'s value shall consist of one or more patterns separated by <newline> characters; the *pattern\_file*'s contents shall consist of one or more patterns terminated by a <newline> character. By default, an input line shall be selected if any pattern, treated as an entire basic regular expression (BRE) as described in XBD [Section 9.3](#) (on page 183), matches any part of the line excluding the terminating <newline>; a null BRE shall match every line. By default, each selected input line shall be written to the standard output.

Regular expression matching shall be based on text lines. Since a <newline> separates or terminates patterns (see the **-e** and **-f** options below), regular expressions cannot contain a <newline>. Similarly, since patterns are matched against individual lines (excluding the terminating <newline> characters) of the input, there is no way for a pattern to match a <newline> found in the input.

**OPTIONS**

The *grep* utility shall conform to XBD [Section 12.2](#) (on page 215).

The following options shall be supported:

**-E** Match using extended regular expressions. Treat each pattern specified as an ERE, as described in XBD [Section 9.4](#) (on page 188). If any entire ERE pattern matches some part of an input line excluding the terminating <newline>, the line shall be matched. A null ERE shall match every line.

**-F** Match using fixed strings. Treat each pattern specified as a string instead of a regular expression. If an input line contains any of the patterns as a contiguous sequence of bytes, the line shall be matched. A null string shall match every line.

**-c** Write only a count of selected lines to standard output.

**-e pattern\_list**

Specify one or more patterns to be used during the search for input. The application shall ensure that patterns in *pattern\_list* are separated by a <newline>. A null pattern can be specified by two adjacent <newline> characters in *pattern\_list*. Unless the **-E** or **-F** option is also specified, each pattern shall be treated as a BRE, as described in XBD [Section 9.3](#) (on page 183). Multiple **-e** and **-f** options shall be accepted by the *grep* utility. All of the specified patterns shall be used when matching lines, but the order of evaluation is unspecified.

**-f pattern\_file**

Read one or more patterns from the file named by the pathname *pattern\_file*. Patterns in *pattern\_file* shall be terminated by a <newline>. A null pattern can be specified by an empty line in *pattern\_file*. Unless the **-E** or **-F** option is also

- 92196 specified, each pattern shall be treated as a BRE, as described in XBD [Section 9.3](#)  
 92197 (on page 183).
- 92198 **-i** Perform pattern matching in searches without regard to case; see XBD [Section 9.2](#)  
 92199 (on page 182).
- 92200 **-l** (The letter ell.) Write only the names of files containing selected lines to standard  
 92201 output. Pathnames shall be written once per file searched. If the standard input is  
 92202 searched, a pathname of "(standard input)" shall be written, in the POSIX  
 92203 locale. In other locales, "standard input" may be replaced by something more  
 92204 appropriate in those locales.
- 92205 **-n** Precede each output line by its relative line number in the file, each file starting at  
 92206 line 1. The line number counter shall be reset for each file processed.
- 92207 **-q** Quiet. Nothing shall be written to the standard output, regardless of matching  
 92208 lines. Exit with zero status if an input line is selected.
- 92209 **-s** Suppress the error messages ordinarily written for nonexistent or unreadable files.  
 92210 Other error messages shall not be suppressed.
- 92211 **-v** Select lines not matching any of the specified patterns. If the **-v** option is not  
 92212 specified, selected lines shall be those that match any of the specified patterns.
- 92213 **-x** Consider only input lines that use all characters in the line excluding the  
 92214 terminating <newline> to match an entire fixed string or regular expression to be  
 92215 matching lines.

## 92216 OPERANDS

92217 The following operands shall be supported:

- 92218 *pattern\_list* Specify one or more patterns to be used during the search for input. This operand  
 92219 shall be treated as if it were specified as **-e pattern\_list**.
- 92220 *file* A pathname of a file to be searched for the patterns. If no *file* operands are  
 92221 specified, the standard input shall be used.

## 92222 STDIN

92223 The standard input shall be used if no *file* operands are specified, and shall be used if a *file*  
 92224 operand is '-' and the implementation treats the '-' as meaning standard input. Otherwise,  
 92225 the standard input shall not be used. See the INPUT FILES section.

## 92226 INPUT FILES

92227 The input files shall be text files.

## 92228 ENVIRONMENT VARIABLES

92229 The following environment variables shall affect the execution of *grep*:

- 92230 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 92231 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 92232 variables used to determine the values of locale categories.)
- 92233 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 92234 internationalization variables.
- 92235 *LC\_COLLATE*  
 92236 Determine the locale for the behavior of ranges, equivalence classes, and multi-  
 92237 character collating elements within regular expressions.

|       |                               |                                                                                                                                                                                                                                                            |
|-------|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 92238 | <i>LC_CTYPE</i>               | Determine the locale for the interpretation of sequences of bytes of text data as characters (for example, single-byte as opposed to multi-byte characters in arguments and input files) and the behavior of character classes within regular expressions. |
| 92239 |                               |                                                                                                                                                                                                                                                            |
| 92240 |                               |                                                                                                                                                                                                                                                            |

| 92269 | <b>EXIT STATUS</b>            |                                                                                                                                                                                                                                                            |
| 92270 |                               | The following exit values shall be returned:                                                                                                                                                                                                               |
| 92271 | 0                             | One or more lines were selected.                                                                                                                                                                                                                           |
| 92272 | 1                             | No lines were selected.                                                                                                                                                                                                                                    |
| 92273 | >1                            | An error occurred.                                                                                                                                                                                                                                         |
| 92274 | <b>CONSEQUENCES OF ERRORS</b> |                                                                                                                                                                                                                                                            |
| 92275 |                               | If the <b>-q</b> option is specified, the exit status shall be zero if an input line is selected, even if an error was detected. Otherwise, default actions shall be performed.                                                                            |
| 92276 |                               |                                                                                                                                                                                                                                                            |

## APPLICATION USAGE

Care should be taken when using characters in *pattern\_list* that may also be meaningful to the command interpreter. It is safest to enclose the entire *pattern\_list* argument in single-quotes:

'...'

