93206 only the process ID and *<command>* fields.

#### 93207 **STDERR**

93208 The standard error shall be used only for diagnostic messages.

#### 93209 **OUTPUT FILES**

93210 None.

#### 93211 **EXTENDED DESCRIPTION**

93212 None.

#### 93213 **EXIT STATUS**

93214 The following exit values shall be returned:

93215 0 Successful completion.

93216 >0 An error occurred.

#### 93217 **CONSEQUENCES OF ERRORS**

93218 Default.

#### 93219 **APPLICATION USAGE**

93220 The **-p** option is the only portable way to find out the process group of a job because different  
 93221 implementations have different strategies for defining the process group of the job. Usage such  
 93222 as *\$(jobs -p)* provides a way of referring to the process group of the job in an implementation-  
 93223 independent way.

93224 The *jobs* utility does not work as expected when it is operating in its own utility execution  
 93225 environment because that environment has no applicable jobs to manipulate. See the  
 93226 APPLICATION USAGE section for *bg*. For this reason, *jobs* is generally implemented as a shell  
 93227 regular built-in.

#### 93228 **EXAMPLES**

93229 None.

#### 93230 **RATIONALE**

93231 Both "**%%**" and "**%+**" are used to refer to the current job. Both forms are of equal validity—the  
 93232 "**%%**" mirroring "**\$\$**" and "**%+**" mirroring the output of *jobs*. Both forms reflect historical  
 93233 practice of the KornShell and the C shell with job control.

93234 The job control features provided by *bg*, *fg*, and *jobs* are based on the KornShell. The standard  
 93235 developers examined the characteristics of the C shell versions of these utilities and found that  
 93236 differences exist. Despite widespread use of the C shell, the KornShell versions were selected for  
 93237 this volume of POSIX.1-2008 to maintain a degree of uniformity with the rest of the KornShell  
 93238 features selected (such as the very popular command line editing features).

93239 The *jobs* utility is not dependent on the job control option, as are the seemingly related *bg* and *fg*  
 93240 utilities because *jobs* is useful for examining background jobs, regardless of the condition of job  
 93241 control. When the user has invoked a *set +m* command and job control has been turned off, *jobs*  
 93242 can still be used to examine the background jobs associated with that current session. Similarly,  
 93243 *kill* can then be used to kill background jobs with *kill %<background job number>*.

93244 The output for terminated jobs is left unspecified to accommodate various historical systems.  
 93245 The following formats have been witnessed:

- 93246 1. **Killed**(*signal name*)
- 93247 2. *signal name*

93248 3. *signal name*(**coredump**)

93249 4. *signal description*– **core dumped**

93250 Most users should be able to understand these formats, although it means that applications have  
93251 trouble parsing them.

93252 The calculation of job IDs was not described since this would suggest an implementation, which  
93253 may impose unnecessary restrictions.

93254 In an early proposal, a **-n** option was included to “Display the status of jobs that have changed,  
93255 exited, or stopped since the last status report”. It was removed because the shell always writes  
93256 any changed status of jobs before each prompt.

#### 93257 **FUTURE DIRECTIONS**

93258 None.

#### 93262 **CHANGE HISTORY**

93263 First released in Issue 4.

#### 93264 **Issue 6**

93265 This utility is marked as part of the User Portability Utilities option.

93266 The JC shading is removed as job control is mandatory in this version.

#### 93267 **Issue 7**

93268 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

**NAME**

join — relational database operator

**SYNOPSIS**

```
join [-a file_number|-v file_number] [-e string] [-o list] [-t char]
 [-1 field] [-2 field] file1 file2
```

**DESCRIPTION**

The *join* utility shall perform an equality join on the files *file1* and *file2*. The joined files shall be written to the standard output.

The join field is a field in each file on which the files are compared. The *join* utility shall write one line in the output for each pair of lines in *file1* and *file2* that have identical join fields. The output line by default shall consist of the join field, then the remaining fields from *file1*, then the remaining fields from *file2*. This format can be changed by using the **-o** option (see below). The **-a** option can be used to add unmatched lines to the output. The **-v** option can be used to output only unmatched lines.

The files *file1* and *file2* shall be ordered in the collating sequence of *sort -b* on the fields on which they shall be joined, by default the first in each line. All selected output shall be written in the same collating sequence.

The default input field separators shall be <blank> characters. In this case, multiple separators shall count as one field separator, and leading separators shall be ignored. The default output field separator shall be a <space>.

The field separator and collating sequence can be changed by using the **-t** option (see below).

If the same key appears more than once in either file, all combinations of the set of remaining fields in *file1* and the set of remaining fields in *file2* are output in the order of the lines encountered.

If the input files are not in the appropriate collating sequence, the results are unspecified.

**OPTIONS**

The *join* utility shall conform to XBD [Section 12.2](#) (on page 215).

The following options shall be supported:

**-a file\_number**

Produce a line for each unpairable line in file *file\_number*, where *file\_number* is 1 or 2, in addition to the default output. If both **-a1** and **-a2** are specified, all unpairable lines shall be output.

**-e string**

Replace empty output fields in the list selected by **-o** with the string *string*.

**-o list**

Construct the output line to comprise the fields specified in *list*, each element of which shall have one of the following two forms:

1. *file\_number.field*, where *file\_number* is a file number and *field* is a decimal integer field number
2. 0 (zero), representing the join field

The elements of *list* shall be either <comma>-separated or <blank>-separated, as specified in Guideline 8 of XBD [Section 12.2](#) (on page 215). The fields specified by *list* shall be written for all selected output lines. Fields selected by *list* that do not appear in the input shall be treated as empty output fields. (See the **-e** option.) Only specifically requested fields shall be written. The application shall ensure that *list* is a single command line argument.

93313        **-t *char***        Use character *char* as a separator, for both input and output. Every appearance of  
 93314        *char* in a line shall be significant. When this option is specified, the collating  
 93315        sequence shall be the same as *sort* without the **-b** option.

93316        **-v *file\_number***        Instead of the default output, produce a line only for each unpairable line in  
 93317        *file\_number*, where *file\_number* is 1 or 2. If both **-v1** and **-v2** are specified, all  
 93318        unpairable lines shall be output.  
 93319

93320        **-1 *field***        Join on the *field*th field of file 1. Fields are decimal integers starting with 1.

93321        **-2 *field***        Join on the *field*th field of file 2. Fields are decimal integers starting with 1.

## 93322 OPERANDS

93323        The following operands shall be supported:

93324        *file1, file2*        A pathname of a file to be joined. If either of the *file1* or *file2* operands is **'-'**, the  
 93325        standard input shall be used in its place.

## 93326 STDIN

93327        The standard input shall be used only if the *file1* or *file2* operand is **'-'**. See the INPUT FILES  
 93328        section.

## 93329 INPUT FILES

93330        The input files shall be text files.

## 93331 ENVIRONMENT VARIABLES

93332        The following environment variables shall affect the execution of *join*:

93333        *LANG*        Provide a default value for the internationalization variables that are unset or null.  
 93334        (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 93335        variables used to determine the values of locale categories.)

93336        *LC\_ALL*        If set to a non-empty string value, override the values of all the other  
 93337        internationalization variables.

93338        *LC\_COLLATE*        Determine the locale of the collating sequence *join* expects to have been used when  
 93339        the input files were sorted.  
 93340

93341        *LC\_CTYPE*        Determine the locale for the interpretation of sequences of bytes of text data as  
 93342        characters (for example, single-byte as opposed to multi-byte characters in  
 93343        arguments and input files).

93344        *LC\_MESSAGES*        Determine the locale that should be used to affect the format and contents of  
 93345        diagnostic messages written to standard error.  
 93346

93347        XSI        *NLSPATH*        Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

## 93348 ASYNCHRONOUS EVENTS

93349        Default.

## 93350 STDOUT

93351        The *join* utility output shall be a concatenation of selected character fields. When the **-o** option  
 93352        is not specified, the output shall be:

93353        "%s%s%s\n", <*join field*>, <*other file1 fields*>,  
 93354        <*other file2 fields*>

93355        If the join field is not the first field in a file, the <*other file fields*> for that file shall be:

93356 <fields preceding join field>, <fields following join field>

93357 When the **-o** option is specified, the output format shall be:

93358 "%s\n", <concatenation of fields>

93359 where the concatenation of fields is described by the **-o** option, above.

93360 For either format, each field (except the last) shall be written with its trailing separator character.  
 93361 If the separator is the default (<blank> characters), a single <space> shall be written after each  
 93362 field (except the last).

## 93363 STDERR

93364 The standard error shall be used only for diagnostic messages.

## 93365 OUTPUT FILES

93366 None.

## 93367 EXTENDED DESCRIPTION

93368 None.

## 93369 EXIT STATUS

93370 The following exit values shall be returned:

93371 0 All input files were output successfully.

93372 >0 An error occurred.

## 93373 CONSEQUENCES OF ERRORS

93374 Default.

## 93375 APPLICATION USAGE

93376 Pathnames consisting of numeric digits or of the form *string.string* should not be specified  
 93377 directly following the **-o** list.

## 93378 EXAMPLES

93379 The **-o 0** field essentially selects the union of the join fields. For example, given file **phone**:

```
93380 !Name Phone Number
93381 Don +1 123-456-7890
93382 Hal +1 234-567-8901
93383 Yasushi +2 345-678-9012
```

93384 and file **fax**:

```
93385 !Name Fax Number
93386 Don +1 123-456-7899
93387 Keith +1 456-789-0122
93388 Yasushi +2 345-678-9011
```

93389 (where the large expanses of white space are meant to each represent a single <tab>), the  
 93390 command:

```
93391 join -t "<tab>" -a 1 -a 2 -e '(unknown)' -o 0,1.2,2.2 phone fax
```

93392 would produce:

```
93393 !Name Phone Number Fax Number
93394 Don +1 123-456-7890 +1 123-456-7899
93395 Hal +1 234-567-8901 (unknown)
93396 Keith (unknown) +1 456-789-0122
93397 Yasushi +2 345-678-9012 +2 345-678-9011
```

Multiple instances of the same key will produce combinatorial results. The following:

```
fa:
 a x
 a y
 a z
fb:
 a p
```

will produce:

```
a x p
a y p
a z p
```

And the following:

```
fa:
 a b c
 a d e
fb:
 a w x
 a y z
 a o p
```

will produce:

```
a b c w x
a b c y z
a b c o p
a d e w x
a d e y z
a d e o p
```

## RATIONALE

The **-e** option is only effective when used with **-o** because, unless specific fields are identified using **-o**, *join* is not aware of what fields might be empty. The exception to this is the join field, but identifying an empty join field with the **-e** string is not historical practice and some scripts might break if this were changed.

The 0 field in the **-o** list was adopted from the Tenth Edition version of *join* to satisfy international objections that the *join* in the base documents does not support the “full join” or “outer join” described in relational database literature. Although it has been possible to include a join field in the output (by default, or by field number using **-o**), the join field could not be included for an unpaired line selected by **-a**. The **-o 0** field essentially selects the union of the join fields.

This sort of outer join was not possible with the *join* commands in the base documents. The **-o 0** field was chosen because it is an upwards-compatible change for applications. An alternative was considered: have the join field represent the union of the fields in the files (where they are identical for matched lines, and one or both are null for unmatched lines). This was not adopted because it would break some historical applications.

The ability to specify *file2* as **-** is not historical practice; it was added for completeness.

The **-v** option is not historical practice, but was considered necessary because it permitted the writing of *only* those lines that do not match on the join field, as opposed to the **-a** option, which prints both lines that do and do not match. This additional facility is parallel with the **-v** option

93444 of *grep*.

93445 Some historical implementations have been encountered where a blank line in one of the input  
93446 files was considered to be the end of the file; the description in this volume of POSIX.1-2008 does  
93447 not cite this as an allowable case.

93448 Earlier versions of this standard allowed *-j*, *-j1*, *-j2* options, and a form of the *-o* option that  
93449 allowed the *list* option-argument to be multiple arguments. These forms are no longer specified  
93450 by POSIX.1-2008 but may be present in some implementations.

#### 93451 FUTURE DIRECTIONS

93452 None.

#### 93453 SEE ALSO

93454 *awk*, *comm*, *sort*, *uniq*

93455 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)

#### 93456 CHANGE HISTORY

93457 First released in Issue 2.

#### 93458 Issue 6

93459 The obsolescent *-j* options and the multi-argument *-o* option are removed in this version.

93460 The normative text is reworded to avoid use of the term “must” for application requirements.

#### 93461 Issue 7

93462 Austin Group Interpretation 1003.1-2001 #027 is applied.

93463 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

## 93464 NAME

93465 kill — terminate or signal processes

## 93466 SYNOPSIS

93467 kill -s *signal\_name* *pid*...93468 kill -l [*exit\_status*]93469 XSI kill [-*signal\_name*] *pid*...93470 kill [-*signal\_number*] *pid*...

## 93471 DESCRIPTION

93472 The *kill* utility shall send a signal to the process or processes specified by each *pid* operand.93473 For each *pid* operand, the *kill* utility shall perform actions equivalent to the *kill()* function  
93474 defined in the System Interfaces volume of POSIX.1-2008 called with the following arguments:

- 93475
- The value of the *pid* operand shall be used as the *pid* argument.
  - The *sig* argument is the value specified by the *-s* option, *-signal\_number* option, or the *-signal\_name* option, or by SIGTERM, if none of these options is specified.

## 93478 OPTIONS

93479 XSI The *kill* utility shall conform to XBD [Section 12.2](#) (on page 215), except that in the last two  
93480 SYNOPSIS forms, the *-signal\_number* and *-signal\_name* options are usually more than a single  
93481 character.

93482 The following options shall be supported:

93483 **-l** (The letter ell.) Write all values of *signal\_name* supported by the implementation, if  
93484 no operand is given. If an *exit\_status* operand is given and it is a value of the ' ? '   
93485 shell special parameter (see [Section 2.5.2](#) (on page 2324) and *wait*) corresponding to  
93486 a process that was terminated by a signal, the *signal\_name* corresponding to the  
93487 signal that terminated the process shall be written. If an *exit\_status* operand is  
93488 given and it is the unsigned decimal integer value of a signal number, the  
93489 *signal\_name* (the symbolic constant name without the **SIG** prefix defined in the  
93490 Base Definitions volume of POSIX.1-2008) corresponding to that signal shall be  
93491 written. Otherwise, the results are unspecified.93492 **-s *signal\_name***93493 Specify the signal to send, using one of the symbolic names defined in the  
93494 **<signal.h>** header. Values of *signal\_name* shall be recognized in a case-independent  
93495 fashion, without the **SIG** prefix. In addition, the symbolic name 0 shall be  
93496 recognized, representing the signal value zero. The corresponding signal shall be  
93497 sent instead of SIGTERM.93498 XSI **-*signal\_name***93499 Equivalent to **-s *signal\_name***.93500 XSI **-*signal\_number***93501 Specify a non-negative decimal integer, *signal\_number*, representing the signal to be  
93502 used instead of SIGTERM, as the *sig* argument in the effective call to *kill()*. The  
93503 correspondence between integer values and the *sig* value used is shown in the  
93504 following list.93505 The effects of specifying any *signal\_number* other than those listed below are  
93506 undefined.

|       |                                                                                                 |         |
|-------|-------------------------------------------------------------------------------------------------|---------|
| 93507 | 0                                                                                               | 0       |
| 93508 | 1                                                                                               | SIGHUP  |
| 93509 | 2                                                                                               | SIGINT  |
| 93510 | 3                                                                                               | SIGQUIT |
| 93511 | 6                                                                                               | SIGABRT |
| 93512 | 9                                                                                               | SIGKILL |
| 93513 | 14                                                                                              | SIGALRM |
| 93514 | 15                                                                                              | SIGTERM |
| 93515 | If the first argument is a negative integer, it shall be interpreted as a <i>-signal_number</i> |         |
| 93516 | option, not as a negative <i>pid</i> operand specifying a process group.                        |         |

## 93517 OPERANDS

93518 The following operands shall be supported:

|       |                    |                                                                                                |
|-------|--------------------|------------------------------------------------------------------------------------------------|
| 93519 | <i>pid</i>         | One of the following:                                                                          |
| 93520 |                    | 1. A decimal integer specifying a process or process group to be signaled. The                 |
| 93521 |                    | process or processes selected by positive, negative, and zero values of the                    |
| 93522 |                    | <i>pid</i> operand shall be as described for the <i>kill()</i> function. If process number 0   |
| 93523 |                    | is specified, all processes in the current process group shall be signaled. For                |
| 93524 |                    | the effects of negative <i>pid</i> numbers, see the <i>kill()</i> function defined in the      |
| 93525 |                    | System Interfaces volume of POSIX.1-2008. If the first <i>pid</i> operand is                   |
| 93526 |                    | negative, it should be preceded by "--" to keep it from being interpreted as                   |
| 93527 |                    | an option.                                                                                     |
| 93528 |                    | 2. A job control job ID (see XBD <a href="#">Section 3.204</a> , on page 65) that identifies a |
| 93529 |                    | background process group to be signaled. The job control job ID notation is                    |
| 93530 |                    | applicable only for invocations of <i>kill</i> in the current shell execution                  |
| 93531 |                    | environment; see <a href="#">Section 2.12</a> (on page 2353).                                  |
| 93532 | <i>exit_status</i> | A decimal integer specifying a signal number or the exit status of a process                   |
| 93533 |                    | terminated by a signal.                                                                        |

## 93534 STDIN

93535 Not used.

## 93536 INPUT FILES

93537 None.

## 93538 ENVIRONMENT VARIABLES

93539 The following environment variables shall affect the execution of *kill*:

|       |                 |                                                                                               |
|-------|-----------------|-----------------------------------------------------------------------------------------------|
| 93540 | <i>LANG</i>     | Provide a default value for the internationalization variables that are unset or null.        |
| 93541 |                 | (See XBD <a href="#">Section 8.2</a> (on page 174) for the precedence of internationalization |
| 93542 |                 | variables used to determine the values of locale categories.)                                 |
| 93543 | <i>LC_ALL</i>   | If set to a non-empty string value, override the values of all the other                      |
| 93544 |                 | internationalization variables.                                                               |
| 93545 | <i>LC_CTYPE</i> | Determine the locale for the interpretation of sequences of bytes of text data as             |
| 93546 |                 | characters (for example, single-byte as opposed to multi-byte characters in                   |
| 93547 |                 | arguments).                                                                                   |

93548 *LC\_MESSAGES*  
 93549 Determine the locale that should be used to affect the format and contents of  
 93550 diagnostic messages written to standard error.

93551 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

93552 **ASYNCHRONOUS EVENTS**  
 93553 Default.

93554 **STDOUT**  
 93555 When the *-l* option is not specified, the standard output shall not be used.  
 93556 When the *-l* option is specified, the symbolic name of each signal shall be written in the  
 93557 following format:  
 93558 "%s%c", <signal\_name>, <separator>  
 93559 where the <signal\_name> is in uppercase, without the **SIG** prefix, and the <separator> shall be  
 93560 either a <newline> or a <space>. For the last signal written, <separator> shall be a <newline>.  
 93561 When both the *-l* option and *exit\_status* operand are specified, the symbolic name of the  
 93562 corresponding signal shall be written in the following format:  
 93563 "%s\n", <signal\_name>

93564 **STDERR**  
 93565 The standard error shall be used only for diagnostic messages.

93566 **OUTPUT FILES**  
 93567 None.

93568 **EXTENDED DESCRIPTION**  
 93569 None.

93570 **EXIT STATUS**  
 93571 The following exit values shall be returned:  
 93572 0 At least one matching process was found for each *pid* operand, and the specified signal was  
 93573 successfully processed for at least one matching process.  
 93574 >0 An error occurred.

93575 **CONSEQUENCES OF ERRORS**  
 93576 Default.

93577 **APPLICATION USAGE**  
 93578 Process numbers can be found by using *ps*.  
 93579 The job control job ID notation is not required to work as expected when *kill* is operating in its  
 93580 own utility execution environment. In either of the following examples:  
 93581 nohup kill %1 &  
 93582 system("kill %1");  
 93583 the *kill* operates in a different environment and does not share the shell's understanding of job  
 93584 numbers.

93585 **EXAMPLES**  
 93586 Any of the commands:  
 93587 kill -9 100 -165  
 93588 kill -s kill 100 -165

```
93589 kill -s KILL 100 -165
```

```
93590 sends the SIGKILL signal to the process whose process ID is 100 and to all processes whose
93591 process group ID is 165, assuming the sending process has permission to send that signal to the
93592 specified processes, and that they exist.
```

```
93593 The System Interfaces volume of POSIX.1-2008 and this volume of POSIX.1-2008 do not require
93594 specific signal numbers for any signal_names. Even the -signal_number option provides symbolic
93595 (although numeric) names for signals. If a process is terminated by a signal, its exit status
93596 indicates the signal that killed it, but the exact values are not specified. The kill -l option,
93597 however, can be used to map decimal signal numbers and exit status values into the name of a
93598 signal. The following example reports the status of a terminated job:
```

```
93599 job
93600 stat=$?
93601 if [$stat -eq 0]
93602 then
93603 echo job completed successfully.
93604 elif [$stat -gt 128]
93605 then
93606 echo job terminated by signal SIG$(kill -l $stat).
93607 else
93608 echo job terminated with error code $stat.
93609 fi
```

```
93610 To send the default signal to a process group (say 123), an application should use a command
93611 similar to one of the following:
```

```
93612 kill -TERM -123
93613 kill -- -123
```

#### 93614 RATIONALE

```
93615 The -l option originated from the C shell, and is also implemented in the KornShell. The C shell
93616 output can consist of multiple output lines because the signal names do not always fit on a
93617 single line on some terminal screens. The KornShell output also included the implementation-
93618 defined signal numbers and was considered by the standard developers to be too difficult for
93619 scripts to parse conveniently. The specified output format is intended not only to accommodate
93620 the historical C shell output, but also to permit an entirely vertical or entirely horizontal listing
93621 on systems for which this is appropriate.
```

```
93622 An early proposal invented the name SIGNULL as a signal_name for signal 0 (used by the System
93623 Interfaces volume of POSIX.1-2008 to test for the existence of a process without sending it a
93624 signal). Since the signal_name 0 can be used in this case unambiguously, SIGNULL has been
93625 removed.
```

```
93626 An early proposal also required symbolic signal_names to be recognized with or without the SIG
93627 prefix. Historical versions of kill have not written the SIG prefix for the -l option and have not
93628 recognized the SIG prefix on signal_names. Since neither applications portability nor ease-of-use
93629 would be improved by requiring this extension, it is no longer required.
```

```
93630 To avoid an ambiguity of an initial negative number argument specifying either a signal number
93631 or a process group, POSIX.1-2008 mandates that it is always considered the former by
93632 implementations that support the XSI option. It also requires that conforming applications
93633 always use the "--" options terminator argument when specifying a process group, unless an
93634 option is also specified.
```

```
93635 The -s option was added in response to international interest in providing some form of kill that
```

93636 meets the Utility Syntax Guidelines.

93637 The job control job ID notation is not required to work as expected when *kill* is operating in its  
93638 own utility execution environment. In either of the following examples:

93639 `nohup kill %1 &`  
93640 `system("kill %1");`

93641 the *kill* operates in a different environment and does not understand how the shell has managed  
93642 its job numbers.

#### 93643 **FUTURE DIRECTIONS**

93644 None.

#### 93649 **CHANGE HISTORY**

93650 First released in Issue 2.

#### 93651 **Issue 6**

93652 The obsolescent versions of the SYNOPSIS are turned into non-obsolescent features of the XSI  
93653 option, corresponding to a similar change in the *trap* special built-in.

#### 93654 **Issue 7**

93655 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

93656 **NAME**

93657       lex — generate programs for lexical tasks (DEVELOPMENT)

93658 **SYNOPSIS**93659 CD       lex [-t] [-n|-v] [*file...*]93660 **DESCRIPTION**

93661       The *lex* utility shall generate C programs to be used in lexical processing of character input, and  
 93662       that can be used as an interface to *yacc*. The C programs shall be generated from *lex* source code  
 93663       and conform to the ISO C standard, without depending on any undefined, unspecified, or  
 93664       implementation-defined behavior, except in cases where the code is copied directly from the  
 93665       supplied source, or in cases that are documented by the implementation. Usually, the *lex* utility  
 93666       shall write the program it generates to the file **lex.yy.c**; the state of this file is unspecified if *lex*  
 93667       exits with a non-zero exit status. See the EXTENDED DESCRIPTION section for a complete  
 93668       description of the *lex* input language.

93669 **OPTIONS**93670       The *lex* utility shall conform to XBD [Section 12.2](#) (on page 215), except for Guideline 9.

93671       The following options shall be supported:

- 93672       **-n**       Suppress the summary of statistics usually written with the **-v** option. If no table  
 93673       sizes are specified in the *lex* source code and the **-v** option is not specified, then **-n**  
 93674       is implied.
- 93675       **-t**       Write the resulting program to standard output instead of **lex.yy.c**.
- 93676       **-v**       Write a summary of *lex* statistics to the standard output. (See the discussion of *lex*  
 93677       table sizes in [Definitions in lex](#) (on page 2852).) If the **-t** option is specified and **-n**  
 93678       is not specified, this report shall be written to standard error. If table sizes are  
 93679       specified in the *lex* source code, and if the **-n** option is not specified, the **-v** option  
 93680       may be enabled.

93681 **OPERANDS**

93682       The following operand shall be supported:

- 93683       *file*       A pathname of an input file. If more than one such *file* is specified, all files shall be  
 93684       concatenated to produce a single *lex* program. If no *file* operands are specified, or if  
 93685       a *file* operand is **'-'**, the standard input shall be used.

93686 **STDIN**

93687       The standard input shall be used if no *file* operands are specified, or if a *file* operand is **'-'**. See  
 93688       INPUT FILES.

93689 **INPUT FILES**

93690       The input files shall be text files containing *lex* source code, as described in the EXTENDED  
 93691       DESCRIPTION section.

93692 **ENVIRONMENT VARIABLES**93693       The following environment variables shall affect the execution of *lex*:

- 93694       **LANG**       Provide a default value for the internationalization variables that are unset or null.  
 93695       (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 93696       variables used to determine the values of locale categories.)
- 93697       **LC\_ALL**      If set to a non-empty string value, override the values of all the other  
 93698       internationalization variables.

- 93699 *LC\_COLLATE*
- 93700 Determine the locale for the behavior of ranges, equivalence classes, and multi-
- 93701 character collating elements within regular expressions. If this variable is not set to
- 93702 the POSIX locale, the results are unspecified.
- 93703 *LC\_CTYPE*
- 93704 Determine the locale for the interpretation of sequences of bytes of text data as
- 93705 characters (for example, single-byte as opposed to multi-byte characters in
- 93706 arguments and input files), and the behavior of character classes within regular
- 93707 expressions. If this variable is not set to the POSIX locale, the results are
- unspecified.
- 93708 *LC\_MESSAGES*
- 93709 Determine the locale that should be used to affect the format and contents of
- 93710 diagnostic messages written to standard error.
- 93711 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.
- 93712 **ASYNCHRONOUS EVENTS**
- 93713 Default.
- 93714 **STDOUT**
- 93715 If the **-t** option is specified, the text file of C source code output of *lex* shall be written to
- 93716 standard output.
- 93717 If the **-t** option is not specified:
- 93718 • Implementation-defined informational, error, and warning messages concerning the
  - 93719 contents of *lex* source code input shall be written to either the standard output or standard
  - 93720 error.
  - 93721 • If the **-v** option is specified and the **-n** option is not specified, *lex* statistics shall also be
  - 93722 written to either the standard output or standard error, in an implementation-defined
  - 93723 format. These statistics may also be generated if table sizes are specified with a '**%**'
  - 93724 operator in the *Definitions* section, as long as the **-n** option is not specified.
- 93725 **STDERR**
- 93726 If the **-t** option is specified, implementation-defined informational, error, and warning messages
- 93727 concerning the contents of *lex* source code input shall be written to the standard error.
- 93728 If the **-t** option is not specified:
- 93729 1. Implementation-defined informational, error, and warning messages concerning the
  - 93730 contents of *lex* source code input shall be written to either the standard output or
  - 93731 standard error.
  - 93732 2. If the **-v** option is specified and the **-n** option is not specified, *lex* statistics shall also be
  - 93733 written to either the standard output or standard error, in an implementation-defined
  - 93734 format. These statistics may also be generated if table sizes are specified with a '**%**'
  - 93735 operator in the *Definitions* section, as long as the **-n** option is not specified.
- 93736 **OUTPUT FILES**
- 93737 A text file containing C source code shall be written to **lex.yy.c**, or to the standard output if the **-t**
- 93738 option is present.
- 93739 **EXTENDED DESCRIPTION**
- 93740 Each input file shall contain *lex* source code, which is a table of regular expressions with
- 93741 corresponding actions in the form of C program fragments.
- 93742 When **lex.yy.c** is compiled and linked with the *lex* library (using the **-ll** operand with *c99*), the

resulting program shall read character input from the standard input and shall partition it into strings that match the given expressions.

When an expression is matched, these actions shall occur:

- The input string that was matched shall be left in *yytext* as a null-terminated string; *yytext* shall either be an external character array or a pointer to a character string. As explained in [Definitions in lex](#) (on page 2852), the type can be explicitly selected using the **%array** or **%pointer** declarations, but the default is implementation-defined.
- The external **int** *yylen* shall be set to the length of the matching string.
- The expression's corresponding program fragment, or action, shall be executed.

During pattern matching, *lex* shall search the set of patterns for the single longest possible match. Among rules that match the same number of characters, the rule given first shall be chosen.

The general format of *lex* source shall be:

```

Definitions
%%
Rules
%%
UserSubroutines
```

The first "%%" is required to mark the beginning of the rules (regular expressions and actions); the second "%%" is required only if user subroutines follow.

Any line in the *Definitions* section beginning with a <blank> shall be assumed to be a C program fragment and shall be copied to the external definition area of the **lex.yy.c** file. Similarly, anything in the *Definitions* section included between delimiter lines containing only "%{" and "%}" shall also be copied unchanged to the external definition area of the **lex.yy.c** file.

Any such input (beginning with a <blank> or within "%{" and "%}" delimiter lines) appearing at the beginning of the *Rules* section before any rules are specified shall be written to **lex.yy.c** after the declarations of variables for the *yylex()* function and before the first line of code in *yylex()*. Thus, user variables local to *yylex()* can be declared here, as well as application code to execute upon entry to *yylex()*.

The action taken by *lex* when encountering any input beginning with a <blank> or within "%{" and "%}" delimiter lines appearing in the *Rules* section but coming after one or more rules is undefined. The presence of such input may result in an erroneous definition of the *yylex()* function.

C-language code in the input shall not contain C-language trigraphs. The C-language code within "%{" and "%}" delimiter lines shall not contain any lines consisting only of "%}", or only of "%%".

## Definitions in lex

*Definitions* appear before the first "%" delimiter. Any line in this section not contained between "%{" and "%}" lines and not beginning with a <blank> shall be assumed to define a *lex* substitution string. The format of these lines shall be:

*name substitute*

If a *name* does not meet the requirements for identifiers in the ISO C standard, the result is undefined. The string *substitute* shall replace the string {*name*} when it is used in a rule. The *name* string shall be recognized in this context only when the braces are provided and when it does not appear within a bracket expression or within double-quotes.

In the *Definitions* section, any line beginning with a <percent-sign> ('%') character and followed by an alphanumeric word beginning with either 's' or 'S' shall define a set of start conditions. Any line beginning with a '%' followed by a word beginning with either 'x' or 'X' shall define a set of exclusive start conditions. When the generated scanner is in a %s state, patterns with no state specified shall be also active; in a %x state, such patterns shall not be active. The rest of the line, after the first word, shall be considered to be one or more <blank>-separated names of start conditions. Start condition names shall be constructed in the same way as definition names. Start conditions can be used to restrict the matching of regular expressions to one or more states as described in [Regular Expressions in lex](#) (on page 2853).

Implementations shall accept either of the following two mutually-exclusive declarations in the *Definitions* section:

**%array**      Declare the type of *yytext* to be a null-terminated character array.

**%pointer**    Declare the type of *yytext* to be a pointer to a null-terminated character string.

The default type of *yytext* is implementation-defined. If an application refers to *yytext* outside of the scanner source file (that is, via an **extern**), the application shall include the appropriate **%array** or **%pointer** declaration in the scanner source file.

Implementations shall accept declarations in the *Definitions* section for setting certain internal table sizes. The declarations are shown in the following table.

**Table 4-10** Table Size Declarations in *lex*

| Declaration | Description                        | Minimum Value |
|-------------|------------------------------------|---------------|
| %p <i>n</i> | Number of positions                | 2 500         |
| %n <i>n</i> | Number of states                   | 500           |
| %a <i>n</i> | Number of transitions              | 2 000         |
| %e <i>n</i> | Number of parse tree nodes         | 1 000         |
| %k <i>n</i> | Number of packed character classes | 1 000         |
| %o <i>n</i> | Size of the output array           | 3 000         |

In the table, *n* represents a positive decimal integer, preceded by one or more <blank> characters. The exact meaning of these table size numbers is implementation-defined. The implementation shall document how these numbers affect the *lex* utility and how they are related to any output that may be generated by the implementation should limitations be encountered during the execution of *lex*. It shall be possible to determine from this output which of the table size values needs to be modified to permit *lex* to successfully generate tables for the input language. The values in the column Minimum Value represent the lowest values conforming implementations shall provide.

**Rules in lex**

The rules in *lex* source files are a table in which the left column contains regular expressions and the right column contains actions (C program fragments) to be executed when the expressions are recognized.

```
ERE action
ERE action
...
```

The extended regular expression (ERE) portion of a row shall be separated from *action* by one or more <blank> characters. A regular expression containing <blank> characters shall be recognized under one of the following conditions:

- The entire expression appears within double-quotes.
- The <blank> characters appear within double-quotes or square brackets.
- Each <blank> is preceded by a <backslash> character.

**User Subroutines in lex**

Anything in the user subroutines section shall be copied to **lex.yy.c** following *yylex()*.

**Regular Expressions in lex**

The *lex* utility shall support the set of extended regular expressions (see XBD [Section 9.4](#), on page 188), with the following additions and exceptions to the syntax:

"..." Any string enclosed in double-quotes shall represent the characters within the double-quotes as themselves, except that <backslash>-escapes (which appear in the following table) shall be recognized. Any <backslash>-escape sequence shall be terminated by the closing quote. For example, "\01"1" represents a single string: the octal value 1 followed by the character '1'.

<state>*r*, <state1, state2, ...>*r*

The regular expression *r* shall be matched only when the program is in one of the start conditions indicated by *state*, *state1*, and so on; see [Actions in lex](#) (on page 2855). (As an exception to the typographical conventions of the rest of this volume of POSIX.1-2008, in this case <state> does not represent a metavariable, but the literal angle-bracket characters surrounding a symbol.) The start condition shall be recognized as such only at the beginning of a regular expression.

*r*/*x*

The regular expression *r* shall be matched only if it is followed by an occurrence of regular expression *x* (*x* is the instance of trailing context, further defined below). The token returned in *yytext* shall only match *r*. If the trailing portion of *r* matches the beginning of *x*, the result is unspecified. The *r* expression cannot include further trailing context or the '\$' (match-end-of-line) operator; *x* cannot include the '^' (match-beginning-of-line) operator, nor trailing context, nor the '\$' operator. That is, only one occurrence of trailing context is allowed in a *lex* regular expression, and the '^' operator only can be used at the beginning of such an expression.

{*name*}

When *name* is one of the substitution symbols from the *Definitions* section, the string, including the enclosing braces, shall be replaced by the *substitute* value. The *substitute* value shall be treated in the extended regular expression as if it were enclosed in parentheses. No substitution shall occur if {*name*} occurs within a bracket expression or within double-quotes.

Within an ERE, a <backslash> character shall be considered to begin an escape sequence as specified in the table in XBD [Chapter 5](#) (on page 121) ('\\', '\a', '\b', '\f', '\n', '\r', '\t', '\v'). In addition, the escape sequences in the following table shall be recognized.

A literal <newline> cannot occur within an ERE; the escape sequence '\n' can be used to represent a <newline>. A <newline> shall not be matched by a period operator.

**Table 4-11** Escape Sequences in *lex*

| Escape Sequence | Description                                                                                                                                                                                                             | Meaning                                                                                                                                                                                                                         |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| \digits         | A <backslash> character followed by the longest sequence of one, two, or three octal-digit characters (01234567). If all of the digits are 0 (that is, representation of the NUL character), the behavior is undefined. | The character whose encoding is represented by the one, two, or three-digit octal integer. Multi-byte characters require multiple, concatenated escape sequences of this type, including the leading <backslash> for each byte. |
| \xdigits        | A <backslash> character followed by the longest sequence of hexadecimal-digit characters (01234567abcdefABCDEF). If all of the digits are 0 (that is, representation of the NUL character), the behavior is undefined.  | The character whose encoding is represented by the hexadecimal integer.                                                                                                                                                         |
| \c              | A <backslash> character followed by any character not described in this table or in the table in XBD <a href="#">Chapter 5</a> (on page 121) ('\\', '\a', '\b', '\f', '\n', '\r', '\t', '\v').                          | The character 'c', unchanged.                                                                                                                                                                                                   |

**Note:** If a '\x' sequence needs to be immediately followed by a hexadecimal digit character, a sequence such as "\x1"1" can be used, which represents a character containing the value 1, followed by the character '1'.

The order of precedence given to extended regular expressions for *lex* differs from that specified in XBD [Section 9.4](#) (on page 188). The order of precedence for *lex* shall be as shown in the following table, from high to low.

**Note:** The escaped characters entry is not meant to imply that these are operators, but they are included in the table to show their relationships to the true operators. The start condition, trailing context, and anchoring notations have been omitted from the table because of the placement restrictions described in this section; they can only appear at the beginning or ending of an ERE.

Table 4-12 ERE Precedence in *lex*

| Extended Regular Expression       | Precedence            |
|-----------------------------------|-----------------------|
| collation-related bracket symbols | [ = ] [ : : ] [ . . ] |
| escaped characters                | \<special character>  |
| bracket expression                | [ ]                   |
| quoting                           | " . . . "             |
| grouping                          | ( )                   |
| definition                        | { name }              |
| single-character RE duplication   | * + ?                 |
| concatenation                     |                       |
| interval expression               | { m , n }             |
| alternation                       |                       |

The ERE anchoring operators '*^*' and '*\$*' do not appear in the table. With *lex* regular expressions, these operators are restricted in their use: the '*^*' operator can only be used at the beginning of an entire regular expression, and the '*\$*' operator only at the end. The operators apply to the entire regular expression. Thus, for example, the pattern "*(^abc) | (def\$)*" is undefined; it can instead be written as two separate rules, one with the regular expression "*^abc*" and one with "*def\$*", which share a common action via the special '*|*' action (see below). If the pattern were written "*^abc|def\$*", it would match either "*abc*" or "*def*" on a line by itself.

Unlike the general ERE rules, embedded anchoring is not allowed by most historical *lex* implementations. An example of embedded anchoring would be for patterns such as "*(^| )foo( |\$)*" to match "*foo*" when it exists as a complete word. This functionality can be obtained using existing *lex* features:

```
^foo/[\n] |
" foo"/[\n] /* Found foo as a separate word. */
```

Note also that '*\$*' is a form of trailing context (it is equivalent to "*/\n*") and as such cannot be used with regular expressions containing another instance of the operator (see the preceding discussion of trailing context).

The additional regular expressions trailing-context operator '*/'*' can be used as an ordinary character if presented within double-quotes, "*/"*"; preceded by a <backslash>, "*\"*"; or within a bracket expression, "*[/]*". The start-condition '*<*' and '*>*' operators shall be special only in a start condition at the beginning of a regular expression; elsewhere in the regular expression they shall be treated as ordinary characters.

### Actions in *lex*

The action to be taken when an ERE is matched can be a C program fragment or the special actions described below; the program fragment can contain one or more C statements, and can also include special actions. The empty C statement '*;*' shall be a valid action; any string in the *lex.yy.c* input that matches the pattern portion of such a rule is effectively ignored or skipped. However, the absence of an action shall not be valid, and the action *lex* takes in such a condition is undefined.

The specification for an action, including C statements and special actions, can extend across several lines if enclosed in braces:

```
ERE <one or more blanks> { program statement
 program statement }
```

93949 The program statements shall not contain unbalanced curly brace preprocessing tokens.

93950 The default action when a string in the input to a **lex.yy.c** program is not matched by any  
 93951 expression shall be to copy the string to the output. Because the default behavior of a program  
 93952 generated by *lex* is to read the input and copy it to the output, a minimal *lex* source program that  
 93953 has just "%%" shall generate a C program that simply copies the input to the output unchanged.

93954 Four special actions shall be available:

93955 | ECHO; REJECT; BEGIN

93956 | The action ' | ' means that the action for the next rule is the action for this rule.  
 93957 Unlike the other three actions, ' | ' cannot be enclosed in braces or be  
 93958 <semicolon>-terminated; the application shall ensure that it is specified alone, with  
 93959 no other actions.

93960 **ECHO;** Write the contents of the string *yytext* on the output.

93961 **REJECT;** Usually only a single expression is matched by a given string in the input.  
 93962 **REJECT** means "continue to the next expression that matches the current input",  
 93963 and shall cause whatever rule was the second choice after the current rule to be  
 93964 executed for the same input. Thus, multiple rules can be matched and executed for  
 93965 one input string or overlapping input strings. For example, given the regular  
 93966 expressions "xyz" and "xy" and the input "xyz", usually only the regular  
 93967 expression "xyz" would match. The next attempted match would start after **z**. If  
 93968 the last action in the "xyz" rule is **REJECT**, both this rule and the "xy" rule  
 93969 would be executed. The **REJECT** action may be implemented in such a fashion that  
 93970 flow of control does not continue after it, as if it were equivalent to a **goto** to  
 93971 another part of *yylex()*. The use of **REJECT** may result in somewhat larger and  
 93972 slower scanners.

93973 **BEGIN** The action:

93974 BEGIN *newstate*;

93975 switches the state (start condition) to *newstate*. If the string *newstate* has not been  
 93976 declared previously as a start condition in the *Definitions* section, the results are  
 93977 unspecified. The initial state is indicated by the digit '0' or the token **INITIAL**.

93978 The functions or macros described below are accessible to user code included in the *lex* input. It  
 93979 is unspecified whether they appear in the C code output of *lex*, or are accessible only through the  
 93980 **-ll** operand to *c99* (the *lex* library).

93981 **int yylex(void)**  
 93982 Performs lexical analysis on the input; this is the primary function generated by the *lex*  
 93983 utility. The function shall return zero when the end of input is reached; otherwise, it shall  
 93984 return non-zero values (tokens) determined by the actions that are selected.

93985 **int yymore(void)**  
 93986 When called, indicates that when the next input string is recognized, it is to be appended to  
 93987 the current value of *yytext* rather than replacing it; the value in *yyleng* shall be adjusted  
 93988 accordingly.

93989 **int yyless(int n)**  
 93990 Retains *n* initial characters in *yytext*, NUL-terminated, and treats the remaining characters as  
 93991 if they had not been read; the value in *yyleng* shall be adjusted accordingly.

**int input(void)**

Returns the next character from the input, or zero on end-of-file. It shall obtain input from the stream pointer *yyin*, although possibly via an intermediate buffer. Thus, once scanning has begun, the effect of altering the value of *yyin* is undefined. The character read shall be removed from the input stream of the scanner without any processing by the scanner.

**int unput(int c)**

Returns the character 'c' to the input; *yytext* and *yylen* are undefined until the next expression is matched. The result of using *unput()* for more characters than have been input is unspecified.

The following functions shall appear only in the *lex* library accessible through the **-ll** operand; they can therefore be redefined by a conforming application:

**int yywrap(void)**

Called by *yylex()* at end-of-file; the default *yywrap()* shall always return 1. If the application requires *yylex()* to continue processing with another source of input, then the application can include a function *yywrap()*, which associates another file with the external variable **FILE \* yyin** and shall return a value of zero.

**int main(int argc, char \*argv[])**

Calls *yylex()* to perform lexical analysis, then exits. The user code can contain *main()* to perform application-specific operations, calling *yylex()* as applicable.

Except for *input()*, *unput()*, and *main()*, all external and static names generated by *lex* shall begin with the prefix **yy** or **YY**.

**EXIT STATUS**

The following exit values shall be returned:

- 0 Successful completion.
- >0 An error occurred.

**CONSEQUENCES OF ERRORS**

Default.

**APPLICATION USAGE**

Conforming applications are warned that in the *Rules* section, an ERE without an action is not acceptable, but need not be detected as erroneous by *lex*. This may result in compilation or runtime errors.

The purpose of *input()* is to take characters off the input stream and discard them as far as the lexical analysis is concerned. A common use is to discard the body of a comment once the beginning of a comment is recognized.

The *lex* utility is not fully internationalized in its treatment of regular expressions in the *lex* source code or generated lexical analyzer. It would seem desirable to have the lexical analyzer interpret the regular expressions given in the *lex* source according to the environment specified when the lexical analyzer is executed, but this is not possible with the current *lex* technology. Furthermore, the very nature of the lexical analyzers produced by *lex* must be closely tied to the lexical requirements of the input language being described, which is frequently locale-specific anyway. (For example, writing an analyzer that is used for French text is not automatically useful for processing other languages.)

**EXAMPLES**

The following is an example of a *lex* program that implements a rudimentary scanner for a Pascal-like syntax:

```
%{
/* Need this for the call to atof() below. */
#include <math.h>
/* Need this for printf(), fopen(), and stdin below. */
#include <stdio.h>
}%

DIGIT [0-9]
ID [a-z][a-z0-9]*

%%

{DIGIT}+ {
 printf("An integer: %s (%d)\n", yytext,
 atoi(yytext));
}

{DIGIT}+"."{DIGIT}* {
 printf("A float: %s (%g)\n", yytext,
 atof(yytext));
}

if|then|begin|end|procedure|function {
 printf("A keyword: %s\n", yytext);
}

{ID} printf("An identifier: %s\n", yytext);

"+"|"-"|"*"|"/" printf("An operator: %s\n", yytext);

"{[^]\n}*" /* Eat up one-line comments. */

[\t\n]+ /* Eat up white space. */

. printf("Unrecognized character: %s\n", yytext);

%%

int main(int argc, char *argv[])
{
 ++argv, --argc; /* Skip over program name. */
 if (argc > 0)
 yyin = fopen(argv[0], "r");
 else
 yyin = stdin;

 yylex();
}
```

**RATIONALE**

Even though the `-c` option and references to the C language are retained in this description, *lex* may be generalized to other languages, as was done at one time for EFL, the Extended FORTRAN Language. Since the *lex* input specification is essentially language-independent, versions of this utility could be written to produce Ada, Modula-2, or Pascal code, and there are known historical implementations that do so.

The current description of *lex* bypasses the issue of dealing with internationalized EREs in the *lex* source code or generated lexical analyzer. If it follows the model used by *awk* (the source code is assumed to be presented in the POSIX locale, but input and output are in the locale specified by the environment variables), then the tables in the lexical analyzer produced by *lex* would interpret EREs specified in the *lex* source in terms of the environment variables specified when *lex* was executed. The desired effect would be to have the lexical analyzer interpret the EREs given in the *lex* source according to the environment specified when the lexical analyzer is executed, but this is not possible with the current *lex* technology.

The description of octal and hexadecimal-digit escape sequences agrees with the ISO C standard use of escape sequences.

Earlier versions of this standard allowed for implementations with bytes other than eight bits, but this has been modified in this version.

There is no detailed output format specification. The observed behavior of *lex* under four different historical implementations was that none of these implementations consistently reported the line numbers for error and warning messages. Furthermore, there was a desire that *lex* be allowed to output additional diagnostic messages. Leaving message formats unspecified avoids these formatting questions and problems with internationalization.

Although the `%x` specifier for *exclusive* start conditions is not historical practice, it is believed to be a minor change to historical implementations and greatly enhances the usability of *lex* programs since it permits an application to obtain the expected functionality with fewer statements.

The `%array` and `%pointer` declarations were added as a compromise between historical systems. The System V-based *lex* copies the matched text to a *yytext* array. The *flex* program, supported in BSD and GNU systems, uses a pointer. In the latter case, significant performance improvements are available for some scanners. Most historical programs should require no change in porting from one system to another because the string being referenced is null-terminated in both cases. (The method used by *flex* in its case is to null-terminate the token in place by remembering the character that used to come right after the token and replacing it before continuing on to the next scan.) Multi-file programs with external references to *yytext* outside the scanner source file should continue to operate on their historical systems, but would require one of the new declarations to be considered strictly portable.

The description of EREs avoids unnecessary duplication of ERE details because their meanings within a *lex* ERE are the same as that for the ERE in this volume of POSIX.1-2008.

The reason for the undefined condition associated with text beginning with a <blank> or within "`%{`" and "`%}`" delimiter lines appearing in the *Rules* section is historical practice. Both the BSD and System V *lex* copy the indented (or enclosed) input in the *Rules* section (except at the beginning) to unreachable areas of the *yylex()* function (the code is written directly after a *break* statement). In some cases, the System V *lex* generates an error message or a syntax error, depending on the form of indented input.

The intention in breaking the list of functions into those that may appear in `lex.yy.c` *versus* those that only appear in `libl.a` is that only those functions in `libl.a` can be reliably redefined by a conforming application.

The descriptions of standard output and standard error are somewhat complicated because historical *lex* implementations chose to issue diagnostic messages to standard output (unless `-t` was given). POSIX.1-2008 allows this behavior, but leaves an opening for the more expected behavior of using standard error for diagnostics. Also, the System V behavior of writing the statistics when any table sizes are given is allowed, while BSD-derived systems can avoid it. The

programmer can always precisely obtain the desired results by using either the `-t` or `-n` options.

The OPERANDS section does not mention the use of `-` as a synonym for standard input; not all historical implementations support such usage for any of the *file* operands.

A description of the *translation table* was deleted from early proposals because of its relatively low usage in historical applications.

The change to the definition of the *input()* function that allows buffering of input presents the opportunity for major performance gains in some applications.

The following examples clarify the differences between *lex* regular expressions and regular expressions appearing elsewhere in this volume of POSIX.1-2008. For regular expressions of the form `"r/x"`, the string matching *r* is always returned; confusion may arise when the beginning of *x* matches the trailing portion of *r*. For example, given the regular expression `"a*b/cc"` and the input `"aaabcc"`, *yytext* would contain the string `"aaab"` on this match. But given the regular expression `"x*/xy"` and the input `"xxxxy"`, the token `xxx`, not `xx`, is returned by some implementations because `xxx` matches `"x*"`.

In the rule `"ab*/bc"`, the `"b*"` at the end of *r* extends *r*'s match into the beginning of the trailing context, so the result is unspecified. If this rule were `"ab/bc"`, however, the rule matches the text `"ab"` when it is followed by the text `"bc"`. In this latter case, the matching of *r* cannot extend into the beginning of *x*, so the result is specified.

#### FUTURE DIRECTIONS

None.

#### CHANGE HISTORY

First released in Issue 2.

#### Issue 6

This utility is marked as part of the C-Language Development Utilities option.

The obsolescent `-c` option is removed.

The normative text is reworded to avoid use of the term “must” for application requirements.

IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/14 is applied, removing text describing behavior on systems with bytes consisting of more than eight bits.

#### Issue 7

Austin Group Interpretation 1003.1-2001 #190 is applied, clarifying the requirements for generated code to conform to the ISO C standard.

Austin Group Interpretation 1003.1-2001 #191 is applied, clarifying the handling of C-language trigraphs and curly brace preprocessing tokens.

SD5-XCU-ERN-6 is applied, clarifying that Guideline 9 of the Utility Syntax Guidelines does not apply.

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

94165 **NAME**94166 link — call *link()* function94167 **SYNOPSIS**94168 XSI `link file1 file2`94169 **DESCRIPTION**94170 The *link* utility shall perform the function call:94171 `link(file1, file2);`94172 A user may need appropriate privileges to invoke the *link* utility.94173 **OPTIONS**

**94225 CHANGE HISTORY**

94226       First released in Issue 5.

**NAME**

ln — link files

**SYNOPSIS**

ln [-fs] [-L|-P] *source\_file target\_file*

ln [-fs] [-L|-P] *source\_file... target\_dir*

**DESCRIPTION**

In the first synopsis form, the *ln* utility shall create a new directory entry (link) at the destination path specified by the *target\_file* operand. If the *-s* option is specified, a symbolic link shall be created for the file specified by the *source\_file* operand. This first synopsis form shall be assumed when the final operand does not name an existing directory; if more than two operands are specified and the final is not an existing directory, an error shall result.

In the second synopsis form, the *ln* utility shall create a new directory entry (link), or if the *-s* option is specified a symbolic link, for each file specified by a *source\_file* operand, at a destination path in the existing directory named by *target\_dir*.

If the last operand specifies an existing file of a type not specified by the System Interfaces volume of POSIX.1-2008, the behavior is implementation-defined.

The corresponding destination path for each *source\_file* shall be the concatenation of the target directory pathname, a <slash> character if the target directory pathname did not end in a <slash>, and the last pathname component of the *source\_file*. The second synopsis form shall be assumed when the final operand names an existing directory.

For each *source\_file*:

1. If the destination path exists and was created by a previous step, it is unspecified whether *ln* shall write a diagnostic message to standard error, do nothing more with the current *source\_file*, and go on to any remaining *source\_files*; or will continue processing the current *source\_file*. If the destination path exists:

- a. If the *-f* option is not specified, *ln* shall write a diagnostic message to standard error, do nothing more with the current *source\_file*, and go on to any remaining *source\_files*.
- b. If *destination* names the same directory entry as the current *source\_file* *ln* shall write a diagnostic message to standard error, do nothing more with the current *source\_file*, and go on to any remaining *source\_files*.
- c. Actions shall be performed equivalent to the *unlink()* function defined in the System Interfaces volume of POSIX.1-2008, called using *destination* as the *path* argument. If this fails for any reason, *ln* shall write a diagnostic message to standard error, do nothing more with the current *source\_file*, and go on to any remaining *source\_files*.

2. If the *-s* option is specified, actions shall be performed equivalent to the *symlink()* function with *source\_file* as the *path1* argument and the destination path as the *path2* argument. The *ln* utility shall do nothing more with *source\_file* and shall go on to any remaining files.

3. If *source\_file* is a symbolic link:

- a. If the *-P* option is in effect, actions shall be performed equivalent to the *linkat()* function with *source\_file* as the *path1* argument, the destination path as the *path2* argument, *AT\_FDCWD* as the *fd1* and *fd2* arguments, and zero as the *flag* argument.

- b. If the **-L** option is in effect, actions shall be performed equivalent to the *linkat()* function with *source\_file* as the *path1* argument, the destination path as the *path2* argument, **AT\_FDCWD** as the *fd1* and *fd2* arguments, and **AT\_SYMLINK\_FOLLOW** as the *flag* argument.

The *ln* utility shall do nothing more with *source\_file* and shall go on to any remaining files.

4. Actions shall be performed equivalent to the *link()* function defined in the System Interfaces volume of POSIX.1-2008 using *source\_file* as the *path1* argument, and the destination path as the *path2* argument.

## OPTIONS

The *ln* utility shall conform to XBD [Section 12.2](#) (on page 215).

The following options shall be supported:

- f** Force existing destination pathnames to be removed to allow the link.
- L** For each *source\_file* operand that names a file of type symbolic link, create a (hard) link to the file referenced by the symbolic link.
- P** For each *source\_file* operand that names a file of type symbolic link, create a (hard) link to the symbolic link itself.
- s** Create symbolic links instead of hard links. If the **-s** option is specified, the **-L** and **-P** options shall be silently ignored.

Specifying more than one of the mutually-exclusive options **-L** and **-P** shall not be considered an error. The last option specified shall determine the behavior of the utility (unless the **-s** option causes it to be ignored).

If the **-s** option is not specified and neither a **-L** nor a **-P** option is specified, it is implementation-defined which of the **-L** and **-P** options will be used as the default.

## OPERANDS

The following operands shall be supported:

- source\_file* A pathname of a file to be linked. If the **-s** option is specified, no restrictions on the type of file or on its existence shall be made. If the **-s** option is not specified, whether a directory can be linked is implementation-defined.
- target\_file* The pathname of the new directory entry to be created.
- target\_dir* A pathname of an existing directory in which the new directory entries are created.

## STDIN

Not used.

## INPUT FILES

None.

## ENVIRONMENT VARIABLES

The following environment variables shall affect the execution of *ln*:

- LANG** Provide a default value for the internationalization variables that are unset or null. (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization variables used to determine the values of locale categories.)
- LC\_ALL** If set to a non-empty string value, override the values of all the other internationalization variables.

| 94341 |                               | The CONSEQUENCES OF ERRORS section does not require <i>ln -f a b</i> to remove <i>b</i> if a subsequent link operation would fail.                                                                                                                                                                                                                |
| 94342 |                               |                                                                                                                                                                                                                                                                                                                                                   |
| 94343 |                               | Some historic versions of <i>ln</i> (including the one specified by the SVID) unlink the destination file, if it exists, by default. If the mode does not permit writing, these versions prompt for confirmation before attempting the unlink. In these versions the <i>-f</i> option causes <i>ln</i> not to attempt to prompt for confirmation. |
| 94344 |                               |                                                                                                                                                                                                                                                                                                                                                   |
| 94345 |                               |                                                                                                                                                                                                                                                                                                                                                   |
| 94346 |                               |                                                                                                                                                                                                                                                                                                                                                   |
| 94347 |                               | This allows <i>ln</i> to succeed in creating links when the target file already exists, even if the file itself is not writable (although the directory must be). Early proposals specified this functionality.                                                                                                                                   |
| 94348 |                               |                                                                                                                                                                                                                                                                                                                                                   |
| 94349 |                               | This volume of POSIX.1-2008 does not allow the <i>ln</i> utility to unlink existing destination paths by default for the following reasons:                                                                                                                                                                                                       |
| 94350 |                               |                                                                                                                                                                                                                                                                                                                                                   |
| 94351 |                               | • The <i>ln</i> utility has historically been used to provide locking for shell applications, a usage that is incompatible with <i>ln</i> unlinking the destination path by default. There was no corresponding technical advantage to adding this functionality.                                                                                 |
| 94352 |                               |                                                                                                                                                                                                                                                                                                                                                   |
| 94353 |                               |                                                                                                                                                                                                                                                                                                                                                   |

- This functionality gave *ln* the ability to destroy the link structure of files, which changes the historical behavior of *ln*.
- This functionality is easily replicated with a combination of *rm* and *ln*.
- It is not historical practice in many systems; BSD and BSD-derived systems do not support this behavior. Unfortunately, whichever behavior is selected can cause scripts written expecting the other behavior to fail.
- It is preferable that *ln* perform in the same manner as the *link()* function, which does not permit the target to exist already.

This volume of POSIX.1-2008 retains the *-f* option to provide support for shell scripts depending on the SVID semantics. It seems likely that shell scripts would not be written to handle prompting by *ln* and would therefore have specified the *-f* option.

The *-f* option is an undocumented feature of many historical versions of the *ln* utility, allowing linking to directories. These versions require modification.

Early proposals of this volume of POSIX.1-2008 also required a *-i* option, which behaved like the *-i* options in *cp* and *mv*, prompting for confirmation before unlinking existing files. This was not historical practice for the *ln* utility and has been omitted.

The *-L* and *-P* options allow for implementing both common behaviors of the *ln* utility. Earlier versions of this standard did not specify these options and required the behavior now described for the *-L* option. Many systems by default or as an alternative provided a non-conforming *ln* utility with the behavior now described for the *-P* option. Since applications could not rely on *ln* following links in practice, the *-L* and *-P* options were added to specify the desired behavior for the application.

The *-L* and *-P* options are ignored when *-s* is specified in order to allow an alias to be created to alter the default behavior when creating hard links (for example, *alias ln='ln -L'*). They serve no purpose when *-s* is specified, since *source\_file* is then just a string to be used as the contents of the created symbolic link and need not exist as a file.

The specification ensures that *ln a a* with or without the *-f* option will not unlink the file *a*. Earlier versions of this standard were unclear in this case.

## FUTURE DIRECTIONS

None.

XSH *link()*, *unlink()*

## CHANGE HISTORY

First released in Issue 2.

### Issue 6

The *ln* utility is updated to include symbolic link processing as defined in the IEEE P1003.2b draft standard.

### Issue 7

Austin Group Interpretations 1003.1-2001 #164, #168, and #169 are applied.

SD5-XCU-ERN-27 is applied, adding a new paragraph to the RATIONALE.

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

94397 The **-L** and **-P** options are added to make it implementation-defined whether the *ln* utility  
94398 follows symbolic links.  
94399 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0096 [136] is applied. +

94400 **NAME**

94401 locale — get locale-specific information

94402 **SYNOPSIS**

94403 locale [-a|-m]

94404 locale [-ck] name...

94405 **DESCRIPTION**

94406 The *locale* utility shall write information about the current locale environment, or all public  
 94407 locales, to the standard output. For the purposes of this section, a *public locale* is one provided by  
 94408 the implementation that is accessible to the application.

94409 When *locale* is invoked without any arguments, it shall summarize the current locale  
 94410 environment for each locale category as determined by the settings of the environment variables  
 94411 defined in XBD [Chapter 7](#) (on page 135).

94412 When invoked with operands, it shall write values that have been assigned to the keywords in  
 94413 the locale categories, as follows:

- 94414 • Specifying a keyword name shall select the named keyword and the category containing  
 94415 that keyword.
- 94416 • Specifying a category name shall select the named category and all keywords in that  
 94417 category.

94418 **OPTIONS**94419 The *locale* utility shall conform to XBD [Section 12.2](#) (on page 215).

94420 The following options shall be supported:

- 94421 **-a** Write information about all available public locales. The available locales shall  
 94422 include **POSIX**, representing the POSIX locale. The manner in which the  
 94423 implementation determines what other locales are available is implementation-  
 94424 defined.
- 94425 **-c** Write the names of selected locale categories; see the STDOUT section. The **-c**  
 94426 option increases readability when more than one category is selected (for example,  
 94427 via more than one keyword name or via a category name). It is valid both with  
 94428 and without the **-k** option.
- 94429 **-k** Write the names and values of selected keywords. The implementation may omit  
 94430 values for some keywords; see the OPERANDS section.
- 94431 **-m** Write names of available charmaps; see XBD [Section 6.1](#) (on page 125).

94432 **OPERANDS**

94433 The following operand shall be supported:

- 94434 *name* The name of a locale category as defined in XBD [Chapter 7](#) (on page 135), the name  
 94435 of a keyword in a locale category, or the reserved name **charmap**. The named  
 94436 category or keyword shall be selected for output. If a single *name* represents both a  
 94437 locale category name and a keyword name in the current locale, the results are  
 94438 unspecified. Otherwise, both category and keyword names can be specified as  
 94439 *name* operands, in any sequence. It is implementation-defined whether any  
 94440 keyword values are written for the categories *LC\_CTYPE* and *LC\_COLLATE*.

94441 **STDIN**  
 94442 Not used.

94443 **INPUT FILES**  
 94444 None.

94445 **ENVIRONMENT VARIABLES**  
 94446 The following environment variables shall affect the execution of *locale*:

94447 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 94448 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 94449 variables used to determine the values of locale categories.)

94450 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 94451 internationalization variables.

94452 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 94453 characters (for example, single-byte as opposed to multi-byte characters in  
 94454 arguments and input files).

94455 *LC\_MESSAGES*  
 94456 Determine the locale that should be used to affect the format and contents of  
 94457 diagnostic messages written to standard error.

94458 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

94459 XSI The application shall ensure that the *LANG*, *LC\_\**, and *NLSPATH* environment variables specify  
 94460 the current locale environment to be written out; they shall be used if the *-a* option is not  
 94461 specified.

94462 **ASYNCHRONOUS EVENTS**  
 94463 Default.

94464 **STDOUT**  
 94465 The *LANG* variable shall be written first using the format:  
 94466 "LANG=%s\n", <value>

94467 If *LANG* is not set or is an empty string, the value is the empty string.

94468 If *locale* is invoked without any options or operands, the names and values of the *LC\_\**  
 94469 environment variables described in this volume of POSIX.1-2008 shall be written to the standard  
 94470 output, one variable per line, and each line using the following format. Only those variables set  
 94471 in the environment and not overridden by *LC\_ALL* shall be written using this format:  
 94472 "%s=%s\n", <variable\_name>, <value>

94473 The names of those *LC\_\** variables associated with locale categories defined in this volume of  
 94474 POSIX.1-2008 that are not set in the environment or are overridden by *LC\_ALL* shall be written  
 94475 in the following format:  
 94476 "%s=\"%s\"\\n", <variable\_name>, <implied value>

94477 The <implied value> shall be the name of the locale that has been selected for that category by the  
 94478 implementation, based on the values in *LANG* and *LC\_ALL*, as described in XBD [Chapter 8](#) (on  
 94479 page 173).

94480 The <value> and <implied value> shown above shall be properly quoted for possible later reentry  
 94481 to the shell. The <value> shall not be quoted using double-quotes (so that it can be distinguished  
 94482 by the user from the <implied value> case, which always requires double-quotes).

The `LC_ALL` variable shall be written last, using the first format shown above. If it is not set, it shall be written as:

```
"LC_ALL=\n"
```

If any arguments are specified:

1. If the `-a` option is specified, the names of all the public locales shall be written, each in the following format:

```
"%s\n", <locale name>
```

2. If the `-c` option is specified, the names of all selected categories shall be written, each in the following format:

```
"%s\n", <category name>
```

If keywords are also selected for writing (see following items), the category name output shall precede the keyword output for that category.

If the `-c` option is not specified, the names of the categories shall not be written; only the keywords, as selected by the `<name>` operand, shall be written.

3. If the `-k` option is specified, the names and values of selected keywords shall be written. If a value is non-numeric and is not a compound keyword value, it shall be written in the following format:

```
"%s=\"%s\"\n", <keyword name>, <keyword value>
```

If a value is a non-numeric compound keyword value, it shall either be written in the format:

```
"%s=\"%s\"\n", <keyword name>, <keyword value>
```

where the `<keyword value>` is a single string of values separated by `<semicolon>` characters, or it shall be written in the format:

```
"%s=%s\n", <keyword name>, <keyword value>
```

where the `<keyword value>` is encoded as a set of strings, each enclosed in double-quotation-marks, separated by `<semicolon>` characters.

If the keyword was **charmap**, the name of the charmap (if any) that was specified via the `localedef -f` option when the locale was created shall be written, with the word **charmap** as `<keyword name>`.

If a value is numeric, it shall be written in one of the following formats:

```
"%s=%d\n", <keyword name>, <keyword value>
```

```
"%s=%c%o\n", <keyword name>, <escape character>, <keyword value>
```

```
"%s=%cx%x\n", <keyword name>, <escape character>, <keyword value>
```

where the `<escape character>` is that identified by the **escape\_char** keyword in the current locale; see XBD [Section 7.3](#) (on page 136).

Compound keyword values (list entries) shall be separated in the output by `<semicolon>` characters. When included in keyword values, the `<semicolon>`, `<backslash>`, double-quote, and any control character shall be preceded (escaped) with the escape character.

4. If the **-k** option is not specified, selected keyword values shall be written, each in the following format:

```
"%s\n", <keyword value>
```

If the keyword was **charmap**, the name of the charmap (if any) that was specified via the *localedef -f* option when the locale was created shall be written.

5. If the **-m** option is specified, then a list of all available charmaps shall be written, each in the format:

```
"%s\n", <charmap>
```

where *<charmap>* is in a format suitable for use as the option-argument to the *localedef -f* option.

## STDERR

The standard error shall be used only for diagnostic messages.

## OUTPUT FILES

None.

## EXTENDED DESCRIPTION

None.

## EXIT STATUS

The following exit values shall be returned:

- 0 All the requested information was found and output successfully.
- >0 An error occurred.

## CONSEQUENCES OF ERRORS

Default.

## APPLICATION USAGE

If the *LANG* environment variable is not set or set to an empty value, or one of the *LC\_\** environment variables is set to an unrecognized value, the actual locales assumed (if any) are implementation-defined as described in XBD [Chapter 8](#) (on page 173).

Implementations are not required to write out the actual values for keywords in the categories *LC\_CTYPE* and *LC\_COLLATE*; however, they must write out the categories (allowing an application to determine, for example, which character classes are available).

## EXAMPLES

In the following examples, the assumption is that locale environment variables are set as follows:

```
LANG=locale_x
LC_COLLATE=locale_y
```

The command *locale* would result in the following output:

```
LANG=locale_x
LC_CTYPE="locale_x"
LC_COLLATE=locale_y
LC_TIME="locale_x"
LC_NUMERIC="locale_x"
LC_MONETARY="locale_x"
LC_MESSAGES="locale_x"
LC_ALL=
```

The order of presentation of the categories is not specified by this volume of POSIX.1-2008.

The command:

```
LC_ALL=POSIX locale -ck decimal_point
```

would produce:

```
LC_NUMERIC
decimal_point="."
```

The following command shows an application of *locale* to determine whether a user-supplied response is affirmative:

```
if printf "%s\n" "$response" | grep -Eq "${locale yesexpr}"
then
 affirmative processing goes here
else
 non-affirmative processing goes here
fi
```

## RATIONALE

The output for categories *LC\_CTYPE* and *LC\_COLLATE* has been made implementation-defined because there is a questionable value in having a shell script receive an entire array of characters. It is also difficult to return a logical collation description, short of returning a complete *localedef* source.

The **-m** option was included to allow applications to query for the existence of charmaps. The output is a list of the charmaps (implementation-supplied and user-supplied, if any) on the system.

The **-c** option was included for readability when more than one category is selected (for example, via more than one keyword name or via a category name). It is valid both with and without the **-k** option.

The **charmap** keyword, which returns the name of the charmap (if any) that was used when the current locale was created, was included to allow applications needing the information to retrieve it.

According to XBD [Section 6.1](#) (on page 125), the standard requires that all supported locales must have the same encoding for <period> and <slash>, because these two characters are used within the locale-independent pathname resolution sequence. Therefore, it would be an error if *locale -a* listed both ASCII and EBCDIC-based locales, since those two encodings do not share the same representation for either <period> or <slash>. Any system that supports both environments would be expected to provide two POSIX locales, one in either codeset, where only the locales appropriate to the current environment can be visible at a time. In an XSI-compliant implementation, the *dd* utility is the only portable means for performing conversions between the two character sets.

## FUTURE DIRECTIONS

None.

94607 **CHANGE HISTORY**

94608 First released in Issue 4.

94609 **Issue 5**

94610 The FUTURE DIRECTIONS section is added.

94611 **Issue 6**

94612 The normative text is reworded to avoid use of the term “must” for application requirements.

94613 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/30 is applied, correcting an editorial error  
94614 in the STDOUT section.94615 **Issue 7**94616 Austin Group Interpretations 1003.1-2001 #017, #021, and #088 are applied, clarifying the  
94617 standard output for the **-k** option when *LANG* is not set or is an empty string.

94618 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

94619 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0097 [291] is applied.

+

94620 **NAME**

94621 localedef — define locale environment

94622 **SYNOPSIS**94623 localedef **[-c]** **[-f charmap]** **[-i sourcefile]** **[-u code\_set\_name]** *name*94624 **DESCRIPTION**

94625 The *localedef* utility shall convert source definitions for locale categories into a format usable by  
 94626 the functions and utilities whose operational behavior is determined by the setting of the locale  
 94627 environment variables defined in XBD [Chapter 7](#) (on page 135). It is implementation-defined  
 94628 whether users have the capability to create new locales, in addition to those supplied by the  
 94629 implementation. If the symbolic constant POSIX2\_LOCALEDEF is defined, the system supports  
 94630 XSI the creation of new locales. On XSI-conformant systems, the symbolic constant  
 94631 POSIX2\_LOCALEDEF shall be defined.

94632 The utility shall read source definitions for one or more locale categories belonging to the same  
 94633 locale from the file named in the **-i** option (if specified) or from standard input.

94634 The *name* operand identifies the target locale. The utility shall support the creation of *public*, or  
 94635 generally accessible locales, as well as *private*, or restricted-access locales. Implementations may  
 94636 restrict the capability to create or modify public locales to users with appropriate privileges.

94637 Each category source definition shall be identified by the corresponding environment variable  
 94638 name and terminated by an **END category-name** statement. The following categories shall be  
 94639 supported. In addition, the input may contain source for implementation-defined categories.

94640 *LC\_CTYPE* Defines character classification and case conversion.

94641 *LC\_COLLATE*  
 94642 Defines collation rules.

94643 *LC\_MONETARY*  
 94644 Defines the format and symbols used in formatting of monetary information.

94645 *LC\_NUMERIC*  
 94646 Defines the decimal delimiter, grouping, and grouping symbol for non-monetary  
 94647 numeric editing.

94648 *LC\_TIME* Defines the format and content of date and time information.

94649 *LC\_MESSAGES*  
 94650 Defines the format and values of affirmative and negative responses.

94651 **OPTIONS**

94652 The *localedef* utility shall conform to XBD [Section 12.2](#) (on page 215).

94653 The following options shall be supported:

94654 **-c** Create permanent output even if warning messages have been issued.

94655 **-f charmap** Specify the pathname of a file containing a mapping of character symbols and  
 94656 collating element symbols to actual character encodings. The format of the  
 94657 *charmap* is described in XBD [Section 6.4](#) (on page 129). The application shall ensure  
 94658 that this option is specified if symbolic names (other than collating symbols  
 94659 defined in a **collating-symbol** keyword) are used. If the **-f** option is not present, an  
 94660 implementation-defined character mapping shall be used.

94661 **-i inputfile** The pathname of a file containing the source definitions. If this option is not  
 94662 present, source definitions shall be read from standard input. The format of the  
 94663 *inputfile* is described in XBD [Section 7.3](#) (on page 136).

94664        **-u** *code\_set\_name*  
 94665               Specify the name of a codeset used as the target mapping of character symbols and  
 94666               collating element symbols whose encoding values are defined in terms of the  
 94667               ISO/IEC 10646-1:2000 standard position constant values.

## 94668 OPERANDS

94669        The following operand shall be supported:

94670        *name*           Identifies the locale; see XBD [Chapter 7](#) (on page 135) for a description of the use of  
 94671               this name. If the name contains one or more <slash> characters, *name* shall be  
 94672               interpreted as a pathname where the created locale definitions shall be stored. If  
 94673               *name* does not contain any <slash> characters, the interpretation of the name is  
 94674               implementation-defined and the locale shall be public. The ability to create public  
 94675               locales in this way may be restricted to users with appropriate privileges. (As a  
 94676               consequence of specifying one *name*, although several categories can be processed  
 94677               in one execution, only categories belonging to the same locale can be processed.)

## 94678 STDIN

94679        Unless the **-i** option is specified, the standard input shall be a text file containing one or more  
 94680        locale category source definitions, as described in XBD [Section 7.3](#) (on page 136). When lines are  
 94681        continued using the escape character mechanism, there is no limit to the length of the  
 94682        accumulated continued line.

## 94683 INPUT FILES

94684        The character set mapping file specified as the *charmap* option-argument is described in XBD  
 94685        [Section 6.4](#) (on page 129). If a locale category source definition contains a **copy** statement, as  
 94686        defined in XBD [Chapter 7](#) (on page 135), and the **copy** statement names a valid, existing locale,  
 94687        then *localedef* shall behave as if the source definition had contained a valid category source  
 94688        definition for the named locale.

## 94689 ENVIRONMENT VARIABLES

94690        The following environment variables shall affect the execution of *localedef*:

94691        **LANG**           Provide a default value for the internationalization variables that are unset or null.  
 94692               (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 94693               variables used to determine the values of locale categories.)

94694        **LC\_ALL**        If set to a non-empty string value, override the values of all the other  
 94695               internationalization variables.

94696        **LC\_COLLATE**  
 94697               (This variable has no affect on *localedef*; the POSIX locale is used for this category.)

94698        **LC\_CTYPE**       Determine the locale for the interpretation of sequences of bytes of text data as  
 94699               characters (for example, single-byte as opposed to multi-byte characters in  
 94700               arguments and input files). This variable has no affect on the processing of *localedef*  
 94701               input data; the POSIX locale is used for this purpose, regardless of the value of this  
 94702               variable.

94703        **LC\_MESSAGES**  
 94704               Determine the locale that should be used to affect the format and contents of  
 94705               diagnostic messages written to standard error.

94706        **XS1 NLSPATH**   Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

94707 **ASYNCHRONOUS EVENTS**

94708 Default.

94709 **STDOUT**

94710 The utility shall report all categories successfully processed, in an unspecified format.

94711 **STDERR**

94712 The standard error shall be used only for diagnostic messages.

94713 **OUTPUT FILES**94714 The format of the created output is unspecified. If the *name* operand does not contain a <slash>,  
94715 the existence of an output file for the locale is unspecified.94716 **EXTENDED DESCRIPTION**94717 When the **-u** option is used, the *code\_set\_name* option-argument shall be interpreted as an  
94718 implementation-defined name of a codeset to which the ISO/IEC 10646-1:2000 standard  
94719 position constant values shall be converted via an implementation-defined method. Both the  
94720 ISO/IEC 10646-1:2000 standard position constant values and other formats (decimal,  
94721 hexadecimal, or octal) shall be valid as encoding values within the *charmap* file. The codeset  
94722 represented by the implementation-defined name can be any codeset that is supported by the  
94723 implementation.94724 When conflicts occur between the *charmap* specification of <*code\_set\_name*>, <*mb\_cur\_max*>, or  
94725 <*mb\_cur\_min*> and the implementation-defined interpretation of these respective items for the  
94726 codeset represented by the **-u** option-argument *code\_set\_name*, the result is unspecified.94727 When conflicts occur between the *charmap* encoding values specified for symbolic names of  
94728 characters of the portable character set and the implementation-defined assignment of character  
94729 encoding values, the result is unspecified.94730 If a non-printable character in the *charmap* has a width specified that is not **-1**, the result will be  
94731 undefined.94732 **EXIT STATUS**

94733 The following exit values shall be returned:

- 94734 0 No errors occurred and the locales were successfully created.
- 94735 1 Warnings occurred and the locales were successfully created.
- 94736 2 The locale specification exceeded implementation limits or the coded character set or sets  
94737 used were not supported by the implementation, and no locale was created.
- 94738 3 The capability to create new locales is not supported by the implementation.
- 94739 >3 Warnings or errors occurred and no output was created.

94740 **CONSEQUENCES OF ERRORS**

94741 If an error is detected, no permanent output shall be created.

94742 If warnings occur, permanent output shall be created if the **-c** option was specified. The  
94743 following conditions shall cause warning messages to be issued:

- 94744 • If a symbolic name not found in the *charmap* file is used for the descriptions of the  
94745 *LC\_CTYPE* or *LC\_COLLATE* categories (for other categories, this shall be an error  
94746 condition).
- 94747 • If the number of operands to the **order** keyword exceeds the {*COLL\_WEIGHTS\_MAX*}  
94748 limit.

- If optional keywords not supported by the implementation are present in the source.

Other implementation-defined conditions may also cause warnings.

## APPLICATION USAGE

The *charmap* definition is optional, and is contained outside the locale definition. This allows both completely self-defined source files, and generic sources (applicable to more than one codeset). To aid portability, all *charmap* definitions must use the same symbolic names for the portable character set. As explained in XBD [Section 6.4](#) (on page 129), it is implementation-defined whether or not users or applications can provide additional character set description files. Therefore, the `-f` option might be operable only when an implementation-defined *charmap* is named.

## EXAMPLES

None.

## RATIONALE

The output produced by the *localedef* utility is implementation-defined. The *name* operand is used to identify the specific locale. (As a consequence, although several categories can be processed in one execution, only categories belonging to the same locale can be processed.)

## FUTURE DIRECTIONS

None.

## SEE ALSO

[locale](#)

XBD [Section 6.4](#) (on page 129), [Chapter 7](#) (on page 135), [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)

## CHANGE HISTORY

First released in Issue 4.

### Issue 6

The `-u` option is added, as specified in the IEEE P1003.2b draft standard.

The normative text is reworded to avoid use of the term “must” for application requirements.

IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/15 is applied, rewording text in the OPERANDS section describing the ability to create public locales.

IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/16 is applied, making the text consistent with the descriptions of **WIDTH** and **WIDTH\_DEFAULT** in the Base Definitions volume of POSIX.1-2008.

### Issue 7

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

94783 **NAME**

94784       logger — log messages

94785 **SYNOPSIS**94786       logger *string*...94787 **DESCRIPTION**

94788       The *logger* utility saves a message, in an unspecified manner and format, containing the *string*  
 94789       operands provided by the user. The messages are expected to be evaluated later by personnel  
 94790       performing system administration tasks.

94791       It is implementation-defined whether messages written in locales other than the POSIX locale  
 94792       are effective.

94793 **OPTIONS**

94794       None.

94795 **OPERANDS**

94796       The following operand shall be supported:

94797       *string*       One of the string arguments whose contents are concatenated together, in the order  
 94798       specified, separated by single <space> characters.

94799 **STDIN**

94800       Not used.

94801 **INPUT FILES**

94802       None.

94803 **ENVIRONMENT VARIABLES**94804       The following environment variables shall affect the execution of *logger*:

94805       *LANG*       Provide a default value for the internationalization variables that are unset or null.  
 94806       (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 94807       variables used to determine the values of locale categories.)

94808       *LC\_ALL*      If set to a non-empty string value, override the values of all the other  
 94809       internationalization variables.

94810       *LC\_CTYPE*   Determine the locale for the interpretation of sequences of bytes of text data as  
 94811       characters (for example, single-byte as opposed to multi-byte characters in  
 94812       arguments).

94813       *LC\_MESSAGES*

94814       Determine the locale that should be used to affect the format and contents of  
 94815       diagnostic messages written to standard error. (This means diagnostics from *logger*  
 94816       to the user or application, not diagnostic messages that the user is sending to the  
 94817       system administrator.)

94818       XSI       *NLSPATH*   Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

94819 **ASYNCHRONOUS EVENTS**

94820       Default.

94821 **STDOUT**

94822       Not used.

**94823 STDERR**

94824 The standard error shall be used only for diagnostic messages.

**94825 OUTPUT FILES**

94826 Unspecified.

**94827 EXTENDED DESCRIPTION**

94828 None.

**94829 EXIT STATUS**

94830 The following exit values shall be returned:

94831 0 Successful completion.

94832 >0 An error occurred.

**94833 CONSEQUENCES OF ERRORS**

94834 Default.

**94835 APPLICATION USAGE**

94836 This utility allows logging of information for later use by a system administrator or programmer  
94837 in determining why non-interactive utilities have failed. The locations of the saved messages,  
94838 their format, and retention period are all unspecified. There is no method for a conforming  
94839 application to read messages, once written.

**94840 EXAMPLES**

94841 A batch application, running non-interactively, tries to read a configuration file and fails; it may  
94842 attempt to notify the system administrator with:

94843 `logger myname: unable to read file foo. [timestamp]`

**94844 RATIONALE**

94845 The standard developers believed strongly that some method of alerting administrators to errors  
94846 was necessary. The obvious example is a batch utility, running non-interactively, that is unable to  
94847 read its configuration files or that is unable to create or write its results file. However, the  
94848 standard developers did not wish to define the format or delivery mechanisms as they have  
94849 historically been (and will probably continue to be) very system-specific, as well as involving  
94850 functionality clearly outside the scope of this volume of POSIX.1-2008.

94851 The text with *LC\_MESSAGES* about diagnostic messages means diagnostics from *logger* to the  
94852 user or application, not diagnostic messages that the user is sending to the system administrator.

94853 Multiple *string* arguments are allowed, similar to *echo*, for ease-of-use.

94854 Like the utilities *mailx* and *lp*, *logger* is admittedly difficult to test. This was not deemed sufficient  
94855 justification to exclude these utilities from this volume of POSIX.1-2008. It is also arguable that  
94856 they are, in fact, testable, but that the tests themselves are not portable.

**94857 FUTURE DIRECTIONS**

94858 None.

**94859 SEE ALSO**

94860 *lp*, *mailx*, *write*

94861 XBD Chapter 8 (on page 173)

**94862 CHANGE HISTORY**

94863 First released in Issue 4.

94864

94865

Issue 7

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

94866 **NAME**

94867       logname — return the user's login name

94868 **SYNOPSIS**

94869       logname

94870 **DESCRIPTION**

94871       The *logname* utility shall write the user's login name to standard output. The login name shall be  
 94872       the string that would be returned by the *getlogin()* function defined in the System Interfaces  
 94873       volume of POSIX.1-2008. Under the conditions where the *getlogin()* function would fail, the  
 94874       *logname* utility shall write a diagnostic message to standard error and exit with a non-zero exit  
 94875       status.

94876 **OPTIONS**

94877       None.

94878 **OPERANDS**

94879       None.

94880 **STDIN**

94881       Not used.

94882 **INPUT FILES**

94883       None.

94884 **ENVIRONMENT VARIABLES**94885       The following environment variables shall affect the execution of *logname*:

94886       *LANG*       Provide a default value for the internationalization variables that are unset or null.  
 94887       (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 94888       variables used to determine the values of locale categories.)

94889       *LC\_ALL*     If set to a non-empty string value, override the values of all the other  
 94890       internationalization variables.

94891       *LC\_CTYPE*   Determine the locale for the interpretation of sequences of bytes of text data as  
 94892       characters (for example, single-byte as opposed to multi-byte characters in  
 94893       arguments).

94894       *LC\_MESSAGES*  
 94895       Determine the locale that should be used to affect the format and contents of  
 94896       diagnostic messages written to standard error.

94897   XSI       *NLSPATH*   Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

94898 **ASYNCHRONOUS EVENTS**

94899       Default.

94900 **STDOUT**94901       The *logname* utility output shall be a single line consisting of the user's login name:

94902       "%s\n", &lt;login name&gt;

94903 **STDERR**

94904       The standard error shall be used only for diagnostic messages.

94905 **OUTPUT FILES**

94906       None.

94907 **EXTENDED DESCRIPTION**

94908 None.

94909 **EXIT STATUS**

94910 The following exit values shall be returned:

94911 0 Successful completion.

94912 &gt;0 An error occurred.

94913 **CONSEQUENCES OF ERRORS**

94914 Default.

94915 **APPLICATION USAGE**94916 The *logname* utility explicitly ignores the *LOGNAME* environment variable because environment  
94917 changes could produce erroneous results.94918 **EXAMPLES**

94919 None.

94920 **RATIONALE**94921 The **passwd** file is not listed as required because the implementation may have other means of  
94922 mapping login names.94923 **FUTURE DIRECTIONS**

94924 None.

94925 **SEE ALSO**94926 *id*, *who*94927 XBD [Chapter 8](#) (on page 173)94928 XSH [getlogin\(\)](#)94929 **CHANGE HISTORY**

94930 First released in Issue 2.

94931 **NAME**94932 `lp` — send files to a printer94933 **SYNOPSIS**94934 `lp [-c] [-d dest] [-n copies] [-msw] [-o option]... [-t title] [file...]`94935 **DESCRIPTION**

94936 The *lp* utility shall copy the input files to an output destination in an unspecified manner. The  
 94937 default output destination should be to a hardcopy device, such as a printer or microfilm  
 94938 recorder, that produces non-volatile, human-readable documents. If such a device is not  
 94939 available to the application, or if the system provides no such device, the *lp* utility shall exit with  
 94940 a non-zero exit status.

94941 The actual writing to the output device may occur some time after the *lp* utility successfully  
 94942 exits. During the portion of the writing that corresponds to each input file, the implementation  
 94943 shall guarantee exclusive access to the device.

94944 The *lp* utility shall associate a unique *request ID* with each request.

94945 Normally, a banner page is produced to separate and identify each print job. This page may be  
 94946 suppressed by implementation-defined conditions, such as an operator command or one of the  
 94947 `-o option` values.

94948 **OPTIONS**94949 The *lp* utility shall conform to XBD [Section 12.2](#) (on page 215).

94950 The following options shall be supported:

94951 `-c` Exit only after further access to any of the input files is no longer required. The  
 94952 application can then safely delete or modify the files without affecting the output  
 94953 operation. Normally, files are not copied, but are linked whenever possible. If the  
 94954 `-c` option is not given, then the user should be careful not to remove any of the  
 94955 files before the request has been printed in its entirety. It should also be noted that  
 94956 in the absence of the `-c` option, any changes made to the named files after the  
 94957 request is made but before it is printed may be reflected in the printed output. On  
 94958 some implementations, `-c` may be on by default.

94959 `-d dest` Specify a string that names the destination (*dest*). If *dest* is a printer, the request  
 94960 shall be printed only on that specific printer. If *dest* is a class of printers, the request  
 94961 shall be printed on the first available printer that is a member of the class. Under  
 94962 certain conditions (printer unavailability, file space limitation, and so on), requests  
 94963 for specific destinations need not be accepted. Destination names vary between  
 94964 systems.

94965 If `-d` is not specified, and neither the *LPDEST* nor *PRINTER* environment variable  
 94966 is set, an unspecified destination is used. The `-d dest` option shall take precedence  
 94967 over *LPDEST*, which in turn shall take precedence over *PRINTER*. Results are  
 94968 undefined when *dest* contains a value that is not a valid destination name.

94969 `-m` Send mail (see [mailx](#)) after the files have been printed. By default, no mail is sent  
 94970 upon normal completion of the print request.

94971 `-n copies` Write *copies* number of copies of the files, where *copies* is a positive decimal integer.  
 94972 The methods for producing multiple copies and for arranging the multiple copies  
 94973 when multiple *file* operands are used are unspecified, except that each file shall be  
 94974 output as an integral whole, not interleaved with portions of other files.

- 94975        **-o option**        Specify printer-dependent or class-dependent *options*. Several such *options* may be  
 94976        collected by specifying the **-o** option more than once.
- 94977        **-s**                Suppress messages from *lp*.
- 94978        **-t title**            Write *title* on the banner page of the output.
- 94979        **-w**                Write a message on the user's terminal after the files have been printed. If the user  
 94980        is not logged in, then mail shall be sent instead.

## 94981 OPERANDS

94982        The following operand shall be supported:

- 94983        *file*            A pathname of a file to be output. If no *file* operands are specified, or if a *file*  
 94984        operand is '-', the standard input shall be used. If a *file* operand is used, but the  
 94985        **-c** option is not specified, the process performing the writing to the output device  
 94986        may have user and group permissions that differ from that of the process invoking  
 94987        *lp*.

## 94988 STDIN

94989        The standard input shall be used only if no *file* operands are specified, or if a *file* operand is '-'.  
 94990        See the INPUT FILES section.

## 94991 INPUT FILES

94992        The input files shall be text files.

## 94993 ENVIRONMENT VARIABLES

94994        The following environment variables shall affect the execution of *lp*:

- 94995        *LANG*            Provide a default value for the internationalization variables that are unset or null.  
 94996        (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 94997        variables used to determine the values of locale categories.)
- 94998        *LC\_ALL*            If set to a non-empty string value, override the values of all the other  
 94999        internationalization variables.
- 95000        *LC\_CTYPE*        Determine the locale for the interpretation of sequences of bytes of text data as  
 95001        characters (for example, single-byte as opposed to multi-byte characters in  
 95002        arguments and input files).
- 95003        *LC\_MESSAGES*     Determine the locale that should be used to affect the format and contents of  
 95004        diagnostic messages written to standard error and informative messages written to  
 95005        standard output.  
 95006
- 95007        *LC\_TIME*        Determine the format and contents of date and time strings displayed in the *lp*  
 95008        banner page, if any.
- 95009        *LPDEST*            Determine the destination. If the *LPDEST* environment variable is not set, the  
 95010        *PRINTER* environment variable shall be used. The **-d dest** option takes precedence  
 95011        over *LPDEST*. Results are undefined when **-d** is not specified and *LPDEST*  
 95012        contains a value that is not a valid destination name.
- 95013        *NLSPATH*        Determine the location of message catalogs for the processing of *LC\_MESSAGES*.
- 95014        *PRINTER*        Determine the output device or destination. If the *LPDEST* and *PRINTER*  
 95015        environment variables are not set, an unspecified output device is used. The **-d**  
 95016        *dest* option and the *LPDEST* environment variable shall take precedence over  
 95017        *PRINTER*. Results are undefined when **-d** is not specified, *LPDEST* is unset, and  
 95018        *PRINTER* contains a value that is not a valid device or destination name.

95019            *TZ*            Determine the timezone used to calculate date and time strings displayed in the *lp*  
 95020 banner page, if any. If *TZ* is unset or null, an unspecified default timezone shall be  
 95021 used.

## 95022 **ASYNCHRONOUS EVENTS**

95023            Default.

## 95024 **STDOUT**

95025            The *lp* utility shall write a *request ID* to the standard output, unless *-s* is specified. The format of  
 95026 the message is unspecified. The request ID can be used on systems supporting the historical  
 95027 *cancel* and *lpstat* utilities.

## 95028 **STDERR**

95029            The standard error shall be used only for diagnostic messages.

## 95030 **OUTPUT FILES**

95031            None.

## 95032 **EXTENDED DESCRIPTION**

95033            None.

## 95034 **EXIT STATUS**

95035            The following exit values shall be returned:

95036            0    All input files were processed successfully.

95037            >0   No output device was available, or an error occurred.

## 95038 **CONSEQUENCES OF ERRORS**

95039            Default.

## 95040 **APPLICATION USAGE**

95041            The *pr* and *fold* utilities can be used to achieve reasonable formatting for the implementation's  
 95042 default page size.

95043            A conforming application can use one of the *file* operands only with the *-c* option or if the file is  
 95044 publicly readable and guaranteed to be available at the time of printing. This is because  
 95045 POSIX.1-2008 gives the implementation the freedom to queue up the request for printing at  
 95046 some later time by a different process that might not be able to access the file.

## 95047 **EXAMPLES**

95048            1. To print file *file*:

95049            `lp -c file`

95050            2. To print multiple files with headers:

95051            `pr file1 file2 | lp`

## 95052 **RATIONALE**

95053            The *lp* utility was designed to be a basic version of a utility that is already available in many  
 95054 historical implementations. The standard developers considered that it should be implementable  
 95055 simply as:

95056            `cat "$@" > /dev/lp`

95057            after appropriate processing of options, if that is how the implementation chose to do it and if  
 95058 exclusive access could be granted (so that two users did not write to the device simultaneously).  
 95059 Although in the future the standard developers may add other options to this utility, it should  
 95060 always be able to execute with no options or operands and send the standard input to an

unspecified output device.

This volume of POSIX.1-2008 makes no representations concerning the format of the printed output, except that it must be “human-readable” and “non-volatile”. Thus, writing by default to a disk or tape drive or a display terminal would not qualify. (Such destinations are not prohibited when `-d dest`, `LPDEST`, or `PRINTER` are used, however.)

This volume of POSIX.1-2008 is worded such that a “print job” consisting of multiple input files, possibly in multiple copies, is guaranteed to print so that any one file is not intermixed with another, but there is no statement that all the files or copies have to print out together.

The `-c` option may imply a spooling operation, but this is not required. The utility can be implemented to wait until the printer is ready and then wait until it is finished. Because of that, there is no attempt to define a queuing mechanism (priorities, classes of output, and so on).

On some historical systems, the request ID reported on the `STDOUT` can be used to later cancel or find the status of a request using utilities not defined in this volume of POSIX.1-2008.

Although the historical System V `lp` and BSD `lpr` utilities have provided similar functionality, they used different names for the environment variable specifying the destination printer. Since the name of the utility here is `lp`, `LPDEST` (used by the System V `lp` utility) was given precedence over `PRINTER` (used by the BSD `lpr` utility). Since environments of users frequently contain one or the other environment variable, the `lp` utility is required to recognize both. If this was not done, many applications would send output to unexpected output devices when users moved from system to system.

Some have commented that `lp` has far too little functionality to make it worthwhile. Requests have proposed additional options or operands or both that added functionality. The requests included:

- Wording *requiring* the output to be “hardcopy”
- A requirement for multiple printers
- Options for supporting various page-description languages

Given that a compliant system is not required to even have a printer, placing further restrictions upon the behavior of the printer is not useful. Since hardcopy format is so application-dependent, it is difficult, if not impossible, to select a reasonable subset of functionality that should be required on all compliant systems.

The term *unspecified* is used in this section in lieu of *implementation-defined* as most known implementations would not be able to make definitive statements in their conformance documents; the existence and usage of printers is very dependent on how the system administrator configures each individual system.

Since the default destination, device type, queuing mechanisms, and acceptable forms of input are all unspecified, usage guidelines for what a conforming application can do are as follows:

- Use the command in a pipeline, or with `-c`, so that there are no permission problems and the files can be safely deleted or modified.
- Limit output to text files of reasonable line lengths and printable characters and include no device-specific formatting information, such as a page description language. The meaning of “reasonable” in this context can only be answered as a quality-of-implementation issue, but it should be apparent from historical usage patterns in the industry and the locale. The `pr` and `fold` utilities can be used to achieve reasonable formatting for the default page size of the implementation.

Alternatively, the application can arrange its installation in such a way that it requires the system administrator or operator to provide the appropriate information on *lp* options and environment variable values.

At a minimum, having this utility in this volume of POSIX.1-2008 tells the industry that conforming applications require a means to print output and provides at least a command name and *LPDEST* routing mechanism that can be used for discussions between vendors, application developers, and users. The use of “should” in the DESCRIPTION of *lp* clearly shows the intent of the standard developers, even if they cannot mandate that all systems (such as laptops) have printers.

This volume of POSIX.1-2008 does not specify what the ownership of the process performing the writing to the output device may be. If *-c* is not used, it is unspecified whether the process performing the writing to the output device has permission to read *file* if there are any restrictions in place on who may read *file* until after it is printed. Also, if *-c* is not used, the results of deleting *file* before it is printed are unspecified.

#### FUTURE DIRECTIONS

None.

#### SEE ALSO

*mailx*

XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)

#### CHANGE HISTORY

First released in Issue 2.

#### Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In the DESCRIPTION, the requirement to associate a unique request ID, and the normal generation of a banner page is added.
- In the OPTIONS section:
  - The *-d dest* description is expanded, but references to *lpstat* are removed.
  - The *-m*, *-o*, *-s*, *-t*, and *-w* options are added.
- In the ENVIRONMENT VARIABLES section, *LC\_TIME* may now affect the execution.
- The STDOUT section is added.

The normative text is reworded to avoid use of the term “must” for application requirements.

The *TZ* entry is added to the ENVIRONMENT VARIABLES section.

#### Issue 7

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

**NAME**

ls — list directory contents

**SYNOPSIS**

```
ls [-ikqrs] [-g lno] [-A|-a] [-C|-m|-x|-l] \
 [-F|-p] [-H|-L] [-R|-d] [-S|-f|-t] [-c|-u] [file...]
```

**DESCRIPTION**

For each operand that names a file of a type other than directory or symbolic link to a directory, *ls* shall write the name of the file as well as any requested, associated information. For each operand that names a file of type directory, *ls* shall write the names of files contained within the directory as well as any requested, associated information. Filenames beginning with a <period> ('.') and any associated information shall not be written out unless explicitly referenced, the *-A* or *-a* option is supplied, or an implementation-defined condition causes them to be written. If one or more of the *-d*, *-F*, or *-l* options are specified, and neither the *-H* nor the *-L* option is specified, for each operand that names a file of type symbolic link to a directory, *ls* shall write the name of the file as well as any requested, associated information. If none of the *-d*, *-F*, or *-l* options are specified, or the *-H* or *-L* options are specified, for each operand that names a file of type symbolic link to a directory, *ls* shall write the names of files contained within the directory as well as any requested, associated information. In each case where the names of files contained within a directory are written, if the directory contains any symbolic links then *ls* shall evaluate the file information and file type to be those of the symbolic link itself, unless the *-L* option is specified.

If no operands are specified, *ls* shall behave as if a single operand of dot ('.') had been specified. If more than one operand is specified, *ls* shall write non-directory operands first; it shall sort directory and non-directory operands separately according to the collating sequence in the current locale.

The *ls* utility shall detect infinite loops; that is, entering a previously visited directory that is an ancestor of the last file encountered. When it detects an infinite loop, *ls* shall write a diagnostic message to standard error and shall either recover its position in the hierarchy or terminate.

**OPTIONS**

The *ls* utility shall conform to XBD [Section 12.2](#) (on page 215).

The following options shall be supported:

- A** Write out all directory entries, including those whose names begin with a <period> ('.') but excluding the entries dot and dot-dot (if they exist).
- C** Write multi-text-column output with entries sorted down the columns, according to the collating sequence. The number of text columns and the column separator characters are unspecified, but should be adapted to the nature of the output device. This option disables long format output.
- F** Do not follow symbolic links named as operands unless the *-H* or *-L* options are specified. Write a <slash> ('/') immediately after each pathname that is a directory, an <asterisk> ('\*') after each that is executable, a <vertical-line> ('|') after each that is a FIFO, and an at-sign('@') after each that is a symbolic link. For other file types, other symbols may be written.
- H** Evaluate the file information and file type for symbolic links specified on the command line to be those of the file referenced by the link, and not the link itself; however, *ls* shall write the name of the link itself and not the file referenced by the link.

|       |     |           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |   |
|-------|-----|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---|
| 95186 |     | <b>-L</b> | Evaluate the file information and file type for all symbolic links (whether named on the command line or encountered in a file hierarchy) to be those of the file referenced by the link, and not the link itself; however, <i>ls</i> shall write the name of the link itself and not the file referenced by the link. When <b>-L</b> is used with <b>-l</b> , write the contents of symbolic links in the long format (see the STDOUT section).                                                               |   |
| 95187 |     |           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |   |
| 95188 |     |           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |   |

| 95217 |     | <b>-m</b> | Stream output format; list pathnames across the page, separated by a <comma> character followed by a <space> character. Use a <newline> character as the list terminator and after the separator sequence when there is not room on a line for the next list entry. This option disables long format output.                                                                                                                                                                                                   |   |
| 95218 |     |           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |   |

| 95240 | <b>-u</b> | Use time of last access (see XBD <a href="#">&lt;sys/stat.h&gt;</a> ) instead of last modification of the file for sorting ( <b>-t</b> ) or writing ( <b>-l</b> ).                                                                                                                                                                                                                                        |  |
| 95241 |           |                                                                                                                                                                                                                                                                                                                                                                                                           |  |
| 95242 | <b>-x</b> | The same as <b>-C</b> , except that the multi-text-column output is produced with entries sorted across, rather than down, the columns. This option disables long format output.                                                                                                                                                                                                                          |  |
| 95243 |           |                                                                                                                                                                                                                                                                                                                                                                                                           |  |
| 95244 |           |                                                                                                                                                                                                                                                                                                                                                                                                           |  |
| 95245 | <b>-1</b> | (The numeric digit one.) Force output to be one entry per line. This option does not disable long format output. (Long format output is enabled by <b>-g</b> , <b>-l</b> (ell), <b>-n</b> , and <b>-o</b> ; and disabled by <b>-C</b> , <b>-m</b> , and <b>-x</b> .)                                                                                                                                      |  |
| 95246 | XSI       |                                                                                                                                                                                                                                                                                                                                                                                                           |  |
| 95247 | XSI       |                                                                                                                                                                                                                                                                                                                                                                                                           |  |
| 95248 | XSI       | If an option that enables long format output ( <b>-g</b> , <b>-l</b> (ell), <b>-n</b> , and <b>-o</b> ) is given with an option that disables long format output ( <b>-C</b> , <b>-m</b> , and <b>-x</b> ), this shall not be considered an error. The last of these options specified shall determine whether long format output is written.                                                             |  |
| 95249 |           |                                                                                                                                                                                                                                                                                                                                                                                                           |  |
| 95250 |           |                                                                                                                                                                                                                                                                                                                                                                                                           |  |
| 95251 |           | If <b>-R</b> , <b>-d</b> , or <b>-f</b> are specified, the results of specifying these mutually-exclusive options are specified by the descriptions of these options above. If more than one of any of the other options shown in the SYNOPSIS section in mutually-exclusive sets are given, this shall not be considered an error; the last option specified in each set shall determine the output.     |  |
| 95252 |           |                                                                                                                                                                                                                                                                                                                                                                                                           |  |
| 95253 |           |                                                                                                                                                                                                                                                                                                                                                                                                           |  |
| 95254 |           |                                                                                                                                                                                                                                                                                                                                                                                                           |  |
| 95255 |           | Note that if <b>-t</b> is specified, <b>-c</b> and <b>-u</b> are not only mutually-exclusive with each other, they are also mutually-exclusive with <b>-S</b> when determining sort order. But even if <b>-S</b> is specified after all occurrences of <b>-c</b> , <b>-t</b> , and <b>-u</b> , the last use of <b>-c</b> or <b>-u</b> determines the timestamp printed when producing long format output. |  |
| 95256 |           |                                                                                                                                                                                                                                                                                                                                                                                                           |  |
| 95257 |           |                                                                                                                                                                                                                                                                                                                                                                                                           |  |
| 95258 |           |                                                                                                                                                                                                                                                                                                                                                                                                           |  |

## OPERANDS

The following operand shall be supported:

|       |             |                                                                                                                                 |
|-------|-------------|---------------------------------------------------------------------------------------------------------------------------------|
| 95261 | <i>file</i> | A pathname of a file to be written. If the file specified is not found, a diagnostic message shall be output on standard error. |
| 95262 |             |                                                                                                                                 |

## STDIN

Not used.

## INPUT FILES

None.

**ENVIRONMENT VARIABLES**

The following environment variables shall affect the execution of *ls*:

**COLUMNS** Determine the user's preferred column position width for writing multiple text-column output. If this variable contains a string representing a decimal integer, the *ls* utility shall calculate how many pathname text columns to write (see **-C**) based on the width provided. If **COLUMNS** is not set or invalid, an implementation-defined number of column positions shall be assumed, based on the implementation's knowledge of the output device. The column width chosen to write the names of files in any given directory shall be constant. Filenames shall not be truncated to fit into the multiple text-column output.

**LANG** Provide a default value for the internationalization variables that are unset or null. (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization variables used to determine the values of locale categories.)

**LC\_ALL** If set to a non-empty string value, override the values of all the other internationalization variables.

**LC\_COLLATE** Determine the locale for character collation information in determining the pathname collation sequence.

**LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as characters (for example, single-byte as opposed to multi-byte characters in arguments) and which characters are defined as printable (character class **print**).

**LC\_MESSAGES** Determine the locale that should be used to affect the format and contents of diagnostic messages written to standard error.

**LC\_TIME** Determine the format and contents for date and time strings written by *ls*.

**NLSPATH** Determine the location of message catalogs for the processing of **LC\_MESSAGES**.

**TZ** Determine the timezone for date and time strings written by *ls*. If **TZ** is unset or null, an unspecified default timezone shall be used.

**ASYNCHRONOUS EVENTS**

Default.

**STDOUT**

The default format shall be to list one entry per line to standard output; the exceptions are to terminals or when one of the **-C**, **-m**, or **-x** options is specified. If the output is to a terminal, the format is implementation-defined.

When **-m** is specified, the format used for the last element of the list shall be:

"%s\n", <filename>

The format used for each other element of the list shall be:

"%s,%s", <filename>, <separator>

where, if there is not room for the next element of the list to fit within the current line length, <separator> is a string containing an optional <space> character and a mandatory <newline> character; otherwise it is a single <space> character.

If the **-i** option is specified, the file's file serial number (see XBD [<sys/stat.h>](#)) shall be written in the following format before any other output for the corresponding entry:

95310        %u ", <file serial number>

95311        If the **-l** option is specified, the following information shall be written for files other than  
95312        character special and block special files:

95313        "%s %u %s %s %u %s %s\n", <file mode>, <number of links>,  
95314               <owner name>, <group name>, <size>, <date and time>,  
95315               <pathname>

95316        If the **-l** option is specified, the following information shall be written for character special and  
95317        block special files:

95318        "%s %u %s %s %s %s %s\n", <file mode>, <number of links>,  
95319               <owner name>, <group name>, <device info>, <date and time>,  
95320               <pathname>

95321        In both cases if the file is a symbolic link and the **-L** option is also specified, this information  
95322        shall be for the file resolved from the symbolic link, except that the <pathname> field shall  
95323        contain the pathname of the symbolic link itself. If the file is a symbolic link and the **-L** option is  
95324        not specified, this information shall be about the link itself and the <pathname> field shall be of  
95325        the form:

95326        "%s -> %s", <pathname of link>, <contents of link>

95327        XSI        The **-n**, **-g**, and **-o** options use the same format as **-l**, but with omitted items and their  
95328        associated <blank> characters. See the OPTIONS section.

95329        In both the preceding **-l** forms, if <owner name> or <group name> cannot be determined, or if **-n**  
95330        is given, they shall be replaced with their associated numeric values using the format %u.

95331        The <size> field shall contain the value that would be returned for the file in the *st\_size* field of  
95332        **struct stat** (see XBD <sys/stat.h>). Note that for some file types this value is unspecified.

95333        The <device info> field shall contain implementation-defined information associated with the  
95334        device in question.

95335        The <date and time> field shall contain the appropriate date and timestamp of when the file was  
95336        last modified. In the POSIX locale, the field shall be the equivalent of the output of the following  
95337        *date* command:

95338        date "+%b %e %H:%M"

95339        if the file has been modified in the last six months, or:

95340        date "+%b %e %Y"

95341        (where two <space> characters are used between %e and %Y) if the file has not been modified in  
95342        the last six months or if the modification date is in the future, except that, in both cases, the final  
95343        <newline> produced by *date* shall not be included and the output shall be as if the *date*  
95344        command were executed at the time of the last modification date of the file rather than the  
95345        current time. When the *LC\_TIME* locale category is not set to the POSIX locale, a different format  
95346        and order of presentation of this field may be used.

95347        If the pathname was specified as a *file* operand, it shall be written as specified.

95348        XSI        The file mode written under the **-l**, **-n**, **-g**, and **-o** options shall consist of the following format:

95349        "%c%s%s%s", <entry type>, <owner permissions>,  
95350               <group permissions>, <other permissions>,  
95351               <optional alternate access method flag>

95352 The *<optional alternate access method flag>* shall be the empty string if there is no alternate or  
 95353 additional access control method associated with the file; otherwise, it shall be a string  
 95354 containing a single printable character that is not a *<blank>*.

