31672	l (ell)	Specifies that a following d, i, o, u, x, X, or n conversion specifier applies to an argument with type pointer to long or unsigned long ; that a following a, A, e, E, f, F, g, or G conversion specifier applies to an argument with type pointer to double ; or that a following c, s, or [conversion specifier applies to an argument with type pointer to wchar_t . If the 'm' assignment-allocation character is specified, the conversion applies to an argument with the type pointer to a pointer to wchar_t .
31673		
31674		
31675		
31676	CX	
31677		
31678	ll (ell-ell)	Specifies that a following d, i, o, u, x, X, or n conversion specifier applies to an argument with type pointer to long long or unsigned long long .
31679		
31680		
31681	j	Specifies that a following d, i, o, u, x, X, or n conversion specifier applies to an argument with type pointer to intmax_t or uintmax_t .
31682		
31683	z	Specifies that a following d, i, o, u, x, X, or n conversion specifier applies to an argument with type pointer to size_t or the corresponding signed integer type.
31684		
31685	t	Specifies that a following d, i, o, u, x, X, or n conversion specifier applies to an argument with type pointer to ptrdiff_t or the corresponding unsigned type.
31686		
31687	L	Specifies that a following a, A, e, E, f, F, g, or G conversion specifier applies to an argument with type pointer to long double .
31688		
31689	If a length modifier appears with any conversion specifier other than as specified above, the behavior is undefined.	
31690		
31691	The following conversion specifiers are valid:	
31692	d	Matches an optionally signed decimal integer, whose format is the same as expected for the subject sequence of <i>strtol()</i> with the value 10 for the <i>base</i> argument. In the absence of a size modifier, the application shall ensure that the corresponding argument is a pointer to int .
31693		
31694		
31695		
31696	i	Matches an optionally signed integer, whose format is the same as expected for the subject sequence of <i>strtol()</i> with 0 for the <i>base</i> argument. In the absence of a size modifier, the application shall ensure that the corresponding argument is a pointer to int .
31697		
31698		
31699		
31700	o	Matches an optionally signed octal integer, whose format is the same as expected for the subject sequence of <i>strtoul()</i> with the value 8 for the <i>base</i> argument. In the absence of a size modifier, the application shall ensure that the corresponding argument is a pointer to unsigned .
31701		
31702		
31703		
31704	u	Matches an optionally signed decimal integer, whose format is the same as expected for the subject sequence of <i>strtoul()</i> with the value 10 for the <i>base</i> argument. In the absence of a size modifier, the application shall ensure that the corresponding argument is a pointer to unsigned .
31705		
31706		
31707		
31708	x	Matches an optionally signed hexadecimal integer, whose format is the same as expected for the subject sequence of <i>strtoul()</i> with the value 16 for the <i>base</i> argument. In the absence of a size modifier, the application shall ensure that the corresponding
31709		
31710		

31711 argument is a pointer to **unsigned**.

31712 a, e, f, g

31713 Matches an optionally signed floating-point number, infinity, or NaN, whose format is

31714 the same as expected for the subject sequence of *strtod*(). In the absence of a size

31715 modifier, the application shall ensure that the corresponding argument is a pointer to

31716 **float**.

31717 If the *fprintf*() family of functions generates character string representations for infinity

31718 and NaN (a symbolic entity encoded in floating-point format) to support

31719 IEEE Std 754-1985, the *fscanf*() family of functions shall recognize them as input.

31720 s

31721 Matches a sequence of bytes that are not white-space characters. If the 'm' assignment-

31722 allocation character is not specified, the application shall ensure that the corresponding

31723 argument is a pointer to the initial byte of an array of **char**, **signed char**, or **unsigned**

31724 **char** large enough to accept the sequence and a terminating null character code, which

31725 CX shall be added automatically. Otherwise, the application shall ensure that the

31726 corresponding argument is a pointer to a pointer to a **char**.

31727 If an l (ell) qualifier is present, the input is a sequence of characters that begins in the

31728 initial shift state. Each character shall be converted to a wide character as if by a call to

31729 the *mbrtowc*() function, with the conversion state described by an **mbstate_t** object

31730 initialized to zero before the first character is converted. If the 'm' assignment-

31731 allocation character is not specified, the application shall ensure that the corresponding

31732 argument is a pointer to an array of **wchar_t** large enough to accept the sequence and

31733 CX the terminating null wide character, which shall be added automatically. Otherwise,

31734 the application shall ensure that the corresponding argument is a pointer to a pointer to

31735 a **wchar_t**.

31736 [

31737 Matches a non-empty sequence of bytes from a set of expected bytes (the *scanset*). The

31738 normal skip over white-space characters shall be suppressed in this case. If the 'm'

31739 assignment-allocation character is not specified, the application shall ensure that the

31740 corresponding argument is a pointer to the initial byte of an array of **char**, **signed char**,

31741 CX or **unsigned char** large enough to accept the sequence and a terminating null byte,

31742 which shall be added automatically. Otherwise, the application shall ensure that the

31743 corresponding argument is a pointer to a pointer to a **char**.

31744 If an l (ell) qualifier is present, the input is a sequence of characters that begins in the

31745 initial shift state. Each character in the sequence shall be converted to a wide character

31746 as if by a call to the *mbrtowc*() function, with the conversion state described by an

31747 **mbstate_t** object initialized to zero before the first character is converted. If the 'm'

31748 assignment-allocation character is not specified, the application shall ensure that the

31749 corresponding argument is a pointer to an array of **wchar_t** large enough to accept the

31750 CX sequence and the terminating null wide character, which shall be added automatically.

31751 Otherwise, the application shall ensure that the corresponding argument is a pointer to

31752 a pointer to a **wchar_t**.

31753 The conversion specification includes all subsequent bytes in the *format* string up to

31754 and including the matching <right-square-bracket> ('*]*'). The bytes between the

31755 square brackets (the *scanlist*) comprise the *scanset*, unless the byte after the <left-

31756 square-bracket> is a <circumflex> ('*^*'), in which case the *scanset* contains all bytes

31757 that do not appear in the *scanlist* between the <circumflex> and the <right-square-

31758 bracket>. If the conversion specification begins with "[*]*" or "[*^*]", the <right-

31759			first <right-square-bracket> is the one that ends the conversion specification. If a '-' is
31760			in the scanlist and is not the first character, nor the second where the first character is a
31761			'^', nor the last character, the behavior is implementation-defined.
31762		c	Matches a sequence of bytes of the number specified by the field width (1 if no field
31763			width is present in the conversion specification). No null byte is added. The normal
31764			skip over white-space characters shall be suppressed in this case. If the 'm'
31765			assignment-allocation character is not specified, the application shall ensure that the
31766			corresponding argument is a pointer to the initial byte of an array of char , signed char ,
31767	CX		or unsigned char large enough to accept the sequence. Otherwise, the application
31768			shall ensure that the corresponding argument is a pointer to a pointer to a char .
31769			If an l (ell) qualifier is present, the input shall be a sequence of characters that begins in
31770			the initial shift state. Each character in the sequence is converted to a wide character as
31771			if by a call to the <i>mbrtowc()</i> function, with the conversion state described by an
31772			mbstate_t object initialized to zero before the first character is converted. No null wide
31773			character is added. If the 'm' assignment-allocation character is not specified, the
31774			application shall ensure that the corresponding argument is a pointer to an array of
31775	CX		wchar_t large enough to accept the resulting sequence of wide characters. Otherwise,
31776			the application shall ensure that the corresponding argument is a pointer to a pointer to
31777			a wchar_t .
31778		p	Matches an implementation-defined set of sequences, which shall be the same as the set
31779			of sequences that is produced by the %p conversion specification of the corresponding
31780			<i>fprintf()</i> functions. The application shall ensure that the corresponding argument is a
31781			pointer to a pointer to void . The interpretation of the input item is implementation-
31782			defined. If the input item is a value converted earlier during the same program
31783			execution, the pointer that results shall compare equal to that value; otherwise, the
31784			behavior of the %p conversion specification is undefined.
31785		n	No input is consumed. The application shall ensure that the corresponding argument is
31786			a pointer to the integer into which shall be written the number of bytes read from the
31787			input so far by this call to the <i>fscanf()</i> functions. Execution of a %n conversion
31788			specification shall not increment the assignment count returned at the completion of
31789			execution of the function. No argument shall be converted, but one shall be consumed.
31790			If the conversion specification includes an assignment-suppressing character or a field
31791			width, the behavior is undefined.
31792	XSI	C	Equivalent to lc.
31793	XSI	S	Equivalent to ls.
31794		%	Matches a single '%' character; no conversion or assignment occurs. The complete
31795			conversion specification shall be %%.
31796			If a conversion specification is invalid, the behavior is undefined.
31797			The conversion specifiers A, E, F, G, and X are also valid and shall be equivalent to a, e, f, g, and
31798			x, respectively.
31799			If end-of-file is encountered during input, conversion shall be terminated. If end-of-file occurs
31800			before any bytes matching the current conversion specification (except for %n) have been read
31801			(other than leading white-space characters, where permitted), execution of the current
31802			conversion specification shall terminate with an input failure. Otherwise, unless execution of the
31803			current conversion specification is terminated with a matching failure, execution of the
31804			following conversion specification (if any) shall be terminated with an input failure.

31805 Reaching the end of the string in *sscanf()* shall be equivalent to encountering end-of-file for
 31806 *fscanf()*.

31807 If conversion terminates on a conflicting input, the offending input is left unread in the input.
 31808 Any trailing white space (including <newline> characters) shall be left unread unless matched
 31809 by a conversion specification. The success of literal matches and suppressed assignments is only
 31810 directly determinable via the %n conversion specification.

31811 CX The *fscanf()* and *scanf()* functions may mark the last data access timestamp of the file associated
 31812 with *stream* for update. The last data access timestamp shall be marked for update by the first
 31813 successful execution of *fgetc()*, *fgets()*, *fread()*, *getc()*, *getchar()*, *getdelim()*, *getline()*, *gets()*,
 31814 *fscanf()*, or *scanf()* using *stream* that returns data not supplied by a prior call to *ungetc()*.

31815 RETURN VALUE

31816 Upon successful completion, these functions shall return the number of successfully matched
 31817 and assigned input items; this number can be zero in the event of an early matching failure. If
 31818 the input ends before the first conversion (if any) has completed, and without a matching failure
 31819 having occurred, EOF shall be returned. If an error occurs before the first conversion (if any) has
 31820 CX completed, and without a matching failure having occurred, EOF shall be returned and *errno*
 31821 shall be set to indicate the error. If a read error occurs, the error indicator for the stream shall be
 31822 set.

31823 ERRORS

31824 For the conditions under which the *fscanf()* functions fail and may fail, refer to *fgetc()* or
 31825 *fgetwc()*.

31826 In addition, the *fscanf()* function shall fail if:

31827 CX [EILSEQ] Input byte sequence does not form a valid character.

31828 [ENOMEM] Insufficient storage space is available.

31829 In addition, the *fscanf()* function may fail if:

31830 CX [EINVAL] There are insufficient arguments.

31831 EXAMPLES

31832 The call:

```
31833 int i, n; float x; char name[50];
31834 n = scanf("%d%f%s", &i, &x, name);
```

31835 with the input line:

```
31836 25 54.32E-1 Hamster
```

31837 assigns to *n* the value 3, to *i* the value 25, to *x* the value 5.432, and *name* contains the string
 31838 "Hamster".

31839 The call:

```
31840 int i; float x; char name[50];
31841 (void) scanf("%2d%f%d %[0123456789]", &i, &x, name);
```

31842 with input:

```
31843 56789 0123 56a72
```

31844 assigns 56 to *i*, 789.0 to *x*, skips 0123, and places the string "56\0" in *name*. The next call to
 31845 *getchar()* shall return the character 'a'.

Reading Data into an Array

The following call uses *fscanf()* to read three floating-point numbers from standard input into the *input* array.

```
float input[3]; fscanf (stdin, "%f %f %f", input, input+1, input+2);
```

APPLICATION USAGE

If the application calling *fscanf()* has any objects of type **wint_t** or **wchar_t**, it must also include the **<wchar.h>** header to have these objects defined.

For functions that allocate memory as if by *malloc()*, the application should release such memory when it is no longer required by a call to *free()*. For *fscanf()*, this is memory allocated via use of the 'm' assignment-allocation character.

RATIONALE

This function is aligned with the ISO/IEC 9899:1999 standard, and in doing so a few “obvious” things were not included. Specifically, the set of characters allowed in a scanset is limited to single-byte characters. In other similar places, multi-byte characters have been permitted, but for alignment with the ISO/IEC 9899:1999 standard, it has not been done here. Applications needing this could use the corresponding wide-character functions to achieve the desired results.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

Aligned with ISO/IEC 9899:1990/Amendment 1:1995 (E). Specifically, the **l** (ell) qualifier is now defined for the **c**, **s**, and **[** conversion specifiers.

The DESCRIPTION is updated to indicate that if infinity and NaN can be generated by the *fprintf()* family of functions, then they are recognized by the *fscanf()* family.

Issue 6

The Open Group Corrigenda U021/7 and U028/10 are applied. These correct several occurrences of “characters” in the text which have been replaced with the term “bytes”.

The normative text is updated to avoid use of the term “must” for application requirements.

The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- The prototypes for *fscanf()*, *scanf()*, and *sscanf()* are updated.
- The DESCRIPTION is updated.
- The **hh**, **ll**, **j**, **t**, and **z** length modifiers are added.
- The **a**, **A**, and **F** conversion characters are added.

The DESCRIPTION is updated to use the terms “conversion specifier” and “conversion specification” consistently.

31886 **Issue 7**

31887 Austin Group Interpretation 1003.1-2001 #170 is applied.

31888 SD5-XSH-ERN-9 is applied, correcting *fscanf()* to *scanf()* in the DESCRIPTION.

31889 SD5-XSH-ERN-132 is applied, adding the assignment-allocation character 'm'.

31890 Functionality relating to the %n\$ form of conversion specification is moved from the XSI option
31891 to the Base.

31892 Changes are made related to support for finegrained timestamps.

31893 The APPLICATION USAGE section is updated to clarify that memory is allocated as if by
31894 *malloc()*.

31895 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0185 [302], XSH/TC1-2008/0186 [90], +
31896 and XSH/TC1-2008/0187 [14] are applied. XSH/TC1-2008/0186 [90] changes the second +
31897 sentence in the RETURN VALUE section to align with expected wording changes in the next +
31898 revision of the ISO C standard.

31899 **NAME**

31900 fseek, fseeko — reposition a file-position indicator in a stream

31901 **SYNOPSIS**

31902 #include <stdio.h>

31903 int fseek(FILE *stream, long offset, int whence);

31904 CX int fseeko(FILE *stream, off_t offset, int whence);

31905 **DESCRIPTION**

31906 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 31907 conflict between the requirements described here and the ISO C standard is unintentional. This
 31908 volume of POSIX.1-2008 defers to the ISO C standard.

31909 The *fseek()* function shall set the file-position indicator for the stream pointed to by *stream*. If a
 31910 read or write error occurs, the error indicator for the stream shall be set and *fseek()* fails.

31911 The new position, measured in bytes from the beginning of the file, shall be obtained by adding
 31912 *offset* to the position specified by *whence*. The specified point is the beginning of the file for
 31913 SEEK_SET, the current value of the file-position indicator for SEEK_CUR, or end-of-file for
 31914 SEEK_END.

31915 If the stream is to be used with wide-character input/output functions, the application shall
 31916 ensure that *offset* is either 0 or a value returned by an earlier call to *ftell()* on the same stream and
 31917 *whence* is SEEK_SET.

31918 A successful call to *fseek()* shall clear the end-of-file indicator for the stream and undo any effects
 31919 of *ungetc()* and *ungetwc()* on the same stream. After an *fseek()* call, the next operation on an
 31920 update stream may be either input or output.

31921 CX If the most recent operation, other than *ftell()*, on a given stream is *fflush()*, the file offset in the
 31922 underlying open file description shall be adjusted to reflect the location specified by *fseek()*.

31923 The *fseek()* function shall allow the file-position indicator to be set beyond the end of existing
 31924 data in the file. If data is later written at this point, subsequent reads of data in the gap shall
 31925 return bytes with the value 0 until data is actually written into the gap.

31926 The behavior of *fseek()* on devices which are incapable of seeking is implementation-defined.
 31927 The value of the file offset associated with such a device is undefined.

31928 If the stream is writable and buffered data had not been written to the underlying file, *fseek()*
 31929 shall cause the unwritten data to be written to the file and shall mark the last data modification
 31930 and last file status change timestamps of the file for update.

31931 In a locale with state-dependent encoding, whether *fseek()* restores the stream's shift state is
 31932 implementation-defined.

31933 The *fseeko()* function shall be equivalent to the *fseek()* function except that the *offset* argument is
 31934 of type **off_t**.

31935 **RETURN VALUE**31936 CX The *fseek()* and *fseeko()* functions shall return 0 if they succeed.31937 CX Otherwise, they shall return -1 and set *errno* to indicate the error.31938 **ERRORS**

31939 CX The *fseek()* and *fseeko()* functions shall fail if, either the *stream* is unbuffered or the *stream's*
 31940 buffer needed to be flushed, and the call to *fseek()* or *fseeko()* causes an underlying *lseek()* or
 31941 *write()* to be invoked, and:

31942	CX	[EAGAIN]	The O_NONBLOCK flag is set for the file descriptor and the thread would be delayed in the write operation.	
31943				
31944	CX	[EBADF]	The file descriptor underlying the stream file is not open for writing or the stream's buffer needed to be flushed and the file is not open.	
31945				
31946	CX	[EFBIG]	An attempt was made to write a file that exceeds the maximum file size.	
31947	XSI	[EFBIG]	An attempt was made to write a file that exceeds the file size limit of the process.	
31948				
31949	CX	[EFBIG]	The file is a regular file and an attempt was made to write at or beyond the offset maximum associated with the corresponding stream.	
31950				
31951	CX	[EINTR]	The write operation was terminated due to the receipt of a signal, and no data was transferred.	
31952				
31953	CX	[EINVAL]	The <i>whence</i> argument is invalid. The resulting file-position indicator would be set to a negative value.	
31954				
31955	CX	[EIO]	A physical I/O error has occurred, or the process is a member of a background process group attempting to perform a <i>write()</i> to its controlling terminal, TOSTOP is set, the calling thread is not blocking SIGTTOU, the process is not ignoring SIGTTOU, and the process group of the process is orphaned. This error may also be returned under implementation-defined conditions.	
31956				
31957				
31958				
31959				
31960	CX	[ENOSPC]	There was no free space remaining on the device containing the file.	-
31961	CX	[EOVERFLOW]	For <i>fseek()</i> , the resulting file offset would be a value which cannot be represented correctly in an object of type long .	
31962				
31963	CX	[EOVERFLOW]	For <i>fseeko()</i> , the resulting file offset would be a value which cannot be represented correctly in an object of type off_t .	
31964				
31965	CX	[EPIPE]	An attempt was made to write to a pipe or FIFO that is not open for reading by any process; a SIGPIPE signal shall also be sent to the thread.	
31966				
31967	CX	[ESPIPE]	The file descriptor underlying <i>stream</i> is associated with a pipe, FIFO, or socket.	
31968				
31969	CX	The <i>fseek()</i> and <i>fseeko()</i> functions may fail if:		
31970	CX	[ENXIO]	A request was made of a nonexistent device, or the request was outside the capabilities of the device.	
31971

XBD <stdio.h>

31984 **CHANGE HISTORY**

31985 First released in Issue 1. Derived from Issue 1 of the SVID.

31986 **Issue 5**31987 Normative text previously in the APPLICATION USAGE section is moved to the
31988 DESCRIPTION.

31989 Large File Summit extensions are added.

31990 **Issue 6**

31991 Extensions beyond the ISO C standard are marked.

31992 The following new requirements on POSIX implementations derive from alignment with the
31993 Single UNIX Specification:31994 • The *fseeko()* function is added.

31995 • The [EFBIG], [EOVERFLOW], and [ENXIO] mandatory error conditions are added.

31996 The following change is incorporated for alignment with the FIPS requirements:

31997 • The [EINTR] error is no longer an indication that the implementation does not report
31998 partial transfers.

31999 The normative text is updated to avoid use of the term “must” for application requirements.

32000 The DESCRIPTION is updated to explicitly state that *fseek()* sets the file-position indicator, and
32001 then on error the error indicator is set and *fseek()* fails. This is for alignment with the
32002 ISO/IEC 9899:1999 standard.32003 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/42 is applied, updating the [EAGAIN]
32004 error in the ERRORS section from “the process would be delayed” to “the thread would be
32005 delayed”.32006 **Issue 7**

32007 Changes are made related to support for finegrained timestamps.

32008 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0188 [79], XSH/TC1-2008/0189 [122], +
32009 XSH/TC1-2008/0190 [225], and XSH/TC1-2008/0191 [14] are applied.

32010 **NAME**

32011 fsetpos — set current file position

32012 **SYNOPSIS**

32013 #include <stdio.h>

32014 int fsetpos(FILE **stream*, const fpos_t **pos*);32015 **DESCRIPTION**

32016 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 32017 conflict between the requirements described here and the ISO C standard is unintentional. This
 32018 volume of POSIX.1-2008 defers to the ISO C standard.

32019 The *fsetpos()* function shall set the file position and state indicators for the stream pointed to by
 32020 *stream* according to the value of the object pointed to by *pos*, which the application shall ensure is
 32021 a value obtained from an earlier call to *fgetpos()* on the same stream. If a read or write error
 32022 occurs, the error indicator for the stream shall be set and *fsetpos()* fails.

32023 A successful call to the *fsetpos()* function shall clear the end-of-file indicator for the stream and
 32024 undo any effects of *ungetc()* on the same stream. After an *fsetpos()* call, the next operation on an
 32025 update stream may be either input or output.

32026 CX The behavior of *fsetpos()* on devices which are incapable of seeking is implementation-defined.
 32027 The value of the file offset associated with such a device is undefined.

32028 The *fsetpos()* function shall not change the setting of *errno* if successful.

+

32029 **RETURN VALUE**

32030 The *fsetpos()* function shall return 0 if it succeeds; otherwise, it shall return a non-zero value and
 32031 set *errno* to indicate the error.

32032 **ERRORS**

32033 CX The *fsetpos()* function shall fail if, either the *stream* is unbuffered or the *stream*'s buffer needed to
 32034 be flushed, and the call to *fsetpos()* causes an underlying *lseek()* or *write()* to be invoked, and:

32035 CX [EAGAIN] The O_NONBLOCK flag is set for the file descriptor and the thread would be
 32036 delayed in the write operation.

32037 CX [EBADF] The file descriptor underlying the stream file is not open for writing or the
 32038 stream's buffer needed to be flushed and the file is not open.

32039 CX [EFBIG] An attempt was made to write a file that exceeds the maximum file size.

32040 XSI [EFBIG] An attempt was made to write a file that exceeds the file size limit of the
 32041 process.

32042 CX [EFBIG] The file is a regular file and an attempt was made to write at or beyond the
 32043 offset maximum associated with the corresponding stream.

32044 CX [EINTR] The write operation was terminated due to the receipt of a signal, and no data
 32045 was transferred.

32046 CX [EIO] A physical I/O error has occurred, or the process is a member of a background
 32047 process group attempting to perform a *write()* to its controlling terminal,
 32048 TOSTOP is set, the calling thread is not blocking SIGTTOU, the process is not
 32049 ignoring SIGTTOU, and the process group of the process is orphaned. This
 32050 error may also be returned under implementation-defined conditions.

32051 CX [ENOSPC] There was no free space remaining on the device containing the file.

-

32052 CX [EPIPE] An attempt was made to write to a pipe or FIFO that is not open for reading
 32053 by any process; a SIGPIPE signal shall also be sent to the thread.

32054 CX [ESPIPE] The file descriptor underlying *stream* is associated with a pipe, FIFO, or socket.
 32055

32056 The *fsetpos()* function may fail if:

32057 CX [ENXIO] A request was made of a nonexistent device, or the request was outside the
 32058 capabilities of the device.

32070 CHANGE HISTORY

32071 First released in Issue 4. Derived from the ISO C standard.

32072 Issue 6

32073 Extensions beyond the ISO C standard are marked.

32074 The normative text is updated to avoid use of the term “must” for application requirements. -

32075 The DESCRIPTION is updated to clarify that the error indicator is set for the stream on a read or
 32076 write error. This is for alignment with the ISO/IEC 9899:1999 standard.

32077 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/21 is applied, deleting an erroneous
 32078 [EINVAL] error case from the ERRORS section.

32079 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/43 is applied, updating the [EAGAIN]
 32080 error in the ERRORS section from “the process would be delayed” to “the thread would be
 32081 delayed”.

32082 Issue 7

32083 SD5-XSH-ERN-220 is applied.

32084 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0192 [105], XSH/TC1-2008/0193 [79], +
 32085 XSH/TC1-2008/0194 [225], XSH/TC1-2008/0195 [450], XSH/TC1-2008/0196 [450], and +
 32086 XSH/TC1-2008/0197 [14] are applied.

32087 **NAME**32088 `fstat` — get file status32089 **SYNOPSIS**32090 `#include <sys/stat.h>`32091 `int fstat(int fildes, struct stat *buf);`32092 **DESCRIPTION**32093 The `fstat()` function shall obtain information about an open file associated with the file
32094 descriptor *fildes*, and shall write it to the area pointed to by *buf*.32095 SHM If *fildes* references a shared memory object, the implementation shall update in the **stat** structure
32096 pointed to by the *buf* argument the *st_uid*, *st_gid*, *st_size*, and *st_mode* fields, and only the
32097 S_IRUSR, S_IWUSR, S_IRGRP, S_IWGRP, S_IROTH, and S_IWOTH file permission bits need be
32098 valid. The implementation may update other fields and flags.32099 TYM If *fildes* references a typed memory object, the implementation shall update in the **stat** structure
32100 pointed to by the *buf* argument the *st_uid*, *st_gid*, *st_size*, and *st_mode* fields, and only the
32101 S_IRUSR, S_IWUSR, S_IRGRP, S_IWGRP, S_IROTH, and S_IWOTH file permission bits need be
32102 valid. The implementation may update other fields and flags.32103 The *buf* argument is a pointer to a **stat** structure, as defined in `<sys/stat.h>`, into which
32104 information is placed concerning the file.32105 For all other file types defined in this volume of POSIX.1-2008, the structure members *st_mode*,
32106 *st_ino*, *st_dev*, *st_uid*, *st_gid*, *st_atim*, *st_ctim*, and *st_mtim* shall have meaningful values and the
32107 value of the *st_nlink* member shall be set to the number of links to the file.32108 An implementation that provides additional or alternative file access control mechanisms may,
32109 under implementation-defined conditions, cause `fstat()` to fail.32110 The `fstat()` function shall update any time-related fields (as described in XBD [Section 4.8](#), on
32111 page 109), before writing into the **stat** structure.32112 **RETURN VALUE**32113 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to
32114 indicate the error.32115 **ERRORS**32116 The `fstat()` function shall fail if:32117 [EBADF] The *fildes* argument is not a valid file descriptor.

32118 [EIO] An I/O error occurred while reading from the file system.

32119 [EOVERFLOW] The file size in bytes or the number of blocks allocated to the file or the file
32120 serial number cannot be represented correctly in the structure pointed to by
32121 *buf*.32122 The `fstat()` function may fail if:32123 [EOVERFLOW] One of the values is too large to store into the structure pointed to by the *buf*
32124 argument.

32125 **EXAMPLES**32126 **Obtaining File Status Information**

32127 The following example shows how to obtain file status information for a file named
 32128 **/home/cnd/mod1**. The structure variable *buffer* is defined for the **stat** structure. The
 32129 **/home/cnd/mod1** file is opened with read/write privileges and is passed to the open file
 32130 descriptor *fildes*.

```
32131 #include <sys/types.h>
32132 #include <sys/stat.h>
32133 #include <fcntl.h>

32134 struct stat buffer;
32135 int      status;
32136 ...
32137 fildes = open("/home/cnd/mod1", O_RDWR);
32138 status = fstat(fildes, &buffer);
```

32139 **APPLICATION USAGE**

32140 None.

32141 **RATIONALE**

32142 None.

32143 **FUTURE DIRECTIONS**

32144 None.

32145 **SEE ALSO**

32148 **CHANGE HISTORY**

32149 First released in Issue 1. Derived from Issue 1 of the SVID.

32150 **Issue 5**

32151 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension.

32152 Large File Summit extensions are added.

32153 **Issue 6**

32154 In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.

32155 The following new requirements on POSIX implementations derive from alignment with the
 32156 Single UNIX Specification:

- 32157 • The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was
 32158 required for conforming implementations of previous POSIX specifications, it was not
 32159 required for UNIX applications.
- 32160 • The [EIO] mandatory error condition is added.
- 32161 • The [EOVERFLOW] mandatory error condition is added. This change is to support large
 32162 files.
- 32163 • The [EOVERFLOW] optional error condition is added.

32164 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that
 32165 shared memory object semantics apply to typed memory objects.

Issue 7

32166 XSH-SD5-ERN-161 is applied, updating the DESCRIPTION to clarify to which file types *st_nlink*
32167 applies.
32168

32169 Changes are made related to support for finegrained timestamps.

NAME

fstatat, lstat, stat — get file status

SYNOPSIS

```
#include <sys/stat.h>

int fstatat(int fd, const char *restrict path,
            struct stat *restrict buf, int flag);
int lstat(const char *restrict path, struct stat *restrict buf);
int stat(const char *restrict path, struct stat *restrict buf);
```

DESCRIPTION

The *stat()* function shall obtain information about the named file and write it to the area pointed to by the *buf* argument. The *path* argument points to a pathname naming a file. Read, write, or execute permission of the named file is not required. An implementation that provides additional or alternate file access control mechanisms may, under implementation-defined conditions, cause *stat()* to fail. In particular, the system may deny the existence of the file specified by *path*.

If the named file is a symbolic link, the *stat()* function shall continue pathname resolution using the contents of the symbolic link, and shall return information pertaining to the resulting file if the file exists.

The *buf* argument is a pointer to a **stat** structure, as defined in the **<sys/stat.h>** header, into which information is placed concerning the file.

The *stat()* function shall update any time-related fields (as described in XBD [Section 4.8](#), on page 109), before writing into the **stat** structure.

SHM

If the named file is a shared memory object, the implementation shall update in the **stat** structure pointed to by the *buf* argument the *st_uid*, *st_gid*, *st_size*, and *st_mode* fields, and only the S_IRUSR, S_IWUSR, S_IRGRP, S_IWGRP, S_IROTH, and S_IWOTH file permission bits need be valid. The implementation may update other fields and flags.

TYM

If the named file is a typed memory object, the implementation shall update in the **stat** structure pointed to by the *buf* argument the *st_uid*, *st_gid*, *st_size*, and *st_mode* fields, and only the S_IRUSR, S_IWUSR, S_IRGRP, S_IWGRP, S_IROTH, and S_IWOTH file permission bits need be valid. The implementation may update other fields and flags.

For all other file types defined in this volume of POSIX.1-2008, the structure members *st_mode*, *st_ino*, *st_dev*, *st_uid*, *st_gid*, *st_atim*, *st_ctim*, and *st_mtim* shall have meaningful values and the value of the member *st_nlink* shall be set to the number of links to the file.

The *lstat()* function shall be equivalent to *stat()*, except when *path* refers to a symbolic link. In that case *lstat()* shall return information about the link, while *stat()* shall return information about the file the link references.

For symbolic links, the *st_mode* member shall contain meaningful information when used with the file type macros. The file mode bits in *st_mode* are unspecified. The structure members *st_ino*, *st_dev*, *st_uid*, *st_gid*, *st_atim*, *st_ctim*, and *st_mtim* shall have meaningful values and the value of the *st_nlink* member shall be set to the number of (hard) links to the symbolic link. The value of the *st_size* member shall be set to the length of the pathname contained in the symbolic link not including any terminating null byte.

The *fstatat()* function shall be equivalent to the *stat()* or *lstat()* function, depending on the value of *flag* (see below), except in the case where *path* specifies a relative path. In this case the status shall be retrieved from a file relative to the directory associated with the file descriptor *fd* instead of the current working directory. If the file descriptor was opened without O_SEARCH, the

32216 function shall check whether directory searches are permitted using the current permissions of
 32217 the directory underlying the file descriptor. If the file descriptor was opened with O_SEARCH,
 32218 the function shall not perform the check.

32219 Values for *flag* are constructed by a bitwise-inclusive OR of flags from the following list, defined
 32220 in **<fcntl.h>**:

32221 AT_SYMLINK_NOFOLLOW

32222 If *path* names a symbolic link, the status of the symbolic link is returned.

32223 If *fstatat()* is passed the special value AT_FDCWD in the *fd* parameter, the current working
 32224 directory shall be used and the behavior shall be identical to a call to *stat()* or *lstat()* respectively,
 32225 depending on whether or not the AT_SYMLINK_NOFOLLOW bit is set in *flag*.

32226 RETURN VALUE

32227 Upon successful completion, these functions shall return 0. Otherwise, these functions shall
 32228 return -1 and set *errno* to indicate the error.

32229 ERRORS

32230 These functions shall fail if:

32231 [EACCES] Search permission is denied for a component of the path prefix.

32232 [EIO] An error occurred while reading from the file system.

32233 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*
 32234 argument.

32235 [ENAMETOOLONG]

32236 The length of a component of a pathname is longer than {NAME_MAX}.

32237 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.

32238 [ENOTDIR] A component of the path prefix names an existing file that is neither a
 32239 directory nor a symbolic link to a directory, or the *path* argument contains at
 32240 least one non-*<slash>* character and ends with one or more trailing *<slash>*
 32241 characters and the last pathname component names an existing file that is
 32242 neither a directory nor a symbolic link to a directory.

32243 [EOVERFLOW] The file size in bytes or the number of blocks allocated to the file or the file
 32244 serial number cannot be represented correctly in the structure pointed to by
 32245 *buf*.

32246 The *fstatat()* function shall fail if:

32247 [EACCES] *fd* was not opened with O_SEARCH and the permissions of the directory
 32248 underlying *fd* do not permit directory searches.

32249 [EBADF] The *path* argument does not specify an absolute path and the *fd* argument is
 32250 neither AT_FDCWD nor a valid file descriptor open for reading or searching.

32251 [ENOTDIR] The *path* argument is not an absolute path and *fd* is a file descriptor associated +
 32252 with a non-directory file.

32253 These functions may fail if:

32254 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
 32255 resolution of the *path* argument.

[ENAMETOOLONG]

The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a symbolic link produced an intermediate result with a length that exceeds {PATH_MAX}.

[EOVERFLOW] A value to be stored would overflow one of the members of the **stat** structure.

The *fstatat()* function may fail if:

[EINVAL] The value of the *flag* argument is not valid.

EXAMPLES

Obtaining File Status Information

The following example shows how to obtain file status information for a file named **/home/cnd/mod1**. The structure variable *buffer* is defined for the **stat** structure.

```
#include <sys/types.h>
#include <sys/stat.h>
#include <fcntl.h>

struct stat buffer;
int      status;
...
status = stat("/home/cnd/mod1", &buffer);
```

Getting Directory Information

The following example fragment gets status information for each entry in a directory. The call to the *stat()* function stores file information in the **stat** structure pointed to by *statbuf*. The lines that follow the *stat()* call format the fields in the **stat** structure for presentation to the user of the program.

```
#include <sys/types.h>
#include <sys/stat.h>
#include <dirent.h>
#include <pwd.h>
#include <grp.h>
#include <time.h>
#include <locale.h>
#include <langinfo.h>
#include <stdio.h>
#include <stdint.h>

struct dirent *dp;
struct stat   statbuf;
struct passwd *pwd;
struct group  *grp;
struct tm     *tm;
char          datestring[256];
...
/* Loop through directory entries. */
while ((dp = readdir(dir)) != NULL) {

    /* Get entry's information. */
    if (stat(dp->d_name, &statbuf) == -1)
```

```

32300         continue;

32301         /* Print out type, permissions, and number of links. */
32302         printf("%10.10s", spem (statbuf.st_mode));
32303         printf("%4d", statbuf.st_nlink);

32304         /* Print out owner's name if it is found using getpwuid(). */
32305         if ((pwd = getpwuid(statbuf.st_uid)) != NULL)
32306             printf(" %-8.8s", pwd->pw_name);
32307         else
32308             printf(" %-8d", statbuf.st_uid);

32309         /* Print out group name if it is found using getgrgid(). */
32310         if ((grp = getgrgid(statbuf.st_gid)) != NULL)
32311             printf(" %-8.8s", grp->gr_name);
32312         else
32313             printf(" %-8d", statbuf.st_gid);

32314         /* Print size of file. */
32315         printf(" %9jd", (intmax_t)statbuf.st_size);

32316         tm = localtime(&statbuf.st_mtime);

32317         /* Get localized date string. */
32318         strftime(datestring, sizeof(datestring), nl_langinfo(D_T_FMT), tm);

32319         printf(" %s %s\n", datestring, dp->d_name);
32320     }

```

Obtaining Symbolic Link Status Information

The following example shows how to obtain status information for a symbolic link named **/modules/pass1**. The structure variable *buffer* is defined for the **stat** structure. If the *path* argument specified the pathname for the file pointed to by the symbolic link (**/home/cnd/mod1**), the results of calling the function would be the same as those returned by a call to the *stat()* function.

```

32327 #include <sys/stat.h>

32328 struct stat buffer;
32329 int status;
32330 ...
32331 status = lstat("/modules/pass1", &buffer);

```

APPLICATION USAGE

None.

RATIONALE

The intent of the paragraph describing “additional or alternate file access control mechanisms” is to allow a secure implementation where a process with a label that does not dominate the file’s label cannot perform a *stat()* function. This is not related to read permission; a process with a label that dominates the file’s label does not need read permission. An implementation that supports write-up operations could fail *fstat()* function calls even though it has a valid file descriptor open for writing.

The *lstat()* function is not required to update the time-related fields if the named file is not a symbolic link. While the *st_uid*, *st_gid*, *st_atim*, *st_mtim*, and *st_ctim* members of the **stat** structure may apply to a symbolic link, they are not required to do so. No functions in POSIX.1-2008 are

required to maintain any of these time fields.

The purpose of the *fstatat()* function is to obtain the status of files in directories other than the current working directory without exposure to race conditions. Any part of the path of a file could be changed in parallel to a call to *stat()*, resulting in unspecified behavior. By opening a file descriptor for the target directory and using the *fstatat()* function it can be guaranteed that the file for which status is returned is located relative to the desired directory.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

Large File Summit extensions are added.

Issue 6

In the SYNOPSIS, the optional include of the *<sys/types.h>* header is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include *<sys/types.h>* has been removed. Although *<sys/types.h>* was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- The [EIO] mandatory error condition is added.
- The [ELOOP] mandatory error condition is added.
- The [EOVERFLOW] mandatory error condition is added. This change is to support large files.
- The [ENAMETOOLONG] and the second [EOVERFLOW] optional error conditions are added.

The following changes were made to align with the IEEE P1003.1a draft standard:

- Details are added regarding the treatment of symbolic links.
- The [ELOOP] optional error condition is added.

The normative text is updated to avoid use of the term “must” for application requirements.

The **restrict** keyword is added to the *stat()* prototype for alignment with the ISO/IEC 9899:1999 standard.

Issue 7

Austin Group Interpretation 1003.1-2001 #143 is applied.

XSH-SD5-ERN-161 is applied, updating the DESCRIPTION to clarify to which file types *st_nlink* applies.

The *fstatat()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 2.

Changes are made related to support for finegrained timestamps.

32385 The *lstat()* function is now required to return meaningful data for symbolic links in all **stat**
32386 structure fields, except for the permission bits of *st_mode*.

32387 Changes are made to allow a directory to be opened for searching.

32388 The [ENOTDIR] error condition is clarified to cover the condition where the last component of a
32389 pathname exists but is not a directory or a symbolic link to a directory.

32390 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0198 [461], XSH/TC1-2008/0199 [324], +
32391 XSH/TC1-2008/0200 [278], XSH/TC1-2008/0201 [278], and XSH/TC1-2008/0202 [291] are +
32392 applied.

NAME

fstatvfs, statvfs — get file system information

SYNOPSIS

```
#include <sys/statvfs.h>
```

```
int fstatvfs(int fildes, struct statvfs *buf);
```

```
int statvfs(const char *restrict path, struct statvfs *restrict buf);
```

DESCRIPTION

The *fstatvfs()* function shall obtain information about the file system containing the file referenced by *fildes*.

The *statvfs()* function shall obtain information about the file system containing the file named by *path*.

For both functions, the *buf* argument is a pointer to a **statvfs** structure that shall be filled. Read, write, or execute permission of the named file is not required.

The following flags can be returned in the *f_flag* member:

ST_RDONLY Read-only file system.

ST_NOSUID Setuid/setgid bits ignored by *exec*.

It is unspecified whether all members of the **statvfs** structure have meaningful values on all file systems.

RETURN VALUE

Upon successful completion, *statvfs()* shall return 0. Otherwise, it shall return -1 and set *errno* to indicate the error.

ERRORS

The *fstatvfs()* and *statvfs()* functions shall fail if:

[EIO] An I/O error occurred while reading the file system.

[EINTR] A signal was caught during execution of the function.

[EOVERFLOW] One of the values to be returned cannot be represented correctly in the structure pointed to by *buf*.

The *fstatvfs()* function shall fail if:

[EBADF] The *fildes* argument is not an open file descriptor.

The *statvfs()* function shall fail if:

[EACCES] Search permission is denied on a component of the path prefix.

[ELOOP] A loop exists in symbolic links encountered during resolution of the *path* argument.

[ENAMETOOLONG]

The length of a component of a pathname is longer than {NAME_MAX}.

[ENOENT] A component of *path* does not name an existing file or *path* is an empty string.

[ENOTDIR] A component of the path prefix names an existing file that is neither a directory nor a symbolic link to a directory, or the *path* argument contains at least one non-*<slash>* character and ends with one or more trailing *<slash>* characters and the last pathname component names an existing file that is neither a directory nor a symbolic link to a directory.

32434 The *statvfs()* function may fail if:

32435 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during

32436 resolution of the *path* argument.

32437 [ENAMETOOLONG]

32438 The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a

32439 symbolic link produced an intermediate result with a length that exceeds

32440 {PATH_MAX}.

32441 EXAMPLES

32442 Obtaining File System Information Using *fstatvfs()*

32443 The following example shows how to obtain file system information for the file system upon

32444 which the file named **/home/cnd/mod1** resides, using the *fstatvfs()* function. The

32445 **/home/cnd/mod1** file is opened with read/write privileges and the open file descriptor is passed

32446 to the *fstatvfs()* function.

```
32447 #include <sys/statvfs.h>
32448 #include <fcntl.h>

32449 struct statvfs buffer;
32450 int          status;
32451 ...
32452 fildes = open("/home/cnd/mod1", O_RDWR);
32453 status = fstatvfs(fildes, &buffer);
```

32454 Obtaining File System Information Using *statvfs()*

32455 The following example shows how to obtain file system information for the file system upon

32456 which the file named **/home/cnd/mod1** resides, using the *statvfs()* function.

```
32457 #include <sys/statvfs.h>

32458 struct statvfs buffer;
32459 int          status;
32460 ...
32461 status = statvfs("/home/cnd/mod1", &buffer);
```

32462 APPLICATION USAGE

32463 None.

32464 RATIONALE

32465 None.

32466 FUTURE DIRECTIONS

32467 None.

32468 SEE ALSO

32472 **CHANGE HISTORY**

32473 First released in Issue 4, Version 2.

32474 **Issue 5**

32475 Moved from X/OPEN UNIX extension to BASE.

32476 Large File Summit extensions are added.

32477 **Issue 6**

32478 The normative text is updated to avoid use of the term “must” for application requirements.

32479 The **restrict** keyword is added to the *statvfs()* prototype for alignment with the
32480 ISO/IEC 9899:1999 standard.32481 The wording of the mandatory [ELOOP] error condition is updated, and a second optional
32482 [ELOOP] error condition is added.32483 **Issue 7**

32484 Austin Group Interpretation 1003.1-2001 #143 is applied.

32485 SD5-XSH-ERN-68 is applied, correcting the EXAMPLES section.

32486 The *fstatvfs()* and *statvfs()* functions are moved from the XSI option to the Base.32487 The [ENOTDIR] error condition is clarified to cover the condition where the last component of a
32488 pathname exists but is not a directory or a symbolic link to a directory.

32489 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0203 [324] is applied.

+

32490 **NAME**

32491 fsync — synchronize changes to a file

32492 **SYNOPSIS**

```
32493 #include <unistd.h>
32494 int fsync(int fildes);
```

32495 **DESCRIPTION**

32496 The *fsync()* function shall request that all data for the open file descriptor named by *fildes* is to be
 32497 transferred to the storage device associated with the file described by *fildes*. The nature of the
 32498 transfer is implementation-defined. The *fsync()* function shall not return until the system has
 32499 completed that action or until an error is detected.

32500 SIO If `_POSIX_SYNCHRONIZED_IO` is defined, the *fsync()* function shall force all currently queued
 32501 I/O operations associated with the file indicated by file descriptor *fildes* to the synchronized I/O
 32502 completion state. All I/O operations shall be completed as defined for synchronized I/O file
 32503 integrity completion.

32504 **RETURN VALUE**

32505 Upon successful completion, *fsync()* shall return 0. Otherwise, `-1` shall be returned and *errno* set
 32506 to indicate the error. If the *fsync()* function fails, outstanding I/O operations are not guaranteed
 32507 to have been completed.

32508 **ERRORS**32509 The *fsync()* function shall fail if:

- 32510 [EBADF] The *fildes* argument is not a valid descriptor.
- 32511 [EINTR] The *fsync()* function was interrupted by a signal.
- 32512 [EINVAL] The *fildes* argument does not refer to a file on which this operation is possible.
- 32513 [EIO] An I/O error occurred while reading from or writing to the file system.

32514 In the event that any of the queued I/O operations fail, *fsync()* shall return the error conditions
 32515 defined for *read()* and *write()*.

32516 **EXAMPLES**

32517 None.

32518 **APPLICATION USAGE**

32519 The *fsync()* function should be used by programs which require modifications to a file to be
 32520 completed before continuing; for example, a program which contains a simple transaction
 32521 facility might use it to ensure that all modifications to a file or files caused by a transaction are
 32522 recorded.

32523 **RATIONALE**

32524 The *fsync()* function is intended to force a physical write of data from the buffer cache, and to
 32525 assure that after a system crash or other failure that all data up to the time of the *fsync()* call is
 32526 recorded on the disk. Since the concepts of “buffer cache”, “system crash”, “physical write”, and
 32527 “non-volatile storage” are not defined here, the wording has to be more abstract.

32528 If `_POSIX_SYNCHRONIZED_IO` is not defined, the wording relies heavily on the conformance
 32529 document to tell the user what can be expected from the system. It is explicitly intended that a
 32530 null implementation is permitted. This could be valid in the case where the system cannot assure
 32531 non-volatile storage under any circumstances or when the system is highly fault-tolerant and the
 32532 functionality is not required. In the middle ground between these extremes, *fsync()* might or
 32533 might not actually cause data to be written where it is safe from a power failure. The

conformance document should identify at least that one configuration exists (and how to obtain that configuration) where this can be assured for at least some files that the user can select to use for critical data. It is not intended that an exhaustive list is required, but rather sufficient information is provided so that if critical data needs to be saved, the user can determine how the system is to be configured to allow the data to be written to non-volatile storage.

It is reasonable to assert that the key aspects of *fsync()* are unreasonable to test in a test suite. That does not make the function any less valuable, just more difficult to test. A formal conformance test should probably force a system crash (power shutdown) during the test for this condition, but it needs to be done in such a way that automated testing does not require this to be done except when a formal record of the results is being made. It would also not be unreasonable to omit testing for *fsync()*, allowing it to be treated as a quality-of-implementation issue.

FUTURE DIRECTIONS

None.

sync()

XBD <unistd.h>

CHANGE HISTORY

First released in Issue 3.

Issue 5

Aligned with *fsync()* in the POSIX Realtime Extension. Specifically, the DESCRIPTION and RETURN VALUE sections are much expanded, and the ERRORS section is updated to indicate that *fsync()* can return the error conditions defined for *read()* and *write()*.

Issue 6

This function is marked as part of the File Synchronization option.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The [EINVAL] and [EIO] mandatory error conditions are added.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/44 is applied, applying an editorial rewording of the DESCRIPTION. No change in meaning is intended.

32564 **NAME**

32565 ftell, ftello — return a file offset in a stream

32566 **SYNOPSIS**

32567 #include <stdio.h>

32568 long ftell(FILE *stream);

32569 CX off_t ftello(FILE *stream);

32570 **DESCRIPTION**

32571 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 32572 conflict between the requirements described here and the ISO C standard is unintentional. This
 32573 volume of POSIX.1-2008 defers to the ISO C standard.

32574 The *ftell()* function shall obtain the current value of the file-position indicator for the stream
 32575 pointed to by *stream*.

32576 The *ftell()* function shall not change the setting of *errno* if successful. +

32577 CX The *ftello()* function shall be equivalent to *ftell()*, except that the return value is of type *off_t* and
 32578 the *ftello()* function may change the setting of *errno* if successful. |

32579 **RETURN VALUE**

32580 CX Upon successful completion, *ftell()* and *ftello()* shall return the current value of the file-position
 32581 indicator for the stream measured in bytes from the beginning of the file.

32582 Otherwise, *ftell()* and *ftello()* shall return *-1*, and set *errno* to indicate the error. |

32583 **ERRORS**

32584 CX The *ftell()* and *ftello()* functions shall fail if:

32585 CX [EBADF] The file descriptor underlying *stream* is not an open file descriptor.

32586 CX [E_OVERFLOW] For *ftell()*, the current file offset cannot be represented correctly in an object of
 32587 type *long*.

32588 CX [E_OVERFLOW] For *ftello()*, the current file offset cannot be represented correctly in an object
 32589 of type *off_t*.

32590 CX [ESPIPE] The file descriptor underlying *stream* is associated with a pipe, FIFO, or socket. |

32591 **EXAMPLES**

32592 None.

32593 **APPLICATION USAGE**

32594 None.

32595 **RATIONALE**

32596 None.

32597 **FUTURE DIRECTIONS**

32598 None.

CHANGE HISTORY

32602 First released in Issue 1. Derived from Issue 1 of the SVID.
32603

Issue 5

32604 Large File Summit extensions are added.
32605

Issue 6

32606 Extensions beyond the ISO C standard are marked.
32607

32608 The following new requirements on POSIX implementations derive from alignment with the
32609 Single UNIX Specification:

- 32610 • The *ftello()* function is added.
- 32611 • The [EOVERFLOW] error conditions are added.

32612 An additional [ESPIPE] error condition is added for sockets.

Issue 7

32613 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0204 [105], XSH/TC1-2008/0205 [421], +
32614 XSH/TC1-2008/0206 [122], XSH/TC1-2008/0207 [122], and XSH/TC1-2008/0208 [14] are +
32615 applied.
32616

32617 **NAME**

32618 ftok — generate an IPC key

32619 **SYNOPSIS**

```
32620 XSI      #include <sys/ipc.h>
32621         key_t ftok(const char *path, int id);
```

32622 **DESCRIPTION**

32623 The *ftok()* function shall return a key based on *path* and *id* that is usable in subsequent calls to
 32624 *msgget()*, *semget()*, and *shmget()*. The application shall ensure that the *path* argument is the
 32625 pathname of an existing file that the process is able to *stat()*, with the exception that if *stat()* |
 32626 would fail with [EOVERFLOW] due to file size, *ftok()* shall still succeed.

32627 The *ftok()* function shall return the same key value for all paths that name the same file, when
 32628 called with the same *id* value, and should return different key values when called with different |
 32629 *id* values or with paths that name different files existing on the same file system at the same
 32630 time. It is unspecified whether *ftok()* shall return the same key value when called again after the
 32631 file named by *path* is removed and recreated with the same name.

32632 Only the low-order 8-bits of *id* are significant. The behavior of *ftok()* is unspecified if these bits
 32633 are 0.

32634 **RETURN VALUE**

32635 Upon successful completion, *ftok()* shall return a key. Otherwise, *ftok()* shall return (**key_t**)-1
 32636 and set *errno* to indicate the error.

32637 **ERRORS**

32638 The *ftok()* function shall fail if:

32639 [EACCES] Search permission is denied for a component of the path prefix.

32640 [EIO] An error occurred while reading from the file system. +

32641 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*
 32642 argument.

32643 [ENAMETOOLONG] The length of a component of a pathname is longer than {NAME_MAX}.
 32644

32645 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.

32646 [ENOTDIR] A component of the path prefix names an existing file that is neither a |
 32647 directory nor a symbolic link to a directory, or the *path* argument contains at
 32648 least one non-*<slash>* character and ends with one or more trailing *<slash>*
 32649 characters and the last pathname component names an existing file that is
 32650 neither a directory nor a symbolic link to a directory.

32651 The *ftok()* function may fail if:

32652 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
 32653 resolution of the *path* argument.

32654 [ENAMETOOLONG] The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a
 32655 symbolic link produced an intermediate result with a length that exceeds
 32656 {PATH_MAX}.
 32657

EXAMPLES**Getting an IPC Key**

The following example gets a key based on the pathname `/tmp` and the ID value `a`. It also assigns the value of the resulting key to the `semkey` variable so that it will be available to a later call to `semget()`, `msgget()`, or `shmget()`.

```
#include <sys/ipc.h>
...
key_t semkey;

if ((semkey = ftok("/tmp", 'a')) == (key_t) -1) {
    perror("IPC error: ftok"); exit(1);
}
```

APPLICATION USAGE

For maximum portability, *id* should be a single-byte character.

Applications should not assume that the resulting key value is unique.

RATIONALE

None.

FUTURE DIRECTIONS

Future versions of this standard may add new interfaces to provide unique keys.

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Issue 6

The normative text is updated to avoid use of the term “must” for application requirements.

The wording of the mandatory [ELOOP] error condition is updated, and a second optional [ELOOP] error condition is added.

Issue 7

Austin Group Interpretation 1003.1-2001 #143 is applied.

The [ENOTDIR] error condition is clarified to cover the condition where the last component of a pathname exists but is not a directory or a symbolic link to a directory.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0209 [343], XSH/TC1-2008/0210 [366], XSH/TC1-2008/0211 [343], XSH/TC1-2008/0212 [324], XSH/TC1-2008/0213 [366], XSH/TC1-2008/0214 [366], XSH/TC1-2008/0215 [366], and XSH/TC1-2008/0216 [366] are applied.

32695 **NAME**

32696 ftruncate — truncate a file to a specified length

32697 **SYNOPSIS**

32698 #include <unistd.h>

32699 int ftruncate(int *fildes*, off_t *length*);32700 **DESCRIPTION**32701 If *fildes* is not a valid file descriptor open for writing, the *ftruncate()* function shall fail.

32702 If *fildes* refers to a regular file, the *ftruncate()* function shall cause the size of the file to be truncated to *length*. If the size of the file previously exceeded *length*, the extra data shall no longer be available to reads on the file. If the file previously was smaller than this size, *ftruncate()* shall increase the size of the file. If the file size is increased, the extended area shall appear as if it were zero-filled. The value of the seek pointer shall not be modified by a call to *ftruncate()*.

32708 Upon successful completion, if *fildes* refers to a regular file, *ftruncate()* shall mark for update the last data modification and last file status change timestamps of the file and the S_ISUID and S_ISGID bits of the file mode may be cleared. If the *ftruncate()* function is unsuccessful, the file is unaffected.

32712 XSI If the request would cause the file size to exceed the soft file size limit for the process, the request shall fail and the implementation shall generate the SIGXFSZ signal for the thread.

32714 If *fildes* refers to a directory, *ftruncate()* shall fail.32715 If *fildes* refers to any other file type, except a shared memory object, the result is unspecified.

32716 SHM If *fildes* refers to a shared memory object, *ftruncate()* shall set the size of the shared memory object to *length*.

32718 SHM If the effect of *ftruncate()* is to decrease the size of a memory mapped file or a shared memory object and whole pages beyond the new end were previously mapped, then the whole pages beyond the new end shall be discarded.

32721 References to discarded pages shall result in the generation of a SIGBUS signal.

32722 If the effect of *ftruncate()* is to increase the size of a memory object, it is unspecified whether the contents of any mapped pages between the old end-of-file and the new are flushed to the underlying object.

32725 **RETURN VALUE**

32726 Upon successful completion, *ftruncate()* shall return 0; otherwise, -1 shall be returned and *errno* set to indicate the error.

32728 **ERRORS**32729 The *ftruncate()* function shall fail if:

32730 [EINTR] A signal was caught during execution.

32731 [EINVAL] The *length* argument was less than 0.

32732 [EFBIG] or [EINVAL]

32733 The *length* argument was greater than the maximum file size.

32734 [EFBIG] The file is a regular file and *length* is greater than the offset maximum established in the open file description associated with *fildes*.

32736 [EIO] An I/O error occurred while reading from or writing to a file system.
32737 [EBADF] or [EINVAL]
32738 The *fildest* argument is not a file descriptor open for writing.

32739 EXAMPLES

32740 None.

32741 APPLICATION USAGE

32742 None.

32743 RATIONALE

32744 None.

32745 FUTURE DIRECTIONS

32746 None.

32747 SEE ALSO

32748 *open()*, *truncate()*

32749 XBD <unistd.h>

32750 CHANGE HISTORY

32751 First released in Issue 4, Version 2.

32752 Issue 5

32753 Moved from X/OPEN UNIX extension to BASE and aligned with *ftruncate()* in the POSIX
32754 Realtime Extension. Specifically, the DESCRIPTION is extensively reworded and [EROFS] is
32755 added to the list of mandatory errors that can be returned by *ftruncate()*.

32756 Large File Summit extensions are added.

32757 Issue 6

32758 The *truncate()* function is split out into a separate reference page.

32759 The following new requirements on POSIX implementations derive from alignment with the
32760 Single UNIX Specification:

- 32761 • The DESCRIPTION is changed to indicate that if the file size is changed, and if the file is a
32762 regular file, the S_ISUID and S_ISGID bits in the file mode may be cleared.

32763 The following changes were made to align with the IEEE P1003.1a draft standard:

- 32764 • The DESCRIPTION text is updated.

32765 XSI-conformant systems are required to increase the size of the file if the file was previously
32766 smaller than the size requested.

32767 Issue 7

32768 Austin Group Interpretation 1003.1-2001 #056 is applied, revising the ERRORS section (although
32769 the [EINVAL] “may fail” error was subsequently removed during review of the XSI option).

32770 Functionality relating to the Memory Protection and Memory Mapped Files options is moved to
32771 the Base.

32772 The DESCRIPTION is updated so that a call to *ftruncate()* when the file is smaller than the size
32773 requested will increase the size of the file. Previously, non-XSI-conforming implementations
32774 were allowed to increase the size of the file or fail.

32775 Changes are made related to support for finegrained timestamps.

32776 **NAME**

32777 ftrylockfile — stdio locking functions

32778 **SYNOPSIS**

```
32779 CX      #include <stdio.h>
32780          int ftrylockfile(FILE *file);
```

32781 **DESCRIPTION**32782 Refer to *flockfile()*.

NAME

ftw — traverse (walk) a file tree

SYNOPSIS

```
#include <ftw.h>

int ftw(const char *path, int (*fn)(const char *,
    const struct stat *ptr, int flag), int ndirs);
```

DESCRIPTION

The *ftw()* function shall recursively descend the directory hierarchy rooted in *path*. For each object in the hierarchy, *ftw()* shall call the function pointed to by *fn*, passing it a pointer to a null-terminated character string containing the name of the object, a pointer to a **stat** structure containing information about the object, filled in as if *stat()* or *lstat()* had been called to retrieve the information. Possible values of the integer, defined in the **<ftw.h>** header, are:

FTW_D For a directory.

FTW_DNR For a directory that cannot be read.

FTW_F For a non-directory file.

FTW_SL For a symbolic link (but see also FTW_NS below).

FTW_NS For an object other than a symbolic link on which *stat()* could not successfully be executed. If the object is a symbolic link and *stat()* failed, it is unspecified whether *ftw()* passes FTW_SL or FTW_NS to the user-supplied function.

If the integer is FTW_DNR, descendants of that directory shall not be processed. If the integer is FTW_NS, the **stat** structure contains undefined values. An example of an object that would cause FTW_NS to be passed to the function pointed to by *fn* would be a file in a directory with read but without execute (search) permission.

The *ftw()* function shall visit a directory before visiting any of its descendants.

The *ftw()* function shall use at most one file descriptor for each level in the tree.

The argument *ndirs* should be in the range [1,{OPEN_MAX}].

The tree traversal shall continue until either the tree is exhausted, an invocation of *fn* returns a non-zero value, or some error, other than [EACCES], is detected within *ftw()*.

The *ndirs* argument shall specify the maximum number of directory streams or file descriptors or both available for use by *ftw()* while traversing the tree. When *ftw()* returns it shall close any directory streams and file descriptors it uses not counting any opened by the application-supplied *fn* function.

The results are unspecified if the application-supplied *fn* function does not preserve the current working directory.

The *ftw()* function need not be thread-safe.

RETURN VALUE

If the tree is exhausted, *ftw()* shall return 0. If the function pointed to by *fn* returns a non-zero value, *ftw()* shall stop its tree traversal and return whatever value was returned by the function pointed to by *fn*. If *ftw()* detects an error, it shall return -1 and set *errno* to indicate the error.

If *ftw()* encounters an error other than [EACCES] (see FTW_DNR and FTW_NS above), it shall return -1 and set *errno* to indicate the error. The external variable *errno* may contain any error value that is possible when a directory is opened or when one of the *stat* functions is executed on

32825 a directory or file.

32826 ERRORS

32827 The *ftw()* function shall fail if:

32828 [EACCES] Search permission is denied for any component of *path* or read permission is
32829 denied for *path*.

32830 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*
32831 argument.

32832 [ENAMETOOLONG]

32833 The length of a component of a pathname is longer than {NAME_MAX}.

32834 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.

32835 [ENOTDIR] A component of *path* names an existing file that is neither a directory nor a
32836 symbolic link to a directory.

32837 [EOVERFLOW] A field in the **stat** structure cannot be represented correctly in the current
32838 programming environment for one or more files found in the file hierarchy.

32839 The *ftw()* function may fail if:

32840 [EINVAL] The value of the *ndirs* argument is invalid.

32841 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
32842 resolution of the *path* argument.

32843 [ENAMETOOLONG]

32844 The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a
32845 symbolic link produced an intermediate result with a length that exceeds
32846 {PATH_MAX}.

32847 In addition, if the function pointed to by *fn* encounters system errors, *errno* may be set
32848 accordingly.

32849 EXAMPLES

32850 Walking a Directory Structure

32851 The following example walks the current directory structure, calling the *fn* function for every
32852 directory entry, using at most 10 file descriptors:

```
32853 #include <ftw.h>
32854 ...
32855 if (ftw(".", fn, 10) != 0) {
32856     perror("ftw"); exit(2);
32857 }
```

32858 APPLICATION USAGE

32859 The *ftw()* function may allocate dynamic storage during its operation. If *ftw()* is forcibly
32860 terminated, such as by *longjmp()* or *siglongjmp()* being executed by the function pointed to by *fn*
32861 or an interrupt routine, *ftw()* does not have a chance to free that storage, so it remains
32862 permanently allocated. A safe way to handle interrupts is to store the fact that an interrupt has
32863 occurred, and arrange to have the function pointed to by *fn* return a non-zero value at its next
32864 invocation.

32865 Applications should use the *nftw()* function instead of the obsolescent *ftw()* function.

32866 **RATIONALE**

32867 None.

32868 **FUTURE DIRECTIONS**32869 The *ftw()* function may be removed in a future version.32870 **SEE ALSO**32871 *fdopendir()*, *fstatat()*, *longjmp()*, *nftw()*, *siglongjmp()*

32872 XBD <ftw.h>, <sys/stat.h>

32873 **CHANGE HISTORY**

32874 First released in Issue 1. Derived from Issue 1 of the SVID.

32875 **Issue 5**

32876 UX codings in the DESCRIPTION, RETURN VALUE, and ERRORS sections are changed to EX.

32877 **Issue 6**

32878 The ERRORS section is updated as follows:

- 32879 • The wording of the mandatory [ELOOP] error condition is updated.
- 32880 • A second optional [ELOOP] error condition is added.
- 32881 • The [Eoverflow] mandatory error condition is added.

32882 A note is added to the DESCRIPTION indicating that this function need not be reentrant, and
 32883 that the results are unspecified if the application-supplied *fn* function does not preserve the
 32884 current working directory.

32885 **Issue 7**

32886 Austin Group Interpretations 1003.1-2001 #143 and #156 are applied.

32887 SD5-XBD-ERN-61 is applied.

32888 The *ftw()* function is marked obsolescent. |

32889 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0217 [403], XSH/TC1-2008/0218 [324], |
 32890 and XSH/TC1-2008/0219 [361] are applied.

32891 **NAME**

32892 funlockfile — stdio locking functions

32893 **SYNOPSIS**

```
32894 CX      #include <stdio.h>  
32895      void funlockfile(FILE *file);
```

32896 **DESCRIPTION**32897 Refer to *flockfile()*.

NAME

futimens, utimensat, utimes — set file access and modification times

SYNOPSIS

```
#include <sys/stat.h>

int futimens(int fd, const struct timespec times[2]);
int utimensat(int fd, const char *path, const struct timespec times[2],
              int flag);

#include <sys/time.h>

int utimes(const char *path, const struct timeval times[2]);
```

DESCRIPTION

The *futimens()* and *utimensat()* functions shall set the access and modification times of a file to the values of the *times* argument. The *futimens()* function changes the times of the file associated with the file descriptor *fd*. The *utimensat()* function changes the times of the file pointed to by the *path* argument, relative to the directory associated with the file descriptor *fd*. Both functions allow time specifications accurate to the nanosecond.

For *futimens()* and *utimensat()*, the *times* argument is an array of two **timespec** structures. The first array member represents the date and time of last access, and the second member represents the date and time of last modification. The times in the **timespec** structure are measured in seconds and nanoseconds since the Epoch. The file's relevant timestamp shall be set to the greatest value supported by the file system that is not greater than the specified time.

If the *tv_nsec* field of a **timespec** structure has the special value **UTIME_NOW**, the file's relevant timestamp shall be set to the greatest value supported by the file system that is not greater than the current time. If the *tv_nsec* field has the special value **UTIME_OMIT**, the file's relevant timestamp shall not be changed. In either case, the *tv_sec* field shall be ignored.

If the *times* argument is a null pointer, both the access and modification timestamps shall be set to the greatest value supported by the file system that is not greater than the current time. If *utimensat()* is passed a relative path in the *path* argument, the file to be used shall be relative to the directory associated with the file descriptor *fd* instead of the current working directory. If the file descriptor was opened without **O_SEARCH**, the function shall check whether directory searches are permitted using the current permissions of the directory underlying the file descriptor. If the file descriptor was opened with **O_SEARCH**, the function shall not perform the check.

If *utimensat()* is passed the special value **AT_FDCWD** in the *fd* parameter, the current working directory shall be used.

Only a process with the effective user ID equal to the user ID of the file, or with write access to the file, or with appropriate privileges may use *futimens()* or *utimensat()* with a null pointer as the *times* argument or with both *tv_nsec* fields set to the special value **UTIME_NOW**. Only a process with the effective user ID equal to the user ID of the file or with appropriate privileges may use *futimens()* or *utimensat()* with a non-null *times* argument that does not have both *tv_nsec* fields set to **UTIME_NOW** and does not have both *tv_nsec* fields set to **UTIME_OMIT**. If both *tv_nsec* fields are set to **UTIME_OMIT**, no ownership or permissions check shall be performed for the file, but other error conditions may still be detected (including [EACCES] errors related to the path prefix).

Values for the *flag* argument of *utimensat()* are constructed by a bitwise-inclusive OR of flags from the following list, defined in **<fcntl.h>**:

32943 AT_SYMLINK_NOFOLLOW

32944 If *path* names a symbolic link, then the access and modification times of the symbolic link
32945 are changed.

32946 Upon completion, *futimens()* and *utimensat()* shall mark the last file status change timestamp for
32947 update.

32948 The *utimes()* function shall be equivalent to the *utimensat()* function with the special value
32949 AT_FDCWD as the *fd* argument and the *flag* argument set to zero, except that the *times* argument
32950 is a **timeval** structure rather than a **timespec** structure, and accuracy is only to the microsecond,
32951 not nanosecond, and rounding towards the nearest second may occur.

32952 RETURN VALUE

32953 Upon successful completion, these functions shall return 0. Otherwise, these functions shall
32954 return -1 and set *errno* to indicate the error. If -1 is returned, the file times shall not be affected.

32955 ERRORS

32956 These functions shall fail if:

32957 [EACCES] The *times* argument is a null pointer, or both *tv_nsec* values are UTIME_NOW,
32958 and the effective user ID of the process does not match the owner of the file
32959 and write access is denied.

32960 [EINVAL] Either of the *times* argument structures specified a *tv_nsec* value that was
32961 neither UTIME_NOW nor UTIME_OMIT, and was a value less than zero or
32962 greater than or equal to 1 000 million.

32963 [EINVAL] A new file timestamp would be a value whose *tv_sec* component is not a value
32964 supported by the file system.

32965 [EPERM] The *times* argument is not a null pointer, does not have both *tv_nsec* fields set
32966 to UTIME_NOW, does not have both *tv_nsec* fields set to UTIME_OMIT, the
32967 calling process' effective user ID does not match the owner of the file, and the
32968 calling process does not have appropriate privileges.

32969 [EROFS] The file system containing the file is read-only.

32970 The *futimens()* function shall fail if:

32971 [EBADF] The *fd* argument is not a valid file descriptor.

32972 The *utimensat()* function shall fail if:

32973 [EACCES] *fd* was not opened with O_SEARCH and the permissions of the directory
32974 underlying *fd* do not permit directory searches.

32975 [EBADF] The *path* argument does not specify an absolute path and the *fd* argument is
32976 neither AT_FDCWD nor a valid file descriptor open for reading or searching.

32977 [ENOTDIR] The *path* argument is not an absolute path and *fd* is a file descriptor associated
32978 with a non-directory file.

32979 The *utimensat()* and *utimes()* functions shall fail if:

32980 [EACCES] Search permission is denied by a component of the path prefix.

32981 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*
32982 argument.

- 32983 [ENAMETOOLONG]
 32984 The length of a component of a pathname is longer than {NAME_MAX}.
- 32985 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.
- 32986 [ENOTDIR] A component of the path prefix names an existing file that is neither a
 32987 directory nor a symbolic link to a directory, or the *path* argument contains at
 32988 least one non-`<slash>` character and ends with one or more trailing `<slash>`
 32989 characters and the last pathname component names an existing file that is
 32990 neither a directory nor a symbolic link to a directory.
- 32991 The *utimensat()* and *utimes()* functions may fail if:
- 32992 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
 32993 resolution of the *path* argument.
- 32994 [ENAMETOOLONG]
 32995 The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a
 32996 symbolic link produced an intermediate result with a length that exceeds
 32997 {PATH_MAX}.
- 32998 The *utimensat()* function may fail if:
- 32999 [EINVAL] The value of the *flag* argument is not valid. |

EXAMPLES

33001 None.

APPLICATION USAGE

33003 None.

RATIONALE

33005 The purpose of the *utimensat()* function is to set the access and modification time of files in
 33006 directories other than the current working directory without exposure to race conditions. Any
 33007 part of the path of a file could be changed in parallel to a call to *utimes()*, resulting in unspecified
 33008 behavior. By opening a file descriptor for the target directory and using the *utimensat()* function
 33009 it can be guaranteed that the changed file is located relative to the desired directory.

33010 The standard developers considered including a special case for the permissions required by
 33011 *utimensat()* when one *tv_nsec* field is `UTIME_NOW` and the other is `UTIME_OMIT`. One
 33012 possibility would be to include this case in with the cases where *times* is a null pointer or both
 33013 fields are `UTIME_NOW`, where the call is allowed if the process has write permission for the file.
 33014 However, associating write permission with an update to just the last data access timestamp
 33015 (which is normally updated by *read()*) did not seem appropriate. The other possibility would be
 33016 to specify that this one case is allowed if the process has read permission, but this was felt to be
 33017 too great a departure from the *utime()* and *utimes()* functions on which *utimensat()* is based. If
 33018 an application needs to set the last data access timestamp to the current time for a file on which
 33019 it has read permission but is not the owner, it can do so by opening the file, reading one or more
 33020 bytes (or reading a directory entry, if the file is a directory), and then closing it.

FUTURE DIRECTIONS

33022 None.

CHANGE HISTORY

33026 First released in Issue 4, Version 2.

Issue 5

33028 Moved from X/OPEN UNIX extension to BASE.

Issue 6

33030 This function is marked LEGACY.

33031 The normative text is updated to avoid use of the term “must” for application requirements.

33032 The wording of the mandatory [ELOOP] error condition is updated, and a second optional [ELOOP] error condition is added.

Issue 7

33033 Austin Group Interpretation 1003.1-2001 #143 is applied.

33034 The LEGACY marking is removed.

33035 The *utimensat()* function (renamed from *futimesat()*) is added from The Open Group Technical Standard, 2006, Extended API Set Part 2, and changed to allow modifying a symbolic link by adding a *flag* argument.

33036 The *futimens()* function is added.

33037 Changes are made related to support for finegrained timestamps.

33038 Changes are made to allow a directory to be opened for searching.

33039 The [ENOTDIR] error condition is clarified to cover the condition where the last component of a pathname exists but is not a directory or a symbolic link to a directory.

33040 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0220 [63,428], XSH/TC1-2008/0221 + [278], XSH/TC1-2008/0222 [324], XSH/TC1-2008/0223 [306], and XSH/TC1-2008/0224 [278] are + applied.

33049 **NAME**

33050 fwide — set stream orientation

33051 **SYNOPSIS**

33052 #include <stdio.h>

33053 #include <wchar.h>

33054 int fwide(FILE **stream*, int *mode*);33055 **DESCRIPTION**

33056 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 33057 conflict between the requirements described here and the ISO C standard is unintentional. This
 33058 volume of POSIX.1-2008 defers to the ISO C standard.

33059 The *fwide()* function shall determine the orientation of the stream pointed to by *stream*. If *mode* is
 33060 greater than zero, the function first attempts to make the stream wide-oriented. If *mode* is less
 33061 than zero, the function first attempts to make the stream byte-oriented. Otherwise, *mode* is zero
 33062 and the function does not alter the orientation of the stream.

33063 If the orientation of the stream has already been determined, *fwide()* shall not change it.

33064 CX The *fwide()* function shall not change the setting of *errno* if successful. +

33065 Since no return value is reserved to indicate an error, an application wishing to check for error
 33066 situations should set *errno* to 0, then call *fwide()*, then check *errno*, and if it is non-zero, assume
 33067 an error has occurred.

33068 **RETURN VALUE**

33069 The *fwide()* function shall return a value greater than zero if, after the call, the stream has wide-
 33070 orientation, a value less than zero if the stream has byte-orientation, or zero if the stream has no
 33071 orientation.

33072 **ERRORS**

33073 The *fwide()* function may fail if:

33074 CX [EBADF] The *stream* argument is not a valid stream.

33075 **EXAMPLES**

33076 None.

33077 **APPLICATION USAGE**

33078 A call to *fwide()* with *mode* set to zero can be used to determine the current orientation of a
 33079 stream.

33080 **RATIONALE**

33081 None.

33082 **FUTURE DIRECTIONS**

33083 None.

33084 **SEE ALSO**

33085 XBD <stdio.h>, <wchar.h>

33086 **CHANGE HISTORY**

33087 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995
 33088 (E).

33089 **Issue 6**

33090 Extensions beyond the ISO C standard are marked.

33091 **Issue 7**

33092 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0225 [272] is applied.

+

33093 NAME

33094 fwprintf, swprintf, wprintf — print formatted wide-character output

33095 SYNOPSIS

```

33096 #include <stdio.h>
33097 #include <wchar.h>
33098 int fwprintf(FILE *restrict stream, const wchar_t *restrict format, ...);
33099 int swprintf(wchar_t *restrict ws, size_t n,
33100             const wchar_t *restrict format, ...);
33101 int wprintf(const wchar_t *restrict format, ...);

```

33102 DESCRIPTION

33103 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 33104 conflict between the requirements described here and the ISO C standard is unintentional. This
 33105 volume of POSIX.1-2008 defers to the ISO C standard.

33106 The *fwprintf()* function shall place output on the named output *stream*. The *wprintf()* function
 33107 shall place output on the standard output stream *stdout*. The *swprintf()* function shall place
 33108 output followed by the null wide character in consecutive wide characters starting at **ws*; no
 33109 more than *n* wide characters shall be written, including a terminating null wide character, which
 33110 is always added (unless *n* is zero).

33111 Each of these functions shall convert, format, and print its arguments under control of the *format*
 33112 wide-character string. The *format* is composed of zero or more directives: *ordinary wide-characters*,
 33113 which are simply copied to the output stream, and *conversion specifications*, each of which results
 33114 in the fetching of zero or more arguments. The results are undefined if there are insufficient
 33115 arguments for the *format*. If the *format* is exhausted while arguments remain, the excess
 33116 arguments are evaluated but are otherwise ignored.

33117 CX Conversions can be applied to the *n*th argument after the *format* in the argument list, rather than
 33118 to the next unused argument. In this case, the conversion specifier wide character % (see below)
 33119 is replaced by the sequence "%*n*\$", where *n* is a decimal integer in the range
 33120 [1,{NL_ARGMAX}], giving the position of the argument in the argument list. This feature
 33121 provides for the definition of *format* wide-character strings that select arguments in an order
 33122 appropriate to specific languages (see the EXAMPLES section).

33123 The *format* can contain either numbered argument specifications (that is, "%*n*\$" and "%*m*\$"), or
 33124 unnumbered argument conversion specifications (that is, % and *), but not both. The only
 33125 exception to this is that %% can be mixed with the "%*n*\$" form. The results of mixing numbered
 33126 and unnumbered argument specifications in a *format* wide-character string are undefined. When
 33127 numbered argument specifications are used, specifying the *N*th argument requires that all the
 33128 leading arguments, from the first to the (*N*–1)th, are specified in the *format* wide-character string.

33129 In *format* wide-character strings containing the "%*n*\$" form of conversion specification,
 33130 numbered arguments in the argument list can be referenced from the *format* wide-character
 33131 string as many times as required.

33132 In *format* wide-character strings containing the % form of conversion specification, each
 33133 argument in the argument list shall be used exactly once.

33134 CX All forms of the *fwprintf()* function allow for the insertion of a locale-dependent radix character
 33135 in the output string, output as a wide-character value. The radix character is defined in the
 33136 current locale (category LC_NUMERIC). In the POSIX locale, or in a locale where the radix
 33137 character is not defined, the radix character shall default to a <period> (' . ').