The **-e** *pattern\_list* option has the same effect as the *pattern\_list* operand, but is useful when *pattern\_list* begins with the <hyphen> delimiter. It is also useful when it is more convenient to provide multiple patterns as separate arguments.

Multiple **-e** and **-f** options are accepted and *grep* uses all of the patterns it is given while matching input text lines. (Note that the order of evaluation is not specified. If an implementation finds a null string as a pattern, it is allowed to use that pattern first, matching every line, and effectively ignore any other patterns.)

The **-q** option provides a means of easily determining whether or not a pattern (or string) exists in a group of files. When searching several files, it provides a performance improvement (because it can quit as soon as it finds the first match) and requires less care by the user in choosing the set of files to supply as arguments (because it exits zero if it finds a match even if *grep* detected an access or read error on earlier *file* operands).

## EXAMPLES

1. To find all uses of the word "Posix" (in any case) in file **text.mm** and write with line numbers:

```
grep -i -n posix text.mm
```

2. To find all empty lines in the standard input:

```
grep ^$
```

or:

```
grep -v .
```

3. Both of the following commands print all lines containing strings "abc" or "def" or both:

```
grep -E 'abc|def'
```

```
grep -F 'abc
def'
```

4. Both of the following commands print all lines matching exactly "abc" or "def":

```
grep -E '^abc$|^def$'
```

```
grep -F -x 'abc
def'
```

## RATIONALE

This *grep* has been enhanced in an upwards-compatible way to provide the exact functionality of the historical *egrep* and *fgrep* commands as well. It was the clear intention of the standard developers to consolidate the three *greps* into a single command.

The old *egrep* and *fgrep* commands are likely to be supported for many years to come as implementation extensions, allowing historical applications to operate unmodified.

Historical implementations usually silently ignored all but one of multiply-specified **-e** and **-f** options, but were not consistent as to which specification was actually used.

- 92318 The **-b** option was omitted from the **OPTIONS** section because block numbers are  
92319 implementation-defined.
- 92320 The System V restriction on using **-** to mean standard input was omitted.
- 92321 A definition of action taken when given a null BRE or ERE is specified. This is an error  
92322 condition in some historical implementations.
- 92323 The **-l** option previously indicated that its use was undefined when no files were explicitly  
92324 named. This behavior was historical and placed an unnecessary restriction on future  
92325 implementations. It has been removed.
- 92326 The historical BSD *grep* **-s** option practice is easily duplicated by redirecting standard output to  
92327 **/dev/null**. The **-s** option required here is from System V.
- 92328 The **-x** option, historically available only with *fgrep*, is available here for all of the non-  
92329 obsolescent versions.
- 92330 **FUTURE DIRECTIONS**
- 92331 None.
- 92332 **SEE ALSO**

92346 **NAME**

92347 hash — remember or report utility locations

92348 **SYNOPSIS**92349 hash [*utility*...]

92350 hash -r

92351 **DESCRIPTION**

92352 The *hash* utility shall affect the way the current shell environment remembers the locations of  
 92353 utilities found as described in [Section 2.9.1.1](#) (on page 2339). Depending on the arguments  
 92354 specified, it shall add utility locations to its list of remembered locations or it shall purge the  
 92355 contents of the list. When no arguments are specified, it shall report on the contents of the list.

92356 Utilities provided as built-ins to the shell shall not be reported by *hash*.92357 **OPTIONS**92358 The *hash* utility shall conform to XBD [Section 12.2](#) (on page 215).

92359 The following option shall be supported:

92360 -r Forget all previously remembered utility locations.

92361 **OPERANDS**

92362 The following operand shall be supported:

92363 *utility* The name of a utility to be searched for and added to the list of remembered  
 92364 locations. If *utility* contains one or more <slash> characters, the results are  
 92365 unspecified.

92366 **STDIN**

92367 Not used.

92368 **INPUT FILES**

92369 None.

92370 **ENVIRONMENT VARIABLES**92371 The following environment variables shall affect the execution of *hash*:

92372 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 92373 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 92374 variables used to determine the values of locale categories.)

92375 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 92376 internationalization variables.

92377 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 92378 characters (for example, single-byte as opposed to multi-byte characters in  
 92379 arguments).

92380 *LC\_MESSAGES*

92381 Determine the locale that should be used to affect the format and contents of  
 92382 diagnostic messages written to standard error.

92383 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.92384 *PATH* Determine the location of *utility*, as described in XBD [Chapter 8](#) (on page 173).

**92385 ASYNCHRONOUS EVENTS**

92386 Default.

**92387 STDOUT**

92388 The standard output of *hash* shall be used when no arguments are specified. Its format is  
92389 unspecified, but includes the pathname of each utility in the list of remembered locations for the  
92390 current shell environment. This list shall consist of those utilities named in previous *hash*  
92391 invocations that have been invoked, and may contain those invoked and found through the  
92392 normal command search process.

**92393 STDERR**

92394 The standard error shall be used only for diagnostic messages.

**92395 OUTPUT FILES**

92396 None.

**92397 EXTENDED DESCRIPTION**

92398 None.

**92399 EXIT STATUS**

92400 The following exit values shall be returned:

92401 0 Successful completion.

92402 >0 An error occurred.

**92403 CONSEQUENCES OF ERRORS**

92404 Default.

**92405 APPLICATION USAGE**

92406 Since *hash* affects the current shell execution environment, it is always provided as a shell  
92407 regular built-in. If it is called in a separate utility execution environment, such as one of the  
92408 following:

92409 `nohup hash -r`  
92410 `find . -type f | xargs hash`

92411 it does not affect the command search process of the caller's environment.

92412 The *hash* utility may be implemented as an alias—for example, *alias -t -*, in which case utilities  
92413 found through normal command search are not listed by the *hash* command.

92414 The effects of *hash -r* can also be achieved portably by resetting the value of *PATH*; in the  
92415 simplest form, this can be:

92416 `PATH="$PATH"`

92417 The use of *hash* with *utility* names is unnecessary for most applications, but may provide a  
92418 performance improvement on a few implementations; normally, the hashing process is included  
92419 by default.