95355 The *<entry type>* character shall describe the type of file, as follows:

- 95356 d Directory.
- 95357 b Block special file.
- 95358 c Character special file.
- 95359 l (ell) Symbolic link.
- 95360 p FIFO.
- 95361 – Regular file.

95362 Implementations may add other characters to this list to represent other implementation-defined  
 95363 file types.

95364 The next three fields shall be three characters each:

95365 *<owner permissions>*

95366 Permissions for the file owner class (see XBD [Section 4.4](#), on page 108).

95367 *<group permissions>*

95368 Permissions for the file group class.

95369 *<other permissions>*

95370 Permissions for the file other class.

95371 Each field shall have three character positions:

- 95372 1. If 'r', the file is readable; if '–', the file is not readable.
- 95373 2. If 'w', the file is writable; if '–', the file is not writable.
- 95374 3. The first of the following that applies:
  - 95375 S If in *<owner permissions>*, the file is not executable and set-user-ID mode is set. If in
  - 95376 *<group permissions>*, the file is not executable and set-group-ID mode is set.
  - 95377 s If in *<owner permissions>*, the file is executable and set-user-ID mode is set. If in
  - 95378 *<group permissions>*, the file is executable and set-group-ID mode is set.
  - 95379 XSI T If in *<other permissions>* and the file is a directory, search permission is not granted to
  - 95380 others, and the restricted deletion flag is set.
  - 95381 XSI t If in *<other permissions>* and the file is a directory, search permission is granted to
  - 95382 others, and the restricted deletion flag is set.
  - 95383 x The file is executable or the directory is searchable.
  - 95384 – None of the attributes of 'S', 's', 'T', 't', or 'x' applies.

95385 Implementations may add other characters to this list for the third character position.  
 95386 Such additions shall, however, be written in lowercase if the file is executable or  
 95387 searchable, and in uppercase if it is not.

95388 XSI If any of the *–l*, *–n*, *–s*, *–g*, or *–o* options is specified, each list of files within the directory shall be  
 95389 preceded by a status line indicating the number of file system blocks occupied by files in the  
 95390 directory in 512-byte units if the *–k* option is not specified, or 1024-byte units if the *–k* option is  
 95391 specified, rounded up to the next integral number of units, if necessary. In the POSIX locale, the

95392 format shall be:

95393 "total %u\n", <number of units in the directory>

95394 If more than one directory, or a combination of non-directory files and directories are written,  
 95395 either as a result of specifying multiple operands, or the **-R** option, each list of files within a  
 95396 directory shall be preceded by:

95397 "\n%s:\n", <directory name>

95398 If this string is the first thing to be written, the first <newline> shall not be written. This output  
 95399 shall precede the number of units in the directory.

95400 If the **-s** option is given, each file shall be written with the number of blocks used by the file.  
 95401 XSI Along with **-C**, **-l**, **-m**, or **-x**, the number and a <space> shall precede the filename; with **-l**, **-n**,  
 95402 **-g**, or **-o**, they shall precede each line describing a file.

95403 **STDERR**

95404 The standard error shall be used only for diagnostic messages.

95405 **OUTPUT FILES**

95406 None.

95407 **EXTENDED DESCRIPTION**

95408 None.

95409 **EXIT STATUS**

95410 The following exit values shall be returned:

95411 0 Successful completion.

95412 >0 An error occurred.

95413 **CONSEQUENCES OF ERRORS**

95414 Default.

95415 **APPLICATION USAGE**

95416 Many implementations use the <equals-sign> ('=') to denote sockets bound to the file system  
 95417 for the **-F** option. Similarly, many historical implementations use the 's' character to denote  
 95418 sockets as the entry type characters for the **-l** option.

95419 It is difficult for an application to use every part of the file modes field of **ls -l** in a portable  
 95420 manner. Certain file types and executable bits are not guaranteed to be exactly as shown, as  
 95421 implementations may have extensions. Applications can use this field to pass directly to a user  
 95422 printout or prompt, but actions based on its contents should generally be deferred, instead, to  
 95423 the *test* utility.

95424 The output of **ls** (with the **-l** and related options) contains information that logically could be  
 95425 used by utilities such as *chmod* and *touch* to restore files to a known state. However, this  
 95426 information is presented in a format that cannot be used directly by those utilities or be easily  
 95427 translated into a format that can be used. A character has been added to the end of the  
 95428 permissions string so that applications at least have an indication that they may be working in  
 95429 an area they do not understand instead of assuming that they can translate the permissions  
 95430 string into something that can be used. Future versions or related documents may define one or  
 95431 more specific characters to be used based on different standard additional or alternative access  
 95432 control mechanisms.

95433 As with many of the utilities that deal with filenames, the output of **ls** for multiple files or in one  
 95434 of the long listing formats must be used carefully on systems where filenames can contain  
 95435 embedded white space. Systems and system administrators should institute policies and user

training to limit the use of such filenames.

The number of disk blocks occupied by the file that it reports varies depending on underlying file system type, block size units reported, and the method of calculating the number of blocks. On some file system types, the number is the actual number of blocks occupied by the file (counting indirect blocks and ignoring holes in the file); on others it is calculated based on the file size (usually making an allowance for indirect blocks, but ignoring holes).

## EXAMPLES

An example of a small directory tree being fully listed with *ls -laRF a* in the POSIX locale:

```
total 11
drwxr-xr-x 3 fox prog 64 Jul 4 12:07 ./
drwxrwxrwx 4 fox prog 3264 Jul 4 12:09 ../
drwxr-xr-x 2 fox prog 48 Jul 4 12:07 b/
-rwxr--r-- 1 fox prog 572 Jul 4 12:07 foo*

a/b:
total 4
drwxr-xr-x 2 fox prog 48 Jul 4 12:07 ./
drwxr-xr-x 3 fox prog 64 Jul 4 12:07 ../
-rw-r--r-- 1 fox prog 700 Jul 4 12:07 bar
```

## RATIONALE

Some historical implementations of the *ls* utility show all entries in a directory except dot and dot-dot when a superuser invokes *ls* without specifying the *-a* option. When “normal” users invoke *ls* without specifying *-a*, they should not see information about any files with names beginning with a <period> unless they were named as *file* operands.

Implementations are expected to traverse arbitrary depths when processing the *-R* option. The only limitation on depth should be based on running out of physical storage for keeping track of untraversed directories.

The *-1* (one) option was historically found in BSD and BSD-derived implementations only. It is required in this volume of POSIX.1-2008 so that conforming applications might ensure that output is one entry per line, even if the output is to a terminal.

The *-S* option was added in Issue 7, but had been provided by several implementations for many years. The description given in the standard documents historic practice, but does not match much of the documentation that described its behavior. Historical documentation typically described it as something like:

*-S* Sort by size (largest size first) instead of by name. Special character devices (listed last) are sorted by name.

even though the file type was never considered when sorting the output. Character special files do typically sort close to the end of the list because their file size on most implementations is zero. But they are sorted alphabetically with any other files that happen to have the same file size (zero), not sorted separately and added to the end.

This volume of POSIX.1-2008 is frequently silent about what happens when mutually-exclusive options are specified. Except for *-R*, *-d*, and *-f*, the *ls* utility is required to accept multiple options from each mutually-exclusive option set without treating them as errors and to use the behavior specified by the last option given in each mutually-exclusive set. Since *ls* is one of the most aliased commands, it is important that the implementation perform intuitively. For example, if the alias were:

```
alias ls="ls -C"
```

and the user typed `ls -1` (one), single-text-column output should result, not an error.

The `-g`, `-l` (ell), `-n`, and `-o` options are not mutually-exclusive options. They all enable long format output. They work together to determine whether the file's owner is written (no if `-g` is present), file's group is written (no if `-o` is present), and if the file's group or owner is written whether it is written as the name (default) or a string representation of the UID or GID number (if `-n` is present). The `-C`, `-m`, `-x`, and `-1` (one) are mutually-exclusive options and the first three of these disable long format output. The `-1` (one) option does not directly change whether or not long format output is enabled, but by overriding `-C`, `-m`, and `-x`, it can re-enable long format output that had been disabled by one of these options.

Earlier versions of this standard did not describe the BSD `-A` option (like `-a`, but dot and dot-dot are not written out). It has been added due to widespread implementation.

Implementations may make `-q` the default for terminals to prevent trojan horse attacks on terminals with special escape sequences. This is not required because:

- Some control characters may be useful on some terminals; for example, a system might write them as `"\001"` or `"^A"`.
- Special behavior for terminals is not relevant to applications portability.

An early proposal specified that the *<optional alternate access method flag>* had to be `'+'` if there was an alternate access method used on the file or `<space>` if there was not. This was changed to be `<space>` if there is not and a single printable character if there is. This was done for three reasons:

1. There are historical implementations using characters other than `'+'`.
2. There are implementations that vary this character used in that position to distinguish between various alternate access methods in use.
3. The standard developers did not want to preclude future specifications that might need a way to specify more than one alternate access method.

Nonetheless, implementations providing a single alternate access method are encouraged to use `'+'`.

Earlier versions of this standard did not have the `-k` option, which meant that the `-s` option could not be used portably as its block size was implementation-defined, and the units used to specify the number of blocks occupied by files in a directory in an `ls -l` listing were fixed as 512-byte units. The `-k` option has been added to provide a way for the `-s` option to be used portably, and for consistency it also changes the aforementioned units from 512-byte to 1024-byte.

The *<date and time>* field in the `-l` format is specified only for the POSIX locale. As noted, the format can be different in other locales. No mechanism for defining this is present in this volume of POSIX.1-2008, as the appropriate vehicle is a messaging system; that is, the format should be specified as a "message".

## FUTURE DIRECTIONS

Allowing `-f` to ignore the `-A`, `-g`, `-l`, `-n`, `-o`, and `-s` options may be removed in a future version.

95525 **CHANGE HISTORY**

95526 First released in Issue 2.

95527 **Issue 5**

95528 A second FUTURE DIRECTION is added.

95529 **Issue 6**95530 The following new requirements on POSIX implementations derive from alignment with the  
95531 Single UNIX Specification:

- 95532
- In the **-F** option, other symbols are allowed for other file types.

95533 Treatment of symbolic links is added, as defined in the IEEE P1003.2b draft standard.

95534 The Open Group Base Resolution bwg2001-010 is applied, adding the **T** and **t** fields as part of  
95535 the XSI option.95536 **Issue 7**95537 Austin Group Interpretation 1003.1-2001 #101 is applied, clarifying the optional alternate access  
95538 method flag in the STDOUT section.95539 Austin Group Interpretation 1003.1-2001 #128 is applied, clarifying the DESCRIPTION and the  
95540 definition of the **-R** option.95541 Austin Group Interpretation 1003.1-2001 #129 is applied, clarifying the behavior of *ls* when no  
95542 operands are specified.95543 Austin Group Interpretation 1003.1-2001 #198 is applied, clarifying the requirements for the **-H**  
95544 option.95545 SD5-XCU-ERN-50 is applied, adding the **-A** option.

95546 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

95547 The **-S** option is added from The Open Group Technical Standard, 2006, Extended API Set  
95548 Part 1.95549 The **-f**, **-m**, **-n**, **-p**, **-s**, and **-x** options are moved from the XSI option to the Base.95550 The description of the **-f**, **-s**, and **-t** options are revised and the **-k** option is added.95551 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0098 [424], XCU/TC1-2008/0099 +  
95552 [424], XCU/TC1-2008/0100 [424], XCU/TC1-2008/0101 [424], XCU/TC1-2008/0102 [424], +  
95553 XCU/TC1-2008/0103 [424], XCU/TC1-2008/0104 [424], XCU/TC1-2008/0105 [423,424], +  
95554 XCU/TC1-2008/0106 [424], XCU/TC1-2008/0107 [424], XCU/TC1-2008/0108 [424], +  
95555 XCU/TC1-2008/0109 [424], XCU/TC1-2008/0110 [424], XCU/TC1-2008/0111 [423], +  
95556 XCU/TC1-2008/0112 [117], XCU/TC1-2008/0113 [117], XCU/TC1-2008/0114 [117], +  
95557 XCU/TC1-2008/0115 [424], and XCU/TC1-2008/0116 [424] are applied.

95558 **NAME**

95559 m4 — macro processor

95560 **SYNOPSIS**95561 m4 [-s] [-D *name*[=*val*]]... [-U *name*]... *file*...95562 **DESCRIPTION**

95563 The *m4* utility is a macro processor that shall read one or more text files, process them according  
 95564 to their included macro statements, and write the results to standard output.

95565 **OPTIONS**

95566 The *m4* utility shall conform to XBD [Section 12.2](#) (on page 215), except that the order of the **-D**  
 95567 and **-U** options shall be significant, and options can be interspersed with operands.

95568 The following options shall be supported:

95569 **-s** Enable line synchronization output for the *c99* preprocessor phase (that is, **#line**  
 95570 directives).

95571 **-D *name*[=*val*]**

95572 Define *name* to *val* or to null if *=val* is omitted.

95573 **-U *name*** Undefine *name*.

95574 **OPERANDS**

95575 The following operand shall be supported:

95576 *file* A pathname of a text file to be processed. If no *file* is given, or if it is '-', the  
 95577 standard input shall be read.

95578 **STDIN**

95579 The standard input shall be a text file that is used if no *file* operand is given, or if it is '-'.

95580 **INPUT FILES**

95581 The input file named by the *file* operand shall be a text file.

95582 **ENVIRONMENT VARIABLES**

95583 The following environment variables shall affect the execution of *m4*:

95584 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 95585 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 95586 variables used to determine the values of locale categories.)

95587 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 95588 internationalization variables.

95589 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 95590 characters (for example, single-byte as opposed to multi-byte characters in  
 95591 arguments and input files).

95592 **LC\_MESSAGES**

95593 Determine the locale that should be used to affect the format and contents of  
 95594 diagnostic messages written to standard error.

95595 **XSI NLSPATH** Determine the location of message catalogs for the processing of **LC\_MESSAGES**.

95596 **ASYNCHRONOUS EVENTS**

95597 Default.

**STDOUT**

The standard output shall be the same as the input files, after being processed for macro expansion.

**STDERR**

The standard error shall be used to display strings with the **errprint** macro, macro tracing enabled by the **traceon** macro, the defined text for macros written by the **dumpdef** macro, or for diagnostic messages.

**OUTPUT FILES**

None.

**EXTENDED DESCRIPTION**

The *m4* utility shall compare each token from the input against the set of built-in and user-defined macros. If the token matches the name of a macro, then the token shall be replaced by the macro's defining text, if any, and rescanned for matching macro names. Once no portion of the token matches the name of a macro, it shall be written to standard output. Macros may have arguments, in which case the arguments shall be substituted into the defining text before it is rescanned.

Macro calls have the form:

```
name(arg1, arg2, ..., argn)
```

Macro names shall consist of letters, digits, and underscores, where the first character is not a digit. Tokens not of this form shall not be treated as macros.

The application shall ensure that the <left-parenthesis> immediately follows the name of the macro. If a token matching the name of a macro is not followed by a <left-parenthesis>, it is handled as a use of that macro without arguments.

If a macro name is followed by a <left-parenthesis>, its arguments are the <comma>-separated tokens between the <left-parenthesis> and the matching <right-parenthesis>. Unquoted white-space characters preceding each argument shall be ignored. All other characters, including trailing white-space characters, are retained. <comma> characters enclosed between <left-parenthesis> and <right-parenthesis> characters do not delimit arguments.

Arguments are positionally defined and referenced. The string "\$1" in the defining text shall be replaced by the first argument. Systems shall support at least nine arguments; only the first nine can be referenced, using the strings "\$1" to "\$9", inclusive. The string "\$0" is replaced with the name of the macro. The string "\$#" is replaced by the number of arguments as a string. The string "\$\*" is replaced by a list of all of the arguments, separated by <comma> characters. The string "\$@" is replaced by a list of all of the arguments separated by <comma> characters, and each argument is quoted using the current left and right quoting strings. The string "\${" produces unspecified behavior.

If fewer arguments are supplied than are in the macro definition, the omitted arguments are taken to be null. It is not an error if more arguments are supplied than are in the macro definition.

No special meaning is given to any characters enclosed between matching left and right quoting strings, but the quoting strings are themselves discarded. By default, the left quoting string consists of a grave accent (backquote) and the right quoting string consists of an acute accent (single-quote); see also the **changequote** macro.

Comments are written but not scanned for matching macro names; by default, the begin-comment string consists of the <number-sign> character and the end-comment string consists of a <newline>. See also the **changecom** and **dnl** macros.

95644 The *m4* utility shall make available the following built-in macros. They can be redefined, but  
 95645 once this is done the original meaning is lost. Their values shall be null unless otherwise stated.  
 95646 In the descriptions below, the term *defining text* refers to the value of the macro: the second  
 95647 argument to the **define** macro, among other things. Except for the first argument to the **eval**  
 95648 macro, all numeric arguments to built-in macros shall be interpreted as decimal values. The  
 95649 string values produced as the defining text of the **decr**, **divnum**, **incr**, **index**, **len**, and **sysval**  
 95650 built-in macros shall be in the form of a decimal-constant as defined in the C language.

95651 **changecom** The **changecom** macro shall set the begin-comment and end-comment strings.  
 95652 With no arguments, the comment mechanism shall be disabled. With a single non-  
 95653 null argument, that argument shall become the begin-comment and the <newline>  
 95654 shall become the end-comment string. With two non-null arguments, the first  
 95655 argument shall become the begin-comment string and the second argument shall  
 95656 become the end-comment string. The behavior is unspecified if either argument is  
 95657 provided but null. Systems shall support comment strings of at least five  
 95658 characters.

95659 **changequote** The **changequote** macro shall set the begin-quote and end-quote strings. With no  
 95660 arguments, the quote strings shall be set to the default values (that is, ` `'). The  
 95661 behavior is unspecified if there is a single argument or either argument is null.  
 95662 With two non-null arguments, the first argument shall become the begin-quote  
 95663 string and the second argument shall become the end-quote string. Systems shall  
 95664 support quote strings of at least five characters.

95665 **decr** The defining text of the **decr** macro shall be its first argument decremented by 1. It  
 95666 shall be an error to specify an argument containing any non-numeric characters.  
 95667 The behavior is unspecified if **decr** is not immediately followed by a <left-  
 95668 parenthesis>.

95669 **define** The second argument shall become the defining text of the macro whose name is  
 95670 the first argument. It is unspecified whether the **define** macro deletes all prior  
 95671 definitions of the macro named by its first argument or preserves all but the  
 95672 current definition of the macro. The behavior is unspecified if **define** is not  
 95673 immediately followed by a <left-parenthesis>.

95674 **defn** The defining text of the **defn** macro shall be the quoted definition (using the  
 95675 current quoting strings) of its arguments. The behavior is unspecified if **defn** is not  
 95676 immediately followed by a <left-parenthesis>.

95677 **divert** The *m4* utility maintains nine temporary buffers, numbered 1 to 9, inclusive.  
 95678 When the last of the input has been processed, any output that has been placed in  
 95679 these buffers shall be written to standard output in buffer-numerical order. The  
 95680 **divert** macro shall divert future output to the buffer specified by its argument.  
 95681 Specifying no argument or an argument of 0 shall resume the normal output  
 95682 process. Output diverted to a stream with a negative number shall be discarded.  
 95683 Behavior is implementation-defined if a stream number larger than 9 is specified. It  
 95684 shall be an error to specify an argument containing any non-numeric characters.

95685 **divnum** The defining text of the **divnum** macro shall be the number of the current output  
 95686 stream as a string.

95687 **dnl** The **dnl** macro shall cause *m4* to discard all input characters up to and including  
 95688 the next <newline>.

|       |                 |                                                                                                                                                                                                                                                                                                                                   |
|-------|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 95689 | <b>dumpdef</b>  | The <b>dumpdef</b> macro shall write the defined text to standard error for each of the macros specified as arguments, or, if no arguments are specified, for all macros.                                                                                                                                                         |
| 95690 |                 |                                                                                                                                                                                                                                                                                                                                   |
| 95691 | <b>errprint</b> | The <b>errprint</b> macro shall write its arguments to standard error. The behavior is unspecified if <b>errprint</b> is not immediately followed by a <left-parenthesis>.                                                                                                                                                        |
| 95692 |                 |                                                                                                                                                                                                                                                                                                                                   |
| 95693 | <b>eval</b>     | The <b>eval</b> macro shall evaluate its first argument as an arithmetic expression, using signed integer arithmetic with at least 32-bit precision. At least the following C-language operators shall be supported, with precedence, associativity, and behavior as described in <a href="#">Section 1.1.2.1</a> (on page 2305): |
| 95694 |                 |                                                                                                                                                                                                                                                                                                                                   |
| 95695 |                 |                                                                                                                                                                                                                                                                                                                                   |
| 95696 |                 |                                                                                                                                                                                                                                                                                                                                   |
| 95697 |                 | ( )                                                                                                                                                                                                                                                                                                                               |
| 95698 |                 | unary +                                                                                                                                                                                                                                                                                                                           |
| 95699 |                 | unary -                                                                                                                                                                                                                                                                                                                           |
| 95700 |                 | ~                                                                                                                                                                                                                                                                                                                                 |

Behavior is unspecified if the radix falls                                                                                                                                                                                                                                            |
| 95723 |                 | outside the range 2 to 36, inclusive. The third argument, if specified, sets the                                                                                                                                                                                                                                                  |
| 95724 |                 | minimum number of digits in the result. Behavior is unspecified if the third                                                                                                                                                                                                                                                      |
| 95725 |                 | argument is less than zero. It shall be an error to specify the second or third                                                                                                                                                                                                                                                   |
| 95726 |                 | argument containing any non-numeric characters. The behavior is unspecified if                                                                                                                                                                                                                                                    |
| 95727 |                 | <b>eval</b> is not immediately followed by a <left-parenthesis>.                                                                                                                                                                                                                                                                  |
| 95728 | <b>ifdef</b>    | If the first argument to the <b>ifdef</b> macro is defined, the defining text shall be the                                                                                                                                                                                                                                        |
| 95729 |                 | second argument. Otherwise, the defining text shall be the third argument, if                                                                                                                                                                                                                                                     |
| 95730 |                 | specified, or the null string, if not. The behavior is unspecified if <b>ifdef</b> is not                                                                                                                                                                                                                                         |
| 95731 |                 | immediately followed by a <left-parenthesis>.                                                                                                                                                                                                                                                                                     |
| 95732 | <b>ifelse</b>   | The <b>ifelse</b> macro takes three or more arguments. If the first two arguments                                                                                                                                                                                                                                                 |
| 95733 |                 | compare as equal strings (after macro expansion of both arguments), the defining                                                                                                                                                                                                                                                  |
| 95734 |                 | text shall be the third argument. If the first two arguments do not compare as equal                                                                                                                                                                                                                                              |
| 95735 |                 | strings and there are three arguments, the defining text shall be null. If the first two                                                                                                                                                                                                                                          |
| 95736 |                 | arguments do not compare as equal strings and there are four or five arguments,                                                                                                                                                                                                                                                   |

|       |                    |                                                                                                 |
|-------|--------------------|-------------------------------------------------------------------------------------------------|
| 95737 |                    | the defining text shall be the fourth argument. If the first two arguments do not               |
| 95738 |                    | compare as equal strings and there are six or more arguments, the first three                   |
| 95739 |                    | arguments shall be discarded and processing shall restart with the remaining                    |
| 95740 |                    | arguments. The behavior is unspecified if <b>ifelse</b> is not immediately followed by a        |
| 95741 |                    | <left-parenthesis>.                                                                             |
| 95742 | <b>include</b>     | The defining text for the <b>include</b> macro shall be the contents of the file named by       |
| 95743 |                    | the first argument. It shall be an error if the file cannot be read. The behavior is            |
| 95744 |                    | unspecified if <b>include</b> is not immediately followed by a <left-parenthesis>.              |
| 95745 | <b>incr</b>        | The defining text of the <b>incr</b> macro shall be its first argument incremented by 1. It     |
| 95746 |                    | shall be an error to specify an argument containing any non-numeric characters.                 |
| 95747 |                    | The behavior is unspecified if <b>incr</b> is not immediately followed by a <left-              |
| 95748 |                    | parenthesis>.                                                                                   |
| 95749 | <b>index</b>       | The defining text of the <b>index</b> macro shall be the first character position (as a         |
| 95750 |                    | string) in the first argument where a string matching the second argument begins                |
| 95751 |                    | (zero origin), or -1 if the second argument does not occur. The behavior is                     |
| 95752 |                    | unspecified if <b>index</b> is not immediately followed by a <left-parenthesis>.                |
| 95753 | <b>len</b>         | The defining text of the <b>len</b> macro shall be the length (as a string) of the first        |
| 95754 |                    | argument. The behavior is unspecified if <b>len</b> is not immediately followed by a            |
| 95755 |                    | <left-parenthesis>.                                                                             |
| 95756 | <b>m4exit</b>      | Exit from the <i>m4</i> utility. If the first argument is specified, it is the exit code. The   |
| 95757 |                    | default is zero. It shall be an error to specify an argument containing any non-                |
| 95758 |                    | numeric characters.                                                                             |
| 95759 | <b>m4wrap</b>      | The first argument shall be processed when EOF is reached. If the <b>m4wrap</b> macro           |
| 95760 |                    | is used multiple times, the arguments specified shall be processed in the order in              |
| 95761 |                    | which the <b>m4wrap</b> macros were processed. The behavior is unspecified if <b>m4wrap</b>     |
| 95762 |                    | is not immediately followed by a <left-parenthesis>.                                            |
| 95763 | OB <b>maketemp</b> | The defining text shall be the first argument, with any trailing 'X' characters                 |
| 95764 |                    | replaced with the current process ID as a string. The behavior is unspecified if                |
| 95765 |                    | <b>maketemp</b> is not immediately followed by a <left-parenthesis>.                            |
| 95766 | <b>mkstemp</b>     | The first argument shall be taken as a template for creating an empty file, with                |
| 95767 |                    | trailing 'X' characters replaced with characters from the portable filename                     |
| 95768 |                    | character set. The behavior is unspecified if the first argument does not end in at             |
| 95769 |                    | least six 'X' characters. If a temporary file is successfully created, then the                 |
| 95770 |                    | defining text of the macro shall be the name of the new file. The user ID of the file           |
| 95771 |                    | shall be set to the effective user ID of the process. The group ID of the file shall be         |
| 95772 |                    | set to the group ID of the file's parent directory or to the effective group ID of the          |
| 95773 |                    | process. The file access permission bits are set such that only the owner can both              |
| 95774 |                    | read and write the file, regardless of the current <i>umask</i> of the process. If a file could |
| 95775 |                    | not be created, the defining text of the macro shall be the empty string. The                   |
| 95776 |                    | behavior is unspecified if <b>mkstemp</b> is not immediately followed by a <left-               |
| 95777 |                    | parenthesis>.                                                                                   |
| 95778 | <b>popdef</b>      | The <b>popdef</b> macro shall delete the current definition of its arguments, replacing         |
| 95779 |                    | that definition with the previous one. If there is no previous definition, the macro            |
| 95780 |                    | is undefined. The behavior is unspecified if <b>popdef</b> is not immediately followed by       |
| 95781 |                    | a <left-parenthesis>.                                                                           |

| 95790 | <b>sinclude</b> | The <b>sinclude</b> macro shall be equivalent to the <b>include</b> macro, except that it shall not be an error if the file is inaccessible. The behavior is unspecified if <b>sinclude</b> is not immediately followed by a <left-parenthesis>.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |  |
| 95791 |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |  |
| 95792 |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |  |
| 95793 | <b>substr</b>   | The defining text for the <b>substr</b> macro shall be the substring of the first argument beginning at the zero-offset character position specified by the second argument. The third argument, if specified, shall be the number of characters to select; if not specified, the characters from the starting point to the end of the first argument shall become the defining text. It shall not be an error to specify a starting point beyond the end of the first argument and the defining text shall be null. It shall be an error to specify an argument containing any non-numeric characters. The behavior is unspecified if <b>substr</b> is not immediately followed by a <left-parenthesis>.                                                                            |  |
| 95794 |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |  |

| 95802 | <b>syscmd</b>   | The <b>syscmd</b> macro shall interpret its first argument as a shell command line. The defining text shall be the string result of that command. The string result shall not be rescanned for macros while setting the defining text. No output redirection shall be performed by the <i>m4</i> utility. The exit status value from the command can be retrieved using the <b>sysval</b> macro. The behavior is unspecified if <b>syscmd</b> is not immediately followed by a <left-parenthesis>.                                                                                                                                                                                                                                                                                   |  |
| 95803 |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |  |

| 95813 | <b>traceoff</b> | The <b>traceoff</b> macro shall disable tracing for the macros specified as arguments, or, if no arguments are specified, for all macros.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |  |
| 95814 |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |  |
| 95815 | <b>translit</b> | The defining text of the <b>translit</b> macro shall be the first argument with every character that occurs in the second argument replaced with the corresponding character from the third argument. If no replacement character is specified for some source character because the second argument is longer than the third argument, that character shall be deleted from the first argument in <b>translit</b> 's defining text. The behavior is unspecified if the '-' character appears within the second or third argument anywhere besides the first or last character. The behavior is unspecified if the same character appears more than once in the second argument. The behavior is unspecified if <b>translit</b> is not immediately followed by a <left-parenthesis>. |  |

| 95825 | <b>undefine</b> | The <b>undefine</b> macro shall delete all definitions (including those preserved using the <b>pushdef</b> macro) of the macros named by its arguments. The behavior is unspecified if <b>undefine</b> is not immediately followed by a <left-parenthesis>.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |  |
| 95826 |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |  |
| 95827 |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |  |

95828       **undivert**    The **undivert** macro shall cause immediate output of any text in temporary buffers  
 95829                    named as arguments, or all temporary buffers if no arguments are specified.  
 95830                    Buffers can be undiverted into other temporary buffers. Undiverting shall discard  
 95831                    the contents of the temporary buffer. The behavior is unspecified if an argument  
 95832                    contains any non-numeric characters.

#### 95833 **EXIT STATUS**

95834        The following exit values shall be returned:

95835            0    Successful completion.

95836            >0   An error occurred

95837        If the **m4exit** macro is used, the exit value can be specified by the input file.

#### 95838 **CONSEQUENCES OF ERRORS**

95839        Default.

#### 95840 **APPLICATION USAGE**

95841        The **defn** macro is useful for renaming macros, especially built-ins.

95842        Since **eval** defers to the ISO C standard, some operations have undefined behavior. In some  
 95843        implementations, division or remainder by zero cause a fatal signal, even if the division occurs  
 95844        on the short-circuited branch of "&&" or "||". Any operation that overflows in signed  
 95845        arithmetic produces undefined behavior. Likewise, using the **shift** operators with a shift amount  
 95846        that is not positive and smaller than the precision is undefined, as is shifting a negative number  
 95847        to the right. Historically, not all implementations obeyed C-language precedence rules: '~' and  
 95848        '!' were lower than '=='; '==' and '!=' were not lower than '<'; and '|' was not lower  
 95849        than '^'; the liberal use of "()" can force the desired precedence even with these non-  
 95850        compliant implementations. Furthermore, some traditional implementations treated '^' as an  
 95851        exponentiation operator, although most implementations now use "\*\*\*" as an extension for this  
 95852        purpose.

95853        When a macro has been multiply defined via the **pushdef** macro, it is unspecified whether the  
 95854        **define** macro will alter only the most recent definition (as though by **popdef** and **pushdef**), or  
 95855        replace the entire stack of definitions with a single definition (as though by **undefine** and  
 95856        **pushdef**). An application desiring particular behavior for the **define** macro in this case can  
 95857        redefine it accordingly.

95858        Applications should use the **mkstemp** macro instead of the obsolescent **maketemp** macro for  
 95859        creating temporary files.

#### 95860 **EXAMPLES**

95861        If the file **m4src** contains the lines:

```
95862 The value of 'VER' is "VER".
95863 ifdef('VER', ``VER'' is defined to be VER., VER is not defined.)
95864 ifelse(VER, 1, ``VER'' is 'VER'.)
95865 ifelse(VER, 2, ``VER'' is 'VER'., ``VER'' is not 2.)
95866 end
```

95867        then the command

95868        **m4 m4src**

95869        or the command:

95870        **m4 -U VER m4src**

95871        produces the output:

95872       The value of VER is "VER".  
95873       VER is not defined.  
  
95874       VER is not 2.  
95875       end

95876       **The command:**

95877       m4 -D VER m4src

95878       **produces the output:**

95879       The value of VER is "".  
95880       VER is defined to be .  
  
95881       VER is not 2.  
95882       end

95883       **The command:**

95884       m4 -D VER=1 m4src

95885       **produces the output:**

95886       The value of VER is "1".  
95887       VER is defined to be 1.  
95888       VER is 1.  
95889       VER is not 2.  
95890       end

95891       **The command:**

95892       m4 -D VER=2 m4src

95893       **produces the output:**

95894       The value of VER is "2".  
95895       VER is defined to be 2.  
  
95896       VER is 2.  
95897       end

#### 95898 **RATIONALE**

95899       Historic System V-based behavior treated "\${" in a macro definition as two literal characters.  
95900       However, this sequence is left unspecified so that implementations may offer extensions such as  
95901       "\${11}" meaning the eleventh positional parameter. Macros can still be defined with  
95902       appropriate uses of nested quoting to result in a literal "\${" in the output after rescanning  
95903       removes the nested quotes.

95904       In the **translit** built-in, historic System V-based behavior treated '–' as a literal; GNU behavior  
95905       treats it as a range. This version of the standard allows either behavior.

#### 95906 **FUTURE DIRECTIONS**

95907       None.

#### 95908 **SEE ALSO**

95909       c99

95910       XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)

**CHANGE HISTORY**

First released in Issue 2.

**Issue 5**

The phrase “the defined text for macros written by the **dumpdef** macro” is added to the description of **STDERR**, and the description of **dumpdef** is updated to indicate that output is written to standard error. The description of **eval** is updated to indicate that the list of excluded C operators excludes unary **'&'** and **'.'**. In the description of **ifdef**, the phrase “and it is not defined to be zero” is deleted.

**Issue 6**

In the EXTENDED DESCRIPTION, the **eval** text is updated to include a **'&'** character in the excepted list.

The EXTENDED DESCRIPTION of **divert** is updated to clarify that there are only nine diversion buffers.

The normative text is reworded to avoid use of the term “must” for application requirements.

The Open Group Base Resolution bwg2000-006 is applied.

IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/31 is applied, replacing the EXAMPLES section.

**Issue 7**

Austin Group Interpretation 1003.1-2001 #117 is applied, marking the **maketemp** macro obsolescent and adding a new **mkstemp** macro.

Austin Group Interpretation 1003.1-2001 #207 is applied, clarifying the handling of white-space characters that precede or trail any macro arguments.

SD5-XCU-ERN-6 is applied, clarifying that Guideline 9 of the Utility Syntax Guidelines does not apply (options can be interspersed with operands).

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

SD5-XCU-ERN-99 is applied, clarifying the definition of the **divert** macro in the EXTENDED DESCRIPTION.

SD5-XCU-ERN-100 is applied, clarifying the definition of the **syscmd** macro in the EXTENDED DESCRIPTION.

SD5-XCU-ERN-101 is applied, clarifying the definition of the **undivert** macro in the EXTENDED DESCRIPTION.

SD5-XCU-ERN-111 is applied to the EXTENDED DESCRIPTION, clarifying that the string **"\${ "** produces unspecified behavior.

SD5-XCU-ERN-112 is applied, updating the **changequote** macro.

SD5-XCU-ERN-118 is applied, clarifying the definition of the **define** macro in the EXTENDED DESCRIPTION and APPLICATION USAGE sections.

SD5-XCU-ERN-119 is applied, clarifying the definition of the **translit** macro in the EXTENDED DESCRIPTION and RATIONALE sections.

SD5-XCU-ERN-130, SD5-XCU-ERN-131, and SD5-XCU-ERN-137 are applied.

The **m4** utility is moved from the XSI option to the Base.

95951  
95952

POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0117 [241], XCU/TC1-2008/0118 +  
[242,431], XCU/TC1-2008/0119 [242,431], and XCU/TC1-2008/0120 [325,430] are applied.

95953 **NAME**

95954 mailx — process messages

95955 **SYNOPSIS**95956 **Send Mode**95957 mailx [-s *subject*] *address...*95958 **Receive Mode**

```
95959 UP mailx -e
95960 mailx [-HiNn] [-F] [-u user]
95961 mailx -f [-HiNn] [-F] [file]
```

95962 **DESCRIPTION**

95963 The *mailx* utility provides a message sending and receiving facility. It has two major modes,  
 95964 selected by the options used: Send Mode and Receive Mode.

95965 On systems that do not support the User Portability Utilities option, an application using *mailx*  
 95966 shall have the ability to send messages in an unspecified manner (Send Mode). Unless the first  
 95967 character of one or more lines is <tilde> (' ~ '), all characters in the input message shall appear in  
 95968 the delivered message, but additional characters may be inserted in the message before it is  
 95969 retrieved.

95970 UP On systems supporting the User Portability Utilities option, mail-receiving capabilities and other  
 95971 interactive features, Receive Mode, described below, also shall be enabled.

95972 **Send Mode**

95973 Send Mode can be used by applications or users to send messages from the text in standard  
 95974 input.

95975 UP **Receive Mode**

95976 Receive Mode is more oriented towards interactive users. Mail can be read and sent in this  
 95977 interactive mode.

95978 When reading mail, *mailx* provides commands to facilitate saving, deleting, and responding to  
 95979 messages. When sending mail, *mailx* allows editing, reviewing, and other modification of the  
 95980 message as it is entered.

95981 Incoming mail shall be stored in one or more unspecified locations for each user, collectively  
 95982 called the system *mailbox* for that user. When *mailx* is invoked in Receive Mode, the system  
 95983 mailbox shall be the default place to find new mail. As messages are read, they shall be marked  
 95984 to be moved to a secondary file for storage, unless specific action is taken. This secondary file is  
 95985 called the **mbox** and is normally located in the directory referred to by the *HOME* environment  
 95986 variable (see *MBOX* in the ENVIRONMENT VARIABLES section for a description of this file).  
 95987 Messages shall remain in this file until explicitly removed. When the **-f** option is used to read  
 95988 mail messages from secondary files, messages shall be retained in those files unless specifically  
 95989 removed. All three of these locations—system mailbox, **mbox**, and secondary file—are referred  
 95990 to in this section as simply “mailboxes”, unless more specific identification is required.

## OPTIONS

The *mailx* utility shall conform to XBD [Section 12.2](#) (on page 215).

The following options shall be supported. (Only the `-s subject` option shall be required on all systems. The other options are required only on systems supporting the User Portability Utilities option.)

**-e** Test for the presence of mail in the system mailbox. The *mailx* utility shall write nothing and exit with a successful return code if there is mail to read.

**-f** Read messages from the file named by the *file* operand instead of the system mailbox. (See also **folder**.) If no *file* operand is specified, read messages from **mbox** instead of the system mailbox.

**-F** Record the message in a file named after the first recipient. The name is the login-name portion of the address found first on the **To:** line in the mail header. Overrides the **record** variable, if set (see [Internal Variables in mailx](#), on page 2915).

**-H** Write a header summary only.

**-i** Ignore interrupts. (See also **ignore**.)

**-n** Do not initialize from the system default start-up file. See the EXTENDED DESCRIPTION section.

**-N** Do not write an initial header summary.

**-s subject** Set the **Subject** header field to *subject*. All characters in the *subject* string shall appear in the delivered message. The results are unspecified if *subject* is longer than {LINE\_MAX} – 10 bytes or contains a <newline>.

**-u user** Read the system mailbox of the login name *user*. This shall only be successful if the invoking user has appropriate privileges to read the system mailbox of that user.

## OPERANDS

The following operands shall be supported:

*address* Addressee of message. When **-n** is specified and no user start-up files are accessed (see the EXTENDED DESCRIPTION section), the user or application shall ensure this is an address to pass to the mail delivery system. Any system or user start-up files may enable aliases (see **alias** under [Commands in mailx](#), on page 2918) that may modify the form of *address* before it is passed to the mail delivery system.

*file* A pathname of a file to be read instead of the system mailbox when **-f** is specified. The meaning of the *file* option-argument shall be affected by the contents of the **folder** internal variable; see [Internal Variables in mailx](#) (on page 2915).

## STDIN

When *mailx* is invoked in Send Mode (the first synopsis line), standard input shall be the message to be delivered to the specified addresses. When in Receive Mode, user commands shall be accepted from *stdin*. If the User Portability Utilities option is not supported, standard input lines beginning with a <tilde> ('~') character produce unspecified results.

If the User Portability Utilities option is supported, then in both Send and Receive Modes, standard input lines beginning with the escape character (usually <tilde> ('~')) shall affect processing as described in [Command Escapes in mailx](#) (on page 2927).

## INPUT FILES

When *mailx* is used as described by this volume of POSIX.1-2008, the *file* option-argument (see the **-f** option) and the **mbox** shall be text files containing mail messages, formatted as described in the OUTPUT FILES section. The nature of the system mailbox is unspecified; it need not be a file.

## ENVIRONMENT VARIABLES

UP Some of the functionality described in this section shall be provided on implementations that support the User Portability Utilities option as described in the text, and is not further shaded for this option.

The following environment variables shall affect the execution of *mailx*:

**DEAD** Determine the pathname of the file in which to save partial messages in case of interrupts or delivery errors. The default shall be **dead.letter** in the directory named by the *HOME* variable. The behavior of *mailx* in saving partial messages is unspecified if the User Portability Utilities option is not supported and *DEAD* is not defined with the value **/dev/null**.

XSI **EDITOR** Determine the name of a utility to invoke when the **edit** (see [Commands in mailx](#), on page 2918) or **~e** (see [Command Escapes in mailx](#), on page 2927) command is used. The default editor is unspecified. On XSI-conformant systems it is *ed*. The effects of this variable are unspecified if the User Portability Utilities option is not supported.

**HOME** Determine the pathname of the user's home directory.

**LANG** Provide a default value for the internationalization variables that are unset or null. (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization variables used to determine the values of locale categories.)

**LC\_ALL** If set to a non-empty string value, override the values of all the other internationalization variables.

**LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as characters (for example, single-byte as opposed to multi-byte characters in arguments and input files) and the handling of case-insensitive address and header-field comparisons.

**LC\_TIME** This variable may determine the format and contents of the date and time strings written by *mailx*. This volume of POSIX.1-2008 specifies the effects of this variable only for systems supporting the User Portability Utilities option.

**LC\_MESSAGES**

Determine the locale that should be used to affect the format and contents of diagnostic messages written to standard error and informative messages written to standard output.

**LISTER** Determine a string representing the command for writing the contents of the **folder** directory to standard output when the **folders** command is given (see **folders** in [Commands in mailx](#), on page 2918). Any string acceptable as a *command\_string* operand to the *sh -c* command shall be valid. If this variable is null or not set, the output command shall be *ls*. The effects of this variable are unspecified if the User Portability Utilities option is not supported.

**MAILRC** Determine the pathname of the start-up file. The default shall be **.mailrc** in the directory referred to by the *HOME* environment variable. The behavior of *mailx* is unspecified if the User Portability Utilities option is not supported and *MAILRC* is

|       |                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| 96086 | <i>PAGER</i>               | Determine a string representing an output filtering or pagination command for writing the output to the terminal. Any string acceptable as a <i>command_string</i> operand to the <i>sh -c</i> command shall be valid. When standard output is a terminal device, the message output shall be piped through the command if the <i>mailx</i> internal variable <b>cr</b> t is set to a value less the number of lines in the message; see <a href="#">Internal Variables in mailx</a> (on page 2915). If the <i>PAGER</i> variable is null or not set, the paginator shall be either <i>more</i> or another paginator utility documented in the system documentation. The effects of this variable are unspecified if the User Portability Utilities option is not supported. |

| 96116 | UP                         | 1. If in command mode, the current command, if there is one, shall be aborted, and a command-mode prompt shall be written.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 96117 |                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 96118 |                            | 2. If in input mode:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 96119 | UP                         | a. If <b>ignore</b> is set, <i>mailx</i> shall write "@\n", discard the current input line, and continue processing, bypassing the message-abort mechanism described in item 2b.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 96120 |                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 96121 |                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

96122 UP           b. If the interrupt was received while sending mail, either when in **Receive Mode** or  
 96123           **in Send Mode**, a message shall be written, and another subsequent interrupt, with  
 96124           no other intervening characters typed, shall be required to abort the mail message.  
 96125 UP           **If in Receive Mode and another interrupt is received, a command-mode prompt**  
 96126           **shall be written.** If in Send Mode and another interrupt is received, *mailx* shall  
 96127           terminate with a non-zero status.

96128           In both cases listed in item b, if the message is not empty:

96129 UP           i. If **save** is enabled and the file named by *DEAD* can be created, the message  
 96130           shall be written to the file named by *DEAD*. If the file exists, the message  
 96131           shall be written to replace the contents of the file.  
 96132 UP           ii. If **save** is not enabled, or the file named by *DEAD* cannot be created, the  
 96133           message shall not be saved.

96134           The *mailx* utility shall take the standard action for all other signals.

## 96135 **STDOUT**

96136           In command and input modes, all output, including prompts and messages, shall be written to  
 96137           standard output.

## 96138 **STDERR**

96139           The standard error shall be used only for diagnostic messages.

## 96140 **OUTPUT FILES**

96141           Various *mailx* commands and command escapes can create or add to files, including the **mbox**,  
 96142           the dead-letter file, and secondary mailboxes. When *mailx* is used as described in this volume of  
 96143           POSIX.1-2008, these files shall be text files, formatted as follows:

96144           line beginning with **From<space>**  
 96145           [one or more *header-lines*; see [Commands in mailx](#) (on page 2918)]  
 96146           empty line  
 96147           [zero or more *body lines*  
 96148           empty line]  
 96149           [line beginning with **From<space>...**]

96150           where each message begins with the **From <space>** line shown, preceded by the beginning of  
 96151           the file or an empty line. (The **From <space>** line is considered to be part of the message header,  
 96152           but not one of the header-lines referred to in [Commands in mailx](#) (on page 2918); thus, it shall  
 96153           not be affected by the **discard**, **ignore**, or **retain** commands.) The formats of the remainder of the  
 96154           **From <space>** line and any additional header lines are unspecified, except that none shall be  
 96155           empty. The format of a message body line is also unspecified, except that no line following an  
 96156           empty line shall start with **From <space>**; *mailx* shall modify any such user-entered message  
 96157           body lines (following an empty line and beginning with **From <space>**) by adding one or more  
 96158           characters to precede the 'F'; it may add these characters to **From <space>** lines that are not  
 96159           preceded by an empty line.

96160           When a message from the system mailbox or entered by the user is not a text file, it is  
 96161           implementation-defined how such a message is stored in files written by *mailx*.

## 96162 **EXTENDED DESCRIPTION**

96163 UP           The functionality in the entire EXTENDED DESCRIPTION section shall be provided on  
 96164           implementations supporting the User Portability Utilities option. The functionality described in  
 96165           this section shall be provided on implementations that support the User Portability Utilities  
 96166           option (and the rest of this section is not further shaded for this option).

The *mailx* utility need not support for all character encodings in all circumstances. For example, inter-system mail may be restricted to 7-bit data by the underlying network, 8-bit data need not be portable to non-internationalized systems, and so on. Under these circumstances, it is recommended that only characters defined in the ISO/IEC 646:1991 standard International Reference Version (equivalent to ASCII) 7-bit range of characters be used.

When *mailx* is invoked using one of the Receive Mode synopsis forms, it shall write a page of header-summary lines (if `-N` was not specified and there are messages, see below), followed by a prompt indicating that *mailx* can accept regular commands (see [Commands in mailx](#), on page 2918); this is termed *command mode*. The page of header-summary lines shall contain the first new message if there are new messages, or the first unread message if there are unread messages, or the first message. When *mailx* is invoked using the Send Mode synopsis and standard input is a terminal, if no subject is specified on the command line and the **asksub** variable is set, a prompt for the subject shall be written. At this point, *mailx* shall be in input mode. This input mode shall also be entered when using one of the Receive Mode synopsis forms and a reply or new message is composed using the **reply**, **Reply**, **followup**, **Followup**, or **mail** commands and standard input is a terminal. When the message is typed and the end of the message is encountered, the message shall be passed to the mail delivery software. Commands can be entered by beginning a line with the escape character (by default, <tilde> (' ~ ')) followed by a single command letter and optional arguments. See [Commands in mailx](#) (on page 2918) for a summary of these commands. It is unspecified what effect these commands will have if standard input is not a terminal when a message is entered using either the Send Mode synopsis, or the Read Mode commands **reply**, **Reply**, **followup**, **Followup**, or **mail**.

**Note:** For notational convenience, this section uses the default escape character, <tilde>, in all references and examples.

At any time, the behavior of *mailx* shall be governed by a set of environmental and internal variables. These are flags and valued parameters that can be set and cleared via the *mailx* **set** and **unset** commands.

Regular commands are of the form:

```
[command] [msglist] [argument ...]
```

If no *command* is specified in command mode, **next** shall be assumed. In input mode, commands shall be recognized by the escape character, and lines not treated as commands shall be taken as input for the message.

In command mode, each message shall be assigned a sequential number, starting with 1.

All messages have a state that shall affect how they are displayed in the header summary and how they are retained or deleted upon termination of *mailx*. There is at any time the notion of a *current* message, which shall be marked by a '>' at the beginning of a line in the header summary. When *mailx* is invoked using one of the Receive Mode synopsis forms, the current message shall be the first new message, if there is a new message, or the first unread message if there is an unread message, or the first message if there are any messages, or unspecified if there are no messages in the mailbox. Each command that takes an optional list of messages (*msglist*) or an optional single message (*message*) on which to operate shall leave the current message set to the highest-numbered message of the messages specified, unless the command deletes messages, in which case the current message shall be set to the first undeleted message (that is, a message not in the deleted state) after the highest-numbered message deleted by the command, if one exists, or the first undeleted message before the highest-numbered message deleted by the command, if one exists, or to an unspecified value if there are no remaining undeleted messages. All messages shall be in one of the following states:

|       |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 96214 | <i>new</i>       | The message is present in the system mailbox and has not been viewed by the user or moved to any other state. Messages in state <i>new</i> when <i>mailx</i> quits shall be retained in the system mailbox.                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| 96228 | <i>deleted</i>   | The message has been processed by one of the following commands: <b>delete, dp, dt</b> . Messages in state <i>deleted</i> when <i>mailx</i> quits shall be deleted. Deleted messages shall be ignored until <i>mailx</i> quits or changes mailboxes or they are specified to the undelete command; for example, the message specification <i>/string</i> shall only search the subject lines of messages that have not yet been deleted, unless the command operating on the list of messages is <b>undelete</b> . No deleted message or deleted message header shall be displayed by any <i>mailx</i> command other than <b>undelete</b> .                                |

| 96255 | <i>*</i>         | All messages.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

- 96256        *n-m*        An inclusive range of message numbers.
- 96257        *address*    All messages from *address*; any address as shown in a header summary shall be  
96258                   matchable in this form.
- 96259        */string*    All messages with *string* in the subject line (case ignored).
- 96260        *: c*        All messages of type *c*, where *c* shall be one of:
- 96261                *d*       Deleted messages.
- 96262                *n*       New messages.
- 96263                *o*       Old messages (any not in state *read* or *new*).
- 96264                *r*       Read messages.
- 96265                *u*       Unread messages.

96266        Other commands take an optional message (*message*) on which to operate, which defaults to the  
96267                   current message. All of the forms allowed for *msglist* are also allowed for *message*, but if more  
96268                   than one message is specified, only the first shall be operated on.

96269        Other arguments are usually arbitrary strings whose usage depends on the command involved.

## 96270        **Start-Up in mailx**

96271        At start-up time, *mailx* shall take the following steps in sequence:

- 96272                1. Establish all variables at their stated default values.
- 96273                2. Process command line options, overriding corresponding default values.
- 96274                3. Import any of the *DEAD*, *EDITOR*, *MBOX*, *LISTER*, *PAGER*, *SHELL*, or *VISUAL* variables  
96275                   that are present in the environment, overriding the corresponding default values.
- 96276                4. Read *mailx* commands from an unspecified system start-up file, unless the *-n* option is  
96277                   given, to initialize any internal *mailx* variables and aliases.
- 96278                5. Process the start-up file of *mailx* commands named in the user *MAILRC* variable.

96279        Most regular *mailx* commands are valid inside start-up files, the most common use being to set  
96280                   up initial display options and alias lists. The following commands shall be invalid in the start-up  
96281                   file: **!**, **edit**, **hold**, **mail**, **preserve**, **reply**, **Reply**, **shell**, **visual**, **Copy**, **followup**, and **Followup**.  
96282                   Any errors in the start-up file shall either cause *mailx* to terminate with a diagnostic message and  
96283                   a non-zero status or to continue after writing a diagnostic message, ignoring the remainder of  
96284                   the lines in the start-up file.

96285        A blank line in a start-up file shall be ignored.

## 96286        **Internal Variables in mailx**

96287        The following variables are internal *mailx* variables. Each internal variable can be set via the  
96288                   *mailx set* command at any time. The **unset** and **set no name** commands can be used to erase  
96289                   variables.

96290        In the following list, variables shown as:

96291        *variable*

96292        represent Boolean values. Variables shown as:

96293        *variable=value*

|       |                         |                                                                                                               |
|-------|-------------------------|---------------------------------------------------------------------------------------------------------------|
| 96294 |                         | shall be assigned string or numeric values. For string values, the rules in <a href="#">Commands in mailx</a> |
| 96295 |                         | (on page 2918) concerning filenames and quoting shall also apply.                                             |
| 96296 |                         | The defaults specified here may be changed by the unspecified system start-up file unless the                 |
| 96297 |                         | user specifies the <b>-n</b> option.                                                                          |
| 96298 | <b>allnet</b>           | All network names whose login name components match shall be treated as                                       |
| 96299 |                         | identical. This shall cause the <i>msglist</i> message specifications to behave similarly.                    |
| 96300 |                         | The default shall be <b>noallnet</b> . See also the <b>alternates</b> command and the <b>metoo</b>            |
| 96301 |                         | variable.                                                                                                     |
| 96302 | <b>append</b>           | Append messages to the end of the <b>mbox</b> file upon termination instead of placing                        |
| 96303 |                         | them at the beginning. The default shall be <b>noappend</b> . This variable shall not                         |
| 96304 |                         | affect the <b>save</b> command when saving to <b>mbox</b> .                                                   |
| 96305 | <b>ask, asksub</b>      | Prompt for a subject line on outgoing mail if one is not specified on the command                             |
| 96306 |                         | line with the <b>-s</b> option. The <b>ask</b> and <b>asksub</b> forms are synonyms; the system shall         |
| 96307 |                         | refer to <b>asksub</b> and <b>noasksub</b> in its messages, but shall accept <b>ask</b> and <b>noask</b> as   |
| 96308 |                         | user input to mean <b>asksub</b> and <b>noasksub</b> . It shall not be possible to set both <b>ask</b>        |
| 96309 |                         | and <b>noasksub</b> , or <b>noask</b> and <b>asksub</b> . The default shall be <b>asksub</b> , but no         |
| 96310 |                         | prompting shall be done if standard input is not a terminal.                                                  |
| 96311 | <b>askbcc</b>           | Prompt for the blind copy list. The default shall be <b>noaskbcc</b> .                                        |
| 96312 | <b>askcc</b>            | Prompt for the copy list. The default shall be <b>noaskcc</b> .                                               |
| 96313 | <b>autoprint</b>        | Enable automatic writing of messages after <b>delete</b> and <b>undelete</b> commands. The                    |
| 96314 |                         | default shall be <b>noautoprint</b> .                                                                         |
| 96315 | <b>bang</b>             | Enable the special-case treatment of <exclamation-mark> characters ('!') in                                   |
| 96316 |                         | escape command lines; see the <b>escape</b> command and <a href="#">Command Escapes in mailx</a>              |
| 96317 |                         | (on page 2927). The default shall be <b>nobang</b> , disabling the expansion of '!' in the                    |
| 96318 |                         | <i>command</i> argument to the <b>~!</b> command and the <b>~!command</b> escape.                             |
| 96319 | <b>cmd=command</b>      |                                                                                                               |
| 96320 |                         | Set the default command to be invoked by the <b>pipe</b> command. The default shall be                        |
| 96321 |                         | <b>nocmd</b> .                                                                                                |
| 96322 | <b>crt=number</b>       | Pipe messages having more than <i>number</i> lines through the command specified by                           |
| 96323 |                         | the value of the <i>PAGER</i> variable. The default shall be <b>nocrt</b> . If it is set to null, the         |
| 96324 |                         | value used is implementation-defined.                                                                         |
| 96325 | XSI <b>debug</b>        | Enable verbose diagnostics for debugging. Messages are not delivered. The                                     |
| 96326 |                         | default shall be <b>nodebug</b> .                                                                             |
| 96327 | <b>dot</b>              | When <b>dot</b> is set, a <period> on a line by itself during message input from a                            |
| 96328 |                         | terminal shall also signify end-of-file (in addition to normal end-of-file). The                              |
| 96329 |                         | default shall be <b>nodot</b> . If <b>ignoreeof</b> is set (see below), a setting of <b>nodot</b> shall be    |
| 96330 |                         | ignored and the <period> is the only method to terminate input mode.                                          |
| 96331 | <b>escape=c</b>         | Set the command escape character to be the character 'c'. By default, the                                     |
| 96332 |                         | command escape character shall be <tilde>. If <b>escape</b> is unset, <tilde> shall be                        |
| 96333 |                         | used; if it is set to null, command escaping shall be disabled.                                               |
| 96334 | <b>flipr</b>            | Reverse the meanings of the <b>R</b> and <b>r</b> commands. The default shall be <b>noflipr</b> .             |
| 96335 | <b>folder=directory</b> |                                                                                                               |
| 96336 |                         | The default directory for saving mail files. User-specified filenames beginning with                          |
| 96337 |                         | a <plus-sign> ('+') shall be expanded by preceding the filename with this                                     |

|       |                            |                                                                                                          |
|-------|----------------------------|----------------------------------------------------------------------------------------------------------|
| 96338 |                            | directory name to obtain the real pathname. If <i>directory</i> does not start with a                    |
| 96339 |                            | <slash> (' / '), the contents of <i>HOME</i> shall be prefixed to it. The default shall be               |
| 96340 |                            | <b>nofolder</b> . If <b>folder</b> is unset or set to null, user-specified filenames beginning with      |
| 96341 |                            | '+' shall refer to files in the current directory that begin with the literal '+'                        |
| 96342 |                            | character. See also <b>outfolder</b> below. The <b>folder</b> value need not affect the processing       |
| 96343 |                            | of the files named in <i>MBOX</i> and <i>DEAD</i> .                                                      |
| 96344 | <b>header</b>              | Enable writing of the header summary when entering <i>mailx</i> in Receive Mode. The                     |
| 96345 |                            | default shall be <b>header</b> .                                                                         |
| 96346 | <b>hold</b>                | Preserve all messages that are read in the system mailbox instead of putting them                        |
| 96347 |                            | in the <b>mbox</b> save file. The default shall be <b>nohold</b> .                                       |
| 96348 | <b>ignore</b>              | Ignore interrupts while entering messages. The default shall be <b>noignore</b> .                        |
| 96349 | <b>ignoreeof</b>           | Ignore normal end-of-file during message input. Input can be terminated only by                          |
| 96350 |                            | entering a <period> (' . ') on a line by itself or by the ~. command escape. The                         |
| 96351 |                            | default shall be <b>noignoreeof</b> . See also <b>dot</b> above.                                         |
| 96352 | <b>indentprefix=string</b> |                                                                                                          |
| 96353 |                            | A string that shall be added as a prefix to each line that is inserted into the message                  |
| 96354 |                            | by the ~m command escape. This variable shall default to one <tab>.                                      |
| 96355 | <b>keep</b>                | When a system mailbox, secondary mailbox, or <b>mbox</b> is empty, truncate it to zero                   |
| 96356 |                            | length instead of removing it. The default shall be <b>nokeep</b> .                                      |
| 96357 | <b>keepsave</b>            | Keep the messages that have been saved from the system mailbox into other files                          |
| 96358 |                            | in the file designated by the variable <i>MBOX</i> , instead of deleting them. The default               |
| 96359 |                            | shall be <b>nokeepsave</b> .                                                                             |
| 96360 | <b>metoo</b>               | Suppress the deletion of the login name of the user from the recipient list when                         |
| 96361 |                            | replying to a message or sending to a group. The default shall be <b>nometoo</b> .                       |
| 96362 | XSI <b>onehop</b>          | When responding to a message that was originally sent to several recipients, the                         |
| 96363 |                            | other recipient addresses are normally forced to be relative to the originating                          |
| 96364 |                            | author's machine for the response. This flag disables alteration of the recipients'                      |
| 96365 |                            | addresses, improving efficiency in a network where all machines can send directly                        |
| 96366 |                            | to all other machines (that is, one hop away). The default shall be <b>noonehop</b> .                    |
| 96367 | <b>outfolder</b>           | Cause the files used to record outgoing messages to be located in the directory                          |
| 96368 |                            | specified by the <b>folder</b> variable unless the pathname is absolute. The default shall               |
| 96369 |                            | be <b>nooutfolder</b> . See the <b>record</b> variable.                                                  |
| 96370 | <b>page</b>                | Insert a <form-feed> after each message sent through the pipe created by the <b>pipe</b>                 |
| 96371 |                            | command. The default shall be <b>nopage</b> .                                                            |
| 96372 | <b>prompt=string</b>       |                                                                                                          |
| 96373 |                            | Set the command-mode prompt to <i>string</i> . If <i>string</i> is null or if <b>noprompt</b> is set, no |
| 96374 |                            | prompting shall occur. The default shall be to prompt with the string "? ".                              |
| 96375 | <b>quiet</b>               | Refrain from writing the opening message and version when entering <i>mailx</i> . The                    |
| 96376 |                            | default shall be <b>noquiet</b> .                                                                        |
| 96377 | <b>record=file</b>         | Record all outgoing mail in the file with the pathname <i>file</i> . The default shall be                |
| 96378 |                            | <b>norecord</b> . See also <b>outfolder</b> above.                                                       |
| 96379 | <b>save</b>                | Enable saving of messages in the dead-letter file on interrupt or delivery error. See                    |
| 96380 |                            | the variable <i>DEAD</i> for the location of the dead-letter file. The default shall be <b>save</b> .    |

96381 **screen=number**  
 96382 Set the number of lines in a screenful of headers for the **headers** and **z** commands.  
 96383 If **screen** is not specified, a value based on the terminal type identified by the  
 96384 *TERM* environment variable, the window size, the baud rate, or some combination  
 96385 of these shall be used.

96386 **sendwait** Wait for the background mailer to finish before returning. The default shall be  
 96387 **nosendwait**.

96388 **showto** When the sender of the message was the user who is invoking *mailx*, write the  
 96389 information from the **To:** line instead of the **From:** line in the header summary. The  
 96390 default shall be **noshowto**.

96391 **sign=string** Set the variable inserted into the text of a message when the **~a** command escape is  
 96392 given. The default shall be **nosign**. The character sequences **'\t'** and **'\n'** shall  
 96393 be recognized in the variable as <tab> and <newline> characters, respectively. (See  
 96394 also **~i** in [Command Escapes in mailx](#) (on page 2927).)

96395 **Sign=string** Set the variable inserted into the text of a message when the **~A** command escape is  
 96396 given. The default shall be **noSign**. The character sequences **'\t'** and **'\n'** shall  
 96397 be recognized in the variable as <tab> and <newline> characters, respectively.

96398 **toplines=number**  
 96399 Set the number of lines of the message to write with the **top** command. The default  
 96400 shall be 5.

## 96401 Commands in mailx

96402 The following *mailx* commands shall be provided. In the following list, header refers to lines  
 96403 from the message header, as shown in the OUTPUT FILES section. Header-line refers to lines  
 96404 within the header that begin with one or more non-white-space characters, immediately  
 96405 followed by a <colon> and white space and continuing until the next line beginning with a non-  
 96406 white-space character or an empty line. Header-field refers to the portion of a header line prior  
 96407 to the first <colon> in that line.

96408 For each of the commands listed below, the command can be entered as the abbreviation (those  
 96409 characters in the Synopsis command word preceding the **' ['**), the full command (all characters  
 96410 shown for the command word, omitting the **' ['** and **' ]'**), or any truncation of the full  
 96411 command down to the abbreviation. For example, the **exit** command (shown as **ex[it]** in the  
 96412 Synopsis) can be entered as **ex**, **exi**, or **exit**.

96413 The arguments to commands can be quoted, using the following methods:

- 96414 • An argument can be enclosed between paired double-quotes (**" "**) or single-quotes (**' '**);  
 96415 any white space, shell word expansion, or <backslash> characters within the quotes shall  
 96416 be treated literally as part of the argument. A double-quote shall be treated literally within  
 96417 single-quotes and *vice versa*. These special properties of the <quotation-mark> characters  
 96418 shall occur only when they are paired at the beginning and end of the argument.
- 96419 • A <backslash> outside of the enclosing quotes shall be discarded and the following  
 96420 character treated literally as part of the argument.
- 96421 • An unquoted <backslash> at the end of a command line shall be discarded and the next  
 96422 line shall continue the command.

96423 Filenames, where expected, shall be subjected to the following transformations, in sequence:

- 96424 • If the filename begins with an unquoted <plus-sign>, and the **folder** variable is defined  
96425 (see the **folder** variable), the <plus-sign> shall be replaced by the value of the **folder**  
96426 variable followed by a <slash>. If the **folder** variable is unset or is set to null, the filename  
96427 shall be unchanged.
- 96428 • Shell word expansions shall be applied to the filename (see [Section 2.6](#), on page 2327). If  
96429 more than a single pathname results from this expansion and the command is expecting  
96430 one file, the effects are unspecified.

## 96431 Declare Aliases

96432 *Synopsis:*     a[lias] [alias [address...]]  
96433               g[roup] [alias [address...]]

96434 Add the given addresses to the alias specified by *alias*. The names shall be substituted when  
96435 *alias* is used as a recipient address specified by the user in an outgoing message (that is, other  
96436 recipients addressed indirectly through the **reply** command shall not be substituted in this  
96437 manner). Mail address alias substitution shall apply only when the alias string is used as a full  
96438 address; for example, when **hlj** is an alias, *hlj@posix.com* does not trigger the alias substitution. If  
96439 no arguments are given, write a listing of the current aliases to standard output. If only an *alias*  
96440 argument is given, write a listing of the specified alias to standard output. These listings need  
96441 not reflect the same order of addresses that were entered.

## 96442 Declare Alternatives

96443 *Synopsis:*     alt[ernates] name...

96444 (See also the **metoo** variable.) Declare a list of alternative names for the user's login. When  
96445 responding to a message, these names shall be removed from the list of recipients for the  
96446 response. The comparison of names shall be in a case-insensitive manner. With no arguments,  
96447 **alternates** shall write the current list of alternative names.

## 96448 Change Current Directory

96449 *Synopsis:*     cd [directory]  
96450               ch[dir] [directory]

96451 Change directory. If *directory* is not specified, the contents of *HOME* shall be used.

## 96452 Copy Messages

96453 *Synopsis:*     c[opy] [file]  
96454               c[opy] [msglist] file  
96455               C[opy] [msglist]

96456 Copy messages to the file named by the pathname *file* without marking the messages as saved.  
96457 Otherwise, it shall be equivalent to the **save** command.

96458 In the capitalized form, save the specified messages in a file whose name is derived from the  
96459 author of the message to be saved, without marking the messages as saved. Otherwise, it shall  
96460 be equivalent to the **Save** command.

## Delete Messages

*Synopsis:*     d[delete] [msglist]

Mark messages for deletion from the mailbox. The deletions shall not occur until *mailx* quits (see the **quit** command) or changes mailboxes (see the **folder** command). If **autoprint** is set and there are messages remaining after the **delete** command, the current message shall be written as described for the **print** command (see the **print** command); otherwise, the *mailx* prompt shall be written.

## Discard Header Fields

*Synopsis:*     di[scard] [header-field...]  
              ig[nore] [header-field...]

Suppress the specified header fields when writing messages. Specified *header-fields* shall be added to the list of suppressed header fields. Examples of header fields to ignore are **status** and **cc**. The fields shall be included when the message is saved. The **Print** and **Type** commands shall override this command. The comparison of header fields shall be in a case-insensitive manner. If no arguments are specified, write a list of the currently suppressed header fields to standard output; the listing need not reflect the same order of header fields that were entered.

If both **retain** and **discard** commands are given, **discard** commands shall be ignored.

## Delete Messages and Display

*Synopsis:*     dp [msglist]  
              dt [msglist]

Delete the specified messages as described for the **delete** command, except that the **autoprint** variable shall have no effect, and the current message shall be written only if it was set to a message after the last message deleted by the command. Otherwise, an informational message to the effect that there are no further messages in the mailbox shall be written, followed by the *mailx* prompt.

## Echo a String

*Synopsis:*     ec[ho] string ...

Echo the given strings, equivalent to the shell *echo* utility.

## Edit Messages

*Synopsis:*     e[dit] [msglist]

Edit the given messages. The messages shall be placed in a temporary file and the utility named by the *EDITOR* variable is invoked to edit each file in sequence. The default *EDITOR* is unspecified.

The **edit** command does not modify the contents of those messages in the mailbox.

**Exit**

*Synopsis:*     ex[it]  
                  x[it]

Exit from *mailx* without changing the mailbox. No messages shall be saved in the **mbox** (see also **quit**).

**Change Folder**

*Synopsis:*     fi[le] [*file*]  
                 fold[er] [*file*]

Quit (see the **quit** command) from the current file of messages and read in the file named by the pathname *file*. If no argument is given, the name and status of the current mailbox shall be written.

Several unquoted special characters shall be recognized when used as *file* names, with the following substitutions:

- %           The system mailbox for the invoking user.
  - %*user*     The system mailbox for *user*.
  - #           The previous file.
  - &           The current **mbox**.
  - +*file*     The named file in the **folder** directory. (See the **folder** variable.)
- The default file shall be the current mailbox.

**Display List of Folders**

*Synopsis:*     folders

Write the names of the files in the directory set by the **folder** variable. The command specified by the *LISTER* environment variable shall be used (see the ENVIRONMENT VARIABLES section).

**Follow Up Specified Messages**

*Synopsis:*     fo[llowup] [*message*]  
                 F[ollowup] [*msglist*]

In the lowercase form, respond to a message, recording the response in a file whose name is derived from the author of the message. See also the **save** and **copy** commands and **outfolder**.

In the capitalized form, respond to the first message in the *msglist*, sending the message to the author of each message in the *msglist*. The subject line shall be taken from the first message and the response shall be recorded in a file whose name is derived from the author of the first message. See also the **Save** and **Copy** commands and **outfolder**.

Both forms shall override the **record** variable, if set.

**Display Header Summary for Specified Messages**

*Synopsis:*     f[rom] [msglist]

Write the header summary for the specified messages.

**Display Header Summary**

*Synopsis:*     h[eaders] [message]

Write the page of headers that includes the message specified. If the *message* argument is not specified, the current message shall not change. However, if the *message* argument is specified, the current message shall become the message that appears at the top of the page of headers that includes the message specified. The **screen** variable sets the number of headers per page. See also the **z** command.

**Help**

*Synopsis:*     hel[p]  
                 ?

Write a summary of commands.

**Hold Messages**

*Synopsis:*     ho[ld] [msglist]  
                 pre[serve] [msglist]

Mark the messages in *msglist* to be retained in the mailbox when *mailx* terminates. This shall override any commands that might previously have marked the messages to be deleted. During the current invocation of *mailx*, only the **delete**, **dp**, or **dt** commands shall remove the *preserve* marking of a message.

**Execute Commands Conditionally**

*Synopsis:*     i[f] s|r  
                 mail-commands  
                 el[se]  
                 mail-commands  
                 en[dif]

Execute commands conditionally, where **if s** executes the following *mail-commands*, up to an **else** or **endif**, if the program is in Send Mode, and **if r** shall cause the *mail-commands* to be executed only in Receive Mode.

**List Available Commands**

*Synopsis:*     l[ist]

Write a list of all commands available. No explanation shall be given.

**Mail a Message**

*Synopsis:*    m[ail] address...

Mail a message to the specified addresses or aliases.

**Direct Messages to mbox**

*Synopsis:*    mb[ox] [msglist]

Arrange for the given messages to end up in the **mbox** save file when *mailx* terminates normally. See **MBOX**. See also the **exit** and **quit** commands.

**Process Next Specified Message**

*Synopsis:*    n[ext] [message]

If the current message has not been written (for example, by the **print** command) since *mailx* started or since any other message was the current message, behave as if the **print** command was entered. Otherwise, if there is an undeleted message after the current message, make it the current message and behave as if the **print** command was entered. Otherwise, an informational message to the effect that there are no further messages in the mailbox shall be written, followed by the *mailx* prompt. Should the current message location be the result of an immediately preceding **hold**, **mbox**, **preserve**, or **touch** command, **next** will act as if the current message has already been written.

**Pipe Message**

*Synopsis:*    pi[pe] [[msglist] command]  
              | [[msglist] command]

Pipe the messages through the given *command* by invoking the command interpreter specified by *SHELL* with two arguments: **-c** and *command*. (See also *sh -c*.) The application shall ensure that the command is given as a single argument. Quoting, described previously, can be used to accomplish this. If no arguments are given, the current message shall be piped through the command specified by the value of the **cmd** variable. If the **page** variable is set, a <form-feed> shall be inserted after each message.

**Display Message with Headers**

*Synopsis:*    P[rint] [msglist]  
              T[ype] [msglist]

Write the specified messages, including all header lines, to standard output. Override suppression of lines by the **discard**, **ignore**, and **retain** commands. If **crt** is set, the messages longer than the number of lines specified by the **crt** variable shall be paged through the command specified by the *PAGER* environment variable.

**Display Message**

*Synopsis:*    p[rint] [msglist]  
              t[ype] [msglist]

Write the specified messages to standard output. If **crt** is set, the messages longer than the number of lines specified by the **crt** variable shall be paged through the command specified by the *PAGER* environment variable.

**Quit**

*Synopsis:*     q[uit]  
                  end-of-file

Terminate *mailx*, storing messages that were read in **mbox** (if the current mailbox is the system mailbox and unless **hold** is set), deleting messages that have been explicitly saved (unless **keepsave** is set), discarding messages that have been deleted, and saving all remaining messages in the mailbox.

**Reply to a Message List**

*Synopsis:*     R[eply] [msglist]  
                  R[espond] [msglist]

Mail a reply message to the sender of each message in the *msglist*. The subject line shall be formed by concatenating **Re:**<space> (unless it already begins with that string) and the subject from the first message. If **record** is set to a filename, the response shall be saved at the end of that file.

See also the **flipr** variable.

**Reply to a Message**

*Synopsis:*     r[eply] [message]  
                  r[espond] [message]

Mail a reply message to all recipients included in the header of the message. The subject line shall be formed by concatenating **Re:**<space> (unless it already begins with that string) and the subject from the message. If **record** is set to a filename, the response shall be saved at the end of that file.

See also the **flipr** variable.

**Retain Header Fields**

*Synopsis:*     ret[ain] [header-field...]

Retain the specified header fields when writing messages. This command shall override all **discard** and **ignore** commands. The comparison of header fields shall be in a case-insensitive manner. If no arguments are specified, write a list of the currently retained header fields to standard output; the listing need not reflect the same order of header fields that were entered.

**Save Messages**

*Synopsis:*     s[ave] [file]  
                  s[ave] [msglist] file  
                  S[ave] [msglist]

Save the specified messages in the file named by the pathname *file*, or the **mbox** if the *file* argument is omitted. The file shall be created if it does not exist; otherwise, the messages shall be appended to the file. The message shall be put in the state *saved*, and shall behave as specified in the description of the *saved* state when the current mailbox is exited by the **quit** or **file** command.

In the capitalized form, save the specified messages in a file whose name is derived from the author of the first message. The name of the file shall be taken to be the author's name with all network addressing stripped off. See also the **Copy**, **followup**, and **Followup** commands and

96642        **outfolder** variable.

### 96643        **Set Variables**

96644        *Synopsis:*     **se**[t] [*name*=[*string*]] ...] [*name=number* ...] [*noname* ...]

96645        Define one or more variables called *name*. The variable can be given a null, string, or numeric value. Quoting and <backslash>-escapes can occur anywhere in *string*, as described previously, as if the *string* portion of the argument were the entire argument. The forms *name* and *name=* shall be equivalent to *name=""* for variables that take string values. The **set** command without arguments shall write a list of all defined variables and their values. The **no name** form shall be equivalent to **unset name**.

### 96651        **Invoke a Shell**

96652        *Synopsis:*     **sh**[ell]

96653        Invoke an interactive command interpreter (see also *SHELL*).

### 96654        **Display Message Size**

96655        *Synopsis:*     **si**[ze] [*msglist*]

96656        Write the size in bytes of each of the specified messages.

### 96657        **Read mailx Commands From a File**

96658        *Synopsis:*     **so**[urce] *file*

96659        Read and execute commands from the file named by the pathname *file* and return to command mode.

### 96661        **Display Beginning of Messages**

96662        *Synopsis:*     **to**[p] [*msglist*]

96663        Write the top few lines of each of the specified messages. If the **toplines** variable is set, it is taken as the number of lines to write. The default shall be 5.

### 96665        **Touch Messages**

96666        *Synopsis:*     **tou**[ch] [*msglist*]

96667        Touch the specified messages. If any message in *msglist* is not specifically deleted nor saved in a file, it shall be placed in the **mbox** upon normal termination. See **exit** and **quit**.

### 96669        **Delete Aliases**

96670        *Synopsis:*     **una**[lias] [*alias*] ...

96671        Delete the specified alias names. If a specified alias does not exist, the results are unspecified.

**Undelete Messages**

*Synopsis:*     u[ndelete] [*msglist*]

Change the state of the specified messages from deleted to read. If **autoprint** is set, the last message of those restored shall be written. If *msglist* is not specified, the message shall be selected as follows:

- If there are any deleted messages that follow the current message, the first of these shall be chosen.
- Otherwise, the last deleted message that also precedes the current message shall be chosen.

**Unset Variables**

*Synopsis:*     uns[et] *name...*

Cause the specified variables to be erased.

**Edit Message with Full-Screen Editor**

*Synopsis:*     v[isual] [*msglist*]

Edit the given messages with a screen editor. Each message shall be placed in a temporary file, and the utility named by the *VISUAL* variable shall be invoked to edit each file in sequence. The default editor shall be *vi*.

The **visual** command does not modify the contents of those messages in the mailbox.

**Write Messages to a File**

*Synopsis:*     w[rite] [*msglist*] *file*

Write the given messages to the file specified by the pathname *file*, minus the message header. Otherwise, it shall be equivalent to the **save** command.

**Scroll Header Display**

*Synopsis:*     z[+|-]

Scroll the header display forward (if '+' is specified or if no option is specified) or backward (if '-' is specified) one screenful. The number of headers written shall be set by the **screen** variable.

**Invoke Shell Command**

*Synopsis:*     !*command*

Invoke the command interpreter specified by *SHELL* with two arguments: **-c** and *command*. (See also *sh -c*.) If the **bang** variable is set, each unescaped occurrence of '!' in *command* shall be replaced with the command executed by the previous ! command or ~! command escape.

**Null Command**

*Synopsis:*     # *comment*

This null command (comment) shall be ignored by *mailx*.

**Display Current Message Number**

*Synopsis:*     =

Write the current message number.

**Command Escapes in mailx**

The following commands can be entered only from input mode, by beginning a line with the escape character (by default, <tilde> (' ~')). See the **escape** variable description for changing this special character. The format for the commands shall be:

<escape-character><command-char><separator> [<arguments>]

where the <separator> can be zero or more <blank> characters.

In the following descriptions, the application shall ensure that the argument *command* (but not *mailx-command*) is a shell command string. Any string acceptable to the command interpreter specified by the *SHELL* variable when it is invoked as *SHELL -c command\_string* shall be valid. The command can be presented as multiple arguments (that is, quoting is not required).

Command escapes that are listed with *msglist* or *mailx-command* arguments are invalid in Send Mode and produce unspecified results.

**~! *command***   Invoke the command interpreter specified by *SHELL* with two arguments: **-c** and *command*; and then return to input mode. If the **bang** variable is set, each unescaped occurrence of '!' in *command* shall be replaced with the command executed by the previous ! command or ~! command escape.

**~.**             Simulate end-of-file (terminate message input).

**~: *mailx-command*, ~\_ *mailx-command***  
Perform the command-level request.

**~?**             Write a summary of command escapes.

**~A**             This shall be equivalent to **~i Sign**.

**~a**             This shall be equivalent to **~i sign**.

**~b *name...***   Add the *names* to the blind carbon copy (**Bcc**) list.

**~c *name...***   Add the *names* to the carbon copy (**Cc**) list.

**~d**             Read in the dead-letter file. See *DEAD* for a description of this file.

**~e**             Invoke the editor, as specified by the *EDITOR* environment variable, on the partial message.

**~f [*msglist*]**   Forward the specified messages. The specified messages shall be inserted into the current message without alteration. This command escape also shall insert message headers into the message with field selection affected by the **discard**, **ignore**, and **retain** commands.

|       |                                                                                                             |                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------|-------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 96740 | <b>~F</b> [ <i>msglist</i> ]                                                                                | This shall be the equivalent of the <b>~f</b> command escape, except that all headers shall be included in the message, regardless of previous <b>discard</b> , <b>ignore</b> , and <b>retain</b> commands.                                                                                                                                                                                                                                |
| 96741 |                                                                                                             |                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 96742 |                                                                                                             |                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 96743 | <b>~h</b>                                                                                                   | If standard input is a terminal, prompt for a <b>Subject</b> line and the <b>To</b> , <b>Cc</b> , and <b>Bcc</b> lists. Other implementation-defined headers may also be presented for editing. If the field is written with an initial value, it can be edited as if it had just been typed.                                                                                                                                              |
| 96744 |                                                                                                             |                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| 96772 |                                                                                                             |                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 96773 |                                                                                                             |                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 96774 | <b>~x</b>                                                                                                   | Exit as with <b>~q</b> , except the message shall not be saved in the dead-letter file.                                                                                                                                                                                                                                                                                                                                                    |
| 96775 | <b>~ </b> <i>command</i>                                                                                    | Pipe the body of the message through the given <i>command</i> by invoking the command interpreter specified by <i>SHELL</i> with two arguments: <b>-c</b> and <i>command</i> . If the <i>command</i> returns a successful exit status, the standard output of the command shall replace the message. Otherwise, the message shall remain unchanged. If the <i>command</i> fails, an error message giving the exit status shall be written. |
| 96776 |                                                                                                             |                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 96777 |                                                                                                             |                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 96778 |                                                                                                             |                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 96779 |                                                                                                             |                                                                                                                                                                                                                                                                                                                                                                                                                                            |

96780 **EXIT STATUS**96781 UP When the **-e** option is specified, the following exit values are returned:

96782     0 Mail was found.

96783     &gt;0 Mail was not found or an error occurred.

96784 Otherwise, the following exit values are returned:

96785     0 Successful completion; note that this status implies that all messages were *sent*, but it gives  
96786 no assurances that any of them were actually *delivered*.

96787     &gt;0 An error occurred.

96788 **CONSEQUENCES OF ERRORS**96789 UP When in **input mode (Receive Mode)** or Send Mode:96790     • If an error is encountered processing an input line beginning with a <tilde> ('~')  
96791 UP character, (see [Command Escapes in mailx](#), on page 2927), a diagnostic message shall be  
96792 written to standard error, and the message being composed may be modified, but this  
96793 condition shall not prevent the message from being sent.

96794     • Other errors shall prevent the sending of the message.

96795 UP When in command mode:

96796     • Default.

96797 **APPLICATION USAGE**96798 Delivery of messages to remote systems requires the existence of communication paths to such  
96799 systems. These need not exist.96800 Input lines are limited to {LINE\_MAX} bytes, but mailers between systems may impose more  
96801 severe line-length restrictions. This volume of POSIX.1-2008 does not place any restrictions on  
96802 the length of messages handled by *mailx*, and for delivery of local messages the only limitations  
96803 should be the normal problems of available disk space for the target mail file. When sending  
96804 messages to external machines, applications are advised to limit messages to less than 100 000  
96805 bytes because some mail gateways impose message-length restrictions.96806 The format of the system mailbox is intentionally unspecified. Not all systems implement  
96807 system mailboxes as flat files, particularly with the advent of multimedia mail messages. Some  
96808 system mailboxes may be multiple files, others records in a database. The internal format of the  
96809 messages themselves is specified with the historical format from Version 7, but only after the  
96810 messages have been saved in some file other than the system mailbox. This was done so that  
96811 many historical applications expecting text-file mailboxes are not broken.96812 Some new formats for messages can be expected in the future, probably including binary data,  
96813 bit maps, and various multimedia objects. As described here, *mailx* is not prohibited from  
96814 handling such messages, but it must store them as text files in secondary mailboxes (unless some  
96815 extension, such as a variable or command line option, is used to change the stored format). Its  
96816 method of doing so is implementation-defined and might include translating the data into text  
96817 file-compatible or readable form or omitting certain portions of the message from the stored  
96818 output.96819 The **discard** and **ignore** commands are not inverses of the **retain** command. The **retain**  
96820 command discards all header-fields except those explicitly retained. The **discard** command  
96821 keeps all header-fields except those explicitly discarded. If headers exist on the retained header

list, **discard** and **ignore** commands are ignored.

## 96823 EXAMPLES

96824 None.

## 96825 RATIONALE

96826 The standard developers felt strongly that a method for applications to send messages to specific  
 96827 users was necessary. The obvious example is a batch utility, running non-interactively, that  
 96828 wishes to communicate errors or results to a user. However, the actual format, delivery  
 96829 mechanism, and method of reading the message are clearly beyond the scope of this volume of  
 96830 POSIX.1-2008.

96831 The intent of this command is to provide a simple, portable interface for sending messages non-  
 96832 interactively. It merely defines a “front-end” to the historical mail system. It is suggested that  
 96833 implementations explicitly denote the sender and recipient in the body of the delivered message.  
 96834 Further specification of formats for either the message envelope or the message itself were  
 96835 deliberately not made, as the industry is in the midst of changing from the current standards to a  
 96836 more internationalized standard and it is probably incorrect, at this time, to require either one.

96837 Implementations are encouraged to conform to the various delivery mechanisms described in  
 96838 the CCITT X.400 standards or to the equivalent Internet standards, described in Internet Request  
 96839 for Comment (RFC) documents RFC 819, RFC 822, RFC 920, RFC 921, and RFC 1123.

96840 Many historical systems modified each body line that started with **From** by prefixing the ‘F’  
 96841 with ‘>’. It is unnecessary, but allowed, to do that when the string does not follow a blank line  
 96842 because it cannot be confused with the next header.

96843 The **edit** and **visual** commands merely edit the specified messages in a temporary file. They do  
 96844 not modify the contents of those messages in the mailbox; such a capability could be added as an  
 96845 extension, such as by using different command names.

96846 The restriction on a subject line being {LINE\_MAX}-10 bytes is based on the historical format  
 96847 that consumes 10 bytes for **Subject:** and the trailing <newline>. Many historical mailers that a  
 96848 message may encounter on other systems are not able to handle lines that long, however.

96849 Like the utilities *logger* and *lp*, *mailx* admittedly is difficult to test. This was not deemed sufficient  
 96850 justification to exclude this utility from this volume of POSIX.1-2008. It is also arguable that it is,  
 96851 in fact, testable, but that the tests themselves are not portable.

96852 When *mailx* is being used by an application that wishes to receive the results as if none of the  
 96853 User Portability Utilities option features were supported, the *DEAD* environment variable must  
 96854 be set to **/dev/null**. Otherwise, it may be subject to the file creations described in *mailx*  
 96855 ASYNCHRONOUS EVENTS. Similarly, if the *MAILRC* environment variable is not set to  
 96856 **/dev/null**, historical versions of *mailx* and *Mail* read initialization commands from a file before  
 96857 processing begins. Since the initialization that a user specifies could alter the contents of  
 96858 messages an application is trying to send, such applications must set *MAILRC* to **/dev/null**.

96859 The description of *LC\_TIME* uses “may affect” because many historical implementations do not  
 96860 or cannot manipulate the date and time strings in the incoming mail headers. Some headers  
 96861 found in incoming mail do not have enough information to determine the timezone in which the  
 96862 mail originated, and, therefore, *mailx* cannot convert the date and time strings into the internal  
 96863 form that then is parsed by routines like *strftime()* that can take *LC\_TIME* settings into account.  
 96864 Changing all these times to a user-specified format is allowed, but not required.

96865 The paginator selected when *PAGER* is null or unset is partially unspecified to allow the System  
 96866 V historical practice of using *pg* as the default. Bypassing the pagination function, such as by  
 96867 declaring that *cat* is the paginator, would not meet with the intended meaning of this

description. However, any “portable user” would have to set *PAGER* explicitly to get his or her preferred paginator on all systems. The paginator choice was made partially unspecified, unlike the *VISUAL* editor choice (mandated to be *vi*) because most historical pagers follow a common theme of user input, whereas editors differ dramatically.

Options to specify addresses as **cc** (carbon copy) or **bcc** (blind carbon copy) were considered to be format details and were omitted.

A zero exit status implies that all messages were *sent*, but it gives no assurances that any of them were actually *delivered*. The reliability of the delivery mechanism is unspecified and is an appropriate marketing distinction between systems.

In order to conform to the Utility Syntax Guidelines, a solution was required to the optional *file* option-argument to **-f**. By making *file* an operand, the guidelines are satisfied and users remain portable. However, it does force implementations to support usage such as:

```
mailx -fin mymail.box
```

The **no name** method of unsetting variables is not present in all historical systems, but it is in System V and provides a logical set of commands corresponding to the format of the display of options from the *mailx set* command without arguments.

The **ask** and **asksub** variables are the names selected by BSD and System V, respectively, for the same feature. They are synonyms in this volume of POSIX.1-2008.

The *mailx echo* command was not documented in the BSD version and has been omitted here because it is not obviously useful for interactive users.

The default prompt on the System V *mailx* is a <question-mark>, on BSD *Mail* an <ampersand>. Since this volume of POSIX.1-2008 chose the *mailx* name, it kept the System V default, assuming that BSD users would not have difficulty with this minor incompatibility (that they can override).

The meanings of **r** and **R** are reversed between System V *mailx* and SunOS *Mail*. Once again, since this volume of POSIX.1-2008 chose the *mailx* name, it kept the System V default, but allows the SunOS user to achieve the desired results using **flpr**, an internal variable in System V *mailx*, although it has not been documented in the SVID.

The **indentprefix** variable, the **retain** and **unalias** commands, and the **~F** and **~M** command escapes were adopted from 4.3 BSD *Mail*.

The **version** command was not included because no sufficiently general specification of the version information could be devised that would still be useful to a portable user. This command name should be used by suppliers who wish to provide version information about the *mailx* command.

The “implementation-specific (unspecified) system start-up file” historically has been named **/etc/mailx.rc**, but this specific name and location are not required.

The intent of the wording for the **next** command is that if any command has already displayed the current message it should display a following message, but, otherwise, it should display the current message. Consider the command sequence:

```
next 3
delete 3
next
```

where the **autoprint** option was not set. The normative text specifies that the second **next** command should display a message following the third message, because even though the

96912 current message has not been displayed since it was set by the **delete** command, it has been  
96913 displayed since the current message was anything other than message number 3. This does not  
96914 always match historical practice in some implementations, where the command file address  
96915 followed by **next** (or the default command) would skip the message for which the user had  
96916 searched.

#### 96917 FUTURE DIRECTIONS

96918 None.

#### 96919 SEE ALSO

96920 [Chapter 2](#) (on page 2319), *ed*, *ls*, *more*, *vi*

96921 [XBD Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)

#### 96922 CHANGE HISTORY

96923 First released in Issue 2.

#### 96924 Issue 5

96925 The description of the *EDITOR* environment variable is changed to indicate that *ed* is the default  
96926 editor if this variable is not set. In previous issues, this default was not stated explicitly at this  
96927 point but was implied further down in the text.

96928 The FUTURE DIRECTIONS section is added.

#### 96929 Issue 6

96930 The following new requirements on POSIX implementations derive from alignment with the  
96931 Single UNIX Specification:

- 96932 • The **-F** option is added.
- 96933 • The **allnet**, **debug**, and **sendwait** internal variables are added.
- 96934 • The **C**, **ec**, **fo**, **F**, and **S** *mailx* commands are added.

96935 In the DESCRIPTION and ENVIRONMENT VARIABLES sections, text stating “*HOME*  
96936 directory” is replaced by “directory referred to by the *HOME* environment variable”.

96937 The *mailx* utility is aligned with the IEEE P1003.2b draft standard, which includes various  
96938 clarifications to resolve IEEE PASC Interpretations submitted for the ISO POSIX-2:1993  
96939 standard. In particular, the changes here address IEEE PASC Interpretations 1003.2 #10, #11,  
96940 #103, #106, #108, #114, #115, #122, and #129.

96941 The normative text is reworded to avoid use of the term “must” for application requirements.

96942 The *TZ* entry is added to the ENVIRONMENT VARIABLES section.

96943 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/32 is applied, applying a change to the  
96944 EXTENDED DESCRIPTION, raised by IEEE PASC Interpretation 1003.2 #122, which was  
96945 overlooked in the first version of this standard.

96946 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/17 is applied, updating the EXTENDED  
96947 DESCRIPTION (Internal Variables in *mailx*). The system start-up file is changed from  
96948 “implementation-defined” to “unspecified” for consistency with other text in the EXTENDED  
96949 DESCRIPTION.

#### 96950 Issue 7

96951 Austin Group Interpretation 1003.1-2001 #089 is applied, clarifying the effect of the *LC\_TIME*  
96952 environment variable.

96953 Austin Group Interpretation 1003.1-2001 #090 is applied, updating the description of the **next**  
96954 command.

- 96955 SD5-XCU-ERN-69 is applied.
- 96956 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.
- 96957 Shading to indicate support for the User Portability Utilities option is added.

**NAME**

make — maintain, update, and regenerate groups of programs (**DEVELOPMENT**)

**SYNOPSIS**

```
SD make [-einpqrst] [-f makefile]... [-k|-S] [macro=value...]
 [target_name...]
```

**DESCRIPTION**

The *make* utility shall update files that are derived from other files. A typical case is one where object files are derived from the corresponding source files. The *make* utility examines time relationships and shall update those derived files (called targets) that have modified times earlier than the modified times of the files (called prerequisites) from which they are derived. A description file (makefile) contains a description of the relationships between files, and the commands that need to be executed to update the targets to reflect changes in their prerequisites. Each specification, or rule, shall consist of a target, optional prerequisites, and optional commands to be executed when a prerequisite is newer than the target. There are two types of rule:

1. *Inference rules*, which have one target name with at least one <period> ('.') and no <slash> ('/')
2. *Target rules*, which can have more than one target name

In addition, *make* shall have a collection of built-in macros and inference rules that infer prerequisite relationships to simplify maintenance of programs.

To receive exactly the behavior described in this section, the user shall ensure that a portable makefile shall:

- Include the special target **.POSIX**
- Omit any special target reserved for implementations (a leading period followed by uppercase letters) that has not been specified by this section

The behavior of *make* is unspecified if either or both of these conditions are not met.

**OPTIONS**

The *make* utility shall conform to XBD [Section 12.2](#) (on page 215), except for Guideline 9.

The following options shall be supported:

- e** Cause environment variables, including those with null values, to override macro assignments within makefiles.
- f *makefile*** Specify a different makefile. The argument *makefile* is a pathname of a description file, which is also referred to as the *makefile*. A pathname of '-' shall denote the standard input. There can be multiple instances of this option, and they shall be processed in the order specified. The effect of specifying the same option-argument more than once is unspecified.
- i** Ignore error codes returned by invoked commands. This mode is the same as if the special target **.IGNORE** were specified without prerequisites.
- k** Continue to update other targets that do not depend on the current target if a non-ignored error occurs while executing the commands to bring a target up-to-date.
- n** Write commands that would be executed on standard output, but do not execute them. However, lines with a <plus-sign> ('+') prefix shall be executed. In this mode, lines with an at-sign ('@') character prefix shall be written to standard

|       |           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 97001 |           | output.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 97002 | <b>-p</b> | Write to standard output the complete set of macro definitions and target descriptions. The output format is unspecified.                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 97003 |           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 97004 | <b>-q</b> | Return a zero exit value if the target file is up-to-date; otherwise, return an exit value of 1. Targets shall not be updated if this option is specified. However, a makefile command line (associated with the targets) with a <plus-sign> ('+') prefix shall be executed.                                                                                                                                                                                                                                                                                |
| 97005 |           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 97006 |           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 97007 |           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 97008 | <b>-r</b> | Clear the suffix list and do not use the built-in rules.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 97009 | <b>-S</b> | Terminate <i>make</i> if an error occurs while executing the commands to bring a target up-to-date. This shall be the default and the opposite of <b>-k</b> .                                                                                                                                                                                                                                                                                                                                                                                               |
| 97010 |           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 97011 | <b>-s</b> | Do not write makefile command lines or touch messages (see <b>-t</b> ) to standard output before executing. This mode shall be the same as if the special target <b>.SILENT</b> were specified without prerequisites.                                                                                                                                                                                                                                                                                                                                       |
| 97012 |           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 97013 |           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 97014 | <b>-t</b> | Update the modification time of each target as though a <i>touch target</i> had been executed. Targets that have prerequisites but no commands (see <a href="#">Target Rules</a> , on page 2939), or that are already up-to-date, shall not be touched in this manner. Write messages to standard output for each target file indicating the name of the file and that it was touched. Normally, the <i>makefile</i> command lines associated with each target are not executed. However, a command line with a <plus-sign> ('+') prefix shall be executed. |
| 97015 |           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 97016 |           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 97017 |           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| 97019 |           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 97020 |           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

Any options specified in the *MAKEFLAGS* environment variable shall be evaluated before any options specified on the *make* utility command line. If the **-k** and **-S** options are both specified on the *make* utility command line or by the *MAKEFLAGS* environment variable, the last option specified shall take precedence. If the **-f** or **-p** options appear in the *MAKEFLAGS* environment variable, the result is undefined.

## 97026 OPERANDS

97027 The following operands shall be supported:

97028 *target\_name* Target names, as defined in the EXTENDED DESCRIPTION section. If no target is  
 97029 specified, while *make* is processing the makefiles, the first target that *make*  
 97030 encounters that is not a special target or an inference rule shall be used.

97031 *macro=value* Macro definitions, as defined in [Macros](#) (on page 2940).

97032 If the *target\_name* and *macro=value* operands are intermixed on the *make* utility command line,  
 97033 the results are unspecified.

## 97034 STDIN

97035 The standard input shall be used only if the *makefile* option-argument is '-'. See the INPUT  
 97036 FILES section.

## 97037 INPUT FILES

97038 The input file, otherwise known as the makefile, is a text file containing rules, macro definitions,  
 97039 and comments. See the EXTENDED DESCRIPTION section.

## 97040 ENVIRONMENT VARIABLES

97041 The following environment variables shall affect the execution of *make*:

97042 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 97043 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 97044 variables used to determine the values of locale categories.)

| 97069 |     |                            | Provide a directory to be used to search for SCCS files not found in the current directory. In all of the following cases, the search for SCCS files is made in the directory <b>SCCS</b> in the identified directory. If the value of <b>PROJECTDIR</b> begins with a <slash>, it shall be considered an absolute pathname; otherwise, the value of <b>PROJECTDIR</b> is treated as a user name and that user's initial working directory shall be examined for a subdirectory <b>src</b> or <b>source</b> . If such a directory is found, it shall be used. Otherwise, the value is used as a relative pathname. |

| 97087 |     |                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 97088 |     |                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 97089 |     |                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 97090 |     |                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

**STDOUT**

The *make* utility shall write all commands to be executed to standard output unless the `-s` option was specified, the command is prefixed with an at-sign, or the special target **.SILENT** has either the current target as a prerequisite or has no prerequisites. If *make* is invoked without any work needing to be done, it shall write a message to standard output indicating that no action was taken. If the `-t` option is present and a file is touched, *make* shall write to standard output a message of unspecified format indicating that the file was touched, including the filename of the file.

**STDERR**

The standard error shall be used only for diagnostic messages.

**OUTPUT FILES**

Files can be created when the `-t` option is present. Additional files can also be created by the utilities invoked by *make*.

**EXTENDED DESCRIPTION**

The *make* utility attempts to perform the actions required to ensure that the specified targets are up-to-date. A target is considered out-of-date if it is older than any of its prerequisites or if it does not exist. The *make* utility shall treat all prerequisites as targets themselves and recursively ensure that they are up-to-date, processing them in the order in which they appear in the rule. The *make* utility shall use the modification times of files to determine whether the corresponding targets are out-of-date.

After *make* has ensured that all of the prerequisites of a target are up-to-date and if the target is out-of-date, the commands associated with the target entry shall be executed. If there are no commands listed for the target, the target shall be treated as up-to-date.

**Makefile Syntax**

A makefile can contain rules, macro definitions (see [Macros](#), on page 2940), include lines, and comments. There are two kinds of rules: *inference rules* and *target rules*. The *make* utility shall contain a set of built-in inference rules. If the `-r` option is present, the built-in rules shall not be used and the suffix list shall be cleared. Additional rules of both types can be specified in a makefile. If a rule is defined more than once, the value of the rule shall be that of the last one specified. Macros can also be defined more than once, and the value of the macro is specified in [Macros](#) (on page 2940). Comments start with a <number-sign> ('#') and continue until an unescaped <newline> is reached.

By default, the following files shall be tried in sequence: **./makefile** and **./Makefile**. If neither **./makefile** or **./Makefile** are found, other implementation-defined files may also be tried. On XSI-conformant systems, the additional files **./s.makefile**, **SCCS/s.makefile**, **./s.Makefile**, and **SCCS/s.Makefile** shall also be tried.

The `-f` option shall direct *make* to ignore any of these default files and use the specified argument as a makefile instead. If the `'-'` argument is specified, standard input shall be used.

The term *makefile* is used to refer to any rules provided by the user, whether in **./makefile** or its variants, or specified by the `-f` option.

The rules in makefiles shall consist of the following types of lines: target rules, including special targets (see [Target Rules](#), on page 2939), inference rules (see [Inference Rules](#), on page 2942), macro definitions (see [Macros](#), on page 2940), empty lines, and comments.

Target and Inference Rules may contain *command lines*. Command lines can have a prefix that shall be removed before execution (see [Makefile Execution](#), on page 2938).

When an escaped <newline> (one preceded by a <backslash>) is found anywhere in the makefile except in a command line, an include line, or a line immediately preceding an include line, it shall be replaced, along with any leading white space on the following line, with a single <space>. When an escaped <newline> is found in a command line in a makefile, the command line shall contain the <backslash>, the <newline>, and the next line, except that the first character of the next line shall not be included if it is a <tab>. When an escaped <newline> is found in an include line or in a line immediately preceding an include line, the behavior is unspecified.

## Include Lines

If the word **include** appears at the beginning of a line and is followed by one or more <blank> characters, the string formed by the remainder of the line shall be processed as follows to produce a pathname:

- The trailing <newline> and any comment shall be discarded. If the resulting string contains any double-quote characters ( ' " ' ) the behavior is unspecified.
- The resulting string shall be processed for macro expansion (see [Macros](#) (on page 2940)).
- Any <blank> characters that appear after the first non-<blank> shall be used as separators to divide the macro-expanded string into fields. It is unspecified whether any other white-space characters are also used as separators. It is unspecified whether pathname expansion (see [Section 2.13](#), on page 2354) is also performed.
- If the processing of separators and optional pathname expansion results in either zero or two or more non-empty fields, the behavior is unspecified. If it results in one non-empty field, that field is taken as the pathname.

If the pathname does not begin with a ' / ' it shall be treated as relative to the current working directory of the process, not relative to the directory containing the makefile. If the file does not exist in this location, it is unspecified whether additional directories are searched.

The contents of the file specified by the pathname shall be read and processed as if they appeared in the makefile in place of the include line. If the file ends with an escaped <newline> the behavior is unspecified.

The file may itself contain further include lines. Implementations shall support nesting of include files up to a depth of at least 16.

## Makefile Execution

Makefile command lines shall be processed one at a time.

Makefile command lines can have one or more of the following prefixes: a <hyphen> ( ' - ' ), an at-sign ( ' @ ' ), or a <plus-sign> ( ' + ' ). These shall modify the way in which *make* processes the command.

- If the command prefix contains a <hyphen>, or the **-i** option is present, or the special target **.IGNORE** has either the current target as a prerequisite or has no prerequisites, any error found while executing the command shall be ignored.
- @ If the command prefix contains an at-sign and the *make* utility command line **-n** option is not specified, or the **-s** option is present, or the special target **.SILENT** has either the current target as a prerequisite or has no prerequisites, the command shall not be written to standard output before it is executed.

- + If the command prefix contains a <plus-sign>, this indicates a makefile command line that shall be executed even if **-n**, **-q**, or **-t** is specified.

An *execution line* is built from the command line by removing any prefix characters. Except as described under the at-sign prefix, the execution line shall be written to the standard output, optionally preceded by a <tab>. The execution line shall then be executed by a shell as if it were passed as the argument to the *system()* interface, except that if errors are not being ignored then the shell **-e** option shall also be in effect. If errors are being ignored for the command (as a result of the **-i** option, a **'-'** command prefix, or a **.IGNORE** special target), the shell **-e** option shall not be in effect. The environment for the command being executed shall contain all of the variables in the environment of *make*.

By default, when *make* receives a non-zero status from the execution of a command, it shall terminate with an error message to standard error.

## Target Rules

Target rules are formatted as follows:

```
target [target...]: [prerequisite...][;command]
[<tab>command
<tab>command
...]
```

*line that does not begin with <tab>*

Target entries are specified by a <blank>-separated, non-null list of targets, then a <colon>, then a <blank>-separated, possibly empty list of prerequisites. Text following a <semicolon>, if any, and all following lines that begin with a <tab>, are makefile command lines to be executed to update the target. The first non-empty line that does not begin with a <tab> or **'#'** shall begin a new entry. An empty or blank line, or a line beginning with **'#'**, may begin a new entry.

Applications shall select target names from the set of characters consisting solely of periods, underscores, digits, and alphabets from the portable character set (see XBD [Section 6.1](#), on page 125). Implementations may allow other characters in target names as extensions. The interpretation of targets containing the characters **'%'** and **'\"'** is implementation-defined.

A target that has prerequisites, but does not have any commands, can be used to add to the prerequisite list for that target. Only one target rule for any given target can contain commands.

Lines that begin with one of the following are called *special targets* and control the operation of *make*:

**.DEFAULT** If the makefile uses this special target, the application shall ensure that it is specified with commands, but without prerequisites. The commands shall be used by *make* if there are no other rules available to build a target.

**.IGNORE** Prerequisites of this special target are targets themselves; this shall cause errors from commands associated with them to be ignored in the same manner as specified by the **-i** option. Subsequent occurrences of **.IGNORE** shall add to the list of targets ignoring command errors. If no prerequisites are specified, *make* shall behave as if the **-i** option had been specified and errors from all commands associated with all targets shall be ignored.

**.POSIX** The application shall ensure that this special target is specified without prerequisites or commands. If it appears as the first non-comment line in the makefile, *make* shall process the makefile as specified by this section; otherwise, the behavior of *make* is unspecified.

97223 **.PRECIOUS** Prerequisites of this special target shall not be removed if *make* receives one of the  
 97224 asynchronous events explicitly described in the ASYNCHRONOUS EVENTS  
 97225 section. Subsequent occurrences of **.PRECIOUS** shall add to the list of precious  
 97226 files. If no prerequisites are specified, all targets in the makefile shall be treated as  
 97227 if specified with **.PRECIOUS**.

97228 XSI **.SCCS\_GET** The application shall ensure that this special target is specified without  
 97229 prerequisites. If this special target is included in a makefile, the commands  
 97230 specified with this target shall replace the default commands associated with this  
 97231 special target (see [Default Rules](#), on page 2945). The commands specified with this  
 97232 target are used to get all SCCS files that are not found in the current directory.

97233 When source files are named in a dependency list, *make* shall treat them just like  
 97234 any other target. Because the source file is presumed to be present in the directory,  
 97235 there is no need to add an entry for it to the makefile. When a target has no  
 97236 dependencies, but is present in the directory, *make* shall assume that that file is up-  
 97237 to-date. If, however, an SCCS file named **SCCS/s.source\_file** is found for a target  
 97238 *source\_file*, *make* compares the timestamp of the target file with that of the  
 97239 **SCCS/s.source\_file** to ensure the target is up-to-date. If the target is missing, or if  
 97240 the SCCS file is newer, *make* shall automatically issue the commands specified for  
 97241 the **.SCCS\_GET** special target to retrieve the most recent version. However, if the  
 97242 target is writable by anyone, *make* shall not retrieve a new version.

97243 **.SILENT** Prerequisites of this special target are targets themselves; this shall cause  
 97244 commands associated with them not to be written to the standard output before  
 97245 they are executed. Subsequent occurrences of **.SILENT** shall add to the list of  
 97246 targets with silent commands. If no prerequisites are specified, *make* shall behave  
 97247 as if the **-s** option had been specified and no commands or touch messages  
 97248 associated with any target shall be written to standard output.

97249 **.SUFFIXES** Prerequisites of **.SUFFIXES** shall be appended to the list of known suffixes and are  
 97250 used in conjunction with the inference rules (see [Inference Rules](#), on page 2942). If  
 97251 **.SUFFIXES** does not have any prerequisites, the list of known suffixes shall be  
 97252 cleared.

97253 The special targets **.IGNORE**, **.POSIX**, **.PRECIOUS**, **.SILENT**, and **.SUFFIXES** shall be specified  
 97254 without commands.

97255 Targets with names consisting of a leading <period> followed by the uppercase letters "POSIX"  
 97256 and then any other characters are reserved for future standardization. Targets with names  
 97257 consisting of a leading <period> followed by one or more uppercase letters are reserved for  
 97258 implementation extensions.