Each conversion specification is introduced by the `' % '` wide character or by the wide-character sequence `"%n$"`, after which the following appear in sequence:

- Zero or more *flags* (in any order), which modify the meaning of the conversion specification.
- An optional minimum *field width*. If the converted value has fewer wide characters than the field width, it shall be padded with `<space>` characters by default on the left; it shall be padded on the right, if the left-adjustment flag (`' - '`), described below, is given to the field width. The field width takes the form of an `<asterisk>` (`' * '`), described below, or a decimal integer.
- An optional *precision* that gives the minimum number of digits to appear for the `d`, `i`, `o`, `u`, `x`, and `X` conversion specifiers; the number of digits to appear after the radix character for the `a`, `A`, `e`, `E`, `f`, and `F` conversion specifiers; the maximum number of significant digits for the `g` and `G` conversion specifiers; or the maximum number of wide characters to be printed from a string in the `s` conversion specifiers. The precision takes the form of a `<period>` (`' . '`) followed either by an `<asterisk>` (`' * '`), described below, or an optional decimal digit string, where a null digit string is treated as 0. If a precision appears with any other conversion wide character, the behavior is undefined.
- An optional length modifier that specifies the size of the argument.
- A *conversion specifier* wide character that indicates the type of conversion to be applied.

A field width, or precision, or both, may be indicated by an `<asterisk>` (`' * '`). In this case an argument of type `int` supplies the field width or precision. Applications shall ensure that arguments specifying field width, or precision, or both appear in that order before the argument, if any, to be converted. A negative field width is taken as a `' - '` flag followed by a positive field width. A negative precision is taken as if the precision were omitted. In *format* wide-character strings containing the `"%n$"` form of a conversion specification, a field width or precision may be indicated by the sequence `"*m$"`, where `m` is a decimal integer in the range `[1, {NL_ARGMAX}]` giving the position in the argument list (after the *format* argument) of an integer argument containing the field width or precision, for example:

```
wprintf(L"%1$d:%2$.*3$d:%4$.*3$d\n", hour, min, precision, sec);
```

The flag wide characters and their meanings are:

- `'` (The `<apostrophe>`.) The integer portion of the result of a decimal conversion (`%i`, `%d`, `%u`, `%f`, `%F`, `%g`, or `%G`) shall be formatted with thousands' grouping wide characters. For other conversions, the behavior is undefined. The numeric grouping wide character is used.
- `-` The result of the conversion shall be left-justified within the field. The conversion shall be right-justified if this flag is not specified.
- `+` The result of a signed conversion shall always begin with a sign (`' + '` or `' - '`). The conversion shall begin with a sign only when a negative value is converted if this flag is not specified.
- `<space>` If the first wide character of a signed conversion is not a sign, or if a signed conversion results in no wide characters, a `<space>` shall be prefixed to the result. This means that if the `<space>` and `' + '` flags both appear, the `<space>` flag shall be ignored.
- `#` Specifies that the value is to be converted to an alternative form. For `o` conversion, it increases the precision (if necessary) to force the first digit of the result to be 0. For `x` or `X` conversion specifiers, a non-zero result shall have `0x` (or `0X`) prefixed to it. For `a`, `A`, `e`,

33183 E, f, F, g, and G conversion specifiers, the result shall always contain a radix character,
 33184 even if no digits follow it. Without this flag, a radix character appears in the result of
 33185 these conversions only if a digit follows it. For g and G conversion specifiers, trailing
 33186 zeros shall *not* be removed from the result as they normally are. For other conversion
 33187 specifiers, the behavior is undefined.

33188 0 For d, i, o, u, x, X, a, A, e, E, f, F, g, and G conversion specifiers, leading zeros
 33189 (following any indication of sign or base) are used to pad to the field width rather than
 33190 performing space padding, except when converting an infinity or NaN. If the '0' and
 33191 '-' flags both appear, the '0' flag shall be ignored. For d, i, o, u, x, and X conversion
 33192 CX specifiers, if a precision is specified, the '0' flag shall be ignored. If the '0' and
 33193 <apostrophe> flags both appear, the grouping wide characters are inserted before zero
 33194 padding. For other conversions, the behavior is undefined.

33195 The length modifiers and their meanings are:

33196 hh Specifies that a following d, i, o, u, x, or X conversion specifier applies to a **signed char**
 33197 or **unsigned char** argument (the argument will have been promoted according to the
 33198 integer promotions, but its value shall be converted to **signed char** or **unsigned char**
 33199 before printing); or that a following n conversion specifier applies to a pointer to a
 33200 **signed char** argument.

33201 h Specifies that a following d, i, o, u, x, or X conversion specifier applies to a **short** or
 33202 **unsigned short** argument (the argument will have been promoted according to the
 33203 integer promotions, but its value shall be converted to **short** or **unsigned short** before
 33204 printing); or that a following n conversion specifier applies to a pointer to a **short**
 33205 argument.

33206 l (ell) Specifies that a following d, i, o, u, x, or X conversion specifier applies to a **long** or
 33207 **unsigned long** argument; that a following n conversion specifier applies to a pointer to
 33208 a **long** argument; that a following c conversion specifier applies to a **wint_t** argument;
 33209 that a following s conversion specifier applies to a pointer to a **wchar_t** argument; or
 33210 has no effect on a following a, A, e, E, f, F, g, or G conversion specifier.

33211 ll (ell-ell) Specifies that a following d, i, o, u, x, or X conversion specifier applies to a **long long**
 33212 or **unsigned long long** argument; or that a following n conversion specifier applies to a
 33213 pointer to a **long long** argument.

33215 j Specifies that a following d, i, o, u, x, or X conversion specifier applies to an **intmax_t**
 33216 or **uintmax_t** argument; or that a following n conversion specifier applies to a pointer
 33217 to an **intmax_t** argument.

33218 z Specifies that a following d, i, o, u, x, or X conversion specifier applies to a **size_t** or the
 33219 corresponding signed integer type argument; or that a following n conversion specifier
 33220 applies to a pointer to a signed integer type corresponding to a **size_t** argument.

33221 t Specifies that a following d, i, o, u, x, or X conversion specifier applies to a **ptrdiff_t** or
 33222 the corresponding **unsigned** type argument; or that a following n conversion specifier
 33223 applies to a pointer to a **ptrdiff_t** argument.

33224 L Specifies that a following a, A, e, E, f, F, g, or G conversion specifier applies to a **long**
 33225 **double** argument.

33226		If a length modifier appears with any conversion specifier other than as specified above, the
33227		behavior is undefined.
33228		The conversion specifiers and their meanings are:
33229	d, i	The int argument shall be converted to a signed decimal in the style "[−] dddd". The
33230		precision specifies the minimum number of digits to appear; if the value being
33231		converted can be represented in fewer digits, it shall be expanded with leading zeros.
33232		The default precision shall be 1. The result of converting zero with an explicit precision
33233		of zero shall be no wide characters.
33234	o	The unsigned argument shall be converted to unsigned octal format in the style
33235		"dddd". The precision specifies the minimum number of digits to appear; if the value
33236		being converted can be represented in fewer digits, it shall be expanded with leading
33237		zeros. The default precision shall be 1. The result of converting zero with an explicit
33238		precision of zero shall be no wide characters.
33239	u	The unsigned argument shall be converted to unsigned decimal format in the style
33240		"dddd". The precision specifies the minimum number of digits to appear; if the value
33241		being converted can be represented in fewer digits, it shall be expanded with leading
33242		zeros. The default precision shall be 1. The result of converting zero with an explicit
33243		precision of zero shall be no wide characters.
33244	x	The unsigned argument shall be converted to unsigned hexadecimal format in the style
33245		"dddd"; the letters "abcdef" are used. The precision specifies the minimum number
33246		of digits to appear; if the value being converted can be represented in fewer digits, it
33247		shall be expanded with leading zeros. The default precision shall be 1. The result of
33248		converting zero with an explicit precision of zero shall be no wide characters.
33249	X	Equivalent to the x conversion specifier, except that letters "ABCDEF" are used instead
33250		of "abcdef".
33251	f, F	The double argument shall be converted to decimal notation in the style
33252		"[−] ddd.ddd", where the number of digits after the radix character shall be equal to
33253		the precision specification. If the precision is missing, it shall be taken as 6; if the
33254		precision is explicitly zero and no ' # ' flag is present, no radix character shall appear. If
33255		a radix character appears, at least one digit shall appear before it. The value shall be
33256		rounded in an implementation-defined manner to the appropriate number of digits.
33257		A double argument representing an infinity shall be converted in one of the styles
33258		"[−]inf" or "[−]infinity"; which style is implementation-defined. A double
33259		argument representing a NaN shall be converted in one of the styles "[−]nan" or
33260		"[−]nan(n-char-sequence)"; which style, and the meaning of any <i>n-char-sequence</i> ,
33261		is implementation-defined. The F conversion specifier produces "INF", "INFINITY",
33262		or "NAN" instead of "inf", "infinity", or "nan", respectively.
33263	e, E	The double argument shall be converted in the style "[−] d.ddde±dd", where there
33264		shall be one digit before the radix character (which is non-zero if the argument is non-
33265		zero) and the number of digits after it shall be equal to the precision; if the precision is
33266		missing, it shall be taken as 6; if the precision is zero and no ' # ' flag is present, no
33267		radix character shall appear. The value shall be rounded in an implementation-defined
33268		manner to the appropriate number of digits. The E conversion wide character shall
33269		produce a number with 'E' instead of 'e' introducing the exponent. The exponent
33270		shall always contain at least two digits. If the value is zero, the exponent shall be zero.
33271		A double argument representing an infinity or NaN shall be converted in the style of
33272		an f or F conversion specifier.

33273	g, G	The double argument representing a floating-point number shall be converted in the style <code>f</code> or <code>e</code> (or in the style <code>F</code> or <code>E</code> in the case of a <code>G</code> conversion specifier), depending on the value converted and the precision. Let <code>P</code> equal the precision if non-zero, 6 if the precision is omitted, or 1 if the precision is zero. Then, if a conversion with style <code>E</code> would have an exponent of <code>X</code> :
33274		
33275		
33276		
33277		
33278		— If $P > X \geq -4$, the conversion shall be with style <code>f</code> (or <code>F</code>) and precision $P - (X + 1)$.
33279		— Otherwise, the conversion shall be with style <code>e</code> (or <code>E</code>) and precision $P - 1$.
33280		Finally, unless the <code>'#'</code> flag is used, any trailing zeros shall be removed from the fractional portion of the result and the decimal-point character shall be removed if there is no fractional portion remaining.
33281		
33282		
33283		A double argument representing an infinity or NaN shall be converted in the style of an <code>f</code> or <code>F</code> conversion specifier.
33284		
33285	a, A	A double argument representing a floating-point number shall be converted in the style <code>"[-]0xh.hhhhp±d"</code> , where there shall be one hexadecimal digit (which is non-zero if the argument is a normalized floating-point number and is otherwise unspecified) before the decimal-point wide character and the number of hexadecimal digits after it shall be equal to the precision; if the precision is missing and <code>FLT_RADIX</code> is a power of 2, then the precision shall be sufficient for an exact representation of the value; if the precision is missing and <code>FLT_RADIX</code> is not a power of 2, then the precision shall be sufficient to distinguish values of type double , except that trailing zeros may be omitted; if the precision is zero and the <code>'#'</code> flag is not specified, no decimal-point wide character shall appear. The letters <code>"abcdef"</code> are used for a conversion and the letters <code>"ABCDEF"</code> for A conversion. The A conversion specifier produces a number with <code>'X'</code> and <code>'P'</code> instead of <code>'x'</code> and <code>'p'</code> . The exponent shall always contain at least one digit, and only as many more digits as necessary to represent the decimal exponent of 2. If the value is zero, the exponent shall be zero.
33286		
33287		
33288		
33289		
33290		
33291		
33292		
33293		
33294		
33295		
33296		
33297		
33298		
33299		A double argument representing an infinity or NaN shall be converted in the style of an <code>f</code> or <code>F</code> conversion specifier.
33300		
33301	c	If no <code>l</code> (ell) qualifier is present, the int argument shall be converted to a wide character as if by calling the <code>btowc()</code> function and the resulting wide character shall be written. Otherwise, the wint_t argument shall be converted to wchar_t , and written.
33302		
33303		
33304	s	If no <code>l</code> (ell) qualifier is present, the application shall ensure that the argument is a pointer to a character array containing a character sequence beginning in the initial shift state. Characters from the array shall be converted as if by repeated calls to the <code>mbrtowc()</code> function, with the conversion state described by an mbstate_t object initialized to zero before the first character is converted, and written up to (but not including) the terminating null wide character. If the precision is specified, no more than that many wide characters shall be written. If the precision is not specified, or is greater than the size of the array, the application shall ensure that the array contains a null wide character.
33305		
33306		
33307		
33308		
33309		
33310		
33311		
33312		
33313		If an <code>l</code> (ell) qualifier is present, the application shall ensure that the argument is a pointer to an array of type wchar_t . Wide characters from the array shall be written up to (but not including) a terminating null wide character. If no precision is specified, or is greater than the size of the array, the application shall ensure that the array contains a null wide character. If a precision is specified, no more than that many wide characters shall be written.
33314		
33315		
33316		
33317		
33318		

33319	p	The application shall ensure that the argument is a pointer to void . The value of the
33320		pointer shall be converted to a sequence of printable wide characters in an
33321		implementation-defined manner.
33322	n	The application shall ensure that the argument is a pointer to an integer into which is
33323		written the number of wide characters written to the output so far by this call to one of
33324		the <i>fwprintf()</i> functions. No argument shall be converted, but one shall be consumed. If
33325		the conversion specification includes any flags, a field width, or a precision, the
33326		behavior is undefined.
33327	XSI	C Equivalent to <code>lc</code> .
33328	XSI	S Equivalent to <code>ls</code> .
33329	%	Output a ' % ' wide character; no argument shall be converted. The entire conversion
33330		specification shall be %%.
33331		If a conversion specification does not match one of the above forms, the behavior is undefined.
33332		In no case does a nonexistent or small field width cause truncation of a field; if the result of a
33333		conversion is wider than the field width, the field shall be expanded to contain the conversion
33334		result. Characters generated by <i>fwprintf()</i> and <i>wprintf()</i> shall be printed as if <i>fputwc()</i> had been
33335		called.
33336		For a and A conversions, if FLT_RADIX is not a power of 2 and the result is not exactly
33337		representable in the given precision, the result should be one of the two adjacent numbers in
33338		hexadecimal floating style with the given precision, with the extra stipulation that the error
33339		should have a correct sign for the current rounding direction.
33340		For e, E, f, F, g, and G conversion specifiers, if the number of significant decimal digits is at
33341		most DECIMAL_DIG, then the result should be correctly rounded. If the number of significant
33342		decimal digits is more than DECIMAL_DIG but the source value is exactly representable with
33343		DECIMAL_DIG digits, then the result should be an exact representation with trailing zeros.
33344		Otherwise, the source value is bounded by two adjacent decimal strings $L < U$, both having
33345		DECIMAL_DIG significant digits; the value of the resultant decimal string D should satisfy $L \leq$
33346		$D \leq U$, with the extra stipulation that the error should have a correct sign for the current
33347		rounding direction.
33348	CX	The last data modification and last file status change timestamps of the file shall be marked for
33349		update between the call to a successful execution of <i>fwprintf()</i> or <i>wprintf()</i> and the next
33350		successful completion of a call to <i>fflush()</i> or <i>fclose()</i> on the same stream, or a call to <i>exit()</i> or
33351		<i>abort()</i> .
33352		RETURN VALUE
33353		Upon successful completion, these functions shall return the number of wide characters
33354		transmitted, excluding the terminating null wide character in the case of <i>swprintf()</i> , or a negative
33355	CX	value if an output error was encountered, and set <i>errno</i> to indicate the error.
33356		If <i>n</i> or more wide characters were requested to be written, <i>swprintf()</i> shall return a negative
33357	CX	value, and set <i>errno</i> to indicate the error.
33358		ERRORS
33359		For the conditions under which <i>fwprintf()</i> and <i>wprintf()</i> fail and may fail, refer to <i>fputwc()</i> .
33360		In addition, all forms of <i>fwprintf()</i> shall fail if:
33361	CX	[EILSEQ] A wide-character code that does not correspond to a valid character has been
33362		detected.

33363 In addition, all forms of *fwprintf()* may fail if:

33364 CX [EINVAL] There are insufficient arguments.

33365 In addition, *fwprintf()* and *wprintf()* may fail if:

33366 CX [ENOMEM] Insufficient storage space is available.

33367 The *swprintf()* shall fail if:

33368 CX [EOVERFLOW] The value of *n* is greater than {INT_MAX} or the number of bytes needed to
33369 hold the output excluding the terminating null is greater than {INT_MAX}.

33370 EXAMPLES

33371 To print the language-independent date and time format, the following statement could be used:

33372 `wprintf(format, weekday, month, day, hour, min);`

33373 For American usage, *format* could be a pointer to the wide-character string:

33374 `L"%s, %s %d, %d:%.2d\n"`

33375 producing the message:

33376 `Sunday, July 3, 10:02`

33377 whereas for German usage, *format* could be a pointer to the wide-character string:

33378 `L"%1$s, %3$d. %2$s, %4$d:%5$.2d\n"`

33379 producing the message:

33380 `Sonntag, 3. Juli, 10:02`

33381 APPLICATION USAGE

33390 CHANGE HISTORY

33391 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995
33392 (E).

33393 Issue 6

33394 The Open Group Corrigendum U040/1 is applied to the RETURN VALUE section, describing
33395 the case if *n* or more wide characters are requested to be written using *swprintf()*.

33396 The normative text is updated to avoid use of the term “must” for application requirements.

33397 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- 33398 • The prototypes for *fwprintf()*, *swprintf()*, and *wprintf()* are updated.
- 33399 • The DESCRIPTION is updated.

33400	• The <code>hh</code>, <code>ll</code>, <code>j</code>, <code>t</code>, and <code>z</code> length modifiers are added.
33401	• The <code>a</code>, <code>A</code>, and <code>F</code> conversion characters are added.
33402	• XSI shading is removed from the description of character string representations of infinity and NaN floating-point values.
33403	
33404	The DESCRIPTION is updated to use the terms “conversion specifier” and “conversion specification” consistently.
33405	
33406	ISO/IEC 9899:1999 standard, Technical Corrigendum 1 is incorporated.
33407	Issue 7
33408	Austin Group Interpretation 1003.1-2001 #161 is applied, updating the DESCRIPTION of the <code>0</code> flag.
33409	
33410	Austin Group Interpretation 1003.1-2001 #170 is applied.
33411	ISO/IEC 9899:1999 standard, Technical Corrigendum 2 #68 (SD5-XSH-ERN-70) is applied, revising the description of <code>g</code> and <code>G</code> .
33412	
33413	Functionality relating to the “ <code>%n\$</code> ” form of conversion specification and the <code><apostrophe></code> flag is moved from the XSI option to the Base.
33414	
33415	The <code>[Eoverflow]</code> error is added for <code>swprintf()</code> .
33416	Changes are made related to support for finegrained timestamps.
33417	POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0226 [302] and XSH/TC1-2008/0227 + [14] are applied.
33418	

NAME

fwrite — binary output

SYNOPSIS

#include <stdio.h>

```
size_t fwrite(const void *restrict ptr, size_t size, size_t nitems,
FILE *restrict stream);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

The *fwrite()* function shall write, from the array pointed to by *ptr*, up to *nitems* elements whose size is specified by *size*, to the stream pointed to by *stream*. For each object, *size* calls shall be made to the *fputc()* function, taking the values (in order) from an array of **unsigned char** exactly overlaying the object. The file-position indicator for the stream (if defined) shall be advanced by the number of bytes successfully written. If an error occurs, the resulting value of the file-position indicator for the stream is unspecified.

CX The last data modification and last file status change timestamps of the file shall be marked for update between the successful execution of *fwrite()* and the next successful completion of a call to *fflush()* or *fclose()* on the same stream, or a call to *exit()* or *abort()*.

RETURN VALUE

The *fwrite()* function shall return the number of elements successfully written, which may be less than *nitems* if a write error is encountered. If *size* or *nitems* is 0, *fwrite()* shall return 0 and the state of the stream remains unchanged. Otherwise, if a write error occurs, the error indicator for the stream shall be set, and *errno* shall be set to indicate the error.

ERRORSRefer to *fputc()*.**EXAMPLES**

None.

APPLICATION USAGE

Because of possible differences in element length and byte ordering, files written using *fwrite()* are application-dependent, and possibly cannot be read using *fread()* by a different application or by the same application on a different processor.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSOSection 2.5 (on page 495), *ferror()*, *fopen()*, *fprintf()*, *putc()*, *puts()*, *write()*

XBD <stdio.h>

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

33460 **Issue 6**

33461 Extensions beyond the ISO C standard are marked.

33462 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- 33463 • The *fwrite()* prototype is updated.
- 33464 • The DESCRIPTION is updated to clarify how the data is written out using *fputc()*.

33465 **Issue 7**

33466 Changes are made related to support for finegrained timestamps.

33467 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0228 [14] is applied.

+

NAME

fwscanf, swscanf, wscanf — convert formatted wide-character input

SYNOPSIS

```
#include <stdio.h>
#include <wchar.h>

int fwscanf(FILE *restrict stream, const wchar_t *restrict format, ...);
int swscanf(const wchar_t *restrict ws,
            const wchar_t *restrict format, ...);
int wscanf(const wchar_t *restrict format, ...);
```

DESCRIPTION

The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

The *fwscanf()* function shall read from the named input *stream*. The *wscanf()* function shall read from the standard input stream *stdin*. The *swscanf()* function shall read from the wide-character string *ws*. Each function reads wide characters, interprets them according to a format, and stores the results in its arguments. Each expects, as arguments, a control wide-character string *format* described below, and a set of *pointer* arguments indicating where the converted input should be stored. The result is undefined if there are insufficient arguments for the format. If the *format* is exhausted while arguments remain, the excess arguments are evaluated but are otherwise ignored.

Conversions can be applied to the *n*th argument after the *format* in the argument list, rather than to the next unused argument. In this case, the conversion specifier wide character % (see below) is replaced by the sequence "%n\$", where *n* is a decimal integer in the range [1,{NL_ARGMAX}]. This feature provides for the definition of *format* wide-character strings that select arguments in an order appropriate to specific languages. In *format* wide-character strings containing the "%n\$" form of conversion specifications, it is unspecified whether numbered arguments in the argument list can be referenced from the *format* wide-character string more than once.

The *format* can contain either form of a conversion specification—that is, % or "%n\$" — but the two forms cannot normally be mixed within a single *format* wide-character string. The only exception to this is that %% or %* can be mixed with the "%n\$" form. When numbered argument specifications are used, specifying the *N*th argument requires that all the leading arguments, from the first to the (*N*−1)th, are pointers.

The *fwscanf()* function in all its forms allows for detection of a language-dependent radix character in the input string, encoded as a wide-character value. The radix character is defined in the current locale (category *LC_NUMERIC*). In the POSIX locale, or in a locale where the radix character is not defined, the radix character shall default to a <period> ('.').

The *format* is a wide-character string composed of zero or more directives. Each directive is composed of one of the following: one or more white-space wide characters (<space>, <tab>, <newline>, <vertical-tab>, or <form-feed>); an ordinary wide character (neither '%' nor a white-space character); or a conversion specification.

Each conversion specification is introduced by the '%' or by the character sequence "%n\$", after which the following appear in sequence:

- An optional assignment-suppressing character '*'.

33513		• An optional non-zero decimal integer that specifies the maximum field width.
33514	CX	• An optional assignment-allocation character 'm'.
33515		• An optional length modifier that specifies the size of the receiving object.
33516		• A conversion specifier wide character that specifies the type of conversion to be applied.
33517		The valid conversion specifiers are described below.
33518		The <i>fwscanf()</i> functions shall execute each directive of the format in turn. If a directive fails, as
33519		detailed below, the function shall return. Failures are described as input failures (due to the
33520		unavailability of input bytes) or matching failures (due to inappropriate input).
33521		A directive composed of one or more white-space wide characters is executed by reading input
33522		until no more valid input can be read, or up to the first wide character which is not a white-
33523		space wide character, which remains unread.
33524		A directive that is an ordinary wide character shall be executed as follows. The next wide
33525		character is read from the input and compared with the wide character that comprises the
33526		directive; if the comparison shows that they are not equivalent, the directive shall fail, and the
33527		differing and subsequent wide characters remain unread. Similarly, if end-of-file, an encoding
33528		error, or a read error prevents a wide character from being read, the directive shall fail.
33529		A directive that is a conversion specification defines a set of matching input sequences, as
33530		described below for each conversion wide character. A conversion specification is executed in
33531		the following steps.
33532		Input white-space wide characters (as specified by <i>iswspace()</i>) shall be skipped, unless the
33533		conversion specification includes a [, c, or n conversion specifier.
33534		An item shall be read from the input, unless the conversion specification includes an n
33535		conversion specifier wide character. An input item is defined as the longest sequence of input
33536		wide characters, not exceeding any specified field width, which is an initial subsequence of a
33537		matching sequence. The first wide character, if any, after the input item shall remain unread. If
33538		the length of the input item is zero, the execution of the conversion specification shall fail; this
33539		condition is a matching failure, unless end-of-file, an encoding error, or a read error prevented
33540		input from the stream, in which case it is an input failure.
33541		Except in the case of a % conversion specifier, the input item (or, in the case of a %n conversion
33542		specification, the count of input wide characters) shall be converted to a type appropriate to the
33543		conversion wide character. If the input item is not a matching sequence, the execution of the
33544		conversion specification shall fail; this condition is a matching failure. Unless assignment
33545		suppression was indicated by a '*', the result of the conversion shall be placed in the object
33546		pointed to by the first argument following the <i>format</i> argument that has not already received a
33547	CX	conversion result if the conversion specification is introduced by %, or in the <i>n</i> th argument if
33548		introduced by the wide-character sequence "%n\$". If this object does not have an appropriate
33549		type, or if the result of the conversion cannot be represented in the space provided, the behavior
33550		is undefined.
33551	CX	The %c, %s, and %[conversion specifiers shall accept an optional assignment-allocation
33552		character 'm', which shall cause a memory buffer to be allocated to hold the wide-character
33553		string converted including a terminating null wide character. In such a case, the argument
33554		corresponding to the conversion specifier should be a reference to a pointer value that will
33555		receive a pointer to the allocated buffer. The system shall allocate a buffer as if <i>malloc()</i> had been
33556		called. The application shall be responsible for freeing the memory after usage. If there is
33557		insufficient memory to allocate a buffer, the function shall set <i>errno</i> to [ENOMEM] and a
33558		conversion error shall result. If the function returns EOF, any memory successfully allocated for

parameters using assignment-allocation character 'm' by this call shall be freed before the function returns.

The length modifiers and their meanings are:

hh Specifies that a following d, i, o, u, x, X, or n conversion specifier applies to an argument with type pointer to **signed char** or **unsigned char**.

h Specifies that a following d, i, o, u, x, X, or n conversion specifier applies to an argument with type pointer to **short** or **unsigned short**.

l (ell) Specifies that a following d, i, o, u, x, X, or n conversion specifier applies to an argument with type pointer to **long** or **unsigned long**; that a following a, A, e, E, f, F, g, or G conversion specifier applies to an argument with type pointer to **double**; or that a following c, s, or [conversion specifier applies to an argument with type pointer to **wchar_t**. If the 'm' assignment-allocation character is specified, the conversion applies to an argument with the type pointer to a pointer to **wchar_t**.

ll (ell-ell) Specifies that a following d, i, o, u, x, X, or n conversion specifier applies to an argument with type pointer to **long long** or **unsigned long long**.

j Specifies that a following d, i, o, u, x, X, or n conversion specifier applies to an argument with type pointer to **intmax_t** or **uintmax_t**.

z Specifies that a following d, i, o, u, x, X, or n conversion specifier applies to an argument with type pointer to **size_t** or the corresponding signed integer type.

t Specifies that a following d, i, o, u, x, X, or n conversion specifier applies to an argument with type pointer to **ptrdiff_t** or the corresponding **unsigned** type.

L Specifies that a following a, A, e, E, f, F, g, or G conversion specifier applies to an argument with type pointer to **long double**.

If a length modifier appears with any conversion specifier other than as specified above, the behavior is undefined.

The following conversion specifier wide characters are valid:

d Matches an optionally signed decimal integer, whose format is the same as expected for the subject sequence of *wcstol()* with the value 10 for the *base* argument. In the absence of a size modifier, the application shall ensure that the corresponding argument is a pointer to **int**.

i Matches an optionally signed integer, whose format is the same as expected for the subject sequence of *wcstol()* with 0 for the *base* argument. In the absence of a size modifier, the application shall ensure that the corresponding argument is a pointer to **int**.

o Matches an optionally signed octal integer, whose format is the same as expected for the subject sequence of *wcstoul()* with the value 8 for the *base* argument. In the absence of a size modifier, the application shall ensure that the corresponding argument is a pointer to **unsigned**.

u Matches an optionally signed decimal integer, whose format is the same as expected for the subject sequence of *wcstoul()* with the value 10 for the *base* argument. In the absence of a size modifier, the application shall ensure that the corresponding argument is a pointer to **unsigned**.

33602	x	Matches an optionally signed hexadecimal integer, whose format is the same as expected for the subject sequence of <i>wcstoul()</i> with the value 16 for the <i>base</i> argument.
33603		
33604		In the absence of a size modifier, the application shall ensure that the corresponding argument is a pointer to unsigned .
33605		
33606	a, e, f, g	
33607		Matches an optionally signed floating-point number, infinity, or NaN whose format is the same as expected for the subject sequence of <i>wcstod()</i> . In the absence of a size modifier, the application shall ensure that the corresponding argument is a pointer to float .
33608		
33609		
33610		
33611		If the <i>fwprintf()</i> family of functions generates character string representations for infinity and NaN (a symbolic entity encoded in floating-point format) to support IEEE Std 754-1985, the <i>fwscanf()</i> family of functions shall recognize them as input.
33612		
33613		
33614	s	Matches a sequence of non-white-space wide characters. If no l (ell) qualifier is present, characters from the input field shall be converted as if by repeated calls to the <i>wcrtomb()</i> function, with the conversion state described by an mbstate_t object initialized to zero before the first wide character is converted. If the 'm' assignment-allocation character is not specified, the application shall ensure that the corresponding argument is a pointer to a character array large enough to accept the sequence and the terminating null character, which shall be added automatically. Otherwise, the application shall ensure that the corresponding argument is a pointer to a pointer to a wchar_t .
33615		
33616		
33617		
33618		
33619		
33620	CX	
33621		
33622		
33623		If the l (ell) qualifier is present and the 'm' assignment-allocation character is not specified, the application shall ensure that the corresponding argument is a pointer to an array of wchar_t large enough to accept the sequence and the terminating null wide character, which shall be added automatically. If the l (ell) qualifier is present and the 'm' assignment-allocation character is present, the application shall ensure that the corresponding argument is a pointer to a pointer to a wchar_t .
33624		
33625		
33626	CX	
33627		
33628		
33629	[	Matches a non-empty sequence of wide characters from a set of expected wide characters (the <i>scanset</i>). If no l (ell) qualifier is present, wide characters from the input field shall be converted as if by repeated calls to the <i>wcrtomb()</i> function, with the conversion state described by an mbstate_t object initialized to zero before the first wide character is converted. If the 'm' assignment-allocation character is not specified, the application shall ensure that the corresponding argument is a pointer to a character array large enough to accept the sequence and the terminating null character, which shall be added automatically. Otherwise, the application shall ensure that the corresponding argument is a pointer to a pointer to a wchar_t .
33630		
33631		
33632		
33633		
33634		
33635		
33636	CX	
33637		
33638		If an l (ell) qualifier is present and the 'm' assignment-allocation character is not specified, the application shall ensure that the corresponding argument is a pointer to an array of wchar_t large enough to accept the sequence and the terminating null wide character. If an l (ell) qualifier is present and the 'm' assignment-allocation character is specified, the application shall ensure that the corresponding argument is a pointer to a pointer to a wchar_t .
33639		
33640		
33641	CX	
33642		
33643		
33644		The conversion specification includes all subsequent wide characters in the <i>format</i> string up to and including the matching <right-square-bracket> ('] '). The wide characters between the square brackets (the <i>scanlist</i>) comprise the <i>scanset</i> , unless the wide character after the <left-square-bracket> is a <circumflex> (' ^ '), in which case the <i>scanset</i> contains all wide characters that do not appear in the <i>scanlist</i> between the <circumflex> and the <right-square-bracket>. If the conversion specification begins
33645		
33646		
33647		
33648		
33649		

33650			with "[]" or "[^]", the <right-square-bracket> is included in the scanlist and the
33651			next <right-square-bracket> is the matching <right-square-bracket> that ends the
33652			conversion specification; otherwise, the first <right-square-bracket> is the one that ends
33653			the conversion specification. If a '-' is in the scanlist and is not the first wide character,
33654			nor the second where the first wide character is a '^', nor the last wide character, the
33655			behavior is implementation-defined.
33656	c		Matches a sequence of wide characters of exactly the number specified by the field
33657			width (1 if no field width is present in the conversion specification).
33658			If no l (ell) length modifier is present, characters from the input field shall be converted
33659			as if by repeated calls to the <i>wcrtomb()</i> function, with the conversion state described by
33660			an mbstate_t object initialized to zero before the first wide character is converted. No
33661			null character is added. If the 'm' assignment-allocation character is not specified, the
33662			application shall ensure that the corresponding argument is a pointer to the initial
33663	CX		element of a character array large enough to accept the sequence. Otherwise, the
33664			application shall ensure that the corresponding argument is a pointer to a pointer to a
33665			char .
33666			No null wide character is added. If an l (ell) length modifier is present and the 'm'
33667			assignment-allocation character is not specified, the application shall ensure that the
33668			corresponding argument shall be a pointer to the initial element of an array of wchar_t
33669	CX		large enough to accept the sequence. If an l (ell) qualifier is present and the 'm'
33670			assignment-allocation character is specified, the application shall ensure that the
33671			corresponding argument is a pointer to a pointer to a wchar_t .
33672	p		Matches an implementation-defined set of sequences, which shall be the same as the set
33673			of sequences that is produced by the %p conversion specification of the corresponding
33674			<i>fwprintf()</i> functions. The application shall ensure that the corresponding argument is a
33675			pointer to a pointer to void . The interpretation of the input item is implementation-
33676			defined. If the input item is a value converted earlier during the same program
33677			execution, the pointer that results shall compare equal to that value; otherwise, the
33678			behavior of the %p conversion is undefined.
33679	n		No input is consumed. The application shall ensure that the corresponding argument is
33680			a pointer to the integer into which is to be written the number of wide characters read
33681			from the input so far by this call to the <i>fwscanf()</i> functions. Execution of a %n
33682			conversion specification shall not increment the assignment count returned at the
33683			completion of execution of the function. No argument shall be converted, but one shall
33684			be consumed. If the conversion specification includes an assignment-suppressing wide
33685			character or a field width, the behavior is undefined.
33686	XSI	C	Equivalent to lc .
33687	XSI	S	Equivalent to ls .
33688	%		Matches a single '%' wide character; no conversion or assignment shall occur. The
33689			complete conversion specification shall be %%.
33690			If a conversion specification is invalid, the behavior is undefined.
33691			The conversion specifiers A, E, F, G, and X are also valid and shall be equivalent to, respectively,
33692			a, e, f, g, and x.
33693			If end-of-file is encountered during input, conversion is terminated. If end-of-file occurs before
33694			any wide characters matching the current conversion specification (except for %n) have been
33695			read (other than leading white-space, where permitted), execution of the current conversion

33696 specification shall terminate with an input failure. Otherwise, unless execution of the current
 33697 conversion specification is terminated with a matching failure, execution of the following
 33698 conversion specification (if any) shall be terminated with an input failure.

33699 Reaching the end of the string in *swscanf()* shall be equivalent to encountering end-of-file for
 33700 *fwscanf()*.

33701 If conversion terminates on a conflicting input, the offending input shall be left unread in the
 33702 input. Any trailing white space (including <newline>) shall be left unread unless matched by a
 33703 conversion specification. The success of literal matches and suppressed assignments is only
 33704 directly determinable via the %n conversion specification.

33705 CX The *fwscanf()* and *wscanf()* functions may mark the last data access timestamp of the file
 33706 associated with *stream* for update. The last data access timestamp shall be marked for update by
 33707 the first successful execution of *fgetc()*, *fgetws()*, *fwscanf()*, *getc()*, *getwchar()*, *vfwscanf()*,
 33708 *vwscanf()*, or *wscanf()* using *stream* that returns data not supplied by a prior call to *ungetc()*.

33709 RETURN VALUE

33710 Upon successful completion, these functions shall return the number of successfully matched
 33711 and assigned input items; this number can be zero in the event of an early matching failure. If
 33712 the input ends before the first matching failure or conversion, EOF shall be returned. If any
 33713 CX error occurs, EOF shall be returned, and *errno* shall be set to indicate the error. If a read error
 33714 occurs, the error indicator for the stream shall be set.

33715 ERRORS

33716 For the conditions under which the *fwscanf()* functions shall fail and may fail, refer to *fgetc()*.

33717 In addition, the *fwscanf()* function shall fail if:

33718 CX [EILSEQ] Input byte sequence does not form a valid character.

33719 [ENOMEM] Insufficient storage space is available.

33720 In addition, the *fwscanf()* function may fail if:

33721 CX [EINVAL] There are insufficient arguments.

33722 EXAMPLES

33723 The call:

```
33724 int i, n; float x; char name[50];
33725 n = wscanf(L"%d%f%s", &i, &x, name);
```

33726 with the input line:

```
33727 25 54.32E-1 Hamster
```

33728 assigns to *n* the value 3, to *i* the value 25, to *x* the value 5.432, and *name* contains the string
 33729 "Hamster".

33730 The call:

```
33731 int i; float x; char name[50];
33732 (void) wscanf(L"%2d%f%*d %[0123456789]", &i, &x, name);
```

33733 with input:

```
33734 56789 0123 56a72
```

33735 assigns 56 to *i*, 789.0 to *x*, skips 0123, and places the string "56\0" in *name*. The next call to
 33736 *getchar()* shall return the character 'a'.

APPLICATION USAGE

In format strings containing the ' % ' form of conversion specifications, each argument in the argument list is used exactly once.

For functions that allocate memory as if by *malloc()*, the application should release such memory when it is no longer required by a call to *free()*. For *fwscanf()*, this is memory allocated via use of the ' m ' assignment-allocation character.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995 (E).

Issue 6

The normative text is updated to avoid use of the term “must” for application requirements.

The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- The prototypes for *fwscanf()* and *swscanf()* are updated.
- The DESCRIPTION is updated.
- The hh, ll, j, t, and z length modifiers are added.
- The a, A, and F conversion characters are added.

The DESCRIPTION is updated to use the terms “conversion specifier” and “conversion specification” consistently.

Issue 7

Austin Group Interpretation 1003.1-2001 #170 is applied.

SD5-XSH-ERN-132 is applied, adding the assignment-allocation character ' m '.

Functionality relating to the " % n \$ " form of conversion specification is moved from the XSI option to the Base.

Changes are made related to support for finegrained timestamps.

The APPLICATION USAGE section is updated to clarify that memory is allocated as if by *malloc()*.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0229 [302] and XSH/TC1-2008/0230 + [14] are applied.

NAME

gai_strerror — address and name information error description

SYNOPSIS

```
#include <netdb.h>
```

```
const char *gai_strerror(int ecode);
```

DESCRIPTION

The *gai_strerror()* function shall return a text string describing an error value for the *getaddrinfo()* and *getnameinfo()* functions listed in the **<netdb.h>** header.

When the *ecode* argument is one of the following values listed in the **<netdb.h>** header:

[EAI_AGAIN]	[EAI_NONAME]
[EAI_BADFLAGS]	[EAI_OVERFLOW]
[EAI_FAIL]	[EAI_SERVICE]
[EAI_FAMILY]	[EAI_SOCKTYPE]
[EAI_MEMORY]	[EAI_SYSTEM]

the function return value shall point to a string describing the error. If the argument is not one of those values, the function shall return a pointer to a string whose contents indicate an unknown error.

RETURN VALUE

Upon successful completion, *gai_strerror()* shall return a pointer to an implementation-defined string.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

The Open Group Base Resolution bwg2001-009 is applied, which changes the return type from **char *** to **const char ***. This is for coordination with the IPnG Working Group.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/22 is applied, adding the [EAI_OVERFLOW] error code.

33811 NAME

33812 getaddrinfo — get address information

33813 SYNOPSIS

```
33814 #include <sys/socket.h>
33815 #include <netdb.h>

33816 int getaddrinfo(const char *restrict nodename,
33817                const char *restrict servname,
33818                const struct addrinfo *restrict hints,
33819                struct addrinfo **restrict res);
```

33820 DESCRIPTION

33821 Refer to *freeaddrinfo()*.

33822 **NAME**

33823 getc — get a byte from a stream

33824 **SYNOPSIS**

33825 #include <stdio.h>

33826 int getc(FILE *stream);

33827 **DESCRIPTION**

33828 CX The functionality described on this reference page is aligned with the ISO C standard. Any
33829 conflict between the requirements described here and the ISO C standard is unintentional. This
33830 volume of POSIX.1-2008 defers to the ISO C standard.

33831 The *getc()* function shall be equivalent to *fgetc()*, except that if it is implemented as a macro it
33832 may evaluate *stream* more than once, so the argument should never be an expression with side-
33833 effects.

33834 **RETURN VALUE**33835 Refer to *fgetc()*.33836 **ERRORS**33837 Refer to *fgetc()*.33838 **EXAMPLES**

33839 None.

33840 **APPLICATION USAGE**

33841 If the integer value returned by *getc()* is stored into a variable of type **char** and then compared
33842 against the integer constant EOF, the comparison may never succeed, because sign-extension of
33843 a variable of type **char** on widening to integer is implementation-defined.

33844 Since it may be implemented as a macro, *getc()* may treat incorrectly a *stream* argument with
33845 side-effects. In particular, *getc(*f++)* does not necessarily work as expected. Therefore, use of this
33846 function should be preceded by "#undef getc" in such situations; *fgetc()* could also be used.

33847 **RATIONALE**

33848 None.

33849 **FUTURE DIRECTIONS**

33850 None.

33851 **SEE ALSO**33852 Section 2.5 (on page 495), *fgetc()*

33853 XBD <stdio.h>

33854 **CHANGE HISTORY**

33855 First released in Issue 1. Derived from Issue 1 of the SVID.

NAME

getc_unlocked, getchar_unlocked, putc_unlocked, putchar_unlocked — stdio with explicit client locking

SYNOPSIS

```
#include <stdio.h>

int getc_unlocked(FILE *stream);
int getchar_unlocked(void);
int putc_unlocked(int c, FILE *stream);
int putchar_unlocked(int c);
```

DESCRIPTION

Versions of the functions *getc()*, *getchar()*, *putc()*, and *putchar()* respectively named *getc_unlocked()*, *getchar_unlocked()*, *putc_unlocked()*, and *putchar_unlocked()* shall be provided which are functionally equivalent to the original versions, with the exception that they are not required to be implemented in a thread-safe manner. They may only safely be used within a scope protected by *flockfile()* (or *ftrylockfile()*) and *funlockfile()*. These functions may safely be used in a multi-threaded program if and only if they are called while the invoking thread owns the (FILE *) object, as is the case after a successful call to the *flockfile()* or *ftrylockfile()* functions.

If *getc_unlocked()* or *putc_unlocked()* are implemented as macros they may evaluate *stream* more than once, so the *stream* argument should never be an expression with side-effects.

RETURN VALUE

See *getc()*, *getchar()*, *putc()*, and *putchar()*.

ERRORS

See *getc()*, *getchar()*, *putc()*, and *putchar()*.

EXAMPLES

None.

APPLICATION USAGE

Since they may be implemented as macros, *getc_unlocked()* and *putc_unlocked()* may treat incorrectly a *stream* argument with side-effects. In particular, *getc_unlocked(*f++)* and *putc_unlocked(c,*f++)* do not necessarily work as expected. Therefore, use of these functions in such situations should be preceded by the following statement as appropriate:

```
#undef getc_unlocked
#undef putc_unlocked
```

RATIONALE

Some I/O functions are typically implemented as macros for performance reasons (for example, *putc()* and *getc()*). For safety, they need to be synchronized, but it is often too expensive to synchronize on every character. Nevertheless, it was felt that the safety concerns were more important; consequently, the *getc()*, *getchar()*, *putc()*, and *putchar()* functions are required to be thread-safe. However, unlocked versions are also provided with names that clearly indicate the unsafe nature of their operation but can be used to exploit their higher performance. These unlocked versions can be safely used only within explicitly locked program regions, using exported locking primitives. In particular, a sequence such as:

```
flockfile(fileptr);
putc_unlocked('1', fileptr);
putc_unlocked('\n', fileptr);
fprintf(fileptr, "Line 2\n");
funlockfile(fileptr);
```

is permissible, and results in the text sequence:

```
1
Line 2
```

being printed without being interspersed with output from other threads.

It would be wrong to have the standard names such as *getc()*, *putc()*, and so on, map to the “faster, but unsafe” rather than the “slower, but safe” versions. In either case, you would still want to inspect all uses of *getc()*, *putc()*, and so on, by hand when converting existing code. Choosing the safe bindings as the default, at least, results in correct code and maintains the “atomicity at the function” invariant. To do otherwise would introduce gratuitous synchronization errors into converted code. Other routines that modify the *stdio* (**FILE** *) structures or buffers are also safely synchronized.

Note that there is no need for functions of the form *getc_locked()*, *putc_locked()*, and so on, since this is the functionality of *getc()*, *putc()*, *et al.* It would be inappropriate to use a feature test macro to switch a macro definition of *getc()* between *getc_locked()* and *getc_unlocked()*, since the ISO C standard requires an actual function to exist, a function whose behavior could not be changed by the feature test macro. Also, providing both the *xxx_locked()* and *xxx_unlocked()* forms leads to the confusion of whether the suffix describes the behavior of the function or the circumstances under which it should be used.

Three additional routines, *flockfile()*, *ftrylockfile()*, and *funlockfile()* (which may be macros), are provided to allow the user to delineate a sequence of I/O statements that are executed synchronously.

The *ungetc()* function is infrequently called relative to the other functions/macros so no unlocked variation is needed.

FUTURE DIRECTIONS

None.

33975 **NAME**

33976 getchar_unlocked — stdio with explicit client locking

33977 **SYNOPSIS**

33978 CX #include <stdio.h>

33979 int getchar_unlocked(void);

33980 **DESCRIPTION**33981 Refer to *getc_unlocked()*.

NAME

getcwd — get the pathname of the current working directory

SYNOPSIS

```
#include <unistd.h>

char *getcwd(char *buf, size_t size);
```

DESCRIPTION

The *getcwd()* function shall place an absolute pathname of the current working directory in the array pointed to by *buf*, and return *buf*. The pathname shall contain no components that are dot or dot-dot, or are symbolic links.

If there are multiple pathnames that *getcwd()* could place in the array pointed to by *buf*, one beginning with a single <slash> character and one or more beginning with two <slash> characters, then *getcwd()* shall place the pathname beginning with a single <slash> character in the array. The pathname shall not contain any unnecessary <slash> characters after the leading one or two <slash> characters.

The *size* argument is the size in bytes of the character array pointed to by the *buf* argument. If *buf* is a null pointer, the behavior of *getcwd()* is unspecified.

RETURN VALUE

Upon successful completion, *getcwd()* shall return the *buf* argument. Otherwise, *getcwd()* shall return a null pointer and set *errno* to indicate the error. The contents of the array pointed to by *buf* are then undefined.

ERRORS

The *getcwd()* function shall fail if:

[EINVAL]	The <i>size</i> argument is 0.
[ERANGE]	The <i>size</i> argument is greater than 0, but is smaller than the length of the string +1.

The *getcwd()* function may fail if:

[EACCES]	Search permission was denied for the current directory, or read or search permission was denied for a directory above the current directory in the file hierarchy.
[ENOMEM]	Insufficient storage space is available.

EXAMPLES

The following example uses {PATH_MAX} as the initial buffer size (unless it is indeterminate or very large), and calls *getcwd()* with progressively larger buffers until it does not give an [ERANGE] error.

```
#include <stdlib.h>
#include <errno.h>
#include <unistd.h>

...

long path_max;
size_t size;
char *buf;
char *ptr;

path_max = pathconf(".", _PC_PATH_MAX);
if (path_max == -1)
```

```

34026         size = 1024;
34027     else if (path_max > 10240)
34028         size = 10240;
34029     else
34030         size = path_max;
34031     for (buf = ptr = NULL; ptr == NULL; size *= 2)
34032     {
34033         if ((buf = realloc(buf, size)) == NULL)
34034         {
34035             ... handle error ...
34036         }
34037         ptr = getcwd(buf, size);
34038         if (ptr == NULL && errno != ERANGE)
34039         {
34040             ... handle error ...
34041         }
34042     }
34043     ...
34044     free (buf);

```

APPLICATION USAGE

If the pathname obtained from *getcwd()* is longer than {PATH_MAX} bytes, it could produce an [ENAMETOOLONG] error if passed to *chdir()*. Therefore, in order to return to that directory it may be necessary to break the pathname into sections shorter than {PATH_MAX} bytes and call *chdir()* on each section in turn (the first section being an absolute pathname and subsequent sections being relative pathnames). A simpler way to handle saving and restoring the working directory when it may be deeper than {PATH_MAX} bytes in the file hierarchy is to use a file descriptor and *fchdir()*, rather than *getcwd()* and *chdir()*. However, the two methods do have some differences. The *fchdir()* approach causes the program to restore a working directory even if it has been renamed in the meantime, whereas the *chdir()* approach restores to a directory with the same name as the original, even if the directories were renamed in the meantime. Since the *fchdir()* approach does not access parent directories, it can succeed when *getcwd()* would fail due to permissions problems. In applications conforming to earlier versions of this standard, it was not possible to use the *fchdir()* approach when the working directory is searchable but not readable, as the only way to open a directory was with O_RDONLY, whereas the *getcwd()* approach can succeed in this case.

RATIONALE

Having *getcwd()* take no arguments and instead use the *malloc()* function to produce space for the returned argument was considered. The advantage is that *getcwd()* knows how big the working directory pathname is and can allocate an appropriate amount of space. But the programmer would have to use the *free()* function to free the resulting object, or each use of *getcwd()* would further reduce the available memory. Finally, *getcwd()* is taken from the SVID where it has the two arguments used in this volume of POSIX.1-2008.

The older function *getwd()* was rejected for use in this context because it had only a buffer argument and no *size* argument, and thus had no way to prevent overwriting the buffer, except to depend on the programmer to provide a large enough buffer.

On some implementations, if *buf* is a null pointer, *getcwd()* may obtain *size* bytes of memory using *malloc()*. In this case, the pointer returned by *getcwd()* may be used as the argument in a subsequent call to *free()*. Invoking *getcwd()* with *buf* as a null pointer is not recommended in conforming applications.

Earlier implementations of *getcwd()* sometimes generated pathnames like ".../.../subdirname" internally, using them to explore the path of ancestor directories back to the root. If one of these internal pathnames exceeded {PATH_MAX} in length, the implementation could fail with *errno* set to [ENAMETOOLONG]. This is no longer allowed.

If a program is operating in a directory where some (grand)parent directory does not permit reading, *getcwd()* may fail, as in most implementations it must read the directory to determine the name of the file. This can occur if search, but not read, permission is granted in an intermediate directory, or if the program is placed in that directory by some more privileged process (for example, login). Including the [EACCES] error condition makes the reporting of the error consistent and warns the application developer that *getcwd()* can fail for reasons beyond the control of the application developer or user. Some implementations can avoid this occurrence (for example, by implementing *getcwd()* using *pwd*, where *pwd* is a set-user-root process), thus the error was made optional. Since this volume of POSIX.1-2008 permits the addition of other errors, this would be a common addition and yet one that applications could not be expected to deal with without this addition.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The [ENOMEM] optional error condition is added.

Issue 7

Austin Group Interpretation 1003.1-2001 #140 is applied, changing the text for consistency with the *pwd* utility, adding text to address the case where the current directory is deeper in the file hierarchy than {PATH_MAX} bytes, and adding the requirements relating to pathnames beginning with two <slash> characters.

34106 **NAME**34107 `getdate` — convert user format date and time34108 **SYNOPSIS**

```
34109 XSI      #include <time.h>
34110      struct tm *getdate(const char *string);
```

34111 **DESCRIPTION**

34112 The `getdate()` function shall convert a string representation of a date or time into a broken-down
 34113 time.

34114 The external variable or macro `getdate_err`, which has type **int**, is used by `getdate()` to return error
 34115 values. It is unspecified whether `getdate_err` is a macro or an identifier declared with external
 34116 linkage, and whether or not it is a modifiable lvalue. If a macro definition is suppressed in order
 34117 to access an actual object, or a program defines an identifier with the name `getdate_err`, the
 34118 behavior is undefined.

34119 Templates are used to parse and interpret the input string. The templates are contained in a text
 34120 file identified by the environment variable `DATMSK`. The `DATMSK` variable should be set to
 34121 indicate the full pathname of the file that contains the templates. The first line in the template
 34122 that matches the input specification is used for interpretation and conversion into the internal
 34123 time format.

34124 The following conversion specifications shall be supported:

34125	<code>%%</code>	Equivalent to <code>%</code> .
34126	<code>%a</code>	Abbreviated weekday name.
34127	<code>%A</code>	Full weekday name.
34128	<code>%b</code>	Abbreviated month name.
34129	<code>%B</code>	Full month name.
34130	<code>%c</code>	Locale's appropriate date and time representation.
34131	<code>%C</code>	Century number [00,99]; leading zeros are permitted but not required.
34132	<code>%d</code>	Day of month [01,31]; the leading 0 is optional.
34133	<code>%D</code>	Date as <code>%m/%d/%y</code> .
34134	<code>%e</code>	Equivalent to <code>%d</code> .
34135	<code>%h</code>	Abbreviated month name.
34136	<code>%H</code>	Hour [00,23].
34137	<code>%I</code>	Hour [01,12].
34138	<code>%m</code>	Month number [01,12].
34139	<code>%M</code>	Minute [00,59].
34140	<code>%n</code>	Equivalent to <code><newline></code> .
34141	<code>%p</code>	Locale's equivalent of either AM or PM.
34142	<code>%r</code>	The locale's appropriate representation of time in AM and PM notation. In the POSIX 34143 locale, this shall be equivalent to <code>%I:%M:%S %p</code> .

34144	%R	Time as %H:%M.
34145	%S	Seconds [00,60]. The range goes to 60 (rather than stopping at 59) to allow positive leap seconds to be expressed. Since leap seconds cannot be predicted by any algorithm, leap second data must come from some external source.
34146		
34147		
34148	%t	Equivalent to <tab>.
34149	%T	Time as %H:%M:%S.
34150	%w	Weekday number (Sunday = [0,6]).
34151	%x	Locale's appropriate date representation.
34152	%X	Locale's appropriate time representation.
34153	%y	Year within century. When a century is not otherwise specified, values in the range [69,99] shall refer to years 1969 to 1999 inclusive, and values in the range [00,68] shall refer to years 2000 to 2068 inclusive.
34154		
34155		
34156		Note: It is expected that in a future version of this standard the default century inferred from a 2-digit year will change. (This would apply to all commands accepting a 2-digit year as input.)
34157		
34158		
34159	%Y	Year as "ccyy" (for example, 2001).
34160	%Z	Timezone name or no characters if no timezone exists. If the timezone supplied by %Z is not the timezone that <i>getdate()</i> expects, an invalid input specification error shall result. The <i>getdate()</i> function calculates an expected timezone based on information supplied to the function (such as the hour, day, and month).
34161		
34162		
34163		
34164		The match between the template and input specification performed by <i>getdate()</i> shall be case-insensitive.
34165		
34166		The month and weekday names can consist of any combination of upper and lowercase letters. The process can request that the input date or time specification be in a specific language by setting the <i>LC_TIME</i> category (see <i>setlocale()</i>).
34167		
34168		
34169		Leading zeros are not necessary for the descriptors that allow leading zeros. However, at most two digits are allowed for those descriptors, including leading zeros. Extra white space in either the template file or in <i>string</i> shall be ignored.
34170		
34171		
34172		The results are undefined if the conversion specifications %c, %x, and %X include unsupported conversion specifications.
34173		
34174		The following rules apply for converting the input specification into the internal format:
34175		• If %Z is being scanned, then <i>getdate()</i> shall initialize the broken-down time to be the current time in the scanned timezone. Otherwise, it shall initialize the broken-down time based on the current local time as if <i>localtime()</i> had been called.
34176		
34177		
34178		• If only the weekday is given, the day chosen shall be the day, starting with today and moving into the future, which first matches the named day.
34179		
34180		• If only the month (and no year) is given, the month chosen shall be the month, starting with the current month and moving into the future, which first matches the named month. The first day of the month shall be assumed if no day is given.
34181		
34182		
34183		• If no hour, minute, and second are given, the current hour, minute, and second shall be assumed.
34184		

- If no date is given, the hour chosen shall be the hour, starting with the current hour and moving into the future, which first matches the named hour.

If a conversion specification in the DATEMSK file does not correspond to one of the conversion specifications above, the behavior is unspecified.

The `getdate()` function need not be thread-safe.

RETURN VALUE

Upon successful completion, `getdate()` shall return a pointer to a **struct tm**. Otherwise, it shall return a null pointer and set `getdate_err` to indicate the error.

ERRORS

The `getdate()` function shall fail in the following cases, setting `getdate_err` to the value shown in the list below. Any changes to `errno` are unspecified.

1. The `DATEMSK` environment variable is null or undefined.
2. The template file cannot be opened for reading.
3. Failed to get file status information.
4. The template file is not a regular file.
5. An I/O error is encountered while reading the template file.
6. Memory allocation failed (not enough memory available).
7. There is no line in the template that matches the input.
8. Invalid input specification. For example, February 31; or a time is specified that cannot be represented in a **time_t** (representing the time in seconds since the Epoch).

EXAMPLES

1. The following example shows the possible contents of a template:

```
%m
%A %B %d, %Y, %H:%M:%S
%A
%B
%m/%d/%y %I %p
%d, %m, %Y %H:%M
at %A the %dst of %B in %Y
run job at %I %p, %B %dnd
%A den %d. %B %Y %H.%M Uhr
```

2. The following are examples of valid input specifications for the template in Example 1:

```
getdate("10/1/87 4 PM");
getdate("Friday");
getdate("Friday September 18, 1987, 10:30:30");
getdate("24,9,1986 10:30");
getdate("at monday the 1st of december in 1986");
getdate("run job at 3 PM, december 2nd");
```

If the `LC_TIME` category is set to a German locale that includes *freitag* as a weekday name and *oktober* as a month name, the following would be valid:

```
getdate("freitag den 10. oktober 1986 10.30 Uhr");
```

3. The following example shows how local date and time specification can be defined in the template:

Invocation	Line in Template
getdate("11/27/86")	%m/%d/%y
getdate("27.11.86")	%d.%m.%y
getdate("86-11-27")	%y-%m-%d
getdate("Friday 12:00:00")	%A %H:%M:%S

4. The following examples help to illustrate the above rules assuming that the current date is Mon Sep 22 12:19:47 EDT 1986 and the *LC_TIME* category is set to the default C locale:

Input	Line in Template	Date
Mon	%a	Mon Sep 22 12:19:47 EDT 1986
Sun	%a	Sun Sep 28 12:19:47 EDT 1986
Fri	%a	Fri Sep 26 12:19:47 EDT 1986
September	%B	Mon Sep 1 12:19:47 EDT 1986
January	%B	Thu Jan 1 12:19:47 EST 1987
December	%B	Mon Dec 1 12:19:47 EST 1986
Sep Mon	%b %a	Mon Sep 1 12:19:47 EDT 1986
Jan Fri	%b %a	Fri Jan 2 12:19:47 EST 1987
Dec Mon	%b %a	Mon Dec 1 12:19:47 EST 1986
Jan Wed 1989	%b %a %Y	Wed Jan 4 12:19:47 EST 1989
Fri 9	%a %H	Fri Sep 26 09:00:00 EDT 1986
Feb 10:30	%b %H:%S	Sun Feb 1 10:00:30 EST 1987
10:30	%H:%M	Tue Sep 23 10:30:00 EDT 1986
13:30	%H:%M	Mon Sep 22 13:30:00 EDT 1986

APPLICATION USAGE

Although historical versions of *getdate()* did not require that **<time.h>** declare the external variable *getdate_err*, this volume of POSIX.1-2008 does require it. The standard developers encourage applications to remove declarations of *getdate_err* and instead incorporate the declaration by including **<time.h>**.

Applications should use %Y (4-digit years) in preference to %y (2-digit years).

RATIONALE

In standard locales, the conversion specifications %c, %x, and %X do not include unsupported conversion specifiers and so the text regarding results being undefined is not a problem in that case.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

- 34267 Moved from X/OPEN UNIX extension to BASE.
- 34268
- 34269 The last paragraph of the DESCRIPTION is added.
- 34270 The %C conversion specification is added, and the exact meaning of the %y conversion
- 34271 specification is clarified in the DESCRIPTION.
- 34272 A note indicating that this function need not be reentrant is added to the DESCRIPTION.
- 34273 The %R conversion specification is changed to follow historical practice.

Issue 6

- 34274 The DESCRIPTION is updated to refer to “seconds since the Epoch” rather than “seconds since
- 34275 00:00:00 UTC (Coordinated Universal Time), January 1 1970” for consistency with other *time*
- 34276 functions.
- 34277
- 34278 The description of %S is updated so that the valid range is [00,60] rather than [00,61].
- 34279 The DESCRIPTION is updated to refer to conversion specifications instead of field descriptors
- 34280 for consistency with other functions.

Issue 7

- 34281 Austin Group Interpretation 1003.1-2001 #156 is applied.
- 34282
- 34283 The description of the *getdate_err* value is expanded.

NAME

getdelim, getline — read a delimited record from *stream*

SYNOPSIS

```
CX      #include <stdio.h>

ssize_t getdelim(char **restrict lineptr, size_t *restrict n,
                 int delimiter, FILE *restrict stream);
ssize_t getline(char **restrict lineptr, size_t *restrict n,
                FILE *restrict stream);
```

DESCRIPTION

The *getdelim()* function shall read from *stream* until it encounters a character matching the *delimiter* character. The *delimiter* argument is an **int**, the value of which the application shall ensure is a character representable as an **unsigned char** of equal value that terminates the read process. If the *delimiter* argument has any other value, the behavior is undefined.

The application shall ensure that **lineptr* is a valid argument that could be passed to the *free()* function. If **n* is non-zero, the application shall ensure that **lineptr* either points to an object of size at least **n* bytes, or is a null pointer.

The size of the object pointed to by **lineptr* shall be increased to fit the incoming line, if it isn't already large enough, including room for the delimiter and a terminating NUL. The characters read, including any delimiter, shall be stored in the string pointed to by the *lineptr* argument, and a terminating NUL added when the delimiter or end of file is encountered.

The *getline()* function shall be equivalent to the *getdelim()* function with the *delimiter* character equal to the <newline> character.

The *getdelim()* and *getline()* functions may mark the last data access timestamp of the file associated with *stream* for update. The last data access timestamp shall be marked for update by the first successful execution of *fgetc()*, *fgets()*, *fread()*, *fscanf()*, *getc()*, *getchar()*, *getdelim()*, *getline()*, *gets()*, or *scanf()* using *stream* that returns data not supplied by a prior call to *ungetc()*.

RETURN VALUE

Upon successful completion, the *getline()* and *getdelim()* functions shall return the number of characters written into the buffer, including the delimiter character if one was encountered before EOF, but excluding the terminating NUL character. If no characters were read, and the end-of-file indicator for the stream is set, or if the stream is at end-of-file, the end-of-file indicator for the stream shall be set and the function shall return -1. If an error occurs, the error indicator for the stream shall be set, and the function shall return -1 and set *errno* to indicate the error.

ERRORS

For the conditions under which the *getdelim()* and *getline()* functions shall fail and may fail, refer to *fgetc()*.

In addition, these functions shall fail if:

[EINVAL] *lineptr* or *n* is a null pointer.

[ENOMEM] Insufficient memory is available.

These functions may fail if:

[EOVERFLOW] More than {SSIZE_MAX} characters were read without encountering the *delimiter* character.

EXAMPLES

```

#include <stdio.h>
#include <stdlib.h>

int main(void)
{
    FILE *fp;
    char *line = NULL;
    size_t len = 0;
    ssize_t read;
    fp = fopen("/etc/motd", "r");
    if (fp == NULL)
        exit(1);
    while ((read = getline(&line, &len, fp)) != -1) {
        printf("Retrieved line of length %zu :\\n", read);
        printf("%s", line);
    }
    if (ferror(fp)) {
        /* handle error */
    }
    free(line);
    fclose(fp);
    return 0;
}

```

APPLICATION USAGE

Setting **lineptr* to a null pointer and **n* to zero are allowed and a recommended way to start parsing a file.

The *ferror()* or *feof()* functions should be used to distinguish between an error condition and an end-of-file condition.

Although a NUL terminator is always supplied after the line, note that *strlen(*lineptr)* will be smaller than the return value if the line contains embedded NUL characters.

RATIONALE

These functions are widely used to solve the problem that the *fgets()* function has with long lines. The functions automatically enlarge the target buffers if needed. These are especially useful since they reduce code needed for applications.

FUTURE DIRECTIONS

None.

34390 XBD <sys/types.h>, <unistd.h>

34391 **CHANGE HISTORY**

34392 First released in Issue 1. Derived from Issue 1 of the SVID.

34393 **Issue 6**

34394 In the SYNOPSIS, the optional include of the <sys/types.h> header is removed.

34395 The following new requirements on POSIX implementations derive from alignment with the
34396 Single UNIX Specification:

- 34397
- The requirement to include <sys/types.h> has been removed. Although <sys/types.h> was
34398 required for conforming implementations of previous POSIX specifications, it was not
34399 required for UNIX applications.

34400 **NAME**

34401 getenv — get value of an environment variable

34402 **SYNOPSIS**

34403 #include <stdlib.h>

34404 char *getenv(const char *name);

34405 **DESCRIPTION**

34406 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 34407 conflict between the requirements described here and the ISO C standard is unintentional. This
 34408 volume of POSIX.1-2008 defers to the ISO C standard.

34409 The *getenv()* function shall search the environment of the calling process (see XBD [Chapter 8](#), on
 34410 page 173) for the environment variable *name* if it exists and return a pointer to the value of the
 34411 environment variable. If the specified environment variable cannot be found, a null pointer shall
 34412 be returned. The application shall ensure that it does not modify the string pointed to by the
 34413 *getenv()* function.

34414 CX The returned string pointer might be invalidated or the string content might be overwritten by a
 34415 CX subsequent call to *getenv()*, *setenv()*, *unsetenv()*, or (if supported) *putenv()* but they shall not be
 34416 affected by a call to any other function in this volume of POSIX.1-2008.

34417 CX The *getenv()* function need not be thread-safe. -

34418 **RETURN VALUE**

34419 Upon successful completion, *getenv()* shall return a pointer to a string containing the *value* for
 34420 the specified *name*. If the specified *name* cannot be found in the environment of the calling
 34421 process, a null pointer shall be returned.

34422 **ERRORS**

34423 No errors are defined.

34424 **EXAMPLES**34425 **Getting the Value of an Environment Variable**34426 The following example gets the value of the *HOME* environment variable.

34427 #include <stdlib.h>

34428 ...

34429 const char *name = "HOME";

34430 char *value;

34431 value = getenv(name);

34432 **APPLICATION USAGE**

34433 None.

34434 **RATIONALE**

34435 The *clearenv()* function was considered but rejected. The *putenv()* function has now been
 34436 included for alignment with the Single UNIX Specification.

34437 The *getenv()* function is inherently not thread-safe because it returns a value pointing to static
 34438 data.

34439 Conforming applications are required not to directly modify the pointers to which *environ*
 34440 points, but to use only the *setenv()*, *unsetenv()*, and *putenv()* functions, or assignment to *environ*
 34441 itself, to manipulate the process environment. This constraint allows the implementation to
 34442 properly manage the memory it allocates. This enables the implementation to free any space it

has allocated to strings (and perhaps the pointers to them) stored in *environ* when *unsetenv()* is called. A C runtime start-up procedure (that which invokes *main()* and perhaps initializes *environ*) can also initialize a flag indicating that none of the environment has yet been copied to allocated storage, or that the separate table has not yet been initialized. If the application switches to a complete new environment by assigning a new value to *environ*, this can be detected by *getenv()*, *setenv()*, *unsetenv()*, or *putenv()* and the implementation can at that point reinitialize based on the new environment. (This may include copying the environment strings into a new array and assigning *environ* to point to it.)

In fact, for higher performance of *getenv()*, implementations that do not provide *putenv()* could also maintain a separate copy of the environment in a data structure that could be searched much more quickly (such as an indexed hash table, or a binary tree), and update both it and the linear list at *environ* when *setenv()* or *unsetenv()* is invoked. On implementations that do provide *putenv()*, such a copy might still be worthwhile but would need to allow for the fact that applications can directly modify the content of environment strings added with *putenv()*. For example, if an environment string found by searching the copy is one that was added using *putenv()*, the implementation would need to check that the string in *environ* still has the same name (and value, if the copy includes values), and whenever searching the copy produces no match the implementation would then need to search each environment string in *environ* that was added using *putenv()* in case any of them have changed their names and now match. Thus, each use of *putenv()* to add to the environment would reduce the speed advantage of having the copy.

Performance of *getenv()* can be important for applications which have large numbers of environment variables. Typically, applications like this use the environment as a resource database of user-configurable parameters. The fact that these variables are in the user's shell environment usually means that any other program that uses environment variables (such as *ls*, which attempts to use *COLUMNS*), or really almost any utility (*LANG*, *LC_ALL*, and so on) is similarly slowed down by the linear search through the variables.

An implementation that maintains separate data structures, or even one that manages the memory it consumes, is not currently required as it was thought it would reduce consensus among implementors who do not want to change their historical implementations.

FUTURE DIRECTIONS

A future version may add one or more functions to access and modify the environment in a thread-safe manner.

34553 **Issue 6**34554 In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.34555 The following new requirements on POSIX implementations derive from alignment with the
34556 Single UNIX Specification:

- 34557
- The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was
34558 required for conforming implementations of previous POSIX specifications, it was not
34559 required for UNIX applications.

34560 **NAME**

34561 getgrent — get the group database entry

34562 **SYNOPSIS**

34563 XSI #include <grp.h>

34564 struct group *getgrent(void);

34565 **DESCRIPTION**

34566 Refer to *endgrent()*.

NAME

getgrgid, getgrgid_r — get group database entry for a group ID

SYNOPSIS

```
#include <grp.h>

struct group *getgrgid(gid_t gid);
int getgrgid_r(gid_t gid, struct group *grp, char *buffer,
               size_t bufsize, struct group **result);
```

DESCRIPTION

The *getgrgid()* function shall search the group database for an entry with a matching *gid*.

The *getgrgid()* function need not be thread-safe.

The *getgrgid_r()* function shall update the **group** structure pointed to by *grp* and store a pointer to that structure at the location pointed to by *result*. The structure shall contain an entry from the group database with a matching *gid*. Storage referenced by the group structure is allocated from the memory provided with the *buffer* parameter, which is *bufsize* bytes in size. A call to *sysconf(_SC_GETGR_R_SIZE_MAX)* returns either *-1* without changing *errno* or an initial value suggested for the size of this buffer. A null pointer shall be returned at the location pointed to by *result* on error or if the requested entry is not found.

RETURN VALUE

Upon successful completion, *getgrgid()* shall return a pointer to a **struct group** with the structure defined in **<grp.h>** with a matching entry if one is found. The *getgrgid()* function shall return a null pointer if either the requested entry was not found, or an error occurred. On error, *errno* shall be set to indicate the error.

The application shall not modify the structure to which the return value points, nor any storage areas pointed to by pointers within the structure. The returned pointer, and pointers within the structure, might be invalidated or the structure or the storage areas might be overwritten by a subsequent call to *getgrent()*, *getgrgid()*, or *getgrnam()*.

If successful, the *getgrgid_r()* function shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *getgrgid()* and *getgrgid_r()* functions may fail if:

[EIO]	An I/O error has occurred.
[EINTR]	A signal was caught during <i>getgrgid()</i> .
[EMFILE]	All file descriptors available to the process are currently open.
[ENFILE]	The maximum allowable number of files is currently open in the system.
- The *getgrgid_r()* function may fail if:
- | | |
|----------|--|
| [ERANGE] | Insufficient storage was supplied via <i>buffer</i> and <i>bufsize</i> to contain the data to be referenced by the resulting group structure. |
|----------|--|

EXAMPLES

Note that *sysconf*(_SC_GETGR_R_SIZE_MAX) may return -1 if there is no hard limit on the size of the buffer needed to store all the groups returned. This example shows how an application can allocate a buffer of sufficient size to work with *getgrgid_r*().

```

long int initlen = sysconf(_SC_GETGR_R_SIZE_MAX);
size_t len;
if (initlen == -1)
    /* Default initial length. */
    len = 1024;
else
    len = (size_t) initlen;
struct group result;
struct group *resultp;
char *buffer = malloc(len);
if (buffer == NULL)
    ...handle error...
int e;
while ((e = getgrgid_r(42, &result, buffer, len, &resultp)) == ERANGE)
{
    size_t newlen = 2 * len;
    if (newlen < len)
        ...handle error...
    len = newlen;
    char *newbuffer = realloc(buffer, len);
    if (newbuffer == NULL)
        ...handle error...
    buffer = newbuffer;
}
if (e != 0)
    ...handle error...
free (buffer);

```

Finding an Entry in the Group Database

The following example uses *getgrgid*() to search the group database for a group ID that was previously stored in a **stat** structure, then prints out the group name if it is found. If the group is not found, the program prints the numeric value of the group for the entry.

```

#include <sys/types.h>
#include <grp.h>
#include <stdio.h>
...
struct stat statbuf;
struct group *grp;
...
if ((grp = getgrgid(statbuf.st_gid)) != NULL)
    printf(" %-8.8s", grp->gr_name);
else
    printf(" %-8d", statbuf.st_gid);
...

```

APPLICATION USAGE

Applications wishing to check for error situations should set *errno* to 0 before calling *getgrgid()*. If *errno* is set on return, an error occurred.

The *getgrgid_r()* function is thread-safe and shall return values in a user-supplied buffer instead of possibly using a static data area that may be overwritten by each call.

Portable applications should take into account that it is usual for an implementation to return -1 from *sysconf()* indicating that there is no maximum for *_SC_GETGR_R_SIZE_MAX*.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from System V Release 2.0.

Issue 5

Normative text previously in the APPLICATION USAGE section is moved to the RETURN VALUE section.

The *getgrgid_r()* function is included for alignment with the POSIX Threads Extension.

A note indicating that the *getgrgid()* function need not be reentrant is added to the DESCRIPTION.

Issue 6

The *getgrgid_r()* function is marked as part of the Thread-Safe Functions option.

The Open Group Corrigendum U028/3 is applied, correcting text in the DESCRIPTION describing matching the *gid*.

In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- In the RETURN VALUE section, the requirement to set *errno* on error is added.
- The [EIO], [EINTR], [EMFILE], and [ENFILE] optional error conditions are added.

The APPLICATION USAGE section is updated to include a note on the thread-safe function and its avoidance of possibly using a static data area.

IEEE PASC Interpretation 1003.1 #116 is applied, changing the description of the size of the buffer from *bufsize* characters to bytes.

34690 **Issue 7**

34691 Austin Group Interpretation 1003.1-2001 #156 is applied.

34692 SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.

34693 SD5-XSH-ERN-166 is applied.

34694 The *getgrgid_r()* function is moved from the Thread-Safe Functions option to the Base.

34695 A minor addition is made to the EXAMPLES section, reminding the application developer to
34696 free memory allocated as if by *malloc()*.

34697 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0241 [75] is applied.

+

NAME

getgrnam, getgrnam_r — search group database for a name

SYNOPSIS

```
#include <grp.h>

struct group *getgrnam(const char *name);
int getgrnam_r(const char *name, struct group *grp, char *buffer,
               size_t bufsize, struct group **result);
```

DESCRIPTION

The *getgrnam()* function shall search the group database for an entry with a matching *name*.

The *getgrnam()* function need not be thread-safe.

The *getgrnam_r()* function shall update the **group** structure pointed to by *grp* and store a pointer to that structure at the location pointed to by *result*. The structure shall contain an entry from the group database with a matching *name*. Storage referenced by the **group** structure is allocated from the memory provided with the *buffer* parameter, which is *bufsize* bytes in size. A call to *sysconf(_SC_GETGR_R_SIZE_MAX)* returns either *-1* without changing *errno* or an initial value suggested for the size of this buffer. A null pointer is returned at the location pointed to by *result* on error or if the requested entry is not found.

RETURN VALUE

The *getgrnam()* function shall return a pointer to a **struct group** with the structure defined in **<grp.h>** with a matching entry if one is found. The *getgrnam()* function shall return a null pointer if either the requested entry was not found, or an error occurred. On error, *errno* shall be set to indicate the error.

The application shall not modify the structure to which the return value points, nor any storage areas pointed to by pointers within the structure. The returned pointer, and pointers within the structure, might be invalidated or the structure or the storage areas might be overwritten by a subsequent call to *getgrent()*, *getgrgid()*, or *getgrnam()*.

The *getgrnam_r()* function shall return zero on success or if the requested entry was not found and no error has occurred. If any error has occurred, an error number shall be returned to indicate the error.

ERRORS

The *getgrnam()* and *getgrnam_r()* functions may fail if:

[EIO]	An I/O error has occurred.
[EINTR]	A signal was caught during <i>getgrnam()</i> .
[EMFILE]	All file descriptors available to the process are currently open.
[ENFILE]	The maximum allowable number of files is currently open in the system.
- The *getgrnam_r()* function may fail if:
- | | |
|----------|--|
| [ERANGE] | Insufficient storage was supplied via <i>buffer</i> and <i>bufsize</i> to contain the data to be referenced by the resulting group structure. |
|----------|--|

EXAMPLES

Note that `sysconf(_SC_GETGR_R_SIZE_MAX)` may return `-1` if there is no hard limit on the size of the buffer needed to store all the groups returned. This example shows how an application can allocate a buffer of sufficient size to work with `getgrnam_r()`.