**92420 EXAMPLES**

92421 None.

**92422 RATIONALE**

92423 None.

92424 **FUTURE DIRECTIONS**

92425 None.

92426 **SEE ALSO**92427 [Section 2.9.1.1](#) (on page 2339)92428 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)92429 **CHANGE HISTORY**

92430 First released in Issue 2.

92431 **Issue 7**92432 The *hash* utility is moved from the XSI option to the Base.

92433 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0093 [241] is applied.

+

92434 **NAME**

92435 head — copy the first part of files

92436 **SYNOPSIS**92437 head [**-n** *number*] [*file*...]92438 **DESCRIPTION**92439 The *head* utility shall copy its input files to the standard output, ending the output for each file at  
92440 a designated point.92441 Copying shall end at the point in each input file indicated by the **-n** *number* option. The option-  
92442 argument *number* shall be counted in units of lines.92443 **OPTIONS**92444 The *head* utility shall conform to XBD [Section 12.2](#) (on page 215).

92445 The following option shall be supported:

92446 **-n** *number* The first *number* lines of each input file shall be copied to standard output. The  
92447 application shall ensure that the *number* option-argument is a positive decimal  
92448 integer.92449 When a file contains less than *number* lines, it shall be copied to standard output in its entirety.  
92450 This shall not be an error.92451 If no options are specified, *head* shall act as if **-n 10** had been specified.92452 **OPERANDS**

92453 The following operand shall be supported:

92454 *file* A pathname of an input file. If no *file* operands are specified, the standard input  
92455 shall be used.92456 **STDIN**92457 The standard input shall be used if no *file* operands are specified, and shall be used if a *file*  
92458 operand is '-' and the implementation treats the '-' as meaning standard input. Otherwise,  
92459 the standard input shall not be used. See the INPUT FILES section.92460 **INPUT FILES**

92461 Input files shall be text files, but the line length is not restricted to {LINE\_MAX} bytes.

92462 **ENVIRONMENT VARIABLES**92463 The following environment variables shall affect the execution of *head*:92464 **LANG** Provide a default value for the internationalization variables that are unset or null.  
92465 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
92466 variables used to determine the values of locale categories.)92467 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
92468 internationalization variables.92469 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
92470 characters (for example, single-byte as opposed to multi-byte characters in  
92471 arguments and input files).92472 **LC\_MESSAGES**92473 Determine the locale that should be used to affect the format and contents of  
92474 diagnostic messages written to standard error.

92475 XSI **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

92476 **ASYNCHRONOUS EVENTS**

92477 Default.

92478 **STDOUT**

92479 The standard output shall contain designated portions of the input files.

92480 If multiple *file* operands are specified, *head* shall precede the output for each with the header:

92481 "*\n==> %s <==\n*", *<pathname>*

92482 except that the first header written shall not include the initial *<newline>*.

92483 **STDERR**

92484 The standard error shall be used only for diagnostic messages.

92485 **OUTPUT FILES**

92486 None.

92487 **EXTENDED DESCRIPTION**

92488 None.

92489 **EXIT STATUS**

92490 The following exit values shall be returned:

92491 0 Successful completion.

92492 >0 An error occurred.

92493 **CONSEQUENCES OF ERRORS**

92494 Default.

92495 **APPLICATION USAGE**

92496 None.

92497 **EXAMPLES**

92498 To write the first ten lines of all files (except those with a leading period) in the directory:

92499 *head -- \**

92500 **RATIONALE**

92501 Although it is possible to simulate *head* with *sed 10q* for a single file, the standard developers

92502 decided that the popularity of *head* on historical BSD systems warranted its inclusion alongside

92503 *tail*.

92504 POSIX.1-2008 version of *head* follows the Utility Syntax Guidelines. The *-n* option was added to

92505 this new interface so that *head* and *tail* would be more logically related. Earlier versions of this

92506 standard allowed a *-number* option. This form is no longer specified by POSIX.1-2008 but may

92507 be present in some implementations.

92508 There is no *-c* option (as there is in *tail*) because it is not historical practice and because other

92509 utilities in this volume of POSIX.1-2008 provide similar functionality.

92510 **FUTURE DIRECTIONS**

92511 None.

92512 **SEE ALSO**

92513 *sed*, *tail*

92514 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)

**92515 CHANGE HISTORY**

92516 First released in Issue 4.

**92517 Issue 6**

92518 The obsolescent **–number** form is removed.

92519 The normative text is reworded to avoid use of the term “must” for application requirements.

92520 The DESCRIPTION is updated to clarify that when a file contains less than the number of lines  
92521 requested, the entire file is copied to standard output.

**92522 Issue 7**

92523 Austin Group Interpretations 1003.1-2001 #027 and #092 are applied.

92524 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

92525 The APPLICATION USAGE section is removed and the EXAMPLES section is corrected.

**NAME**

iconv — codeset conversion

**SYNOPSIS**

```
iconv [-cs] -f frommap -t tomap [file...]
iconv -f fromcode [-cs] [-t tocode] [file...]
iconv -t tocode [-cs] [-f fromcode] [file...]
iconv -l
```

**DESCRIPTION**

The *iconv* utility shall convert the encoding of characters in *file* from one codeset to another and write the results to standard output.

When the options indicate that charmap files are used to specify the codesets (see **OPTIONS**), the codeset conversion shall be accomplished by performing a logical join on the symbolic character names in the two charmaps. The implementation need not support the use of charmap files for codeset conversion unless the POSIX2\_LOCALEDEF symbol is defined on the system.

**OPTIONS**

The *iconv* utility shall conform to XBD [Section 12.2](#) (on page 215).

The following options shall be supported:

**-c** Omit any characters that are invalid in the codeset of the input file from the output. When **-c** is not used, the results of encountering invalid characters in the input stream (either those that are not characters in the codeset of the input file or that have no corresponding character in the codeset of the output file) shall be specified in the system documentation. The presence or absence of **-c** shall not affect the exit status of *iconv*.

**-f** *fromcodeset*

Identify the codeset of the input file. The implementation shall recognize the following two forms of the *fromcodeset* option-argument:

*fromcode* The *fromcode* option-argument must not contain a <slash> character. It shall be interpreted as the name of one of the codeset descriptions provided by the implementation in an unspecified format. Valid values of *fromcode* are implementation-defined.