## 97259 Macros

97260 Macro definitions are in the form:

97261 *string1* = [*string2*]

97262 The macro named *string1* is defined as having the value of *string2*, where *string2* is defined as all  
 97263 characters, if any, after the <equals-sign>, up to a comment character ('#') or an unescaped  
 97264 <newline>. Any <blank> characters immediately before or after the <equals-sign> shall be  
 97265 ignored.

97266 Applications shall select macro names from the set of characters consisting solely of periods,  
 97267 underscores, digits, and alphabets from the portable character set (see XBD [Section 6.1](#), on  
 97268 page 125). A macro name shall not contain an <equals-sign>. Implementations may allow other

characters in macro names as extensions.

Macros can appear anywhere in the makefile. Macro expansions using the forms  $\$(string1)$  or  $\${string1}$  shall be replaced by *string2*, as follows:

- Macros in target lines shall be evaluated when the target line is read.
- Macros in makefile command lines shall be evaluated when the command is executed.
- Macros in the string before the <equals-sign> in a macro definition shall be evaluated when the macro assignment is made.
- Macros after the <equals-sign> in a macro definition shall not be evaluated until the defined macro is used in a rule or command, or before the <equals-sign> in a macro definition.

The parentheses or braces are optional if *string1* is a single character. The macro  $\$\$$  shall be replaced by the single character '\$'. If *string1* in a macro expansion contains a macro expansion, the results are unspecified.

Macro expansions using the forms  $\$(string1[:subst1=[subst2]])$  or  $\${string1[:subst1=[subst2]]}$  can be used to replace all occurrences of *subst1* with *subst2* when the macro substitution is performed. The *subst1* to be replaced shall be recognized when it is a suffix at the end of a word in *string1* (where a *word*, in this context, is defined to be a string delimited by the beginning of the line, a <blank>, or a <newline>). If *string1* in a macro expansion contains a macro expansion, the results are unspecified.

Macro expansions in *string1* of macro definition lines shall be evaluated when read. Macro expansions in *string2* of macro definition lines shall be performed when the macro identified by *string1* is expanded in a rule or command.

Macro definitions shall be taken from the following sources, in the following logical order, before the makefile(s) are read.

1. Macros specified on the *make* utility command line, in the order specified on the command line. It is unspecified whether the internal macros defined in [Internal Macros](#) (on page 2943) are accepted from this source.
2. Macros defined by the *MAKEFLAGS* environment variable, in the order specified in the environment variable. It is unspecified whether the internal macros defined in [Internal Macros](#) (on page 2943) are accepted from this source.
3. The contents of the environment, excluding the *MAKEFLAGS* and *SHELL* variables and including the variables with null values.
4. Macros defined in the inference rules built into *make*.

Macro definitions from these sources shall not override macro definitions from a lower-numbered source. Macro definitions from a single source (for example, the *make* utility command line, the *MAKEFLAGS* environment variable, or the other environment variables) shall override previous macro definitions from the same source.

Macros defined in the makefile(s) shall override macro definitions that occur before them in the makefile(s) and macro definitions from source 4. If the *-e* option is not specified, macros defined in the makefile(s) shall override macro definitions from source 3. Macros defined in the makefile(s) shall not override macro definitions from source 1 or source 2.

Before the makefile(s) are read, all of the *make* utility command line options (except *-f* and *-p*) and *make* utility command line macro definitions (except any for the *MAKEFLAGS* macro), not already included in the *MAKEFLAGS* macro, shall be added to the *MAKEFLAGS* macro, quoted

in an implementation-defined manner such that when *MAKEFLAGS* is read by another instance of the *make* command, the original macro's value is recovered. Other implementation-defined options and macros may also be added to the *MAKEFLAGS* macro. If this modifies the value of the *MAKEFLAGS* macro, or, if the *MAKEFLAGS* macro is modified at any subsequent time, the *MAKEFLAGS* environment variable shall be modified to match the new value of the *MAKEFLAGS* macro. The result of setting *MAKEFLAGS* in the Makefile is unspecified.

Before the makefile(s) are read, all of the *make* utility command line macro definitions (except the *MAKEFLAGS* macro or the *SHELL* macro) shall be added to the environment of *make*. Other implementation-defined variables may also be added to the environment of *make*.

The **SHELL** macro shall be treated specially. It shall be provided by *make* and set to the pathname of the shell command language interpreter (see *sh*). The *SHELL* environment variable shall not affect the value of the **SHELL** macro. If **SHELL** is defined in the makefile or is specified on the command line, it shall replace the original value of the **SHELL** macro, but shall not affect the *SHELL* environment variable. Other effects of defining **SHELL** in the makefile or on the command line are implementation-defined.

## Inference Rules

Inference rules are formatted as follows:

```
target:
<tab>command
[<tab>command]
...
line that does not begin with <tab> or #
```

The application shall ensure that the *target* portion is a valid target name (see [Target Rules](#), on page 2939) of the form *.s2* or *.s1.s2* (where *.s1* and *.s2* are suffixes that have been given as prerequisites of the **.SUFFIXES** special target and *s1* and *s2* do not contain any *<slash>* or *<period>* characters.) If there is only one *<period>* in the target, it is a single-suffix inference rule. Targets with two periods are double-suffix inference rules. Inference rules can have only one target before the *<colon>*.

The application shall ensure that the makefile does not specify prerequisites for inference rules; no characters other than white space shall follow the *<colon>* in the first line, except when creating the *empty rule*, described below. Prerequisites are inferred, as described below.

Inference rules can be redefined. A target that matches an existing inference rule shall overwrite the old inference rule. An empty rule can be created with a command consisting of simply a *<semicolon>* (that is, the rule still exists and is found during inference rule search, but since it is empty, execution has no effect). The empty rule can also be formatted as follows:

```
rule: ;
```

where zero or more *<blank>* characters separate the *<colon>* and *<semicolon>*.

The *make* utility uses the suffixes of targets and their prerequisites to infer how a target can be made up-to-date. A list of inference rules defines the commands to be executed. By default, *make* contains a built-in set of inference rules. Additional rules can be specified in the makefile.

The special target **.SUFFIXES** contains as its prerequisites a list of suffixes that shall be used by the inference rules. The order in which the suffixes are specified defines the order in which the inference rules for the suffixes are used. New suffixes shall be appended to the current list by specifying a **.SUFFIXES** special target in the makefile. A **.SUFFIXES** target with no prerequisites shall clear the list of suffixes. An empty **.SUFFIXES** target followed by a new **.SUFFIXES** list is

required to change the order of the suffixes.

Normally, the user would provide an inference rule for each suffix. The inference rule to update a target with a suffix `.s1` from a prerequisite with a suffix `.s2` is specified as a target `.s2.s1`. The internal macros provide the means to specify general inference rules (see [Internal Macros](#)).

When no target rule is found to update a target, the inference rules shall be checked. The suffix of the target (`.s1`) to be built is compared to the list of suffixes specified by the `.SUFFIXES` special targets. If the `.s1` suffix is found in `.SUFFIXES`, the inference rules shall be searched in the order defined for the first `.s2.s1` rule whose prerequisite file (`$(s2)`) exists. If the target is out-of-date with respect to this prerequisite, the commands for that inference rule shall be executed.

If the target to be built does not contain a suffix and there is no rule for the target, the single suffix inference rules shall be checked. The single-suffix inference rules define how to build a target if a file is found with a name that matches the target name with one of the single suffixes appended. A rule with one suffix `.s2` is the definition of how to build *target* from `target.s2`. The other suffix (`.s1`) is treated as null.

A `<tilde> (' ~')` in the above rules refers to an SCCS file in the current directory. Thus, the rule `.c.o` would transform an SCCS C-language source file into an object file (`.o`). Because the `s.` of the SCCS files is a prefix, it is incompatible with *make's* suffix point of view. Hence, the `' ~'` is a way of changing any file reference into an SCCS file reference.

## Libraries

If a target or prerequisite contains parentheses, it shall be treated as a member of an archive library. For the `lib(member.o)` expression *lib* refers to the name of the archive library and *member.o* to the member name. The application shall ensure that the member is an object file with the `.o` suffix. The modification time of the expression is the modification time for the member as kept in the archive library; see [ar](#). The `.a` suffix shall refer to an archive library. The `.s2.a` rule shall be used to update a member in the library from a file with a suffix `.s2`.

## Internal Macros

The *make* utility shall maintain five internal macros that can be used in target and inference rules. In order to clearly define the meaning of these macros, some clarification of the terms *target rule*, *inference rule*, *target*, and *prerequisite* is necessary.

Target rules are specified by the user in a makefile for a particular target. Inference rules are user-specified or *make*-specified rules for a particular class of target name. Explicit prerequisites are those prerequisites specified in a makefile on target lines. Implicit prerequisites are those prerequisites that are generated when inference rules are used. Inference rules are applied to implicit prerequisites or to explicit prerequisites that do not have target rules defined for them in the makefile. Target rules are applied to targets specified in the makefile.

Before any target in the makefile is updated, each of its prerequisites (both explicit and implicit) shall be updated. This shall be accomplished by recursively processing each prerequisite. Upon recursion, each prerequisite shall become a target itself. Its prerequisites in turn shall be processed recursively until a target is found that has no prerequisites, at which point the recursion stops. The recursion shall then back up, updating each target as it goes.

In the definitions that follow, the word *target* refers to one of:

- A target specified in the makefile

- An explicit prerequisite specified in the makefile that becomes the target when *make* processes it during recursion
- An implicit prerequisite that becomes a target when *make* processes it during recursion

In the definitions that follow, the word *prerequisite* refers to one of the following:

- An explicit prerequisite specified in the makefile for a particular target
- An implicit prerequisite generated as a result of locating an appropriate inference rule and corresponding file that matches the suffix of the target

The five internal macros are:

**\$@** The **\$@** shall evaluate to the full target name of the current target, or the archive filename part of a library archive target. It shall be evaluated for both target and inference rules.

For example, in the **.c.a** inference rule, **\$@** represents the out-of-date **.a** file to be built. Similarly, in a makefile target rule to build **lib.a** from **file.c**, **\$@** represents the out-of-date **lib.a**.

**\$%** The **\$%** macro shall be evaluated only when the current target is an archive library member of the form *libname(member.o)*. In these cases, **\$@** shall evaluate to *libname* and **\$%** shall evaluate to *member.o*. The **\$%** macro shall be evaluated for both target and inference rules.

For example, in a makefile target rule to build **lib.a(file.o)**, **\$%** represents **file.o**, as opposed to **\$@**, which represents **lib.a**.

**\$?** The **\$?** macro shall evaluate to the list of prerequisites that are newer than the current target. It shall be evaluated for both target and inference rules.

For example, in a makefile target rule to build *prog* from **file1.o**, **file2.o**, and **file3.o**, and where *prog* is not out-of-date with respect to **file1.o**, but is out-of-date with respect to **file2.o** and **file3.o**, **\$?** represents **file2.o** and **file3.o**.

**\$<** In an inference rule, the **\$<** macro shall evaluate to the filename whose existence allowed the inference rule to be chosen for the target. In the **.DEFAULT** rule, the **\$<** macro shall evaluate to the current target name. The meaning of the **\$<** macro shall be otherwise unspecified.

For example, in the **.c.a** inference rule, **\$<** represents the prerequisite **.c** file.

**\$\*** The **\$\*** macro shall evaluate to the current target name with its suffix deleted. It shall be evaluated at least for inference rules.

For example, in the **.c.a** inference rule, **\$\*.o** represents the out-of-date **.o** file that corresponds to the prerequisite **.c** file.

Each of the internal macros has an alternative form. When an uppercase **'D'** or **'F'** is appended to any of the macros, the meaning shall be changed to the *directory part* for **'D'** and *filename part* for **'F'**. The directory part is the path prefix of the file without a trailing **<slash>**; for the current directory, the directory part is **'.'**. When the **\$?** macro contains more than one prerequisite filename, the **\$(?D)** and **\$(?F)** (or **\${?D}** and **\${?F}**) macros expand to a list of directory name parts and filename parts respectively.

For the target **lib(member.o)** and the **s2.a** rule, the internal macros shall be defined as:

```

97441 $< member.s2
97442 $* member
97443 @$ lib
97444 $? member.s2
97445 $% member.o

```

## 97446 Default Rules

97447 The default rules for *make* shall achieve results that are the same as if the following were used.  
 97448 Implementations that do not support the C-Language Development Utilities option may omit  
 97449 **CC**, **CFLAGS**, **YACC**, **YFLAGS**, **LEX**, **LFLAGS**, **LDFLAGS**, and the **.c**, **.y**, and **.l** inference rules.  
 97450 Implementations that do not support FORTRAN may omit **FC**, **FFLAGS**, and the **.f** inference  
 97451 rules. Implementations may provide additional macros and rules.

## 97452 SPECIAL TARGETS

```

97453 XSI .SCCS_GET: sccs $(SCCSFLAGS) get $(SCCSGETFLAGS) $@

```

```

97454 XSI .SUFFIXES: .o .c .y .l .a .sh .f .c~ .y~ .l~ .sh~ .f~

```

## 97455 MACROS

```

97456 MAKE=make
97457 AR=ar
97458 ARFLAGS=-rv
97459 YACC=yacc
97460 YFLAGS=
97461 LEX=lex
97462 LFLAGS=
97463 LDFLAGS=
97464 CC=c99
97465 CFLAGS=-O
97466 FC=fort77
97467 FFLAGS=-O 1
97468 XSI GET=get
97469 GFLAGS=
97470 SCCSFLAGS=
97471 SCCSGETFLAGS=-s

```

## 97472 SINGLE SUFFIX RULES

```

97473 .c:
97474 $(CC) $(CFLAGS) $(LDFLAGS) -o $@ $<
97475 .f:
97476 $(FC) $(FFLAGS) $(LDFLAGS) -o $@ $<
97477 .sh:
97478 cp $< $@
97479 chmod a+x $@
97480 XSI .c~:
97481 $(GET) $(GFLAGS) -p $< > $*.c

```

```

97482 $(CC) $(CFLAGS) $(LDFLAGS) -o $@ $*.c
97483 .f~:
97484 $(GET) $(GFLAGS) -p $< > $*.f
97485 $(FC) $(FFLAGS) $(LDFLAGS) -o $@ $*.f
97486 .sh~:
97487 $(GET) $(GFLAGS) -p $< > $*.sh
97488 cp $*.sh $@
97489 chmod a+x $@

```

97490 *DOUBLE SUFFIX RULES*

```

97491 .c.o:
97492 $(CC) $(CFLAGS) -c $<
97493 .f.o:
97494 $(FC) $(FFLAGS) -c $<
97495 .y.o:
97496 $(YACC) $(YFLAGS) $<
97497 $(CC) $(CFLAGS) -c y.tab.c
97498 rm -f y.tab.c
97499 mv y.tab.o $@
97500 .l.o:
97501 $(LEX) $(LFLAGS) $<
97502 $(CC) $(CFLAGS) -c lex.yy.c
97503 rm -f lex.yy.c
97504 mv lex.yy.o $@
97505 .y.c:
97506 $(YACC) $(YFLAGS) $<
97507 mv y.tab.c $@
97508 .l.c:
97509 $(LEX) $(LFLAGS) $<
97510 mv lex.yy.c $@

```

```

97511 XSI .c~.o:
97512 $(GET) $(GFLAGS) -p $< > $*.c
97513 $(CC) $(CFLAGS) -c $*.c
97514 .f~.o:
97515 $(GET) $(GFLAGS) -p $< > $*.f
97516 $(FC) $(FFLAGS) -c $*.f
97517 .y~.o:
97518 $(GET) $(GFLAGS) -p $< > $*.y
97519 $(YACC) $(YFLAGS) $*.y
97520 $(CC) $(CFLAGS) -c y.tab.c
97521 rm -f y.tab.c
97522 mv y.tab.o $@
97523 .l~.o:
97524 $(GET) $(GFLAGS) -p $< > $*.l
97525 $(LEX) $(LFLAGS) $*.l

```

```

97526 $(CC) $(CFLAGS) -c lex.yy.c
97527 rm -f lex.yy.c
97528 mv lex.yy.o $@

97529 .y~.c:
97530 $(GET) $(GFLAGS) -p $< > $*.y
97531 $(YACC) $(YFLAGS) $*.y
97532 mv y.tab.c $@

97533 .l~.c:
97534 $(GET) $(GFLAGS) -p $< > $*.l
97535 $(LEX) $(LFLAGS) $*.l
97536 mv lex.yy.c $@

```

```

97537 .c.a:
97538 $(CC) -c $(CFLAGS) $<
97539 $(AR) $(ARFLAGS) $@ $*.o
97540 rm -f $*.o

97541 .f.a:
97542 $(FC) -c $(FFLAGS) $<
97543 $(AR) $(ARFLAGS) $@ $*.o
97544 rm -f $*.o

```

## EXIT STATUS

When the **-q** option is specified, the *make* utility shall exit with one of the following values:

- 0 Successful completion.
- 1 The target was not up-to-date.
- >1 An error occurred.

When the **-q** option is not specified, the *make* utility shall exit with one of the following values:

- 0 Successful completion.
- >0 An error occurred.

## CONSEQUENCES OF ERRORS

Default.

## APPLICATION USAGE

If there is a source file (such as *./source.c*) and there are two SCCS files corresponding to it (*./s.source.c* and *./SCCS/s.source.c*), on XSI-conformant systems *make* uses the SCCS file in the current directory. However, users are advised to use the underlying SCCS utilities (*admin*, *delta*, *get*, and so on) or the *sccs* utility for all source files in a given directory. If both forms are used for a given source file, future developers are very likely to be confused.

It is incumbent upon portable makefiles to specify the **.POSIX** special target in order to guarantee that they are not affected by local extensions.

The **-k** and **-S** options are both present so that the relationship between the command line, the *MAKEFLAGS* variable, and the makefile can be controlled precisely. If the **k** flag is passed in *MAKEFLAGS* and a command is of the form:

```
$(MAKE) -S foo
```

then the default behavior is restored for the child *make*.

When the `-n` option is specified, it is always added to `MAKEFLAGS`. This allows a recursive `make -n target` to be used to see all of the action that would be taken to update *target*.

Because of widespread historical practice, interpreting a `<number-sign>` (`'#'`) inside a variable as the start of a comment has the unfortunate side-effect of making it impossible to place a `<number-sign>` in a variable, thus forbidding something like:

```
CFLAGS = "-D COMMENT_CHAR='#' "
```

Many historical *make* utilities stop chaining together inference rules when an intermediate target is nonexistent. For example, it might be possible for a *make* to determine that both `.y.c` and `.c.o` could be used to convert a `.y` to a `.o`. Instead, in this case, *make* requires the use of a `.y.o` rule.

The best way to provide portable makefiles is to include all of the rules needed in the makefile itself. The rules provided use only features provided by other parts of this volume of POSIX.1-2008. The default rules include rules for optional commands in this volume of POSIX.1-2008. Only rules pertaining to commands that are provided are needed in an implementation's default set.

Macros used within other macros are evaluated when the new macro is used rather than when the new macro is defined. Therefore:

```
MACRO = value1
NEW = $(MACRO)
MACRO = value2
```

```
target:
 echo $(NEW)
```

would produce *value2* and not *value1* since `NEW` was not expanded until it was needed in the *echo* command line.

Some historical applications have been known to intermix *target\_name* and *macro=name* operands on the command line, expecting that all of the macros are processed before any of the targets are dealt with. Conforming applications do not do this, although some backwards-compatibility support may be included in some implementations.

The following characters in filenames may give trouble: `'=`, `':`, `'`, `'`, `'`, `'`, single-quote, and `'@`. In include filenames, pattern matching characters and `'` `"` `'` should also be avoided, as they may be treated as special by some implementations.

For inference rules, the description of `$<` and `$?` seem similar. However, an example shows the minor difference. In a makefile containing:

```
foo.o: foo.h
```

if `foo.h` is newer than `foo.o`, yet `foo.c` is older than `foo.o`, the built-in rule to make `foo.o` from `foo.c` is used, with `$<` equal to `foo.c` and `$?` equal to `foo.h`. If `foo.c` is also newer than `foo.o`, `$<` is equal to `foo.c` and `$?` is equal to `foo.h foo.c`.

## EXAMPLES

1. The following command:

```
make
```

makes the first target found in the makefile.

2. The following command:

```
make junk
```

97610 makes the target **junk**.

97611 3. The following makefile says that **pgm** depends on two files, **a.o** and **b.o**, and that they in

97612 turn depend on their corresponding source files (**a.c** and **b.c**), and a common file **incl.h**:

97613 `pgm: a.o b.o`

97614 `c99 a.o b.o -o pgm`

97615 `a.o: incl.h a.c`

97616 `c99 -c a.c`

97617 `b.o: incl.h b.c`

97618 `c99 -c b.c`

97619 4. An example for making optimized **.o** files from **.c** files is:

97620 `.c.o:`

97621 `c99 -c -O $*.c`

97622 or:

97623 `.c.o:`

97624 `c99 -c -O $<`

97625 5. The most common use of the archive interface follows. Here, it is assumed that the source

97626 files are all C-language source:

97627 `lib: lib(file1.o) lib(file2.o) lib(file3.o)`

97628 `@echo lib is now up-to-date`

97629 The **.c.a** rule is used to make **file1.o**, **file2.o**, and **file3.o** and insert them into **lib**.

97630 The treatment of escaped <newline> characters throughout the makefile is historical

97631 practice. For example, the inference rule:

97632 `.c.o\`

97633 `:`

97634 works, and the macro:

97635 `f= bar baz\`

97636 `biz`

97637 `a:`

97638 `echo ==$f==`

97639 echoes `"==bar baz biz=="`.

97640 If  `$?`  were:

97641 `/usr/include/stdio.h /usr/include/unistd.h foo.h`

97642 then `$(?D)` would be:

97643 `/usr/include /usr/include .`

97644 and `$(?F)` would be:

97645 `stdio.h unistd.h foo.h`

97646 6. The contents of the built-in rules can be viewed by running:

97647 `make -p -f /dev/null 2>/dev/null`

**RATIONALE**

The *make* utility described in this volume of POSIX.1-2008 is intended to provide the means for changing portable source code into executables that can be run on an POSIX.1-2008-conforming system. It reflects the most common features present in System V and BSD *makes*.

Historically, the *make* utility has been an especially fertile ground for vendor and research organization-specific syntax modifications and extensions. Examples include:

- Syntax supporting parallel execution (such as from various multi-processor vendors, GNU, and others)
- Additional “operators” separating targets and their prerequisites (System V, BSD, and others)
- Specifying that command lines containing the strings “`${MAKE}`” and “`$(MAKE)`” are executed when the `-n` option is specified (GNU and System V)
- Modifications of the meaning of internal macros when referencing libraries (BSD and others)
- Using a single instance of the shell for all of the command lines of the target (BSD and others)
- Allowing `<space>` characters as well as `<tab>` characters to delimit command lines (BSD)
- Adding C preprocessor-style “include” and “ifdef” constructs (System V, GNU, BSD, and others)
- Remote execution of command lines (Sprite and others)
- Specifying additional special targets (BSD, System V, and most others)

Additionally, many vendors and research organizations have rethought the basic concepts of *make*, creating vastly extended, as well as completely new, syntaxes. Each of these versions of *make* fulfills the needs of a different community of users; it is unreasonable for this volume of POSIX.1-2008 to require behavior that would be incompatible (and probably inferior) to historical practice for such a community.

In similar circumstances, when the industry has enough sufficiently incompatible formats as to make them irreconcilable, this volume of POSIX.1-2008 has followed one or both of two courses of action. Commands have been renamed (*cksum*, *echo*, and *pax*) and/or command line options have been provided to select the desired behavior (*grep*, *od*, and *pax*).

Because the syntax specified for the *make* utility is, by and large, a subset of the syntaxes accepted by almost all versions of *make*, it was decided that it would be counter-productive to change the name. And since the makefile itself is a basic unit of portability, it would not be completely effective to reserve a new option letter, such as *make -P*, to achieve the portable behavior. Therefore, the special target **.POSIX** was added to the makefile, allowing users to specify “standard” behavior. This special target does not preclude extensions in the *make* utility, nor does it preclude such extensions being used by the makefile specifying the target; it does, however, preclude any extensions from being applied that could alter the behavior of previously valid syntax; such extensions must be controlled via command line options or new special targets. It is incumbent upon portable makefiles to specify the **.POSIX** special target in order to guarantee that they are not affected by local extensions.

The portable version of *make* described in this reference page is not intended to be the state-of-the-art software generation tool and, as such, some newer and more leading-edge features have not been included. An attempt has been made to describe the portable makefile in a manner that does not preclude such extensions as long as they do not disturb the portable behavior described

here.

When the `-n` option is specified, it is always added to `MAKEFLAGS`. This allows a recursive `make -n target` to be used to see all of the action that would be taken to update *target*.

The definition of `MAKEFLAGS` allows both the System V letter string and the BSD command line formats. The two formats are sufficiently different to allow implementations to support both without ambiguity.

Early proposals stated that an “unquoted” `<number-sign>` was treated as the start of a comment. The *make* utility does not pay any attention to quotes. A `<number-sign>` starts a comment regardless of its surroundings.

The text about “other implementation-defined pathnames may also be tried” in addition to `./makefile` and `./Makefile` is to allow such extensions as `SCCS/s.Makefile` and other variations. It was made an implementation-defined requirement (as opposed to unspecified behavior) to highlight surprising implementations that might select something unexpected like `/etc/Makefile`. XSI-conformant systems also try `./s.makefile`, `SCCS/s.makefile`, `./s.Makefile`, and `SCCS/s.Makefile`.

Early proposals contained the macro `NPROC` as a means of specifying that *make* should use *n* processes to do the work required. While this feature is a valuable extension for many systems, it is not common usage and could require other non-trivial extensions to makefile syntax. This extension is not required by this volume of POSIX.1-2008, but could be provided as a compatible extension. The macro `PARALLEL` is used by some historical systems with essentially the same meaning (but without using a name that is a common system limit value). It is suggested that implementors recognize the existing use of `NPROC` and/or `PARALLEL` as extensions to *make*.

The default rules are based on System V. The default `CC=` value is `c99` instead of `cc` because this volume of POSIX.1-2008 does not standardize the utility named `cc`. Thus, every conforming application would be required to define `CC=c99` to expect to run. There is no advantage conferred by the hope that the makefile might hit the “preferred” compiler because this cannot be guaranteed to work. Also, since the portable makescript can only use the `c99` options, no advantage is conferred in terms of what the script can do. It is a quality-of-implementation issue as to whether `c99` is as valuable as `cc`.

The `-d` option to *make* is frequently used to produce debugging information, but is too implementation-defined to add to this volume of POSIX.1-2008.

The `-p` option is not passed in `MAKEFLAGS` on most historical implementations and to change this would cause many implementations to break without sufficiently increased portability.

Commands that begin with a `<plus-sign>` (`'+'`) are executed even if the `-n` option is present. Based on the GNU version of *make*, the behavior of `-n` when the `<plus-sign>` prefix is encountered has been extended to apply to `-q` and `-t` as well. However, the System V convention of forcing command execution with `-n` when the command line of a target contains either of the strings `"$(MAKE)"` or `"${MAKE}"` has not been adopted. This functionality appeared in early proposals, but the danger of this approach was pointed out with the following example of a portion of a makefile:

```
subdir:
 cd subdir; rm all_the_files; $(MAKE)
```

The loss of the System V behavior in this case is well-balanced by the safety afforded to other makefiles that were not aware of this situation. In any event, the command line `<plus-sign>` prefix can provide the desired functionality.

The double `<colon>` in the target rule format is supported in BSD systems to allow more than

one target line containing the same target name to have commands associated with it. Since this is not functionality described in the SVID or XPG3 it has been allowed as an extension, but not mandated.

The default rules are provided with text specifying that the built-in rules shall be the same as if the listed set were used. The intent is that implementations should be able to use the rules without change, but will be allowed to alter them in ways that do not affect the primary behavior.

The best way to provide portable makefiles is to include all of the rules needed in the makefile itself. The rules provided use only features provided by other portions of this volume of POSIX.1-2008. The default rules include rules for optional commands in this volume of POSIX.1-2008. Only rules pertaining to commands that are provided are needed in the default set of an implementation.

One point of discussion was whether to drop the default rules list from this volume of POSIX.1-2008. They provide convenience, but do not enhance portability of applications. The prime benefit is in portability of users who wish to type *make command* and have the command build from a **command.c** file.

The historical **MAKESHELL** feature was omitted. In some implementations it is used to let a user override the shell to be used to run *make* commands. This was confusing; for a portable *make*, the shell should be chosen by the makefile writer or specified on the *make* command line and not by a user running *make*.

The *make* utilities in most historical implementations process the prerequisites of a target in left-to-right order, and the makefile format requires this. It supports the standard idiom used in many makefiles that produce *yacc* programs; for example:

```
foo: y.tab.o lex.o main.o
 $(CC) $(CFLAGS) -o $@ t.tab.o lex.o main.o
```

In this example, if *make* chose any arbitrary order, the **lex.o** might not be made with the correct **y.tab.h**. Although there may be better ways to express this relationship, it is widely used historically. Implementations that desire to update prerequisites in parallel should require an explicit extension to *make* or the makefile format to accomplish it, as described previously.

The algorithm for determining a new entry for target rules is partially unspecified. Some historical *makes* allow blank, empty, or comment lines within the collection of commands marked by leading <tab> characters. A conforming makefile must ensure that each command starts with a <tab>, but implementations are free to ignore blank, empty, and comment lines without triggering the start of a new entry.

The ASYNCHRONOUS EVENTS section includes having SIGTERM and SIGHUP, along with the more traditional SIGINT and SIGQUIT, remove the current target unless directed not to do so. SIGTERM and SIGHUP were added to parallel other utilities that have historically cleaned up their work as a result of these signals. When *make* receives any signal other than SIGQUIT, it is required to resend itself the signal it received so that it exits with a status that reflects the signal. The results from SIGQUIT are partially unspecified because, on systems that create **core** files upon receipt of SIGQUIT, the **core** from *make* would conflict with a **core** file from the command that was running when the SIGQUIT arrived. The main concern was to prevent damaged files from appearing up-to-date when *make* is rerun.

The **.PRECIOUS** special target was extended to affect all targets globally (by specifying no prerequisites). The **.IGNORE** and **.SILENT** special targets were extended to allow prerequisites; it was judged to be more useful in some cases to be able to turn off errors or echoing for a list of targets than for the entire makefile. These extensions to *make* in System V were made to match

historical practice from the BSD *make*.

Macros are not exported to the environment of commands to be run. This was never the case in any historical *make* and would have serious consequences. The environment is the same as the environment to *make* except that *MAKEFLAGS* and macros defined on the *make* command line are added.

Some implementations do not use *system()* for all command lines, as required by the portable makefile format; as a performance enhancement, they select lines without shell metacharacters for direct execution by *execve()*. There is no requirement that *system()* be used specifically, but merely that the same results be achieved. The metacharacters typically used to bypass the direct *execve()* execution have been any of:

```
= | ^ () ; & < > * ? [] : $ ` ' " \ \n
```

The default in some advanced versions of *make* is to group all the command lines for a target and execute them using a single shell invocation; the System V method is to pass each line individually to a separate shell. The single-shell method has the advantages in performance and the lack of a requirement for many continued lines. However, converting to this newer method has caused portability problems with many historical makefiles, so the behavior with the POSIX makefile is specified to be the same as that of System V. It is suggested that the special target **.ONESHELL** be used as an implementation extension to achieve the single-shell grouping for a target or group of targets.

Novice users of *make* have had difficulty with the historical need to start commands with a <tab>. Since it is often difficult to discern differences between <tab> and <space> characters on terminals or printed listings, confusing bugs can arise. In early proposals, an attempt was made to correct this problem by allowing leading <blank> characters instead of <tab> characters. However, implementors reported many makefiles that failed in subtle ways following this change, and it is difficult to implement a *make* that unambiguously can differentiate between macro and command lines. There is extensive historical practice of allowing leading <space> characters before macro definitions. Forcing macro lines into column 1 would be a significant backwards-compatibility problem for some makefiles. Therefore, historical practice was restored.

There is substantial variation in the handling of include lines by different implementations. However, there is enough commonality for the standard to be able to specify a minimum set of requirements that allow the feature to be used portably. Known variations have been explicitly called out as unspecified behavior in the description.

The System V dynamic dependency feature was not included. It would support:

```
cat: $$@.c
```

that would expand to;

```
cat: cat.c
```

This feature exists only in the new version of System V *make* and, while useful, is not in wide usage. This means that macros are expanded twice for prerequisites: once at makefile parse time and once at target update time.

Consideration was given to adding metarules to the POSIX *make*. This would make **%.o: %.c** the same as **.c.o:**. This is quite useful and available from some vendors, but it would cause too many changes to this *make* to support. It would have introduced rule chaining and new substitution rules. However, the rules for target names have been set to reserve the **'%'** and **'\"'** characters. These are traditionally used to implement metarules and quoting of target names, respectively. Implementors are strongly encouraged to use these characters only for these purposes.

A request was made to extend the suffix delimiter character from a <period> to any character. The metarules feature in newer *makes* solves this problem in a more general way. This volume of POSIX.1-2008 is staying with the more conservative historical definition.

The standard output format for the **-p** option is not described because it is primarily a debugging option and because the format is not generally useful to programs. In historical implementations the output is not suitable for use in generating makefiles. The **-p** format has been variable across historical implementations. Therefore, the definition of **-p** was only to provide a consistently named option for obtaining *make* script debugging information.

Some historical implementations have not cleared the suffix list with **-r**.

Implementations should be aware that some historical applications have intermixed *target\_name* and *macro=value* operands on the command line, expecting that all of the macros are processed before any of the targets are dealt with. Conforming applications do not do this, but some backwards-compatibility support may be warranted.

Empty inference rules are specified with a <semicolon> command rather than omitting all commands, as described in an early proposal. The latter case has no traditional meaning and is reserved for implementation extensions, such as in GNU *make*.

## CHANGE HISTORY

First released in Issue 2.

### Issue 5

The FUTURE DIRECTIONS section is added.

### Issue 6

This utility is marked as part of the Software Development Utilities option.

The Open Group Corrigendum U029/1 is applied, correcting a typographical error in the SPECIAL TARGETS section.

In the ENVIRONMENT VARIABLES section, the *PROJECTDIR* description is updated from “otherwise, the home directory of a user of that name is examined” to “otherwise, the value of *PROJECTDIR* is treated as a user name and that user’s initial working directory is examined”.

It is specified whether the command line is related to the makefile or to the *make* command, and the macro processing rules are updated to align with the IEEE P1003.2b draft standard.

The normative text is reworded to avoid use of the term “must” for application requirements.

PASC Interpretation 1003.2 #193 is applied.

### Issue 7

SD5-XCU-ERN-6 is applied, clarifying that Guideline 9 of the Utility Syntax Guidelines does not apply.

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

Include lines in makefiles are introduced.

97874  
97875  
97876

Austin Group Interpretation 1003.1-2001 #131 is applied, changing the **Makefile Execution** section.

POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0121 [257] is applied.

+

97877 **NAME**

97878       man — display system documentation

97879 **SYNOPSIS**97880       man [-k] *name*...97881 **DESCRIPTION**

97882       The *man* utility shall write information about each of the *name* operands. If *name* is the name of a  
 97883       standard utility, *man* at a minimum shall write a message describing the syntax used by the  
 97884       standard utility, its options, and operands. If more information is available, the *man* utility shall  
 97885       provide it in an implementation-defined manner.

97886       An implementation may provide information for values of *name* other than the standard utilities.  
 97887       Standard utilities that are listed as optional and that are not supported by the implementation  
 97888       either shall cause a brief message indicating that fact to be displayed or shall cause a full display  
 97889       of information as described previously.

97890 **OPTIONS**97891       The *man* utility shall conform to XBD [Section 12.2](#) (on page 215).

97892       The following option shall be supported:

97893       **-k**       Interpret *name* operands as keywords to be used in searching a utilities summary  
 97894       database that contains a brief purpose entry for each standard utility and write lines  
 97895       from the summary database that match any of the keywords. The keyword search shall  
 97896       produce results that are the equivalent of the output of the following command:

```
97897 grep -Ei '
97898 name
97899 name
97900 ...
97901 ' summary-database
```

97902       This assumes that the *summary-database* is a text file with a single entry per line; this  
 97903       organization is not required and the example using *grep -Ei* is merely illustrative of the  
 97904       type of search intended. The purpose entry to be included in the database shall consist  
 97905       of a terse description of the purpose of the utility.

97906 **OPERANDS**

97907       The following operand shall be supported:

97908       *name*       A keyword or the name of a standard utility. When **-k** is not specified and *name*  
 97909       does not represent one of the standard utilities, the results are unspecified.

97910 **STDIN**

97911       Not used.

97912 **INPUT FILES**

97913       None.

97914 **ENVIRONMENT VARIABLES**97915       The following environment variables shall affect the execution of *man*:

97916       **LANG**       Provide a default value for the internationalization variables that are unset or null.  
 97917       (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 97918       variables used to determine the values of locale categories.)

97919       **LC\_ALL**      If set to a non-empty string value, override the values of all the other  
 97920       internationalization variables.

97921 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 97922 characters (for example, single-byte as opposed to multi-byte characters in  
 97923 arguments and in the summary database). The value of *LC\_CTYPE* need not affect  
 97924 the format of the information written about the *name* operands.

97925 **LC\_MESSAGES**  
 97926 Determine the locale that should be used to affect the format and contents of  
 97927 diagnostic messages written to standard error and informative messages written to  
 97928 standard output.

97929 XSI **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

97930 **PAGER** Determine an output filtering command for writing the output to a terminal. Any  
 97931 string acceptable as a *command\_string* operand to the *sh -c* command shall be valid.  
 97932 When standard output is a terminal device, the reference page output shall be  
 97933 piped through the command. If the *PAGER* variable is null or not set, the command  
 97934 shall be either *more* or another paginator utility documented in the system  
 97935 documentation.

## 97936 ASYNCHRONOUS EVENTS

97937 Default.

## 97938 STDOUT

97939 The *man* utility shall write text describing the syntax of the utility *name*, its options and its  
 97940 operands, or, when *-k* is specified, lines from the summary database. The format of this text is  
 97941 implementation-defined.

## 97942 STDERR

97943 The standard error shall be used for diagnostic messages, and may also be used for  
 97944 informational messages of unspecified format.

## 97945 OUTPUT FILES

97946 None.

## 97947 EXTENDED DESCRIPTION

97948 None.

## 97949 EXIT STATUS

97950 The following exit values shall be returned:

97951 0 Successful completion.

97952 >0 An error occurred.

## 97953 CONSEQUENCES OF ERRORS

97954 Default.

## 97955 APPLICATION USAGE

97956 None.

## 97957 EXAMPLES

97958 None.

## 97959 RATIONALE

97960 It is recognized that the *man* utility is only of minimal usefulness as specified. The opinion of the  
 97961 standard developers was strongly divided as to how much or how little information *man* should  
 97962 be required to provide. They considered, however, that the provision of some portable way of  
 97963 accessing documentation would aid user portability. The arguments against a fuller specification  
 97964 were:

- Large quantities of documentation should not be required on a system that does not have excess disk space.
- The current manual system does not present information in a manner that greatly aids user portability.
- A “better help system” is currently an area in which vendors feel that they can add value to their POSIX implementations.

The `-f` option was considered, but due to implementation differences, it was not included in this volume of POSIX.1-2008.

The description was changed to be more specific about what has to be displayed for a utility. The standard developers considered it insufficient to allow a display of only the synopsis without giving a short description of what each option and operand does.

The “purpose” entry to be included in the database can be similar to the section title (less the numeric prefix) from this volume of POSIX.1-2008 for each utility. These titles are similar to those used in historical systems for this purpose.

See *mailx* for rationale concerning the default paginator.

The caveat in the *LC\_CTYPE* description was added because it is not a requirement that an implementation provide reference pages for all of its supported locales on each system; changing *LC\_CTYPE* does not necessarily translate the reference page into another language. This is equivalent to the current state of *LC\_MESSAGES* in POSIX.1-2008—locale-specific messages are not yet a requirement.

The historical *MANPATH* variable is not included in POSIX because no attempt is made to specify naming conventions for reference page files, nor even to mandate that they are files at all. On some implementations they could be a true database, a hypertext file, or even fixed strings within the *man* executable. The standard developers considered the portability of reference pages to be outside their scope of work. However, users should be aware that *MANPATH* is implemented on a number of historical systems and that it can be used to tailor the search pattern for reference pages from the various categories (utilities, functions, file formats, and so on) when the system administrator reveals the location and conventions for reference pages on the system.

The keyword search can rely on at least the text of the section titles from these utility descriptions, and the implementation may add more keywords. The term “section titles” refers to the strings such as:

```
man - Display system documentation
ps - Report process status
```

## FUTURE DIRECTIONS

None.

## CHANGE HISTORY

First released in Issue 4.

98006 **Issue 5**

98007 The FUTURE DIRECTIONS section is added.

98008 **Issue 7**

98009 Austin Group Interpretation 1003.1-2001 #108 is applied, clarifying that informational messages  
98010 may appear on standard error.

98011 **NAME**

98012       mesg — permit or deny messages

98013 **SYNOPSIS**98014       mesg [*y*|*n*]98015 **DESCRIPTION**

98016       The *mesg* utility shall control whether other users are allowed to send messages via *write*, *talk*, or  
 98017       other utilities to a terminal device. The terminal device affected shall be determined by searching  
 98018       for the first terminal in the sequence of devices associated with standard input, standard output,  
 98019       and standard error, respectively. With no arguments, *mesg* shall report the current state without  
 98020       changing it. Processes with appropriate privileges may be able to send messages to the terminal  
 98021       independent of the current state.

98022 **OPTIONS**

98023       None.

98024 **OPERANDS**

98025       The following operands shall be supported in the POSIX locale:

98026       *y*               Grant permission to other users to send messages to the terminal device.98027       *n*               Deny permission to other users to send messages to the terminal device.98028 **STDIN**

98029       Not used.

98030 **INPUT FILES**

98031       None.

98032 **ENVIRONMENT VARIABLES**98033       The following environment variables shall affect the execution of *mesg*:

98034       *LANG*           Provide a default value for the internationalization variables that are unset or null.  
 98035                       (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 98036                       variables used to determine the values of locale categories.)

98037       *LC\_ALL*       If set to a non-empty string value, override the values of all the other  
 98038                       internationalization variables.

98039       *LC\_CTYPE*   Determine the locale for the interpretation of sequences of bytes of text data as  
 98040                       characters (for example, single-byte as opposed to multi-byte characters in  
 98041                       arguments).

98042       *LC\_MESSAGES*

98043                       Determine the locale that should be used to affect the format and contents of  
 98044                       diagnostic messages written (by *mesg*) to standard error.

98045 XSI       *NLSPATH*   Determine the location of message catalogs for the processing of *LC\_MESSAGES*.98046 **ASYNCHRONOUS EVENTS**

98047       Default.

98048 **STDOUT**98049       If no operand is specified, *mesg* shall display the current terminal state in an unspecified format.98050 **STDERR**

98051       The standard error shall be used only for diagnostic messages.

**98052 OUTPUT FILES**

98053 None.

**98054 EXTENDED DESCRIPTION**

98055 None.

**98056 EXIT STATUS**

98057 The following exit values shall be returned:

98058 0 Receiving messages is allowed.

98059 1 Receiving messages is not allowed.

98060 >1 An error occurred.

**98061 CONSEQUENCES OF ERRORS**

98062 Default.

**98063 APPLICATION USAGE**

98064 The mechanism by which the message status of the terminal is changed is unspecified.  
98065 Therefore, unspecified actions may cause the status of the terminal to change after *mesg* has  
98066 successfully completed. These actions may include, but are not limited to: another invocation of  
98067 the *mesg* utility, login procedures; invocation of the *stty* utility, invocation of the *chmod* utility or  
98068 *chmod()* function, and so on.

**98069 EXAMPLES**

98070 None.

**98071 RATIONALE**

98072 The terminal changed by *mesg* is that associated with the standard input, output, or error, rather  
98073 than the controlling terminal for the session. This is because users logged in more than once  
98074 should be able to change any of their login terminals without having to stop the job running in  
98075 those sessions. This is not a security problem involving the terminals of other users because  
98076 appropriate privileges would be required to affect the terminal of another user.

98077 The method of checking each of the first three file descriptors in sequence until a terminal is  
98078 found was adopted from System V.

98079 The file */dev/tty* is not specified for the terminal device because it was thought to be too  
98080 restrictive. Typical environment changes for the *n* operand are that write permissions are  
98081 removed for *others* and *group* from the appropriate device. It was decided to leave the actual  
98082 description of what is done as unspecified because of potential differences between  
98083 implementations.

98084 The format for standard output is unspecified because of differences between historical  
98085 implementations. This output is generally not useful to shell scripts (they can use the exit status),  
98086 so exact parsing of the output is unnecessary.

**98087 FUTURE DIRECTIONS**

98088 None.

**98089 SEE ALSO**

98090 *talk*, *write*

98091 XBD Chapter 8 (on page 173)

98092 **CHANGE HISTORY**

98093 First released in Issue 2.

98094 **Issue 6**

98095 This utility is marked as part of the User Portability Utilities option.

98096 **Issue 7**98097 The *mesg* utility is moved from the User Portability Utilities option to the Base. User Portability  
98098 Utilities is now an option for interactive utilities.

98099 **NAME**98100 `mkdir` — make directories98101 **SYNOPSIS**98102 `mkdir [-p] [-m mode] dir...`98103 **DESCRIPTION**98104 The *mkdir* utility shall create the directories specified by the operands, in the order specified.98105 For each *dir* operand, the *mkdir* utility shall perform actions equivalent to the *mkdir()* function  
98106 defined in the System Interfaces volume of POSIX.1-2008, called with the following arguments:

- 98107 1. The *dir* operand is used as the *path* argument.
- 98108 2. The value of the bitwise-inclusive OR of `S_IRWXU`, `S_IRWXG`, and `S_IRWXO` is used as  
98109 the *mode* argument. (If the `-m` option is specified, the value of the *mkdir()* *mode* argument  
98110 is unspecified, but the directory shall at no time have permissions less restrictive than the  
98111 `-m mode` option-argument.)

98112 **OPTIONS**98113 The *mkdir* utility shall conform to XBD [Section 12.2](#) (on page 215).

98114 The following options shall be supported:

98115 `-m mode` Set the file permission bits of the newly-created directory to the specified *mode*  
98116 value. The *mode* option-argument shall be the same as the *mode* operand defined  
98117 for the *chmod* utility. In the *symbolic\_mode* strings, the *op* characters '+' and '-'  
98118 shall be interpreted relative to an assumed initial mode of *a=rwx*; '+' shall add  
98119 permissions to the default mode, '-' shall delete permissions from the default  
98120 mode.

98121 `-p` Create any missing intermediate pathname components.

98122 For each *dir* operand that does not name an existing directory, before performing  
98123 the actions described in the DESCRIPTION above, the *mkdir* utility shall create any  
98124 pathname components of the path prefix of *dir* that do not name an existing  
98125 directory by performing actions equivalent to first calling the *mkdir()* function with  
98126 the following arguments:

- 98127 1. A pathname naming the missing pathname component, ending with a  
98128 trailing <slash> character, as the *path* argument
- 98129 2. The value zero as the *mode* argument

98130 and then calling the *chmod()* function with the following arguments:

- 98131 1. The same *path* argument as in the *mkdir()* call
- 98132 2. The value `(S_IWUSR|S_IXUSR|~filemask)&0777` as the *mode*  
98133 argument, where *filemask* is the file mode creation mask of the process (see  
98134 XSH [umask\(\)](#))

98135 Each *dir* operand that names an existing directory shall be ignored without error.98136 **OPERANDS**

98137 The following operand shall be supported:

98138 *dir* A pathname of a directory to be created.

98139 **STDIN**

98140 Not used.

98141 **INPUT FILES**

98142 None.

98143 **ENVIRONMENT VARIABLES**98144 The following environment variables shall affect the execution of *mkdir*:

98145 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 98146 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 98147 variables used to determine the values of locale categories.)

98148 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 98149 internationalization variables.

98150 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 98151 characters (for example, single-byte as opposed to multi-byte characters in  
 98152 arguments).

98153 *LC\_MESSAGES*

98154 Determine the locale that should be used to affect the format and contents of  
 98155 diagnostic messages written to standard error.

98156 *XSI* *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

98157 **ASYNCHRONOUS EVENTS**

98158 Default.

98159 **STDOUT**

98160 Not used.

98161 **STDERR**

98162 The standard error shall be used only for diagnostic messages.

98163 **OUTPUT FILES**

98164 None.

98165 **EXTENDED DESCRIPTION**

98166 None.

98167 **EXIT STATUS**

98168 The following exit values shall be returned:

98169 0 All the specified directories were created successfully or the **-p** option was specified and all  
 98170 the specified directories now exist.

98171 &gt;0 An error occurred.

98172 **CONSEQUENCES OF ERRORS**

98173 Default.

**APPLICATION USAGE**

The default file mode for directories is *a=rwx* (777 on most systems) with selected permissions removed in accordance with the file mode creation mask. For intermediate pathname components created by *mkdir*, the mode is the default modified by *u+rwx* so that the subdirectories can always be created regardless of the file mode creation mask; if different ultimate permissions are desired for the intermediate directories, they can be changed afterwards with *chmod*.

Note that some of the requested directories may have been created even if an error occurs.

**EXAMPLES**

None.

**RATIONALE**

The System V *-m* option was included to control the file mode.

The System V *-p* option was included to create any needed intermediate directories and to complement the functionality provided by *rmdir* for removing directories in the path prefix as they become empty. Because no error is produced if any path component already exists, the *-p* option is also useful to ensure that a particular directory exists.

The functionality of *mkdir* is described substantially through a reference to the *mkdir()* function in the System Interfaces volume of POSIX.1-2008. For example, by default, the mode of the directory is affected by the file mode creation mask in accordance with the specified behavior of the *mkdir()* function. In this way, there is less duplication of effort required for describing details of the directory creation.

**FUTURE DIRECTIONS**

None.

**CHANGE HISTORY**

First released in Issue 2.

**Issue 5**

The FUTURE DIRECTIONS section is added.

**Issue 7**

SD5-XCU-ERN-56 is applied, aligning the *-m* option with the IEEE P1003.2b draft standard to clarify an ambiguity.

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0122 [161] is applied.

+

**NAME**

mkfifo — make FIFO special files

**SYNOPSIS**

mkfifo [-m *mode*] *file*...

**DESCRIPTION**

The *mkfifo* utility shall create the FIFO special files specified by the operands, in the order specified.

For each *file* operand, the *mkfifo* utility shall perform actions equivalent to the *mkfifo()* function defined in the System Interfaces volume of POSIX.1-2008, called with the following arguments:

1. The *file* operand is used as the *path* argument.
2. The value of the bitwise-inclusive OR of S\_IRUSR, S\_IWUSR, S\_IRGRP, S\_IWGRP, S\_IROTH, and S\_IWOTH is used as the *mode* argument. (If the -m option is specified, the value of the *mkfifo()* *mode* argument is unspecified, but the FIFO shall at no time have permissions less restrictive than the -m *mode* option-argument.)

**OPTIONS**

The *mkfifo* utility shall conform to XBD [Section 12.2](#) (on page 215).

The following option shall be supported:

-m *mode* Set the file permission bits of the newly-created FIFO to the specified *mode* value. The *mode* option-argument shall be the same as the *mode* operand defined for the *chmod* utility. In the *symbolic\_mode* strings, the *op* characters '+' and '-' shall be interpreted relative to an assumed initial mode of *a=rw*.

**OPERANDS**

The following operand shall be supported:

*file* A pathname of the FIFO special file to be created.

**STDIN**

Not used.

**INPUT FILES**

None.

**ENVIRONMENT VARIABLES**

The following environment variables shall affect the execution of *mkfifo*:

*LANG* Provide a default value for the internationalization variables that are unset or null. (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization variables used to determine the values of locale categories.)

*LC\_ALL* If set to a non-empty string value, override the values of all the other internationalization variables.

*LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as characters (for example, single-byte as opposed to multi-byte characters in arguments).

*LC\_MESSAGES*

Determine the locale that should be used to affect the format and contents of diagnostic messages written to standard error.

| 98272 |     | <b>RATIONALE</b>              |                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 98273 |     |                               | This utility was added to permit shell applications to create FIFO special files.                                                                                                                                                                                                                                                                                                                                                                  |
| 98274 |     |                               | The <b>-m</b> option was added to control the file mode, for consistency with the similar functionality provided by the <i>mkdir</i> utility.                                                                                                                                                                                                                                                                                                      |
| 98276 |     |                               | Early proposals included a <b>-p</b> option similar to the <i>mkdir -p</i> option that created intermediate directories leading up to the FIFO specified by the final component. This was removed because it is not commonly needed and is not common practice with similar utilities.                                                                                                                                                             |
| 98277 |     |                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 98278 |     |                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 98279 |     |                               | The functionality of <i>mkfifo</i> is described substantially through a reference to the <i>mkfifo()</i> function in the System Interfaces volume of POSIX.1-2008. For example, by default, the mode of the FIFO file is affected by the file mode creation mask in accordance with the specified behavior of the <i>mkfifo()</i> function. In this way, there is less duplication of effort required for describing details of the file creation. |

| 98293 | The <b>-m</b> option is aligned with the IEEE P1003.2b draft standard to clarify an ambiguity. |

98294 **NAME**98295 **more** — display files on a page-by-page basis98296 **SYNOPSIS**98297 UP **more** [**-ceisu**] [**-n** *number*] [**-p** *command*] [**-t** *tagstring*] [*file...*]98298 **DESCRIPTION**

98299 The *more* utility shall read files and either write them to the terminal on a page-by-page basis or  
 98300 filter them to standard output. If standard output is not a terminal device, all input files shall be  
 98301 copied to standard output in their entirety, without modification, except as specified for the **-s**  
 98302 option. If standard output is a terminal device, the files shall be written a number of lines (one  
 98303 screenful) at a time under the control of user commands. See the EXTENDED DESCRIPTION  
 98304 section.

98305 Certain block-mode terminals do not have all the capabilities necessary to support the complete  
 98306 *more* definition; they are incapable of accepting commands that are not terminated with a  
 98307 <newline>. Implementations that support such terminals shall provide an operating mode to  
 98308 *more* in which all commands can be terminated with a <newline> on those terminals. This mode:

- 98309 • Shall be documented in the system documentation
- 98310 • Shall, at invocation, inform the user of the terminal deficiency that requires the <newline>  
 98311 usage and provide instructions on how this warning can be suppressed in future  
 98312 invocations
- 98313 • Shall not be required for implementations supporting only fully capable terminals
- 98314 • Shall not affect commands already requiring <newline> characters
- 98315 • Shall not affect users on the capable terminals from using *more* as described in this volume  
 98316 of POSIX.1-2008

98317 **OPTIONS**

98318 The *more* utility shall conform to XBD [Section 12.2](#) (on page 215), except that '+' may be  
 98319 recognized as an option delimiter as well as '-'.

98320 The following options shall be supported:

- 98321 **-c** If a screen is to be written that has no lines in common with the current screen, or  
 98322 *more* is writing its first screen, *more* shall not scroll the screen, but instead shall  
 98323 redraw each line of the screen in turn, from the top of the screen to the bottom. In  
 98324 addition, if *more* is writing its first screen, the screen shall be cleared. This option  
 98325 may be silently ignored on devices with insufficient terminal capabilities.
- 98326 **-e** Exit immediately after writing the last line of the last file in the argument list; see  
 98327 the EXTENDED DESCRIPTION section.
- 98328 **-i** Perform pattern matching in searches without regard to case; see XBD [Section 9.2](#)  
 98329 (on page 182).
- 98330 **-n** *number* Specify the number of lines per screenful. The *number* argument is a positive  
 98331 decimal integer. The **-n** option shall override any values obtained from any other  
 98332 source.
- 98333 **-p** *command* Each time a screen from a new file is displayed or redisplayed (including as a  
 98334 result of *more* commands; for example, **:p**), execute the *more* command(s) in the  
 98335 command arguments in the order specified, as if entered by the user after the first  
 98336 screen has been displayed. No intermediate results shall be displayed (that is, if the  
 98337 command is a movement to a screen different from the normal first screen, only the

98338 screen resulting from the command shall be displayed.) If any of the commands  
 98339 fail for any reason, an informational message to this effect shall be written, and no  
 98340 further commands specified using the **-p** option shall be executed for this file.

98341 **-s** Behave as if consecutive empty lines were a single empty line.

98342 **-t tagstring** Write the screenful of the file containing the tag named by the *tagstring* argument.  
 98343 See the *ctags* utility. The tags feature represented by **-t tagstring** and the **:t**  
 98344 command is optional. It shall be provided on any system that also provides a  
 98345 conforming implementation of *ctags*; otherwise, the use of **-t** produces undefined  
 98346 results.

98347 The filename resulting from the **-t** option shall be logically added as a prefix to the  
 98348 list of command line files, as if specified by the user. If the tag named by the  
 98349 *tagstring* argument is not found, it shall be an error, and *more* shall take no further  
 98350 action.

98351 If the tag specifies a line number, the first line of the display shall contain the  
 98352 beginning of that line. If the tag specifies a pattern, the first line of the display shall  
 98353 contain the beginning of the matching text from the first line of the file that  
 98354 contains that pattern. If the line does not exist in the file or matching text is not  
 98355 found, an informational message to this effect shall be displayed, and *more* shall  
 98356 display the default screen as if **-t** had not been specified.

98357 If both the **-t tagstring** and **-p command** options are given, the **-t tagstring** shall be  
 98358 processed first; that is, the file and starting line for the display shall be as specified  
 98359 by **-t**, and then the **-p more** command shall be executed. If the line (matching text)  
 98360 specified by the **-t** command does not exist (is not found), no **-p more** command  
 98361 shall be executed for this file at any time.

98362 **-u** Treat a <backspace> as a printable control character, displayed as an  
 98363 implementation-defined character sequence (see the EXTENDED DESCRIPTION  
 98364 section), suppressing backspacing and the special handling that produces  
 98365 underlined or standout mode text on some terminal types. Also, do not ignore a  
 98366 <carriage-return> at the end of a line.

## 98367 OPERANDS

98368 The following operand shall be supported:

98369 *file* A pathname of an input file. If no *file* operands are specified, the standard input  
 98370 shall be used. If a *file* is *'-'*, the standard input shall be read at that point in the  
 98371 sequence.

## 98372 STDIN

98373 The standard input shall be used only if no *file* operands are specified, or if a *file* operand is *'-'*.

## 98374 INPUT FILES

98375 The input files being examined shall be text files. If standard output is a terminal, standard error  
 98376 shall be used to read commands from the user. If standard output is a terminal, standard error is  
 98377 not readable, and command input is needed, *more* may attempt to obtain user commands from  
 98378 the controlling terminal (for example, */dev/tty*); otherwise, *more* shall terminate with an error  
 98379 indicating that it was unable to read user commands. If standard output is not a terminal, no  
 98380 error shall result if standard error cannot be opened for reading.

98381 **ENVIRONMENT VARIABLES**98382 The following environment variables shall affect the execution of *more*:

98383 *COLUMNS* Override the system-selected horizontal display line size. See XBD [Chapter 8](#) (on  
98384 page 173) for valid values and results when it is unset or null.

98385 *EDITOR* Used by the *v* command to select an editor. See the EXTENDED DESCRIPTION  
98386 section.

98387 *LANG* Provide a default value for the internationalization variables that are unset or null.  
98388 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
98389 variables used to determine the values of locale categories.)

98390 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
98391 internationalization variables.

98392 *LC\_COLLATE*  
98393 Determine the locale for the behavior of ranges, equivalence classes, and multi-  
98394 character collating elements within regular expressions.

98395 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
98396 characters (for example, single-byte as opposed to multi-byte characters in  
98397 arguments and input files) and the behavior of character classes within regular  
98398 expressions.

98399 *LC\_MESSAGES*  
98400 Determine the locale that should be used to affect the format and contents of  
98401 diagnostic messages written to standard error and informative messages written to  
98402 standard output.

98403 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

98404 *LINES* Override the system-selected vertical screen size, used as the number of lines in a  
98405 screenful. See XBD [Chapter 8](#) (on page 173) for valid values and results when it is  
98406 unset or null. The *-n* option shall take precedence over the *LINES* variable for  
98407 determining the number of lines in a screenful.

98408 *MORE* Determine a string containing options described in the OPTIONS section preceded  
98409 with <hyphen> characters and <blank>-separated as on the command line. Any  
98410 command line options shall be processed after those in the *MORE* variable, as if  
98411 the command line were:

98412 *more \$MORE options operands*

98413 The *MORE* variable shall take precedence over the *TERM* and *LINES* variables for  
98414 determining the number of lines in a screenful.

98415 *TERM* Determine the name of the terminal type. If this variable is unset or null, an  
98416 unspecified default terminal type is used.

98417 **ASYNCHRONOUS EVENTS**

98418 Default.

98419 **STDOUT**

98420 The standard output shall be used to write the contents of the input files.

**STDERR**

The standard error shall be used for diagnostic messages and user commands (see the INPUT FILES section), and, if standard output is a terminal device, to write a prompting string. The prompting string shall appear on the screen line below the last line of the file displayed in the current screenful. The prompt shall contain the name of the file currently being examined and shall contain an end-of-file indication and the name of the next file, if any, when prompting at the end-of-file. If an error or informational message is displayed, it is unspecified whether it is contained in the prompt. If it is not contained in the prompt, it shall be displayed and then the user shall be prompted for a continuation character, at which point another message or the user prompt may be displayed. The prompt is otherwise unspecified. It is unspecified whether informational messages are written for other user commands.

**OUTPUT FILES**

None.

**EXTENDED DESCRIPTION**

The following section describes the behavior of *more* when the standard output is a terminal device. If the standard output is not a terminal device, no options other than *-s* shall have any effect, and all input files shall be copied to standard output otherwise unmodified, at which time *more* shall exit without further action.

The number of lines available per screen shall be determined by the *-n* option, if present, or by examining values in the environment (see the ENVIRONMENT VARIABLES section). If neither method yields a number, an unspecified number of lines shall be used.

The maximum number of lines written shall be one less than this number, because the screen line after the last line written shall be used to write a user prompt and user input. If the number of lines in the screen is less than two, the results are undefined. It is unspecified whether user input is permitted to be longer than the remainder of the single line where the prompt has been written.

The number of columns available per line shall be determined by examining values in the environment (see the ENVIRONMENT VARIABLES section), with a default value as described in XBD Chapter 8 (on page 173).

Lines that are longer than the display shall be folded; the length at which folding occurs is unspecified, but should be appropriate for the output device. Folding may occur between glyphs of single characters that take up multiple display columns.

When standard output is a terminal and *-u* is not specified, *more* shall treat <backspace> and <carriage-return> characters specially:

- A character, followed first by a sequence of *n* <backspace> characters (where *n* is the same as the number of column positions that the character occupies), then by *n* <underscore> characters ('\_'), shall cause that character to be written as underlined text, if the terminal type supports that. The *n* <underscore> characters, followed first by *n* <backspace> characters, then any character with *n* column positions, shall also cause that character to be written as underlined text, if the terminal type supports that.
- A sequence of *n* <backspace> characters (where *n* is the same as the number of column positions that the previous character occupies) that appears between two identical printable characters shall cause the first of those two characters to be written as emboldened text (that is, visually brighter, standout mode, or inverse-video mode), if the terminal type supports that, and the second to be discarded. Immediately subsequent occurrences of <backspace>/character pairs for that same character shall also be discarded. (For example, the sequence "a\ba\ba\ba" is interpreted as a single

emboldened 'a'.)

- The *more* utility shall logically discard all other <backspace> characters from the line as well as the character which precedes them, if any.
- A <carriage-return> at the end of a line shall be ignored, rather than being written as a non-printable character, as described in the next paragraph.

It is implementation-defined how other non-printable characters are written. Implementations should use the same format that they use for the *ex* **print** command; see the OPTIONS section within the *ed* utility. It is unspecified whether a multi-column character shall be separated if it crosses a display line boundary; it shall not be discarded. The behavior is unspecified if the number of columns on the display is less than the number of columns any single character in the line being displayed would occupy.

When each new file is displayed (or redisplayed), *more* shall write the first screen of the file. Once the initial screen has been written, *more* shall prompt for a user command. If the execution of the user command results in a screen that has lines in common with the current screen, and the device has sufficient terminal capabilities, *more* shall scroll the screen; otherwise, it is unspecified whether the screen is scrolled or redrawn.

For all files but the last (including standard input if no file was specified, and for the last file as well, if the **-e** option was not specified), when *more* has written the last line in the file, *more* shall prompt for a user command. This prompt shall contain the name of the next file as well as an indication that *more* has reached end-of-file. If the user command is **f**, <control>-F, <space>, **j**, <newline>, **d**, <control>-D, or **s**, *more* shall display the next file. Otherwise, if displaying the last file, *more* shall exit. Otherwise, *more* shall execute the user command specified.

Several of the commands described in this section display a previous screen from the input stream. In the case that text is being taken from a non-rewindable stream, such as a pipe, it is implementation-defined how much backwards motion is supported. If a command cannot be executed because of a limitation on backwards motion, an error message to this effect shall be displayed, the current screen shall not change, and the user shall be prompted for another command.

If a command cannot be performed because there are insufficient lines to display, *more* shall alert the terminal. If a command cannot be performed because there are insufficient lines to display or a **/** command fails: if the input is the standard input, the last screen in the file may be displayed; otherwise, the current file and screen shall not change, and the user shall be prompted for another command.

The interactive commands in the following sections shall be supported. Some commands can be preceded by a decimal integer, called *count* in the following descriptions. If not specified with the command, *count* shall default to 1. In the following descriptions, *pattern* is a basic regular expression, as described in XBD [Section 9.3](#) (on page 183). The term “examine” is historical usage meaning “open the file for viewing”; for example, *more* **foo** would be expressed as examining file **foo**.

In the following descriptions, unless otherwise specified, *line* is a line in the *more* display, not a line from the file being examined.

In the following descriptions, the *current position* refers to two things:

1. The position of the current line on the screen
2. The line number (in the file) of the current line on the screen

Usually, the line on the screen corresponding to the current position is the third line on the

screen. If this is not possible (there are fewer than three lines to display or this is the first page of the file, or it is the last page of the file), then the current position is either the first or last line on the screen as described later.

## Help

*Synopsis:*     **h**

Write a summary of these commands and other implementation-defined commands. The behavior shall be as if the *more* utility were executed with the **-e** option on a file that contained the summary information. The user shall be prompted as described earlier in this section when end-of-file is reached. If the user command is one of those specified to continue to the next file, *more* shall return to the file and screen state from which the **h** command was executed.

## Scroll Forward One Screenful

*Synopsis:*     **[count]f**  
                 **[count]<control>-F**

Scroll forward *count* lines, with a default of one screenful. If *count* is more than the screen size, only the final screenful shall be written.

## Scroll Backward One Screenful

*Synopsis:*     **[count]b**  
                 **[count]<control>-B**

Scroll backward *count* lines, with a default of one screenful (see the **-n** option). If *count* is more than the screen size, only the final screenful shall be written.

## Scroll Forward One Line

*Synopsis:*     **[count]<space>**  
                 **[count]j**  
                 **[count]<newline>**

Scroll forward *count* lines. The default *count* for the **<space>** shall be one screenful; for **j** and **<newline>**, one line. The entire *count* lines shall be written, even if *count* is more than the screen size.

## Scroll Backward One Line

*Synopsis:*     **[count]k**

Scroll backward *count* lines. The entire *count* lines shall be written, even if *count* is more than the screen size.

## Scroll Forward One Half Screenful

*Synopsis:*     **[count]d**  
                 **[count]<control>-D**

Scroll forward *count* lines, with a default of one half of the screen size. If *count* is specified, it shall become the new default for subsequent **d**, **<control>-D**, and **u** commands.

**Skip Forward One Line**

*Synopsis:*     [*count*]s

Display the screenful beginning with the line *count* lines after the last line on the current screen. If *count* would cause the current position to be such that less than one screenful would be written, the last screenful in the file shall be written.

**Scroll Backward One Half Screenful**

*Synopsis:*     [*count*]u  
              [*count*]<control>-U

Scroll backward *count* lines, with a default of one half of the screen size. If *count* is specified, it shall become the new default for subsequent **d**, <control>-D, **u**, and <control>-U commands. The entire *count* lines shall be written, even if *count* is more than the screen size.

**Go to Beginning of File**

*Synopsis:*     [*count*]g

Display the screenful beginning with line *count*.

**Go to End-of-File**

*Synopsis:*     [*count*]G

If *count* is specified, display the screenful beginning with the line *count*. Otherwise, display the last screenful of the file.

**Refresh the Screen**

*Synopsis:*     r  
              <control>-L

Refresh the screen.

**Discard and Refresh**

*Synopsis:*     R

Refresh the screen, discarding any buffered input. If the current file is non-seekable, buffered input shall not be discarded and the **R** command shall be equivalent to the **r** command.

**Mark Position**

*Synopsis:*     m*letter*

Mark the current position with the letter named by *letter*, where *letter* represents the name of one of the lowercase letters of the portable character set. When a new file is examined, all marks may be lost.

**Return to Mark**

*Synopsis:*     ' *letter*

Return to the position that was previously marked with the letter named by *letter*, making that line the current position.

**Return to Previous Position**

*Synopsis:*     ''

Return to the position from which the last large movement command was executed (where a "large movement" is defined as any movement of more than a screenful of lines). If no such movements have been made, return to the beginning of the file.

**Search Forward for Pattern**

*Synopsis:*     [*count*]/[!]*pattern*<newline>

Display the screenful beginning with the *count*th line containing the pattern. The search shall start after the first line currently displayed. The null regular expression ('/' followed by a <newline>) shall repeat the search using the previous regular expression, with a default *count*. If the character '!' is included, the matching lines shall be those that do not contain the *pattern*. If no match is found for the *pattern*, a message to that effect shall be displayed.

**Search Backward for Pattern**

*Synopsis:*     [*count*?][!]*pattern*<newline>

Display the screenful beginning with the *count*th previous line containing the pattern. The search shall start on the last line before the first line currently displayed. The null regular expression ('?' followed by a <newline>) shall repeat the search using the previous regular expression, with a default *count*. If the character '!' is included, matching lines shall be those that do not contain the *pattern*. If no match is found for the *pattern*, a message to that effect shall be displayed.

**Repeat Search**

*Synopsis:*     [*count*]n

Repeat the previous search for *count*th line containing the last *pattern* (or not containing the last *pattern*, if the previous search was "/" or "?").

**Repeat Search in Reverse**

*Synopsis:*     [*count*]N

Repeat the search in the opposite direction of the previous search for the *count*th line containing the last *pattern* (or not containing the last *pattern*, if the previous search was "/" or "?").

**Examine New File**

*Synopsis:*        :e [*filename*]<newline>

Examine a new file. If the *filename* argument is not specified, the current file (see the :n and :p commands below) shall be re-examined. The *filename* shall be subjected to the process of shell word expansions (see [Section 2.6](#), on page 2327); if more than a single pathname results, the effects are unspecified. If *filename* is a <number-sign> ('#'), the previously examined file shall be re-examined. If *filename* is not accessible for any reason (including that it is a non-seekable file), an error message to this effect shall be displayed and the current file and screen shall not change.

**Examine Next File**

*Synopsis:*        [*count*]:n

Examine the next file. If a number *count* is specified, the *count*th next file shall be examined. If *filename* refers to a non-seekable file, the results are unspecified.

**Examine Previous File**

*Synopsis:*        [*count*]:p

Examine the previous file. If a number *count* is specified, the *count*th previous file shall be examined. If *filename* refers to a non-seekable file, the results are unspecified.

**Go to Tag**

*Synopsis:*        :t *tagstring*<newline>

If the file containing the tag named by the *tagstring* argument is not the current file, examine the file, as if the :e command was executed with that file as the argument. Otherwise, or in addition, display the screenful beginning with the tag, as described for the -t option (see the OPTIONS section). If the *ctags* utility is not supported by the system, the use of :t produces undefined results.

**Invoke Editor**

*Synopsis:*        v

Invoke an editor to edit the current file being examined. If standard input is being examined, the results are unspecified. The name of the editor shall be taken from the environment variable *EDITOR*, or shall default to *vi*. If the last pathname component in *EDITOR* is either *vi* or *ex*, the editor shall be invoked with a -c *linenumber* command line argument, where *linenumber* is the line number of the file line containing the display line currently displayed as the first line of the screen. It is implementation-defined whether line-setting options are passed to editors other than *vi* and *ex*.

When the editor exits, *more* shall resume with the same file and screen as when the editor was invoked.

**Display Position**

*Synopsis:*       =

                  <control>-G

Write a message for which the information references the first byte of the line after the last line of the file on the screen. This message shall include the name of the file currently being examined, its number relative to the total number of files there are to examine, the line number in the file, the byte number and the total bytes in the file, and what percentage of the file precedes the current position. If *more* is reading from standard input, or the file is shorter than a single screen, the line number, the byte number, the total bytes, and the percentage need not be written.

**Quit**

*Synopsis:*       q

                  :q

                  ZZ

Exit *more*.

**EXIT STATUS**

The following exit values shall be returned:

- 0   Successful completion.
- >0   An error occurred.

**CONSEQUENCES OF ERRORS**

If an error is encountered accessing a file when using the **:n** command, *more* shall attempt to examine the next file in the argument list, but the final exit status shall be affected. If an error is encountered accessing a file via the **:p** command, *more* shall attempt to examine the previous file in the argument list, but the final exit status shall be affected. If an error is encountered accessing a file via the **:e** command, *more* shall remain in the current file and the final exit status shall not be affected.

**APPLICATION USAGE**

When the standard output is not a terminal, only the **-s** filter-modification option is effective. This is based on historical practice. For example, a typical implementation of *man* pipes its output through *more -s* to squeeze excess white space for terminal users. When *man* is piped to *lp*, however, it is undesirable for this squeezing to happen.

**EXAMPLES**

The **-p** allows arbitrary commands to be executed at the start of each file. Examples are:

*more -p G file1 file2*  
Examine each file starting with its last screenful.

*more -p 100 file1 file2*  
Examine each file starting with line 100 in the current position (usually the third line, so line 98 would be the first line written).

*more -p /100 file1 file2*  
Examine each file starting with the first line containing the string "100" in the current position

## RATIONALE

The *more* utility, available in BSD and BSD-derived systems, was chosen as the prototype for the POSIX file display program since it is more widely available than either the public-domain program *less* or than *pg*, a pager provided in System V. The 4.4 BSD *more* is the model for the features selected; it is almost fully upwards-compatible from the 4.3 BSD version in wide use and has become more amenable for *vi* users. Several features originally derived from various file editors, found in both *less* and *pg*, have been added to this volume of POSIX.1-2008 as they have proved extremely popular with users.

There are inconsistencies between *more* and *vi* that result from historical practice. For example, the single-character commands **h**, **f**, **b**, and **<space>** are screen movers in *more*, but cursor movers in *vi*. These inconsistencies were maintained because the cursor movements are not applicable to *more* and the powerful functionality achieved without the use of the control key justifies the differences.

The tags interface has been included in a program that is not a text editor because it promotes another degree of consistent operation with *vi*. It is conceivable that the paging environment of *more* would be superior for browsing source code files in some circumstances.

The operating mode referred to for block-mode terminals effectively adds a **<newline>** to each Synopsis line that currently has none. So, for example, **d<newline>** would page one screenful. The mode could be triggered by a command line option, environment variable, or some other method. The details are not imposed by this volume of POSIX.1-2008 because there are so few systems known to support such terminals. Nevertheless, it was considered that all systems should be able to support *more* given the exception cited for this small community of terminals because, in comparison to *vi*, the cursor movements are few and the command set relatively amenable to the optional **<newline>** characters.

Some versions of *more* provide a shell escaping mechanism similar to the *ex* **!** command. The standard developers did not consider that this was necessary in a paginator, particularly given the wide acceptance of multiple window terminals and job control features. (They chose to retain such features in the editors and *mailx* because the shell interaction also gives an opportunity to modify the editing buffer, which is not applicable to *more*.)

The **-p** (position) option replaces the **+** command because of the Utility Syntax Guidelines. The **+command** option is no longer specified by POSIX.1-2008 but may be present in some implementations. In early proposals, it took a *pattern* argument, but historical *less* provided the *more* general facility of a command. It would have been desirable to use the same **-c** as *ex* and *vi*, but the letter was already in use.

The text stating “from a non-rewindable stream ... implementations may limit the amount of backwards motion supported” would allow an implementation that permitted no backwards motion beyond text already on the screen. It was not possible to require a minimum amount of backwards motion that would be effective for all conceivable device types. The implementation should allow the user to back up as far as possible, within device and reasonable memory allocation constraints.

Historically, non-printable characters were displayed using the ARPA standard mappings, which are as follows:

1. Printable characters are left alone.
2. Control characters less than **\177** are represented as followed by the character offset from the **'@'** character in the ASCII map; for example, **\007** is represented as **'G'**.

98732 3. \177 is represented as followed by ' ? '.

98733 The display of characters having their eighth bit set was less standard. Existing implementations  
 98734 use hex (0x00), octal (\000), and a meta-bit display. (The latter displayed characters with their  
 98735 eighth bit set as the two characters "M-", followed by the seven-bit display as described  
 98736 previously.) The latter probably has the best claim to historical practice because it was used with  
 98737 the -v option of 4 BSD and 4 BSD-derived versions of the *cat* utility since 1980.

98738 No specific display format is required by POSIX.1-2008. Implementations are encouraged to  
 98739 conform to historic practice in the absence of any strong reason to diverge.

#### 98740 FUTURE DIRECTIONS

98741 None.

#### 98742 SEE ALSO

98743 [Chapter 2](#) (on page 2319), *ctags*, *ed*, *ex*, *vi*

98744 XBD [Chapter 8](#) (on page 173), [Section 9.2](#) (on page 182), [Section 9.3](#) (on page 183), [Section 12.2](#)  
 98745 (on page 215)

#### 98746 CHANGE HISTORY

98747 First released in Issue 4.

#### 98748 Issue 5

98749 The FUTURE DIRECTIONS section is added.

#### 98750 Issue 6

98751 This utility is marked as part of the User Portability Utilities option.

98752 The obsolescent SYNOPSIS is removed.

98753 The utility has been extensively reworked for alignment with the IEEE P1003.2b draft standard:

- 98754 • Changes have been made as a result of IEEE PASC Interpretations 1003.2 #37 and #109.
- 98755 • The *more* utility should be able to handle underlined and emboldened displays of
- 98756 characters that are wider than a single column position.

#### 98757 Issue 7

98758 Austin Group Interpretation 1003.1-2001 #027 is applied, clarifying that ' +' may be recognized  
 98759 as an option delimiter in the OPTIONS section.

98760 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

98761 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0123 [265] is applied.

+

**NAME**

mv — move files

**SYNOPSIS**

mv [-if] *source\_file target\_file*

mv [-if] *source\_file... target\_dir*

**DESCRIPTION**

In the first synopsis form, the *mv* utility shall move the file named by the *source\_file* operand to the destination specified by the *target\_file*. This first synopsis form is assumed when the final operand does not name an existing directory and is not a symbolic link referring to an existing directory. In this case, if *source\_file* names a non-directory file and *target\_file* ends with a trailing <slash> character, *mv* shall treat this as an error and no *source\_file* operands will be processed. +

In the second synopsis form, *mv* shall move each file named by a *source\_file* operand to a destination file in the existing directory named by the *target\_dir* operand, or referenced if *target\_dir* is a symbolic link referring to an existing directory. The destination path for each *source\_file* shall be the concatenation of the target directory, a single <slash> character if the target did not end in a <slash>, and the last pathname component of the *source\_file*. This second form is assumed when the final operand names an existing directory.

If any operand specifies an existing file of a type not specified by the System Interfaces volume of POSIX.1-2008, the behavior is implementation-defined.

For each *source\_file* the following steps shall be taken:

1. If the destination path exists, the *-f* option is not specified, and either of the following conditions is true:

- a. The permissions of the destination path do not permit writing and the standard input is a terminal.
- b. The *-i* option is specified.

the *mv* utility shall write a prompt to standard error and read a line from standard input. If the response is not affirmative, *mv* shall do nothing more with the current *source\_file* and go on to any remaining *source\_files*.

2. If the *source\_file* operand and destination path name the same existing file, then the destination path shall not be removed, and one of the following shall occur:

- a. No change is made to *source\_file*, no error occurs, and no diagnostic is issued.
- b. No change is made to *source\_file*, a diagnostic is issued to standard error identifying the two names, and the exit status is affected.
- c. If the *source\_file* operand and destination path name distinct directory entries, then the *source\_file* operand is removed, no error occurs, and no diagnostic is issued.

The *mv* utility shall do nothing more with the current *source\_file*, and go on to any remaining *source\_files*.

3. The *mv* utility shall perform actions equivalent to the *rename()* function defined in the System Interfaces volume of POSIX.1-2008, called with the following arguments:

- a. The *source\_file* operand is used as the *old* argument.
- b. The destination path is used as the *new* argument.

If this succeeds, *mv* shall do nothing more with the current *source\_file* and go on to any remaining *source\_files*. If this fails for any reasons other than those described for the *errno*

[EXDEV] in the System Interfaces volume of POSIX.1-2008, *mv* shall write a diagnostic message to standard error, do nothing more with the current *source\_file*, and go on to any remaining *source\_files*.

4. If the destination path exists, and it is a file of type directory and *source\_file* is not a file of type directory, or it is a file not of type directory and *source\_file* is a file of type directory, *mv* shall write a diagnostic message to standard error, do nothing more with the current *source\_file*, and go on to any remaining *source\_files*. If the destination path exists and was created by a previous step, it is unspecified whether this will be treated as an error or the destination path will be overwritten.
5. If the destination path exists, *mv* shall attempt to remove it. If this fails for any reason, *mv* shall write a diagnostic message to standard error, do nothing more with the current *source\_file*, and go on to any remaining *source\_files*.
6. The file hierarchy rooted in *source\_file* shall be duplicated as a file hierarchy rooted in the destination path. If *source\_file* or any of the files below it in the hierarchy are symbolic links, the links themselves shall be duplicated, including their contents, rather than any files to which they refer. The following characteristics of each file in the file hierarchy shall be duplicated:
  - The time of last data modification and time of last access
  - The user ID and group ID
  - The file mode

If the user ID, group ID, or file mode of a regular file cannot be duplicated, the file mode bits `S_ISUID` and `S_ISGID` shall not be duplicated.

When files are duplicated to another file system, the implementation may require that the process invoking *mv* has read access to each file being duplicated.

If files being duplicated to another file system have hard links to other files, it is unspecified whether the files copied to the new file system have the hard links preserved or separate copies are created for the linked files.

If the duplication of the file hierarchy fails for any reason, *mv* shall write a diagnostic message to standard error, do nothing more with the current *source\_file*, and go on to any remaining *source\_files*.

If the duplication of the file characteristics fails for any reason, *mv* shall write a diagnostic message to standard error, but this failure shall not cause *mv* to modify its exit status.
7. The file hierarchy rooted in *source\_file* shall be removed. If this fails for any reason, *mv* shall write a diagnostic message to the standard error, do nothing more with the current *source\_file*, and go on to any remaining *source\_files*.

## OPTIONS

The *mv* utility shall conform to XBD [Section 12.2](#) (on page 215).

The following options shall be supported:

- f** Do not prompt for confirmation if the destination path exists. Any previous occurrence of the **-i** option is ignored.
- i** Prompt for confirmation if the destination path exists. Any previous occurrence of the **-f** option is ignored.

Specifying more than one of the **-f** or **-i** options shall not be considered an error. The last option

98848 specified shall determine the behavior of *mv*.

#### 98849 OPERANDS

98850 The following operands shall be supported:

98851 *source\_file* A pathname of a file or directory to be moved.

98852 *target\_file* A new pathname for the file or directory being moved.

98853 *target\_dir* A pathname of an existing directory into which to move the input files.

#### 98854 STDIN

98855 The standard input shall be used to read an input line in response to each prompt specified in  
98856 the STDERR section. Otherwise, the standard input shall not be used.

#### 98857 INPUT FILES

98858 The input files specified by each *source\_file* operand can be of any file type.

#### 98859 ENVIRONMENT VARIABLES

98860 The following environment variables shall affect the execution of *mv*:

98861 *LANG* Provide a default value for the internationalization variables that are unset or null.  
98862 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
98863 variables used to determine the values of locale categories.)

98864 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
98865 internationalization variables.

98866 *LC\_COLLATE*

98867 Determine the locale for the behavior of ranges, equivalence classes, and multi-  
98868 character collating elements used in the extended regular expression defined for  
98869 the **yesexpr** locale keyword in the *LC\_MESSAGES* category.

98870 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
98871 characters (for example, single-byte as opposed to multi-byte characters in  
98872 arguments and input files), the behavior of character classes used in the extended  
98873 regular expression defined for the **yesexpr** locale keyword in the *LC\_MESSAGES*  
98874 category.

98875 *LC\_MESSAGES*

98876 Determine the locale used to process affirmative responses, and the locale used to  
98877 affect the format and contents of diagnostic messages and prompts written to  
98878 standard error.

98879 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

#### 98880 ASYNCHRONOUS EVENTS

98881 Default.

#### 98882 STDOUT

98883 Not used.

#### 98884 STDERR

98885 Prompts shall be written to the standard error under the conditions specified in the  
98886 DESCRIPTION section. The prompts shall contain the destination pathname, but their format is  
98887 otherwise unspecified. Otherwise, the standard error shall be used only for diagnostic  
98888 messages.

**OUTPUT FILES**

The output files may be of any file type.

**EXTENDED DESCRIPTION**

None.

**EXIT STATUS**

The following exit values shall be returned:

0 All input files were moved successfully.

>0 An error occurred.

**CONSEQUENCES OF ERRORS**

If the copying or removal of *source\_file* is prematurely terminated by a signal or error, *mv* may leave a partial copy of *source\_file* at the source or destination. The *mv* utility shall not modify both *source\_file* and the destination path simultaneously; termination at any point shall leave either *source\_file* or the destination path complete.

**APPLICATION USAGE**

Some implementations mark for update the last file status change timestamp of renamed files and some do not. Applications which make use of the last file status change timestamp may behave differently with respect to renamed files unless they are designed to allow for either behavior.

The specification ensures that *mv a a* will not alter the contents of file **a**, and allows the implementation to issue an error that a file cannot be moved onto itself. Likewise, when **a** and **b** are hard links to the same file, *mv a b* will not alter **b**, but if a diagnostic is not issued, then it is unspecified whether **a** is left untouched (as it would be by the *rename()* function) or unlinked (reducing the link count of **b**).

**EXAMPLES**

If the current directory contains only files **a** (of any type defined by the System Interfaces volume of POSIX.1-2008), **b** (also of any type), and a directory **c**:

```
mv a b c
```

```
mv c d
```

results with the original files **a** and **b** residing in the directory **d** in the current directory.

**RATIONALE**

Early proposals diverged from the SVID and BSD historical practice in that they required that when the destination path exists, the *-f* option is not specified, and input is not a terminal, *mv* fails. This was done for compatibility with *cp*. The current text returns to historical practice. It should be noted that this is consistent with the *rename()* function defined in the System Interfaces volume of POSIX.1-2008, which does not require write permission on the target.

For absolute clarity, paragraph (1), describing the behavior of *mv* when prompting for confirmation, should be interpreted in the following manner:

```
if (exists AND (NOT f_option) AND
 ((not_writable AND input_is_terminal) OR i_option))
```

The *-i* option exists on BSD systems, giving applications and users a way to avoid accidentally unlinking files when moving others. When the standard input is not a terminal, the 4.3 BSD *mv* deletes all existing destination paths without prompting, even when *-i* is specified; this is inconsistent with the behavior of the 4.3 BSD *cp* utility, which always generates an error when the file is unwritable and the standard input is not a terminal. The standard developers decided that use of *-i* is a request for interaction, so when the destination path exists, the utility takes

instructions from whatever responds to standard input.

The `rename()` function is able to move directories within the same file system. Some historical versions of `mv` have been able to move directories, but not to a different file system. The standard developers considered that this was an annoying inconsistency, so this volume of POSIX.1-2008 requires directories to be able to be moved even across file systems. There is no `-R` option to confirm that moving a directory is actually intended, since such an option was not required for moving directories in historical practice. Requiring the application to specify it sometimes, depending on the destination, seemed just as inconsistent. The semantics of the `rename()` function were preserved as much as possible. For example, `mv` is not permitted to “rename” files to or from directories, even though they might be empty and removable.

Historic implementations of `mv` did not exit with a non-zero exit status if they were unable to duplicate any file characteristics when moving a file across file systems, nor did they write a diagnostic message for the user. The former behavior has been preserved to prevent scripts from breaking; a diagnostic message is now required, however, so that users are alerted that the file characteristics have changed.

The exact format of the interactive prompts is unspecified. Only the general nature of the contents of prompts are specified because implementations may desire more descriptive prompts than those used on historical implementations. Therefore, an application not using the `-f` option or using the `-i` option relies on the system to provide the most suitable dialog directly with the user, based on the behavior specified.

When `mv` is dealing with a single file system and `source_file` is a symbolic link, the link itself is moved as a consequence of the dependence on the `rename()` functionality, per the DESCRIPTION. Across file systems, this has to be made explicit.

## FUTURE DIRECTIONS

None.

## CHANGE HISTORY

First released in Issue 2.

### Issue 6

The `mv` utility is changed to describe processing of symbolic links as specified in the IEEE P1003.2b draft standard.

The APPLICATION USAGE section is added.

### Issue 7

Austin Group Interpretation 1003.1-2001 #016 is applied.

Austin Group Interpretation 1003.1-2001 #126 is applied, changing the description of the `LC_MESSAGES` environment variable.

Austin Group Interpretations 1003.1-2001 #164, #168, and #169 are applied.

SD5-XCU-ERN-13 is applied, making an editorial correction to the SYNOPSIS.

SD5-XCU-ERN-51 is applied to the DESCRIPTION, defining the behavior for when files are being duplicated to another file system while having hard links.

|       |                                                                           |                                                                                       |

98979 **NAME**98980 `newgrp` — change to a new group98981 **SYNOPSIS**98982 `newgrp [-l] [group]`98983 **DESCRIPTION**

98984 The *newgrp* utility shall create a new shell execution environment with a new real and effective  
 98985 group identification. Of the attributes listed in [Section 2.12](#) (on page 2353), the new shell  
 98986 execution environment shall retain the working directory, file creation mask, and exported  
 98987 variables from the previous environment (that is, open files, traps, unexported variables, alias  
 98988 definitions, shell functions, and *set* options may be lost). All other aspects of the process  
 98989 environment that are preserved by the *exec* family of functions defined in the System Interfaces  
 98990 volume of POSIX.1-2008 shall also be preserved by *newgrp*; whether other aspects are preserved  
 98991 is unspecified.

98992 A failure to assign the new group identifications (for example, for security or password-related  
 98993 reasons) shall not prevent the new shell execution environment from being created.

98994 The *newgrp* utility shall affect the supplemental groups for the process as follows:

- 98995 • On systems where the effective group ID is normally in the supplementary group list (or  
 98996 whenever the old effective group ID actually is in the supplementary group list):
  - 98997 — If the new effective group ID is also in the supplementary group list, *newgrp* shall  
 98998 change the effective group ID.
  - 98999 — If the new effective group ID is not in the supplementary group list, *newgrp* shall add  
 99000 the new effective group ID to the list, if there is room to add it.
- 99001 • On systems where the effective group ID is not normally in the supplementary group list  
 99002 (or whenever the old effective group ID is not in the supplementary group list):
  - 99003 — If the new effective group ID is in the supplementary group list, *newgrp* shall delete  
 99004 it.
  - 99005 — If the old effective group ID is not in the supplementary list, *newgrp* shall add it if  
 99006 there is room.

99007 **Note:** The System Interfaces volume of POSIX.1-2008 does not specify whether the effective group ID  
 99008 of a process is included in its supplementary group list.

99009 With no operands, *newgrp* shall change the effective group back to the groups identified in the  
 99010 user's user entry, and shall set the list of supplementary groups to that set in the user's group  
 99011 database entries.

99012 If the first argument is `'-'`, the results are unspecified.

99013 If a password is required for the specified group, and the user is not listed as a member of that  
 99014 group in the group database, the user shall be prompted to enter the correct password for that  
 99015 group. If the user is listed as a member of that group, no password shall be requested. If no  
 99016 password is required for the specified group, it is implementation-defined whether users not  
 99017 listed as members of that group can change to that group. Whether or not a password is  
 99018 required, implementation-defined system accounting or security mechanisms may impose  
 99019 additional authorization restrictions that may cause *newgrp* to write a diagnostic message and  
 99020 suppress the changing of the group identification.

**OPTIONS**

The *newgrp* utility shall conform to XBD [Section 12.2](#) (on page 215), except for the unspecified usage of *'-'*.

The following option shall be supported:

**-l** (The letter ell.) Change the environment to what would be expected if the user actually logged in again.

**OPERANDS**

The following operand shall be supported:

*group* A group name from the group database or a non-negative numeric group ID. Specifies the group ID to which the real and effective group IDs shall be set. If *group* is a non-negative numeric string and exists in the group database as a group name (see *getgrnam()*), the numeric group ID associated with that group name shall be used as the group ID.

**STDIN**

Not used.

**INPUT FILES**

The file */dev/tty* shall be used to read a single line of text for password checking, when one is required.

**ENVIRONMENT VARIABLES**

The following environment variables shall affect the execution of *newgrp*:

**LANG** Provide a default value for the internationalization variables that are unset or null. (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization variables used to determine the values of locale categories.)

**LC\_ALL** If set to a non-empty string value, override the values of all the other internationalization variables.

**LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as characters (for example, single-byte as opposed to multi-byte characters in arguments).

**LC\_MESSAGES**

Determine the locale that should be used to affect the format and contents of diagnostic messages written to standard error.

**NSLSPATH** Determine the location of message catalogs for the processing of **LC\_MESSAGES**.

**ASYNCHRONOUS EVENTS**

Default.

**STDOUT**

Not used.

**STDERR**

The standard error shall be used for diagnostic messages and a prompt string for a password, if one is required. Diagnostic messages may be written in cases where the exit status is not available. See the EXIT STATUS section.

**99061 OUTPUT FILES**

99062 None.

**99063 EXTENDED DESCRIPTION**

99064 None.

**99065 EXIT STATUS**

99066 If *newgrp* succeeds in creating a new shell execution environment, whether or not the group  
99067 identification was changed successfully, the exit status shall be the exit status of the shell.  
99068 Otherwise, the following exit value shall be returned:

99069 >0 An error occurred.

**99070 CONSEQUENCES OF ERRORS**

99071 The invoking shell may terminate.

**99072 APPLICATION USAGE**

99073 There is no convenient way to enter a password into the group database. Use of group  
99074 passwords is not encouraged, because by their very nature they encourage poor security  
99075 practices. Group passwords may disappear in the future.

99076 A common implementation of *newgrp* is that the current shell uses *exec* to overlay itself with  
99077 *newgrp*, which in turn overlays itself with a new shell after changing group. On some  
99078 implementations, however, this may not occur and *newgrp* may be invoked as a subprocess.

99079 The *newgrp* command is intended only for use from an interactive terminal. It does not offer a  
99080 useful interface for the support of applications.

99081 The exit status of *newgrp* is generally inapplicable. If *newgrp* is used in a script, in most cases it  
99082 successfully invokes a new shell and the rest of the original shell script is bypassed when the  
99083 new shell exits. Used interactively, *newgrp* displays diagnostic messages to indicate problems.  
99084 But usage such as:

99085 `newgrp foo`  
99086 `echo $?`

99087 is not useful because the new shell might not have access to any status *newgrp* may have  
99088 generated (and most historical systems do not provide this status). A zero status echoed here  
99089 does not necessarily indicate that the user has changed to the new group successfully. Following  
99090 *newgrp* with the *id* command provides a portable means of determining whether the group  
99091 change was successful or not.

**99092 EXAMPLES**

99093 None.

**99094 RATIONALE**

99095 Most historical implementations use one of the *exec* functions to implement the behavior of  
99096 *newgrp*. Errors detected before the *exec* leave the environment unchanged, while errors detected  
99097 after the *exec* leave the user in a changed environment. While it would be useful to have *newgrp*  
99098 issue a diagnostic message to tell the user that the environment changed, it would be  
99099 inappropriate to require this change to some historical implementations.

99100 The password mechanism is allowed in the group database, but how this would be  
99101 implemented is not specified.

99102 The *newgrp* utility was retained in this volume of POSIX.1-2008, even given the existence of the  
99103 multiple group permissions feature in the System Interfaces volume of POSIX.1-2008, for several  
99104 reasons. First, in some implementations, the group ownership of a newly created file is  
99105 determined by the group of the directory in which the file is created, as allowed by the System

99106 Interfaces volume of POSIX.1-2008; on other implementations, the group ownership of a newly  
99107 created file is determined by the effective group ID. On implementations of the latter type,  
99108 *newgrp* allows files to be created with a specific group ownership. Finally, many  
99109 implementations use the real group ID in accounting, and on such systems, *newgrp* allows the  
99110 accounting identity of the user to be changed.

#### 99111 FUTURE DIRECTIONS

99112 None.

#### 99117 CHANGE HISTORY

99118 First released in Issue 2.

#### 99119 Issue 6

99120 This utility is marked as part of the User Portability Utilities option.

99121 The obsolescent SYNOPSIS is removed.

99122 The text describing supplemental groups is no longer conditional on {NGROUPS\_MAX} being  
99123 greater than 1. This is because {NGROUPS\_MAX} now has a minimum value of 8. This is a FIPS  
99124 requirement.

#### 99125 Issue 7

99126 Austin Group Interpretation 1003.1-2001 #027 is applied, clarifying the behavior if the first  
99127 argument is *'-'*.

99128 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

99129 The *newgrp* utility is moved from the User Portability Utilities option to the Base. User  
99130 Portability Utilities is now an option for interactive utilities.

99131 **NAME**99132        *nice* — invoke a utility with an altered nice value99133 **SYNOPSIS**99134        *nice* [*-n increment*] *utility* [*argument...*]99135 **DESCRIPTION**

99136        The *nice* utility shall invoke a utility, requesting that it be run with a different nice value (see  
 99137        XBD [Section 3.240](#), on page 71). With no options, the executed utility shall be run with a nice  
 99138        value that is some implementation-defined quantity greater than or equal to the nice value of the  
 99139        current process. If the user lacks appropriate privileges to affect the nice value in the requested  
 99140        manner, the *nice* utility shall not affect the nice value; in this case, a warning message may be  
 99141        written to standard error, but this shall not prevent the invocation of *utility* or affect the exit  
 99142        status.

99143 **OPTIONS**99144        The *nice* utility shall conform to XBD [Section 12.2](#) (on page 215).

99145        The following option is supported:

99146        *-n increment* A positive or negative decimal integer which shall have the same effect on the  
 99147        execution of the utility as if the utility had called the *nice()* function with the  
 99148        numeric value of the *increment* option-argument.

99149 **OPERANDS**

99150        The following operands shall be supported:

99151        *utility*        The name of a utility that is to be invoked. If the *utility* operand names any of the  
 99152        special built-in utilities in [Section 2.14](#) (on page 2356), the results are undefined.

99153        *argument*      Any string to be supplied as an argument when invoking the utility named by the  
 99154        *utility* operand.

99155 **STDIN**

99156        Not used.

99157 **INPUT FILES**

99158        None.

99159 **ENVIRONMENT VARIABLES**99160        The following environment variables shall affect the execution of *nice*:

99161        *LANG*        Provide a default value for the internationalization variables that are unset or null.  
 99162        (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 99163        variables used to determine the values of locale categories.)

99164        *LC\_ALL*        If set to a non-empty string value, override the values of all the other  
 99165        internationalization variables.

99166        *LC\_CTYPE*      Determine the locale for the interpretation of sequences of bytes of text data as  
 99167        characters (for example, single-byte as opposed to multi-byte characters in  
 99168        arguments).

99169        *LC\_MESSAGES*

99170        Determine the locale that should be used to affect the format and contents of  
 99171        diagnostic messages written to standard error.

99172        *XSIX*        *NLSPATH*      Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

99173 *PATH* Determine the search path used to locate the utility to be invoked. See XBD  
 99174 Chapter 8 (on page 173).

99175 **ASYNCHRONOUS EVENTS**

99176 Default.

99177 **STDOUT**

99178 Not used.

99179 **STDERR**

99180 The standard error shall be used only for diagnostic messages.

99181 **OUTPUT FILES**

99182 None.

99183 **EXTENDED DESCRIPTION**

99184 None.

99185 **EXIT STATUS**

99186 If *utility* is invoked, the exit status of *nice* shall be the exit status of *utility*; otherwise, the *nice*  
 99187 utility shall exit with one of the following values:

99188 1-125 An error occurred in the *nice* utility.

99189 126 The utility specified by *utility* was found but could not be invoked.

99190 127 The utility specified by *utility* could not be found.

99191 **CONSEQUENCES OF ERRORS**

99192 Default.

99193 **APPLICATION USAGE**

99194 The only guaranteed portable uses of this utility are:

99195 *nice utility*

99196 Run *utility* with the default higher or equal nice value.

99197 *nice -n <positive integer> utility*

99198 Run *utility* with a higher nice value.

99199 On some implementations they have no discernible effect on the invoked utility and on some  
 99200 others they are exactly equivalent.

99201 Historical systems have frequently supported the *<positive integer>* up to 20. Since there is no  
 99202 error penalty associated with guessing a number that is too high, users without access to the  
 99203 system conformance document (to see what limits are actually in place) could use the historical 1  
 99204 to 20 range or attempt to use very large numbers if the job should be truly low priority.

99205 The nice value of a process can be displayed using the command:

99206 `ps -o nice`

99207 The *command*, *env*, *nice*, *nohup*, *time*, and *xargs* utilities have been specified to use exit code 127 if  
 99208 an error occurs so that applications can distinguish “failure to find a utility” from “invoked  
 99209 utility exited with an error indication”. The value 127 was chosen because it is not commonly  
 99210 used for other meanings; most utilities use small values for “normal error conditions” and the  
 99211 values above 128 can be confused with termination due to receipt of a signal. The value 126 was  
 99212 chosen in a similar manner to indicate that the utility could be found, but not invoked. Some  
 99213 scripts produce meaningful error messages differentiating the 126 and 127 cases. The distinction  
 99214 between exit codes 126 and 127 is based on KornShell practice that uses 127 when all attempts to  
 99215 *exec* the utility fail with [ENOENT], and uses 126 when any attempt to *exec* the utility fails for

99216 any other reason.

#### 99217 EXAMPLES

99218 None.

#### 99219 RATIONALE

99220 The 4.3 BSD version of *nice* does not check whether *increment* is a valid decimal integer. The  
99221 command *nice -x utility*, for example, would be treated the same as the command *nice --1*  
99222 *utility*. If the user does not have appropriate privileges, this results in a “permission denied”  
99223 error. This is considered a bug.

99224 When a user without appropriate privileges gives a negative *increment*, System V treats it like  
99225 the command *nice -0 utility*, while 4.3 BSD writes a “permission denied” message and does not  
99226 run the utility. The standard specifies the System V behavior together with an optional BSD-style  
99227 “permission denied” message.

99228 The C shell has a built-in version of *nice* that has a different interface from the one described in  
99229 this volume of POSIX.1-2008.

99230 The term “utility” is used, rather than “command”, to highlight the fact that shell compound  
99231 commands, pipelines, and so on, cannot be used. Special built-ins also cannot be used.  
99232 However, “utility” includes user application programs and shell scripts, not just utilities defined  
99233 in this volume of POSIX.1-2008.

99234 Historical implementations of *nice* provide a nice value range of 40 or 41 discrete steps, with the  
99235 default nice value being the midpoint of that range. By default, they raise the nice value of the  
99236 executed utility by 10.

99237 Some historical documentation states that the *increment* value must be within a fixed range. This  
99238 is misleading; the valid *increment* values on any invocation are determined by the current  
99239 process nice value, which is not always the default.

99240 The definition of nice value is not intended to suggest that all processes in a system have  
99241 priorities that are comparable. Scheduling policy extensions such as the realtime priorities in the  
99242 System Interfaces volume of POSIX.1-2008 make the notion of a single underlying priority for all  
99243 scheduling policies problematic. Some implementations may implement the *nice*-related features  
99244 to affect all processes on the system, others to affect just the general time-sharing activities  
99245 implied by this volume of POSIX.1-2008, and others may have no effect at all. Because of the use  
99246 of “implementation-defined” in *nice* and *renice*, a wide range of implementation strategies are  
99247 possible.

99248 Earlier versions of this standard allowed a *-increment* option. This form is no longer specified by  
99249 POSIX.1-2008 but may be present in some implementations.

#### 99250 FUTURE DIRECTIONS

99251 None.

#### 99256 CHANGE HISTORY

99257 First released in Issue 4.

99258 **Issue 6**

99259 This utility is marked as part of the User Portability Utilities option.

99260 The obsolescent SYNOPSIS is removed.

99261 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/18 is applied, deleting a paragraph of  
99262 RATIONALE that referred to text no longer in the standard.

99263 **Issue 7**

99264 Austin Group Interpretation 1003.1-2001 #027 is applied.

99265 SD5-XCU-ERN-32 and SD5-XCU-ERN-33 are applied, updating the DESCRIPTION,  
99266 APPLICATION USAGE, and RATIONALE sections.

99267 The *nice* utility is moved from the User Portability Utilities option to the Base. User Portability  
99268 Utilities is now an option for interactive utilities.

99269 **NAME**

99270 nl — line numbering filter

99271 **SYNOPSIS**

```
99272 xSI nl [-p] [-b type] [-d delim] [-f type] [-h type] [-i incr] [-l num]
99273 [-n format] [-s sep] [-v startnum] [-w width] [file]
```

99274 **DESCRIPTION**

99275 The *nl* utility shall read lines from the named *file* or the standard input if no *file* is named and  
 99276 shall reproduce the lines to standard output. Lines shall be numbered on the left. Additional  
 99277 functionality may be provided in accordance with the command options in effect.

99278 The *nl* utility views the text it reads in terms of logical pages. Line numbering shall be reset at  
 99279 the start of each logical page. A logical page consists of a header, a body, and a footer section.  
 99280 Empty sections are valid. Different line numbering options are independently available for  
 99281 header, body, and footer (for example, no numbering of header and footer lines while  
 99282 numbering blank lines only in the body).

99283 The starts of logical page sections shall be signaled by input lines containing nothing but the  
 99284 following delimiter characters:

| Line     | Start of |
|----------|----------|
| \: \: \: | Header   |
| \: \:    | Body     |
| \:       | Footer   |

99289 Unless otherwise specified, *nl* shall assume the text being read is in a single logical page body.

99290 **OPTIONS**

99291 The *nl* utility shall conform to XBD [Section 12.2](#) (on page 215). Only one file can be named.

99292 The following options shall be supported:

99293 **-b *type*** Specify which logical page body lines shall be numbered. Recognized *types* and  
 99294 their meaning are:

99295 **a** Number all lines.

99296 **t** Number only non-empty lines.

99297 **n** No line numbering.

99298 **pstring** Number only lines that contain the basic regular expression specified in  
 99299 *string*.

99300 The default *type* for logical page body shall be **t** (text lines numbered).

99301 **-d *delim*** Specify the delimiter characters that indicate the start of a logical page section.  
 99302 These can be changed from the default characters "\: " to two user-specified  
 99303 characters. If only one character is entered, the second character shall remain the  
 99304 default character ' : '.

99305 **-f *type*** Specify the same as **b *type*** except for footer. The default for logical page footer shall  
 99306 be **n** (no lines numbered).

99307 **-h *type*** Specify the same as **b *type*** except for header. The default *type* for logical page  
 99308 header shall be **n** (no lines numbered).

|       |                           |                                                                                                                                                                                                                                                                                         |
|-------|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 99309 | <b>-i</b> <i>incr</i>     | Specify the increment value used to number logical page lines. The default shall be 1.                                                                                                                                                                                                  |
| 99310 |                           |                                                                                                                                                                                                                                                                                         |
| 99311 | <b>-l</b> <i>num</i>      | Specify the number of blank lines to be considered as one. For example, <b>-l 2</b> results in only the second adjacent blank line being numbered (if the appropriate <b>-h a</b> , <b>-b a</b> , or <b>-f a</b> option is set). The default shall be 1.                                |
| 99312 |                           |                                                                                                                                                                                                                                                                                         |
| 99313 |                           |                                                                                                                                                                                                                                                                                         |
| 99314 | <b>-n</b> <i>format</i>   | Specify the line numbering format. Recognized values are: <b>ln</b> , left justified, leading zeros suppressed; <b>rn</b> , right justified, leading zeros suppressed; <b>rz</b> , right justified, leading zeros kept. The default <i>format</i> shall be <b>rn</b> (right justified). |
| 99315 |                           |                                                                                                                                                                                                                                                                                         |
| 99316 |                           |                                                                                                                                                                                                                                                                                         |
| 99317 | <b>-p</b>                 | Specify that numbering should not be restarted at logical page delimiters.                                                                                                                                                                                                              |
| 99318 | <b>-s</b> <i>sep</i>      | Specify the characters used in separating the line number and the corresponding text line. The default <i>sep</i> shall be a <tab>.                                                                                                                                                     |
| 99319 |                           |                                                                                                                                                                                                                                                                                         |
| 99320 | <b>-v</b> <i>startnum</i> | Specify the initial value used to number logical page lines. The default shall be 1.                                                                                                                                                                                                    |
| 99321 | <b>-w</b> <i>width</i>    | Specify the number of characters to be used for the line number. The default <i>width</i> shall be 6.                                                                                                                                                                                   |
| 99322 |                           |                                                                                                                                                                                                                                                                                         |

## 99323 OPERANDS

99324 The following operand shall be supported:

|       |             |                                                |
|-------|-------------|------------------------------------------------|
| 99325 | <i>file</i> | A pathname of a text file to be line-numbered. |
|-------|-------------|------------------------------------------------|

## 99326 STDIN

99327 The standard input shall be used if no *file* operand is specified, and shall be used if the *file*  
 99328 operand is '-' and the implementation treats the '-' as meaning standard input. Otherwise,  
 99329 the standard input shall not be used. See the INPUT FILES section.