```

long int initlen = sysconf(_SC_GETGR_R_SIZE_MAX);
size_t len;
if (initlen == -1)
    /* Default initial length. */
    len = 1024;
else
    len = (size_t) initlen;
struct group result;
struct group *resultp;
char *buffer = malloc(len);
if (buffer == NULL)
    ...handle error...
int e;
while ((e = getgrnam_r("somegroup", &result, buffer, len, &resultp))
      == ERANGE)
{
    size_t newlen = 2 * len;
    if (newlen < len)
        ...handle error...
    len = newlen;
    char *newbuffer = realloc(buffer, len);
    if (newbuffer == NULL)
        ...handle error...
    buffer = newbuffer;
}
if (e != 0)
    ...handle error...
free (buffer);

```

APPLICATION USAGE

Applications wishing to check for error situations should set `errno` to 0 before calling `getgrnam()`. If `errno` is set on return, an error occurred.

The `getgrnam_r()` function is thread-safe and shall return values in a user-supplied buffer instead of possibly using a static data area that may be overwritten by each call.

Portable applications should take into account that it is usual for an implementation to return `-1` from `sysconf()` indicating that there is no maximum for `_SC_GETGR_R_SIZE_MAX`.

RATIONALE

None.

FUTURE DIRECTIONS

None.

A minor addition is made to the EXAMPLES section, reminding the application developer to free memory allocated as if by `malloc()`.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0242 [75] is applied.

+

34814 **NAME**

34815 getgroups — get supplementary group IDs

34816 **SYNOPSIS**

34817 #include <unistd.h>

34818 int getgroups(int *gidsetsize*, gid_t *grouplist*[]);34819 **DESCRIPTION**

34820 The *getgroups()* function shall fill in the array *grouplist* with the current supplementary group
 34821 IDs of the calling process. It is implementation-defined whether *getgroups()* also returns the
 34822 effective group ID in the *grouplist* array.

34823 The *gidsetsize* argument specifies the number of elements in the array *grouplist*. The actual
 34824 number of group IDs stored in the array shall be returned. The values of array entries with
 34825 indices greater than or equal to the value returned are undefined.

34826 If *gidsetsize* is 0, *getgroups()* shall return the number of group IDs that it would otherwise return
 34827 without modifying the array pointed to by *grouplist*.

34828 If the effective group ID of the process is returned with the supplementary group IDs, the value
 34829 returned shall always be greater than or equal to one and less than or equal to the value of
 34830 {NGROUPS_MAX}+1.

34831 **RETURN VALUE**

34832 Upon successful completion, the number of supplementary group IDs shall be returned. A
 34833 return value of -1 indicates failure and *errno* shall be set to indicate the error.

34834 **ERRORS**34835 The *getgroups()* function shall fail if:

34836 [EINVAL] The *gidsetsize* argument is non-zero and less than the number of group IDs
 34837 that would have been returned.

34838 **EXAMPLES**34839 **Getting the Supplementary Group IDs of the Calling Process**

34840 The following example places the current supplementary group IDs of the calling process into
 34841 the *group* array.

```
34842       #include <sys/types.h>
34843       #include <unistd.h>
34844       ...
34845       gid_t *group;
34846       int nogroups;
34847       long ngroups_max;

34848       ngroups_max = sysconf(_SC_NGROUPS_MAX) + 1;
34849       group = (gid_t *)malloc(ngroups_max * sizeof(gid_t));
34850       ngroups = getgroups(ngroups_max, group);
```

34851 **APPLICATION USAGE**

34852 None.

34853 **RATIONALE**

34854 The related function *setgroups()* is a privileged operation and therefore is not covered by this
 34855 volume of POSIX.1-2008.

34856 As implied by the definition of supplementary groups, the effective group ID may appear in the

array returned by *getgroups()* or it may be returned only by *getegid()*. Duplication may exist, but the application needs to call *getegid()* to be sure of getting all of the information. Various implementation variations and administrative sequences cause the set of groups appearing in the result of *getgroups()* to vary in order and as to whether the effective group ID is included, even when the set of groups is the same (in the mathematical sense of “set”). (The history of a process and its parents could affect the details of the result.)

Application developers should note that {NGROUPS_MAX} is not necessarily a constant on all implementations.

FUTURE DIRECTIONS

None.

SEE ALSO

getegid(), *setgid()*

XBD <sys/types.h>, <unistd.h>

CHANGE HISTORY

First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

Issue 5

Normative text previously in the APPLICATION USAGE section is moved to the DESCRIPTION.

Issue 6

In the SYNOPSIS, the optional include of the <sys/types.h> header is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include <sys/types.h> has been removed. Although <sys/types.h> was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- A return value of 0 is not permitted, because {NGROUPS_MAX} cannot be 0. This is a FIPS requirement.

The following changes were made to align with the IEEE P1003.1a draft standard:

- An explanation is added that the effective group ID may be included in the supplementary group list.

34887 **NAME**

34888 gethostent — network host database functions

34889 **SYNOPSIS**

34890 #include <netdb.h>

34891 struct hostent *gethostent(void);

34892 **DESCRIPTION**

34893 Refer to *endhostent()*.

34894 NAME

34895 gethostid — get an identifier for the current host

34896 SYNOPSIS

```
34897 XSI      #include <unistd.h>  
34898         long gethostid(void);
```

34899 DESCRIPTION

34900 The *gethostid()* function shall retrieve a 32-bit identifier for the current host.

34901 RETURN VALUE

34902 Upon successful completion, *gethostid()* shall return an identifier for the current host.

34903 ERRORS

34904 No errors are defined.

34905 EXAMPLES

34906 None.

34907 APPLICATION USAGE

34908 This volume of POSIX.1-2008 does not define the domain in which the return value is unique.

34948 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

34949 The Open Group Base Resolution bwg2001-008 is applied, changing the *namelen* parameter from
34950 *socklen_t* to *size_t*.

NAME

getitimer, setitimer — get and set value of interval timer

SYNOPSIS

OB XSI `#include <sys/time.h>`

```
int getitimer(int which, struct itimerval *value);
int setitimer(int which, const struct itimerval *restrict value,
              struct itimerval *restrict ovalue);
```

DESCRIPTION

The *getitimer()* function shall store the current value of the timer specified by *which* into the structure pointed to by *value*. The *setitimer()* function shall set the timer specified by *which* to the value specified in the structure pointed to by *value*, and if *ovalue* is not a null pointer, store the previous value of the timer in the structure pointed to by *ovalue*.

A timer value is defined by the **itimerval** structure, specified in **<sys/time.h>**. If *it_value* is non-zero, it shall indicate the time to the next timer expiration. If *it_interval* is non-zero, it shall specify a value to be used in reloading *it_value* when the timer expires. Setting *it_value* to 0 shall disable a timer, regardless of the value of *it_interval*. Setting *it_interval* to 0 shall disable a timer after its next expiration (assuming *it_value* is non-zero).

Implementations may place limitations on the granularity of timer values. For each interval timer, if the requested timer value requires a finer granularity than the implementation supports, the actual timer value shall be rounded up to the next supported value.

An XSI-conforming implementation provides each process with at least three interval timers, which are indicated by the *which* argument:

ITIMER_PROF	Decrements both in process virtual time and when the system is running on behalf of the process. It is designed to be used by interpreters in statistically profiling the execution of interpreted programs. Each time the ITIMER_PROF timer expires, the SIGPROF signal is delivered.
ITIMER_REAL	Decrements in real time. A SIGALRM signal is delivered when this timer expires.
ITIMER_VIRTUAL	Decrements in process virtual time. It runs only when the process is executing. A SIGVTALRM signal is delivered when it expires.

The interaction between *setitimer()* and *alarm()* or *sleep()* is unspecified.

RETURN VALUE

Upon successful completion, *getitimer()* or *setitimer()* shall return 0; otherwise, -1 shall be returned and *errno* set to indicate the error.

ERRORS

The *setitimer()* function shall fail if:

[EINVAL]	The <i>value</i> argument is not in canonical form. (In canonical form, the number of microseconds is a non-negative integer less than 1 000 000 and the number of seconds is a non-negative integer.)

The *getitimer()* and *setitimer()* functions may fail if:

[EINVAL]	The <i>which</i> argument is not recognized.

34992 **EXAMPLES**

34993 None.

34994 **APPLICATION USAGE**

34995 Applications should use the *timer_gettime()* and *timer_settime()* functions instead of the
34996 obsolescent *gettimer()* and *setitimer()* functions, respectively.

34997 **RATIONALE**

34998 None.

34999 **FUTURE DIRECTIONS**35000 The *gettimer()* and *setitimer()* functions may be removed in a future version.35001 **SEE ALSO**35002 *alarm()*, *exec*, *sleep()*, *timer_getoverrun()*

35004 **CHANGE HISTORY**

35005 First released in Issue 4, Version 2.

35006 **Issue 5**

35007 Moved from X/OPEN UNIX extension to BASE.

35008 **Issue 6**

35009 The **restrict** keyword is added to the *setitimer()* prototype for alignment with the
35010 ISO/IEC 9899:1999 standard.

35011 **Issue 7**35012 The *gettimer()* and *setitimer()* functions are marked obsolescent.

35013 **NAME**35014 getline — read a delimited record from *stream*35015 **SYNOPSIS**

```
35016 CX      #include <stdio.h>
35017          ssize_t getline(char **restrict lineptr, size_t *restrict n,
35018                          FILE *restrict stream);
```

35019 **DESCRIPTION**35020 Refer to *getdelim()*.

NAME

getlogin, getlogin_r — get login name

SYNOPSIS

```
#include <unistd.h>
```

```
char *getlogin(void);
```

```
int getlogin_r(char *name, size_t namesize);
```

DESCRIPTION

The *getlogin()* function shall return a pointer to a string containing the user name associated by the login activity with the controlling terminal of the current process. If *getlogin()* returns a non-null pointer, then that pointer points to the name that the user logged in under, even if there are several login names with the same user ID.

The *getlogin()* function need not be thread-safe.

The *getlogin_r()* function shall put the name associated by the login activity with the controlling terminal of the current process in the character array pointed to by *name*. The array is *namesize* characters long and should have space for the name and the terminating null character. The maximum size of the login name is {LOGIN_NAME_MAX}.

If *getlogin_r()* is successful, *name* points to the name the user used at login, even if there are several login names with the same user ID.

The *getlogin()* and *getlogin_r()* functions may make use of file descriptors 0, 1, and 2 to find the controlling terminal of the current process, examining each in turn until the terminal is found. If in this case none of these three file descriptors is open to the controlling terminal, these functions may fail. The method used to find the terminal associated with a file descriptor may depend on the file descriptor being open to the actual terminal device, not **/dev/tty**.

RETURN VALUE

Upon successful completion, *getlogin()* shall return a pointer to the login name or a null pointer if the user's login name cannot be found. Otherwise, it shall return a null pointer and set *errno* to indicate the error.

The application shall not modify the string returned. The returned pointer might be invalidated or the string content might be overwritten by a subsequent call to *getlogin()*.

If successful, the *getlogin_r()* function shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

These functions may fail if:

[EMFILE] All file descriptors available to the process are currently open.

[ENFILE] The maximum allowable number of files is currently open in the system.

[ENOTTY] None of the file descriptors 0, 1, or 2 is open to the controlling terminal of the current process.

[ENXIO] The calling process has no controlling terminal.

The *getlogin_r()* function may fail if:

[ERANGE] The value of *namesize* is smaller than the length of the string to be returned including the terminating null character.

EXAMPLES**Getting the User Login Name**

The following example calls the *getlogin()* function to obtain the name of the user associated with the calling process, and passes this information to the *getpwnam()* function to get the associated user database information.

```
#include <unistd.h>
#include <sys/types.h>
#include <pwd.h>
#include <stdio.h>
...
char *lgn;
struct passwd *pw;
...
if ((lgn = getlogin()) == NULL || (pw = getpwnam(lgn)) == NULL) {
    fprintf(stderr, "Get of user information failed.\n"); exit(1);
}
```

APPLICATION USAGE

Three names associated with the current process can be determined: *getpwuid(geteuid())* shall return the name associated with the effective user ID of the process; *getlogin()* shall return the name associated with the current login activity; and *getpwuid(getuid())* shall return the name associated with the real user ID of the process.

The *getlogin_r()* function is thread-safe and returns values in a user-supplied buffer instead of possibly using a static data area that may be overwritten by each call.

RATIONALE

The *getlogin()* function returns a pointer to the user's login name. The same user ID may be shared by several login names. If it is desired to get the user database entry that is used during login, the result of *getlogin()* should be used to provide the argument to the *getpwnam()* function. (This might be used to determine the user's login shell, particularly where a single user has multiple login shells with distinct login names, but the same user ID.)

The information provided by the *cuserid()* function, which was originally defined in the POSIX.1-1988 standard and subsequently removed, can be obtained by the following:

```
getpwuid(geteuid())
```

while the information provided by historical implementations of *cuserid()* can be obtained by:

```
getpwuid(getuid())
```

The thread-safe version of this function places the user name in a user-supplied buffer and returns a non-zero value if it fails. The non-thread-safe version may return the name in a static data area that may be overwritten by each call.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from System V Release 2.0.

Issue 5

Normative text previously in the APPLICATION USAGE section is moved to the RETURN VALUE section.

The *getlogin_r()* function is included for alignment with the POSIX Threads Extension.

A note indicating that the *getlogin()* function need not be reentrant is added to the DESCRIPTION.

Issue 6

The *getlogin_r()* function is marked as part of the Thread-Safe Functions option.

In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In the RETURN VALUE section, the requirement to set *errno* on error is added.
- The [EMFILE], [ENFILE], and [ENXIO] optional error conditions are added.

The APPLICATION USAGE section is updated to include a note on the thread-safe function and its avoidance of possibly using a static data area.

Issue 7

Austin Group Interpretation 1003.1-2001 #156 is applied.

SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.

The *getlogin_r()* function is moved from the Thread-Safe Functions option to the Base.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0243 [172], XSH/TC1-2008/0244 [75], + and XSH/TC1-2008/0245 [172] are applied.

NAME

getmsg, getpmsg — receive next message from a STREAMS file (**STREAMS**)

SYNOPSIS

```
OB XSR #include <stropts.h>
```

```
int getmsg(int fildes, struct strbuf *restrict ctlptr,
           struct strbuf *restrict dataptr, int *restrict flagsp);
int getpmsg(int fildes, struct strbuf *restrict ctlptr,
            struct strbuf *restrict dataptr, int *restrict bandp,
            int *restrict flagsp);
```

DESCRIPTION

The *getmsg()* function shall retrieve the contents of a message located at the head of the STREAM head read queue associated with a STREAMS file and place the contents into one or more buffers. The message contains either a data part, a control part, or both. The data and control parts of the message shall be placed into separate buffers, as described below. The semantics of each part are defined by the originator of the message.

The *getpmsg()* function shall be equivalent to *getmsg()*, except that it provides finer control over the priority of the messages received. Except where noted, all requirements on *getmsg()* also pertain to *getpmsg()*.

The *fildes* argument specifies a file descriptor referencing a STREAMS-based file.

The *ctlptr* and *dataptr* arguments each point to a **strbuf** structure, in which the *buf* member points to a buffer in which the data or control information is to be placed, and the *maxlen* member indicates the maximum number of bytes this buffer can hold. On return, the *len* member shall contain the number of bytes of data or control information actually received. The *len* member shall be set to 0 if there is a zero-length control or data part and *len* shall be set to -1 if no data or control information is present in the message.

When *getmsg()* is called, *flagsp* should point to an integer that indicates the type of message the process is able to receive. This is described further below.

The *ctlptr* argument is used to hold the control part of the message, and *dataptr* is used to hold the data part of the message. If *ctlptr* (or *dataptr*) is a null pointer or the *maxlen* member is -1, the control (or data) part of the message shall not be processed and shall be left on the STREAM head read queue, and if the *ctlptr* (or *dataptr*) is not a null pointer, *len* shall be set to -1. If the *maxlen* member is set to 0 and there is a zero-length control (or data) part, that zero-length part shall be removed from the read queue and *len* shall be set to 0. If the *maxlen* member is set to 0 and there are more than 0 bytes of control (or data) information, that information shall be left on the read queue and *len* shall be set to 0. If the *maxlen* member in *ctlptr* (or *dataptr*) is less than the control (or data) part of the message, *maxlen* bytes shall be retrieved. In this case, the remainder of the message shall be left on the STREAM head read queue and a non-zero return value shall be provided.

By default, *getmsg()* shall process the first available message on the STREAM head read queue. However, a process may choose to retrieve only high-priority messages by setting the integer pointed to by *flagsp* to RS_HIPRI. In this case, *getmsg()* shall only process the next message if it is a high-priority message. When the integer pointed to by *flagsp* is 0, any available message shall be retrieved. In this case, on return, the integer pointed to by *flagsp* shall be set to RS_HIPRI if a high-priority message was retrieved, or 0 otherwise.

For *getpmsg()*, the flags are different. The *flagsp* argument points to a bitmask with the following mutually-exclusive flags defined: MSG_HIPRI, MSG_BAND, and MSG_ANY. Like *getmsg()*,

getpmsg() shall process the first available message on the STREAM head read queue. A process may choose to retrieve only high-priority messages by setting the integer pointed to by *flagsp* to MSG_HIPRI and the integer pointed to by *bandp* to 0. In this case, *getpmsg()* shall only process the next message if it is a high-priority message. In a similar manner, a process may choose to retrieve a message from a particular priority band by setting the integer pointed to by *flagsp* to MSG_BAND and the integer pointed to by *bandp* to the priority band of interest. In this case, *getpmsg()* shall only process the next message if it is in a priority band equal to, or greater than, the integer pointed to by *bandp*, or if it is a high-priority message. If a process wants to get the first message off the queue, the integer pointed to by *flagsp* should be set to MSG_ANY and the integer pointed to by *bandp* should be set to 0. On return, if the message retrieved was a high-priority message, the integer pointed to by *flagsp* shall be set to MSG_HIPRI and the integer pointed to by *bandp* shall be set to 0. Otherwise, the integer pointed to by *flagsp* shall be set to MSG_BAND and the integer pointed to by *bandp* shall be set to the priority band of the message.

If O_NONBLOCK is not set, *getmsg()* and *getpmsg()* shall block until a message of the type specified by *flagsp* is available at the front of the STREAM head read queue. If O_NONBLOCK is set and a message of the specified type is not present at the front of the read queue, *getmsg()* and *getpmsg()* shall fail and set *errno* to [EAGAIN].

If a hangup occurs on the STREAM from which messages are retrieved, *getmsg()* and *getpmsg()* shall continue to operate normally, as described above, until the STREAM head read queue is empty. Thereafter, they shall return 0 in the *len* members of *ctlptr* and *dataptr*.

RETURN VALUE

Upon successful completion, *getmsg()* and *getpmsg()* shall return a non-negative value. A value of 0 indicates that a full message was read successfully. A return value of MORECTL indicates that more control information is waiting for retrieval. A return value of MOREDATA indicates that more data is waiting for retrieval. A return value of the bitwise-logical OR of MORECTL and MOREDATA indicates that both types of information remain. Subsequent *getmsg()* and *getpmsg()* calls shall retrieve the remainder of the message. However, if a message of higher priority has come in on the STREAM head read queue, the next call to *getmsg()* or *getpmsg()* shall retrieve that higher-priority message before retrieving the remainder of the previous message.

If the high priority control part of the message is consumed, the message shall be placed back on the queue as a normal message of band 0. Subsequent *getmsg()* and *getpmsg()* calls shall retrieve the remainder of the message. If, however, a priority message arrives or already exists on the STREAM head, the subsequent call to *getmsg()* or *getpmsg()* shall retrieve the higher-priority message before retrieving the remainder of the message that was put back.

Upon failure, *getmsg()* and *getpmsg()* shall return -1 and set *errno* to indicate the error.

ERRORS

The *getmsg()* and *getpmsg()* functions shall fail if:

[EAGAIN]	The O_NONBLOCK flag is set and no messages are available.
[EBADF]	The <i>fildev</i> argument is not a valid file descriptor open for reading.
[EBADMSG]	The queued message to be read is not valid for <i>getmsg()</i> or <i>getpmsg()</i> or a pending file descriptor is at the STREAM head.
[EINTR]	A signal was caught during <i>getmsg()</i> or <i>getpmsg()</i> .
[EINVAL]	An illegal value was specified by <i>flagsp</i> , or the STREAM or multiplexer referenced by <i>fildev</i> is linked (directly or indirectly) downstream from a multiplexer.

35219 [ENOSTR] A STREAM is not associated with *fil*des.

35220 In addition, *getmsg()* and *getpmsg()* shall fail if the STREAM head had processed an
 35221 asynchronous error before the call. In this case, the value of *errno* does not reflect the result of
 35222 *getmsg()* or *getpmsg()* but reflects the prior error.

35223 EXAMPLES

35224 Getting Any Message

35225 In the following example, the value of *fd* is assumed to refer to an open STREAMS file. The call
 35226 to *getmsg()* retrieves any available message on the associated STREAM-head read queue,
 35227 returning control and data information to the buffers pointed to by *ctrlbuf* and *databuf*,
 35228 respectively.

```
35229 #include <stropts.h>
35230 ...
35231 int fd;
35232 char ctrlbuf[128];
35233 char databuf[512];
35234 struct strbuf ctrl;
35235 struct strbuf data;
35236 int flags = 0;
35237 int ret;

35238 ctrl.buf = ctrlbuf;
35239 ctrl.maxlen = sizeof(ctrlbuf);

35240 data.buf = databuf;
35241 data.maxlen = sizeof(databuf);

35242 ret = getmsg (fd, &ctrl, &data, &flags);
```

35243 Getting the First Message off the Queue

35244 In the following example, the call to *getpmsg()* retrieves the first available message on the
 35245 associated STREAM-head read queue.

```
35246 #include <stropts.h>
35247 ...
35248 int fd;
35249 char ctrlbuf[128];
35250 char databuf[512];
35251 struct strbuf ctrl;
35252 struct strbuf data;
35253 int band = 0;
35254 int flags = MSG_ANY;
35255 int ret;

35256 ctrl.buf = ctrlbuf;
35257 ctrl.maxlen = sizeof(ctrlbuf);

35258 data.buf = databuf;
35259 data.maxlen = sizeof(databuf);

35260 ret = getpmsg (fd, &ctrl, &data, &band, &flags);
```

35261 APPLICATION USAGE

35262 None.

35263 RATIONALE

35264 None.

35265 FUTURE DIRECTIONS

35266 The *getmsg()* and *getpmsg()* functions may be removed in a future version.

35270 CHANGE HISTORY

35271 First released in Issue 4, Version 2.

35272 Issue 5

35273 Moved from X/OPEN UNIX extension to BASE.

35274 A paragraph regarding “high-priority control parts of messages” is added to the RETURN
35275 VALUE section.

35276 Issue 6

35277 This function is marked as part of the XSI STREAMS Option Group.

35278 The **restrict** keyword is added to the *getmsg()* and *getpmsg()* prototypes for alignment with the
35279 ISO/IEC 9899:1999 standard.

35280 Issue 7

35281 The *getmsg()* and *getpmsg()* functions are marked obsolescent.

NAME

getnameinfo — get name information

SYNOPSIS

```
#include <sys/socket.h>
#include <netdb.h>

int getnameinfo(const struct sockaddr *restrict sa, socklen_t salen,
                char *restrict node, socklen_t nodelen, char *restrict service,
                socklen_t servicelen, int flags);
```

DESCRIPTION

The *getnameinfo()* function shall translate a socket address to a node name and service location, all of which are defined as in *freeaddrinfo()*.

The *sa* argument points to a socket address structure to be translated. The *salen* argument contains the length of the address pointed to by *sa*.

IP6 If the socket address structure contains an IPv4-mapped IPv6 address or an IPv4-compatible IPv6 address, the implementation shall extract the embedded IPv4 address and lookup the node name for that IPv4 address.

If the address is the IPv6 unspecified address ("::"), a lookup shall not be performed and the behavior shall be the same as when the node's name cannot be located.

If the *node* argument is non-NULL and the *nodelen* argument is non-zero, then the *node* argument points to a buffer able to contain up to *nodelen* bytes that receives the node name as a null-terminated string. If the *node* argument is NULL or the *nodelen* argument is zero, the node name shall not be returned. If the node's name cannot be located, the numeric form of the address contained in the socket address structure pointed to by the *sa* argument is returned instead of its name.

If the *service* argument is non-NULL and the *servicelen* argument is non-zero, then the *service* argument points to a buffer able to contain up to *servicelen* bytes that receives the service name as a null-terminated string. If the *service* argument is NULL or the *servicelen* argument is zero, the service name shall not be returned. If the service's name cannot be located, the numeric form of the service address (for example, its port number) shall be returned instead of its name.

The *flags* argument is a flag that changes the default actions of the function. By default the fully-qualified domain name (FQDN) for the host shall be returned, but:

- If the flag bit NI_NOFQDN is set, only the node name portion of the FQDN shall be returned for local hosts.
- If the flag bit NI_NUMERICHOST is set, the numeric form of the address contained in the socket address structure pointed to by the *sa* argument shall be returned instead of its name.
- If the flag bit NI_NAMEREQD is set, an error shall be returned if the host's name cannot be located.
- If the flag bit NI_NUMERICSERV is set, the numeric form of the service address shall be returned (for example, its port number) instead of its name.
- If the flag bit NI_NUMERICSERVICE is set, the numeric form of the scope identifier shall be returned (for example, interface index) instead of its name. This flag shall be ignored if the *sa* argument is not an IPv6 address.

- If the flag bit NI_DGRAM is set, this indicates that the service is a datagram service (SOCK_DGRAM). The default behavior shall assume that the service is a stream service (SOCK_STREAM).

Notes:

1. The two NI_NUMERICxxx flags are required to support the `-n` flag that many commands provide.
2. The NI_DGRAM flag is required for the few AF_INET and AF_INET6 port numbers (for example, [512,514]) that represent different services for UDP and TCP.

The `getnameinfo()` function shall be thread-safe.

RETURN VALUE

A zero return value for `getnameinfo()` indicates successful completion; a non-zero return value indicates failure. The possible values for the failures are listed in the ERRORS section.

Upon successful completion, `getnameinfo()` shall return the *node* and *service* names, if requested, in the buffers provided. The returned names are always null-terminated strings.

ERRORS

The `getnameinfo()` function shall fail and return the corresponding value if:

[EAI_AGAIN]	The name could not be resolved at this time. Future attempts may succeed.
[EAI_BADFLAGS]	The <i>flags</i> had an invalid value.
[EAI_FAIL]	A non-recoverable error occurred.
[EAI_FAMILY]	The address family was not recognized or the address length was invalid for the specified family.
[EAI_MEMORY]	There was a memory allocation failure.
[EAI_NONAME]	The name does not resolve for the supplied parameters.
	NI_NAMEREQD is set and the host's name cannot be located, or both <i>nodename</i> and <i>servname</i> were null.
[EAI_OVERFLOW]	An argument buffer overflowed. The buffer pointed to by the <i>node</i> argument or the <i>service</i> argument was too small.
[EAI_SYSTEM]	A system error occurred. The error code can be found in <i>errno</i> .

EXAMPLES

None.

APPLICATION USAGE

If the returned values are to be used as part of any further name resolution (for example, passed to `getaddrinfo()`), applications should provide buffers large enough to store any result possible on the system.

Given the IPv4-mapped IPv6 address "`::ffff:1.2.3.4`", the implementation performs a lookup as if the socket address structure contains the IPv4 address "`1.2.3.4`".

The IPv6 unspecified address ("`:::`") and the IPv6 loopback address ("`:::1`") are not IPv4-compatible addresses.

35365 **RATIONALE**

35366 None.

```

35392 DESCRIPTION

35393 Refer to *endnetent()*.

NAME

getopt, optarg, opterr, optind, optopt — command option parsing

SYNOPSIS

```
#include <unistd.h>

int getopt(int argc, char * const argv[], const char *optstring);
extern char *optarg;
extern int opterr, optind, optopt;
```

DESCRIPTION

The *getopt()* function is a command-line parser that shall follow Utility Syntax Guidelines 3, 4, 5, 6, 7, 9, and 10 in XBD [Section 12.2](#) (on page 215).

The parameters *argc* and *argv* are the argument count and argument array as passed to *main()* (see *exec()*). The argument *optstring* is a string of recognized option characters; if a character is followed by a <colon>, the option takes an argument. All option characters allowed by Utility Syntax Guideline 3 are allowed in *optstring*. The implementation may accept other characters as an extension.

The variable *optind* is the index of the next element of the *argv[]* vector to be processed. It shall be initialized to 1 by the system, and *getopt()* shall update it when it finishes with each element of *argv[]*. If the application sets *optind* to zero before calling *getopt()*, the behavior is unspecified. When an element of *argv[]* contains multiple option characters, it is unspecified how *getopt()* determines which options have already been processed.

The *getopt()* function shall return the next option character (if one is found) from *argv* that matches a character in *optstring*, if there is one that matches. If the option takes an argument, *getopt()* shall set the variable *optarg* to point to the option-argument as follows:

1. If the option was the last character in the string pointed to by an element of *argv*, then *optarg* shall contain the next element of *argv*, and *optind* shall be incremented by 2. If the resulting value of *optind* is greater than *argc*, this indicates a missing option-argument, and *getopt()* shall return an error indication.
2. Otherwise, *optarg* shall point to the string following the option character in that element of *argv*, and *optind* shall be incremented by 1.

If, when *getopt()* is called:

```
argv[optind]   is a null pointer
*argv[optind]  is not the character -
argv[optind]   points to the string "--"
```

getopt() shall return -1 without changing *optind*. If:

```
argv[optind]   points to the string "--"
```

getopt() shall return -1 after incrementing *optind*.

If *getopt()* encounters an option character that is not contained in *optstring*, it shall return the <question-mark> ('?') character. If it detects a missing option-argument, it shall return the <colon> character (':') if the first character of *optstring* was a <colon>, or a <question-mark> character ('?') otherwise. In either case, *getopt()* shall set the variable *optopt* to the option character that caused the error. If the application has not set the variable *opterr* to 0 and the first character of *optstring* is not a <colon>, *getopt()* shall also print a diagnostic message to *stderr* in the format specified for the *getopts* utility.

The *getopt()* function need not be thread-safe.

RETURN VALUE

The *getopt()* function shall return the next option character specified on the command line.

A <colon> (':') shall be returned if *getopt()* detects a missing argument and the first character of *optstring* was a <colon> (':').

A <question-mark> ('?') shall be returned if *getopt()* encounters an option character not in *optstring* or detects a missing argument and the first character of *optstring* was not a <colon> (':').

Otherwise, *getopt()* shall return -1 when all command line options are parsed.

ERRORS

If the application has not set the variable *opterr* to 0, the first character of *optstring* is not a <colon>, and a write error occurs while *getopt()* is printing a diagnostic message to *stderr*, then the error indicator for *stderr* shall be set; but *getopt()* shall still succeed and the value of *errno* after *getopt()* is unspecified.

EXAMPLES**Parsing Command Line Options**

The following code fragment shows how you might process the arguments for a utility that can take the mutually-exclusive options *a* and *b* and the options *f* and *o*, both of which require arguments:

```
#include <stdio.h>
#include <stdlib.h>
#include <unistd.h>

int
main(int argc, char *argv[ ])
{
    int c;
    int bflg = 0, aflg = 0, errflg = 0;
    char *ifile;
    char *ofile;
    . . .
    while ((c = getopt(argc, argv, ":abf:o:")) != -1) {
        switch(c) {
            case 'a':
                if (bflg)
                    errflg++;
                else
                    aflg++;
                break;
            case 'b':
                if (aflg)
                    errflg++;
                else
                    bflg++;
                break;
            case 'f':
                ifile = optarg;
                break;
            case 'o':
```

```

35485         ofile = optarg;
35486         break;
35487     case ':':          /* -f or -o without operand */
35488         fprintf(stderr,
35489             "Option -%c requires an operand\n", optopt);
35490         errflg++;
35491         break;
35492     case '?':
35493         fprintf(stderr,
35494             "Unrecognized option: '-%c'\n", optopt);
35495         errflg++;
35496     }
35497 }
35498 if (errflg) {
35499     fprintf(stderr, "usage: . . . ");
35500     exit(2);
35501 }
35502 for ( ; optind < argc; optind++) {
35503     if (access(argv[optind], R_OK)) {
35504         . . .
35505     }

```

This code accepts any of the following as equivalent:

```

35507 cmd -ao arg path path
35508 cmd -a -o arg path path
35509 cmd -o arg -a path path
35510 cmd -a -o arg -- path path
35511 cmd -a -oarg path path
35512 cmd -aoarg path path

```

Selecting Options from the Command Line

The following example selects the type of database routines the user wants to use based on the *Options* argument.

```

35516 #include <unistd.h>
35517 #include <string.h>
35518 ...
35519 const char *Options = "hdbt1";
35520 ...
35521 int dbtype, c;
35522 char *st;
35523 ...
35524 dbtype = 0;
35525 while ((c = getopt(argc, argv, Options)) != -1) {
35526     if ((st = strchr(Options, c)) != NULL) {
35527         dbtype = st - Options;
35528         break;
35529     }
35530 }

```

APPLICATION USAGE

The *getopt()* function is only required to support option characters included in Utility Syntax Guideline 3. Many historical implementations of *getopt()* support other characters as options. This is an allowed extension, but applications that use extensions are not maximally portable. Note that support for multi-byte option characters is only possible when such characters can be represented as type **int**.

While *ferror(stderr)* may be used to detect failures to write a diagnostic to *stderr* when *getopt()* returns ' ?', the value of *errno* is unspecified in such a condition. Applications desiring more control over handling write failures should set *opterr* to 0 and independently perform output to *stderr*, rather than relying on *getopt()* to do the output.

RATIONALE

The *optopt* variable represents historical practice and allows the application to obtain the identity of the invalid option.

The description has been written to make it clear that *getopt()*, like the *getopts* utility, deals with option-arguments whether separated from the option by <blank> characters or not. Note that the requirements on *getopt()* and *getopts* are more stringent than the Utility Syntax Guidelines.

The *getopt()* function shall return -1, rather than EOF, so that <stdio.h> is not required.

The special significance of a <colon> as the first character of *optstring* makes *getopt()* consistent with the *getopts* utility. It allows an application to make a distinction between a missing argument and an incorrect option letter without having to examine the option letter. It is true that a missing argument can only be detected in one case, but that is a case that has to be considered.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

A note indicating that the *getopt()* function need not be reentrant is added to the DESCRIPTION.

Issue 6

IEEE PASC Interpretation 1003.2 #150 is applied.

Austin Group Interpretation 1003.1-2001 #156 is applied.

Issue 7

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0248 [318], XSH/TC1-2008/0249 [460], XSH/TC1-2008/0250 [189], XSH/TC1-2008/0251 [189], XSH/TC1-2008/0252 [189], and XSH/TC1-2008/0253 [460] are applied.

35570 **NAME**35571 `getpeername` — get the name of the peer socket35572 **SYNOPSIS**

```
35573 #include <sys/socket.h>
35574 int getpeername(int socket, struct sockaddr *restrict address,
35575                 socklen_t *restrict address_len);
```

35576 **DESCRIPTION**

35577 The `getpeername()` function shall retrieve the peer address of the specified socket, store this
 35578 address in the **sockaddr** structure pointed to by the *address* argument, and store the length of this
 35579 address in the object pointed to by the *address_len* argument.

35580 The *address_len* argument points to a **socklen_t** object which on input specifies the length of the +
 35581 supplied **sockaddr** structure, and on output specifies the length of the stored address. If the
 35582 actual length of the address is greater than the length of the supplied **sockaddr** structure, the
 35583 stored address shall be truncated.

35584 If the protocol permits connections by unbound clients, and the peer is not bound, then the
 35585 value stored in the object pointed to by *address* is unspecified.

35586 **RETURN VALUE**

35587 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to
 35588 indicate the error.

35589 **ERRORS**

35590 The `getpeername()` function shall fail if:

- 35591 [EBADF] The *socket* argument is not a valid file descriptor.
- 35592 [EINVAL] The socket has been shut down.
- 35593 [ENOTCONN] The socket is not connected or otherwise has not had the peer pre-specified.
- 35594 [ENOTSOCK] The *socket* argument does not refer to a socket.
- 35595 [EOPNOTSUPP] The operation is not supported for the socket protocol.

35596 The `getpeername()` function may fail if:

- 35597 [ENOBUFS] Insufficient resources were available in the system to complete the call.

NAME

getpgrp — get the process group ID of the calling process

SYNOPSIS

```
#include <unistd.h>

pid_t getpgrp(void);
```

DESCRIPTION

The *getpgrp()* function shall return the process group ID of the calling process.

RETURN VALUE

The *getpgrp()* function shall always be successful and no return value is reserved to indicate an error.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

4.3 BSD provides a *getpgrp()* function that returns the process group ID for a specified process. Although this function supports job control, all known job control shells always specify the calling process with this function. Thus, the simpler System V *getpgrp()* suffices, and the added complexity of the 4.3 BSD *getpgrp()* is provided by the XSI extension *getpgid()*.

FUTURE DIRECTIONS

None.

 - The requirement to include <sys/types.h> has been removed. Although <sys/types.h> was
35757 required for conforming implementations of previous POSIX specifications, it was not
35758 required for UNIX applications.

NAME

getpriority, setpriority — get and set the nice value

SYNOPSIS

```

#include <sys/resource.h>

int getpriority(int which, id_t who);
int setpriority(int which, id_t who, int value);

```

DESCRIPTION

The *getpriority()* function shall obtain the nice value of a process, process group, or user. The *setpriority()* function shall set the nice value of a process, process group, or user to *value*+{NZERO}.

Target processes are specified by the values of the *which* and *who* arguments. The *which* argument may be one of the following values: PRIO_PROCESS, PRIO_PGRP, or PRIO_USER, indicating that the *who* argument is to be interpreted as a process ID, a process group ID, or an effective user ID, respectively. A 0 value for the *who* argument specifies the current process, process group, or user.

The nice value set with *setpriority()* shall be applied to the process. If the process is multi-threaded, the nice value shall affect all system scope threads in the process.

If more than one process is specified, *getpriority()* shall return value {NZERO} less than the lowest nice value pertaining to any of the specified processes, and *setpriority()* shall set the nice values of all of the specified processes to *value*+{NZERO}.

The default nice value is {NZERO}; lower nice values shall cause more favorable scheduling. While the range of valid nice values is [0,{NZERO}*2-1], implementations may enforce more restrictive limits. If *value*+{NZERO} is less than the system's lowest supported nice value, *setpriority()* shall set the nice value to the lowest supported value; if *value*+{NZERO} is greater than the system's highest supported nice value, *setpriority()* shall set the nice value to the highest supported value.

Only a process with appropriate privileges can lower its nice value.

PS|TPS

Any processes or threads using SCHED_FIFO or SCHED_RR shall be unaffected by a call to *setpriority()*. This is not considered an error. A process which subsequently reverts to SCHED_OTHER need not have its priority affected by such a *setpriority()* call.

The effect of changing the nice value may vary depending on the process-scheduling algorithm in effect.

Since *getpriority()* can return the value -1 upon successful completion, it is necessary to set *errno* to 0 prior to a call to *getpriority()*. If *getpriority()* returns the value -1, then *errno* can be checked to see if an error occurred or if the value is a legitimate nice value.

RETURN VALUE

Upon successful completion, *getpriority()* shall return an integer in the range -{NZERO} to {NZERO}-1. Otherwise, -1 shall be returned and *errno* set to indicate the error.

Upon successful completion, *setpriority()* shall return 0; otherwise, -1 shall be returned and *errno* set to indicate the error.

ERRORS

The *getpriority()* and *setpriority()* functions shall fail if:

[ESRCH] No process could be located using the *which* and *who* argument values specified.

[EINVAL] The value of the *which* argument was not recognized, or the value of the *who* argument is not a valid process ID, process group ID, or user ID.

In addition, *setpriority()* may fail if:

[EPERM] A process was located, but neither the real nor effective user ID of the executing process match the effective user ID of the process whose nice value is being changed.

[EACCES] A request was made to change the nice value to a lower numeric value and the current process does not have appropriate privileges.

EXAMPLES**Using getpriority()**

The following example returns the current scheduling priority for the process ID returned by the call to *getpid()*.

```
#include <sys/resource.h>
...
int which = PRIO_PROCESS;
id_t pid;
int ret;

pid = getpid();
ret = getpriority(which, pid);
```

Using setpriority()

The following example sets the priority for the current process ID to -20.

```
#include <sys/resource.h>
...
int which = PRIO_PROCESS;
id_t pid;
int priority = -20;
int ret;

pid = getpid();
ret = setpriority(which, pid, priority);
```

APPLICATION USAGE

The *getpriority()* and *setpriority()* functions work with an offset nice value (nice value -{NZERO}). The nice value is in the range [0,2*{NZERO} -1], while the return value for *getpriority()* and the third parameter for *setpriority()* are in the range [-{NZERO},{NZERO} -1].

RATIONALE

None.

35838 **FUTURE DIRECTIONS**

35839 None.

35843 **CHANGE HISTORY**

35844 First released in Issue 4, Version 2.

35845 **Issue 5**

35846 Moved from X/OPEN UNIX extension to BASE.

35847 The DESCRIPTION is reworded in terms of the nice value rather than *priority* to avoid confusion
35848 with functionality in the POSIX Realtime Extension.

35849 **NAME**

35850 getprotobyname, getprotobynumber, getprotoent — network protocol database functions

35851 **SYNOPSIS**

35852 #include <netdb.h>

35853 struct protoent *getprotobyname(const char *name);

35854 struct protoent *getprotobynumber(int proto);

35855 struct protoent *getprotoent(void);

35856 **DESCRIPTION**35857 Refer to *endprotoent()*.

35858 **NAME**

35859 getpwent — get user database entry

35860 **SYNOPSIS**

```
35861 XSI      #include <pwd.h>
35862          struct passwd *getpwent(void);
```

35863 **DESCRIPTION**

35864 Refer to *endpwent()*.

35865 **NAME**

35866 getpwnam, getpwnam_r — search user database for a name

35867 **SYNOPSIS**

```
35868     #include <pwd.h>
35869
35869     struct passwd *getpwnam(const char *name);
35870     int getpwnam_r(const char *name, struct passwd *pwd, char *buffer,
35871                   size_t bufsize, struct passwd **result);
```

35872 **DESCRIPTION**35873 The *getpwnam()* function shall search the user database for an entry with a matching *name*.35874 The *getpwnam()* function need not be thread-safe.

35875 Applications wishing to check for error situations should set *errno* to 0 before calling
 35876 *getpwnam()*. If *getpwnam()* returns a null pointer and *errno* is non-zero, an error occurred.

35877 The *getpwnam_r()* function shall update the **passwd** structure pointed to by *pwd* and store a
 35878 pointer to that structure at the location pointed to by *result*. The structure shall contain an entry
 35879 from the user database with a matching *name*. Storage referenced by the structure is allocated
 35880 from the memory provided with the *buffer* parameter, which is *bufsize* bytes in size. A call to
 35881 *sysconf(_SC_GETPW_R_SIZE_MAX)* returns either -1 without changing *errno* or an initial value
 35882 suggested for the size of this buffer. A null pointer shall be returned at the location pointed to
 35883 by *result* on error or if the requested entry is not found.

35884 **RETURN VALUE**

35885 The *getpwnam()* function shall return a pointer to a **struct passwd** with the structure as defined
 35886 in **<pwd.h>** with a matching entry if found. A null pointer shall be returned if the requested
 35887 entry is not found, or an error occurs. On error, *errno* shall be set to indicate the error.

35888 The application shall not modify the structure to which the return value points, nor any storage
 35889 areas pointed to by pointers within the structure. The returned pointer, and pointers within the
 35890 structure, might be invalidated or the structure or the storage areas might be overwritten by a
 35891 subsequent call to *getpwent()*, *getpwnam()*, or *getpwuid()*.

35892 The *getpwnam_r()* function shall return zero on success or if the requested entry was not found
 35893 and no error has occurred. If an error has occurred, an error number shall be returned to indicate
 35894 the error.

35895 **ERRORS**

35896 These functions may fail if:

35897	[EIO]	An I/O error has occurred.
35898	[EINTR]	A signal was caught during <i>getpwnam()</i> .
35899	[EMFILE]	All file descriptors available to the process are currently open.
35900	[ENFILE]	The maximum allowable number of files is currently open in the system.

35901 The *getpwnam_r()* function may fail if:

35902	[ERANGE]	Insufficient storage was supplied via <i>buffer</i> and <i>bufsize</i> to contain the data to be 35903 referenced by the resulting passwd structure.

EXAMPLES

Note that *sysconf*(*_SC_GETPW_R_SIZE_MAX*) may return *-1* if there is no hard limit on the size of the buffer needed to store all the groups returned. This example shows how an application can allocate a buffer of sufficient size to work with *getpwnam_r*().

```

long int initlen = sysconf(_SC_GETPW_R_SIZE_MAX);
size_t len;
if (initlen == -1)
    /* Default initial length. */
    len = 1024;
else
    len = (size_t) initlen;
struct passwd result;
struct passwd *resultp;
char *buffer = malloc(len);
if (buffer == NULL)
    ...handle error...
int e;
while ((e = getpwnam_r("someuser", &result, buffer, len, &resultp))
      == ERANGE)
{
    size_t newlen = 2 * len;
    if (newlen < len)
        ...handle error...
    len = newlen;
    char *newbuffer = realloc(buffer, len);
    if (newbuffer == NULL)
        ...handle error...
    buffer = newbuffer;
}
if (e != 0)
    ...handle error...
free (buffer);

```

Getting an Entry for the Login Name

The following example uses the *getlogin*() function to return the name of the user who logged in; this information is passed to the *getpwnam*() function to get the user database entry for that user.

```

#include <sys/types.h>
#include <pwd.h>
#include <unistd.h>
#include <stdio.h>
#include <stdlib.h>
...
char *lgn;
struct passwd *pw;
...
if ((lgn = getlogin()) == NULL || (pw = getpwnam(lgn)) == NULL) {
    fprintf(stderr, "Get of user information failed.\n"); exit(1);
}
...

```

APPLICATION USAGE

Three names associated with the current process can be determined: *getpwuid(geteuid())* returns the name associated with the effective user ID of the process; *getlogin()* returns the name associated with the current login activity; and *getpwuid(getuid())* returns the name associated with the real user ID of the process.

The *getpwnam_r()* function is thread-safe and returns values in a user-supplied buffer instead of possibly using a static data area that may be overwritten by each call.

Portable applications should take into account that it is usual for an implementation to return `-1` from *sysconf()* indicating that there is no maximum for `_SC_GETPW_R_SIZE_MAX`.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from System V Release 2.0.

Issue 5

Normative text previously in the APPLICATION USAGE section is moved to the RETURN VALUE section.

The *getpwnam_r()* function is included for alignment with the POSIX Threads Extension.

A note indicating that the *getpwnam()* function need not be reentrant is added to the DESCRIPTION.

Issue 6

The *getpwnam_r()* function is marked as part of the Thread-Safe Functions option.

The Open Group Corrigendum U028/3 is applied, correcting text in the DESCRIPTION describing matching the *name*.

In the SYNOPSIS, the optional include of the `<sys/types.h>` header is removed.

In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- In the RETURN VALUE section, the requirement to set *errno* on error is added.
- The [EMFILE], [ENFILE], and [ENXIO] optional error conditions are added.

The APPLICATION USAGE section is updated to include a note on the thread-safe function and its avoidance of possibly using a static data area.

IEEE PASC Interpretation 1003.1 #116 is applied, changing the description of the size of the buffer from *bufsize* characters to bytes.

35993 **Issue 7**

35994 Austin Group Interpretation 1003.1-2001 #156 is applied.

35995 SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.

35996 SD5-XSH-ERN-166 is applied.

35997 The *getpwnam_r()* function is moved from the Thread-Safe Functions option to the Base.35998 A minor addition is made to the EXAMPLES section, reminding the application developer to
35999 free memory allocated as if by *malloc()*.

36000 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0255 [75,428] is applied.

+

36001 **NAME**36002 `getpwuid, getpwuid_r` — search user database for a user ID36003 **SYNOPSIS**

```
36004     #include <pwd.h>
36005     struct passwd *getpwuid(uid_t uid);
36006     int getpwuid_r(uid_t uid, struct passwd *pwd, char *buffer,
36007                   size_t bufsize, struct passwd **result);
```

36008 **DESCRIPTION**36009 The `getpwuid()` function shall search the user database for an entry with a matching *uid*.36010 The `getpwuid()` function need not be thread-safe.

36011 Applications wishing to check for error situations should set *errno* to 0 before calling `getpwuid()`.
 36012 If `getpwuid()` returns a null pointer and *errno* is set to non-zero, an error occurred.

36013 The `getpwuid_r()` function shall update the **passwd** structure pointed to by *pwd* and store a
 36014 pointer to that structure at the location pointed to by *result*. The structure shall contain an entry
 36015 from the user database with a matching *uid*. Storage referenced by the structure is allocated
 36016 from the memory provided with the *buffer* parameter, which is *bufsize* bytes in size. A call to
 36017 `sysconf(_SC_GETPW_R_SIZE_MAX)` returns either `-1` without changing *errno* or an initial value
 36018 suggested for the size of this buffer. A null pointer shall be returned at the location pointed to
 36019 by *result* on error or if the requested entry is not found.

36020 **RETURN VALUE**

36021 The `getpwuid()` function shall return a pointer to a **struct passwd** with the structure as defined in
 36022 `<pwd.h>` with a matching entry if found. A null pointer shall be returned if the requested entry
 36023 is not found, or an error occurs. On error, *errno* shall be set to indicate the error.

36024 The application shall not modify the structure to which the return value points, nor any storage |
 36025 areas pointed to by pointers within the structure. The returned pointer, and pointers within the |
 36026 structure, might be invalidated or the structure or the storage areas might be overwritten by a |
 36027 subsequent call to `getpwent()`, `getpwnam()`, or `getpwuid()`.

36028 If successful, the `getpwuid_r()` function shall return zero; otherwise, an error number shall be
 36029 returned to indicate the error.

36030 **ERRORS**

36031 These functions may fail if:

36032	[EIO]	An I/O error has occurred.
36033	[EINTR]	A signal was caught during <code>getpwuid()</code> .
36034	[EMFILE]	All file descriptors available to the process are currently open.
36035	[ENFILE]	The maximum allowable number of files is currently open in the system.

36036 The `getpwuid_r()` function may fail if:

36037	[ERANGE]	Insufficient storage was supplied via <i>buffer</i> and <i>bufsize</i> to contain the data to be 36038 referenced by the resulting passwd structure.

EXAMPLES

Note that `sysconf(_SC_GETPW_R_SIZE_MAX)` may return `-1` if there is no hard limit on the size of the buffer needed to store all the groups returned. This example shows how an application can allocate a buffer of sufficient size to work with `getpwuid_r()`.

```

36043 long int initlen = sysconf(_SC_GETPW_R_SIZE_MAX);
36044 size_t len;
36045 if (initlen == -1)
36046     /* Default initial length. */
36047     len = 1024;
36048 else
36049     len = (size_t) initlen;
36050 struct passwd result;
36051 struct passwd *resultp;
36052 char *buffer = malloc(len);
36053 if (buffer == NULL)
36054     ...handle error...
36055 int e;
36056 while ((e = getpwuid_r(42, &result, buffer, len, &resultp)) == ERANGE)
36057 {
36058     size_t newlen = 2 * len;
36059     if (newlen < len)
36060         ...handle error...
36061     len = newlen;
36062     char *newbuffer = realloc(buffer, len);
36063     if (newbuffer == NULL)
36064         ...handle error...
36065     buffer = newbuffer;
36066 }
36067 if (e != 0)
36068     ...handle error...
36069 free (buffer);

```

Getting an Entry for the Root User

The following example gets the user database entry for the user with user ID 0 (root).

```

36072 #include <sys/types.h>
36073 #include <pwd.h>
36074 ...
36075 uid_t id = 0;
36076 struct passwd *pwd;
36077 pwd = getpwuid(id);

```

Finding the Name for the Effective User ID

The following example defines *pws* as a pointer to a structure of type **passwd**, which is used to store the structure pointer returned by the call to the *getpwuid()* function. The *geteuid()* function shall return the effective user ID of the calling process; this is used as the search criteria for the *getpwuid()* function. The call to *getpwuid()* shall return a pointer to the structure containing that user ID value.

```
#include <unistd.h>
#include <sys/types.h>
#include <pwd.h>
...
struct passwd *pws;
pws = getpwuid(geteuid());
```

Finding an Entry in the User Database

The following example uses *getpwuid()* to search the user database for a user ID that was previously stored in a **stat** structure, then prints out the user name if it is found. If the user is not found, the program prints the numeric value of the user ID for the entry.

```
#include <sys/types.h>
#include <pwd.h>
#include <stdio.h>
...
struct stat statbuf;
struct passwd *pwd;
...
if ((pwd = getpwuid(statbuf.st_uid)) != NULL)
    printf(" %-8.8s", pwd->pw_name);
else
    printf(" %-8d", statbuf.st_uid);
```

APPLICATION USAGE

Three names associated with the current process can be determined: *getpwuid(geteuid())* returns the name associated with the effective user ID of the process; *getlogin()* returns the name associated with the current login activity; and *getpwuid(getuid())* returns the name associated with the real user ID of the process.

The *getpwuid_r()* function is thread-safe and returns values in a user-supplied buffer instead of possibly using a static data area that may be overwritten by each call.

Portable applications should take into account that it is usual for an implementation to return `-1` from *sysconf()* indicating that there is no maximum for `_SC_GETPW_R_SIZE_MAX`.

36154 **NAME**

36155 getrlimit, setrlimit — control maximum resource consumption

36156 **SYNOPSIS**

```

36157 XSI    #include <sys/resource.h>
36158
36158     int getrlimit(int resource, struct rlimit *rlp);
36159     int setrlimit(int resource, const struct rlimit *rlp);

```

36160 **DESCRIPTION**

36161 The *getrlimit()* function shall get, and the *setrlimit()* function shall set, limits on the consumption
 36162 of a variety of resources.

36163 Each call to either *getrlimit()* or *setrlimit()* identifies a specific resource to be operated upon as
 36164 well as a resource limit. A resource limit is represented by an **rlimit** structure. The *rlim_cur*
 36165 member specifies the current or soft limit and the *rlim_max* member specifies the maximum or
 36166 hard limit. Soft limits may be changed by a process to any value that is less than or equal to the
 36167 hard limit. A process may (irreversibly) lower its hard limit to any value that is greater than or
 36168 equal to the soft limit. Only a process with appropriate privileges can raise a hard limit. Both
 36169 hard and soft limits can be changed in a single call to *setrlimit()* subject to the constraints
 36170 described above.

36171 The value RLIM_INFINITY, defined in **<sys/resource.h>**, shall be considered to be larger than
 36172 any other limit value. If a call to *getrlimit()* returns RLIM_INFINITY for a resource, it means the
 36173 implementation shall not enforce limits on that resource. Specifying RLIM_INFINITY as any
 36174 resource limit value on a successful call to *setrlimit()* shall inhibit enforcement of that resource
 36175 limit.

36176 The following resources are defined:

36177	RLIMIT_CORE	This is the maximum size of a core file, in bytes, that may be created by a process. A limit of 0 shall prevent the creation of a core file. If this limit is exceeded, the writing of a core file shall terminate at this size.
36178		
36179		
36180	RLIMIT_CPU	This is the maximum amount of CPU time, in seconds, used by a process. If this limit is exceeded, SIGXCPU shall be generated for the process. If the process is catching or ignoring SIGXCPU, or all threads belonging to that process are blocking SIGXCPU, the behavior is unspecified.
36181		
36182		
36183		
36184	RLIMIT_DATA	This is the maximum size of a data segment of the process, in bytes. If this limit is exceeded, the <i>malloc()</i> function shall fail with <i>errno</i> set to [ENOMEM].
36185		
36186		
36187	RLIMIT_FSIZE	This is the maximum size of a file, in bytes, that may be created by a process. If a write or truncate operation would cause this limit to be exceeded, SIGXFSZ shall be generated for the thread. If the thread is blocking, or the process is catching or ignoring SIGXFSZ, continued attempts to increase the size of a file from end-of-file to beyond the limit shall fail with <i>errno</i> set to [EFBIG].
36188		
36189		
36190		
36191		
36192		
36193	RLIMIT_NOFILE	This is a number one greater than the maximum value that the system may assign to a newly-created descriptor. If this limit is exceeded, functions that allocate a file descriptor shall fail with <i>errno</i> set to [EMFILE]. This limit constrains the number of file descriptors that a process may allocate.
36194		
36195		
36196		
36197		

36198	RLIMIT_STACK	This is the maximum size of the initial thread's stack, in bytes. The implementation does not automatically grow the stack beyond this limit.
36199		If this limit is exceeded, SIGSEGV shall be generated for the thread. If the
36200		thread is blocking SIGSEGV, or the process is ignoring or catching
36201		SIGSEGV and has not made arrangements to use an alternate stack, the
36202		disposition of SIGSEGV shall be set to SIG_DFL before it is generated.
36203		
36204	RLIMIT_AS	This is the maximum size of total available memory of the process, in
36205		bytes. If this limit is exceeded, the <i>malloc()</i> and <i>mmap()</i> functions shall fail
36206		with <i>errno</i> set to [ENOMEM]. In addition, the automatic stack growth
36207		fails with the effects outlined above.
36208	When using the <i>getrlimit()</i> function, if a resource limit can be represented correctly in an object	
36209	of type rlim_t , then its representation is returned; otherwise, if the value of the resource limit is	
36210	equal to that of the corresponding saved hard limit, the value returned shall be	
36211	RLIM_SAVED_MAX; otherwise, the value returned shall be RLIM_SAVED_CUR.	
36212	When using the <i>setrlimit()</i> function, if the requested new limit is RLIM_INFINITY, the new limit	
36213	shall be "no limit"; otherwise, if the requested new limit is RLIM_SAVED_MAX, the new limit	
36214	shall be the corresponding saved hard limit; otherwise, if the requested new limit is	
36215	RLIM_SAVED_CUR, the new limit shall be the corresponding saved soft limit; otherwise, the	
36216	new limit shall be the requested value. In addition, if the corresponding saved limit can be	
36217	represented correctly in an object of type rlim_t then it shall be overwritten with the new limit.	
36218	The result of setting a limit to RLIM_SAVED_MAX or RLIM_SAVED_CUR is unspecified unless	
36219	a previous call to <i>getrlimit()</i> returned that value as the soft or hard limit for the corresponding	
36220	resource limit.	
36221	The determination of whether a limit can be correctly represented in an object of type rlim_t is	
36222	implementation-defined. For example, some implementations permit a limit whose value is	
36223	greater than RLIM_INFINITY and others do not.	
36224	The <i>exec</i> family of functions shall cause resource limits to be saved.	
36225	RETURN VALUE	
36226	Upon successful completion, <i>getrlimit()</i> and <i>setrlimit()</i> shall return 0. Otherwise, these functions	
36227	shall return -1 and set <i>errno</i> to indicate the error.	
36228	ERRORS	
36229	The <i>getrlimit()</i> and <i>setrlimit()</i> functions shall fail if:	
36230	[EINVAL]	An invalid <i>resource</i> was specified; or in a <i>setrlimit()</i> call, the new <i>rlim_cur</i>
36231		exceeds the new <i>rlim_max</i> .
36232	[EPERM]	The limit specified to <i>setrlimit()</i> would have raised the maximum limit value,
36233		and the calling process does not have appropriate privileges.
36234	The <i>setrlimit()</i> function may fail if:	
36235	[EINVAL]	The limit specified cannot be lowered because current usage is already higher
36236		than the limit.

EXAMPLES

None.

APPLICATION USAGE

If a process attempts to set the hard limit or soft limit for RLIMIT_NOFILE to less than the value of {_POSIX_OPEN_MAX} from <limits.h>, unexpected behavior may occur.

If a process attempts to set the hard limit or soft limit for RLIMIT_NOFILE to less than the highest currently open file descriptor +1, unexpected behavior may occur.

RATIONALE

It should be noted that RLIMIT_STACK applies “at least” to the stack of the initial thread in the process, and not to the sum of all the stacks in the process, as that would be very limiting unless the value is so big as to provide no value at all with a single thread.

FUTURE DIRECTIONS

None.

SEE ALSO

exec, fork(), malloc(), open(), sigaltstack(), sysconf(), ulimit()

XBD <stropts.h>, <sys/resource.h>

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

An APPLICATION USAGE section is added.

Large File Summit extensions are added.

Issue 6

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/25 is applied, changing wording for RLIMIT_NOFILE in the DESCRIPTION related to functions that allocate a file descriptor failing with [EMFILE]. Text is added to the APPLICATION USAGE section noting the consequences of a process attempting to set the hard or soft limit for RLIMIT_NOFILE less than the highest currently open file descriptor +1.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/46 is applied, updating the definition of RLIMIT_STACK in the DESCRIPTION from “the maximum size of a process stack” to “the maximum size of the initial thread’s stack”. Text is added to the RATIONALE section.

NAME

getrusage — get information about resource utilization

SYNOPSIS

```
#include <sys/resource.h>

int getrusage(int who, struct rusage *r_usage);
```

DESCRIPTION

The *getrusage()* function shall provide measures of the resources used by the current process or its terminated and waited-for child processes. If the value of the *who* argument is `RUSAGE_SELF`, information shall be returned about resources used by the current process. If the value of the *who* argument is `RUSAGE_CHILDREN`, information shall be returned about resources used by the terminated and waited-for children of the current process. If the child is never waited for (for example, if the parent has `SA_NOCLDWAIT` set or sets `SIGCHLD` to `SIG_IGN`), the resource information for the child process is discarded and not included in the resource information provided by *getrusage()*.

The *r_usage* argument is a pointer to an object of type **struct rusage** in which the returned information is stored.

RETURN VALUE

Upon successful completion, *getrusage()* shall return 0; otherwise, `-1` shall be returned and *errno* set to indicate the error.

ERRORS

The *getrusage()* function shall fail if:

[EINVAL] The value of the *who* argument is not valid.

EXAMPLES**Using getrusage()**

The following example returns information about the resources used by the current process.

```
#include <sys/resource.h>
...
int who = RUSAGE_SELF;
struct rusage usage;
int ret;

ret = getrusage(who, &usage);
```

APPLICATION USAGE

36308	CHANGE HISTORY
36309	First released in Issue 4, Version 2.
36310	Issue 5
36311	Moved from X/OPEN UNIX extension to BASE.

36312 **NAME**36313 gets — get a string from a *stdin* stream36314 **SYNOPSIS**

```
36315 OB      #include <stdio.h>
36316      char *gets(char *s);
```

36317 **DESCRIPTION**

36318 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 36319 conflict between the requirements described here and the ISO C standard is unintentional. This
 36320 volume of POSIX.1-2008 defers to the ISO C standard.

36321 The *gets()* function shall read bytes from the standard input stream, *stdin*, into the array pointed
 36322 to by *s*, until a <newline> is read or an end-of-file condition is encountered. Any <newline> shall
 36323 be discarded and a null byte shall be placed immediately after the last byte read into the array.

36324 CX The *gets()* function may mark the last data access timestamp of the file associated with *stream* for
 36325 update. The last data access timestamp shall be marked for update by the first successful
 36326 execution of *fgetc()*, *fgets()*, *fread()*, *fscanf()*, *getc()*, *getchar()*, *getdelim()*, *getline()*, *gets()*, or
 36327 *scanf()* using *stream* that returns data not supplied by a prior call to *ungetc()*.

36328 **RETURN VALUE**

36329 Upon successful completion, *gets()* shall return *s*. If the end-of-file indicator for the stream is set,
 36330 or if the stream is at end-of-file, the end-of-file indicator for the stream shall be set and *gets()*
 36331 shall return a null pointer. If a read error occurs, the error indicator for the stream shall be set,
 36332 CX *gets()* shall return a null pointer, and set *errno* to indicate the error.

36333 **ERRORS**36334 Refer to *fgetc()*.36335 **EXAMPLES**

36336 None.

36337 **APPLICATION USAGE**

36338 Reading a line that overflows the array pointed to by *s* results in undefined behavior. The use of
 36339 *fgets()* is recommended.

36340 Since the user cannot specify the length of the buffer passed to *gets()*, use of this function is
 36341 discouraged. The length of the string read is unlimited. It is possible to overflow this buffer in
 36342 such a way as to cause applications to fail, or possible system security violations.

36343 Applications should use the *fgets()* function instead of the obsolescent *gets()* function.

36344 **RATIONALE**

36345 The standard developers decided to mark the *gets()* function as obsolescent even though it is in
 36346 the ISO C standard due to the possibility of buffer overflow.

36347 **FUTURE DIRECTIONS**

36348 The *gets()* function may be removed in a future version.

36349 **SEE ALSO**36350 [Section 2.5](#) (on page 495), [feof\(\)](#), [ferror\(\)](#), [fgets\(\)](#)36351 XBD [<stdio.h>](#)

CHANGE HISTORY

36352 First released in Issue 1. Derived from Issue 1 of the SVID.

36361 NAME

36362 getservbyname, getservbyport, getservent — network services database functions

36363 SYNOPSIS

36364 #include <netdb.h>

36365 struct servent *getservbyname(const char *name, const char *proto);

36366 struct servent *getservbyport(int port, const char *proto);

36367 struct servent *getservent(void);

36368 DESCRIPTION

36369 Refer to *endservent()*.

36370 **NAME**

36371 getsid — get the process group ID of a session leader

36372 **SYNOPSIS**

36373 #include <unistd.h>

36374 pid_t getsid(pid_t pid);

36375 **DESCRIPTION**

36376 The *getsid()* function shall obtain the process group ID of the process that is the session leader of
 36377 the process specified by *pid*. If *pid* is (**pid_t**)0, it specifies the calling process.

36378 **RETURN VALUE**

36379 Upon successful completion, *getsid()* shall return the process group ID of the session leader of
 36380 the specified process. Otherwise, it shall return **-1** and set *errno* to indicate the error. |

36381 **ERRORS**36382 The *getsid()* function shall fail if:

36383 [EPERM] The process specified by *pid* is not in the same session as the calling process,
 36384 and the implementation does not allow access to the process group ID of the
 36385 session leader of that process from the calling process.

36386 [ESRCH] There is no process with a process ID equal to *pid*.

36387 **EXAMPLES**

36388 None.

36389 **APPLICATION USAGE**

36390 None.

36391 **RATIONALE**

36392 None.

36393 **FUTURE DIRECTIONS**

36394 None.

36400 **Issue 5**

36401 Moved from X/OPEN UNIX extension to BASE.

36402 **Issue 7**36403 The *getsid()* function is moved from the XSI option to the Base.

36404 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0258 [421] is applied. +

NAME

getsockname — get the socket name

SYNOPSIS

```
#include <sys/socket.h>
```

```
int getsockname(int socket, struct sockaddr *restrict address,
                socklen_t *restrict address_len);
```

DESCRIPTION

The *getsockname()* function shall retrieve the locally-bound name of the specified socket, store this address in the **sockaddr** structure pointed to by the *address* argument, and store the length of this address in the object pointed to by the *address_len* argument.

The *address_len* argument points to a **socklen_t** object which on input specifies the length of the supplied **sockaddr** structure, and on output specifies the length of the stored address. If the actual length of the address is greater than the length of the supplied **sockaddr** structure, the stored address shall be truncated.

If the socket has not been bound to a local name, the value stored in the object pointed to by *address* is unspecified.

RETURN VALUE

Upon successful completion, 0 shall be returned, the *address* argument shall point to the address of the socket, and the *address_len* argument shall point to the length of the address. Otherwise, -1 shall be returned and *errno* set to indicate the error.

ERRORS

The *getsockname()* function shall fail if:

[EBADF] The *socket* argument is not a valid file descriptor.

[ENOTSOCK] The *socket* argument does not refer to a socket.

[EOPNOTSUPP] The operation is not supported for this socket's protocol.

The *getsockname()* function may fail if:

[EINVAL] The socket has been shut down.

[ENOBUFS] Insufficient resources were available in the system to complete the function.

CHANGE HISTORY

36444 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

36446 The **restrict** keyword is added to the *getsockname()* prototype for alignment with the
36447 ISO/IEC 9899:1999 standard.

Issue 7

36448 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0259 [464] is applied.

+

NAME

getsockopt — get the socket options

SYNOPSIS

```
#include <sys/socket.h>

int getsockopt(int socket, int level, int option_name,
               void *restrict option_value, socklen_t *restrict option_len);
```

DESCRIPTION

The *getsockopt()* function manipulates options associated with a socket.

The *getsockopt()* function shall retrieve the value for the option specified by the *option_name* argument for the socket specified by the *socket* argument. If the size of the option value is greater than *option_len*, the value stored in the object pointed to by the *option_value* argument shall be silently truncated. Otherwise, the object pointed to by the *option_len* argument shall be modified to indicate the actual length of the value.

The *level* argument specifies the protocol level at which the option resides. To retrieve options at the socket level, specify the *level* argument as SOL_SOCKET. To retrieve options at other levels, supply the appropriate level identifier for the protocol controlling the option. For example, to indicate that an option is interpreted by the TCP (Transmission Control Protocol), set *level* to IPPROTO_TCP as defined in the **<netinet/in.h>** header.

The socket in use may require the process to have appropriate privileges to use the *getsockopt()* function.

The *option_name* argument specifies a single option to be retrieved. It can be one of the socket-level options defined in **<sys/socket.h>** and described in [Section 2.10.16](#) (on page 527).

RETURN VALUE

Upon successful completion, *getsockopt()* shall return 0; otherwise, -1 shall be returned and *errno* set to indicate the error.

ERRORS

The *getsockopt()* function shall fail if:

- [EBADF] The *socket* argument is not a valid file descriptor.
- [EINVAL] The specified option is invalid at the specified socket level.
- [ENOPROTOOPT] The option is not supported by the protocol.
- [ENOTSOCK] The *socket* argument does not refer to a socket.

The *getsockopt()* function may fail if:

- [EACCES] The calling process does not have appropriate privileges.
- [EINVAL] The socket has been shut down.
- [ENOBUFFS] Insufficient resources are available in the system to complete the function.

36486 EXAMPLES

36487 None.

36488 APPLICATION USAGE

36489 None.

36490 RATIONALE

36491 None.

36496 XBD [<sys/socket.h>](#), [<netinet/in.h>](#)

36497 CHANGE HISTORY

36498 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

36499 The **restrict** keyword is added to the *getsockopt()* prototype for alignment with the
36500 ISO/IEC 9899:1999 standard.

36501 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/47 is applied, updating the description of
36502 SO_LINGER in the DESCRIPTION so that it blocks the calling thread rather than the process.

36503 Issue 7

36504 Austin Group Interpretation 1003.1-2001 #158 is applied, removing text relating to socket options
36505 that is now in [Section 2.10.16](#) (on page 527).

NAME

getsubopt — parse suboption arguments from a string

SYNOPSIS

```
#include <stdlib.h>
```

```
int getsubopt(char **optionp, char * const *keylistp, char **valuep);
```

DESCRIPTION

The *getsubopt()* function shall parse suboption arguments in a flag argument. Such options often result from the use of *getopt()*.

The *getsubopt()* argument *optionp* is a pointer to a pointer to the option argument string. The suboption arguments shall be separated by <comma> characters and each may consist of either a single token, or a token-value pair separated by an <equals-sign>.

The *keylistp* argument shall be a pointer to a vector of strings. The end of the vector is identified by a null pointer. Each entry in the vector is one of the possible tokens that might be found in **optionp*. Since <comma> characters delimit suboption arguments in *optionp*, they should not appear in any of the strings pointed to by *keylistp*. Similarly, because an <equals-sign> separates a token from its value, the application should not include an <equals-sign> in any of the strings pointed to by *keylistp*. The *getsubopt()* function shall not modify the *keylistp* vector. +

The *valuep* argument is the address of a value string pointer.

If a <comma> appears in *optionp*, it shall be interpreted as a suboption separator. After <comma> characters have been processed, if there are one or more <equals-sign> characters in a suboption string, the first <equals-sign> in any suboption string shall be interpreted as a separator between a token and a value. Subsequent <equals-sign> characters in a suboption string shall be interpreted as part of the value.

If the string at **optionp* contains only one suboption argument (equivalently, no <comma> characters), *getsubopt()* shall update **optionp* to point to the null character at the end of the string. Otherwise, it shall isolate the suboption argument by replacing the <comma> separator with a null character, and shall update **optionp* to point to the start of the next suboption argument. If the suboption argument has an associated value (equivalently, contains an <equals-sign>), *getsubopt()* shall update **valuep* to point to the value's first character. Otherwise, it shall set **valuep* to a null pointer. The calling application may use this information to determine whether the presence or absence of a value for the suboption is an error.

Additionally, when *getsubopt()* fails to match the suboption argument with a token in the *keylistp* array, the calling application should decide if this is an error, or if the unrecognized option should be processed in another way.

RETURN VALUE

The *getsubopt()* function shall return the index of the matched token string, or -1 if no token strings were matched.

ERRORS

No errors are defined.

EXAMPLES

Parsing Suboptions

The following example uses the `getsubopt()` function to parse a *value* argument in the *optarg* external variable returned by a call to `getopt()`.

```
#include <stdio.h>
#include <stdlib.h>
#include <unistd.h>

int do_all;
const char *type;
int read_size;
int write_size;
int read_only;

enum
{
    RO_OPTION = 0,
    RW_OPTION,
    READ_SIZE_OPTION,
    WRITE_SIZE_OPTION
};

const char *mount_opts[] =
{
    [RO_OPTION] = "ro",
    [RW_OPTION] = "rw",
    [READ_SIZE_OPTION] = "rsize",
    [WRITE_SIZE_OPTION] = "wsize",
    NULL
};

int
main(int argc, char *argv[])
{
    char *subopts, *value;
    int opt;

    while ((opt = getopt(argc, argv, "at:o:")) != -1)
        switch(opt)
        {
            case 'a':
                do_all = 1;
                break;
            case 't':
                type = optarg;
                break;
            case 'o':
                subopts = optarg;
                while (*subopts != ' ')
                {
                    char *saved = subopts;
                    switch(getsubopt(&subopts, (char **)mount_opts,
```

```

36592         &value))
36593     {
36594     case RO_OPTION:
36595         read_only = 1;
36596         break;
36597     case RW_OPTION:
36598         read_only = 0;
36599         break;
36600     case READ_SIZE_OPTION:
36601         if (value == NULL)
36602             abort();
36603         read_size = atoi(value);
36604         break;
36605     case WRITE_SIZE_OPTION:
36606         if (value == NULL)
36607             abort();
36608         write_size = atoi(value);
36609         break;
36610     default:
36611         /* Unknown suboption. */
36612         printf("Unknown suboption '%s'\n", saved);
36613         abort();
36614     }
36615 }
36616 break;
36617 default:
36618     abort();
36619 }
36620
36621 /* Do the real work. */
36622 return 0;
36623 }

```

If the above example is invoked with:

```
program -o ro,rsiz=512
```

then after option parsing, the variable *do_all* will be 0, *type* will be a null pointer, *read_size* will be 512, *write_size* will be 0, and *read_only* will be 1. If it is invoked with:

```
program -o oops
```

it will print:

```
"Unknown suboption 'oops' "
```

before aborting.

APPLICATION USAGE

The value of **valuep* when *getsubopt()* returns *-1* is unspecified. Historical implementations provide various incompatible extensions to allow an application to access the suboption text that was not found in the *keylistp* array.

RATIONALE

The *keylistp* argument of *getsubopt()* is typed as **char * const *** to match historical practice. However, the standard is clear that implementations will not modify either the array or the strings contained in the array, as if the argument had been typed **const char * const ***.

FUTURE DIRECTIONS

None.

NAME

gettimeofday — get the date and time

SYNOPSIS

OB XSI `#include <sys/time.h>`

```
int gettimeofday(struct timeval *restrict tp, void *restrict tzp);
```

DESCRIPTION

The *gettimeofday()* function shall obtain the current time, expressed as seconds and microseconds since the Epoch, and store it in the **timeval** structure pointed to by *tp*. The resolution of the system clock is unspecified.

If *tzp* is not a null pointer, the behavior is unspecified.

RETURN VALUE

The *gettimeofday()* function shall return 0 and no value shall be reserved to indicate an error.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

Applications should use the *clock_gettime()* function instead of the obsolescent *gettimeofday()* function.

RATIONALE

None.

FUTURE DIRECTIONS

The *gettimeofday()* function may be removed in a future version.

SEE ALSO

clock_getres(), *ctime()*

XBD [<sys/time.h>](#)

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Issue 6

The DESCRIPTION is updated to refer to “seconds since the Epoch” rather than “seconds since 00:00:00 UTC (Coordinated Universal Time), January 1 1970” for consistency with other *time* functions.

The **restrict** keyword is added to the *gettimeofday()* prototype for alignment with the ISO/IEC 9899:1999 standard.

Issue 7

The *gettimeofday()* function is marked obsolescent.

36695 **NAME**

36696 getuid — get a real user ID

36697 **SYNOPSIS**

36698 #include <unistd.h>

36699 uid_t getuid(void);

36700 **DESCRIPTION**36701 The *getuid()* function shall return the real user ID of the calling process.36702 **RETURN VALUE**36703 The *getuid()* function shall always be successful and no return value is reserved to indicate the
36704 error.36705 **ERRORS**

36706 No errors are defined.

36707 **EXAMPLES**36708 **Setting the Effective User ID to the Real User ID**36709 The following example sets the effective user ID and the real user ID of the current process to the
36710 real user ID of the caller.36711 #include <unistd.h>
36712 #include <sys/types.h>
36713 ...
36714 setreuid(getuid(), getuid());

36726 First released in Issue 1. Derived from Issue 1 of the SVID.

36727 **Issue 6**36728 In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.36729 The following new requirements on POSIX implementations derive from alignment with the
36730 Single UNIX Specification:

- 36731
- The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was
36732 required for conforming implementations of previous POSIX specifications, it was not
36733 required for UNIX applications.

36734 NAME

36735 getutxent, getutxid, getutxline — get user accounting database entries

36736 SYNOPSIS

```
36737 XSI      #include <utmpx.h>
36738          struct utmpx *getutxent(void);
36739          struct utmpx *getutxid(const struct utmpx *id);
36740          struct utmpx *getutxline(const struct utmpx *line);
```

36741 DESCRIPTION

36742 Refer to *endutxent()*.

36743 **NAME**36744 `getwc` — get a wide character from a stream36745 **SYNOPSIS**36746 `#include <stdio.h>`36747 `#include <wchar.h>`36748 `wint_t getwc(FILE *stream);`36749 **DESCRIPTION**

36750 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any
 36751 conflict between the requirements described here and the ISO C standard is unintentional. This
 36752 volume of POSIX.1-2008 defers to the ISO C standard.

36753 The `getwc()` function shall be equivalent to `fgetwc()`, except that if it is implemented as a macro it
 36754 may evaluate *stream* more than once, so the argument should never be an expression with side-
 36755 effects.

36756 **RETURN VALUE**36757 Refer to `fgetwc()`.36758 **ERRORS**36759 Refer to `fgetwc()`.36760 **EXAMPLES**

36761 None.

36762 **APPLICATION USAGE**

36763 Since it may be implemented as a macro, `getwc()` may treat incorrectly a *stream* argument with
 36764 side-effects. In particular, `getwc(*f++)` does not necessarily work as expected. Therefore, use of
 36765 this function is not recommended; `fgetwc()` should be used instead.

36766 **RATIONALE**

36767 None.

36768 **FUTURE DIRECTIONS**

36769 None.

36779 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0270 [14] is applied.