*frommap* The *frommap* option-argument must contain a <slash> character. It shall be interpreted as the pathname of a charmap file as defined in XBD [Section 6.4](#) (on page 129). If the pathname does not represent a valid, readable charmap file, the results are undefined.

If this option is omitted, the codeset of the current locale shall be used.

**-l** Write all supported *fromcode* and *tocode* values to standard output in an unspecified format.

**-s** Suppress any messages written to standard error concerning invalid characters. When **-s** is not used, the results of encountering invalid characters in the input stream (either those that are not valid characters in the codeset of the input file or that have no corresponding character in the codeset of the output file) shall be specified in the system documentation. The presence or absence of **-s** shall not affect the exit status of *iconv*.

|       |                            |                                                                               |
|-------|----------------------------|-------------------------------------------------------------------------------|
| 92569 | <b>-t <i>tocodeset</i></b> | Identify the codeset to be used for the output file. The implementation shall |
| 92570 |                            | recognize the following two forms of the <i>tocodeset</i> option-argument:    |

|       |                |                                                                           |
|-------|----------------|---------------------------------------------------------------------------|
| 92571 | <i>to</i> code | The semantics shall be equivalent to the <code>-f fromcode</code> option. |
|-------|----------------|---------------------------------------------------------------------------|

|       |              |                                                                          |
|-------|--------------|--------------------------------------------------------------------------|
| 92572 | <i>tomap</i> | The semantics shall be equivalent to the <code>-f frommap</code> option. |
|-------|--------------|--------------------------------------------------------------------------|

92573 If this option is omitted, the codeset of the current locale shall be used.

92574 If either `-f` or `-t` represents a charmap file, but the other does not (or is omitted), or both `-f` and  
92575 `-t` are omitted, the results are undefined.

## 92576 OPERANDS

92577 The following operand shall be supported:

|       |             |                                                                                                       |
|-------|-------------|-------------------------------------------------------------------------------------------------------|
| 92578 | <i>file</i> | A pathname of an input file. If no <i>file</i> operands are specified, or if a <i>file</i> operand is |
| 92579 |             | '-', the standard input shall be used.                                                                |

## 92580 STDIN

92581 The standard input shall be used only if no *file* operands are specified, or if a *file* operand is '–'.

## 92582 INPUT FILES

92583            The input file shall be a text file.

## 92584 ENVIRONMENT VARIABLES

92585      The following environment variables shall affect the execution of *iconv*:

|       |             |                                                                                               |
|-------|-------------|-----------------------------------------------------------------------------------------------|
| 92586 | <i>LANG</i> | Provide a default value for the internationalization variables that are unset or null.        |
| 92587 |             | (See XBD <a href="#">Section 8.2</a> (on page 174) for the precedence of internationalization |
| 92588 |             | variables used to determine the values of locale categories.)                                 |

|       |               |                                                                          |
|-------|---------------|--------------------------------------------------------------------------|
| 92589 | <i>LC_ALL</i> | If set to a non-empty string value, override the values of all the other |
| 92590 |               | internationalization variables.                                          |

92591 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
92592 characters (for example, single-byte as opposed to multi-byte characters in  
92593 arguments). During translation of the file, this variable is superseded by the use of  
92594 the *fromcode* option-argument.

```

92595 LC_MESSAGES
92596 Determine the locale that should be used to affect the format and contents of
92597 diagnostic messages written to standard error.

```

|       |     |                |                                                                                       |
|-------|-----|----------------|---------------------------------------------------------------------------------------|
| 92598 | XSI | <i>NLSPATH</i> | Determine the location of message catalogs for the processing of <i>LC_MESSAGES</i> . |
|-------|-----|----------------|---------------------------------------------------------------------------------------|

92599 **ASYNCHRONOUS EVENTS**

|       |          |
|-------|----------|
| 92600 | Default. |
|-------|----------|

92601 **STDOUT**

92602 When the `-I` option is used, the standard output shall contain all supported *fromcode* and *tocode*  
92603 values, written in an unspecified format.

92604 When the `-l` option is not used, the standard output shall contain the sequence of characters  
92605 read from the input files, translated to the specified codeset. Nothing else shall be written to the  
92606 standard output.

## 92607 STDERR

92608 The standard error shall be used only for diagnostic messages.

**92609 OUTPUT FILES**

92610 None.

**92611 EXTENDED DESCRIPTION**

92612 None.

**92613 EXIT STATUS**

92614 The following exit values shall be returned:

92615 0 Successful completion.

92616 >0 An error occurred.

**92617 CONSEQUENCES OF ERRORS**

92618 Default.

**92619 APPLICATION USAGE**

92620 The user must ensure that both charmap files use the same symbolic names for characters the  
92621 two codesets have in common.

**92622 EXAMPLES**

92623 The following example converts the contents of file **mail.x400** from the ISO/IEC 6937:2001  
92624 standard codeset to the ISO/IEC 8859-1:1998 standard codeset, and stores the results in file  
92625 **mail.local**:

92626 `iconv -f IS6937 -t IS8859 mail.x400 > mail.local`

**92627 RATIONALE**

92628 The *iconv* utility can be used portably only when the user provides two charmap files as option-  
92629 arguments. This is because a single charmap provided by the user cannot reliably be joined with  
92630 the names in a system-provided character set description. The valid values for *fromcode* and  
92631 *toctype* are implementation-defined and do not have to have any relation to the charmap  
92632 mechanisms. As an aid to interactive users, the `-l` option was adopted from the Plan 9 operating  
92633 system. It writes information concerning these implementation-defined values. The format is  
92634 unspecified because there are many possible useful formats that could be chosen, such as a  
92635 matrix of valid combinations of *fromcode* and *toctype*. The `-l` option is not intended for shell script  
92636 usage; conforming applications will have to use charmaps.

92637 The *iconv* utility may support the conversion between ASCII and EBCDIC-based encodings, but +  
92638 is not required to do so. In an XSI-compliant implementation, the *dd* utility is the only method +  
92639 guaranteed to support conversion between these two character sets.