## 99330 INPUT FILES

99331 The input file shall be a text file.

## 99332 ENVIRONMENT VARIABLES

99333 The following environment variables shall affect the execution of *nl*:

|       |                    |                                                                                                                                                                                                                                                                                                                                                                                              |
|-------|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 99334 | <b>LANG</b>        | Provide a default value for the internationalization variables that are unset or null. (See XBD <a href="#">Section 8.2</a> (on page 174) for the precedence of internationalization variables used to determine the values of locale categories.)                                                                                                                                           |
| 99335 |                    |                                                                                                                                                                                                                                                                                                                                                                                              |
| 99336 |                    |                                                                                                                                                                                                                                                                                                                                                                                              |
| 99337 | <b>LC_ALL</b>      | If set to a non-empty string value, override the values of all the other internationalization variables.                                                                                                                                                                                                                                                                                     |
| 99338 |                    |                                                                                                                                                                                                                                                                                                                                                                                              |
| 99339 | <b>LC_COLLATE</b>  | Determine the locale for the behavior of ranges, equivalence classes, and multi-character collating elements within regular expressions.                                                                                                                                                                                                                                                     |
| 99340 |                    |                                                                                                                                                                                                                                                                                                                                                                                              |
| 99341 |                    |                                                                                                                                                                                                                                                                                                                                                                                              |
| 99342 | <b>LC_CTYPE</b>    | Determine the locale for the interpretation of sequences of bytes of text data as characters (for example, single-byte as opposed to multi-byte characters in arguments and input files), the behavior of character classes within regular expressions, and for deciding which characters are in character class <b>graph</b> (for the <b>-b t</b> , <b>-f t</b> , and <b>-h t</b> options). |
| 99343 |                    |                                                                                                                                                                                                                                                                                                                                                                                              |
| 99344 |                    |                                                                                                                                                                                                                                                                                                                                                                                              |
| 99345 |                    |                                                                                                                                                                                                                                                                                                                                                                                              |
| 99346 |                    |                                                                                                                                                                                                                                                                                                                                                                                              |
| 99347 | <b>LC_MESSAGES</b> | Determine the locale that should be used to affect the format and contents of diagnostic messages written to standard error.                                                                                                                                                                                                                                                                 |
| 99348 |                    |                                                                                                                                                                                                                                                                                                                                                                                              |
| 99349 |                    |                                                                                                                                                                                                                                                                                                                                                                                              |

99350 *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

99351 **ASYNCHRONOUS EVENTS**

99352 Default.

99353 **STDOUT**

99354 The standard output shall be a text file in the following format:

99355 "%s%s%s", *<line number>*, *<separator>*, *<input line>*

99356 where *<line number>* is one of the following numeric formats:

99357 %6d When the **rn** format is used (the default; see **-n**).

99358 %06d When the **rz** format is used.

99359 %-6d When the **ln** format is used.

99360 <empty> When line numbers are suppressed for a portion of the page; the *<separator>* is also suppressed.

99361

99362 In the preceding list, the number 6 is the default width; the **-w** option can change this value.

99363 **STDERR**

99364 The standard error shall be used only for diagnostic messages.

99365 **OUTPUT FILES**

99366 None.

99367 **EXTENDED DESCRIPTION**

99368 None.

99369 **EXIT STATUS**

99370 The following exit values shall be returned:

99371 0 Successful completion.

99372 >0 An error occurred.

99373 **CONSEQUENCES OF ERRORS**

99374 Default.

99375 **APPLICATION USAGE**

99376 In using the **-d delim** option, care should be taken to escape characters that have special meaning to the command interpreter.

99377

99378 **EXAMPLES**

99379 The command:

99380 `nl -v 10 -i 10 -d \!+ file1`

99381 numbers *file1* starting at line number 10 with an increment of 10. The logical page delimiter is

99382 "!+". Note that the '!' has to be escaped when using *cs*h as a command interpreter because of

99383 its history substitution syntax. For *ks*h and *sh* the escape is not necessary, but does not do any

99384 harm.

99385 **RATIONALE**

99386 None.

99387 **FUTURE DIRECTIONS**

99388 None.

99389 **SEE ALSO**99390 *pr*99391 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)99392 **CHANGE HISTORY**

99393 First released in Issue 2.

99394 **Issue 5**99395 The option `[-f type]` is added to the SYNOPSIS. The option descriptions are presented in  
99396 alphabetic order. The description of `-bt` is changed to “Number only non-empty lines”.99397 **Issue 6**99398 The obsolescent behavior allowing the options to be intermingled with the optional *file* operand  
99399 is removed.99400 **Issue 7**

99401 Austin Group Interpretation 1003.1-2001 #092 is applied.

99402 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

99403 **NAME**

99404 nm — write the name list of an object file (DEVELOPMENT)

99405 **SYNOPSIS**

99406 SD nm [-APv] [-g|-u] [-t *format*] *file*...

99407 XSI nm [-APv] [-efox] [-g|-u] [-t *format*] *file*...

99408 **DESCRIPTION**

99409 The *nm* utility shall display symbolic information appearing in the object file, executable file, or

99410 object-file library named by *file*. If no symbolic information is available for a valid input file, the

99411 *nm* utility shall report that fact, but not consider it an error condition.

99412 XSI The default base used when numeric values are written is unspecified. On XSI-conformant

99413 systems, it shall be decimal.

99414 **OPTIONS**99415 The *nm* utility shall conform to XBD [Section 12.2](#) (on page 215).

99416 The following options shall be supported:

99417 **-A** Write the full pathname or library name of an object on each line.99418 XSI **-e** Write only external (global) and static symbol information.

99419 XSI **-f** Produce full output. Write redundant symbols (**.text**, **.data**, and **.bss**), normally

99420 suppressed.

99421 **-g** Write only external (global) symbol information.99422 XSI **-o** Write numeric values in octal (equivalent to **-t o**).99423 **-P** Write information in a portable output format, as specified in the STDOUT section.

99424 **-t *format*** Write each numeric value in the specified format. The format shall be dependent

99425 on the single character used as the *format* option-argument:

99426 XSI d The offset is written in decimal (default).

99427 o The offset is written in octal.

99428 x The offset is written in hexadecimal.

99429 **-u** Write only undefined symbols.99430 **-v** Sort output by value instead of by symbol name.99431 XSI **-x** Write numeric values in hexadecimal (equivalent to **-t x**).99432 **OPERANDS**

99433 The following operand shall be supported:

99434 *file* A pathname of an object file, executable file, or object-file library.99435 **STDIN**

99436 See the INPUT FILES section.

99437 **INPUT FILES**

99438 The input file shall be an object file, an object-file library whose format is the same as those

99439 produced by the *ar* utility for link editing, or an executable file. The *nm* utility may accept

99440 additional implementation-defined object library formats for the input file.

**ENVIRONMENT VARIABLES**

The following environment variables shall affect the execution of *nm*:

**LANG** Provide a default value for the internationalization variables that are unset or null. (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization variables used to determine the values of locale categories.)

**LC\_ALL** If set to a non-empty string value, override the values of all the other internationalization variables.

**LC\_COLLATE**

Determine the locale for character collation information for the symbol-name and symbol-value collation sequences.

**LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as characters (for example, single-byte as opposed to multi-byte characters in arguments).

**LC\_MESSAGES**

Determine the locale that should be used to affect the format and contents of diagnostic messages written to standard error.

**NSI** **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

**ASYNCHRONOUS EVENTS**

Default.

**STDOUT**

If symbolic information is present in the input files, then for each file or for each member of an archive, the *nm* utility shall write the following information to standard output. By default, the format is unspecified, but the output shall be sorted by symbol name according to the collation sequence in the current locale.

- Library or object name, if **-A** is specified
- Symbol name
- Symbol type, which shall either be one of the following single characters or an implementation-defined type represented by a single character:
  - A** Global absolute symbol.
  - a** Local absolute symbol.
  - B** Global “bss” (that is, uninitialized data space) symbol.
  - b** Local bss symbol.
  - D** Global data symbol.
  - d** Local data symbol.
  - T** Global text symbol.
  - t** Local text symbol.
  - U** Undefined symbol.
- Value of the symbol
- The size associated with the symbol, if applicable

This information may be supplemented by additional information specific to the

implementation.

If the **-P** option is specified, the previous information shall be displayed using the following portable format. The three versions differ depending on whether **-t d**, **-t o**, or **-t x** was specified, respectively:

```
"%s%s %s %d %d\n", <library/object name>, <name>, <type>,
 <value>, <size>
```

```
"%s%s %s %o %o\n", <library/object name>, <name>, <type>,
 <value>, <size>
```

```
"%s%s %s %x %x\n", <library/object name>, <name>, <type>,
 <value>, <size>
```

where *<library/object name>* shall be formatted as follows:

- If **-A** is not specified, *<library/object name>* shall be an empty string.
- If **-A** is specified and the corresponding *file* operand does not name a library:

```
"%s: ", <file>
```

- If **-A** is specified and the corresponding *file* operand names a library. In this case, *<object file>* shall name the object file in the library containing the symbol being described:

```
"%s[%s]: ", <file>, <object file>
```

If **-A** is not specified, then if more than one *file* operand is specified or if only one *file* operand is specified and it names a library, *nm* shall write a line identifying the object containing the following symbols before the lines containing those symbols, in the form:

- If the corresponding *file* operand does not name a library:

```
"%s:\n", <file>
```

- If the corresponding *file* operand names a library; in this case, *<object file>* shall be the name of the file in the library containing the following symbols:

```
"%s[%s]:\n", <file>, <object file>
```

If **-P** is specified, but **-t** is not, the format shall be as if **-t x** had been specified.

## STDERR

The standard error shall be used only for diagnostic messages.

## OUTPUT FILES

None.

## EXTENDED DESCRIPTION

None.

## EXIT STATUS

The following exit values shall be returned:

0 Successful completion.

>0 An error occurred.

## CONSEQUENCES OF ERRORS

Default.

**APPLICATION USAGE**

Mechanisms for dynamic linking make this utility less meaningful when applied to an executable file because a dynamically linked executable may omit numerous library routines that would be found in a statically linked executable.

**EXAMPLES**

None.

**RATIONALE**

Historical implementations of *nm* have used different bases for numeric output and supplied different default types of symbols that were reported. The *-t format* option, similar to that used in *od* and *strings*, can be used to specify the numeric base; *-g* and *-u* can be used to restrict the amount of output or the types of symbols included in the output.

The compromise of using *-t format* versus using *-d*, *-o*, and other similar options was necessary because of differences in the meaning of *-o* between implementations. The *-o* option from BSD has been provided here as *-A* to avoid confusion with the *-o* from System V (which has been provided here as *-t* and as *-o* on XSI-conformant systems).

The option list was significantly reduced from that provided by historical implementations.

The *nm* description is a subset of both the System V and BSD *nm* utilities with no specified default output.

It was recognized that mechanisms for dynamic linking make this utility less meaningful when applied to an executable file (because a dynamically linked executable file may omit numerous library routines that would be found in a statically linked executable file), but the value of *nm* during software development was judged to outweigh other limitations.

The default output format of *nm* is not specified because of differences in historical implementations. The *-P* option was added to allow some type of portable output format. After a comparison of the different formats used in SunOS, BSD, SVR3, and SVR4, it was decided to create one that did not match the current format of any of these four systems. The format devised is easy to parse by humans, easy to parse in shell scripts, and does not need to vary depending on locale (because no English descriptions are included). All of the systems currently have the information available to use this format.

The format given in *nm* STDOUT uses <space> characters between the fields, which may be any number of <blank> characters required to align the columns. The single-character types were selected to match historical practice, and the requirement that implementation additions also be single characters made parsing the information easier for shell scripts.

**FUTURE DIRECTIONS**

None.

**CHANGE HISTORY**

First released in Issue 2.

**Issue 6**

This utility is marked as supported when both the User Portability Utilities option and the Software Development Utilities option are supported.

99562 **Issue 7**

99563 The *nm* utility is removed from the User Portability Utilities option. User Portability Utilities is  
99564 now an option for interactive utilities.

99565 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

99566 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0125 [263] and XCU/TC1-2008/0126 +  
99567 [263] are applied.

99568 **NAME**

99569       nohup — invoke a utility immune to hangups

99570 **SYNOPSIS**99571       nohup *utility* [*argument...*]99572 **DESCRIPTION**

99573       The *nohup* utility shall invoke the utility named by the *utility* operand with arguments supplied  
 99574       as the *argument* operands. At the time the named *utility* is invoked, the SIGHUP signal shall be  
 99575       set to be ignored.

99576       If standard input is associated with a terminal, the *nohup* utility may redirect standard input  
 99577       from an unspecified file.

99578       If the standard output is a terminal, all output written by the named *utility* to its standard output  
 99579       shall be appended to the end of the file **nohup.out** in the current directory. If **nohup.out** cannot  
 99580       be created or opened for appending, the output shall be appended to the end of the file  
 99581       **nohup.out** in the directory specified by the *HOME* environment variable. If neither file can be  
 99582       created or opened for appending, *utility* shall not be invoked. If a file is created, the file's  
 99583       permission bits shall be set to S\_IRUSR | S\_IWUSR.

99584       If standard error is a terminal and standard output is open but is not a terminal, all output  
 99585       written by the named utility to its standard error shall be redirected to the same open file  
 99586       description as the standard output. If standard error is a terminal and standard output either is a  
 99587       terminal or is closed, the same output shall instead be appended to the end of the **nohup.out** file  
 99588       as described above.

99589 **OPTIONS**

99590       None.

99591 **OPERANDS**

99592       The following operands shall be supported:

99593       *utility*       The name of a utility that is to be invoked. If the *utility* operand names any of the  
 99594       special built-in utilities in [Section 2.14](#) (on page 2356), the results are undefined.

99595       *argument*    Any string to be supplied as an argument when invoking the utility named by the  
 99596       *utility* operand.

99597 **STDIN**

99598       Not used.

99599 **INPUT FILES**

99600       None.

99601 **ENVIRONMENT VARIABLES**99602       The following environment variables shall affect the execution of *nohup*:

99603       *HOME*       Determine the pathname of the user's home directory: if the output file **nohup.out**  
 99604       cannot be created in the current directory, the *nohup* utility shall use the directory  
 99605       named by *HOME* to create the file.

99606       *LANG*       Provide a default value for the internationalization variables that are unset or null.  
 99607       (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 99608       variables used to determine the values of locale categories.)

99609       *LC\_ALL*      If set to a non-empty string value, override the values of all the other  
 99610       internationalization variables.

99611 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 99612 characters (for example, single-byte as opposed to multi-byte characters in  
 99613 arguments).

99614 *LC\_MESSAGES*  
 99615 Determine the locale that should be used to affect the format and contents of  
 99616 diagnostic messages written to standard error.

99617 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.  
 99618 *PATH* Determine the search path that is used to locate the utility to be invoked. See XBD  
 99619 Chapter 8 (on page 173).

## 99620 ASYNCHRONOUS EVENTS

99621 The *nohup* utility shall take the standard action for all signals except that *SIGHUP* shall be  
 99622 ignored.

## 99623 STDOUT

99624 If the standard output is not a terminal, the standard output of *nohup* shall be the standard  
 99625 output generated by the execution of the *utility* specified by the operands. Otherwise, nothing  
 99626 shall be written to the standard output.

## 99627 STDERR

99628 If the standard output is a terminal, a message shall be written to the standard error, indicating  
 99629 the name of the file to which the output is being appended. The name of the file shall be either  
 99630 **nohup.out** or **\$HOME/nohup.out**.

## 99631 OUTPUT FILES

99632 Output written by the named utility is appended to the file **nohup.out** (or **\$HOME/nohup.out**),  
 99633 if the conditions hold as described in the DESCRIPTION.

## 99634 EXTENDED DESCRIPTION

99635 None.

## 99636 EXIT STATUS

99637 The following exit values shall be returned:

99638 126 The utility specified by *utility* was found but could not be invoked.  
 99639 127 An error occurred in the *nohup* utility or the utility specified by *utility* could not be  
 99640 found.

99641 Otherwise, the exit status of *nohup* shall be that of the utility specified by the *utility* operand.

## 99642 CONSEQUENCES OF ERRORS

99643 Default.

## 99644 APPLICATION USAGE

99645 The *command*, *env*, *nice*, *nohup*, *time*, and *xargs* utilities have been specified to use exit code 127 if  
 99646 an error occurs so that applications can distinguish “failure to find a utility” from “invoked  
 99647 utility exited with an error indication”. The value 127 was chosen because it is not commonly  
 99648 used for other meanings; most utilities use small values for “normal error conditions” and the  
 99649 values above 128 can be confused with termination due to receipt of a signal. The value 126 was  
 99650 chosen in a similar manner to indicate that the utility could be found, but not invoked. Some  
 99651 scripts produce meaningful error messages differentiating the 126 and 127 cases. The distinction  
 99652 between exit codes 126 and 127 is based on KornShell practice that uses 127 when all attempts to  
 99653 *exec* the utility fail with [ENOENT], and uses 126 when any attempt to *exec* the utility fails for  
 99654 any other reason.

**EXAMPLES**

It is frequently desirable to apply *nohup* to pipelines or lists of commands. This can be done by placing pipelines and command lists in a single file; this file can then be invoked as a utility, and the *nohup* applies to everything in the file.

Alternatively, the following command can be used to apply *nohup* to a complex command:

```
nohup sh -c 'complex-command-line' </dev/null
```

**RATIONALE**

The 4.3 BSD version ignores SIGTERM and SIGHUP, and if *./nohup.out* cannot be used, it fails instead of trying to use *\$HOME/nohup.out*.

The *cs*h utility has a built-in version of *nohup* that acts differently from the *nohup* defined in this volume of POSIX.1-2008.

The term *utility* is used, rather than *command*, to highlight the fact that shell compound commands, pipelines, special built-ins, and so on, cannot be used directly. However, *utility* includes user application programs and shell scripts, not just the standard utilities.

Historical versions of the *nohup* utility use default file creation semantics. Some more recent versions use the permissions specified here as an added security precaution.

Some historical implementations ignore SIGQUIT in addition to SIGHUP; others ignore SIGTERM. An early proposal allowed, but did not require, SIGQUIT to be ignored. Several reviewers objected that *nohup* should only modify the handling of SIGHUP as required by this volume of POSIX.1-2008.

Historical versions of *nohup* did not affect standard input, but that causes problems in the common scenario where the user logs into a system, types the command:

```
nohup make &
```

at the prompt, and then logs out. If standard input is not affected by *nohup*, the login session may not terminate for quite some time, since standard input remains open until *make* exits. To avoid this problem, POSIX.1-2008 allows implementations to redirect standard input if it is a terminal. Since the behavior is implementation-defined, portable applications that may run into the problem should redirect standard input themselves. For example, instead of:

```
nohup make &
```

an application can invoke:

```
nohup make </dev/null &
```

**CHANGE HISTORY**

First released in Issue 2.

99694 **Issue 7**  
99695

Austin Group Interpretations 1003.1-2001 #104, #105, and #106 are applied.

## 99696 NAME

99697 od — dump files in various formats

## 99698 SYNOPSIS

99699 od [-v] [-A *address\_base*] [-j *skip*] [-N *count*] [-t *type\_string*]...  
99700 [*file*...]99701 XSI od [-bcdosx] [*file*] [[+] *offset*][.][b]]

## 99702 DESCRIPTION

99703 The *od* utility shall write the contents of its input files to standard output in a user-specified  
99704 format.

## 99705 OPTIONS

99706 The *od* utility shall conform to XBD [Section 12.2](#) (on page 215), except that the order of  
99707 XSI presentation of the **-t** options and the **-bcdosx** options is significant.

99708 The following options shall be supported:

99709 **-A** *address\_base*99710 Specify the input offset base. See the EXTENDED DESCRIPTION section. The  
99711 application shall ensure that the *address\_base* option-argument is a character. The  
99712 characters 'd', 'o', and 'x' specify that the offset base shall be written in  
99713 decimal, octal, or hexadecimal, respectively. The character 'n' specifies that the  
99714 offset shall not be written.99715 XSI **-b** Interpret bytes in octal. This shall be equivalent to **-t o1**.99716 XSI **-c** Interpret bytes as characters specified by the current setting of the *LC\_CTYPE*  
99717 category. Certain non-graphic characters appear as C escapes: "NUL=\0",  
99718 "BS=\b", "FF=\f", "NL=\n", "CR=\r", "HT=\t"; others appear as 3-digit octal  
99719 numbers.99720 XSI **-d** Interpret *words* (two-byte units) in unsigned decimal. This shall be equivalent to  
99721 **-t u2**.99722 **-j** *skip* Jump over *skip* bytes from the beginning of the input. The *od* utility shall read or  
99723 seek past the first *skip* bytes in the concatenated input files. If the combined input is  
99724 not at least *skip* bytes long, the *od* utility shall write a diagnostic message to  
99725 standard error and exit with a non-zero exit status.99726 By default, the *skip* option-argument shall be interpreted as a decimal number.  
99727 With a leading 0x or 0X, the offset shall be interpreted as a hexadecimal number;  
99728 otherwise, with a leading '0', the offset shall be interpreted as an octal number.  
99729 Appending the character 'b', 'k', or 'm' to offset shall cause it to be interpreted  
99730 as a multiple of 512, 1024, or 1048576 bytes, respectively. If the *skip* number is  
99731 hexadecimal, any appended 'b' shall be considered to be the final hexadecimal  
99732 digit.99733 **-N** *count* Format no more than *count* bytes of input. By default, *count* shall be interpreted as  
99734 a decimal number. With a leading 0x or 0X, *count* shall be interpreted as a  
99735 hexadecimal number; otherwise, with a leading '0', it shall be interpreted as an  
99736 octal number. If *count* bytes of input (after successfully skipping, if **-j** *skip* is  
99737 specified) are not available, it shall not be considered an error; the *od* utility shall  
99738 format the input that is available.

|       |     |                             |                                                                                                                             |
|-------|-----|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------|
| 99739 | XSI | <b>-o</b>                   | Interpret <i>words</i> (two-byte units) in octal. This shall be equivalent to <b>-t o2</b> .                                |
| 99740 | XSI | <b>-s</b>                   | Interpret <i>words</i> (two-byte units) in signed decimal. This shall be equivalent to                                      |
| 99741 |     | <b>-t d2</b> .              |                                                                                                                             |
| 99742 |     | <b>-t type_string</b>       |                                                                                                                             |
| 99743 |     |                             | Specify one or more output types. See the EXTENDED DESCRIPTION section. The                                                 |
| 99744 |     |                             | application shall ensure that the <i>type_string</i> option-argument is a string specifying                                 |
| 99745 |     |                             | the types to be used when writing the input data. The string shall consist of the                                           |
| 99746 |     |                             | type specification characters a, c, d, f, o, u, and x, specifying named character,                                          |
| 99747 |     |                             | character, signed decimal, floating point, octal, unsigned decimal, and                                                     |
| 99748 |     |                             | hexadecimal, respectively. The type specification characters d, f, o, u, and x can be                                       |
| 99749 |     |                             | followed by an optional unsigned decimal integer that specifies the number of                                               |
| 99750 |     |                             | bytes to be transformed by each instance of the output type. The type specification                                         |
| 99751 |     |                             | character f can be followed by an optional F, D, or L indicating that the conversion                                        |
| 99752 |     |                             | should be applied to an item of type <b>float</b> , <b>double</b> , or <b>long double</b> , respectively.                   |
| 99753 |     |                             | The type specification characters d, o, u, and x can be followed by an optional C, S,                                       |
| 99754 |     |                             | I, or L indicating that the conversion should be applied to an item of type <b>char</b> ,                                   |
| 99755 |     |                             | <b>short</b> , <b>int</b> , or <b>long</b> , respectively. Multiple types can be concatenated within the                    |
| 99756 |     |                             | same <i>type_string</i> and multiple <b>-t</b> options can be specified. Output lines shall be                              |
| 99757 |     |                             | written for each type specified in the order in which the type specification                                                |
| 99758 |     |                             | characters are specified.                                                                                                   |
| 99759 |     | <b>-v</b>                   | Write all input data. Without the <b>-v</b> option, any number of groups of output lines,                                   |
| 99760 |     |                             | which would be identical to the immediately preceding group of output lines                                                 |
| 99761 |     |                             | (except for the byte offsets), shall be replaced with a line containing only an                                             |
| 99762 |     |                             | <asterisk> (' *').                                                                                                          |
| 99763 | XSI | <b>-x</b>                   | Interpret <i>words</i> (two-byte units) in hexadecimal. This shall be equivalent to <b>-t x2</b> .                          |
| 99764 | XSI |                             | Multiple types can be specified by using multiple <b>-bcdostx</b> options. Output lines are written for                     |
| 99765 |     |                             | each type specified in the order in which the types are specified.                                                          |
| 99766 |     | <b>OPERANDS</b>             |                                                                                                                             |
| 99767 |     |                             | The following operands shall be supported:                                                                                  |
| 99768 |     | <i>file</i>                 | A pathname of a file to be read. If no <i>file</i> operands are specified, the standard input                               |
| 99769 |     |                             | shall be used.                                                                                                              |
| 99770 |     |                             | If there are no more than two operands, none of the <b>-A</b> , <b>-j</b> , <b>-N</b> , <b>-t</b> , or <b>-v</b> options is |
| 99771 |     |                             | specified, and either of the following is true: the first character of the last operand                                     |
| 99772 |     |                             | is a <plus-sign> (' + '), or there are two operands and the first character of the last                                     |
| 99773 | XSI |                             | operand is numeric; the last operand shall be interpreted as an offset operand on                                           |
| 99774 |     |                             | XSI-conformant systems. Under these conditions, the results are unspecified on                                              |
| 99775 |     |                             | systems that are not XSI-conformant systems.                                                                                |
| 99776 | XSI | <b>[+]<i>offset</i>[[b]</b> | The <i>offset</i> operand specifies the offset in the file where dumping is to commence.                                    |
| 99777 |     |                             | This operand is normally interpreted as octal bytes. If ' . ' is appended, the offset                                       |
| 99778 |     |                             | shall be interpreted in decimal. If ' b ' is appended, the offset shall be interpreted                                      |
| 99779 |     |                             | in units of 512 bytes.                                                                                                      |
| 99780 |     | <b>STDIN</b>                |                                                                                                                             |
| 99781 |     |                             | The standard input shall be used if no <i>file</i> operands are specified, and shall be used if a <i>file</i>               |
| 99782 |     |                             | operand is ' - ' and the implementation treats the ' - ' as meaning standard input. Otherwise,                              |
| 99783 |     |                             | the standard input shall not be used. See the INPUT FILES section.                                                          |

99784 **INPUT FILES**

99785 The input files can be any file type.

99786 **ENVIRONMENT VARIABLES**99787 The following environment variables shall affect the execution of *od*:

99788 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 99789 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 99790 variables used to determine the values of locale categories.)

99791 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 99792 internationalization variables.

99793 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 99794 characters (for example, single-byte as opposed to multi-byte characters in  
 99795 arguments and input files).

99796 **LC\_MESSAGES**  
 99797 Determine the locale that should be used to affect the format and contents of  
 99798 diagnostic messages written to standard error.

99799 **LC\_NUMERIC**  
 99800 Determine the locale for selecting the radix character used when writing floating-  
 99801 point formatted output.

99802 XSI **NLSPATH** Determine the location of message catalogs for the processing of **LC\_MESSAGES**.

99803 **ASYNCHRONOUS EVENTS**

99804 Default.

99805 **STDOUT**

99806 See the EXTENDED DESCRIPTION section.

99807 **STDERR**

99808 The standard error shall be used only for diagnostic messages.

99809 **OUTPUT FILES**

99810 None.

99811 **EXTENDED DESCRIPTION**

99812 The *od* utility shall copy sequentially each input file to standard output, transforming the input  
 99813 XSI data according to the output types specified by the **-t** option or the **-bcdosx** options. If no  
 99814 output type is specified, the default output shall be as if **-t oS** had been specified.

99815 The number of bytes transformed by the output type specifier *c* may be variable depending on  
 99816 the **LC\_CTYPE** category.

99817 The default number of bytes transformed by output type specifiers *d*, *f*, *o*, *u*, and *x* corresponds  
 99818 to the various C-language types as follows. If the *c99* compiler is present on the system, these  
 99819 specifiers shall correspond to the sizes used by default in that compiler. Otherwise, these sizes  
 99820 may vary among systems that conform to POSIX.1-2008.

- 99821 • For the type specifier characters *d*, *o*, *u*, and *x*, the default number of bytes shall
- 99822 correspond to the size of the underlying implementation's basic integer type. For these
- 99823 specifier characters, the implementation shall support values of the optional number of
- 99824 bytes to be converted corresponding to the number of bytes in the C-language types **char**,
- 99825 **short**, **int**, and **long**. These numbers can also be specified by an application as the
- 99826 characters '*C*', '*S*', '*I*', and '*L*', respectively. The implementation shall also support
- 99827 the values 1, 2, 4, and 8, even if it provides no C-Language types of those sizes. The

implementation shall support the decimal value corresponding to the C-language type **long long**. The byte order used when interpreting numeric values is implementation-defined, but shall correspond to the order in which a constant of the corresponding type is stored in memory on the system.

- For the type specifier character `f`, the default number of bytes shall correspond to the number of bytes in the underlying implementation's basic double precision floating-point data type. The implementation shall support values of the optional number of bytes to be converted corresponding to the number of bytes in the C-language types **float**, **double**, and **long double**. These numbers can also be specified by an application as the characters `'F'`, `'D'`, and `'L'`, respectively.

The type specifier character `a` specifies that bytes shall be interpreted as named characters from the International Reference Version (IRV) of the ISO/IEC 646:1991 standard. Only the least significant seven bits of each byte shall be used for this type specification. Bytes with the values listed in the following table shall be written using the corresponding names for those characters.

**Table 4-13** Named Characters in *od*

| Value | Name | Value | Name | Value | Name      | Value | Name |
|-------|------|-------|------|-------|-----------|-------|------|
| \000  | nul  | \001  | soh  | \002  | stx       | \003  | etx  |
| \004  | eot  | \005  | enq  | \006  | ack       | \007  | bel  |
| \010  | bs   | \011  | ht   | \012  | lf or nl* | \013  | vt   |
| \014  | ff   | \015  | cr   | \016  | so        | \017  | si   |
| \020  | dle  | \021  | dc1  | \022  | dc2       | \023  | dc3  |
| \024  | dc4  | \025  | nak  | \026  | syn       | \027  | etb  |
| \030  | can  | \031  | em   | \032  | sub       | \033  | esc  |
| \034  | fs   | \035  | gs   | \036  | rs        | \037  | us   |
| \040  | sp   | \177  | del  |       |           |       |      |

**Note:** The `"\012"` value may be written either as `lf` or `nl`.

The type specifier character `c` specifies that bytes shall be interpreted as characters specified by the current setting of the `LC_CTYPE` locale category. Characters listed in the table in XBD Chapter 5 (on page 121) (`'\'`, `'\a'`, `'\b'`, `'\f'`, `'\n'`, `'\r'`, `'\t'`, `'\v'`) shall be written as the corresponding escape sequences, except that `<backslash>` shall be written as a single `<backslash>` and a NUL shall be written as `'\0'`. Other non-printable characters shall be written as one three-digit octal number for each byte in the character. Printable multi-byte characters shall be written in the area corresponding to the first byte of the character; the two-character sequence `"**"` shall be written in the area corresponding to each remaining byte in the character, as an indication that the character is continued. When either the `-j skip` or `-N count` option is specified along with the `c` type specifier, and this results in an attempt to start or finish in the middle of a multi-byte character, the result is implementation-defined.

The input data shall be manipulated in blocks, where a block is defined as a multiple of the least common multiple of the number of bytes transformed by the specified output types. If the least common multiple is greater than 16, the results are unspecified. Each input block shall be written as transformed by each output type, one per written line, in the order that the output types were specified. If the input block size is larger than the number of bytes transformed by the output type, the output type shall sequentially transform the parts of the input block, and the output from each of the transformations shall be separated by one or more `<blank>` characters.

If, as a result of the specification of the `-N` option or end-of-file being reached on the last input file, input data only partially satisfies an output type, the input shall be extended sufficiently

99875 with null bytes to write the last byte of the input.

99876 Unless **-A n** is specified, the first output line produced for each input block shall be preceded by  
 99877 the input offset, cumulative across input files, of the next byte to be written. The format of the  
 99878 input offset is unspecified; however, it shall not contain any <blank> characters, shall start at the  
 99879 first character of the output line, and shall be followed by one or more <blank> characters. In  
 99880 addition, the offset of the byte following the last byte written shall be written after all the input  
 99881 data has been processed, but shall not be followed by any <blank> characters.

99882 If no **-A** option is specified, the input offset base is unspecified.

## 99883 EXIT STATUS

99884 The following exit values shall be returned:

99885 0 All input files were processed successfully.

99886 >0 An error occurred.

## 99887 CONSEQUENCES OF ERRORS

99888 Default.

## 99889 APPLICATION USAGE

99890 XSI-conformant applications are warned not to use filenames starting with '+' or a first  
 99891 operand starting with a numeric character so that the old functionality can be maintained by  
 99892 implementations, unless they specify one of the **-A**, **-j**, or **-N** options. To guarantee that one of  
 99893 these filenames is always interpreted as a filename, an application could always specify the  
 99894 address base format with the **-A** option.

## 99895 EXAMPLES

99896 If a file containing 128 bytes with decimal values zero to 127, in increasing order, is supplied as  
 99897 standard input to the command:

99898 `od -A d -t a`

99899 on an implementation using an input block size of 16 bytes, the standard output, independent of  
 99900 the current locale setting, would be similar to:

```

99901 0000000 nul soh stx etx eot enq ack bel bs ht nl vt ff cr so si
99902 0000016 dle dc1 dc2 dc3 dc4 nak syn etb can em sub esc fs gs rs us
99903 0000032 sp ! " # $ % & ' () * + , - . /
99904 0000048 0 1 2 3 4 5 6 7 8 9 : ; < = > ?
99905 0000064 @ A B C D E F G H I J K L M N O
99906 0000080 P Q R S T U V W X Y Z [\] ^ _
99907 0000096 ` a b c d e f g h i j k l m n o
99908 0000112 p q r s t u v w x y z { | } ~ del
99909 0000128
```

99910 Note that this volume of POSIX.1-2008 allows **nl** or **lf** to be used as the name for the  
 99911 ISO/IEC 646:1991 standard IRV character with decimal value 10. The IRV names this character  
 99912 **lf** (line feed), but traditional implementations have referred to this character as newline (**nl**) and  
 99913 the POSIX locale character set symbolic name for the corresponding character is a <newline>.

99914 The command:

99915 `od -A o -t o2x2x -N 18`

99916 on a system with 32-bit words and an implementation using an input block size of 16 bytes  
 99917 could write 18 bytes in approximately the following format:

99918 `0000000 032056 031440 041123 042040 052516 044530 020043 031464`

```

99919 342e 3320 4253 4420 554e 4958 2023 3334
99920 342e3320 42534420 554e4958 20233334
99921 0000020 032472
99922 353a
99923 353a0000
99924 0000022

```

The command:

```

99926 od -A d -t f -t o4 -t x4 -N 24 -j 0x15

```

on a system with 64-bit doubles (for example, IEEE Std 754-1985 double precision floating-point format) would skip 21 bytes of input data and then write 24 bytes in approximately the following format:

```

99930 0000000 1.000000000000000e+00 1.573500000000000e+01
99931 07774000000 00000000000 10013674121 35341217270
99932 3ff00000 00000000 402f3851 eb851eb8
99933 0000016 1.406682300000000e+02
99934 10030312542 04370303230
99935 40619562 23e18698
99936 0000024

```

## RATIONALE

The *od* utility went through several names in early proposals, including *hd*, *xd*, and most recently *hexdump*. There were several objections to all of these based on the following reasons:

- The *hd* and *xd* names conflicted with historical utilities that behaved differently.
- The *hexdump* description was much more complex than needed for a simple dump utility.
- The *od* utility has been available on all historical implementations and there was no need to create a new name for a utility so similar to the historical *od* utility.

The original reasons for not standardizing historical *od* were also fairly widespread. Those reasons are given below along with rationale explaining why the standard developers believe that this version does not suffer from the indicated problem:

- The BSD and System V versions of *od* have diverged, and the intersection of features provided by both does not meet the needs of the user community. In fact, the System V version only provides a mechanism for dumping octal bytes and **shorts**, signed and unsigned decimal **shorts**, hexadecimal **shorts**, and ASCII characters. BSD added the ability to dump **floats**, **doubles**, named ASCII characters, and octal, signed decimal, unsigned decimal, and hexadecimal **longs**. The version presented here provides more normalized forms for dumping bytes, **shorts**, **ints**, and **longs** in octal, signed decimal, unsigned decimal, and hexadecimal; **float**, **double**, and **long double**; and named ASCII as well as current locale characters.
- It would not be possible to come up with a compatible superset of the BSD and System V flags that met the requirements of the standard developers. The historical default *od* output is the specified default output of this utility. None of the option letters chosen for this version of *od* conflict with any of the options to historical versions of *od*.
- On systems with different sizes for **short**, **int**, and **long**, there was no way to ask for dumps of **ints**, even in the BSD version. Because of the way options are named, the name space could not be extended to solve these problems. This is why the **-t** option was added (with type specifiers more closely matched to the *printf()* formats used in the rest of this volume of POSIX.1-2008) and the optional field sizes were added to the **d**, **f**, **o**, **u**, and **x** type

specifiers. It is also one of the reasons why the historical practice was not mandated as a required obsolescent form of *od*. (Although the old versions of *od* are not listed as an obsolescent form, implementations are urged to continue to recognize the older forms for several more years.) The *a*, *c*, *f*, *o*, and *x* types match the meaning of the corresponding format characters in the historical implementations of *od* except for the default sizes of the fields converted. The *d* format is signed in this volume of POSIX.1-2008 to match the *printf()* notation. (Historical versions of *od* used *d* as a synonym for *u* in this version. The System V implementation uses *s* for signed decimal; BSD uses *i* for signed decimal and *s* for null-terminated strings.) Other than *d* and *u*, all of the type specifiers match format characters in the historical BSD version of *od*.

The sizes of the C-language types **char**, **short**, **int**, **long**, **float**, **double**, and **long double** are used even though it is recognized that there may be zero or more than one compiler for the C language on an implementation and that they may use different sizes for some of these types. (For example, one compiler might use 2 bytes **shorts**, 2 bytes **ints**, and 4 bytes **longs**, while another compiler (or an option to the same compiler) uses 2 bytes **shorts**, 4 bytes **ints**, and 4 bytes **longs**.) Nonetheless, there has to be a basic size known by the implementation for these types, corresponding to the values reported by invocations of the *getconf* utility when called with *system\_var* operands {UCHAR\_MAX}, {USHORT\_MAX}, {UINT\_MAX}, and {ULONG\_MAX} for the types **char**, **short**, **int**, and **long**, respectively. There are similar constants required by the ISO C standard, but not required by the System Interfaces volume of POSIX.1-2008 or this volume of POSIX.1-2008. They are {FLT\_MANT\_DIG}, {DBL\_MANT\_DIG}, and {LDBL\_MANT\_DIG} for the types **float**, **double**, and **long double**, respectively. If the optional *c99* utility is provided by the implementation and used as specified by this volume of POSIX.1-2008, these are the sizes that would be provided. If an option is used that specifies different sizes for these types, there is no guarantee that the *od* utility is able to interpret binary data output by such a program correctly.

This volume of POSIX.1-2008 requires that the numeric values of these lengths be recognized by the *od* utility and that symbolic forms also be recognized. Thus, a conforming application can always look at an array of **unsigned long** data elements using *od -t uL*.

- The method of specifying the format for the address field based on specifying a starting offset in a file unnecessarily tied the two together. The **-A** option now specifies the address base and the **-S** option specifies a starting offset.
- It would be difficult to break the dependence on US ASCII to achieve an internationalized utility. It does not seem to be any harder for *od* to dump characters in the current locale than it is for the *ed* or *sed* **l** commands. The **c** type specifier does this without difficulty and is completely compatible with the historical implementations of the **c** format character when the current locale uses a superset of the ISO/IEC 646:1991 standard as a codeset. The **a** type specifier (from the BSD **a** format character) was left as a portable means to dump ASCII (or more correctly ISO/IEC 646:1991 standard (IRV)) so that headers produced by *pax* could be deciphered even on systems that do not use the ISO/IEC 646:1991 standard as a subset of their base codeset.

The use of **"\*\*"** as an indication of continuation of a multi-byte character in **c** specifier output was chosen based on seeing an implementation that uses this method. The continuation bytes have to be marked in a way that is not ambiguous with another single-byte or multi-byte character.

An early proposal used **-S** and **-n**, respectively, for the **-j** and **-N** options eventually selected. These were changed to avoid conflicts with historical implementations.

- 100014 The original standard specified **-t o2** as the default when no output type was given. This was  
100015 changed to **-t oS** (the length of a **short**) to accommodate a supercomputer implementation that  
100016 historically used 64 bits as its default (and that defined shorts as 64 bits). This change should not  
100017 affect conforming applications. The requirement to support lengths of 1, 2, and 4 was added at  
100018 the same time to address an historical implementation that had no two-byte data types in its C  
100019 compiler.
- 100020 The use of a basic integer data type is intended to allow the implementation to choose a word  
100021 size commonly used by applications on that architecture.
- 100022 Earlier versions of this standard allowed for implementations with bytes other than eight bits,  
100023 but this has been modified in this version.
- 100024 **FUTURE DIRECTIONS**
- 100025 All option and operand interfaces marked XSI may be removed in a future version.

- 100033 The FUTURE DIRECTIONS section is modified.
- 100034 **Issue 6**
- 100035 The *od* utility is changed to remove the assumption that **short** was a two-byte entity, as per the  
100036 revisions in the IEEE P1003.2b draft standard.
- 100037 The normative text is reworded to avoid use of the term “must” for application requirements.
- 100038 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/33 is applied, correcting the examples  
100039 which used an undefined **-n** option, which should have been **-N**.
- 100040 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/19 is applied, removing text describing  
100041 behavior on systems with bytes consisting of more than eight bits.
- 100042 **Issue 7**
- 100043 Austin Group Interpretation 1003.1-2001 #092 is applied.
- 100044 SD5-XCU-ERN-37 is applied, updating the OPERANDS section.
- 100045 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

100046 **NAME**100047 `paste` — merge corresponding or subsequent lines of files100048 **SYNOPSIS**100049 `paste [-s] [-d list] file...`100050 **DESCRIPTION**100051 The *paste* utility shall concatenate the corresponding lines of the given input files, and write the  
100052 resulting lines to standard output.100053 The default operation of *paste* shall concatenate the corresponding lines of the input files. The  
100054 <newline> of every line except the line from the last input file shall be replaced with a <tab>.100055 If an end-of-file condition is detected on one or more input files, but not all input files, *paste* shall  
100056 behave as though empty lines were read from the files on which end-of-file was detected, unless  
100057 the **-s** option is specified.100058 **OPTIONS**100059 The *paste* utility shall conform to XBD [Section 12.2](#) (on page 215).

100060 The following options shall be supported:

100061 **-d *list*** Unless a <backslash> character appears in *list*, each character in *list* is an element  
100062 specifying a delimiter character. If a <backslash> character appears in *list*, the  
100063 <backslash> character and one or more characters following it are an element  
100064 specifying a delimiter character as described below. These elements specify one or  
100065 more delimiters to use, instead of the default <tab>, to replace the <newline> of  
100066 the input lines. The elements in *list* shall be used circularly; that is, when the list is  
100067 exhausted the first element from the list is reused. When the **-s** option is specified:

- 100068
- The last <newline> in a file shall not be modified.
  - The delimiter shall be reset to the first element of *list* after each *file* operand is  
100069 processed.
- 100070

100071 When the **-s** option is not specified:

- 100072
- The <newline> characters in the file specified by the last *file* operand shall  
100073 not be modified.
  - The delimiter shall be reset to the first element of *list* each time a line is  
100074 processed from each file.
- 100075

100076 If a <backslash> character appears in *list*, it and the character following it shall be  
100077 used to represent the following delimiter characters:100078 `\n` <newline>.100079 `\t` <tab>.100080 `\\` <backslash> character.100081 `\0` Empty string (not a null character). If '`\0`' is immediately followed by the  
100082 character '`x`', the character '`X`', or any character defined by the *LC\_CTYPE*  
100083 **digit** keyword (see XBD [Chapter 7](#), on page 135), the results are unspecified.

100084 If any other characters follow the &lt;backslash&gt;, the results are unspecified.

100085 **-s** Concatenate all of the lines of each separate input file in command line order. The  
100086 <newline> of every line except the last line in each input file shall be replaced with  
100087 the <tab>, unless otherwise specified by the **-d** option.

**100088 OPERANDS**

100089 The following operand shall be supported:

100090 *file* A pathname of an input file. If '-' is specified for one or more of the *files*, the  
 100091 standard input shall be used; the standard input shall be read one line at a time,  
 100092 circularly, for each instance of '-'. Implementations shall support pasting of at  
 100093 least 12 *file* operands.

**100094 STDIN**

100095 The standard input shall be used only if one or more *file* operands is '-'. See the INPUT FILES  
 100096 section.

**100097 INPUT FILES**

100098 The input files shall be text files, except that line lengths shall be unlimited.

**100099 ENVIRONMENT VARIABLES**

100100 The following environment variables shall affect the execution of *paste*:

100101 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 100102 (See XBD Section 8.2 (on page 174) the precedence of internationalization variables  
 100103 used to determine the values of locale categories.)

100104 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 100105 internationalization variables.

100106 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 100107 characters (for example, single-byte as opposed to multi-byte characters in  
 100108 arguments and input files).

100109 *LC\_MESSAGES*

100110 Determine the locale that should be used to affect the format and contents of  
 100111 diagnostic messages written to standard error.

100112 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

**100113 ASYNCHRONOUS EVENTS**

100114 Default.

**100115 STDOUT**

100116 Concatenated lines of input files shall be separated by the <tab> (or other characters under the  
 100117 control of the -d option) and terminated by a <newline>.

**100118 STDERR**

100119 The standard error shall be used only for diagnostic messages.

**100120 OUTPUT FILES**

100121 None.

**100122 EXTENDED DESCRIPTION**

100123 None.

**100124 EXIT STATUS**

100125 The following exit values shall be returned:

100126 0 Successful completion.

100127 >0 An error occurred.

## 100128 CONSEQUENCES OF ERRORS

100129 If one or more input files cannot be opened when the `-s` option is not specified, a diagnostic  
 100130 message shall be written to standard error, but no output is written to standard output. If the `-s`  
 100131 option is specified, the *paste* utility shall provide the default behavior described in [Section 1.4](#) (on  
 100132 page 2310).

## 100133 APPLICATION USAGE

100134 When the escape sequences of the *list* option-argument are used in a shell script, they must be  
 100135 quoted; otherwise, the shell treats the `<backslash>` as a special character.

100136 Conforming applications should only use the specific `<backslash>`-escaped delimiters presented  
 100137 in this volume of POSIX.1-2008. Historical implementations treat `'\x'`, where `'x'` is not in this  
 100138 list, as `'x'`, but future implementations are free to expand this list to recognize other common  
 100139 escapes similar to those accepted by *printf* and other standard utilities.

100140 Most of the standard utilities work on text files. The *cut* utility can be used to turn files with  
 100141 arbitrary line lengths into a set of text files containing the same data. The *paste* utility can be used  
 100142 to create (or recreate) files with arbitrary line lengths. For example, if *file* contains long lines:

```
100143 cut -b 1-500 -n file > file1
100144 cut -b 501- -n file > file2
```

100145 creates **file1** (a text file) with lines no longer than 500 bytes (plus the `<newline>`) and **file2** that  
 100146 contains the remainder of the data from *file*. Note that **file2** is not a text file if there are lines in  
 100147 *file* that are longer than 500 + `{LINE_MAX}` bytes. The original file can be recreated from **file1**  
 100148 and **file2** using the command:

```
100149 paste -d "\0" file1 file2 > file
```

100150 The commands:

```
100151 paste -d "\0" ...
100152 paste -d "" ...
```

100153 are not necessarily equivalent; the latter is not specified by this volume of POSIX.1-2008 and  
 100154 may result in an error. The construct `'\0'` is used to mean “no separator” because historical  
 100155 versions of *paste* did not follow the syntax guidelines, and the command:

```
100156 paste -d"" ...
```

100157 could not be handled properly by *getopt()*.

## 100158 EXAMPLES

100159 1. Write out a directory in four columns:

```
100160 ls | paste - - - -
```

100161 2. Combine pairs of lines from a file into single lines:

```
100162 paste -s -d "\t\n" file
```

## 100163 RATIONALE

100164 None.

## 100165 FUTURE DIRECTIONS

100166 None.

100167 **SEE ALSO**100168 [Section 1.4](#) (on page 2310), *cut*, *grep*, *pr*100169 XBD [Chapter 7](#) (on page 135), [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)100170 **CHANGE HISTORY**

100171 First released in Issue 2.

100172 **Issue 6**

100173 The normative text is reworded to avoid use of the term “must” for application requirements.

100174 **Issue 7**

100175 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

## 100176 NAME

100177 patch — apply changes to files

## 100178 SYNOPSIS

100179 patch [-blNR] [-c|-e|-n|-u] [-d *dir*] [-D *define*] [-i *patchfile*]  
 100180 [-o *outfile*] [-p *num*] [-r *rejectfile*] [*file*]

## 100181 DESCRIPTION

100182 The *patch* utility shall read a source (patch) file containing any of four forms of difference (diff)  
 100183 listings produced by the *diff* utility (normal, copied context, unified context, or in the style of *ed*)  
 100184 and apply those differences to a file. By default, *patch* shall read from the standard input.

100185 The *patch* utility shall attempt to determine the type of the *diff* listing, unless overruled by a *-c*,  
 100186 *-e*, *-n*, or *-u* option.

100187 If the patch file contains more than one patch, *patch* shall attempt to apply each of them as if they  
 100188 came from separate patch files. (In this case, the application shall ensure that the name of the  
 100189 patch file is determinable for each *diff* listing.)

## 100190 OPTIONS

100191 The *patch* utility shall conform to XBD [Section 12.2](#) (on page 215).

100192 The following options shall be supported:

100193 *-b* Save a copy of the original contents of each modified file, before the differences are  
 100194 applied, in a file of the same name with the suffix **.orig** appended to it. If the file  
 100195 already exists, it shall be overwritten; if multiple patches are applied to the same  
 100196 file, the **.orig** file shall be written only for the first patch. When the *-o outfile* option  
 100197 is also specified, *file.orig* shall not be created but, if *outfile* already exists, *outfile.orig*  
 100198 shall be created.

100199 *-c* Interpret the patch file as a copied context difference (the output of the utility *diff*  
 100200 when the *-c* or *-C* options are specified).

100201 *-d dir* Change the current directory to *dir* before processing as described in the  
 100202 EXTENDED DESCRIPTION section.

100203 *-D define* Mark changes with one of the following C preprocessor constructs:

```
100204 #ifdef define
100205 ...
100206 #endif

100207 #ifndef define
100208 ...
100209 #endif
```

100210 optionally combined with the C preprocessor construct **#else**. If the patched file is  
 100211 processed with the C preprocessor, where the macro *define* is defined, the output  
 100212 shall contain the changes from the patch file; otherwise, the output shall not  
 100213 contain the patches specified in the patch file.

100214 *-e* Interpret the patch file as an *ed* script, rather than a *diff* script.

100215 *-i patchfile* Read the patch information from the file named by the pathname *patchfile*, rather  
 100216 than the standard input.

100217 *-l* (The letter ell.) Cause any sequence of <blank> characters in the difference script to  
 100218 match any sequence of <blank> characters in the input file. Other characters shall  
 100219 be matched exactly.

|        |                      |                                                                                                      |
|--------|----------------------|------------------------------------------------------------------------------------------------------|
| 100220 | <b>-n</b>            | Interpret the script as a normal difference.                                                         |
| 100221 | <b>-N</b>            | Ignore patches where the differences have already been applied to the file; by                       |
| 100222 |                      | default, already-applied patches shall be rejected.                                                  |
| 100223 | <b>-o outfile</b>    | Instead of modifying the files (specified by the <i>file</i> operand or the difference               |
| 100224 |                      | listings) directly, write a copy of the file referenced by each patch, with the                      |
| 100225 |                      | appropriate differences applied, to <i>outfile</i> . Multiple patches for a single file shall be     |
| 100226 |                      | applied to the intermediate versions of the file created by any previous patches,                    |
| 100227 |                      | and shall result in multiple, concatenated versions of the file being written to                     |
| 100228 |                      | <i>outfile</i> .                                                                                     |
| 100229 | <b>-p num</b>        | For all pathnames in the patch file that indicate the names of files to be patched,                  |
| 100230 |                      | delete <i>num</i> pathname components from the beginning of each pathname. If the                    |
| 100231 |                      | pathname in the patch file is absolute, any leading <slash> characters shall be                      |
| 100232 |                      | considered the first component (that is, <b>-p 1</b> shall remove the leading <slash>                |
| 100233 |                      | characters). Specifying <b>-p 0</b> shall cause the full pathname to be used. If <b>-p</b> is not    |
| 100234 |                      | specified, only the basename (the final pathname component) shall be used.                           |
| 100235 | <b>-R</b>            | Reverse the sense of the patch script; that is, assume that the difference script was                |
| 100236 |                      | created from the new version to the old version. The <b>-R</b> option cannot be used                 |
| 100237 |                      | with <i>ed</i> scripts. The <i>patch</i> utility shall attempt to reverse each portion of the script |
| 100238 |                      | before applying it. Rejected differences shall be saved in swapped format. If this                   |
| 100239 |                      | option is not specified, and until a portion of the patch file is successfully applied,              |
| 100240 |                      | <i>patch</i> attempts to apply each portion in its reversed sense as well as in its normal           |
| 100241 |                      | sense. If the attempt is successful, the user shall be prompted to determine whether                 |
| 100242 |                      | the <b>-R</b> option should be set.                                                                  |
| 100243 | <b>-r rejectfile</b> | Override the default reject filename. In the default case, the reject file shall have the            |
| 100244 |                      | same name as the output file, with the suffix <b>.rej</b> appended to it; see <a href="#">Patch</a>  |
| 100245 |                      | <a href="#">Application</a> (on page 3023).                                                          |
| 100246 | <b>-u</b>            | Interpret the patch file as a unified context difference (the output of the <i>diff</i> utility      |
| 100247 |                      | when the <b>-u</b> or <b>-U</b> options are specified).                                              |

#### 100248 OPERANDS

100249 The following operand shall be supported:

100250 *file* A pathname of a file to patch.

#### 100251 STDIN

100252 See the INPUT FILES section.

#### 100253 INPUT FILES

100254 Input files shall be text files.

#### 100255 ENVIRONMENT VARIABLES

100256 The following environment variables shall affect the execution of *patch*:

100257 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 100258 (See XBD [Section 8.2](#) (on page 174) the precedence of internationalization variables  
 100259 used to determine the values of locale categories.)

100260 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 100261 internationalization variables.

100262 *LC\_COLLATE*  
 100263 Determine the locale for the behavior of ranges, equivalence classes, and multi-  
 100264 character collating elements used in the extended regular expression defined for

|        |                                                                                                                                                                                                                                                                                                                                                                                          |                                                                                                                                                                                                                                                                                                                                                           |
|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| 100303 | If all lines (including headers) within a patch begin with the same leading sequence of <blank> characters, the <i>patch</i> utility shall remove this sequence before proceeding. Within each patch, if the type of difference is common context, the <i>patch</i> utility shall recognize the following expressions:                                                                   |                                                                                                                                                                                                                                                                                                                                                           |
| 100304 |                                                                                                                                                                                                                                                                                                                                                                                          |                                                                                                                                                                                                                                                                                                                                                           |
| 100305 |                                                                                                                                                                                                                                                                                                                                                                                          |                                                                                                                                                                                                                                                                                                                                                           |
| 100306 |                                                                                                                                                                                                                                                                                                                                                                                          |                                                                                                                                                                                                                                                                                                                                                           |

100307 \*\*\* *filename timestamp*  
 100308 The patches arose from *filename*.

100309 --- *filename timestamp*  
 100310 The patches should be applied to *filename*.

100311 If the type of difference is unified context, the *patch* utility shall recognize the following  
 100312 expressions:

100313 --- *filename timestamp*  
 100314 The patches arose from *filename*.

100315 +++ *filename timestamp*  
 100316 The patches should be applied to *filename*.

100317 Each hunk within a patch shall be the *diff* output to change a line range within the original file.  
 100318 The line numbers for successive hunks within a patch shall occur in ascending order.

### 100319 Filename Determination

100320 If no *file* operand is specified, *patch* shall perform the following steps to determine the filename  
 100321 to use:

- 100322 1. If the type of *diff* is context, the *patch* utility shall delete pathname components (as  
 100323 specified by the **-p** option) from the filename on the line beginning with "\*\*\*\*" (if copied  
 100324 context) or "---" (if unified context), then test for the existence of this file relative to the  
 100325 current directory (or the directory specified with the **-d** option). If the file exists, the *patch*  
 100326 utility shall use this filename.
- 100327 2. If the type of *diff* is context, the *patch* utility shall delete the pathname components (as  
 100328 specified by the **-p** option) from the filename on the line beginning with "---" (if copied  
 100329 context) or "+++" (if unified context), then test for the existence of this file relative to the  
 100330 current directory (or the directory specified with the **-d** option). If the file exists, the *patch*  
 100331 utility shall use this filename.
- 100332 3. If the header information contains a line beginning with the string **Index:**, the *patch* utility  
 100333 shall delete pathname components (as specified by the **-p** option) from this line, then test  
 100334 for the existence of this file relative to the current directory (or the directory specified  
 100335 with the **-d** option). If the file exists, the *patch* utility shall use this filename.
- 100336 XSI 4. If an **SCCS** directory exists in the current directory, *patch* shall attempt to perform a **get -e**  
 100337 **SCCS/s.filename** command to retrieve an editable version of the file. If the file exists, the  
 100338 *patch* utility shall use this filename.
- 100339 5. The *patch* utility shall write a prompt to standard output and request a filename  
 100340 interactively from the controlling terminal (for example, **/dev/tty**).

### 100341 Patch Application

100342 If the **-c**, **-e**, **-n**, or **-u** option is present, the *patch* utility shall interpret information within each  
 100343 hunk as a copied context difference, an *ed* difference, a normal difference, or a unified context  
 100344 difference, respectively. In the absence of any of these options, the *patch* utility shall determine  
 100345 the type of difference based on the format of information within the hunk.

100346 For each hunk, the *patch* utility shall begin to search for the place to apply the patch at the line  
 100347 number at the beginning of the hunk, plus or minus any offset used in applying the previous  
 100348 hunk. If lines matching the hunk context are not found, *patch* shall scan both forwards and  
 100349 backwards at least 1 000 bytes for a set of lines that match the hunk context.

100350 If no such place is found and it is a context difference, then another scan shall take place,  
100351 ignoring the first and last line of context. If that fails, the first two and last two lines of context  
100352 shall be ignored and another scan shall be made. Implementations may search more extensively  
100353 for installation locations.

100354 If no location can be found, the *patch* utility shall append the hunk to the reject file. A rejected  
100355 hunk that is a copied context difference, an *ed* difference, or a normal difference shall be written  
100356 in copied-context-difference format regardless of the format of the patch file. It is  
100357 implementation-defined whether a rejected hunk that is a unified context difference is written in  
100358 copied-context-difference format or in unified-context-difference format. If the input was a  
100359 normal or *ed*-style difference, the reject file may contain differences with zero lines of context.  
100360 The line numbers on the hunks in the reject file may be different from the line numbers in the  
100361 patch file since they shall reflect the approximate locations for the failed hunks in the new file  
100362 rather than the old one.

100363 If the type of patch is an *ed* diff, the implementation may accomplish the patching by invoking  
100364 the *ed* utility.

#### 100365 EXIT STATUS

100366 The following exit values shall be returned:

- 100367 0 Successful completion.
- 100368 1 One or more lines were written to a reject file.
- 100369 >1 An error occurred.

#### 100370 CONSEQUENCES OF ERRORS

100371 Patches that cannot be correctly placed in the file shall be written to a reject file.

#### 100372 APPLICATION USAGE

100373 The **-R** option does not work with *ed* scripts because there is too little information to reconstruct  
100374 the reverse operation.

100375 The **-p** option makes it possible to customize a patch file to local user directory structures  
100376 without manually editing the patch file. For example, if the filename in the patch file was:

100377 `/curds/whey/src/blurfl/blurfl.c`

100378 Setting **-p 0** gives the entire pathname unmodified; **-p 1** gives:

100379 `curds/whey/src/blurfl/blurfl.c`

100380 without the leading <slash>, **-p 4** gives:

100381 `blurfl/blurfl.c`

100382 and not specifying **-p** at all gives:

100383 `blurfl.c` .

#### 100384 EXAMPLES

100385 None.

#### 100386 RATIONALE

100387 Some of the functionality in historical *patch* implementations was not specified. The following  
100388 documents those features present in historical implementations that have not been specified.

100389 A deleted piece of functionality was the '+' pseudo-option allowing an additional set of options  
100390 and a patch file operand to be given. This was seen as being insufficiently useful to standardize.

100391 In historical implementations, if the string "Prereq:" appeared in the header, the *patch* utility

would search for the corresponding version information (the string specified in the header, delimited by <blank> characters or the beginning or end of a line or the file) anywhere in the original file. This was deleted as too simplistic and insufficiently trustworthy a mechanism to standardize. For example, if:

Prereq: 1.2

were in the header, the presence of a delimited 1.2 anywhere in the file would satisfy the prerequisite.

The following options were dropped from historical implementations of *patch* as insufficiently useful to standardize:

**-b** The **-b** option historically provided a method for changing the name extension of the backup file from the default **.orig**. This option has been modified and retained in this volume of POSIX.1-2008.

**-F** The **-F** option specified the number of lines of a context diff to ignore when searching for a place to install a patch.

**-f** The **-f** option historically caused *patch* not to request additional information from the user.

**-r** The **-r** option historically provided a method of overriding the extension of the reject file from the default **.rej**.

**-s** The **-s** option historically caused *patch* to work silently unless an error occurred.

**-x** The **-x** option historically set internal debugging flags.

In some file system implementations, the saving of a **.orig** file may produce unwanted results. In the case of 12, 13, or 14-character filenames (on file systems supporting 14-character maximum filenames), the **.orig** file overwrites the new file. The reject file may also exceed this filename limit. It was suggested, due to some historical practice, that a <tilde> ('~') suffix be used instead of **.orig** and some other character instead of the **.rej** suffix. This was rejected because it is not obvious to the user which file is which. The suffixes **.orig** and **.rej** are clearer and more understandable.

The **-b** option has the opposite sense in some historical implementations—do not save the **.orig** file. The default case here is not to save the files, making *patch* behave more consistently with the other standard utilities.

The **-w** option in early proposals was changed to **-l** to match historical practice.

The **-N** option was included because without it, a non-interactive application cannot reject previously applied patches. For example, if a user is piping the output of *diff* into the *patch* utility, and the user only wants to patch a file to a newer version non-interactively, the **-N** option is required.

Changes to the **-l** option description were proposed to allow matching across <newline> characters in addition to just <blank> characters. Since this is not historical practice, and since some ambiguities could result, it is suggested that future developments in this area utilize another option letter, such as **-L**.

The **-u** option of GNU *patch* has been added, along with support for unified context formats.

100432 **FUTURE DIRECTIONS**

100433 None.

100434 **SEE ALSO**100435 *diff, ed*100436 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)100437 **CHANGE HISTORY**

100438 First released in Issue 4.

100439 **Issue 5**

100440 The FUTURE DIRECTIONS section is added.

100441 **Issue 6**

100442 This utility is marked as part of the User Portability Utilities option.

100443 The description of the **-D** option and the steps in [Filename Determination](#) (on page 3023) are  
100444 changed to match historical practice as defined in the IEEE P1003.2b draft standard.

100445 The normative text is reworded to avoid use of the term “must” for application requirements.

100446 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/34 is applied, clarifying the way that the  
100447 *patch* utility performs **ifdef** selection for the **-D** option.100448 **Issue 7**100449 The *patch* utility is moved from the User Portability Utilities option to the Base. User Portability  
100450 Utilities is now an option for interactive utilities.

100451 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

100452 SD5-XCU-ERN-103 and SD5-XCU-ERN-120 are applied, adding the **-u** option.100453 Austin Group Interpretation 1003.1-2001 #126 is applied, changing the description of the  
100454 *LC\_MESSAGES* and *LC\_CTYPE* environment variables and adding the *LC\_COLLATE*  
100455 environment variable.

100456 **NAME**

100457 pathchk — check pathnames

100458 **SYNOPSIS**100459 pathchk [-p] [-P] *pathname*...100460 **DESCRIPTION**

100461 The *pathchk* utility shall check that one or more pathnames are valid (that is, they could be used  
 100462 to access or create a file without causing syntax errors) and portable (that is, no filename  
 100463 truncation results). More extensive portability checks are provided by the **-p** and **-P** options.

100464 By default, the *pathchk* utility shall check each component of each *pathname* operand based on the  
 100465 underlying file system. A diagnostic shall be written for each *pathname* operand that:

- 100466 • Is longer than {PATH\_MAX} bytes (see **Pathname Variable Values** in XBD [<limits.h>](#))
- 100467 • Contains any component longer than {NAME\_MAX} bytes in its containing directory
- 100468 • Contains any component in a directory that is not searchable
- 100469 • Contains any byte sequence that is not valid in its containing directory

100470 The format of the diagnostic message is not specified, but shall indicate the error detected and  
 100471 the corresponding *pathname* operand.

100472 It shall not be considered an error if one or more components of a *pathname* operand do not exist  
 100473 as long as a file matching the pathname specified by the missing components could be created  
 100474 that does not violate any of the checks specified above.

100475 **OPTIONS**100476 The *pathchk* utility shall conform to XBD [Section 12.2](#) (on page 215).

100477 The following option shall be supported:

100478 **-p** Instead of performing checks based on the underlying file system, write a  
 100479 diagnostic for each *pathname* operand that:

- 100480 • Is longer than {\_POSIX\_PATH\_MAX} bytes (see **Minimum Values** in XBD  
 100481 [<limits.h>](#))
- 100482 • Contains any component longer than {\_POSIX\_NAME\_MAX} bytes
- 100483 • Contains any character in any component that is not in the portable filename  
 100484 character set

100485 **-P** Write a diagnostic for each *pathname* operand that:

- 100486 • Contains a component whose first character is the <hyphen> character
- 100487 • Is empty

100488 **OPERANDS**

100489 The following operand shall be supported:

100490 *pathname* A pathname to be checked.100491 **STDIN**

100492 Not used.

100493 **INPUT FILES**

100494 None.

100495 **ENVIRONMENT VARIABLES**100496 The following environment variables shall affect the execution of *pathchk*:

100497 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 100498 (See XBD [Section 8.2](#) (on page 174) the precedence of internationalization variables  
 100499 used to determine the values of locale categories.)

100500 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 100501 internationalization variables.

100502 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 100503 characters (for example, single-byte as opposed to multi-byte characters in  
 100504 arguments).

100505 *LC\_MESSAGES*

100506 Determine the locale that should be used to affect the format and contents of  
 100507 diagnostic messages written to standard error.

100508 *XSI NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

100509 **ASYNCHRONOUS EVENTS**

100510 Default.

100511 **STDOUT**

100512 Not used.

100513 **STDERR**

100514 The standard error shall be used only for diagnostic messages.

100515 **OUTPUT FILES**

100516 None.

100517 **EXTENDED DESCRIPTION**

100518 None.

100519 **EXIT STATUS**

100520 The following exit values shall be returned:

100521 0 All *pathname* operands passed all of the checks.

100522 &gt;0 An error occurred.

100523 **CONSEQUENCES OF ERRORS**

100524 Default.

100525 **APPLICATION USAGE**

100526 The *test* utility can be used to determine whether a given pathname names an existing file; it  
 100527 does not, however, give any indication of whether or not any component of the pathname was  
 100528 truncated in a directory where the `_POSIX_NO_TRUNC` feature is not in effect. The *pathchk*  
 100529 utility does not check for file existence; it performs checks to determine whether a pathname  
 100530 does exist or could be created with no pathname component truncation.

100531 The *noclobber* option in the shell (see the [set](#) special built-in) can be used to atomically create a  
 100532 file. As with all file creation semantics in the System Interfaces volume of POSIX.1-2008, it  
 100533 guarantees atomic creation, but still depends on applications to agree on conventions and  
 100534 cooperate on the use of files after they have been created.

100535 To verify that a pathname meets the requirements of filename portability, applications should  
 100536 use both the `-p` and `-P` options together.

**EXAMPLES**

To verify that all pathnames in an imported data interchange archive are legitimate and unambiguous on the current system:

```
This example assumes that no pathnames in the archive
contain <newline> characters.
pax -f archive | sed -e 's/^[[:alnum:]]/\\&/g' | xargs pathchk --
if [$? -eq 0]
then
 pax -r -f archive
else
 echo Investigate problems before importing files.
 exit 1
fi
```

To verify that all files in the current directory hierarchy could be moved to any system conforming to the System Interfaces volume of POSIX.1-2008 that also supports the *pax* utility:

```
find . -exec pathchk -p -P {} +
if [$? -eq 0]
then
 pax -w -f ../archive .
else
 echo Portable archive cannot be created.
 exit 1
fi
```

To verify that a user-supplied pathname names a readable file and that the application can create a file extending the given path without truncation and without overwriting any existing file:

```
case $- in
 C) reset="";;
 *) reset="set +C"
 set -C;;
esac
test -r "$path" && pathchk "$path.out" &&
rm "$path.out" > "$path.out"
if [$? -ne 0]; then
 printf "%s: %s not found or %s.out fails \
creation checks.\n" $0 "$path" "$path"
 $reset # Reset the noclobber option in case a trap
 # on EXIT depends on it.
 exit 1
fi
$reset
PROCESSING < "$path" > "$path.out"
```

The following assumptions are made in this example:

1. **PROCESSING** represents the code that is used by the application to use **\$path** once it is verified that **\$path.out** works as intended.
2. The state of the *noclobber* option is unknown when this code is invoked and should be set on exit to the state it was in when this code was invoked. (The **reset** variable is used in this example to restore the initial state.)

## 3. Note the usage of:

```
rm "$path.out" > "$path.out"
```

- a. The *pathchk* command has already verified, at this point, that **\$path.out** is not truncated.
- b. With the *noclobber* option set, the shell verifies that **\$path.out** does not already exist before invoking *rm*.
- c. If the shell succeeded in creating **\$path.out**, *rm* removes it so that the application can create the file again in the **PROCESSING** step.
- d. If the **PROCESSING** step wants the file to exist already when it is invoked, the:

```
rm "$path.out" > "$path.out"
```

should be replaced with:

```
> "$path.out"
```

which verifies that the file did not already exist, but leaves **\$path.out** in place for use by **PROCESSING**.

**RATIONALE**

The *pathchk* utility was new for the ISO POSIX-2:1993 standard. It, along with the *set -C(noclobber)* option added to the shell, replaces the *mktemp*, *validfnam*, and *create* utilities that appeared in early proposals. All of these utilities were attempts to solve several common problems:

- Verify the validity (for several different definitions of “valid”) of a pathname supplied by a user, generated by an application, or imported from an external source.
- Atomically create a file.
- Perform various string handling functions to generate a temporary filename.

The *create* utility, included in an early proposal, provided checking and atomic creation in a single invocation of the utility; these are orthogonal issues and need not be grouped into a single utility. Note that the *noclobber* option also provides a way of creating a lock for process synchronization; since it provides an atomic *create*, there is no race between a test for existence and the following creation if it did not exist.

Having a function like *tmpnam()* in the ISO C standard is important in many high-level languages. The shell programming language, however, has built-in string manipulation facilities, making it very easy to construct temporary filenames. The names needed obviously depend on the application, but are frequently of a form similar to:

```
$TMPDIR/application_abbreviation$$suffix
```

In cases where there is likely to be contention for a given suffix, a simple shell **for** or **while** loop can be used with the shell *noclobber* option to create a file without risk of collisions, as long as applications trying to use the same filename name space are cooperating on the use of files after they have been created.

For historical purposes, **-p** does not check for the use of the <hyphen> character as the first character in a component of the pathname, or for an empty *pathname* operand.

100623 **FUTURE DIRECTIONS**

100624 None.

## 100634 NAME

100635 pax — portable archive interchange

## 100636 SYNOPSIS

100637 pax [-dv] [-c|-n] [-H|-L] [-o options] [-f archive] [-s replstr]...  
 100638 [pattern...]

100639 pax -r[-c|-n] [-dikuv] [-H|-L] [-f archive] [-o options]... [-p string]...  
 100640 [-s replstr]... [pattern...]

100641 pax -w [-dituvX] [-H|-L] [-b blocksize] [[-a] [-f archive]] [-o options]...  
 100642 [-s replstr]... [-x format] [file...]

100643 pax -r -w [-diklntuvX] [-H|-L] [-o options]... [-p string]...  
 100644 [-s replstr]... [file...] directory

## 100645 DESCRIPTION

100646 The *pax* utility shall read, write, and write lists of the members of archive files and copy  
 100647 directory hierarchies. A variety of archive formats shall be supported; see the *-x format* option.

100648 The action to be taken depends on the presence of the *-r* and *-w* options. The four combinations  
 100649 of *-r* and *-w* are referred to as the four modes of operation: **list**, **read**, **write**, and **copy** modes,  
 100650 corresponding respectively to the four forms shown in the SYNOPSIS section.

100651 **list** In **list** mode (when neither *-r* nor *-w* are specified), *pax* shall write the names of  
 100652 the members of the archive file read from the standard input, with pathnames  
 100653 matching the specified patterns, to standard output. If a named file is of type  
 100654 directory, the file hierarchy rooted at that file shall be listed as well.

100655 **read** In **read** mode (when *-r* is specified, but *-w* is not), *pax* shall extract the members of  
 100656 the archive file read from the standard input, with pathnames matching the  
 100657 specified patterns. If an extracted file is of type directory, the file hierarchy rooted  
 100658 at that file shall be extracted as well. The extracted files shall be created performing  
 100659 pathname resolution with the directory in which *pax* was invoked as the current  
 100660 working directory.

100661 If an attempt is made to extract a directory when the directory already exists, this  
 100662 shall not be considered an error. If an attempt is made to extract a FIFO when the  
 100663 FIFO already exists, this shall not be considered an error.

100664 The ownership, access, and modification times, and file mode of the restored files  
 100665 are discussed under the *-p* option.

100666 **write** In **write** mode (when *-w* is specified, but *-r* is not), *pax* shall write the contents of  
 100667 the *file* operands to the standard output in an archive format. If no *file* operands are  
 100668 specified, a list of files to copy, one per line, shall be read from the standard input  
 100669 and each entry in this list shall be processed as if it had been a *file* operand on the  
 100670 command line. A file of type directory shall include all of the files in the file  
 100671 hierarchy rooted at the file.

100672 **copy** In **copy** mode (when both *-r* and *-w* are specified), *pax* shall copy the *file* operands  
 100673 to the destination directory.

100674 If no *file* operands are specified, a list of files to copy, one per line, shall be read  
 100675 from the standard input. A file of type directory shall include all of the files in the  
 100676 file hierarchy rooted at the file.

100677 The effect of the **copy** shall be as if the copied files were written to a *pax* format  
 100678 archive file and then subsequently extracted, except that there may be hard links

100679                   between the original and the copied files. If the destination directory is a  
 100680                   subdirectory of one of the files to be copied, the results are unspecified. If the  
 100681                   destination directory is a file of a type not defined by the System Interfaces volume  
 100682                   of POSIX.1-2008, the results are implementation-defined; otherwise, it shall be an  
 100683                   error for the file named by the *directory* operand not to exist, not be writable by the  
 100684                   user, or not be a file of type directory.

100685           In **read** or **copy** modes, if intermediate directories are necessary to extract an archive member,  
 100686           *pax* shall perform actions equivalent to the *mkdir()* function defined in the System Interfaces  
 100687           volume of POSIX.1-2008, called with the following arguments:

- 100688           • The intermediate directory used as the *path* argument
- 100689           • The value of the bitwise-inclusive OR of S\_IRWXU, S\_IRWXG, and S\_IRWXO as the *mode*  
 100690           argument

100691           If any specified *pattern* or *file* operands are not matched by at least one file or archive member,  
 100692           *pax* shall write a diagnostic message to standard error for each one that did not match and exit  
 100693           with a non-zero exit status.

100694           The archive formats described in the EXTENDED DESCRIPTION section shall be automatically  
 100695           detected on input. The default output archive format shall be implementation-defined.

100696           A single archive can span multiple files. The *pax* utility shall determine, in an implementation-  
 100697           defined manner, what file to read or write as the next file.

100698           If the selected archive format supports the specification of linked files, it shall be an error if these  
 100699           files cannot be linked when the archive is extracted. For archive formats that do not store file  
 100700           contents with each name that causes a hard link, if the file that contains the data is not extracted  
 100701           during this *pax* session, either the data shall be restored from the original file, or a diagnostic  
 100702           message shall be displayed with the name of a file that can be used to extract the data. In  
 100703           traversing directories, *pax* shall detect infinite loops; that is, entering a previously visited  
 100704           directory that is an ancestor of the last file visited. When it detects an infinite loop, *pax* shall  
 100705           write a diagnostic message to standard error and shall terminate.

## 100706 OPTIONS

100707           The *pax* utility shall conform to XBD [Section 12.2](#) (on page 215), except that the order of  
 100708           presentation of the **-o**, **-p**, and **-s** options is significant.

100709           The following options shall be supported:

- 100710           **-r**           Read an archive file from standard input.
- 100711           **-w**           Write files to the standard output in the specified archive format.
- 100712           **-a**           Append files to the end of the archive. It is implementation-defined which devices  
 100713           on the system support appending. Additional file formats unspecified by this  
 100714           volume of POSIX.1-2008 may impose restrictions on appending.
- 100715           **-b** *blocksize*   Block the output at a positive decimal integer number of bytes per write to the  
 100716           archive file. Devices and archive formats may impose restrictions on blocking.  
 100717           Blocking shall be automatically determined on input. Conforming applications  
 100718           shall not specify a *blocksize* value larger than 32256. Default blocking when  
 100719           creating archives depends on the archive format. (See the **-x** option below.)
- 100720           **-c**           Match all file or archive members except those specified by the *pattern* or *file*  
 100721           operands.

|        |                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 100722 | -d                | Cause files of type directory being copied or archived or archive members of type directory being extracted or listed to match only the file or archive member itself and not the file hierarchy rooted at the file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 100723 |                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 100724 |                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 100725 | -f <i>archive</i> | Specify the pathname of the input or output archive, overriding the default standard input (in <b>list</b> or <b>read</b> modes) or standard output ( <b>write</b> mode).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| 100734 | -i                | Interactively rename files or archive members. For each archive member matching a <i>pattern</i> operand or file matching a <i>file</i> operand, a prompt shall be written to the file <b>/dev/tty</b> . The prompt shall contain the name of the file or archive member, but the format is otherwise unspecified. A line shall then be read from <b>/dev/tty</b> . If this line is blank, the file or archive member shall be skipped. If this line consists of a single period, the file or archive member shall be processed with no modification to its name. Otherwise, its name shall be replaced with the contents of the line. The <i>pax</i> utility shall immediately exit with a non-zero exit status if end-of-file is encountered when reading a response or if <b>/dev/tty</b> cannot be opened for reading and writing. |

| 100752 |                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 100753 |                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 100754 | -L                | If a symbolic link referencing a file of type directory is specified on the command line or encountered during the traversal of a file hierarchy, <i>pax</i> shall archive the file hierarchy rooted in the file referenced by the link, using the name of the link as the root of the file hierarchy. Otherwise, if a symbolic link referencing a file of any other file type which <i>pax</i> can normally archive is specified on the command line or encountered during the traversal of a file hierarchy, <i>pax</i> shall archive the file referenced by the link, using the name of the link. The default behavior, when neither -H or -L are specified, shall be to archive the symbolic link itself.                                                                                                                          |

| 100765 | -o <i>options</i> | Provide information to the implementation to modify the algorithm for extracting or writing files. The value of <i>options</i> shall consist of one or more <comma>-separated keywords of the form:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 100766 |                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 100767 |                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 100768 |                   | <i>keyword</i> [[:]= <i>value</i> ][, <i>keyword</i> [[:]= <i>value</i> ], ...]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

Some keywords apply only to certain file formats, as indicated with each description. Use of keywords that are inapplicable to the file format being processed produces undefined results.

Keywords in the *options* argument shall be a string that would be a valid portable filename as described in XBD [Section 3.278](#) (on page 78).

**Note:** Keywords are not expected to be filenames, merely to follow the same character composition rules as portable filenames.

Keywords can be preceded with white space. The *value* field shall consist of zero or more characters; within *value*, the application shall precede any literal <comma> with a <backslash>, which shall be ignored, but preserves the <comma> as part of *value*. A <comma> as the final character, or a <comma> followed solely by white space as the final characters, in *options* shall be ignored. Multiple **-o** options can be specified; if keywords given to these multiple **-o** options conflict, the keywords and values appearing later in command line sequence shall take precedence and the earlier shall be silently ignored. The following keyword values of *options* shall be supported for the file formats as indicated:

**delete=pattern**

(Applicable only to the **-x pax** format.) When used in **write** or **copy** mode, *pax* shall omit from extended header records that it produces any keywords matching the string pattern. When used in **read** or **list** mode, *pax* shall ignore any keywords matching the string pattern in the extended header records. In both cases, matching shall be performed using the pattern matching notation described in [Section 2.13.1](#) (on page 2354) and [Section 2.13.2](#) (on page 2355). For example:

**-o delete=security.\***

would suppress security-related information. See [pax Extended Header](#) (on page 3045) for extended header record keyword usage.

When multiple **-odelete=pattern** options are specified, the patterns shall be additive; all keywords matching the specified string patterns shall be omitted from extended header records that *pax* produces.

**exthdr.name=string**

(Applicable only to the **-x pax** format.) This keyword allows user control over the name that is written into the **ustar** header blocks for the extended header produced under the circumstances described in [pax Header Block](#) (on page 3045). The name shall be the contents of *string*, after the following character substitutions have been made:

| <i>string</i><br>Includes: | Replaced by:                                                                                                       |
|----------------------------|--------------------------------------------------------------------------------------------------------------------|
| %d                         | The directory name of the file, equivalent to the result of the <i>dirname</i> utility on the translated pathname. |
| %f                         | The filename of the file, equivalent to the result of the <i>basename</i> utility on the translated pathname.      |
| %p                         | The process ID of the <i>pax</i> process.                                                                          |
| %%                         | A ' % ' character.                                                                                                 |

Any other ' % ' characters in *string* produce undefined results.

If no **-o exthdr.name=string** is specified, *pax* shall use the following default

value:

```
%d/PaxHeaders.%p/%f
```

#### **globexthdr.name=string**

(Applicable only to the **-x pax** format.) When used in **write** or **copy** mode with the appropriate options, *pax* shall create global extended header records with **ustar** header blocks that will be treated as regular files by previous versions of *pax*. This keyword allows user control over the name that is written into the **ustar** header blocks for global extended header records. The name shall be the contents of *string*, after the following character substitutions have been made:

| <i>string</i><br>Includes: | Replaced by:                                                                                                       |
|----------------------------|--------------------------------------------------------------------------------------------------------------------|
| %n                         | An integer that represents the sequence number of the global extended header record in the archive, starting at 1. |
| %p                         | The process ID of the <i>pax</i> process.                                                                          |
| %%                         | A '%' character.                                                                                                   |

Any other '%' characters in *string* produce undefined results.

If no **-o globexthdr.name=string** is specified, *pax* shall use the following default value:

```
$TMPDIR/GlobalHead.%p.%n
```

where *\$TMPDIR* represents the value of the *TMPDIR* environment variable. If *TMPDIR* is not set, *pax* shall use **/tmp**.

#### **invalid=action**

(Applicable only to the **-x pax** format.) This keyword allows user control over the action *pax* takes upon encountering values in an extended header record that, in **read** or **copy** mode, are invalid in the destination hierarchy or, in **list** mode, cannot be written in the codeset and current locale of the implementation. The following are invalid values that shall be recognized by *pax*:

- In **read** or **copy** mode, a filename or link name that contains character encodings invalid in the destination hierarchy. (For example, the name may contain embedded NULs.)
- In **read** or **copy** mode, a filename or link name that is longer than the maximum allowed in the destination hierarchy (for either a pathname component or the entire pathname).
- In **list** mode, any character string value (filename, link name, user name, and so on) that cannot be written in the codeset and current locale of the implementation.

The following mutually-exclusive values of the *action* argument are supported:

**binary** In **write** mode, *pax* shall generate a **hdrcharset=BINARY** extended header record for each file with a filename, link name, group name, owner name, or any other field in an extended header record that cannot be translated to the UTF-8 codeset, allowing the archive to contain the files with unencoded extended header record values. In **read** or **copy** mode, *pax* shall

|        |                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 100860 |                       | use the values specified in the header without translation, regardless of whether this may overwrite an existing file with a valid name. In <b>list</b> mode, <i>pax</i> shall behave identically to the <b>bypass</b> action.                                                                                                                                                                                                                                                                                                                                                                                          |
| 100861 |                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 100862 |                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 100863 |                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 100864 | <b>bypass</b>         | In <b>read</b> or <b>copy</b> mode, <i>pax</i> shall bypass the file, causing no change to the destination hierarchy. In <b>list</b> mode, <i>pax</i> shall write all requested valid values for the file, but its method for writing invalid values is unspecified.                                                                                                                                                                                                                                                                                                                                                    |

| 100893 | <b>listopt=format</b> | This keyword specifies the output format of the table of contents produced when the <b>-v</b> option is specified in <b>list</b> mode. See <a href="#">List Mode Format Specifications</a> (on page 3040). To avoid ambiguity, the <b>listopt=format</b> shall be the only or final <b>keyword=value</b> pair in a <b>-o</b> option-argument; all characters in the remainder of the option-argument shall be considered part of the format string. When multiple <b>-olistopt=format</b> options are specified, the format strings shall be considered a single, concatenated string, evaluated in command line order. |

| 100906 |                       | In addition to these keywords, if the <b>-x pax</b> format is specified, any of the                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

keywords and values defined in [pax Extended Header](#) (on page 3045), including implementation extensions, can be used in **-o** option-arguments, in either of two modes:

**keyword=***value*

When used in **write** or **copy** mode, these keyword/value pairs shall be included at the beginning of the archive as **typeflag g** global extended header records. When used in **read** or **list** mode, these keyword/value pairs shall act as if they had been at the beginning of the archive as **typeflag g** global extended header records.

**keyword:=***value*

When used in **write** or **copy** mode, these keyword/value pairs shall be included as records at the beginning of a **typeflag x** extended header for each file. (This shall be equivalent to the `<equals-sign>` form except that it creates no **typeflag g** global extended header records.) When used in **read** or **list** mode, these keyword/value pairs shall act as if they were included as records at the end of each extended header; thus, they shall override any global or file-specific extended header record keywords of the same names. For example, in the command:

```
pax -r -o "
 gname:=mygroup,
 " <archive
```

the group name will be forced to a new value for all files read from the archive.

The precedence of **-o** keywords over various fields in the archive is described in [pax Extended Header Keyword Precedence](#) (on page 3048).

**-p** *string*

Specify one or more file characteristic options (privileges). The *string* option-argument shall be a string specifying file characteristics to be retained or discarded on extraction. The string shall consist of the specification characters *a*, *e*, *m*, *o*, and *p*. Other implementation-defined characters can be included. Multiple characteristics can be concatenated within the same string and multiple **-p** options can be specified. The meaning of the specification characters are as follows:

- a* Do not preserve file access times.
- e* Preserve the user ID, group ID, file mode bits (see [XBD Section 3.169](#), on page 60), access time, modification time, and any other implementation-defined file characteristics.
- m* Do not preserve file modification times.
- o* Preserve the user ID and group ID.
- p* Preserve the file mode bits. Other implementation-defined file mode attributes may be preserved.

In the preceding list, “preserve” indicates that an attribute stored in the archive shall be given to the extracted file, subject to the permissions of the invoking process. The access and modification times of the file shall be preserved unless otherwise specified with the **-p** option or not stored in the archive. All attributes that are not preserved shall be determined as part of the normal file creation action (see [Section 1.1.1.4](#), on page 2302).

| 100978 | <code>-u</code>         | Ignore files that are older (having a less recent file modification time) than a pre-existing file or archive member with the same name. In <b>read</b> mode, an archive member with the same name as a file in the file system shall be extracted if the archive member is newer than the file. In <b>write</b> mode, an archive file member with the same name as a file in the file system shall be superseded if the file is newer than the archive member. If <code>-a</code> is also specified, this is accomplished by appending to the archive; otherwise, it is unspecified whether this is accomplished by actual replacement in the archive or by appending to the archive. In <b>copy</b> mode, the file in the destination hierarchy shall be replaced by the file in the source hierarchy or by a link to the file in the source hierarchy if the file in the source hierarchy is newer. |

| 101034 |              | — Any of the Field Name entries in Table 4-14 (on page 3050) and Table 4-16 (on page 3053). The implementation may support the <i>cpio</i> keywords without the leading <b>c_</b> in addition to the form required by Table 4-16 (on page 3053).                                                                                                                                                                                                                                                                                               |
| 101035 |              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 101036 |              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 101037 |              | — Any keyword defined for the extended header in pax Extended Header (on page 3045).                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 101038 |              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 101039 |              | — Any keyword provided as an implementation-defined extension within the extended header defined in pax Extended Header (on page 3045).                                                                                                                                                                                                                                                                                                                                                                                                        |
| 101040 |              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 101041 |              | For example, the sequence "%(charset)s" is the string value of the name of the character                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

- 101042 set in the extended header.
- 101043 The result of the keyword conversion argument shall be the value from the applicable  
101044 header field or extended header, without any trailing NULs.
- 101045 All keyword values used as conversion arguments shall be translated from the UTF-8  
101046 encoding (or alternative encoding specified by any **hdrcharset** extended header record) to  
101047 the character set appropriate for the local file system, user database, and so on, as  
101048 applicable.
- 101049 8. An additional conversion specifier character, **T**, shall be used to specify time formats. The **T**  
101050 conversion specifier character can be preceded by the sequence (*keyword=subformat*), where  
101051 *subformat* is a date format as defined by *date* operands. The default *keyword* shall be **mtime**  
101052 and the default subformat shall be:
- 101053 %b %e %H:%M %Y
- 101054 9. An additional conversion specifier character, **M**, shall be used to specify the file mode string  
101055 as defined in *ls* Standard Output. If (*keyword*) is omitted, the **mode** keyword shall be used.  
101056 For example, % .1M writes the single character corresponding to the <entry type> field of the  
101057 *ls -l* command.
- 101058 10. An additional conversion specifier character, **D**, shall be used to specify the device for block  
101059 or special files, if applicable, in an implementation-defined format. If not applicable, and  
101060 (*keyword*) is specified, then this conversion shall be equivalent to %(*keyword*)u. If not  
101061 applicable, and (*keyword*) is omitted, then this conversion shall be equivalent to <space>.
- 101062 11. An additional conversion specifier character, **F**, shall be used to specify a pathname. The **F**  
101063 conversion character can be preceded by a sequence of <comma>-separated keywords:
- 101064 (*keyword*[ , *keyword*] . . . )
- 101065 The values for all the keywords that are non-null shall be concatenated together, each  
101066 separated by a ' / '. The default shall be (**path**) if the keyword **path** is defined; otherwise,  
101067 the default shall be (**prefix,name**).
- 101068 12. An additional conversion specifier character, **L**, shall be used to specify a symbolic link  
101069 expansion. If the current file is a symbolic link, then %L shall expand to:
- 101070 "%s -> %s", <value of keyword>, <contents of link>
- 101071 Otherwise, the %L conversion specification shall be the equivalent of %F.

## 101072 OPERANDS

101073 The following operands shall be supported:

- 101074 *directory* The destination directory pathname for **copy** mode.
- 101075 *file* A pathname of a file to be copied or archived.
- 101076 *pattern* A pattern matching one or more pathnames of archive members. A pattern must  
101077 be given in the name-generating notation of the pattern matching notation in  
101078 [Section 2.13](#) (on page 2354), including the filename expansion rules in [Section](#)  
101079 [2.13.3](#) (on page 2355). The default, if no *pattern* is specified, is to select all members  
101080 in the archive.

## 101081 STDIN

- 101082 In **write** mode, the standard input shall be used only if no *file* operands are specified. It shall be a |  
101083 file containing a list of pathnames, each terminated by a <newline> character.
- 101084 In **list** and **read** modes, if **-f** is not specified, the standard input shall be an archive file.

101085           Otherwise, the standard input shall not be used.

## 101086 INPUT FILES

101087           The input file named by the *archive* option-argument, or standard input when the archive is read  
101088           from there, shall be a file formatted according to one of the specifications in the EXTENDED  
101089           DESCRIPTION section or some other implementation-defined format.

101090           The file */dev/tty* shall be used to write prompts and read responses.

## 101091 ENVIRONMENT VARIABLES

101092           The following environment variables shall affect the execution of *pax*:

101093           **LANG**           Provide a default value for the internationalization variables that are unset or null.  
101094                               (See XBD [Section 8.2](#) (on page 174) the precedence of internationalization variables  
101095                               used to determine the values of locale categories.)

101096           **LC\_ALL**       If set to a non-empty string value, override the values of all the other  
101097                               internationalization variables.

101098           **LC\_COLLATE**

101099                               Determine the locale for the behavior of ranges, equivalence classes, and multi-  
101100                               character collating elements used in the pattern matching expressions for the  
101101                               *pattern* operand, the basic regular expression for the *-s* option, and the extended  
101102                               regular expression defined for the **yesexpr** locale keyword in the *LC\_MESSAGES*  
101103                               category.

101104           **LC\_CTYPE**   Determine the locale for the interpretation of sequences of bytes of text data as  
101105                               characters (for example, single-byte as opposed to multi-byte characters in  
101106                               arguments and input files), the behavior of character classes used in the extended  
101107                               regular expression defined for the **yesexpr** locale keyword in the *LC\_MESSAGES*  
101108                               category, and pattern matching.

101109           **LC\_MESSAGES**

101110                               Determine the locale used to process affirmative responses, and the locale used to  
101111                               affect the format and contents of diagnostic messages and prompts written to  
101112                               standard error.

101113           **LC\_TIME**     Determine the format and contents of date and time strings when the *-v* option is  
101114                               specified.

101115 XSI       **NLSPATH**   Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

101116           **TMPDIR**     Determine the pathname that provides part of the default global extended header  
101117                               record file, as described for the **-o globexthdr=** keyword in the *OPTIONS* section.

101118           **TZ**           Determine the timezone used to calculate date and time strings when the *-v* option  
101119                               is specified. If *TZ* is unset or null, an unspecified default timezone shall be used.

## 101120 ASYNCHRONOUS EVENTS

101121           Default.

## 101122 STDOUT

101123           In **write** mode, if *-f* is not specified, the standard output shall be the archive formatted  
101124           according to one of the specifications in the EXTENDED DESCRIPTION section, or some other  
101125           implementation-defined format (see *-x format*).

101126           In **list** mode, when the **-olistopt=format** has been specified, the selected archive members shall  
101127           be written to standard output using the format described under [List Mode Format Specifications](#)  
101128           (on page 3040). In **list** mode without the **-olistopt=format** option, the table of contents of the

101129 selected archive members shall be written to standard output using the following format:

101130 "%s\n", <pathname>

101131 If the **-v** option is specified in **list** mode, the table of contents of the selected archive members  
101132 shall be written to standard output using the following formats.

101133 For pathnames representing hard links to previous members of the archive:

101134 "%sΔ==Δ%s\n", <ls -l listing>, <linkname>

101135 For all other pathnames:

101136 "%s\n", <ls -l listing>

101137 where <ls -l listing> shall be the format specified by the *ls* utility with the **-l** option. When  
101138 writing pathnames in this format, it is unspecified what is written for fields for which the  
101139 underlying archive format does not have the correct information, although the correct number of  
101140 <blank>-separated fields shall be written.

101141 In **list** mode, standard output shall not be buffered more than a pathname (plus any associated  
101142 information and a <newline> terminator) at a time.

#### 101143 STDERR

101144 If **-v** is specified in **read**, **write**, or **copy** modes, *pax* shall write the pathnames it processes to the  
101145 standard error output using the following format:

101146 "%s\n", <pathname>

101147 These pathnames shall be written as soon as processing is begun on the file or archive member,  
101148 and shall be flushed to standard error. The trailing <newline>, which shall not be buffered, is  
101149 written when the file has been read or written.

101150 If the **-s** option is specified, and the replacement string has a trailing 'p', substitutions shall be  
101151 written to standard error in the following format:

101152 "%sΔ>>Δ%s\n", <original pathname>, <new pathname>

101153 In all operating modes of *pax*, optional messages of unspecified format concerning the input  
101154 archive format and volume number, the number of files, blocks, volumes, and media parts as  
101155 well as other diagnostic messages may be written to standard error.

101156 In all formats, for both standard output and standard error, it is unspecified how non-printable  
101157 characters in pathnames or link names are written.

101158 When using the **-xpax** archive format, if a filename, link name, group name, owner name, or any  
101159 other field in an extended header record cannot be translated between the codeset in use for that  
101160 extended header record and the character set of the current locale, *pax* shall write a diagnostic  
101161 message to standard error, shall process the file as described for the **-o invalid=** option, and then  
101162 shall continue processing with the next file.

#### 101163 OUTPUT FILES

101164 In **read** mode, the extracted output files shall be of the archived file type. In **copy** mode, the  
101165 copied output files shall be the type of the file being copied. In either mode, existing files in the  
101166 destination hierarchy shall be overwritten only when all permission (**-p**), modification time (**-u**),  
101167 and invalid-value (**-o invalid=**) tests allow it.

101168 In **write** mode, the output file named by the **-f** option-argument shall be a file formatted  
101169 according to one of the specifications in the EXTENDED DESCRIPTION section, or some other  
101170 implementation-defined format.

## 101171 EXTENDED DESCRIPTION

101172 **pax Interchange Format**

101173 A *pax* archive tape or file produced in the **-xpax** format shall contain a series of blocks. The  
 101174 physical layout of the archive shall be identical to the **ustar** format described in **ustar**  
 101175 **Interchange Format** (on page 3049). Each file archived shall be represented by the following  
 101176 sequence:

- 101177 • An optional header block with extended header records. This header block is of the form  
 101178 described in **pax Header Block** (on page 3045), with a *typeflag* value of **x** or **g**. The  
 101179 extended header records, described in **pax Extended Header** (on page 3045), shall be  
 101180 included as the data for this header block.
- 101181 • A header block that describes the file. Any fields in the preceding optional extended  
 101182 header shall override the associated fields in this header block for this file.
- 101183 • Zero or more blocks that contain the contents of the file.

101184 At the end of the archive file there shall be two 512-byte blocks filled with binary zeros,  
 101185 interpreted as an end-of-archive indicator.

101186 A schematic of an example archive with global extended header records and two actual files is  
 101187 shown in **Figure 4-1**. In the example, the second file in the archive has no extended header  
 101188 preceding it, presumably because it has no need for extended attributes.

**Figure 4-1** pax Format Archive Example

101189

## pax Header Block

The **pax** header block shall be identical to the **ustar** header block described in **ustar Interchange Format** (on page 3049), except that two additional *typeflag* values are defined:

- x Represents extended header records for the following file in the archive (which shall have its own **ustar** header block). The format of these extended header records shall be as described in **pax Extended Header**.
- g Represents global extended header records for the following files in the archive. The format of these extended header records shall be as described in **pax Extended Header**. Each value shall affect all subsequent files that do not override that value in their own extended header record and until another global extended header record is reached that provides another value for the same field. The *typeflag* **g** global headers should not be used with interchange media that could suffer partial data loss in transporting the archive.

For both of these types, the *size* field shall be the size of the extended header records in octets. The other fields in the header block are not meaningful to this version of the *pax* utility. However, if this archive is read by a *pax* utility conforming to the ISO POSIX-2:1993 standard, the header block fields are used to create a regular file that contains the extended header records as data. Therefore, header block field values should be selected to provide reasonable file access to this regular file.

A further difference from the **ustar** header block is that data blocks for files of *typeflag* 1 (the digit one) (hard link) may be included, which means that the *size* field may be greater than zero. Archives created by *pax -o linkdata* shall include these data blocks with the hard links.

## pax Extended Header

A **pax** extended header contains values that are inappropriate for the **ustar** header block because of limitations in that format: fields requiring a character encoding other than that described in the ISO/IEC 646:1991 standard, fields representing file attributes not described in the **ustar** header, and fields whose format or length do not fit the requirements of the **ustar** header. The values in an extended header add attributes to the following file (or files; see the description of the *typeflag* **g** header block) or override values in the following header block(s), as indicated in the following list of keywords.

An extended header shall consist of one or more records, each constructed as follows:

```
"%d %s=%s\n", <length>, <keyword>, <value>
```

The extended header records shall be encoded according to the ISO/IEC 10646-1:2000 standard UTF-8 encoding. The *<length>* field, *<blank>*, *<equals-sign>*, and *<newline>* shown shall be limited to the portable character set, as encoded in UTF-8. The *<keyword>* fields can be any UTF-8 characters. The *<length>* field shall be the decimal length of the extended header record in octets, including the trailing *<newline>*. If there is a **hdrcharset** extended header in effect for a file, the *value* field for any **gname**, **linkpath**, **path**, and **uname** extended header records shall be encoded using the character set specified by the **hdrcharset** extended header record; otherwise, the *value* field shall be encoded using UTF-8. The *value* field for all other keywords specified by POSIX.1-2008 shall be encoded using UTF-8.

The *<keyword>* field shall be one of the entries from the following list or a keyword provided as an implementation extension. Keywords consisting entirely of lowercase letters, digits, and periods are reserved for future standardization. A keyword shall not include an *<equals-sign>*. (In the following list, the notations "file(s)" or "block(s)" is used to acknowledge that a keyword affects the following single file after a *typeflag* **x** extended header, but possibly multiple files after *typeflag* **g**. Any requirements in the list for *pax* to include a record when in **write** or **copy** mode

shall apply only when such a record has not already been provided through the use of the **-o** option. When used in **copy** mode, *pax* shall behave as if an archive had been created with applicable extended header records and then extracted.)

**atime** The file access time for the following file(s), equivalent to the value of the *st\_atime* member of the **stat** structure for a file, as described by the *stat()* function. The access time shall be restored if the process has appropriate privileges required to do so. The format of the *<value>* shall be as described in [pax Extended Header File Times](#) (on page 3049).

**charset** The name of the character set used to encode the data in the following file(s). The entries in the following table are defined to refer to known standards; additional names may be agreed on between the originator and recipient.

| <i>&lt;value&gt;</i>    | Formal Standard               |
|-------------------------|-------------------------------|
| ISO-IRΔ646Δ1990         | ISO/IEC 646:1990              |
| ISO-IRΔ8859Δ1Δ1998      | ISO/IEC 8859-1:1998           |
| ISO-IRΔ8859Δ2Δ1999      | ISO/IEC 8859-2:1999           |
| ISO-IRΔ8859Δ3Δ1999      | ISO/IEC 8859-3:1999           |
| ISO-IRΔ8859Δ4Δ1998      | ISO/IEC 8859-4:1998           |
| ISO-IRΔ8859Δ5Δ1999      | ISO/IEC 8859-5:1999           |
| ISO-IRΔ8859Δ6Δ1999      | ISO/IEC 8859-6:1999           |
| ISO-IRΔ8859Δ7Δ1987      | ISO/IEC 8859-7:1987           |
| ISO-IRΔ8859Δ8Δ1999      | ISO/IEC 8859-8:1999           |
| ISO-IRΔ8859Δ9Δ1999      | ISO/IEC 8859-9:1999           |
| ISO-IRΔ8859Δ10Δ1998     | ISO/IEC 8859-10:1998          |
| ISO-IRΔ8859Δ13Δ1998     | ISO/IEC 8859-13:1998          |
| ISO-IRΔ8859Δ14Δ1998     | ISO/IEC 8859-14:1998          |
| ISO-IRΔ8859Δ15Δ1999     | ISO/IEC 8859-15:1999          |
| ISO-IRΔ10646Δ2000       | ISO/IEC 10646:2000            |
| ISO-IRΔ10646Δ2000ΔUTF-8 | ISO/IEC 10646, UTF-8 encoding |
| BINARY                  | None.                         |

The encoding is included in an extended header for information only; when *pax* is used as described in POSIX.1-2008, it shall not translate the file data into any other encoding. The **BINARY** entry indicates unencoded binary data.

When used in **write** or **copy** mode, it is implementation-defined whether *pax* includes a **charset** extended header record for a file.

**comment** A series of characters used as a comment. All characters in the *<value>* field shall be ignored by *pax*.

**gid** The group ID of the group that owns the file, expressed as a decimal number using digits from the ISO/IEC 646:1991 standard. This record shall override the *gid* field in the following header block(s). When used in **write** or **copy** mode, *pax* shall include a *gid* extended header record for each file whose group ID is greater than 2 097 151 (octal 7 777 777).

**gname** The group of the file(s), formatted as a group name in the group database. This record shall override the *gid* and *gname* fields in the following header block(s), and any *gid* extended header record. When used in **read**, **copy**, or **list** mode, *pax* shall translate the name from the encoding in the header record to the character set appropriate for the group database on the receiving system. If any of the characters cannot be translated, and if neither the **-oinvalid=UTF-8** option nor the

101283 **—oinvalid=binary** option is specified, the results are implementation-defined.  
 101284 When used in **write** or **copy** mode, *pax* shall include a **gname** extended header  
 101285 record for each file whose group name cannot be represented entirely with the  
 101286 letters and digits of the portable character set.

101287 **hdrcharset** The name of the character set used to encode the value field of the **gname**,  
 101288 **linkpath**, **path**, and **uname** *pax* extended header records. The entries in the  
 101289 following table are defined to refer to known standards; additional names may be  
 101290 agreed between the originator and the recipient.

| <value>                 | Formal Standard               |
|-------------------------|-------------------------------|
| ISO-IRΔ10646Δ2000ΔUTF-8 | ISO/IEC 10646, UTF-8 encoding |
| BINARY                  | None.                         |

101294 If no **hdrcharset** extended header record is specified, the default character set used  
 101295 to encode all values in extended header records shall be the ISO/IEC 10646-1: 2000  
 101296 standard UTF-8 encoding.

101297 The **BINARY** entry indicates that all values recorded in extended headers for  
 101298 affected files are unencoded binary data from the underlying system.

101299 **linkpath** The pathname of a link being created to another file, of any type, previously  
 101300 archived. This record shall override the *linkname* field in the following **ustar** header  
 101301 block(s). The following **ustar** header block shall determine the type of link created.  
 101302 If *typeflag* of the following header block is 1, it shall be a hard link. If *typeflag* is 2, it  
 101303 shall be a symbolic link and the **linkpath** value shall be the contents of the  
 101304 symbolic link. The *pax* utility shall translate the name of the link (contents of the  
 101305 symbolic link) from the encoding in the header to the character set appropriate for  
 101306 the local file system. When used in **write** or **copy** mode, *pax* shall include a  
 101307 **linkpath** extended header record for each link whose pathname cannot be  
 101308 represented entirely with the members of the portable character set other than  
 101309 NUL.

101310 **mtime** The file modification time of the following file(s), equivalent to the value of the  
 101311 *st\_mtime* member of the **stat** structure for a file, as described in the *stat()* function.  
 101312 This record shall override the *mtime* field in the following header block(s). The  
 101313 modification time shall be restored if the process has appropriate privileges  
 101314 required to do so. The format of the <value> shall be as described in [pax Extended](#)  
 101315 [Header File Times](#) (on page 3049).

101316 **path** The pathname of the following file(s). This record shall override the *name* and  
 101317 *prefix* fields in the following header block(s). The *pax* utility shall translate the  
 101318 pathname of the file from the encoding in the header to the character set  
 101319 appropriate for the local file system.

101320 When used in **write** or **copy** mode, *pax* shall include a *path* extended header record  
 101321 for each file whose pathname cannot be represented entirely with the members of  
 101322 the portable character set other than NUL.

101323 **realtime.any** The keywords prefixed by “realtime.” are reserved for future standardization.

101324 **security.any** The keywords prefixed by “security.” are reserved for future standardization.

101325 **size** The size of the file in octets, expressed as a decimal number using digits from the  
 101326 ISO/IEC 646:1991 standard. This record shall override the *size* field in the  
 101327 following header block(s). When used in **write** or **copy** mode, *pax* shall include a  
 101328 *size* extended header record for each file with a size value greater than 8 589 934 591

**uid**

The user ID of the file owner, expressed as a decimal number using digits from the ISO/IEC 646:1991 standard. This record shall override the *uid* field in the following header block(s). When used in **write** or **copy** mode, *pax* shall include a *uid* extended header record for each file whose owner ID is greater than 2097151 (octal 7777777).

**uname**

The owner of the following file(s), formatted as a user name in the user database. This record shall override the *uid* and *uname* fields in the following header block(s), and any *uid* extended header record. When used in **read**, **copy**, or **list** mode, *pax* shall translate the name from the encoding in the header record to the character set appropriate for the user database on the receiving system. If any of the characters cannot be translated, and if neither the **-oinvalid=UTF-8** option nor the **-oinvalid=binary** option is specified, the results are implementation-defined. When used in **write** or **copy** mode, *pax* shall include a **uname** extended header record for each file whose user name cannot be represented entirely with the letters and digits of the portable character set.

If the *<value>* field is zero length, it shall delete any header block field, previously entered extended header value, or global extended header value of the same name.

If a keyword in an extended header record (or in a **-o** option-argument) overrides or deletes a corresponding field in the **ustar** header block, *pax* shall ignore the contents of that header block field.