+

NAME

getwchar — get a wide character from a *stdin* stream

SYNOPSIS

```
#include <wchar.h>
```

```
wint_t getwchar(void);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

The *getwchar()* function shall be equivalent to *getwc(stdin)*.

RETURN VALUE

Refer to *fgetwc()*.

ERRORS

Refer to *fgetwc()*.

EXAMPLES

None.

APPLICATION USAGE

If the **wint_t** value returned by *getwchar()* is stored into a variable of type **wchar_t** and then compared against the **wint_t** macro WEOF, the result may be incorrect. Only the **wint_t** type is guaranteed to be able to represent any wide character and WEOF.

RATIONALE

None.

FUTURE DIRECTIONS

None.

NAME

glob, globfree — generate pathnames matching a pattern

SYNOPSIS

```
#include <glob.h>

int glob(const char *restrict pattern, int flags,
         int (*errfunc)(const char *epath, int errno),
         glob_t *restrict pglob);
void globfree(glob_t *pglob);
```

DESCRIPTION

The *glob()* function is a pathname generator that shall implement the rules defined in XCU [Section 2.13](#) (on page 2354), with optional support for rule 3 in XCU [Section 2.13.3](#) (on page 2355).

The structure type **glob_t** is defined in **<glob.h>** and includes at least the following members:

Member Type	Member Name	Description
size_t	<i>gl_pathc</i>	Count of paths matched by <i>pattern</i> .
char **	<i>gl_pathv</i>	Pointer to a list of matched pathnames.
size_t	<i>gl_offs</i>	Slots to reserve at the beginning of <i>gl_pathv</i> .

The argument *pattern* is a pointer to a pathname pattern to be expanded. The *glob()* function shall match all accessible pathnames against this pattern and develop a list of all pathnames that match. In order to have access to a pathname, *glob()* requires search permission on every component of a path except the last, and read permission on each directory of any filename component of *pattern* that contains any of the following special characters: '*', '?', and '['.

The *glob()* function shall store the number of matched pathnames into *pglob->gl_pathc* and a pointer to a list of pointers to pathnames into *pglob->gl_pathv*. The pathnames shall be in sort order as defined by the current setting of the *LC_COLLATE* category; see XBD [Section 7.3.2](#) (on page 147). The first pointer after the last pathname shall be a null pointer. If the pattern does not match any pathnames, the returned number of matched paths is set to 0, and the contents of *pglob->gl_pathv* are implementation-defined.

It is the caller's responsibility to create the structure pointed to by *pglob*. The *glob()* function shall allocate other space as needed, including the memory pointed to by *gl_pathv*. The *globfree()* function shall free any space associated with *pglob* from a previous call to *glob()*.

The *flags* argument is used to control the behavior of *glob()*. The value of *flags* is a bitwise-inclusive OR of zero or more of the following constants, which are defined in **<glob.h>**:

GLOB_APPEND	Append pathnames generated to the ones from a previous call to <i>glob()</i> .
GLOB_DOOFFS	Make use of <i>pglob->gl_offs</i> . If this flag is set, <i>pglob->gl_offs</i> is used to specify how many null pointers to add to the beginning of <i>pglob->gl_pathv</i> . In other words, <i>pglob->gl_pathv</i> shall point to <i>pglob->gl_offs</i> null pointers, followed by <i>pglob->gl_pathc</i> pathname pointers, followed by a null pointer.
GLOB_ERR	Cause <i>glob()</i> to return when it encounters a directory that it cannot open or read. Ordinarily, <i>glob()</i> continues to find matches.
GLOB_MARK	Each pathname that is a directory that matches <i>pattern</i> shall have a <slash> appended.

- 36856 GLOB_NOCHECK Supports rule 3 in XCU [Section 2.13.3](#) (on page 2355). If *pattern* does not
 36857 match any pathname, then *glob()* shall return a list consisting of only
 36858 *pattern*, and the number of matched pathnames is 1.
- 36859 GLOB_NOESCAPE Disable backslash escaping.
- 36860 GLOB_NOSORT Ordinarily, *glob()* sorts the matching pathnames according to the current
 36861 setting of the *LC_COLLATE* category; see XBD [Section 7.3.2](#) (on page 147).
 36862 When this flag is used, the order of pathnames returned is unspecified.

36863 The GLOB_APPEND flag can be used to append a new set of pathnames to those found in a
 36864 previous call to *glob()*. The following rules apply to applications when two or more calls to
 36865 *glob()* are made with the same value of *pglob* and without intervening calls to *globfree()*:

- 36866 1. The first such call shall not set GLOB_APPEND. All subsequent calls shall set it.
- 36867 2. All the calls shall set GLOB_DOOFFS, or all shall not set it.
- 36868 3. After the second call, *pglob->gl_pathv* points to a list containing the following:
- 36869 a. Zero or more null pointers, as specified by GLOB_DOOFFS and *pglob->gl_offs*.
- 36870 b. Pointers to the pathnames that were in the *pglob->gl_pathv* list before the call, in
 36871 the same order as before.
- 36872 c. Pointers to the new pathnames generated by the second call, in the specified order.
- 36873 4. The count returned in *pglob->gl_pathc* shall be the total number of pathnames from the
 36874 two calls.
- 36875 5. The application can change any of the fields after a call to *glob()*. If it does, the
 36876 application shall reset them to the original value before a subsequent call, using the same
 36877 *pglob* value, to *globfree()* or *glob()* with the GLOB_APPEND flag.

36878 If, during the search, a directory is encountered that cannot be opened or read and *errfunc* is not
 36879 a null pointer, *glob()* calls (**errfunc()*) with two arguments:

- 36880 1. The *epath* argument is a pointer to the path that failed.
- 36881 2. The *errno* argument is the value of *errno* from the failure, as set by *opendir()*, *readdir()*, or
 36882 *stat()*. (Other values may be used to report other errors not explicitly documented for
 36883 those functions.)

36884 If (**errfunc()*) is called and returns non-zero, or if the GLOB_ERR flag is set in *flags*, *glob()* shall
 36885 stop the scan and return GLOB_ABORTED after setting *gl_pathc* and *gl_pathv* in *pglob* to reflect
 36886 the paths already scanned. If GLOB_ERR is not set and either *errfunc* is a null pointer or
 36887 (**errfunc()*) returns 0, the error shall be ignored.

36888 The *glob()* function shall not fail because of large files.

36889 RETURN VALUE

36890 Upon successful completion, *glob()* shall return 0. The argument *pglob->gl_pathc* shall return the
 36891 number of matched pathnames and the argument *pglob->gl_pathv* shall contain a pointer to a
 36892 null-terminated list of matched and sorted pathnames. However, if *pglob->gl_pathc* is 0, the
 36893 content of *pglob->gl_pathv* is undefined.

36894 The *globfree()* function shall not return a value.

36895 If *glob()* terminates due to an error, it shall return one of the non-zero constants defined in
 36896 **<glob.h>**. The arguments *pglob->gl_pathc* and *pglob->gl_pathv* are still set as defined above.

ERRORS

The *glob()* function shall fail and return the corresponding value if:

36899	GLOB_ABORTED	The scan was stopped because GLOB_ERR was set or (*errfunc()) returned non-zero.
36901	GLOB_NOMATCH	The pattern does not match any existing pathname, and GLOB_NOCHECK was not set in flags.
36903	GLOB_NOSPACE	An attempt to allocate memory failed.

EXAMPLES

One use of the GLOB_DOOFFS flag is by applications that build an argument list for use with *execv()*, *execve()*, or *execvp()*. Suppose, for example, that an application wants to do the equivalent of:

```
ls -l *.c
```

but for some reason:

```
system("ls -l *.c")
```

is not acceptable. The application could obtain approximately the same result using the sequence:

```
globbuf.gl_offs = 2;
glob("*.c", GLOB_DOOFFS, NULL, &globbuf);
globbuf.gl_pathv[0] = "ls";
globbuf.gl_pathv[1] = "-l";
execvp("ls", &globbuf.gl_pathv[0]);
```

Using the same example:

```
ls -l *.c *.h
```

could be approximately simulated using GLOB_APPEND as follows:

```
globbuf.gl_offs = 2;
glob("*.c", GLOB_DOOFFS, NULL, &globbuf);
glob("*.h", GLOB_DOOFFS|GLOB_APPEND, NULL, &globbuf);
...
```

APPLICATION USAGE

This function is not provided for the purpose of enabling utilities to perform pathname expansion on their arguments, as this operation is performed by the shell, and utilities are explicitly not expected to redo this. Instead, it is provided for applications that need to do pathname expansion on strings obtained from other sources, such as a pattern typed by a user or read from a file.

If a utility needs to see if a pathname matches a given pattern, it can use *fnmatch()*.

Note that *gl_pathc* and *gl_pathv* have meaning even if *glob()* fails. This allows *glob()* to report partial results in the event of an error. However, if *gl_pathc* is 0, *gl_pathv* is unspecified even if *glob()* did not return an error.

The GLOB_NOCHECK option could be used when an application wants to expand a pathname if wildcards are specified, but wants to treat the pattern as just a string otherwise. The *sh* utility might use this for option-arguments, for example.

The new pathnames generated by a subsequent call with GLOB_APPEND are not sorted together with the previous pathnames. This mirrors the way that the shell handles pathname

expansion when multiple expansions are done on a command line.

Applications that need tilde and parameter expansion should use *wordexp()*.

RATIONALE

It was claimed that the GLOB_DOOFFS flag is unnecessary because it could be simulated using:

```
new = (char **)malloc((n + pglob->gl_pathc + 1)
    * sizeof(char *));
(void) memcpy(new+n, pglob->gl_pathv,
    pglob->gl_pathc * sizeof(char *));
(void) memset(new, 0, n * sizeof(char *));
free(pglob->gl_pathv);
pglob->gl_pathv = new;
```

However, this assumes that the memory pointed to by *gl_pathv* is a block that was separately created using *malloc()*. This is not necessarily the case. An application should make no assumptions about how the memory referenced by fields in *pglob* was allocated. It might have been obtained from *malloc()* in a large chunk and then carved up within *glob()*, or it might have been created using a different memory allocator. It is not the intent of the standard developers to specify or imply how the memory used by *glob()* is managed.

The GLOB_APPEND flag would be used when an application wants to expand several different patterns into a single list.

FUTURE DIRECTIONS

None.

XBD [Section 7.3.2](#) (on page 147), [<glob.h>](#)

CHANGE HISTORY

First released in Issue 4. Derived from the ISO POSIX-2 standard.

Issue 5

Moved from POSIX2 C-language Binding to BASE.

Issue 6

The normative text is updated to avoid use of the term “must” for application requirements.

The **restrict** keyword is added to the *glob()* prototype for alignment with the ISO/IEC 9899:1999 standard.

36972 **NAME**

36973 gmtime, gmtime_r — convert a time value to a broken-down UTC time

36974 **SYNOPSIS**

```
36975 #include <time.h>
36976 struct tm *gmtime(const time_t *timer);
36977 CX struct tm *gmtime_r(const time_t *restrict timer,
36978 struct tm *restrict result);
```

36979 **DESCRIPTION**

36980 CX For *gmtime()*: The functionality described on this reference page is aligned with the ISO C
 36981 standard. Any conflict between the requirements described here and the ISO C standard is
 36982 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

36983 The *gmtime()* function shall convert the time in seconds since the Epoch pointed to by *timer* into
 36984 a broken-down time, expressed as Coordinated Universal Time (UTC).

36985 CX The relationship between a time in seconds since the Epoch used as an argument to *gmtime()*
 36986 and the **tm** structure (defined in the **<time.h>** header) is that the result shall be as specified in
 36987 the expression given in the definition of seconds since the Epoch (see XBD [Section 4.15](#), on page
 36988 113), where the names in the structure and in the expression correspond.

36989 The same relationship shall apply for *gmtime_r()*.

36990 The *gmtime()* function need not be thread-safe.

36991 The *asctime()*, *ctime()*, *gmtime()*, and *localtime()* functions shall return values in one of two static
 36992 objects: a broken-down time structure and an array of type **char**. Execution of any of the
 36993 functions may overwrite the information returned in either of these objects by any of the other
 36994 functions.

36995 The *gmtime_r()* function shall convert the time in seconds since the Epoch pointed to by *timer*
 36996 into a broken-down time expressed as Coordinated Universal Time (UTC). The broken-down
 36997 time is stored in the structure referred to by *result*. The *gmtime_r()* function shall also return the
 36998 address of the same structure.

36999 **RETURN VALUE**

37000 Upon successful completion, the *gmtime()* function shall return a pointer to a **struct tm**. If an
 37001 CX error is detected, *gmtime()* shall return a null pointer and set *errno* to indicate the error.

37002 Upon successful completion, *gmtime_r()* shall return the address of the structure pointed to by
 37003 the argument *result*. If an error is detected, *gmtime_r()* shall return a null pointer and set *errno* to
 37004 indicate the error.

37005 **ERRORS**

37006 CX The *gmtime()* and *gmtime_r()* functions shall fail if:

37007 CX **[EOVERFLOW]** The result cannot be represented.

EXAMPLES

None.

APPLICATION USAGE

The *gmtime_r()* function is thread-safe and returns values in a user-supplied buffer instead of possibly using a static data area that may be overwritten by each call.

RATIONALE

None.

FUTURE DIRECTIONS

None.

XBD Section 4.15 (on page 113), [<time.h>](#)

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

A note indicating that the *gmtime()* function need not be reentrant is added to the DESCRIPTION.

The *gmtime_r()* function is included for alignment with the POSIX Threads Extension.

Issue 6

The *gmtime_r()* function is marked as part of the Thread-Safe Functions option.

Extensions beyond the ISO C standard are marked.

The APPLICATION USAGE section is updated to include a note on the thread-safe function and its avoidance of possibly using a static data area.

The **restrict** keyword is added to the *gmtime_r()* prototype for alignment with the ISO/IEC 9899:1999 standard.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/27 is applied, adding the [EOVERFLOW] error.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/48 is applied, updating the error handling for *gmtime_r()*.

Issue 7

Austin Group Interpretation 1003.1-2001 #156 is applied.

The *gmtime_r()* function is moved from the Thread-Safe Functions option to the Base.

NAME

grantpt — grant access to the slave pseudo-terminal device

SYNOPSIS

```
#include <stdlib.h>

int grantpt(int fildes);
```

DESCRIPTION

The *grantpt()* function shall change the mode and ownership of the slave pseudo-terminal device associated with its master pseudo-terminal counterpart. The *fildes* argument is a file descriptor that refers to a master pseudo-terminal device. The user ID of the slave shall be set to the real UID of the calling process and the group ID shall be set to an unspecified group ID. The permission mode of the slave pseudo-terminal shall be set to readable and writable by the owner, and writable by the group.

The behavior of the *grantpt()* function is unspecified if the application has installed a signal handler to catch SIGCHLD signals.

RETURN VALUE

Upon successful completion, *grantpt()* shall return 0; otherwise, it shall return -1 and set *errno* to indicate the error.

ERRORS

The *grantpt()* function may fail if:

[EBADF]	The <i>fildes</i> argument is not a valid open file descriptor.
[EINVAL]	The <i>fildes</i> argument is not associated with a master pseudo-terminal device.
[EACCES]	The corresponding slave pseudo-terminal device could not be accessed.

Moved from X/OPEN UNIX extension to BASE.

The last paragraph of the DESCRIPTION is moved from the APPLICATION USAGE section.

37078 **Issue 7**
37079

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0272 [96] is applied.

+

37080 **NAME**37081 `hcreate, hdestroy, hsearch` — manage hash search table37082 **SYNOPSIS**

```

37083 XSI      #include <search.h>
37084
37084      int hcreate(size_t nel);
37085      void hdestroy(void);
37086      ENTRY *hsearch(ENTRY item, ACTION action);

```

37087 **DESCRIPTION**37088 The `hcreate()`, `hdestroy()`, and `hsearch()` functions shall manage hash search tables.

37089 The `hcreate()` function shall allocate sufficient space for the table, and the application shall ensure it is called before `hsearch()` is used. The `nel` argument is an estimate of the maximum number of entries that the table shall contain. This number may be adjusted upward by the algorithm in order to obtain certain mathematically favorable circumstances.

37093 The `hdestroy()` function shall dispose of the search table, and may be followed by another call to `hcreate()`. After the call to `hdestroy()`, the data can no longer be considered accessible.

37095 The `hsearch()` function is a hash-table search routine. It shall return a pointer into a hash table indicating the location at which an entry can be found. The `item` argument is a structure of type **ENTRY** (defined in the `<search.h>` header) containing two pointers: `item.key` points to the comparison key (a `char *`), and `item.data` (a `void *`) points to any other data to be associated with that key. The comparison function used by `hsearch()` is `strcmp()`. The `action` argument is a member of an enumeration type **ACTION** indicating the disposition of the entry if it cannot be found in the table. **ENTER** indicates that the item should be inserted in the table at an appropriate point. **FIND** indicates that no entry should be made. Unsuccessful resolution is indicated by the return of a null pointer.

37104 These functions need not be thread-safe.

37105 **RETURN VALUE**37106 The `hcreate()` function shall return 0 if it cannot allocate sufficient space for the table; otherwise, it shall return non-zero.37108 The `hdestroy()` function shall not return a value.

37109 The `hsearch()` function shall return a null pointer if either the action is **FIND** and the item could not be found or the action is **ENTER** and the table is full.

37111 **ERRORS**37112 The `hcreate()` and `hsearch()` functions may fail if:

37113 [ENOMEM] Insufficient storage space is available.

37114 **EXAMPLES**

37115 The following example reads in strings followed by two numbers and stores them in a hash table, discarding duplicates. It then reads in strings and finds the matching entry in the hash table and prints it out.

```

37118 #include <stdio.h>
37119 #include <search.h>
37120 #include <string.h>
37121
37121 struct info {          /* This is the info stored in the table */
37122     int age, room;     /* other than the key. */
37123 };

```

```

37124     #define NUM_EMPL      5000      /* # of elements in search table. */
37125     int main(void)
37126     {
37127         char string_space[NUM_EMPL*20]; /* Space to store strings. */
37128         struct info info_space[NUM_EMPL]; /* Space to store employee info. */
37129         char *str_ptr = string_space; /* Next space in string_space. */
37130         struct info *info_ptr = info_space;
37131                                     /* Next space in info_space. */
37132         ENTRY item;
37133         ENTRY *found_item; /* Name to look for in table. */
37134         char name_to_find[30];
37135
37136         int i = 0;
37137
37138         /* Create table; no error checking is performed. */
37139         (void) hcreate(NUM_EMPL);
37140         while (scanf("%s%d%d", str_ptr, &info_ptr->age,
37141                     &info_ptr->room) != EOF && i++ < NUM_EMPL) {
37142             /* Put information in structure, and structure in item. */
37143             item.key = str_ptr;
37144             item.data = info_ptr;
37145             str_ptr += strlen(str_ptr) + 1;
37146             info_ptr++;
37147
37148             /* Put item into table. */
37149             (void) hsearch(item, ENTER);
37150         }
37151
37152         /* Access table. */
37153         item.key = name_to_find;
37154         while (scanf("%s", item.key) != EOF) {
37155             if ((found_item = hsearch(item, FIND)) != NULL) {
37156                 /* If item is in the table. */
37157                 (void)printf("found %s, age = %d, room = %d\n",
37158                             found_item->key,
37159                             ((struct info *)found_item->data)->age,
37160                             ((struct info *)found_item->data)->room);
37161             } else
37162                 (void)printf("no such employee %s\n", name_to_find);
37163         }
37164         return 0;
37165     }

```

APPLICATION USAGE

The *hcreate()* and *hsearch()* functions may use *malloc()* to allocate space.

NAME

htonl, htons, ntohl, ntohs — convert values between host and network byte order

SYNOPSIS

```
#include <arpa/inet.h>

uint32_t htonl(uint32_t hostlong);
uint16_t htons(uint16_t hostshort);
uint32_t ntohl(uint32_t netlong);
uint16_t ntohs(uint16_t netshort);
```

DESCRIPTION

These functions shall convert 16-bit and 32-bit quantities between network byte order and host byte order.

On some implementations, these functions are defined as macros.

The `uint32_t` and `uint16_t` types are defined in `<inttypes.h>`.

RETURN VALUE

The `htonl()` and `htons()` functions shall return the argument value converted from host to network byte order.

The `ntohl()` and `ntohs()` functions shall return the argument value converted from network to host byte order.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

These functions are most often used in conjunction with IPv4 addresses and ports as returned by `gethostent()` and `getservent()`.

RATIONALE

37212 **NAME**

37213 hypot, hypotf, hypotl — Euclidean distance function

37214 **SYNOPSIS**

```
37215 #include <math.h>
37216 double hypot(double x, double y);
37217 float hypotf(float x, float y);
37218 long double hypotl(long double x, long double y);
```

37219 **DESCRIPTION**

37220 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 37221 conflict between the requirements described here and the ISO C standard is unintentional. This
 37222 volume of POSIX.1-2008 defers to the ISO C standard.

37223 These functions shall compute the value of the square root of x^2+y^2 without undue overflow or
 37224 underflow.

37225 An application wishing to check for error situations should set *errno* to zero and call
 37226 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 37227 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 37228 zero, an error has occurred.

37229 **RETURN VALUE**

37230 Upon successful completion, these functions shall return the length of the hypotenuse of a right-
 37231 angled triangle with sides of length *x* and *y*.

37232 If the correct value would cause overflow, a range error shall occur and *hypot()*, *hypotf()*, and
 37233 *hypotl()* shall return the value of the macro HUGE_VAL, HUGE_VALF, and HUGE_VALL,
 37234 respectively.

37235 MX If *x* or *y* is $\pm\text{Inf}$, $\pm\text{Inf}$ shall be returned (even if one of *x* or *y* is NaN).

37236 If *x* or *y* is NaN, and the other is not $\pm\text{Inf}$, a NaN shall be returned.

37237 MXX If both arguments are subnormal and the correct result is subnormal, a range error may occur
 37238 and the correct result shall be returned.

37239 **ERRORS**

37240 These functions shall fail if:

37241 Range Error The result overflows.

37242 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 37243 then *errno* shall be set to [ERANGE]. If the integer expression
 37244 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the overflow
 37245 floating-point exception shall be raised.

37246 These functions may fail if:

37247 MX Range Error The result underflows.

37248 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 37249 then *errno* shall be set to [ERANGE]. If the integer expression
 37250 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the underflow
 37251 floating-point exception shall be raised.

EXAMPLES

See the EXAMPLES section in `atan2()`.

APPLICATION USAGE

$\text{hypot}(x,y)$, $\text{hypot}(y,x)$, and $\text{hypot}(x,-y)$ are equivalent.

$\text{hypot}(x, \pm 0)$ is equivalent to $\text{fabs}(x)$.

Underflow only happens when both x and y are subnormal and the (inexact) result is also subnormal.

These functions take precautions against overflow during intermediate steps of the computation.

On error, the expressions `(math_errhandling & MATH_ERRNO)` and `(math_errhandling & MATH_ERREXCEPT)` are independent of each other, but at least one of them must be non-zero.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated to indicate how an application should check for an error. This text was previously published in the APPLICATION USAGE section.

Issue 6

The `hypot()` function is no longer marked as an extension.

The `hypotf()` and `hypotl()` functions are added for alignment with the ISO/IEC 9899:1999 standard.

The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899:1999 standard.

IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are marked.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/49 is applied, updating the EXAMPLES section.

Issue 7

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0273 [68] is applied.

+

NAME

iconv — codeset conversion function

SYNOPSIS

```
#include <iconv.h>

size_t iconv(iconv_t cd, char **restrict inbuf,
             size_t *restrict inbytesleft, char **restrict outbuf,
             size_t *restrict outbytesleft);
```

DESCRIPTION

The *iconv()* function shall convert the sequence of characters from one codeset, in the array specified by *inbuf*, into a sequence of corresponding characters in another codeset, in the array specified by *outbuf*. The codesets are those specified in the *iconv_open()* call that returned the conversion descriptor, *cd*. The *inbuf* argument points to a variable that points to the first character in the input buffer and *inbytesleft* indicates the number of bytes to the end of the buffer to be converted. The *outbuf* argument points to a variable that points to the first available byte in the output buffer and *outbytesleft* indicates the number of the available bytes to the end of the buffer.

For state-dependent encodings, the conversion descriptor *cd* is placed into its initial shift state by a call for which *inbuf* is a null pointer, or for which *inbuf* points to a null pointer. When *iconv()* is called in this way, and if *outbuf* is not a null pointer or a pointer to a null pointer, and *outbytesleft* points to a positive value, *iconv()* shall place, into the output buffer, the byte sequence to change the output buffer to its initial shift state. If the output buffer is not large enough to hold the entire reset sequence, *iconv()* shall fail and set *errno* to [E2BIG]. Subsequent calls with *inbuf* as other than a null pointer or a pointer to a null pointer cause the conversion to take place from the current state of the conversion descriptor.

If a sequence of input bytes does not form a valid character in the specified codeset, conversion shall stop after the previous successfully converted character. If the input buffer ends with an incomplete character or shift sequence, conversion shall stop after the previous successfully converted bytes. If the output buffer is not large enough to hold the entire converted input, conversion shall stop just prior to the input bytes that would cause the output buffer to overflow. The variable pointed to by *inbuf* shall be updated to point to the byte following the last byte successfully used in the conversion. The value pointed to by *inbytesleft* shall be decremented to reflect the number of bytes still not converted in the input buffer. The variable pointed to by *outbuf* shall be updated to point to the byte following the last byte of converted output data. The value pointed to by *outbytesleft* shall be decremented to reflect the number of bytes still available in the output buffer. For state-dependent encodings, the conversion descriptor shall be updated to reflect the shift state in effect at the end of the last successfully converted byte sequence.

If *iconv()* encounters a character in the input buffer that is valid, but for which an identical character does not exist in the target codeset, *iconv()* shall perform an implementation-defined conversion on this character.

RETURN VALUE

The *iconv()* function shall update the variables pointed to by the arguments to reflect the extent of the conversion and return the number of non-identical conversions performed. If the entire string in the input buffer is converted, the value pointed to by *inbytesleft* shall be 0. If the input conversion is stopped due to any conditions mentioned above, the value pointed to by *inbytesleft* shall be non-zero and *errno* shall be set to indicate the condition. If an error occurs, *iconv()* shall return (**size_t**)−1 and set *errno* to indicate the error.

ERRORS

The *iconv()* function shall fail if:

[EILSEQ] Input conversion stopped due to an input byte that does not belong to the input codeset.

[E2BIG] Input conversion stopped due to lack of space in the output buffer.

[EINVAL] Input conversion stopped due to an incomplete character or shift sequence at the end of the input buffer.

The *iconv()* function may fail if:

[EBADF] The *cd* argument is not a valid open conversion descriptor.

EXAMPLES

None.

APPLICATION USAGE

The *inbuf* argument indirectly points to the memory area which contains the conversion input data. The *outbuf* argument indirectly points to the memory area which is to contain the result of the conversion. The objects indirectly pointed to by *inbuf* and *outbuf* are not restricted to containing data that is directly representable in the ISO C standard language **char** data type. The type of *inbuf* and *outbuf*, **char ****, does not imply that the objects pointed to are interpreted as null-terminated C strings or arrays of characters. Any interpretation of a byte sequence that represents a character in a given character set encoding scheme is done internally within the codeset converters. For example, the area pointed to indirectly by *inbuf* and/or *outbuf* can contain all zero octets that are not interpreted as string terminators but as coded character data according to the respective codeset encoding scheme. The type of the data (**char**, **short**, **long**, and so on) read or stored in the objects is not specified, but may be inferred for both the input and output data by the converters determined by the *fromcode* and *tocode* arguments of *iconv_open()*.

Regardless of the data type inferred by the converter, the size of the remaining space in both input and output objects (the *intbytesleft* and *outbytesleft* arguments) is always measured in bytes.

For implementations that support the conversion of state-dependent encodings, the conversion descriptor must be able to accurately reflect the shift-state in effect at the end of the last successful conversion. It is not required that the conversion descriptor itself be updated, which would require it to be a pointer type. Thus, implementations are free to implement the descriptor as a handle (other than a pointer type) by which the conversion information can be accessed and updated.

RATIONALE

None.

FUTURE DIRECTIONS

None.

XBD [**<iconv.h>**](#)

CHANGE HISTORY

First released in Issue 4. Derived from the HP-UX Manual.

37374 **Issue 6**

37375 The SYNOPSIS has been corrected to align with the **<iconv.h>** reference page.

37376 The **restrict** keyword is added to the *iconv()* prototype for alignment with the
37377 ISO/IEC 9899:1999 standard.

37378 **Issue 7**

37379 The *iconv()* function is moved from the XSI option to the Base.

37380 NAME

37381 iconv_close — codeset conversion deallocation function

37382 SYNOPSIS

37383 #include <iconv.h>

37384 int iconv_close(iconv_t *cd*);

37385 DESCRIPTION

37386 The *iconv_close()* function shall deallocate the conversion descriptor *cd* and all other associated
37387 resources allocated by *iconv_open()*.

37388 If a file descriptor is used to implement the type **iconv_t**, that file descriptor shall be closed.

37389 RETURN VALUE

37390 Upon successful completion, 0 shall be returned; otherwise, -1 shall be returned and *errno* set to
37391 indicate the error.

37392 ERRORS

37393 The *iconv_close()* function may fail if:

37394 [EBADF] The conversion descriptor is invalid.

37395 EXAMPLES

37396 None.

37397 APPLICATION USAGE

37398 None.

37399 RATIONALE

37400 None.

37401 FUTURE DIRECTIONS

37402 None.

37403 SEE ALSO

37404 *iconv()*, *iconv_open()*

37405 XBD <**iconv.h**>

37406 CHANGE HISTORY

37407 First released in Issue 4. Derived from the HP-UX Manual.

37408 Issue 7

37409 The *iconv_close()* function is moved from the XSI option to the Base.

37410 **NAME**

37411 iconv_open — codeset conversion allocation function

37412 **SYNOPSIS**

37413 #include <iconv.h>

37414 iconv_t iconv_open(const char **tocode*, const char **fromcode*);37415 **DESCRIPTION**

37416 The *iconv_open()* function shall return a conversion descriptor that describes a conversion from
 37417 the codeset specified by the string pointed to by the *fromcode* argument to the codeset specified
 37418 by the string pointed to by the *tocode* argument. For state-dependent encodings, the conversion
 37419 descriptor shall be in a codeset-dependent initial shift state, ready for immediate use with
 37420 *iconv()*.

37421 Settings of *fromcode* and *tocode* and their permitted combinations are implementation-defined.

37422 A conversion descriptor shall remain valid until it is closed by *iconv_close()* or an implicit close.

37423 If a file descriptor is used to implement conversion descriptors, the FD_CLOEXEC flag shall be
 37424 set; see <fcntl.h>.

37425 **RETURN VALUE**

37426 Upon successful completion, *iconv_open()* shall return a conversion descriptor for use on
 37427 subsequent calls to *iconv()*. Otherwise, *iconv_open()* shall return (**iconv_t**)−1 and set *errno* to
 37428 indicate the error.

37429 **ERRORS**

37430 The *iconv_open()* function may fail if:

37431 [EMFILE] All file descriptors available to the process are currently open.

37432 [ENFILE] Too many files are currently open in the system.

37433 [ENOMEM] Insufficient storage space is available.

37434 [EINVAL] The conversion specified by *fromcode* and *tocode* is not supported by the
 37435 implementation.

37436 **EXAMPLES**

37437 None.

37438 **APPLICATION USAGE**

37439 Some implementations of *iconv_open()* use *malloc()* to allocate space for internal buffer areas.
 37440 The *iconv_open()* function may fail if there is insufficient storage space to accommodate these
 37441 buffers.

37442 Conforming applications must assume that conversion descriptors are not valid after a call to
 37443 one of the *exec* functions.

37444 Application developers should consult the system documentation to determine the supported
 37445 codesets and their naming schemes.

37446 **RATIONALE**

37447 None.

37448 **FUTURE DIRECTIONS**

37449 None.

37456 SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.

37457 The *iconv_open()* function is moved from the XSI option to the Base.

37458 **NAME**

37459 if_freenameindex — free memory allocated by if_nameindex

37460 **SYNOPSIS**

37461 #include <net/if.h>

37462 void if_freenameindex(struct if_nameindex *ptr);

37463 **DESCRIPTION**

37464 The *if_freenameindex()* function shall free the memory allocated by *if_nameindex()*. The *ptr*
37465 argument shall be a pointer that was returned by *if_nameindex()*. After *if_freenameindex()* has
37466 been called, the application shall not use the array of which *ptr* is the address.

37467 **RETURN VALUE**

37468 None.

37469 **ERRORS**

37470 No errors are defined.

37471 **EXAMPLES**

37472 None.

37483 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

37484 **NAME**

37485 if_indextoname — map a network interface index to its corresponding name

37486 **SYNOPSIS**

37487 #include <net/if.h>

37488 char *if_indextoname(unsigned *ifindex*, char **ifname*);37489 **DESCRIPTION**37490 The *if_indextoname()* function shall map an interface index to its corresponding name.37491 When this function is called, *ifname* shall point to a buffer of at least {IF_NAMESIZE} bytes. The
37492 function shall place in this buffer the name of the interface with index *ifindex*.37493 **RETURN VALUE**37494 If *ifindex* is an interface index, then the function shall return the value supplied in *ifname*, which
37495 points to a buffer now containing the interface name. Otherwise, the function shall return a null
37496 pointer and set *errno* to indicate the error.37497 **ERRORS**37498 The *if_indextoname()* function shall fail if:

37499 [ENXIO] The interface does not exist.

37500 **EXAMPLES**

37501 None.

37502 **APPLICATION USAGE**

37503 None.

37510 XBD <net/if.h>

37511 **CHANGE HISTORY**

37512 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

37513 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/28 is applied, changing {IFNAMSIZ} to
37514 {IF_NAMESIZ} in the DESCRIPTION.

37515 **NAME**

37516 if_nameindex — return all network interface names and indexes

37517 **SYNOPSIS**

37518 #include <net/if.h>

37519 struct if_nameindex *if_nameindex(void);

37520 **DESCRIPTION**

37521 The *if_nameindex()* function shall return an array of *if_nameindex* structures, one structure per
 37522 interface. The end of the array is indicated by a structure with an *if_index* field of zero and an
 37523 *if_name* field of NULL.

37524 Applications should call *if_freenameindex()* to release the memory that may be dynamically
 37525 allocated by this function, after they have finished using it.

37526 **RETURN VALUE**

37527 An array of structures identifying local interfaces. A null pointer is returned upon an error, with
 37528 *errno* set to indicate the error.

37529 **ERRORS**37530 The *if_nameindex()* function may fail if:

37531 [ENOBUFS] Insufficient resources are available to complete the function.

37532 **EXAMPLES**

37533 None.

37534 **APPLICATION USAGE**

37535 None.

37567 CHANGE HISTORY

37568 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

37569 **NAME**

37570 ilogb, ilogbf, ilogbl — return an unbiased exponent

37571 **SYNOPSIS**

```
37572     #include <math.h>
37573
37574     int ilogb(double x);
37575     int ilogbf(float x);
37576     int ilogbl(long double x);
```

37576 **DESCRIPTION**

37577 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 37578 conflict between the requirements described here and the ISO C standard is unintentional. This
 37579 volume of POSIX.1-2008 defers to the ISO C standard.

37580 These functions shall return the exponent part of their argument x . Formally, the return value is
 37581 the integral part of $\log_r |x|$ as a signed integral value, for non-zero x , where r is the radix of the
 37582 machine's floating-point arithmetic, which is the value of `FLT_RADIX` defined in `<float.h>`.

37583 An application wishing to check for error situations should set `errno` to zero and call
 37584 *feclearexcept*(`FE_ALL_EXCEPT`) before calling these functions. On return, if `errno` is non-zero or
 37585 *fetestexcept*(`FE_INVALID` | `FE_DIVBYZERO` | `FE_OVERFLOW` | `FE_UNDERFLOW`) is non-
 37586 zero, an error has occurred.

37587 **RETURN VALUE**

37588 Upon successful completion, these functions shall return the exponent part of x as a signed
 37589 integer value. They are equivalent to calling the corresponding `logb()` function and casting the
 37590 returned value to type `int`.

37591 XSI If x is 0, the value `FP_ILOGB0` shall be returned. On XSI-conformant systems, a domain error
 37592 shall occur;

37593 CX otherwise, a domain error may occur.

37594 XSI If x is $\pm\text{Inf}$, the value `{INT_MAX}` shall be returned. On XSI-conformant systems, a domain
 37595 error shall occur;

37596 CX otherwise, a domain error may occur.

37597 XSI If x is a NaN, the value `FP_ILOGBNAN` shall be returned. On XSI-conformant systems, a
 37598 domain error shall occur;

37599 CX otherwise, a domain error may occur.

37600 MX If the correct value is greater than `{INT_MAX}`, a domain error shall occur and an unspecified
 37601 XSI value shall be returned. On XSI-conformant systems, a domain error shall occur and
 37602 `{INT_MAX}` shall be returned.

37603 MX If the correct value is less than `{INT_MIN}`, a domain error shall occur and an unspecified value
 37604 XSI shall be returned. On XSI-conformant systems, a domain error shall occur and `{INT_MIN}` shall
 37605 be returned.

37606 **ERRORS**

37607 These functions shall fail if:

37608 XSI|MX **Domain Error** The correct value is not representable as an integer.

37609 XSI The x argument is zero, NaN, or $\pm\text{Inf}$.

37610 XSI|MX If the integer expression (*math_errhandling* & `MATH_ERRNO`) is non-zero,
 37611 then `errno` shall be set to `[EDOM]`. If the integer expression (*math_errhandling*
 37612 & `MATH_ERREXCEPT`) is non-zero, then the invalid floating-point exception
 37613 shall be raised.

37614 These functions may fail if:

37615 Domain Error The *x* argument is zero, NaN, or $\pm\text{Inf}$.

37616 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 37617 then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling*
 37618 & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
 37619 shall be raised.

37620 EXAMPLES

37621 None.

37622 APPLICATION USAGE

37623 On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* &
 37624 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

37625 RATIONALE

37626 The errors come from taking the expected floating-point value and converting it to **int**, which is
 37627 an invalid operation in IEEE Std 754-1985 (since overflow, infinity, and NaN are not
 37628 representable in a type **int**), so should be a domain error.

37629 There are no known implementations that overflow. For overflow to happen, {INT_MAX} must
 37630 be less than $\text{LDBL\_MAX\_EXP} \times \log_2(\text{FLT\_RADIX})$ or {INT_MIN} must be greater than
 37631 $\text{LDBL\_MIN\_EXP} \times \log_2(\text{FLT\_RADIX})$ if subnormals are not supported, or {INT_MIN} must be
 37632 greater than $(\text{LDBL\_MIN\_EXP} - \text{LDBL\_MANT\_DIG}) \times \log_2(\text{FLT\_RADIX})$ if subnormals are
 37633 supported.

37634 FUTURE DIRECTIONS

37635 None.

37678 **CHANGE HISTORY**

37679 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

NAME

imaxdiv — return quotient and remainder

SYNOPSIS

```
#include <inttypes.h>
```

```
imaxdiv_t imaxdiv(intmax_t numer, intmax_t denom);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

The *imaxdiv()* function shall compute *numer* / *denom* and *numer* % *denom* in a single operation.

RETURN VALUE

The *imaxdiv()* function shall return a structure of type **imaxdiv_t**, comprising both the quotient and the remainder. The structure shall contain (in either order) the members *quot* (the quotient) and *rem* (the remainder), each of which has type **intmax_t**.

If either part of the result cannot be represented, the behavior is undefined.

ERRORS

No errors are defined.

CHANGE HISTORY

First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

NAME

inet_addr, inet_ntoa — IPv4 address manipulation

SYNOPSIS

```
#include <arpa/inet.h>

in_addr_t inet_addr(const char *cp);
char *inet_ntoa(struct in_addr in);
```

DESCRIPTION

The *inet_addr()* function shall convert the string pointed to by *cp*, in the standard IPv4 dotted decimal notation, to an integer value suitable for use as an Internet address.

The *inet_ntoa()* function shall convert the Internet host address specified by *in* to a string in the Internet standard dot notation.

The *inet_ntoa()* function need not be thread-safe.

All Internet addresses shall be returned in network order (bytes ordered from left to right).

Values specified using IPv4 dotted decimal notation take one of the following forms:

a.b.c.d When four parts are specified, each shall be interpreted as a byte of data and assigned, from left to right, to the four bytes of an Internet address.

a.b.c When a three-part address is specified, the last part shall be interpreted as a 16-bit quantity and placed in the rightmost two bytes of the network address. This makes the three-part address format convenient for specifying Class B network addresses as "128.net.host".

a.b When a two-part address is supplied, the last part shall be interpreted as a 24-bit quantity and placed in the rightmost three bytes of the network address. This makes the two-part address format convenient for specifying Class A network addresses as "net.host".

a When only one part is given, the value shall be stored directly in the network address without any byte rearrangement.

All numbers supplied as parts in IPv4 dotted decimal notation may be decimal, octal, or hexadecimal, as specified in the ISO C standard (that is, a leading 0x or 0X implies hexadecimal; otherwise, a leading '0' implies octal; otherwise, the number is interpreted as decimal).

RETURN VALUE

Upon successful completion, *inet_addr()* shall return the Internet address. Otherwise, it shall return (*in_addr_t*)(-1).

The *inet_ntoa()* function shall return a pointer to the network address in Internet standard dot notation.

ERRORS

No errors are defined.

37746 EXAMPLES

37747 None.

37748 APPLICATION USAGE

37749 The return value of *inet_ntoa()* may point to static data that may be overwritten by subsequent
37750 calls to *inet_ntoa()*.

37758 CHANGE HISTORY

37759 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

37760 Issue 7

37761 Austin Group Interpretation 1003.1-2001 #156 is applied.

NAME

inet_ntop, inet_pton — convert IPv4 and IPv6 addresses between binary and text form

SYNOPSIS

```
#include <arpa/inet.h>

const char *inet_ntop(int af, const void *restrict src,
    char *restrict dst, socklen_t size);
int inet_pton(int af, const char *restrict src, void *restrict dst);
```

DESCRIPTION

The *inet_ntop()* function shall convert a numeric address into a text string suitable for presentation. The *af* argument shall specify the family of the address. This can be AF_INET or AF_INET6. The *src* argument points to a buffer holding an IPv4 address if the *af* argument is AF_INET, or an IPv6 address if the *af* argument is AF_INET6; the address must be in network byte order. The *dst* argument points to a buffer where the function stores the resulting text string; it shall not be NULL. The *size* argument specifies the size of this buffer, which shall be large enough to hold the text string (INET_ADDRSTRLEN characters for IPv4, INET6_ADDRSTRLEN characters for IPv6).

The *inet_pton()* function shall convert an address in its standard text presentation form into its numeric binary form. The *af* argument shall specify the family of the address. The AF_INET and AF_INET6 address families shall be supported. The *src* argument points to the string being passed in. The *dst* argument points to a buffer into which the function stores the numeric address; this shall be large enough to hold the numeric address (32 bits for AF_INET, 128 bits for AF_INET6).

If the *af* argument of *inet_pton()* is AF_INET, the *src* string shall be in the standard IPv4 dotted-decimal form:

```
ddd.ddd.ddd.ddd
```

where "ddd" is a one to three digit decimal number between 0 and 255 (see *inet_addr()*). The *inet_pton()* function does not accept other formats (such as the octal numbers, hexadecimal numbers, and fewer than four numbers that *inet_addr()* accepts).

If the *af* argument of *inet_pton()* is AF_INET6, the *src* string shall be in one of the following standard IPv6 text forms:

1. The preferred form is "x:x:x:x:x:x:x:x", where the 'x's are the hexadecimal values of the eight 16-bit pieces of the address. Leading zeros in individual fields can be omitted, but there shall be at least one numeral in every field.
2. A string of contiguous zero fields in the preferred form can be shown as "::". The "::" can only appear once in an address. Unspecified addresses ("0:0:0:0:0:0:0:0") may be represented simply as "::".
3. A third form that is sometimes more convenient when dealing with a mixed environment of IPv4 and IPv6 nodes is "x:x:x:x:x:x.d.d.d.d", where the 'x's are the hexadecimal values of the six high-order 16-bit pieces of the address, and the 'd's are the decimal values of the four low-order 8-bit pieces of the address (standard IPv4 representation).

Note: A more extensive description of the standard representations of IPv6 addresses can be found in RFC 2373.

RETURN VALUE

The *inet_ntop()* function shall return a pointer to the buffer containing the text string if the conversion succeeds, and NULL otherwise, and set *errno* to indicate the error.

The *inet_pton()* function shall return 1 if the conversion succeeds, with the address pointed to by *dst* in network byte order. It shall return 0 if the input is not a valid IPv4 dotted-decimal string or a valid IPv6 address string, or -1 with *errno* set to [EAFNOSUPPORT] if the *af* argument is unknown.

ERRORS

The *inet_ntop()* and *inet_pton()* functions shall fail if:

[EAFNOSUPPORT]

The *af* argument is invalid.

[ENOSPC]

The size of the *inet_ntop()* result buffer is inadequate.

CHANGE HISTORY

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

IPv6 extensions are marked.

The **restrict** keyword is added to the *inet_ntop()* and *inet_pton()* prototypes for alignment with the ISO/IEC 9899:1999 standard.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/29 is applied, adding “the address must be in network byte order” to the end of the fourth sentence of the first paragraph in the DESCRIPTION.

NAME

initstate, random, setstate, srandom — pseudo-random number functions

SYNOPSIS

```
XSI #include <stdlib.h>

char *initstate(unsigned seed, char *state, size_t size);
long random(void);
char *setstate(char *state);
void srandom(unsigned seed);
```

DESCRIPTION

The *random()* function shall use a non-linear additive feedback random-number generator employing a default state array size of 31 **long** integers to return successive pseudo-random numbers in the range from 0 to $2^{31}-1$. The period of this random-number generator is approximately $16 \times (2^{31}-1)$. The size of the state array determines the period of the random-number generator. Increasing the state array size shall increase the period.

With 256 bytes of state information, the period of the random-number generator shall be greater than 2^{69} .

Like *rand()*, *random()* shall produce by default a sequence of numbers that can be duplicated by calling *srandom()* with 1 as the seed.

The *srandom()* function shall initialize the current state array using the value of *seed*.

The *initstate()* and *setstate()* functions handle restarting and changing random-number generators. The *initstate()* function allows a state array, pointed to by the *state* argument, to be initialized for future use. The *size* argument, which specifies the size in bytes of the state array, shall be used by *initstate()* to decide what type of random-number generator to use; the larger the state array, the more random the numbers. Values for the amount of state information are 8, 32, 64, 128, and 256 bytes. Other values greater than 8 bytes are rounded down to the nearest one of these values. If *initstate()* is called with $8 \leq \text{size} < 32$, then *random()* shall use a simple linear congruential random number generator. The *seed* argument specifies a starting point for the random-number sequence and provides for restarting at the same point. The *initstate()* function shall return a pointer to the previous state information array.

If *initstate()* has not been called, then *random()* shall behave as though *initstate()* had been called with *seed*=1 and *size*=128.

Once a state has been initialized, *setstate()* allows switching between state arrays. The array defined by the *state* argument shall be used for further random-number generation until *initstate()* is called or *setstate()* is called again. The *setstate()* function shall return a pointer to the previous state array.

RETURN VALUE

If *initstate()* is called with *size* less than 8, it shall return NULL.

The *random()* function shall return the generated pseudo-random number.

The *srandom()* function shall not return a value.

Upon successful completion, *initstate()* and *setstate()* shall return a pointer to the previous state array; otherwise, a null pointer shall be returned.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

After initialization, a state array can be restarted at a different point in one of two ways:

1. The *initstate()* function can be used, with the desired seed, state array, and size of the array.
2. The *setstate()* function, with the desired state, can be used, followed by *srandom()* with the desired seed. The advantage of using both of these functions is that the size of the state array does not have to be saved once it is initialized.

Although some implementations of *random()* have written messages to standard error, such implementations do not conform to POSIX.1-2008.

Issue 5 restored the historical behavior of this function.

Threaded applications should use *erand48()*, *nrand48()*, or *jrand48()* instead of *random()* when an independent random number sequence in multiple threads is required.

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

In the DESCRIPTION, the phrase “values smaller than 8” is replaced with “values greater than or equal to 8, or less than 32”, “*size*<8” is replaced with “*8*≤*size* <32”, and a new first paragraph is added to the RETURN VALUE section. A note is added to the APPLICATION USAGE indicating that these changes restore the historical behavior of the function.

Issue 6

In the DESCRIPTION, duplicate text “For values greater than or equal to 8...” is removed.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/30 is applied, removing *rand_r()* from the list of suggested functions in the APPLICATION USAGE section.

Issue 7

The type of the first argument to *setstate()* is changed from **const char *** to **char ***.

NAME

insque, remque — insert or remove an element in a queue

SYNOPSIS

```
XSI    #include <search.h>

void insque(void *element, void *pred);
void remque(void *element);
```

DESCRIPTION

The *insque()* and *remque()* functions shall manipulate queues built from doubly-linked lists. The queue can be either circular or linear. An application using *insque()* or *remque()* shall ensure it defines a structure in which the first two members of the structure are pointers to the same type of structure, and any further members are application-specific. The first member of the structure is a forward pointer to the next entry in the queue. The second member is a backward pointer to the previous entry in the queue. If the queue is linear, the queue is terminated with null pointers. The names of the structure and of the pointer members are not subject to any special restriction.

The *insque()* function shall insert the element pointed to by *element* into a queue immediately after the element pointed to by *pred*.

The *remque()* function shall remove the element pointed to by *element* from a queue.

If the queue is to be used as a linear list, invoking *insque(&element, NULL)*, where *element* is the initial element of the queue, shall initialize the forward and backward pointers of *element* to null pointers.

If the queue is to be used as a circular list, the application shall ensure it initializes the forward pointer and the backward pointer of the initial element of the queue to the element's own address.

RETURN VALUE

The *insque()* and *remque()* functions do not return a value.

ERRORS

No errors are defined.

EXAMPLES**Creating a Linear Linked List**

The following example creates a linear linked list.

```
#include <search.h>
...
struct myque element1;
struct myque element2;

char *data1 = "DATA1";
char *data2 = "DATA2";
...
element1.data = data1;
element2.data = data2;

insque (&element1, NULL);
insque (&element2, &element1);
```

Creating a Circular Linked List

The following example creates a circular linked list.

```
#include <search.h>
...
struct myque element1;
struct myque element2;

char *data1 = "DATA1";
char *data2 = "DATA2";
...
element1.data = data1;
element2.data = data2;

element1.fwd = &element1;
element1.bck = &element1;

insque (&element2, &element1);
```

Removing an Element

The following example removes the element pointed to by *element1*.

```
#include <search.h>
...
struct myque element1;
...
remque (&element1);
```

APPLICATION USAGE

The historical implementations of these functions described the arguments as being of type **struct qelem *** rather than as being of type **void *** as defined here. In those implementations, **struct qelem** was commonly defined in **<search.h>** as:

```
struct qelem {
    struct qelem *q_forw;
    struct qelem *q_back;
};
```

Applications using these functions, however, were never able to use this structure directly since it provided no room for the actual data contained in the elements. Most applications defined structures that contained the two pointers as the initial elements and also provided space for, or pointers to, the object's data. Applications that used these functions to update more than one type of table also had the problem of specifying two or more different structures with the same name, if they literally used **struct qelem** as specified.

As described here, the implementations were actually expecting a structure type where the first two members were forward and backward pointers to structures. With C compilers that didn't provide function prototypes, applications used structures as specified in the DESCRIPTION above and the compiler did what the application expected.

If this method had been carried forward with an ISO C standard compiler and the historical function prototype, most applications would have to be modified to cast pointers to the structures actually used to be pointers to **struct qelem** to avoid compilation warnings. By specifying **void *** as the argument type, applications do not need to change (unless they specifically referenced **struct qelem** and depended on it being defined in **<search.h>**).

38010 The normative text is updated to avoid use of the term “must” for application requirements.

38011 **NAME**38012 **ioctl** — control a STREAMS device (**STREAMS**)38013 **SYNOPSIS**

```
38014 OB XSR  #include <stropts.h>
38015         int ioctl(int fildes, int request, ... /* arg */);
```

38016 **DESCRIPTION**

38017 The *ioctl()* function shall perform a variety of control functions on STREAMS devices. For non-
 38018 STREAMS devices, the functions performed by this call are unspecified. The *request* argument
 38019 and an optional third argument (with varying type) shall be passed to and interpreted by the
 38020 appropriate part of the STREAM associated with *fildes*.

38021 The *fildes* argument is an open file descriptor that refers to a device.

38022 The *request* argument selects the control function to be performed and shall depend on the
 38023 STREAMS device being addressed.

38024 The *arg* argument represents additional information that is needed by this specific STREAMS
 38025 device to perform the requested function. The type of *arg* depends upon the particular control
 38026 request, but it shall be either an integer or a pointer to a device-specific data structure.

38027 The *ioctl()* commands applicable to STREAMS, their arguments, and error conditions that apply
 38028 to each individual command are described below.

38029 The following *ioctl()* commands, with error values indicated, are applicable to all STREAMS
 38030 files:

38031 **I_PUSH** Pushes the module whose name is pointed to by *arg* onto the top of the current
 38032 STREAM, just below the STREAM head. It then calls the *open()* function of the
 38033 newly-pushed module.

38034 The *ioctl()* function with the **I_PUSH** command shall fail if:

38035 [EINVAL] Invalid module name.

38036 [ENXIO] Open function of new module failed.

38037 [ENXIO] Hangup received on *fildes*.

38038 **I_POP** Removes the module just below the STREAM head of the STREAM pointed to
 38039 by *fildes*. The *arg* argument should be 0 in an **I_POP** request.

38040 The *ioctl()* function with the **I_POP** command shall fail if:

38041 [EINVAL] No module present in the STREAM.

38042 [ENXIO] Hangup received on *fildes*.

38043 **I_LOOK** Retrieves the name of the module just below the STREAM head of the
 38044 STREAM pointed to by *fildes*, and places it in a character string pointed to by
 38045 *arg*. The buffer pointed to by *arg* should be at least FMNAMESZ+1 bytes long,
 38046 where FMNAMESZ is defined in **<stropts.h>**.

38047 The *ioctl()* function with the **I_LOOK** command shall fail if:

38048 [EINVAL] No module present in the STREAM.

38049 **I_FLUSH** Flushes read and/or write queues, depending on the value of *arg*. Valid *arg*
 38050 values are:

38051	FLUSHR	Flush all read queues.
38052	FLUSHW	Flush all write queues.
38053	FLUSHRW	Flush all read and all write queues.
38054	The <i>ioctl()</i> function with the I_FLUSH command shall fail if:	
38055	[EINVAL]	Invalid <i>arg</i> value.
38056	[EAGAIN] or [ENOSR]	Unable to allocate buffers for flush message.
38057		
38058	[ENXIO]	Hangup received on <i>fildev</i> .
38059	I_FLUSHBAND	Flushes a particular band of messages. The <i>arg</i> argument points to a bandinfo structure. The <i>bi_flag</i> member may be one of FLUSHR, FLUSHW, or FLUSHRW as described above. The <i>bi_pri</i> member determines the priority band to be flushed.
38060		
38061		
38062		
38063	I_SETSIG	Requests that the STREAMS implementation send the SIGPOLL signal to the calling process when a particular event has occurred on the STREAM associated with <i>fildev</i> . I_SETSIG supports an asynchronous processing capability in STREAMS. The value of <i>arg</i> is a bitmask that specifies the events for which the process should be signaled. It is the bitwise-inclusive OR of any combination of the following constants:
38064		
38065		
38066		
38067		A normal (priority band set to 0) message has arrived at the head of a STREAM head read queue. A signal shall be generated even if the message is of zero length.
38068	S_RDNORM	
38069		
38070		
38071		A message with a non-zero priority band has arrived at the head of a STREAM head read queue. A signal shall be generated even if the message is of zero length.
38072	S_RDBAND	
38073		
38074		
38075	S_INPUT	A message, other than a high-priority message, has arrived at the head of a STREAM head read queue. A signal shall be generated even if the message is of zero length.
38076		
38077		
38078		
38079	S_HIPRI	A high-priority message is present on a STREAM head read queue. A signal shall be generated even if the message is of zero length.
38080		
38081		
38082		
38083	S_OUTPUT	The write queue for normal data (priority band 0) just below the STREAM head is no longer full. This notifies the process that there is room on the queue for sending (or writing) normal data downstream.
38084		
38085		
38086		
38087	S_WRNORM	Equivalent to S_OUTPUT.
38088		
38089		
38090		
38091	S_WRBAND	The write queue for a non-zero priority band just below the STREAM head is no longer full. This notifies the process that there is room on the queue for sending (or writing) priority data downstream.
38092		
38090	S_MSG	A STREAMS signal message that contains the SIGPOLL signal has reached the front of the STREAM head read queue.
38091		
38092		

38093		S_ERROR	Notification of an error condition has reached the STREAM head.
38094			
38095		S_HANGUP	Notification of a hangup has reached the STREAM head.
38096		S_BANDURG	When used in conjunction with S_RDBAND, SIGURG is generated instead of SIGPOLL when a priority message reaches the front of the STREAM head read queue.
38097			
38098			
38099			If <i>arg</i> is 0, the calling process shall be unregistered and shall not receive further SIGPOLL signals for the stream associated with <i>fildev</i> .
38100			
38101			Processes that wish to receive SIGPOLL signals shall ensure that they explicitly register to receive them using I_SETSIG. If several processes register to receive this signal for the same event on the same STREAM, each process shall be signaled when the event occurs.
38102			
38103			
38104			
38105			The <i>ioctl()</i> function with the I_SETSIG command shall fail if:
38106		[EINVAL]	The value of <i>arg</i> is invalid.
38107		[EINVAL]	The value of <i>arg</i> is 0 and the calling process is not registered to receive the SIGPOLL signal.
38108			
38109		[EAGAIN]	There were insufficient resources to store the signal request.
38110	I_GETSIG		Returns the events for which the calling process is currently registered to be sent a SIGPOLL signal. The events are returned as a bitmask in an int pointed to by <i>arg</i> , where the events are those specified in the description of I_SETSIG above.
38111			
38112			
38113			
38114			The <i>ioctl()</i> function with the I_GETSIG command shall fail if:
38115		[EINVAL]	Process is not registered to receive the SIGPOLL signal.
38116	I_FIND		Compares the names of all modules currently present in the STREAM to the name pointed to by <i>arg</i> , and returns 1 if the named module is present in the STREAM, or returns 0 if the named module is not present.
38117			
38118			
38119			The <i>ioctl()</i> function with the I_FIND command shall fail if:
38120		[EINVAL]	<i>arg</i> does not contain a valid module name.
38121	I_PEEK		Retrieves the information in the first message on the STREAM head read queue without taking the message off the queue. It is analogous to <i>getmsg()</i> except that this command does not remove the message from the queue. The <i>arg</i> argument points to a strpeek structure.
38122			
38123			
38124			
38125			The application shall ensure that the <i>maxlen</i> member in the ctlbuf and databuf structures is set to the number of bytes of control information and/or data information, respectively, to retrieve. The <i>flags</i> member may be marked RS_HIPRI or 0, as described by <i>getmsg()</i> . If the process sets <i>flags</i> to RS_HIPRI, for example, I_PEEK shall only look for a high-priority message on the STREAM head read queue.
38126			
38127			
38128			
38129			
38130			
38131			I_PEEK returns 1 if a message was retrieved, and returns 0 if no message was found on the STREAM head read queue, or if the RS_HIPRI flag was set in <i>flags</i> and a high-priority message was not present on the STREAM head read queue. It does not wait for a message to arrive. On return, ctlbuf specifies information in the control buffer, databuf specifies information in the data
38132			
38133			
38134			
38135			

38136		buffer, and <i>flags</i> contains the value RS_HIPRI or 0.
38137	I_SRDOPT	Sets the read mode using the value of the argument <i>arg</i> . Read modes are
38138		described in <i>read()</i> . Valid <i>arg</i> flags are:
38139		RNORM Byte-stream mode, the default.
38140		RMSGD Message-discard mode.
38141		RMSGN Message-nondiscard mode.
38142		The bitwise-inclusive OR of RMSGD and RMSGN shall return [EINVAL]. The
38143		bitwise-inclusive OR of RNORM and either RMSGD or RMSGN shall result in
38144		the other flag overriding RNORM which is the default.
38145		In addition, treatment of control messages by the STREAM head may be
38146		changed by setting any of the following flags in <i>arg</i> :
38147		RPROTNORM Fail <i>read()</i> with [EBADMSG] if a message containing a
38148		control part is at the front of the STREAM head read queue.
38149		RPROTDAT Deliver the control part of a message as data when a process
38150		issues a <i>read()</i> .
38151		RPROTDIS Discard the control part of a message, delivering any data
38152		portion, when a process issues a <i>read()</i> .
38153		The <i>ioctl()</i> function with the I_SRDOPT command shall fail if:
38154		[EINVAL] The <i>arg</i> argument is not valid.
38155	I_GRDOPT	Returns the current read mode setting, as described above, in an int pointed to
38156		by the argument <i>arg</i> . Read modes are described in <i>read()</i> .
38157	I_NREAD	Counts the number of data bytes in the data part of the first message on the
38158		STREAM head read queue and places this value in the int pointed to by <i>arg</i> .
38159		The return value for the command shall be the number of messages on the
38160		STREAM head read queue. For example, if 0 is returned in <i>arg</i> , but the <i>ioctl()</i>
38161		return value is greater than 0, this indicates that a zero-length message is next
38162		on the queue.
38163	I_FDINSERT	Creates a message from specified buffer(s), adds information about another
38164		STREAM, and sends the message downstream. The message contains a
38165		control part and an optional data part. The data and control parts to be sent
38166		are distinguished by placement in separate buffers, as described below. The
38167		<i>arg</i> argument points to a strfdinsert structure.
38168		The application shall ensure that the <i>len</i> member in the ctlbuf strbuf structure
38169		is set to the size of a t_uscalar_t plus the number of bytes of control
38170		information to be sent with the message. The <i>fildev</i> member specifies the file
38171		descriptor of the other STREAM, and the <i>offset</i> member, which must be
38172		suitably aligned for use as a t_uscalar_t , specifies the offset from the start of
38173		the control buffer where I_FDINSERT shall store a t_uscalar_t whose
38174		interpretation is specific to the STREAM end. The application shall ensure that
38175		the <i>len</i> member in the databuf strbuf structure is set to the number of bytes of
38176		data information to be sent with the message, or to 0 if no data part is to be
38177		sent.
38178		The <i>flags</i> member specifies the type of message to be created. A normal
38179		message is created if <i>flags</i> is set to 0, and a high-priority message is created if

38180		<i>flags</i> is set to RS_HIPRI. For non-priority messages, I_FDINSERT shall block if
38181		the STREAM write queue is full due to internal flow control conditions. For
38182		priority messages, I_FDINSERT does not block on this condition. For non-
38183		priority messages, I_FDINSERT does not block when the write queue is full
38184		and O_NONBLOCK is set. Instead, it fails and sets <i>errno</i> to [EAGAIN].
38185		I_FDINSERT also blocks, unless prevented by lack of internal resources,
38186		waiting for the availability of message blocks in the STREAM, regardless of
38187		priority or whether O_NONBLOCK has been specified. No partial message is
38188		sent.
38189		The <i>ioctl()</i> function with the I_FDINSERT command shall fail if:
38190	[EAGAIN]	A non-priority message is specified, the O_NONBLOCK
38191		flag is set, and the STREAM write queue is full due to
38192		internal flow control conditions.
38193	[EAGAIN] or [ENOSR]	
38194		Buffers cannot be allocated for the message that is to be
38195		created.
38196	[EINVAL]	One of the following:
38197		— The <i>fildes</i> member of the strfdinsert structure is not a
38198		valid, open STREAM file descriptor.
38199		— The size of a t_uscalar_t plus <i>offset</i> is greater than the
38200		<i>len</i> member for the buffer specified through ctlbuf .
38201		— The <i>offset</i> member does not specify a properly-aligned
38202		location in the data buffer.
38203		— An undefined value is stored in <i>flags</i> .
38204	[ENXIO]	Hangup received on the STREAM identified by either the
38205		<i>fildes</i> argument or the <i>fildes</i> member of the strfdinsert
38206		structure.
38207	[ERANGE]	The <i>len</i> member for the buffer specified through databuf
38208		does not fall within the range specified by the maximum
38209		and minimum packet sizes of the topmost STREAM
38210		module; or the <i>len</i> member for the buffer specified through
38211		databuf is larger than the maximum configured size of the
38212		data part of a message; or the <i>len</i> member for the buffer
38213		specified through ctlbuf is larger than the maximum
38214		configured size of the control part of a message.
38215	I_STR	Constructs an internal STREAMS <i>ioctl()</i> message from the data pointed to by
38216		<i>arg</i> , and sends that message downstream.
38217		This mechanism is provided to send <i>ioctl()</i> requests to downstream modules
38218		and drivers. It allows information to be sent with <i>ioctl()</i> , and returns to the
38219		process any information sent upstream by the downstream recipient. I_STR
38220		shall block until the system responds with either a positive or negative
38221		acknowledgement message, or until the request times out after some period of
38222		time. If the request times out, it shall fail with <i>errno</i> set to [ETIME].
38223		At most, one I_STR can be active on a STREAM. Further I_STR calls shall
38224		block until the active I_STR completes at the STREAM head. The default

38225		timeout interval for these requests is 15 seconds. The O_NONBLOCK flag has
38226		no effect on this call.
38227		To send requests downstream, the application shall ensure that <i>arg</i> points to a
38228		striocctl structure.
38229		The <i>ic_cmd</i> member is the internal <i>ioctl()</i> command intended for a
38230		downstream module or driver and <i>ic_timeout</i> is the number of seconds
38231		(−1=infinite, 0=use implementation-defined timeout interval, >0=as specified)
38232		an I_STR request shall wait for acknowledgement before timing out. <i>ic_len</i> is
38233		the number of bytes in the data argument, and <i>ic_dp</i> is a pointer to the data
38234		argument. The <i>ic_len</i> member has two uses: on input, it contains the length of
38235		the data argument passed in, and on return from the command, it contains the
38236		number of bytes being returned to the process (the buffer pointed to by <i>ic_dp</i>
38237		should be large enough to contain the maximum amount of data that any
38238		module or the driver in the STREAM can return).
38239		The STREAM head shall convert the information pointed to by the striocctl
38240		structure to an internal <i>ioctl()</i> command message and send it downstream.
38241		The <i>ioctl()</i> function with the I_STR command shall fail if:
38242		[EAGAIN] or [ENOSR]
38243		Unable to allocate buffers for the <i>ioctl()</i> message.
38244		[EINVAL] The <i>ic_len</i> member is less than 0 or larger than the
38245		maximum configured size of the data part of a message, or
38246		<i>ic_timeout</i> is less than −1.
38247		[ENXIO] Hangup received on <i>fildev</i> .
38248		[ETIME] A downstream <i>ioctl()</i> timed out before acknowledgement
38249		was received.
38250		An I_STR can also fail while waiting for an acknowledgement if a message
38251		indicating an error or a hangup is received at the STREAM head. In addition,
38252		an error code can be returned in the positive or negative acknowledgement
38253		message, in the event the <i>ioctl()</i> command sent downstream fails. For these
38254		cases, I_STR shall fail with <i>errno</i> set to the value in the message.
38255	I_SWROPT	Sets the write mode using the value of the argument <i>arg</i> . Valid bit settings for
38256		<i>arg</i> are:
38257		SNDZERO Send a zero-length message downstream when a <i>write()</i> of 0
38258		bytes occurs. To not send a zero-length message when a
38259		<i>write()</i> of 0 bytes occurs, the application shall ensure that
38260		this bit is not set in <i>arg</i> (for example, <i>arg</i> would be set to 0).
38261		The <i>ioctl()</i> function with the I_SWROPT command shall fail if:
38262		[EINVAL] <i>arg</i> is not the above value.
38263	I_GWROPT	Returns the current write mode setting, as described above, in the int that is
38264		pointed to by the argument <i>arg</i> .
38265	I_SENDFD	Creates a new reference to the open file description associated with the file
38266		descriptor <i>arg</i> , and writes a message on the STREAMS-based pipe <i>fildev</i>
38267		containing this reference, together with the user ID and group ID of the calling
38268		process.

38269		The <i>ioctl()</i> function with the I_SENDFD command shall fail if:
38270		[EAGAIN] The sending STREAM is unable to allocate a message block
38271		to contain the file pointer; or the read queue of the receiving
38272		STREAM head is full and cannot accept the message sent by
38273		I_SENDFD.
38274		[EBADF] The <i>arg</i> argument is not a valid, open file descriptor.
38275		[EINVAL] The <i>fildev</i> argument is not connected to a STREAM pipe.
38276		[ENXIO] Hangup received on <i>fildev</i> .
38277		The <i>ioctl()</i> function with the I_SENDFD command may fail if:
38278		[EINVAL] The <i>arg</i> argument is equal to the <i>fildev</i> argument.
38279	I_RECVFD	Retrieves the reference to an open file description from a message written to a
38280		STREAMS-based pipe using the I_SENDFD command, and allocates a new file
38281		descriptor in the calling process that refers to this open file description. The
38282		<i>arg</i> argument is a pointer to a strrecvfd data structure as defined in
38283		<stropts.h>.
38284		The <i>fd</i> member is a file descriptor. The <i>uid</i> and <i>gid</i> members are the effective
38285		user ID and effective group ID, respectively, of the sending process.
38286		If O_NONBLOCK is not set, I_RECVFD shall block until a message is present
38287		at the STREAM head. If O_NONBLOCK is set, I_RECVFD shall fail with <i>errno</i>
38288		set to [EAGAIN] if no message is present at the STREAM head.
38289		If the message at the STREAM head is a message sent by an I_SENDFD, a new
38290		file descriptor shall be allocated for the open file descriptor referenced in
38291		the message. The new file descriptor is placed in the <i>fd</i> member of the strrecvfd
38292		structure pointed to by <i>arg</i> .
38293		The <i>ioctl()</i> function with the I_RECVFD command shall fail if:
38294		[EAGAIN] A message is not present at the STREAM head read queue
38295		and the O_NONBLOCK flag is set.
38296		[EBADMSG] The message at the STREAM head read queue is not a
38297		message containing a passed file descriptor.
38298		[EMFILE] All file descriptors available to the process are currently
38299		open.
38300		[ENXIO] Hangup received on <i>fildev</i> .
38301	I_LIST	Allows the process to list all the module names on the STREAM, up to and
38302		including the topmost driver name. If <i>arg</i> is a null pointer, the return value
38303		shall be the number of modules, including the driver, that are on the STREAM
38304		pointed to by <i>fildev</i> . This lets the process allocate enough space for the module
38305		names. Otherwise, it should point to a str_list structure.
38306		The <i>sl_nmods</i> member indicates the number of entries the process has
38307		allocated in the array. Upon return, the <i>sl_modlist</i> member of the str_list
38308		structure shall contain the list of module names, and the number of entries
38309		that have been filled into the <i>sl_modlist</i> array is found in the <i>sl_nmods</i> member
38310		(the number includes the number of modules including the driver). The return
38311		value from <i>ioctl()</i> shall be 0. The entries are filled in starting at the top of the

38312		STREAM and continuing downstream until either the end of the STREAM is
38313		reached, or the number of requested modules (<i>sl_nmods</i>) is satisfied.
38314		The <i>ioctl()</i> function with the <i>I_LIST</i> command shall fail if:
38315		[EINVAL] The <i>sl_nmods</i> member is less than 1.
38316		[EAGAIN] or [ENOSR]
38317		Unable to allocate buffers.
38318	<i>I_ATMARK</i>	Allows the process to see if the message at the head of the STREAM head read
38319		queue is marked by some module downstream. The <i>arg</i> argument determines
38320		how the checking is done when there may be multiple marked messages on
38321		the STREAM head read queue. It may take on the following values:
38322		ANYMARK Check if the message is marked.
38323		LASTMARK Check if the message is the last one marked on the queue.
38324		The bitwise-inclusive OR of the flags ANYMARK and LASTMARK is
38325		permitted.
38326		The return value shall be 1 if the mark condition is satisfied; otherwise, the
38327		value shall be 0.
38328		The <i>ioctl()</i> function with the <i>I_ATMARK</i> command shall fail if:
38329		[EINVAL] Invalid <i>arg</i> value.
38330	<i>I_CKBAND</i>	Checks if the message of a given priority band exists on the STREAM head
38331		read queue. This shall return 1 if a message of the given priority exists, 0 if no
38332		such message exists, or -1 on error. <i>arg</i> should be of type int .
38333		The <i>ioctl()</i> function with the <i>I_CKBAND</i> command shall fail if:
38334		[EINVAL] Invalid <i>arg</i> value.
38335	<i>I_GETBAND</i>	Returns the priority band of the first message on the STREAM head read
38336		queue in the integer referenced by <i>arg</i> .
38337		The <i>ioctl()</i> function with the <i>I_GETBAND</i> command shall fail if:
38338		[ENODATA] No message on the STREAM head read queue.
38339	<i>I_CANPUT</i>	Checks if a certain band is writable. <i>arg</i> is set to the priority band in question.
38340		The return value shall be 0 if the band is flow-controlled, 1 if the band is
38341		writable, or -1 on error.
38342		The <i>ioctl()</i> function with the <i>I_CANPUT</i> command shall fail if:
38343		[EINVAL] Invalid <i>arg</i> value.
38344	<i>I_SETCLTIME</i>	This request allows the process to set the time the STREAM head shall delay
38345		when a STREAM is closing and there is data on the write queues. Before
38346		closing each module or driver, if there is data on its write queue, the STREAM
38347		head shall delay for the specified amount of time to allow the data to drain. If,
38348		after the delay, data is still present, it shall be flushed. The <i>arg</i> argument is a
38349		pointer to an integer specifying the number of milliseconds to delay, rounded
38350		up to the nearest valid value. If <i>I_SETCLTIME</i> is not performed on a STREAM,
38351		an implementation-defined default timeout interval is used.

38352		The <i>ioctl()</i> function with the I_SETCLTIME command shall fail if:
38353	[EINVAL]	Invalid <i>arg</i> value.
38354	I_GETCLTIME	Returns the close time delay in the integer pointed to by <i>arg</i> .
38355	Multiplexed STREAMS Configurations	
38356	The following commands are used for connecting and disconnecting multiplexed STREAMS configurations. These commands use an implementation-defined default timeout interval.	
38357		
38358	I_LINK	Connects two STREAMs, where <i>fildev</i> is the file descriptor of the STREAM connected to the multiplexing driver, and <i>arg</i> is the file descriptor of the STREAM connected to another driver. The STREAM designated by <i>arg</i> is connected below the multiplexing driver. I_LINK requires the multiplexing driver to send an acknowledgement message to the STREAM head regarding the connection. This call shall return a multiplexer ID number (an identifier used to disconnect the multiplexer; see I_UNLINK) on success, and -1 on failure.
38359		
38360		
38361		
38362		
38363		
38364		
38365		
38366		The <i>ioctl()</i> function with the I_LINK command shall fail if:
38367	[ENXIO]	Hangup received on <i>fildev</i> .
38368	[ETIME]	Timeout before acknowledgement message was received at STREAM head.
38369		
38370	[EAGAIN] or [ENOSR]	
38371		Unable to allocate STREAMS storage to perform the I_LINK.
38372		
38373	[EBADF]	The <i>arg</i> argument is not a valid, open file descriptor.
38374	[EINVAL]	The <i>fildev</i> argument does not support multiplexing; or <i>arg</i> is not a STREAM or is already connected downstream from a multiplexer; or the specified I_LINK operation would connect the STREAM head in more than one place in the multiplexed STREAM.
38375		
38376		
38377		
38378		
38379		An I_LINK can also fail while waiting for the multiplexing driver to acknowledge the request, if a message indicating an error or a hangup is received at the STREAM head of <i>fildev</i> . In addition, an error code can be returned in the positive or negative acknowledgement message. For these cases, I_LINK fails with <i>errno</i> set to the value in the message.
38380		
38381		
38382		
38383		
38384	I_UNLINK	Disconnects the two STREAMs specified by <i>fildev</i> and <i>arg</i> . <i>fildev</i> is the file descriptor of the STREAM connected to the multiplexing driver. The <i>arg</i> argument is the multiplexer ID number that was returned by the I_LINK <i>ioctl()</i> command when a STREAM was connected downstream from the multiplexing driver. If <i>arg</i> is MUXID_ALL, then all STREAMs that were connected to <i>fildev</i> shall be disconnected. As in I_LINK, this command requires acknowledgement.
38385		
38386		
38387		
38388		
38389		
38390		
38391		The <i>ioctl()</i> function with the I_UNLINK command shall fail if:
38392	[ENXIO]	Hangup received on <i>fildev</i> .