**92640 FUTURE DIRECTIONS**

92641 None.

**92645 CHANGE HISTORY**

92646 First released in Issue 3.

**92647 Issue 6**

92648 This utility has been rewritten to align with the IEEE P1003.2b draft standard. Specifically, the  
92649 ability to use charmap files for conversion has been added.

92650 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/29 is applied, making changes to address  
92651 inconsistencies with the *iconv()* function in the System Interfaces volume of POSIX.1-2008.

92652 **Issue 7**

92653 Austin Group Interpretation 1003.1-2001 #206 is applied, correcting the *tomap* option.

92654 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

92655 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0094 [291] and XCU/TC1-2008/0095 +  
92656 [291] are applied.

92657 **NAME**

92658       id — return user identity

92659 **SYNOPSIS**92660       id [*user*]92661       id -G [-n] [*user*]92662       id -g [-nr] [*user*]92663       id -u [-nr] [*user*]92664 **DESCRIPTION**

92665       If no *user* operand is provided, the *id* utility shall write the user and group IDs and the  
 92666       corresponding user and group names of the invoking process to standard output. If the effective  
 92667       and real IDs do not match, both shall be written. If multiple groups are supported by the  
 92668       underlying system (see the description of {NGROUPS\_MAX} in the System Interfaces volume of  
 92669       POSIX.1-2008), the supplementary group affiliations of the invoking process shall also be  
 92670       written.

92671       If a *user* operand is provided and the process has appropriate privileges, the user and group IDs  
 92672       of the selected user shall be written. In this case, effective IDs shall be assumed to be identical to  
 92673       real IDs. If the selected user has more than one allowable group membership listed in the group  
 92674       database, these shall be written in the same manner as the supplementary groups described in  
 92675       the preceding paragraph.

92676 **OPTIONS**92677       The *id* utility shall conform to XBD [Section 12.2](#) (on page 215).

92678       The following options shall be supported:

92679       **-G**       Output all different group IDs (effective, real, and supplementary) only, using the  
 92680       format "%u\n". If there is more than one distinct group affiliation, output each  
 92681       such affiliation, using the format " %u", before the <newline> is output.

92682       **-g**       Output only the effective group ID, using the format "%u\n".

92683       **-n**       Output the name in the format "%s" instead of the numeric ID using the format  
 92684       "%u".

92685       **-r**       Output the real ID instead of the effective ID.

92686       **-u**       Output only the effective user ID, using the format "%u\n".

92687 **OPERANDS**

92688       The following operand shall be supported:

92689       *user*       The login name for which information is to be written.

92690 **STDIN**

92691       Not used.

92692 **INPUT FILES**

92693       None.

92694 **ENVIRONMENT VARIABLES**92695       The following environment variables shall affect the execution of *id*:

92696       **LANG**       Provide a default value for the internationalization variables that are unset or null.  
 92697       (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 92698       variables used to determine the values of locale categories.)

92699 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 92700 internationalization variables.

92701 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 92702 characters (for example, single-byte as opposed to multi-byte characters in  
 92703 arguments).

92704 *LC\_MESSAGES*  
 92705 Determine the locale that should be used to affect the format and contents of  
 92706 diagnostic messages written to standard error and informative messages written to  
 92707 standard output.

92708 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

92709 **ASYNCHRONOUS EVENTS**  
 92710 Default.

92711 **STDOUT**  
 92712 The following formats shall be used when the *LC\_MESSAGES* locale category specifies the  
 92713 POSIX locale. In other locales, the strings *uid*, *gid*, *euid*, *egid*, and *groups* may be replaced with  
 92714 more appropriate strings corresponding to the locale.

92715 "uid=%u(%s) gid=%u(%s)\n", <real user ID>, <user-name>,  
 92716 <real group ID>, <group-name>

92717 If the effective and real user IDs do not match, the following shall be inserted immediately  
 92718 before the '\n' character in the previous format:

92719 " euid=%u(%s) "

92720 with the following arguments added at the end of the argument list:

92721 <effective user ID>, <effective user-name>

92722 If the effective and real group IDs do not match, the following shall be inserted directly before  
 92723 the '\n' character in the format string (and after any addition resulting from the effective and  
 92724 real user IDs not matching):

92725 " egid=%u(%s) "

92726 with the following arguments added at the end of the argument list:

92727 <effective group-ID>, <effective group name>

92728 If the process has supplementary group affiliations or the selected user is allowed to belong to  
 92729 multiple groups, the first shall be added directly before the <newline> in the format string:

92730 " groups=%u(%s) "

92731 with the following arguments added at the end of the argument list:

92732 <supplementary group ID>, <supplementary group name>

92733 and the necessary number of the following added after that for any remaining supplementary  
 92734 group IDs:

92735 ", %u(%s) "

92736 and the necessary number of the following arguments added at the end of the argument list:

92737 <supplementary group ID>, <supplementary group name>

92738 If any of the user ID, group ID, effective user ID, effective group ID, or supplementary/multiple

group IDs cannot be mapped by the system into printable user or group names, the corresponding "(%s)" and *name* argument shall be omitted from the corresponding format string.

When any of the options are specified, the output format shall be as described in the OPTIONS section.

#### STDERR

The standard error shall be used only for diagnostic messages.

#### OUTPUT FILES

None.

#### EXTENDED DESCRIPTION

None.

#### EXIT STATUS

The following exit values shall be returned:

0 Successful completion.

>0 An error occurred.

#### CONSEQUENCES OF ERRORS

Default.

#### APPLICATION USAGE

Output produced by the **-G** option and by the default case could potentially produce very long lines on systems that support large numbers of supplementary groups. (On systems with user and group IDs that are 32-bit integers and with group names with a maximum of 8 bytes per name, 93 supplementary groups plus distinct effective and real group and user IDs could theoretically overflow the 2048-byte {LINE\_MAX} text file line limit on the default output case. It would take about 186 supplementary groups to overflow the 2048-byte barrier using *id -G*). This is not expected to be a problem in practice, but in cases where it is a concern, applications should consider using *fold -s* before post-processing the output of *id*.