Unlike the **ustar** header block fields, NULs shall not delimit *<value>*s; all characters within the *<value>* field shall be considered data for the field. None of the length limitations of the **ustar** header block fields in [Table 4-14](#) (on page 3050) shall apply to the extended header records.

**pax Extended Header Keyword Precedence**

This section describes the precedence in which the various header records and fields and command line options are selected to apply to a file in the archive. When *pax* is used in **read** or **list** modes, it shall determine a file attribute in the following sequence:

1. If **-odelete=keyword-prefix** is used, the affected attributes shall be determined from step 7., if applicable, or ignored otherwise.
2. If **-okeyword:=** is used, the affected attributes shall be ignored.
3. If **-okeyword:=value** is used, the affected attribute shall be assigned the value.
4. If there is a *typeflag* **x** extended header record, the affected attribute shall be assigned the *<value>*. When extended header records conflict, the last one given in the header shall take precedence.
5. If **-okeyword=value** is used, the affected attribute shall be assigned the value.
6. If there is a *typeflag* **g** global extended header record, the affected attribute shall be assigned the *<value>*. When global extended header records conflict, the last one given in the global header shall take precedence.
7. Otherwise, the attribute shall be determined from the **ustar** header block.

**pax Extended Header File Times**

The *pax* utility shall write an **mtime** record for each file in **write** or **copy** modes if the file's modification time cannot be represented exactly in the **ustar** header logical record described in **ustar Interchange Format**. This can occur if the time is out of **ustar** range, or if the file system of the underlying implementation supports non-integer time granularities and the time is not an integer. All of these time records shall be formatted as a decimal representation of the time in seconds since the Epoch. If a <period> ( ' . ' ) decimal point character is present, the digits to the right of the point shall represent the units of a subsecond timing granularity, where the first digit is tenths of a second and each subsequent digit is a tenth of the previous digit. In **read** or **copy** mode, the *pax* utility shall truncate the time of a file to the greatest value that is not greater than the input header file time. In **write** or **copy** mode, the *pax* utility shall output a time exactly if it can be represented exactly as a decimal number, and otherwise shall generate only enough digits so that the same time shall be recovered if the file is extracted on a system whose underlying implementation supports the same time granularity.

**ustar Interchange Format**

A **ustar** archive tape or file shall contain a series of logical records. Each logical record shall be a fixed-size logical record of 512 octets (see below). Although this format may be thought of as being stored on 9-track industry-standard 12.7 mm (0.5 in) magnetic tape, other types of transportable media are not excluded. Each file archived shall be represented by a header logical record that describes the file, followed by zero or more logical records that give the contents of the file. At the end of the archive file there shall be two 512-octet logical records filled with binary zeros, interpreted as an end-of-archive indicator.

The logical records may be grouped for physical I/O operations, as described under the **-bblocksize** and **-x ustar** options. Each group of logical records may be written with a single operation equivalent to the *write()* function. On magnetic tape, the result of this write shall be a single tape physical block. The last physical block shall always be the full size, so logical records after the two zero logical records may contain undefined data.

The header logical record shall be structured as shown in the following table. All lengths and offsets are in decimal.

Table 4-14 ustar Header Block

| Field Name      | Octet Offset | Length (in Octets) |
|-----------------|--------------|--------------------|
| <i>name</i>     | 0            | 100                |
| <i>mode</i>     | 100          | 8                  |
| <i>uid</i>      | 108          | 8                  |
| <i>gid</i>      | 116          | 8                  |
| <i>size</i>     | 124          | 12                 |
| <i>mtime</i>    | 136          | 12                 |
| <i>chksum</i>   | 148          | 8                  |
| <i>typeflag</i> | 156          | 1                  |
| <i>linkname</i> | 157          | 100                |
| <i>magic</i>    | 257          | 6                  |
| <i>version</i>  | 263          | 2                  |
| <i>uname</i>    | 265          | 32                 |
| <i>gname</i>    | 297          | 32                 |
| <i>devmajor</i> | 329          | 8                  |
| <i>devminor</i> | 337          | 8                  |
| <i>prefix</i>   | 345          | 155                |

All characters in the header logical record shall be represented in the coded character set of the ISO/IEC 646: 1991 standard. For maximum portability between implementations, names should be selected from characters represented by the portable filename character set as octets with the most significant bit zero. If an implementation supports the use of characters outside of <slash> and the portable filename character set in names for files, users, and groups, one or more implementation-defined encodings of these characters shall be provided for interchange purposes.

However, the *pax* utility shall never create filenames on the local system that cannot be accessed via the procedures described in POSIX.1-2008. If a filename is found on the medium that would create an invalid filename, it is implementation-defined whether the data from the file is stored on the file hierarchy and under what name it is stored. The *pax* utility may choose to ignore these files as long as it produces an error indicating that the file is being ignored.

Each field within the header logical record is contiguous; that is, there is no padding used. Each character on the archive medium shall be stored contiguously.

The fields *magic*, *uname*, and *gname* are character strings each terminated by a NUL character. The fields *name*, *linkname*, and *prefix* are NUL-terminated character strings except when all characters in the array contain non-NUL characters including the last character. The *version* field is two octets containing the characters "00" (zero-zero). The *typeflag* contains a single character. All other fields are leading zero-filled octal numbers using digits from the ISO/IEC 646: 1991 standard IRV. Each numeric field is terminated by one or more <space> or NUL characters.

The *name* and the *prefix* fields shall produce the pathname of the file. A new pathname shall be formed, if *prefix* is not an empty string (its first character is not NUL), by concatenating *prefix* (up to the first NUL character), a <slash> character, and *name*; otherwise, *name* is used alone. In either case, *name* is terminated at the first NUL character. If *prefix* begins with a NUL character, it shall be ignored. In this manner, pathnames of at most 256 characters can be supported. If a pathname does not fit in the space provided, *pax* shall notify the user of the error, and shall not store any part of the file—header or data—on the medium.

The *linkname* field, described below, shall not use the *prefix* to produce a pathname. As such, a *linkname* is limited to 100 characters. If the name does not fit in the space provided, *pax* shall

notify the user of the error, and shall not attempt to store the link on the medium.

The *mode* field provides 12 bits encoded in the ISO/IEC 646:1991 standard octal digit representation. The encoded bits shall represent the following values:

**Table 4-15** ustar *mode* Field

| Bit Value | POSIX.1-2008 Bit | Description                                     |
|-----------|------------------|-------------------------------------------------|
| 04 000    | S_ISUID          | Set UID on execution.                           |
| 02 000    | S_ISGID          | Set GID on execution.                           |
| 01 000    | <reserved>       | Reserved for future standardization.            |
| 00 400    | S_IRUSR          | Read permission for file owner class.           |
| 00 200    | S_IWUSR          | Write permission for file owner class.          |
| 00 100    | S_IXUSR          | Execute/search permission for file owner class. |
| 00 040    | S_IRGRP          | Read permission for file group class.           |
| 00 020    | S_IWGRP          | Write permission for file group class.          |
| 00 010    | S_IXGRP          | Execute/search permission for file group class. |
| 00 004    | S_IROTH          | Read permission for file other class.           |
| 00 002    | S_IWOTH          | Write permission for file other class.          |
| 00 001    | S_IXOTH          | Execute/search permission for file other class. |

When appropriate privileges are required to set one of these mode bits, and the user restoring the files from the archive does not have appropriate privileges, the mode bits for which the user does not have appropriate privileges shall be ignored. Some of the mode bits in the archive format are not mentioned elsewhere in this volume of POSIX.1-2008. If the implementation does not support those bits, they may be ignored.

The *uid* and *gid* fields are the user and group ID of the owner and group of the file, respectively.

The *size* field is the size of the file in octets. If the *typeflag* field is set to specify a file to be of type 1 (a link) or 2 (a symbolic link), the *size* field shall be specified as zero. If the *typeflag* field is set to specify a file of type 5 (directory), the *size* field shall be interpreted as described under the definition of that record type. No data logical records are stored for types 1, 2, or 5. If the *typeflag* field is set to 3 (character special file), 4 (block special file), or 6 (FIFO), the meaning of the *size* field is unspecified by this volume of POSIX.1-2008, and no data logical records shall be stored on the medium. Additionally, for type 6, the *size* field shall be ignored when reading. If the *typeflag* field is set to any other value, the number of logical records written following the header shall be  $(size+511)/512$ , ignoring any fraction in the result of the division.

The *mtime* field shall be the modification time of the file at the time it was archived. It is the ISO/IEC 646:1991 standard representation of the octal value of the modification time obtained from the *stat()* function.

The *chksum* field shall be the ISO/IEC 646:1991 standard IRV representation of the octal value of the simple sum of all octets in the header logical record. Each octet in the header shall be treated as an unsigned value. These values shall be added to an unsigned integer, initialized to zero, the precision of which is not less than 17 bits. When calculating the checksum, the *chksum* field is treated as if it were all <space> characters.

The *typeflag* field specifies the type of file archived. If a particular implementation does not recognize the type, or the user does not have appropriate privileges to create that type, the file shall be extracted as if it were a regular file if the file type is defined to have a meaning for the *size* field that could cause data logical records to be written on the medium (see the previous description for *size*). If conversion to a regular file occurs, the *pax* utility shall produce an error indicating that the conversion took place. All of the *typeflag* fields shall be coded in the

Such files are identified by having the same device and file serial numbers, and pathnames that refer to different directory entries. All such files shall be archived as linked files. The linked-to name is specified in the <i>linkname</i> field with a NUL-character terminator if it is less than 100 octets in length.                  |
| 101497 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                                                                                                                                                                                                                                                                                                                                                                                                            |

In this case the <i>devmajor</i> and <i>devminor</i> fields shall contain information defining the device, the format of which is unspecified by this volume of POSIX.1-2008. Implementations may map the device specifications to their own local specification or may ignore the entry.                                                          |

On systems where disk allocation is performed on a directory basis, the <i>size</i> field shall contain the maximum number of octets (which may be rounded to the nearest disk block allocation unit) that the directory may hold. A <i>size</i> field of zero indicates no such limiting. Systems that do not support limiting in this manner should ignore the <i>size</i> field. |

| 101519 | It is unspecified whether files with pathnames that refer to the same directory entry are archived as linked files or as separate files. If they are archived as linked files, this means that attempting to extract both pathnames from the resulting archive will always cause an error (unless the <i>-u</i> option is used) because the link cannot be created.                                                                                                                                                                                                                                                                                                                                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                            |

| 101527 | The <i>magic</i> field is the specification that this archive was output in this archive format. If this field contains <i>ustar</i> (the five characters from the ISO/IEC 646: 1991 standard IRV shown followed by NUL), the <i>uname</i> and <i>gname</i> fields shall contain the ISO/IEC 646: 1991 standard IRV representation of the owner and group of the file, respectively (truncated to fit, if necessary). When the file is restored by a privileged, protection-preserving version of the utility, the user and group databases shall be scanned for these names. If found, the user and group IDs contained within these files shall be used rather than the values contained within the <i>uid</i> and <i>gid</i> fields. |                                                                                                                                                                                                                                                                                                                                                                                                                            |

| 101532 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 101533 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 101534 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                                                                                                                                                                                                                                                                                                                                                                                                            |

**cpio Interchange Format**

The octet-oriented **cpio** archive format shall be a series of entries, each comprising a header that describes the file, the name of the file, and then the contents of the file.

An archive may be recorded as a series of fixed-size blocks of octets. This blocking shall be used only to make physical I/O more efficient. The last group of blocks shall always be at the full size.

For the octet-oriented **cpio** archive format, the individual entry information shall be in the order indicated and described by the following table; see also the **<cpio.h>** header.

**Table 4-16** Octet-Oriented cpio Archive Entry

| Header Field Name    | Length (in Octets) | Interpreted as  |
|----------------------|--------------------|-----------------|
| <i>c_magic</i>       | 6                  | Octal number    |
| <i>c_dev</i>         | 6                  | Octal number    |
| <i>c_ino</i>         | 6                  | Octal number    |
| <i>c_mode</i>        | 6                  | Octal number    |
| <i>c_uid</i>         | 6                  | Octal number    |
| <i>c_gid</i>         | 6                  | Octal number    |
| <i>c_nlink</i>       | 6                  | Octal number    |
| <i>c_rdev</i>        | 6                  | Octal number    |
| <i>c_mtime</i>       | 11                 | Octal number    |
| <i>c_namesize</i>    | 6                  | Octal number    |
| <i>c_filesize</i>    | 11                 | Octal number    |
| Filename Field Name  | Length             | Interpreted as  |
| <i>c_name</i>        | <i>c_namesize</i>  | Pathname string |
| File Data Field Name | Length             | Interpreted as  |
| <i>c_filedata</i>    | <i>c_filesize</i>  | Data            |

**cpio Header**

For each file in the archive, a header as defined previously shall be written. The information in the header fields is written as streams of the ISO/IEC 646:1991 standard characters interpreted as octal numbers. The octal numbers shall be extended to the necessary length by appending the ISO/IEC 646:1991 standard IRV zeros at the most-significant-digit end of the number; the result is written to the most-significant digit of the stream of octets first. The fields shall be interpreted as follows:

*c\_magic* Identify the archive as being a transportable archive by containing the identifying value "070707".

*c\_dev, c\_ino* Contains values that uniquely identify the file within the archive (that is, no files contain the same pair of *c\_dev* and *c\_ino* values unless they are links to the same file). The values shall be determined in an unspecified manner.

*c\_mode* Contains the file type and access permissions as defined in the following table.

| C_ISDIR               | 040 000  | Directory              |
| C_ISFIFO              | 010 000  | FIFO                   |
| C_ISREG               | 0100 000 | Regular file           |
| C_ISLNK               | 0120 000 | Symbolic link          |
| C_ISBLK               | 060 000  | Block special file     |
| C_ISCHR               | 020 000  | Character special file |
| C_ISSOCK              | 0140 000 | Socket                 |
| C_ISCTG               | 0110 000 | Reserved               |

101596

101597

101598

101599

101600

Directories, FIFOs, symbolic links, and regular files shall be supported on a system conforming to this volume of POSIX.1-2008; additional values defined previously are reserved for compatibility with existing systems. Additional file types may be supported; however, such files should not be written to archives intended to be transported to other systems.

101601

*c\_uid*

Contains the user ID of the owner.

101602

*c\_gid*

Contains the group ID of the group.

101603

*c\_nlink*

Contains a number greater than or equal to the number of links in the archive referencing the file. If the *-a* option is used to append to a *cpio* archive, then the *pax* utility need not account for the files in the existing part of the archive when calculating the *c\_nlink* values for the appended part of the archive, and need not alter the *c\_nlink* values in the existing part of the archive if additional files with the same *c\_dev* and *c\_ino* values are appended to the archive.

101604

101605

101606

101607

101608

101609

*c\_rdev*

Contains implementation-defined information for character or block special files.

101610

*c\_mtime*

Contains the latest time of modification of the file at the time the archive was created.

101611

101612

*c\_namesize*

Contains the length of the pathname, including the terminating NUL character.

101613

*c\_filesiz*

Contains the length in octets of the data section following the header structure.

**cpio Filename**

The *c\_name* field shall contain the pathname of the file. The length of this field in octets is the value of *c\_namesize*.

If a filename is found on the medium that would create an invalid pathname, it is implementation-defined whether the data from the file is stored on the file hierarchy and under what name it is stored.

All characters shall be represented in the ISO/IEC 646:1991 standard IRV. For maximum portability between implementations, names should be selected from characters represented by the portable filename character set as octets with the most significant bit zero. If an implementation supports the use of characters outside the portable filename character set in names for files, users, and groups, one or more implementation-defined encodings of these characters shall be provided for interchange purposes. However, the *pax* utility shall never create filenames on the local system that cannot be accessed via the procedures described previously in this volume of POSIX.1-2008. If a filename is found on the medium that would create an invalid filename, it is implementation-defined whether the data from the file is stored on the local file system and under what name it is stored. The *pax* utility may choose to ignore these files as long as it produces an error indicating that the file is being ignored.

**cpio File Data**

Following *c\_name*, there shall be *c\_filesize* octets of data. Interpretation of such data occurs in a manner dependent on the file. For regular files, the data shall consist of the contents of the file. For symbolic links, the data shall consist of the contents of the symbolic link. If *c\_filesize* is zero, no data shall be contained in *c\_filedata*.

When restoring from an archive:

- If the user does not have appropriate privileges to create a file of the specified type, *pax* shall ignore the entry and write an error message to standard error.
- Only regular files and symbolic links have data to be restored. Presuming a regular file meets any selection criteria that might be imposed on the format-reading utility by the user, such data shall be restored.
- If a user does not have appropriate privileges to set a particular mode flag, the flag shall be ignored. Some of the mode flags in the archive format are not mentioned elsewhere in this volume of POSIX.1-2008. If the implementation does not support those flags, they may be ignored.

**cpio Special Entries**

FIFO special files, directories, and the trailer shall be recorded with *c\_filesize* equal to zero. Symbolic links shall be recorded with *c\_filesize* equal to the length of the contents of the symbolic link. For other special files, *c\_filesize* is unspecified by this volume of POSIX.1-2008. The header for the next file entry in the archive shall be written directly after the last octet of the file entry preceding it. A header denoting the filename **TRAILER!!!** shall indicate the end of the archive; the contents of octets in the last block of the archive following such a header are undefined.

**EXIT STATUS**

The following exit values shall be returned:

- 0 All files were processed successfully.

101656 >0 An error occurred.

## 101657 CONSEQUENCES OF ERRORS

101658 If *pax* cannot create a file or a link when reading an archive or cannot find a file when writing an  
 101659 archive, or cannot preserve the user ID, group ID, or file mode when the **-p** option is specified, a  
 101660 diagnostic message shall be written to standard error and a non-zero exit status shall be  
 101661 returned, but processing shall continue. In the case where *pax* cannot create a link to a file, *pax*  
 101662 shall not, by default, create a second copy of the file.

101663 If the extraction of a file from an archive is prematurely terminated by a signal or error, *pax* may  
 101664 have only partially extracted the file or (if the **-n** option was not specified) may have extracted a  
 101665 file of the same name as that specified by the user, but which is not the file the user wanted.  
 101666 Additionally, the file modes of extracted directories may have additional bits from the S\_IRWXU  
 101667 mask set as well as incorrect modification and access times.

## 101668 APPLICATION USAGE

101669 Caution is advised when using the **-a** option to append to a *cpio* format archive. If any of the  
 101670 files being appended happen to be given the same *c\_dev* and *c\_ino* values as a file in the existing  
 101671 part of the archive, then they may be treated as links to that file on extraction. Thus, it is risky to  
 101672 use **-a** with *cpio* format except when it is done on the same system that the original archive was  
 101673 created on, and with the same *pax* utility, and in the knowledge that there has been little or no  
 101674 file system activity since the original archive was created that could lead to any of the files  
 101675 appended being given the same *c\_dev* and *c\_ino* values as an unrelated file in the existing part of  
 101676 the archive. Also, when (intentionally) appending additional links to a file in the existing part of  
 101677 the archive, the *c\_nlink* values in the modified archive can be smaller than the number of links to  
 101678 the file in the archive, which may mean that the links are not preserved on extraction.

101679 The **-p** (privileges) option was invented to reconcile differences between historical *tar* and *cpio*  
 101680 implementations. In particular, the two utilities use **-m** in diametrically opposed ways. The **-p**  
 101681 option also provides a consistent means of extending the ways in which future file attributes can  
 101682 be addressed, such as for enhanced security systems or high-performance files. Although it may  
 101683 seem complex, there are really two modes that are most commonly used:

101684 **-p e** “Preserve everything”. This would be used by the historical superuser, someone with  
 101685 all appropriate privileges, to preserve all aspects of the files as they are recorded in the  
 101686 archive. The **e** flag is the sum of **o** and **p**, and other implementation-defined attributes.

101687 **-p p** “Preserve” the file mode bits. This would be used by the user with regular privileges  
 101688 who wished to preserve aspects of the file other than the ownership. The file times are  
 101689 preserved by default, but two other flags are offered to disable these and use the time  
 101690 of extraction.

101691 The one pathname per line format of standard input precludes pathnames containing <newline>  
 101692 characters. Although such pathnames violate the portable filename guidelines, they may exist  
 101693 and their presence may inhibit usage of *pax* within shell scripts. This problem is inherited from  
 101694 historical archive programs. The problem can be avoided by listing filename arguments on the  
 101695 command line instead of on standard input.

101696 It is almost certain that appropriate privileges are required for *pax* to accomplish parts of this  
 101697 volume of POSIX.1-2008. Specifically, creating files of type block special or character special,  
 101698 restoring file access times unless the files are owned by the user (the **-t** option), or preserving file  
 101699 owner, group, and mode (the **-p** option) all probably require appropriate privileges.

101700 In **read** mode, implementations are permitted to overwrite files when the archive has multiple  
 101701 members with the same name. This may fail if permissions on the first version of the file do not  
 101702 permit it to be overwritten.

101703 The **cpio** and **ustar** formats can only support files up to 8 589 934 592 bytes ( $8 * 2^{30}$ ) in size.

101704 When archives containing binary header information are listed , the filenames printed may  
101705 cause strange behavior on some terminals.

101706 When all of the following are true: +

- 101707 1. A file of type directory is being placed into an archive. +
- 101708 2. The **ustar** archive format is being used. +
- 101709 3. The pathname of the directory is less than or equal to 155 bytes long (it will fit in the *prefix* +  
101710 field in the **ustar** header block). +
- 101711 4. The last component of the pathname of the directory is longer than 100 bytes long (it will +  
101712 not fit in the *name* field in the **ustar** header block). +

101713 some implementations of the *pax* utility will place the entire directory pathname in the *prefix* +  
101714 field, set the *name* field to an empty string, and place the directory in the archive. Other +  
101715 implementations of the *pax* utility will give an error under these conditions because the *name* +  
101716 field is not large enough to hold the last component of the directory name. This standard allows +  
101717 either behavior. However, when extracting a directory from a **ustar** format archive, this standard +  
101718 requires that all implementations be able to extract a directory even if the *name* field contains an +  
101719 empty string as long as the *prefix* field does not also contain an empty string.

101720 **EXAMPLES**

101721 The following command:

101722 `pax -w -f /dev/rmt/lm .`

101723 copies the contents of the current directory to tape drive 1, medium density (assuming historical  
101724 System V device naming procedures—the historical BSD device name would be **/dev/rmt9**).

101725 The following commands:

101726 `mkdir newdir`  
101727 `pax -rw olddir newdir`

101728 copy the *olddir* directory hierarchy to *newdir*.

101729 `pax -r -s ',^//*usr//*,,' -f a.pax`

101730 reads the archive **a.pax**, with all files rooted in **/usr** in the archive extracted relative to the current  
101731 directory.

101732 Using the option:

101733 `-o listopt="%M %(atime)T %(size)D %(name)s"`

101734 overrides the default output description in Standard Output and instead writes:

101735 `-rw-rw--- Jan 12 15:53 2003 1492 /usr/foo/bar`

101736 Using the options:

101737 `-o listopt='%L\t%(size)D\n%.7' \`  
101738 `-o listopt='(name)s\n%(atime)T\n%T'`

101739 overrides the default output description in Standard Output and instead writes:

101740 `/usr/foo/bar -> /tmp 1492`  
101741 `/usr/fo`  
101742 `Jan 12 15:53 1991`

101743 Jan 31 15:53 2003

#### 101744 RATIONALE

101745 The *pax* utility was new for the ISO POSIX-2:1993 standard. It represents a peaceful compromise  
101746 between advocates of the historical *tar* and *cpio* utilities.

101747 A fundamental difference between *cpio* and *tar* was in the way directories were treated. The *cpio*  
101748 utility did not treat directories differently from other files, and to select a directory and its  
101749 contents required that each file in the hierarchy be explicitly specified. For *tar*, a directory  
101750 matched every file in the file hierarchy it rooted.

101751 The *pax* utility offers both interfaces; by default, directories map into the file hierarchy they root.  
101752 The **-d** option causes *pax* to skip any file not explicitly referenced, as *cpio* historically did. The *tar*  
101753 *-style* behavior was chosen as the default because it was believed that this was the more  
101754 common usage and because *tar* is the more commonly available interface, as it was historically  
101755 provided on both System V and BSD implementations.

101756 The data interchange format specification in this volume of POSIX.1-2008 requires that processes  
101757 with “appropriate privileges” shall always restore the ownership and permissions of extracted  
101758 files exactly as archived. If viewed from the historic equivalence between superuser and  
101759 “appropriate privileges”, there are two problems with this requirement. First, users running as  
101760 superusers may unknowingly set dangerous permissions on extracted files. Second, it is  
101761 needlessly limiting, in that superusers cannot extract files and own them as superuser unless the  
101762 archive was created by the superuser. (It should be noted that restoration of ownerships and  
101763 permissions for the superuser, by default, is historical practice in *cpio*, but not in *tar*.) In order to  
101764 avoid these two problems, the *pax* specification has an additional “privilege” mechanism, the **-p**  
101765 option. Only a *pax* invocation with the privileges needed, and which has the **-p** option set using  
101766 the *e* specification character, has appropriate privileges to restore full ownership and permission  
101767 information.

101768 Note also that this volume of POSIX.1-2008 requires that the file ownership and access  
101769 permissions shall be set, on extraction, in the same fashion as the *creat()* function when provided  
101770 with the mode stored in the archive. This means that the file creation mask of the user is applied  
101771 to the file permissions.

101772 Users should note that directories may be created by *pax* while extracting files with permissions  
101773 that are different from those that existed at the time the archive was created. When extracting  
101774 sensitive information into a directory hierarchy that no longer exists, users are encouraged to set  
101775 their file creation mask appropriately to protect these files during extraction.

101776 The table of contents output is written to standard output to facilitate pipeline processing.

101777 An early proposal had hard links displaying for all pathnames. This was removed because it  
101778 complicates the output of the case where **-v** is not specified and does not match historical *cpio*  
101779 usage. The hard-link information is available in the **-v** display.

101780 The description of the **-l** option allows implementations to make hard links to symbolic links. |  
101781 Earlier versions of this standard did not specify any way to create a hard link to a symbolic link, |  
101782 but many implementations provided this capability as an extension. If there are hard links to |  
101783 symbolic links when an archive is created, the implementation is required to archive the hard |  
101784 link in the archive (unless **-H** or **-L** is specified). When in **read** mode and in **copy** mode,  
101785 implementations supporting hard links to symbolic links should use them when appropriate.

101786 The archive formats inherited from the POSIX.1-1990 standard have certain restrictions that have  
101787 been brought along from historical usage. For example, there are restrictions on the length of  
101788 pathnames stored in the archive. When *pax* is used in **copy(-rw)** mode (copying directory  
101789 hierarchies), the ability to use extensions from the **-xpax** format overcomes these restrictions.

The default *blocksize* value of 5120 bytes for *cpio* was selected because it is one of the standard block-size values for *cpio*, set when the **-B** option is specified. (The other default block-size value for *cpio* is 512 bytes, and this was considered to be too small.) The default block value of 10240 bytes for *tar* was selected because that is the standard block-size value for BSD *tar*. The maximum block size of 32256 bytes ( $2^{15}$ –512 bytes) is the largest multiple of 512 bytes that fits into a signed 16-bit tape controller transfer register. There are known limitations in some historical systems that would prevent larger blocks from being accepted. Historical values were chosen to improve compatibility with historical scripts using *dd* or similar utilities to manipulate archives. Also, default block sizes for any file type other than character special file has been deleted from this volume of POSIX.1-2008 as unimportant and not likely to affect the structure of the resulting archive.

Implementations are permitted to modify the block-size value based on the archive format or the device to which the archive is being written. This is to provide implementations with the opportunity to take advantage of special types of devices, and it should not be used without a great deal of consideration as it almost certainly decreases archive portability.

The intended use of the **-n** option was to permit extraction of one or more files from the archive without processing the entire archive. This was viewed by the standard developers as offering significant performance advantages over historical implementations. The **-n** option in early proposals had three effects; the first was to cause special characters in patterns to not be treated specially. The second was to cause only the first file that matched a pattern to be extracted. The third was to cause *pax* to write a diagnostic message to standard error when no file was found matching a specified pattern. Only the second behavior is retained by this volume of POSIX.1-2008, for many reasons. First, it is in general not acceptable for a single option to have multiple effects. Second, the ability to make pattern matching characters act as normal characters is useful for parts of *pax* other than file extraction. Third, a finer degree of control over the special characters is useful because users may wish to normalize only a single special character in a single filename. Fourth, given a more general escape mechanism, the previous behavior of the **-n** option can be easily obtained using the **-s** option or a *sed* script. Finally, writing a diagnostic message when a pattern specified by the user is unmatched by any file is useful behavior in all cases.

In this version, the **-n** was removed from the **copy** mode synopsis of *pax*; it is inapplicable because there are no pattern operands specified in this mode.

There is another method than *pax* for copying subtrees in POSIX.1-2008 described as part of the *cp* utility. Both methods are historical practice: *cp* provides a simpler, more intuitive interface, while *pax* offers a finer granularity of control. Each provides additional functionality to the other; in particular, *pax* maintains the hard-link structure of the hierarchy while *cp* does not. It is the intention of the standard developers that the results be similar (using appropriate option combinations in both utilities). The results are not required to be identical; there seemed insufficient gain to applications to balance the difficulty of implementations having to guarantee that the results would be exactly identical.

A single archive may span more than one file. It is suggested that implementations provide informative messages to the user on standard error whenever the archive file is changed.

The **-d** option (do not create intermediate directories not listed in the archive) found in early proposals was originally provided as a complement to the historic **-d** option of *cpio*. It has been deleted.

The **-s** option in early proposals specified a subset of the substitution command from the *ed* utility. As there was no reason for only a subset to be supported, the **-s** option is now compatible with the current *ed* specification. Since the delimiter can be any non-null character, the following

usage with single <space> characters is valid:

```
pax -s " foo bar " ...
```

The **-t** description is worded so as to note that this may cause the access time update caused by some other activity (which occurs while the file is being read) to be overwritten.

The default behavior of *pax* with regard to file modification times is the same as historical implementations of *tar*. It is not the historical behavior of *cpio*.

Because the **-i** option uses **/dev/tty**, utilities without a controlling terminal are not able to use this option.

The **-y** option, found in early proposals, has been deleted because a line containing a single <period> for the **-i** option has equivalent functionality. The special lines for the **-i** option (a single <period> and the empty line) are historical practice in *cpio*.

In early drafts, a **-echarmap** option was included to increase portability of files between systems using different coded character sets. This option was omitted because it was apparent that consensus could not be formed for it. In this version, the use of UTF-8 should be an adequate substitute.

The ISO POSIX-2:1993 standard and ISO POSIX-1 standard requirements for *pax*, however, made it very difficult to create a single archive containing files created using extended characters provided by different locales. This version adds the **hdrcharset** keyword to make it possible to archive files in these cases without dropping files due to translation errors.

Translating filenames and other attributes from a locale's encoding to UTF-8 and then back again can lose information, as the resulting filename might not be byte-for-byte equivalent to the original. To avoid this problem, users can specify the **-o hdrcharset=binary** option, which will cause the resulting archive to use binary format for all names and attributes. Such archives are not portable among hosts that use different native encodings (e.g., EBCDIC *versus* ASCII-based encodings), but they will allow interchange among the vast majority of POSIX file systems in practical use. Also, the **-o hdrcharset=binary** option will cause *pax* in **copy** mode to behave more like other standard utilities such as *cp*.

If the values specified by the **-o exthdr.name=value**, **-o globexthdr.name=value**, or by **\$TMPDIR** (if **-o globexthdr.name** is not specified) require a character encoding other than that described in the ISO/IEC 646:1991 standard, a **path** extended header record will have to be created for the file. If a **hdrcharset** extended header record is active for such headers, it will determine the codeset used for the value field in these extended **path** header records. These **path** extended header records always need to be created when writing an archive even if **hdrcharset=binary** has been specified and would contain the same (binary) data that appears in the **ustar** header record prefix and *name* fields. (In other words, an extended header **path** record is always required to be generated if the *prefix* or *name* fields contain non-ASCII characters even when **hdrcharset=binary** is also in effect for that file.)

The **-k** option was added to address international concerns about the dangers involved in the character set transformations of **-e** (if the target character set were different from the source, the filenames might be transformed into names matching existing files) and also was made more general to protect files transferred between file systems with different {NAME\_MAX} values (truncating a filename on a smaller system might also inadvertently overwrite existing files). As stated, it prevents any overwriting, even if the target file is older than the source. This version adds more granularity of options to solve this problem by introducing the **-oinvalid=option**—specifically the **UTF-8** and **binary** actions. (Note that an existing file is still subject to overwriting in this case. The **-k** option closes that loophole.)

Some of the file characteristics referenced in this volume of POSIX.1-2008 might not be supported by some archive formats. For example, neither the **tar** nor **cpio** formats contain the file access time. For this reason, the **e** specification character has been provided, intended to cause all file characteristics specified in the archive to be retained.

It is required that extracted directories, by default, have their access and modification times and permissions set to the values specified in the archive. This has obvious problems in that the directories are almost certainly modified after being extracted and that directory permissions may not permit file creation. One possible solution is to create directories with the mode specified in the archive, as modified by the *umask* of the user, with sufficient permissions to allow file creation. After all files have been extracted, *pax* would then reset the access and modification times and permissions as necessary.

The list-mode formatting description borrows heavily from the one defined by the *printf* utility. However, since there is no separate operand list to get conversion arguments, the format was extended to allow specifying the name of the conversion argument as part of the conversion specification.

The **T** conversion specifier allows time fields to be displayed in any of the date formats. Unlike the *ls* utility, *pax* does not adjust the format when the date is less than six months in the past. This makes parsing the output more predictable.

The **D** conversion specifier handles the ability to display the major/minor or file size, as with *ls*, by using `%-8(size)D`.

The **L** conversion specifier handles the *ls* display for symbolic links.

Conversion specifiers were added to generate existing known types used for *ls*.

### **pax Interchange Format**

The new POSIX data interchange format was developed primarily to satisfy international concerns that the **ustar** and **cpio** formats did not provide for file, user, and group names encoded in characters outside a subset of the ISO/IEC 646:1991 standard. The standard developers realized that this new POSIX data interchange format should be very extensible because there were other requirements they foresaw in the near future:

- Support international character encodings and locale information
- Support security information (ACLs, and so on)
- Support future file types, such as realtime or contiguous files
- Include data areas for implementation use
- Support systems with words larger than 32 bits and timers with subsecond granularity

The following were not goals for this format because these are better handled by separate utilities or are inappropriate for a portable format:

- Encryption
- Compression
- Data translation between locales and codesets
- *inode* storage

The format chosen to support the goals is an extension of the **ustar** format. Of the two formats previously available, only the **ustar** format was selected for extensions because:

- It was easier to extend in an upwards-compatible way. It offered version flags and header block type fields with room for future standardization. The **cpio** format, while possessing a more flexible file naming methodology, could not be extended without breaking some theoretical implementation or using a dummy filename that could be a legitimate filename.
- Industry experience since the original “tar wars” fought in developing the ISO POSIX-1 standard has clearly been in favor of the **ustar** format, which is generally the default output format selected for *pax* implementations on new systems.

The new format was designed with one additional goal in mind: reasonable behavior when an older *tar* or *pax* utility happened to read an archive. Since the POSIX.1-1990 standard mandated that a “format-reading utility” had to treat unrecognized *typeflag* values as regular files, this allowed the format to include all the extended information in a pseudo-regular file that preceded each real file. An option is given that allows the archive creator to set up reasonable names for these files on the older systems. Also, the normative text suggests that reasonable file access values be used for this **ustar** header block. Making these header files inaccessible for convenient reading and deleting would not be reasonable. File permissions of 600 or 700 are suggested.

The **ustar** *typeflag* field was used to accommodate the additional functionality of the new format rather than magic or version because the POSIX.1-1990 standard (and, by reference, the previous version of *pax*), mandated the behavior of the format-reading utility when it encountered an unknown *typeflag*, but was silent about the other two fields.

Early proposals for the first version of this standard contained a proposed archive format that was based on compatibility with the standard for tape files (ISO 1001, similar to the format used historically on many mainframes and minicomputers). This format was overly complex and required considerable overhead in volume and header records. Furthermore, the standard developers felt that it would not be acceptable to the community of POSIX developers, so it was later changed to be a format more closely related to historical practice on POSIX systems.

The prefix and name split of pathnames in **ustar** was replaced by the single path extended header record for simplicity.

The concept of a global extended header (*typeflag g*) was controversial. If this were applied to an archive being recorded on magnetic tape, a few unreadable blocks at the beginning of the tape could be a serious problem; a utility attempting to extract as many files as possible from a damaged archive could lose a large percentage of file header information in this case. However, if the archive were on a reliable medium, such as a CD-ROM, the global extended header offers considerable potential size reductions by eliminating redundant information. Thus, the text warns against using the global method for unreliable media and provides a method for implanting global information in the extended header for each file, rather than in the *typeflag g* records.

No facility for data translation or filtering on a per-file basis is included because the standard developers could not invent an interface that would allow this in an efficient manner. If a filter, such as encryption or compression, is to be applied to all the files, it is more efficient to apply the filter to the entire archive as a single file. The standard developers considered interfaces that would invoke a shell script for each file going into or out of the archive, but the system overhead in this approach was considered to be too high.

One such approach would be to have **filter=** records that give a pathname for an executable. When the program is invoked, the file and archive would be open for standard input/output and all the header fields would be available as environment variables or command-line arguments. The standard developers did discuss such schemes, but they were omitted from POSIX.1-2008 due to concerns about excessive overhead. Also, the program itself would need to

|        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 101973 | be in the archive if it were to be used portably.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 101974 | There is currently no portable means of identifying the character set(s) used for a file in the file system. Therefore, <i>pax</i> has not been given a mechanism to generate charset records automatically. The only portable means of doing this is for the user to write the archive using the <b>-ocharset=string</b> command line option. This assumes that all of the files in the archive use the same encoding. The “implementation-defined” text is included to allow for a system that can identify the encodings used for each of its files.                                                                                               |
| 101975 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| 101980 | The table of standards that accompanies the charset record description is acknowledged to be very limited. Only a limited number of character set standards is reasonable for maximal interchange. Any character set is, of course, possible by prior agreement. It was suggested that EBCDIC be listed, but it was omitted because it is not defined by a formal standard. Formal standards, and then only those with reasonably large followings, can be included here, simply as a matter of practicality. The <i>&lt;value&gt;s</i> represent names of officially registered character sets in the format required by the ISO 2375:1985 standard. |

| 102006 | Device and <i>i</i> -number labeling of files was not adopted from <i>cpio</i> ; files are interchanged strictly on a symbolic name basis, as in <b>ustar</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 102007 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 102008 | Just as with the <b>ustar</b> format descriptions, the new format makes no special arrangements for multi-volume archives. Each of the <i>pax</i> archive types is assumed to be inside a single POSIX file and splitting that file over multiple volumes (diskettes, tape cartridges, and so on), processing their labels, and mounting each in the proper sequence are considered to be implementation details that cannot be described portably.                                                                                                                                                                                                   |

- It translates names into a portable character set and identifies locale-related information, both of which are probably unnecessary for backup.

The requirements on restoring from an archive are slightly different from the historical wording, allowing for non-monolithic privilege to bring forward as much as possible. In particular, attributes such as “high performance file” might be broadly but not universally granted while set-user-ID or *chown()* might be much more restricted. There is no implication in POSIX.1-2008 that the security information be honored after it is restored to the file hierarchy, in spite of what might be improperly inferred by the silence on that topic. That is a topic for another standard.

Links are recorded in the fashion described here because a link can be to any file type. It is desirable in general to be able to restore part of an archive selectively and restore all of those files completely. If the data is not associated with each link, it is not possible to do this. However, the data associated with a file can be large, and when selective restoration is not needed, this can be a significant burden. The archive is structured so that files that have no associated data can always be restored by the name of any link name of any link, and the user may choose whether data is recorded with each instance of a file that contains data. The format permits mixing of both types of links in a single archive; this can be done for special needs, and *pax* is expected to interpret such archives on input properly, despite the fact that there is no *pax* option that would force this mixed case on output. (When **-o linkdata** is used, the output must contain the duplicate data, but the implementation is free to include it or omit it when **-o linkdata** is not used.)

The time values are included as extended header records for those implementations needing more than the eleven octal digits allowed by the **ustar** format. Portable file timestamps cannot be negative. If *pax* encounters a file with a negative timestamp in **copy** or **write** mode, it can reject the file, substitute a non-negative timestamp, or generate a non-portable timestamp with a leading ‘-’. Even though some implementations can support finer file-time granularities than seconds, the normative text requires support only for seconds since the Epoch because the ISO POSIX-1 standard states them that way. The **ustar** format includes only *mtime*; the new format adds *atime* and *ctime* for symmetry. The *atime* access time restored to the file system will be affected by the **-p a** and **-p e** options. The *ctime* creation time (actually *inode* modification time) is described with appropriate privileges so that it can be ignored when writing to the file system. POSIX does not provide a portable means to change file creation time. Nothing is intended to prevent a non-portable implementation of *pax* from restoring the value.

The *gid*, *size*, and *uid* extended header records were included to allow expansion beyond the sizes specified in the regular *tar* header. New file system architectures are emerging that will exhaust the 12-digit size field. There are probably not many systems requiring more than 8 digits for user and group IDs, but the extended header values were included for completeness, allowing overrides for all of the decimal values in the *tar* header.

The standard developers intended to describe the effective results of *pax* with regard to file ownerships and permissions; implementations are not restricted in timing or sequencing the restoration of such, provided the results are as specified.

Much of the text describing the extended headers refers to use in “**write** or **copy** modes”. The **copy** mode references are due to the normative text: “The effect of the copy shall be as if the copied files were written to an archive file and then subsequently extracted ...”. There is certainly no way to test whether *pax* is actually generating the extended headers in **copy** mode, but the effects must be as if it had.

### pax Archive Character Set Encoding/Decoding

There is a need to exchange archives of files between systems of different native codesets. Filenames, group names, and user names must be preserved to the fullest extent possible when an archive is read on the receiving platform. Translation of the contents of files is not within the scope of the *pax* utility.

There will also be the need to represent characters that are not available on the receiving platform. These unsupported characters cannot be automatically folded to the local set of characters due to the chance of collisions. This could result in overwriting previous extracted files from the archive or pre-existing files on the system.

For these reasons, the codeset used to represent characters within the extended header records of the *pax* archive must be sufficiently rich to handle all commonly used character sets. The fields requiring translation include, at a minimum, filenames, user names, group names, and link pathnames. Implementations may wish to have localized extended keywords that use non-portable characters.

The standard developers considered the following options:

- The archive creator specifies the well-defined name of the source codeset. The receiver must then recognize the codeset name and perform the appropriate translations to the destination codeset.
- The archive creator includes within the archive the character mapping table for the source codeset used to encode extended header records. The receiver must then read the character mapping table and perform the appropriate translations to the destination codeset.
- The archive creator translates the extended header records in the source codeset into a canonical form. The receiver must then perform the appropriate translations to the destination codeset.

The approach that incorporates the name of the source codeset poses the problem of codeset name registration, and makes the archive useless to *pax* archive decoders that do not recognize that codeset.

Because parts of an archive may be corrupted, the standard developers felt that including the character map of the source codeset was too fragile. The loss of this one key component could result in making the entire archive useless. (The difference between this and the global extended header decision was that the latter has a workaround—duplicating extended header records on unreliable media—but this would be too burdensome for large character set maps.)

Both of the above approaches also put an undue burden on the *pax* archive receiver to handle the cross-product of all source and destination codesets.

To simplify the translation from the source codeset to the canonical form and from the canonical form to the destination codeset, the standard developers decided that the internal representation should be a stateless encoding. A stateless encoding is one where each codepoint has the same meaning, without regard to the decoder being in a specific state. An example of a stateful encoding would be the Japanese Shift-JIS; an example of a stateless encoding would be the ISO/IEC 646:1991 standard (equivalent to 7-bit ASCII).

For these reasons, the standard developers decided to adopt a canonical format for the representation of file information strings. The obvious, well-endorsed candidate is the ISO/IEC 10646-1:2000 standard (based in part on Unicode), which can be used to represent the characters of virtually all standardized character sets. The standard developers initially agreed upon using UCS2 (16-bit Unicode) as the internal representation. This repertoire of characters

provides a sufficiently rich set to represent all commonly-used codesets.

However, the standard developers found that the 16-bit Unicode representation had some problems. It forced the issue of standardizing byte ordering. The 2-byte length of each character made the extended header records twice as long for the case of strings coded entirely from historical 7-bit ASCII. For these reasons, the standard developers chose the UTF-8 defined in the ISO/IEC 10646-1:2000 standard. This multi-byte representation encodes UCS2 or UCS4 characters reliably and deterministically, eliminating the need for a canonical byte ordering. In addition, NUL octets and other characters possibly confusing to POSIX file systems do not appear, except to represent themselves. It was realized that certain national codesets take up more space after the encoding, due to their placement within the UCS range; it was felt that the usefulness of the encoding of the names outweighs the disadvantage of size increase for file, user, and group names.

The encoding of UTF-8 is as follows:

| UCS4 Hex Encoding   | UTF-8 Binary Encoding                                 |
|---------------------|-------------------------------------------------------|
| 00000000-0000007F   | 0xxxxxxx                                              |
| 00000080-000007FF   | 110xxxxx 10xxxxxx                                     |
| 00000800-0000FFFF   | 1110xxxx 10xxxxxx 10xxxxxx                            |
| 00010000-001FFFFFFF | 11110xxx 10xxxxxx 10xxxxxx 10xxxxxx                   |
| 00200000-03FFFFFFF  | 111110xx 10xxxxxx 10xxxxxx 10xxxxxx 10xxxxxx          |
| 04000000-7FFFFFFF   | 1111110x 10xxxxxx 10xxxxxx 10xxxxxx 10xxxxxx 10xxxxxx |

where each 'x' represents a bit value from the character being translated.

### ustar Interchange Format

The description of the **ustar** format reflects numerous enhancements over pre-1988 versions of the historical *tar* utility. The goal of these changes was not only to provide the functional enhancements desired, but also to retain compatibility between new and old versions. This compatibility has been retained. Archives written using the old archive format are compatible with the new format.

Implementors should be aware that the previous file format did not include a mechanism to archive directory type files. For this reason, the convention of using a filename ending with <slash> was adopted to specify a directory on the archive.

The total size of the *name* and *prefix* fields have been set to meet the minimum requirements for {PATH\_MAX}. If a pathname will fit within the *name* field, it is recommended that the pathname be stored there without the use of the *prefix* field. Although the name field is known to be too small to contain {PATH\_MAX} characters, the value was not changed in this version of the archive file format to retain backwards-compatibility, and instead the prefix was introduced. Also, because of the earlier version of the format, there is no way to remove the restriction on the *linkname* field being limited in size to just that of the *name* field.

The *size* field is required to be meaningful in all implementation extensions, although it could be zero. This is required so that the data blocks can always be properly counted.

It is suggested that if device special files need to be represented that cannot be represented in the standard format, that one of the extension types (A-Z) be used, and that the additional information for the special file be represented as data and be reflected in the *size* field.

Attempting to restore a special file type, where it is converted to ordinary data and conflicts with an existing filename, need not be specially detected by the utility. If run as an ordinary user, *pax* should not be able to overwrite the entries in, for example, */dev* in any case (whether the file is

converted to another type or not). If run as a privileged user, it should be able to do so, and it would be considered a bug if it did not. The same is true of ordinary data files and similarly named special files; it is impossible to anticipate the needs of the user (who could really intend to overwrite the file), so the behavior should be predictable (and thus regular) and rely on the protection system as required.

The value 7 in the *typeflag* field is intended to define how contiguous files can be stored in a **ustar** archive. POSIX.1-2008 does not require the contiguous file extension, but does define a standard way of archiving such files so that all conforming systems can interpret these file types in a meaningful and consistent manner. On a system that does not support extended file types, the *pax* utility should do the best it can with the file and go on to the next.

The file protection modes are those conventionally used by the *ls* utility. This is extended beyond the usage in the ISO POSIX-2 standard to support the “shared text” or “sticky” bit. It is intended that the conformance document should not document anything beyond the existence of and support of such a mode. Further extensions are expected to these bits, particularly with overloading the set-user-ID and set-group-ID flags.

### cpio Interchange Format

The reference to appropriate privileges in the **cpio** format refers to an error on standard output; the **ustar** format does not make comparable statements.

The model for this format was the historical System V *cpio-c* data interchange format. This model documents the portable version of the **cpio** format and not the binary version. It has the flexibility to transfer data of any type described within POSIX.1-2008, yet is extensible to transfer data types specific to extensions beyond POSIX.1-2008 (for example, contiguous files). Because it describes existing practice, there is no question of maintaining upwards-compatibility.

### cpio Header

There has been some concern that the size of the *c\_ino* field of the header is too small to handle those systems that have very large *inode* numbers. However, the *c\_ino* field in the header is used strictly as a hard-link resolution mechanism for archives. It is not necessarily the same value as the *inode* number of the file in the location from which that file is extracted.

The name *c\_magic* is based on historical usage.

### cpio Filename

For most historical implementations of the *cpio* utility, {PATH\_MAX} octets can be used to describe the pathname without the addition of any other header fields (the NUL character would be included in this count). {PATH\_MAX} is the minimum value for pathname size, documented as 256 bytes. However, an implementation may use *c\_namesize* to determine the exact length of the pathname. With the current description of the **<cpio.h>** header, this pathname size can be as large as a number that is described in six octal digits.

Two values are documented under the *c\_mode* field values to provide for extensibility for known file types:

**0110 000** Reserved for contiguous files. The implementation may treat the rest of the information for this archive like a regular file. If this file type is undefined, the implementation may create the file as a regular file.

This provides for extensibility of the **cpio** format while allowing for the ability to read old archives. Files of an unknown type may be read as “regular files” on some implementations. On a system that does not support extended file types, the *pax* utility should do the best it can with

102197 the file and go on to the next.

## 102198 FUTURE DIRECTIONS

102199 None.

## 102205 CHANGE HISTORY

102206 First released in Issue 4.

### 102207 Issue 5

102208 A note is added to the APPLICATION USAGE indicating that the **cpio** and **tar** formats can only  
102209 support files up to 8 gigabytes in size.

### 102210 Issue 6

102211 The *pax* utility is aligned with the IEEE P1003.2b draft standard:

- 102212 • Support has been added for symbolic links in the options and interchange formats.
- 102213 • A new format has been devised, based on extensions to **ustar**.
- 102214 • References to the “extended” **tar** and **cpio** formats derived from the POSIX.1-1990  
102215 standard have been changed to remove the “extended” adjective because this could cause  
102216 confusion with the extended *tar* header added in this version. (All references to *tar* are  
102217 actually to **ustar**.)

102218 The *TZ* entry is added to the ENVIRONMENT VARIABLES section.

102219 IEEE PASC Interpretation 1003.2 #168 is applied, clarifying that *mkdir()* and *mkfifo()* calls can  
102220 ignore an [EEXIST] error when extracting an archive.

102221 IEEE PASC Interpretation 1003.2 #180 is applied, clarifying how extracted files are created when  
102222 in **read** mode.

102223 IEEE PASC Interpretation 1003.2 #181 is applied, clarifying the description of the **-t** option.

102224 IEEE PASC Interpretation 1003.2 #195 is applied.

102225 IEEE PASC Interpretation 1003.2 #206 is applied, clarifying the handling of links for the **-H**, **-L**,  
102226 and **-l** options.

102227 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/35 is applied, adding the process ID of  
102228 the *pax* process into certain fields. This change provides a method for the implementation to  
102229 ensure that different instances of *pax* extracting a file named */a/b/foo* will not collide when  
102230 processing the extended header information associated with **foo**.

102231 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/36 is applied, changing **-x B** to **-x pax** in  
102232 the OPTIONS section.

102233 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/20 is applied, updating the SYNOPSIS to  
102234 be consistent with the normative text.

102235 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/21 is applied, updating the  
102236 DESCRIPTION to describe the behavior when files to be linked are symbolic links and the  
102237 system is not capable of making hard links to symbolic links.

- 102238 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/22 is applied, updating the OPTIONS  
102239 section to describe the behavior for how multiple **-odelete=pattern** options are to be handled.
- 102240 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/23 is applied, updating the **write** option  
102241 within the OPTIONS section.
- 102242 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/24 is applied, adding a paragraph into  
102243 the OPTIONS section that states that specifying more than one of the mutually-exclusive options  
102244 (**-H** and **-L**) is not considered an error and that the last option specified will determine the  
102245 behavior of the utility.
- 102246 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/25 is applied, removing the *ctime*  
102247 paragraph within the EXTENDED DESCRIPTION. There is a contradiction in the definition of  
102248 the *ctime* keyword for the *pax* extended header, in that the *st\_ctime* member of the **stat** structure  
102249 does not refer to a file creation time. No field in the standard **stat** structure from **<sys/stat.h>**  
102250 includes a file creation time.
- 102251 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/26 is applied, making it clear that *typeflag*  
102252 1 (**ustar** Interchange Format) applies not only to files that are hard-linked, but also to files that  
102253 are aliased via symbolic links.
- 102254 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/27 is applied, clarifying the *cpio c\_nlink*  
102255 field.
- 102256 **Issue 7**
- 102257 Austin Group Interpretations 1003.1-2001 #011, #036, #086, and #109 are applied.
- 102258 Austin Group Interpretation 1003.1-2001 #126 is applied, changing the description of the  
102259 *LC\_MESSAGES* environment variable.
- 102260 SD5-XCU-ERN-2 is applied, making **-c** and **-n** mutually-exclusive in the SYNOPSIS.
- 102261 SD5-XCU-ERN-3 is applied, revising the default behavior of **-H** and **-L**.
- 102262 SD5-XCU-ERN-5, SD5-XCU-ERN-6, SD5-XCU-ERN-7, SD5-XCU-ERN-60 are applied.
- 102263 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.
- 102264 The *pax* utility is no longer allowed to create separate identical symbolic links when extracting  
102265 linked symbolic links from an archive.
- 102266 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0128 [260], XCU/TC1-2008/0129 +  
102267 [261], XCU/TC1-2008/0130 [261], XCU/TC1-2008/0131 [313], and XCU/TC1-2008/0132 [233] +  
102268 are applied.

102269 **NAME**102270 `pr` — print files102271 **SYNOPSIS**

```
102272 pr [+page] [-column] [-adFmrt] [-e[char][gap]] [-h header] [-i[char][gap]]
102273 XSI [-l lines] [-n[char][width]] [-o offset] [-s[char]] [-w width] [-fp]
102274 [file...]
```

102275 **DESCRIPTION**

102276 The *pr* utility is a printing and pagination filter. If multiple input files are specified, each shall be  
 102277 read, formatted, and written to standard output. By default, the input shall be separated into  
 102278 66-line pages, each with:

- 102279 • A 5-line header that includes the page number, date, time, and the pathname of the file
- 102280 • A 5-line trailer consisting of blank lines

102281 If standard output is associated with a terminal, diagnostic messages shall be deferred until the  
 102282 *pr* utility has completed processing.

102283 When options specifying multi-column output are specified, output text columns shall be of  
 102284 equal width; input lines that do not fit into a text column shall be truncated. By default, text  
 102285 columns shall be separated with at least one <blank>.

102286 **OPTIONS**

102287 The *pr* utility shall conform to XBD [Section 12.2](#) (on page 215), except that: the *page* option has a  
 102288 '+' delimiter; *page* and *column* can be multi-digit numbers; some of the option-arguments are  
 102289 optional; and some of the option-arguments cannot be specified as separate arguments from the  
 102290 preceding option letter. In particular, the *-s* option does not allow the option letter to be  
 102291 separated from its argument, and the options *-e*, *-i*, and *-n* require that both arguments, if  
 102292 present, not be separated from the option letter.

102293 The following options shall be supported. In the following option descriptions, *column*, *lines*,  
 102294 *offset*, *page*, and *width* are positive decimal integers; *gap* is a non-negative decimal integer.

- |        |                      |                                                                                                          |
|--------|----------------------|----------------------------------------------------------------------------------------------------------|
| 102295 | <b>+page</b>         | Begin output at page number <i>page</i> of the formatted input.                                          |
| 102296 | <b>-column</b>       | Produce multi-column output that is arranged in <i>column</i> columns (the default shall                 |
| 102297 |                      | be 1) and is written down each column in the order in which the text is received                         |
| 102298 |                      | from the input file. This option should not be used with <i>-m</i> . The options <i>-e</i> and <i>-i</i> |
| 102299 |                      | shall be assumed for multiple text-column output. Whether or not text columns are                        |
| 102300 |                      | produced with identical vertical lengths is unspecified, but a text column shall                         |
| 102301 |                      | never exceed the length of the page (see the <i>-l</i> option). When used with <i>-t</i> , use the       |
| 102302 |                      | minimum number of lines to write the output.                                                             |
| 102303 | <b>-a</b>            | Modify the effect of the <i>-column</i> option so that the columns are filled across the                 |
| 102304 |                      | page in a round-robin order (for example, when <i>column</i> is 2, the first input line                  |
| 102305 |                      | heads column 1, the second heads column 2, the third is the second line in column                        |
| 102306 |                      | 1, and so on).                                                                                           |
| 102307 | <b>-d</b>            | Produce output that is double-spaced; append an extra <newline> following every                          |
| 102308 |                      | <newline> found in the input.                                                                            |
| 102309 | <b>-e[char][gap]</b> |                                                                                                          |
| 102310 |                      | Expand each input <tab> to the next greater column position specified by the                             |
| 102311 |                      | formula $n*gap+1$ , where <i>n</i> is an integer > 0. If <i>gap</i> is zero or is omitted, it shall      |
| 102312 |                      | default to 8. All <tab> characters in the input shall be expanded into the                               |
| 102313 |                      | appropriate number of <space> characters. If any non-digit character, <i>char</i> , is                   |
| 102314 |                      | specified, it shall be used as the input <tab>. If the first character of the <i>-e</i> option-          |

|        |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|-----|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 102315 |     | argument is a digit, the entire option-argument shall be assumed to be <i>gap</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 102316 | XSI | <b>-f</b> Use a <form-feed> for new pages, instead of the default behavior that uses a sequence of <newline> characters. Pause before beginning the first page if the standard output is associated with a terminal.                                                                                                                                                                                                                                                                                                                                                |
| 102317 |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 102318 |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 102319 |     | <b>-F</b> Use a <form-feed> for new pages, instead of the default behavior that uses a sequence of <newline> characters.                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 102320 |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 102321 |     | <b>-h header</b> Use the string <i>header</i> to replace the contents of the <i>file</i> operand in the page header.                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 102322 |     | <b>-i[char][gap]</b> In output, replace <space> characters with <tab> characters wherever one or more adjacent <space> characters reach column positions <i>gap</i> +1, 2* <i>gap</i> +1, 3* <i>gap</i> +1, and so on. If <i>gap</i> is zero or is omitted, default tab settings at every eighth column position shall be assumed. If any non-digit character, <i>char</i> , is specified, it shall be used as the output <tab>. If the first character of the <b>-i</b> option-argument is a digit, the entire option-argument shall be assumed to be <i>gap</i> . |

| 102335 |     | <b>-n[char][width]</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 102336 |     | Provide <i>width</i> -digit line numbering (default for <i>width</i> shall be 5). The number shall occupy the first <i>width</i> column positions of each text column of default output or each line of <b>-m</b> output. If <i>char</i> (any non-digit character) is given, it shall be appended to the line number to separate it from whatever follows (default for <i>char</i> is a <tab>).                                                                                                                                                                     |
| 102337 |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| 102346 |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 102347 |     | <b>-r</b> Write no diagnostic reports on failure to open files.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 102348 |     | <b>-s[char]</b> Separate text columns by the single character <i>char</i> instead of by the appropriate number of <space> characters (default for <i>char</i> shall be <tab>).                                                                                                                                                                                                                                                                                                                                                                                      |
| 102349 |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 102350 |     | <b>-t</b> Write neither the five-line identifying header nor the five-line trailer usually supplied for each page. Quit writing after the last line of each file without spacing to the end of the page.                                                                                                                                                                                                                                                                                                                                                            |
| 102351 |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 102352 |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 102353 |     | <b>-w width</b> Set the width of the line to <i>width</i> column positions for multiple text-column output only. If the <b>-w</b> option is not specified and the <b>-s</b> option is not specified, the default width shall be 72. If the <b>-w</b> option is not specified and the <b>-s</b> option is specified, the default width shall be 512.                                                                                                                                                                                                                 |
| 102354 |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 102355 |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 102356 |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 102357 |     | For single column output, input lines shall not be truncated.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

102358 **OPERANDS**

102359 The following operand shall be supported:

102360 *file* A pathname of a file to be written. If no *file* operands are specified, or if a *file*  
 102361 operand is *'-'*, the standard input shall be used.

102362 **STDIN**

102363 The standard input shall be used only if no *file* operands are specified, or if a *file* operand is *'-'*.  
 102364 See the INPUT FILES section.

102365 **INPUT FILES**

102366 The input files shall be text files.

102367 The file */dev/tty* shall be used to read responses required by the *-p* option.102368 **ENVIRONMENT VARIABLES**102369 The following environment variables shall affect the execution of *pr*:

102370 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 102371 (See XBD [Section 8.2](#) (on page 174) the precedence of internationalization variables  
 102372 used to determine the values of locale categories.)

102373 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 102374 internationalization variables.

102375 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 102376 characters (for example, single-byte as opposed to multi-byte characters in  
 102377 arguments and input files) and which characters are defined as printable (character  
 102378 class **print**). Non-printable characters are still written to standard output, but are  
 102379 not counted for the purpose for column-width and line-length calculations.

102380 *LC\_MESSAGES*

102381 Determine the locale that should be used to affect the format and contents of  
 102382 diagnostic messages written to standard error.

102383 *LC\_TIME* Determine the format of the date and time for use in writing header lines.102384 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

102385 *TZ* Determine the timezone used to calculate date and time strings written in header  
 102386 lines. If *TZ* is unset or null, an unspecified default timezone shall be used.

102387 **ASYNCHRONOUS EVENTS**

102388 If *pr* receives an interrupt while writing to a terminal, it shall flush all accumulated error  
 102389 messages to the screen before terminating.

102390 **STDOUT**

102391 The *pr* utility output shall be a paginated version of the original file (or files). This pagination  
 102392 shall be accomplished using either *<form-feed>* characters or a sequence of *<newline>*  
 102393 XSI characters, as controlled by the *-F* or *-f* option. Page headers shall be generated unless the *-t*  
 102394 option is specified. The page headers shall be of the form:

102395 *"\n\n%s %s Page %d\n\n\n", <output of date>, <file>, <page number>*

102396 In the POSIX locale, the *<output of date>* field, representing the date and time of last modification  
 102397 of the input file (or the current date and time if the input file is standard input), shall be  
 102398 equivalent to the output of the following command as it would appear if executed at the given  
 102399 time:

102400 *date "+%b %e %H:%M %Y"*

without the trailing <newline>, if the page being written is from standard input. If the page being written is not from standard input, in the POSIX locale, the same format shall be used, but the time used shall be the modification time of the file corresponding to *file* instead of the current time. When the *LC\_TIME* locale category is not set to the POSIX locale, a different format and order of presentation of this field may be used.

If the standard input is used instead of a *file* operand, the <*file*> field shall be replaced by a null string.

If the **-h** option is specified, the <*file*> field shall be replaced by the *header* argument.

#### 102409 **STDERR**

The standard error shall be used for diagnostic messages and for alerting the terminal when **-p** is specified.

#### 102412 **OUTPUT FILES**

None.

#### 102414 **EXTENDED DESCRIPTION**

None.

#### 102416 **EXIT STATUS**

The following exit values shall be returned:

0 Successful completion.

>0 An error occurred.

#### 102420 **CONSEQUENCES OF ERRORS**

Default.

#### 102422 **APPLICATION USAGE**

A conforming application must protect its first operand, if it starts with a <plus-sign>, by preceding it with the "--" argument that denotes the end of the options. For example, *pr+x* could be interpreted as an invalid page number or a *file* operand.

#### 102426 **EXAMPLES**

1. Print a numbered list of all files in the current directory:

```
ls -a | pr -n -h "Files in $(pwd)."

```

2. Print **file1** and **file2** as a double-spaced, three-column listing headed by "file list":

```
pr -3d -h "file list" file1 file2

```

3. Write **file1** on **file2**, expanding tabs to columns 10, 19, 28, ...:

```
pr -e9 -t <file1 >file2

```

#### 102433 **RATIONALE**

This utility is one of those that does not follow the Utility Syntax Guidelines because of its historical origins. The standard developers could have added new options that obeyed the guidelines (and marked the old options obsolescent) or devised an entirely new utility; there are examples of both actions in this volume of POSIX.1-2008. Because of its widespread use by historical applications, the standard developers decided to exempt this version of *pr* from many of the guidelines.

Implementations are required to accept option-arguments to the **-h**, **-l**, **-o**, and **-w** options whether presented as part of the same argument or as a separate argument to *pr*, as suggested by the Utility Syntax Guidelines. The **-n** and **-s** options, however, are specified as in historical

practice because they are frequently specified without their optional arguments. If a <blank> were allowed before the option-argument in these cases, a *file* operand could mistakenly be interpreted as an option-argument in historical applications.

The text about the minimum number of lines in multi-column output was included to ensure that a best effort is made in balancing the length of the columns. There are known historical implementations in which, for example, 60-line files are listed by *pr -2* as one column of 56 lines and a second of 4. Although this is not a problem when a full page with headers and trailers is produced, it would be relatively useless when used with *-t*.

Historical implementations of the *pr* utility have differed in the action taken for the *-f* option. BSD uses it as described here for the *-F* option; System V uses it to change trailing <newline> characters on each page to a <form-feed> and, if standard output is a TTY device, sends an <alert> to standard error and reads a line from */dev/tty* before the first page. There were strong arguments from both sides of this issue concerning historical practice and as a result the *-F* option was added. XSI-conformant systems support the System V historical actions for the *-f* option.

The <output of date> field in the *-l* format is specified only for the POSIX locale. As noted, the format can be different in other locales. No mechanism for defining this is present in this volume of POSIX.1-2008, as the appropriate vehicle is a message catalog; that is, the format should be specified as a “message”.

#### FUTURE DIRECTIONS

None.

#### SEE ALSO

*expand*, *lp*

XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)

#### CHANGE HISTORY

First released in Issue 2.

#### Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The *-p* option is added.

The normative text is reworded to avoid use of the term “must” for application requirements.

#### Issue 7

PASC Interpretation 1003.2-92 #151 (SD5-XCU-ERN-44) is applied.

Austin Group Interpretation 1003.1-2001 #093 is applied.

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

102478 **NAME**

102479       printf — write formatted output

102480 **SYNOPSIS**102481       printf *format* [*argument...*]102482 **DESCRIPTION**

102483       The *printf* utility shall write formatted operands to the standard output. The *argument* operands  
 102484       shall be formatted under control of the *format* operand.

102485 **OPTIONS**

102486       None.

102487 **OPERANDS**

102488       The following operands shall be supported:

102489       *format*       A string describing the format to use to write the remaining operands. See the  
 102490       EXTENDED DESCRIPTION section.

102491       *argument*   The strings to be written to standard output, under the control of *format*. See the  
 102492       EXTENDED DESCRIPTION section.

102493 **STDIN**

102494       Not used.

102495 **INPUT FILES**

102496       None.

102497 **ENVIRONMENT VARIABLES**102498       The following environment variables shall affect the execution of *printf*:

102499       *LANG*       Provide a default value for the internationalization variables that are unset or null.  
 102500       (See XBD [Section 8.2](#) (on page 174) the precedence of internationalization variables  
 102501       used to determine the values of locale categories.)

102502       *LC\_ALL*      If set to a non-empty string value, override the values of all the other  
 102503       internationalization variables.

102504       *LC\_CTYPE*   Determine the locale for the interpretation of sequences of bytes of text data as  
 102505       characters (for example, single-byte as opposed to multi-byte characters in  
 102506       arguments).

102507       *LC\_MESSAGES*

102508       Determine the locale that should be used to affect the format and contents of  
 102509       diagnostic messages written to standard error.

102510       *LC\_NUMERIC*

102511       Determine the locale for numeric formatting. It shall affect the format of numbers  
 102512       written using the e, E, f, g, and G conversion specifier characters (if supported).

102513 *XSI*       *NLSPATH*   Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

102514 **ASYNCHRONOUS EVENTS**

102515       Default.

102516 **STDOUT**

102517       See the EXTENDED DESCRIPTION section.

102518 **STDERR**

102519 The standard error shall be used only for diagnostic messages.

102520 **OUTPUT FILES**

102521 None.

102522 **EXTENDED DESCRIPTION**

102523 The *format* operand shall be used as the *format* string described in XBD [Chapter 5](#) (on page 121)  
 102524 with the following exceptions:

- 102525 1. A <space> in the format string, in any context other than a flag of a conversion  
 102526 specification, shall be treated as an ordinary character that is copied to the output.
- 102527 2. A 'Δ' character in the format string shall be treated as a 'Δ' character, not as a <space>.
- 102528 3. In addition to the escape sequences shown in XBD [Chapter 5](#) (on page 121) ('\\', '\a',  
 102529 '\b', '\f', '\n', '\r', '\t', '\v'), "\ddd", where *ddd* is a one, two, or three-digit  
 102530 octal number, shall be written as a byte with the numeric value specified by the octal  
 102531 number.
- 102532 4. The implementation shall not precede or follow output from the d or u conversion  
 102533 specifiers with <blank> characters not specified by the *format* operand.
- 102534 5. The implementation shall not precede output from the o conversion specifier with zeros  
 102535 not specified by the *format* operand.
- 102536 6. The a, A, e, E, f, F, g, and G conversion specifiers need not be supported.
- 102537 7. An additional conversion specifier character, b, shall be supported as follows. The  
 102538 argument shall be taken to be a string that may contain <backslash>-escape sequences.  
 102539 The following <backslash>-escape sequences shall be supported:
  - 102540 — The escape sequences listed in XBD [Chapter 5](#) (on page 121) ('\\', '\a', '\b',  
 102541 '\f', '\n', '\r', '\t', '\v'), which shall be converted to the characters they  
 102542 represent
  - 102543 — "\0ddd", where *ddd* is a zero, one, two, or three-digit octal number that shall be  
 102544 converted to a byte with the numeric value specified by the octal number
  - 102545 — '\c', which shall not be written and shall cause *printf* to ignore any remaining  
 102546 characters in the string operand containing it, any remaining string operands, and  
 102547 any additional characters in the *format* operand

102548 The interpretation of a <backslash> followed by any other sequence of characters is  
 102549 unspecified.

102550 Bytes from the converted string shall be written until the end of the string or the number  
 102551 of bytes indicated by the precision specification is reached. If the precision is omitted, it  
 102552 shall be taken to be infinite, so all bytes up to the end of the converted string shall be  
 102553 written.

- 102554 8. For each conversion specification that consumes an argument, the next argument operand  
 102555 shall be evaluated and converted to the appropriate type for the conversion as specified  
 102556 below.
- 102557 9. The *format* operand shall be reused as often as necessary to satisfy the argument  
 102558 operands. Any extra c or s conversion specifiers shall be evaluated as if a null string  
 102559 argument were supplied; other extra conversion specifications shall be evaluated as if a  
 102560 zero argument were supplied. If the *format* operand contains no conversion specifications  
 102561 and *argument* operands are present, the results are unspecified.

10. If a character sequence in the *format* operand begins with a '%' character, but does not form a valid conversion specification, the behavior is unspecified.
11. The argument to the *c* conversion specifier can be a string containing zero or more bytes. If it contains one or more bytes, the first byte shall be written and any additional bytes shall be ignored. If the argument is an empty string, it is unspecified whether nothing is written or a null byte is written.

The *argument* operands shall be treated as strings if the corresponding conversion specifier is *b*, *c*, or *s*, and shall be evaluated as if by the *strtod()* function if the corresponding conversion specifier is *a*, *A*, *e*, *E*, *f*, *F*, *g*, or *G*. Otherwise, they shall be evaluated as unsuffixed C integer constants, as described by the ISO C standard, with the following extensions:

- A leading <plus-sign> or minus-sign shall be allowed.
- If the leading character is a single-quote or double-quote, the value shall be the numeric value in the underlying codeset of the character following the single-quote or double-quote.
- Suffixed integer constants may be allowed.

If an argument operand cannot be completely converted into an internal value appropriate to the corresponding conversion specification, a diagnostic message shall be written to standard error and the utility shall not exit with a zero exit status, but shall continue processing any remaining operands and shall write the value accumulated at the time the error was detected to standard output.

It is not considered an error if an argument operand is not completely used for a *c* or *s* conversion.

## EXIT STATUS

The following exit values shall be returned:

- 0 Successful completion.
- >0 An error occurred.

## CONSEQUENCES OF ERRORS

Default.

## APPLICATION USAGE

The floating-point formatting conversion specifications of *printf()* are not required because all arithmetic in the shell is integer arithmetic. The *awk* utility performs floating-point calculations and provides its own **printf** function. The *bc* utility can perform arbitrary-precision floating-point arithmetic, but does not provide extensive formatting capabilities. (This *printf* utility cannot really be used to format *bc* output; it does not support arbitrary precision.) Implementations are encouraged to support the floating-point conversions as an extension.

Note that this *printf* utility, like the *printf()* function defined in the System Interfaces volume of POSIX.1-2008 on which it is based, makes no special provision for dealing with multi-byte characters when using the *%c* conversion specification or when a precision is specified in a *%b* or *%s* conversion specification. Applications should be extremely cautious using either of these features when there are multi-byte characters in the character set.

No provision is made in this volume of POSIX.1-2008 which allows field widths and precisions to be specified as '\*' since the '\*' can be replaced directly in the *format* operand using shell variable substitution. Implementations can also provide this feature as an extension if they so choose.

Hexadecimal character constants as defined in the ISO C standard are not recognized in the *format* operand because there is no consistent way to detect the end of the constant. Octal character constants are limited to, at most, three octal digits, but hexadecimal character constants are only terminated by a non-hex-digit character. In the ISO C standard, the "##" concatenation operator can be used to terminate a constant and follow it with a hexadecimal character to be written. In the shell, concatenation occurs before the *printf* utility has a chance to parse the end of the hexadecimal constant.

The %b conversion specification is not part of the ISO C standard; it has been added here as a portable way to process <backslash>-escapes expanded in string operands as provided by the *echo* utility. See also the APPLICATION USAGE section of *echo* (on page 2639) for ways to use *printf* as a replacement for all of the traditional versions of the *echo* utility.

If an argument cannot be parsed correctly for the corresponding conversion specification, the *printf* utility is required to report an error. Thus, overflow and extraneous characters at the end of an argument being used for a numeric conversion shall be reported as errors.

## EXAMPLES

To alert the user and then print and read a series of prompts:

```
printf "\aPlease fill in the following: \nName: "
read name
printf "Phone number: "
read phone
```

To read out a list of right and wrong answers from a file, calculate the percentage correctly, and print them out. The numbers are right-justified and separated by a single <tab>. The percentage is written to one decimal place of accuracy:

```
while read right wrong ; do
 percent=$(echo "scale=1; ($right*100)/($right+$wrong)" | bc)
 printf "%2d right\t%2d wrong\t(%s%%)\n" \
 $right $wrong $percent
done < database_file
```

The command:

```
printf "%5d%4d\n" 1 21 321 4321 54321
```

produces:

```
 1 21
 3214321
54321 0
```

Note that the *format* operand is used three times to print all of the given strings and that a '0' was supplied by *printf* to satisfy the last %4d conversion specification.

The *printf* utility is required to notify the user when conversion errors are detected while producing numeric output; thus, the following results would be expected on an implementation with 32-bit twos-complement integers when %d is specified as the *format* operand:

| Argument    | Standard Output | Diagnostic Output                                |
|-------------|-----------------|--------------------------------------------------|
| 5a          | 5               | <b>printf: "5a" not completely converted</b>     |
| 9999999999  | 2147483647      | <b>printf: "9999999999" arithmetic overflow</b>  |
| -9999999999 | -2147483648     | <b>printf: "-9999999999" arithmetic overflow</b> |
| ABC         | 0               | <b>printf: "ABC" expected numeric value</b>      |

The diagnostic message format is not specified, but these examples convey the type of information that should be reported. Note that the value shown on standard output is what would be expected as the return value from the *strtol()* function as defined in the System Interfaces volume of POSIX.1-2008. A similar correspondence exists between *%u* and *strtoul()* and *%e*, *%f*, and *%g* (if the implementation supports floating-point conversions) and *strtod()*.

In a locale using the ISO/IEC 646: 1991 standard as the underlying codeset, the command:

```
printf "%d\n" 3 +3 -3 \'3 \"+3 "'-3"
```

produces:

```
3 Numeric value of constant 3
```

```
3 Numeric value of constant 3
```

```
-3 Numeric value of constant -3
```

```
51 Numeric value of the character '3' in the ISO/IEC 646: 1991 standard codeset
```

```
43 Numeric value of the character '+' in the ISO/IEC 646: 1991 standard codeset
```

```
45 Numeric value of the character '-' in the ISO/IEC 646: 1991 standard codeset
```

Note that in a locale with multi-byte characters, the value of a character is intended to be the value of the equivalent of the *wchar\_t* representation of the character as described in the System Interfaces volume of POSIX.1-2008.

## RATIONALE

The *printf* utility was added to provide functionality that has historically been provided by *echo*. However, due to irreconcilable differences in the various versions of *echo* extant, the version has few special features, leaving those to this new *printf* utility, which is based on one in the Ninth Edition system.

The EXTENDED DESCRIPTION section almost exactly matches the *printf()* function in the ISO C standard, although it is described in terms of the file format notation in XBD [Chapter 5](#) (on page 121).

Earlier versions of this standard specified that arguments for all conversions other than *b*, *c*, and *s* were evaluated in the same way (as C constants, but with stated exceptions). For implementations supporting the floating-point conversions it was not clear whether integer conversions need only accept integer constants and floating-point conversions need only accept floating-point constants, or whether both types of conversions should accept both types of constants. Also by not distinguishing between them, the requirement relating to a leading single-quote or double-quote applied to floating-point conversions even though this provided no useful functionality to applications that was not already available through the integer conversions. The current standard clarifies the situation by specifying that the arguments for floating-point conversions are evaluated as if by *strtod()*, and the arguments for integer conversions are evaluated as C integer constants, with the special treatment of leading single-quote and double-quote applying only to integer conversions.

102688 **FUTURE DIRECTIONS**

102689       None.

102690 **SEE ALSO**102691       *awk, bc, echo*102692       XBD [Chapter 5](#) (on page 121), [Chapter 8](#) (on page 173)102693       XSH *fprintf()*, *strtod()*102694 **CHANGE HISTORY**

102695       First released in Issue 4.

102696 **Issue 7**

102697       Austin Group Interpretations 1003.1-2001 #175 and #177 are applied.

102698       SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

102699 **NAME**102700        **prs** — print an SCCS file (**DEVELOPMENT**)102701 **SYNOPSIS**

```

102702 XSI prs [-a] [-d dataspec] [-r[SID]] file...
102703 prs [-e|-l] -c cutoff [-d dataspec] file...
102704 prs [-e|-l] -r[SID] [-d dataspec] file...

```

102705 **DESCRIPTION**

102706        The *prs* utility shall write to standard output parts or all of an SCCS file in a user-supplied  
 102707        format.

102708 **OPTIONS**

102709        The *prs* utility shall conform to XBD [Section 12.2](#) (on page 215), except that the **-r** option has an  
 102710        optional option-argument. This optional option-argument cannot be presented as a separate  
 102711        argument. The following options shall be supported:

102712        **-d *dataspec***    Specify the output data specification. The *dataspec* shall be a string consisting of  
 102713        SCCS file *data keywords* (see [Data Keywords](#), on page 3082) interspersed with  
 102714        optional user-supplied text.

102715        **-r[*SID*]**        Specify the SCCS identification string (SID) of a delta for which information is  
 102716        desired. If no *SID* option-argument is specified, the SID of the most recently  
 102717        created delta shall be assumed.

102718        **-e**                Request information for all deltas created earlier than and including the delta  
 102719        designated via the **-r** option or the date-time given by the **-c** option.

102720        **-l**                Request information for all deltas created later than and including the delta  
 102721        designated via the **-r** option or the date-time given by the **-c** option.

102722        **-c *cutoff***        Indicate the *cutoff* date-time, in the form:

102723        *YY*[*MM*[*DD*[*HH*[*MM*[*SS*]]]]]

102724        For the *YY* component, values in the range [69,99] shall refer to years 1969 to 1999  
 102725        inclusive, and values in the range [00,68] shall refer to years 2000 to 2068 inclusive.

102726        **Note:**        It is expected that in a future version of this standard the default century inferred  
 102727        from a 2-digit year will change. (This would apply to all commands accepting a  
 102728        2-digit year as input.)

102729        No changes (deltas) to the SCCS file that were created after the specified *cutoff*  
 102730        date-time shall be included in the output. Units omitted from the date-time default  
 102731        to their maximum possible values; for example, **-c 7502** is equivalent to  
 102732        **-c 750228235959**.

102733        **-a**                Request writing of information for both removed—that is, *delta type=R* (see  
 102734        *rm~~del~~*)—and existing—that is, *delta type=D*,—deltas. If the **-a** option is not  
 102735        specified, information for existing deltas only shall be provided.

102736 **OPERANDS**

102737        The following operand shall be supported:

102738        *file*            A pathname of an existing SCCS file or a directory. If *file* is a directory, the *prs*  
 102739        utility shall behave as though each file in the directory were specified as a named  
 102740        file, except that non-SCCS files (last component of the pathname does not begin  
 102741        with **s**.) and unreadable files shall be silently ignored.

102742 If exactly one *file* operand appears, and it is '–', the standard input shall be read;  
 102743 each line of the standard input shall be taken to be the name of an SCCS file to be  
 102744 processed. Non-SCCS files and unreadable files shall be silently ignored.

#### 102745 STDIN

102746 The standard input shall be a text file used only when the *file* operand is specified as '–'. Each  
 102747 line of the text file shall be interpreted as an SCCS pathname.

#### 102748 INPUT FILES

102749 Any SCCS files displayed are files of an unspecified format.

#### 102750 ENVIRONMENT VARIABLES

102751 The following environment variables shall affect the execution of *prs*:

102752 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 102753 (See XBD [Section 8.2](#) (on page 174) the precedence of internationalization variables  
 102754 used to determine the values of locale categories.)

102755 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 102756 internationalization variables.

102757 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 102758 characters (for example, single-byte as opposed to multi-byte characters in  
 102759 arguments and input files).

102760 *LC\_MESSAGES*

102761 Determine the locale that should be used to affect the format and contents of  
 102762 diagnostic messages written to standard error.

102763 *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

#### 102764 ASYNCHRONOUS EVENTS

102765 Default.

#### 102766 STDOUT

102767 The standard output shall be a text file whose format is dependent on the data keywords  
 102768 specified with the *–d* option.

#### 102769 Data Keywords

102770 Data keywords specify which parts of an SCCS file shall be retrieved and output. All parts of an  
 102771 SCCS file have an associated data keyword. A data keyword may appear in a *dataspec* multiple  
 102772 times.

102773 The information written by *prs* shall consist of:

- 102774 1. The user-supplied text
- 102775 2. Appropriate values (extracted from the SCCS file) substituted for the recognized data  
 102776 keywords in the order of appearance in the *dataspec*

102777 The format of a data keyword value shall either be simple ('S'), in which keyword substitution  
 102778 is direct, or multi-line ('M').

102779 User-supplied text shall be any text other than recognized data keywords. A <tab> shall be  
 102780 specified by '\t' and <newline> by '\n'. When the *–r* option is not specified, the default  
 102781 *dataspec* shall be:

102782 :PN::\n\n

102783 and the following *dataspec* shall be used for each selected delta:

102784 :Dt:\t:DL:\nMRs:\n:MR:COMMENTS:\n:C:

- \* **:Dt:=:DT: :I: :D: :T: :P: :DS: :DP:**
- \*\* **:R::L::B::S:** if the delta is a branch delta (**:BF:= =yes**)  
**:R::L:** if the delta is not a branch delta (**:BF:= =no**)
- \*\*\* The line statistics are capped at 99 999. For example, if 100 000 lines were unchanged in a certain revision, **:Lu:** shall produce the value 99 999.

## 102848 STDERR

102849 The standard error shall be used only for diagnostic messages.

## 102850 OUTPUT FILES

102851 None.

## 102852 EXTENDED DESCRIPTION

102853 None.

## 102854 EXIT STATUS

102855 The following exit values shall be returned:

- 102856 0 Successful completion.
- 102857 >0 An error occurred.

## 102858 CONSEQUENCES OF ERRORS

102859 Default.

## 102860 APPLICATION USAGE

102861 None.

## 102862 EXAMPLES

- 102863 1. The following example:

102864 prs -d "User Names for :F: are:\n:UN:" s.file  
 102865 might write to standard output:  
 102866 User Names for s.file are:  
 102867 xyz  
 102868 131  
 102869 abc

- 102870 2. The following example:

102871 prs -d "Delta for pgm :M:: :I: - :D: By :P:" -r s.file  
 102872 might write to standard output:  
 102873 Delta for pgm main.c: 3.7 - 77/12/01 By cas

102874           3. As a special case:

102875            prs s.file

102876           might write to standard output:

102877            s.file:

102878            <blank line>

102879            D 1.1 77/12/01 00:00:00 cas 1 000000/00000/00000

102880            MRs:

102881            b178-12345

102882            b179-54321

102883            COMMENTS:

102884            this is the comment line for s.file initial delta

102885            <blank line>

102886            for each delta table entry of the **D** type. The only option allowed to be used with this

102887            special case is the **-a** option.

102888 **RATIONALE**

102889            None.

102890 **FUTURE DIRECTIONS**

102891            None.

102892 **SEE ALSO**

102893            [admin](#), [delta](#), [get](#), [what](#)

102894            XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)

102895 **CHANGE HISTORY**

102896            First released in Issue 2.

102897 **Issue 5**

102898            The phrase “in which keyword substitution is followed by a <newline>” is deleted from the end

102899            of the second paragraph of [Data Keywords](#) (on page 3082).

102900            The interpretation of the YY component of the **-c cutoff** argument is noted.

102901 **Issue 6**

102902            The normative text is reworded to emphasize the term “shall” for implementation requirements.

102903            The Open Group Base Resolution bwg2001-007 is applied, updating the table in STDOUT with a

102904            note that line statistics are capped at 99 999 for the **:Li:**, **:Ld:**, **:Lu:**, and **:DL:** keywords.

102905            The Open Group Interpretation PIN4C.00009 is applied.

102906 **Issue 7**

102907            SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

102908 **NAME**

102909       ps — report process status

102910 **SYNOPSIS**

```
102911 XSI ps [-aA] [-defl] [-g grouplist] [-G grouplist]
102912 [-n namelist] [-o format]... [-p proclist] [-t termlist]
102913 [-u userlist] [-U userlist]
```

102914 **DESCRIPTION**

102915       The *ps* utility shall write information about processes, subject to having appropriate privileges to  
 102916       obtain information about those processes.

102917       By default, *ps* shall select all processes with the same effective user ID as the current user and the  
 102918       same controlling terminal as the invoker.

102919 **OPTIONS**

102920       The *ps* utility shall conform to XBD [Section 12.2](#) (on page 215).

102921       The following options shall be supported:

102922       **-a**       Write information for all processes associated with terminals. Implementations  
 102923       may omit session leaders from this list.

102924       **-A**       Write information for all processes.

102925 XSI       **-d**       Write information for all processes, except session leaders.

102926 XSI       **-e**       Write information for all processes. (Equivalent to **-A**.)

102927 XSI       **-f**       Generate a **full** listing. (See the STDOUT section for the contents of a **full** listing.)

102928 XSI       **-g grouplist** Write information for processes whose session leaders are given in *grouplist*. The  
 102929       application shall ensure that the *grouplist* is a single argument in the form of a  
 102930       <blank> or <comma>-separated list.

102931       **-G grouplist** Write information for processes whose real group ID numbers are given in  
 102932       *grouplist*. The application shall ensure that the *grouplist* is a single argument in the  
 102933       form of a <blank> or <comma>-separated list.

102934 XSI       **-l**       Generate a **long** listing. (See STDOUT for the contents of a **long** listing.)

102935 XSI       **-n namelist** Specify the name of an alternative system *namelist* file in place of the default. The  
 102936       name of the default file and the format of a *namelist* file are unspecified.

102937       **-o format**   Write information according to the format specification given in *format*. This is  
 102938       fully described in the STDOUT section. Multiple **-o** options can be specified; the  
 102939       format specification shall be interpreted as the <space>-separated concatenation of  
 102940       all the *format* option-arguments.

102941       **-p proclist** Write information for processes whose process ID numbers are given in *proclist*.  
 102942       The application shall ensure that the *proclist* is a single argument in the form of a  
 102943       <blank> or <comma>-separated list.

102944       **-t termlist** Write information for processes associated with terminals given in *termlist*. The  
 102945       application shall ensure that the *termlist* is a single argument in the form of a  
 102946       <blank> or <comma>-separated list. Terminal identifiers shall be given in an  
 102947 XSI       implementation-defined format. On XSI-conformant systems, they shall be given  
 102948       in one of two forms: the device's filename (for example, **tty04**) or, if the device's  
 102949       filename starts with **tty**, just the identifier following the characters **tty** (for example,  
 102950       "04").

| 102989 |     | <b>ASYNCHRONOUS EVENTS</b>   |                                                                                                                                                                                                                                                                                                                                                                               |
| 102990 |     |                              | Default.                                                                                                                                                                                                                                                                                                                                                                      |

102991 **STDOUT**

102992 When the **-o** option is not specified, the standard output format is unspecified.

102993 XSI On XSI-conformant systems, the output format shall be as follows. The column headings and  
 102994 descriptions of the columns in a *ps* listing are given below. The precise meanings of these fields  
 102995 are implementation-defined. The letters 'f' and 'l' (below) indicate the option (**full** or **long**)  
 102996 that shall cause the corresponding heading to appear; **all** means that the heading always  
 102997 appears. Note that these two options determine only what information is provided for a process;  
 102998 they do not determine which processes are listed.

|        |              |       |                                                                         |
|--------|--------------|-------|-------------------------------------------------------------------------|
| 102999 | <b>F</b>     | (l)   | Flags (octal and additive) associated with the process.                 |
| 103000 | <b>S</b>     | (l)   | The state of the process.                                               |
| 103001 | <b>UID</b>   | (f,l) | The user ID number of the process owner; the login name is printed      |
| 103002 |              |       | under the <b>-f</b> option.                                             |
| 103003 | <b>PID</b>   | (all) | The process ID of the process; it is possible to kill a process if this |
| 103004 |              |       | datum is known.                                                         |
| 103005 | <b>PPID</b>  | (f,l) | The process ID of the parent process.                                   |
| 103006 | <b>C</b>     | (f,l) | Processor utilization for scheduling.                                   |
| 103007 | <b>PRI</b>   | (l)   | The priority of the process; higher numbers mean lower priority.        |
| 103008 | <b>NI</b>    | (l)   | Nice value; used in priority computation.                               |
| 103009 | <b>ADDR</b>  | (l)   | The address of the process.                                             |
| 103010 | <b>SZ</b>    | (l)   | The size in blocks of the core image of the process.                    |
| 103011 | <b>WCHAN</b> | (l)   | The event for which the process is waiting or sleeping; if blank, the   |
| 103012 |              |       | process is running.                                                     |
| 103013 | <b>STIME</b> | (f)   | Starting time of the process.                                           |
| 103014 | <b>TTY</b>   | (all) | The controlling terminal for the process.                               |
| 103015 | <b>TIME</b>  | (all) | The cumulative execution time for the process.                          |
| 103016 | <b>CMD</b>   | (all) | The command name; the full command name and its arguments are           |
| 103017 |              |       | written under the <b>-f</b> option.                                     |

103018 A process that has exited and has a parent, but has not yet been waited for by the parent, shall be  
 103019 marked **defunct**.

103020 Under the option **-f**, *ps* tries to determine the command name and arguments given when the  
 103021 process was created by examining memory or the swap area. Failing this, the command name, as  
 103022 it would appear without the option **-f**, is written in square brackets.

103023 The **-o** option allows the output format to be specified under user control.

103024 The application shall ensure that the format specification is a list of names presented as a single  
 103025 argument, <blank> or <comma>-separated. Each variable has a default header. The default  
 103026 header can be overridden by appending an <equals-sign> and the new text of the header. The  
 103027 rest of the characters in the argument shall be used as the header text. The fields specified shall  
 103028 be written in the order specified on the command line, and should be arranged in columns in the  
 103029 output. The field widths shall be selected by the system to be at least as wide as the header text  
 103030 (default or overridden value). If the header text is null, such as **-o user=**, the field width shall be  
 103031 at least as wide as the default header text. If all header text fields are null, no header line shall  
 103032 be written.

103033 The following names are recognized in the POSIX locale:

|        |              |                                                                                           |
|--------|--------------|-------------------------------------------------------------------------------------------|
| 103034 | <b>ruser</b> | The real user ID of the process. This shall be the textual user ID, if it can be obtained |
| 103035 |              | and the field width permits, or a decimal representation otherwise.                       |

|        |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 103036 | <b>user</b>   | The effective user ID of the process. This shall be the textual user ID, if it can be obtained and the field width permits, or a decimal representation otherwise.                                                                                                                                                                                                                                                                                                                                                                                       |
| 103037 |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 103038 | <b>rgroup</b> | The real group ID of the process. This shall be the textual group ID, if it can be obtained and the field width permits, or a decimal representation otherwise.                                                                                                                                                                                                                                                                                                                                                                                          |
| 103039 |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 103040 | <b>group</b>  | The effective group ID of the process. This shall be the textual group ID, if it can be obtained and the field width permits, or a decimal representation otherwise.                                                                                                                                                                                                                                                                                                                                                                                     |
| 103041 |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 103042 | <b>pid</b>    | The decimal value of the process ID.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 103043 | <b>ppid</b>   | The decimal value of the parent process ID.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 103044 | <b>pgid</b>   | The decimal value of the process group ID.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 103045 | <b>pcpu</b>   | The ratio of CPU time used recently to CPU time available in the same period, expressed as a percentage. The meaning of “recently” in this context is unspecified. The CPU time available is determined in an unspecified manner.                                                                                                                                                                                                                                                                                                                        |

| 103060 | <b>comm</b>   | The name of the command being executed ( <i>argv</i> [0] value) as a string.                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 103061 | <b>args</b>   | The command with all its arguments as a string. The implementation may truncate this value to the field width; it is implementation-defined whether any further truncation occurs. It is unspecified whether the string represented is a version of the argument list as it was passed to the command when it started, or is a version of the arguments as they may have been modified by the application. Applications cannot depend on being able to modify their argument list and having that modification be reflected in the output of <i>ps</i> . |

| 103073 |               | The following table specifies the default header to be used in the POSIX locale corresponding to each format specifier.                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 103074 |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

Table 4-18 Variable Names and Default Headers in *ps*

| Format Specifier | Default Header | Format Specifier | Default Header |
|------------------|----------------|------------------|----------------|
| <b>args</b>      | <b>COMMAND</b> | <b>ppid</b>      | <b>PPID</b>    |
| <b>comm</b>      | <b>COMMAND</b> | <b>rgroup</b>    | <b>RGROUP</b>  |
| <b>etime</b>     | <b>ELAPSED</b> | <b>ruser</b>     | <b>RUSER</b>   |
| <b>group</b>     | <b>GROUP</b>   | <b>time</b>      | <b>TIME</b>    |
| <b>nice</b>      | <b>NI</b>      | <b>tty</b>       | <b>TT</b>      |
| <b>pcpu</b>      | <b>%CPU</b>    | <b>user</b>      | <b>USER</b>    |
| <b>pgid</b>      | <b>PGID</b>    | <b>vsz</b>       | <b>VSZ</b>     |
| <b>pid</b>       | <b>PID</b>     |                  |                |

**STDERR**

The standard error shall be used only for diagnostic messages.

**OUTPUT FILES**

None.

**EXTENDED DESCRIPTION**

None.

**EXIT STATUS**

The following exit values shall be returned:

0 Successful completion.

>0 An error occurred.

**CONSEQUENCES OF ERRORS**

Default.

**APPLICATION USAGE**

Things can change while *ps* is running; the snapshot it gives is only true for an instant, and might not be accurate by the time it is displayed.

The **args** format specifier is allowed to produce a truncated version of the command arguments. In some implementations, this information is no longer available when the *ps* utility is executed.

If the field width is too narrow to display a textual ID, the system may use a numeric version. Normally, the system would be expected to choose large enough field widths, but if a large number of fields were selected to write, it might squeeze fields to their minimum sizes to fit on one line. One way to ensure adequate width for the textual IDs is to override the default header for a field to make it larger than most or all user or group names.

There is no special quoting mechanism for header text. The header text is the rest of the argument. If multiple header changes are needed, multiple **-o** options can be used, such as:

```
ps -o "user=User Name" -o pid=Process\ ID
```

On some implementations, especially multi-level secure systems, *ps* may be severely restricted and produce information only about child processes owned by the user.

**EXAMPLES**

The command:

```
ps -o user,pid,ppid=MOM -o args
```

writes at least the following in the POSIX locale:

```
USER PID MOM COMMAND
```

103117 helene 34 12 ps -o uid,pid,ppid=MOM -o args

103118 The contents of the **COMMAND** field need not be the same in all implementations, due to  
103119 possible truncation.

#### 103120 RATIONALE

103121 There is very little commonality between BSD and System V implementations of *ps*. Many  
103122 options conflict or have subtly different usages. The standard developers attempted to select a  
103123 set of options for the base standard that were useful on a wide range of systems and selected  
103124 options that either can be implemented on both BSD and System V-based systems without  
103125 breaking the current implementations or where the options are sufficiently similar that any  
103126 changes would not be unduly problematic for users or implementors.

103127 It is recognized that on some implementations, especially multi-level secure systems, *ps* may be  
103128 nearly useless. The default output has therefore been chosen such that it does not break  
103129 historical implementations and also is likely to provide at least some useful information on most  
103130 systems.

103131 The major change is the addition of the format specification capability. The motivation for this  
103132 invention is to provide a mechanism for users to access a wider range of system information, if  
103133 the system permits it, in a portable manner. The fields chosen to appear in this volume of  
103134 POSIX.1-2008 were arrived at after considering what concepts were likely to be both reasonably  
103135 useful to the “average” user and had a reasonable chance of being implemented on a wide range  
103136 of systems. Again it is recognized that not all systems are able to provide all the information  
103137 and, conversely, some may wish to provide more. It is hoped that the approach adopted will be  
103138 sufficiently flexible and extensible to accommodate most systems. Implementations may be  
103139 expected to introduce new format specifiers.

103140 The default output should consist of a short listing containing the process ID, terminal name,  
103141 cumulative execution time, and command name of each process.

103142 The preference of the standard developers would have been to make the format specification an  
103143 operand of the *ps* command. Unfortunately, BSD usage precluded this.

103144 At one time a format was included to display the environment array of the process. This was  
103145 deleted because there is no portable way to display it.

103146 The **-A** option is equivalent to the BSD **-g** and the SVID **-e**. Because the two systems differed, a  
103147 mnemonic compromise was selected.

103148 The **-a** option is described with some optional behavior because the SVID omits session leaders,  
103149 but BSD does not.

103150 In an early proposal, format specifiers appeared for priority and start time. The former was not  
103151 defined adequately in this volume of POSIX.1-2008 and was removed in deference to the defined  
103152 nice value; the latter because elapsed time was considered to be more useful.

103153 In a new BSD version of *ps*, a **-O** option can be used to write all of the default information,  
103154 followed by additional format specifiers. This was not adopted because the default output is  
103155 implementation-defined. Nevertheless, this is a useful option that should be reserved for that  
103156 purpose. In the **-o** option for the POSIX Shell and Utilities *ps*, the format is the concatenation of  
103157 each **-o**. Therefore, the user can have an alias or function that defines the beginning of their  
103158 desired format and add more fields to the end of the output in certain cases where that would be  
103159 useful.

103160 The format of the terminal name is unspecified, but the descriptions of *ps*, *talk*, *who*, and *write*  
103161 require that they all use the same format.

103162 The **pcpu** field indicates that the CPU time available is determined in an unspecified manner.  
103163 This is because it is difficult to express an algorithm that is useful across all possible machine  
103164 architectures. Historical counterparts to this value have attempted to show percentage of use in  
103165 the recent past, such as the preceding minute. Frequently, these values for all processes did not  
103166 add up to 100%. Implementations are encouraged to provide data in this field to users that will  
103167 help them identify processes currently affecting the performance of the system.

103168 **FUTURE DIRECTIONS**

103169 None.

103173 **CHANGE HISTORY**

103174 First released in Issue 2.

103175 **Issue 6**

103176 This utility is marked as part of the User Portability Utilities option.

103177 The normative text is reworded to avoid use of the term “must” for application requirements.

103178 The *TZ* entry is added to the ENVIRONMENT VARIABLES section.

103179 **Issue 7**

103180 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

103181 SD5-XCU-ERN-148 is applied, updating the OPTIONS section.

103182 **NAME**103183        `pwd` — return working directory name103184 **SYNOPSIS**103185        `pwd [-L|-P]`103186 **DESCRIPTION**

103187        The *pwd* utility shall write to standard output an absolute pathname of the current working  
 103188        directory, which does not contain the filenames dot or dot-dot.

103189 **OPTIONS**103190        The *pwd* utility shall conform to XBD [Section 12.2](#) (on page 215).

103191        The following options shall be supported by the implementation:

103192        **-L**        If the *PWD* environment variable contains an absolute pathname of the current  
 103193        directory that does not contain the filenames dot or dot-dot, *pwd* shall write this  
 103194        pathname to standard output. Otherwise, if the *PWD* environment variable  
 103195        contains a pathname of the current directory that is longer than {PATH\_MAX}  
 103196        bytes including the terminating null, and the pathname does not contain any  
 103197        components that are dot or dot-dot, it is unspecified whether *pwd* writes this  
 103198        pathname to standard output or behaves as if the **-P** option had been specified.  
 103199        Otherwise, the **-L** option shall behave as the **-P** option.

103200        **-P**        The pathname written to standard output shall not contain any components that  
 103201        refer to files of type symbolic link. If there are multiple pathnames that the *pwd*  
 103202        utility could write to standard output, one beginning with a single <slash>  
 103203        character and one or more beginning with two <slash> characters, then it shall  
 103204        write the pathname beginning with a single <slash> character. The pathname shall  
 103205        not contain any unnecessary <slash> characters after the leading one or two  
 103206        <slash> characters.

103207        If both **-L** and **-P** are specified, the last one shall apply. If neither **-L** nor **-P** is specified, the *pwd*  
 103208        utility shall behave as if **-L** had been specified.

103209 **OPERANDS**

103210        None.

103211 **STDIN**

103212        Not used.

103213 **INPUT FILES**

103214        None.

103215 **ENVIRONMENT VARIABLES**103216        The following environment variables shall affect the execution of *pwd*:

103217        *LANG*        Provide a default value for the internationalization variables that are unset or null.  
 103218        (See XBD [Section 8.2](#) (on page 174) the precedence of internationalization variables  
 103219        used to determine the values of locale categories.)

103220        *LC\_ALL*        If set to a non-empty string value, override the values of all the other  
 103221        internationalization variables.

103222        *LC\_MESSAGES*

103223        Determine the locale that should be used to affect the format and contents of  
 103224        diagnostic messages written to standard error.

|--------|-----|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 103225 | XSI | <b>NLSPATH</b>                | Determine the location of message catalogs for the processing of <i>LC_MESSAGES</i> .                                                                        |
| 103226 |     | <b>PWD</b>                    | An absolute pathname of the current working directory. If an application sets or unsets the value of <i>PWD</i> , the behavior of <i>pwd</i> is unspecified. |
| 103227 |     |                               |                                                                                                                                                              |
| 103228 |     | <b>ASYNCHRONOUS EVENTS</b>    |                                                                                                                                                              |
| 103229 |     |                               | Default.                                                                                                                                                     |
| 103230 |     | <b>STDOUT</b>                 |                                                                                                                                                              |
| 103231 |     |                               | The <i>pwd</i> utility output is an absolute pathname of the current working directory:                                                                      |
| 103232 |     |                               | "%s\n", <directory pathname>                                                                                                                                 |
| 103233 |     | <b>STDERR</b>                 |                                                                                                                                                              |
| 103234 |     |                               | The standard error shall be used only for diagnostic messages.                                                                                               |
| 103235 |     | <b>OUTPUT FILES</b>           |                                                                                                                                                              |
| 103236 |     |                               | None.                                                                                                                                                        |
| 103237 |     | <b>EXTENDED DESCRIPTION</b>   |                                                                                                                                                              |
| 103238 |     |                               | None.                                                                                                                                                        |
| 103239 |     | <b>EXIT STATUS</b>            |                                                                                                                                                              |
| 103240 |     |                               | The following exit values shall be returned:                                                                                                                 |
| 103241 |     |                               | 0 Successful completion.                                                                                                                                     |
| 103242 |     |                               | >0 An error occurred.                                                                                                                                        |
| 103243 |     | <b>CONSEQUENCES OF ERRORS</b> |                                                                                                                                                              |
| 103244 |     |                               | If an error is detected, output shall not be written to standard output, a diagnostic message shall                                                          |
| 103245 |     |                               | be written to standard error, and the exit status is not zero.                                                                                               |
| 103246 |     | <b>APPLICATION USAGE</b>      |                                                                                                                                                              |
| 103247 |     |                               | If the pathname obtained from <i>pwd</i> is longer than {PATH_MAX} bytes, it could produce an error                                                          |
| 103248 |     |                               | if passed to <i>cd</i> . Therefore, in order to return to that directory it may be necessary to break the                                                    |
| 103249 |     |                               | pathname into sections shorter than {PATH_MAX} and call <i>cd</i> on each section in turn (the first                                                         |
| 103250 |     |                               | section being an absolute pathname and subsequent sections being relative pathnames).                                                                        |
| 103251 |     | <b>EXAMPLES</b>               |                                                                                                                                                              |
| 103252 |     |                               | None.                                                                                                                                                        |
| 103253 |     | <b>RATIONALE</b>              |                                                                                                                                                              |
| 103254 |     |                               | Some implementations have historically provided <i>pwd</i> as a shell special built-in command.                                                              |
| 103255 |     |                               | In most utilities, if an error occurs, partial output may be written to standard output. This does                                                           |
| 103256 |     |                               | not happen in historical implementations of <i>pwd</i> . Because <i>pwd</i> is frequently used in historical                                                 |
| 103257 |     |                               | shell scripts without checking the exit status, it is important that the historical behavior is                                                              |
| 103258 |     |                               | required here; therefore, the CONSEQUENCES OF ERRORS section specifically disallows any                                                                      |
| 103259 |     |                               | partial output being written to standard output.                                                                                                             |
| 103260 |     |                               | An earlier version of this standard stated that the <i>PWD</i> environment variable was affected when                                                        |
| 103261 |     |                               | the <b>-P</b> option was in effect. This was incorrect; conforming implementations do not do this.                                                           |
| 103262 |     | <b>FUTURE DIRECTIONS</b>      |                                                                                                                                                              |
| 103263 |     |                               | None.                                                                                                                                                        |

103269 First released in Issue 2.

103270 **Issue 6**103271 The **-P** and **-L** options are added to describe actions relating to symbolic links as specified in the  
103272 IEEE P1003.2b draft standard.103273 **Issue 7**

103274 Austin Group Interpretation 1003.1-2001 #097 is applied.

103275 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

103276 Changes to the *pwd* utility and *PWD* environment variable have been made to match the  
103277 changes to the *getcwd()* function made for Austin Group Interpretation 1003.1-2001 #140.

103278 **NAME**

103279 qalter — alter batch job

103280 **SYNOPSIS**

```
103281 OB BE qalter [-a date_time] [-A account_string] [-c interval] [-e path_name]
103282 [-h hold_list] [-j join_list] [-k keep_list] [-l resource_list]
103283 [-m mail_options] [-M mail_list] [-N name] [-o path_name]
103284 [-p priority] [-r y|n] [-S path_name_list] [-u user_list]
103285 job_identifier...
```

103286 **DESCRIPTION**

103287 The attributes of a batch job are altered by a request to the batch server that manages the batch  
 103288 job. The *qalter* utility is a user-accessible batch client that requests the alteration of the attributes  
 103289 of one or more batch jobs.

103290 The *qalter* utility shall alter the attributes of those batch jobs, and only those batch jobs, for which  
 103291 a batch *job\_identifier* is presented to the utility.

103292 The *qalter* utility shall alter the attributes of batch jobs in the order in which the batch  
 103293 *job\_identifiers* are presented to the utility.

103294 If the *qalter* utility fails to process a batch *job\_identifier* successfully, the utility shall proceed to  
 103295 process the remaining batch *job\_identifiers*, if any.

103296 For each batch *job\_identifier* for which the *qalter* utility succeeds, each attribute of the identified  
 103297 batch job shall be altered as indicated by all the options presented to the utility.

103298 For each identified batch job for which the *qalter* utility fails, the utility shall not alter any  
 103299 attribute of the batch job.

103300 For each batch job that the *qalter* utility processes, the utility shall not modify any attribute other  
 103301 than those required by the options and option-arguments presented to the utility.

103302 The *qalter* utility shall alter batch jobs by sending a *Modify Job Request* to the batch server that  
 103303 manages each batch job. At the time the *qalter* utility exits, it shall have modified the batch job  
 103304 corresponding to each successfully processed batch *job\_identifier*. An attempt to alter the  
 103305 attributes of a batch job in the RUNNING state is implementation-defined.

103306 **OPTIONS**

103307 The *qalter* utility shall conform to XBD [Section 12.2](#) (on page 215).

103308 The following options shall be supported by the implementation:

103309 **-a date\_time** Redefine the time at which the batch job becomes eligible for execution.

103310 The *date\_time* argument shall be in the same form and represent the same time as  
 103311 for the *touch* utility. The time so represented shall be set into the *Execution\_Time*  
 103312 attribute of the batch job. If the time specified is earlier than the current time, the  
 103313 **-a** option shall have no effect.