38393		[ETIME]	Timeout before acknowledgement message was received at
38394			STREAM head.
38395		[EAGAIN] or [ENOSR]	
38396			Unable to allocate buffers for the acknowledgement
38397			message.
38398		[EINVAL]	Invalid multiplexer ID number.
38399			An I_UNLINK can also fail while waiting for the multiplexing driver to
38400			acknowledge the request if a message indicating an error or a hangup is
38401			received at the STREAM head of <i>fildev</i> . In addition, an error code can be
38402			returned in the positive or negative acknowledgement message. For these
38403			cases, I_UNLINK shall fail with <i>errno</i> set to the value in the message.
38404	I_PLINK		Creates a <i>persistent connection</i> between two STREAMs, where <i>fildev</i> is the file
38405			descriptor of the STREAM connected to the multiplexing driver, and <i>arg</i> is the
38406			file descriptor of the STREAM connected to another driver. This call shall
38407			create a persistent connection which can exist even if the file descriptor <i>fildev</i>
38408			associated with the upper STREAM to the multiplexing driver is closed. The
38409			STREAM designated by <i>arg</i> gets connected via a persistent connection below
38410			the multiplexing driver. I_PLINK requires the multiplexing driver to send an
38411			acknowledgement message to the STREAM head. This call shall return a
38412			multiplexer ID number (an identifier that may be used to disconnect the
38413			multiplexer; see I_PUNLINK) on success, and -1 on failure.
38414			The <i>ioctl()</i> function with the I_PLINK command shall fail if:
38415		[ENXIO]	Hangup received on <i>fildev</i> .
38416		[ETIME]	Timeout before acknowledgement message was received at
38417			STREAM head.
38418		[EAGAIN] or [ENOSR]	
38419			Unable to allocate STREAMS storage to perform the
38420			I_PLINK.
38421		[EBADF]	The <i>arg</i> argument is not a valid, open file descriptor.
38422		[EINVAL]	The <i>fildev</i> argument does not support multiplexing; or <i>arg</i> is
38423			not a STREAM or is already connected downstream from a
38424			multiplexer; or the specified I_PLINK operation would
38425			connect the STREAM head in more than one place in the
38426			multiplexed STREAM.
38427			An I_PLINK can also fail while waiting for the multiplexing driver to
38428			acknowledge the request, if a message indicating an error or a hangup is
38429			received at the STREAM head of <i>fildev</i> . In addition, an error code can be
38430			returned in the positive or negative acknowledgement message. For these
38431			cases, I_PLINK shall fail with <i>errno</i> set to the value in the message.
38432	I_PUNLINK		Disconnects the two STREAMs specified by <i>fildev</i> and <i>arg</i> from a persistent
38433			connection. The <i>fildev</i> argument is the file descriptor of the STREAM
38434			connected to the multiplexing driver. The <i>arg</i> argument is the multiplexer ID
38435			number that was returned by the I_PLINK <i>ioctl()</i> command when a STREAM
38436			was connected downstream from the multiplexing driver. If <i>arg</i> is
38437			MUXID_ALL, then all STREAMs which are persistent connections to <i>fildev</i>
38438			shall be disconnected. As in I_PLINK, this command requires the multiplexing

38439	driver to acknowledge the request.
38440	The <i>ioctl()</i> function with the I_PUNLINK command shall fail if:
38441	[ENXIO] Hangup received on <i>fildev</i> .
38442	[ETIME] Timeout before acknowledgement message was received at
38443	STREAM head.
38444	[EAGAIN] or [ENOSR]
38445	Unable to allocate buffers for the acknowledgement
38446	message.
38447	[EINVAL] Invalid multiplexer ID number.
38448	An I_PUNLINK can also fail while waiting for the multiplexing driver to
38449	acknowledge the request if a message indicating an error or a hangup is
38450	received at the STREAM head of <i>fildev</i> . In addition, an error code can be
38451	returned in the positive or negative acknowledgement message. For these
38452	cases, I_PUNLINK shall fail with <i>errno</i> set to the value in the message.
38453	RETURN VALUE
38454	Upon successful completion, <i>ioctl()</i> shall return a value other than -1 that depends upon the
38455	STREAMS device control function. Otherwise, it shall return -1 and set <i>errno</i> to indicate the
38456	error.
38457	ERRORS
38458	Under the following general conditions, <i>ioctl()</i> shall fail if:
38459	[EBADF] The <i>fildev</i> argument is not a valid open file descriptor.
38460	[EINTR] A signal was caught during the <i>ioctl()</i> operation.
38461	[EINVAL] The STREAM or multiplexer referenced by <i>fildev</i> is linked (directly or
38462	indirectly) downstream from a multiplexer.
38463	If an underlying device driver detects an error, then <i>ioctl()</i> shall fail if:
38464	[EINVAL] The <i>request</i> or <i>arg</i> argument is not valid for this device.
38465	[EIO] Some physical I/O error has occurred.
38466	[ENOTTY] The file associated with the <i>fildev</i> argument is not a STREAMS device that
38467	accepts control functions.
38468	[ENXIO] The <i>request</i> and <i>arg</i> arguments are valid for this device driver, but the service
38469	requested cannot be performed on this particular sub-device.
38470	[ENODEV] The <i>fildev</i> argument refers to a valid STREAMS device, but the corresponding
38471	device driver does not support the <i>ioctl()</i> function.
38472	If a STREAM is connected downstream from a multiplexer, any <i>ioctl()</i> command except
38473	I_UNLINK and I_PUNLINK shall set <i>errno</i> to [EINVAL].

EXAMPLES

None.

APPLICATION USAGE

The implementation-defined timeout interval for STREAMS has historically been 15 seconds.

RATIONALE

None.

FUTURE DIRECTIONS

The *ioctl()* function may be removed in a future version.

XBD <stropts.h>

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Issue 6

The Open Group Corrigendum U028/4 is applied, correcting text in the *I_FDINSERT* [EINVAL] case to refer to *ctlbuf*.

This function is marked as part of the XSI STREAMS Option Group.

The normative text is updated to avoid use of the term “must” for application requirements.

Issue 7

Austin Group Interpretation 1003.1-2001 #155 is applied, adding a “may fail” [EINVAL] error condition for the *I_SENDFD* command.

SD5-XSH-ERN-100 is applied, correcting the definition of the [ENOTTY] error condition.

The *ioctl()* function is marked obsolescent.

38500 **NAME**

38501 isalnum, isalnum_l — test for an alphanumeric character

38502 **SYNOPSIS**

38503 #include <ctype.h>

38504 int isalnum(int c);

38505 CX int isalnum_l(int c, locale_t locale);

38506 **DESCRIPTION**38507 CX For *isalnum()*: The functionality described on this reference page is aligned with the ISO C
38508 standard. Any conflict between the requirements described here and the ISO C standard is
38509 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.38510 CX The *isalnum()* and *isalnum_l()* functions shall test whether *c* is a character of class **alpha** or
38511 CX **digit** in the current locale, or in the locale represented by *locale*, respectively; see XBD Chapter 7
38512 (on page 135).38513 The *c* argument is an **int**, the value of which the application shall ensure is representable as an
38514 **unsigned char** or equal to the value of the macro EOF. If the argument has any other value, the
38515 behavior is undefined.38516 CX The behavior is undefined if the *locale* argument to *isalnum_l()* is the special locale object +
38517 LC_GLOBAL_LOCALE or is not a valid locale object handle.38518 **RETURN VALUE**38519 CX The *isalnum()* and *isalnum_l()* functions shall return non-zero if *c* is an alphanumeric character;
38520 otherwise, they shall return 0.38521 **ERRORS**

38522 No errors are defined.

38523 **EXAMPLES**

38524 None.

38525 **APPLICATION USAGE**38526 To ensure applications portability, especially across natural languages, only these functions and
38527 the functions in the reference pages listed in the SEE ALSO section should be used for character
38528 classification.38529 **RATIONALE**

38530 None.

38537 **CHANGE HISTORY**

38538 First released in Issue 1. Derived from Issue 1 of the SVID.

38539 **Issue 6**

38540 The normative text is updated to avoid use of the term “must” for application requirements.

38541 **Issue 7**

38542 The *isalnum_l()* function is added from The Open Group Technical Standard, 2006, Extended
38543 API Set Part 4.

38544 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0274 [302], XSH/TC1-2008/0275 [283], +
38545 and XSH/TC1-2008/0276 [283] are applied.

38546 **NAME**

38547 isalpha, isalpha_l — test for an alphabetic character

38548 **SYNOPSIS**

38549 #include <ctype.h>

38550 int isalpha(int c);

38551 CX int isalpha_l(int c, locale_t locale);

38552 **DESCRIPTION**

38553 CX For *isalpha()*: The functionality described on this reference page is aligned with the ISO C
 38554 standard. Any conflict between the requirements described here and the ISO C standard is
 38555 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

38556 CX The *isalpha()* and *isalpha_l()* functions shall test whether *c* is a character of class **alpha** in the
 38557 CX current locale, or in the locale represented by *locale*, respectively; see XBD Chapter 7 (on page
 38558 135).

38559 The *c* argument is an **int**, the value of which the application shall ensure is representable as an
 38560 **unsigned char** or equal to the value of the macro EOF. If the argument has any other value, the
 38561 behavior is undefined.

38562 CX The behavior is undefined if the *locale* argument to *isalpha_l()* is the special locale object +
 38563 LC_GLOBAL_LOCALE or is not a valid locale object handle.

38564 **RETURN VALUE**

38565 CX The *isalpha()* and *isalpha_l()* functions shall return non-zero if *c* is an alphabetic character;
 38566 otherwise, they shall return 0.

38567 **ERRORS**

38568 No errors are defined.

38569 **EXAMPLES**

38570 None.

38571 **APPLICATION USAGE**

38572 To ensure applications portability, especially across natural languages, only these functions and
 38573 the functions in the reference pages listed in the SEE ALSO section should be used for character
 38574 classification.

NAME

isatty — test for a terminal device

SYNOPSIS

```
#include <unistd.h>
```

```
int isatty(int fildes);
```

DESCRIPTION

The *isatty()* function shall test whether *fildes*, an open file descriptor, is associated with a terminal device.

RETURN VALUE

The *isatty()* function shall return 1 if *fildes* is associated with a terminal; otherwise, it shall return 0 and may set *errno* to indicate the error.

ERRORS

The *isatty()* function may fail if:

[EBADF] The *fildes* argument is not a valid open file descriptor.

[ENOTTY] The file associated with the *fildes* argument is not a terminal.

EXAMPLES

None.

APPLICATION USAGE

The *isatty()* function does not necessarily indicate that a human being is available for interaction via *fildes*. It is quite possible that non-terminal devices are connected to the communications line.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

XBD [**<unistd.h>**](#)

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The optional setting of *errno* to indicate an error is added.
- The [EBADF] and [ENOTTY] optional error conditions are added.

Issue 7

SD5-XSH-ERN-100 is applied, correcting the definition of the [ENOTTY] error condition.

38685 **NAME**

38686 isblank, isblank_l — test for a blank character

38687 **SYNOPSIS**

```
38688     #include <ctype.h>
38689
38689     int isblank(int c);
38690 CX     int isblank_l(int c, locale_t locale);
```

38691 **DESCRIPTION**

38692 CX For *isblank()*: The functionality described on this reference page is aligned with the ISO C
 38693 standard. Any conflict between the requirements described here and the ISO C standard is
 38694 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

38695 CX The *isblank()* and *isblank_l()* functions shall test whether *c* is a character of class **blank** in the
 38696 CX current locale, or in the locale represented by *locale*, respectively; see XBD Chapter 7 (on page
 38697 135).

38698 The *c* argument is a type **int**, the value of which the application shall ensure is a character
 38699 representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has
 38700 any other value, the behavior is undefined.

38701 CX The behavior is undefined if the *locale* argument to *isblank_l()* is the special locale object +
 38702 LC_GLOBAL_LOCALE or is not a valid locale object handle.

38703 **RETURN VALUE**

38704 CX The *isblank()* and *isblank_l()* functions shall return non-zero if *c* is a <blank>; otherwise, they
 38705 shall return 0.

38706 **ERRORS**

38707 No errors are defined.

38708 **EXAMPLES**

38709 None.

38710 **APPLICATION USAGE**

38711 To ensure applications portability, especially across natural languages, only these functions and
 38712 the functions in the reference pages listed in the SEE ALSO section should be used for character
 38713 classification.

and XSH/TC1-2008/0282 [283] are applied.

38729 **NAME**

38730 isctrl, isctrl_l — test for a control character

38731 **SYNOPSIS**

38732 #include <ctype.h>

38733 int isctrl(int c);

38734 CX int isctrl_l(int c, locale_t locale);

38735 **DESCRIPTION**

38736 CX For *isctrl()*: The functionality described on this reference page is aligned with the ISO C
 38737 standard. Any conflict between the requirements described here and the ISO C standard is
 38738 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

38739 CX The *isctrl()* and *isctrl_l()* functions shall test whether *c* is a character of class **cntrl** in the
 38740 CX current locale, or in the locale represented by *locale*, respectively; see XBD Chapter 7 (on page
 38741 135).

38742 The *c* argument is a type **int**, the value of which the application shall ensure is a character
 38743 representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has
 38744 any other value, the behavior is undefined.

38745 CX The behavior is undefined if the *locale* argument to *isctrl_l()* is the special locale object +
 38746 LC_GLOBAL_LOCALE or is not a valid locale object handle.

38747 **RETURN VALUE**

38748 CX The *isctrl()* and *isctrl_l()* functions shall return non-zero if *c* is a control character; otherwise,
 38749 they shall return 0.

38750 **ERRORS**

38751 No errors are defined.

38752 **EXAMPLES**

38753 None.

38754 **APPLICATION USAGE**

38755 To ensure applications portability, especially across natural languages, only these functions and
 38756 the functions in the reference pages listed in the SEE ALSO section should be used for character
 38757 classification.

38766 **CHANGE HISTORY**

38767 First released in Issue 1. Derived from Issue 1 of the SVID.

38768 **Issue 6**

38769 The normative text is updated to avoid use of the term “must” for application requirements.

38770 **Issue 7**

38771 The *iscntrl_l()* function is added from The Open Group Technical Standard, 2006, Extended API
38772 Set Part 4.

38773 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0283 [302], XSH/TC1-2008/0284 [283], +
38774 and XSH/TC1-2008/0285 [283] are applied.

38775 **NAME**38776 `isdigit, isdigit_l` — test for a decimal digit38777 **SYNOPSIS**

```
38778        #include <ctype.h>
38779        int isdigit(int c);
38780 CX     int isdigit_l(int c, locale_t locale);
```

38781 **DESCRIPTION**

38782 CX For `isdigit()`: The functionality described on this reference page is aligned with the ISO C
 38783 standard. Any conflict between the requirements described here and the ISO C standard is
 38784 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

38785 CX The `isdigit()` and `isdigit_l()` functions shall test whether *c* is a character of class **digit** in the
 38786 CX current locale, or in the locale represented by *locale*, respectively; see XBD Chapter 7 (on page
 38787 135).

38788 The *c* argument is an **int**, the value of which the application shall ensure is a character
 38789 representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has
 38790 any other value, the behavior is undefined.

38791 CX The behavior is undefined if the *locale* argument to `isdigit_l()` is the special locale object +
 38792 LC_GLOBAL_LOCALE or is not a valid locale object handle.

38793 **RETURN VALUE**

38794 CX The `isdigit()` and `isdigit_l()` functions shall return non-zero if *c* is a decimal digit; otherwise,
 38795 they shall return 0.

38796 **ERRORS**

38797 No errors are defined.

38798 **EXAMPLES**

38799 None.

38800 **APPLICATION USAGE**

38801 To ensure applications portability, especially across natural languages, only these functions and
 38802 the functions in the reference pages listed in the SEE ALSO section should be used for character
 38803 classification.

38804 **RATIONALE**

38813 First released in Issue 1. Derived from Issue 1 of the SVID.

38814 **Issue 6**

38815 The normative text is updated to avoid use of the term “must” for application requirements.

38816 **Issue 7**

38817 The *isdigit_l()* function is added from The Open Group Technical Standard, 2006, Extended API
38818 Set Part 4.

38819 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0286 [302], XSH/TC1-2008/0287 [283], +
38820 and XSH/TC1-2008/0288 [283] are applied.

38821 **NAME**

38822 isfinite — test for finite value

38823 **SYNOPSIS**

38824 #include <math.h>

38825 int isfinite(real-floating x);

38826 **DESCRIPTION**

38827 CX The functionality described on this reference page is aligned with the ISO C standard. Any
38828 conflict between the requirements described here and the ISO C standard is unintentional. This
38829 volume of POSIX.1-2008 defers to the ISO C standard.

38830 The *isfinite()* macro shall determine whether its argument has a finite value (zero, subnormal, or
38831 normal, and not infinite or NaN). First, an argument represented in a format wider than its
38832 semantic type is converted to its semantic type. Then determination is based on the type of the
38833 argument.

38834 **RETURN VALUE**38835 The *isfinite()* macro shall return a non-zero value if and only if its argument has a finite value.38836 **ERRORS**

38837 No errors are defined.

38838 **EXAMPLES**

38839 None.

38840 **APPLICATION USAGE**

38849 **CHANGE HISTORY**

38850 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

38851 **NAME**

38852 isgraph, isgraph_l — test for a visible character

38853 **SYNOPSIS**

38854 #include <ctype.h>

38855 int isgraph(int c);

38856 CX int isgraph_l(int c, locale_t locale);

38857 **DESCRIPTION**

38858 CX For *isgraph()*: The functionality described on this reference page is aligned with the ISO C
 38859 standard. Any conflict between the requirements described here and the ISO C standard is
 38860 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

38861 CX The *isgraph()* and *isgraph_l()* functions shall test whether *c* is a character of class **graph** in the
 38862 CX current locale, or in the locale represented by *locale*, respectively; see XBD Chapter 7 (on page
 38863 135).

38864 The *c* argument is an **int**, the value of which the application shall ensure is a character
 38865 representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has
 38866 any other value, the behavior is undefined.

38867 CX The behavior is undefined if the *locale* argument to *isgraph_l()* is the special locale object +
 38868 LC_GLOBAL_LOCALE or is not a valid locale object handle.

38869 **RETURN VALUE**

38870 CX The *isgraph()* and *isgraph_l()* functions shall return non-zero if *c* is a character with a visible
 38871 representation; otherwise, they shall return 0.

38872 **ERRORS**

38873 No errors are defined.

38874 **EXAMPLES**

38875 None.

38876 **APPLICATION USAGE**

38877 To ensure applications portability, especially across natural languages, only these functions and
 38878 the functions in the reference pages listed in the SEE ALSO section should be used for character
 38879 classification.

38880 **RATIONALE**

38888 **CHANGE HISTORY**

38889 First released in Issue 1. Derived from Issue 1 of the SVID.

38890 **Issue 6**

38891 The normative text is updated to avoid use of the term “must” for application requirements.

38892 **Issue 7**38893
38894

The *isgraph_l()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

38895
38896

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0289 [302], XSH/TC1-2008/0290 [283], + and XSH/TC1-2008/0291 [283] are applied.

38897 **NAME**38898 isgreater — test if *x* greater than *y*38899 **SYNOPSIS**

38900 #include <math.h>

38901 int isgreater(real-floating *x*, real-floating *y*);38902 **DESCRIPTION**

38903 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any
38904 conflict between the requirements described here and the ISO C standard is unintentional. This
38905 volume of POSIX.1-2008 defers to the ISO C standard.

38906 The *isgreater()* macro shall determine whether its first argument is greater than its second
38907 argument. The value of *isgreater(x, y)* shall be equal to $(x) > (y)$; however, unlike $(x) > (y)$,
38908 *isgreater(x, y)* shall not raise the invalid floating-point exception when *x* and *y* are unordered.

38909 **RETURN VALUE**38910 Upon successful completion, the *isgreater()* macro shall return the value of $(x) > (y)$.38911 If *x* or *y* is NaN, 0 shall be returned.38912 **ERRORS**

38913 No errors are defined.

38914 **EXAMPLES**

38915 None.

38916 **APPLICATION USAGE**

38917 The relational and equality operators support the usual mathematical relationships between
38918 numeric values. For any ordered pair of numeric values, exactly one of the relationships (less,
38919 greater, and equal) is true. Relational operators may raise the invalid floating-point exception
38920 when argument values are NaNs. For a NaN and a numeric value, or for two NaNs, just the
38921 unordered relationship is true. This macro is a quiet (non-floating-point exception raising)
38922 version of a relational operator. It facilitates writing efficient code that accounts for NaNs
38923 without suffering the invalid floating-point exception. In the SYNOPSIS section, **real-floating**
38924 indicates that the argument shall be an expression of **real-floating** type.

38925 **RATIONALE**

38926 None.

38927 **FUTURE DIRECTIONS**

38931 XBD <math.h>

38932 **CHANGE HISTORY**

38933 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

38934 **NAME**38935 isgreaterequal — test if *x* is greater than or equal to *y*38936 **SYNOPSIS**

38937 #include <math.h>

38938 int isgreaterequal(real-floating *x*, real-floating *y*);38939 **DESCRIPTION**

38940 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any
 38941 conflict between the requirements described here and the ISO C standard is unintentional. This
 38942 volume of POSIX.1-2008 defers to the ISO C standard.

38943 The *isgreaterequal()* macro shall determine whether its first argument is greater than or equal to
 38944 its second argument. The value of *isgreaterequal(x, y)* shall be equal to $(x) \geq (y)$; however, unlike
 38945 $(x) \geq (y)$, *isgreaterequal(x, y)* shall not raise the invalid floating-point exception when *x* and *y* are
 38946 unordered.

38947 **RETURN VALUE**38948 Upon successful completion, the *isgreaterequal()* macro shall return the value of $(x) \geq (y)$.38949 If *x* or *y* is NaN, 0 shall be returned.38950 **ERRORS**

38951 No errors are defined.

38952 **EXAMPLES**

38953 None.

38954 **APPLICATION USAGE**

38955 The relational and equality operators support the usual mathematical relationships between
 38956 numeric values. For any ordered pair of numeric values, exactly one of the relationships (less,
 38957 greater, and equal) is true. Relational operators may raise the invalid floating-point exception
 38958 when argument values are NaNs. For a NaN and a numeric value, or for two NaNs, just the
 38959 unordered relationship is true. This macro is a quiet (non-floating-point exception raising)
 38960 version of a relational operator. It facilitates writing efficient code that accounts for NaNs
 38961 without suffering the invalid floating-point exception. In the SYNOPSIS section, **real-floating**
 38962 indicates that the argument shall be an expression of **real-floating** type.

38963 **RATIONALE**

38964 None.

38965 **FUTURE DIRECTIONS**

38966 None.

39037 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

NAME

islessequal — test if *x* is less than or equal to *y*

SYNOPSIS

```
#include <math.h>
```

```
int islessequal(real-floating x, real-floating y);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

The *islessequal()* macro shall determine whether its first argument is less than or equal to its second argument. The value of *islessequal*(*x*, *y*) shall be equal to (*x*) <= (*y*); however, unlike (*x*) <= (*y*), *islessequal*(*x*, *y*) shall not raise the invalid floating-point exception when *x* and *y* are unordered.

RETURN VALUE

Upon successful completion, the *islessequal()* macro shall return the value of (*x*) <= (*y*).

If *x* or *y* is NaN, 0 shall be returned.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

The relational and equality operators support the usual mathematical relationships between numeric values. For any ordered pair of numeric values, exactly one of the relationships (less, greater, and equal) is true. Relational operators may raise the invalid floating-point exception when argument values are NaNs. For a NaN and a numeric value, or for two NaNs, just the unordered relationship is true. This macro is a quiet (non-floating-point exception raising) version of a relational operator. It facilitates writing efficient code that accounts for NaNs without suffering the invalid floating-point exception. In the SYNOPSIS section, **real-floating** indicates that the argument shall be an expression of **real-floating** type.

RATIONALE

None.

FUTURE DIRECTIONS

XBD **<math.h>**

CHANGE HISTORY

First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

39076 **NAME**39077 `islessgreater` — test if *x* is less than or greater than *y*39078 **SYNOPSIS**39079 `#include <math.h>`39080 `int islessgreater(real-floating x, real-floating y);`39081 **DESCRIPTION**

39082 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 39083 conflict between the requirements described here and the ISO C standard is unintentional. This
 39084 volume of POSIX.1-2008 defers to the ISO C standard.

39085 The `islessgreater()` macro shall determine whether its first argument is less than or greater than
 39086 its second argument. The `islessgreater(x, y)` macro is similar to `(x < (y) || (x) > (y))`; however,
 39087 `islessgreater(x, y)` shall not raise the invalid floating-point exception when *x* and *y* are unordered
 39088 (nor shall it evaluate *x* and *y* twice).

39089 **RETURN VALUE**

39090 Upon successful completion, the `islessgreater()` macro shall return the value of
 39091 `(x < (y) || (x) > (y))`.

39092 If *x* or *y* is NaN, 0 shall be returned.

39093 **ERRORS**

39094 No errors are defined.

39095 **EXAMPLES**

39096 None.

39097 **APPLICATION USAGE**

39098 The relational and equality operators support the usual mathematical relationships between
 39099 numeric values. For any ordered pair of numeric values, exactly one of the relationships (less,
 39100 greater, and equal) is true. Relational operators may raise the invalid floating-point exception
 39101 when argument values are NaNs. For a NaN and a numeric value, or for two NaNs, just the
 39102 unordered relationship is true. This macro is a quiet (non-floating-point exception raising)
 39103 version of a relational operator. It facilitates writing efficient code that accounts for NaNs
 39104 without suffering the invalid floating-point exception. In the SYNOPSIS section, **real-floating**
 39105 indicates that the argument shall be an expression of **real-floating** type.

39106 **RATIONALE**

39107 None.

39108 **FUTURE DIRECTIONS**

39109 None.

39110 **SEE ALSO**

39112 XBD [`<math.h>`](#)

39113 **CHANGE HISTORY**

39114 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

39115 **NAME**

39116 islower, islower_l — test for a lowercase letter

39117 **SYNOPSIS**

```
39118     #include <ctype.h>
39119
39119     int islower(int c);
39120 CX    int islower_l(int c, locale_t locale);
```

39121 **DESCRIPTION**

39122 CX For *islower()*: The functionality described on this reference page is aligned with the ISO C
 39123 standard. Any conflict between the requirements described here and the ISO C standard is
 39124 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

39125 CX The *islower()* and *islower_l()* functions shall test whether *c* is a character of class **lower** in the
 39126 CX current locale, or in the locale represented by *locale*, respectively; see XBD Chapter 7 (on page
 39127 135).

39128 The *c* argument is an **int**, the value of which the application shall ensure is a character
 39129 representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has
 39130 any other value, the behavior is undefined.

39131 CX The behavior is undefined if the *locale* argument to *islower_l()* is the special locale object
 39132 LC_GLOBAL_LOCALE or is not a valid locale object handle.

39133 **RETURN VALUE**

39134 CX The *islower()* and *islower_l()* functions shall return non-zero if *c* is a lowercase letter; otherwise,
 39135 they shall return 0.

39136 **ERRORS**

39137 No errors are defined.

39138 **EXAMPLES**39139 **Testing for a Lowercase Letter**

39140 Two examples follow, the first using *islower()*, the second using multiple concurrent locales and
 39141 *islower_l()*.

39142 The examples test whether the value is a lowercase letter, based on the current locale, then use it
 39143 as part of a key value.

```
39144     /* Example 1 -- using islower() */
39145     #include <ctype.h>
39146     #include <stdlib.h>
39147     #include <locale.h>
39148     ...
39149     char *keystr;
39150     int elementlen, len;
39151     unsigned char c;
39152     ...
39153     setlocale(LC_ALL, "");
39154     ...
39155     len = 0;
39156     while (len < elementlen) {
39157         c = (unsigned char) (rand() % 256);
39158         ...
```

```

39159         if (islower(c))
39160             keystr[len++] = c;
39161     }
39162     ...
39163     /* Example 2 -- using islower_l() */
39164     #include <ctype.h>
39165     #include <stdlib.h>
39166     #include <locale.h>
39167     ...
39168     char *keystr;
39169     int elementlen, len;
39170     unsigned char c;
39171     ...
39172     locale_t loc = newlocale (LC_ALL_MASK, "", (locale_t) 0);
39173     ...
39174     len = 0;
39175     while (len < elementlen) {
39176         c = (unsigned char) (rand() % 256);
39177         ...
39178         if (islower_l(c, loc))
39179             keystr[len++] = c;
39180     }
39181     ...

```

APPLICATION USAGE

To ensure applications portability, especially across natural languages, only these functions and the functions in the reference pages listed in the SEE ALSO section should be used for character classification.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

The normative text is updated to avoid use of the term “must” for application requirements and an example is added.

Issue 7

The *islower_l()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0292 [302], XSH/TC1-2008/0293 [283], XSH/TC1-2008/0294 [283], XSH/TC1-2008/0295 [302], and XSH/TC1-2008/0296 [304] are applied.

39205 **NAME**

39206 isnan — test for a NaN

39207 **SYNOPSIS**

39208 #include <math.h>

39209 int isnan(real-floating x);

39210 **DESCRIPTION**

39211 CX The functionality described on this reference page is aligned with the ISO C standard. Any
39212 conflict between the requirements described here and the ISO C standard is unintentional. This
39213 volume of POSIX.1-2008 defers to the ISO C standard.

39214 The *isnan()* macro shall determine whether its argument value is a NaN. First, an argument
39215 represented in a format wider than its semantic type is converted to its semantic type. Then
39216 determination is based on the type of the argument.

39217 **RETURN VALUE**39218 The *isnan()* macro shall return a non-zero value if and only if its argument has a NaN value.39219 **ERRORS**

39232 **CHANGE HISTORY**

39233 First released in Issue 3.

39234 **Issue 5**

39235 The DESCRIPTION is updated to indicate the return value when NaN is not supported. This
39236 text was previously published in the APPLICATION USAGE section.

39237 **Issue 6**

39238 Re-written for alignment with the ISO/IEC 9899:1999 standard.

39239 NAME

39240 isnormal — test for a normal value

39241 SYNOPSIS

39242 #include <math.h>

39243 int isnormal(real-floating x);

39244 DESCRIPTION

39245 CX The functionality described on this reference page is aligned with the ISO C standard. Any
39246 conflict between the requirements described here and the ISO C standard is unintentional. This
39247 volume of POSIX.1-2008 defers to the ISO C standard.

39248 The *isnormal()* macro shall determine whether its argument value is normal (neither zero,
39249 subnormal, infinite, nor NaN). First, an argument represented in a format wider than its
39250 semantic type is converted to its semantic type. Then determination is based on the type of the
39251 argument.

39252 RETURN VALUE

39253 The *isnormal()* macro shall return a non-zero value if and only if its argument has a normal
39254 value.

39255 ERRORS

39357 **Issue 7**

39358 The *ispunct_l()* function is added from The Open Group Technical Standard, 2006, Extended API
39359 Set Part 4.

39360 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0300 [302], XSH/TC1-2008/0301 [283], +
39361 and XSH/TC1-2008/0302 [283] are applied.

39362 **NAME**

39363 isspace, isspace_l — test for a white-space character

39364 **SYNOPSIS**

```
39365       #include <ctype.h>
39366       int isspace(int c);
39367 CX     int isspace_l(int c, locale_t locale);
```

39368 **DESCRIPTION**

39369 CX For *isspace()*: The functionality described on this reference page is aligned with the ISO C
 39370 standard. Any conflict between the requirements described here and the ISO C standard is
 39371 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

39372 CX The *isspace()* and *isspace_l()* functions shall test whether *c* is a character of class **space** in the
 39373 CX current locale, or in the locale represented by *locale*, respectively; see XBD Chapter 7 (on page
 39374 135).

39375 The *c* argument is an **int**, the value of which the application shall ensure is a character
 39376 representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has
 39377 any other value, the behavior is undefined.

39378 CX The behavior is undefined if the *locale* argument to *isspace_l()* is the special locale object +
 39379 LC_GLOBAL_LOCALE or is not a valid locale object handle.

39380 **RETURN VALUE**

39381 CX The *isspace()* and *isspace_l()* functions shall return non-zero if *c* is a white-space character;
 39382 otherwise, they shall return 0.

39383 **ERRORS**

39384 No errors are defined.

39385 **EXAMPLES**

39386 None.

39387 **APPLICATION USAGE**

39388 To ensure applications portability, especially across natural languages, only these functions and
 39389 the functions in the reference pages listed in the SEE ALSO section should be used for character
 39390 classification.

39391 **RATIONALE**

39392 None.

39393 **FUTURE DIRECTIONS**

39394 None.

39395 **SEE ALSO**

39396 *isalnum()*, *isalpha()*, *iscntrl()*, *isdigit()*, *isgraph()*, *islower()*, *isprint()*, *ispunct()*, *isupper()*,
 39397 *isxdigit()*, *setlocale()*, *uselocale()*

39398 XBD Chapter 7 (on page 135), [<ctype.h>](#), [<locale.h>](#)

39399 **CHANGE HISTORY**

39400 First released in Issue 1. Derived from Issue 1 of the SVID.

39401 **Issue 6**

39402 The normative text is updated to avoid use of the term “must” for application requirements.

39403 **Issue 7**

39404 The *isspace_l()* function is added from The Open Group Technical Standard, 2006, Extended API
39405 Set Part 4.

39406 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0303 [302], XSH/TC1-2008/0304 [283], +
39407 and XSH/TC1-2008/0305 [283] are applied.

39408 **NAME**

39409 isunordered — test if arguments are unordered

39410 **SYNOPSIS**

39411 #include <math.h>

39412 int isunordered(real-floating *x*, real-floating *y*);39413 **DESCRIPTION**

39414 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any
 39415 conflict between the requirements described here and the ISO C standard is unintentional. This
 39416 volume of POSIX.1-2008 defers to the ISO C standard.

39417 The *isunordered()* macro shall determine whether its arguments are unordered.39418 **RETURN VALUE**39419 Upon successful completion, the *isunordered()* macro shall return 1 if its arguments are
 39420 unordered, and 0 otherwise.39421 If *x* or *y* is NaN, 1 shall be returned.39422 **ERRORS**

39423 No errors are defined.

39424 **EXAMPLES**

39425 None.

39426 **APPLICATION USAGE**

39427 The relational and equality operators support the usual mathematical relationships between
 39428 numeric values. For any ordered pair of numeric values, exactly one of the relationships (less,
 39429 greater, and equal) is true. Relational operators may raise the invalid floating-point exception
 39430 when argument values are NaNs. For a NaN and a numeric value, or for two NaNs, just the
 39431 unordered relationship is true. This macro is a quiet (non-floating-point exception raising)
 39432 version of a relational operator. It facilitates writing efficient code that accounts for NaNs
 39433 without suffering the invalid floating-point exception. In the SYNOPSIS section, **real-floating**
 39434 indicates that the argument shall be an expression of **real-floating** type.

39435 **RATIONALE**

39436 None.

39437 **FUTURE DIRECTIONS**

39438 None.

39439 **SEE ALSO**39440 *isgreater()*, *isgreaterequal()*, *isless()*, *islessequal()*, *islessgreater()*

39441 XBD <math.h>

39442 **CHANGE HISTORY**

39443 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

39444 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/50 is applied, correcting the RETURN
 39445 VALUE section when *x* or *y* is NaN.

39446 **NAME**

39447 isupper, isupper_l — test for an uppercase letter

39448 **SYNOPSIS**

39449 #include <ctype.h>

39450 int isupper(int c);

39451 CX int isupper_l(int c, locale_t locale);

39452 **DESCRIPTION**

39453 CX For *isupper()*: The functionality described on this reference page is aligned with the ISO C
 39454 standard. Any conflict between the requirements described here and the ISO C standard is
 39455 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

39456 CX The *isupper()* and *isupper_l()* functions shall test whether *c* is a character of class **upper** in the
 39457 CX current locale, or in the locale represented by *locale*, respectively; see XBD Chapter 7 (on page
 39458 135).

39459 The *c* argument is an **int**, the value of which the application shall ensure is a character
 39460 representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has
 39461 any other value, the behavior is undefined.

39462 CX The behavior is undefined if the *locale* argument to *isupper_l()* is the special locale object +
 39463 LC_GLOBAL_LOCALE or is not a valid locale object handle.

39464 **RETURN VALUE**

39465 CX The *isupper()* and *isupper_l()* functions shall return non-zero if *c* is an uppercase letter;
 39466 otherwise, they shall return 0.

39467 **ERRORS**

39468 No errors are defined.

39469 **EXAMPLES**

39470 None.

39471 **APPLICATION USAGE**

39472 To ensure applications portability, especially across natural languages, only these functions and
 39473 the functions in the reference pages listed in the SEE ALSO section should be used for character
 39474 classification.

39475 **RATIONALE**

39476 None.

39477 **FUTURE DIRECTIONS**

39478 None.

39479 **SEE ALSO**

39480 *isalnum()*, *isalpha()*, *isblank()*, *iscntrl()*, *isdigit()*, *isgraph()*, *islower()*, *isprint()*, *ispunct()*, *isspace()*,

39482 XBD Chapter 7 (on page 135), <ctype.h>, <locale.h>

39483 **CHANGE HISTORY**

39484 First released in Issue 1. Derived from Issue 1 of the SVID.

39485 **Issue 6**

39486 The normative text is updated to avoid use of the term “must” for application requirements.

39487 **Issue 7**

39488 The *isupper_l()* function is added from The Open Group Technical Standard, 2006, Extended API
39489 Set Part 4.

39490 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0306 [302], XSH/TC1-2008/0307 [283], +
39491 and XSH/TC1-2008/0308 [283] are applied.

39492 **NAME**

39493 iswalnum, iswalnum_l — test for an alphanumeric wide-character code

39494 **SYNOPSIS**

39495 #include <wctype.h>

39496 int iswalnum(wint_t wc);

39497 CX int iswalnum_l(wint_t wc, locale_t locale);

39498 **DESCRIPTION**39499 CX For *iswalnum()*: The functionality described on this reference page is aligned with the ISO C
39500 standard. Any conflict between the requirements described here and the ISO C standard is
39501 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.39502 CX The *iswalnum()* and *iswalnum_l()* functions shall test whether *wc* is a wide-character code
39503 CX representing a character of class **alpha** or **digit** in the current locale, or in the locale represented
39504 by *locale*, respectively; see XBD Chapter 7 (on page 135).39505 The *wc* argument is a **wint_t**, the value of which the application shall ensure is a wide-character
39506 code corresponding to a valid character in the current locale, or equal to the value of the macro
39507 WEOF. If the argument has any other value, the behavior is undefined.39508 CX The behavior is undefined if the *locale* argument to *iswalnum_l()* is the special locale object +
39509 LC_GLOBAL_LOCALE or is not a valid locale object handle.39510 **RETURN VALUE**39511 CX The *iswalnum()* and *iswalnum_l()* functions shall return non-zero if *wc* is an alphanumeric
39512 wide-character code; otherwise, they shall return 0.39513 **ERRORS**

39514 No errors are defined.

39515 **EXAMPLES**

39516 None.

39517 **APPLICATION USAGE**39518 To ensure applications portability, especially across natural languages, only these functions and
39519 the functions in the reference pages listed in the SEE ALSO section should be used for character
39520 classification.39521 **RATIONALE**

39522 None.

39523 **FUTURE DIRECTIONS**

39524 None.

39525 **SEE ALSO**39526 *iswalpha()*, *iswcntrl()*, *iswctype()*, *iswdigit()*, *iswgraph()*, *iswlower()*, *iswprint()*, *iswpunct()*,

39528 XBD Chapter 7 (on page 135), <locale.h>, <stdio.h>, <wctype.h>

39529 **CHANGE HISTORY**

39530 First released as a World-wide Portability Interface in Issue 4.

39531 **Issue 5**39532 The following change has been made in this version for alignment with
39533 ISO/IEC 9899:1990/Amendment 1:1995 (E):

- 39534 • The SYNOPSIS has been changed to indicate that this function and associated data types
39535 are now made visible by inclusion of the `<wctype.h>` header rather than `<wchar.h>`.
- 39536 **Issue 6**
- 39537 The normative text is updated to avoid use of the term “must” for application requirements.
- 39538 **Issue 7**
- 39539 The `iswalnum_l()` function is added from The Open Group Technical Standard, 2006, Extended
39540 API Set Part 4.
- 39541 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0309 [302], XSH/TC1-2008/0310 [283], +
39542 and XSH/TC1-2008/0311 [283] are applied.

39543 **NAME**

39544 iswalpha, iswalpha_l — test for an alphabetic wide-character code

39545 **SYNOPSIS**

39546 #include <wctype.h>

39547 int iswalpha(wint_t wc);

39548 CX int iswalpha_l(wint_t wc, locale_t locale);

39549 **DESCRIPTION**

39550 CX For *iswalpha()*: The functionality described on this reference page is aligned with the ISO C
 39551 standard. Any conflict between the requirements described here and the ISO C standard is
 39552 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

39553 CX The *iswalpha()* and *iswalpha_l()* functions shall test whether *wc* is a wide-character code
 39554 CX representing a character of class **alpha** in the current locale, or in the locale represented by *locale*,
 39555 respectively; see XBD Chapter 7 (on page 135).

39556 The *wc* argument is a **wint_t**, the value of which the application shall ensure is a wide-character
 39557 code corresponding to a valid character in the current locale, or equal to the value of the macro
 39558 WEOF. If the argument has any other value, the behavior is undefined.

39559 CX The behavior is undefined if the *locale* argument to *iswalpha_l()* is the special locale object
 39560 LC_GLOBAL_LOCALE or is not a valid locale object handle.

39561 **RETURN VALUE**

39562 CX The *iswalpha()* and *iswalpha_l()* functions shall return non-zero if *wc* is an alphabetic wide-
 39563 character code; otherwise, they shall return 0.

39564 **ERRORS**

39565 No errors are defined.

39566 **EXAMPLES**

39567 None.

39568 **APPLICATION USAGE**

39569 To ensure applications portability, especially across natural languages, only these functions and
 39570 the functions in the reference pages listed in the SEE ALSO section should be used for character
 39571 classification.

39572 **RATIONALE**

39573 None.

39574 **FUTURE DIRECTIONS**

39575 None.

39576 **SEE ALSO**

39577 *iswalnum()*, *iswcntrl()*, *iswctype()*, *iswdigit()*, *iswgraph()*, *iswlower()*, *iswprint()*, *iswpunct()*,
 39578 *iswspace()*, *iswupper()*, *iswxdigit()*, *setlocale()*, *uselocale()*

39579 XBD Chapter 7 (on page 135), <locale.h>, <wctype.h>

39580 **CHANGE HISTORY**

39581 First released in Issue 4.

39582 **Issue 5**

39583 The following change has been made in this version for alignment with
 39584 ISO/IEC 9899:1990/Amendment 1:1995 (E):

- 39585 • The SYNOPSIS has been changed to indicate that this function and associated data types
39586 are now made visible by inclusion of the `<wctype.h>` header rather than `<wchar.h>`.
- 39587 **Issue 6**
- 39588 The normative text is updated to avoid use of the term “must” for application requirements.
- 39589 **Issue 7**
- 39590 The *iswalpha_l()* function is added from The Open Group Technical Standard, 2006, Extended
39591 API Set Part 4.
- 39592 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0312 [302], XSH/TC1-2008/0313 [283], +
39593 and XSH/TC1-2008/0314 [283] are applied.

39594 **NAME**

39595 iswblank, iswblank_l — test for a blank wide-character code

39596 **SYNOPSIS**

39597 #include <wctype.h>

39598 int iswblank(wint_t wc);

39599 CX int iswblank_l(wint_t wc, locale_t locale);

39600 **DESCRIPTION**

39601 CX For *iswblank()*: The functionality described on this reference page is aligned with the ISO C
 39602 standard. Any conflict between the requirements described here and the ISO C standard is
 39603 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

39604 CX The *iswblank()* and *iswblank_l()* functions shall test whether *wc* is a wide-character code
 39605 CX representing a character of class **blank** in the current locale, or in the locale represented by
 39606 *locale*, respectively; see XBD Chapter 7 (on page 135).

39607 The *wc* argument is a **wint_t**, the value of which the application shall ensure is a wide-character
 39608 code corresponding to a valid character in the current locale, or equal to the value of the macro
 39609 WEOF. If the argument has any other value, the behavior is undefined.

39610 CX The behavior is undefined if the *locale* argument to *iswblank_l()* is the special locale object +
 39611 LC_GLOBAL_LOCALE or is not a valid locale object handle.

39612 **RETURN VALUE**

39613 CX The *iswblank()* and *iswblank_l()* functions shall return non-zero if *wc* is a blank wide-character
 39614 code; otherwise, they shall return 0.

39615 **ERRORS**

39616 No errors are defined.

39617 **EXAMPLES**

39618 None.

39619 **APPLICATION USAGE**

39620 To ensure applications portability, especially across natural languages, only these functions and
 39621 the functions in the reference pages listed in the SEE ALSO section should be used for character
 39622 classification.

39623 **RATIONALE**

39624 None.

39625 **FUTURE DIRECTIONS**

39626 None.

39627 **SEE ALSO**

39628 *iswalnum()*, *iswalpha()*, *iswcntrl()*, *iswctype()*, *iswdigit()*, *iswgraph()*, *iswlower()*, *iswprint()*,

39630 XBD Chapter 7 (on page 135), <locale.h>, <wctype.h>

39631 **CHANGE HISTORY**

39632 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

39633 **Issue 7**

39634 The *iswblank_l()* function is added from The Open Group Technical Standard, 2006, Extended
 39635 API Set Part 4.

39636
39637

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0315 [302], XSH/TC1-2008/0316 [283], +
and XSH/TC1-2008/0317 [283] are applied.

39638 **NAME**

39639 iswcntrl, iswcntrl_l — test for a control wide-character code

39640 **SYNOPSIS**

39641 #include <wctype.h>

39642 int iswcntrl(wint_t wc);

39643 CX int iswcntrl_l(wint_t wc, locale_t locale);

39644 **DESCRIPTION**

39645 CX For *iswcntrl()*: The functionality described on this reference page is aligned with the ISO C
 39646 standard. Any conflict between the requirements described here and the ISO C standard is
 39647 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

39648 CX The *iswcntrl()* and *iswcntrl_l()* functions shall test whether *wc* is a wide-character code
 39649 CX representing a character of class **cntrl** in the current locale, or in the locale represented by *locale*,
 39650 respectively; see XBD Chapter 7 (on page 135).

39651 The *wc* argument is a **wint_t**, the value of which the application shall ensure is a wide-character
 39652 code corresponding to a valid character in the current locale, or equal to the value of the macro
 39653 WEOF. If the argument has any other value, the behavior is undefined.

39654 CX The behavior is undefined if the *locale* argument to *iswcntrl_l()* is the special locale object
 39655 LC_GLOBAL_LOCALE or is not a valid locale object handle.

39656 **RETURN VALUE**

39657 CX The *iswcntrl()* and *iswcntrl_l()* functions shall return non-zero if *wc* is a control wide-character
 39658 code; otherwise, they shall return 0.

39659 **ERRORS**

39660 No errors are defined.

39661 **EXAMPLES**

39662 None.

39663 **APPLICATION USAGE**

39664 To ensure applications portability, especially across natural languages, only these functions and
 39665 the functions in the reference pages listed in the SEE ALSO section should be used for character
 39666 classification.

39667 **RATIONALE**

39668 None.

39669 **FUTURE DIRECTIONS**

39670 None.

39671 **SEE ALSO**

39672 *iswalnum()*, *iswalpha()*, *iswctype()*, *iswdigit()*, *iswgraph()*, *iswlower()*, *iswprint()*, *iswpunct()*,

39674 XBD Chapter 7 (on page 135), <locale.h>, <wctype.h>

39675 **CHANGE HISTORY**

39676 First released in Issue 4.

39677 **Issue 5**

39678 The following change has been made in this version for alignment with
 39679 ISO/IEC 9899:1990/Amendment 1:1995 (E):

- 39680 • The SYNOPSIS has been changed to indicate that this function and associated data types
39681 are now made visible by inclusion of the `<wctype.h>` header rather than `<wchar.h>`.
- 39682 **Issue 6**
- 39683 The normative text is updated to avoid use of the term “must” for application requirements.
- 39684 **Issue 7**
- 39685 The `iswcntrl_l()` function is added from The Open Group Technical Standard, 2006, Extended
39686 API Set Part 4.
- 39687 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0318 [302], XSH/TC1-2008/0319 [283], +
39688 and XSH/TC1-2008/0320 [283] are applied.

39689 **NAME**

39690 iswctype, iswctype_l — test character for a specified class

39691 **SYNOPSIS**

```
39692     #include <wctype.h>
39693
39693     int iswctype(wint_t wc, wctype_t charclass);
39694 CX     int iswctype_l(wint_t wc, wctype_t charclass,
39695                     locale_t locale);
```

39696 **DESCRIPTION**

39697 CX For *iswctype()*: The functionality described on this reference page is aligned with the ISO C
 39698 standard. Any conflict between the requirements described here and the ISO C standard is
 39699 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

39700 CX The *iswctype()* and *iswctype_l()* functions shall determine whether the wide-character code *wc*
 39701 CX has the character class *charclass*, returning true or false. The *iswctype()* and *iswctype_l()*
 39702 functions are defined on WEOF and wide-character codes corresponding to the valid character
 39703 CX encodings in the current locale, or in the locale represented by *locale*, respectively. If the *wc*
 39704 CX argument is not in the domain of the function, the result is undefined. If the value of *charclass* is
 39705 invalid (that is, not obtained by a call to *wctype()* or *charclass* is invalidated by a subsequent call
 39706 to *setlocale()* that has affected category *LC_CTYPE*) the result is unspecified.

39707 CX The behavior is undefined if the *locale* argument to *iswctype_l()* is the special locale object
 39708 LC_GLOBAL_LOCALE or is not a valid locale object handle.

39709 **RETURN VALUE**

39710 CX The *iswctype()* and *iswctype_l()* functions shall return non-zero (true) if and only if *wc* has the
 39711 CX property described by *charclass*. If *charclass* is 0, these functions shall return 0.

39712 **ERRORS**

39713 No errors are defined.

39714 **EXAMPLES**39715 **Testing for a Valid Character**

```
39716     #include <wctype.h>
39717     ...
39718     int yes_or_no;
39719     wint_t wc;
39720     wctype_t valid_class;
39721     ...
39722     if ((valid_class=wctype("vowel")) == (wctype_t)0)
39723         /* Invalid character class. */
39724     yes_or_no=iswctype(wc,valid_class);
```

39725 **APPLICATION USAGE**

39726 The twelve strings "alnum", "alpha", "blank", "cntrl", "digit", "graph", "lower",
 39727 "print", "punct", "space", "upper", and "xdigit" are reserved for the standard
 39728 character classes. In the table below, the functions in the left column are equivalent to the
 39729 functions in the right column.

39730 iswalnum(<i>wc</i>)	iswctype(<i>wc</i> , wctype("alnum"))
39731 iswalnum_l(<i>wc</i> , <i>locale</i>)	iswctype_l(<i>wc</i> , wctype("alnum"), <i>locale</i>)
39732 iswalpna(<i>wc</i>)	iswctype(<i>wc</i> , wctype("alpha"))
39733 iswalpna_l(<i>wc</i> , <i>locale</i>)	iswctype_l(<i>wc</i> , wctype("alpha"), <i>locale</i>)

```

39734      iswblank(wc)           iswctype(wc, wctype("blank"))
39735      iswblank_l(wc, locale) iswctype_l(wc, wctype("blank"), locale)
39736      iswcntrl(wc)           iswctype(wc, wctype("cntrl"))
39737      iswcntrl_l(wc, locale) iswctype_l(wc, wctype("cntrl"), locale)
39738      iswdigit(wc)           iswctype(wc, wctype("digit"))
39739      iswdigit_l(wc, locale) iswctype_l(wc, wctype("digit"), locale)
39740      iswgraph(wc)           iswctype(wc, wctype("graph"))
39741      iswgraph_l(wc, locale) iswctype_l(wc, wctype("graph"), locale)
39742      iswlower(wc)           iswctype(wc, wctype("lower"))
39743      iswlower_l(wc, locale) iswctype_l(wc, wctype("lower"), locale)
39744      iswprint(wc)           iswctype(wc, wctype("print"))
39745      iswprint_l(wc, locale) iswctype_l(wc, wctype("print"), locale)
39746      iswpunct(wc)           iswctype(wc, wctype("punct"))
39747      iswpunct_l(wc, locale) iswctype_l(wc, wctype("punct"), locale)
39748      iswspace(wc)           iswctype(wc, wctype("space"))
39749      iswspace_l(wc, locale) iswctype_l(wc, wctype("space"), locale)
39750      iswupper(wc)           iswctype(wc, wctype("upper"))
39751      iswupper_l(wc, locale) iswctype_l(wc, wctype("upper"), locale)
39752      iswxdigit(wc)          iswctype(wc, wctype("xdigit"))
39753      iswxdigit_l(wc, locale) iswctype_l(wc, wctype("xdigit"), locale)

```

XBD **<locale.h>**, **<wctype.h>**

CHANGE HISTORY

First released as World-wide Portability Interfaces in Issue 4.

Issue 5

The following change has been made in this version for alignment with ISO/IEC 9899:1990/Amendment 1:1995 (E):

- The SYNOPSIS has been changed to indicate that this function and associated data types are now made visible by inclusion of the **<wctype.h>** header rather than **<wchar.h>**.

Issue 6

The behavior of $n=0$ is now described.

An example is added.

A new function, *iswblank()*, is added to the list in the APPLICATION USAGE.

Issue 7

The *iswctype_l()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0321 [283] and XSH/TC1-2008/0322 + [283] are applied.

39778 **NAME**

39779 iswdigit, iswdigit_l — test for a decimal digit wide-character code

39780 **SYNOPSIS**

39781 #include <wctype.h>

39782 int iswdigit(wint_t wc);

39783 CX int iswdigit_l(wint_t wc, locale_t locale);

39784 **DESCRIPTION**

39785 CX For *iswdigit()*: The functionality described on this reference page is aligned with the ISO C
 39786 standard. Any conflict between the requirements described here and the ISO C standard is
 39787 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

39788 CX The *iswdigit()* and *iswdigit_l()* functions shall test whether *wc* is a wide-character code
 39789 CX representing a character of class **digit** in the current locale, or in the locale represented by *locale*,
 39790 respectively; see XBD Chapter 7 (on page 135).

39791 The *wc* argument is a **wint_t**, the value of which the application shall ensure is a wide-character
 39792 code corresponding to a valid character in the current locale, or equal to the value of the macro
 39793 WEOF. If the argument has any other value, the behavior is undefined.

39794 CX The behavior is undefined if the *locale* argument to *iswdigit_l()* is the special locale object
 39795 LC_GLOBAL_LOCALE or is not a valid locale object handle.

39796 **RETURN VALUE**

39797 CX The *iswdigit()* and *iswdigit_l()* functions shall return non-zero if *wc* is a decimal digit wide-
 39798 character code; otherwise, they shall return 0.

39799 **ERRORS**

39800 No errors are defined.

39801 **EXAMPLES**

39802 None.

39803 **APPLICATION USAGE**

39804 To ensure applications portability, especially across natural languages, only these functions and
 39805 the functions in the reference pages listed in the SEE ALSO section should be used for character
 39806 classification.

39807 **RATIONALE**

39808 None.

39809 **FUTURE DIRECTIONS**

39810 None.

39811 **SEE ALSO**

39812 *iswalnum()*, *iswalpha()*, *iswcntrl()*, *iswctype()*, *iswgraph()*, *iswlower()*, *iswprint()*, *iswpunct()*,
 39813 *iswspace()*, *iswupper()*, *iswxdigit()*, *setlocale()*, *uselocale()*

39814 XBD Chapter 7 (on page 135), <locale.h>, <wctype.h>

39815 **CHANGE HISTORY**

39816 First released in Issue 4.

39817 **Issue 5**

39818 The following change has been made in this version for alignment with
 39819 ISO/IEC 9899:1990/Amendment 1:1995 (E):

- 39820 • The SYNOPSIS has been changed to indicate that this function and associated data types
39821 are now made visible by inclusion of the `<wctype.h>` header rather than `<wchar.h>`.
- 39822 **Issue 6**
- 39823 The normative text is updated to avoid use of the term “must” for application requirements.
- 39824 **Issue 7**
- 39825 The `iswdigit_l()` function is added from The Open Group Technical Standard, 2006, Extended
39826 API Set Part 4.
- 39827 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0323 [302], XSH/TC1-2008/0324 [283], +
39828 and XSH/TC1-2008/0325 [283] are applied.

39829 **NAME**

39830 iswgraph, iswgraph_l — test for a visible wide-character code

39831 **SYNOPSIS**

39832 #include <wctype.h>

39833 int iswgraph(wint_t wc);

39834 CX int iswgraph_l(wint_t wc, locale_t locale);

39835 **DESCRIPTION**

39836 CX For *iswgraph()*: The functionality described on this reference page is aligned with the ISO C
 39837 standard. Any conflict between the requirements described here and the ISO C standard is
 39838 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

39839 CX The *iswgraph()* and *iswgraph_l()* functions shall test whether *wc* is a wide-character code
 39840 CX representing a character of class **graph** in the current locale, or in the locale represented by
 39841 *locale*, respectively; see XBD [Chapter 7](#) (on page 135).

39842 The *wc* argument is a **wint_t**, the value of which the application shall ensure is a wide-character
 39843 code corresponding to a valid character in the current locale, or equal to the value of the macro
 39844 WEOF. If the argument has any other value, the behavior is undefined.

39845 CX The behavior is undefined if the *locale* argument to *iswgraph_l()* is the special locale object
 39846 LC_GLOBAL_LOCALE or is not a valid locale object handle.

39847 **RETURN VALUE**

39848 CX The *iswgraph()* and *iswgraph_l()* functions shall return non-zero if *wc* is a wide-character code
 39849 with a visible representation; otherwise, they shall return 0.

39850 **ERRORS**

39851 No errors are defined.

39852 **EXAMPLES**

39853 None.

39854 **APPLICATION USAGE**

39855 To ensure applications portability, especially across natural languages, only these functions and
 39856 the functions in the reference pages listed in the SEE ALSO section should be used for character
 39857 classification.

39858 **RATIONALE**

39859 None.

39860 **FUTURE DIRECTIONS**

39861 None.

39867 First released in Issue 4.

39868 **Issue 5**

39869 The following change has been made in this version for alignment with
 39870 ISO/IEC 9899:1990/Amendment 1:1995 (E):

- 39871 • The SYNOPSIS has been changed to indicate that this function and associated data types
39872 are now made visible by inclusion of the `<wctype.h>` header rather than `<wchar.h>`.
- 39873 **Issue 6**
- 39874 The normative text is updated to avoid use of the term “must” for application requirements.
- 39875 **Issue 7**
- 39876 The `iswgraph_l()` function is added from The Open Group Technical Standard, 2006, Extended
39877 API Set Part 4.
- 39878 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0326 [302], XSH/TC1-2008/0327 [283], +
39879 and XSH/TC1-2008/0328 [283] are applied.

39880 **NAME**

39881 iswlower, iswlower_l — test for a lowercase letter wide-character code

39882 **SYNOPSIS**

39883 #include <wctype.h>

39884 int iswlower(wint_t wc);

39885 CX int iswlower_l(wint_t wc, locale_t locale);

39886 **DESCRIPTION**

39887 CX For *iswlower()*: The functionality described on this reference page is aligned with the ISO C
 39888 standard. Any conflict between the requirements described here and the ISO C standard is
 39889 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

39890 CX The *iswlower()* and *iswlower_l()* functions shall test whether *wc* is a wide-character code
 39891 CX representing a character of class **lower** in the current locale, or in the locale represented by
 39892 *locale*, respectively; see XBD Chapter 7 (on page 135).

39893 The *wc* argument is a **wint_t**, the value of which the application shall ensure is a wide-character
 39894 code corresponding to a valid character in the current locale, or equal to the value of the macro
 39895 WEOF. If the argument has any other value, the behavior is undefined.

39896 CX The behavior is undefined if the *locale* argument to *iswlower_l()* is the special locale object +
 39897 LC_GLOBAL_LOCALE or is not a valid locale object handle.

39898 **RETURN VALUE**

39899 CX The *iswlower()* and *iswlower_l()* functions shall return non-zero if *wc* is a lowercase letter wide-
 39900 character code; otherwise, they shall return 0.

39901 **ERRORS**

39902 No errors are defined.

39903 **EXAMPLES**

39904 None.

39905 **APPLICATION USAGE**

39906 To ensure applications portability, especially across natural languages, only these functions and
 39907 the functions in the reference pages listed in the SEE ALSO section should be used for character
 39908 classification.

39930 and XSH/TC1-2008/0331 [283] are applied.

NAME

iswprint, iswprint_l — test for a printable wide-character code

SYNOPSIS

```
#include <wctype.h>
```

```
int iswprint(wint_t wc);
```

```
CX int iswprint_l(wint_t wc, locale_t locale);
```

DESCRIPTION

CX For *iswprint()*: The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

CX The *iswprint()* and *iswprint_l()* functions shall test whether *wc* is a wide-character code representing a character of class **print** in the current locale, or in the locale represented by *locale*, respectively; see XBD Chapter 7 (on page 135).

The *wc* argument is a **wint_t**, the value of which the application shall ensure is a wide-character code corresponding to a valid character in the current locale, or equal to the value of the macro WEOF. If the argument has any other value, the behavior is undefined.

CX The behavior is undefined if the *locale* argument to *iswprint_l()* is the special locale object LC_GLOBAL_LOCALE or is not a valid locale object handle.

RETURN VALUE

CX The *iswprint()* and *iswprint_l()* functions shall return non-zero if *wc* is a printable wide-character code; otherwise, they shall return 0.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

To ensure applications portability, especially across natural languages, only these functions and the functions in the reference pages listed in the SEE ALSO section should be used for character classification.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 4.

Issue 5

The following change has been made in this version for alignment with ISO/IEC 9899:1990/Amendment 1:1995 (E):

- 39973 • The SYNOPSIS has been changed to indicate that this function and associated data types
39974 are now made visible by inclusion of the **<wctype.h>** header rather than **<wchar.h>**.
- 39975 **Issue 6**
39976 The normative text is updated to avoid use of the term “must” for application requirements.
- 39977 **Issue 7**
39978 The *iswprint_l()* function is added from The Open Group Technical Standard, 2006, Extended
39979 API Set Part 4.
- 39980 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0332 [302], XSH/TC1-2008/0333 [283], +
39981 and XSH/TC1-2008/0334 [283] are applied.

39982 **NAME**

39983 iswpunct, iswpunct_l — test for a punctuation wide-character code

39984 **SYNOPSIS**

```
39985     #include <wctype.h>
39986
39987     int iswpunct(wint_t wc);
39987 CX    int iswpunct_l(wint_t wc, locale_t locale);
```

39988 **DESCRIPTION**

39989 CX For *iswpunct()*: The functionality described on this reference page is aligned with the ISO C
 39990 standard. Any conflict between the requirements described here and the ISO C standard is
 39991 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

39992 CX The *iswpunct()* and *iswpunct_l()* functions shall test whether *wc* is a wide-character code
 39993 CX representing a character of class **punct** in the current locale, or in the locale represented by
 39994 *locale*, respectively; see XBD Chapter 7 (on page 135).

39995 The *wc* argument is a **wint_t**, the value of which the application shall ensure is a wide-character
 39996 code corresponding to a valid character in the current locale, or equal to the value of the macro
 39997 WEOF. If the argument has any other value, the behavior is undefined.

39998 CX The behavior is undefined if the *locale* argument to *iswpunct_l()* is the special locale object +
 39999 LC_GLOBAL_LOCALE or is not a valid locale object handle.

40000 **RETURN VALUE**

40001 CX The *iswpunct()* and *iswpunct_l()* functions shall return non-zero if *wc* is a punctuation wide-
 40002 character code; otherwise, they shall return 0.

40003 **ERRORS**

40004 No errors are defined.

40005 **EXAMPLES**

40006 None.

40007 **APPLICATION USAGE**

40008 To ensure applications portability, especially across natural languages, only these functions and
 40009 the functions in the reference pages listed in the SEE ALSO section should be used for character
 40010 classification.

40019 **CHANGE HISTORY**

40020 First released in Issue 4.

40021 **Issue 5**

40022 The following change has been made in this version for alignment with
 40023 ISO/IEC 9899:1990/Amendment 1:1995 (E):

- 40024 • The SYNOPSIS has been changed to indicate that this function and associated data types
40025 are now made visible by inclusion of the **<wctype.h>** header rather than **<wchar.h>**.
- 40026 **Issue 6**
- 40027 The normative text is updated to avoid use of the term “must” for application requirements.
- 40028 **Issue 7**
- 40029 The *iswpunct_l()* function is added from The Open Group Technical Standard, 2006, Extended
40030 API Set Part 4.
- 40031 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0335 [302], XSH/TC1-2008/0336 [283], +
40032 and XSH/TC1-2008/0337 [283] are applied.

40033 **NAME**

40034 iswspace, iswspace_l — test for a white-space wide-character code

40035 **SYNOPSIS**

40036 #include <wctype.h>

40037 int iswspace(wint_t wc);

40038 CX int iswspace_l(wint_t wc, locale_t locale);

40039 **DESCRIPTION**

40040 CX For *iswspace()*: The functionality described on this reference page is aligned with the ISO C
 40041 standard. Any conflict between the requirements described here and the ISO C standard is
 40042 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

40043 CX The *iswspace()* and *iswspace_l()* functions shall test whether *wc* is a wide-character code
 40044 CX representing a character of class **space** in the current locale, or in the locale represented by *locale*,
 40045 respectively; see XBD Chapter 7 (on page 135).

40046 The *wc* argument is a **wint_t**, the value of which the application shall ensure is a wide-character
 40047 code corresponding to a valid character in the current locale, or equal to the value of the macro
 40048 WEOF. If the argument has any other value, the behavior is undefined.

40049 CX The behavior is undefined if the *locale* argument to *iswspace_l()* is the special locale object
 40050 LC_GLOBAL_LOCALE or is not a valid locale object handle.

40051 **RETURN VALUE**

40052 CX The *iswspace()* and *iswspace_l()* functions shall return non-zero if *wc* is a white-space wide-
 40053 character code; otherwise, they shall return 0.

40054 **ERRORS**

40055 No errors are defined.

40056 **EXAMPLES**

40057 None.

40058 **APPLICATION USAGE**

40059 To ensure applications portability, especially across natural languages, only these functions and
 40060 the functions in the reference pages listed in the SEE ALSO section should be used for character
 40061 classification.

40062 **RATIONALE**

- 40079 **Issue 7**
- 40080 The *iswspace_l()* function is added from The Open Group Technical Standard, 2006, Extended
40081 API Set Part 4.
- 40082 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0338 [302], XSH/TC1-2008/0339 [283], +
40083 and XSH/TC1-2008/0340 [283] are applied.

40084 **NAME**

40085 iswupper, iswupper_l — test for an uppercase letter wide-character code

40086 **SYNOPSIS**

40087 #include <wctype.h>

40088 int iswupper(wint_t wc);

40089 CX int iswupper_l(wint_t wc, locale_t locale);

40090 **DESCRIPTION**

40091 CX For *iswupper()*: The functionality described on this reference page is aligned with the ISO C
 40092 standard. Any conflict between the requirements described here and the ISO C standard is
 40093 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

40094 CX The *iswupper()* and *iswupper_l()* functions shall test whether *wc* is a wide-character code
 40095 CX representing a character of class **upper** in the current locale, or in the locale represented by
 40096 *locale*, respectively; see XBD Chapter 7 (on page 135).

40097 The *wc* argument is a **wint_t**, the value of which the application shall ensure is a wide-character
 40098 code corresponding to a valid character in the current locale, or equal to the value of the macro
 40099 WEOF. If the argument has any other value, the behavior is undefined.

40100 CX The behavior is undefined if the *locale* argument to *iswupper_l()* is the special locale object +
 40101 LC_GLOBAL_LOCALE or is not a valid locale object handle.

40102 **RETURN VALUE**

40103 CX The *iswupper()* and *iswupper_l()* functions shall return non-zero if *wc* is an uppercase letter
 40104 wide-character code; otherwise, they shall return 0.

40105 **ERRORS**

40106 No errors are defined.

40107 **EXAMPLES**

40108 None.

40109 **APPLICATION USAGE**

40110 To ensure applications portability, especially across natural languages, only these functions and
 40111 the functions in the reference pages listed in the SEE ALSO section should be used for character
 40112 classification.

40113 **RATIONALE**

40114 None.

40115 **FUTURE DIRECTIONS**

40116 None.

40117 **SEE ALSO**

40118 *iswalnum()*, *iswalpha()*, *iswcntrl()*, *iswctype()*, *iswdigit()*, *iswgraph()*, *iswlower()*, *iswprint()*,

40121 **CHANGE HISTORY**

40122 First released in Issue 4.

40123 **Issue 5**

40124 The following change has been made in this version for alignment with
 40125 ISO/IEC 9899:1990/Amendment 1:1995 (E):

- 40126 • The SYNOPSIS has been changed to indicate that this function and associated data types
- 40127 are now made visible by inclusion of the **<wctype.h>** header rather than **<wchar.h>**.
- 40128 **Issue 6**
- 40129 The normative text is updated to avoid use of the term “must” for application requirements.
- 40130 **Issue 7**
- 40131 The *iswupper_l()* function is added from The Open Group Technical Standard, 2006, Extended
- 40132 API Set Part 4.
- 40133 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0341 [302], XSH/TC1-2008/0342 [283], +
- 40134 and XSH/TC1-2008/0343 [283] are applied.

40135 **NAME**

40136 iswxdigit, iswxdigit_l — test for a hexadecimal digit wide-character code

40137 **SYNOPSIS**

40138 #include <wctype.h>

40139 int iswxdigit(wint_t wc);

40140 CX int iswxdigit_l(wint_t wc, locale_t locale);

40141 **DESCRIPTION**

40142 CX For *iswxdigit()*: The functionality described on this reference page is aligned with the ISO C
 40143 standard. Any conflict between the requirements described here and the ISO C standard is
 40144 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

40145 CX The *iswxdigit()* and *iswxdigit_l()* functions shall test whether *wc* is a wide-character code
 40146 CX representing a character of class **xdigit** in the current locale, or in the locale represented by
 40147 *locale*, respectively; see XBD Chapter 7 (on page 135).

40148 The *wc* argument is a **wint_t**, the value of which the application shall ensure is a wide-character
 40149 code corresponding to a valid character in the current locale, or equal to the value of the macro
 40150 WEOF. If the argument has any other value, the behavior is undefined.

40151 CX The behavior is undefined if the *locale* argument to *iswxdigit_l()* is the special locale object +
 40152 LC_GLOBAL_LOCALE or is not a valid locale object handle.

40153 **RETURN VALUE**

40154 CX The *iswxdigit()* and *iswxdigit_l()* functions shall return non-zero if *wc* is a hexadecimal digit
 40155 wide-character code; otherwise, they shall return 0.

40156 **ERRORS**

40157 No errors are defined.

40158 **EXAMPLES**

40159 None.

40160 **APPLICATION USAGE**

40161 To ensure applications portability, especially across natural languages, only these functions and
 40162 the functions in the reference pages listed in the SEE ALSO section should be used for character
 40163 classification.

40164 **RATIONALE**

40172 **CHANGE HISTORY**

40173 First released in Issue 4.

40174 **Issue 5**

40175 The following change has been made in this version for alignment with
 40176 ISO/IEC 9899:1990/Amendment 1:1995 (E):

- 40177 • The SYNOPSIS has been changed to indicate that this function and associated data types
40178 are now made visible by inclusion of the **<wctype.h>** header rather than **<wchar.h>**.
- 40179 **Issue 6**
- 40180 The normative text is updated to avoid use of the term “must” for application requirements.
- 40181 **Issue 7**
- 40182 The *iswxdigit_l()* function is added from The Open Group Technical Standard, 2006, Extended
40183 API Set Part 4.
- 40184 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0344 [302], XSH/TC1-2008/0345 [283], +
40185 and XSH/TC1-2008/0346 [283] are applied.

40186 **NAME**

40187 isxdigit, isxdigit_l — test for a hexadecimal digit

40188 **SYNOPSIS**

```
40189     #include <ctype.h>
40190     int isxdigit(int c);
40191 CX    int isxdigit_l(int c, locale_t locale);
```

40192 **DESCRIPTION**

40193 CX For *isxdigit()*: The functionality described on this reference page is aligned with the ISO C
 40194 standard. Any conflict between the requirements described here and the ISO C standard is
 40195 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

40196 CX The *isxdigit()* and *isxdigit_l()* functions shall test whether *c* is a character of class **xdigit** in the
 40197 CX current locale, or in the locale represented by *locale*, respectively; see XBD Chapter 7 (on page
 40198 135).

40199 The *c* argument is an **int**, the value of which the application shall ensure is a character
 40200 representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has
 40201 any other value, the behavior is undefined.

40202 CX The behavior is undefined if the *locale* argument to *isxdigit_l()* is the special locale object +
 40203 LC_GLOBAL_LOCALE or is not a valid locale object handle.

40204 **RETURN VALUE**

40205 CX The *isxdigit()* and *isxdigit_l()* functions shall return non-zero if *c* is a hexadecimal digit;
 40206 otherwise, they shall return 0.

40207 **ERRORS**

40208 No errors are defined.

40209 **EXAMPLES**

40210 None.

40211 **APPLICATION USAGE**

40212 To ensure applications portability, especially across natural languages, only these functions and
 40213 the functions in the reference pages listed in the SEE ALSO section should be used for character
 40214 classification.

40215 **RATIONALE**

40216 None.

40224 First released in Issue 1. Derived from Issue 1 of the SVID.

40225 **Issue 6**

40226 The normative text is updated to avoid use of the term “must” for application requirements.

40227 **Issue 7**

40228 The *isxdigit_l()* function is added from The Open Group Technical Standard, 2006, Extended API
40229 Set Part 4.

40230 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0347 [302], XSH/TC1-2008/0348 [283], +
40231 and XSH/TC1-2008/0349 [283] are applied.

40232 **NAME**

40233 j0, j1, jn — Bessel functions of the first kind

40234 **SYNOPSIS**

```

40235 XSI      #include <math.h>
40236
40236         double j0(double x);
40237         double j1(double x);
40238         double jn(int n, double x);

```

40239 **DESCRIPTION**

40240 The *j0()*, *j1()*, and *jn()* functions shall compute Bessel functions of *x* of the first kind of orders 0, 1, and *n*, respectively.

40242 An application wishing to check for error situations should set *errno* to zero and call *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

40246 **RETURN VALUE**

40247 Upon successful completion, these functions shall return the relevant Bessel value of *x* of the first kind.

40249 If the *x* argument is too large in magnitude, or the correct result would cause underflow, 0 shall be returned and a range error may occur.

40251 MXX If *x* is NaN, a NaN shall be returned.

40252 **ERRORS**

40253 These functions may fail if:

40254 Range Error The value of *x* was too large in magnitude, or an underflow occurred.

40255 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the underflow floating-point exception shall be raised.

40259 No other errors shall occur.

40260 **EXAMPLES**

40261 None.

40262 **APPLICATION USAGE**

40263 On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

40265 **RATIONALE**

40266 None.

40267 **FUTURE DIRECTIONS**

40268 None.

40283 NAME

40284 jrand48 — generate a uniformly distributed pseudo-random long signed integer

40285 SYNOPSIS

```
40286 XSI      #include <stdlib.h>  
40287          long jrand48(unsigned short xsubi[3]);
```

40288 DESCRIPTION

40289 Refer to *drand48()*.

NAME

kill — send a signal to a process or a group of processes

SYNOPSIS

```
CX      #include <signal.h>
      int kill(pid_t pid, int sig);
```

DESCRIPTION

The *kill()* function shall send a signal to a process or a group of processes specified by *pid*. The signal to be sent is specified by *sig* and is either one from the list given in **<signal.h>** or 0. If *sig* is 0 (the null signal), error checking is performed but no signal is actually sent. The null signal can be used to check the validity of *pid*.

For a process to have permission to send a signal to a process designated by *pid*, unless the sending process has appropriate privileges, the real or effective user ID of the sending process shall match the real or saved set-user-ID of the receiving process.

If *pid* is greater than 0, *sig* shall be sent to the process whose process ID is equal to *pid*.

If *pid* is 0, *sig* shall be sent to all processes (excluding an unspecified set of system processes) whose process group ID is equal to the process group ID of the sender, and for which the process has permission to send a signal.

If *pid* is -1, *sig* shall be sent to all processes (excluding an unspecified set of system processes) for which the process has permission to send that signal.

If *pid* is negative, but not -1, *sig* shall be sent to all processes (excluding an unspecified set of system processes) whose process group ID is equal to the absolute value of *pid*, and for which the process has permission to send a signal.

If the value of *pid* causes *sig* to be generated for the sending process, and if *sig* is not blocked for the calling thread and if no other thread has *sig* unblocked or is waiting in a *sigwait()* function for *sig*, either *sig* or at least one pending unblocked signal shall be delivered to the sending thread before *kill()* returns.

The user ID tests described above shall not be applied when sending SIGCONT to a process that is a member of the same session as the sending process.

An implementation that provides extended security controls may impose further implementation-defined restrictions on the sending of signals, including the null signal. In particular, the system may deny the existence of some or all of the processes specified by *pid*.

The *kill()* function is successful if the process has permission to send *sig* to any of the processes specified by *pid*. If *kill()* fails, no signal shall be sent.

RETURN VALUE

Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to indicate the error.

ERRORS

The *kill()* function shall fail if:

[EINVAL]	The value of the <i>sig</i> argument is an invalid or unsupported signal number.
[EPERM]	The process does not have permission to send the signal to any receiving process.

40331 [ESRCH] No process or process group can be found corresponding to that specified by
40332 *pid*.

40333 EXAMPLES

40334 None.

40335 APPLICATION USAGE

40336 None.

40337 RATIONALE

40338 The semantics for permission checking for *kill()* differed between System V and most other
40339 implementations, such as Version 7 or 4.3 BSD. The semantics chosen for this volume of
40340 POSIX.1-2008 agree with System V. Specifically, a set-user-ID process cannot protect itself
40341 against signals (or at least not against SIGKILL) unless it changes its real user ID. This choice
40342 allows the user who starts an application to send it signals even if it changes its effective user ID.
40343 The other semantics give more power to an application that wants to protect itself from the user
40344 who ran it.

40345 Some implementations provide semantic extensions to the *kill()* function when the absolute
40346 value of *pid* is greater than some maximum, or otherwise special, value. Negative values are a
40347 flag to *kill()*. Since most implementations return [ESRCH] in this case, this behavior is not
40348 included in this volume of POSIX.1-2008, although a conforming implementation could provide
40349 such an extension.

40350 The unspecified processes to which a signal cannot be sent may include the scheduler or *init*.

40351 There was initially strong sentiment to specify that, if *pid* specifies that a signal be sent to the
40352 calling process and that signal is not blocked, that signal would be delivered before *kill()*
40353 returns. This would permit a process to call *kill()* and be guaranteed that the call never return.
40354 However, historical implementations that provide only the *signal()* function make only the
40355 weaker guarantee in this volume of POSIX.1-2008, because they only deliver one signal each
40356 time a process enters the kernel. Modifications to such implementations to support the
40357 *sigaction()* function generally require entry to the kernel following return from a signal-catching
40358 function, in order to restore the signal mask. Such modifications have the effect of satisfying the
40359 stronger requirement, at least when *sigaction()* is used, but not necessarily when *signal()* is used.
40360 The standard developers considered making the stronger requirement except when *signal()* is
40361 used, but felt this would be unnecessarily complex. Implementors are encouraged to meet the
40362 stronger requirement whenever possible. In practice, the weaker requirement is the same, except
40363 in the rare case when two signals arrive during a very short window. This reasoning also applies
40364 to a similar requirement for *sigprocmask()*.

40365 In 4.2 BSD, the SIGCONT signal can be sent to any descendant process regardless of user-ID
40366 security checks. This allows a job control shell to continue a job even if processes in the job have
40367 altered their user IDs (as in the *su* command). In keeping with the addition of the concept of
40368 sessions, similar functionality is provided by allowing the SIGCONT signal to be sent to any
40369 process in the same session regardless of user ID security checks. This is less restrictive than BSD
40370 in the sense that ancestor processes (in the same session) can now be the recipient. It is more
40371 restrictive than BSD in the sense that descendant processes that form new sessions are now
40372 subject to the user ID checks. A similar relaxation of security is not necessary for the other job
40373 control signals since those signals are typically sent by the terminal driver in recognition of
40374 special characters being typed; the terminal driver bypasses all security checks.

40375 In secure implementations, a process may be restricted from sending a signal to a process having
40376 a different security label. In order to prevent the existence or nonexistence of a process from
40377 being used as a covert channel, such processes should appear nonexistent to the sender; that is,
40378 [ESRCH] should be returned, rather than [EPERM], if *pid* refers only to such processes.

Existing implementations vary on the result of a *kill()* with *pid* indicating an inactive process (a terminated process that has not been waited for by its parent). Some indicate success on such a call (subject to permission checking), while others give an error of [ESRCH]. Since the definition of process lifetime in this volume of POSIX.1-2008 covers inactive processes, the [ESRCH] error as described is inappropriate in this case. In particular, this means that an application cannot have a parent process check for termination of a particular child with *kill()*. (Usually this is done with the null signal; this can be done reliably with *waitpid()*.)

There is some belief that the name *kill()* is misleading, since the function is not always intended to cause process termination. However, the name is common to all historical implementations, and any change would be in conflict with the goal of minimal changes to existing application code.

FUTURE DIRECTIONS

None.

SEE ALSO

getpid(), *raise()*, *setsid()*, *sigaction()*, *sigqueue()*, *wait()*

XBD [*<signal.h>*](#), [*<sys/types.h>*](#)

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

Issue 6

In the SYNOPSIS, the optional include of the [*<sys/types.h>*](#) header is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In the DESCRIPTION, the second paragraph is reworded to indicate that the saved set-user-ID of the calling process is checked in place of its effective user ID. This is a FIPS requirement.
- The requirement to include [*<sys/types.h>*](#) has been removed. Although [*<sys/types.h>*](#) was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- The behavior when *pid* is *-1* is now specified. It was previously explicitly unspecified in the POSIX.1-1988 standard.

The normative text is updated to avoid use of the term “must” for application requirements.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/51 is applied, correcting the RATIONALE section.

NAME

killpg — send a signal to a process group

SYNOPSIS

```
XSI      #include <signal.h>
int killpg(pid_t pgrp, int sig);
```

DESCRIPTION

The *killpg()* function shall send the signal specified by *sig* to the process group specified by *pgrp*.

If *pgrp* is greater than 1, *killpg(pgrp, sig)* shall be equivalent to *kill(-pgrp, sig)*. If *pgrp* is less than or equal to 1, the behavior of *killpg()* is undefined.

RETURN VALUE

Refer to *kill()*.

ERRORS

Refer to *kill()*.

EXAMPLES**Sending a Signal to All Other Members of a Process Group**

The following example shows how the calling process could send a signal to all other members of its process group. To prevent itself from receiving the signal it first makes itself immune to the signal by ignoring it.