#### EXAMPLES

None.

#### RATIONALE

The functionality provided by the 4 BSD *groups* utility can be simulated using:

```
id -Gn [user]
```

The 4 BSD command *groups* was considered, but it was not included because it did not provide the functionality of the *id* utility of the SVID. Also, it was thought that it would be easier to modify *id* to provide the additional functionality necessary to systems with multiple groups than to invent another command.

The options **-u**, **-g**, **-n**, and **-r** were added to ease the use of *id* with shell commands substitution. Without these options it is necessary to use some preprocessor such as *sed* to select the desired piece of information. Since output such as that produced by:

```
id -u -n
```

is frequently wanted, it seemed desirable to add the options.

92779 **FUTURE DIRECTIONS**

92780 None.

92781 **SEE ALSO**92782 *fold, logname, who*92783 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)92784 XSH *getgid()*, *getgroups()*, *getuid()*92785 **CHANGE HISTORY**

92786 First released in Issue 2.

92787 **Issue 7**

92788 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

92789 **NAME**92790 `ipcrm` — remove an XSI message queue, semaphore set, or shared memory segment identifier92791 **SYNOPSIS**92792 XSI `ipcrm [-q msgid|-Q msgkey|-s semid|-S semkey|-m shmid|-M shmkey]...`92793 **DESCRIPTION**92794 The *ipcrm* utility shall remove zero or more message queues, semaphore sets, or shared memory  
92795 segments. The interprocess communication facilities to be removed are specified by the options.92796 Only a user with appropriate privileges shall be allowed to remove an interprocess  
92797 communication facility that was not created by or owned by the user invoking *ipcrm*.92798 **OPTIONS**92799 The *ipcrm* utility shall conform to XBD [Section 12.2](#) (on page 215).

92800 The following options shall be supported:

92801 `-q msgid` Remove the message queue identifier *msgid* from the system and destroy the  
92802 message queue and data structure associated with it.92803 `-m shmid` Remove the shared memory identifier *shmid* from the system. The shared memory  
92804 segment and data structure associated with it shall be destroyed after the last  
92805 detach.92806 `-s semid` Remove the semaphore identifier *semid* from the system and destroy the set of  
92807 semaphores and data structure associated with it.92808 `-Q msgkey` Remove the message queue identifier, created with key *msgkey*, from the system  
92809 and destroy the message queue and data structure associated with it.92810 `-M shmkey` Remove the shared memory identifier, created with key *shmkey*, from the system.  
92811 The shared memory segment and data structure associated with it shall be  
92812 destroyed after the last detach.92813 `-S semkey` Remove the semaphore identifier, created with key *semkey*, from the system and  
92814 destroy the set of semaphores and data structure associated with it.92815 **OPERANDS**

92816 None.

92817 **STDIN**

92818 Not used.

92819 **INPUT FILES**

92820 None.

92821 **ENVIRONMENT VARIABLES**92822 The following environment variables shall affect the execution of *ipcrm*:92823 `LANG` Provide a default value for the internationalization variables that are unset or null.  
92824 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
92825 variables used to determine the values of locale categories.)92826 `LC_ALL` If set to a non-empty string value, override the values of all the other  
92827 internationalization variables.92828 `LC_CTYPE` Determine the locale for the interpretation of sequences of bytes of text data as  
92829 characters (for example, single-byte as opposed to multi-byte characters in  
92830 arguments).

|       |                               |                                                                                         |
|-------|-------------------------------|-----------------------------------------------------------------------------------------|
| 92831 | <i>LC_MESSAGES</i>            |                                                                                         |
| 92832 |                               | Determine the locale that should be used to affect the format and contents of           |
| 92833 |                               | diagnostic messages written to standard error.                                          |
| 92834 | <i>NLSPATH</i>                | Determine the location of message catalogs for the processing of <i>LC_MESSAGES</i> .   |
| 92835 | <b>ASYNCHRONOUS EVENTS</b>    |                                                                                         |
| 92836 |                               | Default.                                                                                |
| 92837 | <b>STDOUT</b>                 |                                                                                         |
| 92838 |                               | Not used.                                                                               |
| 92839 | <b>STDERR</b>                 |                                                                                         |
| 92840 |                               | The standard error shall be used only for diagnostic messages.                          |
| 92841 | <b>OUTPUT FILES</b>           |                                                                                         |
| 92842 |                               | None.                                                                                   |
| 92843 | <b>EXTENDED DESCRIPTION</b>   |                                                                                         |
| 92844 |                               | None.                                                                                   |
| 92845 | <b>EXIT STATUS</b>            |                                                                                         |
| 92846 |                               | The following exit values shall be returned:                                            |
| 92847 | 0                             | Successful completion.                                                                  |
| 92848 | >0                            | An error occurred.                                                                      |
| 92849 | <b>CONSEQUENCES OF ERRORS</b> |                                                                                         |
| 92850 |                               | Default.                                                                                |
| 92851 | <b>APPLICATION USAGE</b>      |                                                                                         |
| 92852 |                               | None.                                                                                   |
| 92853 | <b>EXAMPLES</b>               |                                                                                         |

92867 **NAME**

92868        *ipcs* — report XSI interprocess communication facilities status

92869 **SYNOPSIS**

92870 XSI        *ipcs* [-qms] [-a|-bcopt]

92871 **DESCRIPTION**

92872        The *ipcs* utility shall write information about active interprocess communication facilities.

92873        Without options, information shall be written in short format for message queues, shared  
92874        memory segments, and semaphore sets that are currently active in the system. Otherwise, the  
92875        information that is displayed is controlled by the options specified.

92876 **OPTIONS**

92877        The *ipcs* utility shall conform to XBD [Section 12.2](#) (on page 215).

92878        The *ipcs* utility accepts the following options:

92879        **-q**        Write information about active message queues.

92880        **-m**        Write information about active shared memory segments.

92881        **-s**        Write information about active semaphore sets.