103314 **-A account\_string**

103315 Redefine the account to which the resource consumption of the batch job should be  
 103316 charged.

103317 The syntax of the *account\_string* option-argument is unspecified.

103318 The *qalter* utility shall set the *Account\_Name* attribute of the batch job to the value  
 103319 of the *account\_string* option-argument.

103320       **-c interval**     Redefine whether the batch job should be checkpointed, and if so, how often.

103321                     The *qalter* utility shall accept a value for the interval option-argument that is one of

103322                     the following:

103323               n             No checkpointing is to be performed on the batch job

103324                     (NO\_CHECKPOINT).

103325               s             Checkpointing is to be performed only when the batch server is shut

103326                     down (CHECKPOINT\_AT\_SHUTDOWN).

103327               c             Automatic periodic checkpointing is to be performed at the

103328                     *Minimum\_Cpu\_Interval* attribute of the batch queue, in units of CPU

103329                     minutes (CHECKPOINT\_AT\_MIN\_CPU\_INTERVAL).

103330               c=*minutes*   Automatic periodic checkpointing is to be performed every *minutes*

103331                     of CPU time, or every *Minimum\_Cpu\_Interval* minutes, whichever is

103332                     greater. The *minutes* argument shall conform to the syntax for

103333                     unsigned integers and shall be greater than zero.

103334                     An implementation may define other checkpoint intervals. The conformance

103335                     document for an implementation shall describe any alternative checkpoint

103336                     intervals, how they are specified, their internal behavior, and how they affect the

103337                     behavior of the utility.

103338                     The *qalter* utility shall set the *Checkpoint* attribute of the batch job to the value of the

103339                     *interval* option-argument.

103340       **-e path\_name**     Redefine the path to be used for the standard error stream of the batch job.

103341                     The *qalter* utility shall accept a *path\_name* option-argument that conforms to the

103342                     syntax of the *path\_name* element defined in the System Interfaces volume of

103343                     POSIX.1-2008, which can be preceded by a host name element of the form

103344                     *hostname*::.

103345                     If the *path\_name* option-argument constitutes an absolute pathname, the *qalter*

103346                     utility shall set the *Error\_Path* attribute of the batch job to the value of the

103347                     *path\_name* option-argument, including the host name element, if present.

103348                     If the *path\_name* option-argument constitutes a relative pathname and no host

103349                     name element is specified, the *qalter* utility shall set the *Error\_Path* attribute of the

103350                     batch job to the value of the absolute pathname derived by expanding the

103351                     *path\_name* option-argument relative to the current directory of the process that

103352                     executes the *qalter* utility.

103353                     If the *path\_name* option-argument constitutes a relative pathname and a host name

103354                     element is specified, the *qalter* utility shall set the *Error\_Path* attribute of the batch

103355                     job to the value of the option-argument without expansion.

103356                     If the *path\_name* option-argument does not include a host name element, the *qalter*

103357                     utility shall prefix the pathname in the *Error\_Path* attribute with *hostname*::, where

103358                     *hostname* is the name of the host upon which the *qalter* utility is being executed.

103359                     103360       **-h hold\_list**     Redefine the types of holds, if any, on the batch job. The *qalter* **-h** option shall

103361                     accept a value for the *hold\_list* option-argument that is a string of alphanumeric

103362                     characters in the portable character set.

103363                     The *qalter* utility shall accept a value for the *hold\_list* option-argument that is a

103364 string of one or more of the characters 'u', 's', or 'o', or the single character  
 103365 'n'. For each unique character in the *hold\_list* option-argument, the *qalter* utility  
 103366 shall add a value to the *Hold\_Types* attribute of the batch job as follows, each  
 103367 representing a different hold type:

- 103368 u USER
- 103369 s SYSTEM
- 103370 o OPERATOR

103371 If any of these characters are duplicated in the *hold\_list* option-argument, the  
 103372 duplicates shall be ignored. An existing *Hold\_Types* attribute can be cleared by the  
 103373 hold type:

- 103374 n NO\_HOLD

103375 The *qalter* utility shall consider it an error if any hold type other than 'n' is  
 103376 combined with hold type 'n'. Strictly conforming applications shall not repeat  
 103377 any of the characters 'u', 's', 'o', or 'n' within the *hold\_list* option-argument.  
 103378 The *qalter* utility shall permit the repetition of characters, but shall not assign  
 103379 additional meaning to the repeated characters. An implementation may define  
 103380 other hold types. The conformance document for an implementation shall describe  
 103381 any additional hold types, how they are specified, their internal behavior, and how  
 103382 they affect the behavior of the utility.

103383 *-j join\_list* Redefine which streams of the batch job are to be merged. The *qalter* *-j* option shall  
 103384 accept a value for the *join\_list* option-argument that is a string of alphanumeric  
 103385 characters in the portable character set.

103386 The *qalter* utility shall accept a *join\_list* option-argument that consists of one or  
 103387 more of the characters 'e' and 'o', or the single character 'n'.

103388 All of the other batch job output streams specified shall be merged into the output  
 103389 stream represented by the character listed first in the *join\_list* option-argument.

103390 For each unique character in the *join\_list* option-argument, the *qalter* utility shall  
 103391 add a value to the *Join\_Path* attribute of the batch job as follows, each representing  
 103392 a different batch job stream to join:

- 103393 e The standard error of the batch job (JOIN\_STD\_ERROR).
- 103394 o The standard output of the batch job (JOIN\_STD\_OUTPUT).

103395 An existing *Join\_Path* attribute can be cleared by the join type:

- 103396 n NO\_JOIN

103397 If 'n' is specified, then no files are joined. The *qalter* utility shall consider it an  
 103398 error if any join type other than 'n' is combined with join type 'n'.

103399 Strictly conforming applications shall not repeat any of the characters 'e', 'o', or  
 103400 'n' within the *join\_list* option-argument. The *qalter* utility shall permit the  
 103401 repetition of characters, but shall not assign additional meaning to the repeated  
 103402 characters.

103403 An implementation may define other join types. The conformance document for an  
 103404 implementation shall describe any additional batch job streams, how they are  
 103405 specified, their internal behavior, and how they affect the behavior of the utility.

103406       **-k keep\_list**   Redefine which output of the batch job to retain on the execution host.

103407                   The *qalter* **-k** option shall accept a value for the *keep\_list* option-argument that is a

103408                   string of alphanumeric characters in the portable character set.

103409                   The *qalter* utility shall accept a *keep\_list* option-argument that consists of one or

103410                   more of the characters 'e' and 'o', or the single character 'n'.

103411                   For each unique character in the *keep\_list* option-argument, the *qalter* utility shall

103412                   add a value to the *Keep\_Files* attribute of the batch job as follows, each representing

103413                   a different batch job stream to keep:

103414                   e    The standard error of the batch job (KEEP\_STD\_ERROR).

103415                   o    The standard output of the batch job (KEEP\_STD\_OUTPUT).

103416                   If both 'e' and 'o' are specified, then both files are retained. An existing

103417                   *Keep\_Files* attribute can be cleared by the keep type:

103418                   n    NO\_KEEP

103419                   If 'n' is specified, then no files are retained. The *qalter* utility shall consider it an

103420                   error if any keep type other than 'n' is combined with keep type 'n'.

103421                   Strictly conforming applications shall not repeat any of the characters 'e', 'o', or

103422                   'n' within the *keep\_list* option-argument. The *qalter* utility shall permit the

103423                   repetition of characters, but shall not assign additional meaning to the repeated

103424                   characters. An implementation may define other keep types. The conformance

103425                   document for an implementation shall describe any additional keep types, how

103426                   they are specified, their internal behavior, and how they affect the behavior of the

103427                   utility.

103428       **-l resource\_list**   Redefine the resources that are allowed or required by the batch job.

103429                   The *qalter* utility shall accept a *resource\_list* option-argument that conforms to the

103430                   following syntax:

103431                   

103432                   resource=value[, , resource=value, , ...]

103433                   The *qalter* utility shall set one entry in the value of the *Resource\_List* attribute of the

103434                   batch job for each resource listed in the *resource\_list* option-argument.

103435                   Because the list of supported resource names might vary by batch server, the *qalter*

103436                   utility shall rely on the batch server to validate the resource names and associated

103437                   values. See [Section 3.3.3](#) (on page 2421) for a means of removing *keyword=value*

103438                   (and *value@keyword*) pairs and other general rules for list-oriented batch job

103439                   attributes.

103440       **-m mail\_options**   Redefine the points in the execution of the batch job at which the batch server is to

103441                   send mail about a change in the state of the batch job.

103442                   

103443                   The *qalter* **-m** option shall accept a value for the *mail\_options* option-argument that

103444                   is a string of alphanumeric characters in the portable character set.

103445                   The *qalter* utility shall accept a value for the *mail\_options* option-argument that is a

103446                   string of one or more of the characters 'e', 'b', and 'a', or the single character

103447                   'n'. For each unique character in the *mail\_options* option-argument, the *qalter*

103448                   utility shall add a value to the *Mail\_Users* attribute of the batch job as follows, each

103449 representing a different time during the life of a batch job at which to send mail:

103450 e MAIL\_AT\_EXIT

103451 b MAIL\_AT\_BEGINNING

103452 a MAIL\_AT\_ABORT

103453 If any of these characters are duplicated in the *mail\_options* option-argument, the

103454 duplicates shall be ignored.

103455 An existing *Mail\_Points* attribute can be cleared by the mail type:

103456 n NO\_MAIL

103457 If 'n' is specified, then mail is not sent. The *qalter* utility shall consider it an error

103458 if any mail type other than 'n' is combined with mail type 'n'. Strictly

103459 conforming applications shall not repeat any of the characters 'e', 'b', 'a', or

103460 'n' within the *mail\_options* option-argument. The *qalter* utility shall permit the

103461 repetition of characters but shall not assign additional meaning to the repeated

103462 characters.

103463 An implementation may define other mail types. The conformance document for

103464 an implementation shall describe any additional mail types, how they are

103465 specified, their internal behavior, and how they affect the behavior of the utility.

103466 **-M mail\_list** Redefine the list of users to which the batch server that executes the batch job is to

103467 send mail, if the batch server sends mail about the batch job.

103468 The syntax of the *mail\_list* option-argument is unspecified. If the implementation

103469 of the *qalter* utility uses a name service to locate users, the utility shall accept the

103470 syntax used by the name service.

103471 If the implementation of the *qalter* utility does not use a name service to locate

103472 users, the implementation shall accept the following syntax for user names:

103473 mail\_address[, mail\_address, ...]

103474 The interpretation of *mail\_address* is implementation-defined.

103475 The *qalter* utility shall set the *Mail\_Users* attribute of the batch job to the value of

103476 the *mail\_list* option-argument.

103477 **-N name** Redefine the name of the batch job.

103478 The *qalter* -N option shall accept a value for the *name* option-argument that is a

103479 string of up to 15 alphanumeric characters in the portable character set where the

103480 first character is alphabetic.

103481 The syntax of the *name* option-argument is unspecified.

103482 The *qalter* utility shall set the *Job\_Name* attribute of the batch job to the value of the

103483 *name* option-argument.

103484 **-o path\_name**

103485 Redefine the path for the standard output of the batch job.

103486 The *qalter* utility shall accept a *path\_name* option-argument that conforms to the

103487 syntax of the *path\_name* element defined in the System Interfaces volume of

103488 POSIX.1-2008, which can be preceded by a host name element of the form

103489 *hostname::*.

|        |                          |                                                                                                                                                                                                                                                                                                                                                                                   |

| 103531 |                          | The <i>qalter</i> utility shall accept a <i>user_list</i> option-argument that conforms to the following syntax:                                                                                                                                                                                                                                                                  |
| 103532 |                          |                                                                                                                                                                                                                                                                                                                                                                                   |

103533                   username[@host] [, , username[@host] , , ...]

103534                   The *qalter* utility shall accept only one user name that is missing a corresponding  
103535                   host name. The *qalter* utility shall accept only one user name per named host.

103536                   The *qalter* utility shall add a value to the *User\_List* attribute of the batch job for each  
103537                   entry in the *user\_list* option-argument. See [Section 3.3.3](#) (on page 2421) for a means  
103538                   of removing *keyword=value* (and *value@keyword*) pairs and other general rules for  
103539                   list-oriented batch job attributes.

#### 103540 OPERANDS

103541                   The *qalter* utility shall accept one or more operands that conform to the syntax for a batch  
103542                   *job\_identifier* (see [Section 3.3.1](#), on page 2419).

#### 103543 STDIN

103544                   Not used.

#### 103545 INPUT FILES

103546                   None.

#### 103547 ENVIRONMENT VARIABLES

103548                   The following environment variables shall affect the execution of *qalter*:

103549                   *LANG*           Provide a default value for the internationalization variables that are unset or null.  
103550                   (See XBD [Section 8.2](#) (on page 174) the precedence of internationalization variables  
103551                   used to determine the values of locale categories.)

103552                   *LC\_ALL*          If set to a non-empty string value, override the values of all the other  
103553                   internationalization variables.

103554                   *LC\_CTYPE*       Determine the locale for the interpretation of sequences of bytes of text data as  
103555                   characters (for example, single-byte as opposed to multi-byte characters in  
103556                   arguments).

103557                   *LC\_MESSAGES*

103558                   Determine the locale that should be used to affect the format and contents of  
103559                   diagnostic messages written to standard error.

103560                   *LOGNAME*       Determine the login name of the user.

103561                   *TZ*             Determine the timezone used to interpret the *date-time* option-argument. If *TZ* is  
103562                   unset or null, an unspecified default timezone shall be used.

#### 103563 ASYNCHRONOUS EVENTS

103564                   Default.

#### 103565 STDOUT

103566                   None.

#### 103567 STDERR

103568                   The standard error shall be used only for diagnostic messages.

#### 103569 OUTPUT FILES

103570                   None.

#### 103571 EXTENDED DESCRIPTION

103572                   None.

103573 **EXIT STATUS**

103574 The following exit values shall be returned:

103575 0 Successful completion.

103576 >0 An error occurred.

103577 **CONSEQUENCES OF ERRORS**

103578 In addition to the default behavior, the *qalter* utility shall not be required to write a diagnostic  
 103579 message to standard error when the error reply received from a batch server indicates that the  
 103580 batch *job\_identifier* does not exist on the server. Whether or not the *qalter* utility attempts to locate  
 103581 the batch job on other batch servers is implementation-defined.

103582 **APPLICATION USAGE**

103583 None.

103584 **EXAMPLES**

103585 None.

103586 **RATIONALE**

103587 The *qalter* utility allows users to change the attributes of a batch job.

103588 As a means of altering a queued job, the *qalter* utility is superior to deleting and requeuing the  
 103589 batch job insofar as an altered job retains its place in the queue with some traditional selection  
 103590 algorithms. In addition, the *qalter* utility is both shorter and simpler than a sequence of *qdel* and  
 103591 *qsub* utilities.

103592 The result of an attempt on the part of a user to alter a batch job in a RUNNING state is  
 103593 implementation-defined because a batch job in the RUNNING state will already have opened its  
 103594 output files and otherwise performed any actions indicated by the options in effect at the time  
 103595 the batch job began execution.

103596 The options processed by the *qalter* utility are identical to those of the *qsub* utility, with a few  
 103597 exceptions: **-V**, **-v**, and **-q**. The **-V** and **-v** are inappropriate for the *qalter* utility, since they  
 103598 capture potentially transient environment information from the submitting process. The **-q**  
 103599 option would specify a new queue, which would largely negate the previously stated advantage  
 103600 of using *qalter*; furthermore, the *qmove* utility provides a superior means of moving jobs.

103601 Each of the following paragraphs provides the rationale for a *qalter* option.

103602 Additional rationale concerning these options can be found in the rationale for the *qsub* utility.

103603 The **-a** option allows users to alter the date and time at which a batch job becomes eligible to  
 103604 run.

103605 The **-A** option allows users to change the account that will be charged for the resources  
 103606 consumed by the batch job. Support for the **-A** option is mandatory for conforming  
 103607 implementations of *qalter*, even though support of accounting is optional for servers. Whether or  
 103608 not to support accounting is left to the implementor of the server, but mandatory support of the  
 103609 **-A** option assures users of a consistent interface and allows them to control accounting on  
 103610 servers that support accounting.

103611 The **-c** option allows users to alter the checkpointing interval of a batch job. A checkpointing  
 103612 system, which is not defined by POSIX.1-2008, allows recovery of a batch job at the most recent  
 103613 checkpoint in the event of a crash. Checkpointing is typically used for jobs that consume  
 103614 expensive computing time or must meet a critical schedule. Users should be allowed to make  
 103615 the tradeoff between the overhead of checkpointing and the risk to the timely completion of the  
 103616 batch job; therefore, this volume of POSIX.1-2008 provides the checkpointing interval option.  
 103617 Support for checkpointing is optional for servers.

The **-e** option allows users to alter the name and location of the standard error stream written by a batch job. However, the path of the standard error stream is meaningless if the value of the *Join\_Path* attribute of the batch job is TRUE.

The **-h** option allows users to set the hold type in the *Hold\_Types* attribute of a batch job. The *qhold* and *qrls* utilities add or remove hold types to the *Hold\_Types* attribute, respectively. The **-h** option has been modified to allow for implementation-defined hold types.

The **-j** option allows users to alter the decision to join (merge) the standard error stream of the batch job with the standard output stream of the batch job.

The **-l** option allows users to change the resource limits imposed on a batch job.

The **-m** option allows users to modify the list of points in the life of a batch job at which the designated users will receive mail notification.

The **-M** option allows users to alter the list of users who will receive notification about events in the life of a batch job.

The **-N** option allows users to change the name of a batch job.

The **-o** option allows users to alter the name and path to which the standard output stream of the batch job will be written.

The **-P** option allows users to modify the priority of a batch job. Support for priority is optional for batch servers.

The **-r** option allows users to alter the rerunability status of a batch job.

The **-S** option allows users to change the name and location of the shell image that will be invoked to interpret the script of the batch job. This option has been modified to allow a list of shell name and locations associated with different hosts.

The **-u** option allows users to change the user identifier under which the batch job will execute.

The *job\_identifier* operand syntax is provided so that the user can differentiate between the originating and destination (or executing) batch server. These may or may not be the same. The *.server\_name* portion identifies the originating batch server, while the *@server* portion identifies the destination batch server.

Historically, the *qalter* utility has been a component of the Network Queuing System (NQS), the existing practice from which this utility has been derived.

#### FUTURE DIRECTIONS

The *qalter* utility may be removed in a future version.

#### CHANGE HISTORY

Derived from IEEE Std 1003.2d-1994.

#### Issue 6

The *TZ* entry is added to the ENVIRONMENT VARIABLES section.

IEEE PASC Interpretation 1003.2 #182 is applied, clarifying the description of the **-a** option.

103657 **Issue 7**

103658 The *qalter* utility is marked obsolescent.

103659 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

103660 **NAME**

103661 qdel — delete batch jobs

103662 **SYNOPSIS**103663 OB BE `qdel job_identifier...`103664 **DESCRIPTION**

103665 A batch job is deleted by sending a request to the batch server that manages the batch job. A  
 103666 batch job that has been deleted is no longer subject to management by batch services.

103667 The *qdel* utility is a user-accessible client of batch services that requests the deletion of one or  
 103668 more batch jobs.

103669 The *qdel* utility shall request a batch server to delete those batch jobs for which a batch  
 103670 *job\_identifier* is presented to the utility.

103671 The *qdel* utility shall delete batch jobs in the order in which their batch *job\_identifiers* are  
 103672 presented to the utility.

103673 If the *qdel* utility fails to process any batch *job\_identifier* successfully, the utility shall proceed to  
 103674 process the remaining batch *job\_identifiers*, if any.

103675 The *qdel* utility shall delete each batch job by sending a *Delete Job Request* to the batch server that  
 103676 manages the batch job.

103677 The *qdel* utility shall not exit until the batch job corresponding to each successfully processed  
 103678 batch *job\_identifier* has been deleted.

103679 **OPTIONS**

103680 None.

103681 **OPERANDS**

103682 The *qdel* utility shall accept one or more operands that conform to the syntax for a batch  
 103683 *job\_identifier* (see [Section 3.3.1](#), on page 2419).

103684 **STDIN**

103685 Not used.

103686 **INPUT FILES**

103687 None.

103688 **ENVIRONMENT VARIABLES**103689 The following environment variables shall affect the execution of *qdel*:

103690 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 103691 (See XBD [Section 8.2](#) (on page 174) the precedence of internationalization variables  
 103692 used to determine the values of locale categories.)

103693 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 103694 internationalization variables.

103695 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 103696 characters (for example, single-byte as opposed to multi-byte characters in  
 103697 arguments).

103698 *LC\_MESSAGES*

103699 Determine the locale that should be used to affect the format and contents of  
 103700 diagnostic messages written to standard error.

- 103701 *LOGNAME* Determine the login name of the user.
- 103702 **ASYNCHRONOUS EVENTS**
- 103703 Default.
- 103704 **STDOUT**
- 103705 An implementation of the *qdel* utility may write informative messages to standard output.
- 103706 **STDERR**
- 103707 The standard error shall be used only for diagnostic messages.
- 103708 **OUTPUT FILES**
- 103709 None.
- 103710 **EXTENDED DESCRIPTION**
- 103711 None.
- 103712 **EXIT STATUS**
- 103713 The following exit values shall be returned:
- 103714 0 Successful completion.
- 103715 >0 An error occurred.
- 103716 **CONSEQUENCES OF ERRORS**
- 103717 In addition to the default behavior, the *qdel* utility shall not be required to write a diagnostic message to standard error when the error reply received from a batch server indicates that the batch *job\_identifier* does not exist on the server. Whether or not the *qdel* utility waits to output the diagnostic message while attempting to locate the job on other servers is implementation-defined.
- 103722 **APPLICATION USAGE**
- 103723 None.
- 103724 **EXAMPLES**
- 103725 None.
- 103726 **RATIONALE**
- 103727 The *qdel* utility allows users and administrators to delete jobs.
- 103728 The *qdel* utility provides functionality that is not otherwise available. For example, the *kill* utility of the operating system does not suffice. First, to use the *kill* utility, the user might have to log in on a remote node, because the *kill* utility does not operate across the network. Second, unlike *qdel*, *kill* cannot remove jobs from queues. Lastly, the arguments of the *qdel* utility are job identifiers rather than process identifiers, and so this utility can be passed the output of the *qselect* utility, thus providing users with a means of deleting a list of jobs.
- 103734 Because a set of jobs can be selected using the *qselect* utility, the *qdel* utility has not been complicated with options that provide for selection of jobs. Instead, the batch jobs to be deleted are identified individually by their job identifiers.
- 103737 Historically, the *qdel* utility has been a component of NQS, the existing practice on which it is based. However, the *qdel* utility defined in this volume of POSIX.1-2008 does not provide an option for specifying a signal number to send to the batch job prior to the killing of the process; that capability has been subsumed by the *qsig* utility.
- 103741 A discussion was held about the delays of networking and the possibility that the batch server may never respond, due to a down router, down batch server, or other network mishap. The DESCRIPTION records this under the words “fails to process any job identifier”. In the broad sense, the network problem is also an error, which causes the failure to process the batch job

103745 identifier.

103746 **FUTURE DIRECTIONS**

103747 The *qdel* utility may be removed in a future version.

103748 **SEE ALSO**

103749 [Chapter 3](#) (on page 2397), *kill*, *qselect*, *qsig*

103750 XBD [Chapter 8](#) (on page 173)

103751 **CHANGE HISTORY**

103752 Derived from IEEE Std 1003.2d-1994.

103753 **Issue 6**

103754 The *LC\_TIME* and *TZ* entries are removed from the ENVIRONMENT VARIABLES section.

103755 **Issue 7**

103756 The *qdel* utility is marked obsolescent.

103757 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

103758 **NAME**

103759 qhold — hold batch jobs

103760 **SYNOPSIS**103761 OB BE `qhold [-h hold_list] job_identifier...`103762 **DESCRIPTION**

103763 A hold is placed on a batch job by a request to the batch server that manages the batch job. A  
 103764 batch job that has one or more holds is not eligible for execution. The *qhold* utility is a user-  
 103765 accessible client of batch services that requests one or more types of hold to be placed on one or  
 103766 more batch jobs.

103767 The *qhold* utility shall place holds on those batch jobs for which a batch *job\_identifier* is presented  
 103768 to the utility.

103769 The *qhold* utility shall place holds on batch jobs in the order in which their batch *job\_identifiers*  
 103770 are presented to the utility. If the *qhold* utility fails to process any batch *job\_identifier* successfully,  
 103771 the utility shall proceed to process the remaining batch *job\_identifiers*, if any.

103772 The *qhold* utility shall place holds on each batch job by sending a *Hold Job Request* to the batch  
 103773 server that manages the batch job.

103774 The *qhold* utility shall not exit until holds have been placed on the batch job corresponding to  
 103775 each successfully processed batch *job\_identifier*.

103776 **OPTIONS**

103777 The *qhold* utility shall conform to XBD [Section 12.2](#) (on page 215).

103778 The following option shall be supported by the implementation:

103779 **-h *hold\_list*** Define the types of holds to be placed on the batch job.

103780 The *qhold* **-h** option shall accept a value for the *hold\_list* option-argument that is a  
 103781 string of alphanumeric characters in the portable character set (see XBD [Section](#)  
 103782 [6.1](#), on page 125).

103783 The *qhold* utility shall accept a value for the *hold\_list* option-argument that is a  
 103784 string of one or more of the characters 'u', 's', or 'o', or the single character  
 103785 'n'.

103786 For each unique character in the *hold\_list* option-argument, the *qhold* utility shall  
 103787 add a value to the *Hold\_Types* attribute of the batch job as follows, each  
 103788 representing a different hold type:

103789 u USER

103790 s SYSTEM

103791 o OPERATOR

103792 If any of these characters are duplicated in the *hold\_list* option-argument, the  
 103793 duplicates shall be ignored.

103794 An existing *Hold\_Types* attribute can be cleared by the following hold type:

103795 n NO\_HOLD

103796 The *qhold* utility shall consider it an error if any hold type other than 'n' is  
 103797 combined with hold type 'n'.

103798 Strictly conforming applications shall not repeat any of the characters 'u', 's',

103799 'o', or 'n' within the *hold\_list* option-argument. The *qhold* utility shall permit the  
 103800 repetition of characters, but shall not assign additional meaning to the repeated  
 103801 characters.

103802 An implementation may define other hold types. The conformance document for  
 103803 an implementation shall describe any additional hold types, how they are  
 103804 specified, their internal behavior, and how they affect the behavior of the utility.

103805 If the **-h** option is not presented to the *qhold* utility, the implementation shall set  
 103806 the *Hold\_Types* attribute to USER.

#### 103807 OPERANDS

103808 The *qhold* utility shall accept one or more operands that conform to the syntax for a batch  
 103809 *job\_identifier* (see [Section 3.3.1](#), on page 2419).

#### 103810 STDIN

103811 Not used.

#### 103812 INPUT FILES

103813 None.

#### 103814 ENVIRONMENT VARIABLES

103815 The following environment variables shall affect the execution of *qhold*:

103816 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 103817 (See XBD [Section 8.2](#) (on page 174) the precedence of internationalization variables  
 103818 used to determine the values of locale categories.)

103819 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 103820 internationalization variables.

103821 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 103822 characters (for example, single-byte as opposed to multi-byte characters in  
 103823 arguments).

103824 *LC\_MESSAGES*

103825 Determine the locale that should be used to affect the format and contents of  
 103826 diagnostic messages written to standard error.

103827 *LOGNAME* Determine the login name of the user.

#### 103828 ASYNCHRONOUS EVENTS

103829 Default.

#### 103830 STDOUT

103831 None.

#### 103832 STDERR

103833 The standard error shall be used only for diagnostic messages.

#### 103834 OUTPUT FILES

103835 None.

#### 103836 EXTENDED DESCRIPTION

103837 None.

#### 103838 EXIT STATUS

103839 The following exit values shall be returned:

103840 0 Successful completion.

103841 >0 An error occurred.

#### 103842 CONSEQUENCES OF ERRORS

103843 In addition to the default behavior, the *qhold* utility shall not be required to write a diagnostic  
103844 message to standard error when the error reply received from a batch server indicates that the  
103845 batch *job\_identifier* does not exist on the server. Whether or not the *qhold* utility waits to output  
103846 the diagnostic message while attempting to locate the job on other servers is implementation-  
103847 defined.

#### 103848 APPLICATION USAGE

103849 None.

#### 103850 EXAMPLES

103851 None.

#### 103852 RATIONALE

103853 The *qhold* utility allows users to place a hold on one or more jobs. A hold makes a batch job  
103854 ineligible for execution.

103855 The *qhold* utility has options that allow the user to specify the type of hold. Should the user wish  
103856 to place a hold on a set of jobs that meet a selection criteria, such a list of jobs can be acquired  
103857 using the *qselect* utility.

103858 The *-h* option allows the user to specify the type of hold that is to be placed on the job. This  
103859 option allows for USER, SYSTEM, OPERATOR, and implementation-defined hold types. The  
103860 USER and OPERATOR holds are distinct. The batch server that manages the batch job will verify  
103861 that the user is authorized to set the specified hold for the batch job.

103862 Mail is not required on hold because the administrator has the tools and libraries to build this  
103863 option if he or she wishes.

103864 Historically, the *qhold* utility has been a part of some existing batch systems, although it has not  
103865 traditionally been a part of the NQS.

#### 103866 FUTURE DIRECTIONS

103867 The *qhold* utility may be removed in a future version.

#### 103868 SEE ALSO

103869 [Chapter 3](#) (on page 2397), *qselect*

103870 [XBD Section 6.1](#) (on page 125), [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)

#### 103871 CHANGE HISTORY

103872 Derived from IEEE Std 1003.2d-1994.

#### 103873 Issue 6

103874 The *LC\_TIME* and *TZ* entries are removed from the ENVIRONMENT VARIABLES section.

#### 103875 Issue 7

103876 The *qhold* utility is marked obsolescent.

103877 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

103878 **NAME**

103879 qmove — move batch jobs

103880 **SYNOPSIS**103881 OB BE `qmove destination job_identifier...`103882 **DESCRIPTION**

103883 To move a batch job is to remove the batch job from the batch queue in which it resides and  
 103884 instantiate the batch job in another batch queue. A batch job is moved by a request to the batch  
 103885 server that manages the batch job. The *qmove* utility is a user-accessible batch client that requests  
 103886 the movement of one or more batch jobs.

103887 The *qmove* utility shall move those batch jobs, and only those batch jobs, for which a batch  
 103888 *job\_identifier* is presented to the utility.

103889 The *qmove* utility shall move batch jobs in the order in which the corresponding batch  
 103890 *job\_identifiers* are presented to the utility.

103891 If the *qmove* utility fails to process a batch *job\_identifier* successfully, the utility shall proceed to  
 103892 process the remaining batch *job\_identifiers*, if any.

103893 The *qmove* utility shall move batch jobs by sending a *Move Job Request* to the batch server that  
 103894 manages each batch job. The *qmove* utility shall not exit before the batch jobs corresponding to all  
 103895 successfully processed batch *job\_identifiers* have been moved.

103896 **OPTIONS**

103897 None.

103898 **OPERANDS**

103899 The *qmove* utility shall accept one operand that conforms to the syntax for a destination (see  
 103900 [Section 3.3.2](#), on page 2420).

103901 The *qmove* utility shall accept one or more operands that conform to the syntax for a batch  
 103902 *job\_identifier* (see [Section 3.3.1](#), on page 2419).

103903 **STDIN**

103904 Not used.

103905 **INPUT FILES**

103906 None.

103907 **ENVIRONMENT VARIABLES**103908 The following environment variables shall affect the execution of *qmove*:

103909 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 103910 (See XBD [Section 8.2](#) (on page 174) the precedence of internationalization variables  
 103911 used to determine the values of locale categories.)

103912 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 103913 internationalization variables.

103914 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 103915 characters (for example, single-byte as opposed to multi-byte characters in  
 103916 arguments).

103917 *LC\_MESSAGES*

103918 Determine the locale that should be used to affect the format and contents of  
 103919 diagnostic messages written to standard error.

- 103920 *LOGNAME* Determine the login name of the user.
- 103921 **ASYNCHRONOUS EVENTS**
- 103922 Default.
- 103923 **STDOUT**
- 103924 None.
- 103925 **STDERR**
- 103926 The standard error shall be used only for diagnostic messages.
- 103927 **OUTPUT FILES**
- 103928 None.
- 103929 **EXTENDED DESCRIPTION**
- 103930 None.
- 103931 **EXIT STATUS**
- 103932 The following exit values shall be returned:
- 103933 0 Successful completion.
- 103934 >0 An error occurred.
- 103935 **CONSEQUENCES OF ERRORS**
- 103936 In addition to the default behavior, the *qmove* utility shall not be required to write a diagnostic message to standard error when the error reply received from a batch server indicates that the batch *job\_identifier* does not exist on the server. Whether or not the *qmove* utility waits to output the diagnostic message while attempting to locate the job on other servers is implementation-defined.
- 103941 **APPLICATION USAGE**
- 103942 None.
- 103943 **EXAMPLES**
- 103944 None.
- 103945 **RATIONALE**
- 103946 The *qmove* utility allows users to move jobs between queues.
- 103947 The alternative to using the *qmove* utility—deleting the batch job and requeuing it—entails considerably more typing.
- 103949 Since the means of selecting jobs based on attributes has been encapsulated in the *qselect* utility, the only option of the *qmove* utility concerns authorization. The **-u** option provides the user with the convenience of changing the user identifier under which the batch job will execute.
- 103952 Minimalism and consistency have taken precedence over convenience; the **-u** option has been deleted because the equivalent capability exists with the **-u** option of the *qalter* utility.
- 103954 **FUTURE DIRECTIONS**
- 103955 The *qmove* utility may be removed in a future version.
- 103956 **SEE ALSO**
- 103957 [Chapter 3](#) (on page 2397), *qalter*, *qselect*
- 103958 [XBD Chapter 8](#) (on page 173)

103959 **CHANGE HISTORY**

103960 Derived from IEEE Std 1003.2d-1994.

103961 **Issue 6**

103962 The *LC\_TIME* and *TZ* entries are removed from the ENVIRONMENT VARIABLES section.

103963 **Issue 7**

103964 The *qmove* utility is marked obsolescent.

103965 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

103966 **NAME**

103967       qmsg — send message to batch jobs

103968 **SYNOPSIS**103969 OB BE   qmsg [-EO] *message\_string job\_identifier...*103970 **DESCRIPTION**

103971 To send a message to a batch job is to request that a server write a message string into one or  
 103972 more output files of the batch job. A message is sent to a batch job by a request to the batch  
 103973 server that manages the batch job. The *qmsg* utility is a user-accessible batch client that requests  
 103974 the sending of messages to one or more batch jobs.

103975 The *qmsg* utility shall write messages into the files of batch jobs by sending a *Job Message Request*  
 103976 to the batch server that manages the batch job. The *qmsg* utility shall not directly write the  
 103977 message into the files of the batch job.

103978 The *qmsg* utility shall send a *Job Message Request* for those batch jobs, and only those batch jobs,  
 103979 for which a batch *job\_identifier* is presented to the utility.

103980 The *qmsg* utility shall send *Job Message Requests* for batch jobs in the order in which their batch  
 103981 *job\_identifiers* are presented to the utility.

103982 If the *qmsg* utility fails to process any batch *job\_identifier* successfully, the utility shall proceed to  
 103983 process the remaining batch *job\_identifiers*, if any.

103984 The *qmsg* utility shall not exit before a *Job Message Request* has been sent to the server that  
 103985 manages the batch job that corresponds to each successfully processed batch *job\_identifier*.

103986 **OPTIONS**

103987 The *qmsg* utility shall conform to XBD [Section 12.2](#) (on page 215).

103988 The following options shall be supported by the implementation:

103989    -E       Specify that the message is written to the standard error of each batch job.

103990           The *qmsg* utility shall write the message into the standard error of the batch job.

103991    -O       Specify that the message is written to the standard output of each batch job.

103992           The *qmsg* utility shall write the message into the standard output of the batch job.

103993 If neither the -O nor the -E option is presented to the *qmsg* utility, the utility shall write the  
 103994 message into an implementation-defined file. The conformance document for the  
 103995 implementation shall describe the name and location of the implementation-defined file. If both  
 103996 the -O and the -E options are presented to the *qmsg* utility, then the utility shall write the  
 103997 messages to both standard output and standard error.

103998 **OPERANDS**

103999 The *qmsg* utility shall accept a minimum of two operands, *message\_string* and one or more batch  
 104000 *job\_identifiers*.

104001 The *message\_string* operand shall be the string to be written to one or more output files of the  
 104002 batch job followed by a <newline>. If the string contains <blank> characters, then the  
 104003 application shall ensure that the string is quoted. The *message\_string* shall be encoded in the  
 104004 portable character set (see XBD [Section 6.1](#), on page 125).

104005 All remaining operands are batch *job\_identifiers* that conform to the syntax for a batch  
 104006 *job\_identifier* (see [Section 3.3.1](#), on page 2419).

104007 **STDIN**

104008 Not used.

104009 **INPUT FILES**

104010 None.

104011 **ENVIRONMENT VARIABLES**104012 The following environment variables shall affect the execution of *qmsg*:

104013 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 104014 (See XBD [Section 8.2](#) (on page 174) the precedence of internationalization variables  
 104015 used to determine the values of locale categories.)

104016 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 104017 internationalization variables.

104018 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 104019 characters (for example, single-byte as opposed to multi-byte characters in  
 104020 arguments).

104021 *LC\_MESSAGES*

104022 Determine the locale that should be used to affect the format and contents of  
 104023 diagnostic messages written to standard error.

104024 *LOGNAME* Determine the login name of the user.

104025 **ASYNCHRONOUS EVENTS**

104026 Default.

104027 **STDOUT**

104028 None.

104029 **STDERR**

104030 The standard error shall be used only for diagnostic messages.

104031 **OUTPUT FILES**

104032 None.

104033 **EXTENDED DESCRIPTION**

104034 None.

104035 **EXIT STATUS**

104036 The following exit values shall be returned:

104037 0 Successful completion.

104038 &gt;0 An error occurred.

104039 **CONSEQUENCES OF ERRORS**

104040 In addition to the default behavior, the *qmsg* utility shall not be required to write a diagnostic  
 104041 message to standard error when the error reply received from a batch server indicates that the  
 104042 batch *job\_identifier* does not exist on the server. Whether or not the *qmsg* utility waits to output  
 104043 the diagnostic message while attempting to locate the job on other servers is implementation-  
 104044 defined.

**104045 APPLICATION USAGE**

104046 None.

**104047 EXAMPLES**

104048 None.

**104049 RATIONALE**

104050 The *qmsg* utility allows users to write messages into the output files of running jobs. Users,  
104051 including operators and administrators, have a number of occasions when they want to place  
104052 messages in the output files of a batch job. For example, if a disk that is being used by a batch job  
104053 is showing errors, the operator might note this in the standard error stream of the batch job.

104054 The options of the *qmsg* utility provide users with the means of placing the message in the  
104055 output stream of their choice. The default output stream for the message—if the user does not  
104056 designate an output stream—is implementation-defined, since many implementations will  
104057 provide, as an extension to this volume of POSIX.1-2008, a log file that shows the history of  
104058 utility execution.

104059 If users wish to send a message to a set of jobs that meet a selection criteria, the *qselect* utility can  
104060 be used to acquire the appropriate list of job identifiers.

104061 The **-E** option allows users to place the message in the standard error stream of the batch job.

104062 The **-O** option allows users to place the message in the standard output stream of the batch job.

104063 Historically, the *qmsg* utility is an existing practice in the offerings of one or more implementors  
104064 of an NQS-derived batch system. The utility has been found to be useful enough that it deserves  
104065 to be included in this volume of POSIX.1-2008.

**104066 FUTURE DIRECTIONS**

104067 The *qmsg* utility may be removed in a future version.

**104068 SEE ALSO**

104069 [Chapter 3](#) (on page 2397), *qselect*

104070 XBD [Section 6.1](#) (on page 125), [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)

**104071 CHANGE HISTORY**

104072 Derived from IEEE Std 1003.2d-1994.

**104073 Issue 6**

104074 The *LC\_TIME* and *TZ* entries are removed from the ENVIRONMENT VARIABLES section.

**104075 Issue 7**

104076 The *qmsg* utility is marked obsolescent.

104077 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

104078 **NAME**

104079        qrerun — rerun batch jobs

104080 **SYNOPSIS**104081 OB BE    `qrerun job_identifier...`104082 **DESCRIPTION**

104083        To rerun a batch job is to terminate the session leader of the batch job, delete any associated  
 104084        checkpoint files, and return the batch job to the batch queued state. A batch job is rerun by a  
 104085        request to the batch server that manages the batch job. The *qrerun* utility is a user-accessible  
 104086        batch client that requests the rerunning of one or more batch jobs.

104087        The *qrerun* utility shall rerun those batch jobs for which a batch *job\_identifier* is presented to the  
 104088        utility.

104089        The *qrerun* utility shall rerun batch jobs in the order in which their batch *job\_identifiers* are  
 104090        presented to the utility.

104091        If the *qrerun* utility fails to process any batch *job\_identifier* successfully, the utility shall proceed to  
 104092        process the remaining batch *job\_identifiers*, if any.

104093        The *qrerun* utility shall rerun batch jobs by sending a *Rerun Job Request* to the batch server that  
 104094        manages each batch job.

104095        For each successfully processed batch *job\_identifier*, the *qrerun* utility shall have rerun the  
 104096        corresponding batch job at the time the utility exits.

104097 **OPTIONS**

104098        None.

104099 **OPERANDS**

104100        The *qrerun* utility shall accept one or more operands that conform to the syntax for a batch  
 104101        *job\_identifier* (see [Section 3.3.1](#), on page 2419).

104102 **STDIN**

104103        Not used.

104104 **INPUT FILES**

104105        None.

104106 **ENVIRONMENT VARIABLES**104107        The following environment variables shall affect the execution of *qrerun*:

104108        *LANG*        Provide a default value for the internationalization variables that are unset or null.  
 104109        (See [XBD Section 8.2](#) (on page 174) the precedence of internationalization variables  
 104110        used to determine the values of locale categories.)

104111        *LC\_ALL*       If set to a non-empty string value, override the values of all the other  
 104112        internationalization variables.

104113        *LC\_CTYPE*    Determine the locale for the interpretation of sequences of bytes of text data as  
 104114        characters (for example, single-byte as opposed to multi-byte characters in  
 104115        arguments).

104116        *LC\_MESSAGES*

104117        Determine the locale that should be used to affect the format and contents of  
 104118        diagnostic messages written to standard error.

- 104119 *LOGNAME* Determine the login name of the user.
- 104120 **ASYNCHRONOUS EVENTS**
- 104121 Default.
- 104122 **STDOUT**
- 104123 None.
- 104124 **STDERR**
- 104125 The standard error shall be used only for diagnostic messages.
- 104126 **OUTPUT FILES**
- 104127 None.
- 104128 **EXTENDED DESCRIPTION**
- 104129 None.
- 104130 **EXIT STATUS**
- 104131 The following exit values shall be returned:
- 104132 0 Successful completion.
- 104133 >0 An error occurred.
- 104134 **CONSEQUENCES OF ERRORS**
- 104135 In addition to the default behavior, the *qrerun* utility shall not be required to write a diagnostic message to standard error when the error reply received from a batch server indicates that the batch *job\_identifier* does not exist on the server. Whether or not the *qrerun* utility waits to output the diagnostic message while attempting to locate the job on other servers is implementation-defined.
- 104140 **APPLICATION USAGE**
- 104141 None.
- 104142 **EXAMPLES**
- 104143 None.
- 104144 **RATIONALE**
- 104145 The *qrerun* utility allows users to cause jobs in the running state to exit and rerun.
- 104146 The *qrerun* utility is a new utility, *vis-a-vis* existing practice, that has been defined in this volume of POSIX.1-2008 to correct user-perceived deficiencies in the existing practice.
- 104147
- 104148 **FUTURE DIRECTIONS**
- 104149 The *qrerun* utility may be removed in a future version.
- 104150 **SEE ALSO**
- 104151 [Chapter 3](#) (on page 2397)
- 104152 XBD [Chapter 8](#) (on page 173)
- 104153 **CHANGE HISTORY**
- 104154 Derived from IEEE Std 1003.2d-1994.
- 104155 **Issue 6**
- 104156 The *LC\_TIME* and *TZ* entries are removed from the ENVIRONMENT VARIABLES section.

104157 **Issue 7**

104158 The *qrerun* utility is marked obsolescent.

104159 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

104160 **NAME**

104161 qrln — release batch jobs

104162 **SYNOPSIS**104163 OB BE `qrln [-h hold_list] job_identifier...`104164 **DESCRIPTION**

104165 A batch job might have one or more holds, which prevent the batch job from executing. A batch  
 104166 job from which all the holds have been removed becomes eligible for execution and is said to  
 104167 have been released. A batch job hold is removed by sending a request to the batch server that  
 104168 manages the batch job. The *qrln* utility is a user-accessible client of batch services that requests  
 104169 holds be removed from one or more batch jobs.

104170 The *qrln* utility shall remove one or more holds from those batch jobs for which a batch  
 104171 *job\_identifier* is presented to the utility.

104172 The *qrln* utility shall remove holds from batch jobs in the order in which their batch *job\_identifiers*  
 104173 are presented to the utility.

104174 If the *qrln* utility fails to process a batch *job\_identifier* successfully, the utility shall proceed to  
 104175 process the remaining batch *job\_identifiers*, if any.

104176 The *qrln* utility shall remove holds on each batch job by sending a *Release Job Request* to the batch  
 104177 server that manages the batch job.

104178 The *qrln* utility shall not exit until the holds have been removed from the batch job  
 104179 corresponding to each successfully processed batch *job\_identifier*.

104180 **OPTIONS**

104181 The *qrln* utility shall conform to XBD [Section 12.2](#) (on page 215).

104182 The following option shall be supported by the implementation:

104183 **-h *hold\_list*** Define the types of holds to be removed from the batch job.

104184 The *qrln* **-h** option shall accept a value for the *hold\_list* option-argument that is a  
 104185 string of alphanumeric characters in the portable character set (see XBD [Section](#)  
 104186 [6.1](#), on page 125).

104187 The *qrln* utility shall accept a value for the *hold\_list* option-argument that is a string  
 104188 of one or more of the characters 'u', 's', or 'o', or the single character 'n'.

104189 For each unique character in the *hold\_list* option-argument, the *qrln* utility shall add  
 104190 a value to the *Hold\_Types* attribute of the batch job as follows, each representing a  
 104191 different hold type:

104192 u USER

104193 s SYSTEM

104194 o OPERATOR

104195 If any of these characters are duplicated in the *hold\_list* option-argument, the  
 104196 duplicates shall be ignored.

104197 An existing *Hold\_Types* attribute can be cleared by the following hold type:

104198 n NO\_HOLD

104199 The *qrln* utility shall consider it an error if any hold type other than 'n' is  
 104200 combined with hold type 'n'.

104201 Strictly conforming applications shall not repeat any of the characters 'u', 's',  
 104202 'o', or 'n' within the *hold\_list* option-argument. The *qrls* utility shall permit the  
 104203 repetition of characters, but shall not assign additional meaning to the repeated  
 104204 characters.

104205 An implementation may define other hold types. The conformance document for  
 104206 an implementation shall describe any additional hold types, how they are  
 104207 specified, their internal behavior, and how they affect the behavior of the utility.

104208 If the **-h** option is not presented to the *qrls* utility, the implementation shall remove  
 104209 the USER hold in the *Hold\_Types* attribute.

#### 104210 OPERANDS

104211 The *qrls* utility shall accept one or more operands that conform to the syntax for a batch  
 104212 *job\_identifier* (see [Section 3.3.1](#), on page 2419).

#### 104213 STDIN

104214 Not used.

#### 104215 INPUT FILES

104216 None.

#### 104217 ENVIRONMENT VARIABLES

104218 The following environment variables shall affect the execution of *qrls*:

104219 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 104220 (See XBD [Section 8.2](#) (on page 174) the precedence of internationalization variables  
 104221 used to determine the values of locale categories.)

104222 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 104223 internationalization variables.

104224 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 104225 characters (for example, single-byte as opposed to multi-byte characters in  
 104226 arguments).

104227 *LC\_MESSAGES*

104228 Determine the locale that should be used to affect the format and contents of  
 104229 diagnostic messages written to standard error.

104230 *LOGNAME* Determine the login name of the user.

#### 104231 ASYNCHRONOUS EVENTS

104232 Default.

#### 104233 STDOUT

104234 None.

#### 104235 STDERR

104236 The standard error shall be used only for diagnostic messages.

#### 104237 OUTPUT FILES

104238 None.

#### 104239 EXTENDED DESCRIPTION

104240 None.

**104241 EXIT STATUS**

104242 The following exit values shall be returned:

104243 0 Successful completion.

104244 >0 An error occurred.

**104245 CONSEQUENCES OF ERRORS**

104246 In addition to the default behavior, the *qrsl* utility shall not be required to write a diagnostic  
104247 message to standard error when the error reply received from a batch server indicates that the  
104248 batch *job\_identifier* does not exist on the server. Whether or not the *qrsl* utility waits to output the  
104249 diagnostic message while attempting to locate the job on other servers is implementation-  
104250 defined.

**104251 APPLICATION USAGE**

104252 None.

**104253 EXAMPLES**

104254 None.

**104255 RATIONALE**

104256 The *qrsl* utility allows users, operators, and administrators to remove holds from jobs.

104257 The *qrsl* utility does not support any job selection options or wildcard arguments. Users may  
104258 acquire a list of jobs selected by attributes using the *qselect* utility. For example, a user could  
104259 select all of their held jobs.

104260 The **-h** option allows the user to specify the type of hold that is to be removed. This option  
104261 allows for USER, SYSTEM, OPERATOR, and implementation-defined hold types. The batch  
104262 server that manages the batch job will verify whether the user is authorized to remove the  
104263 specified hold for the batch job. If more than one type of hold has been placed on the batch job, a  
104264 user may wish to remove only some of them.

104265 Mail is not required on release because the administrator has the tools and libraries to build this  
104266 option if required.

104267 The *qrsl* utility is a new utility *vis-a-vis* existing practice; it has been defined in this volume of  
104268 POSIX.1-2008 as the natural complement to the *qhold* utility.

**104269 FUTURE DIRECTIONS**

104270 The *qrsl* utility may be removed in a future version.

**104271 SEE ALSO**

104272 [Chapter 3](#) (on page 2397), *qhold*, *qselect*

104273 [XBD Section 6.1](#) (on page 125), [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)

**104274 CHANGE HISTORY**

104275 Derived from IEEE Std 1003.2d-1994.

**104276 Issue 6**

104277 The *LC\_TIME* and *TZ* entries are removed from the ENVIRONMENT VARIABLES section.

**104278 Issue 7**

104279 The *qrsl* utility is marked obsolescent.

104280 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

104281 **NAME**

104282 qselect — select batch jobs

104283 **SYNOPSIS**

```
104284 OB BE qselect [-a [op]date_time] [-A account_string] [-c [op]interval]
104285 [-h hold_list] [-l resource_list] [-N name] [-p [op]priority]
104286 [-q destination] [-r y|n] [-s states] [-u user_list]
```

104287 **DESCRIPTION**

104288 To select a set of batch jobs is to return the batch *job\_identifiers* for each batch job that meets a list  
 104289 of selection criteria. A set of batch jobs is selected by a request to a batch server. The *qselect* utility  
 104290 is a user-accessible batch client that requests the selection of batch jobs.

104291 Upon successful completion, the *qselect* utility shall have returned a list of zero or more batch  
 104292 *job\_identifiers* that meet the criteria specified by the options and option-arguments presented to  
 104293 the utility.

104294 The *qselect* utility shall select batch jobs by sending a *Select Jobs Request* to a batch server. The  
 104295 *qselect* utility shall not exit until the server replies to each request generated.

104296 For each option presented to the *qselect* utility, the utility shall restrict the set of selected batch  
 104297 jobs as described in the OPTIONS section.

104298 The *qselect* utility shall not restrict selection of batch jobs except by authorization and as required  
 104299 by the options presented to the utility.

104300 When an option is specified with a mandatory or optional *op* component to the option-  
 104301 argument, then *op* shall specify a relation between the value of a certain batch job attribute and  
 104302 the *value* component of the option-argument. If an *op* is allowable on an option, then the  
 104303 description of the option letter indicates the *op* as either mandatory or optional. Acceptable  
 104304 strings for the *op* component, and the relation the string indicates, are shown in the following  
 104305 list:

- 104306 .eq. The value represented by the attribute of the batch job is equal to the value represented
- 104307 by the option-argument.
- 104308 .ge. The value represented by the attribute of the batch job is greater than or equal to the
- 104309 value represented by the option-argument.
- 104310 .gt. The value represented by the attribute of the batch job is greater than the value
- 104311 represented by the option-argument.
- 104312 .lt. The value represented by the attribute of the batch job is less than the value represented
- 104313 by the option-argument.
- 104314 .le. The value represented by the attribute of the batch job is less than or equal to the value
- 104315 represented by the option-argument.
- 104316 .ne. The value represented by the attribute of the batch job is not equal to the value
- 104317 represented by the option-argument.

104318 **OPTIONS**

104319 The *qselect* utility shall conform to XBD [Section 12.2](#) (on page 215).

104320 The following options shall be supported by the implementation:

104321 **-a [op]date\_time**

104322 Restrict selection to a specific time, or a range of times.

104323 The *qselect* utility shall select only batch jobs for which the value of the

104324 *Execution\_Time* attribute is related to the Epoch equivalent of the local time  
 104325 expressed by the value of the *date\_time* component of the option-argument in the  
 104326 manner indicated by the value of the *op* component of the option-argument.

104327 The *qselect* utility shall accept a *date\_time* component of the option-argument that  
 104328 conforms to the syntax of the *time* operand of the *touch* utility.

104329 If the *op* component of the option-argument is not presented to the *qselect* utility,  
 104330 the utility shall select batch jobs for which the *Execution\_Time* attribute is equal to  
 104331 the *date\_time* component of the option-argument.

104332 When comparing times, the *qselect* utility shall use the following definitions for the  
 104333 *op* component of the option-argument:

104334 .eq. The time represented by value of the *Execution\_Time* attribute of the batch  
 104335 job is equal to the time represented by the *date\_time* component of the  
 104336 option-argument.

104337 .ge. The time represented by value of the *Execution\_Time* attribute of the batch  
 104338 job is after or equal to the time represented by the *date\_time* component of  
 104339 the option-argument.

104340 .gt. The time represented by value of the *Execution\_Time* attribute of the batch  
 104341 job is after the time represented by the *date\_time* component of the option-  
 104342 argument.

104343 .lt. The time represented by value of the *Execution\_Time* attribute of the batch  
 104344 job is before the time represented by the *date\_time* component of the  
 104345 option-argument.

104346 .le. The time represented by value of the *Execution\_Time* attribute of the batch  
 104347 job is before or equal to the time represented by the *date\_time* component  
 104348 of the option-argument.

104349 .ne. The time represented by value of the *Execution\_Time* attribute of the batch  
 104350 job is not equal to the time represented by the *date\_time* component of the  
 104351 option-argument.

104352 The *qselect* utility shall accept the defined character strings for the *op* component of  
 104353 the option-argument.

104354 **-A** *account\_string*  
 104355 Restrict selection to the batch jobs charging a specified account.

104356 The *qselect* utility shall select only batch jobs for which the value of the  
 104357 *Account\_Name* attribute of the batch job matches the value of the *account\_string*  
 104358 option-argument.

104359 The syntax of the *account\_string* option-argument is unspecified.

104360 **-c** [*op*]*interval*  
 104361 Restrict selection to batch jobs within a range of checkpoint intervals.

104362 The *qselect* utility shall select only batch jobs for which the value of the *Checkpoint*  
 104363 attribute relates to the value of the *interval* component of the option-argument in  
 104364 the manner indicated by the value of the *op* component of the option-argument.

104365 If the *op* component of the option-argument is omitted, the *qselect* utility shall select  
 104366 batch jobs for which the value of the *Checkpoint* attribute is equal to the value of the  
 104367 *interval* component of the option-argument.

104368 When comparing checkpoint intervals, the *qselect* utility shall use the following  
 104369 definitions for the *op* component of the option-argument:

104370 .eq. The value of the *Checkpoint* attribute of the batch job equals the value of  
 104371 the *interval* component of the option-argument.

104372 .ge. The value of the *Checkpoint* attribute of the batch job is greater than or  
 104373 equal to the value of the *interval* component option-argument.

104374 .gt. The value of the *Checkpoint* attribute of the batch job is greater than the  
 104375 value of the *interval* component option-argument.

104376 .lt. The value of the *Checkpoint* attribute of the batch job is less than the value  
 104377 of the *interval* component option-argument.

104378 .le. The value of the *Checkpoint* attribute of the batch job is less than or equal  
 104379 to the value of the *interval* component option-argument.

104380 .ne. The value of the *Checkpoint* attribute of the batch job does not equal the  
 104381 value of the *interval* component option-argument.

104382 The *qselect* utility shall accept the defined character strings for the *op* component of  
 104383 the option-argument.

104384 The ordering relationship for the values of the interval option-argument is defined  
 104385 to be:

104386 'n' .gt. 's' .gt. 'c=minutes' .ge. 'c'

104387 When comparing *Checkpoint* attributes with an interval having the value of the  
 104388 single character 'u', only equality or inequality are valid comparisons.

104389 **-h hold\_list** Restrict selection to batch jobs that have a specific type of hold.

104390 The *qselect* utility shall select only batch jobs for which the value of the *Hold\_Types*  
 104391 attribute matches the value of the *hold\_list* option-argument.

104392 The *qselect* **-h** option shall accept a value for the *hold\_list* option-argument that is a  
 104393 string of alphanumeric characters in the portable character set (see XBD [Section 6.1](#), on page 125).  
 104394

104395 The *qselect* utility shall accept a value for the *hold\_list* option-argument that is a  
 104396 string of one or more of the characters 'u', 's', or 'o', or the single character  
 104397 'n'.

104398 Each unique character in the *hold\_list* option-argument of the *qselect* utility is  
 104399 defined as follows, each representing a different hold type:

104400 u USER  
 104401 s SYSTEM  
 104402 o OPERATOR

104403 If any of these characters are duplicated in the *hold\_list* option-argument, the  
 104404 duplicates shall be ignored.

104405 The *qselect* utility shall consider it an error if any hold type other than 'n' is  
 104406 combined with hold type 'n'.

104407 Strictly conforming applications shall not repeat any of the characters 'u', 's',  
 104408 'o', or 'n' within the *hold\_list* option-argument. The *qselect* utility shall permit

104409 the repetition of characters, but shall not assign additional meaning to the repeated  
 104410 characters.

104411 An implementation may define other hold types. The conformance document for  
 104412 an implementation shall describe any additional hold types, how they are  
 104413 specified, their internal behavior, and how they affect the behavior of the utility.

104414 **-I *resource\_list***  
 104415 Restrict selection to batch jobs with specified resource limits and attributes.

104416 The *qselect* utility shall accept a *resource\_list* option-argument with the following  
 104417 syntax:

104418 *resource\_name op value [, , resource\_name op value, , ...]*

104419 When comparing resource values, the *qselect* utility shall use the following  
 104420 definitions for the *op* component of the option-argument:

104421 *.eq.* The value of the resource of the same name in the *Resource\_List* attribute  
 104422 of the batch job equals the value of the value component of the option-  
 104423 argument.

104424 *.ge.* The value of the resource of the same name in the *Resource\_List* attribute  
 104425 of the batch job is greater than or equal to the value of the *value*  
 104426 component of the option-argument.

104427 *.gt.* The value of the resource of the same name in the *Resource\_List* attribute  
 104428 of the batch job is greater than the value of the value component of the  
 104429 option-argument.

104430 *.lt.* The value of the resource of the same name in the *Resource\_List* attribute  
 104431 of the batch job is less than the value of the value component of the  
 104432 option-argument.

104433 *.ne.* The value of the resource of the same name in the *Resource\_List* attribute  
 104434 of the batch job does not equal the value of the value component of the  
 104435 option-argument.

104436 *.le.* The value of the resource of the same name in the *Resource\_List* attribute  
 104437 of the batch job is less than or equal to the value of the *value* component of  
 104438 the option-argument.

104439 When comparing the limit of a *Resource\_List* attribute with the *value* component of  
 104440 the option-argument, if the limit, the value, or both are non-numeric, only equality  
 104441 or inequality are valid comparisons.

104442 The *qselect* utility shall select only batch jobs for which the values of the  
 104443 *resource\_names* listed in the *resource\_list* option-argument match the corresponding  
 104444 limits of the *Resource\_List* attribute of the batch job.

104445 Limits of *resource\_names* present in the *Resource\_List* attribute of the batch job that  
 104446 have no corresponding values in the *resource\_list* option-argument shall not be  
 104447 considered when selecting batch jobs.

104448 **-N *name*** Restrict selection to batch jobs with a specified name.

104449 The *qselect* utility shall select only batch jobs for which the value of the *Job\_Name*  
 104450 attribute matches the value of the *name* option-argument. The string specified in  
 104451 the *name* option-argument shall be passed, uninterpreted, to the server. This allows  
 104452 an implementation to match “wildcard” patterns against batch job names.

|        |                                         |                                                                                                                                                                                                                                                                                                    |
|--------|-----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 104453 |                                         | An implementation shall describe in the conformance document the format it supports for matching against the <i>Job_Name</i> attribute.                                                                                                                                                            |
| 104454 |                                         |                                                                                                                                                                                                                                                                                                    |
| 104455 | <b>-p</b> [ <i>op</i> ] <i>priority</i> |                                                                                                                                                                                                                                                                                                    |
| 104456 |                                         | Restrict selection to batch jobs of the specified priority or range of priorities.                                                                                                                                                                                                                 |
| 104457 |                                         | The <i>qselect</i> utility shall select only batch jobs for which the value of the <i>Priority</i> attribute of the batch job relates to the value of the <i>priority</i> component of the option-argument in the manner indicated by the value of the <i>op</i> component of the option-argument. |
| 104458 |                                         |                                                                                                                                                                                                                                                                                                    |
| 104459 |                                         |                                                                                                                                                                                                                                                                                                    |
| 104460 |                                         |                                                                                                                                                                                                                                                                                                    |
| 104461 |                                         | If the <i>op</i> component of the option-argument is omitted, the <i>qselect</i> utility shall select batch jobs for which the value of the <i>Priority</i> attribute of the batch job is equal to the value of the <i>priority</i> component of the option-argument.                              |
| 104462 |                                         |                                                                                                                                                                                                                                                                                                    |
| 104463 |                                         |                                                                                                                                                                                                                                                                                                    |
| 104464 |                                         | When comparing priority values, the <i>qselect</i> utility shall use the following definitions for the <i>op</i> component of the option-argument:                                                                                                                                                 |
| 104465 |                                         |                                                                                                                                                                                                                                                                                                    |

| 104563 | 0                             | Successful completion.                                                                                                                                                                                                                         |
| 104564 | >0                            | An error occurred.                                                                                                                                                                                                                             |
| 104565 | <b>CONSEQUENCES OF ERRORS</b> |                                                                                                                                                                                                                                                |
| 104566 |                               | Default.                                                                                                                                                                                                                                       |

**104567 APPLICATION USAGE**

104568 None.

**104569 EXAMPLES**

104570 The following example shows how a user might use the *qselect* utility in conjunction with the  
104571 *qdel* utility to delete all of his or her jobs in the queued state without affecting any jobs that are  
104572 already running:

104573 `qdel $(qselect -s q)`

104574 or:

104575 `qselect -s q || xargs qdel`

**104576 RATIONALE**

104577 The *qselect* utility allows users to acquire a list of job identifiers that match user-specified  
104578 selection criteria. The list of identifiers returned by the *qselect* utility conforms to the syntax of  
104579 the batch job identifier list processed by a utility such as *qmove*, *qdel*, and *qrls*. The *qselect* utility  
104580 is thus a powerful tool for causing another batch system utility to act upon a set of jobs that  
104581 match a list of selection criteria.

104582 The options of the *qselect* utility let the user apply a number of useful filters for selecting jobs.  
104583 Each option further restricts the selection of jobs. Many of the selection options allow the  
104584 specification of a relational operator. The FORTRAN-like syntax of the operator—that is,  
104585 ".lt."—was chosen rather than the C-like "<=" meta-characters.

104586 The **-a** option allows users to restrict the selected jobs to those that have been submitted (or  
104587 altered) to wait until a particular time. The time period is determined by the argument of this  
104588 option, which includes both a time and an operator—it is thus possible to select jobs waiting  
104589 until a specific time, jobs waiting until after a certain time, or those waiting for a time before the  
104590 specified time.

104591 The **-A** option allows users to restrict the selected jobs to those that have been submitted (or  
104592 altered) to charge a particular account.

104593 The **-c** option allows users to restrict the selected jobs to those whose checkpointing interval  
104594 falls within the specified range.

104595 The **-l** option allows users to select those jobs whose resource limits fall within the range  
104596 indicated by the value of the option. For example, a user could select those jobs for which the  
104597 CPU time limit is greater than two hours.

104598 The **-N** option allows users to select jobs by job name. For instance, all the parts of a task that  
104599 have been divided in parallel jobs might be given the same name, and thus manipulated as a  
104600 group by means of this option.

104601 The **-q** option allows users to select jobs in a specified queue.

104602 The **-r** option allows users to select only those jobs with a specified rerun criteria. For instance, a  
104603 user might select only those jobs that can be rerun for use with the *qrerun* utility.

104604 The **-s** option allows users to select only those jobs that are in a certain state.

104605 The **-u** option allows users to select jobs that have been submitted to execute under a particular  
104606 account.

104607 The selection criteria provided by the options of the *qselect* utility allow users to select jobs based  
104608 on all the appropriate attributes that can be assigned to jobs by the *qsub* utility.

104609 Historically, the *qselect* utility has not been a part of existing practice; it is an improvement that

104610 has been introduced in this volume of POSIX.1-2008.

104611 **FUTURE DIRECTIONS**

104612 The *qselect* utility may be removed in a future version.

104616 **CHANGE HISTORY**

104617 Derived from IEEE Std 1003.2d-1994.

104618 **Issue 7**

104619 The *qselect* utility is marked obsolescent.

104620 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

104621 **NAME**

104622       qsig — signal batch jobs

104623 **SYNOPSIS**104624 OB BE   qsig [-s *signal*] *job\_identifier...*104625 **DESCRIPTION**

104626       To signal a batch job is to send a signal to the session leader of the batch job. A batch job is  
 104627       signaled by sending a request to the batch server that manages the batch job. The *qsig* utility is a  
 104628       user-accessible batch client that requests the signaling of a batch job.

104629       The *qsig* utility shall signal those batch jobs for which a batch *job\_identifier* is presented to the  
 104630       utility. The *qsig* utility shall not signal any batch jobs whose batch *job\_identifiers* are not  
 104631       presented to the utility.

104632       The *qsig* utility shall signal batch jobs in the order in which the corresponding batch  
 104633       *job\_identifiers* are presented to the utility. If the *qsig* utility fails to process a batch *job\_identifier*  
 104634       successfully, the utility shall proceed to process the remaining batch *job\_identifiers*, if any.

104635       The *qsig* utility shall signal batch jobs by sending a *Signal Job Request* to the batch server that  
 104636       manages the batch job.

104637       For each successfully processed batch *job\_identifier*, the *qsig* utility shall have received a  
 104638       completion reply to each *Signal Job Request* sent to a batch server at the time the utility exits.

104639 **OPTIONS**104640       The *qsig* utility shall conform to XBD [Section 12.2](#) (on page 215).

104641       The following option shall be supported by the implementation:

104642       -s *signal*     Define the signal to be sent to the batch job.

104643       The *qsig* utility shall accept a *signal* option-argument that is either a symbolic signal  
 104644       name or an unsigned integer signal number (see the POSIX.1-1990 standard,  
 104645       Section 3.3.1.1). The *qsig* utility shall accept signal names for which the SIG prefix  
 104646       has been omitted.

104647       If the *signal* option-argument is a signal name, the *qsig* utility shall send that name.

104648       If the *signal* option-argument is a number, the *qsig* utility shall send the signal  
 104649       value represented by the number.

104650       If the -s option is not presented to the *qsig* utility, the utility shall send the signal  
 104651       SIGTERM to each signaled batch job.

104652 **OPERANDS**

104653       The *qsig* utility shall accept one or more operands that conform to the syntax for a batch  
 104654       *job\_identifier* (see [Section 3.3.1](#), on page 2419).

104655 **STDIN**

104656       Not used.

104657 **INPUT FILES**

104658       None.

104659 **ENVIRONMENT VARIABLES**104660       The following environment variables shall affect the execution of *qsig*:

|        |                               |                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| 104688 |                               | In addition to the default behavior, the <i>qsig</i> utility shall not be required to write a diagnostic message to standard error when the error reply received from a batch server indicates that the batch <i>job_identifier</i> does not exist on the server. Whether or not the <i>qsig</i> utility waits to output the diagnostic message while attempting to locate the batch job on other servers is implementation-defined. |

| 104696 |                               | None.                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 104697 | <b>RATIONALE</b>              |                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 104698 |                               | The <i>qsig</i> utility allows users to signal batch jobs.                                                                                                                                                                                                                                                                                                                                                                           |
| 104699 |                               | A user may be unable to signal a batch job with the <i>kill</i> utility of the operating system for a number of reasons. First, the process ID of the batch job may be unknown to the user. Second, the processes of the batch job may be on a remote node. However, by virtue of communication between batch nodes, the <i>qsig</i> utility can arrange for the signaling of a process.                                             |
| 104700 |                               |                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 104701 |                               |                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 104702 |                               |                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 104703 |                               | Because a batch job that is not running cannot be signaled, and because the signal may not                                                                                                                                                                                                                                                                                                                                           |

- 104704 terminate the batch job, the *qsig* utility is not a substitute for the *qdel* utility.
- 104705 The options of the *qsig* utility allow the user to specify the signal that is to be sent to the batch  
104706 job.
- 104707 The **-s** option allows users to specify a signal by name or by number, and thus override the  
104708 default signal. The POSIX.1-1990 standard defines signals by both name and number.
- 104709 The *qsig* utility is a new utility, *vis-a-vis* existing practice; it has been defined in this volume of  
104710 POSIX.1-2008 in response to user-perceived shortcomings in existing practice.
- 104711 **FUTURE DIRECTIONS**
- 104712 The *qsig* utility may be removed in a future version.

- 104717 Derived from IEEE Std 1003.2d-1994.
- 104718 **Issue 6**
- 104719 The *LC\_TIME* and *TZ* entries are removed from the ENVIRONMENT VARIABLES section.
- 104720 **Issue 7**
- 104721 The *qsig* utility is marked obsolescent.
- 104722 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

104723 **NAME**

104724       qstat — show status of batch jobs

104725 **SYNOPSIS**104726 OB BE   qstat [-f] *job\_identifier...*104727       qstat -Q [-f] *destination...*104728       qstat -B [-f] *server\_name...*104729 **DESCRIPTION**

104730       The status of a batch job, batch queue, or batch server is obtained by a request to the server. The  
 104731       *qstat* utility is a user-accessible batch client that requests the status of one or more batch jobs,  
 104732       batch queues, or servers, and writes the status information to standard output.

104733       For each successfully processed batch *job\_identifier*, the *qstat* utility shall display information  
 104734       about the corresponding batch job.

104735       For each successfully processed destination, the *qstat* utility shall display information about the  
 104736       corresponding batch queue.

104737       For each successfully processed server name, the *qstat* utility shall display information about the  
 104738       corresponding server.

104739       The *qstat* utility shall acquire batch job status information by sending a *Job Status Request* to a  
 104740       batch server. The *qstat* utility shall acquire batch queue status information by sending a *Queue*  
 104741       *Status Request* to a batch server. The *qstat* utility shall acquire server status information by  
 104742       sending a *Server Status Request* to a batch server.

104743 **OPTIONS**104744       The *qstat* utility shall conform to XBD [Section 12.2](#) (on page 215).

104745       The following options shall be supported by the implementation:

104746       **-f**       Specify that a full display is produced.

104747       The minimum contents of a full display are specified in the STDOUT section.

104748       Additional contents and format of a full display are implementation-defined.

104749       **-Q**       Specify that the operand is a destination.

104750       The *qstat* utility shall display information about each batch queue at each  
 104751       destination identified as an operand.

104752       **-B**       Specify that the operand is a server name.

104753       The *qstat* utility shall display information about each server identified as an  
 104754       operand.

104755 **OPERANDS**

104756       If the **-Q** option is presented to the *qstat* utility, the utility shall accept one or more operands that  
 104757       conform to the syntax for a destination (see [Section 3.3.2](#), on page 2420).

104758       If the **-B** option is presented to the *qstat* utility, the utility shall accept one or more *server\_name*  
 104759       operands.

104760       If neither the **-B** nor the **-Q** option is presented to the *qstat* utility, the utility shall accept one or  
 104761       more operands that conform to the syntax for a batch *job\_identifier* (see [Section 3.3.1](#), on page  
 104762       2419).

104763 **STDIN**

104764 Not used.

104765 **INPUT FILES**

104766 None.

104767 **ENVIRONMENT VARIABLES**104768 The following environment variables shall affect the execution of *qstat*:104769 *HOME* Determine the pathname of the user's home directory.

104770 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 104771 (See XBD [Section 8.2](#) (on page 174) the precedence of internationalization variables  
 104772 used to determine the values of locale categories.)

104773 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 104774 internationalization variables.

104775 *LC\_COLLATE*

104776 Determine the locale for the behavior of ranges, equivalence classes, and multi-  
 104777 character collating elements within regular expressions.

104778 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 104779 characters (for example, single-byte as opposed to multi-byte characters in  
 104780 arguments).

104781 *LC\_MESSAGES*

104782 Determine the locale that should be used to affect the format and contents of  
 104783 diagnostic messages written to standard error.

104784 *LC\_NUMERIC*

104785 Determine the locale for selecting the radix character used when writing floating-  
 104786 point formatted output.

104787 **ASYNCHRONOUS EVENTS**

104788 Default.

104789 **STDOUT**

104790 If an operand presented to the *qstat* utility is a batch *job\_identifier* and the *-f* option is not  
 104791 specified, the *qstat* utility shall display the following items on a single line, in the stated order,  
 104792 with white space between each item, for each successfully processed operand:

- 104793 • The batch *job\_identifier*
- 104794 • The batch job name
- 104795 • The *Job\_Owner* attribute
- 104796 • The CPU time used by the batch job
- 104797 • The batch job state
- 104798 • The batch job location

104799 If an operand presented to the *qstat* utility is a batch *job\_identifier* and the *-f* option is specified,  
 104800 the *qstat* utility shall display the following items for each success fully processed operand:

- 104801 • The batch *job\_identifier*
- 104802 • The batch job name

- 104803 • The *Job\_Owner* attribute
  - 104804 • The execution user ID
  - 104805 • The CPU time used by the batch job
  - 104806 • The batch job state
  - 104807 • The batch job location
  - 104808 • Additional implementation-defined information, if any, about the batch job or batch queue
- 104809 If an operand presented to the *qstat* utility is a destination, the **-Q** option is specified, and the **-f**  
 104810 option is not specified, the *qstat* utility shall display the following items on a single line, in the  
 104811 stated order, with white space between each item, for each successfully processed operand:
- 104812 • The batch queue name
  - 104813 • The maximum number of batch jobs that shall be run in the batch queue concurrently
  - 104814 • The total number of batch jobs in the batch queue
  - 104815 • The status of the batch queue
  - 104816 • For each state, the number of batch jobs in that state in the batch queue and the name of  
 104817 the state
  - 104818 • The type of batch queue (execution or routing)
- 104819 If the operands presented to the *qstat* utility are destinations, the **-Q** option is specified, and the  
 104820 **-f** option is specified, the *qstat* utility shall display the following items for each successfully  
 104821 processed operand:
- 104822 • The batch queue name
  - 104823 • The maximum number of batch jobs that shall be run in the batch queue concurrently
  - 104824 • The total number of batch jobs in the batch queue
  - 104825 • The status of the batch queue
  - 104826 • For each state, the number of batch jobs in that state in the batch queue and the name of  
 104827 the state
  - 104828 • The type of batch queue (execution or routing)
  - 104829 • Additional implementation-defined information, if any, about the batch queue
- 104830 If the operands presented to the *qstat* utility are batch server names, the **-B** option is specified,  
 104831 and the **-f** option is not specified, the *qstat* utility shall display the following items on a single  
 104832 line, in the stated order, with white space between each item, for each successfully processed  
 104833 operand:
- 104834 • The batch server name
  - 104835 • The maximum number of batch jobs that shall be run in the batch queue concurrently
  - 104836 • The total number of batch jobs managed by the batch server
  - 104837 • The status of the batch server
  - 104838 • For each state, the number of batch jobs in that state and the name of the state
- 104839 If the operands presented to the *qstat* utility are server names, the **-B** option is specified, and the  
 104840 **-f** option is specified, the *qstat* utility shall display the following items for each successfully

104841 processed operand:

- 104842 • The server name
- 104843 • The maximum number of batch jobs that shall be run in the batch queue concurrently
- 104844 • The total number of batch jobs managed by the server
- 104845 • The status of the server
- 104846 • For each state, the number of batch jobs in that state and the name of the state
- 104847 • Additional implementation-defined information, if any, about the server

#### 104848 **STDERR**

104849 The standard error shall be used only for diagnostic messages.

#### 104850 **OUTPUT FILES**

104851 None.

#### 104852 **EXTENDED DESCRIPTION**

104853 None.

#### 104854 **EXIT STATUS**

104855 The following exit values shall be returned:

- 104856 0 Successful completion.
- 104857 >0 An error occurred.

#### 104858 **CONSEQUENCES OF ERRORS**

104859 In addition to the default behavior, the *qstat* utility shall not be required to write a diagnostic  
 104860 message to standard error when the error reply received from a batch server indicates that the  
 104861 batch *job\_identifier* does not exist on the server. Whether or not the *qstat* utility waits to output  
 104862 the diagnostic message while attempting to locate the batch job on other servers is  
 104863 implementation-defined.

#### 104864 **APPLICATION USAGE**

104865 None.

#### 104866 **EXAMPLES**

104867 None.

#### 104868 **RATIONALE**

104869 The *qstat* utility allows users to display the status of jobs and list the batch jobs in queues.

104870 The operands of the *qstat* utility may be either job identifiers, queues (specified as destination  
 104871 identifiers), or batch server names. The **-Q** and **-B** options, or absence thereof, indicate the  
 104872 nature of the operands.

104873 The other options of the *qstat* utility allow the user to control the amount of information  
 104874 displayed and the format in which it is displayed. Should a user wish to display the status of a  
 104875 set of jobs that match a selection criteria, the *qselect* utility may be used to acquire such a list.

104876 The **-f** option allows users to request a “full” display in an implementation-defined format.

104877 Historically, the *qstat* utility has been a part of the NQS and its derivatives, the existing practice  
 104878 on which it is based.

**104879 FUTURE DIRECTIONS**

104880 The *qstat* utility may be removed in a future version.

**104881 SEE ALSO**

104882 [Chapter 3](#) (on page 2397), [qselect](#)

104883 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)

**104884 CHANGE HISTORY**

104885 Derived from IEEE Std 1003.2d-1994.

**104886 Issue 6**

104887 IEEE PASC Interpretation 1003.2 #191 is applied, removing the following ENVIRONMENT  
104888 VARIABLES listed as affecting *qstat*: *COLUMNS*, *LINES*, *LOGNAME*, *TERM*, and *TZ*.

104889 The *LC\_TIME* entry is also removed from the ENVIRONMENT VARIABLES section.

**104890 Issue 7**

104891 The *qstat* utility is marked obsolescent.

104892 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

104893 **NAME**

104894       qsub — submit a script

104895 **SYNOPSIS**

```

104896 OB BE qsub [-a date_time] [-A account_string] [-c interval]
104897 [-C directive_prefix] [-e path_name] [-h] [-j join_list]
104898 [-k keep_list] [-m mail_options] [-M mail_list] [-N name]
104899 [-o path_name] [-p priority] [-q destination] [-r y|n]
104900 [-S path_name_list] [-u user_list] [-v variable_list] [-V]
104901 [-z] [script]

```

104902 **DESCRIPTION**

104903       To submit a script is to create a batch job that executes the script. A script is submitted by a  
 104904       request to a batch server. The *qsub* utility is a user-accessible batch client that submits a script.

104905       Upon successful completion, the *qsub* utility shall have created a batch job that will execute the  
 104906       submitted script.

104907       The *qsub* utility shall submit a script by sending a *Queue Job Request* to a batch server.

104908       The *qsub* utility shall place the value of the following environment variables in the *Variable\_List*  
 104909       attribute of the batch job: *HOME*, *LANG*, *LOGNAME*, *PATH*, *MAIL*, *SHELL*, and *TZ*. The name  
 104910       of the environment variable shall be the current name prefixed with the string *PBS\_O\_*.

104911       **Note:**     If the current value of the *HOME* variable in the environment space of the *qsub* utility is  
 104912       */aa/bb/cc*, then *qsub* shall place *PBS\_O\_HOME=/aa/bb/cc* in the *Variable\_List* attribute of the  
 104913       batch job.

104914       In addition to the variables described above, the *qsub* utility shall add the following variables  
 104915       with the indicated values to the variable list:

104916       *PBS\_O\_WORKDIR*     The absolute path of the current working directory of the *qsub* utility  
 104917       process.

104918       *PBS\_O\_HOST*        The name of the host on which the *qsub* utility is running.

104919 **OPTIONS**

104920       The *qsub* utility shall conform to XBD [Section 12.2](#) (on page 215).

104921       The following options shall be supported by the implementation:

104922       **-a date\_time**    Define the time at which a batch job becomes eligible for execution.

104923       The *qsub* utility shall accept an option-argument that conforms to the syntax of the  
 104924       *time* operand of the *touch* utility.

Table 4-19 Environment Variable Values (Utilities)

| Variable Name        | Value at qsub Time        |
|----------------------|---------------------------|
| <i>PBS_O_HOME</i>    | <i>HOME</i>               |
| <i>PBS_O_HOST</i>    | Client host name          |
| <i>PBS_O_LANG</i>    | <i>LANG</i>               |
| <i>PBS_O_LOGNAME</i> | <i>LOGNAME</i>            |
| <i>PBS_O_PATH</i>    | <i>PATH</i>               |
| <i>PBS_O_MAIL</i>    | <i>MAIL</i>               |
| <i>PBS_O_SHELL</i>   | <i>SHELL</i>              |
| <i>PBS_O_TZ</i>      | <i>TZ</i>                 |
| <i>PBS_O_WORKDIR</i> | Current working directory |

**Note:** The server that initiates execution of the batch job will add other variables to the batch job's environment; see [Section 3.2.2.1](#) (on page 2403).

The *qsub* utility shall set the *Execution\_Time* attribute of the batch job to the number of seconds since the Epoch that is equivalent to the local time expressed by the value of the *date\_time* option-argument. The Epoch is defined in XBD [Section 3.150](#) (on page 57).

If the *-a* option is not presented to the *qsub* utility, the utility shall set the *Execution\_Time* attribute of the batch job to a time (number of seconds since the Epoch) that is earlier than the time at which the utility exits.

#### *-A account\_string*

Define the account to which the resource consumption of the batch job should be charged.

The syntax of the *account\_string* option-argument is unspecified.

The *qsub* utility shall set the *Account\_Name* attribute of the batch job to the value of the *account\_string* option-argument.

If the *-A* option is not presented to the *qsub* utility, the utility shall omit the *Account\_Name* attribute from the attributes of the batch job.

#### *-c interval*

Define whether the batch job should be checkpointed, and if so, how often.

The *qsub* utility shall accept a value for the interval option-argument that is one of the following:

*n* No checkpointing shall be performed on the batch job (NO\_CHECKPOINT).

*s* Checkpointing shall be performed only when the batch server is shut down (CHECKPOINT\_AT\_SHUTDOWN).

*c* Automatic periodic checkpointing shall be performed at the *Minimum\_Cpu\_Interval* attribute of the batch queue, in units of CPU minutes (CHECKPOINT\_AT\_MIN\_CPU\_INTERVAL).

*c=minutes* Automatic periodic checkpointing shall be performed every *minutes* of CPU time, or every *Minimum\_Cpu\_Interval* minutes, whichever is greater. The *minutes* argument shall conform to the syntax for unsigned integers and shall be greater than zero.

The *qsub* utility shall set the *Checkpoint* attribute of the batch job to the value of the

104968 *interval* option-argument.

104969 If the `-c` option is not presented to the *qsub* utility, the utility shall set the *Checkpoint*  
 104970 attribute of the batch job to the single character `'u'`  
 104971 (`CHECKPOINT_UNSPECIFIED`).

104972 **-C** *directive\_prefix*  
 104973 Define the prefix that declares a directive to the *qsub* utility within the script.

104974 The *directive\_prefix* is not a batch job attribute; it affects the behavior of the *qsub*  
 104975 utility.

104976 If the `-C` option is presented to the *qsub* utility, and the value of the *directive\_prefix*  
 104977 option-argument is the null string, the utility shall not scan the script file for  
 104978 directives. If the `-C` option is not presented to the *qsub* utility, then the value of the  
 104979 *PBS\_DPREFIX* environment variable is used. If the environment variable is not  
 104980 defined, then `#PBS` encoded in the portable character set is the default.

104981 **-e** *path\_name*  
 104982 Define the path to be used for the standard error stream of the batch job.

104983 The *qsub* utility shall accept a *path\_name* option-argument which can be preceded  
 104984 by a host name element of the form *hostname*:

104985 If the *path\_name* option-argument constitutes an absolute pathname, the *qsub* utility  
 104986 shall set the *Error\_Path* attribute of the batch job to the value of the *path\_name*  
 104987 option-argument.

104988 If the *path\_name* option-argument constitutes a relative pathname and no host  
 104989 name element is specified, the *qsub* utility shall set the *Error\_Path* attribute of the  
 104990 batch job to the value of the absolute pathname derived by expanding the  
 104991 *path\_name* option-argument relative to the current directory of the process  
 104992 executing *qsub*.

104993 If the *path\_name* option-argument constitutes a relative pathname and a host name  
 104994 element is specified, the *qsub* utility shall set the *Error\_Path* attribute of the batch  
 104995 job to the value of the *path\_name* option-argument without expansion. The host  
 104996 name element shall be included.

104997 If the *path\_name* option-argument does not include a host name element, the *qsub*  
 104998 utility shall prefix the pathname with *hostname*:, where *hostname* is the name of the  
 104999 host upon which the *qsub* utility is being executed.

105000 If the `-e` option is not presented to the *qsub* utility, the utility shall set the  
 105001 *Error\_Path* attribute of the batch job to the host name and path of the current  
 105002 directory of the submitting process and the default filename.

105003 The default filename for standard error has the following format:  
 105004 *job\_name.esquence\_number*

105005 **-h** Specify that a USER hold is applied to the batch job.

105006 The *qsub* utility shall set the value of the *Hold\_Types* attribute of the batch job to the  
 105007 value USER.

105008 If the `-h` option is not presented to the *qsub* utility, the utility shall set the  
 105009 *Hold\_Types* attribute of the batch job to the value NO\_HOLD.

105010        **-j** *join\_list*    Define which streams of the batch job are to be merged. The *qsub* **-j** option shall  
 105011                            accept a value for the *join\_list* option-argument that is a string of alphanumeric  
 105012                            characters in the portable character set (see XBD [Section 6.1](#), on page 125).

105013                            The *qsub* utility shall accept a *join\_list* option-argument that consists of one or more  
 105014                            of the characters 'e' and 'o', or the single character 'n'.

105015                            All of the other batch job output streams specified will be merged into the output  
 105016                            stream represented by the character listed first in the *join\_list* option-argument.

105017                            For each unique character in the *join\_list* option-argument, the *qsub* utility shall  
 105018                            add a value to the *Join\_Path* attribute of the batch job as follows, each representing  
 105019                            a different batch job stream to join:

105020                            e    The standard error of the batch job (JOIN\_STD\_ERROR).

105021                            o    The standard output of the batch job (JOIN\_STD\_OUTPUT).

105022                            An existing *Join\_Path* attribute can be cleared by the following join type:

105023                            n    NO\_JOIN

105024                            If 'n' is specified, then no files are joined. The *qsub* utility shall consider it an error  
 105025                            if any join type other than 'n' is combined with join type 'n'.

105026                            Strictly conforming applications shall not repeat any of the characters 'e', 'o', or  
 105027                            'n' within the *join\_list* option-argument. The *qsub* utility shall permit the  
 105028                            repetition of characters, but shall not assign additional meaning to the repeated  
 105029                            characters.

105030                            An implementation may define other join types. The conformance document for an  
 105031                            implementation shall describe any additional batch job streams, how they are  
 105032                            specified, their internal behavior, and how they affect the behavior of the utility.

105033                            If the **-j** option is not presented to the *qsub* utility, the utility shall set the value of  
 105034                            the *Join\_Path* attribute of the batch job to NO\_JOIN.

105035        **-k** *keep\_list*    Define which output of the batch job to retain on the execution host.

105036                            The *qsub* **-k** option shall accept a value for the *keep\_list* option-argument that is a  
 105037                            string of alphanumeric characters in the portable character set (see XBD [Section](#)  
 105038                            [6.1](#), on page 125).

105039                            The *qsub* utility shall accept a *keep\_list* option-argument that consists of one or  
 105040                            more of the characters 'e' and 'o', or the single character 'n'.

105041                            For each unique character in the *keep\_list* option-argument, the *qsub* utility shall  
 105042                            add a value to the *Keep\_Files* attribute of the batch job as follows, each representing  
 105043                            a different batch job stream to keep:

105044                            e    The standard error of the batch job (KEEP\_STD\_ERROR).

105045                            o    The standard output of the batch job (KEEP\_STD\_OUTPUT).

105046                            If both 'e' and 'o' are specified, then both files are retained. An existing  
 105047                            *Keep\_Files* attribute can be cleared by the following keep type:

105048                            n    NO\_KEEP

105049                            If 'n' is specified, then no files are retained. The *qsub* utility shall consider it an  
 105050                            error if any keep type other than 'n' is combined with keep type 'n'.

105051 Strictly conforming applications shall not repeat any of the characters 'e', 'o', or  
 105052 'n' within the *keep\_list* option-argument. The *qsub* utility shall permit the  
 105053 repetition of characters, but shall not assign additional meaning to the repeated  
 105054 characters.

105055 An implementation may define other keep types. The conformance document for  
 105056 an implementation shall describe any additional keep types, how they are  
 105057 specified, their internal behavior, and how they affect the behavior of the utility. If  
 105058 the **-k** option is not presented to the *qsub* utility, the utility shall set the *Keep\_Files*  
 105059 attribute of the batch job to the value NO\_KEEP.

105060 **-m** *mail\_options*

105061 Define the points in the execution of the batch job at which the batch server that  
 105062 manages the batch job shall send mail about a change in the state of the batch job.

105063 The *qsub* **-m** option shall accept a value for the *mail\_options* option-argument that  
 105064 is a string of alphanumeric characters in the portable character set (see XBD [Section](#)  
 105065 [6.1](#), on page 125).

105066 The *qsub* utility shall accept a value for the *mail\_options* option-argument that is a  
 105067 string of one or more of the characters 'e', 'b', and 'a', or the single character  
 105068 'n'.

105069 For each unique character in the *mail\_options* option-argument, the *qsub* utility shall  
 105070 add a value to the *Mail\_Users* attribute of the batch job as follows, each  
 105071 representing a different time during the life of a batch job at which to send mail:

105072 e MAIL\_AT\_EXIT

105073 b MAIL\_AT\_BEGINNING

105074 a MAIL\_AT\_ABORT

105075 If any of these characters are duplicated in the *mail\_options* option-argument, the  
 105076 duplicates shall be ignored.

105077 An existing *Mail\_Points* attribute can be cleared by the following mail type:

105078 n NO\_MAIL

105079 If 'n' is specified, then mail is not sent. The *qsub* utility shall consider it an error if  
 105080 any mail type other than 'n' is combined with mail type 'n'.

105081 Strictly conforming applications shall not repeat any of the characters 'e', 'b',  
 105082 'a', or 'n' within the *mail\_options* option-argument.

105083 The *qsub* utility shall permit the repetition of characters, but shall not assign  
 105084 additional meaning to the repeated characters. An implementation may define  
 105085 other mail types. The conformance document for an implementation shall describe  
 105086 any additional mail types, how they are specified, their internal behavior, and how  
 105087 they affect the behavior of the utility.

105088 If the **-m** option is not presented to the *qsub* utility, the utility shall set the  
 105089 *Mail\_Points* attribute to the value MAIL\_AT\_ABORT.

105090 **-M** *mail\_list* Define the list of users to which a batch server that executes the batch job shall  
 105091 send mail, if the server sends mail about the batch job.

105092 The syntax of the *mail\_list* option-argument is unspecified.

105093 If the implementation of the *qsub* utility uses a name service to locate users, the

|        |                     |                                                                                                                |
|--------|---------------------|----------------------------------------------------------------------------------------------------------------|
| 105094 |                     | utility should accept the syntax used by the name service.                                                     |
| 105095 |                     | If the implementation of the <i>qsub</i> utility does not use a name service to locate users,                  |
| 105096 |                     | the implementation should accept the following syntax for user names:                                          |
| 105097 |                     | <i>mail_address</i> [ <i>,</i> <i>mail_address</i> <i>,</i> . . .]                                             |
| 105098 |                     | The interpretation of <i>mail_address</i> is implementation-defined.                                           |
| 105099 |                     | The <i>qsub</i> utility shall set the <i>Mail_Users</i> attribute of the batch job to the value of the         |
| 105100 |                     | <i>mail_list</i> option-argument.                                                                              |
| 105101 |                     | If the <b>-M</b> option is not presented to the <i>qsub</i> utility, the utility shall place only the          |
| 105102 |                     | user name and host name for the current process in the <i>Mail_Users</i> attribute of the                      |
| 105103 |                     | batch job.                                                                                                     |
| 105104 | <b>-N name</b>      | Define the name of the batch job.                                                                              |
| 105105 |                     | The <i>qsub</i> <b>-N</b> option shall accept a value for the <i>name</i> option-argument that is a            |
| 105106 |                     | string of up to 15 alphanumeric characters in the portable character set (see XBD                              |
| 105107 |                     | <a href="#">Section 6.1</a> , on page 125) where the first character is alphabetic.                            |
| 105108 |                     | The <i>qsub</i> utility shall set the value of the <i>Job_Name</i> attribute of the batch job to the           |
| 105109 |                     | value of the <i>name</i> option-argument.                                                                      |
| 105110 |                     | If the <b>-N</b> option is not presented to the <i>qsub</i> utility, the utility shall set the <i>Job_Name</i> |
| 105111 |                     | attribute of the batch job to the name of the <i>script</i> argument from which the                            |
| 105112 |                     | directory specification if any, has been removed.                                                              |
| 105113 |                     | If the <b>-N</b> option is not presented to the <i>qsub</i> utility, and the script is read from               |
| 105114 |                     | standard input, the utility shall set the <i>Job_Name</i> attribute of the batch job to the                    |
| 105115 |                     | value STDIN.                                                                                                   |
| 105116 | <b>-o path_name</b> |                                                                                                                |
| 105117 |                     | Define the path for the standard output of the batch job.                                                      |
| 105118 |                     | The <i>qsub</i> utility shall accept a <i>path_name</i> option-argument that conforms to the                   |
| 105119 |                     | syntax of the <i>path_name</i> element defined in the System Interfaces volume of                              |
| 105120 |                     | POSIX.1-2008, which can be preceded by a host name element of the form                                         |
| 105121 |                     | <i>hostname</i> ..                                                                                             |
| 105122 |                     | If the <i>path_name</i> option-argument constitutes an absolute pathname, the <i>qsub</i> utility              |
| 105123 |                     | shall set the <i>Output_Path</i> attribute of the batch job to the value of the <i>path_name</i>               |
| 105124 |                     | option-argument without expansion.                                                                             |
| 105125 |                     | If the <i>path_name</i> option-argument constitutes a relative pathname and no host                            |
| 105126 |                     | name element is specified, the <i>qsub</i> utility shall set the <i>Output_Path</i> attribute of the           |
| 105127 |                     | batch job to the pathname derived by expanding the value of the <i>path_name</i> option-                       |
| 105128 |                     | argument relative to the current directory of the process executing the <i>qsub</i> .                          |
| 105129 |                     | If the <i>path_name</i> option-argument constitutes a relative pathname and a host name                        |
| 105130 |                     | element is specified, the <i>qsub</i> utility shall set the <i>Output_Path</i> attribute of the batch          |
| 105131 |                     | job to the value of the <i>path_name</i> option-argument without expansion.                                    |
| 105132 |                     | If the <i>path_name</i> option-argument does not specify a host name element, the <i>qsub</i>                  |
| 105133 |                     | utility shall prefix the pathname with <i>hostname</i> ., where <i>hostname</i> is the name of the             |
| 105134 |                     | host upon which the <i>qsub</i> utility is executing.                                                          |
| 105135 |                     | If the <b>-o</b> option is not presented to the <i>qsub</i> utility, the utility shall set the                 |
| 105136 |                     | <i>Output_Path</i> attribute of the batch job to the host name and path of the current                         |

|        |                          |                                                                                                                                                                                                                                      |
|--------|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 105137 |                          | directory of the submitting process and the default filename.                                                                                                                                                                        |
| 105138 |                          | The default filename for standard output has the following format:                                                                                                                                                                   |
| 105139 |                          | <i>job_name.osequence_number</i>                                                                                                                                                                                                     |
| 105140 | <b>-p priority</b>       | Define the priority the batch job should have relative to other batch jobs owned by the batch server.                                                                                                                                |
| 105141 |                          |                                                                                                                                                                                                                                      |
| 105142 |                          | The <i>qsub</i> utility shall set the <i>Priority</i> attribute of the batch job to the value of the <i>priority</i> option-argument.                                                                                                |
| 105143 |                          |                                                                                                                                                                                                                                      |
| 105144 |                          | If the <b>-p</b> option is not presented to the <i>qsub</i> utility, the value of the <i>Priority</i> attribute is implementation-defined.                                                                                           |
| 105145 |                          |                                                                                                                                                                                                                                      |
| 105146 |                          | The <i>qsub</i> utility shall accept a value for the <i>priority</i> option-argument that conforms to the syntax for signed decimal integers, and which is not less than -1 024 and not greater than 1 023.                          |
| 105147 |                          |                                                                                                                                                                                                                                      |
| 105148 |                          |                                                                                                                                                                                                                                      |
| 105149 | <b>-q destination</b>    | Define the destination of the batch job.                                                                                                                                                                                             |
| 105150 |                          |                                                                                                                                                                                                                                      |
| 105151 |                          | The destination is not a batch job attribute; it determines the batch server, and possibly the batch queue, to which the <i>qsub</i> utility batch queues the batch job.                                                             |
| 105152 |                          |                                                                                                                                                                                                                                      |
| 105153 |                          | The <i>qsub</i> utility shall submit the script to the batch server named by the <i>destination</i> option-argument or the server that owns the batch queue named in the <i>destination</i> option-argument.                         |
| 105154 |                          |                                                                                                                                                                                                                                      |
| 105155 |                          |                                                                                                                                                                                                                                      |
| 105156 |                          | The <i>qsub</i> utility shall accept an option-argument for the <b>-q</b> option that conforms to the syntax for a destination (see <a href="#">Section 3.3.2</a> , on page 2420).                                                   |
| 105157 |                          |                                                                                                                                                                                                                                      |
| 105158 |                          | If the <b>-q</b> option is not presented to the <i>qsub</i> utility, the <i>qsub</i> utility shall submit the batch job to the default destination. The mechanism for determining the default destination is implementation-defined. |
| 105159 |                          |                                                                                                                                                                                                                                      |
| 105160 |                          |                                                                                                                                                                                                                                      |
| 105161 | <b>-r y   n</b>          | Define whether the batch job is rerunnable.                                                                                                                                                                                          |
| 105162 |                          | If the value of the option-argument is <i>y</i> , the <i>qsub</i> utility shall set the <i>Rerunable</i> attribute of the batch job to TRUE.                                                                                         |
| 105163 |                          |                                                                                                                                                                                                                                      |
| 105164 |                          | If the value of the option-argument is <i>n</i> , the <i>qsub</i> utility shall set the <i>Rerunable</i> attribute of the batch job to FALSE.                                                                                        |
| 105165 |                          |                                                                                                                                                                                                                                      |
| 105166 |                          | If the <b>-r</b> option is not presented to the <i>qsub</i> utility, the utility shall set the <i>Rerunable</i> attribute of the batch job to TRUE.                                                                                  |
| 105167 |                          |                                                                                                                                                                                                                                      |
| 105168 | <b>-S path_name_list</b> | Define the pathname to the shell under which the batch job is to execute.                                                                                                                                                            |
| 105169 |                          |                                                                                                                                                                                                                                      |
| 105170 |                          | The <i>qsub</i> utility shall accept a <i>path_name_list</i> option-argument that conforms to the following syntax:                                                                                                                  |
| 105171 |                          |                                                                                                                                                                                                                                      |
| 105172 |                          | <i>pathname</i> [ <i>@host</i> ][ <i>,</i> <i>,</i> <i>pathname</i> [ <i>@host</i> ] <i>,</i> <i>,</i> . . .]                                                                                                                        |
| 105173 |                          | The <i>qsub</i> utility shall allow only one pathname for a given host name. The <i>qsub</i> utility shall allow only one pathname that is missing a corresponding host name.                                                        |
| 105174 |                          |                                                                                                                                                                                                                                      |
| 105175 |                          | The <i>qsub</i> utility shall add a value to the <i>Shell_Path_List</i> attribute of the batch job for each entry in the <i>path_name_list</i> option-argument.                                                                      |
| 105176 |                          |                                                                                                                                                                                                                                      |
| 105177 |                          | If the <b>-S</b> option is not presented to the <i>qsub</i> utility, the utility shall set the                                                                                                                                       |

|        |                                |                                                                                                                          |
|--------|--------------------------------|--------------------------------------------------------------------------------------------------------------------------|
| 105178 |                                | <i>Shell_Path_List</i> attribute of the batch job to the null string.                                                    |
| 105179 |                                | The conformance document for an implementation shall describe the mechanism                                              |
| 105180 |                                | used to set the default shell and determine the current value of the default shell.                                      |
| 105181 |                                | An implementation shall provide a means for the installation to set the default                                          |
| 105182 |                                | shell to the login shell of the user under which the batch job is to execute. See                                        |
| 105183 |                                | <a href="#">Section 3.3.3</a> (on page 2421) for a means of removing <i>keyword=value</i> (and                           |
| 105184 |                                | <i>value@keyword</i> ) pairs and other general rules for list-oriented batch job attributes.                             |
| 105185 | <b>-u <i>user_list</i></b>     | Define the user name under which the batch job is to execute.                                                            |
| 105186 |                                | The <i>qsub</i> utility shall accept a <i>user_list</i> option-argument that conforms to the                             |
| 105187 |                                | following syntax:                                                                                                        |
| 105188 |                                | <i>username</i> [ <i>@host</i> ][ <i>,</i> <i>username</i> [ <i>@host</i> ] <i>,</i> <i>...</i> ]                        |
| 105189 |                                | The <i>qsub</i> utility shall accept only one user name that is missing a corresponding                                  |
| 105190 |                                | host name. The <i>qsub</i> utility shall accept only one user name per named host.                                       |
| 105191 |                                | The <i>qsub</i> utility shall add a value to the <i>User_List</i> attribute of the batch job for each                    |
| 105192 |                                | entry in the <i>user_list</i> option-argument.                                                                           |
| 105193 |                                | If the <b>-u</b> option is not presented to the <i>qsub</i> utility, the utility shall set the <i>User_List</i>          |
| 105194 |                                | attribute of the batch job to the user name from which the utility is executing. See                                     |
| 105195 |                                | <a href="#">Section 3.3.3</a> (on page 2421) for a means of removing <i>keyword=value</i> (and                           |
| 105196 |                                | <i>value@keyword</i> ) pairs and other general rules for list-oriented batch job attributes.                             |
| 105197 | <b>-v <i>variable_list</i></b> |                                                                                                                          |
| 105198 |                                | Add to the list of variables that are exported to the session leader of the batch job.                                   |
| 105199 |                                | A <i>variable_list</i> is a set of strings of either the form <i>&lt;variable&gt;</i> or <i>&lt;variable=value&gt;</i> , |
| 105200 |                                | delimited by <i>&lt;comma&gt;</i> characters.                                                                            |
| 105201 |                                | If the <b>-v</b> option is presented to the <i>qsub</i> utility, the utility shall also add, to the                      |
| 105202 |                                | environment <i>Variable_List</i> attribute of the batch job, every variable named in the                                 |
| 105203 |                                | environment <i>variable_list</i> option-argument and, optionally, values of specified                                    |
| 105204 |                                | variables.                                                                                                               |
| 105205 |                                | If a value is not provided on the command line, the <i>qsub</i> utility shall set the value                              |
| 105206 |                                | of each variable in the environment <i>Variable_List</i> attribute of the batch job to the                               |
| 105207 |                                | value of the corresponding environment variable for the process in which the                                             |
| 105208 |                                | utility is executing; see <a href="#">Table 4-19</a> (on page 3142).                                                     |
| 105209 |                                | A conforming application shall not repeat a variable in the environment                                                  |
| 105210 |                                | <i>variable_list</i> option-argument.                                                                                    |
| 105211 |                                | The <i>qsub</i> utility shall not repeat a variable in the environment <i>Variable_List</i> attribute                    |
| 105212 |                                | of the batch job. See <a href="#">Section 3.3.3</a> (on page 2421) for a means of removing                               |
| 105213 |                                | <i>keyword=value</i> (and <i>value@keyword</i> ) pairs and other general rules for list-oriented                         |
| 105214 |                                | batch job attributes.                                                                                                    |
| 105215 | <b>-V</b>                      |                                                                                                                          |
| 105216 |                                | Specify that all of the environment variables of the process are exported to the                                         |
|        |                                | context of the batch job.                                                                                                |
| 105217 |                                | The <i>qsub</i> utility shall place every environment variable in the process in which the                               |
| 105218 |                                | utility is executing in the list and shall set the value of each variable in the attribute                               |
| 105219 |                                | to the value of that variable in the process.                                                                            |

105220            **-z**            Specify that the utility does not write the batch *job\_identifier* of the created batch job  
105221            to standard output.

105222            If the **-z** option is presented to the *qsub* utility, the utility shall not write the batch  
105223            *job\_identifier* of the created batch job to standard output.

105224            If the **-z** option is not presented to the *qsub* utility, the utility shall write the  
105225            identifier of the created batch job to standard output.

#### 105226 OPERANDS

105227            The *qsub* utility shall accept a *script* operand that indicates the path to the script of the batch job.

105228            If the *script* operand is not presented to the *qsub* utility, or if the operand is the single-character  
105229            string **'-'**, the utility shall read the script from standard input.

105230            If the script represents a partial path, the *qsub* utility shall expand the path relative to the current  
105231            directory of the process executing the utility.

#### 105232 STDIN

105233            The *qsub* utility reads the script of the batch job from standard input if the script operand is  
105234            omitted or is the single character **'-'**.

#### 105235 INPUT FILES

105236            In addition to binding the file indicated by the *script* operand to the batch job, the *qsub* utility  
105237            reads the script file and acts on directives in the script.

#### 105238 ENVIRONMENT VARIABLES

105239            The following environment variables shall affect the execution of *qsub*:

105240            **LANG**            Provide a default value for the internationalization variables that are unset or null.  
105241            (See XBD [Section 8.2](#) (on page 174) the precedence of internationalization variables  
105242            used to determine the values of locale categories.)

105243            **LC\_ALL**            If set to a non-empty string value, override the values of all the other  
105244            internationalization variables.

105245            **LC\_CTYPE**          Determine the locale for the interpretation of sequences of bytes of text data as  
105246            characters (for example, single-byte as opposed to multi-byte characters in  
105247            arguments).

105248            **LC\_MESSAGES**

105249            Determine the locale that should be used to affect the format and contents of  
105250            diagnostic messages written to standard error.

105251            **LOGNAME**          Determine the login name of the user.

105252            **PBS\_DPREFIX**

105253            Determine the default prefix for directives within the script.

105254            **SHELL**            Determine the pathname of the preferred command language interpreter of the  
105255            user.

105256            **TZ**                Determine the timezone used to interpret the *date-time* option-argument. If *TZ* is  
105257            unset or null, an unspecified default timezone shall be used.

#### 105258 ASYNCHRONOUS EVENTS

105259            Once created, a batch job exists until it exits, aborts, or is deleted.

105260            After a batch job is created by the *qsub* utility, batch servers might route, execute, modify, or  
105261            delete the batch job.

105262 **STDOUT**

105263 The *qsub* utility writes the batch *job\_identifier* assigned to the batch job to standard output, unless  
 105264 the **-z** option is specified.

105265 **STDERR**

105266 The standard error shall be used only for diagnostic messages.

105267 **OUTPUT FILES**

105268 None.

105269 **EXTENDED DESCRIPTION**105270 **Script Preservation**

105271 The *qsub* utility shall make the script available to the server executing the batch job in such a  
 105272 way that the server executes the script as it exists at the time of submission.

105273 The *qsub* utility can send a copy of the script to the server with the *Queue Job Request* or store a  
 105274 temporary copy of the script in a location specified to the server.

105275 **Option Specification**

105276 A script can contain directives to the *qsub* utility.

105277 The *qsub* utility shall scan the lines of the script for directives, skipping blank lines, until the first  
 105278 line that begins with a string other than the directive string; if directives occur on subsequent  
 105279 lines, the utility shall ignore those directives.

105280 Lines are separated by a <newline>. If the first line of the script begins with "#!" or a <colon>  
 105281 (' : '), then it is skipped. The *qsub* utility shall process a line in the script as a directive if and  
 105282 only if the string of characters from the first non-white-space character on the line until the first  
 105283 <space> or <tab> on the line match the directive prefix. If a line in the script contains a directive  
 105284 and the final characters of the line are <backslash> and <newline>, then the next line shall be  
 105285 interpreted as a continuation of that directive.