```
#include <signal.h>
#include <unistd.h>
...
    if (signal(SIGUSR1, SIG_IGN) == SIG_ERR)
        /* Handle error */;

    if (killpg(getpgrp(), SIGUSR1) == -1)
        /* Handle error */;
```

APPLICATION USAGE

None.

40498 lchown — change the owner and group of a symbolic link

40499 **SYNOPSIS**

40500 #include <unistd.h>

40501 int lchown(const char *path, uid_t owner, gid_t group);

40502 **DESCRIPTION**

40503 The *lchown()* function shall be equivalent to *chown()*, except in the case where the named file is a
 40504 symbolic link. In this case, *lchown()* shall change the ownership of the symbolic link file itself,
 40505 while *chown()* changes the ownership of the file or directory to which the symbolic link refers.

40506 **RETURN VALUE**

40507 Upon successful completion, *lchown()* shall return 0. Otherwise, it shall return -1 and set *errno* to
 40508 indicate an error.

40509 **ERRORS**40510 The *lchown()* function shall fail if:

40511 [EACCES] Search permission is denied on a component of the path prefix of *path*.
 40512 [EINVAL] The owner or group ID is not a value supported by the implementation.
 40513 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*
 40514 argument.

40515 [ENAMETOOLONG]

40516 The length of a component of a pathname is longer than {NAME_MAX}.

40517 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.

40518 [ENOTDIR] A component of the path prefix names an existing file that is neither a
 40519 directory nor a symbolic link to a directory, or the *path* argument contains at
 40520 least one non-*<slash>* character and ends with one or more trailing *<slash>*
 40521 characters and the last pathname component names an existing file that is
 40522 neither a directory nor a symbolic link to a directory.

40523 [EPERM] The effective user ID does not match the owner of the file and the process does
 40524 not have appropriate privileges.

40525 [EROFS] The file resides on a read-only file system.

40526 The *lchown()* function may fail if:

40527 [EIO] An I/O error occurred while reading or writing to the file system.

40528 [EINTR] A signal was caught during execution of the function.

40529 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
 40530 resolution of the *path* argument.

40531 [ENAMETOOLONG]

40532 The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a
 40533 symbolic link produced an intermediate result with a length that exceeds
 40534 {PATH_MAX}.

40535 **EXAMPLES**40536 **Changing the Current Owner of a File**

40537 The following example shows how to change the ownership of the symbolic link named
 40538 **/modules/pass1** to the user ID associated with “jones” and the group ID associated with “cnd”.

40539 The numeric value for the user ID is obtained by using the *getpwnam()* function. The numeric
 40540 value for the group ID is obtained by using the *getgrnam()* function.

```
40541 #include <sys/types.h>
40542 #include <unistd.h>
40543 #include <pwd.h>
40544 #include <grp.h>

40545 struct passwd *pwd;
40546 struct group *grp;
40547 char          *path = "/modules/pass1";
40548 ...
40549 pwd = getpwnam("jones");
40550 grp = getgrnam("cnd");
40551 lchown(path, pwd->pw_uid, grp->gr_gid);
```

40552 **APPLICATION USAGE**

40553 On implementations which support symbolic links as directory entries rather than files, *lchown()*
 40554 may fail.

40555 **RATIONALE**

40556 None.

40557 **FUTURE DIRECTIONS**

40558 None.

40559 **SEE ALSO**

40562 **CHANGE HISTORY**

40563 First released in Issue 4, Version 2.

40564 **Issue 5**

40565 Moved from X/OPEN UNIX extension to BASE.

40566 **Issue 6**

40567 The wording of the mandatory [ELOOP] error condition is updated, and a second optional
 40568 [ELOOP] error condition is added.

40569 The Open Group Base Resolution bwg2001-013 is applied, adding wording to the
 40570 APPLICATION USAGE.

40571 **Issue 7**

40572 Austin Group Interpretation 1003.1-2001 #143 is applied.

40573 The *lchown()* function is moved from the XSI option to the Base.

40574 The [EOPNOTSUPP] error is removed.

40575 The [ENOTDIR] error condition is clarified to cover the condition where the last component of a
 40576 pathname exists but is not a directory or a symbolic link to a directory.

40577

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0351 [324] is applied.

+

40578 **NAME**

40579 lcong48 — seed a uniformly distributed pseudo-random signed long integer generator

40580 **SYNOPSIS**

```
40581 XSI      #include <stdlib.h>  
40582          void lcong48(unsigned short param[7]);
```

40583 **DESCRIPTION**40584 Refer to *drand48()*.

NAME

ldexp, ldexpf, ldexpl — load exponent of a floating-point number

SYNOPSIS

```
#include <math.h>

double ldexp(double x, int exp);
float ldexpf(float x, int exp);
long double ldexpl(long double x, int exp);
```

DESCRIPTION

The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

These functions shall compute the quantity $x * 2^{exp}$.

An application wishing to check for error situations should set *errno* to zero and call *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE

Upon successful completion, these functions shall return *x* multiplied by 2, raised to the power *exp*.

If these functions would cause overflow, a range error shall occur and *ldexp*(), *ldexpf*(), and *ldexpl*() shall return $\pm\text{HUGE\_VAL}$, $\pm\text{HUGE\_VALF}$, and $\pm\text{HUGE\_VALL}$ (according to the sign of *x*), respectively.

If the correct value would cause underflow, and is not representable, a range error may occur, and *ldexp*(), *ldexpf*(), and *ldexpl*() shall return 0.0, or (if IEC 60559 Floating-Point is not supported) an implementation-defined value no greater in magnitude than DBL_MIN, FLT_MIN, and LDBL_MIN, respectively.

If *x* is NaN, a NaN shall be returned.

If *x* is ± 0 or $\pm\text{Inf}$, *x* shall be returned.

If *exp* is 0, *x* shall be returned.

If the correct value would cause underflow, and is representable, a range error may occur and the correct value shall be returned.

ERRORS

These functions shall fail if:

Range Error The result overflows.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the overflow floating-point exception shall be raised.

These functions may fail if:

Range Error The result underflows.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the underflow

40628 floating-point exception shall be raised.

40629 **EXAMPLES**

40630 None.

40631 **APPLICATION USAGE**

40632 On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* &
40633 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

40634 **RATIONALE**

40635 None.

40636 **FUTURE DIRECTIONS**

40637 None.

40654 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0352 [68] and XSH/TC1-2008/0353 +
40655 [68] are applied.

NAME

ldiv, lldiv — compute quotient and remainder of a long division

SYNOPSIS

```
#include <stdlib.h>
```

```
ldiv_t ldiv(long numer, long denom);
```

```
lldiv_t lldiv(long long numer, long long denom);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

These functions shall compute the quotient and remainder of the division of the numerator *numer* by the denominator *denom*. If the division is inexact, the resulting quotient is the **long** integer (for the *ldiv()* function) or **long long** integer (for the *lldiv()* function) of lesser magnitude that is the nearest to the algebraic quotient. If the result cannot be represented, the behavior is undefined; otherwise, *quot* * *denom* + *rem* shall equal *numer*.

RETURN VALUE

The *ldiv()* function shall return a structure of type **ldiv_t**, comprising both the quotient and the remainder. The structure shall include the following members, in any order:

```
long    quot;    /* Quotient */
long    rem;     /* Remainder */
```

The *lldiv()* function shall return a structure of type **lldiv_t**, comprising both the quotient and the remainder. The structure shall include the following members, in any order:

```
long long quot;    /* Quotient */
long long rem;     /* Remainder */
```

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 4. Derived from the ISO C standard.

Issue 6

The *lldiv()* function is added for alignment with the ISO/IEC 9899:1999 standard.

40697 **NAME**

40698 lfind — find entry in a linear search table

40699 **SYNOPSIS**

```
40700 XSI      #include <search.h>
40701          void *lfind(const void *key, const void *base, size_t *nelp,
40702                      size_t width, int (*compar)(const void *, const void *));
```

40703 **DESCRIPTION**40704 Refer to *lsearch()*.

40705 **NAME**

40706 lgamma, lgammaf, lgammal, signgam — log gamma function

40707 **SYNOPSIS**

```
40708 #include <math.h>
40709 double lgamma(double x);
40710 float lgammaf(float x);
40711 long double lgammal(long double x);
40712 XSI extern int signgam;
```

40713 **DESCRIPTION**

40714 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 40715 conflict between the requirements described here and the ISO C standard is unintentional. This
 40716 volume of POSIX.1-2008 defers to the ISO C standard.

40717 These functions shall compute $\log_e |\Gamma(x)|$ where $\Gamma(x)$ is defined as $\int_0^{\infty} e^{-t} t^{x-1} dt$. The argument x
 40718 need not be a non-positive integer ($\Gamma(x)$ is defined over the reals, except the non-positive
 40719 integers).

40720 XSI If x is NaN, $-\text{Inf}$, or a negative integer, the value of *signgam* is unspecified.

40721 CX These functions need not be thread-safe.

40722 An application wishing to check for error situations should set *errno* to zero and call
 40723 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 40724 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 40725 zero, an error has occurred.

40726 **RETURN VALUE**

40727 Upon successful completion, these functions shall return the logarithmic gamma of x .

40728 If x is a non-positive integer, a pole error shall occur and *lgamma*(), *lgammaf*(), and *lgammal*()
 40729 shall return +HUGE_VAL, +HUGE_VALF, and +HUGE_VALL, respectively.

40730 If the correct value would cause overflow, a range error shall occur and *lgamma*(), *lgammaf*(),
 40731 and *lgammal*() shall return $\pm\text{HUGE\_VAL}$, $\pm\text{HUGE\_VALF}$, and $\pm\text{HUGE\_VALL}$ (having the same
 40732 sign as the correct value), respectively.

40733 MX If x is NaN, a NaN shall be returned.

40734 If x is 1 or 2, +0 shall be returned.

40735 If x is $\pm\text{Inf}$, +Inf shall be returned.

40736 **ERRORS**

40737 These functions shall fail if:

40738 Pole Error The x argument is a negative integer or zero.

40739 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 40740 then *errno* shall be set to [ERANGE]. If the integer expression
 40741 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the divide-by-zero
 40742 floating-point exception shall be raised.

40743 Range Error The result overflows.

40744 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 40745 then *errno* shall be set to [ERANGE]. If the integer expression

40746 (math_errhandling & MATH_ERREXCEPT) is non-zero, then the overflow
 40747 floating-point exception shall be raised.

40748 EXAMPLES

40749 None.

40750 APPLICATION USAGE

40751 On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling &
 40752 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

40753 RATIONALE

40754 None.

40755 FUTURE DIRECTIONS

40756 None.

40757 SEE ALSO

40759 XBD Section 4.19 (on page 116), <math.h>

40760 CHANGE HISTORY

40761 First released in Issue 3.

40762 Issue 5

40763 The DESCRIPTION is updated to indicate how an application should check for an error. This
 40764 text was previously published in the APPLICATION USAGE section.

40765 A note indicating that this function need not be reentrant is added to the DESCRIPTION.

40766 Issue 6

40767 The *lgamma()* function is no longer marked as an extension.

40768 The *lgammaf()* and *lgammal()* functions are added for alignment with the ISO/IEC 9899:1999
 40769 standard.

40770 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are
 40771 revised to align with the ISO/IEC 9899:1999 standard.

40772 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are
 40773 marked.

40774 Functionality relating to the XSI option is marked.

40775 Issue 7

40776 Austin Group Interpretation 1003.1-2001 #156 is applied.

40777 The DESCRIPTION is clarified regarding the value of *signgam* when *x* is Nan, -Inf, or a negative
 40778 integer.

NAME

link, linkat — link one file to another file relative to two directory file descriptors

SYNOPSIS

```
#include <unistd.h>
```

```
int link(const char *path1, const char *path2);
int linkat(int fd1, const char *path1, int fd2,
           const char *path2, int flag);
```

DESCRIPTION

The *link()* function shall create a new link (directory entry) for the existing file, *path1*.

The *path1* argument points to a pathname naming an existing file. The *path2* argument points to a pathname naming the new directory entry to be created. The *link()* function shall atomically create a new link for the existing file and the link count of the file shall be incremented by one.

If *path1* names a directory, *link()* shall fail unless the process has appropriate privileges and the implementation supports using *link()* on directories.

If *path1* names a symbolic link, it is implementation-defined whether *link()* follows the symbolic link, or creates a new link to the symbolic link itself.

Upon successful completion, *link()* shall mark for update the last file status change timestamp of the file. Also, the last data modification and last file status change timestamps of the directory that contains the new entry shall be marked for update.

If *link()* fails, no link shall be created and the link count of the file shall remain unchanged.

The implementation may require that the calling process has permission to access the existing file.

The *linkat()* function shall be equivalent to the *link()* function except that symbolic links shall be handled as specified by the value of *flag* (see below) and except in the case where either *path1* or *path2* or both are relative paths. In this case a relative path *path1* is interpreted relative to the directory associated with the file descriptor *fd1* instead of the current working directory and similarly for *path2* and the file descriptor *fd2*. If the file descriptor was opened without *O_SEARCH*, the function shall check whether directory searches are permitted using the current permissions of the directory underlying the file descriptor. If the file descriptor was opened with *O_SEARCH*, the function shall not perform the check.

Values for *flag* are constructed by a bitwise-inclusive OR of flags from the following list, defined in *<fcntl.h>*:

AT_SYMLINK_FOLLOW

If *path1* names a symbolic link, a new link for the target of the symbolic link is created.

If *linkat()* is passed the special value *AT_FDCWD* in the *fd1* or *fd2* parameter, the current working directory shall be used for the respective *path* argument. If both *fd1* and *fd2* have value *AT_FDCWD*, the behavior shall be identical to a call to *link()*, except that symbolic links shall be handled as specified by the value of *flag*.

If the *AT_SYMLINK_FOLLOW* flag is clear in the *flag* argument and the *path1* argument names a symbolic link, a new link is created for the symbolic link *path1* and not its target.

RETURN VALUE

Upon successful completion, these functions shall return 0. Otherwise, these functions shall return -1 and set *errno* to indicate the error.

40822 **ERRORS**

40823 These functions shall fail if:

40824 [EACCES] A component of either path prefix denies search permission, or the requested
 40825 link requires writing in a directory that denies write permission, or the calling
 40826 process does not have permission to access the existing file and this is required
 40827 by the implementation.

40828 [EEXIST] The *path2* argument resolves to an existing directory entry or refers to a
 40829 symbolic link.

40830 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path1* or
 40831 *path2* argument.

40832 [EMLINK] The number of links to the file named by *path1* would exceed {LINK_MAX}.

40833 [ENAMETOOLONG]

40834 The length of a component of a pathname is longer than {NAME_MAX}.

40835 [ENOENT] A component of either path prefix does not exist; the file named by *path1* does
 40836 not exist; or *path1* or *path2* points to an empty string.

40837 [ENOSPC] The directory to contain the link cannot be extended.

40838 [ENOTDIR] A component of either path prefix names an existing file that is neither a
 40839 directory nor a symbolic link to a directory, or the *path1* argument contains at
 40840 least one non-`<slash>` character and ends with one or more trailing `<slash>`
 40841 characters and the last pathname component names an existing file that is
 40842 neither a directory nor a symbolic link to a directory, or the *path1* argument
 40843 names an existing non-directory file and the *path2* argument names a
 40844 nonexistent file, contains at least one non-`<slash>` character, and ends with
 40845 one or more trailing `<slash>` characters.

40846 [EPERM] The file named by *path1* is a directory and either the calling process does not
 40847 have appropriate privileges or the implementation prohibits using *link()* on
 40848 directories.

40849 [EROFS] The requested link requires writing in a directory on a read-only file system.

40850 [EXDEV] The link named by *path2* and the file named by *path1* are on different file
 40851 systems and the implementation does not support links between file systems.

40852 OB XSR [EXDEV] *path1* refers to a named STREAM.

40853 The *linkat()* function shall fail if:

40854 [EBADF] The *path1* or *path2* argument does not specify an absolute path and the *fd1* or
 40855 *fd2* argument, respectively, is neither AT_FDCWD nor a valid file descriptor
 40856 open for reading or searching.

40857 [ENOTDIR] The *path1* or *path2* argument is not an absolute path and *fd1* or *fd2*,
 40858 respectively, is a file descriptor associated with a non-directory file.

40859 These functions may fail if:

40860 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
 40861 resolution of the *path1* or *path2* argument.

40862 [ENAMETOOLONG]

40863 The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a
 40864 symbolic link produced an intermediate result with a length that exceeds

40865 {PATH_MAX}.

40866 The *linkat()* function may fail if:

40867 [EINVAL] The value of the *flag* argument is not valid. -

40868 EXAMPLES

40869 Creating a Link to a File

40870 The following example shows how to create a link to a file named **/home/cnd/mod1** by creating
40871 a new directory entry named **/modules/pass1**.

```
40872 #include <unistd.h>
40873 char *path1 = "/home/cnd/mod1";
40874 char *path2 = "/modules/pass1";
40875 int status;
40876 ...
40877 status = link (path1, path2);
```

40878 Creating a Link to a File Within a Program

40879 In the following program example, the *link()* function links the **/etc/passwd** file (defined as
40880 **PASSWDFILE**) to a file named **/etc/opasswd** (defined as **SAVEFILE**), which is used to save the
40881 current password file. Then, after removing the current password file (defined as
40882 **PASSWDFILE**), the new password file is saved as the current password file using the *link()*
40883 function again.

```
40884 #include <unistd.h>
40885 #define LOCKFILE "/etc/ptmp"
40886 #define PASSWDFILE "/etc/passwd"
40887 #define SAVEFILE "/etc/opasswd"
40888 ...
40889 /* Save current password file */
40890 link (PASSWDFILE, SAVEFILE);
40891
40892 /* Remove current password file. */
40893 unlink (PASSWDFILE);
40894
40895 /* Save new password file as current password file. */
40896 link (LOCKFILE, PASSWDFILE);
```

40895 APPLICATION USAGE

40896 Some implementations do allow links between file systems.

40897 If *path1* refers to a symbolic link, application developers should use *linkat()* with appropriate
40898 flags to select whether or not the symbolic link should be resolved. |

40899 RATIONALE

40900 Linking to a directory is restricted to the superuser in most historical implementations because
40901 this capability may produce loops in the file hierarchy or otherwise corrupt the file system. This
40902 volume of POSIX.1-2008 continues that philosophy by prohibiting *link()* and *unlink()* from
40903 doing this. Other functions could do it if the implementor designed such an extension. |

40904 Some historical implementations allow linking of files on different file systems. Wording was
40905 added to explicitly allow this optional behavior. |

The exception for cross-file system links is intended to apply only to links that are programmatically indistinguishable from “hard” links.

The purpose of the *linkat()* function is to link files in directories other than the current working directory without exposure to race conditions. Any part of the path of a file could be changed in parallel to a call to *link()*, resulting in unspecified behavior. By opening a file descriptor for the directory of both the existing file and the target location and using the *linkat()* function it can be guaranteed that the both filenames are in the desired directories.

The AT_SYMLINK_FOLLOW flag allows for implementing both common behaviors of the *link()* function. The POSIX specification requires that if *path1* is a symbolic link, a new link for the target of the symbolic link is created. Many systems by default or as an alternative provide a mechanism to avoid the implicit symbolic link lookup and create a new link for the symbolic link itself.

Earlier versions of this standard specified only the *link()* function, and required it to behave like *linkat()* with the AT_SYMLINK_FOLLOW flag. However, historical practice from SVR4 and Linux kernels had *link()* behaving like *linkat()* with no flags, and many systems that attempted to provide a conforming *link()* function did so in a way that was rarely used, and when it was used did not conform to the standard (e.g., by not being atomic, or by dereferencing the symbolic link incorrectly). Since applications could not rely on *link()* following links in practice, the *linkat()* function was added taking a flag to specify the desired behavior for the application.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The [ELOOP] mandatory error condition is added.
- A second [ENAMETOOLONG] is added as an optional error condition.

The following changes were made to align with the IEEE P1003.1a draft standard:

- An explanation is added of the action when *path2* refers to a symbolic link.
- The [ELOOP] optional error condition is added.

Issue 7

Austin Group Interpretation 1003.1-2001 #143 is applied.

SD5-XSH-ERN-93 is applied, adding RATIONALE.

The *linkat()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 2.

Functionality relating to XSI STREAMS is marked obsolescent.

Changes are made related to support for finegrained timestamps.

The [EOPNOTSUPP] error is removed.

NAME

lio_listio — list directed I/O

SYNOPSIS

```
#include <aio.h>

int lio_listio(int mode, struct aiocb *restrict const list[restrict],
               int nent, struct sigevent *restrict sig);
```

DESCRIPTION

The *lio_listio()* function shall initiate a list of I/O requests with a single function call.

The *mode* argument takes one of the values LIO_WAIT or LIO_NOWAIT declared in **<aio.h>** and determines whether the function returns when the I/O operations have been completed, or as soon as the operations have been queued. If the *mode* argument is LIO_WAIT, the function shall wait until all I/O is complete and the *sig* argument shall be ignored.

If the *mode* argument is LIO_NOWAIT, the function shall return immediately, and asynchronous notification shall occur, according to the *sig* argument, when all the I/O operations complete. If *sig* is NULL, then no asynchronous notification shall occur. If *sig* is not NULL, asynchronous notification occurs as specified in [Section 2.4.1](#) (on page 488) when all the requests in *list* have completed.

The I/O requests enumerated by *list* are submitted in an unspecified order.

The *list* argument is an array of pointers to **aiocb** structures. The array contains *nent* elements. The array may contain NULL elements, which shall be ignored.

If the buffer pointed to by *list* or the **aiocb** structures pointed to by the elements of the array *list* become illegal addresses before all asynchronous I/O completed and, if necessary, the notification is sent, then the behavior is undefined. If the buffers pointed to by the *aio_buf* member of the **aiocb** structure pointed to by the elements of the array *list* become illegal addresses prior to the asynchronous I/O associated with that **aiocb** structure being completed, the behavior is undefined.

The *aio_lio_opcode* field of each **aiocb** structure specifies the operation to be performed. The supported operations are LIO_READ, LIO_WRITE, and LIO_NOP; these symbols are defined in **<aio.h>**. The LIO_NOP operation causes the list entry to be ignored. If the *aio_lio_opcode* element is equal to LIO_READ, then an I/O operation is submitted as if by a call to *aio_read()* with the *aio_cbp* equal to the address of the **aiocb** structure. If the *aio_lio_opcode* element is equal to LIO_WRITE, then an I/O operation is submitted as if by a call to *aio_write()* with the *aio_cbp* equal to the address of the **aiocb** structure.

The *aio_fildes* member specifies the file descriptor on which the operation is to be performed.

The *aio_buf* member specifies the address of the buffer to or from which the data is transferred.

The *aio_nbytes* member specifies the number of bytes of data to be transferred.

The members of the **aiocb** structure further describe the I/O operation to be performed, in a manner identical to that of the corresponding **aiocb** structure when used by the *aio_read()* and *aio_write()* functions.

The *nent* argument specifies how many elements are members of the list; that is, the length of the array.

The behavior of this function is altered according to the definitions of synchronized I/O data integrity completion and synchronized I/O file integrity completion if synchronized I/O is enabled on the file associated with *aio_fildes*.

For regular files, no data transfer shall occur past the offset maximum established in the open file description associated with *aio*cbp->*aio_fildes*.

If *sig*->*sigev_notify* is SIGEV_THREAD and *sig*->*sigev_notify_attributes* is a non-null pointer and the block pointed to by this pointer becomes an illegal address prior to all asynchronous I/O being completed, then the behavior is undefined.

RETURN VALUE

If the *mode* argument has the value LIO_NOWAIT, the *lio_listio*() function shall return the value zero if the I/O operations are successfully queued; otherwise, the function shall return the value -1 and set *errno* to indicate the error.

If the *mode* argument has the value LIO_WAIT, the *lio_listio*() function shall return the value zero when all the indicated I/O has completed successfully. Otherwise, *lio_listio*() shall return a value of -1 and set *errno* to indicate the error.

In either case, the return value only indicates the success or failure of the *lio_listio*() call itself, not the status of the individual I/O requests. In some cases one or more of the I/O requests contained in the list may fail. Failure of an individual request does not prevent completion of any other individual request. To determine the outcome of each I/O request, the application shall examine the error status associated with each **aio**cb control block. The error statuses so returned are identical to those returned as the result of an *aio_read*() or *aio_write*() function.

ERRORS

The *lio_listio*() function shall fail if:

41016 41017 41018	[EAGAIN]	The resources necessary to queue all the I/O requests were not available. The application may check the error status for each aio cb to determine the individual request(s) that failed.
41019 41020	[EAGAIN]	The number of entries indicated by <i>nent</i> would cause the system-wide limit {AIO_MAX} to be exceeded.
41021 41022	[EINVAL]	The <i>mode</i> argument is not a proper value, or the value of <i>nent</i> was greater than {AIO_LISTIO_MAX}.
41023 41024 41025 41026 41027 41028 41029	[EINTR]	A signal was delivered while waiting for all I/O requests to complete during an LIO_WAIT operation. Note that, since each I/O operation invoked by <i>lio_listio</i> () may possibly provoke a signal when it completes, this error return may be caused by the completion of one (or more) of the very I/O operations being awaited. Outstanding I/O requests are not canceled, and the application shall examine each list element to determine whether the request was initiated, canceled, or completed.
41030 41031 41032	[EIO]	One or more of the individual I/O operations failed. The application may check the error status for each aio cb structure to determine the individual request(s) that failed.

In addition to the errors returned by the *lio_listio*() function, if the *lio_listio*() function succeeds or fails with errors of [EAGAIN], [EINTR], or [EIO], then some of the I/O specified by the list may have been initiated. If the *lio_listio*() function fails with an error code other than [EAGAIN], [EINTR], or [EIO], no operations from the list shall have been initiated. The I/O operation indicated by each list element can encounter errors specific to the individual read or write function being performed. In this event, the error status for each **aio**cb control block contains the associated error code. The error codes that can be set are the same as would be set by a *read*() or *write*() function, with the following additional error codes possible:

- 41041 [EAGAIN] The requested I/O operation was not queued due to resource limitations.
- 41042 [ECANCELED] The requested I/O was canceled before the I/O completed due to an explicit *aio_cancel()* request.
- 41043
- 41044 [EFBIG] The *aiocbp->aio_lio_opcode* is LIO_WRITE, the file is a regular file, *aiocbp->aio_nbytes* is greater than 0, and the *aiocbp->aio_offset* is greater than or equal to the offset maximum in the open file description associated with *aiocbp->aio_fildes*.
- 41045
- 41046
- 41047
- 41048 [EINPROGRESS] The requested I/O is in progress.
- 41049 [EOVERFLOW] The *aiocbp->aio_lio_opcode* is LIO_READ, the file is a regular file, *aiocbp->aio_nbytes* is greater than 0, and the *aiocbp->aio_offset* is before the end-of-file and is greater than or equal to the offset maximum in the open file description associated with *aiocbp->aio_fildes*.
- 41050
- 41051
- 41052

EXAMPLES

41053 None.

41054

APPLICATION USAGE

41055 None.

41056

RATIONALE

41057 Although it may appear that there are inconsistencies in the specified circumstances for error codes, the [EIO] error condition applies when any circumstance relating to an individual operation makes that operation fail. This might be due to a badly formulated request (for example, the *aio_lio_opcode* field is invalid, and *aio_error()* returns [EINVAL]) or might arise from application behavior (for example, the file descriptor is closed before the operation is initiated, and *aio_error()* returns [EBADF]).

41058

41059

41060

41061

41062

41063

41064 The limitation on the set of error codes returned when operations from the list shall have been initiated enables applications to know when operations have been started and whether *aio_error()* is valid for a specific operation.

41065

41066

FUTURE DIRECTIONS

41067 None.

41068

41071

41072 XBD <*aio.h*>

CHANGE HISTORY

41073 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

41074

41075 Large File Summit extensions are added.

Issue 6

41076 The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Asynchronous Input and Output option.

41077

41078

41079 The *lio_listio()* function is marked as part of the Asynchronous Input and Output option.

41080 The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

41081

- In the DESCRIPTION, text is added to indicate that for regular files no data transfer occurs past the offset maximum established in the open file description associated with *aiocbp*→*aio_fildes*. This change is to support large files.

- The [EBIG] and [EOVERFLOW] error conditions are defined. This change is to support large files.

The normative text is updated to avoid use of the term “must” for application requirements.

The **restrict** keyword is added to the *lio_listio()* prototype for alignment with the ISO/IEC 9899:1999 standard.

Issue 6

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/53 is applied, adding new text for symmetry with the *aio_read()* and *aio_write()* functions to the DESCRIPTION.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/54 is applied, adding text to the DESCRIPTION making it explicit that the user is required to keep the structure pointed to by *sig*→*sigev_notify_attributes* valid until the last asynchronous operation finished and the notification has been sent.

Issue 7

The *lio_listio()* function is moved from the Asynchronous Input and Output option to the Base.

41099 **NAME**

41100 listen — listen for socket connections and limit the queue of incoming connections

41101 **SYNOPSIS**

41102 #include <sys/socket.h>

41103 int listen(int *socket*, int *backlog*);41104 **DESCRIPTION**41105 The *listen()* function shall mark a connection-mode socket, specified by the *socket* argument, as
41106 accepting connections.41107 The *backlog* argument provides a hint to the implementation which the implementation shall use
41108 to limit the number of outstanding connections in the socket's listen queue. Implementations
41109 may impose a limit on *backlog* and silently reduce the specified value. Normally, a larger *backlog*
41110 argument value shall result in a larger or equal length of the listen queue. Implementations shall
41111 support values of *backlog* up to SOMAXCONN, defined in <sys/socket.h>.41112 The implementation may include incomplete connections in its listen queue. The limits on the
41113 number of incomplete connections and completed connections queued may be different.41114 The implementation may have an upper limit on the length of the listen queue—either global or
41115 per accepting socket. If *backlog* exceeds this limit, the length of the listen queue is set to the limit.41116 If *listen()* is called with a *backlog* argument value that is less than 0, the function behaves as if it
41117 had been called with a *backlog* argument value of 0.41118 A *backlog* argument of 0 may allow the socket to accept connections, in which case the length of
41119 the listen queue may be set to an implementation-defined minimum value.41120 The socket in use may require the process to have appropriate privileges to use the *listen()*
41121 function.41122 **RETURN VALUE**41123 Upon successful completions, *listen()* shall return 0; otherwise, -1 shall be returned and *errno* set
41124 to indicate the error.41125 **ERRORS**41126 The *listen()* function shall fail if:41127 [EBADF] The *socket* argument is not a valid file descriptor.

41128 [EDESTADDRREQ]

41129 The socket is not bound to a local address, and the protocol does not support
41130 listening on an unbound socket.41131 [EINVAL] The *socket* is already connected.41132 [ENOTSOCK] The *socket* argument does not refer to a socket.41133 [EOPNOTSUPP] The socket protocol does not support *listen()*.41134 The *listen()* function may fail if:

41135 [EACCES] The calling process does not have appropriate privileges.

41136 [EINVAL] The *socket* has been shut down.

41137 [ENOBUFS] Insufficient resources are available in the system to complete the call.

41138 EXAMPLES

41139 None.

41140 APPLICATION USAGE

41141 None.

41142 RATIONALE

41143 None.

41144 FUTURE DIRECTIONS

41146 SEE ALSO

41147 [*accept\(\)*](#), [*connect\(\)*](#), [*socket\(\)*](#)

41148 XBD [*<sys/socket.h>*](#)

41149 CHANGE HISTORY

41150 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

41151 The DESCRIPTION is updated to describe the relationship of SOMAXCONN and the *backlog*
41152 argument.

41153 **NAME**

41154 llabs — return a long integer absolute value

41155 **SYNOPSIS**

41156 #include <stdlib.h>

41157 long long llabs(long long *i*);41158 **DESCRIPTION**41159 Refer to *labs()*.

41160 **NAME**

41161 lldiv — compute quotient and remainder of a long division

41162 **SYNOPSIS**

41163 #include <stdlib.h>

41164 lldiv_t lldiv(long long *numer*, long long *denom*);

41165 **DESCRIPTION**

41166 Refer to *ldiv()*.

41167 **NAME**

41168 llrint, llrintf, llrintl — round to the nearest integer value using current rounding direction

41169 **SYNOPSIS**

```
41170 #include <math.h>
41171 long long llrint(double x);
41172 long long llrintf(float x);
41173 long long llrintl(long double x);
```

41174 **DESCRIPTION**

41175 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 41176 conflict between the requirements described here and the ISO C standard is unintentional. This
 41177 volume of POSIX.1-2008 defers to the ISO C standard.

41178 These functions shall round their argument to the nearest integer value, rounding according to
 41179 the current rounding direction.

41180 An application wishing to check for error situations should set *errno* to zero and call
 41181 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 41182 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 41183 zero, an error has occurred.

41184 **RETURN VALUE**

41185 Upon successful completion, these functions shall return the rounded integer value.

41186 MX If *x* is NaN, a domain error shall occur, and an unspecified value is returned.

41187 If *x* is +Inf, a domain error shall occur and an unspecified value is returned.

41188 If *x* is -Inf, a domain error shall occur and an unspecified value is returned.

41189 If the correct value is positive and too large to represent as a **long long**, an unspecified value
 41190 MX shall be returned. On systems that support the IEC 60559 Floating-Point option, a domain error
 41191 CX shall occur; otherwise, a domain error may occur.

41192 If the correct value is negative and too large to represent as a **long long**, an unspecified value
 41193 MX shall be returned. On systems that support the IEC 60559 Floating-Point option, a domain error
 41194 CX shall occur; otherwise, a domain error may occur.

41195 **ERRORS**

41196 These functions shall fail if:

41197 MX **Domain Error** The *x* argument is NaN or $\pm$ Inf, or the correct value is not representable as an
 41198 integer.

41199 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 41200 then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling*
 41201 & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
 41202 shall be raised.

41203 These functions may fail if:

41204 **Domain Error** The correct value is not representable as an integer.

41205 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 41206 then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling*
 41207 & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
 41208 shall be raised.

41209 EXAMPLES

41210 None.

41211 APPLICATION USAGE

41212 On error, the expressions *(math_errhandling & MATH_ERRNO)* and *(math_errhandling &*
41213 *MATH_ERREXCEPT)* are independent of each other, but at least one of them must be non-zero.

41214 RATIONALE

41215 These functions provide floating-to-integer conversions. They round according to the current
41216 rounding direction. If the rounded value is outside the range of the return type, the numeric
41217 result is unspecified and the invalid floating-point exception is raised. When they raise no other
41218 floating-point exception and the result differs from the argument, they raise the inexact floating-
41219 point exception.

41220 FUTURE DIRECTIONS

41221 None.

41222 SEE ALSO

41223 *feclearexcept()*, *fetestexcept()*, *lrint()*

41224 XBD [Section 4.19](#) (on page 116), [<math.h>](#)

41225 CHANGE HISTORY

41226 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

41227 Issue 7

41228 ISO/IEC 9899:1999 standard, Technical Corrigendum 2 #53 is applied.

41229 **NAME**

41230 llround, llroundf, llroundl — round to nearest integer value

41231 **SYNOPSIS**

```
41232 #include <math.h>
41233 long long llround(double x);
41234 long long llroundf(float x);
41235 long long llroundl(long double x);
```

41236 **DESCRIPTION**

41237 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 41238 conflict between the requirements described here and the ISO C standard is unintentional. This
 41239 volume of POSIX.1-2008 defers to the ISO C standard.

41240 These functions shall round their argument to the nearest integer value, rounding halfway cases
 41241 away from zero, regardless of the current rounding direction.

41242 An application wishing to check for error situations should set *errno* to zero and call
 41243 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 41244 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 41245 zero, an error has occurred.

41246 **RETURN VALUE**

41247 Upon successful completion, these functions shall return the rounded integer value.

41248 MX If *x* is NaN, a domain error shall occur, and an unspecified value is returned.

41249 If *x* is +Inf, a domain error shall occur and an unspecified value is returned.

41250 If *x* is -Inf, a domain error shall occur and an unspecified value is returned.

41251 If the correct value is positive and too large to represent as a **long long**, an unspecified value
 41252 MX shall be returned. On systems that support the IEC 60559 Floating-Point option, a domain error
 41253 CX shall occur; otherwise, a domain error may occur.

41254 If the correct value is negative and too large to represent as a **long long**, an unspecified value
 41255 MX shall be returned. On systems that support the IEC 60559 Floating-Point option, a domain error
 41256 CX shall occur; otherwise, a domain error may occur.

41257 **ERRORS**

41258 These functions shall fail if:

41259 MX **Domain Error** The *x* argument is NaN or $\pm$ Inf, or the correct value is not representable as an
 41260 integer.

41261 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 41262 then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling*
 41263 & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
 41264 shall be raised.

41265 These functions may fail if:

41266 **Domain Error** The correct value is not representable as an integer.

41267 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 41268 then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling*
 41269 & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
 41270 shall be raised.

41271 EXAMPLES

41272 None.

41273 APPLICATION USAGE

41274 On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* &
41275 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

41276 RATIONALE

41277 These functions differ from the *llrint()* functions in that the default rounding direction for the
41278 *llround()* functions round halfway cases away from zero and need not raise the inexact floating-
41279 point exception for non-integer arguments that round to within the range of the return type.

41280 FUTURE DIRECTIONS

41281 None.

41286 First released in Issue 6. Derived from the ISO/IEC 9899: 1999 standard.

41287 Issue 7

41288 ISO/IEC 9899: 1999 standard, Technical Corrigendum 2 #54 (SD5-XSH-ERN-75) is applied.

41289 **NAME**

41290 localeconv — return locale-specific information

41291 **SYNOPSIS**

41292 #include <locale.h>

41293 struct lconv *localeconv(void);

41294 **DESCRIPTION**

41295 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 41296 conflict between the requirements described here and the ISO C standard is unintentional. This
 41297 volume of POSIX.1-2008 defers to the ISO C standard.

41298 The *localeconv()* function shall set the components of an object with the type **struct lconv** with
 41299 the values appropriate for the formatting of numeric quantities (monetary and otherwise)
 41300 according to the rules of the current locale.

41301 The members of the structure with type **char *** are pointers to strings, any of which (except
 41302 **decimal_point**) can point to "", to indicate that the value is not available in the current locale or
 41303 is of zero length. The members with type **char** are non-negative numbers, any of which can be
 41304 {CHAR_MAX} to indicate that the value is not available in the current locale.

41305 The members include the following:

41306 **char *decimal_point**

41307 The radix character used to format non-monetary quantities.

41308 **char *thousands_sep**

41309 The character used to separate groups of digits before the decimal-point character in
 41310 formatted non-monetary quantities.

41311 **char *grouping**

41312 A string whose elements taken as one-byte integer values indicate the size of each group of
 41313 digits in formatted non-monetary quantities.

41314 **char *int_curr_symbol**

41315 The international currency symbol applicable to the current locale. The first three characters
 41316 contain the alphabetic international currency symbol in accordance with those specified in
 41317 the ISO 4217:2001 standard. The fourth character (immediately preceding the null byte) is
 41318 the character used to separate the international currency symbol from the monetary
 41319 quantity.

41320 **char *currency_symbol**

41321 The local currency symbol applicable to the current locale.

41322 **char *mon_decimal_point**

41323 The radix character used to format monetary quantities.

41324 **char *mon_thousands_sep**

41325 The separator for groups of digits before the decimal-point in formatted monetary
 41326 quantities.

41327 **char *mon_grouping**

41328 A string whose elements taken as one-byte integer values indicate the size of each group of
 41329 digits in formatted monetary quantities.

41330 **char *positive_sign**

41331 The string used to indicate a non-negative valued formatted monetary quantity.

41332 **char *negative_sign**
41333 The string used to indicate a negative valued formatted monetary quantity.

41334 **char int_frac_digits**
41335 The number of fractional digits (those after the decimal-point) to be displayed in an
41336 internationally formatted monetary quantity.

41337 **char frac_digits**
41338 The number of fractional digits (those after the decimal-point) to be displayed in a
41339 formatted monetary quantity.

41340 **char p_cs_precedes**
41341 Set to 1 if the **currency_symbol** precedes the value for a non-negative formatted monetary
41342 quantity. Set to 0 if the symbol succeeds the value.

41343 **char p_sep_by_space**
41344 Set to a value indicating the separation of the **currency_symbol**, the sign string, and the
41345 value for a non-negative formatted monetary quantity.

41346 **char n_cs_precedes**
41347 Set to 1 if the **currency_symbol** precedes the value for a negative formatted monetary
41348 quantity. Set to 0 if the symbol succeeds the value.

41349 **char n_sep_by_space**
41350 Set to a value indicating the separation of the **currency_symbol**, the sign string, and the
41351 value for a negative formatted monetary quantity.

41352 **char p_sign_posn**
41353 Set to a value indicating the positioning of the **positive_sign** for a non-negative formatted
41354 monetary quantity.

41355 **char n_sign_posn**
41356 Set to a value indicating the positioning of the **negative_sign** for a negative formatted
41357 monetary quantity.

41358 **char int_p_cs_precedes**
41359 Set to 1 or 0 if the **int_curr_symbol** respectively precedes or succeeds the value for a non-
41360 negative internationally formatted monetary quantity.

41361 **char int_n_cs_precedes**
41362 Set to 1 or 0 if the **int_curr_symbol** respectively precedes or succeeds the value for a
41363 negative internationally formatted monetary quantity.

41364 **char int_p_sep_by_space**
41365 Set to a value indicating the separation of the **int_curr_symbol**, the sign string, and the
41366 value for a non-negative internationally formatted monetary quantity.

41367 **char int_n_sep_by_space**
41368 Set to a value indicating the separation of the **int_curr_symbol**, the sign string, and the
41369 value for a negative internationally formatted monetary quantity.

41370 **char int_p_sign_posn**
41371 Set to a value indicating the positioning of the **positive_sign** for a non-negative
41372 internationally formatted monetary quantity.

41373 **char int_n_sign_posn**
41374 Set to a value indicating the positioning of the **negative_sign** for a negative internationally
41375 formatted monetary quantity.

41376 The elements of **grouping** and **mon_grouping** are interpreted according to the following:

41377 {CHAR_MAX} No further grouping is to be performed.

41378 0 The previous element is to be repeatedly used for the remainder of the digits.

41379 *other* The integer value is the number of digits that comprise the current group. The

41380 next element is examined to determine the size of the next group of digits

41381 before the current group.

41382 The values of **p_sep_by_space**, **n_sep_by_space**, **int_p_sep_by_space**, and **int_n_sep_by_space**

41383 are interpreted according to the following:

41384 0 No space separates the currency symbol and value.

41385 1 If the currency symbol and sign string are adjacent, a space separates them from the value;

41386 otherwise, a space separates the currency symbol from the value.

41387 2 If the currency symbol and sign string are adjacent, a space separates them; otherwise, a

41388 space separates the sign string from the value.

41389 For **int_p_sep_by_space** and **int_n_sep_by_space**, the fourth character of **int_curr_symbol** is

41390 used instead of a space.

41391 The values of **p_sign_posn**, **n_sign_posn**, **int_p_sign_posn**, and **int_n_sign_posn** are

41392 interpreted according to the following:

41393 0 Parentheses surround the quantity and **currency_symbol** or **int_curr_symbol**.

41394 1 The sign string precedes the quantity and **currency_symbol** or **int_curr_symbol**.

41395 2 The sign string succeeds the quantity and **currency_symbol** or **int_curr_symbol**.

41396 3 The sign string immediately precedes the **currency_symbol** or **int_curr_symbol**.

41397 4 The sign string immediately succeeds the **currency_symbol** or **int_curr_symbol**.

41398 The implementation shall behave as if no function in this volume of POSIX.1-2008 calls

41399 *localeconv()*.

41400 CX The *localeconv()* function need not be thread-safe.

41401 RETURN VALUE

41402 The *localeconv()* function shall return a pointer to the filled-in object. The application shall not

41403 CX modify the structure to which the return value points, nor any storage areas pointed to by

41404 pointers within the structure. The returned pointer, and pointers within the structure, might be

41405 CX invalidated or the structure or the storage areas might be overwritten by a subsequent call to

41406 CX *localeconv()*. In addition, the returned pointer, and pointers within the structure, might be

41407 CX invalidated or the structure or the storage areas might be overwritten by subsequent calls to

41408 CX *setlocale()* with the categories LC_ALL, LC_MONETARY, or LC_NUMERIC, or by calls to

41409 *uselocale()* which change the categories LC_MONETARY or LC_NUMERIC.

41410 ERRORS

41411 No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

The following table illustrates the rules which may be used by four countries to format monetary quantities.

Country	Positive Format	Negative Format	International Format
Italy	€1.230	−€1.230	EUR.1.230
Netherlands	€ 1.234,56	€ −1.234,56	EUR 1.234,56
Norway	kr1.234,56	kr1.234,56−	NOK 1.234,56
Switzerland	SFrs.1,234.56	SFrs.1,234.56C	CHF 1,234.56

For these four countries, the respective values for the monetary members of the structure returned by *localeconv()* are:

	Italy	Netherlands	Norway	Switzerland
int_curr_symbol	"EUR. "	"EUR "	"NOK "	"CHF "
currency_symbol	"€. "	"€"	"kr"	"SFrs. "
mon_decimal_point	" "	", "	", "	". "
mon_thousands_sep	". "	". "	". "	", "
mon_grouping	"\3"	"\3"	"\3"	"\3"
positive_sign	" "	" "	" "	" "
negative_sign	"_ "	"_ "	"_ "	"C "
int_frac_digits	0	2	2	2
frac_digits	0	2	2	2
p_cs_precedes	1	1	1	1
p_sep_by_space	0	1	0	0
n_cs_precedes	1	1	1	1
n_sep_by_space	0	1	0	0
p_sign_posn	1	1	1	1
n_sign_posn	1	4	2	2
int_p_cs_precedes	1	1	1	1
int_n_cs_precedes	1	1	1	1
int_p_sep_by_space	0	0	0	0
int_n_sep_by_space	0	0	0	0
int_p_sign_posn	1	1	1	1
int_n_sign_posn	1	4	4	2

41454 **CHANGE HISTORY**

41455 First released in Issue 4. Derived from the ANSI C standard.

41456 **Issue 6**

41457 A note indicating that this function need not be reentrant is added to the DESCRIPTION.

41458 The RETURN VALUE section is rewritten to avoid use of the term “must”.

41459 This reference page is updated for alignment with the ISO/IEC 9899: 1999 standard.

41460 ISO/IEC 9899: 1999 standard, Technical Corrigendum 1 is incorporated. -

41461 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/31 is applied, removing references to
 41462 **int_curr_symbol** and updating the descriptions of **p_sep_by_space** and **n_sep_by_space**. These
 41463 changes are for alignment with the ISO C standard.

41464 **Issue 7**

41465 Austin Group Interpretation 1003.1-2001 #156 is applied.

41466 The definitions of **int_curr_symbol** and **currency_symbol** are updated.

41467 The examples in the APPLICATION USAGE section are updated.

41468 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0362 [75] is applied. +

41469 **NAME**

41470 localtime, localtime_r — convert a time value to a broken-down local time

41471 **SYNOPSIS**

```
41472     #include <time.h>

41473     struct tm *localtime(const time_t *timer);
41474 CX    struct tm *localtime_r(const time_t *restrict timer,
41475                             struct tm *restrict result);
```

41476 **DESCRIPTION**

41477 CX For *localtime()*: The functionality described on this reference page is aligned with the ISO C
 41478 standard. Any conflict between the requirements described here and the ISO C standard is
 41479 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

41480 The *localtime()* function shall convert the time in seconds since the Epoch pointed to by *timer*
 41481 into a broken-down time, expressed as a local time. The function corrects for the timezone and
 41482 CX any seasonal time adjustments. Local timezone information is used as though *localtime()* calls
 41483 *tzset()*.

41484 The relationship between a time in seconds since the Epoch used as an argument to *localtime()*
 41485 and the **tm** structure (defined in the **<time.h>** header) is that the result shall be as specified in
 41486 the expression given in the definition of seconds since the Epoch (see XBD [Section 4.15](#), on page
 41487 113) corrected for timezone and any seasonal time adjustments, where the names in the structure
 41488 and in the expression correspond.

41489 The same relationship shall apply for *localtime_r()*.

41490 The *localtime()* function need not be thread-safe.

41491 The *asctime()*, *ctime()*, *gmtime()*, and *localtime()* functions shall return values in one of two static
 41492 objects: a broken-down time structure and an array of type **char**. Execution of any of the
 41493 functions may overwrite the information returned in either of these objects by any of the other
 41494 functions.

41495 The *localtime_r()* function shall convert the time in seconds since the Epoch pointed to by *timer*
 41496 into a broken-down time stored in the structure to which *result* points. The *localtime_r()* function
 41497 shall also return a pointer to that same structure.

41498 Unlike *localtime()*, the *localtime_r()* function is not required to set *tzname*. If *localtime_r()* does
 41499 not set *tzname*, it shall not set *daylight* and shall not set *timezone*.

41500 **RETURN VALUE**

41501 Upon successful completion, the *localtime()* function shall return a pointer to the broken-down
 41502 CX time structure. If an error is detected, *localtime()* shall return a null pointer and set *errno* to
 41503 indicate the error.

41504 Upon successful completion, *localtime_r()* shall return a pointer to the structure pointed to by the
 41505 argument *result*. If an error is detected, *localtime_r()* shall return a null pointer and set *errno* to
 41506 indicate the error.

41507 **ERRORS**

41508 CX The *localtime()* and *localtime_r()* functions shall fail if:

41509 CX **[EOVERFLOW]** The result cannot be represented.

41510 **EXAMPLES**41511 **Getting the Local Date and Time**

41512 The following example uses the *time()* function to calculate the time elapsed, in seconds, since
 41513 January 1, 1970 0:00 UTC (the Epoch), *localtime()* to convert that value to a broken-down time,
 41514 and *asctime()* to convert the broken-down time values into a printable string.

```
41515 #include <stdio.h>
41516 #include <time.h>

41517 int main(void)
41518 {
41519     time_t result;

41520     result = time(NULL);
41521     printf("%s%ju secs since the Epoch\n",
41522           asctime(localtime(&result)),
41523           (uintmax_t)result);
41524     return(0);
41525 }
```

41526 This example writes the current time to *stdout* in a form like this:

```
41527 Wed Jun 26 10:32:15 1996
41528 835810335 secs since the Epoch
```

41529 **Getting the Modification Time for a File**

41530 The following example prints the last data modification timestamp in the local timezone for a
 41531 given file.

```
41532 #include <stdio.h>
41533 #include <time.h>
41534 #include <sys/stat.h>

41535 int
41536 print_file_time(const char *pathname)
41537 {
41538     struct stat statbuf;
41539     struct tm *tm;
41540     char timestr[BUFSIZ];

41541     if(stat(pathname, &statbuf) == -1)
41542         return -1;
41543     if((tm = localtime(&statbuf.st_mtime)) == NULL)
41544         return -1;
41545     if(strftime(timestr, sizeof(timestr), "%Y-%m-%d %H:%M:%S", tm) == 0)
41546         return -1;
41547     printf("%s: %s.%09ld\n", pathname, timestr, statbuf.st_mtim.tv_nsec);
41548     return 0;
41549 }
```

Timing an Event

The following example gets the current time, converts it to a string using *localtime()* and *asctime()*, and prints it to standard output using *fputs()*. It then prints the number of minutes to an event being timed.

```
#include <time.h>
#include <stdio.h>
...
time_t now;
int minutes_to_event;
...
time(&now);
printf("The time is ");
fputs(asctime(localtime(&now)), stdout);
printf("There are still %d minutes to the event.\n",
       minutes_to_event);
...
```

APPLICATION USAGE

The *localtime_r()* function is thread-safe and returns values in a user-supplied buffer instead of possibly using a static data area that may be overwritten by each call.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

asctime(), *clock()*, *ctime()*, *difftime()*, *getdate()*, *gmtime()*, *mktime()*, *strftime()*, *strptime()*, *time()*, *tzset()*, *utime()*

XBD Section 4.15 (on page 113), [<time.h>](#)

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

A note indicating that the *localtime()* function need not be reentrant is added to the DESCRIPTION.

The *localtime_r()* function is included for alignment with the POSIX Threads Extension.

Issue 6

The *localtime_r()* function is marked as part of the Thread-Safe Functions option.

Extensions beyond the ISO C standard are marked.

The APPLICATION USAGE section is updated to include a note on the thread-safe function and its avoidance of possibly using a static data area.

The **restrict** keyword is added to the *localtime_r()* prototype for alignment with the ISO/IEC 9899:1999 standard.

Examples are added.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/32 is applied, adding the [EOVERFLOW] error.

- 41593 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/55 is applied, updating the error handling
41594 for *localtime_r()*.
- 41595 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/56 is applied, adding a requirement that if
41596 *localtime_r()* does not set the *tzname* variable, it shall not set the *daylight* or *timezone* variables. On
41597 systems supporting XSI, the *daylight*, *timezone*, and *tzname* variables should all be set to provide
41598 information for the same timezone. This updates the description of *localtime_r()* to mention
41599 *daylight* and *timezone* as well as *tzname*. The SEE ALSO section is updated.
- 41600 **Issue 7**
- 41601 Austin Group Interpretation 1003.1-2001 #156 is applied.
- 41602 The *localtime_r()* function is moved from the Thread-Safe Functions option to the Base.
- 41603 Changes are made to the EXAMPLES section related to support for finegrained timestamps.
- 41604 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0363 [291] is applied. +

NAME

lockf — record locking on files

SYNOPSIS

```
#include <unistd.h>

int lockf(int fildest, int function, off_t size);
```

DESCRIPTION

The *lockf()* function shall lock sections of a file with advisory-mode locks. Calls to *lockf()* from threads in other processes which attempt to lock the locked file section shall either return an error value or block until the section becomes unlocked. All the locks for a process are removed when the process terminates. Record locking with *lockf()* shall be supported for regular files and may be supported for other files.

The *fildest* argument is an open file descriptor. To establish a lock with this function, the file descriptor shall be opened with write-only permission (O_WRONLY) or with read/write permission (O_RDWR).

The *function* argument is a control value which specifies the action to be taken. The permissible values for *function* are defined in **<unistd.h>** as follows:

Function	Description
F_ULOCK	Unlock locked sections.
F_LOCK	Lock a section for exclusive use.
F_TLOCK	Test and lock a section for exclusive use.
F_TEST	Test a section for locks by other processes.

F_TEST shall detect if a lock by another process is present on the specified section.

F_LOCK and F_TLOCK shall both lock a section of a file if the section is available.

F_ULOCK shall remove locks from a section of the file.

The *size* argument is the number of contiguous bytes to be locked or unlocked. The section to be locked or unlocked starts at the current offset in the file and extends forward for a positive size or backward for a negative size (the preceding bytes up to but not including the current offset). If *size* is 0, the section from the current offset through the largest possible file offset shall be locked (that is, from the current offset through the present or any future end-of-file). An area need not be allocated to the file to be locked because locks may exist past the end-of-file.

The sections locked with F_LOCK or F_TLOCK may, in whole or in part, contain or be contained by a previously locked section for the same process. When this occurs, or if adjacent locked sections would occur, the sections shall be combined into a single locked section. If the request would cause the number of locks to exceed a system-imposed limit, the request shall fail.

F_LOCK and F_TLOCK requests differ only by the action taken if the section is not available. F_LOCK shall block the calling thread until the section is available. F_TLOCK shall cause the function to fail if the section is already locked by another process.

File locks shall be released on first close by the locking process of any file descriptor for the file.

F_ULOCK requests may release (wholly or in part) one or more locked sections controlled by the process. Locked sections shall be unlocked starting at the current file offset through *size* bytes or to the end-of-file if *size* is (off_t)0. When all of a locked section is not released (that is, when the beginning or end of the area to be unlocked falls within a locked section), the remaining portions of that section shall remain locked by the process. Releasing the center portion of a locked section shall cause the remaining locked beginning and end portions to become two separate

locked sections. If the request would cause the number of locks in the system to exceed a system-imposed limit, the request shall fail.

A potential for deadlock occurs if the threads of a process controlling a locked section are blocked by accessing a locked section of another process. If the system detects that deadlock would occur, *lockf()* shall fail with an [EDEADLK] error.

The interaction between *fcntl()* and *lockf()* locks is unspecified.

Blocking on a section shall be interrupted by any signal.

An F_ULOCK request in which *size* is non-zero and the offset of the last byte of the requested section is the maximum value for an object of type **off_t**, when the process has an existing lock in which *size* is 0 and which includes the last byte of the requested section, shall be treated as a request to unlock from the start of the requested section with a size equal to 0. Otherwise, an F_ULOCK request shall attempt to unlock only the requested section.

Attempting to lock a section of a file that is associated with a buffered stream produces unspecified results.

RETURN VALUE

Upon successful completion, *lockf()* shall return 0. Otherwise, it shall return -1, set *errno* to indicate an error, and existing locks shall not be changed.

ERRORS

The *lockf()* function shall fail if:

[EBADF] The *fildes* argument is not a valid open file descriptor; or *function* is F_LOCK or F_TLOCK and *fildes* is not a valid file descriptor open for writing.

[EACCES] or [EAGAIN]

The *function* argument is F_TLOCK or F_TEST and the section is already locked by another process.

[EDEADLK] The *function* argument is F_LOCK and a deadlock is detected.

[EINTR] A signal was caught during execution of the function.

[EINVAL] The *function* argument is not one of F_LOCK, F_TLOCK, F_TEST, or F_ULOCK; or *size* plus the current file offset is less than 0.

[EOVERFLOW] The offset of the first, or if *size* is not 0 then the last, byte in the requested section cannot be represented correctly in an object of type **off_t**.

The *lockf()* function may fail if:

[EAGAIN] The *function* argument is F_LOCK or F_TLOCK and the file is mapped with *mmap()*.

[EDEADLK] or [ENOLCK]

The *function* argument is F_LOCK, F_TLOCK, or F_ULOCK, and the request would cause the number of locks to exceed a system-imposed limit.

[EOPNOTSUPP] or [EINVAL]

The implementation does not support the locking of files of the type indicated by the *fildes* argument.

41688 **EXAMPLES**41689 **Locking a Portion of a File**

41690 In the following example, a file named `/home/cnd/mod1` is being modified. Other processes that
41691 use locking are prevented from changing it during this process. Only the first 10 000 bytes are
41692 locked, and the lock call fails if another process has any part of this area locked already.

```
41693 #include <fcntl.h>
41694 #include <unistd.h>
41695
41696 int fildes;
41697 int status;
41698 ...
41699 fildes = open("/home/cnd/mod1", O_RDWR);
41700 status = lockf(fildes, F_TLOCK, (off_t)10000);
```

41700 **APPLICATION USAGE**

41701 Record-locking should not be used in combination with the *fopen()*, *fread()*, *fwrite()*, and other
41702 *stdio* functions. Instead, the more primitive, non-buffered functions (such as *open()*) should be
41703 used. Unexpected results may occur in processes that do buffering in the user address space. The
41704 process may later read/write data which is/was locked. The *stdio* functions are the most
41705 common source of unexpected buffering.

41706 The *alarm()* function may be used to provide a timeout facility in applications requiring it.

41707 **RATIONALE**

41708 None.

41709 **FUTURE DIRECTIONS**

41710 None.

41711 **SEE ALSO**

41712 *alarm()*, *chmod()*, *close()*, *creat()*, *fcntl()*, *fopen()*, *mmap()*, *open()*, *read()*, *write()*

41713 XBD **<unistd.h>**

41714 **CHANGE HISTORY**

41715 First released in Issue 4, Version 2.

41716 **Issue 5**

41717 Moved from X/OPEN UNIX extension to BASE.

41718 Large File Summit extensions are added. In particular, the description of [EINVAL] is clarified
41719 and moved from optional to mandatory status.

41720 A note is added to the DESCRIPTION indicating the effects of attempting to lock a section of a
41721 file that is associated with a buffered stream.

41722 **Issue 6**

41723 The normative text is updated to avoid use of the term “must” for application requirements.

41724 **Issue 7**

41725 Austin Group Interpretation 1003.1-2001 #054 is applied, updating the DESCRIPTION.

41726 **NAME**41727 `log, logf, logl` — natural logarithm function41728 **SYNOPSIS**

```
41729 #include <math.h>
41730 double log(double x);
41731 float logf(float x);
41732 long double logl(long double x);
```

41733 **DESCRIPTION**

41734 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 41735 conflict between the requirements described here and the ISO C standard is unintentional. This
 41736 volume of POSIX.1-2008 defers to the ISO C standard.

41737 These functions shall compute the natural logarithm of their argument x , $\log_e(x)$.

41738 An application wishing to check for error situations should set *errno* to zero and call
 41739 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 41740 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 41741 zero, an error has occurred.

41742 **RETURN VALUE**

41743 Upon successful completion, these functions shall return the natural logarithm of x .

41744 If x is ± 0 , a pole error shall occur and *log()*, *logf()*, and *logl()* shall return `-HUGE_VAL`,
 41745 `-HUGE_VALF`, and `-HUGE_VALL`, respectively.

41746 MX For finite values of x that are less than 0, or if x is `-Inf`, a domain error shall occur, and either a
 41747 NaN (if supported), or an implementation-defined value shall be returned.

41748 MX If x is NaN, a NaN shall be returned.

41749 If x is 1, `+0` shall be returned.

41750 If x is `+Inf`, x shall be returned.

41751 **ERRORS**

41752 These functions shall fail if:

41753	MX	Domain Error	The finite value of x is negative, or x is <code>-Inf</code> .
41754			If the integer expression <i>(math_errhandling & MATH_ERRNO)</i> is non-zero,
41755			then <i>errno</i> shall be set to [EDOM]. If the integer expression <i>(math_errhandling</i>
41756			<i>& MATH_ERREXCEPT)</i> is non-zero, then the invalid floating-point exception
41757			shall be raised.

41758		Pole Error	The value of x is zero.

41759		If the integer expression <i>(math_errhandling & MATH_ERRNO)</i> is non-zero,
41760		then <i>errno</i> shall be set to [ERANGE]. If the integer expression
41761		<i>(math_errhandling & MATH_ERREXCEPT)</i> is non-zero, then the divide-by-zero
41762		floating-point exception shall be raised.

41763 **EXAMPLES**

41764 None.

41765 **APPLICATION USAGE**

41766 On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* &
41767 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

41768 **RATIONALE**

41769 None.

41770 **FUTURE DIRECTIONS**

41771 None.

41772 **SEE ALSO**41773 *exp()*, *feclearexcept()*, *fetestexcept()*, *isnan()*, *log10()*, *log1p()*

41774 XBD Section 4.19 (on page 116), <math.h>

41775 **CHANGE HISTORY**

41776 First released in Issue 1. Derived from Issue 1 of the SVID.

41777 **Issue 5**

41778 The DESCRIPTION is updated to indicate how an application should check for an error. This
41779 text was previously published in the APPLICATION USAGE section.

41780 **Issue 6**

41781 The normative text is updated to avoid use of the term “must” for application requirements.

41782 The *logf()* and *logl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

41783 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are
41784 revised to align with the ISO/IEC 9899:1999 standard.

41785 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are
41786 marked.

41787 **NAME**

41788 log10, log10f, log10l — base 10 logarithm function

41789 **SYNOPSIS**

```
41790       #include <math.h>
41791       double log10(double x);
41792       float log10f(float x);
41793       long double log10l(long double x);
```

41794 **DESCRIPTION**

41795 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 41796 conflict between the requirements described here and the ISO C standard is unintentional. This
 41797 volume of POSIX.1-2008 defers to the ISO C standard.

41798 These functions shall compute the base 10 logarithm of their argument x , $\log_{10}(x)$.

41799 An application wishing to check for error situations should set *errno* to zero and call
 41800 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 41801 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 41802 zero, an error has occurred.

41803 **RETURN VALUE**

41804 Upon successful completion, these functions shall return the base 10 logarithm of x .

41805 If x is ± 0 , a pole error shall occur and *log10()*, *log10f()*, and *log10l()* shall return $-\text{HUGE\_VAL}$,
 41806 $-\text{HUGE\_VALF}$, and $-\text{HUGE\_VALL}$, respectively.

41807 MX For finite values of x that are less than 0, or if x is $-\text{Inf}$, a domain error shall occur, and either a
 41808 NaN (if supported), or an implementation-defined value shall be returned.

41809 MX If x is NaN, a NaN shall be returned.

41810 If x is 1, +0 shall be returned.

41811 If x is $+\text{Inf}$, $+\text{Inf}$ shall be returned.

41812 **ERRORS**

41813 These functions shall fail if:

41814	MX	Domain Error	The finite value of x is negative, or x is $-\text{Inf}$.
41815			If the integer expression (<i>math_errhandling</i> & MATH_ERRNO) is non-zero,
41816			then <i>errno</i> shall be set to [EDOM]. If the integer expression (<i>math_errhandling</i>
41817			& MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
41818			shall be raised.

41819		Pole Error	The value of x is zero.

41820		If the integer expression (<i>math_errhandling</i> & MATH_ERRNO) is non-zero,
41821		then <i>errno</i> shall be set to [ERANGE]. If the integer expression
41822		(<i>math_errhandling</i> & MATH_ERREXCEPT) is non-zero, then the divide-by-zero
41823		floating-point exception shall be raised.

41824 **EXAMPLES**

41825 None.

41826 **APPLICATION USAGE**

41827 On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* &
41828 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

41836 **CHANGE HISTORY**

41837 First released in Issue 1. Derived from Issue 1 of the SVID.

41838 **Issue 5**

41839 The DESCRIPTION is updated to indicate how an application should check for an error. This
41840 text was previously published in the APPLICATION USAGE section.

41841 **Issue 6**

41842 The normative text is updated to avoid use of the term “must” for application requirements.

41843 The *log10f()* and *log10l()* functions are added for alignment with the ISO/IEC 9899:1999
41844 standard.

41845 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are
41846 revised to align with the ISO/IEC 9899:1999 standard.

41847 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are
41848 marked.

41849 **NAME**41850 `log1p`, `log1pf`, `log1pl` — compute a natural logarithm41851 **SYNOPSIS**

```
41852     #include <math.h>

41853     double log1p(double x);
41854     float log1pf(float x);
41855     long double log1pl(long double x);
```

41856 **DESCRIPTION**

41857 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any
 41858 conflict between the requirements described here and the ISO C standard is unintentional. This
 41859 volume of POSIX.1-2008 defers to the ISO C standard.

41860 These functions shall compute $\log_e(1.0 + x)$.

41861 An application wishing to check for error situations should set *errno* to zero and call
 41862 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 41863 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 41864 zero, an error has occurred.

41865 **RETURN VALUE**

41866 Upon successful completion, these functions shall return the natural logarithm of $1.0 + x$.

41867 If x is -1 , a pole error shall occur and *log1p()*, *log1pf()*, and *log1pl()* shall return $-\text{HUGE\_VAL}$,
 41868 $-\text{HUGE\_VALF}$, and $-\text{HUGE\_VALL}$, respectively.

41869 **MX** For finite values of x that are less than -1 , or if x is $-\text{Inf}$, a domain error shall occur, and either a
 41870 NaN (if supported), or an implementation-defined value shall be returned.

41871 **MX** If x is NaN, a NaN shall be returned.

41872 If x is ± 0 , or $+\text{Inf}$, x shall be returned.

41873 If x is subnormal, a range error may occur

41874 **MX** and x should be returned.

41875 **MX** If x is not returned, *log1p()*, *log1pf()*, and *log1pl()* shall return an implementation-defined value
 41876 no greater in magnitude than DBL_MIN, FLT_MIN, and LDBL_MIN, respectively.

41877 **ERRORS**

41878 These functions shall fail if:

41879 **MX** Domain Error The finite value of x is less than -1 , or x is $-\text{Inf}$.

41880 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 41881 then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling*
 41882 & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
 41883 shall be raised.

41884 Pole Error The value of x is -1 .

41885 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 41886 then *errno* shall be set to [ERANGE]. If the integer expression
 41887 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the divide-by-zero
 41888 floating-point exception shall be raised.

41889 These functions may fail if:

41890	MX	Range Error	The value of x is subnormal.
41891			If the integer expression $(\text{math\_errhandling} \ \& \ \text{MATH\_ERRNO})$ is non-zero,
41892			then <i>errno</i> shall be set to [ERANGE]. If the integer expression
41893			$(\text{math\_errhandling} \ \& \ \text{MATH\_ERREXCEPT})$ is non-zero, then the underflow
41894			floating-point exception shall be raised.

41895 EXAMPLES

41896 None.

41897 APPLICATION USAGE

41898 On error, the expressions $(\text{math\_errhandling} \ \& \ \text{MATH\_ERRNO})$ and $(\text{math\_errhandling} \ \& \ \text{MATH\_ERREXCEPT})$ are independent of each other, but at least one of them must be non-zero.

41922 **NAME**

41923 log2, log2f, log2l — compute base 2 logarithm functions

41924 **SYNOPSIS**

```
41925 #include <math.h>
41926 double log2(double x);
41927 float log2f(float x);
41928 long double log2l(long double x);
```

41929 **DESCRIPTION**

41930 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 41931 conflict between the requirements described here and the ISO C standard is unintentional. This
 41932 volume of POSIX.1-2008 defers to the ISO C standard.

41933 These functions shall compute the base 2 logarithm of their argument x , $\log_2(x)$.

41934 An application wishing to check for error situations should set *errno* to zero and call
 41935 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 41936 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 41937 zero, an error has occurred.

41938 **RETURN VALUE**

41939 Upon successful completion, these functions shall return the base 2 logarithm of x .

41940 If x is ± 0 , a pole error shall occur and *log2()*, *log2f()*, and *log2l()* shall return $-\text{HUGE\_VAL}$,
 41941 $-\text{HUGE\_VALF}$, and $-\text{HUGE\_VALL}$, respectively.

41942 MX For finite values of x that are less than 0, or if x is $-\text{Inf}$, a domain error shall occur, and either a
 41943 NaN (if supported), or an implementation-defined value shall be returned.

41944 MX If x is NaN, a NaN shall be returned.

41945 If x is 1, +0 shall be returned.

41946 If x is $+\text{Inf}$, x shall be returned.

41947 **ERRORS**

41948 These functions shall fail if:

41949 MX Domain Error The finite value of x is less than zero, or x is $-\text{Inf}$.

41950 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 41951 then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling*
 41952 & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
 41953 shall be raised.

41954 Pole Error The value of x is zero.

41955 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 41956 then *errno* shall be set to [ERANGE]. If the integer expression
 41957 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the divide-by-zero
 41958 floating-point exception shall be raised.

41959 EXAMPLES

41960 None.

41961 APPLICATION USAGE

41962 On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* &
41963 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

41970 XBD [Section 4.19](#) (on page 116), [<math.h>](#)

41971 CHANGE HISTORY

41972 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

41973 **NAME**41974 `logb`, `logbf`, `logbl` — radix-independent exponent41975 **SYNOPSIS**

```
41976     #include <math.h>
41977
41977     double logb(double x);
41978     float logbf(float x);
41979     long double logbl(long double x);
```

41980 **DESCRIPTION**

41981 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 41982 conflict between the requirements described here and the ISO C standard is unintentional. This
 41983 volume of POSIX.1-2008 defers to the ISO C standard.

41984 These functions shall compute the exponent of x , which is the integral part of $\log_r |x|$, as a
 41985 signed floating-point value, for non-zero x , where r is the radix of the machine's floating-point
 41986 arithmetic, which is the value of `FLT_RADIX` defined in the `<float.h>` header.

41987 If x is subnormal it is treated as though it were normalized; thus for finite positive x :

41988 $1 \leq x * \text{FLT\_RADIX}^{-\log_b(x)} < \text{FLT\_RADIX}$

41989 An application wishing to check for error situations should set `errno` to zero and call
 41990 `feclearexcept(FE_ALL_EXCEPT)` before calling these functions. On return, if `errno` is non-zero or
 41991 `fetestexcept(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW)` is non-
 41992 zero, an error has occurred.

41993 **RETURN VALUE**

41994 Upon successful completion, these functions shall return the exponent of x .

41995 If x is ± 0 , `logb()`, `logbf()`, and `logbl()` shall return `-HUGE_VAL`, `-HUGE_VALF`, and
 41996 `-HUGE_VALL`, respectively.

41997 MX On systems that support the IEC 60559 Floating-Point option, a pole error shall occur;

41998 CX otherwise, a pole error may occur.

41999 MX If x is NaN, a NaN shall be returned.

42000 MX If x is $\pm\text{Inf}$, $+\text{Inf}$ shall be returned.

42001 **ERRORS**

42002 These functions shall fail if:

42003 MX **Pole Error** The value of x is ± 0 .

42004 If the integer expression `(math_errhandling & MATH_ERRNO)` is non-zero,
 42005 then `errno` shall be set to `[ERANGE]`. If the integer expression
 42006 `(math_errhandling & MATH_ERREXCEPT)` is non-zero, then the divide-by-zero
 42007 floating-point exception shall be raised.

42008 These functions may fail if:

42009 **Pole Error** The value of x is 0.

42010 If the integer expression `(math_errhandling & MATH_ERRNO)` is non-zero,
 42011 then `errno` shall be set to `[ERANGE]`. If the integer expression
 42012 `(math_errhandling & MATH_ERREXCEPT)` is non-zero, then the divide-by-zero
 42013 floating-point exception shall be raised.

42014 **EXAMPLES**

42015 None.

42016 **APPLICATION USAGE**

42017 On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* &
42018 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

42019 **RATIONALE**

42020 None.

42021 **FUTURE DIRECTIONS**

42022 None.

42023 **SEE ALSO**42024 *feclearexcept()*, *fetestexcept()*, *ilogb()*, *scalbln()*

42026 **CHANGE HISTORY**

42027 First released in Issue 4, Version 2.

42028 **Issue 5**

42029 Moved from X/OPEN UNIX extension to BASE.

42030 **Issue 6**42031 The *logb()* function is no longer marked as an extension.42032 The *logbf()* and *logbl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

42033 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are
42034 revised to align with the ISO/IEC 9899:1999 standard.

42035 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are
42036 marked.

42037 **Issue 7**

42038 ISO/IEC 9899:1999 standard, Technical Corrigendum 2 #50 (SD5-XSH-ERN-76) is applied.

42039 **NAME**

42040 logf, logl — natural logarithm function

42041 **SYNOPSIS**

42042 #include <math.h>

42043 float logf(float x);

42044 long double logl(long double x);

42045 **DESCRIPTION**42046 Refer to *log()*.

42047 **NAME**

42048 longjmp — non-local goto

42049 **SYNOPSIS**

42050 #include <setjmp.h>

42051 void longjmp(jmp_buf env, int val);

42052 **DESCRIPTION**

42053 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 42054 conflict between the requirements described here and the ISO C standard is unintentional. This
 42055 volume of POSIX.1-2008 defers to the ISO C standard.

42056 The *longjmp()* function shall restore the environment saved by the most recent invocation of
 42057 *setjmp()* in the same process, with the corresponding **jmp_buf** argument. If the most recent
 42058 invocation of *setjmp()* with the corresponding **jmp_buf** occurred in another thread, or if there is
 42059 no such invocation, or if the function containing the invocation of *setjmp()* has terminated
 42060 execution in the interim, or if the invocation of *setjmp()* was within the scope of an identifier
 42061 with variably modified type and execution has left that scope in the interim, the behavior is
 42062 CX undefined. It is unspecified whether *longjmp()* restores the signal mask, leaves the signal mask
 42063 unchanged, or restores it to its value at the time *setjmp()* was called.

42064 All accessible objects have values, and all other components of the abstract machine have state
 42065 (for example, floating-point status flags and open files), as of the time *longjmp()* was called,
 42066 except that the values of objects of automatic storage duration are unspecified if they meet all
 42067 the following conditions:

- 42068 • They are local to the function containing the corresponding *setjmp()* invocation.
- 42069 • They do not have volatile-qualified type.
- 42070 • They are changed between the *setjmp()* invocation and *longjmp()* call.

42071 CX As it bypasses the usual function call and return mechanisms, *longjmp()* shall execute correctly
 42072 in contexts of interrupts, signals, and any of their associated functions. However, if *longjmp()* is
 42073 invoked from a nested signal handler (that is, from a function invoked as a result of a signal
 42074 raised during the handling of another signal), the behavior is undefined.

42075 The effect of a call to *longjmp()* where initialization of the **jmp_buf** structure was not performed
 42076 in the calling thread is undefined.

42077 **RETURN VALUE**

42078 After *longjmp()* is completed, program execution continues as if the corresponding invocation of
 42079 *setjmp()* had just returned the value specified by *val*. The *longjmp()* function shall not cause
 42080 *setjmp()* to return 0; if *val* is 0, *setjmp()* shall return 1.

42081 **ERRORS**

42082 No errors are defined.

42083 **EXAMPLES**

42084 None.

42085 **APPLICATION USAGE**

42086 Applications whose behavior depends on the value of the signal mask should not use *longjmp()*
 42087 and *setjmp()*, since their effect on the signal mask is unspecified, but should instead use the
 42088 *siglongjmp()* and *sigsetjmp()* functions (which can save and restore the signal mask under
 42089 application control).