92882        If **-q**, **-m**, or **-s** are specified, only information about those facilities shall be written. If none of  
92883        these three are specified, information about all three shall be written subject to the following  
92884        options:

92885        **-a**        Use all print options. (This is a shorthand notation for **-b**, **-c**, **-o**, **-p**, and **-t**.)

92886        **-b**        Write information on maximum allowable size. (Maximum number of bytes in  
92887        messages on queue for message queues, size of segments for shared memory, and  
92888        number of semaphores in each set for semaphores.)

92889        **-c**        Write creator's user name and group name; see below.

92890        **-o**        Write information on outstanding usage. (Number of messages on queue and total  
92891        number of bytes in messages on queue for message queues, and number of  
92892        processes attached to shared memory segments.)

92893        **-p**        Write process number information. (Process ID of the last process to send a  
92894        message and process ID of the last process to receive a message on message  
92895        queues, process ID of the creating process, and process ID of the last process to  
92896        attach or detach on shared memory segments.)

92897        **-t**        Write time information. (Time of the last control operation that changed the access  
92898        permissions for all facilities, time of the last *msgsnd()* and *msgrcv()* operations on  
92899        message queues, time of the last *shmat()* and *shmdt()* operations on shared  
92900        memory, and time of the last *semop()* operation on semaphores.)

92901 **OPERANDS**

92902        None.

92903 **STDIN**

92904        Not used.

92905 **INPUT FILES**

- 92906        • The group database

- The user database

## ENVIRONMENT VARIABLES

The following environment variables shall affect the execution of *ipcs*:

|             |                                                                                                                                                                                                                                                    |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LANG        | Provide a default value for the internationalization variables that are unset or null. (See XBD <a href="#">Section 8.2</a> (on page 174) for the precedence of internationalization variables used to determine the values of locale categories.) |
| LC_ALL      | If set to a non-empty string value, override the values of all the other internationalization variables.                                                                                                                                           |
| LC_CTYPE    | Determine the locale for the interpretation of sequences of bytes of text data as characters (for example, single-byte as opposed to multi-byte characters in arguments).                                                                          |
| LC_MESSAGES | Determine the locale that should be used to affect the format and contents of diagnostic messages written to standard error.                                                                                                                       |
| NLSPATH     | Determine the location of message catalogs for the processing of <i>LC_MESSAGES</i> .                                                                                                                                                              |
| TZ          | Determine the timezone for the date and time strings written by <i>ipcs</i> . If <i>TZ</i> is unset or null, an unspecified default timezone shall be used.                                                                                        |

## ASYNCHRONOUS EVENTS

Default.

## STDOUT

An introductory line shall be written with the format:

```
"IPC status from %s as of %s\n", <source>, <date>
```

where *<source>* indicates the source used to gather the statistics and *<date>* is the information that would be produced by the *date* command when invoked in the POSIX locale.

The *ipcs* utility then shall create up to three reports depending upon the *-q*, *-m*, and *-s* options. The first report shall indicate the status of message queues, the second report shall indicate the status of shared memory segments, and the third report shall indicate the status of semaphore sets.

If the corresponding facility is not installed or has not been used since the last reboot, then the report shall be written out in the format:

```
"%s facility not in system.\n", <facility>
```

where *<facility>* is *Message Queue*, *Shared Memory*, or *Semaphore*, as appropriate. If the facility has been installed and has been used since the last reboot, column headings separated by one or more *<space>* characters and followed by a *<newline>* shall be written as indicated below followed by the facility name written out using the format:

```
"%s:\n", <facility>
```

where *<facility>* is *Message Queues*, *Shared Memory*, or *Semaphores*, as appropriate. On the second and third reports the column headings need not be written if the last column headings written already provide column headings for all information in that report.

The column headings provided in the first column below and the meaning of the information in those columns shall be given in order below; the letters in parentheses indicate the options that shall cause the corresponding column to appear; “all” means that the column shall always appear. Each column is separated by one or more *<space>* characters. Note that these options

|       |                                                                                          |                                                                                                     |
|-------|------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------|
| 92950 | only determine what information is provided for each report; they do not determine which |                                                                                                     |
| 92951 | reports are written.                                                                     |                                                                                                     |
| 92952 | T (all)                                                                                  | Type of facility:                                                                                   |
| 92953 | q                                                                                        | Message queue.                                                                                      |
| 92954 | m                                                                                        | Shared memory segment.                                                                              |
| 92955 | s                                                                                        | Semaphore.                                                                                          |

93034 shall be written using the format %d:%2.2d:%2.2d. Otherwise, the format  
93035 " no-entry" shall be written.

93036 The following eight columns shall be only written out for shared memory segments.

93037 CREATOR (a,c) The user of the creator of the facility entry. If the user name of the creator is  
93038 found in the user database, at least the first eight column positions of the  
93039 name shall be written using the format %s. Otherwise, the user ID of the  
93040 creator shall be written using the format %d.

93041 CGROUP (a,c) The group name of the creator of the facility entry. If the group name of the  
93042 creator is found in the group database, at least the first eight column positions  
93043 of the name shall be written using the format %s. Otherwise, the group ID of  
93044 the creator shall be written using the format %d.

93045 NATTCH (a,o) The number of processes attached to the associated shared memory segment.  
93046 This field shall be written using the format %d.

93047 SEGSZ (a,b) The size of the associated shared memory segment. This field shall be written  
93048 using the format %d.

93049 CPID (a,p) The process ID of the creator of the shared memory entry. This field shall be  
93050 written using the format %d.

93051 LPID (a,p) The process ID of the last process to attach or detach the shared memory  
93052 segment. This field shall be written using the format:

93053 "%d", <pid>

93054 where <pid> is 0 if no process has attached the corresponding shared memory  
93055 segment; otherwise, <pid> shall be the process ID of the last process to attach  
93056 or detach the segment.

93057 ATIME (a,t) The time the last attach on the associated shared memory segment was  
93058 completed. If the corresponding shared memory segment has ever been  
93059 attached, the hour, minute, and second of the last time the segment was  
93060 attached shall be written using the format %d:%2.2d:%2.2d. Otherwise, the  
93061 format " no-entry" shall be written.