105286 The *qsub* utility shall process the options and option-arguments contained on the directive prefix  
 105287 line using the same syntax as if the options were input on the *qsub* utility.

105288 The *qsub* utility shall continue to process a directive prefix line until after a <newline> is  
 105289 encountered. An implementation may ignore lines which, according to the syntax of the shell  
 105290 that will interpret the script, are comments. An implementation shall describe in the  
 105291 conformance document the format of any shell comments that it will recognize.

105292 If an option is present in both a directive and the arguments to the *qsub* utility, the utility shall  
 105293 ignore the option and the corresponding option-argument, if any, in the directive.

105294 If an option that is present in the directive is not present in the arguments to the *qsub* utility, the  
 105295 utility shall process the option and the option-argument, if any.

105296 In order of preference, the *qsub* utility shall select the directive prefix from one of the following  
 105297 sources:

- 105298 • If the **-C** option is presented to the utility, the value of the *directive\_prefix* option-argument
- 105299 • If the environment variable *PBS\_DPPREFIX* is defined, the value of that variable
- 105300 • The four-character string "#PBS" encoded in the portable character set

105301 If the **-C** option is present in the script file it shall be ignored.

**105302 EXIT STATUS**

105303 The following exit values shall be returned:

105304 0 Successful completion.

105305 >0 An error occurred.

**105306 CONSEQUENCES OF ERRORS**

105307 Default.

**105308 APPLICATION USAGE**

105309 None.

**105310 EXAMPLES**

105311 None.

**105312 RATIONALE**

105313 The *qsub* utility allows users to create a batch job that will process the script specified as the  
105314 operand of the utility.

105315 The options of the *qsub* utility allow users to control many aspects of the queuing and execution  
105316 of a batch job.

105317 The **-a** option allows users to designate the time after which the batch job will become eligible to  
105318 run. By specifying an execution time, users can take advantage of resources at off-peak hours,  
105319 synchronize jobs with chronologically predictable events, and perhaps take advantage of off-  
105320 peak pricing of computing time. For these reasons and others, a timing option is existing  
105321 practice on the part of almost every batch system, including NQS.

105322 The **-A** option allows users to specify the account that will be charged for the batch job. Support  
105323 for account is not mandatory for conforming batch servers.

105324 The **-C** option allows users to prescribe the prefix for directives within the script file. The default  
105325 prefix "**#PBS**" may be inappropriate if the script will be interpreted with an alternate shell, as  
105326 specified by the **-S** option.

105327 The **-c** option allows users to establish the checkpointing interval for their jobs. A checkpointing  
105328 system, which is not defined by this volume of POSIX.1-2008, allows recovery of a batch job at  
105329 the most recent checkpoint in the event of a crash. Checkpointing is typically used for jobs that  
105330 consume expensive computing time or must meet a critical schedule. Users should be allowed to  
105331 make the tradeoff between the overhead of checkpointing and the risk to the timely completion  
105332 of the batch job; therefore, this volume of POSIX.1-2008 provides the checkpointing interval  
105333 option. Support for checkpointing is optional for batch servers.

105334 The **-e** option allows users to redirect the standard error streams of their jobs to a non-default  
105335 path. For example, if the submitted script generally produces a great deal of useless error  
105336 output, a user might redirect the standard error output to the null device. Or, if the file system  
105337 holding the default location (the home directory of the user) has too little free space, the user  
105338 might redirect the standard error stream to a file in another file system.

105339 The **-h** option allows users to create a batch job that is held until explicitly released. The ability  
105340 to create a held job is useful when some external event must complete before the batch job can  
105341 execute. For example, the user might submit a held job and release it when the system load has  
105342 dropped.

105343 The **-j** option allows users to merge the standard error of a batch job into its standard output  
105344 stream, which has the advantage of showing the sequential relationship between output and  
105345 error messages.

The **-m** option allows users to designate those points in the execution of a batch job at which mail will be sent to the submitting user, or to the account(s) indicated by the **-M** option. By requesting mail notification at points of interest in the life of a job, the submitting user, or other designated users, can track the progress of a batch job.

The **-N** option allows users to associate a name with the batch job. The job name in no way affects the processing of the batch job, but rather serves as a mnemonic handle for users. For example, the batch job name can help the user distinguish between multiple jobs listed by the *qstat* utility.

The **-o** option allows users to redirect the standard output stream. A user might, for example, wish to redirect to the null device the standard output stream of a job that produces copious yet superfluous output.

The **-P** option allows users to designate the relative priority of a batch job for selection from a queue.

The **-q** option allows users to specify an initial queue for the batch job. If the user specifies a routing queue, the batch server routes the batch job to another queue for execution or further routing. If the user specifies a non-routing queue, the batch server of the queue eventually executes the batch job.

The **-r** option allows users to control whether the submitted job will be rerun if the controlling batch node fails during execution of the batch job. The **-r** option likewise allows users to indicate whether or not the batch job is eligible to be rerun by the *qrerun* utility. Some jobs cannot be correctly rerun because of changes they make in the state of databases or other aspects of their environment. This volume of POSIX.1-2008 specifies that the default, if the **-r** option is not presented to the utility, will be that the batch job cannot be rerun, since the result of rerunning a non-rerunnable job might be catastrophic.

The **-S** option allows users to specify the program (usually a shell) that will be invoked to process the script of the batch job. This option has been modified to allow a list of shell names and locations associated with different hosts.

The **-u** option is useful when the submitting user is authorized to use more than one account on a given host, in which case the **-u** option allows the user to select from among those accounts. The option-argument is a list of user-host pairs, so that the submitting user can provide different user identifiers for different nodes in the event the batch job is routed. The **-u** option provides a lot of flexibility to accommodate sites with complex account structures. Users that have the same user identifier on all the hosts they are authorized to use will not need to use the **-u** option.

The **-V** option allows users to export all their current environment variables, as of the time the batch job is submitted, to the context of the processes of the batch job.

The **-v** option allows users to export specific environment variables from their current process to the processes of the batch job.

The **-z** option allows users to suppress the writing of the batch job identifier to standard output. The **-z** option is an existing NQS practice that has been standardized.

Historically, the *qsub* utility has served the batch job-submission function in the NQS system, the existing practice on which it is based. Some changes and additions have been made to the *qsub* utility in this volume of POSIX.1-2008, *vis-a-vis* NQS, as a result of the growing pool of experience with distributed batch systems.

The set of features of the *qsub* utility as defined in this volume of POSIX.1-2008 appears to incorporate all the common existing practice on potentially conforming platforms.

**105391 FUTURE DIRECTIONS**

105392 The *qsub* utility may be removed in a future version.

**105393 SEE ALSO**

105394 [Chapter 3](#) (on page 2397), [qrerun](#), [qstat](#), [touch](#)

105395 XBD [Section 3.150](#) (on page 57), [Section 6.1](#) (on page 125), [Chapter 8](#) (on page 173), [Section 12.2](#)  
105396 (on page 215)

**105397 CHANGE HISTORY**

105398 Derived from IEEE Std 1003.2d-1994.

**105399 Issue 6**

105400 The `-I` option has been removed as there is no portable description of the resources that are  
105401 allowed or required by the batch job.

**105402 Issue 7**

105403 The *qsub* utility is marked obsolescent.

105404 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

105405 **NAME**

105406       read — read a line from standard input

105407 **SYNOPSIS**

105408       read [-r] var...

105409 **DESCRIPTION**105410       The *read* utility shall read a single line from standard input.

105411       By default, unless the *-r* option is specified, <backslash> shall act as an escape character. An  
 105412       unescaped <backslash> shall preserve the literal value of the following character, with the  
 105413       exception of a <newline>. If a <newline> follows the <backslash>, the *read* utility shall interpret  
 105414       this as line continuation. The <backslash> and <newline> shall be removed before splitting the  
 105415       input into fields. All other unescaped <backslash> characters shall be removed after splitting the  
 105416       input into fields.

105417       If standard input is a terminal device and the invoking shell is interactive, *read* shall prompt for a  
 105418       continuation line when it reads an input line ending with a <backslash> <newline>, unless the  
 105419       *-r* option is specified.

105420       The terminating <newline> (if any) shall be removed from the input and the results shall be split  
 105421       into fields as in the shell for the results of parameter expansion (see [Section 2.6.5](#), on page 2333);  
 105422       the first field shall be assigned to the first variable *var*, the second field to the second variable  
 105423       *var*, and so on. If there are fewer fields than there are *var* operands, the remaining *vars* shall be  
 105424       set to empty strings. If there are fewer *vars* than fields, the last *var* shall be set to a value  
 105425       comprising the following elements:

- 105426       • The field that corresponds to the last *var* in the normal assignment sequence described  
 105427       above
- 105428       • The delimiter(s) that follow the field corresponding to the last *var*
- 105429       • The remaining fields and their delimiters, with trailing *IFS* white space ignored

105430       The setting of variables specified by the *var* operands shall affect the current shell execution  
 105431       environment; see [Section 2.12](#) (on page 2353). If it is called in a subshell or separate utility  
 105432       execution environment, such as one of the following:

```
105433 (read foo)
105434 nohup read ...
105435 find . -exec read ... \;
```

105436       it shall not affect the shell variables in the caller's environment.

105437 **OPTIONS**105438       The *read* utility shall conform to XBD [Section 12.2](#) (on page 215).

105439       The following option is supported:

105440       *-r*       Do not treat a <backslash> character in any special way. Consider each  
 105441       <backslash> to be part of the input line.

105442 **OPERANDS**

105443       The following operand shall be supported:

105444       *var*       The name of an existing or nonexisting shell variable.

105445 **STDIN**

105446 The standard input shall be a text file.

105447 **INPUT FILES**

105448 None.

105449 **ENVIRONMENT VARIABLES**105450 The following environment variables shall affect the execution of *read*:

105451 *IFS* Determine the internal field separators used to delimit fields; see [Section 2.5.3](#) (on  
105452 page 2324).

105453 *LANG* Provide a default value for the internationalization variables that are unset or null.  
105454 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
105455 variables used to determine the values of locale categories.)

105456 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
105457 internationalization variables.

105458 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
105459 characters (for example, single-byte as opposed to multi-byte characters in  
105460 arguments).

105461 *LC\_MESSAGES*

105462 Determine the locale that should be used to affect the format and contents of  
105463 diagnostic messages written to standard error.

105464 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

105465 *PS2* Provide the prompt string that an interactive shell shall write to standard error  
105466 when a line ending with a <backslash> <newline> is read and the *-r* option was  
105467 not specified.

105468 **ASYNCHRONOUS EVENTS**

105469 Default.

105470 **STDOUT**

105471 Not used.

105472 **STDERR**

105473 The standard error shall be used for diagnostic messages and prompts for continued input.

105474 **OUTPUT FILES**

105475 None.

105476 **EXTENDED DESCRIPTION**

105477 None.

105478 **EXIT STATUS**

105479 The following exit values shall be returned:

105480 0 Successful completion.

105481 &gt;0 End-of-file was detected or an error occurred.

105482 **CONSEQUENCES OF ERRORS**

105483 Default.

**105484 APPLICATION USAGE**

105485 The `-r` option is included to enable *read* to subsume the purpose of the *line* utility, which is not  
 105486 included in POSIX.1-2008.

**105487 EXAMPLES**

105488 The following command:

```
105489 while read -r xx yy
105490 do
105491 printf "%s %s\n" "$yy" "$xx"
105492 done < input_file
```

105493 prints a file with the first field of each line moved to the end of the line.

**105494 RATIONALE**

105495 The *read* utility historically has been a shell built-in. It was separated off into its own utility to  
 105496 take advantage of the richer description of functionality introduced by this volume of  
 105497 POSIX.1-2008.

105498 Since *read* affects the current shell execution environment, it is generally provided as a shell  
 105499 regular built-in. If it is called in a subshell or separate utility execution environment, such as one  
 105500 of the following:

```
105501 (read foo)
105502 nohup read ...
105503 find . -exec read ... \;
```

105504 it does not affect the shell variables in the environment of the caller.

105505 Although the standard input is required to be a text file, and therefore will always end with a  
 105506 <newline> (unless it is an empty file), the processing of continuation lines when the `-r` option is  
 105507 not used can result in the input not ending with a <newline>. This occurs if the last line of the  
 105508 input file ends with a <backslash> <newline>. It is for this reason that “if any” is used in “The  
 105509 terminating <newline> (if any) shall be removed from the input” in the description. It is not a  
 105510 relaxation of the requirement for standard input to be a text file.

**105511 FUTURE DIRECTIONS**

105512 None.

**105513 SEE ALSO**

105514 [Chapter 2](#) (on page 2319)

105515 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)

**105516 CHANGE HISTORY**

105517 First released in Issue 2.

**105518 Issue 7**

105519 Austin Group Interpretation 1003.1-2001 #194 is applied, clarifying the handling of the  
 105520 <backslash> escape character.

105521 SD5-XCU-ERN-126 is applied, clarifying that input lines end with a <newline>.

105522 The description of here-documents is removed from the *read* reference page.

105523 **NAME**105524        **renice** — set nice values of running processes105525 **SYNOPSIS**105526        **renice** [-g|-p|-u] -n *increment* *ID*...105527 **DESCRIPTION**

105528        The *renice* utility shall request that the nice values (see XBD [Section 3.240](#), on page 71) of one or  
 105529        more running processes be changed. By default, the applicable processes are specified by their  
 105530        process IDs. When a process group is specified (see **-g**), the request shall apply to all processes  
 105531        in the process group.

105532        The nice value shall be bounded in an implementation-defined manner. If the requested  
 105533        *increment* would raise or lower the nice value of the executed utility beyond implementation-  
 105534        defined limits, then the limit whose value was exceeded shall be used.

105535        When a user is *reniced*, the request applies to all processes whose saved set-user-ID matches the  
 105536        user ID corresponding to the user.

105537        Regardless of which options are supplied or any other factor, *renice* shall not alter the nice values  
 105538        of any process unless the user requesting such a change has appropriate privileges to do so for  
 105539        the specified process. If the user lacks appropriate privileges to perform the requested action, the  
 105540        utility shall return an error status.

105541        The saved set-user-ID of the user's process shall be checked instead of its effective user ID when  
 105542        *renice* attempts to determine the user ID of the process in order to determine whether the user  
 105543        has appropriate privileges.

105544 **OPTIONS**105545        The *renice* utility shall conform to XBD [Section 12.2](#) (on page 215), except for Guideline 9.

105546        The following options shall be supported:

105547        **-g**            Interpret the following operands as unsigned decimal integer process group IDs.

105548        **-n** *increment* Specify how the nice value of the specified process or processes is to be adjusted.  
 105549        The *increment* option-argument is a positive or negative decimal integer that shall  
 105550        be used to modify the nice value of the specified process or processes.

105551        Positive *increment* values shall cause a lower nice value. Negative *increment* values  
 105552        may require appropriate privileges and shall cause a higher nice value.

105553        **-p**            Interpret the following operands as unsigned decimal integer process IDs. The **-p**  
 105554        option is the default if no options are specified.

105555        **-u**            Interpret the following operands as users. If a user exists with a user name equal to  
 105556        the operand, then the user ID of that user is used in further processing. Otherwise,  
 105557        if the operand represents an unsigned decimal integer, it shall be used as the  
 105558        numeric user ID of the user.

105559 **OPERANDS**

105560        The following operands shall be supported:

105561        *ID*            A process ID, process group ID, or user name/user ID, depending on the option  
 105562        selected.

105563 **STDIN**

105564        Not used.

105565 **INPUT FILES**

105566 None.

105567 **ENVIRONMENT VARIABLES**105568 The following environment variables shall affect the execution of *renice*:

105569 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 105570 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 105571 variables used to determine the values of locale categories.)

105572 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 105573 internationalization variables.

105574 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 105575 characters (for example, single-byte as opposed to multi-byte characters in  
 105576 arguments).

105577 *LC\_MESSAGES*

105578 Determine the locale that should be used to affect the format and contents of  
 105579 diagnostic messages written to standard error.

105580 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

105581 **ASYNCHRONOUS EVENTS**

105582 Default.

105583 **STDOUT**

105584 Not used.

105585 **STDERR**

105586 The standard error shall be used only for diagnostic messages.

105587 **OUTPUT FILES**

105588 None.

105589 **EXTENDED DESCRIPTION**

105590 None.

105591 **EXIT STATUS**

105592 The following exit values shall be returned:

105593 0 Successful completion.

105594 &gt;0 An error occurred.

105595 **CONSEQUENCES OF ERRORS**

105596 Default.

105597 **APPLICATION USAGE**

105598 None.

105599 **EXAMPLES**

105600 1. Adjust the nice value so that process IDs 987 and 32 would have a lower nice value:

105601 `renice -n 5 -p 987 32`

105602 2. Adjust the nice value so that group IDs 324 and 76 would have a higher nice value, if the  
 105603 user has appropriate privileges to do so:

105604 `renice -n -4 -g 324 76`

3. Adjust the nice value so that numeric user ID 8 and user **sas** would have a lower nice value:

```
renice -n 4 -u 8 sas
```

Useful nice value increments on historical systems include 19 or 20 (the affected processes run only when nothing else in the system attempts to run) and any negative number (to make processes run faster).

#### RATIONALE

The *gid*, *pid*, and *user* specifications do not fit either the definition of operand or option-argument. However, for clarity, they have been included in the OPTIONS section, rather than the OPERANDS section.

The definition of nice value is not intended to suggest that all processes in a system have priorities that are comparable. Scheduling policy extensions such as the realtime priorities in the System Interfaces volume of POSIX.1-2008 make the notion of a single underlying priority for all scheduling policies problematic. Some implementations may implement the *nice*-related features to affect all processes on the system, others to affect just the general time-sharing activities implied by this volume of POSIX.1-2008, and others may have no effect at all. Because of the use of “implementation-defined” in *nice* and *renice*, a wide range of implementation strategies are possible.

Originally, this utility was written in the historical manner, using the term “nice value”. This was always a point of concern with users because it was never intuitively obvious what this meant. With a newer version of *renice*, which used the term “system scheduling priority”, it was hoped that novice users could better understand what this utility was meant to do. Also, it would be easier to document what the utility was meant to do. Unfortunately, the addition of the POSIX realtime scheduling capabilities introduced the concepts of process and thread scheduling priorities that were totally unaffected by the *nice*/*renice* utilities or the *nice()*/*setpriority()* functions. Continuing to use the term “system scheduling priority” would have incorrectly suggested that these utilities and functions were indeed affecting these realtime priorities. It was decided to revert to the historical term “nice value” to reference this unrelated process attribute.

Although this utility has use by system administrators (and in fact appears in the system administration portion of the BSD documentation), the standard developers considered that it was very useful for individual end users to control their own processes.

Earlier versions of this standard allowed the following forms in the SYNOPSIS:

```
renice nice_value[-p] pid...[-g gid...][-p pid...][-u user...]
renice nice_value -g gid...[-g gid...]-p pid...[-u user...]
renice nice_value -u user...[-g gid...]-p pid...[-u user...]
```

These forms are no longer specified by POSIX.1-2008 but may be present in some implementations.

#### FUTURE DIRECTIONS

None.

#### SEE ALSO

*nice*

XBD [Section 3.240](#) (on page 71), [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)

**CHANGE HISTORY**

105648  
105649 First released in Issue 4.

**Issue 5**

105650  
105651 In the SYNOPSIS, an ellipsis is added to the **-u** option in all three obsolescent forms.

**Issue 6**

105652  
105653 This utility is marked as part of the User Portability Utilities option.

105654 The APPLICATION USAGE section is added.

105655 The obsolescent forms of the SYNOPSIS are removed.

105656 Text previously conditional on POSIX\_SAVED\_IDS is mandatory in this version. This is a FIPS  
105657 requirement.

**Issue 7**

105658  
105659 Austin Group Interpretation 1003.1-2001 #027 is applied, clarifying that Guideline 9 of the Utility  
105660 Syntax Guidelines does not apply.

105661 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

105662 The *renice* utility is moved from the User Portability Utilities option to the Base. User Portability  
105663 Utilities is now an option for interactive utilities.

105664 **NAME**

105665       rm — remove directory entries

105666 **SYNOPSIS**105667       rm [-fiRr] *file*...105668 **DESCRIPTION**105669       The *rm* utility shall remove the directory entry specified by each *file* argument.

105670       If either of the files dot or dot-dot are specified as the basename portion of an operand (that is,  
 105671       the final pathname component) or if an operand resolves to the root directory, *rm* shall write a  
 105672       diagnostic message to standard error and do nothing more with such operands.

105673       For each *file* the following steps shall be taken:

- 105674       1. If the *file* does not exist:
  - 105675           a. If the **-f** option is not specified, *rm* shall write a diagnostic message to standard  
 105676           error.
  - 105677           b. Go on to any remaining *files*.
- 105678       2. If *file* is of type directory, the following steps shall be taken:
  - 105679           a. If neither the **-R** option nor the **-r** option is specified, *rm* shall write a diagnostic  
 105680           message to standard error, do nothing more with *file*, and go on to any remaining  
 105681           files.
  - 105682           b. If the **-f** option is not specified, and either the permissions of *file* do not permit  
 105683           writing and the standard input is a terminal or the **-i** option is specified, *rm* shall  
 105684           write a prompt to standard error and read a line from the standard input. If the  
 105685           response is not affirmative, *rm* shall do nothing more with the current file and go  
 105686           on to any remaining files.
  - 105687           c. For each entry contained in *file*, other than dot or dot-dot, the four steps listed here  
 105688           (1 to 4) shall be taken with the entry as if it were a *file* operand. The *rm* utility shall  
 105689           not traverse directories by following symbolic links into other parts of the  
 105690           hierarchy, but shall remove the links themselves.
  - 105691           d. If the **-i** option is specified, *rm* shall write a prompt to standard error and read a  
 105692           line from the standard input. If the response is not affirmative, *rm* shall do nothing  
 105693           more with the current file, and go on to any remaining files.
- 105694       3. If *file* is not of type directory, the **-f** option is not specified, and either the permissions of  
 105695       *file* do not permit writing and the standard input is a terminal or the **-i** option is specified,  
 105696       *rm* shall write a prompt to the standard error and read a line from the standard input. If  
 105697       the response is not affirmative, *rm* shall do nothing more with the current file and go on  
 105698       to any remaining files.
- 105699       4. If the current file is a directory, *rm* shall perform actions equivalent to the *rmdir*() function  
 105700       defined in the System Interfaces volume of POSIX.1-2008 called with a pathname of the  
 105701       current file used as the *path* argument. If the current file is not a directory, *rm* shall  
 105702       perform actions equivalent to the *unlink*() function defined in the System Interfaces  
 105703       volume of POSIX.1-2008 called with a pathname of the current file used as the *path*  
 105704       argument.

105705       If this fails for any reason, *rm* shall write a diagnostic message to standard error, do  
 105706       nothing more with the current file, and go on to any remaining files.

105707       The *rm* utility shall be able to descend to arbitrary depths in a file hierarchy, and shall not fail

105708 due to path length limitations (unless an operand specified by the user exceeds system  
105709 limitations).

#### 105710 OPTIONS

105711 The *rm* utility shall conform to XBD [Section 12.2](#) (on page 215).

105712 The following options shall be supported:

105713 **-f** Do not prompt for confirmation. Do not write diagnostic messages or modify the  
105714 exit status in the case of nonexistent operands. Any previous occurrences of the **-i**  
105715 option shall be ignored.

105716 **-i** Prompt for confirmation as described previously. Any previous occurrences of the  
105717 **-f** option shall be ignored.

105718 **-R** Remove file hierarchies. See the DESCRIPTION.

105719 **-r** Equivalent to **-R**.

#### 105720 OPERANDS

105721 The following operand shall be supported:

105722 *file* A pathname of a directory entry to be removed.

#### 105723 STDIN

105724 The standard input shall be used to read an input line in response to each prompt specified in  
105725 the STDOUT section. Otherwise, the standard input shall not be used.

#### 105726 INPUT FILES

105727 None.

#### 105728 ENVIRONMENT VARIABLES

105729 The following environment variables shall affect the execution of *rm*:

105730 **LANG** Provide a default value for the internationalization variables that are unset or null.  
105731 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
105732 variables used to determine the values of locale categories.)

105733 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
105734 internationalization variables.

105735 **LC\_COLLATE**  
105736 Determine the locale for the behavior of ranges, equivalence classes, and multi-  
105737 character collating elements used in the extended regular expression defined for  
105738 the **yesexpr** locale keyword in the **LC\_MESSAGES** category.

105739 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
105740 characters (for example, single-byte as opposed to multi-byte characters in  
105741 arguments) and the behavior of character classes within regular expressions used  
105742 in the extended regular expression defined for the **yesexpr** locale keyword in the  
105743 **LC\_MESSAGES** category.

105744 **LC\_MESSAGES**  
105745 Determine the locale used to process affirmative responses, and the locale used to  
105746 affect the format and contents of diagnostic messages and prompts written to  
105747 standard error.

105748 **XSIX** **NLSPATH** Determine the location of message catalogs for the processing of **LC\_MESSAGES**.

105749 **ASYNCHRONOUS EVENTS**

105750 Default.

105751 **STDOUT**

105752 Not used.

105753 **STDERR**

105754 Prompts shall be written to standard error under the conditions specified in the DESCRIPTION  
 105755 and OPTIONS sections. The prompts shall contain the *file* pathname, but their format is  
 105756 otherwise unspecified. The standard error also shall be used for diagnostic messages.

105757 **OUTPUT FILES**

105758 None.

105759 **EXTENDED DESCRIPTION**

105760 None.

105761 **EXIT STATUS**

105762 The following exit values shall be returned:

105763 0 Each directory entry was successfully removed, unless its removal was canceled by a non-  
 105764 affirmative response to a prompt for confirmation.

105765 &gt;0 An error occurred.

105766 **CONSEQUENCES OF ERRORS**

105767 Default.

105768 **APPLICATION USAGE**

105769 The *rm* utility is forbidden to remove the names dot and dot-dot in order to avoid the  
 105770 consequences of inadvertently doing something like:

105771 `rm -r .*`

105772 Some implementations do not permit the removal of the last link to an executable binary file that  
 105773 is being executed; see the [EBUSY] error in the *unlink()* function defined in the System Interfaces  
 105774 volume of POSIX.1-2008. Thus, the *rm* utility can fail to remove such files.

105775 The *-i* option causes *rm* to prompt and read the standard input even if the standard input is not  
 105776 a terminal, but in the absence of *-i* the mode prompting is not done when the standard input is  
 105777 not a terminal.

105778 **EXAMPLES**

105779 1. The following command:

105780 `rm a.out core`105781 removes the directory entries: **a.out** and **core**.

105782 2. The following command:

105783 `rm -Rf junk`105784 removes the directory **junk** and all its contents, without prompting.105785 **RATIONALE**

105786 For absolute clarity, paragraphs (2b) and (3) in the DESCRIPTION of *rm* describing the behavior  
 105787 when prompting for confirmation, should be interpreted in the following manner:

```
105788 if ((NOT f_option) AND
105789 ((not_writable AND input_is_terminal) OR i_option))
```

The exact format of the interactive prompts is unspecified. Only the general nature of the contents of prompts are specified because implementations may desire more descriptive prompts than those used on historical implementations. Therefore, an application not using the `-f` option, or using the `-i` option, relies on the system to provide the most suitable dialog directly with the user, based on the behavior specified.

The `-r` option is historical practice on all known systems. The synonym `-R` option is provided for consistency with the other utilities in this volume of POSIX.1-2008 that provide options requesting recursive descent through the file hierarchy.

The behavior of the `-f` option in historical versions of *rm* is inconsistent. In general, along with “forcing” the unlink without prompting for permission, it always causes diagnostic messages to be suppressed and the exit status to be unmodified for nonexistent operands and files that cannot be unlinked. In some versions, however, the `-f` option suppresses usage messages and system errors as well. Suppressing such messages is not a service to either shell scripts or users.

It is less clear that error messages regarding files that cannot be unlinked (removed) should be suppressed. Although this is historical practice, this volume of POSIX.1-2008 does not permit the `-f` option to suppress such messages.

When given the `-r` and `-i` options, historical versions of *rm* prompt the user twice for each directory, once before removing its contents and once before actually attempting to delete the directory entry that names it. This allows the user to “prune” the file hierarchy walk. Historical versions of *rm* were inconsistent in that some did not do the former prompt for directories named on the command line and others had obscure prompting behavior when the `-i` option was specified and the permissions of the file did not permit writing. The POSIX Shell and Utilities *rm* differs little from historic practice, but does require that prompts be consistent. Historical versions of *rm* were also inconsistent in that prompts were done to both standard output and standard error. This volume of POSIX.1-2008 requires that prompts be done to standard error, for consistency with *cp* and *mv*, and to allow historical extensions to *rm* that provide an option to list deleted files on standard output.

The *rm* utility is required to descend to arbitrary depths so that any file hierarchy may be deleted. This means, for example, that the *rm* utility cannot run out of file descriptors during its descent (that is, if the number of file descriptors is limited, *rm* cannot be implemented in the historical fashion where one file descriptor is used per directory level). Also, *rm* is not permitted to fail because of path length restrictions, unless an operand specified by the user is longer than `{PATH_MAX}`.

The *rm* utility removes symbolic links themselves, not the files they refer to, as a consequence of the dependence on the *unlink()* functionality, per the DESCRIPTION. When removing hierarchies with `-r` or `-R`, the prohibition on following symbolic links has to be made explicit.

#### FUTURE DIRECTIONS

None.

#### CHANGE HISTORY

First released in Issue 2.

105834 **Issue 5**

105835 The FUTURE DIRECTIONS section is added.

105836 **Issue 6**

105837 Text is added to clarify actions relating to symbolic links as specified in the IEEE P1003.2b draft  
105838 standard.

105839 **Issue 7**

105840 Austin Group Interpretations 1003.1-2001 #019 and #091 are applied.

105841 Austin Group Interpretation 1003.1-2001 #126 is applied, changing the description of the  
105842 *LC\_MESSAGES* environment variable.

105843 **NAME**105844 `rmdel` — remove a delta from an SCCS file (**DEVELOPMENT**)105845 **SYNOPSIS**105846 XSI `rmdel -r SID file...`105847 **DESCRIPTION**

105848 The *rm~~del~~* utility shall remove the delta specified by the *SID* from each named SCCS file. The  
 105849 delta to be removed shall be the most recent delta in its branch in the delta chain of each named  
 105850 SCCS file. In addition, the application shall ensure that the *SID* specified is not that of a version  
 105851 being edited for the purpose of making a delta; that is, if a *p-file* (see [get](#)) exists for the named  
 105852 SCCS file, the *SID* specified shall not appear in any entry of the *p-file*.

105853 Removal of a delta shall be restricted to:

- 105854 1. The user who made the delta
- 105855 2. The owner of the SCCS file
- 105856 3. The owner of the directory containing the SCCS file

105857 **OPTIONS**105858 The *rm~~del~~* utility shall conform to XBD [Section 12.2](#) (on page 215).

105859 The following option shall be supported:

105860 `-r SID` Specify the SCCS identification string (*SID*) of the delta to be deleted.105861 **OPERANDS**

105862 The following operand shall be supported:

105863 *file* A pathname of an existing SCCS file or a directory. If *file* is a directory, the *rm~~del~~*  
 105864 utility shall behave as though each file in the directory were specified as a named  
 105865 file, except that non-SCCS files (last component of the pathname does not begin  
 105866 with *s*.) and unreadable files shall be silently ignored.

105867 If exactly one *file* operand appears, and it is `'-'`, the standard input shall be read;  
 105868 each line of the standard input is taken to be the name of an SCCS file to be  
 105869 processed. Non-SCCS files and unreadable files shall be silently ignored.

105870 **STDIN**

105871 The standard input shall be a text file used only when the *file* operand is specified as `'-'`. Each  
 105872 line of the text file shall be interpreted as an SCCS pathname.

105873 **INPUT FILES**

105874 The SCCS files shall be files of unspecified format.

105875 **ENVIRONMENT VARIABLES**105876 The following environment variables shall affect the execution of *rm~~del~~*:

105877 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 105878 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 105879 variables used to determine the values of locale categories.)

105880 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 105881 internationalization variables.

105882 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 105883 characters (for example, single-byte as opposed to multi-byte characters in  
 105884 arguments and input files).

105885 *LC\_MESSAGES*  
105886 Determine the locale that should be used to affect the format and contents of  
105887 diagnostic messages written to standard error.

105888 *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

105889 **ASYNCHRONOUS EVENTS**  
105890 Default.

105891 **STDOUT**  
105892 Not used.

105893 **STDERR**  
105894 The standard error shall be used only for diagnostic messages.

105895 **OUTPUT FILES**  
105896 The SCCS files shall be files of unspecified format. During processing of a *file*, a temporary *x-file*,  
105897 as described in *admin*, may be created and deleted; a locking *z-file*, as described in *get*, may be  
105898 created and deleted.

105899 **EXTENDED DESCRIPTION**  
105900 None.

105901 **EXIT STATUS**  
105902 The following exit values shall be returned:  
105903 0 Successful completion.  
105904 >0 An error occurred.

105905 **CONSEQUENCES OF ERRORS**  
105906 Default.

105907 **APPLICATION USAGE**  
105908 None.

105909 **EXAMPLES**  
105910 None.

105911 **RATIONALE**  
105912 None.

105913 **FUTURE DIRECTIONS**  
105914 None.

105917 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)

105918 **CHANGE HISTORY**  
105919 First released in Issue 2.

105920 **Issue 6**  
105921 The normative text is reworded to avoid use of the term “must” for application requirements.

105922 **NAME**

105923       rmdir — remove directories

105924 **SYNOPSIS**105925       rmdir [-p] *dir*...105926 **DESCRIPTION**105927       The *rmdir* utility shall remove the directory entry specified by each *dir* operand.105928       For each *dir* operand, the *rmdir* utility shall perform actions equivalent to the *rmdir()* function  
105929       called with the *dir* operand as its only argument.105930       Directories shall be processed in the order specified. If a directory and a subdirectory of that  
105931       directory are specified in a single invocation of the *rmdir* utility, the application shall specify the  
105932       subdirectory before the parent directory so that the parent directory will be empty when the  
105933       *rmdir* utility tries to remove it.105934 **OPTIONS**105935       The *rmdir* utility shall conform to XBD [Section 12.2](#) (on page 215).

105936       The following option shall be supported:

105937       **-p**       Remove all directories in a pathname. For each *dir* operand:

- 105938               1. The directory entry it names shall be removed.
- 
- 105939               2. If the
- dir*
- operand includes more than one pathname component, effects
- 
- 105940               equivalent to the following command shall occur:

105941               rmdir -p \$(dirname *dir*)105942 **OPERANDS**

105943       The following operand shall be supported:

105944       *dir*       A pathname of an empty directory to be removed.105945 **STDIN**

105946       Not used.

105947 **INPUT FILES**

105948       None.

105949 **ENVIRONMENT VARIABLES**105950       The following environment variables shall affect the execution of *rmdir*:105951       **LANG**       Provide a default value for the internationalization variables that are unset or null.  
105952       (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
105953       variables used to determine the values of locale categories.)105954       **LC\_ALL**       If set to a non-empty string value, override the values of all the other  
105955       internationalization variables.105956       **LC\_CTYPE**   Determine the locale for the interpretation of sequences of bytes of text data as  
105957       characters (for example, single-byte as opposed to multi-byte characters in  
105958       arguments).105959       **LC\_MESSAGES**105960       Determine the locale that should be used to affect the format and contents of  
105961       diagnostic messages written to standard error.

105962 XSI **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

105963 **ASYNCHRONOUS EVENTS**

105964 Default.

105965 **STDOUT**

105966 Not used.

105967 **STDERR**

105968 The standard error shall be used only for diagnostic messages.

105969 **OUTPUT FILES**

105970 None.

105971 **EXTENDED DESCRIPTION**

105972 None.

105973 **EXIT STATUS**

105974 The following exit values shall be returned:

105975 0 Each directory entry specified by a *dir* operand was removed successfully.

105976 >0 An error occurred.

105977 **CONSEQUENCES OF ERRORS**

105978 Default.

105979 **APPLICATION USAGE**

105980 The definition of an empty directory is one that contains, at most, directory entries for dot and dot-dot.

105981

105982 **EXAMPLES**

105983 If a directory **a** in the current directory is empty except it contains a directory **b** and **a/b** is empty

105984 except it contains a directory **c**:

105985 `rmdir -p a/b/c`

105986 removes all three directories.

105987 **RATIONALE**

105988 On historical System V systems, the **-p** option also caused a message to be written to the

105989 standard output. The message indicated whether the whole path was removed or whether part

105990 of the path remained for some reason. The **STDERR** section requires this diagnostic when the

105991 entire path specified by a *dir* operand is not removed, but does not allow the status message

105992 reporting success to be written as a diagnostic.

105993 The *rmdir* utility on System V also included a **-s** option that suppressed the informational

105994 message output by the **-p** option. This option has been omitted because the informational

105995 message is not specified by this volume of POSIX.1-2008.

105996 **FUTURE DIRECTIONS**

105997 None.

105998 **SEE ALSO**

106006 **NAME**106007       sact — print current SCCS file-editing activity (**DEVELOPMENT**)106008 **SYNOPSIS**106009 XSI       sact *file*...106010 **DESCRIPTION**

106011       The *sact* utility shall inform the user of any impending deltas to a named SCCS file by writing a  
 106012       list to standard output. This situation occurs when *get -e* has been executed previously without  
 106013       a subsequent execution of *delta*, *unget*, or *scs unedit*.

106014 **OPTIONS**

106015       None.

106016 **OPERANDS**

106017       The following operand shall be supported:

106018       *file*       A pathname of an existing SCCS file or a directory. If *file* is a directory, the *sact*  
 106019       utility shall behave as though each file in the directory were specified as a named  
 106020       file, except that non-SCCS files (last component of the pathname does not begin  
 106021       with **s**.) and unreadable files shall be silently ignored.

106022       If exactly one *file* operand appears, and it is *'-'*, the standard input shall be read;  
 106023       each line of the standard input shall be taken to be the name of an SCCS file to be  
 106024       processed. Non-SCCS files and unreadable files shall be silently ignored.

106025 **STDIN**

106026       The standard input shall be a text file used only when the *file* operand is specified as *'-'*. Each  
 106027       line of the text file shall be interpreted as an SCCS pathname.

106028 **INPUT FILES**

106029       Any SCCS files interrogated are files of an unspecified format.

106030 **ENVIRONMENT VARIABLES**106031       The following environment variables shall affect the execution of *sact*:

106032       *LANG*       Provide a default value for the internationalization variables that are unset or null.  
 106033       (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 106034       variables used to determine the values of locale categories.)

106035       *LC\_ALL*     If set to a non-empty string value, override the values of all the other  
 106036       internationalization variables.

106037       *LC\_CTYPE*   Determine the locale for the interpretation of sequences of bytes of text data as  
 106038       characters (for example, single-byte as opposed to multi-byte characters in  
 106039       arguments and input files).

106040       *LC\_MESSAGES*

106041       Determine the locale that should be used to affect the format and contents of  
 106042       diagnostic messages written to standard error.

106043       *NLSPATH*    Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

106044 **ASYNCHRONOUS EVENTS**

106045       Default.

**106046 STDOUT**

106047 The output for each named file shall consist of a line in the following format:

106048 "%sΔ%sΔ%sΔ%s\n", <SID>, <new SID>, <login>, <date>, <time>

106049 <SID> Specifies the SID of a delta that currently exists in the SCCS file to which changes  
106050 are made to make the new delta.

106051 <new SID> Specifies the SID for the new delta to be created.

106052 <login> Contains the login name of the user who makes the delta (that is, who executed a  
106053 *get* for editing).

106054 <date> Contains the date that *get -e* was executed, in the format used by the *prs :D:* data  
106055 keyword.

106056 <time> Contains the time that *get -e* was executed, in the format used by the *prs :T:* data  
106057 keyword.

106058 If there is more than one named file or if a directory or standard input is named, each pathname  
106059 shall be written before each of the preceding lines:

106060 "\n%s:\n", <pathname>

**106061 STDERR**

106062 The standard error shall be used only for optional informative messages concerning SCCS files  
106063 with no impending deltas, and for diagnostic messages.

**106064 OUTPUT FILES**

106065 None.

**106066 EXTENDED DESCRIPTION**

106067 None.

**106068 EXIT STATUS**

106069 The following exit values shall be returned:

106070 0 Successful completion.

106071 >0 An error occurred.

**106072 CONSEQUENCES OF ERRORS**

106073 Default.

**106074 APPLICATION USAGE**

106075 None.

**106076 EXAMPLES**

106077 None.

**106078 RATIONALE**

106079 None.

**106080 FUTURE DIRECTIONS**

106081 None.

**106082 SEE ALSO**

106083 *delta*, *get*, *sccs*, *unget*

106084 XBD Chapter 8 (on page 173)

106085 **CHANGE HISTORY**  
106086 First released in Issue 2.

106087 **NAME**106088 `sccs` — front end for the SCCS subsystem (**DEVELOPMENT**)106089 **SYNOPSIS**106090 XSI `sccs [-r] [-d path] [-p path] command [options...] [operands...]`106091 **DESCRIPTION**106092 The *sccs* utility is a front end to the SCCS programs. It also includes the capability to run set-  
106093 user-id to another user to provide additional protection.106094 The *sccs* utility shall invoke the specified *command* with the specified *options* and *operands*. By  
106095 default, each of the *operands* shall be modified by prefixing it with the string "SCCS/s.". 106096 The *command* can be the name of one of the SCCS utilities in this volume of POSIX.1-2008 (*admin*,  
106097 *delta*, *get*, *prs*, *rmDEL*, *sact*, *unget*, *val*, or *what*) or one of the pseudo-utilities listed in the  
106098 EXTENDED DESCRIPTION section.106099 **OPTIONS**106100 The *sccs* utility shall conform to XBD [Section 12.2](#) (on page 215), except that *options* operands are  
106101 actually options to be passed to the utility named by *command*. When the portion of the  
106102 command:106103 `command [options ...] [operands ...]`106104 is considered, all of the pseudo-utilities used as *command* shall support the Utility Syntax  
106105 Guidelines. Any of the other SCCS utilities that can be invoked in this manner support the  
106106 Guidelines to the extent indicated by their individual OPTIONS sections.106107 The following options shall be supported preceding the *command* operand:106108 **-d *path*** A pathname of a directory to be used as a root directory for the SCCS files. The  
106109 default shall be the current directory. The **-d** option shall take precedence over the  
106110 *PROJECTDIR* variable. See **-p**.106111 **-p *path*** A pathname of a directory in which the SCCS files are located. The default shall be  
106112 the **SCCS** directory.106113 The **-p** option differs from the **-d** option in that the **-d** option-argument shall be  
106114 prefixed to the entire pathname and the **-p** option-argument shall be inserted  
106115 before the final component of the pathname. For example:106116 `sccs -d /x -p y get a/b`

106117 converts to:

106118 `get /x/a/y/s.b`

106119 This allows the creation of aliases such as:

106120 `alias syssccs="sccs -d /usr/src"`

106121 which is used as:

106122 `syssccs get cmd/who.c`106123 **-r** Invoke *command* with the real user ID of the process, not any effective user ID that  
106124 the *sccs* utility is set to. Certain commands (*admin*, **check**, **clean**, **diffs**, **info**, *rmDEL*,  
106125 and **tell**) cannot be run set-user-ID by all users, since this would allow anyone to  
106126 change the authorizations. These commands are always run as the real user.

106127 **OPERANDS**

106128 The following operands shall be supported:

106129 *command* An SCCS utility name or the name of one of the pseudo-utilities listed in the  
 106130 EXTENDED DESCRIPTION section.

106131 *options* An option or option-argument to be passed to *command*.

106132 *operands* An operand to be passed to *command*.

106133 **STDIN**106134 See the utility description for the specified *command*.106135 **INPUT FILES**106136 See the utility description for the specified *command*.106137 **ENVIRONMENT VARIABLES**106138 The following environment variables shall affect the execution of *sccs*:

106139 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 106140 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 106141 variables used to determine the values of locale categories.)

106142 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 106143 internationalization variables.

106144 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 106145 characters (for example, single-byte as opposed to multi-byte characters in  
 106146 arguments and input files).

106147 *LC\_MESSAGES*

106148 Determine the locale that should be used to affect the format and contents of  
 106149 diagnostic messages written to standard error.

106150 *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

106151 *PROJECTDIR*

106152 Provide a default value for the *-d path* option. If the value of *PROJECTDIR* begins  
 106153 with a <slash>, it shall be considered an absolute pathname; otherwise, the value  
 106154 of *PROJECTDIR* is treated as a user name and that user's initial working directory  
 106155 shall be examined for a subdirectory **src** or **source**. If such a directory is found, it  
 106156 shall be used. Otherwise, the value shall be used as a relative pathname.

106157 Additional environment variable effects may be found in the utility description for the specified  
 106158 *command*.

106159 **ASYNCHRONOUS EVENTS**

106160 Default.

106161 **STDOUT**106162 See the utility description for the specified *command*.106163 **STDERR**106164 See the utility description for the specified *command*.106165 **OUTPUT FILES**106166 See the utility description for the specified *command*.

## 106167 EXTENDED DESCRIPTION

106168 The following pseudo-utilities shall be supported as *command* operands. All options referred to  
 106169 in the following list are values given in the *options* operands following *command*.

- 106170 **check** Equivalent to **info**, except that nothing shall be printed if nothing is being edited, and a  
 106171 non-zero exit status shall be returned if anything is being edited. The intent is to have  
 106172 this included in an “install” entry in a makefile to ensure that everything is included  
 106173 into the SCCS file before a version is installed.
- 106174 **clean** Remove everything from the current directory that can be recreated from SCCS files,  
 106175 but do not remove any files being edited. If the **-b** option is given, branches shall be  
 106176 ignored in the determination of whether they are being edited; this is dangerous if  
 106177 branches are kept in the same directory.
- 106178 **create** Create an SCCS file, taking the initial contents from the file of the same name. Any  
 106179 options to *admin* are accepted. If the creation is successful, the original files shall be  
 106180 renamed by prefixing the basenames with a comma. These renamed files should be  
 106181 removed after it has been verified that the SCCS files have been created successfully.
- 106182 **delget** Perform a *delta* on the named files and then *get* new versions. The new versions shall  
 106183 have ID keywords expanded and shall not be editable. Any **-m**, **-p**, **-r**, **-s**, and **-y**  
 106184 options shall be passed to *delta*, and any **-b**, **-c**, **-e**, **-i**, **-k**, **-l**, **-s**, and **-x** options shall be  
 106185 passed to *get*.
- 106186 **deledit** Equivalent to **delget**, except that the *get* phase shall include the **-e** option. This option is  
 106187 useful for making a checkpoint of the current editing phase. The same options shall be  
 106188 passed to *delta* as described above, and all the options listed for *get* above except **-e**  
 106189 shall be passed to **edit**.
- 106190 **diffs** Write a difference listing between the current version of the files checked out for editing  
 106191 and the versions in SCCS format. Any **-r**, **-c**, **-i**, **-x**, and **-t** options shall be passed to  
 106192 *get*; any **-l**, **-s**, **-e**, **-f**, **-h**, and **-b** options shall be passed to *diff*. A **-C** option shall be  
 106193 passed to *diff* as **-c**.
- 106194 **edit** Equivalent to *get -e*.
- 106195 **fix** Remove the named delta, but leave a copy of the delta with the changes that were in it.  
 106196 It is useful for fixing small compiler bugs, and so on. The application shall ensure that it  
 106197 is followed by a **-r** *SID* option. Since **fix** does not leave audit trails, it should be used  
 106198 carefully.
- 106199 **info** Write a listing of all files being edited. If the **-b** option is given, branches (that is, SIDs  
 106200 with two or fewer components) shall be ignored. If a **-u** *user* option is given, then only  
 106201 files being edited by the named user shall be listed. A **-U** option shall be equivalent to  
 106202 **-u***<current user>*.
- 106203 **print** Write out verbose information about the named files, equivalent to *sccs prs*.
- 106204 **tell** Write a <newline>-separated list of the files being edited to standard output. Takes the  
 106205 **-b**, **-u**, and **-U** options like **info** and **check**.
- 106206 **unedit** This is the opposite of an **edit** or a *get -e*. It should be used with caution, since any  
 106207 changes made since the *get* are lost.

106208 **EXIT STATUS**

106209 The following exit values shall be returned:

106210 0 Successful completion.

106211 &gt;0 An error occurred.

106212 **CONSEQUENCES OF ERRORS**

106213 Default.

106214 **APPLICATION USAGE**

106215 Many of the SCCS utilities take directory names as operands as well as specific filenames. The  
 106216 pseudo-utilities supported by *sccs* are not described as having this capability, but are not  
 106217 prohibited from doing so.

106218 **EXAMPLES**

106219 1. To get a file for editing, edit it and produce a new delta:

106220 `sccs get -e file.c`106221 `ex file.c`106222 `sccs delta file.c`

106223 2. To get a file from another directory:

106224 `sccs -p /usr/src/sccs/s. get cc.c`

106225 or:

106226 `sccs get /usr/src/sccs/s.cc.c`

106227 3. To make a delta of a large number of files in the current directory:

106228 `sccs delta *.c`

106229 4. To get a list of files being edited that are not on branches:

106230 `sccs info -b`

106231 5. To delta everything being edited by the current user:

106232 `sccs delta $(sccs tell -U)`

106233 6. In a makefile, to get source files from an SCCS file if it does not already exist:

106234 `SRCS = <list of source files>`106235 `$(SRCS) :`106236 `sccs get $(REL) $@`106237 **RATIONALE**

106238 *sccs* and its associated utilities are part of the XSI Development Utilities option within the XSI  
 106239 option.

106240 SCCS is an abbreviation for Source Code Control System. It is a maintenance and enhancement  
 106241 tracking tool. When a file is put under SCCS, the source code control system maintains the file  
 106242 and, when changes are made, identifies and stores them in the file with the original source code  
 106243 and/or documentation. As other changes are made, they too are identified and retained in the  
 106244 file.

106245 Retrieval of the original and any set of changes is possible. Any version of the file as it develops  
 106246 can be reconstructed for inspection or additional modification. History data can be stored with  
 106247 each version, documenting why the changes were made, who made them, and when they were  
 106248 made.

106249 **FUTURE DIRECTIONS**

106250 None.

106251 **SEE ALSO**106252 *admin, delta, get, make, prs, rmdel, sact, unget, val, what*106253 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)106254 **CHANGE HISTORY**

106255 First released in Issue 4.

106256 **Issue 6**

106257 In the ENVIRONMENT VARIABLES section, the *PROJECTDIR* description is updated from  
106258 “otherwise, the home directory of a user of that name is examined” to “otherwise, the value of  
106259 *PROJECTDIR* is treated as a user name and that user’s initial working directory is examined”.

106260 The normative text is reworded to avoid use of the term “must” for application requirements.

106261 **Issue 7**

106262 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

106263 **NAME**106264 `sed` — stream editor106265 **SYNOPSIS**106266 `sed [-n] script [file...]`106267 `sed [-n] -e script [-e script]... [-f script_file]... [file...]`106268 `sed [-n] [-e script]... -f script_file [-f script_file]... [file...]`106269 **DESCRIPTION**

106270 The *sed* utility is a stream editor that shall read one or more text files, make editing changes  
 106271 according to a script of editing commands, and write the results to standard output. The script  
 106272 shall be obtained from either the *script* operand string or a combination of the option-arguments  
 106273 from the `-e script` and `-f script_file` options.

106274 **OPTIONS**

106275 The *sed* utility shall conform to XBD [Section 12.2](#) (on page 215), except that the order of  
 106276 presentation of the `-e` and `-f` options is significant.

106277 The following options shall be supported:

106278 `-e script` Add the editing commands specified by the *script* option-argument to the end of  
 106279 the script of editing commands.

106280 `-f script_file` Add the editing commands in the file *script\_file* to the end of the script of editing  
 106281 commands.

106282 `-n` Suppress the default output (in which each line, after it is examined for editing, is  
 106283 written to standard output). Only lines explicitly selected for output are written.

106284 If any `-e` or `-f` options are specified, the script of editing commands shall initially be empty. The  
 106285 commands specified by each `-e` or `-f` option shall be added to the script in the order specified.  
 106286 When each addition is made, if the previous addition (if any) was from a `-e` option, a <newline>  
 106287 shall be inserted before the new addition. The resulting script shall have the same properties as  
 106288 the *script* operand, described in the OPERANDS section.

106289 **OPERANDS**

106290 The following operands shall be supported:

106291 *file* A pathname of a file whose contents are read and edited. If multiple *file* operands  
 106292 are specified, the named files shall be read in the order specified and the  
 106293 concatenation shall be edited. If no *file* operands are specified, the standard input  
 106294 shall be used.

106295 *script* A string to be used as the script of editing commands. The application shall not  
 106296 present a *script* that violates the restrictions of a text file except that the final  
 106297 character need not be a <newline>.

106298 **STDIN**

106299 The standard input shall be used if no *file* operands are specified, and shall be used if a *file*  
 106300 operand is `'-'` and the implementation treats the `'-'` as meaning standard input. Otherwise,  
 106301 the standard input shall not be used. See the INPUT FILES section.

106302 **INPUT FILES**

106303 The input files shall be text files. The *script\_files* named by the `-f` option shall consist of editing  
 106304 commands.

106305 **ENVIRONMENT VARIABLES**

106306 The following environment variables shall affect the execution of *sed*:

106307 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 106308 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 106309 variables used to determine the values of locale categories.)

106310 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 106311 internationalization variables.

106312 *LC\_COLLATE*  
 106313 Determine the locale for the behavior of ranges, equivalence classes, and multi-  
 106314 character collating elements within regular expressions.

106315 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 106316 characters (for example, single-byte as opposed to multi-byte characters in  
 106317 arguments and input files), and the behavior of character classes within regular  
 106318 expressions.

106319 *LC\_MESSAGES*  
 106320 Determine the locale that should be used to affect the format and contents of  
 106321 diagnostic messages written to standard error.

106322 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

106323 **ASYNCHRONOUS EVENTS**

106324 Default.

106325 **STDOUT**

106326 The input files shall be written to standard output, with the editing commands specified in the  
 106327 script applied. If the *-n* option is specified, only those input lines selected by the script shall be  
 106328 written to standard output.

106329 **STDERR**

106330 The standard error shall be used only for diagnostic messages.

106331 **OUTPUT FILES**

106332 The output files shall be text files whose formats are dependent on the editing commands given.

106333 **EXTENDED DESCRIPTION**

106334 The *script* shall consist of editing commands of the following form:

106335 `[address[, address]] function`

106336 where *function* represents a single-character command verb from the list in [Editing Commands](#)  
 106337 [in sed](#) (on page 3181), followed by any applicable arguments.

106338 The command can be preceded by <blank> characters and/or <semicolon> characters. The  
 106339 function can be preceded by <blank> characters. These optional characters shall have no effect.

106340 In default operation, *sed* cyclically shall append a line of input, less its terminating <newline>  
 106341 character, into the pattern space. Reading from input shall be skipped if a <newline> was in the  
 106342 pattern space prior to a **D** command ending the previous cycle. The *sed* utility shall then apply in  
 106343 sequence all commands whose addresses select that pattern space, until a command starts the  
 106344 next cycle or quits. If no commands explicitly started a new cycle, then at the end of the script  
 106345 the pattern space shall be copied to standard output (except when *-n* is specified) and the  
 106346 pattern space shall be deleted. Whenever the pattern space is written to standard output or a  
 106347 named file, *sed* shall immediately follow it with a <newline>.

106348 Some of the editing commands use a hold space to save all or part of the pattern space for

106349 subsequent retrieval. The pattern and hold spaces shall each be able to hold at least 8 192 bytes.

## 106350 **Addresses in sed**

106351 An address is either a decimal number that counts input lines cumulatively across files, a '\$' character that addresses the last line of input, or a context address (which consists of a BRE, as described in [Regular Expressions in sed](#), preceded and followed by a delimiter, usually a <slash>).

106355 An editing command with no addresses shall select every pattern space.

106356 An editing command with one address shall select each pattern space that matches the address.

106357 An editing command with two addresses shall select the inclusive range from the first pattern space that matches the first address through the next pattern space that matches the second. (If the second address is a number less than or equal to the line number first selected, only one line shall be selected.) Starting at the first line following the selected range, *sed* shall look again for the first address. Thereafter, the process shall be repeated. Omitting either or both of the address components in the following form produces undefined results:

106363 `[address[, address]]`

## 106364 **Regular Expressions in sed**

106365 The *sed* utility shall support the BREs described in XBD [Section 9.3](#) (on page 183), with the following additions:

- 106367 • In a context address, the construction "`\cBREc`", where *c* is any character other than <backslash> or <newline>, shall be identical to "`/BRE/`". If the character designated by *c* appears following a <backslash>, then it shall be considered to be that literal character, which shall not terminate the BRE. For example, in the context address "`\xabc\xdefx`", the second *x* stands for itself, so that the BRE is "`abcxdef`".
- 106372 • The escape sequence '`\n`' shall match a <newline> embedded in the pattern space. A literal <newline> shall not be used in the BRE of a context address or in the substitute function.
- 106375 • If an RE is empty (that is, no pattern is specified) *sed* shall behave as if the last RE used in the last command applied (either as an address or as part of a substitute command) was specified.

## 106378 **Editing Commands in sed**

106379 In the following list of editing commands, the maximum number of permissible addresses for each function is indicated by `[0addr]`, `[1addr]`, or `[2addr]`, representing zero, one, or two addresses.

106382 The argument *text* shall consist of one or more lines. Each embedded <newline> in the text shall be preceded by a <backslash>. Other <backslash> characters in text shall be removed, and the following character shall be treated literally.

106385 The **r** and **w** command verbs, and the *w* flag to the **s** command, take an *rfile* (or *wfile*) parameter, separated from the command verb letter or flag by one or more <blank> characters; implementations may allow zero separation as an extension.

106388 The argument *rfile* or the argument *wfile* shall terminate the editing command. Each *wfile* shall be created before processing begins. Implementations shall support at least ten *wfile* arguments in the script; the actual number (greater than or equal to 10) that is supported by the

implementation is unspecified. The use of the *wfile* parameter shall cause that file to be initially created, if it does not exist, or shall replace the contents of an existing file.

The **b**, **r**, **s**, **t**, **w**, **y**, and **:** command verbs shall accept additional arguments. The following synopses indicate which arguments shall be separated from the command verbs by a single <space>.

The **a** and **r** commands schedule text for later output. The text specified for the **a** command, and the contents of the file specified for the **r** command, shall be written to standard output just before the next attempt to fetch a line of input when executing the **N** or **n** commands, or when reaching the end of the script. If written when reaching the end of the script, and the **-n** option was not specified, the text shall be written after copying the pattern space to standard output. The contents of the file specified for the **r** command shall be as of the time the output is written, not the time the **r** command is applied. The text shall be output in the order in which the **a** and **r** commands were applied to the input.

Command verbs other than **{**, **a**, **b**, **c**, **i**, **r**, **t**, **w**, **:**, and **#** can be followed by a <semicolon>, optional <blank> characters, and another command verb. However, when the **s** command verb is used with the *w* flag, following it with another command in this manner produces undefined results.

A function can be preceded by one or more **' ! '** characters, in which case the function shall be applied if the addresses do not select the pattern space. Zero or more <blank> characters shall be accepted before the first **' ! '** character. It is unspecified whether <blank> characters can follow a **' ! '** character, and conforming applications shall not follow a **' ! '** character with <blank> characters.

[2addr] {editing command  
editing command  
...  
}  
Execute a list of *sed* editing commands only when the pattern space is selected. The list of *sed* editing commands shall be surrounded by braces and separated by <newline> characters, and conform to the following rules. The braces can be preceded or followed by <blank> characters. The editing commands can be preceded by <blank> characters, but shall not be followed by <blank> characters. The <right-brace> shall be preceded by a <newline> and can be preceded or followed by <blank> characters.

[1addr]a\  
text  
Write text to standard output as described previously.

[2addr]b [label]  
Branch to the **:** function bearing the *label*. If *label* is not specified, branch to the end of the script. The implementation shall support *labels* recognized as unique up to at least 8 characters; the actual length (greater than or equal to 8) that shall be supported by the implementation is unspecified. It is unspecified whether exceeding a label length causes an error or a silent truncation.

[2addr]c\  
text  
Delete the pattern space. With a 0 or 1 address or at the end of a 2-address range, place *text* on the output and start the next cycle.

[2addr]d  
Delete the pattern space and start the next cycle.

[2addr]D  
If the pattern space contains no <newline>, delete the pattern space and start a normal new cycle as if the **d** command was issued. Otherwise, delete the initial segment of the pattern space through the first <newline>, and start the next cycle

|        |                                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------|---------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 106438 |                                       | with the resultant pattern space and without reading any new input.                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 106439 | <b>[2addr]g</b>                       | Replace the contents of the pattern space by the contents of the hold space.                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 106440 | <b>[2addr]G</b>                       | Append to the pattern space a <newline> followed by the contents of the hold space.                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 106441 |                                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 106442 | <b>[2addr]h</b>                       | Replace the contents of the hold space with the contents of the pattern space.                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 106443 | <b>[2addr]H</b>                       | Append to the hold space a <newline> followed by the contents of the pattern space.                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 106444 |                                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 106445 | <b>[1addr]i\</b>                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 106446 | <i>text</i>                           | Write <i>text</i> to standard output.                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 106447 | <b>[2addr]l</b>                       | (The letter ell.) Write the pattern space to standard output in a visually unambiguous form. The characters listed in XBD <a href="#">Table 5-1</a> (on page 121) ('\\', '\a', '\b', '\f', '\r', '\t', '\v') shall be written as the corresponding escape sequence; the '\n' in that table is not applicable. Non-printable characters not in that table shall be written as one three-digit octal number (with a preceding <backslash>) for each byte in the character (most significant byte first). |

| 106477 |                                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 106478 |                                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 106479 |                                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 106480 |                                       | The replacement string shall be scanned from beginning to end. An <ampersand>                                                                                                                                                                                                                                                                                                                                                                                                                          |

106481 (' & ') appearing in the replacement shall be replaced by the string matching the  
 106482 BRE. The special meaning of ' & ' in this context can be suppressed by preceding it  
 106483 by a <backslash>. The characters "\n", where *n* is a digit, shall be replaced by the  
 106484 text matched by the corresponding back-reference expression. If the corresponding  
 106485 back-reference expression does not match, then the characters "\n" shall be  
 106486 replaced by the empty string. The special meaning of "\n" where *n* is a digit in  
 106487 this context, can be suppressed by preceding it by a <backslash>. For each other  
 106488 <backslash> encountered, the following character shall lose its special meaning (if  
 106489 any). The meaning of a <backslash> immediately followed by any character other  
 106490 than ' & ', <backslash>, a digit, or the delimiter character used for this command, is  
 106491 unspecified.

106492 A line can be split by substituting a <newline> into it. The application shall escape  
 106493 the <newline> in the replacement by preceding it by a <backslash>. A substitution  
 106494 shall be considered to have been performed even if the replacement string is  
 106495 identical to the string that it replaces. Any <backslash> used to alter the default  
 106496 meaning of a subsequent character shall be discarded from the BRE or the  
 106497 replacement before evaluating the BRE or using the replacement.

106498 The value of *flags* shall be zero or more of:

106499 *n* Substitute for the *n*th occurrence only of the BRE found within the  
 106500 pattern space.

106501 *g* Globally substitute for all non-overlapping instances of the BRE  
 106502 rather than just the first one. If both *g* and *n* are specified, the results  
 106503 are unspecified.

106504 *p* Write the pattern space to standard output if a replacement was  
 106505 made.

106506 *w wfile* Write. Append the pattern space to *wfile* if a replacement was made.  
 106507 A conforming application shall precede the *wfile* argument with one  
 106508 or more <blank> characters. If the *w* flag is not the last flag value  
 106509 given in a concatenation of multiple flag values, the results are  
 106510 undefined.

106511 [2addr]**t** [*label*]  
 106512 Test. Branch to the : command verb bearing the *label* if any substitutions have been  
 106513 made since the most recent reading of an input line or execution of a **t**. If *label* is  
 106514 not specified, branch to the end of the script.

106515 [2addr]**w** *wfile*  
 106516 Append (write) the pattern space to *wfile*.

106517 [2addr]**x** Exchange the contents of the pattern and hold spaces.

106518 [2addr]**y**/*string1*/*string2*/  
 106519 Replace all occurrences of characters in *string1* with the corresponding characters  
 106520 in *string2*. If a <backslash> followed by an ' n ' appear in *string1* or *string2*, the two  
 106521 characters shall be handled as a single <newline>. If the number of characters in  
 106522 *string1* and *string2* are not equal, or if any of the characters in *string1* appear more  
 106523 than once, the results are undefined. Any character other than <backslash> or  
 106524 <newline> can be used instead of <slash> to delimit the strings. If the delimiter is  
 106525 not ' n ', within *string1* and *string2*, the delimiter itself can be used as a literal  
 106526 character if it is preceded by a <backslash>. If a <backslash> character is  
 106527 immediately followed by a <backslash> character in *string1* or *string2*, the two

106528 <backslash> characters shall be counted as a single literal <backslash> character.  
 106529 The meaning of a <backslash> followed by any character that is not 'n', a  
 106530 <backslash>, or the delimiter character is undefined.

106531 [0addr]:label Do nothing. This command bears a *label* to which the **b** and **t** commands branch.

106532 [1addr]= Write the following to standard output:

106533 "%d\n", <current line number>

106534 [0addr] Ignore this empty command.

106535 [0addr]# Ignore the '#' and the remainder of the line (treat them as a comment), with the  
 106536 single exception that if the first two characters in the script are "#n", the default  
 106537 output shall be suppressed; this shall be the equivalent of specifying **-n** on the  
 106538 command line.

## 106539 EXIT STATUS

106540 The following exit values shall be returned:

106541 0 Successful completion.

106542 >0 An error occurred.

## 106543 CONSEQUENCES OF ERRORS

106544 Default.

## 106545 APPLICATION USAGE

106546 Regular expressions match entire strings, not just individual lines, but a <newline> is matched  
 106547 by '\n' in a *sed* RE; a <newline> is not allowed by the general definition of regular expression  
 106548 in POSIX.1-2008. Also note that '\n' cannot be used to match a <newline> at the end of an  
 106549 arbitrary input line; <newline> characters appear in the pattern space as a result of the **N** editing  
 106550 command.

## 106551 EXAMPLES

106552 This *sed* script simulates the BSD *cat -s* command, squeezing excess empty lines from standard  
 106553 input.

```
106554 sed -n '
106555 # Write non-empty lines.
106556 ./ {
106557 p
106558 d
106559 }
106560 # Write a single empty line, then look for more empty lines.
106561 /^$/ p
106562 # Get next line, discard the held <newline> (empty line),
106563 # and look for more empty lines.
106564 :Empty
106565 /^$/ {
106566 N
106567 s/./ /
106568 b Empty
106569 }
106570 # Write the non-empty line before going back to search
106571 # for the first in a set of empty lines.
106572 p
106573 '
```

The following *sed* command is a much simpler method of squeezing empty lines, although it is not quite the same as *cat -s* since it removes any initial empty lines:

```
sed -n '/./,/^$/p'
```

#### RATIONALE

This volume of POSIX.1-2008 requires implementations to support at least ten distinct *wfiles*, matching historical practice on many implementations. Implementations are encouraged to support more, but conforming applications should not exceed this limit.

The exit status codes specified here are different from those in System V. System V returns 2 for garbled *sed* commands, but returns zero with its usage message or if the input file could not be opened. The standard developers considered this to be a bug.

The manner in which the *l* command writes non-printable characters was changed to avoid the historical backspace-overstrike method, and other requirements to achieve unambiguous output were added. See the RATIONALE for *ed* for details of the format chosen, which is the same as that chosen for *sed*.

This volume of POSIX.1-2008 requires implementations to provide pattern and hold spaces of at least 8 192 bytes, larger than the 4 000 bytes spaces used by some historical implementations, but less than the 20 480 bytes limit used in an early proposal. Implementations are encouraged to allocate dynamically larger pattern and hold spaces as needed.

The requirements for acceptance of <blank> and <space> characters in command lines has been made more explicit than in early proposals to describe clearly the historical practice and to remove confusion about the phrase “protect initial blanks [*sic*] and tabs from the stripping that is done on every script line” that appears in much of the historical documentation of the *sed* utility description of text. (Not all implementations are known to have stripped <blank> characters from text lines, although they all have allowed leading <blank> characters preceding the address on a command line.)

The treatment of ‘#’ comments differs from the SVID which only allows a comment as the first line of the script, but matches BSD-derived implementations. The comment character is treated as a command, and it has the same properties in terms of being accepted with leading <blank> characters; the BSD implementation has historically supported this.

Early proposals required that a *script\_file* have at least one non-comment line. Some historical implementations have behaved in unexpected ways if this were not the case. The standard developers considered that this was incorrect behavior and that application developers should not have to avoid this feature. A correct implementation of this volume of POSIX.1-2008 shall permit *script\_files* that consist only of comment lines.

Early proposals indicated that if *-e* and *-f* options were intermixed, all *-e* options were processed before any *-f* options. This has been changed to process them in the order presented because it matches historical practice and is more intuitive.

The treatment of the *p* flag to the *s* command differs between System V and BSD-based systems when the default output is suppressed. In the two examples:

```
echo a | sed 's/a/A/p'
```

```
echo a | sed -n 's/a/A/p'
```

this volume of POSIX.1-2008, BSD, System V documentation, and the SVID indicate that the first example should write two lines with *A*, whereas the second should write one. Some System V systems write the *A* only once in both examples because the *p* flag is ignored if the *-n* option is not specified.

This is a case of a diametrical difference between systems that could not be reconciled through the compromise of declaring the behavior to be unspecified. The SVID/BSD/System V documentation behavior was adopted for this volume of POSIX.1-2008 because:

- No known documentation for any historic system describes the interaction between the **p** flag and the **-n** option.
- The selected behavior is more correct as there is no technical justification for any interaction between the **p** flag and the **-n** option. A relationship between **-n** and the **p** flag might imply that they are only used together, but this ignores valid scripts that interrupt the cyclical nature of the processing through the use of the **D**, **d**, **q**, or branching commands. Such scripts rely on the **p** suffix to write the pattern space because they do not make use of the default output at the “bottom” of the script.
- Because the **-n** option makes the **p** flag unnecessary, any interaction would only be useful if *sed* scripts were written to run both with and without the **-n** option. This is believed to be unlikely. It is even more unlikely that programmers have coded the **p** flag expecting it to be unnecessary. Because the interaction was not documented, the likelihood of a programmer discovering the interaction and depending on it is further decreased.
- Finally, scripts that break under the specified behavior produce too much output instead of too little, which is easier to diagnose and correct.

The form of the substitute command that uses the **n** suffix was limited to the first 512 matches in an early proposal. This limit has been removed because there is no reason an editor processing lines of {LINE\_MAX} length should have this restriction. The command **s/a/A/2047** should be able to substitute the 2 047th occurrence of **a** on a line.

The **b**, **t**, and **:** commands are documented to ignore leading white space, but no mention is made of trailing white space. Historical implementations of *sed* assigned different locations to the labels **'x'** and **"x "**. This is not useful, and leads to subtle programming errors, but it is historical practice, and changing it could theoretically break working scripts. Implementors are encouraged to provide warning messages about labels that are never used or jumps to labels that do not exist.

Historically, the *sed* **!** and **}** editing commands did not permit multiple commands on a single line using a <semicolon> as a command delimiter. Implementations are permitted, but not required, to support this extension.

Earlier versions of this standard allowed for implementations with bytes other than eight bits, but this has been modified in this version.

## FUTURE DIRECTIONS

None.

## CHANGE HISTORY

First released in Issue 2.

## Issue 5

The FUTURE DIRECTIONS section is added.

106662 **Issue 6**

106663 The following new requirements on POSIX implementations derive from alignment with the  
106664 Single UNIX Specification:

- 106665 • Implementations are required to support at least ten *wfile* arguments in an editing  
106666 command.

106667 The EXTENDED DESCRIPTION is changed to align with the IEEE P1003.2b draft standard.

106668 IEEE PASC Interpretation 1003.2 #190 is applied.

106669 IEEE PASC Interpretation 1003.2 #203 is applied, clarifying the meaning of the  
106670 <backslash>-escape sequences in a replacement string for a BRE.

106671 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/28 is applied, removing text describing  
106672 behavior on systems with bytes consisting of more than eight bits.

106673 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/29 is applied, making an editorial  
106674 correction within the Editing Commands in *sed* section.

106675 **Issue 7**

106676 Austin Group Interpretations 1003.1-2001 #006, #036, and #092 are applied.

106677 SD5-XCU-ERN-97 and SD5-XCU-ERN-123 are applied, updating the SYNOPSIS.

106678 A second example is added.

106679 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0133 [262], XCU/TC1-2008/0134 +  
106680 [282,431], XCU/TC1-2008/0135 [269], and XCU/TC1-2008/0136 [282,431] are applied.

106681 **NAME**

106682 sh — shell, the standard command language interpreter

106683 **SYNOPSIS**

```
106684 sh [-abCefhimnuvx] [-o option]... [+abCefhimnuvx] [+o option]...
106685 [command_file [argument...]]
106686 sh -c [-abCefhimnuvx] [-o option]... [+abCefhimnuvx] [+o option]...
106687 command_string [command_name [argument...]]
106688 sh -s [-abCefhimnuvx] [-o option]... [+abCefhimnuvx] [+o option]...
106689 [argument...]
```

106690 **DESCRIPTION**

106691 The *sh* utility is a command language interpreter that shall execute commands read from a  
 106692 command line string, the standard input, or a specified file. The application shall ensure that the  
 106693 commands to be executed are expressed in the language described in [Chapter 2](#) (on page 2319).

106694 Pathname expansion shall not fail due to the size of a file.

106695 Shell input and output redirections have an implementation-defined offset maximum that is  
 106696 established in the open file description.

106697 **OPTIONS**

106698 The *sh* utility shall conform to XBD [Section 12.2](#) (on page 215), with an extension for support of a  
 106699 leading <plus-sign> ( ' + ' ) as noted below.

106700 The *-a*, *-b*, *-C*, *-e*, *-f*, *-m*, *-n*, *-o option*, *-u*, *-v*, and *-x* options are described as part of the *set*  
 106701 utility in [Section 2.14](#) (on page 2356). The option letters derived from the *set* special built-in shall  
 106702 also be accepted with a leading <plus-sign> ( ' + ' ) instead of a leading <hyphen> (meaning the  
 106703 reverse case of the option as described in this volume of POSIX.1-2008).

106704 The following additional options shall be supported:

106705 *-c* Read commands from the *command\_string* operand. Set the value of special  
 106706 parameter 0 (see [Section 2.5.2](#), on page 2324) from the value of the *command\_name*  
 106707 operand and the positional parameters (\$1, \$2, and so on) in sequence from the  
 106708 remaining *argument* operands. No commands shall be read from the standard  
 106709 input.

106710 *-i* Specify that the shell is *interactive*; see below. An implementation may treat  
 106711 specifying the *-i* option as an error if the real user ID of the calling process does  
 106712 not equal the effective user ID or if the real group ID does not equal the effective  
 106713 group ID.

106714 *-s* Read commands from the standard input.

106715 If there are no operands and the *-c* option is not specified, the *-s* option shall be assumed.

106716 If the *-i* option is present, or if there are no operands and the shell's standard input and  
 106717 standard error are attached to a terminal, the shell is considered to be *interactive*.

106718 **OPERANDS**

106719 The following operands shall be supported:

106720 *-* A single <hyphen> shall be treated as the first operand and then ignored. If both  
 106721 ' - ' and " -- " are given as arguments, or if other operands precede the single  
 106722 <hyphen>, the results are undefined.

106723 *argument* The positional parameters (\$1, \$2, and so on) shall be set to *arguments*, if any.

106724 *command\_file* The pathname of a file containing commands. If the pathname contains one or  
 106725 more <slash> characters, the implementation attempts to read that file; the file  
 106726 need not be executable. If the pathname does not contain a <slash> character:

- The implementation shall attempt to read that file from the current working directory; the file need not be executable.
- If the file is not in the current working directory, the implementation may perform a search for an executable file using the value of *PATH*, as described in [Section 2.9.1.1](#) (on page 2339).

106727

106728

106729

106730

106731

106732 Special parameter 0 (see [Section 2.5.2](#), on page 2324) shall be set to the value of  
 106733 *command\_file*. If *sh* is called using a synopsis form that omits *command\_file*, special  
 106734 parameter 0 shall be set to the value of the first argument passed to *sh* from its  
 106735 parent (for example, *argv*[0] for a C program), which is normally a pathname used  
 106736 to execute the *sh* utility.

106737 *command\_name*

106738 A string assigned to special parameter 0 when executing the commands in  
 106739 *command\_string*. If *command\_name* is not specified, special parameter 0 shall be set  
 106740 to the value of the first argument passed to *sh* from its parent (for example, *argv*[0]  
 106741 for a C program), which is normally a pathname used to execute the *sh* utility.

106742 *command\_string*

106743 A string that shall be interpreted by the shell as one or more commands, as if the  
 106744 string were the argument to the *system()* function defined in the System Interfaces  
 106745 volume of POSIX.1-2008. If the *command\_string* operand is an empty string, *sh* shall  
 106746 exit with a zero exit status.

106747 **STDIN**

106748 The standard input shall be used only if one of the following is true:

- The *-s* option is specified.
- The *-c* option is not specified and no operands are specified.
- The script executes one or more commands that require input from standard input (such as a *read* command that does not redirect its input).

106749

106750

106751

106752

106753 See the INPUT FILES section.

106754

106755 When the shell is using standard input and it invokes a command that also uses standard input,  
 106756 the shell shall ensure that the standard input file pointer points directly after the command it has  
 106757 read when the command begins execution. It shall not read ahead in such a manner that any  
 106758 characters intended to be read by the invoked command are consumed by the shell (whether  
 106759 interpreted by the shell or not) or that characters that are not read by the invoked command are  
 106760 not seen by the shell. When the command expecting to read standard input is started  
 106761 asynchronously by an interactive shell, it is unspecified whether characters are read by the  
 command or interpreted by the shell.

106762

106763 If the standard input to *sh* is a FIFO or terminal device and is set to non-blocking reads, then *sh*  
 106764 shall enable blocking reads on standard input. This shall remain in effect when the command  
 completes.

106765 **INPUT FILES**

106766 The input file shall be a text file, except that line lengths shall be unlimited. If the input file is  
 106767 empty or consists solely of blank lines or comments, or both, *sh* shall exit with a zero exit status.

106768 **ENVIRONMENT VARIABLES**

106769 The following environment variables shall affect the execution of *sh*:

106770 UP **ENV** This variable, when and only when an interactive shell is invoked, shall be  
 106771 subjected to parameter expansion (see [Section 2.6.2](#), on page 2328) by the shell, and  
 106772 the resulting value shall be used as a pathname of a file containing shell  
 106773 commands to execute in the current environment. The file need not be executable.  
 106774 If the expanded value of *ENV* is not an absolute pathname, the results are  
 106775 unspecified. *ENV* shall be ignored if the real and effective user IDs or real and  
 106776 effective group IDs of the process are different.

106777 UP **FCEDIT** This variable, when expanded by the shell, shall determine the default value for  
 106778 the *-e editor* option's *editor* option-argument. If *FCEDIT* is null or unset, *ed* shall be  
 106779 used as the editor.

106780 UP **HISTFILE** Determine a pathname naming a command history file. If the *HISTFILE* variable is  
 106781 not set, the shell may attempt to access or create a file *.sh\_history* in the directory  
 106782 referred to by the *HOME* environment variable. If the shell cannot obtain both read  
 106783 and write access to, or create, the history file, it shall use an unspecified  
 106784 mechanism that allows the history to operate properly. (References to history  
 106785 "file" in this section shall be understood to mean this unspecified mechanism in  
 106786 such cases.) An implementation may choose to access this variable only when  
 106787 initializing the history file; this initialization shall occur when *fc* or *sh* first attempt  
 106788 to retrieve entries from, or add entries to, the file, as the result of commands issued  
 106789 by the user, the file named by the *ENV* variable, or implementation-defined system  
 106790 start-up files. Implementations may choose to disable the history list mechanism  
 106791 for users with appropriate privileges who do not set *HISTFILE*; the specific  
 106792 circumstances under which this occurs are implementation-defined. If more than  
 106793 one instance of the shell is using the same history file, it is unspecified how  
 106794 updates to the history file from those shells interact. As entries are deleted from the  
 106795 history file, they shall be deleted oldest first. It is unspecified when history file  
 106796 entries are physically removed from the history file.

106797 **HISTSIZE** Determine a decimal number representing the limit to the number of previous  
 106798 commands that are accessible. If this variable is unset, an unspecified default  
 106799 greater than or equal to 128 shall be used. The maximum number of commands in  
 106800 the history list is unspecified, but shall be at least 128. An implementation may  
 106801 choose to access this variable only when initializing the history file, as described  
 106802 under *HISTFILE*. Therefore, it is unspecified whether changes made to *HISTSIZE*  
 106803 after the history file has been initialized are effective.

106804 UP **HOME** Determine the pathname of the user's home directory. The contents of *HOME* are  
 106805 used in tilde expansion as described in [Section 2.6.1](#) (on page 2327).

106806 **IFS** A string treated as a list of characters that is used for field splitting and to split  
 106807 lines into fields with the *read* command.

106808 If *IFS* is not set, it shall behave as normal for an unset variable, except that field  
 106809 splitting by the shell and line splitting by the *read* command shall be performed as  
 106810 if the value of *IFS* is <space><tab><newline>; see [Section 2.6.5](#) (on page 2333).

106811 Implementations may ignore the value of *IFS* in the environment, or the absence of

| 106829 | UP <i>MAIL</i>      | Determine a pathname of the user's mailbox file for purposes of incoming mail notification. If this variable is set, the shell shall inform the user if the file named by the variable is created or if its modification time has changed. Informing the user shall be accomplished by writing a string of unspecified format to standard error prior to the writing of the next primary prompt string. Such check shall be performed only after the completion of the interval defined by the <i>MAILCHECK</i> variable after the last such check. The user shall be informed only if <i>MAIL</i> is set and <i>MAILPATH</i> is not set.                                          |
| 106830 |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| 106838 |                     | Establish a decimal integer value that specifies how often (in seconds) the shell shall check for the arrival of mail in the files specified by the <i>MAILPATH</i> or <i>MAIL</i> variables. The default value shall be 600 seconds. If set to zero, the shell shall check before issuing each primary prompt.                                                                                                                                                                                                                                                                                                                                                                    |

| 106842 | UP <i>MAILPATH</i>  | Provide a list of pathnames and optional messages separated by <colon> characters. If this variable is set, the shell shall inform the user if any of the files named by the variable are created or if any of their modification times change. (See the preceding entry for <i>MAIL</i> for descriptions of mail arrival and user informing.) Each pathname can be followed by ' % ' and a string that shall be subjected to parameter expansion and written to standard error when the modification time changes. If a ' % ' character in the pathname is preceded by a <backslash>, it shall be treated as a literal ' % ' in the pathname. The default message is unspecified. |

| 106854 | <i>PWD</i>          | This variable shall represent an absolute pathname of the current working directory. Assignments to this variable may be ignored.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 106855 |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

106856 **ASYNCHRONOUS EVENTS**

106857 The *sh* utility shall take the standard action for all signals (see [Section 1.4](#), on page 2310) with the  
 106858 following exceptions.

106859 If the shell is interactive, SIGINT signals received during command line editing shall be handled  
 106860 as described in the EXTENDED DESCRIPTION, and SIGINT signals received at other times  
 106861 shall be caught but no action performed.

106862 If the shell is interactive:

- 106863 • SIGQUIT and SIGTERM signals shall be ignored.
- 106864 • If the **-m** option is in effect, SIGTTIN, SIGTTOU, and SIGTSTP signals shall be ignored.
- 106865 • If the **-m** option is not in effect, it is unspecified whether SIGTTIN, SIGTTOU, and  
 106866 SIGTSTP signals are ignored, set to the default action, or caught. If they are caught, the  
 106867 shell shall, in the signal-catching function, set the signal to the default action and raise the  
 106868 signal (after taking any appropriate steps, such as restoring terminal settings).

106869 The standard actions, and the actions described above for interactive shells, can be overridden  
 106870 by use of the *trap* special built-in utility (see *trap* (on page 2391) and [Section 2.11](#), on page 2353).

106871 **STDOUT**

106872 See the STDERR section.

106873 **STDERR**

106874 Except as otherwise stated (by the descriptions of any invoked utilities or in interactive mode),  
 106875 standard error shall be used only for diagnostic messages.

106876 **OUTPUT FILES**

106877 None.

106878 **EXTENDED DESCRIPTION**

106879 UP See [Chapter 2](#). The functionality described in the rest of the EXTENDED DESCRIPTION section  
 106880 shall be provided on implementations that support the User Portability Utilities option (and the  
 106881 rest of this section is not further shaded for this option).

106882 **Command History List**

106883 When the *sh* utility is being used interactively, it shall maintain a list of commands previously  
 106884 entered from the terminal in the file named by the *HISTFILE* environment variable. The type,  
 106885 size, and internal format of this file are unspecified. Multiple *sh* processes can share access to the  
 106886 file for a user, if file access permissions allow this; see the description of the *HISTFILE*  
 106887 environment variable.

106888 **Command Line Editing**

106889 When *sh* is being used interactively from a terminal, the current command and the command  
 106890 history (see *fc*) can be edited using *vi*-mode command line editing. This mode uses commands,  
 106891 described below, similar to a subset of those described in the *vi* utility. Implementations may  
 106892 offer other command line editing modes corresponding to other editing utilities.

106893 The command *set -o vi* shall enable *vi*-mode editing and place *sh* into *vi* insert mode (see  
 106894 [Command Line Editing \(vi-mode\)](#), on page 3194). This command also shall disable any other  
 106895 editing mode that the implementation may provide. The command *set +o vi* disables *vi*-mode  
 106896 editing.

106897 Certain block-mode terminals may be unable to support shell command line editing. If a  
 106898 terminal is unable to provide either edit mode, it need not be possible to *set -o vi* when using the

106899 shell on this terminal.

106900 In the following sections, the characters *erase*, *interrupt*, *kill*, and *end-of-file* are those set by the  
106901 *stty* utility.

## 106902 **Command Line Editing (vi-mode)**

106903 In *vi* editing mode, there shall be a distinguished line, the edit line. All the editing operations  
106904 which modify a line affect the edit line. The edit line is always the newest line in the command  
106905 history buffer.

106906 With *vi*-mode enabled, *sh* can be switched between insert mode and command mode.

106907 When in insert mode, an entered character shall be inserted into the command line, except as  
106908 noted in [vi Line Editing Insert Mode](#). Upon entering *sh* and after termination of the previous  
106909 command, *sh* shall be in insert mode.

106910 Typing an escape character shall switch *sh* into command mode (see [vi Line Editing Command](#)  
106911 [Mode](#), on page 3195). In command mode, an entered character shall either invoke a defined  
106912 operation, be used as part of a multi-character operation, or be treated as an error. A character  
106913 that is not recognized as part of an editing command shall terminate any specific editing  
106914 command and shall alert the terminal. If *sh* receives a SIGINT signal in command mode |  
106915 (whether generated by typing the *interrupt* character or by other means), it shall terminate |  
106916 command line editing on the current command line, reissue the prompt on the next line of the |  
106917 terminal, and reset the command history (see [fc](#)) so that the most recently executed command is |  
106918 the previous command (that is, the command that was being edited when it was interrupted is |  
106919 not re-entered into the history).

106920 In the following sections, the phrase “move the cursor to the beginning of the word” shall mean  
106921 “move the cursor to the first character of the current word” and the phrase “move the cursor to  
106922 the end of the word” shall mean “move the cursor to the last character of the current word”. The  
106923 phrase “beginning of the command line” indicates the point between the end of the prompt  
106924 string issued by the shell (or the beginning of the terminal line, if there is no prompt string) and  
106925 the first character of the command text.

## 106926 **vi Line Editing Insert Mode**

106927 While in insert mode, any character typed shall be inserted in the current command line, unless  
106928 it is from the following set.

106929 <newline> Execute the current command line. If the current command line is not empty, this  
106930 line shall be entered into the command history (see [fc](#)).

106931 *erase* Delete the character previous to the current cursor position and move the current  
106932 cursor position back one character. In insert mode, characters shall be erased from  
106933 both the screen and the buffer when backspacing.

106934 *interrupt* If *sh* receives a SIGINT signal in insert mode (whether generated by typing the |  
106935 *interrupt* character or by other means), it shall terminate command line editing |  
106936 with the same effects as described for interrupting command mode; see [Command](#)  
106937 [Line Editing \(vi-mode\)](#).

106938 *kill* Clear all the characters from the input line.

106939 <control>-V Insert the next character input, even if the character is otherwise a special insert  
106940 mode character.

106941 <control>-W Delete the characters from the one preceding the cursor to the preceding word  
 106942 boundary. The word boundary in this case is the closer to the cursor of either the  
 106943 beginning of the line or a character that is in neither the **blank** nor **punct** character  
 106944 classification of the current locale.

106945 *end-of-file* Interpreted as the end of input in *sh*. This interpretation shall occur only at the  
 106946 beginning of an input line. If *end-of-file* is entered other than at the beginning of the  
 106947 line, the results are unspecified.

106948 <ESC> Place *sh* into command mode.

## 106949 **vi Line Editing Command Mode**

106950 In command mode for the command line editing feature, decimal digits not beginning with 0  
 106951 that precede a command letter shall be remembered. Some commands use these decimal digits  
 106952 as a count number that affects the operation.

106953 The term *motion command* represents one of the commands:

106954 <space> 0 b F l W ^ \$ ; E f T w | , B e h t

106955 If the current line is not the edit line, any command that modifies the current line shall cause the  
 106956 content of the current line to replace the content of the edit line, and the current line shall  
 106957 become the edit line. This replacement cannot be undone (see the **u** and **U** commands below).  
 106958 The modification requested shall then be performed to the edit line. When the current line is the  
 106959 edit line, the modification shall be done directly to the edit line.

106960 Any command that is preceded by *count* shall take a count (the numeric value of any preceding  
 106961 decimal digits). Unless otherwise noted, this count shall cause the specified operation to repeat  
 106962 by the number of times specified by the count. Also unless otherwise noted, a *count* that is out  
 106963 of range is considered an error condition and shall alert the terminal, but neither the cursor  
 106964 position, nor the command line, shall change.

106965 The terms *word* and *bigword* are used as defined in the *vi* description. The term *save buffer*  
 106966 corresponds to the term *unnamed buffer* in *vi*.

106967 The following commands shall be recognized in command mode:

106968 <newline> Execute the current command line. If the current command line is not empty, this  
 106969 line shall be entered into the command history (see *fc*).

106970 <control>-L Redraw the current command line. Position the cursor at the same location on the  
 106971 redrawn line.

106972 **#** Insert the character ' #' at the beginning of the current command line and treat the  
 106973 resulting edit line as a comment. This line shall be entered into the command  
 106974 history; see *fc*.

106975 **=** Display the possible shell word expansions (see [Section 2.6](#), on page 2327) of the  
 106976 bigword at the current command line position.

106977 **Note:** This does not modify the content of the current line, and therefore does not cause  
 106978 the current line to become the edit line.

106979 These expansions shall be displayed on subsequent terminal lines. If the bigword  
 106980 contains none of the characters '?', '\*', or '[', an <asterisk> ('\*') shall be  
 106981 implicitly assumed at the end. If any directories are matched, these expansions  
 106982 shall have a '/' character appended. After the expansion, the line shall be  
 106983 redrawn, the cursor repositioned at the current cursor position, and *sh* shall be  
 106984 placed in command mode.

|        |                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 106985 | \              | Perform pathname expansion (see <a href="#">Section 2.6.6</a> , on page 2333) on the current bigword, up to the largest set of characters that can be matched uniquely. If the bigword contains none of the characters '?', '*', or '[', an <asterisk> ('*') shall be implicitly assumed at the end. This maximal expansion then shall replace the original bigword in the command line, and the cursor shall be placed after this expansion. If the resulting bigword completely and uniquely matches a directory, a '/' character shall be inserted directly after the bigword. If some other file is completely matched, a single <space> shall be inserted after the bigword. After this operation, <i>sh</i> shall be placed in insert mode. |
| 106986 |                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 106987 |                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 106988 |                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| 106994 | *              | Perform pathname expansion on the current bigword and insert all expansions into the command to replace the current bigword, with each expansion separated by a single <space>. If at the end of the line, the current cursor position shall be moved to the first column position following the expansions and <i>sh</i> shall be placed in insert mode. Otherwise, the current cursor position shall be the last column position of the first character after the expansions and <i>sh</i> shall be placed in insert mode. If the current bigword contains none of the characters '?', '*', or '[', before the operation, an <asterisk> ('*') shall be implicitly assumed at the end.                                                           |
| 106995 |                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| 107002 | @letter        | Insert the value of the alias named <i>_letter</i> . The symbol <i>letter</i> represents a single alphabetic character from the portable character set; implementations may support additional characters as an extension. If the alias <i>_letter</i> contains other editing commands, these commands shall be performed as part of the insertion. If no alias <i>_letter</i> is enabled, this command shall have no effect.                                                                                                                                                                                                                                                                                                                     |

| 107007 | [count]~       | Convert, if the current character is a lowercase letter, to the equivalent uppercase letter and <i>vice versa</i> , as prescribed by the current locale. The current cursor position then shall be advanced by one character. If the cursor was positioned on the last character of the line, the case conversion shall occur, but the cursor shall not advance. If the '~' command is preceded by a <i>count</i> , that number of characters shall be converted, and the cursor shall be advanced to the character position after the last character converted. If the <i>count</i> is larger than the number of characters after the cursor, this shall not be considered an error; the cursor shall advance to the last character on the line. |

| 107023 | [number]v      | Invoke the <i>vi</i> editor to edit the current command line in a temporary file. When the editor exits, the commands in the temporary file shall be executed and placed in the command history. If a <i>number</i> is included, it specifies the command number in the command history to be edited, rather than the current command line.                                                                                                                                                                                                                                                                                                                                                                                                       |

| 107126 |                               | character under the current cursor position shall be deleted. If the <i>count</i> is larger       |
| 107127 |                               | than the number of characters between the current cursor position and the end of                  |
| 107128 |                               | the command line toward which the motion command would move the cursor, this                      |
| 107129 |                               | shall not be considered an error; all of the remaining characters in the                          |
| 107130 |                               | aforementioned range shall be deleted and insert mode shall be entered. If the                    |
| 107131 |                               | motion command is invalid, the terminal shall be alerted, the cursor shall not be                 |
| 107132 |                               | moved, and no text shall be deleted.                                                              |
| 107133 | <b>C</b>                      | Delete from the current character to the end of the line and enter insert mode at the             |
| 107134 |                               | new end-of-line.                                                                                  |
| 107135 | <b>S</b>                      | Clear the entire edit line and enter insert mode.                                                 |
| 107136 | <b>[count]rc</b>              | Replace the current character with the character 'c'. With a number <i>count</i> ,                |
| 107137 |                               | replace the current and the following <i>count</i> –1 characters. After this command, the         |
| 107138 |                               | current cursor position shall be on the last character that was changed. If the <i>count</i>      |
| 107139 |                               | is larger than the number of characters after the cursor, this shall not be considered            |
| 107140 |                               | an error; all of the remaining characters shall be changed.                                       |
| 107141 | <b>[count]_</b>               | Append a <space> after the current character position and then append the last                    |
| 107142 |                               | bigword in the previous input line after the <space>. Then enter insert mode after                |
| 107143 |                               | the last character just appended. With a number <i>count</i> , append the <i>count</i> th bigword |
| 107144 |                               | in the previous line.                                                                             |
| 107145 | <b>[count]x</b>               | Delete the character at the current cursor position and place the deleted characters              |
| 107146 |                               | in the save buffer. If the cursor was positioned on the last character of the line, the           |
| 107147 |                               | character shall be deleted and the cursor position shall be moved to the previous                 |
| 107148 |                               | character (the new last character). If the <i>count</i> is larger than the number of              |
| 107149 |                               | characters after the cursor, this shall not be considered an error; all the characters            |
| 107150 |                               | from the cursor to the end of the line shall be deleted.                                          |
| 107151 | <b>[count]X</b>               | Delete the character before the current cursor position and place the deleted                     |
| 107152 |                               | characters in the save buffer. The character under the current cursor position shall              |
| 107153 |                               | not change. If the cursor was positioned on the first character of the line, the                  |
| 107154 |                               | terminal shall be alerted, and the X command shall have no effect. If the line                    |
| 107155 |                               | contained a single character, the X command shall have no effect. If the line                     |
| 107156 |                               | contained no characters, the terminal shall be alerted and the cursor shall not be                |
| 107157 |                               | moved. If the <i>count</i> is larger than the number of characters before the cursor, this        |
| 107158 |                               | shall not be considered an error; all the characters from before the cursor to the                |
| 107159 |                               | beginning of the line shall be deleted.                                                           |
| 107160 | <b>[count]d</b> <i>motion</i> |                                                                                                   |
| 107161 |                               | Delete the characters between the current cursor position and the character                       |
| 107162 |                               | position that would result from the motion command. A number <i>count</i> repeats the             |
| 107163 |                               | motion command <i>count</i> times. If the motion command would move toward the                    |
| 107164 |                               | beginning of the command line, the character under the current cursor position                    |
| 107165 |                               | shall not be deleted. If the motion command is <b>d</b> , the entire current command line         |
| 107166 |                               | shall be cleared. If the <i>count</i> is larger than the number of characters between the         |
| 107167 |                               | current cursor position and the end of the command line toward which the motion                   |
| 107168 |                               | command would move the cursor, this shall not be considered an error; all of the                  |
| 107169 |                               | remaining characters in the aforementioned range shall be deleted. The deleted                    |
| 107170 |                               | characters shall be placed in the save buffer.                                                    |

|        |                       |                                                                                               |
|--------|-----------------------|-----------------------------------------------------------------------------------------------|
| 107171 | <b>D</b>              | Delete all characters from the current cursor position to the end of the line. The            |
| 107172 |                       | deleted characters shall be placed in the save buffer.                                        |
| 107173 | <b>[count]ymotion</b> |                                                                                               |
| 107174 |                       | Yank (that is, copy) the characters from the current cursor position to the position          |
| 107175 |                       | resulting from the motion command into the save buffer. A number <i>count</i> shall be        |
| 107176 |                       | applied to the motion command. If the motion command would move toward the                    |
| 107177 |                       | beginning of the command line, the character under the current cursor position                |
| 107178 |                       | shall not be included in the set of yanked characters. If the motion command is <b>y</b> ,    |
| 107179 |                       | the entire current command line shall be yanked into the save buffer. The current             |
| 107180 |                       | cursor position shall be unchanged. If the <i>count</i> is larger than the number of          |
| 107181 |                       | characters between the current cursor position and the end of the command line                |
| 107182 |                       | toward which the motion command would move the cursor, this shall not be                      |
| 107183 |                       | considered an error; all of the remaining characters in the aforementioned range              |
| 107184 |                       | shall be yanked.                                                                              |
| 107185 | <b>Y</b>              | Yank the characters from the current cursor position to the end of the line into the          |
| 107186 |                       | save buffer. The current character position shall be unchanged.                               |
| 107187 | <b>[count]p</b>       | Put a copy of the current contents of the save buffer after the current cursor                |
| 107188 |                       | position. The current cursor position shall be advanced to the last character put             |
| 107189 |                       | from the save buffer. A <i>count</i> shall indicate how many copies of the save buffer        |
| 107190 |                       | shall be put.                                                                                 |
| 107191 | <b>[count]P</b>       | Put a copy of the current contents of the save buffer before the current cursor               |
| 107192 |                       | position. The current cursor position shall be moved to the last character put from           |
| 107193 |                       | the save buffer. A <i>count</i> shall indicate how many copies of the save buffer shall be    |
| 107194 |                       | put.                                                                                          |
| 107195 | <b>u</b>              | Undo the last command that changed the edit line. This operation shall not undo               |
| 107196 |                       | the copy of any command line to the edit line.                                                |
| 107197 | <b>U</b>              | Undo all changes made to the edit line. This operation shall not undo the copy of             |
| 107198 |                       | any command line to the edit line.                                                            |
| 107199 | <b>[count]k</b>       |                                                                                               |
| 107200 | <b>[count]–</b>       | Set the current command line to be the <i>count</i> th previous command line in the shell     |
| 107201 |                       | command history. If <i>count</i> is not specified, it shall default to 1. The cursor shall be |
| 107202 |                       | positioned on the first character of the new command. If a <b>k</b> or <b>–</b> command would |
| 107203 |                       | retreat past the maximum number of commands in effect for this shell (affected by             |
| 107204 |                       | the <i>HISTSIZE</i> environment variable), the terminal shall be alerted, and the             |
| 107205 |                       | command shall have no effect.                                                                 |
| 107206 | <b>[count]j</b>       |                                                                                               |
| 107207 | <b>[count]+</b>       | Set the current command line to be the <i>count</i> th next command line in the shell         |
| 107208 |                       | command history. If <i>count</i> is not specified, it shall default to 1. The cursor shall be |
| 107209 |                       | positioned on the first character of the new command. If a <b>j</b> or <b>+</b> command       |
| 107210 |                       | advances past the edit line, the current command line shall be restored to the edit           |
| 107211 |                       | line and the terminal shall be alerted.                                                       |
| 107212 | <b>[number]G</b>      | Set the current command line to be the oldest command line stored in the shell                |
| 107213 |                       | command history. With a number <i>number</i> , set the current command line to be the         |
| 107214 |                       | command line <i>number</i> in the history. If command line <i>number</i> does not exist, the  |
| 107215 |                       | terminal shall be alerted and the command line shall not be changed.                          |

107216 */pattern<newline>*

107217 Move backwards through the command history, searching for the specified  
 107218 pattern, beginning with the previous command line. Patterns use the pattern  
 107219 matching notation described in [Section 2.13](#) (on page 2354), except that the '^'  
 107220 character shall have special meaning when it appears as the first character of  
 107221 *pattern*. In this case, the '^' is discarded and the characters after the '^' shall be  
 107222 matched only at the beginning of a line. Commands in the command history shall  
 107223 be treated as strings, not as filenames. If the pattern is not found, the current  
 107224 command line shall be unchanged and the terminal is alerted. If it is found in a  
 107225 previous line, the current command line shall be set to that line and the cursor  
 107226 shall be set to the first character of the new command line.

107227 If *pattern* is empty, the last non-empty pattern provided to / or ? shall be used. If  
 107228 there is no previous non-empty pattern, the terminal shall be alerted and the  
 107229 current command line shall remain unchanged.

107230 *?pattern<newline>*

107231 Move forwards through the command history, searching for the specified pattern,  
 107232 beginning with the next command line. Patterns use the pattern matching notation  
 107233 described in [Section 2.13](#) (on page 2354), except that the '^' character shall have  
 107234 special meaning when it appears as the first character of *pattern*. In this case, the  
 107235 '^' is discarded and the characters after the '^' shall be matched only at the  
 107236 beginning of a line. Commands in the command history shall be treated as strings,  
 107237 not as filenames. If the pattern is not found, the current command line shall be  
 107238 unchanged and the terminal alerted. If it is found in a following line, the current  
 107239 command line shall be set to that line and the cursor shall be set to the first  
 107240 character of the new command line.

107241 If *pattern* is empty, the last non-empty pattern provided to / or ? shall be used. If  
 107242 there is no previous non-empty pattern, the terminal shall be alerted and the  
 107243 current command line shall remain unchanged.

107244 **n** Repeat the most recent / or ? command. If there is no previous / or ?, the terminal  
 107245 shall be alerted and the current command line shall remain unchanged.

107246 **N** Repeat the most recent / or ? command, reversing the direction of the search. If  
 107247 there is no previous / or ?, the terminal shall be alerted and the current command  
 107248 line shall remain unchanged.

## 107249 EXIT STATUS

107250 The following exit values shall be returned:

107251 0 The script to be executed consisted solely of zero or more blank lines or comments, or  
 107252 both.

107253 1-125 A non-interactive shell detected an error other than *command\_file* not found, including  
 107254 but not limited to syntax, redirection, or variable assignment errors.

107255 127 A specified *command\_file* could not be found by a non-interactive shell.

107256 Otherwise, the shell shall return the exit status of the last command it invoked or attempted to  
 107257 invoke (see also the *exit* utility in [Section 2.14](#), on page 2356).

## 107258 CONSEQUENCES OF ERRORS

107259 See [Section 2.8.1](#) (on page 2337).

## APPLICATION USAGE

Standard input and standard error are the files that determine whether a shell is interactive when `-i` is not specified. For example:

```
sh > file
```

and:

```
sh 2> file
```

create interactive and non-interactive shells, respectively. Although both accept terminal input, the results of error conditions are different, as described in [Section 2.8.1](#) (on page 2337); in the second example a redirection error encountered by a special built-in utility aborts the shell.

A conforming application must protect its first operand, if it starts with a <plus-sign>, by preceding it with the `--` argument that denotes the end of the options.

Applications should note that the standard *PATH* to the shell cannot be assumed to be either `/bin/sh` or `/usr/bin/sh`, and should be determined by interrogation of the *PATH* returned by *getconf PATH*, ensuring that the returned pathname is an absolute pathname and not a shell built-in.

For example, to determine the location of the standard *sh* utility:

```
command -v sh
```

On some implementations this might return:

```
/usr/xpg4/bin/sh
```

Furthermore, on systems that support executable scripts (the `#!` construct), it is recommended that applications using executable scripts install them using *getconf PATH* to determine the shell pathname and update the `#!` script appropriately as it is being installed (for example, with *sed*). For example:

```
#
Installation time script to install correct POSIX shell pathname
#
Get list of paths to check
#
Sifs=$IFS
Sifs_set=${IFS+y}
IFS=:
set -- $(getconf PATH)
if ["$Sifs_set" = y]
then
 IFS=$Sifs
else
 unset IFS
fi
#
Check each path for 'sh'
#
for i
do
 if [-x "${i}/sh]
 then
 Pshell=${i}/sh
```

```

107306 fi
107307 done
107308 #
107309 # This is the list of scripts to update. They should be of the
107310 # form '${name}.source' and will be transformed to '${name}'.
107311 # Each script should begin:
107312 #
107313 # #!INSTALLSHELLPATH
107314 #
107315 scripts="a b c"
107316 #
107317 # Transform each script
107318 #
107319 for i in ${scripts}
107320 do
107321 sed -e "s|INSTALLSHELLPATH|${Pshell}|" < ${i}.source > ${i}
107322 done

```

### 107323 EXAMPLES

- 107324 1. Execute a shell command from a string:
- 107325     sh -c "cat myfile"
- 107326 2. Execute a shell script from a file in the current directory:
- 107327     sh my\_shell\_cmds

### 107328 RATIONALE

107329 The *sh* utility and the *set* special built-in utility share a common set of options.

107330 The name *IFS* was originally an abbreviation of “Input Field Separators”; however, this name is  
 107331 misleading as the *IFS* characters are actually used as field terminators. The KornShell ignores the  
 107332 contents of *IFS* upon entry to the script. A conforming application cannot rely on importing *IFS*.  
 107333 One justification for this, beyond security considerations, is to assist possible future shell  
 107334 compilers. Allowing *IFS* to be imported from the environment prevents many optimizations that  
 107335 might otherwise be performed via dataflow analysis of the script itself.

107336 The text in the STDIN section about non-blocking reads concerns an instance of *sh* that has been  
 107337 invoked, probably by a C-language program, with standard input that has been opened using  
 107338 the `O_NONBLOCK` flag; see `open()` in the System Interfaces volume of POSIX.1-2008. If the shell  
 107339 did not reset this flag, it would immediately terminate because no input data would be available  
 107340 yet and that would be considered the same as end-of-file.

107341 The options associated with a *restricted shell* (command name *rsh* and the `-r` option) were  
 107342 excluded because the standard developers considered that the implied level of security could  
 107343 not be achieved and they did not want to raise false expectations.

107344 On systems that support set-user-ID scripts, a historical trapdoor has been to link a script to the  
 107345 name `-i`. When it is called by a sequence such as:

107346 sh -

107347 or by:

107348 #! usr/bin/sh -

107349 the historical systems have assumed that no option letters follow. Thus, this volume of  
 107350 POSIX.1-2008 allows the single `<hyphen>` to mark the end of the options, in addition to the use

of the regular "--" argument, because it was considered that the older practice was so pervasive. An alternative approach is taken by the KornShell, where real and effective user/group IDs must match for an interactive shell; this behavior is specifically allowed by this volume of POSIX.1-2008.

**Note:** There are other problems with set-user-ID scripts that the two approaches described here do not resolve.

The initialization process for the history file can be dependent on the system start-up files, in that they may contain commands that effectively preempt the user's settings of *HISTFILE* and *HISTSIZE*. For example, function definition commands are recorded in the history file, unless the *set -o nolog* option is set. If the system administrator includes function definitions in some system start-up file called before the *ENV* file, the history file is initialized before the user gets a chance to influence its characteristics. In some historical shells, the history file is initialized just after the *ENV* file has been processed. Therefore, it is implementation-defined whether changes made to *HISTFILE* after the history file has been initialized are effective.

The default messages for the various *MAIL*-related messages are unspecified because they vary across implementations. Typical messages are:

"you have mail\n"

or:

"you have new mail\n"

It is important that the descriptions of command line editing refer to the same shell as that in POSIX.1-2008 so that interactive users can also be application programmers without having to deal with programmatic differences in their two environments. It is also essential that the utility name *sh* be specified because this explicit utility name is too firmly rooted in historical practice of application programs for it to change.

Consideration was given to mandating a diagnostic message when attempting to set *vi*-mode on terminals that do not support command line editing. However, it is not historical practice for the shell to be cognizant of all terminal types and thus be able to detect inappropriate terminals in all cases. Implementations are encouraged to supply diagnostics in this case whenever possible, rather than leaving the user in a state where editing commands work incorrectly.