93062 DTIME (a,t) The time the last detach on the associated shared memory segment was  
93063 completed. If the corresponding shared memory segment has ever been  
93064 detached, the hour, minute, and second of the last time the segment was  
93065 detached shall be written using the format %d:%2.2d:%2.2d. Otherwise, the  
93066 format " no-entry" shall be written.

93067 The following four columns shall be only written out for semaphore sets:

93068 CREATOR (a,c) The user of the creator of the facility entry. If the user name of the creator is  
93069 found in the user database, at least the first eight column positions of the  
93070 name shall be written using the format %s. Otherwise, the user ID of the  
93071 creator shall be written using the format %d.

93072 CGROUP (a,c) The group name of the creator of the facility entry. If the group name of the  
93073 creator is found in the group database, at least the first eight column positions  
93074 of the name shall be written using the format %s. Otherwise, the group ID of  
93075 the creator shall be written using the format %d.

|       |                               |                                                                                                                                                                                                                                                                                                                                                                                  |

93115 **Issue 6**

93116 The Open Group Corrigendum U020/1 is applied, correcting the SYNOPSIS.

93117 The Open Group Corrigenda U032/1 and U032/2 are applied, clarifying the output format.

93118 The Open Group Base Resolution bwg98-004 is applied.

93119 **Issue 7**

93120 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

93121 SD5-XCU-ERN-139 is applied, adding the *ipcrm* utility to the SEE ALSO section.

93122 **NAME**93123       *jobs* — display status of jobs in the current session93124 **SYNOPSIS**93125 UP       *jobs* **[-l|-p]** [*job\_id*...]93126 **DESCRIPTION**93127       The *jobs* utility shall display the status of jobs that were started in the current shell environment;  
93128       see [Section 2.12](#) (on page 2353).93129       When *jobs* reports the termination status of a job, the shell shall remove its process ID from the  
93130       list of those “known in the current shell execution environment”; see [Section 2.9.3.1](#) (on page  
93131       2342).93132 **OPTIONS**93133       The *jobs* utility shall conform to XBD [Section 12.2](#) (on page 215).

93134       The following options shall be supported:

93135       **-l**       (The letter ell.) Provide more information about each job listed. This information  
93136       shall include the job number, current job, process group ID, state, and the  
93137       command that formed the job.93138       **-p**       Display only the process IDs for the process group leaders of the selected jobs.93139       By default, the *jobs* utility shall display the status of all stopped jobs, running background jobs  
93140       and all jobs whose status has changed and have not been reported by the shell.93141 **OPERANDS**

93142       The following operand shall be supported:

93143       *job\_id*       Specifies the jobs for which the status is to be displayed. If no *job\_id* is given, the  
93144       status information for all jobs shall be displayed. The format of *job\_id* is described  
93145       in XBD [Section 3.204](#) (on page 65).93146 **STDIN**

93147       Not used.

93148 **INPUT FILES**

93149       None.

93150 **ENVIRONMENT VARIABLES**93151       The following environment variables shall affect the execution of *jobs*:93152       **LANG**       Provide a default value for the internationalization variables that are unset or null.  
93153       (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
93154       variables used to determine the values of locale categories.)93155       **LC\_ALL**       If set to a non-empty string value, override the values of all the other  
93156       internationalization variables.93157       **LC\_CTYPE**   Determine the locale for the interpretation of sequences of bytes of text data as  
93158       characters (for example, single-byte as opposed to multi-byte characters in  
93159       arguments).93160       **LC\_MESSAGES**93161       Determine the locale that should be used to affect the format and contents of  
93162       diagnostic messages written to standard error and informative messages written to  
93163       standard output.

93164 XSI **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

93165 **ASYNCHRONOUS EVENTS**

93166 Default.

93167 **STDOUT**

93168 If the **-p** option is specified, the output shall consist of one line for each process ID:

93169 "%d\n", <process ID>

93170 Otherwise, if the **-l** option is not specified, the output shall be a series of lines of the form:

93171 "[%d] %c %s %s\n", <job-number>, <current>, <state>, <command>

93172 where the fields shall be as follows:

93173 <current> The character '+' identifies the job that would be used as a default for the *fg* or *bg* utilities; this job can also be specified using the *job\_id* %+ or "%%". The character '-' identifies the job that would become the default if the current default job were to exit; this job can also be specified using the *job\_id* %-. For other jobs, this field is a <space>. At most one job can be identified with '+' and at most one job can be identified with '-'. If there is any suspended job, then the current job shall be a suspended job. If there are at least two suspended jobs, then the previous job also shall be a suspended job.

93181 <job-number> A number that can be used to identify the process group to the *wait*, *fg*, *bg*, and *kill* utilities. Using these utilities, the job can be identified by prefixing the job number with '% '.

93182

93183

93184 <state> One of the following strings (in the POSIX locale):

93185 **Running** Indicates that the job has not been suspended by a signal and has not exited.

93186

93187 **Done** Indicates that the job completed and returned exit status zero.

93188 **Done(code)** Indicates that the job completed normally and that it exited with the specified non-zero exit status, *code*, expressed as a decimal number.

93189

93190 **Stopped** Indicates that the job was suspended by the SIGTSTP signal.

93191 **Stopped (SIGTSTP)**

93192 Indicates that the job was suspended by the SIGTSTP signal.

93193 **Stopped (SIGSTOP)**

93194 Indicates that the job was suspended by the SIGSTOP signal.

93195 **Stopped (SIGTTIN)**

93196 Indicates that the job was suspended by the SIGTTIN signal.

93197 **Stopped (SIGTTOU)**

93198 Indicates that the job was suspended by the SIGTTOU signal.

93199 The implementation may substitute the string **Suspended** in place of **Stopped**. If the job was terminated by a signal, the format of <state> is unspecified, but it shall be visibly distinct from all of the other <state> formats shown here and shall indicate the name or description of the signal causing the termination.

93200

93201

93202

93203 <command> The associated command that was given to the shell.

93204 If the **-l** option is specified, a field containing the process group ID shall be inserted before the <state> field. Also, more processes in a process group may be output on separate lines, using

93205