In early proposals, the KornShell-derived *emacs* mode of command line editing was included, even though the *emacs* editor itself was not. The community of *emacs* proponents was adamant that the full *emacs* editor not be standardized because they were concerned that an attempt to standardize this very powerful environment would encourage vendors to ship strictly conforming versions lacking the extensibility required by the community. The author of the original *emacs* program also expressed his desire to omit the program. Furthermore, there were a number of historical systems that did not include *emacs*, or included it without supporting it, but there were very few that did not include and support *vi*. The shell *emacs* command line editing mode was finally omitted because it became apparent that the KornShell version and the editor being distributed with the GNU system had diverged in some respects. The author of *emacs* requested that the POSIX *emacs* mode either be deleted or have a significant number of unspecified conditions. Although the KornShell author agreed to consider changes to bring the shell into alignment, the standard developers decided to defer specification at that time. At the time, it was assumed that convergence on an acceptable definition would occur for a subsequent draft, but that has not happened, and there appears to be no impetus to do so. In any case, implementations are free to offer additional command line editing modes based on the exact models of editors their users are most comfortable with.

Early proposals had the following list entry in [vi Line Editing Insert Mode](#) (on page 3194):

107398 \ If followed by the *erase* or *kill* character, that character shall be inserted into the input line.  
 107399 Otherwise, the <backslash> itself shall be inserted into the input line.

107400 However, this is not actually a feature of *sh* command line editing insert mode, but one of some  
 107401 historical terminal line drivers. Some conforming implementations continue to do this when the  
 107402 *stty ixten* flag is set.

107403 In interactive shells, SIGTERM is ignored so that `kill 0` does not kill the shell, and SIGINT is +  
 107404 caught so that *wait* is interruptible. If the shell does not ignore SIGTTIN, SIGTTOU, and +  
 107405 SIGTSTP signals when it is interactive and the *-m* option is not in effect, these signals suspend +  
 107406 the shell if it is not a session leader. If it is a session leader, the signals are discarded if they +  
 107407 would stop the process, as required by XSH Section 2.4.3 (on page 490) for orphaned process +  
 107408 groups.

#### 107409 FUTURE DIRECTIONS

107410 None.

#### 107411 SEE ALSO

#### 107415 CHANGE HISTORY

107416 First released in Issue 2.

#### 107417 Issue 5

107418 The FUTURE DIRECTIONS section is added.

107419 Text is added to the DESCRIPTION for the Large File Summit proposal.

#### 107420 Issue 6

107421 The Open Group Corrigendum U029/2 is applied, correcting the second SYNOPSIS.

107422 The Open Group Corrigendum U027/3 is applied, correcting a typographical error.

107423 The following new requirements on POSIX implementations derive from alignment with the  
 107424 Single UNIX Specification:

107425 • The option letters derived from the *set* special built-in are also accepted with a leading  
 107426 <plus-sign> ('+').

107427 • Large file extensions are added:

107428 — Pathname expansion does not fail due to the size of a file.

107429 — Shell input and output redirections have an implementation-defined offset maximum  
 107430 that is established in the open file description.

107431 In the ENVIRONMENT VARIABLES section, the text “user’s home directory” is updated to  
 107432 “directory referred to by the *HOME* environment variable”.

107433 Descriptions for the *ENV* and *PWD* environment variables are included to align with the  
 107434 IEEE P1003.2b draft standard.

107435 The normative text is reworded to avoid use of the term “must” for application requirements.

107436 **Issue 7**

- 107437 Austin Group Interpretation 1003.1-2001 #098 is applied, changing the definition of *IFS*.
- 107438 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.
- 107439 Changes to the *pwd* utility and *PWD* environment variable have been made to match the  
107440 changes to the *getcwd()* function made for Austin Group Interpretation 1003.1-2001 #140.
- 107441 Minor editorial changes are made to the User Portability Utilities option shading. No normative  
107442 changes are implied.
- 107443 Minor changes are made to the install script example in the APPLICATION USAGE section.
- 107444 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0137 [152], XCU/TC1-2008/0138 +  
107445 [347], XCU/TC1-2008/0139 [347], XCU/TC1-2008/0140 [347], XCU/TC1-2008/0141 [299], and +  
107446 XCU/TC1-2008/0142 [347] are applied.

107447 **NAME**

107448           sleep — suspend execution for an interval

107449 **SYNOPSIS**107450           sleep *time*107451 **DESCRIPTION**

107452           The *sleep* utility shall suspend execution for at least the integral number of seconds specified by  
 107453           the *time* operand.

107454 **OPTIONS**

107455           None.

107456 **OPERANDS**

107457           The following operand shall be supported:

107458           *time*           A non-negative decimal integer specifying the number of seconds for which to  
 107459           suspend execution.

107460 **STDIN**

107461           Not used.

107462 **INPUT FILES**

107463           None.

107464 **ENVIRONMENT VARIABLES**107465           The following environment variables shall affect the execution of *sleep*:

107466           *LANG*           Provide a default value for the internationalization variables that are unset or null.  
 107467                               (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 107468                               variables used to determine the values of locale categories.)

107469           *LC\_ALL*       If set to a non-empty string value, override the values of all the other  
 107470           internationalization variables.

107471           *LC\_CTYPE*   Determine the locale for the interpretation of sequences of bytes of text data as  
 107472           characters (for example, single-byte as opposed to multi-byte characters in  
 107473           arguments).

107474           *LC\_MESSAGES*

107475                           Determine the locale that should be used to affect the format and contents of  
 107476           diagnostic messages written to standard error.

107477 XSI           *NLSPATH*   Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

107478 **ASYNCHRONOUS EVENTS**107479           If the *sleep* utility receives a SIGALRM signal, one of the following actions shall be taken:

- 107480           1. Terminate normally with a zero exit status.
- 107481           2. Effectively ignore the signal.
- 107482           3. Provide the default behavior for signals described in the ASYNCHRONOUS EVENTS  
 107483           section of [Section 1.4](#) (on page 2310). This could include terminating with a non-zero exit  
 107484           status.

107485           The *sleep* utility shall take the standard action for all other signals.

107486 **STDOUT**

107487 Not used.

107488 **STDERR**

107489 The standard error shall be used only for diagnostic messages.

107490 **OUTPUT FILES**

107491 None.

107492 **EXTENDED DESCRIPTION**

107493 None.

107494 **EXIT STATUS**

107495 The following exit values shall be returned:

107496 0 The execution was successfully suspended for at least *time* seconds, or a SIGALRM signal  
107497 was received. See the ASYNCHRONOUS EVENTS section.

107498 &gt;0 An error occurred.

107499 **CONSEQUENCES OF ERRORS**

107500 Default.

107501 **APPLICATION USAGE**

107502 None.

107503 **EXAMPLES**107504 The *sleep* utility can be used to execute a command after a certain amount of time, as in:107505 `(sleep 105; command) &`

107506 or to execute a command every so often, as in:

```
107507 while true
107508 do
107509 command
107510 sleep 37
107511 done
```

107512 **RATIONALE**

107513 The exit status is allowed to be zero when *sleep* is interrupted by the SIGALRM signal because  
107514 most implementations of this utility rely on the arrival of that signal to notify them that the  
107515 requested finishing time has been successfully attained. Such implementations thus do not  
107516 distinguish this situation from the successful completion case. Other implementations are  
107517 allowed to catch the signal and go back to sleep until the requested time expires or to provide  
107518 the normal signal termination procedures.

107519 As with all other utilities that take integral operands and do not specify subranges of allowed  
107520 values, *sleep* is required by this volume of POSIX.1-2008 to deal with *time* requests of up to  
107521 2 147 483 647 seconds. This may mean that some implementations have to make multiple calls to  
107522 the delay mechanism of the underlying operating system if its argument range is less than this.

107523 **FUTURE DIRECTIONS**

107524 None.

107525 **SEE ALSO**107526 *wait*

107527 XBD Chapter 8 (on page 173)

107528 XSH *alarm()*, *sleep()*

107529 **CHANGE HISTORY**  
107530 First released in Issue 2.

107531 **NAME**107532 `sort` — sort, merge, or sequence check text files107533 **SYNOPSIS**107534 `sort [-m] [-o output] [-bdfinru] [-t char] [-k keydef]... [file...]`107535 `sort [-c|-C] [-bdfinru] [-t char] [-k keydef] [file]`107536 **DESCRIPTION**107537 The *sort* utility shall perform one of the following functions:

- 107538 1. Sort lines of all the named files together and write the result to the specified output.
- 107539 2. Merge lines of all the named (presorted) files together and write the result to the specified output.
- 107540 3. Check that a single input file is correctly presorted.

107542 Comparisons shall be based on one or more sort keys extracted from each line of input (or, if no  
 107543 sort keys are specified, the entire line up to, but not including, the terminating <newline>), and  
 107544 shall be performed using the collating sequence of the current locale.

107545 **OPTIONS**

107546 The *sort* utility shall conform to XBD [Section 12.2](#) (on page 215), except for Guideline 9, and the  
 107547 `-k keydef` option should follow the `-b`, `-d`, `-f`, `-i`, `-n`, and `-r` options. In addition, `'+'` may be  
 107548 recognized as an option delimiter as well as `'-'`.

107549 The following options shall be supported:

- 107550 `-c` Check that the single input file is ordered as specified by the arguments and the  
 107551 collating sequence of the current locale. Output shall not be sent to standard  
 107552 output. The exit code shall indicate whether or not disorder was detected or an  
 107553 error occurred. If disorder (or, with `-u`, a duplicate key) is detected, a warning  
 107554 message shall be sent to standard error indicating where the disorder or duplicate  
 107555 key was found.
- 107556 `-C` Same as `-c`, except that a warning message shall not be sent to standard error if  
 107557 disorder or, with `-u`, a duplicate key is detected.
- 107558 `-m` Merge only; the input file shall be assumed to be already sorted.
- 107559 `-o output` Specify the name of an output file to be used instead of the standard output. This  
 107560 file can be the same as one of the input *files*.
- 107561 `-u` Unique: suppress all but one in each set of lines having equal keys. If used with  
 107562 the `-c` option, check that there are no lines with duplicate keys, in addition to  
 107563 checking that the input file is sorted.

107564 The following options shall override the default ordering rules. When ordering options appear  
 107565 independent of any key field specifications, the requested field ordering rules shall be applied  
 107566 globally to all sort keys. When attached to a specific key (see `-k`), the specified ordering options  
 107567 shall override all global ordering options for that key.

- 107568 `-d` Specify that only <blank> characters and alphanumeric characters, according to  
 107569 the current setting of *LC\_CTYPE*, shall be significant in comparisons. The behavior  
 107570 is undefined for a sort key to which `-i` or `-n` also applies.
- 107571 `-f` Consider all lowercase characters that have uppercase equivalents, according to  
 107572 the current setting of *LC\_CTYPE*, to be the uppercase equivalent for the purposes  
 107573 of comparison.

|        |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 107574 | <b>-i</b>        | Ignore all characters that are non-printable, according to the current setting of <i>LC_CTYPE</i> . The behavior is undefined for a sort key for which <b>-n</b> also applies.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 107575 |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 107576 | <b>-n</b>        | Restrict the sort key to an initial numeric string, consisting of optional <blank> characters, optional minus-sign, and zero or more digits with an optional radix character and thousands separators (as defined in the current locale), which shall be sorted by arithmetic value. An empty digit string shall be treated as zero. Leading zeros and signs on zeros shall not affect ordering.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 107577 |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| 107586 |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 107587 |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 107588 | <b>-t char</b>   | Use <i>char</i> as the field separator character; <i>char</i> shall not be considered to be part of a field (although it can be included in a sort key). Each occurrence of <i>char</i> shall be significant (for example, <char><char> delimits an empty field). If <b>-t</b> is not specified, <blank> characters shall be used as default field separators; each maximal non-empty sequence of <blank> characters that follows a non-<blank> shall be a field separator.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 107589 |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 107590 |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| 107594 |                  | Sort keys can be specified using the options:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 107595 | <b>-k keydef</b> | The <i>keydef</i> argument is a restricted sort key field definition. The format of this definition is:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 107596 |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 107597 |                  | <i>field_start</i> [ <i>type</i> ][, <i>field_end</i> [ <i>type</i> ]]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 107598 |                  | where <i>field_start</i> and <i>field_end</i> define a key field restricted to a portion of the line (see the EXTENDED DESCRIPTION section), and <i>type</i> is a modifier from the list of characters 'b', 'd', 'f', 'i', 'n', 'r'. The 'b' modifier shall behave like the <b>-b</b> option, but shall apply only to the <i>field_start</i> or <i>field_end</i> to which it is attached. The other modifiers shall behave like the corresponding options, but shall apply only to the key field to which they are attached; they shall have this effect if specified with <i>field_start</i> , <i>field_end</i> , or both. If any modifier is attached to a <i>field_start</i> or to a <i>field_end</i> , no option shall apply to either. Implementations shall support at least nine occurrences of the <b>-k</b> option, which shall be significant in command line order. If no <b>-k</b> option is specified, a default sort key of the entire line shall be used. |

| 107616 |                  | The following operand shall be supported:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 107617 | <i>file</i>      | A pathname of a file to be sorted, merged, or checked. If no <i>file</i> operands are specified, or if a <i>file</i> operand is '-', the standard input shall be used.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 107618 |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

107619 **STDIN**

107620 The standard input shall be used only if no *file* operands are specified, or if a *file* operand is *'-'*.  
 107621 See the INPUT FILES section.

107622 **INPUT FILES**

107623 The input files shall be text files, except that the *sort* utility shall add a <newline> to the end of a  
 107624 file ending with an incomplete last line.

107625 **ENVIRONMENT VARIABLES**

107626 The following environment variables shall affect the execution of *sort*:

107627 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 107628 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
 107629 variables used to determine the values of locale categories.)

107630 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 107631 internationalization variables.

107632 *LC\_COLLATE*

107633 Determine the locale for ordering rules.

107634 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 107635 characters (for example, single-byte as opposed to multi-byte characters in  
 107636 arguments and input files) and the behavior of character classification for the *-b*,  
 107637 *-d*, *-f*, *-i*, and *-n* options.

107638 *LC\_MESSAGES*

107639 Determine the locale that should be used to affect the format and contents of  
 107640 diagnostic messages written to standard error.

107641 *LC\_NUMERIC*

107642 Determine the locale for the definition of the radix character and thousands  
 107643 separator for the *-n* option.

107644 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

107645 **ASYNCHRONOUS EVENTS**

107646 Default.

107647 **STDOUT**

107648 Unless the *-o* or *-c* options are in effect, the standard output shall contain the sorted input.

107649 **STDERR**

107650 The standard error shall be used for diagnostic messages. When *-c* is specified, if disorder is  
 107651 detected (or if *-u* is also specified and a duplicate key is detected), a message shall be written to  
 107652 the standard error which identifies the input line at which disorder (or a duplicate key) was  
 107653 detected. A warning message about correcting an incomplete last line of an input file may be  
 107654 generated, but need not affect the final exit status.

107655 **OUTPUT FILES**

107656 If the *-o* option is in effect, the sorted input shall be written to the file *output*.

107657 **EXTENDED DESCRIPTION**

107658 The notation:

107659 *-k field\_start[type][, field\_end[type]]*

107660 shall define a key field that begins at *field\_start* and ends at *field\_end* inclusive, unless *field\_start*  
 107661 falls beyond the end of the line or after *field\_end*, in which case the key field is empty. A missing  
 107662 *field\_end* shall mean the last character of the line.

A field comprises a maximal sequence of non-separating characters and, in the absence of option **-t**, any preceding field separator.

The *field\_start* portion of the *keydef* option-argument shall have the form:

*field\_number*[.*first\_character*]

Fields and characters within fields shall be numbered starting with 1. The *field\_number* and *first\_character* pieces, interpreted as positive decimal integers, shall specify the first character to be used as part of a sort key. If *first\_character* is omitted, it shall refer to the first character of the field.

The *field\_end* portion of the *keydef* option-argument shall have the form:

*field\_number*[.*last\_character*]

The *field\_number* shall be as described above for *field\_start*. The *last\_character* piece, interpreted as a non-negative decimal integer, shall specify the last character to be used as part of the sort key. If *last\_character* evaluates to zero or *last\_character* is omitted, it shall refer to the last character of the field specified by *field\_number*.

If the **-b** option or **b** type modifier is in effect, characters within a field shall be counted from the first non-<blank> in the field. (This shall apply separately to *first\_character* and *last\_character*.)

## EXIT STATUS

The following exit values shall be returned:

- 0 All input files were output successfully, or **-c** was specified and the input file was correctly sorted.
- 1 Under the **-c** option, the file was not ordered as specified, or if the **-c** and **-u** options were both specified, two input lines were found with equal keys.
- >1 An error occurred.

## CONSEQUENCES OF ERRORS

Default.

## APPLICATION USAGE

The default value for **-t**, <blank>, has different properties from, for example, **-t"<space>"**. If a line contains:

<space><space>foo

the following treatment would occur with default separation as opposed to specifically selecting a <space>:

| Field | Default           | <b>-t "&lt;space&gt;"</b> |
|-------|-------------------|---------------------------|
| 1     | <space><space>foo | empty                     |
| 2     | empty             | empty                     |
| 3     | empty             | foo                       |

The leading field separator itself is included in a field when **-t** is not used. For example, this command returns an exit status of zero, meaning the input was already sorted:

```
sort -c -k 2 <<eof
y<tab>b
x<space>a
eof
```

(assuming that a <tab> precedes the <space> in the current collating sequence). The field

separator is not included in a field when it is explicitly set via **-t**. This is historical practice and allows usage such as:

```
sort -t "|" -k 2n <<eof
Atlanta|425022|Georgia
Birmingham|284413|Alabama
Columbia|100385|South Carolina
eof
```

where the second field can be correctly sorted numerically without regard to the non-numeric field separator.

The wording in the OPTIONS section clarifies that the **-b**, **-d**, **-f**, **-i**, **-n**, and **-r** options have to come before the first sort key specified if they are intended to apply to all specified keys. The way it is described in this volume of POSIX.1-2008 matches historical practice, not historical documentation. The results are unspecified if these options are specified after a **-k** option.

The **-f** option might not work as expected in locales where there is not a one-to-one mapping between an uppercase and a lowercase letter.

## EXAMPLES

1. The following command sorts the contents of **infile** with the second field as the sort key:

```
sort -k 2,2 infile
```

2. The following command sorts, in reverse order, the contents of **infile1** and **infile2**, placing the output in **outfile** and using the second character of the second field as the sort key (assuming that the first character of the second field is the field separator):

```
sort -r -o outfile -k 2.2,2.2 infile1 infile2
```

3. The following command sorts the contents of **infile1** and **infile2** using the second non-**<blank>** of the second field as the sort key:

```
sort -k 2.2b,2.2b infile1 infile2
```

4. The following command prints the System V password file (user database) sorted by the numeric user ID (the third **<colon>**-separated field):

```
sort -t : -k 3,3n /etc/passwd
```

5. The following command prints the lines of the already sorted file **infile**, suppressing all but one occurrence of lines having the same third field:

```
sort -um -k 3.1,3.0 infile
```

## RATIONALE

Examples in some historical documentation state that options **-um** with one input file keep the first in each set of lines with equal keys. This behavior was deemed to be an implementation artifact and was not standardized.

The **-z** option was omitted; it is not standard practice on most systems and is inconsistent with using *sort* to sort several files individually and then merge them together. The text concerning **-z** in historical documentation appeared to require implementations to determine the proper buffer length during the sort phase of operation, but not during the merge.

The **-y** option was omitted because of non-portability. The **-M** option, present in System V, was omitted because of non-portability in international usage.

An undocumented **-T** option exists in some implementations. It is used to specify a directory for

intermediate files. Implementations are encouraged to support the use of the *TMPDIR* environment variable instead of adding an option to support this functionality.

The **-k** option was added to satisfy two objections. First, the zero-based counting used by *sort* is not consistent with other utility conventions. Second, it did not meet syntax guideline requirements.

Historical documentation indicates that “setting **-n** implies **-b**”. The description of **-n** already states that optional leading <blank>s are tolerated in doing the comparison. If **-b** is enabled, rather than implied, by **-n**, this has unusual side-effects. When a character offset is used in a column of numbers (for example, to sort modulo 100), that offset is measured relative to the most significant digit, not to the column. Based upon a recommendation from the author of the original *sort* utility, the **-b** implication has been omitted from this volume of POSIX.1-2008, and an application wishing to achieve the previously mentioned side-effects has to code the **-b** flag explicitly.

Earlier versions of this standard allowed the **-o** option to appear after operands. Historical practice allowed all options to be interspersed with operands. This version of the standard allows implementations to accept options after operands but conforming applications should not use this form.

Earlier versions of this standard also allowed the *-number* and *+number* options. These options are no longer specified by POSIX.1-2008 but may be present in some implementations.

Historical implementations produced a message on standard error when **-c** was specified and disorder was detected, and when **-c** and **-u** were specified and a duplicate key was detected. An earlier version of this standard contained wording that did not make it clear that this message was allowed and some implementations removed this message to be sure that they conformed to the standard’s requirements. Confronted with this difference in behavior, interactive users that wanted to be sure that they got visual feedback instead of just exit code 1 could have used a command like:

```
sort -c file || echo disorder
```

whether or not the *sort* utility provided a message in this case. But, it was not easy for a user to find where the disorder or duplicate key occurred on implementations that do not produce a message, especially when some parts of the input line were not part of the key and when one or more of the **-b**, **-d**, **-f**, **-i**, **-n**, or **-r** options or *keydef* type modifiers were in use. POSIX.1-2008 requires a message to be produced in this case. POSIX.1-2008 also contains the **-C** option giving users the ability to choose either behavior.

When a disorder or duplicate is found when the **-c** option is specified, some implementations print a message containing the first line that is out of order or contains a duplicate key; others print a message specifying the line number of the offending line. This standard allows either type of message.

#### FUTURE DIRECTIONS

None.

XSH *toupper()*

**CHANGE HISTORY**

107790  
107791 First released in Issue 2.

**Issue 6**

107792  
107793 IEEE PASC Interpretation 1003.2 #174 is applied, updating the DESCRIPTION of comparisons.

107794 IEEE PASC Interpretation 1003.2 #168 is applied.

**Issue 7**

107795  
107796 Austin Group Interpretation 1003.1-2001 #027 is applied, clarifying that Guideline 9 of the Utility  
107797 Syntax Guidelines does not apply and noting that ' +' may be recognized as an option delimiter.

107798 Austin Group Interpretation 1003.1-2001 #120 is applied, clarifying the use of the -c option and  
107799 introducing the -C option.

107800 XCU-ERN-81 is applied, modifying the description of the -i option.

107801 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

107802 **NAME**107803 `split` — split files into pieces107804 **SYNOPSIS**107805 `split [-l line_count] [-a suffix_length] [file[name]]`107806 `split -b n[k|m] [-a suffix_length] [file[name]]`107807 **DESCRIPTION**

107808 The *split* utility shall read an input file and write one or more output files. The default size of  
 107809 each output file shall be 1 000 lines. The size of the output files can be modified by specification  
 107810 of the `-b` or `-l` options. Each output file shall be created with a unique suffix. The suffix shall  
 107811 consist of exactly *suffix\_length* lowercase letters from the POSIX locale. The letters of the suffix  
 107812 shall be used as if they were a base-26 digit system, with the first suffix to be created consisting  
 107813 of all 'a' characters, the second with a 'b' replacing the last 'a', and so on, until a name of all  
 107814 'z' characters is created. By default, the names of the output files shall be 'x', followed by a  
 107815 two-character suffix from the character set as described above, starting with "aa", "ab", "ac",  
 107816 and so on, and continuing until the suffix "zz", for a maximum of 676 files.

107817 If the number of files required exceeds the maximum allowed by the suffix length provided,  
 107818 such that the last allowable file would be larger than the requested size, the *split* utility shall fail  
 107819 after creating the last file with a valid suffix; *split* shall not delete the files it created with valid  
 107820 suffixes. If the file limit is not exceeded, the last file created shall contain the remainder of the  
 107821 input file, and may be smaller than the requested size.

107822 **OPTIONS**107823 The *split* utility shall conform to XBD [Section 12.2](#) (on page 215).

107824 The following options shall be supported:

107825 `-a suffix_length`

107826 Use *suffix\_length* letters to form the suffix portion of the filenames of the split file. If  
 107827 `-a` is not specified, the default suffix length shall be two. If the sum of the *name*  
 107828 operand and the *suffix\_length* option-argument would create a filename exceeding  
 107829 {NAME\_MAX} bytes, an error shall result; *split* shall exit with a diagnostic message  
 107830 and no files shall be created.

107831 `-b n` Split a file into pieces *n* bytes in size.107832 `-b nk` Split a file into pieces *n*\*1 024 bytes in size.107833 `-b nm` Split a file into pieces *n*\*1 048 576 bytes in size.

107834 `-l line_count` Specify the number of lines in each resulting file piece. The *line\_count* argument is  
 107835 an unsigned decimal integer. The default is 1 000. If the input does not end with a  
 107836 <newline>, the partial line shall be included in the last output file.

107837 **OPERANDS**

107838 The following operands shall be supported:

107839 *file* The pathname of the ordinary file to be split. If no input file is given or *file* is '-',  
 107840 the standard input shall be used.

107841 *name* The prefix to be used for each of the files resulting from the split operation. If no  
 107842 *name* argument is given, 'x' shall be used as the prefix of the output files. The  
 107843 combined length of the basename of *prefix* and *suffix\_length* cannot exceed  
 107844 {NAME\_MAX} bytes. See the OPTIONS section.

107845 **STDIN**

107846 See the INPUT FILES section.

107847 **INPUT FILES**

107848 Any file can be used as input.

107849 **ENVIRONMENT VARIABLES**107850 The following environment variables shall affect the execution of *split*:

107851 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 107852 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 107853 variables used to determine the values of locale categories.)

107854 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 107855 internationalization variables.

107856 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 107857 characters (for example, single-byte as opposed to multi-byte characters in  
 107858 arguments and input files).

107859 **LC\_MESSAGES**

107860 Determine the locale that should be used to affect the format and contents of  
 107861 diagnostic messages written to standard error.

107862 **XSI NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

107863 **ASYNCHRONOUS EVENTS**

107864 Default.

107865 **STDOUT**

107866 Not used.

107867 **STDERR**

107868 The standard error shall be used only for diagnostic messages.

107869 **OUTPUT FILES**

107870 The output files contain portions of the original input file; otherwise, unchanged.

107871 **EXTENDED DESCRIPTION**

107872 None.

107873 **EXIT STATUS**

107874 The following exit values shall be returned:

107875 0 Successful completion.

107876 &gt;0 An error occurred.

107877 **CONSEQUENCES OF ERRORS**

107878 Default.

## 107879 APPLICATION USAGE

107880 None.

## 107881 EXAMPLES

107882 In the following examples **foo** is a text file that contains 5 000 lines.107883 1. Create five files, **xaa**, **xab**, **xac**, **xad**, and **xae**:107884 `split foo`107885 2. Create five files, but the suffixed portion of the created files consists of three letters, **xaaa**,  
107886 **xaab**, **xaac**, **xaad**, and **xaae**:107887 `split -a 3 foo`107888 3. Create three files with four-letter suffixes and a supplied prefix, **bar\_aaaa**, **bar\_aaab**, and  
107889 **bar\_aaac**:107890 `split -a 4 -l 2000 foo bar_`107891 4. Create as many files as are necessary to contain at most 20\*1 024 bytes, each with the  
107892 default prefix of **x** and a five-letter suffix:107893 `split -a 5 -b 20k foo`

## 107894 RATIONALE

107895 The **-b** option was added to provide a mechanism for splitting files other than by lines. While  
107896 most uses of the **-b** option are for transmitting files over networks, some believed it would have  
107897 additional uses.107898 The **-a** option was added to overcome the limitation of being able to create only 676 files.107899 Consideration was given to deleting this utility, using the rationale that the functionality  
107900 provided by this utility is available via the *csplit* utility (see *csplit*). Upon reconsideration of the  
107901 purpose of the User Portability Utilities option, it was decided to retain both this utility and the  
107902 *csplit* utility because users use both utilities and have historical expectations of their behavior.  
107903 Furthermore, the splitting on byte boundaries in *split* cannot be duplicated with the historical  
107904 *csplit*.107905 The text “*split* shall not delete the files it created with valid suffixes” would normally be  
107906 assumed, but since the related utility, *csplit*, does delete files under some circumstances, the  
107907 historical behavior of *split* is made explicit to avoid misinterpretation.107908 Earlier versions of this standard allowed a *-line\_count* option. This form is no longer specified by  
107909 POSIX.1-2008 but may be present in some implementations.

## 107910 FUTURE DIRECTIONS

107911 None.

## 107912 SEE ALSO

107913 *csplit*107914 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)

## 107915 CHANGE HISTORY

107916 First released in Issue 2.

## 107917 Issue 6

107918 This utility is marked as part of the User Portability Utilities option.

107919 The APPLICATION USAGE section is added.

107920 The obsolescent SYNOPSIS is removed.

107921 **Issue 7**

107922 Austin Group Interpretation 1003.1-2001 #027 is applied.

107923 The *split* utility is moved from the User Portability Utilities option to the Base. User Portability  
107924 Utilities is now an option for interactive utilities.

107925 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

107926 **NAME**

107927 strings — find printable strings in files

107928 **SYNOPSIS**107929 strings [-a] [-t *format*] [-n *number*] [*file...*]107930 **DESCRIPTION**

107931 The *strings* utility shall look for printable strings in regular files and shall write those strings to  
 107932 standard output. A printable string is any sequence of four (by default) or more printable  
 107933 characters terminated by a <newline> or NUL character. Additional implementation-defined  
 107934 strings may be written; see *localedef*.

107935 If the first argument is '-', the results are unspecified.

107936 **OPTIONS**

107937 The *strings* utility shall conform to XBD [Section 12.2](#) (on page 215), except for the unspecified  
 107938 usage of '-'.

107939 The following options shall be supported:

107940 -a Scan files in their entirety. If -a is not specified, it is implementation-defined what  
 107941 portion of each file is scanned for strings.

107942 -n *number* Specify the minimum string length, where the *number* argument is a positive  
 107943 decimal integer. The default shall be 4.

107944 -t *format* Write each string preceded by its byte offset from the start of the file. The format  
 107945 shall be dependent on the single character used as the *format* option-argument:

107946 d The offset shall be written in decimal.

107947 o The offset shall be written in octal.

107948 x The offset shall be written in hexadecimal.

107949 **OPERANDS**

107950 The following operand shall be supported:

107951 *file* A pathname of a regular file to be used as input. If no *file* operand is specified, the  
 107952 *strings* utility shall read from the standard input.

107953 **STDIN**

107954 See the INPUT FILES section.

107955 **INPUT FILES**

107956 The input files named by the utility arguments or the standard input shall be regular files of any  
 107957 format.

107958 **ENVIRONMENT VARIABLES**107959 The following environment variables shall affect the execution of *strings*:

107960 LANG Provide a default value for the internationalization variables that are unset or null.  
 107961 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 107962 variables used to determine the values of locale categories.)

107963 LC\_ALL If set to a non-empty string value, override the values of all the other  
 107964 internationalization variables.

107965 LC\_CTYPE Determine the locale for the interpretation of sequences of bytes of text data as  
 107966 characters (for example, single-byte as opposed to multi-byte characters in  
 107967 arguments and input files) and to identify printable strings.

107968 *LC\_MESSAGES*  
 107969 Determine the locale that should be used to affect the format and contents of  
 107970 diagnostic messages written to standard error.

107971 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

107972 **ASYNCHRONOUS EVENTS**  
 107973 Default.

107974 **STDOUT**  
 107975 Strings found shall be written to the standard output, one per line.  
 107976 When the **-t** option is not specified, the format of the output shall be:  
 107977 "%s", <string>  
 107978 With the **-t o** option, the format of the output shall be:  
 107979 "%o %s", <byte offset>, <string>  
 107980 With the **-t x** option, the format of the output shall be:  
 107981 "%x %s", <byte offset>, <string>  
 107982 With the **-t d** option, the format of the output shall be:  
 107983 "%d %s", <byte offset>, <string>

107984 **STDERR**  
 107985 The standard error shall be used only for diagnostic messages.

107986 **OUTPUT FILES**  
 107987 None.

107988 **EXTENDED DESCRIPTION**  
 107989 None.

107990 **EXIT STATUS**  
 107991 The following exit values shall be returned:  
 107992 0 Successful completion.  
 107993 >0 An error occurred.

107994 **CONSEQUENCES OF ERRORS**  
 107995 Default.

107996 **APPLICATION USAGE**  
 107997 By default the data area (as opposed to the text, "bss", or header areas) of a binary executable  
 107998 file is scanned. Implementations document which areas are scanned.  
 107999 Some historical implementations do not require NUL or <newline> terminators for strings to  
 108000 permit those languages that do not use NUL as a string terminator to have their strings written.

108001 **EXAMPLES**  
 108002 None.

108003 **RATIONALE**  
 108004 Apart from rationalizing the option syntax and slight difficulties with object and executable  
 108005 binary files, *strings* is specified to match historical practice closely. The **-a** and **-n** options were  
 108006 introduced to replace the non-conforming **-** and **-number** options. These options are no longer  
 108007 specified by POSIX.1-2008 but may be present in some implementations.

- 108008 The **-o** option historically means different things on different implementations. Some use it to  
108009 mean “*offset* in decimal”, while others use it as “*offset* in octal”. Instead of trying to decide which  
108010 way would be least objectionable, the **-t** option was added. It was originally named **-O** to mean  
108011 “*offset*”, but was changed to **-t** to be consistent with *od*.
- 108012 The ISO C standard function *isprint()* is restricted to a domain of **unsigned char**. This volume of  
108013 POSIX.1-2008 requires implementations to write strings as defined by the current locale.
- 108014 **FUTURE DIRECTIONS**
- 108015 None.
- 108016 **SEE ALSO**
- 108017 *localedef*, *nm*

108029 Portability Utilities is now an option for interactive utilities.
- 108030 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

108031 **NAME**108032 strip — remove unnecessary information from strippable files (**DEVELOPMENT**)108033 **SYNOPSIS**

108034 SD strip file...

108035 **DESCRIPTION**

108036 XSI A strippable file is defined as a relocatable, object, or executable file. On XSI-conformant  
 108037 systems, a strippable file can also be an archive of object or relocatable files.

108038 The *strip* utility shall remove from strippable files named by the *file* operands any information  
 108039 the implementor deems unnecessary for execution of those files. The nature of that information  
 108040 is unspecified. The effect of *strip* on object and executable files shall be similar to the use of the  
 108041 XSI *-s* option to *c99* or *fort77*. The effect of *strip* on an archive of object files shall be similar to the  
 108042 use of the *-s* option to *c99* or *fort77* for each object file in the archive.

108043 **OPTIONS**

108044 None.

108045 **OPERANDS**

108046 The following operand shall be supported:

108047 *file* A pathname referring to a strippable file.

108048 **STDIN**

108049 Not used.

108050 **INPUT FILES**

108051 The input files shall be in the form of strippable files successfully produced by any compiler  
 108052 XSI defined by this volume of POSIX.1-2008 or produced by creating or updating an archive of such  
 108053 files using the *ar* utility.

108054 **ENVIRONMENT VARIABLES**108055 The following environment variables shall affect the execution of *strip*:

108056 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 108057 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
 108058 variables used to determine the values of locale categories.)

108059 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 108060 internationalization variables.

108061 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 108062 characters (for example, single-byte as opposed to multi-byte characters in  
 108063 arguments).

108064 *LC\_MESSAGES*

108065 Determine the locale that should be used to affect the format and contents of  
 108066 diagnostic messages written to standard error.

108067 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

108068 **ASYNCHRONOUS EVENTS**

108069 Default.

108070 **STDOUT**

108071 Not used.

**108072 STDERR**

108073 The standard error shall be used only for diagnostic messages.

**108074 OUTPUT FILES**

108075 The *strip* utility shall produce strippable files of unspecified format.

**108076 EXTENDED DESCRIPTION**

108077 None.

**108078 EXIT STATUS**

108079 The following exit values shall be returned:

108080 0 Successful completion.

108081 >0 An error occurred.

**108082 CONSEQUENCES OF ERRORS**

108083 Default.

**108084 APPLICATION USAGE**

108085 None.

**108086 EXAMPLES**

108087 None.

**108088 RATIONALE**

108089 Historically, this utility has been used to remove the symbol table from a strippable file. It was  
108090 included since it is known that the amount of symbolic information can amount to several  
108091 megabytes; the ability to remove it in a portable manner was deemed important, especially for  
108092 smaller systems.

108093 The behavior of *strip* on object and executable files is said to be the same as the *-s* option to a  
108094 compiler. While the end result is essentially the same, it is not required to be identical.

108095 XSI-conformant systems support use of *strip* on archive files containing object files or relocatable  
108096 files.

**108097 FUTURE DIRECTIONS**

108098 None.

**108099 SEE ALSO**

108100 *ar*, *c99*, *fort77*

108101 XBD Chapter 8 (on page 173)

**108102 CHANGE HISTORY**

108103 First released in Issue 2.

**108104 Issue 6**

108105 This utility is marked as part of the Software Development Utilities option.

**108106 Issue 7**

108107 Austin Group Interpretation 1003.1-2001 #103 is applied.

108108 **NAME**

108109       stty — set the options for a terminal

108110 **SYNOPSIS**

108111       stty [-a|-g]

108112       stty *operand*...108113 **DESCRIPTION**

108114       The *stty* utility shall set or report on terminal I/O characteristics for the device that is its  
 108115       standard input. Without options or operands specified, it shall report the settings of certain  
 108116       characteristics, usually those that differ from implementation-defined defaults. Otherwise, it  
 108117       shall modify the terminal state according to the specified operands. Detailed information about  
 108118       the modes listed in the first five groups below are described in XBD [Chapter 11](#) (on page 199).  
 108119       Operands in the Combination Modes group (see [Combination Modes](#), on page 3231) are  
 108120       implemented using operands in the previous groups. Some combinations of operands are  
 108121       mutually-exclusive on some terminal types; the results of using such combinations are  
 108122       unspecified.

108123       Typical implementations of this utility require a communications line configured to use the  
 108124       **termios** interface defined in the System Interfaces volume of POSIX.1-2008. On systems where  
 108125       none of these lines are available, and on lines not currently configured to support the **termios**  
 108126       interface, some of the operands need not affect terminal characteristics.

108127 **OPTIONS**108128       The *stty* utility shall conform to XBD [Section 12.2](#) (on page 215).

108129       The following options shall be supported:

108130       **-a**           Write to standard output all the current settings for the terminal.

108131       **-g**           Write to standard output all the current settings in an unspecified form that can be  
 108132       used as arguments to another invocation of the *stty* utility on the same system. The  
 108133       form used shall not contain any characters that would require quoting to avoid  
 108134       word expansion by the shell; see [Section 2.6](#) (on page 2327).

108135 **OPERANDS**

108136       The following operands shall be supported to set the terminal characteristics.

108137       **Control Modes**

108138       **parenb** (**-parenb**) Enable (disable) parity generation and detection. This shall have the effect of  
 108139       setting (not setting) PARENB in the **termios** *c\_flag* field, as defined in XBD  
 108140       [Chapter 11](#) (on page 199).

108141       **parodd** (**-parodd**) Select odd (even) parity. This shall have the effect of setting (not setting)  
 108142       PARODD in the **termios** *c\_flag* field, as defined in XBD [Chapter 11](#) (on page  
 108143       199).  
 108144

108145       **cs5 cs6 cs7 cs8** Select character size, if possible. This shall have the effect of setting CS5, CS6,  
 108146       CS7, and CS8, respectively, in the **termios** *c\_flag* field, as defined in XBD  
 108147       [Chapter 11](#) (on page 199).

108148       **number**       Set terminal baud rate to the number given, if possible. If the baud rate is set  
 108149       to zero, the modem control lines shall no longer be asserted. This shall have  
 108150       the effect of setting the input and output **termios** baud rate values as defined  
 108151       in XBD [Chapter 11](#) (on page 199).

|        |                                  |                                                                                                              |
|--------|----------------------------------|--------------------------------------------------------------------------------------------------------------|
| 108152 | <b>ispeed</b> <i>number</i>      | Set terminal input baud rate to the number given, if possible. If the input baud                             |
| 108153 |                                  | rate is set to zero, the input baud rate shall be specified by the value of the                              |
| 108154 |                                  | output baud rate. This shall have the effect of setting the input <b>termios</b> baud                        |
| 108155 |                                  | rate values as defined in XBD <a href="#">Chapter 11</a> (on page 199).                                      |
| 108156 | <b>ospeed</b> <i>number</i>      | Set terminal output baud rate to the number given, if possible. If the output                                |
| 108157 |                                  | baud rate is set to zero, the modem control lines shall no longer be asserted.                               |
| 108158 |                                  | This shall have the effect of setting the output <b>termios</b> baud rate values as                          |
| 108159 |                                  | defined in XBD <a href="#">Chapter 11</a> (on page 199).                                                     |
| 108160 | <b>hupcl</b> ( <b>-hupcl</b> )   | Stop asserting modem control lines (do not stop asserting modem control                                      |
| 108161 |                                  | lines) on last close. This shall have the effect of setting (not setting) HUPCL in                           |
| 108162 |                                  | the <b>termios</b> <i>c_cflag</i> field, as defined in XBD <a href="#">Chapter 11</a> (on page 199).         |
| 108163 | <b>hup</b> ( <b>-hup</b> )       | Equivalent to <b>hupcl</b> ( <b>-hupcl</b> ).                                                                |
| 108164 | <b>cstopb</b> ( <b>-cstopb</b> ) | Use two (one) stop bits per character. This shall have the effect of setting (not                            |
| 108165 |                                  | setting) CSTOPB in the <b>termios</b> <i>c_cflag</i> field, as defined in XBD <a href="#">Chapter 11</a> (on |
| 108166 |                                  | page 199).                                                                                                   |
| 108167 | <b>cread</b> ( <b>-cread</b> )   | Enable (disable) the receiver. This shall have the effect of setting (not setting)                           |
| 108168 |                                  | CREAD in the <b>termios</b> <i>c_cflag</i> field, as defined in XBD <a href="#">Chapter 11</a> (on page      |
| 108169 |                                  | 199).                                                                                                        |
| 108170 | <b>clocal</b> ( <b>-clocal</b> ) | Assume a line without (with) modem control. This shall have the effect of                                    |
| 108171 |                                  | setting (not setting) CLOCAL in the <b>termios</b> <i>c_cflag</i> field, as defined in XBD                   |
| 108172 |                                  | <a href="#">Chapter 11</a> (on page 199).                                                                    |

It is unspecified whether *stty* shall report an error if an attempt to set a Control Mode fails.

## Input Modes

|        |                                  |                                                                                                              |
|--------|----------------------------------|--------------------------------------------------------------------------------------------------------------|
| 108174 |                                  |                                                                                                              |
| 108175 | <b>ignbrk</b> ( <b>-ignbrk</b> ) | Ignore (do not ignore) break on input. This shall have the effect of setting (not                            |
| 108176 |                                  | setting) IGNBRK in the <b>termios</b> <i>c_iflag</i> field, as defined in XBD <a href="#">Chapter 11</a> (on |
| 108177 |                                  | page 199).                                                                                                   |
| 108178 | <b>brkint</b> ( <b>-brkint</b> ) | Signal (do not signal) INTR on break. This shall have the effect of setting (not                             |
| 108179 |                                  | setting) BRKINT in the <b>termios</b> <i>c_iflag</i> field, as defined in XBD <a href="#">Chapter 11</a> (on |
| 108180 |                                  | page 199).                                                                                                   |
| 108181 | <b>ignpar</b> ( <b>-ignpar</b> ) | Ignore (do not ignore) bytes with parity errors. This shall have the effect of                               |
| 108182 |                                  | setting (not setting) IGNPAR in the <b>termios</b> <i>c_iflag</i> field, as defined in XBD                   |
| 108183 |                                  | <a href="#">Chapter 11</a> (on page 199).                                                                    |
| 108184 | <b>parmrk</b> ( <b>-parmrk</b> ) |                                                                                                              |
| 108185 |                                  | Mark (do not mark) parity errors. This shall have the effect of setting (not                                 |
| 108186 |                                  | setting) PARMRK in the <b>termios</b> <i>c_iflag</i> field, as defined in XBD <a href="#">Chapter 11</a> (on |
| 108187 |                                  | page 199).                                                                                                   |
| 108188 | <b>inpck</b> ( <b>-inpck</b> )   | Enable (disable) input parity checking. This shall have the effect of setting (not                           |
| 108189 |                                  | setting) INPCK in the <b>termios</b> <i>c_iflag</i> field, as defined in XBD <a href="#">Chapter 11</a> (on  |
| 108190 |                                  | page 199).                                                                                                   |
| 108191 | <b>istrip</b> ( <b>-istrip</b> ) | Strip (do not strip) input characters to seven bits. This shall have the effect of                           |
| 108192 |                                  | setting (not setting) ISTRIP in the <b>termios</b> <i>c_iflag</i> field, as defined in XBD                   |
| 108193 |                                  | <a href="#">Chapter 11</a> (on page 199).                                                                    |

|        |                                      |                                                                                                                                                                                                                                                                                                                          |
|--------|--------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 108194 | <b>inlcr</b> ( <b>-inlcr</b> )       | Map (do not map) NL to CR on input. This shall have the effect of setting (not setting) INLCR in the <b>termios</b> <i>c_iflag</i> field, as defined in XBD <a href="#">Chapter 11</a> (on page 199).                                                                                                                    |
| 108195 |                                      |                                                                                                                                                                                                                                                                                                                          |

| 108265 |     |                            |                                                                                                                                                                                                                                                                                                                                     |
| 108266 |     | <b>echo (-echo)</b>        | Echo back (do not echo back) every character typed. This shall have the effect of setting (not setting) ECHO in the <b>termios</b> <i>c_lflag</i> field, as defined in XBD <a href="#">Chapter 11</a> (on page 199).                                                                                                                |
| 108267 |     |                            |                                                                                                                                                                                                                                                                                                                                     |
| 108268 |     |                            |                                                                                                                                                                                                                                                                                                                                     |
| 108269 |     | <b>echoe (-echoe)</b>      | The ERASE character visually erases (does not erase) the last character in the current line from the display, if possible. This shall have the effect of setting (not setting) ECHOE in the <b>termios</b> <i>c_lflag</i> field, as defined in XBD <a href="#">Chapter 11</a> (on page 199).                                        |
| 108270 |     |                            |                                                                                                                                                                                                                                                                                                                                     |
| 108271 |     |                            |                                                                                                                                                                                                                                                                                                                                     |
| 108272 |     |                            |                                                                                                                                                                                                                                                                                                                                     |
| 108273 |     | <b>echok (-echok)</b>      | Echo (do not echo) NL after KILL character. This shall have the effect of setting (not setting) ECHOK in the <b>termios</b> <i>c_lflag</i> field, as defined in XBD <a href="#">Chapter 11</a> (on page 199).                                                                                                                       |
| 108274 |     |                            |                                                                                                                                                                                                                                                                                                                                     |
| 108275 |     |                            |                                                                                                                                                                                                                                                                                                                                     |
| 108276 |     | <b>echonl (-echonl)</b>    | Echo (do not echo) NL, even if <b>echo</b> is disabled. This shall have the effect of setting (not setting) ECHONL in the <b>termios</b> <i>c_lflag</i> field, as defined in XBD <a href="#">Chapter 11</a> (on page 199).                                                                                                          |
| 108277 |     |                            |                                                                                                                                                                                                                                                                                                                                     |
| 108278 |     |                            |                                                                                                                                                                                                                                                                                                                                     |

**noflsh** (**-noflsh**) Disable (enable) flush after INTR, QUIT, SUSP. This shall have the effect of setting (not setting) NOFLSH in the **termios** *c\_lflag* field, as defined in XBD [Chapter 11](#) (on page 199).

**tostop** (**-tostop**) Send SIGTTOU for background output. This shall have the effect of setting (not setting) TOSTOP in the **termios** *c\_lflag* field, as defined in XBD [Chapter 11](#) (on page 199).

### Special Control Character Assignments

*<control>-character string*

Set *<control>-character* to *string*. If *<control>-character* is one of the character sequences in the first column of the following table, the corresponding XBD [Chapter 11](#) (on page 199) control character from the second column shall be recognized. This has the effect of setting the corresponding element of the **termios** *c\_cc* array (see XBD [Chapter 13](#) (on page 219), **<termios.h>**).

**Table 4-20** Control Character Names in *stty*

| Control Character | c_cc Subscript | Description     |
|-------------------|----------------|-----------------|
| <b>eof</b>        | VEOF           | EOF character   |
| <b>eol</b>        | VEOL           | EOL character   |
| <b>erase</b>      | VERASE         | ERASE character |
| <b>intr</b>       | VINTR          | INTR character  |
| <b>kill</b>       | VKILL          | KILL character  |
| <b>quit</b>       | VQUIT          | QUIT character  |
| <b>susp</b>       | VSUSP          | SUSP character  |
| <b>start</b>      | VSTART         | START character |
| <b>stop</b>       | VSTOP          | STOP character  |

If *string* is a single character, the control character shall be set to that character. If *string* is the two-character sequence "**^**-" or the string *undef*, the control character shall be set to `_POSIX_VDISABLE`, if it is in effect for the device; if `_POSIX_VDISABLE` is not in effect for the device, it shall be treated as an error. In the POSIX locale, if *string* is a two-character sequence beginning with **<circumflex>** ('**^**'), and the second character is one of those listed in the "**^c**" column of the following table, the control character shall be set to the corresponding character value in the Value column of the table.

**Table 4-21** Circumflex Control Characters in *stty*

| <b>^c</b> | Value              | <b>^c</b> | Value              | <b>^c</b> | Value              |
|-----------|--------------------|-----------|--------------------|-----------|--------------------|
| a, A      | <b>&lt;SOH&gt;</b> | l, L      | <b>&lt;FF&gt;</b>  | w, W      | <b>&lt;ETB&gt;</b> |
| b, B      | <b>&lt;STX&gt;</b> | m, M      | <b>&lt;CR&gt;</b>  | x, X      | <b>&lt;CAN&gt;</b> |
| c, C      | <b>&lt;ETX&gt;</b> | n, N      | <b>&lt;SO&gt;</b>  | y, Y      | <b>&lt;EM&gt;</b>  |
| d, D      | <b>&lt;EOT&gt;</b> | o, O      | <b>&lt;SI&gt;</b>  | z, Z      | <b>&lt;SUB&gt;</b> |
| e, E      | <b>&lt;ENQ&gt;</b> | p, P      | <b>&lt;DLE&gt;</b> | [         | <b>&lt;ESC&gt;</b> |
| f, F      | <b>&lt;ACK&gt;</b> | q, Q      | <b>&lt;DC1&gt;</b> | \         | <b>&lt;FS&gt;</b>  |
| g, G      | <b>&lt;BEL&gt;</b> | r, R      | <b>&lt;DC2&gt;</b> | ]         | <b>&lt;GS&gt;</b>  |
| h, H      | <b>&lt;BS&gt;</b>  | s, S      | <b>&lt;DC3&gt;</b> | ^         | <b>&lt;RS&gt;</b>  |
| i, I      | <b>&lt;HT&gt;</b>  | t, T      | <b>&lt;DC4&gt;</b> | _         | <b>&lt;US&gt;</b>  |
| j, J      | <b>&lt;LF&gt;</b>  | u, U      | <b>&lt;NAK&gt;</b> | ?         | <b>&lt;DEL&gt;</b> |
| k, K      | <b>&lt;VT&gt;</b>  | v, V      | <b>&lt;SYN&gt;</b> |           |                    |

108323 **min** *number*  
 108324 Set the value of MIN to *number*. MIN is used in non-canonical mode input processing  
 108325 (**icanon**).

108326 **time** *number*  
 108327 Set the value of TIME to *number*. TIME is used in non-canonical mode input processing  
 108328 (**icanon**).

108329 **Combination Modes**

108330 *saved settings*  
 108331 Set the current terminal characteristics to the saved settings produced by the **-g** option.

108332 **evenp** or **parity**  
 108333 Enable **parenb** and **cs7**; disable **parodd**.

108334 **oddp**  
 108335 Enable **parenb**, **cs7**, and **parodd**.

108336 **-parity**, **-evenp**, or **-oddp**  
 108337 Disable **parenb**, and set **cs8**.

108338 XSI **raw** (**-raw** or **cooked**)  
 108339 Enable (disable) raw input and output. Raw mode shall be equivalent to setting:  
 108340 `stty cs8 erase ^- kill ^- intr ^- \  
 108341 quit ^- eof ^- eol ^- -post -inpck`

108342 **nl** (**-nl**)  
 108343 Disable (enable) **icrnl**. In addition, **-nl** unsets **inlcr** and **igncr**.

108344 **ek** Reset ERASE and KILL characters back to system defaults.

108345 **sane**  
 108346 Reset all modes to some reasonable, unspecified, values.

108347 **STDIN**  
 108348 Although no input is read from standard input, standard input shall be used to get the current  
 108349 terminal I/O characteristics and to set new terminal I/O characteristics.

108350 **INPUT FILES**  
 108351 None.

108352 **ENVIRONMENT VARIABLES**  
 108353 The following environment variables shall affect the execution of *stty*:

108354 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 108355 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 108356 variables used to determine the values of locale categories.)

108357 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 108358 internationalization variables.

108359 **LC\_CTYPE** This variable determines the locale for the interpretation of sequences of bytes of  
 108360 text data as characters (for example, single-byte as opposed to multi-byte  
 108361 characters in arguments) and which characters are in the class **print**.

108362 **LC\_MESSAGES**  
 108363 Determine the locale that should be used to affect the format and contents of  
 108364 diagnostic messages written to standard error.

108365 XSI **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

108366 **ASYNCHRONOUS EVENTS**  
 108367 Default.

108368 **STDOUT**  
 108369 If operands are specified, no output shall be produced.

108370 If the **-g** option is specified, *stty* shall write to standard output the current settings in a form that  
 108371 can be used as arguments to another instance of *stty* on the same system.

108372 If the **-a** option is specified, all of the information as described in the OPERANDS section shall  
 108373 be written to standard output. Unless otherwise specified, this information shall be written as  
 108374 <space>-separated tokens in an unspecified format, on one or more lines, with an unspecified  
 108375 number of tokens per line. Additional information may be written.

108376 If no options or operands are specified, an unspecified subset of the information written for the  
 108377 **-a** option shall be written.

108378 If speed information is written as part of the default output, or if the **-a** option is specified and if  
 108379 the terminal input speed and output speed are the same, the speed information shall be written  
 108380 as follows:

108381 "speed %d baud;", <speed>  
 108382 Otherwise, speeds shall be written as:

108383 "ispeed %d baud; ospeed %d baud;", <ispeed>, <ospeed>

108384 In locales other than the POSIX locale, the word **baud** may be changed to something more  
 108385 appropriate in those locales.

108386 If control characters are written as part of the default output, or if the **-a** option is specified,  
 108387 control characters shall be written as:

108388 "%s = %s;", <control-character name>, <value>  
 108389 where <value> is either the character, or some visual representation of the character if it is non-  
 108390 printable, or the string *undef* if the character is disabled.

108391 **STDERR**  
 108392 The standard error shall be used only for diagnostic messages.

108393 **OUTPUT FILES**  
 108394 None.

108395 **EXTENDED DESCRIPTION**  
 108396 None.

108397 **EXIT STATUS**  
 108398 The following exit values shall be returned:

108399 0 The terminal options were read or set successfully.

108400 >0 An error occurred.

108401 **CONSEQUENCES OF ERRORS**

108402 Default.

108403 **APPLICATION USAGE**

108404 The **-g** flag is designed to facilitate the saving and restoring of terminal state from the shell level.  
 108405 For example, a program may:

```
108406 saveterm="$(stty -g)" # save terminal state
108407 stty (new settings) # set new state
108408 ... # ...
108409 stty $saveterm # restore terminal state
```

108410 Since the format is unspecified, the saved value is not portable across systems.

108411 Since the **-a** format is so loosely specified, scripts that save and restore terminal settings should  
 108412 use the **-g** option.

108413 **EXAMPLES**

108414 None.

108415 **RATIONALE**

108416 The original *stty* description was taken directly from System V and reflected the System V  
 108417 terminal driver **termio**. It has been modified to correspond to the terminal driver **termios**.

108418 Output modes are specified only for XSI-conformant systems. All implementations are expected  
 108419 to provide *stty* operands corresponding to all of the output modes they support.

108420 The *stty* utility is primarily used to tailor the user interface of the terminal, such as selecting the  
 108421 preferred ERASE and KILL characters. As an application programming utility, *stty* can be used  
 108422 within shell scripts to alter the terminal settings for the duration of the script.

108423 The **termios** section states that individual disabling of control characters is possible through the  
 108424 option `_POSIX_VDISABLE`. If enabled, two conventions currently exist for specifying this:  
 108425 System V uses `"^_"`, and BSD uses *undef*. Both are accepted by *stty* in this volume of  
 108426 POSIX.1-2008. The other BSD convention of using the letter `'u'` was rejected because it conflicts  
 108427 with the actual letter `'u'`, which is an acceptable value for a control character.

108428 Early proposals did not specify the mapping of `"^c"` to control characters because the control  
 108429 characters were not specified in the POSIX locale character set description file requirements. The  
 108430 control character set is now specified in XBD [Chapter 3](#) (on page 33), so the historical mapping is  
 108431 specified. Note that although the mapping corresponds to control-character key assignments on  
 108432 many terminals that use the ISO/IEC 646:1991 standard (or ASCII) character encodings, the  
 108433 mapping specified here is to the control characters, not their keyboard encodings.

108434 Since **termios** supports separate speeds for input and output, two new options were added to  
 108435 specify each distinctly.

108436 Some historical implementations use standard input to get and set terminal characteristics;  
 108437 others use standard output. Since input from a login TTY is usually restricted to the owner while  
 108438 output to a TTY is frequently open to anyone, using standard input provides fewer chances of  
 108439 accidentally (or maliciously) altering the terminal settings of other users. Using standard input  
 108440 also allows *stty -a* and *stty -g* output to be redirected for later use. Therefore, usage of standard  
 108441 input is required by this volume of POSIX.1-2008.

108442 **FUTURE DIRECTIONS**

108443 None.

108444 **SEE ALSO**108445 [Chapter 2](#) (on page 2319)108446 XBD [Chapter 8](#) (on page 173), [Chapter 11](#) (on page 199), [Section 12.2](#) (on page 215), [<termios.h>](#)108447 **CHANGE HISTORY**

108448 First released in Issue 2.

108449 **Issue 5**108450 The description of **tabs** is clarified.

108451 The FUTURE DIRECTIONS section is added.

108452 **Issue 6**108453 The LEGACY items **iuc lc(-iuc lc)**, **xcase**, **olc uc(-olc uc)**, **lcase(-lcase)**, and **LCASE(-LCASE)** are removed.108455 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/37 is applied, applying IEEE PASC Interpretation 1003.2 #133, fixing an error in the OPERANDS section for the Combination Modes **nl(-nl)**.108458 **Issue 7**

108459 Austin Group Interpretation 1003.1-2001 #144 is applied, moving functionality relating to the IXANY symbol from the XSI option to the Base.

108461 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

108462 **NAME**108463        **tabs** — set terminal tabs108464 **SYNOPSIS**108465 XSI        **tabs** [*-n* | *-a* | *-a2* | *-c* | *-c2* | *-c3* | *-f* | *-p* | *-s* | *-u*] [*-T type*]108466        **tabs** [*-T type*] *n*[[*sep*[+]*n*]]...108467 **DESCRIPTION**

108468        The *tabs* utility shall display a series of characters that first clears the hardware terminal tab  
 108469 XSI       settings and then initializes the tab stops at the specified positions and optionally adjusts the  
 108470        margin.

108471        The phrase “tab-stop position *N*” shall be taken to mean that, from the start of a line of output,  
 108472        tabbing to position *N* shall cause the next character output to be in the (*N*+1)th column position  
 108473        on that line. The maximum number of tab stops allowed is terminal-dependent.

108474        It need not be possible to implement *tabs* on certain terminals. If the terminal type obtained from  
 108475        the *TERM* environment variable or *-T* option represents such a terminal, an appropriate  
 108476        diagnostic message shall be written to standard error and *tabs* shall exit with a status greater  
 108477        than zero.

108478 **OPTIONS**

108479 XSI        The *tabs* utility shall conform to XBD [Section 12.2](#) (on page 215), except for various extensions:  
 108480        the options *-a2*, *-c2*, and *-c3* are multi-character.

108481        The following options shall be supported:

108482        *-n*        Specify repetitive tab stops separated by a uniform number of column positions, *n*,  
 108483               where *n* is a single-digit decimal number. The default usage of *tabs* with no  
 108484               arguments shall be equivalent to *tabs -8*. When *-0* is used, the tab stops shall be  
 108485               cleared and no new ones set.

108486 XSI        *-a*        1,10,16,36,72  
 108487               Assembler, applicable to some mainframes.

108488 XSI        *-a2*       1,10,16,40,72  
 108489               Assembler, applicable to some mainframes.

108490 XSI        *-c*        1,8,12,16,20,55  
 108491               COBOL, normal format.

108492 XSI        *-c2*       1,6,10,14,49  
 108493               COBOL, compact format (columns 1 to 6 omitted).

108494 XSI        *-c3*       1,6,10,14,18,22,26,30,34,38,42,46,50,54,58,62,67  
 108495               COBOL compact format (columns 1 to 6 omitted), with more tabs than *-c2*.

108496 XSI        *-f*        1,7,11,15,19,23  
 108497               FORTRAN

108498 XSI        *-p*        1,5,9,13,17,21,25,29,33,37,41,45,49,53,57,61  
 108499               PL/1

108500 XSI        *-s*        1,10,55  
 108501               SNOBOL

108502 XSI        *-u*        1,12,20,44  
 108503               Assembler, applicable to some mainframes.

108504        -T *type*        Indicate the type of terminal. If this option is not supplied and the *TERM* variable  
108505                               is unset or null, an unspecified default terminal type shall be used. The setting of  
108506                               *type* shall take precedence over the value in *TERM*.

## 108507 OPERANDS

108508        The following operand shall be supported:

108509        *n*[[*sep*[+]*n*]...] A single command line argument that consists of one or more tab-stop values (*n*)  
108510                               separated by a separator character (*sep*) which is either a <comma> or a <blank>  
108511                               character. The application shall ensure that the tab-stop values are positive decimal  
108512                               integers in strictly ascending order. If any tab-stop value (except the first one) is  
108513                               preceded by a <plus-sign>, it is taken as an increment to be added to the previous  
108514                               value. For example, the tab lists 1,10,20,30 and "1 10 +10 +10" are considered  
108515                               to be identical.

## 108516 STDIN

108517        Not used.

## 108518 INPUT FILES

108519        None.

## 108520 ENVIRONMENT VARIABLES

108521        The following environment variables shall affect the execution of *tabs*:

108522        *LANG*            Provide a default value for the internationalization variables that are unset or null.  
108523                               (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
108524                               variables used to determine the values of locale categories.)

108525        *LC\_ALL*          If set to a non-empty string value, override the values of all the other  
108526                               internationalization variables.

108527        *LC\_CTYPE*        Determine the locale for the interpretation of sequences of bytes of text data as  
108528                               characters (for example, single-byte as opposed to multi-byte characters in  
108529                               arguments).

108530        *LC\_MESSAGES*

108531                               Determine the locale that should be used to affect the format and contents of  
108532                               diagnostic messages written to standard error.

108533 XSI        *NLSPATH*    Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

108534        *TERM*            Determine the terminal type. If this variable is unset or null, and if the -T option is  
108535                               not specified, an unspecified default terminal type shall be used.

## 108536 ASYNCHRONOUS EVENTS

108537        Default.

## 108538 STDOUT

108539        If standard output is a terminal, the appropriate sequence to clear and set the tab stops may be  
108540        written to standard output in an unspecified format. If standard output is not a terminal,  
108541        undefined results occur.

## 108542 STDERR

108543        The standard error shall be used only for diagnostic messages.

## 108544 OUTPUT FILES

108545        None.

108546 **EXTENDED DESCRIPTION**

108547 None.

108548 **EXIT STATUS**

108549 The following exit values shall be returned:

108550 0 Successful completion.

108551 &gt;0 An error occurred.

108552 **CONSEQUENCES OF ERRORS**

108553 Default.

108554 **APPLICATION USAGE**108555 This utility makes use of the terminal's hardware tabs and the *stty tabs* option.

108556 This utility is not recommended for application use.

108557 Some integrated display units might not have escape sequences to set tab stops, but may be set  
108558 by internal system calls. On these terminals, *tabs* works if standard output is directed to the  
108559 terminal; if output is directed to another file, however, *tabs* fails.

108560 **EXAMPLES**

108561 None.

108562 **RATIONALE**

108563 Consideration was given to having the *tput* utility handle all of the functions described in *tabs*.  
108564 However, the separate *tabs* utility was retained because it seems more intuitive to use a  
108565 command named *tabs* than *tput* with a new option. The *tput* utility does not support setting or  
108566 clearing tabs, and no known historical version of *tabs* supports the capability of setting arbitrary  
108567 tab stops.

108568 The System V *tabs* interface is very complex; the version in this volume of POSIX.1-2008 has a  
108569 reduced feature list, but many of the features omitted were restored as part of the XSI option  
108570 even though the supported languages and coding styles are primarily historical.

108571 There was considerable sentiment for specifying only a means of resetting the tabs back to a  
108572 known state—presumably the “standard” of tabs every eight positions. The following features  
108573 were omitted:

- 108574 • Setting tab stops via the first line in a file, using *--file*. Since even the SVID has no  
108575 complete explanation of this feature, it is doubtful that it is in widespread use.

108576 In an early proposal, a *-t tablist* option was added for consistency with *expand*; this was later  
108577 removed when inconsistencies with the historical list of tabs were identified.

108578 Consideration was given to adding a *-p* option that would output the current tab settings so  
108579 that they could be saved and then later restored. This was not accepted because querying the tab  
108580 stops of the terminal is not a capability in historical *terminfo* or *termcap* facilities and might not be  
108581 supported on a wide range of terminals.

108582 **FUTURE DIRECTIONS**

108583 None.

108584 **SEE ALSO**108585 *expand*, *stty*, *tput*, *unexpand*

108586 XBD Chapter 8 (on page 173), Section 12.2 (on page 215)

108587 **CHANGE HISTORY**

108588 First released in Issue 2.

108589 **Issue 6**

108590 This utility is marked as part of the User Portability Utilities option.

108591 The normative text is reworded to avoid use of the term “must” for application requirements.

108592 **Issue 7**

108593 The *tabs* utility is removed from the User Portability Utilities option. User Portability Utilities is  
108594 now an option for interactive utilities.

108595 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

108596 The SYNOPSIS and OPERANDS sections are updated.

108597 **NAME**

108598       tail — copy the last part of a file

108599 **SYNOPSIS**108600       tail [-f] [-c *number*|-n *number*] [*file*]108601 **DESCRIPTION**108602       The *tail* utility shall copy its input file to the standard output beginning at a designated place.

108603       Copying shall begin at the point in the file indicated by the *-c number* or *-n number* options. The  
 108604       option-argument *number* shall be counted in units of lines or bytes, according to the options *-n*  
 108605       and *-c*. Both line and byte counts start from 1.

108606       Tails relative to the end of the file may be saved in an internal buffer, and thus may be limited in  
 108607       length. Such a buffer, if any, shall be no smaller than {LINE\_MAX}\*10 bytes.

108608 **OPTIONS**

108609       The *tail* utility shall conform to XBD [Section 12.2](#) (on page 215), except that '+' may be  
 108610       recognized as an option delimiter as well as '-'.

108611       The following options shall be supported:

108612       *-c number*   The application shall ensure that the *number* option-argument is a decimal integer,  
 108613       optionally including a sign. The sign shall affect the location in the file, measured  
 108614       in bytes, to begin the copying:

| Sign        | Copying Starts                         |
|-------------|----------------------------------------|
| +           | Relative to the beginning of the file. |
| -           | Relative to the end of the file.       |
| <i>none</i> | Relative to the end of the file.       |

108619       The application shall ensure that if the sign of the *number* option-argument is '+',  
 108620       the *number* option-argument is a non-zero decimal integer.

108621       The origin for counting shall be 1; that is, *-c +1* represents the first byte of the file,  
 108622       *-c -1* the last.

108623       *-f*           If the input file is a regular file or if the *file* operand specifies a FIFO, do not  
 108624       terminate after the last line of the input file has been copied, but read and copy  
 108625       further bytes from the input file when they become available. If no *file* operand is  
 108626       specified and standard input is a pipe or FIFO, the *-f* option shall be ignored. If the  
 108627       input file is not a FIFO, pipe, or regular file, it is unspecified whether or not the *-f*  
 108628       option shall be ignored.

108629       *-n number*   This option shall be equivalent to *-c number*, except the starting location in the file  
 108630       shall be measured in lines instead of bytes. The origin for counting shall be 1; that  
 108631       is, *-n +1* represents the first line of the file, *-n -1* the last.

108632       If neither *-c* nor *-n* is specified, *-n 10* shall be assumed.108633 **OPERANDS**

108634       The following operand shall be supported:

108635       *file*        A pathname of an input file. If no *file* operand is specified, the standard input shall  
 108636       be used.

108637 **STDIN**

108638 The standard input shall be used if no *file* operand is specified, and shall be used if the *file*  
 108639 operand is '-' and the implementation treats the '-' as meaning standard input. Otherwise,  
 108640 the standard input shall not be used. See the INPUT FILES section.

108641 **INPUT FILES**

108642 If the -c option is specified, the input file can contain arbitrary data; otherwise, the input file  
 108643 shall be a text file.

108644 **ENVIRONMENT VARIABLES**

108645 The following environment variables shall affect the execution of *tail*:

108646 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 108647 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
 108648 variables used to determine the values of locale categories.)

108649 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 108650 internationalization variables.

108651 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 108652 characters (for example, single-byte as opposed to multi-byte characters in  
 108653 arguments and input files).

108654 *LC\_MESSAGES*

108655 Determine the locale that should be used to affect the format and contents of  
 108656 diagnostic messages written to standard error.

108657 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

108658 **ASYNCHRONOUS EVENTS**

108659 Default.

108660 **STDOUT**

108661 The designated portion of the input file shall be written to standard output.

108662 **STDERR**

108663 The standard error shall be used only for diagnostic messages.

108664 **OUTPUT FILES**

108665 None.

108666 **EXTENDED DESCRIPTION**

108667 None.

108668 **EXIT STATUS**

108669 The following exit values shall be returned:

108670 0 Successful completion.

108671 >0 An error occurred.

108672 **CONSEQUENCES OF ERRORS**

108673 Default.

## 108674 APPLICATION USAGE

108675 The **-c** option should be used with caution when the input is a text file containing multi-byte  
 108676 characters; it may produce output that does not start on a character boundary.

108677 Although the input file to *tail* can be any type, the results might not be what would be expected  
 108678 on some character special device files or on file types not described by the System Interfaces  
 108679 volume of POSIX.1-2008. Since this volume of POSIX.1-2008 does not specify the block size used  
 108680 when doing input, *tail* need not read all of the data from devices that only perform block  
 108681 transfers.

## 108682 EXAMPLES

108683 The **-f** option can be used to monitor the growth of a file that is being written by some other  
 108684 process. For example, the command:

108685 `tail -f fred`

108686 prints the last ten lines of the file **fred**, followed by any lines that are appended to **fred** between  
 108687 the time *tail* is initiated and killed. As another example, the command:

108688 `tail -f -c 15 fred`

108689 prints the last 15 bytes of the file **fred**, followed by any bytes that are appended to **fred** between  
 108690 the time *tail* is initiated and killed.

## 108691 RATIONALE

108692 This version of *tail* was created to allow conformance to the Utility Syntax Guidelines. The  
 108693 historical **-b** option was omitted because of the general non-portability of block-sized units of  
 108694 text. The **-c** option historically meant “characters”, but this volume of POSIX.1-2008 indicates  
 108695 that it means “bytes”. This was selected to allow reasonable implementations when multi-byte  
 108696 characters are possible; it was not named **-b** to avoid confusion with the historical **-b**.

108697 The origin of counting both lines and bytes is 1, matching all widespread historical  
 108698 implementations. Hence *tail -n +0* is not conforming usage because it attempts to output line  
 108699 zero; but note that *tail -n 0* does conform, and outputs nothing.

108700 Earlier versions of this standard allowed the following forms in the SYNOPSIS:

108701 `tail -[number] [b|c|l] [f] [file]`

108702 `tail +[number] [b|c|l] [f] [file]`

108703 These forms are no longer specified by POSIX.1-2008, but may be present in some  
 108704 implementations.

108705 The restriction on the internal buffer is a compromise between the historical System V  
 108706 implementation of 4 096 bytes and the BSD 32 768 bytes.

108707 The **-f** option has been implemented as a loop that sleeps for 1 second and copies any bytes that  
 108708 are available. This is sufficient, but if more efficient methods of determining when new data are  
 108709 available are developed, implementations are encouraged to use them.

108710 Historical documentation indicates that *tail* ignores the **-f** option if the input file is a pipe (pipe  
 108711 and FIFO on systems that support FIFOs). On BSD-based systems, this has been true; on System  
 108712 V-based systems, this was true when input was taken from standard input, but it did not ignore  
 108713 the **-f** flag if a FIFO was named as the *file* operand. Since the **-f** option is not useful on pipes and  
 108714 all historical implementations ignore **-f** if no *file* operand is specified and standard input is a  
 108715 pipe, this volume of POSIX.1-2008 requires this behavior. However, since the **-f** option is useful  
 108716 on a FIFO, this volume of POSIX.1-2008 also requires that if a FIFO is named, the **-f** option shall  
 108717 not be ignored. Earlier versions of this standard did not state any requirement for the case where  
 108718 no *file* operand is specified and standard input is a FIFO. The standard has been updated to

108719 reflect current practice which is to treat this case the same as a pipe on standard input. Although  
108720 historical behavior does not ignore the `-f` option for other file types, this is unspecified so that  
108721 implementations are allowed to ignore the `-f` option if it is known that the file cannot be  
108722 extended.

#### 108723 **FUTURE DIRECTIONS**

108724 None.

#### 108725 **SEE ALSO**

108727 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)

#### 108728 **CHANGE HISTORY**

108729 First released in Issue 2.

#### 108730 **Issue 6**

108731 The obsolescent SYNOPSIS lines and associated text are removed.

108732 The normative text is reworded to avoid use of the term “must” for application requirements.

#### 108733 **Issue 7**

108734 Austin Group Interpretation 1003.1-2001 #027 is applied, clarifying that ‘+’ may be recognized  
108735 as an option delimiter in the OPTIONS section.

108736 Austin Group Interpretation 1003.1-2001 #092 is applied.

108737 Austin Group Interpretation 1003.1-2001 #100 is applied, adding the requirement on applications  
108738 that if the sign of the option-argument *number* is ‘+’, the *number* option-argument is a non-zero  
108739 decimal integer.

108740 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

108741 SD5-XCU-ERN-114 is applied, updating the OPTIONS section (the `-f` option).

108742 SD5-XCU-ERN-149 is applied.

108743 **NAME**

108744       talk — talk to another user

108745 **SYNOPSIS**108746 UP       talk *address* [*terminal*]108747 **DESCRIPTION**108748       The *talk* utility is a two-way, screen-oriented communication program.108749       When first invoked, *talk* shall send a message similar to:

108750       Message from <unspecified string>  
 108751       talk: connection requested by *your\_address*  
 108752       talk: respond with: talk *your\_address*

108753       to the specified *address*. At this point, the recipient of the message can reply by typing:108754       talk *your\_address*

108755       Once communication is established, the two parties can type simultaneously, with their output  
 108756       displayed in separate regions of the screen. Characters shall be processed as follows:

- 108757       • Typing the <alert> character shall alert the recipient's terminal.
- 108758       • Typing <control>-L shall cause the sender's screen regions to be refreshed.
- 108759       • Typing the erase and kill characters shall affect the sender's terminal in the manner  
 108760       described by the **termios** interface in XBD [Chapter 11](#) (on page 199).
- 108761       • Typing the interrupt or end-of-file characters shall terminate the local *talk* utility. Once the  
 108762       *talk* session has been terminated on one side, the other side of the *talk* session shall be  
 108763       notified that the *talk* session has been terminated and shall be able to do nothing except  
 108764       exit.
- 108765       • Typing characters from *LC\_CTYPE* classifications **print** or **space** shall cause those  
 108766       characters to be sent to the recipient's terminal.
- 108767       • When and only when the *stty iexten* local mode is enabled, the existence and processing of  
 108768       additional special control characters and multi-byte or single-byte functions shall be  
 108769       implementation-defined.
- 108770       • Typing other non-printable characters shall cause implementation-defined sequences of  
 108771       printable characters to be sent to the recipient's terminal.

108772       Permission to be a recipient of a *talk* message can be denied or granted by use of the *mesg* utility.  
 108773       However, a user's privilege may further constrain the domain of accessibility of other users'  
 108774       terminals. The *talk* utility shall fail when the user lacks appropriate privileges to perform the  
 108775       requested action.

108776       Certain block-mode terminals do not have all the capabilities necessary to support the  
 108777       simultaneous exchange of messages required for *talk*. When this type of exchange cannot be  
 108778       supported on such terminals, the implementation may support an exchange with reduced levels  
 108779       of simultaneous interaction or it may report an error describing the terminal-related deficiency.

108780 **OPTIONS**

108781       None.

108782 **OPERANDS**

108783 The following operands shall be supported:

108784 *address* The recipient of the *talk* session. One form of *address* is the *<user name>*, as returned  
 108785 by the *who* utility. Other address formats and how they are handled are  
 108786 unspecified.

108787 *terminal* If the recipient is logged in more than once, the *terminal* argument can be used to  
 108788 indicate the appropriate terminal name. If *terminal* is not specified, the *talk* message  
 108789 shall be displayed on one or more accessible terminals in use by the recipient. The  
 108790 format of *terminal* shall be the same as that returned by the *who* utility.

108791 **STDIN**

108792 Characters read from standard input shall be copied to the recipient's terminal in an unspecified  
 108793 manner. If standard input is not a terminal, *talk* shall write a diagnostic message and exit with a  
 108794 non-zero status.

108795 **INPUT FILES**

108796 None.

108797 **ENVIRONMENT VARIABLES**108798 The following environment variables shall affect the execution of *talk*:

108799 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 108800 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 108801 variables used to determine the values of locale categories.)

108802 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 108803 internationalization variables.

108804 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 108805 characters (for example, single-byte as opposed to multi-byte characters in  
 108806 arguments and input files). If the recipient's locale does not use an *LC\_CTYPE*  
 108807 equivalent to the sender's, the results are undefined.

108808 *LC\_MESSAGES*

108809 Determine the locale that should be used to affect the format and contents of  
 108810 diagnostic messages written to standard error and informative messages written to  
 108811 standard output.

108812 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

108813 *TERM* Determine the name of the invoker's terminal type. If this variable is unset or null,  
 108814 an unspecified default terminal type shall be used.

108815 **ASYNCHRONOUS EVENTS**

108816 When the *talk* utility receives a SIGINT signal, the utility shall terminate and exit with a zero  
 108817 status. It shall take the standard action for all other signals.

108818 **STDOUT**

108819 If standard output is a terminal, characters copied from the recipient's standard input may be  
 108820 written to standard output. Standard output also may be used for diagnostic messages. If  
 108821 standard output is not a terminal, *talk* shall exit with a non-zero status.

108822 **STDERR**

108823 None.

108824 **OUTPUT FILES**

108825 None.

108826 **EXTENDED DESCRIPTION**

108827 None.

108828 **EXIT STATUS**

108829 The following exit values shall be returned:

108830 0 Successful completion.

108831 >0 An error occurred or *talk* was invoked on a terminal incapable of supporting it.108832 **CONSEQUENCES OF ERRORS**

108833 Default.

108834 **APPLICATION USAGE**

108835 Because the handling of non-printable, non-`<space>` characters is tied to the *stty* description of  
108836 *ixten*, implementation extensions within the terminal driver can be accessed. For example,  
108837 some implementations provide line editing functions with certain control character sequences.

108838 **EXAMPLES**

108839 None.

108840 **RATIONALE**

108841 The *write* utility was included in this volume of POSIX.1-2008 since it can be implemented on all  
108842 terminal types. The *talk* utility, which cannot be implemented on certain terminals, was  
108843 considered to be a “better” communications interface. Both of these programs are in widespread  
108844 use on historical implementations. Therefore, both utilities have been specified.

108845 All references to networking abilities (*talking* to a user on another system) were removed as  
108846 being outside the scope of this volume of POSIX.1-2008.

108847 Historical BSD and System V versions of *talk* terminate both of the conversations when either  
108848 user breaks out of the session. This can lead to adverse consequences if a user unwittingly  
108849 continues to enter text that is interpreted by the shell when the other terminates the session.  
108850 Therefore, the version of *talk* specified by this volume of POSIX.1-2008 requires both users to  
108851 terminate their end of the session explicitly.

108852 Only messages sent to the terminal of the invoking user can be internationalized in any way:

- 108853 • The original “Message from *<unspecified string>* ...” message sent to the terminal of the  
108854 recipient cannot be internationalized because the environment of the recipient is as yet  
108855 inaccessible to the *talk* utility. The environment of the invoking party is irrelevant.
- 108856 • Subsequent communication between the two parties cannot be internationalized because  
108857 the two parties may specify different languages in their environment (and non-portable  
108858 characters cannot be mapped from one language to another).
- 108859 • Neither party can be required to communicate in a language other than C and/or the one  
108860 specified by their environment because unavailable terminal hardware support (for  
108861 example, fonts) may be required.

108862 The text in the STDOUT section reflects the usage of the verb “display” in this section; some *talk*  
108863 implementations actually use standard output to write to the terminal, but this volume of  
108864 POSIX.1-2008 does not require that to be the case.

108865 The format of the terminal name is unspecified, but the descriptions of *ps*, *talk*, *who*, and *write*  
108866 require that they all use or accept the same format.

108867 The handling of non-printable characters is partially implementation-defined because the details  
108868 of mapping them to printable sequences is not needed by the user. Historical implementations,  
108869 for security reasons, disallow the transmission of non-printable characters that may send  
108870 commands to the other terminal.

108871 **FUTURE DIRECTIONS**

108872 None.

108873 **SEE ALSO**

108874 *mesg, stty, who, write*

108875 XBD [Chapter 8](#) (on page 173), [Chapter 11](#) (on page 199)

108876 **CHANGE HISTORY**

108877 First released in Issue 4.

108878 **Issue 6**

108879 This utility is marked as part of the User Portability Utilities option.

108880 **NAME**

108881       tee — duplicate standard input

108882 **SYNOPSIS**108883       tee [-ai] [*file...*]108884 **DESCRIPTION**108885       The *tee* utility shall copy standard input to standard output, making a copy in zero or more files.108886       The *tee* utility shall not buffer output.108887       If the **-a** option is not specified, output files shall be written (see [Section 1.1.1.4](#) (on page 2302)).108888 **OPTIONS**108889       The *tee* utility shall conform to XBD [Section 12.2](#) (on page 215).

108890       The following options shall be supported:

108891       **-a**           Append the output to the files.108892       **-i**           Ignore the SIGINT signal.108893 **OPERANDS**

108894       The following operands shall be supported:

108895       *file*           A pathname of an output file. If a *file* operand is '-', it shall refer to a file named  
 108896       -; implementations shall not treat it as meaning standard output. Processing of at  
 108897       least 13 *file* operands shall be supported.

108898 **STDIN**

108899       The standard input can be of any type.

108900 **INPUT FILES**

108901       None.

108902 **ENVIRONMENT VARIABLES**108903       The following environment variables shall affect the execution of *tee*:

108904       **LANG**           Provide a default value for the internationalization variables that are unset or null.  
 108905                       (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 108906                       variables used to determine the values of locale categories.)

108907       **LC\_ALL**       If set to a non-empty string value, override the values of all the other  
 108908                       internationalization variables.

108909       **LC\_CTYPE**   Determine the locale for the interpretation of sequences of bytes of text data as  
 108910                       characters (for example, single-byte as opposed to multi-byte characters in  
 108911                       arguments).

108912       **LC\_MESSAGES**

108913                       Determine the locale that should be used to affect the format and contents of  
 108914                       diagnostic messages written to standard error.

108915 **XSI**       **NLSPATH**   Determine the location of message catalogs for the processing of *LC\_MESSAGES*.108916 **ASYNCHRONOUS EVENTS**108917       Default, except that if the **-i** option was specified, SIGINT shall be ignored.108918 **STDOUT**

108919       The standard output shall be a copy of the standard input.

**108920 STDERR**

108921 The standard error shall be used only for diagnostic messages.

**108922 OUTPUT FILES**

108923 If any *file* operands are specified, the standard input shall be copied to each named file.

**108924 EXTENDED DESCRIPTION**

108925 None.

**108926 EXIT STATUS**

108927 The following exit values shall be returned:

108928 0 The standard input was successfully copied to all output files.

108929 >0 An error occurred.

**108930 CONSEQUENCES OF ERRORS**

108931 If a write to any successfully opened *file* operand fails, writes to other successfully opened *file*  
108932 operands and standard output shall continue, but the exit status shall be non-zero. Otherwise,  
108933 the default actions specified in [Section 1.4](#) (on page 2310) apply.

**108934 APPLICATION USAGE**

108935 The *tee* utility is usually used in a pipeline, to make a copy of the output of some utility.

108936 The *file* operand is technically optional, but *tee* is no more useful than *cat* when none is specified.

**108937 EXAMPLES**

108938 Save an unsorted intermediate form of the data in a pipeline:

108939 `... | tee unsorted | sort > sorted`

**108940 RATIONALE**

108941 The buffering requirement means that *tee* is not allowed to use ISO C standard fully buffered or  
108942 line-buffered writes. It does not mean that *tee* has to do 1-byte reads followed by 1-byte writes.

108943 It should be noted that early versions of BSD ignore any invalid options and accept a single `'-'`  
108944 as an alternative to `-i`. They also print a message if unable to open a file:

108945 `"tee: cannot access %s\n", <pathname>`

108946 Historical implementations ignore write errors. This is explicitly not permitted by this volume of  
108947 POSIX.1-2008.

108948 Some historical implementations use `O_APPEND` when providing append mode; others use the  
108949 `lseek()` function to seek to the end-of-file after opening the file without `O_APPEND`. This volume  
108950 of POSIX.1-2008 requires functionality equivalent to using `O_APPEND`; see [Section 1.1.1.4](#) (on  
108951 page 2302).

**108952 FUTURE DIRECTIONS**

108953 None.

**108954 SEE ALSO**

108955 [Chapter 1](#) (on page 2301), *cat*

108956 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)

108958 **CHANGE HISTORY**

108959 First released in Issue 2.

108960 **Issue 6**

108961 IEEE PASC Interpretation 1003.2 #168 is applied.

108962 **Issue 7**

108963 Austin Group Interpretation 1003.1-2001 #092 is applied.

108964 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

108965 **NAME**

108966       test — evaluate expression

108967 **SYNOPSIS**108968       test [*expression*]108969       [ [*expression*] ]108970 **DESCRIPTION**

108971       The *test* utility shall evaluate the *expression* and indicate the result of the evaluation by its exit  
 108972       status. An exit status of zero indicates that the expression evaluated as true and an exit status of  
 108973       1 indicates that the expression evaluated as false.

108974       In the second form of the utility, which uses "[ ]" rather than *test*, the application shall ensure  
 108975       that the square brackets are separate arguments.

108976 **OPTIONS**

108977       The *test* utility shall not recognize the "--" argument in the manner specified by Guideline 10 in  
 108978       XBD [Section 12.2](#) (on page 215).

108979       No options shall be supported.

108980 **OPERANDS**

108981       The application shall ensure that all operators and elements of primaries are presented as  
 108982       separate arguments to the *test* utility.

108983       The following primaries can be used to construct *expression*:

108984       **-b** *pathname* True if *pathname* resolves to an existing directory entry for a block special file. False  
 108985       if *pathname* cannot be resolved, or if *pathname* resolves to an existing directory entry  
 108986       for a file that is not a block special file.

108987       **-c** *pathname* True if *pathname* resolves to an existing directory entry for a character special file.  
 108988       False if *pathname* cannot be resolved, or if *pathname* resolves to an existing directory  
 108989       entry for a file that is not a character special file.

108990       **-d** *pathname* True if *pathname* resolves to an existing directory entry for a directory. False if  
 108991       *pathname* cannot be resolved, or if *pathname* resolves to an existing directory entry  
 108992       for a file that is not a directory.

108993       **-e** *pathname* True if *pathname* resolves to an existing directory entry. False if *pathname* cannot be  
 108994       resolved.

108995       **-f** *pathname* True if *pathname* resolves to an existing directory entry for a regular file. False if  
 108996       *pathname* cannot be resolved, or if *pathname* resolves to an existing directory entry  
 108997       for a file that is not a regular file.

108998       **-g** *pathname* True if *pathname* resolves to an existing directory entry for a file that has its set-  
 108999       group-ID flag set. False if *pathname* cannot be resolved, or if *pathname* resolves to an  
 109000       existing directory entry for a file that does not have its set-group-ID flag set.

109001       **-h** *pathname* True if *pathname* resolves to an existing directory entry for a symbolic link. False if  
 109002       *pathname* cannot be resolved, or if *pathname* resolves to an existing directory entry  
 109003       for a file that is not a symbolic link. If the final component of *pathname* is a  
 109004       symbolic link, that symbolic link is not followed.

109005       **-L** *pathname* True if *pathname* resolves to an existing directory entry for a symbolic link. False if  
 109006       *pathname* cannot be resolved, or if *pathname* resolves to an existing directory entry  
 109007       for a file that is not a symbolic link. If the final component of *pathname* is a  
 109008       symbolic link, that symbolic link is not followed.

|        |                                  |                                                                                                               |
|--------|----------------------------------|---------------------------------------------------------------------------------------------------------------|
| 109009 | <b>-n</b> <i>string</i>          | True if the length of <i>string</i> is non-zero; otherwise, false.                                            |
| 109010 | <b>-p</b> <i>pathname</i>        | True if <i>pathname</i> resolves to an existing directory entry for a FIFO. False if <i>pathname</i>          |
| 109011 |                                  | cannot be resolved, or if <i>pathname</i> resolves to an existing directory entry for a file                  |
| 109012 |                                  | that is not a FIFO.                                                                                           |
| 109013 | <b>-r</b> <i>pathname</i>        | True if <i>pathname</i> resolves to an existing directory entry for a file for which                          |
| 109014 |                                  | permission to read from the file will be granted, as defined in <a href="#">Section 1.1.1.4</a> (on           |
| 109015 |                                  | page 2302). False if <i>pathname</i> cannot be resolved, or if <i>pathname</i> resolves to an                 |
| 109016 |                                  | existing directory entry for a file for which permission to read from the file will not                       |
| 109017 |                                  | be granted.                                                                                                   |
| 109018 | <b>-S</b> <i>pathname</i>        | True if <i>pathname</i> resolves to an existing directory entry for a socket. False if                        |
| 109019 |                                  | <i>pathname</i> cannot be resolved, or if <i>pathname</i> resolves to an existing directory entry             |
| 109020 |                                  | for a file that is not a socket.                                                                              |
| 109021 | <b>-s</b> <i>pathname</i>        | True if <i>pathname</i> resolves to an existing directory entry for a file that has a size                    |
| 109022 |                                  | greater than zero. False if <i>pathname</i> cannot be resolved, or if <i>pathname</i> resolves to an          |
| 109023 |                                  | existing directory entry for a file that does not have a size greater than zero.                              |
| 109024 | <b>-t</b> <i>file_descriptor</i> |                                                                                                               |
| 109025 |                                  | True if file descriptor number <i>file_descriptor</i> is open and is associated with a                        |
| 109026 |                                  | terminal. False if <i>file_descriptor</i> is not a valid file descriptor number, or if file                   |
| 109027 |                                  | descriptor number <i>file_descriptor</i> is not open, or if it is open but is not associated                  |
| 109028 |                                  | with a terminal.                                                                                              |
| 109029 | <b>-u</b> <i>pathname</i>        | True if <i>pathname</i> resolves to an existing directory entry for a file that has its set-                  |
| 109030 |                                  | user-ID flag set. False if <i>pathname</i> cannot be resolved, or if <i>pathname</i> resolves to an           |
| 109031 |                                  | existing directory entry for a file that does not have its set-user-ID flag set.                              |
| 109032 | <b>-w</b> <i>pathname</i>        | True if <i>pathname</i> resolves to an existing directory entry for a file for which                          |
| 109033 |                                  | permission to write to the file will be granted, as defined in <a href="#">Section 1.1.1.4</a> (on page       |
| 109034 |                                  | 2302). False if <i>pathname</i> cannot be resolved, or if <i>pathname</i> resolves to an existing             |
| 109035 |                                  | directory entry for a file for which permission to write to the file will not be                              |
| 109036 |                                  | granted.                                                                                                      |
| 109037 | <b>-x</b> <i>pathname</i>        | True if <i>pathname</i> resolves to an existing directory entry for a file for which                          |
| 109038 |                                  | permission to execute the file (or search it, if it is a directory) will be granted, as                       |
| 109039 |                                  | defined in <a href="#">Section 1.1.1.4</a> (on page 2302). False if <i>pathname</i> cannot be resolved, or if |
| 109040 |                                  | <i>pathname</i> resolves to an existing directory entry for a file for which permission to                    |
| 109041 |                                  | execute (or search) the file will not be granted.                                                             |
| 109042 | <b>-z</b> <i>string</i>          | True if the length of string <i>string</i> is zero; otherwise, false.                                         |
| 109043 | <i>string</i>                    | True if the string <i>string</i> is not the null string; otherwise, false.                                    |
| 109044 | <i>s1</i> = <i>s2</i>            | True if the strings <i>s1</i> and <i>s2</i> are identical; otherwise, false.                                  |
| 109045 | <i>s1</i> != <i>s2</i>           | True if the strings <i>s1</i> and <i>s2</i> are not identical; otherwise, false.                              |
| 109046 | <i>n1</i> -eq <i>n2</i>          | True if the integers <i>n1</i> and <i>n2</i> are algebraically equal; otherwise, false.                       |
| 109047 | <i>n1</i> -ne <i>n2</i>          | True if the integers <i>n1</i> and <i>n2</i> are not algebraically equal; otherwise, false.                   |
| 109048 | <i>n1</i> -gt <i>n2</i>          | True if the integer <i>n1</i> is algebraically greater than the integer <i>n2</i> ; otherwise, false.         |
| 109049 | <i>n1</i> -ge <i>n2</i>          | True if the integer <i>n1</i> is algebraically greater than or equal to the integer <i>n2</i> ;               |
| 109050 |                                  | otherwise, false.                                                                                             |

109051 *n1 -lt n2* True if the integer *n1* is algebraically less than the integer *n2*; otherwise, false.

109052 *n1 -le n2* True if the integer *n1* is algebraically less than or equal to the integer *n2*; otherwise,  
109053 false.

109054 OB XSI *expression1 -a expression2*  
109055 True if both *expression1* and *expression2* are true; otherwise, false. The *-a* binary  
109056 primary is left associative. It has a higher precedence than *-o*.

109057 OB XSI *expression1 -o expression2*  
109058 True if either *expression1* or *expression2* is true; otherwise, false. The *-o* binary  
109059 primary is left associative.

109060 With the exception of the *-h pathname* and *-L pathname* primaries, if a *pathname* argument is a  
109061 symbolic link, *test* shall evaluate the expression by resolving the symbolic link and using the file  
109062 referenced by the link.

109063 These primaries can be combined with the following operators:

109064 *! expression* True if *expression* is false. False if *expression* is true.

109065 OB XSI *( expression )* True if *expression* is true. False if *expression* is false. The parentheses can be used to  
109066 alter the normal precedence and associativity.

109067 The primaries with two elements of the form:

109068 *-primary\_operator primary\_operand*

109069 are known as *unary primaries*. The primaries with three elements in either of the two forms:

109070 *primary\_operand -primary\_operator primary\_operand*  
109071 *primary\_operand primary\_operator primary\_operand*

109072 are known as *binary primaries*. Additional implementation-defined operators and  
109073 *primary\_operators* may be provided by implementations. They shall be of the form *-operator*  
109074 where the first character of *operator* is not a digit.

109075 The algorithm for determining the precedence of the operators and the return value that shall be  
109076 generated is based on the number of arguments presented to *test*. (However, when using the  
109077 "[...]" form, the <right-square-bracket> final argument shall not be counted in this  
109078 algorithm.)

109079 In the following list, \$1, \$2, \$3, and \$4 represent the arguments presented to *test*:

109080 0 arguments: Exit false (1).

109081 1 argument: Exit true (0) if \$1 is not null; otherwise, exit false.

109082 2 arguments:

- If \$1 is '!', exit true if \$2 is null, false if \$2 is not null.
- If \$1 is a unary primary, exit true if the unary test is true, false if the unary test is false.
- Otherwise, produce unspecified results.

109083

109084

109085

109086 3 arguments:

- If \$2 is a binary primary, perform the binary test of \$1 and \$3.
- If \$1 is '!', negate the two-argument test of \$2 and \$3.
- If \$1 is '(' and \$3 is ')', perform the unary test of \$2. On systems that  
109088 OB XSI do not support the XSI option, the results are unspecified if \$1 is '('  
109089 and \$3 is ')'.  
109090

| 109121 |                              | Default.                                                                                                                             |
| 109122 | <b>STDOUT</b>                |                                                                                                                                      |
| 109123 |                              | Not used.                                                                                                                            |
| 109124 | <b>STDERR</b>                |                                                                                                                                      |
| 109125 |                              | The standard error shall be used only for diagnostic messages.                                                                       |
| 109126 | <b>OUTPUT FILES</b>          |                                                                                                                                      |
| 109127 |                              | None.                                                                                                                                |
| 109128 | <b>EXTENDED DESCRIPTION</b>  |                                                                                                                                      |
| 109129 |                              | None.                                                                                                                                |

109130 **EXIT STATUS**

109131 The following exit values shall be returned:

109132 0 *expression* evaluated to true.109133 1 *expression* evaluated to false or *expression* was missing.

109134 &gt;1 An error occurred.

109135 **CONSEQUENCES OF ERRORS**

109136 Default.

109137 **APPLICATION USAGE**

109138 The XSI extensions specifying the `-a` and `-o` binary primaries and the `' ('` and `') '` operators  
 109139 have been marked obsolescent. (Many expressions using them are ambiguously defined by the  
 109140 grammar depending on the specific expressions being evaluated.) Scripts using these  
 109141 expressions should be converted to the forms given below. Even though many implementations  
 109142 will continue to support these obsolescent forms, scripts should be extremely careful when  
 109143 dealing with user-supplied input that could be confused with these and other primaries and  
 109144 operators. Unless the application developer knows all the cases that produce input to the script,  
 109145 invocations like:

109146 `test "$1" -a "$2"`

109147 should be written as:

109148 `test "$1" && test "$2"`

109149 to avoid problems if a user supplied values such as \$1 set to `' ! '` and \$2 set to the null string.  
 109150 That is, in cases where maximal portability is of concern, replace:

109151 `test expr1 -a expr2`

109152 with:

109153 `test expr1 && test expr2`

109154 and replace:

109155 `test expr1 -o expr2`

109156 with:

109157 `test expr1 || test expr2`

109158 but note that, in *test*, `-a` has higher precedence than `-o` while `"&&"` and `"||"` have equal  
 109159 precedence in the shell.

109160 Parentheses or braces can be used in the shell command language to effect grouping.

109161 Parentheses must be escaped when using *sh*; for example:109162 `test \( expr1 -a expr2 \) -o expr3`

109163 This command is not always portable even on XSI-conformant systems depending on the  
 109164 expressions specified by *expr1*, *expr2*, and *expr3*. The following form can be used instead:

109165 `( test expr1 && test expr2 ) || test expr3`

109166 The two commands:

109167 `test "$1"`109168 `test ! "$1"`

could not be used reliably on some historical systems. Unexpected results would occur if such a *string* expression were used and \$1 expanded to '!', '(', or a known unary primary. Better constructs are:

```
test -n "$1"
test -z "$1"
```

respectively.

Historical systems have also been unreliable given the common construct:

```
test "$response" = "expected string"
```

One of the following is a more reliable form:

```
test "X$response" = "Xexpected string"
test "expected string" = "$response"
```

Note that the second form assumes that *expected string* could not be confused with any unary primary. If *expected string* starts with '-', '(', '!', or even '=', the first form should be used instead. Using the preceding rules without the XSI marked extensions, any of the three comparison forms is reliable, given any input. (However, note that the strings are quoted in all cases.)

Because the string comparison binary primaries, '=' and '!=', have a higher precedence than any unary primary in the greater than 4 argument case, unexpected results can occur if arguments are not properly prepared. For example, in:

```
test -d $1 -o -d $2
```

If \$1 evaluates to a possible directory name of '=', the first three arguments are considered a string comparison, which shall cause a syntax error when the second -d is encountered. One of the following forms prevents this; the second is preferred:

```
test \(-d "$1" \) -o \(-d "$2" \)
test -d "$1" || test -d "$2"
```

Also in the greater than 4 argument case:

```
test "$1" = "bat" -a "$2" = "ball"
```

syntax errors occur if \$1 evaluates to ' (' or ' ! '. One of the following forms prevents this; the third is preferred:

```
test "X$1" = "Xbat" -a "X$2" = "Xball"
test "$1" = "bat" && test "$2" = "ball"
test "X$1" = "Xbat" && test "X$2" = "Xball"
```

## EXAMPLES

1. Exit if there are not two or three arguments (two variations):

```
if [$# -ne 2] && [$# -ne 3]; then exit 1; fi
if [$# -lt 2] || [$# -gt 3]; then exit 1; fi
```

2. Perform a *mkdir* if a directory does not exist:

```
test ! -d tempdir && mkdir tempdir
```

3. Wait for a file to become non-readable:

```
while test -r thefile
do
```

```

109210 sleep 30
109211 done
109212 echo ' "thefile" is no longer readable'

```

4. Perform a command if the argument is one of three strings (two variations):

```

109214 if ["$1" = "pear"] || ["$1" = "grape"] || ["$1" = "apple"]
109215 then
109216 command
109217 fi
109218
109218 case "$1" in
109219 pear|grape|apple) command ;;
109220 esac

```

## RATIONALE

The KornShell-derived conditional command (double bracket `[[ ]]`) was removed from the shell command language description in an early proposal. Objections were raised that the real problem is misuse of the *test* command (`I`), and putting it into the shell is the wrong way to fix the problem. Instead, proper documentation and a new shell reserved word (`!`) are sufficient.

Tests that require multiple *test* operations can be done at the shell level using individual invocations of the *test* command and shell logicals, rather than using the error-prone `-o` flag of *test*.

XSI-conformant systems support more than four arguments.

XSI-conformant systems support the combining of primaries with the following constructs:

*expression1* **-a** *expression2*

True if both *expression1* and *expression2* are true.

*expression1* **-o** *expression2*

True if at least one of *expression1* and *expression2* are true.

**(** *expression* **)**

True if *expression* is true.

In evaluating these more complex combined expressions, the following precedence rules are used:

- The unary primaries have higher precedence than the algebraic binary primaries.
- The unary primaries have lower precedence than the string binary primaries.
- The unary and binary primaries have higher precedence than the unary *string* primary.
- The `!` operator has higher precedence than the `-a` operator, and the `-a` operator has higher precedence than the `-o` operator.
- The `-a` and `-o` operators are left associative.
- The parentheses can be used to alter the normal precedence and associativity.

The BSD and System V versions of `-f` are not the same. The BSD definition was:

**-f** *file*      True if *file* exists and is not a directory.

The SVID version (true if the file exists and is a regular file) was chosen for this volume of POSIX.1-2008 because its use is consistent with the `-b`, `-c`, `-d`, and `-p` operands (*file* exists and is a specific file type).

The **-e** primary, possessing similar functionality to that provided by the C shell, was added because it provides the only way for a shell script to find out if a file exists without trying to open the file. Since implementations are allowed to add additional file types, a portable script cannot use:

```
test -b foo -o -c foo -o -d foo -o -f foo -o -p foo
```

to find out if **foo** is an existing file. On historical BSD systems, the existence of a file could be determined by:

```
test -f foo -o -d foo
```

but there was no easy way to determine that an existing file was a regular file. An early proposal used the KornShell **-a** primary (with the same meaning), but this was changed to **-e** because there were concerns about the high probability of humans confusing the **-a** primary with the **-a** binary operator.

The following options were not included in this volume of POSIX.1-2008, although they are provided by some implementations. These operands should not be used by new implementations for other purposes:

**-k file** True if *file* exists and its sticky bit is set.

**-C file** True if *file* is a contiguous file.

**-V file** True if *file* is a version file.

The following option was not included because it was undocumented in most implementations, has been removed from some implementations (including System V), and the functionality is provided by the shell (see [Section 2.6.2](#) (on page 2328)).

**-l string** The length of the string *string*.

The **-b**, **-c**, **-g**, **-p**, **-u**, and **-x** operands are derived from the SVID; historical BSD does not provide them. The **-k** operand is derived from System V; historical BSD does not provide it.

On historical BSD systems, **test -w directory** always returned false because **test** tried to open the directory for writing, which always fails.

Some additional primaries newly invented or from the KornShell appeared in an early proposal as part of the conditional command ([I II]): *s1 > s2*, *s1 < s2*, *str = pattern*, *str != pattern*, *f1 -nt f2*, *f1 -ot f2*, and *f1 -ef f2*. They were not carried forward into the **test** utility when the conditional command was removed from the shell because they have not been included in the **test** utility built into historical implementations of the *sh* utility.

The **-t file\_descriptor** primary is shown with a mandatory argument because the grammar is ambiguous if it can be omitted. Historical implementations have allowed it to be omitted, providing a default of 1.

It is noted that ' [ ' is not part of the portable filename character set; however, since it is required to be encoded by a single byte, and is part of the portable character set, the name of this utility forms a character string across all supported locales.

## FUTURE DIRECTIONS

None.

## SEE ALSO

[Section 1.1.1.4](#) (on page 2302), *find*

[XBD Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)

**CHANGE HISTORY**

109293  
109294 First released in Issue 2.

**Issue 5**

109295  
109296 The FUTURE DIRECTIONS section is added.

**Issue 6**

109297  
109298 The **-h** operand is added for symbolic links, and access permission requirements are clarified for  
109299 the **-r**, **-w**, and **-x** operands to align with the IEEE P1003.2b draft standard.

109300 The normative text is reworded to avoid use of the term “must” for application requirements.

109301 The **-L** and **-S** operands are added for symbolic links and sockets.

109302 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/38 is applied, adding XSI margin  
109303 marking and shading to a line in the OPERANDS section referring to the use of parentheses as  
109304 arguments to the *test* utility.

109305 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/30 is applied, rewording the existence  
109306 primaries for the *test* utility.

**Issue 7**

109307  
109308 Austin Group Interpretation 1003.1-2001 #107 is applied.

109309 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0143 [291] is applied.

+

109310 **NAME**

109311       time — time a simple command

109312 **SYNOPSIS**109313       time [-p] *utility* [*argument...*]109314 **DESCRIPTION**

109315       The *time* utility shall invoke the utility named by the *utility* operand with arguments supplied as  
 109316       the *argument* operands and write a message to standard error that lists timing statistics for the  
 109317       utility. The message shall include the following information:

- 109318       • The elapsed (real) time between invocation of *utility* and its termination.
- 109319       • The User CPU time, equivalent to the sum of the *tms\_utime* and *tms\_cutime* fields returned  
 109320       by the *times()* function defined in the System Interfaces volume of POSIX.1-2008 for the  
 109321       process in which *utility* is executed.
- 109322       • The System CPU time, equivalent to the sum of the *tms\_stime* and *tms\_cstime* fields  
 109323       returned by the *times()* function for the process in which *utility* is executed.

109324       The precision of the timing shall be no less than the granularity defined for the size of the clock  
 109325       tick unit on the system, but the results shall be reported in terms of standard time units (for  
 109326       example, 0.02 seconds, 00:00:00.02, 1m33.75s, 365.21 seconds), not numbers of clock ticks.

109327       When *time* is used as part of a pipeline, the times reported are unspecified, except when it is the  
 109328       sole command within a grouping command (see [Section 2.9.4.1](#), on page 2344) in that pipeline.  
 109329       For example, the commands on the left are unspecified; those on the right report on utilities **a**  
 109330       and **c**, respectively:

```
109331 time a | b | c { time a; } | b | c
109332 a | b | time c a | b | (time c)
```

109333 **OPTIONS**109334       The *time* utility shall conform to XBD [Section 12.2](#) (on page 215).

109335       The following option shall be supported:

109336       **-p**           Write the timing output to standard error in the format shown in the STDERR  
 109337       section.

109338 **OPERANDS**

109339       The following operands shall be supported:

109340       *utility*       The name of a utility that is to be invoked. If the *utility* operand names any of the  
 109341       special built-in utilities in [Section 2.14](#) (on page 2356), the results are undefined.

109342       *argument*     Any string to be supplied as an argument when invoking the utility named by the  
 109343       *utility* operand.

109344 **STDIN**

109345       Not used.

109346 **INPUT FILES**

109347       None.

109348 **ENVIRONMENT VARIABLES**109349       The following environment variables shall affect the execution of *time*:

109350       **LANG**       Provide a default value for the internationalization variables that are unset or null.  
 109351       (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 109352       variables used to determine the values of locale categories.)

|        |                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 109353 | <i>LC_ALL</i>                 | If set to a non-empty string value, override the values of all the other internationalization variables.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 109354 |                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| 109375 |                               | where each floating-point number shall be expressed in seconds. The precision used may be less than the default six digits of %f, but shall be sufficiently precise to accommodate the size of the clock tick on the system (for example, if there were 60 clock ticks per second, at least two digits shall follow the radix character). The number of digits following the radix character shall be no less than one, even if this always results in a trailing zero. The implementation may append white space and additional information following the format shown here. The implementation may also prepend a single empty line before the format shown here. |