42090 **RATIONALE**

42091 None.

42092 **FUTURE DIRECTIONS**

42093 None.

42097 **CHANGE HISTORY**

42098 First released in Issue 1. Derived from Issue 1 of the SVID.

42099 **Issue 5**

42100 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

42101 **Issue 6**

42102 Extensions beyond the ISO C standard are marked.

42103 The following new requirements on POSIX implementations derive from alignment with the
42104 Single UNIX Specification:

- 42105 • The DESCRIPTION now explicitly makes *longjmp()*'s effect on the signal mask
- 42106 unspecified.

42107 The DESCRIPTION is updated for alignment with the ISO/IEC 9899:1999 standard.

42108 **Issue 7**

42109 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0365 [394] is applied.

+

42110 NAME

42111 lrand48 — generate uniformly distributed pseudo-random non-negative long integers

42112 SYNOPSIS

```
42113 XSI      #include <stdlib.h>  
42114          long lrand48(void);
```

42115 DESCRIPTION

42116 Refer to *drand48()*.

42117 **NAME**

42118 lrint, lrintf, lrintl — round to nearest integer value using current rounding direction

42119 **SYNOPSIS**

```
42120 #include <math.h>
42121 long lrint(double x);
42122 long lrintf(float x);
42123 long lrintl(long double x);
```

42124 **DESCRIPTION**

42125 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 42126 conflict between the requirements described here and the ISO C standard is unintentional. This
 42127 volume of POSIX.1-2008 defers to the ISO C standard.

42128 These functions shall round their argument to the nearest integer value, rounding according to
 42129 the current rounding direction.

42130 An application wishing to check for error situations should set *errno* to zero and call
 42131 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 42132 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 42133 zero, an error has occurred.

42134 **RETURN VALUE**

42135 Upon successful completion, these functions shall return the rounded integer value.

42136 MX If *x* is NaN, a domain error shall occur and an unspecified value is returned.

42137 If *x* is +Inf, a domain error shall occur and an unspecified value is returned.

42138 If *x* is -Inf, a domain error shall occur and an unspecified value is returned.

42139 If the correct value is positive and too large to represent as a **long**, an unspecified value shall be
 42140 MX returned. On systems that support the IEC 60559 Floating-Point option, a domain error shall
 42141 CX occur; otherwise, a domain error may occur.

42142 If the correct value is negative and too large to represent as a **long**, an unspecified value shall be
 42143 MX returned. On systems that support the IEC 60559 Floating-Point option, a domain error shall
 42144 CX occur; otherwise, a domain error may occur.

42145 **ERRORS**

42146 These functions shall fail if:

42147 MX **Domain Error** The *x* argument is NaN or ±Inf, or the correct value is not representable as an
 42148 integer.

42149 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 42150 then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling*
 42151 & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
 42152 shall be raised.

42153 These functions may fail if:

42154 **Domain Error** The correct value is not representable as an integer.

42155 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 42156 then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling*
 42157 & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
 42158 shall be raised.

42159 EXAMPLES

42160 None.

42161 APPLICATION USAGE

42162 On error, the expressions *(math_errhandling & MATH_ERRNO)* and *(math_errhandling &*
42163 *MATH_ERREXCEPT)* are independent of each other, but at least one of them must be non-zero.

42164 RATIONALE

42165 These functions provide floating-to-integer conversions. They round according to the current
42166 rounding direction. If the rounded value is outside the range of the return type, the numeric
42167 result is unspecified and the invalid floating-point exception is raised. When they raise no other
42168 floating-point exception and the result differs from the argument, they raise the inexact floating-
42169 point exception.

42170 FUTURE DIRECTIONS

42171 None.

42172 SEE ALSO

42179 **NAME**

42180 lround, lroundf, lroundl — round to nearest integer value

42181 **SYNOPSIS**

```
42182 #include <math.h>
42183 long lround(double x);
42184 long lroundf(float x);
42185 long lroundl(long double x);
```

42186 **DESCRIPTION**

42187 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 42188 conflict between the requirements described here and the ISO C standard is unintentional. This
 42189 volume of POSIX.1-2008 defers to the ISO C standard.

42190 These functions shall round their argument to the nearest integer value, rounding halfway cases
 42191 away from zero, regardless of the current rounding direction.

42192 An application wishing to check for error situations should set *errno* to zero and call
 42193 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 42194 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 42195 zero, an error has occurred.

42196 **RETURN VALUE**

42197 Upon successful completion, these functions shall return the rounded integer value.

42198 MX If *x* is NaN, a domain error shall occur and an unspecified value is returned.

42199 If *x* is +Inf, a domain error shall occur and an unspecified value is returned.

42200 If *x* is -Inf, a domain error shall occur and an unspecified value is returned.

42201 If the correct value is positive and too large to represent as a **long**, an unspecified value shall be
 42202 MX returned. On systems that support the IEC 60559 Floating-Point option, a domain shall occur;
 42203 CX otherwise, a domain error may occur.

42204 If the correct value is negative and too large to represent as a **long**, an unspecified value shall be
 42205 MX returned. On systems that support the IEC 60559 Floating-Point option, a domain shall occur;
 42206 CX otherwise, a domain error may occur.

42207 **ERRORS**

42208 These functions shall fail if:

42209 MX **Domain Error** The *x* argument is NaN or ±Inf, or the correct value is not representable as an
 42210 integer.

42211 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 42212 then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling*
 42213 & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
 42214 shall be raised.

42215 These functions may fail if:

42216 **Domain Error** The correct value is not representable as an integer.

42217 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 42218 then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling*
 42219 & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
 42220 shall be raised.

42221 **EXAMPLES**

42222 None.

42223 **APPLICATION USAGE**

42224 On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* &
42225 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

42226 **RATIONALE**

42227 These functions differ from the *lrint()* functions in the default rounding direction, with the
42228 *lround()* functions rounding halfway cases away from zero and needing not to raise the inexact
42229 floating-point exception for non-integer arguments that round to within the range of the return
42230 type.

42231 **FUTURE DIRECTIONS**

42232 None.

NAME

`lsearch`, `lfind` — linear search and update

SYNOPSIS

```
XSI
#include <search.h>

void *lsearch(const void *key, void *base, size_t *nel, size_t width,
              int (*compar)(const void *, const void *));
void *lfind(const void *key, const void *base, size_t *nel,
            size_t width, int (*compar)(const void *, const void *));
```

DESCRIPTION

The `lsearch()` function shall linearly search the table and return a pointer into the table for the matching entry. If the entry does not occur, it shall be added at the end of the table. The *key* argument points to the entry to be sought in the table. The *base* argument points to the first element in the table. The *width* argument is the size of an element in bytes. The *nel* argument points to an integer containing the current number of elements in the table. The integer to which *nel* points shall be incremented if the entry is added to the table. The *compar* argument points to a comparison function which the application shall supply (for example, `strcmp()`). It is called with two arguments that point to the elements being compared. The application shall ensure that the function returns 0 if the elements are equal, and non-zero otherwise.

The `lfind()` function shall be equivalent to `lsearch()`, except that if the entry is not found, it is not added to the table. Instead, a null pointer is returned.

RETURN VALUE

If the searched for entry is found, both `lsearch()` and `lfind()` shall return a pointer to it. Otherwise, `lfind()` shall return a null pointer and `lsearch()` shall return a pointer to the newly added element.

Both functions shall return a null pointer in case of error.

ERRORS

No errors are defined.

EXAMPLES**Storing Strings in a Table**

This fragment reads in less than or equal to TABSIZE strings of length less than or equal to ELSIZE and stores them in a table, eliminating duplicates.

```
#include <stdio.h>
#include <string.h>
#include <search.h>

#define TABSIZE 50
#define ELSIZE 120

...
    char line[ELSIZE], tab[TABSIZE][ELSIZE];
    size_t nel = 0;
    ...
    while (fgets(line, ELSIZE, stdin) != NULL && nel < TABSIZE)
        (void) lsearch(line, tab, &nel,
                       ELSIZE, (int (*)(const void *, const void *)) strcmp);
    ...
```

Finding a Matching Entry

The following example finds any line that reads "This is a test.".

```
#include <search.h>
#include <string.h>
...
char line[ELSIZE], tab[TABSIZE][ELSIZE];
size_t nel = 0;
char *findline;
void *entry;

findline = "This is a test.\n";

entry = lfind(findline, tab, &nel, ELSIZE, (
    int (*)(const void *, const void *)) strcmp);
```

APPLICATION USAGE

The comparison function need not compare every byte, so arbitrary data may be contained in the elements in addition to the values being compared.

Undefined results can occur if there is not enough room in the table to add a new item.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

The normative text is updated to avoid use of the term “must” for application requirements.

42311 **NAME**42312 `lseek` — move the read/write file offset42313 **SYNOPSIS**42314 `#include <unistd.h>`42315 `off_t lseek(int fildes, off_t offset, int whence);`42316 **DESCRIPTION**42317 The `lseek()` function shall set the file offset for the open file description associated with the file
42318 descriptor *fildes*, as follows:

- 42319 • If *whence* is `SEEK_SET`, the file offset shall be set to *offset* bytes.
- 42320 • If *whence* is `SEEK_CUR`, the file offset shall be set to its current location plus *offset*.
- 42321 • If *whence* is `SEEK_END`, the file offset shall be set to the size of the file plus *offset*.

42322 The symbolic constants `SEEK_SET`, `SEEK_CUR`, and `SEEK_END` are defined in `<unistd.h>`.42323 The behavior of `lseek()` on devices which are incapable of seeking is implementation-defined.
42324 The value of the file offset associated with such a device is undefined.42325 The `lseek()` function shall allow the file offset to be set beyond the end of the existing data in the
42326 file. If data is later written at this point, subsequent reads of data in the gap shall return bytes
42327 with the value 0 until data is actually written into the gap.42328 The `lseek()` function shall not, by itself, extend the size of a file.42329 SHM If *fildes* refers to a shared memory object, the result of the `lseek()` function is unspecified.42330 TYM If *fildes* refers to a typed memory object, the result of the `lseek()` function is unspecified.42331 **RETURN VALUE**42332 Upon successful completion, the resulting offset, as measured in bytes from the beginning of the
42333 file, shall be returned. Otherwise, `-1` shall be returned, *errno* shall be set to indicate the error, and
42334 the file offset shall remain unchanged.42335 **ERRORS**42336 The `lseek()` function shall fail if:

- 42337 [EBADF] The *fildes* argument is not an open file descriptor.
- 42338 [EINVAL] The *whence* argument is not a proper value, or the resulting file offset would
42339 be negative for a regular file, block special file, or directory.
- 42340 [EOVERFLOW] The resulting file offset would be a value which cannot be represented
42341 correctly in an object of type `off_t`.
- 42342 [ESPIPE] The *fildes* argument is associated with a pipe, FIFO, or socket.

42343 **EXAMPLES**

42344 None.

42345 **APPLICATION USAGE**

42346 None.

42347 **RATIONALE**42348 The ISO C standard includes the functions `fgetpos()` and `fsetpos()`, which work on very large files
42349 by use of a special positioning type.42350 Although `lseek()` may position the file offset beyond the end of the file, this function does not
42351 itself extend the size of the file. While the only function in POSIX.1-2008 that may directly extend

the size of the file is *write()*, *truncate()*, and *ftruncate()*, several functions originally derived from the ISO C standard, such as *fwrite()*, *fprintf()*, and so on, may do so (by causing calls on *write()*).

An invalid file offset that would cause [EINVAL] to be returned may be both implementation-defined and device-dependent (for example, memory may have few invalid values). A negative file offset may be valid for some devices in some implementations.

The POSIX.1-1990 standard did not specifically prohibit *lseek()* from returning a negative offset. Therefore, an application was required to clear *errno* prior to the call and check *errno* upon return to determine whether a return value of (**off_t**)-1 is a negative offset or an indication of an error condition. The standard developers did not wish to require this action on the part of a conforming application, and chose to require that *errno* be set to [EINVAL] when the resulting file offset would be negative for a regular file, block special file, or directory.

FUTURE DIRECTIONS

None.

open()

XBD **<sys/types.h>**, **<unistd.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Realtime Extension.

Large File Summit extensions are added.

Issue 6

In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- The [EOVERFLOW] error condition is added. This change is to support large files.

An additional [ESPIPE] error condition is added for sockets.

The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that *lseek()* results are unspecified for typed memory objects.

Issue 7

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0366 [421] is applied.

+

42386 **NAME**

42387 lstat — get file status

42388 **SYNOPSIS**

42389 #include <sys/stat.h>

42390 int lstat(const char *restrict *path*, struct stat *restrict *buf*);42391 **DESCRIPTION**42392 Refer to *fstatat()*.

NAME

malloc — a memory allocator

SYNOPSIS

```
#include <stdlib.h>
```

```
void *malloc(size_t size);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

The *malloc()* function shall allocate unused space for an object whose size in bytes is specified by *size* and whose value is unspecified.

The order and contiguity of storage allocated by successive calls to *malloc()* is unspecified. The pointer returned if the allocation succeeds shall be suitably aligned so that it may be assigned to a pointer to any type of object and then used to access such an object in the space allocated (until the space is explicitly freed or reallocated). Each such allocation shall yield a pointer to an object disjoint from any other object. The pointer returned points to the start (lowest byte address) of the allocated space. If the space cannot be allocated, a null pointer shall be returned. If the size of the space requested is 0, the behavior is implementation-defined: the value returned shall be either a null pointer or a unique pointer.

RETURN VALUE

Upon successful completion with *size* not equal to 0, *malloc()* shall return a pointer to the allocated space. If *size* is 0, either a null pointer or a unique pointer that can be successfully passed to *free()* shall be returned. Otherwise, it shall return a null pointer and set *errno* to indicate the error.

ERRORS

The *malloc()* function shall fail if:

CX [ENOMEM] Insufficient storage space is available.

EXAMPLES

None.

APPLICATION USAGE

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

Extensions beyond the ISO C standard are marked.

42435
42436
42437
42438

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In the RETURN VALUE section, the requirement to set *errno* to indicate an error is added.
- The [ENOMEM] error condition is added.

42439 **NAME**

42440 mblen — get number of bytes in a character

42441 **SYNOPSIS**

42442 #include <stdlib.h>

42443 int mblen(const char *s, size_t n);

42444 **DESCRIPTION**

42445 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 42446 conflict between the requirements described here and the ISO C standard is unintentional. This
 42447 volume of POSIX.1-2008 defers to the ISO C standard.

42448 If *s* is not a null pointer, *mblen()* shall determine the number of bytes constituting the character
 42449 pointed to by *s*. Except that the shift state of *mbtowc()* is not affected, it shall be equivalent to:

42450 mbtowc((wchar_t *)0, s, n);

42451 The implementation shall behave as if no function defined in this volume of POSIX.1-2008 calls
 42452 *mblen()*.

42453 The behavior of this function is affected by the *LC_CTYPE* category of the current locale. For a
 42454 state-dependent encoding, this function shall be placed into its initial state by a call for which its
 42455 character pointer argument, *s*, is a null pointer. Subsequent calls with *s* as other than a null
 42456 pointer shall cause the internal state of the function to be altered as necessary. A call with *s* as a
 42457 null pointer shall cause this function to return a non-zero value if encodings have state
 42458 dependency, and 0 otherwise. If the implementation employs special bytes to change the shift
 42459 state, these bytes shall not produce separate wide-character codes, but shall be grouped with an
 42460 adjacent character. Changing the *LC_CTYPE* category causes the shift state of this function to be
 42461 unspecified.

42462 CX The *mblen()* function need not be thread-safe.

+

42463 **RETURN VALUE**

42464 If *s* is a null pointer, *mblen()* shall return a non-zero or 0 value, if character encodings,
 42465 respectively, do or do not have state-dependent encodings. If *s* is not a null pointer, *mblen()* shall
 42466 either return 0 (if *s* points to the null byte), or return the number of bytes that constitute the
 42467 character (if the next *n* or fewer bytes form a valid character), or return -1 (if they do not form a
 42468 valid character) and may set *errno* to indicate the error. In no case shall the value returned be
 42469 greater than *n* or the value of the {MB_CUR_MAX} macro.

42470 **ERRORS**42471 The *mblen()* function may fail if:

42472 XSI [EILSEQ] An invalid character sequence is detected.

42473 **EXAMPLES**

42474 None.

42475 **APPLICATION USAGE**

42476 None.

42477 **RATIONALE**

42478 None.

42479 **FUTURE DIRECTIONS**

42480 None.

42481 **SEE ALSO**

42483 XBD **<stdlib.h>**

42484 **CHANGE HISTORY**

42485 First released in Issue 4. Aligned with the ISO C standard.

42486 **Issue 7**

42487 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0367 [109] is applied.

+

42488 **NAME**

42489 mbrlen — get number of bytes in a character (restartable)

42490 **SYNOPSIS**

42491 #include <wchar.h>

42492 size_t mbrlen(const char *restrict *s*, size_t *n*,
42493 mbstate_t *restrict *ps*);

42494 **DESCRIPTION**

42495 CX The functionality described on this reference page is aligned with the ISO C standard. Any
42496 conflict between the requirements described here and the ISO C standard is unintentional. This
42497 volume of POSIX.1-2008 defers to the ISO C standard.

42498 If *s* is not a null pointer, *mbrlen()* shall determine the number of bytes constituting the character
42499 pointed to by *s*. It shall be equivalent to:

42500 mbstate_t internal;
42501 mbrtowc(NULL, *s*, *n*, *ps* != NULL ? *ps* : &internal);

42502 If *ps* is a null pointer, the *mbrlen()* function shall use its own internal **mbstate_t** object, which is
42503 initialized at program start-up to the initial conversion state. Otherwise, the **mbstate_t** object
42504 pointed to by *ps* shall be used to completely describe the current conversion state of the
42505 associated character sequence. The implementation shall behave as if no function defined in this
42506 volume of POSIX.1-2008 calls *mbrlen()*.

42507 The behavior of this function is affected by the *LC_CTYPE* category of the current locale.

42508 CX The *mbrlen()* function need not be thread-safe if called with a NULL *ps* argument. +

42509 The *mbrlen()* function shall not change the setting of *errno* if successful.

42510 **RETURN VALUE**

42511 The *mbrlen()* function shall return the first of the following that applies:

42512 0 If the next *n* or fewer bytes complete the character that corresponds to the null
42513 wide character.

42514 *positive* If the next *n* or fewer bytes complete a valid character; the value returned shall
42515 be the number of bytes that complete the character.

42516 (**size_t**)−2 If the next *n* bytes contribute to an incomplete but potentially valid character,
42517 and all *n* bytes have been processed. When *n* has at least the value of the
42518 {MB_CUR_MAX} macro, this case can only occur if *s* points at a sequence of
42519 redundant shift sequences (for implementations with state-dependent
42520 encodings).

42521 (**size_t**)−1 If an encoding error occurs, in which case the next *n* or fewer bytes do not
42522 contribute to a complete and valid character. In this case, [EILSEQ] shall be
42523 stored in *errno* and the conversion state is undefined.

42524 **ERRORS**

42525 The *mbrlen()* function shall fail if:

42526 [EILSEQ] An invalid character sequence is detected.

42527 The *mbrlen()* function may fail if:

42528 [EINVAL] *ps* points to an object that contains an invalid conversion state.

+

NAME

`mbrtowc` — convert a character to a wide-character code (restartable)

SYNOPSIS

```
#include <wchar.h>
```

```
size_t mbrtowc(wchar_t *restrict pwc, const char *restrict s,
               size_t n, mbstate_t *restrict ps);
```

DESCRIPTION

The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

If *s* is a null pointer, the `mbrtowc()` function shall be equivalent to the call:

```
mbrtowc(NULL, "", 1, ps)
```

In this case, the values of the arguments *pwc* and *n* are ignored.

If *s* is not a null pointer, the `mbrtowc()` function shall inspect at most *n* bytes beginning at the byte pointed to by *s* to determine the number of bytes needed to complete the next character (including any shift sequences). If the function determines that the next character is completed, it shall determine the value of the corresponding wide character and then, if *pwc* is not a null pointer, shall store that value in the object pointed to by *pwc*. If the corresponding wide character is the null wide character, the resulting state described shall be the initial conversion state.

If *ps* is a null pointer, the `mbrtowc()` function shall use its own internal `mbstate_t` object, which shall be initialized at program start-up to the initial conversion state. Otherwise, the `mbstate_t` object pointed to by *ps* shall be used to completely describe the current conversion state of the associated character sequence. The implementation shall behave as if no function defined in this volume of POSIX.1-2008 calls `mbrtowc()`.

The behavior of this function is affected by the `LC_CTYPE` category of the current locale.

CX The `mbrtowc()` function need not be thread-safe if called with a NULL *ps* argument. +

The `mbrtowc()` function shall not change the setting of *errno* if successful.

RETURN VALUE

The `mbrtowc()` function shall return the first of the following that applies:

0 If the next *n* or fewer bytes complete the character that corresponds to the null wide character (which is the value stored).

between 1 and *n* inclusive

If the next *n* or fewer bytes complete a valid character (which is the value stored); the value returned shall be the number of bytes that complete the character.

(`size_t`)−2

If the next *n* bytes contribute to an incomplete but potentially valid character, and all *n* bytes have been processed (no value is stored). When *n* has at least the value of the `{MB_CUR_MAX}` macro, this case can only occur if *s* points at a sequence of redundant shift sequences (for implementations with state-dependent encodings).

(`size_t`)−1

If an encoding error occurs, in which case the next *n* or fewer bytes do not contribute to a complete and valid character (no value is stored). In this case, `[EILSEQ]` shall be stored in *errno* and the conversion state is undefined.

42592 ERRORS

42593 The *mbrtowc()* function shall fail if:

42594 [EILSEQ] An invalid character sequence is detected.

42595 The *mbrtowc()* function may fail if:

42596 CX [EINVAL] *ps* points to an object that contains an invalid conversion state.

+

NAME

mbsinit — determine conversion object status

SYNOPSIS

```
#include <wchar.h>
```

```
int mbsinit(const mbstate_t *ps);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

If *ps* is not a null pointer, the *mbsinit()* function shall determine whether the object pointed to by *ps* describes an initial conversion state.

RETURN VALUE

The *mbsinit()* function shall return non-zero if *ps* is a null pointer, or if the pointed-to object describes an initial conversion state; otherwise, it shall return zero.

If an **mbstate_t** object is altered by any of the functions described as “restartable”, and is then used with a different character sequence, or in the other conversion direction, or with a different *LC_CTYPE* category setting than on earlier function calls, the behavior is undefined.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

The **mbstate_t** object is used to describe the current conversion state from a particular character sequence to a wide-character sequence (or *vice versa*) under the rules of a particular setting of the *LC_CTYPE* category of the current locale.

The initial conversion state corresponds, for a conversion in either direction, to the beginning of a new character sequence in the initial shift state. A zero valued **mbstate_t** object is at least one way to describe an initial conversion state. A zero valued **mbstate_t** object can be used to initiate conversion involving any character sequence, in any *LC_CTYPE* category setting.

RATIONALE

None.

FUTURE DIRECTIONS

None.

42659 NAME

42660 mbsnrtowcs, mbsrtowcs — convert a character string to a wide-character string (restartable)

42661 SYNOPSIS

42662 #include <wchar.h>

```
42663 CX size_t mbsnrtowcs(wchar_t *restrict dst, const char **restrict src,
42664 size_t nmc, size_t len, mbstate_t *restrict ps);
42665 size_t mbsrtowcs(wchar_t *restrict dst, const char **restrict src,
42666 size_t len, mbstate_t *restrict ps);
```

42667 DESCRIPTION

42668 CX For *mbsrtowcs()*: The functionality described on this reference page is aligned with the ISO C
 42669 standard. Any conflict between the requirements described here and the ISO C standard is
 42670 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

42671 The *mbsrtowcs()* function shall convert a sequence of characters, beginning in the conversion
 42672 state described by the object pointed to by *ps*, from the array indirectly pointed to by *src* into a
 42673 sequence of corresponding wide characters. If *dst* is not a null pointer, the converted characters
 42674 shall be stored into the array pointed to by *dst*. Conversion continues up to and including a
 42675 terminating null character, which shall also be stored. Conversion shall stop early in either of the
 42676 following cases:

- 42677 • A sequence of bytes is encountered that does not form a valid character.
- 42678 • *len* codes have been stored into the array pointed to by *dst* (and *dst* is not a null pointer).

42679 Each conversion shall take place as if by a call to the *mbrtowc()* function.

42680 If *dst* is not a null pointer, the pointer object pointed to by *src* shall be assigned either a null
 42681 pointer (if conversion stopped due to reaching a terminating null character) or the address just
 42682 past the last character converted (if any). If conversion stopped due to reaching a terminating
 42683 null character, and if *dst* is not a null pointer, the resulting state described shall be the initial
 42684 conversion state.

42685 If *ps* is a null pointer, the *mbsrtowcs()* function shall use its own internal **mbstate_t** object, which
 42686 is initialized at program start-up to the initial conversion state. Otherwise, the **mbstate_t** object
 42687 pointed to by *ps* shall be used to completely describe the current conversion state of the
 42688 associated character sequence.

42689 CX The *mbsnrtowcs()* function shall be equivalent to the *mbsrtowcs()* function, except that the
 42690 conversion of characters pointed to by *src* is limited to at most *nmc* bytes (the size of the input
 42691 buffer).

42692 The behavior of these functions shall be affected by the *LC_CTYPE* category of the current locale.

42693 The implementation shall behave as if no function defined in this volume of POSIX.1-2008 calls
 42694 these functions.

42695 CX The *mbsnrtowcs()* and *mbsrtowcs()* functions need not be thread-safe if called with a NULL *ps* +
 42696 argument. +

42697 The *mbsrtowcs()* function shall not change the setting of *errno* if successful.

42698 RETURN VALUE

42699 If the input conversion encounters a sequence of bytes that do not form a valid character, an
 42700 encoding error occurs. In this case, these functions shall store the value of the macro [EILSEQ] in
 42701 *errno* and shall return (**size_t**)–1; the conversion state is undefined. Otherwise, these functions
 42702 shall return the number of characters successfully converted, not including the terminating null
 42703 (if any).

42704 **ERRORS**

42705 These functions shall fail if:

42706 [EILSEQ] An invalid character sequence is detected.

42707 These functions may fail if:

42708 CX [EINVAL] *ps* points to an object that contains an invalid conversion state.42709 **EXAMPLES**

42710 None.

42711 **APPLICATION USAGE**

42712 None.

42713 **RATIONALE**

42714 None.

42720 **CHANGE HISTORY**42721 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995
42722 (E).42723 **Issue 6**42724 The *mbsrtowcs()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

42725 The [EINVAL] error condition is marked CX.

42726 **Issue 7**

42727 Austin Group Interpretation 1003.1-2001 #170 is applied.

42728 The *mbsnrtowcs()* function is added from The Open Group Technical Standard, 2006, Extended
42729 API Set Part 1.

42730 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0370 [109,105] is applied.

+

42731 **NAME**

42732 mbstowcs — convert a character string to a wide-character string

42733 **SYNOPSIS**

42734 #include <stdlib.h>

42735 size_t mbstowcs(wchar_t *restrict pwcs, const char *restrict s,
42736 size_t n);42737 **DESCRIPTION**42738 CX The functionality described on this reference page is aligned with the ISO C standard. Any
42739 conflict between the requirements described here and the ISO C standard is unintentional. This
42740 volume of POSIX.1-2008 defers to the ISO C standard.42741 The *mbstowcs()* function shall convert a sequence of characters that begins in the initial shift
42742 state from the array pointed to by *s* into a sequence of corresponding wide-character codes and
42743 shall store not more than *n* wide-character codes into the array pointed to by *pwcs*. No
42744 characters that follow a null byte (which is converted into a wide-character code with value 0)
42745 shall be examined or converted. Each character shall be converted as if by a call to *mbtowc()*,
42746 except that the shift state of *mbtowc()* is not affected.42747 No more than *n* elements shall be modified in the array pointed to by *pwcs*. If copying takes
42748 place between objects that overlap, the behavior is undefined.42749 XSI The behavior of this function shall be affected by the *LC_CTYPE* category of the current locale.
42750 If *pwcs* is a null pointer, *mbstowcs()* shall return the length required to convert the entire array
42751 regardless of the value of *n*, but no values are stored.42752 **RETURN VALUE**42753 CX If an invalid character is encountered, *mbstowcs()* shall return (size_t)-1 and shall set *errno* to
42754 indicate the error.42755 XSI Otherwise, *mbstowcs()* shall return the number of the array elements modified (or required if
42756 *pwcs* is null), not including a terminating 0 code, if any. The array shall not be zero-terminated if
42757 the value returned is *n*.42758 **ERRORS**42759 The *mbstowcs()* function shall fail if:

42760 XSI [EILSEQ] An invalid byte sequence is detected.

42761 **EXAMPLES**

42762 None.

42763 **APPLICATION USAGE**

42764 None.

42765 **RATIONALE**

42766 None.

42772 **CHANGE HISTORY**

42773 First released in Issue 4. Aligned with the ISO C standard.

42774 **Issue 6**42775 The *mbstowcs()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

42776 Extensions beyond the ISO C standard are marked.

42777 **Issue 7**

42778 Austin Group Interpretation 1003.1-2001 #170 is applied.

42779 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0371 [195] is applied.

+

42780 **NAME**

42781 mbtowc — convert a character to a wide-character code

42782 **SYNOPSIS**

42783 #include <stdlib.h>

42784 int mbtowc(wchar_t *restrict *pwc*, const char *restrict *s*, size_t *n*);42785 **DESCRIPTION**

42786 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 42787 conflict between the requirements described here and the ISO C standard is unintentional. This
 42788 volume of POSIX.1-2008 defers to the ISO C standard.

42789 If *s* is not a null pointer, *mbtowc()* shall determine the number of bytes that constitute the
 42790 character pointed to by *s*. It shall then determine the wide-character code for the value of type
 42791 **wchar_t** that corresponds to that character. (The value of the wide-character code corresponding
 42792 to the null byte is 0.) If the character is valid and *pwc* is not a null pointer, *mbtowc()* shall store
 42793 the wide-character code in the object pointed to by *pwc*.

42794 The behavior of this function is affected by the *LC_CTYPE* category of the current locale. For a
 42795 state-dependent encoding, this function is placed into its initial state by a call for which its
 42796 character pointer argument, *s*, is a null pointer. Subsequent calls with *s* as other than a null
 42797 pointer shall cause the internal state of the function to be altered as necessary. A call with *s* as a
 42798 null pointer shall cause this function to return a non-zero value if encodings have state
 42799 dependency, and 0 otherwise. If the implementation employs special bytes to change the shift
 42800 state, these bytes shall not produce separate wide-character codes, but shall be grouped with an
 42801 adjacent character. Changing the *LC_CTYPE* category causes the shift state of this function to be
 42802 unspecified. At most *n* bytes of the array pointed to by *s* shall be examined.

42803 The implementation shall behave as if no function defined in this volume of POSIX.1-2008 calls
 42804 *mbtowc()*.

42805 CX The *mbtowc()* function need not be thread-safe.

+

42806 **RETURN VALUE**

42807 If *s* is a null pointer, *mbtowc()* shall return a non-zero or 0 value, if character encodings,
 42808 respectively, do or do not have state-dependent encodings. If *s* is not a null pointer, *mbtowc()*
 42809 shall either return 0 (if *s* points to the null byte), or return the number of bytes that constitute the
 42810 CX converted character (if the next *n* or fewer bytes form a valid character), or return -1 and shall
 42811 set *errno* to indicate the error (if they do not form a valid character).

42812 In no case shall the value returned be greater than *n* or the value of the {MB_CUR_MAX} macro.

42813 **ERRORS**

42814 The *mbtowc()* function shall fail if:

42815 XSI [EILSEQ] An invalid character sequence is detected.

42816 **EXAMPLES**

42817 None.

42818 **APPLICATION USAGE**

42819 None.

42820 **RATIONALE**

42821 None.

42822 **FUTURE DIRECTIONS**

42823 None.

42824 **SEE ALSO**42825 *mblen()*, *mbstowcs()*, *wctomb()*, *wcstombs()*42826 XBD **<stdlib.h>**42827 **CHANGE HISTORY**

42828 First released in Issue 4. Aligned with the ISO C standard.

42829 **Issue 6**42830 The *mbtowc()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

42831 Extensions beyond the ISO C standard are marked.

42832 **Issue 7**

42833 Austin Group Interpretation 1003.1-2001 #170 is applied.

42834 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0372 [109] and XSH/TC1-2008/0373 +
42835 [195] are applied.

42836 **NAME**

42837 memccpy — copy bytes in memory

42838 **SYNOPSIS**

```
42839 XSI      #include <string.h>
42840          void *memccpy(void *restrict s1, const void *restrict s2,
42841                        int c, size_t n);
```

42842 **DESCRIPTION**

42843 The *memccpy()* function shall copy bytes from memory area *s2* into *s1*, stopping after the first
42844 occurrence of byte *c* (converted to an **unsigned char**) is copied, or after *n* bytes are copied,
42845 whichever comes first. If copying takes place between objects that overlap, the behavior is
42846 undefined.

42847 **RETURN VALUE**

42848 The *memccpy()* function shall return a pointer to the byte after the copy of *c* in *s1*, or a null
42849 pointer if *c* was not found in the first *n* bytes of *s2*.

42850 **ERRORS**

42851 No errors are defined.

42852 **EXAMPLES**

42853 None.

42854 **APPLICATION USAGE**

42855 The *memccpy()* function does not check for the overflow of the receiving memory area.

42856 **RATIONALE**

42857 None.

42937 conflict between the requirements described here and the ISO C standard is unintentional. This
42938 volume of POSIX.1-2008 defers to the ISO C standard.

42939 The *memcpy()* function shall copy *n* bytes from the object pointed to by *s2* into the object pointed
42940 to by *s1*. If copying takes place between objects that overlap, the behavior is undefined.

42941 **RETURN VALUE**42942 The *memcpy()* function shall return *s1*; no return value is reserved to indicate an error.42943 **ERRORS**

42944 No errors are defined.

42945 **EXAMPLES**

42946 None.

42947 **APPLICATION USAGE**42948 The *memcpy()* function does not check for the overflow of the receiving memory area.42949 **RATIONALE**

42950 None.

42951 **FUTURE DIRECTIONS**

42952 None.

42953 **SEE ALSO**

42954 XBD <string.h>

42955 **CHANGE HISTORY**

42956 First released in Issue 1. Derived from Issue 1 of the SVID.

42957 **Issue 6**42958 The *memcpy()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

42959 **NAME**

42960 memmove — copy bytes in memory with overlapping areas

42961 **SYNOPSIS**

42962 #include <string.h>

42963 void *memmove(void *s1, const void *s2, size_t n);

42964 **DESCRIPTION**

42965 CX The functionality described on this reference page is aligned with the ISO C standard. Any
42966 conflict between the requirements described here and the ISO C standard is unintentional. This
42967 volume of POSIX.1-2008 defers to the ISO C standard.

42968 The *memmove()* function shall copy *n* bytes from the object pointed to by *s2* into the object
42969 pointed to by *s1*. Copying takes place as if the *n* bytes from the object pointed to by *s2* are first
42970 copied into a temporary array of *n* bytes that does not overlap the objects pointed to by *s1* and
42971 *s2*, and then the *n* bytes from the temporary array are copied into the object pointed to by *s1*.

42972 **RETURN VALUE**42973 The *memmove()* function shall return *s1*; no return value is reserved to indicate an error.42974 **ERRORS**

42975 No errors are defined.

NAME

mkdir, mkdirat — make a directory relative to directory file descriptor

SYNOPSIS

```
#include <sys/stat.h>
```

```
int mkdir(const char *path, mode_t mode);
```

```
int mkdirat(int fd, const char *path, mode_t mode);
```

DESCRIPTION

The *mkdir()* function shall create a new directory with name *path*. The file permission bits of the new directory shall be initialized from *mode*. These file permission bits of the *mode* argument shall be modified by the process' file creation mask.

When bits in *mode* other than the file permission bits are set, the meaning of these additional bits is implementation-defined.

The directory's user ID shall be set to the process' effective user ID. The directory's group ID shall be set to the group ID of the parent directory or to the effective group ID of the process. Implementations shall provide a way to initialize the directory's group ID to the group ID of the parent directory. Implementations may, but need not, provide an implementation-defined way to initialize the directory's group ID to the effective group ID of the calling process.

The newly created directory shall be an empty directory.

If *path* names a symbolic link, *mkdir()* shall fail and set *errno* to [EEXIST].

Upon successful completion, *mkdir()* shall mark for update the last data access, last data modification, and last file status change timestamps of the directory. Also, the last data modification and last file status change timestamps of the directory that contains the new entry shall be marked for update.

The *mkdirat()* function shall be equivalent to the *mkdir()* function except in the case where *path* specifies a relative path. In this case the newly created directory is created relative to the directory associated with the file descriptor *fd* instead of the current working directory. If the file descriptor was opened without O_SEARCH, the function shall check whether directory searches are permitted using the current permissions of the directory underlying the file descriptor. If the file descriptor was opened with O_SEARCH, the function shall not perform the check.

If *mkdirat()* is passed the special value AT_FDCWD in the *fd* parameter, the current working directory shall be used and the behavior shall be identical to a call to *mkdir()*.

RETURN VALUE

Upon successful completion, these functions shall return 0. Otherwise, these functions shall return -1 and set *errno* to indicate the error. If -1 is returned, no directory shall be created.

ERRORS

These functions shall fail if:

[EACCES] Search permission is denied on a component of the path prefix, or write permission is denied on the parent directory of the directory to be created.

[EEXIST] The named file exists.

[ELOOP] A loop exists in symbolic links encountered during resolution of the *path* argument.

[EMLINK] The link count of the parent directory would exceed {LINK_MAX}.

43057	[ENAMETOOLONG]	
43058		The length of a component of a pathname is longer than {NAME_MAX}.
43059	[ENOENT]	A component of the path prefix specified by <i>path</i> does not name an existing directory or <i>path</i> is an empty string.
43060		
43061	[ENOSPC]	The file system does not contain enough space to hold the contents of the new directory or to extend the parent directory of the new directory.
43062		
43063	[ENOTDIR]	A component of the path prefix names an existing file that is neither a directory nor a symbolic link to a directory.
43064		
43065	[EROFS]	The parent directory resides on a read-only file system.
43066	In addition, the <i>mkdirat</i> () function shall fail if:	
43067	[EBADF]	The <i>path</i> argument does not specify an absolute path and the <i>fd</i> argument is neither AT_FDCWD nor a valid file descriptor open for reading or searching.
43068		
43069	[ENOTDIR]	The <i>path</i> argument is not an absolute path and <i>fd</i> is a file descriptor associated with a non-directory file.
43070		
43071	These functions may fail if:	
43072	[ELOOP]	More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the <i>path</i> argument.
43073		
43074	[ENAMETOOLONG]	
43075		The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a symbolic link produced an intermediate result with a length that exceeds {PATH_MAX}.
43076		
43077		

43078 EXAMPLES

43079 Creating a Directory

43080 The following example shows how to create a directory named **/home/cnd/mod1**, with
 43081 read/write/search permissions for owner and group, and with read/search permissions for
 43082 others.

```

43083 #include <sys/types.h>
43084 #include <sys/stat.h>

43085 int status;
43086 ...
43087 status = mkdir("/home/cnd/mod1", S_IRWXU | S_IRWXG | S_IROTH | S_IXOTH);
  
```

43088 APPLICATION USAGE

43089 None.

43090 RATIONALE

43091 The *mkdir*() function originated in 4.2 BSD and was added to System V in Release 3.0.

43092 4.3 BSD detects [ENAMETOOLONG].

43093 The POSIX.1-1990 standard required that the group ID of a newly created directory be set to the
 43094 group ID of its parent directory or to the effective group ID of the creating process. FIPS 151-2
 43095 required that implementations provide a way to have the group ID be set to the group ID of the
 43096 containing directory, but did not prohibit implementations also supporting a way to set the
 43097 group ID to the effective group ID of the creating process. Conforming applications should not
 43098 assume which group ID will be used. If it matters, an application can use *chown*() to set the

group ID after the directory is created, or determine under what conditions the implementation will set the desired group ID.

The purpose of the *mkdirat()* function is to create a directory in directories other than the current working directory without exposure to race conditions. Any part of the path of a file could be changed in parallel to the call to *mkdir()*, resulting in unspecified behavior. By opening a file descriptor for the target directory and using the *mkdirat()* function it can be guaranteed that the newly created directory is located relative to the desired directory.

FUTURE DIRECTIONS

None.

SEE ALSO

chmod(), *mkdtemp()*, *mknod()*, *umask()*

XBD [<sys/stat.h>](#), [<sys/types.h>](#)

CHANGE HISTORY

First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

Issue 6

In the SYNOPSIS, the optional include of the [<sys/types.h>](#) header is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include [<sys/types.h>](#) has been removed. Although [<sys/types.h>](#) was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- The [ELOOP] mandatory error condition is added.
- A second [ENAMETOOLONG] is added as an optional error condition.

The following changes were made to align with the IEEE P1003.1a draft standard:

- The [ELOOP] optional error condition is added.

Issue 7

Austin Group Interpretation 1003.1-2001 #143 is applied.

The *mkdirat()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 2.

Changes are made related to support for finegrained timestamps.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0375 [461], XSH/TC1-2008/0376 [324], + XSH/TC1-2008/0377 [277], XSH/TC1-2008/0378 [278], and XSH/TC1-2008/0379 [278] are + applied.

NAME

mkdtemp, mkstemp — create a unique directory or file

SYNOPSIS

```
CX      #include <stdlib.h>
char *mkdtemp(char *template);
int mkstemp(char *template);
```

DESCRIPTION

The *mkdtemp()* function uses the contents of *template* to construct a unique directory name. The string provided in *template* shall be a pathname ending with six trailing 'X' s. The *mkdtemp()* function shall replace each 'X' with a character from the portable filename character set. The characters are chosen such that the resulting name does not duplicate the name of an existing file at the time of a call to *mkdtemp()*. The unique directory name is used to attempt to create the directory using mode 0700 as modified by the file creation mask.

The *mkstemp()* function shall replace the contents of the string pointed to by *template* by a unique pathname, and return a file descriptor for the file open for reading and writing. The *mkstemp()* function shall create the file, and obtain a file descriptor for it, as if by a call to:

```
open(pathname, O_RDWR|O_CREAT|O_EXCL, S_IRUSR|S_IWUSR)
```

The function thus prevents any possible race condition between testing whether the file exists and opening it for use. The string in *template* should look like a pathname with six trailing 'X' s; *mkstemp()* replaces each 'X' with a character from the portable filename character set. The characters are chosen such that the resulting name does not duplicate the name of an existing file at the time of a call to *mkstemp()*.

RETURN VALUE

Upon successful completion, the *mkdtemp()* function shall return a pointer to the string containing the directory name if it was created. Otherwise, it shall return a null pointer and shall set *errno* to indicate the error.

Upon successful completion, the *mkstemp()* function shall return an open file descriptor. Otherwise, it shall return -1 if no suitable file could be created.

ERRORS

The *mkdtemp()* function shall fail if:

[EACCES]	Search permission is denied on a component of the path prefix, or write permission is denied on the parent directory of the directory to be created.
[EINVAL]	The string pointed to by <i>template</i> does not end in "XXXXXX".
[ELOOP]	A loop exists in symbolic links encountered during resolution of the path of the directory to be created.
[EMLINK]	The link count of the parent directory would exceed {LINK_MAX}.
[ENAMETOOLONG]	The length of a component of a pathname is longer than {NAME_MAX}.
[ENOENT]	A component of the path prefix specified by the <i>template</i> argument does not name an existing directory.
[ENOSPC]	The file system does not contain enough space to hold the contents of the new directory or to extend the parent directory of the new directory.

43174 [ENOTDIR] A component of the path prefix names an existing file that is neither a |
 43175 directory nor a symbolic link to a directory.

43176 [EROFS] The parent directory resides on a read-only file system.

43177 The *mkdtemp()* function may fail if:

43178 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
 43179 resolution of the path of the directory to be created.

43180 [ENAMETOOLONG]
 43181 The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a
 43182 symbolic link produced an intermediate result with a length that exceeds
 43183 {PATH_MAX}.

43184 The error conditions for the *mkstemp()* function are defined in *open()*.

43185 EXAMPLES

43186 Generating a Pathname

43187 The following example creates a file with a 10-character name beginning with the characters
 43188 "file" and opens the file for reading and writing. The value returned as the value of *fd* is a file
 43189 descriptor that identifies the file.

```
43190 #include <stdlib.h>
43191 ...
43192 char template[] = "/tmp/fileXXXXXX";
43193 int fd;
43194 fd = mkstemp(template);
```

43195 APPLICATION USAGE

43196 It is possible to run out of letters.

43197 The *mkdtemp()* and *mkstemp()* functions need not check to determine whether the filename part
 43198 of *template* exceeds the maximum allowable filename length.

43199 RATIONALE

NAME

mkfifo, mkfifoat — make a FIFO special file relative to directory file descriptor

SYNOPSIS

```
#include <sys/stat.h>

int mkfifo(const char *path, mode_t mode);
int mkfifoat(int fd, const char *path, mode_t mode);
```

DESCRIPTION

The *mkfifo()* function shall create a new FIFO special file named by the pathname pointed to by *path*. The file permission bits of the new FIFO shall be initialized from *mode*. The file permission bits of the *mode* argument shall be modified by the process' file creation mask.

When bits in *mode* other than the file permission bits are set, the effect is implementation-defined.

If *path* names a symbolic link, *mkfifo()* shall fail and set *errno* to [EEXIST].

The FIFO's user ID shall be set to the process' effective user ID. The FIFO's group ID shall be set to the group ID of the parent directory or to the effective group ID of the process. Implementations shall provide a way to initialize the FIFO's group ID to the group ID of the parent directory. Implementations may, but need not, provide an implementation-defined way to initialize the FIFO's group ID to the effective group ID of the calling process.

Upon successful completion, *mkfifo()* shall mark for update the last data access, last data modification, and last file status change timestamps of the file. Also, the last data modification and last file status change timestamps of the directory that contains the new entry shall be marked for update.

The *mkfifoat()* function shall be equivalent to the *mkfifo()* function except in the case where *path* specifies a relative path. In this case the newly created FIFO is created relative to the directory associated with the file descriptor *fd* instead of the current working directory. If the file descriptor was opened without O_SEARCH, the function shall check whether directory searches are permitted using the current permissions of the directory underlying the file descriptor. If the file descriptor was opened with O_SEARCH, the function shall not perform the check.

If *mkfifoat()* is passed the special value AT_FDCWD in the *fd* parameter, the current working directory shall be used and the behavior shall be identical to a call to *mkfifo()*.

RETURN VALUE

Upon successful completion, these functions shall return 0. Otherwise, these functions shall return -1 and set *errno* to indicate the error. If -1 is returned, no FIFO shall be created.

ERRORS

These functions shall fail if:

[EACCES] A component of the path prefix denies search permission, or write permission is denied on the parent directory of the FIFO to be created.

[EEXIST] The named file already exists.

[ELOOP] A loop exists in symbolic links encountered during resolution of the *path* argument.

[ENAMETOOLONG]

The length of a component of a pathname is longer than {NAME_MAX}.

43260	[ENOENT]	A component of the path prefix of <i>path</i> does not name an existing file or <i>path</i> is an empty string.	
43261			
43262	[ENOENT] or [ENOTDIR]		
43263		The <i>path</i> argument contains at least one non- <code><slash></code> character and ends with one or more trailing <code><slash></code> characters. If <i>path</i> names an existing file, an [ENOENT] error shall not occur.	+
43264			+
43265			
43266	[ENOSPC]	The directory that would contain the new file cannot be extended or the file system is out of file-allocation resources.	
43267			
43268	[ENOTDIR]	A component of the path prefix names an existing file that is neither a directory nor a symbolic link to a directory.	
43269			
43270	[EROFS]	The named file resides on a read-only file system.	
43271		The <i>mkfifoat()</i> function shall fail if:	
43272	[EACCES]	<i>fd</i> was not opened with <code>O_SEARCH</code> and the permissions of the directory underlying <i>fd</i> do not permit directory searches.	
43273			
43274	[EBADF]	The <i>path</i> argument does not specify an absolute path and the <i>fd</i> argument is neither <code>AT_FDCWD</code> nor a valid file descriptor open for reading or searching.	
43275			
43276	[ENOTDIR]	The <i>path</i> argument is not an absolute path and <i>fd</i> is a file descriptor associated with a non-directory file.	+
43277			
43278		These functions may fail if:	
43279	[ELOOP]	More than <code>{SYMLOOP_MAX}</code> symbolic links were encountered during resolution of the <i>path</i> argument.	
43280			
43281	[ENAMETOOLONG]		
43282		The length of a pathname exceeds <code>{PATH_MAX}</code> , or pathname resolution of a symbolic link produced an intermediate result with a length that exceeds <code>{PATH_MAX}</code> .	
43283			
43284			

EXAMPLES

Creating a FIFO File

The following example shows how to create a FIFO file named `/home/cnd/mod_done`, with read/write permissions for owner, and with read permissions for group and others.

```
#include <sys/types.h>
#include <sys/stat.h>

int status;
...
status = mkfifo("/home/cnd/mod_done", S_IWUSR | S_IRUSR |
    S_IRGRP | S_IROTH);
```

APPLICATION USAGE

None.

RATIONALE

The syntax of this function is intended to maintain compatibility with historical implementations of *mknod()*. The latter function was included in the 1984 `/usr/group` standard but only for use in creating FIFO special files. The *mknod()* function was originally excluded from the POSIX.1-1988 standard as implementation-defined and replaced by *mkdir()* and

mkfifo(). The *mknod()* function is now included for alignment with the Single UNIX Specification.

The POSIX.1-1990 standard required that the group ID of a newly created FIFO be set to the group ID of its parent directory or to the effective group ID of the creating process. FIPS 151-2 required that implementations provide a way to have the group ID be set to the group ID of the containing directory, but did not prohibit implementations also supporting a way to set the group ID to the effective group ID of the creating process. Conforming applications should not assume which group ID will be used. If it matters, an application can use *chown()* to set the group ID after the FIFO is created, or determine under what conditions the implementation will set the desired group ID.

The purpose of the *mkfifoat()* function is to create a FIFO special file in directories other than the current working directory without exposure to race conditions. Any part of the path of a file could be changed in parallel to a call to *mkfifo()*, resulting in unspecified behavior. By opening a file descriptor for the target directory and using the *mkfifoat()* function it can be guaranteed that the newly created FIFO is located relative to the desired directory.

FUTURE DIRECTIONS

None.

43342 [146,435], XSH/TC1-2008/0385 [324], XSH/TC1-2008/0386 [278], and XSH/TC1-2008/0387 +
43343 [278] are applied.

NAME

mknod, mknodat — make directory, special file, or regular file

SYNOPSIS

```
#include <sys/stat.h>

int mknod(const char *path, mode_t mode, dev_t dev);
int mknodat(int fd, const char *path, mode_t mode, dev_t dev);
```

DESCRIPTION

The *mknod()* function shall create a new file named by the pathname to which the argument *path* points.

The file type for *path* is OR'ed into the *mode* argument, and the application shall select one of the following symbolic constants:

Name	Description
S_IFIFO	FIFO-special
S_IFCHR	Character-special (non-portable)
S_IFDIR	Directory (non-portable)
S_IFBLK	Block-special (non-portable)
S_IFREG	Regular (non-portable)

The only portable use of *mknod()* is to create a FIFO-special file. If *mode* is not S_IFIFO or *dev* is not 0, the behavior of *mknod()* is unspecified.

The permissions for the new file are OR'ed into the *mode* argument, and may be selected from any combination of the following symbolic constants:

Name	Description
S_ISUID	Set user ID on execution.
S_ISGID	Set group ID on execution.
S_IRWXU	Read, write, or execute (search) by owner.
S_IRUSR	Read by owner.
S_IWUSR	Write by owner.
S_IXUSR	Execute (search) by owner.
S_IRWXG	Read, write, or execute (search) by group.
S_IRGRP	Read by group.
S_IWGRP	Write by group.
S_IXGRP	Execute (search) by group.
S_IRWXO	Read, write, or execute (search) by others.
S_IROTH	Read by others.
S_IWOTH	Write by others.
S_IXOTH	Execute (search) by others.
S_ISVTX	On directories, restricted deletion flag.

The user ID of the file shall be initialized to the effective user ID of the process. The group ID of the file shall be initialized to either the effective group ID of the process or the group ID of the parent directory. Implementations shall provide a way to initialize the file's group ID to the group ID of the parent directory. Implementations may, but need not, provide an implementation-defined way to initialize the file's group ID to the effective group ID of the calling process. The owner, group, and other permission bits of *mode* shall be modified by the file mode creation mask of the process. The *mknod()* function shall clear each bit whose corresponding bit in the file mode creation mask of the process is set.

43389	If <i>path</i> names a symbolic link, <i>mknod()</i> shall fail and set <i>errno</i> to [EEXIST].	
43390	Upon successful completion, <i>mknod()</i> shall mark for update the last data access, last data	
43391	modification, and last file status change timestamps of the file. Also, the last data modification	
43392	and last file status change timestamps of the directory that contains the new entry shall be	
43393	marked for update.	
43394	Only a process with appropriate privileges may invoke <i>mknod()</i> for file types other than FIFO-	
43395	special.	
43396	The <i>mknodat()</i> function shall be equivalent to the <i>mknod()</i> function except in the case where <i>path</i>	
43397	specifies a relative path. In this case the newly created directory, special file, or regular file is	
43398	located relative to the directory associated with the file descriptor <i>fd</i> instead of the current	
43399	working directory. If the file descriptor was opened without O_SEARCH, the function shall	
43400	check whether directory searches are permitted using the current permissions of the directory	
43401	underlying the file descriptor. If the file descriptor was opened with O_SEARCH, the function	
43402	shall not perform the check.	
43403	If <i>mknodat()</i> is passed the special value AT_FDCWD in the <i>fd</i> parameter, the current working	
43404	directory shall be used and the behavior shall be identical to a call to <i>mknod()</i> .	
43405	RETURN VALUE	
43406	Upon successful completion, these functions shall return 0. Otherwise, these functions shall	
43407	return -1 and set <i>errno</i> to indicate the error. If -1 is returned, the new file shall not be created.	
43408	ERRORS	
43409	These functions shall fail if:	
43410	[EACCES]	A component of the path prefix denies search permission, or write permission
43411		is denied on the parent directory.
43412	[EEXIST]	The named file exists.
43413	[EINVAL]	An invalid argument exists.
43414	[EIO]	An I/O error occurred while accessing the file system.
43415	[ELOOP]	A loop exists in symbolic links encountered during resolution of the <i>path</i>
43416		argument.
43417	[ENAMETOOLONG]	
43418		The length of a component of a pathname is longer than {NAME_MAX}.
43419	[ENOENT]	A component of the path prefix of <i>path</i> does not name an existing file or <i>path</i> is
43420		an empty string.
43421	[ENOENT] or [ENOTDIR]	
43422		The <i>path</i> argument contains at least one non-<slash> character and ends with
43423		one or more trailing <slash> characters. If <i>path</i> names an existing file, an
43424		[ENOENT] error shall not occur.
43425	[ENOSPC]	The directory that would contain the new file cannot be extended or the file
43426		system is out of file allocation resources.
43427	[ENOTDIR]	A component of the path prefix names an existing file that is neither a
43428		directory nor a symbolic link to a directory.
43429	[EPERM]	The invoking process does not have appropriate privileges and the file type is
43430		not FIFO-special.

43431	[EROFS]	The directory in which the file is to be created is located on a read-only file system.
43432		
43433	The <i>mknodat()</i> function shall fail if:	
43434	[EACCES]	<i>fd</i> was not opened with O_SEARCH and the permissions of the directory underlying <i>fd</i> do not permit directory searches.
43435		
43436	[EBADF]	The <i>path</i> argument does not specify an absolute path and the <i>fd</i> argument is neither AT_FDCWD nor a valid file descriptor open for reading or searching.
43437		
43438	[ENOTDIR]	The <i>path</i> argument is not an absolute path and <i>fd</i> is a file descriptor associated with a non-directory file.
43439		
43440	These functions may fail if:	
43441	[ELOOP]	More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the <i>path</i> argument.
43442		
43443	[ENAMETOOLONG]	The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a symbolic link produced an intermediate result with a length that exceeds {PATH_MAX}.
43444		
43445		
43446		

43447 EXAMPLES

43448 Creating a FIFO Special File

43449 The following example shows how to create a FIFO special file named */home/cnd/mod_done*,
 43450 with read/write permissions for owner, and with read permissions for group and others.

```

43451 #include <sys/types.h>
43452 #include <sys/stat.h>

43453 dev_t dev;
43454 int status;
43455 ...
43456 status = mknod("/home/cnd/mod_done", S_IFIFO | S_IWUSR |
43457             S_IRUSR | S_IRGRP | S_IROTH, dev);

```

43458 APPLICATION USAGE

43459 The *mkfifo()* function is preferred over this function for making FIFO special files.

43460 RATIONALE

43461 The POSIX.1-1990 standard required that the group ID of a newly created file be set to the group
 43462 ID of its parent directory or to the effective group ID of the creating process. FIPS 151-2 required
 43463 that implementations provide a way to have the group ID be set to the group ID of the
 43464 containing directory, but did not prohibit implementations also supporting a way to set the
 43465 group ID to the effective group ID of the creating process. Conforming applications should not
 43466 assume which group ID will be used. If it matters, an application can use *chown()* to set the
 43467 group ID after the file is created, or determine under what conditions the implementation will
 43468 set the desired group ID.

43469 The purpose of the *mknodat()* function is to create directories, special files, or regular files in
 43470 directories other than the current working directory without exposure to race conditions. Any
 43471 part of the path of a file could be changed in parallel to a call to *mknod()*, resulting in unspecified
 43472 behavior. By opening a file descriptor for the target directory and using the *mknodat()* function it
 43473 can be guaranteed that the newly created directory, special file, or regular file is located relative
 43474 to the desired directory.

43475 **FUTURE DIRECTIONS**

43476 None.

43480 **CHANGE HISTORY**

43481 First released in Issue 4, Version 2.

43482 **Issue 5**

43483 Moved from X/OPEN UNIX extension to BASE.

43484 **Issue 6**

43485 The normative text is updated to avoid use of the term “must” for application requirements.

43486 The wording of the mandatory [ELOOP] error condition is updated, and a second optional
43487 [ELOOP] error condition is added.43488 **Issue 7**

43489 Austin Group Interpretation 1003.1-2001 #143 is applied.

43490 The *mknodat()* function is added from The Open Group Technical Standard, 2006, Extended API
43491 Set Part 2.

43492 Changes are made related to support for finegrained timestamps.

43493 Changes are made to allow a directory to be opened for searching.

43494 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0388 [324], XSH/TC1-2008/0389 [461], +
43495 XSH/TC1-2008/0390 [146,435], XSH/TC1-2008/0391 [278], and XSH/TC1-2008/0392 [278] are +
43496 applied.

43497 **NAME**

43498 mkstemp — create a unique directory

43499 **SYNOPSIS**43500 CX `#include <stdlib.h>`43501 `int mkstemp(char *template);`43502 **DESCRIPTION**43503 Refer to *mkdtemp()*.

43504 **NAME**

43505 mktime — convert broken-down time into time since the Epoch

43506 **SYNOPSIS**

43507 #include <time.h>

43508 time_t mktime(struct tm *timeptr);

43509 **DESCRIPTION**

43510 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 43511 conflict between the requirements described here and the ISO C standard is unintentional. This
 43512 volume of POSIX.1-2008 defers to the ISO C standard.

43513 The *mktime()* function shall convert the broken-down time, expressed as local time, in the
 43514 structure pointed to by *timeptr*, into a time since the Epoch value with the same encoding as that
 43515 of the values returned by *time()*. The original values of the *tm_wday* and *tm_yday* components of
 43516 the structure are ignored, and the original values of the other components are not restricted to
 43517 the ranges described in <time.h>.

43518 CX A positive or 0 value for *tm_isdst* shall cause *mktime()* to presume initially that Daylight Savings
 43519 Time, respectively, is or is not in effect for the specified time. A negative value for *tm_isdst* shall
 43520 cause *mktime()* to attempt to determine whether Daylight Savings Time is in effect for the
 43521 specified time.

43522 Local timezone information shall be set as though *mktime()* called *tzset()*.

43523 The relationship between the **tm** structure (defined in the <time.h> header) and the time in
 43524 seconds since the Epoch is that the result shall be as specified in the expression given in the
 43525 definition of seconds since the Epoch (see XBD [Section 4.15](#), on page 113) corrected for timezone
 43526 and any seasonal time adjustments, where the names in the structure and in the expression
 43527 correspond.

43528 Upon successful completion, the values of the *tm_wday* and *tm_yday* components of the structure
 43529 shall be set appropriately, and the other components are set to represent the specified time since
 43530 the Epoch, but with their values forced to the ranges indicated in the <time.h> entry; the final
 43531 value of *tm_mday* shall not be set until *tm_mon* and *tm_year* are determined.

43532 **RETURN VALUE**

43533 The *mktime()* function shall return the specified time since the Epoch encoded as a value of type
 43534 **time_t**. If the time since the Epoch cannot be represented, the function shall return the value
 43535 CX (**time_t**)-1 and set *errno* to indicate the error.

43536 **ERRORS**43537 The *mktime()* function shall fail if:

43538 CX [EOVERFLOW] The result cannot be represented.

43539 **EXAMPLES**

43540 What day of the week is July 4, 2001?

43541 #include <stdio.h>

43542 #include <time.h>

43543 struct tm time_str;

43544 char daybuf[20];

43545 int main(void)

43546 {

43547 time_str.tm_year = 2001 - 1900;

```

43548     time_str.tm_mon = 7 - 1;
43549     time_str.tm_mday = 4;
43550     time_str.tm_hour = 0;
43551     time_str.tm_min = 0;
43552     time_str.tm_sec = 1;
43553     time_str.tm_isdst = -1;
43554     if (mktime(&time_str) == -1)
43555         (void)puts("-unknown-");
43556     else {
43557         (void)strftime(daybuf, sizeof(daybuf), "%A", &time_str);
43558         (void)puts(daybuf);
43559     }
43560     return 0;
43561 }

NAME

mlock, munlock — lock or unlock a range of process address space (**REALTIME**)

SYNOPSIS

```
#include <sys/mman.h>

int mlock(const void *addr, size_t len);
int munlock(const void *addr, size_t len);
```

DESCRIPTION

The *mlock()* function shall cause those whole pages containing any part of the address space of the process starting at address *addr* and continuing for *len* bytes to be memory-resident until unlocked or until the process exits or *execs* another process image. The implementation may require that *addr* be a multiple of {PAGESIZE}.

The *munlock()* function shall unlock those whole pages containing any part of the address space of the process starting at address *addr* and continuing for *len* bytes, regardless of how many times *mlock()* has been called by the process for any of the pages in the specified range. The implementation may require that *addr* be a multiple of {PAGESIZE}.

If any of the pages in the range specified to a call to *munlock()* are also mapped into the address spaces of other processes, any locks established on those pages by another process are unaffected by the call of this process to *munlock()*. If any of the pages in the range specified by a call to *munlock()* are also mapped into other portions of the address space of the calling process outside the range specified, any locks established on those pages via the other mappings are also unaffected by this call.

Upon successful return from *mlock()*, pages in the specified range shall be locked and memory-resident. Upon successful return from *munlock()*, pages in the specified range shall be unlocked with respect to the address space of the process. Memory residency of unlocked pages is unspecified.

Appropriate privileges are required to lock process memory with *mlock()*.

RETURN VALUE

Upon successful completion, the *mlock()* and *munlock()* functions shall return a value of zero. Otherwise, no change is made to any locks in the address space of the process, and the function shall return a value of -1 and set *errno* to indicate the error.

ERRORS

The *mlock()* and *munlock()* functions shall fail if:

[ENOMEM] Some or all of the address range specified by the *addr* and *len* arguments does not correspond to valid mapped pages in the address space of the process.

The *mlock()* function shall fail if:

[EAGAIN] Some or all of the memory identified by the operation could not be locked when the call was made.

The *mlock()* and *munlock()* functions may fail if:

[EINVAL] The *addr* argument is not a multiple of {PAGESIZE}.

The *mlock()* function may fail if:

[ENOMEM] Locking the pages mapped by the specified range would exceed an implementation-defined limit on the amount of memory that the process may lock.

43626 [EPERM] The calling process does not have appropriate privileges to perform the
43627 requested operation.

43628 **EXAMPLES**

43629 None.

43630 **APPLICATION USAGE**

43631 None.

43632 **RATIONALE**

43633 None.

43634 **FUTURE DIRECTIONS**

43635 None.

43636 **SEE ALSO**

43637 *exec, exit(), fork(), mlockall(), munmap()*

43638 XBD <sys/mman.h>

43639 **CHANGE HISTORY**

43640 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

43641 **Issue 6**

43642 The *mlock()* and *munlock()* functions are marked as part of the Range Memory Locking option.

43643 The [ENOSYS] error condition has been removed as stubs need not be provided if an
43644 implementation does not support the Range Memory Locking option.

NAME

mlockall, munlockall — lock/unlock the address space of a process (**REALTIME**)

SYNOPSIS

```
ML      #include <sys/mman.h>

int mlockall(int flags);
int munlockall(void);
```

DESCRIPTION

The *mlockall()* function shall cause all of the pages mapped by the address space of a process to be memory-resident until unlocked or until the process exits or *execs* another process image. The *flags* argument determines whether the pages to be locked are those currently mapped by the address space of the process, those that are mapped in the future, or both. The *flags* argument is constructed from the bitwise-inclusive OR of one or more of the following symbolic constants, defined in *<sys/mman.h>*:

MCL_CURRENT Lock all of the pages currently mapped into the address space of the process.

MCL_FUTURE Lock all of the pages that become mapped into the address space of the process in the future, when those mappings are established.

If **MCL_FUTURE** is specified, and the automatic locking of future mappings eventually causes the amount of locked memory to exceed the amount of available physical memory or any other implementation-defined limit, the behavior is implementation-defined. The manner in which the implementation informs the application of these situations is also implementation-defined.

The *munlockall()* function shall unlock all currently mapped pages of the address space of the process. Any pages that become mapped into the address space of the process after a call to *munlockall()* shall not be locked, unless there is an intervening call to *mlockall()* specifying **MCL_FUTURE** or a subsequent call to *mlockall()* specifying **MCL_CURRENT**. If pages mapped into the address space of the process are also mapped into the address spaces of other processes and are locked by those processes, the locks established by the other processes shall be unaffected by a call by this process to *munlockall()*.

Upon successful return from the *mlockall()* function that specifies **MCL_CURRENT**, all currently mapped pages of the address space of the process shall be memory-resident and locked. Upon return from the *munlockall()* function, all currently mapped pages of the address space of the process shall be unlocked with respect to the address space of the process. The memory residency of unlocked pages is unspecified.

Appropriate privileges are required to lock process memory with *mlockall()*.

RETURN VALUE

Upon successful completion, the *mlockall()* function shall return a value of zero. Otherwise, no additional memory shall be locked, and the function shall return a value of *-1* and set *errno* to indicate the error. The effect of failure of *mlockall()* on previously existing locks in the address space is unspecified.

If it is supported by the implementation, the *munlockall()* function shall always return a value of zero. Otherwise, the function shall return a value of *-1* and set *errno* to indicate the error.

ERRORS

The *mlockall()* function shall fail if:

[EAGAIN] Some or all of the memory identified by the operation could not be locked when the call was made.

43689	[EINVAL]	The <i>flags</i> argument is zero, or includes unimplemented flags.
43690		The <i>mlockall()</i> function may fail if:
43691	[ENOMEM]	Locking all of the pages currently mapped into the address space of the process would exceed an implementation-defined limit on the amount of memory that the process may lock.
43692		
43693		
43694	[EPERM]	The calling process does not have appropriate privileges to perform the requested operation.
43695

43710	The <i>mlockall()</i> and <i>munlockall()</i> functions are marked as part of the Process Memory Locking option.	
43711		
43712	The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Process Memory Locking option.	
43713		

43714 **NAME**43715 `mmap` — map pages of memory43716 **SYNOPSIS**43717 `#include <sys/mman.h>`

```
43718 void *mmap(void *addr, size_t len, int prot, int flags,
43719           int fildes, off_t off);
```

43720 **DESCRIPTION**

43721 The `mmap()` function shall establish a mapping between an address space of a process and a
 43722 memory object.

43723 The `mmap()` function shall be supported for the following memory objects:

- 43724 • Regular files
- 43725 SHM • Shared memory objects
- 43726 TYM • Typed memory objects

43727 Support for any other type of file is unspecified.

43728 The format of the call is as follows:

```
43729 pa=mmap(addr, len, prot, flags, fildes, off);
```

43730 The `mmap()` function shall establish a mapping between the address space of the process at an
 43731 address *pa* for *len* bytes to the memory object represented by the file descriptor *fildes* at offset *off*
 43732 for *len* bytes. The value of *pa* is an implementation-defined function of the parameter *addr* and
 43733 the values of *flags*, further described below. A successful `mmap()` call shall return *pa* as its result.
 43734 The address range starting at *pa* and continuing for *len* bytes shall be legitimate for the possible
 43735 (not necessarily current) address space of the process. The range of bytes starting at *off* and
 43736 continuing for *len* bytes shall be legitimate for the possible (not necessarily current) offsets in the
 43737 memory object represented by *fildes*.

43738 TYM If *fildes* represents a typed memory object opened with either the
 43739 POSIX_TYPED_MEM_ALLOCATE flag or the POSIX_TYPED_MEM_ALLOCATE_CONTIG
 43740 flag, the memory object to be mapped shall be that portion of the typed memory object allocated
 43741 by the implementation as specified below. In this case, if *off* is non-zero, the behavior of `mmap()`
 43742 is undefined. If *fildes* refers to a valid typed memory object that is not accessible from the calling
 43743 process, `mmap()` shall fail.

43744 The mapping established by `mmap()` shall replace any previous mappings for those whole pages
 43745 containing any part of the address space of the process starting at *pa* and continuing for *len*
 43746 bytes.

43747 If the size of the mapped file changes after the call to `mmap()` as a result of some other operation
 43748 on the mapped file, the effect of references to portions of the mapped region that correspond to
 43749 added or removed portions of the file is unspecified.

43750 If *len* is zero, `mmap()` shall fail and no mapping shall be established.

43751 The parameter *prot* determines whether read, write, execute, or some combination of accesses
 43752 are permitted to the data being mapped. The *prot* shall be either PROT_NONE or the bitwise-
 43753 inclusive OR of one or more of the other flags in the following table, defined in the
 43754 `<sys/mman.h>` header.

Symbolic Constant	Description
PROT_READ	Data can be read.
PROT_WRITE	Data can be written.
PROT_EXEC	Data can be executed.
PROT_NONE	Data cannot be accessed.

If an implementation cannot support the combination of access types specified by *prot*, the call to *mmap()* shall fail.

An implementation may permit accesses other than those specified by *prot*; however, the implementation shall not permit a write to succeed where PROT_WRITE has not been set and shall not permit any access where PROT_NONE alone has been set. The implementation shall support at least the following values of *prot*: PROT_NONE, PROT_READ, PROT_WRITE, and the bitwise-inclusive OR of PROT_READ and PROT_WRITE. The file descriptor *fildes* shall have been opened with read permission, regardless of the protection options specified. If PROT_WRITE is specified, the application shall ensure that it has opened the file descriptor *fildes* with write permission unless MAP_PRIVATE is specified in the *flags* parameter as described below.

The parameter *flags* provides other information about the handling of the mapped data. The value of *flags* is the bitwise-inclusive OR of these options, defined in <sys/mman.h>:

Symbolic Constant	Description
MAP_SHARED	Changes are shared.
MAP_PRIVATE	Changes are private.
MAP_FIXED	Interpret <i>addr</i> exactly.

It is implementation-defined whether MAP_FIXED shall be supported. MAP_FIXED shall be supported on XSI-conformant systems.

MAP_SHARED and MAP_PRIVATE describe the disposition of write references to the memory object. If MAP_SHARED is specified, write references shall change the underlying object. If MAP_PRIVATE is specified, modifications to the mapped data by the calling process shall be visible only to the calling process and shall not change the underlying object. It is unspecified whether modifications to the underlying object done after the MAP_PRIVATE mapping is established are visible through the MAP_PRIVATE mapping. Either MAP_SHARED or MAP_PRIVATE can be specified, but not both. The mapping type is retained across *fork()*.

The state of synchronization objects such as mutexes, semaphores, barriers, and conditional variables placed in shared memory mapped with MAP_SHARED becomes undefined when the last region in any process containing the synchronization object is unmapped.

When *fildes* represents a typed memory object opened with either the POSIX_TYPED_MEM_ALLOCATE flag or the POSIX_TYPED_MEM_ALLOCATE_CONTIG flag, *mmap()* shall, if there are enough resources available, map *len* bytes allocated from the corresponding typed memory object which were not previously allocated to any process in any processor that may access that typed memory object. If there are not enough resources available, the function shall fail. If *fildes* represents a typed memory object opened with the POSIX_TYPED_MEM_ALLOCATE_CONTIG flag, these allocated bytes shall be contiguous within the typed memory object. If *fildes* represents a typed memory object opened with the POSIX_TYPED_MEM_ALLOCATE flag, these allocated bytes may be composed of non-contiguous fragments within the typed memory object. If *fildes* represents a typed memory object opened with neither the POSIX_TYPED_MEM_ALLOCATE_CONTIG flag nor the POSIX_TYPED_MEM_ALLOCATE flag, *len* bytes starting at offset *off* within the typed memory object are mapped, exactly as when mapping a file or shared memory object. In this case, if two

processes map an area of typed memory using the same *off* and *len* values and using file descriptors that refer to the same memory pool (either from the same port or from a different port), both processes shall map the same region of storage.

When MAP_FIXED is set in the *flags* argument, the implementation is informed that the value of *pa* shall be *addr*, exactly. If MAP_FIXED is set, *mmap()* may return MAP_FAILED and set *errno* to [EINVAL]. If a MAP_FIXED request is successful, the mapping established by *mmap()* replaces any previous mappings for the pages in the range [*pa*,*pa+len*) of the process.

When MAP_FIXED is not set, the implementation uses *addr* in an implementation-defined manner to arrive at *pa*. The *pa* so chosen shall be an area of the address space that the implementation deems suitable for a mapping of *len* bytes to the file. All implementations interpret an *addr* value of 0 as granting the implementation complete freedom in selecting *pa*, subject to constraints described below. A non-zero value of *addr* is taken to be a suggestion of a process address near which the mapping should be placed. When the implementation selects a value for *pa*, it never places a mapping at address 0, nor does it replace any extant mapping.

If MAP_FIXED is specified and *addr* is non-zero, it shall have the same remainder as the *off* parameter, modulo the page size as returned by *sysconf()* when passed _SC_PAGESIZE or _SC_PAGE_SIZE. The implementation may require that *off* is a multiple of the page size. If MAP_FIXED is specified, the implementation may require that *addr* is a multiple of the page size. The system performs mapping operations over whole pages. Thus, while the parameter *len* need not meet a size or alignment constraint, the system shall include, in any mapping operation, any partial page specified by the address range starting at *pa* and continuing for *len* bytes.

The system shall always zero-fill any partial page at the end of an object. Further, the system shall never write out any modified portions of the last page of an object which are beyond its end. References within the address range starting at *pa* and continuing for *len* bytes to whole pages following the end of an object shall result in delivery of a SIGBUS signal.

An implementation may generate SIGBUS signals when a reference would cause an error in the mapped object, such as out-of-space condition.

The *mmap()* function shall add an extra reference to the file associated with the file descriptor *fd* which is not removed by a subsequent *close()* on that file descriptor. This reference shall be removed when there are no more mappings to the file.

The last data access timestamp of the mapped file may be marked for update at any time between the *mmap()* call and the corresponding *munmap()* call. The initial read or write reference to a mapped region shall cause the file's last data access timestamp to be marked for update if it has not already been marked for update.

The last data modification and last file status change timestamps of a file that is mapped with MAP_SHARED and PROT_WRITE shall be marked for update at some point in the interval between a write reference to the mapped region and the next call to *msync()* with MS_ASYNC or MS_SYNC for that portion of the file by any process. If there is no such call and if the underlying file is modified as a result of a write reference, then these timestamps shall be marked for update at some time after the write reference.

There may be implementation-defined limits on the number of memory regions that can be mapped (per process or per system).

If such a limit is imposed, whether the number of memory regions that can be mapped by a process is decreased by the use of *shmat()* is implementation-defined.

If *mmap()* fails for reasons other than [EBADF], [EINVAL], or [ENOTSUP], some of the

43848 mappings in the address range starting at *addr* and continuing for *len* bytes may have been
 43849 unmapped.

43850 RETURN VALUE

43851 Upon successful completion, the *mmap()* function shall return the address at which the mapping
 43852 was placed (*pa*); otherwise, it shall return a value of MAP_FAILED and set *errno* to indicate the
 43853 error. The symbol MAP_FAILED is defined in the **<sys/mman.h>** header. No successful return
 43854 from *mmap()* shall return the value MAP_FAILED.

43855 ERRORS

43856 The *mmap()* function shall fail if:

43857		[EACCES]	The <i>fildev</i> argument is not open for read, regardless of the protection specified, 43858 or <i>fildev</i> is not open for write and PROT_WRITE was specified for a 43859 MAP_SHARED type mapping.
43860	ML	[EAGAIN]	The mapping could not be locked in memory, if required by <i>mlockall()</i> , due to 43861 a lack of resources.
43862		[EBADF]	The <i>fildev</i> argument is not a valid open file descriptor.
43863		[EINVAL]	The value of <i>len</i> is zero.
43864		[EINVAL]	The value of <i>flags</i> is invalid (neither MAP_PRIVATE nor MAP_SHARED is 43865 set).
43866		[EMFILE]	The number of mapped regions would exceed an implementation-defined 43867 limit (per process or per system).
43868		[ENODEV]	The <i>fildev</i> argument refers to a file whose type is not supported by <i>mmap()</i> .
43869		[ENOMEM]	MAP_FIXED was specified, and the range [<i>addr</i> , <i>addr</i> + <i>len</i>) exceeds that allowed 43870 for the address space of a process; or, if MAP_FIXED was not specified and 43871 there is insufficient room in the address space to effect the mapping.
43872	ML	[ENOMEM]	The mapping could not be locked in memory, if required by <i>mlockall()</i> , 43873 because it would require more space than the system is able to supply.
43874	TYM	[ENOMEM]	Not enough unallocated memory resources remain in the typed memory 43875 object designated by <i>fildev</i> to allocate <i>len</i> bytes.
43876		[ENOTSUP]	MAP_FIXED or MAP_PRIVATE was specified in the <i>flags</i> argument and the 43877 implementation does not support this functionality.
43878			The implementation does not support the combination of accesses requested 43879 in the <i>prot</i> argument.
43880		[ENXIO]	Addresses in the range [<i>off</i> , <i>off</i> + <i>len</i>) are invalid for the object specified by <i>fildev</i> .
43881		[ENXIO]	MAP_FIXED was specified in <i>flags</i> and the combination of <i>addr</i> , <i>len</i> , and <i>off</i> is 43882 invalid for the object specified by <i>fildev</i> .
43883	TYM	[ENXIO]	The <i>fildev</i> argument refers to a typed memory object that is not accessible from 43884 the calling process.
43885		[EOVERFLOW]	The file is a regular file and the value of <i>off</i> plus <i>len</i> exceeds the offset 43886 maximum established in the open file description associated with <i>fildev</i> .

43887 The *mmap()* function may fail if:

43888 [EINVAL] The *addr* argument (if MAP_FIXED was specified) or *off* is not a multiple of the
 43889 page size as returned by *sysconf()*, or is considered invalid by the
 43890 implementation.

43891 EXAMPLES

43892 None.

43893 APPLICATION USAGE

43894 Use of *mmap()* may reduce the amount of memory available to other memory allocation
 43895 functions.

43896 Use of MAP_FIXED may result in unspecified behavior in further use of *malloc()* and *shmat()*.
 43897 The use of MAP_FIXED is discouraged, as it may prevent an implementation from making the
 43898 most effective use of resources. Most implementations require that *off* and *addr* are multiples of
 43899 the page size as returned by *sysconf()*.

43900 The application must ensure correct synchronization when using *mmap()* in conjunction with
 43901 any other file access method, such as *read()* and *write()*, standard input/output, and *shmat()*.

43902 The *mmap()* function allows access to resources via address space manipulations, instead of
 43903 *read()/write()*. Once a file is mapped, all a process has to do to access it is use the data at the
 43904 address to which the file was mapped. So, using pseudo-code to illustrate the way in which an
 43905 existing program might be changed to use *mmap()*, the following:

```
43906 fildes = open(...)
43907 lseek(fildes, some_offset)
43908 read(fildes, buf, len)
43909 /* Use data in buf. */
```

43910 becomes:

```
43911 fildes = open(...)
43912 address = mmap(0, len, PROT_READ, MAP_PRIVATE, fildes, some_offset)
43913 /* Use data at address. */
```

43914 RATIONALE

43915 After considering several other alternatives, it was decided to adopt the *mmap()* definition
 43916 found in SVR4 for mapping memory objects into process address spaces. The SVR4 definition is
 43917 minimal, in that it describes only what has been built, and what appears to be necessary for a
 43918 general and portable mapping facility.

43919 Note that while *mmap()* was first designed for mapping files, it is actually a general-purpose
 43920 mapping facility. It can be used to map any appropriate object, such as memory, files, devices,
 43921 and so on, into the address space of a process.

43922 When a mapping is established, it is possible that the implementation may need to map more
 43923 than is requested into the address space of the process because of hardware requirements. An
 43924 application, however, cannot count on this behavior. Implementations that do not use a paged
 43925 architecture may simply allocate a common memory region and return the address of it; such
 43926 implementations probably do not allocate any more than is necessary. References past the end of
 43927 the requested area are unspecified.

43928 If an application requests a mapping that would overlay existing mappings in the process, it
 43929 might be desirable that an implementation detect this and inform the application. However, the
 43930 default, portable (not MAP_FIXED) operation does not overlay existing mappings. On the other
 43931 hand, if the program specifies a fixed address mapping (which requires some implementation

knowledge to determine a suitable address, if the function is supported at all), then the program is presumed to be successfully managing its own address space and should be trusted when it asks to map over existing data structures. Furthermore, it is also desirable to make as few system calls as possible, and it might be considered onerous to require an *munmap()* before an *mmap()* to the same address range. This volume of POSIX.1-2008 specifies that the new mappings replace any existing mappings, following existing practice in this regard.

It is not expected that all hardware implementations are able to support all combinations of permissions at all addresses. Implementations are required to disallow write access to mappings without write permission and to disallow access to mappings without any access permission. Other than these restrictions, implementations may allow access types other than those requested by the application. For example, if the application requests only *PROT_WRITE*, the implementation may also allow read access. A call to *mmap()* fails if the implementation cannot support allowing all the access requested by the application. For example, some implementations cannot support a request for both write access and execute access simultaneously. All implementations must support requests for no access, read access, write access, and both read and write access. Strictly conforming code must only rely on the required checks. These restrictions allow for portability across a wide range of hardware.

The *MAP_FIXED* address treatment is likely to fail for non-page-aligned values and for certain architecture-dependent address ranges. Conforming implementations cannot count on being able to choose address values for *MAP_FIXED* without utilizing non-portable, implementation-defined knowledge. Nonetheless, *MAP_FIXED* is provided as a standard interface conforming to existing practice for utilizing such knowledge when it is available.

Similarly, in order to allow implementations that do not support virtual addresses, support for directly specifying any mapping addresses via *MAP_FIXED* is not required and thus a conforming application may not count on it.

The *MAP_PRIVATE* function can be implemented efficiently when memory protection hardware is available. When such hardware is not available, implementations can implement such “mappings” by simply making a real copy of the relevant data into process private memory, though this tends to behave similarly to *read()*.

The function has been defined to allow for many different models of using shared memory. However, all uses are not equally portable across all machine architectures. In particular, the *mmap()* function allows the system as well as the application to specify the address at which to map a specific region of a memory object. The most portable way to use the function is always to let the system choose the address, specifying *NULL* as the value for the argument *addr* and not to specify *MAP_FIXED*.

If it is intended that a particular region of a memory object be mapped at the same address in a group of processes (on machines where this is even possible), then *MAP_FIXED* can be used to pass in the desired mapping address. The system can still be used to choose the desired address if the first such mapping is made without specifying *MAP_FIXED*, and then the resulting mapping address can be passed to subsequent processes for them to pass in via *MAP_FIXED*. The availability of a specific address range cannot be guaranteed, in general.

The *mmap()* function can be used to map a region of memory that is larger than the current size of the object. Memory access within the mapping but beyond the current end of the underlying objects may result in *SIGBUS* signals being sent to the process. The reason for this is that the size of the object can be manipulated by other processes and can change at any moment. The implementation should tell the application that a memory reference is outside the object where this can be detected; otherwise, written data may be lost and read data may not reflect actual data in the object.

Note that references beyond the end of the object do not extend the object as the new end cannot be determined precisely by most virtual memory hardware. Instead, the size can be directly manipulated by *ftruncate()*.

Process memory locking does apply to shared memory regions, and the MEMLOCK_FUTURE argument to *mlockall()* can be relied upon to cause new shared memory regions to be automatically locked.

Existing implementations of *mmap()* return the value `-1` when unsuccessful. Since the casting of this value to type `void *` cannot be guaranteed by the ISO C standard to be distinct from a successful value, this volume of POSIX.1-2008 defines the symbol `MAP_FAILED`, which a conforming implementation does not return as the result of a successful call.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Aligned with *mmap()* in the POSIX Realtime Extension as follows:

- The DESCRIPTION is extensively reworded.
- The [EAGAIN] and [ENOTSUP] mandatory error conditions are added.
- New cases of [ENOMEM] and [ENXIO] are added as mandatory error conditions.
- The value returned on failure is the value of the constant `MAP_FAILED`; this was previously defined as `-1`.

Large File Summit extensions are added.

Issue 6

The *mmap()* function is marked as part of the Memory Mapped Files option.

The Open Group Corrigendum U028/6 is applied, changing `(void *)-1` to `MAP_FAILED`.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The DESCRIPTION is updated to describe the use of `MAP_FIXED`.
- The DESCRIPTION is updated to describe the addition of an extra reference to the file associated with the file descriptor passed to *mmap()*.
- The DESCRIPTION is updated to state that there may be implementation-defined limits on the number of memory regions that can be mapped.
- The DESCRIPTION is updated to describe constraints on the alignment and size of the *off* argument.

- The [EINVAL] and [EMFILE] error conditions are added.

- The [EOVERFLOW] error condition is added. This change is to support large files.

The following changes are made for alignment with the ISO POSIX-1: 1996 standard:

- The DESCRIPTION is updated to describe the cases when MAP_PRIVATE and MAP_FIXED need not be supported.

The following changes are made for alignment with IEEE Std 1003.1j-2000:

- Semantics for typed memory objects are added to the DESCRIPTION.
- New [ENOMEM] and [ENXIO] errors are added to the ERRORS section.
- The *posix_typed_mem_open()* function is added to the SEE ALSO section.

The normative text is updated to avoid use of the term “must” for application requirements.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/34 is applied, changing the margin code in the SYNOPSIS from MF|SHM to MC3 (notation for MF|SHM|TYM).

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/60 is applied, updating the DESCRIPTION and ERRORS sections to add the [EINVAL] error when *len* is zero.

Issue 7

Austin Group Interpretations 1003.1-2001 #078 and #079 are applied, clarifying page alignment requirements and adding a note about the state of synchronization objects becoming undefined when a shared region is unmapped.

Functionality relating to the Memory Protection and Memory Mapped Files options is moved to the Base.

Changes are made related to support for finegrained timestamps.

44040 NAME

44041 modf, modff, modfl — decompose a floating-point number

44042 SYNOPSIS

44043 #include <math.h>

44044 double modf(double *x*, double **iptr*);44045 float modff(float *value*, float **iptr*);44046 long double modfl(long double *value*, long double **iptr*);

44047 DESCRIPTION

44048 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 44049 conflict between the requirements described here and the ISO C standard is unintentional. This
 44050 volume of POSIX.1-2008 defers to the ISO C standard.

44051 These functions shall break the argument *x* into integral and fractional parts, each of which has
 44052 the same sign as the argument. It stores the integral part as a **double** (for the *modf()* function), a
 44053 **float** (for the *modff()* function), or a **long double** (for the *modfl()* function), in the object pointed
 44054 to by *iptr*.

44055 RETURN VALUE

44056 Upon successful completion, these functions shall return the signed fractional part of *x*.44057 MX If *x* is NaN, a NaN shall be returned, and **iptr* shall be set to a NaN.44058 If *x* is $\pm\text{Inf}$, ± 0 shall be returned, and **iptr* shall be set to $\pm\text{Inf}$.

44059 ERRORS

44060 No errors are defined.

44061 EXAMPLES

44062 None.

44063 APPLICATION USAGE

44064 The *modf()* function computes the function result and **iptr* such that:44065 *a* = modf(*x*, *iptr*) ;44066 *x* == *a* + **iptr* ;

44067 allowing for the usual floating-point inaccuracies.

44068 RATIONALE

44069 None.

44070 FUTURE DIRECTIONS

44071 None.

44074 XBD <math.h>

44075 CHANGE HISTORY

44076 First released in Issue 1. Derived from Issue 1 of the SVID.

44077 Issue 5

44078 The DESCRIPTION is updated to indicate how an application should check for an error. This
 44079 text was previously published in the APPLICATION USAGE section.

44080 **Issue 6**

44081 The *modff()* and *modfl()* functions are added for alignment with the ISO/IEC 9899:1999
44082 standard.

44083 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are
44084 revised to align with the ISO/IEC 9899:1999 standard.

44085 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are
44086 marked.

44087 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/35 is applied, correcting the code example
44088 in the APPLICATION USAGE section.

44089 **NAME**44090 `mprotect` — set protection of memory mapping44091 **SYNOPSIS**44092 `#include <sys/mman.h>`44093 `int mprotect(void *addr, size_t len, int prot);`44094 **DESCRIPTION**

44095 The `mprotect()` function shall change the access protections to be that specified by *prot* for those
 44096 whole pages containing any part of the address space of the process starting at address *addr* and
 44097 continuing for *len* bytes. The parameter *prot* determines whether read, write, execute, or some
 44098 combination of accesses are permitted to the data being mapped. The *prot* argument should be
 44099 either `PROT_NONE` or the bitwise-inclusive OR of one or more of `PROT_READ`, `PROT_WRITE`,
 44100 and `PROT_EXEC`.

44101 If an implementation cannot support the combination of access types specified by *prot*, the call to
 44102 `mprotect()` shall fail.

44103 An implementation may permit accesses other than those specified by *prot*; however, no
 44104 implementation shall permit a write to succeed where `PROT_WRITE` has not been set or shall
 44105 permit any access where `PROT_NONE` alone has been set. Implementations shall support at
 44106 least the following values of *prot*: `PROT_NONE`, `PROT_READ`, `PROT_WRITE`, and the bitwise-
 44107 inclusive OR of `PROT_READ` and `PROT_WRITE`. If `PROT_WRITE` is specified, the application
 44108 shall ensure that it has opened the mapped objects in the specified address range with write
 44109 permission, unless `MAP_PRIVATE` was specified in the original mapping, regardless of whether
 44110 the file descriptors used to map the objects have since been closed.

44111 The implementation may require that *addr* be a multiple of the page size as returned by
 44112 `sysconf()`.

44113 The behavior of this function is unspecified if the mapping was not established by a call to
 44114 `mmap()`.

44115 When `mprotect()` fails for reasons other than `[EINVAL]`, the protections on some of the pages in
 44116 the range `[addr,addr+len)` may have been changed.

44117 **RETURN VALUE**

44118 Upon successful completion, `mprotect()` shall return 0; otherwise, it shall return `-1` and set *errno*
 44119 to indicate the error.

44120 **ERRORS**

44121 The `mprotect()` function shall fail if:

44122 `[EACCES]` The *prot* argument specifies a protection that violates the access permission the
 44123 process has to the underlying memory object.

44124 `[EAGAIN]` The *prot* argument specifies `PROT_WRITE` over a `MAP_PRIVATE` mapping
 44125 and there are insufficient memory resources to reserve for locking the private
 44126 page.

44127 `[ENOMEM]` Addresses in the range `[addr,addr+len)` are invalid for the address space of a
 44128 process, or specify one or more pages which are not mapped.

44129 `[ENOMEM]` The *prot* argument specifies `PROT_WRITE` on a `MAP_PRIVATE` mapping, and
 44130 it would require more space than the system is able to supply for locking the
 44131 private pages, if required.

44132 [ENOTSUP] The implementation does not support the combination of accesses requested
 44133 in the *prot* argument.

44134 The *mprotect()* function may fail if:

44135 [EINVAL] The *addr* argument is not a multiple of the page size as returned by *sysconf()*.

44136 EXAMPLES

44137 None.

44138 APPLICATION USAGE

44139 Most implementations require that *addr* is a multiple of the page size as returned by *sysconf()*.

44140 RATIONALE

44141 None.

44142 FUTURE DIRECTIONS

44143 None.

44147 CHANGE HISTORY

44148 First released in Issue 4, Version 2.

44149 Issue 5

44150 Moved from X/OPEN UNIX extension to BASE.

44151 Aligned with *mprotect()* in the POSIX Realtime Extension as follows:

- 44152 • The DESCRIPTION is largely reworded.
- 44153 • [ENOTSUP] and a second form of [ENOMEM] are added as mandatory error conditions.
- 44154 • [EAGAIN] is moved from the optional to the mandatory error conditions.

44155 Issue 6

44156 The *mprotect()* function is marked as part of the Memory Protection option.

44157 The following new requirements on POSIX implementations derive from alignment with the
 44158 Single UNIX Specification:

- 44159 • The DESCRIPTION is updated to state that implementations require *addr* to be a multiple
 44160 of the page size as returned by *sysconf()*.
- 44161 • The [EINVAL] error condition is added.

44162 The normative text is updated to avoid use of the term “must” for application requirements.

44163 Issue 7

44164 SD5-XSH-ERN-22 is applied, deleting erroneous APPLICATION USAGE.

44165 Austin Group Interpretation 1003.1-2001 #078 is applied, clarifying page alignment
 44166 requirements.

44167 The *mprotect()* function is moved from the Memory Protection option to the Base.

44168 **NAME**44169 mq_close — close a message queue (**REALTIME**)44170 **SYNOPSIS**

```
44171 MSG    #include <mqueue.h>
44172        int mq_close(mqd_t mqdes);
```

44173 **DESCRIPTION**

44174 The *mq_close()* function shall remove the association between the message queue descriptor,
 44175 *mqdes*, and its message queue. The results of using this message queue descriptor after successful
 44176 return from this *mq_close()*, and until the return of this message queue descriptor from a
 44177 subsequent *mq_open()*, are undefined.

44178 If the process has successfully attached a notification request to the message queue via this
 44179 *mqdes*, this attachment shall be removed, and the message queue is available for another process
 44180 to attach for notification.

44181 **RETURN VALUE**

44182 Upon successful completion, the *mq_close()* function shall return a value of zero; otherwise, the
 44183 function shall return a value of -1 and set *errno* to indicate the error.

44184 **ERRORS**

44185 The *mq_close()* function shall fail if:

44186 [EBADF] The *mqdes* argument is not a valid message queue descriptor.

44198 **CHANGE HISTORY**

44199 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

44200 **Issue 6**

44201 The *mq_close()* function is marked as part of the Message Passing option.

44202 The [ENOSYS] error condition has been removed as stubs need not be provided if an
 44203 implementation does not support the Message Passing option.

NAME

mq_getattr — get message queue attributes (**REALTIME**)

SYNOPSIS

```
#include <mqueue.h>

int mq_getattr(mqd_t mqdes, struct mq_attr *mqstat);
```

DESCRIPTION

The *mq_getattr()* function shall obtain status information and attributes of the message queue and the open message queue description associated with the message queue descriptor.

The *mqdes* argument specifies a message queue descriptor.

The results shall be returned in the **mq_attr** structure referenced by the *mqstat* argument.

Upon return, the following members shall have the values associated with the open message queue description as set when the message queue was opened and as modified by subsequent *mq_setattr()* calls: *mq_flags*.

The following attributes of the message queue shall be returned as set at message queue creation: *mq_maxmsg*, *mq_msgsize*.

Upon return, the following members within the **mq_attr** structure referenced by the *mqstat* argument shall be set to the current state of the message queue:

mq_curmsgs The number of messages currently on the queue.

RETURN VALUE

Upon successful completion, the *mq_getattr()* function shall return zero. Otherwise, the function shall return -1 and set *errno* to indicate the error.

ERRORS

The *mq_getattr()* function may fail if:

[EBADF] The *mqdes* argument is not a valid message queue descriptor.

EXAMPLES

See *mq_notify()*.

XBD **<mqueue.h>**

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6

The *mq_getattr()* function is marked as part of the Message Passing option.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Message Passing option.

44245	The <i>mq_timedsend()</i> function is added to the SEE ALSO section for alignment with IEEE Std
44246	1003.1d-1999.
44247	IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/61 is applied, updating the ERRORS
44248	section to change the [EBADF] error from mandatory to optional.

44249 **NAME**44250 mq_notify — notify process that a message is available (**REALTIME**)44251 **SYNOPSIS**

```
44252 MSG    #include <mqueue.h>
44253        int mq_notify(mqd_t mqdes, const struct sigevent *notification);
```

44254 **DESCRIPTION**

44255 If the argument *notification* is not NULL, this function shall register the calling process to be
 44256 notified of message arrival at an empty message queue associated with the specified message
 44257 queue descriptor, *mqdes*. The notification specified by the *notification* argument shall be sent to
 44258 the process when the message queue transitions from empty to non-empty. At any time, only
 44259 one process may be registered for notification by a message queue. If the calling process or any
 44260 other process has already registered for notification of message arrival at the specified message
 44261 queue, subsequent attempts to register for that message queue shall fail.

44262 If *notification* is NULL and the process is currently registered for notification by the specified
 44263 message queue, the existing registration shall be removed.

44264 When the notification is sent to the registered process, its registration shall be removed. The
 44265 message queue shall then be available for registration.

44266 If a process has registered for notification of message arrival at a message queue and some
 44267 thread is blocked in *mq_receive()* or *mq_timedreceive()* waiting to receive a message when a
 44268 message arrives at the queue, the arriving message shall satisfy the appropriate *mq_receive()* or
 44269 *mq_timedreceive()*, respectively. The resulting behavior is as if the message queue remains empty,
 44270 and no notification shall be sent.

44271 **RETURN VALUE**

44272 Upon successful completion, the *mq_notify()* function shall return a value of zero; otherwise, the
 44273 function shall return a value of -1 and set *errno* to indicate the error.

44274 **ERRORS**

44275 The *mq_notify()* function shall fail if:

44276 [EBADF] The *mqdes* argument is not a valid message queue descriptor.

44277 [EBUSY] A process is already registered for notification by the message queue.

44278 The *mq_notify()* function may fail if:

44279 [EINVAL] The *notification* argument is NULL and the process is currently not registered.

44280 **EXAMPLES**

44281 The following program registers a notification request for the message queue named in its
 44282 command-line argument. Notification is performed by creating a thread. The thread executes a
 44283 function which reads one message from the queue and then terminates the process.

```
44284 #include <pthread.h>
44285 #include <mqueue.h>
44286 #include <assert.h>
44287 #include <stdio.h>
44288 #include <stdlib.h>
44289 #include <unistd.h>

44290 static void                                /* Thread start function */
44291 tfunc(union sigval sv)
44292 {
```

```

44293     struct mq_attr attr;
44294     ssize_t nr;
44295     void *buf;
44296     mqd_t mqdes = *((mqd_t *) sv.sival_ptr);
44297     /* Determine maximum msg size; allocate buffer to receive msg */
44298     if (mq_getattr(mqdes, &attr) == -1) {
44299         perror("mq_getattr");
44300         exit(EXIT_FAILURE);
44301     }
44302     buf = malloc(attr.mq_msgsize);
44303     if (buf == NULL) {
44304         perror("malloc");
44305         exit(EXIT_FAILURE);
44306     }
44307     nr = mq_receive(mqdes, buf, attr.mq_msgsize, NULL);
44308     if (nr == -1) {
44309         perror("mq_receive");
44310         exit(EXIT_FAILURE);
44311     }
44312     printf("Read %ld bytes from message queue\n", (long) nr);
44313     free(buf);
44314     exit(EXIT_SUCCESS);          /* Terminate the process */
44315 }
44316
44317 int
44318 main(int argc, char *argv[])
44319 {
44320     mqd_t mqdes;
44321     struct sigevent not;
44322     assert(argc == 2);
44323     mqdes = mq_open(argv[1], O_RDONLY);
44324     if (mqdes == (mqd_t) -1) {
44325         perror("mq_open");
44326         exit(EXIT_FAILURE);
44327     }
44328     not.sigev_notify = SIGEV_THREAD;
44329     not.sigev_notify_function = tfunc;
44330     not.sigev_notify_attributes = NULL;
44331     not.sigev_value.sival_ptr = &mqdes;    /* Arg. to thread func. */
44332     if (mq_notify(mqdes, &not) == -1) {
44333         perror("mq_notify");
44334         exit(EXIT_FAILURE);
44335     }
44336     pause();    /* Process will be terminated by thread function */
44337 }

44353 1003.1d-1999.44354 **Issue 7**44355 SD5-XSH-ERN-38 is applied, adding the *mq_timedreceive()* function to the DESCRIPTION.

44356 Austin Group Interpretation 1003.1-2001 #032 is applied, adding the [EINVAL] error.

44357 An example is added.

NAME

mq_open — open a message queue (**REALTIME**)

SYNOPSIS

```
#include <mqueue.h>

mqd_t mq_open(const char *name, int oflag, ...);
```

DESCRIPTION

The *mq_open()* function shall establish the connection between a process and a message queue with a message queue descriptor. It shall create an open message queue description that refers to the message queue, and a message queue descriptor that refers to that open message queue description. The message queue descriptor is used by other functions to refer to that message queue. The *name* argument points to a string naming a message queue. It is unspecified whether the name appears in the file system and is visible to other functions that take pathnames as arguments. The *name* argument conforms to the construction rules for a pathname, except that the interpretation of <slash> characters other than the leading <slash> character in *name* is implementation-defined, and that the length limits for the *name* argument are implementation-defined and need not be the same as the pathname limits {PATH_MAX} and {NAME_MAX}. If *name* begins with the <slash> character, then processes calling *mq_open()* with the same value of *name* shall refer to the same message queue object, as long as that name has not been removed. If *name* does not begin with the <slash> character, the effect is implementation-defined. If the *name* argument is not the name of an existing message queue and creation is not requested, *mq_open()* shall fail and return an error.

A message queue descriptor may be implemented using a file descriptor, in which case applications can open up to at least {OPEN_MAX} file and message queues.

The *oflag* argument requests the desired receive and/or send access to the message queue. The requested access permission to receive messages or send messages shall be granted if the calling process would be granted read or write access, respectively, to an equivalently protected file.

The value of *oflag* is the bitwise-inclusive OR of values from the following list. Applications shall specify exactly one of the first three values (access modes) below in the value of *oflag*:

O_RDONLY Open the message queue for receiving messages. The process can use the returned message queue descriptor with *mq_receive()*, but not *mq_send()*. A message queue may be open multiple times in the same or different processes for receiving messages.

O_WRONLY Open the queue for sending messages. The process can use the returned message queue descriptor with *mq_send()* but not *mq_receive()*. A message queue may be open multiple times in the same or different processes for sending messages.

O_RDWR Open the queue for both receiving and sending messages. The process can use any of the functions allowed for **O_RDONLY** and **O_WRONLY**. A message queue may be open multiple times in the same or different processes for sending messages.

Any combination of the remaining flags may be specified in the value of *oflag*:

O_CREAT Create a message queue. It requires two additional arguments: *mode*, which shall be of type **mode_t**, and *attr*, which shall be a pointer to an **mq_attr** structure. If the pathname *name* has already been used to create a message queue that still exists, then this flag shall have no effect, except as noted under **O_EXCL**. Otherwise, a message queue shall be created without any messages

44404		in it. The user ID of the message queue shall be set to the effective user ID of
44405		the process. The group ID of the message queue shall be set to the effective
44406		group ID of the process; however, if the <i>name</i> argument is visible in the file
44407		system, the group ID may be set to the group ID of the containing directory.
44408		When bits in <i>mode</i> other than the file permission bits are specified, the effect is
44409		unspecified. If <i>attr</i> is NULL, the message queue shall be created with
44410		implementation-defined default message queue attributes. If <i>attr</i> is non-NULL
44411		and the calling process has appropriate privileges on <i>name</i> , the message queue
44412		<i>mq_maxmsg</i> and <i>mq_msgsize</i> attributes shall be set to the values of the
44413		corresponding members in the mq_attr structure referred to by <i>attr</i> . The
44414		values of the <i>mq_flags</i> and <i>mq_curmsgs</i> members of the mq_attr structure shall
44415		be ignored. If <i>attr</i> is non-NULL, but the calling process does not have
44416		appropriate privileges on <i>name</i> , the <i>mq_open()</i> function shall fail and return an
44417		error without creating the message queue.
44418	O_EXCL	If O_EXCL and O_CREAT are set, <i>mq_open()</i> shall fail if the message queue
44419		<i>name</i> exists. The check for the existence of the message queue and the creation
44420		of the message queue if it does not exist shall be atomic with respect to other
44421		threads executing <i>mq_open()</i> naming the same <i>name</i> with O_EXCL and
44422		O_CREAT set. If O_EXCL is set and O_CREAT is not set, the result is
44423		undefined.
44424	O_NONBLOCK	Determines whether an <i>mq_send()</i> or <i>mq_receive()</i> waits for resources or
44425		messages that are not currently available, or fails with <i>errno</i> set to [EAGAIN];
44426		see <i>mq_send()</i> and <i>mq_receive()</i> for details.
44427	The <i>mq_open()</i> function does not add or remove messages from the queue.	
44428	RETURN VALUE	
44429	Upon successful completion, the function shall return a message queue descriptor; otherwise,	
44430	the function shall return (mqd_t)−1 and set <i>errno</i> to indicate the error.	
44431	ERRORS	
44432	The <i>mq_open()</i> function shall fail if:	
44433	[EACCES]	The message queue exists and the permissions specified by <i>oflag</i> are denied, or
44434		the message queue does not exist and permission to create the message queue
44435		is denied.
44436	[EEXIST]	O_CREAT and O_EXCL are set and the named message queue already exists.
44437	[EINTR]	The <i>mq_open()</i> function was interrupted by a signal.
44438	[EINVAL]	The <i>mq_open()</i> function is not supported for the given name.
44439	[EINVAL]	O_CREAT was specified in <i>oflag</i> , the value of <i>attr</i> is not NULL, and either
44440		<i>mq_maxmsg</i> or <i>mq_msgsize</i> was less than or equal to zero.
44441	[EMFILE]	Too many message queue descriptors or file descriptors are currently in use by
44442		this process.
44443	[ENFILE]	Too many message queues are currently open in the system.
44444	[ENOENT]	O_CREAT is not set and the named message queue does not exist.
44445	[ENOSPC]	There is insufficient space for the creation of the new message queue.

44446 If any of the following conditions occur, the *mq_open()* function may return (**mqd_t**)–1 and set
 44447 *errno* to the corresponding value.

44448 [ENAMETOOLONG]

44449 The length of the *name* argument exceeds {_POSIX_PATH_MAX} on systems
 44450 XSI that do not support the XSI option or exceeds {_XOPEN_PATH_MAX} on XSI
 44451 systems, or has a pathname component that is longer than
 44452 XSI {_POSIX_NAME_MAX} on systems that do not support the XSI option or
 44453 longer than {_XOPEN_NAME_MAX} on XSI systems.

44466 XBD <mqqueue.h>

44467 CHANGE HISTORY

44468 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

44469 Issue 6

44470 The *mq_open()* function is marked as part of the Message Passing option.

44471 The [ENOSYS] error condition has been removed as stubs need not be provided if an
 44472 implementation does not support the Message Passing option.

44473 The *mq_timedreceive()* and *mq_timedsend()* functions are added to the SEE ALSO section for
 44474 alignment with IEEE Std 1003.1d-1999.

44475 The DESCRIPTION of O_EXCL is updated in response to IEEE PASC Interpretation 1003.1c #48.

44476 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/62 is applied, updating the description of
 44477 the permission bits in the DESCRIPTION. The change is made for consistency with the
 44478 *shm_open()* and *sem_open()* functions.

44479 Issue 7

44480 Austin Group Interpretation 1003.1-2001 #077 is applied, clarifying the *name* argument and
 44481 changing [ENAMETOOLONG] from a “shall fail” to a “may fail” error.

44482 Austin Group Interpretation 1003.1-2001 #141 is applied, adding FUTURE DIRECTIONS.

44483 SD5-XSH-ERN-170 is applied, updating the DESCRIPTION to clarify the wording for setting the
 44484 user ID and group ID of the message queue.

44485 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0394 [259] is applied.

+

NAME

mq_receive, mq_timedreceive — receive a message from a message queue (**REALTIME**)

SYNOPSIS

```
MSG    #include <mqueue.h>

ssize_t mq_receive(mqd_t mqdes, char *msg_ptr, size_t msg_len,
    unsigned *msg_prio);

#include <mqueue.h>
#include <time.h>

ssize_t mq_timedreceive(mqd_t mqdes, char *restrict msg_ptr,
    size_t msg_len, unsigned *restrict msg_prio,
    const struct timespec *restrict abstime);
```

DESCRIPTION

The *mq_receive()* function shall receive the oldest of the highest priority message(s) from the message queue specified by *mqdes*. If the size of the buffer in bytes, specified by the *msg_len* argument, is less than the *mq_msgsize* attribute of the message queue, the function shall fail and return an error. Otherwise, the selected message shall be removed from the queue and copied to the buffer pointed to by the *msg_ptr* argument.

If the value of *msg_len* is greater than {SSIZE_MAX}, the result is implementation-defined.

If the argument *msg_prio* is not NULL, the priority of the selected message shall be stored in the location referenced by *msg_prio*.

If the specified message queue is empty and O_NONBLOCK is not set in the message queue description associated with *mqdes*, *mq_receive()* shall block until a message is enqueued on the message queue or until *mq_receive()* is interrupted by a signal. If more than one thread is waiting to receive a message when a message arrives at an empty queue and the Priority Scheduling option is supported, then the thread of highest priority that has been waiting the longest shall be selected to receive the message. Otherwise, it is unspecified which waiting thread receives the message. If the specified message queue is empty and O_NONBLOCK is set in the message queue description associated with *mqdes*, no message shall be removed from the queue, and *mq_receive()* shall return an error.

The *mq_timedreceive()* function shall receive the oldest of the highest priority messages from the message queue specified by *mqdes* as described for the *mq_receive()* function. However, if O_NONBLOCK was not specified when the message queue was opened via the *mq_open()* function, and no message exists on the queue to satisfy the receive, the wait for such a message shall be terminated when the specified timeout expires. If O_NONBLOCK is set, this function is equivalent to *mq_receive()*.

The timeout expires when the absolute time specified by *abstime* passes, as measured by the clock on which timeouts are based (that is, when the value of that clock equals or exceeds *abstime*), or if the absolute time specified by *abstime* has already been passed at the time of the call.

The timeout shall be based on the CLOCK_REALTIME clock. The resolution of the timeout shall be the resolution of the clock on which it is based. The *timespec* argument is defined in the **<time.h>** header.

Under no circumstance shall the operation fail with a timeout if a message can be removed from the message queue immediately. The validity of the *abstime* parameter need not be checked if a message can be removed from the message queue immediately.

RETURN VALUE

Upon successful completion, the *mq_receive()* and *mq_timedreceive()* functions shall return the length of the selected message in bytes and the message shall be removed from the queue. Otherwise, no message shall be removed from the queue, the functions shall return a value of *-1*, and set *errno* to indicate the error.

ERRORS

These functions shall fail if:

- [EAGAIN] O_NONBLOCK was set in the message description associated with *mqdes*, and the specified message queue is empty.
- [EBADF] The *mqdes* argument is not a valid message queue descriptor open for reading.
- [EMSGSIZE] The specified message buffer size, *msg_len*, is less than the message size attribute of the message queue.
- [EINTR] The *mq_receive()* or *mq_timedreceive()* operation was interrupted by a signal.
- [EINVAL] The process or thread would have blocked, and the *abstime* parameter specified a nanoseconds field value less than zero or greater than or equal to 1 000 million.
- [ETIMEDOUT] The O_NONBLOCK flag was not set when the message queue was opened, but no message arrived on the queue before the specified timeout expired.

These functions may fail if:

- [EBADMSG] The implementation has detected a data corruption problem with the message.

XBD <mqqueue.h>, <time.h>

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6

The *mq_receive()* function is marked as part of the Message Passing option.

The Open Group Corrigendum U021/4 is applied. The DESCRIPTION is changed to refer to *msg_len* rather than *maxsize*.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Message Passing option.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- 44573 • In this function it is possible for the return value to exceed the range of the type **ssize_t**
44574 (since **size_t** has a larger range of positive values than **ssize_t**). A sentence restricting the
44575 size of the **size_t** object is added to the description to resolve this conflict.

44576 The *mq_timedreceive()* function is added for alignment with IEEE Std 1003.1d-1999.

44577 The **restrict** keyword is added to the *mq_timedreceive()* prototype for alignment with the
44578 ISO/IEC 9899:1999 standard.

44579 IEEE PASC Interpretation 1003.1 #109 is applied, correcting the return type for *mq_timedreceive()*
44580 from **int** to **ssize_t**.

44581 **Issue 7**

44582 The *mq_timedreceive()* function is moved from the Timeouts option to the Base.

44583 Functionality relating to the Timers option is moved to the Base.

NAME

mq_send, mq_timedsend — send a message to a message queue (**REALTIME**)

SYNOPSIS

```
MSG    #include <mqueue.h>

int mq_send(mqd_t mqdes, const char *msg_ptr, size_t msg_len,
            unsigned msg_prio);

#include <mqueue.h>
#include <time.h>

int mq_timedsend(mqd_t mqdes, const char *msg_ptr, size_t msg_len,
                unsigned msg_prio, const struct timespec *abstime);
```

DESCRIPTION

The *mq_send()* function shall add the message pointed to by the argument *msg_ptr* to the message queue specified by *mqdes*. The *msg_len* argument specifies the length of the message, in bytes, pointed to by *msg_ptr*. The value of *msg_len* shall be less than or equal to the *mq_msgsize* attribute of the message queue, or *mq_send()* shall fail.

If the specified message queue is not full, *mq_send()* shall behave as if the message is inserted into the message queue at the position indicated by the *msg_prio* argument. A message with a larger numeric value of *msg_prio* shall be inserted before messages with lower values of *msg_prio*. A message shall be inserted after other messages in the queue, if any, with equal *msg_prio*. The value of *msg_prio* shall be less than {MQ_PRIO_MAX}.

If the specified message queue is full and O_NONBLOCK is not set in the message queue description associated with *mqdes*, *mq_send()* shall block until space becomes available to enqueue the message, or until *mq_send()* is interrupted by a signal. If more than one thread is waiting to send when space becomes available in the message queue and the Priority Scheduling option is supported, then the thread of the highest priority that has been waiting the longest shall be unblocked to send its message. Otherwise, it is unspecified which waiting thread is unblocked. If the specified message queue is full and O_NONBLOCK is set in the message queue description associated with *mqdes*, the message shall not be queued and *mq_send()* shall return an error.

The *mq_timedsend()* function shall add a message to the message queue specified by *mqdes* in the manner defined for the *mq_send()* function. However, if the specified message queue is full and O_NONBLOCK is not set in the message queue description associated with *mqdes*, the wait for sufficient room in the queue shall be terminated when the specified timeout expires. If O_NONBLOCK is set in the message queue description, this function shall be equivalent to *mq_send()*.

The timeout shall expire when the absolute time specified by *abstime* passes, as measured by the clock on which timeouts are based (that is, when the value of that clock equals or exceeds *abstime*), or if the absolute time specified by *abstime* has already been passed at the time of the call.

The timeout shall be based on the CLOCK_REALTIME clock. The resolution of the timeout shall be the resolution of the clock on which it is based. The *timespec* argument is defined in the **<time.h>** header.

Under no circumstance shall the operation fail with a timeout if there is sufficient room in the queue to add the message immediately. The validity of the *abstime* parameter need not be checked when there is sufficient room in the queue.

RETURN VALUE

Upon successful completion, the `mq_send()` and `mq_timedsend()` functions shall return a value of zero. Otherwise, no message shall be enqueued, the functions shall return `-1`, and `errno` shall be set to indicate the error.

ERRORS

The `mq_send()` and `mq_timedsend()` functions shall fail if:

- [EAGAIN] The `O_NONBLOCK` flag is set in the message queue description associated with `mqdes`, and the specified message queue is full.
- [EBADF] The `mqdes` argument is not a valid message queue descriptor open for writing.
- [EINTR] A signal interrupted the call to `mq_send()` or `mq_timedsend()`.
- [EINVAL] The value of `msg_prio` was outside the valid range.
- [EINVAL] The process or thread would have blocked, and the `abstime` parameter specified a nanoseconds field value less than zero or greater than or equal to 1 000 million.
- [EMSGSIZE] The specified message length, `msg_len`, exceeds the message size attribute of the message queue.
- [ETIMEDOUT] The `O_NONBLOCK` flag was not set when the message queue was opened, but the timeout expired before the message could be added to the queue.

EXAMPLES

None.

APPLICATION USAGE

The value of the symbol `{MQ_PRIO_MAX}` limits the number of priority levels supported by the application. Message priorities range from 0 to `{MQ_PRIO_MAX}-1`.

RATIONALE

None.

FUTURE DIRECTIONS

None.

XBD `<mqqueue.h>`, `<time.h>`

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6

The `mq_send()` function is marked as part of the Message Passing option.

The `[ENOSYS]` error condition has been removed as stubs need not be provided if an implementation does not support the Message Passing option.

The `mq_timedsend()` function is added for alignment with IEEE Std 1003.1d-1999.

Issue 7

The `mq_timedsend()` function is moved from the Timeouts option to the Base.

Functionality relating to the Timers option is moved to the Base.

NAME

mq_setattr — set message queue attributes (**REALTIME**)

SYNOPSIS

```
#include <mqueue.h>

int mq_setattr(mqd_t mqdes, const struct mq_attr *restrict mqstat,
               struct mq_attr *restrict omqstat);
```

DESCRIPTION

The *mq_setattr()* function shall set attributes associated with the open message queue description referenced by the message queue descriptor specified by *mqdes*.

The message queue attributes corresponding to the following members defined in the **mq_attr** structure shall be set to the specified values upon successful completion of *mq_setattr()*:

mq_flags The value of this member is the bitwise-logical OR of zero or more of **O_NONBLOCK** and any implementation-defined flags.

The values of the *mq_maxmsg*, *mq_msgsize*, and *mq_curmsgs* members of the **mq_attr** structure shall be ignored by *mq_setattr()*.

If *omqstat* is non-NULL, the *mq_setattr()* function shall store, in the location referenced by *omqstat*, the previous message queue attributes and the current queue status. These values shall be the same as would be returned by a call to *mq_getattr()* at that point.

RETURN VALUE

Upon successful completion, the function shall return a value of zero and the attributes of the message queue shall have been changed as specified.

Otherwise, the message queue attributes shall be unchanged, and the function shall return a value of -1 and set *errno* to indicate the error.

ERRORS

The *mq_setattr()* function shall fail if:

[EBADF] The *mqdes* argument is not a valid message queue descriptor.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

44708 **Issue 6**

44709 The *mq_setattr()* function is marked as part of the Message Passing option.

44710 The [ENOSYS] error condition has been removed as stubs need not be provided if an
44711 implementation does not support the Message Passing option.

44712 The *mq_timedsend()* function is added to the SEE ALSO section for alignment with IEEE Std
44713 1003.1d-1999.

44714 The **restrict** keyword is added to the *mq_setattr()* prototype for alignment with the
44715 ISO/IEC 9899:1999 standard.

44716 **NAME**44717 mq_timedreceive — receive a message from a message queue (**ADVANCED REALTIME**)44718 **SYNOPSIS**

```
44719 MSG      #include <mqueue.h>
44720           #include <time.h>
44721           ssize_t mq_timedreceive(mqd_t mqdes, char *restrict msg_ptr,
44722                                   size_t msg_len, unsigned *restrict msg_prio,
44723                                   const struct timespec *restrict abstime);
```

44724 **DESCRIPTION**44725 Refer to *mq_receive()*.

44726 **NAME**44727 mq_timedsend — send a message to a message queue (**ADVANCED REALTIME**)44728 **SYNOPSIS**

```
44729 MSG      #include <mqueue.h>
44730          #include <time.h>
44731          int mq_timedsend(mqd_t mqdes, const char *msg_ptr, size_t msg_len,
44732                          unsigned msg_prio, const struct timespec *abstime);
```

44733 **DESCRIPTION**44734 Refer to *mq_send()*.

44735 **NAME**44736 mq_unlink — remove a message queue (**REALTIME**)44737 **SYNOPSIS**

```
44738 MSG      #include <mqueue.h>
44739          int mq_unlink(const char *name);
```

44740 **DESCRIPTION**

44741 The *mq_unlink()* function shall remove the message queue named by the string name. If one or
 44742 more processes have the message queue open when *mq_unlink()* is called, destruction of the
 44743 message queue shall be postponed until all references to the message queue have been closed.
 44744 However, the *mq_unlink()* call need not block until all references have been closed; it may return
 44745 immediately.

44746 After a successful call to *mq_unlink()*, reuse of the name shall subsequently cause *mq_open()* to
 44747 behave as if no message queue of this name exists (that is, *mq_open()* will fail if O_CREAT is not
 44748 set, or will create a new message queue if O_CREAT is set).

44749 **RETURN VALUE**

44750 Upon successful completion, the function shall return a value of zero. Otherwise, the named
 44751 message queue shall be unchanged by this function call, and the function shall return a value of
 44752 -1 and set *errno* to indicate the error.

44753 **ERRORS**44754 The *mq_unlink()* function shall fail if:

44755 [EACCES] Permission is denied to unlink the named message queue.

44756 [ENOENT] The named message queue does not exist.

44757 The *mq_unlink()* function may fail if:

44758 [ENAMETOOLONG]

44759 The length of the *name* argument exceeds {_POSIX_PATH_MAX} on systems
 44760 XSI that do not support the XSI option or exceeds {_XOPEN_PATH_MAX} on XSI
 44761 systems, or has a pathname component that is longer than
 44762 XSI {_POSIX_NAME_MAX} on systems that do not support the XSI option or
 44763 longer than {_XOPEN_NAME_MAX} on XSI systems. A call to *mq_unlink()*
 44764 with a *name* argument that contains the same message queue name as was
 44765 previously used in a successful *mq_open()* call shall not give an
 44766 [ENAMETOOLONG] error.

44767 **EXAMPLES**

44768 None.

44769 **APPLICATION USAGE**

44770 None.

44771 **RATIONALE**

44772 None.

44773 **FUTURE DIRECTIONS**

44774 A future version might require the *mq_open()* and *mq_unlink()* functions to have semantics
 44775 similar to normal file system operations.

44776 **SEE ALSO**44777 *mq_close()*, *mq_open()*, *msgctl()*, *msgget()*, *msgrcv()*, *msgsnd()*

44778 XBD <mqqueue.h>

44779 **CHANGE HISTORY**

44780 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

44781 **Issue 6**44782 The *mq_unlink()* function is marked as part of the Message Passing option.44783 The Open Group Corrigendum U021/5 is applied, clarifying that upon unsuccessful completion,
44784 the named message queue is unchanged by this function.44785 The [ENOSYS] error condition has been removed as stubs need not be provided if an
44786 implementation does not support the Message Passing option.44787 **Issue 7**44788 Austin Group Interpretation 1003.1-2001 #077 is applied, changing [ENAMETOOLONG] from a
44789 “shall fail” to a “may fail” error .

44790 Austin Group Interpretation 1003.1-2001 #141 is applied.

44791 NAME

44792 mrnd48 — generate uniformly distributed pseudo-random signed long integers

44793 SYNOPSIS

```
44794 XSI #include <stdlib.h>  
44795 long mrnd48(void);
```

44796 DESCRIPTION

44797 Refer to *drand48()*.

44798 **NAME**44799 **msgctl** — XSI message control operations44800 **SYNOPSIS**

```
44801 XSI      #include <sys/msg.h>
44802      int msgctl(int msqid, int cmd, struct msqid_ds *buf);
```

44803 **DESCRIPTION**

44804 The *msgctl()* function operates on XSI message queues (see XBD [Section 3.225](#), on page 69). It is
 44805 unspecified whether this function interoperates with the realtime interprocess communication
 44806 facilities defined in [Section 2.8](#) (on page 502).

44807 The *msgctl()* function shall provide message control operations as specified by *cmd*. The
 44808 following values for *cmd*, and the message control operations they specify, are:

44809 **IPC_STAT** Place the current value of each member of the **msqid_ds** data structure
 44810 associated with *msqid* into the structure pointed to by *buf*. The contents of this
 44811 structure are defined in **<sys/msg.h>**.

44812 **IPC_SET** Set the value of the following members of the **msqid_ds** data structure
 44813 associated with *msqid* to the corresponding value found in the structure
 44814 pointed to by *buf*:

```
44815      msg_perm.uid
44816      msg_perm.gid
44817      msg_perm.mode
44818      msg_qbytes
```

44819 Also, the *msg_ctime* timestamp shall be set to the current time, as described in [Section 2.7.1](#) (on page 501). +
 44820 +

44821 IPC_SET can only be executed by a process with appropriate privileges or that
 44822 has an effective user ID equal to the value of **msg_perm.cuid** or
 44823 **msg_perm.uid** in the **msqid_ds** data structure associated with *msqid*. Only a
 44824 process with appropriate privileges can raise the value of **msg_qbytes**.

44825 **IPC_RMID** Remove the message queue identifier specified by *msqid* from the system and
 44826 destroy the message queue and **msqid_ds** data structure associated with it.
 44827 IPC_RMID can only be executed by a process with appropriate privileges or
 44828 one that has an effective user ID equal to the value of **msg_perm.cuid** or
 44829 **msg_perm.uid** in the **msqid_ds** data structure associated with *msqid*.

44830 **RETURN VALUE**

44831 Upon successful completion, *msgctl()* shall return 0; otherwise, it shall return -1 and set *errno* to
 44832 indicate the error.

44833 **ERRORS**

44834 The *msgctl()* function shall fail if:

44835 **[EACCES]** The argument *cmd* is IPC_STAT and the calling process does not have read
 44836 permission; see [Section 2.7](#) (on page 501).

44837 **[EINVAL]** The value of *msqid* is not a valid message queue identifier; or the value of *cmd*
 44838 is not a valid command.

44839 **[EPERM]** The argument *cmd* is IPC_RMID or IPC_SET and the effective user ID of the
 44840 calling process is not equal to that of a process with appropriate privileges and
 44841 it is not equal to the value of **msg_perm.cuid** or **msg_perm.uid** in the data

44842 structure associated with *mqd*.

44843 [EPERM] The argument *cmd* is IPC_SET, an attempt is being made to increase to the

44844 value of **msg_qbytes**, and the effective user ID of the calling process does not

44845 have appropriate privileges.

44846 EXAMPLES

44847 None.

44848 APPLICATION USAGE

44849 The POSIX Realtime Extension defines alternative interfaces for interprocess communication

44850 (IPC). Application developers who need to use IPC should design their applications so that

44851 modules using the IPC routines described in [Section 2.7](#) (on page 501) can be easily modified to

44852 use the alternative interfaces.

44853 RATIONALE

44854 None.

44855 FUTURE DIRECTIONS

44856 None.

+

NAME

msgget — get the XSI message queue identifier

SYNOPSIS

```
XSI    #include <sys/msg.h>
      int msgget(key_t key, int msgflg);
```

DESCRIPTION

The `msgget()` function operates on XSI message queues (see XBD [Section 3.225](#), on page 69). It is unspecified whether this function interoperates with the realtime interprocess communication facilities defined in [Section 2.8](#) (on page 502).

The `msgget()` function shall return the message queue identifier associated with the argument `key`.

A message queue identifier, associated message queue, and data structure (see `<sys/msg.h>`), shall be created for the argument `key` if one of the following is true:

- The argument `key` is equal to `IPC_PRIVATE`.
- The argument `key` does not already have a message queue identifier associated with it, and (`msgflg & IPC_CREAT`) is non-zero.

Upon creation, the data structure associated with the new message queue identifier shall be initialized as follows:

- `msg_perm.cuid`, `msg_perm.uid`, `msg_perm.cgid`, and `msg_perm.gid` shall be set to the effective user ID and effective group ID, respectively, of the calling process.
- The low-order 9 bits of `msg_perm.mode` shall be set to the low-order 9 bits of `msgflg`.
- `msg_qnum`, `msg_lspid`, `msg_lrpid`, `msg_stime`, and `msg_rtime` shall be set to 0.
- `msg_ctime` shall be set to the current time, as described in [Section 2.7.1](#) (on page 501).
- `msg_qbytes` shall be set to the system limit.

RETURN VALUE

Upon successful completion, `msgget()` shall return a non-negative integer, namely a message queue identifier. Otherwise, it shall return `-1` and set `errno` to indicate the error.

ERRORS

The `msgget()` function shall fail if:

[EACCES]	A message queue identifier exists for the argument <code>key</code> , but operation permission as specified by the low-order 9 bits of <code>msgflg</code> would not be granted; see Section 2.7 (on page 501).
[EEXIST]	A message queue identifier exists for the argument <code>key</code> but (<code>(msgflg & IPC_CREAT) && (msgflg & IPC_EXCL)</code>) is non-zero.
[ENOENT]	A message queue identifier does not exist for the argument <code>key</code> and (<code>msgflg & IPC_CREAT</code>) is 0.
[ENOSPC]	A message queue identifier is to be created but the system-imposed limit on the maximum number of allowed message queue identifiers system-wide would be exceeded.

44907 **EXAMPLES**

44908 None.

44909 **APPLICATION USAGE**

44910 The POSIX Realtime Extension defines alternative interfaces for interprocess communication
44911 (IPC). Application developers who need to use IPC should design their applications so that
44912 modules using the IPC routines described in [Section 2.7](#) (on page 501) can be easily modified to
44913 use the alternative interfaces.

NAME

msgrcv — XSI message receive operation

SYNOPSIS

```
XSI    #include <sys/msg.h>

      ssize_t msgrcv(int msqid, void *msgp, size_t msgsz, long msgtyp,
                    int msgflg);
```

DESCRIPTION

The *msgrcv()* function operates on XSI message queues (see XBD [Section 3.225](#), on page 69). It is unspecified whether this function interoperates with the realtime interprocess communication facilities defined in [Section 2.8](#) (on page 502).

The *msgrcv()* function shall read a message from the queue associated with the message queue identifier specified by *msqid* and place it in the user-defined buffer pointed to by *msgp*.

The application shall ensure that the argument *msgp* points to a user-defined buffer that contains first a field of type **long** specifying the type of the message, and then a data portion that holds the data bytes of the message. The structure below is an example of what this user-defined buffer might look like:

```
struct mymsg {
    long    mtype;      /* Message type. */
    char    mtext[1];   /* Message text. */
}
```

The structure member *mtype* is the received message's type as specified by the sending process.

The structure member *mtext* is the text of the message.

The argument *msgsz* specifies the size in bytes of *mtext*. The received message shall be truncated to *msgsz* bytes if it is larger than *msgsz* and (*msgflg* & MSG_NOERROR) is non-zero. The truncated part of the message shall be lost and no indication of the truncation shall be given to the calling process.

If the value of *msgsz* is greater than {SSIZE_MAX}, the result is implementation-defined.

The argument *msgtyp* specifies the type of message requested as follows:

- If *msgtyp* is 0, the first message on the queue shall be received.
- If *msgtyp* is greater than 0, the first message of type *msgtyp* shall be received.
- If *msgtyp* is less than 0, the first message of the lowest type that is less than or equal to the absolute value of *msgtyp* shall be received.

The argument *msgflg* specifies the action to be taken if a message of the desired type is not on the queue. These are as follows:

- If (*msgflg* & IPC_NOWAIT) is non-zero, the calling thread shall return immediately with a return value of -1 and *errno* set to [ENOMSG].
- If (*msgflg* & IPC_NOWAIT) is 0, the calling thread shall suspend execution until one of the following occurs:
 - A message of the desired type is placed on the queue.
 - The message queue identifier *msqid* is removed from the system; when this occurs, *errno* shall be set to [EIDRM] and -1 shall be returned.

44971 — The calling thread receives a signal that is to be caught; in this case a message is not
 44972 received and the calling thread resumes execution in the manner prescribed in
 44973 *sigaction()*.

44974 Upon successful completion, the following actions are taken with respect to the data structure
 44975 associated with *msqid*:

- 44976 • **msg_qnum** shall be decremented by 1.
- 44977 • **msg_lrpid** shall be set to the process ID of the calling process. |
- 44978 • **msg_rtime** shall be set to the current time, as described in [Section 2.7.1](#) (on page 501). |

44979 RETURN VALUE

44980 Upon successful completion, *msgrcv()* shall return a value equal to the number of bytes actually
 44981 placed into the buffer *mtext*. Otherwise, no message shall be received, *msgrcv()* shall return `-1`,
 44982 and *errno* shall be set to indicate the error. |

44983 ERRORS

44984 The *msgrcv()* function shall fail if:

44985	[E2BIG]	The value of <i>mtext</i> is greater than <i>msgsz</i> and (<i>msgflg</i> & MSG_NOERROR) is 0.
44986	[EACCES]	Operation permission is denied to the calling process; see Section 2.7 (on page 501).
44987		
44988	[EIDRM]	The message queue identifier <i>msqid</i> is removed from the system.
44989	[EINTR]	The <i>msgrcv()</i> function was interrupted by a signal.
44990	[EINVAL]	<i>msqid</i> is not a valid message queue identifier.
44991	[ENOMSG]	The queue does not contain a message of the desired type and (<i>msgflg</i> & IPC_NOWAIT) is non-zero.
44992		

44993 EXAMPLES

44994 Receiving a Message

44995 The following example receives the first message on the queue (based on the value of the *msgtyp*
 44996 argument, 0). The queue is identified by the *msqid* argument (assuming that the value has
 44997 previously been set). This call specifies that an error should be reported if no message is
 44998 available, but not if the message is too large. The message size is calculated directly using the
 44999 *sizeof* operator.

```

45000 #include <sys/msg.h>
45001 ...
45002 int result;
45003 int msqid;
45004 struct message {
45005     long type;
45006     char text[20];
45007 } msg;
45008 long msgtyp = 0;
45009 ...
45010 result = msgrcv(msqid, (void *) &msg, sizeof(msg.text),
45011                 msgtyp, MSG_NOERROR | IPC_NOWAIT);
  
```

45012 APPLICATION USAGE

45013 The POSIX Realtime Extension defines alternative interfaces for interprocess communication
45014 (IPC). Application developers who need to use IPC should design their applications so that
45015 modules using the IPC routines described in [Section 2.7](#) (on page 501) can be easily modified to
45016 use the alternative interfaces.

45027 First released in Issue 2. Derived from Issue 2 of the SVID.

45028 Issue 5

45029 The type of the return value is changed from **int** to **ssize_t**, and a warning is added to the
45030 DESCRIPTION about values of *msgsz* larger the {SSIZE_MAX}.

45031 The note about use of POSIX Realtime Extension IPC routines has been moved from FUTURE
45032 DIRECTIONS to the APPLICATION USAGE section.

45033 Issue 6

45034 The normative text is updated to avoid use of the term “must” for application requirements.

45035 Issue 7

45036 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0398 [345] and XSH/TC1-2008/0399 +
45037 [421] are applied.

NAME

msgsnd — XSI message send operation

SYNOPSIS

```
XSI    #include <sys/msg.h>

int msgsnd(int msqid, const void *msgp, size_t msgsz, int msgflg);
```

DESCRIPTION

The *msgsnd()* function operates on XSI message queues (see XBD [Section 3.225](#), on page 69). It is unspecified whether this function interoperates with the realtime interprocess communication facilities defined in [Section 2.8](#) (on page 502).

The *msgsnd()* function shall send a message to the queue associated with the message queue identifier specified by *msqid*.

The application shall ensure that the argument *msgp* points to a user-defined buffer that contains first a field of type **long** specifying the type of the message, and then a data portion that holds the data bytes of the message. The structure below is an example of what this user-defined buffer might look like:

```
struct mymsg {
    long    mtype;        /* Message type. */
    char    mtext[1];     /* Message text. */
}
```

The structure member *mtype* is a non-zero positive type **long** that can be used by the receiving process for message selection.

The structure member *mtext* is any text of length *msgsz* bytes. The argument *msgsz* can range from 0 to a system-imposed maximum.

The argument *msgflg* specifies the action to be taken if one or more of the following is true:

- The number of bytes already on the queue is equal to **msg_qbytes**; see **<sys/msg.h>**.
- The total number of messages on all queues system-wide is equal to the system-imposed limit.

These actions are as follows:

- If (*msgflg* & IPC_NOWAIT) is non-zero, the message shall not be sent and the calling thread shall return immediately.
- If (*msgflg* & IPC_NOWAIT) is 0, the calling thread shall suspend execution until one of the following occurs:
 - The condition responsible for the suspension no longer exists, in which case the message is sent.
 - The message queue identifier *msqid* is removed from the system; when this occurs, *errno* shall be set to [EIDRM] and **-1** shall be returned.
 - The calling thread receives a signal that is to be caught; in this case the message is not sent and the calling thread resumes execution in the manner prescribed in [sigaction\(\)](#).

Upon successful completion, the following actions are taken with respect to the data structure associated with *msqid*; see `<sys/msg.h>`:

- **msg_qnum** shall be incremented by 1.
- **msg_lspid** shall be set to the process ID of the calling process.
- **msg_stime** shall be set to the current time, as described in [Section 2.7.1](#) (on page 501).

RETURN VALUE

Upon successful completion, *msgsnd()* shall return 0; otherwise, no message shall be sent, *msgsnd()* shall return -1, and *errno* shall be set to indicate the error.

ERRORS

The *msgsnd()* function shall fail if:

[EACCES]	Operation permission is denied to the calling process; see Section 2.7 (on page 501).
[EAGAIN]	The message cannot be sent for one of the reasons cited above and (<i>msgflg</i> & <i>IPC_NOWAIT</i>) is non-zero.
[EIDRM]	The message queue identifier <i>msqid</i> is removed from the system.
[EINTR]	The <i>msgsnd()</i> function was interrupted by a signal.
[EINVAL]	The value of <i>msqid</i> is not a valid message queue identifier, or the value of <i>mtyp</i> is less than 1; or the value of <i>msgsz</i> is greater than the system-imposed limit.

EXAMPLES

Sending a Message

The following example sends a message to the queue identified by the *msqid* argument (assuming that value has previously been set). This call specifies that an error should be reported if no message is available. The message size is calculated directly using the *sizeof* operator.

```
#include <sys/msg.h>
...
int result;
int msqid;
struct message {
    long type;
    char text[20];
} msg;

msg.type = 1;
strcpy(msg.text, "This is message 1");
...
result = msgsnd(msqid, (void *) &msg, sizeof(msg.text), IPC_NOWAIT);
```

APPLICATION USAGE

The POSIX Realtime Extension defines alternative interfaces for interprocess communication (IPC). Application developers who need to use IPC should design their applications so that modules using the IPC routines described in [Section 2.7](#) (on page 501) can be easily modified to use the alternative interfaces.

NAME

msync — synchronize memory with physical storage

SYNOPSIS

```
#include <sys/mman.h>

int msync(void *addr, size_t len, int flags);
```

DESCRIPTION

The *msync()* function shall write all modified data to permanent storage locations, if any, in those whole pages containing any part of the address space of the process starting at address *addr* and continuing for *len* bytes. If no such storage exists, *msync()* need not have any effect. If requested, the *msync()* function shall then invalidate cached copies of data.

The implementation may require that *addr* be a multiple of the page size as returned by *sysconf()*.

For mappings to files, the *msync()* function shall ensure that all write operations are completed as defined for synchronized I/O data integrity completion. It is unspecified whether the implementation also writes out other file attributes. When the *msync()* function is called on MAP_PRIVATE mappings, any modified data shall not be written to the underlying object and shall not cause such data to be made visible to other processes. It is unspecified whether data in MAP_PRIVATE mappings has any permanent storage locations. The effect of *msync()* on a shared memory object or a typed memory object is unspecified. The behavior of this function is unspecified if the mapping was not established by a call to *mmap()*.

The *flags* argument is constructed from the bitwise-inclusive OR of one or more of the following flags defined in the *<sys/mman.h>* header:

Symbolic Constant	Description
MS_ASYNC	Perform asynchronous writes.
MS_SYNC	Perform synchronous writes.
MS_INVALIDATE	Invalidate cached data.

When MS_ASYNC is specified, *msync()* shall return immediately once all the write operations are initiated or queued for servicing; when MS_SYNC is specified, *msync()* shall not return until all write operations are completed as defined for synchronized I/O data integrity completion. Either MS_ASYNC or MS_SYNC shall be specified, but not both.

When MS_INVALIDATE is specified, *msync()* shall invalidate all cached copies of mapped data that are inconsistent with the permanent storage locations such that subsequent references shall obtain data that was consistent with the permanent storage locations sometime between the call to *msync()* and the first subsequent memory reference to the data.

If *msync()* causes any write to a file, the file's last data modification and last file status change timestamps shall be marked for update.

RETURN VALUE

Upon successful completion, *msync()* shall return 0; otherwise, it shall return -1 and set *errno* to indicate the error.

ERRORS

The *msync()* function shall fail if:

[EBUSY] Some or all of the addresses in the range starting at *addr* and continuing for *len* bytes are locked, and MS_INVALIDATE is specified.

45180 [EINVAL] The value of *flags* is invalid.

45181 [ENOMEM] The addresses in the range starting at *addr* and continuing for *len* bytes are

45182 outside the range allowed for the address space of a process or specify one or

45183 more pages that are not mapped.

45184 The *msync()* function may fail if:

45185 [EINVAL] The value of *addr* is not a multiple of the page size as returned by *sysconf()*.

45186 EXAMPLES

45187 None.

45188 APPLICATION USAGE

45189 The *msync()* function is only supported if the Synchronized Input and Output option is

45190 supported, and thus need not be available on all implementations.

45191 The *msync()* function should be used by programs that require a memory object to be in a

45192 known state; for example, in building transaction facilities.

45193 Normal system activity can cause pages to be written to disk. Therefore, there are no guarantees

45194 that *msync()* is the only control over when pages are or are not written to disk.

45195 RATIONALE

45196 The *msync()* function writes out data in a mapped region to the permanent storage for the

45197 underlying object. The call to *msync()* ensures data integrity of the file.

45198 After the data is written out, any cached data may be invalidated if the MS_INVALIDATE flag

45199 was specified. This is useful on systems that do not support read/write consistency.

45200 FUTURE DIRECTIONS

45201 None.

45202 SEE ALSO

45203 *mmap()*, *sysconf()*

45204 XBD <sys/mman.h>

45205 CHANGE HISTORY

45206 First released in Issue 4, Version 2.

45207 Issue 5

45208 Moved from X/OPEN UNIX extension to BASE.

45209 Aligned with *msync()* in the POSIX Realtime Extension as follows:

- 45210 • The DESCRIPTION is extensively reworded.
- 45211 • [EBUSY] and a new form of [EINVAL] are added as mandatory error conditions.

45212 Issue 6

45213 The *msync()* function is marked as part of the Memory Mapped Files and Synchronized Input

45214 and Output options.

45215 The following changes are made for alignment with the ISO POSIX-1:1996 standard:

- 45216 • The [EBUSY] mandatory error condition is added.

45217 The following new requirements on POSIX implementations derive from alignment with the

45218 Single UNIX Specification:

- 45219 • The DESCRIPTION is updated to state that implementations require *addr* to be a multiple
- 45220 of the page size.
- 45221 • The second [EINVAL] error condition is made mandatory.
- 45222 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by adding reference to
- 45223 typed memory objects.
- 45224 **Issue 7**
- 45225 Austin Group Interpretation 1003.1-2001 #078 is applied, clarifying page alignment
- 45226 requirements.
- 45227 SD5-XSH-ERN-110 is applied.
- 45228 The *msync()* function is marked as part of the Synchronized Input and Output option or XSI
- 45229 option as the Memory Mapped Files is moved to the Base.
- 45230 Changes are made related to support for finegrained timestamps.

45231 NAME

45232 munlock — unlock a range of process address space

45233 SYNOPSIS

```
45234 MLR       #include <sys/mman.h>  
45235       int munlock(const void *addr, size_t len);
```

45236 DESCRIPTION

45237 Refer to *mlock()*.

45238 **NAME**

45239 munlockall — unlock the address space of a process

45240 **SYNOPSIS**

45241 ML #include <sys/mman.h>

45242 int munlockall(void);

45243 **DESCRIPTION**45244 Refer to *mlckall()*.

45245 **NAME**45246 **munmap** — unmap pages of memory45247 **SYNOPSIS**45248 `#include <sys/mman.h>`45249 `int munmap(void *addr, size_t len);`45250 **DESCRIPTION**

45251 The *munmap()* function shall remove any mappings for those entire pages containing any part of
 45252 the address space of the process starting at *addr* and continuing for *len* bytes. Further references
 45253 to these pages shall result in the generation of a SIGSEGV signal to the process. If there are no
 45254 mappings in the specified address range, then *munmap()* has no effect.

45255 The implementation may require that *addr* be a multiple of the page size as returned by
 45256 *sysconf()*.

45257 If a mapping to be removed was private, any modifications made in this address range shall be
 45258 discarded.

45259 ML|MLR Any memory locks (see *mlock()* and *mlockall()*) associated with this address range shall be
 45260 removed, as if by an appropriate call to *munlock()*.

45261 TYM If a mapping removed from a typed memory object causes the corresponding address range of
 45262 the memory pool to be inaccessible by any process in the system except through allocatable
 45263 mappings (that is, mappings of typed memory objects opened with the
 45264 POSIX_TYPED_MEM_MAP_ALLOCATABLE flag), then that range of the memory pool shall
 45265 become deallocated and may become available to satisfy future typed memory allocation
 45266 requests.

45267 A mapping removed from a typed memory object opened with the
 45268 POSIX_TYPED_MEM_MAP_ALLOCATABLE flag shall not affect in any way the availability of
 45269 that typed memory for allocation.

45270 The behavior of this function is unspecified if the mapping was not established by a call to
 45271 *mmap()*.

45272 **RETURN VALUE**

45273 Upon successful completion, *munmap()* shall return 0; otherwise, it shall return -1 and set *errno*
 45274 to indicate the error.

45275 **ERRORS**

45276 The *munmap()* function shall fail if:

45277 [EINVAL] Addresses in the range [*addr*,*addr*+*len*) are outside the valid range for the
 45278 address space of a process.

45279 [EINVAL] The *len* argument is 0.

45280 The *munmap()* function may fail if:

45281 [EINVAL] The *addr* argument is not a multiple of the page size as returned by *sysconf()*.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

The *munmap()* function corresponds to SVR4, just as the *mmap()* function does.

It is possible that an application has applied process memory locking to a region that contains shared memory. If this has occurred, the *munmap()* call ignores those locks and, if necessary, causes those locks to be removed.

Most implementations require that *addr* is a multiple of the page size as returned by *sysconf()*.

FUTURE DIRECTIONS

None.

mlock(), *mlockall()*, *mmap()*, *posix_typed_mem_open()*, *sysconf()*

XBD <sys/mman.h>

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Aligned with *munmap()* in the POSIX Realtime Extension as follows:

- The DESCRIPTION is extensively reworded.
- The SIGBUS error is no longer permitted to be generated.

Issue 6

The *munmap()* function is marked as part of the Memory Mapped Files and Shared Memory Objects option.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The DESCRIPTION is updated to state that implementations require *addr* to be a multiple of the page size.
- The [EINVAL] error conditions are added.

The following changes are made for alignment with IEEE Std 1003.1j-2000:

- Semantics for typed memory objects are added to the DESCRIPTION.
- The *posix_typed_mem_open()* function is added to the SEE ALSO section.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/36 is applied, changing the margin code in the SYNOPSIS from MF|SHM to MC3 (notation for MF|SHM|TYM).

Issue 7

Austin Group Interpretation 1003.1-2001 #078 is applied, clarifying page alignment requirements.

The *munmap()* function is moved from the Memory Mapped Files option to the Base.

45321 **NAME**

45322 nan, nanf, nanl — return quiet NaN

45323 **SYNOPSIS**

```
45324 #include <math.h>
45325 double nan(const char *tagp);
45326 float nanf(const char *tagp);
45327 long double nanl(const char *tagp);
```

45328 **DESCRIPTION**

45329 CX The functionality described on this reference page is aligned with the ISO C standard. Any
45330 conflict between the requirements described here and the ISO C standard is unintentional. This
45331 volume of POSIX.1-2008 defers to the ISO C standard.

45332 The function call *nan("n-char-sequence")* shall be equivalent to:

```
45333 strtod("NAN(n-char-sequence)", (char **) NULL);
```

45334 The function call *nan("")* shall be equivalent to:

```
45335 strtod("NAN()", (char **) NULL)
```

45336 If *tagp* does not point to an *n-char* sequence or an empty string, the function call shall be
45337 equivalent to:

```
45338 strtod("NAN", (char **) NULL)
```

45339 Function calls to *nanf()* and *nanl()* are equivalent to the corresponding function calls to *strtod()*
45340 and *strtold()*.

45341 **RETURN VALUE**

45342 These functions shall return a quiet NaN, if available, with content indicated through *tagp*.

45343 If the implementation does not support quiet NaNs, these functions shall return zero.

45344 **ERRORS**

45345 No errors are defined.

45346 **EXAMPLES**

45347 None.

45348 **APPLICATION USAGE**

45349 None.

45350 **RATIONALE**

45351 None.

45352 **FUTURE DIRECTIONS**

45353 None.

45357 **CHANGE HISTORY**

45358 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

NAME

nanosleep — high resolution sleep

SYNOPSIS

```
CX      #include <time.h>
45363      int nanosleep(const struct timespec *rqtp, struct timespec *rmtp);
```

DESCRIPTION

The *nanosleep()* function shall cause the current thread to be suspended from execution until either the time interval specified by the *rqtp* argument has elapsed or a signal is delivered to the calling thread, and its action is to invoke a signal-catching function or to terminate the process. The suspension time may be longer than requested because the argument value is rounded up to an integer multiple of the sleep resolution or because of the scheduling of other activity by the system. But, except for the case of being interrupted by a signal, the suspension time shall not be less than the time specified by *rqtp*, as measured by the system clock *CLOCK_REALTIME*.

The use of the *nanosleep()* function has no effect on the action or blockage of any signal.

RETURN VALUE

If the *nanosleep()* function returns because the requested time has elapsed, its return value shall be zero.

If the *nanosleep()* function returns because it has been interrupted by a signal, it shall return a value of *-1* and set *errno* to indicate the interruption. If the *rmtp* argument is non-NULL, the **timespec** structure referenced by it is updated to contain the amount of time remaining in the interval (the requested time minus the time actually slept). The *rqtp* and *rmtp* arguments may point to the same object. If the *rmtp* argument is NULL, the remaining time is not returned.

If *nanosleep()* fails, it shall return a value of *-1* and set *errno* to indicate the error.

ERRORS

The *nanosleep()* function shall fail if:

[EINTR]	The <i>nanosleep()</i> function was interrupted by a signal.
[EINVAL]	The <i>rqtp</i> argument specified a nanosecond value less than zero or greater than or equal to 1 000 million.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

It is common to suspend execution of a thread for an interval in order to poll the status of a non-interrupting function. A large number of actual needs can be met with a simple extension to *sleep()* that provides finer resolution.

In the POSIX.1-1990 standard and SVR4, it is possible to implement such a routine, but the frequency of wakeup is limited by the resolution of the *alarm()* and *sleep()* functions. In 4.3 BSD, it is possible to write such a routine using no static storage and reserving no system facilities. Although it is possible to write a function with similar functionality to *sleep()* using the remainder of the *timer_**() functions, such a function requires the use of signals and the reservation of some signal number. This volume of POSIX.1-2008 requires that *nanosleep()* be non-intrusive of the signals function.

The *nanosleep()* function shall return a value of 0 on success and *-1* on failure or if interrupted.

45403 This latter case is different from *sleep()*. This was done because the remaining time is returned
45404 via an argument structure pointer, *rmtpt*, instead of as the return value.

45405 **FUTURE DIRECTIONS**

45406 None.

45407 **SEE ALSO**

45408 *clock_nanosleep()*, *sleep()*

45409 XBD <time.h>

45410 **CHANGE HISTORY**

45411 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

45412 **Issue 6**

45413 The *nanosleep()* function is marked as part of the Timers option.

45414 The [ENOSYS] error condition has been removed as stubs need not be provided if an
45415 implementation does not support the Timers option.

45416 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/37 is applied, updating the SEE ALSO
45417 section to include the *clock_nanosleep()* function.

45418 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/63 is applied, correcting text in the
45419 RATIONALE section.

45420 **Issue 7**

45421 SD5-XBD-ERN-33 is applied.

45422 The *nanosleep()* function is moved from the Timers option to the Base.

45423 **NAME**

45424 nearbyint, nearbyintf, nearbyintl — floating-point rounding functions

45425 **SYNOPSIS**

```
45426 #include <math.h>
45427 double nearbyint(double x);
45428 float nearbyintf(float x);
45429 long double nearbyintl(long double x);
```

45430 **DESCRIPTION**

45431 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 45432 conflict between the requirements described here and the ISO C standard is unintentional. This
 45433 volume of POSIX.1-2008 defers to the ISO C standard.

45434 These functions shall round their argument to an integer value in floating-point format, using
 45435 the current rounding direction and without raising the inexact floating-point exception. -

45436 **RETURN VALUE**

45437 MX Upon successful completion, these functions shall return the rounded integer value. The result
 45438 shall have the same sign as x . +

45439 MX If x is NaN, a NaN shall be returned.

45440 If x is ± 0 , ± 0 shall be returned.

45441 If x is $\pm \text{Inf}$, x shall be returned. -

45442 **ERRORS**

45443 No errors are defined. |

45444 **EXAMPLES**

45445 None.

45446 **APPLICATION USAGE**

45447 The integral value returned by these functions need not be expressible as an `intmax_t`. The
 45448 return value should be tested before assigning it to an integer type to avoid the undefined
 45449 results of an integer overflow. |

45450 **RATIONALE**

NAME

newlocale — create or modify a locale object

SYNOPSIS

```
CX    #include <locale.h>

    locale_t newlocale(int category_mask, const char *locale,
    locale_t base);
```

DESCRIPTION

The *newlocale()* function shall create a new locale object or modify an existing one. If the *base* argument is **(locale_t)0**, a new locale object shall be created. It is unspecified whether the locale object pointed to by *base* shall be modified, or freed and a new locale object created.

The *category_mask* argument specifies the locale categories to be set or modified. Values for *category_mask* shall be constructed by a bitwise-inclusive OR of the symbolic constants *LC_CTYPE_MASK*, *LC_NUMERIC_MASK*, *LC_TIME_MASK*, *LC_COLLATE_MASK*, *LC_MONETARY_MASK*, and *LC_MESSAGES_MASK*, or any of the other implementation-defined *LC_*_MASK* values defined in **<locale.h>**.

For each category with the corresponding bit set in *category_mask* the data from the locale named by *locale* shall be used. In the case of modifying an existing locale object, the data from the locale named by *locale* shall replace the existing data within the locale object. If a completely new locale object is created, the data for all sections not requested by *category_mask* shall be taken from the default locale.

The following preset values of *locale* are defined for all settings of *category_mask*:

"POSIX"	Specifies the minimal environment for C-language translation called the POSIX locale.
"C"	Equivalent to "POSIX".
" "	Specifies an implementation-defined native environment. This corresponds to the value of the associated environment variables, <i>LC_*</i> and <i>LANG</i> ; see XBD Chapter 7 (on page 135) and Chapter 8 (on page 173).

If the *base* argument is not **(locale_t)0** and the *newlocale()* function call succeeds, the contents of *base* are unspecified. Applications shall ensure that they stop using *base* as a locale object before calling *newlocale()*. If the function call fails and the *base* argument is not **(locale_t)0**, the contents of *base* shall remain valid and unchanged.

The behavior is undefined if the *base* argument is the special locale object *LC_GLOBAL_LOCALE*, or is not a valid locale object handle and is not **(locale_t)0**.

RETURN VALUE

Upon successful completion, the *newlocale()* function shall return a handle which the caller may use on subsequent calls to *duplocale()*, *freelocale()*, and other functions taking a **locale_t** argument.

Upon failure, the *newlocale()* function shall return **(locale_t)0** and set *errno* to indicate the error.

ERRORS

The *newlocale()* function shall fail if:

[ENOMEM]	There is not enough memory available to create the locale object or load the locale data.

45503 [EINVAL] The *category_mask* contains a bit that does not correspond to a valid category.

45504 [ENOENT] For any of the categories in *category_mask*, the locale data is not available.

45505 The *newlocale()* function may fail if:

45506 [EINVAL] The *locale* argument is not a valid string pointer.

45507 EXAMPLES

45508 Constructing a Locale Object from Different Locales

45509 The following example shows the construction of a locale where the *LC_CTYPE* category data |
 45510 comes from a locale *loc1* and the *LC_TIME* category data from a locale *tok2*:

```
45511 #include <locale.h>
45512 ...
45513 locale_t loc, new_loc;
45514 /* Get the "loc1" data. */
45515 loc = newlocale (LC_CTYPE_MASK, "loc1", (locale_t)0);
45516 if (loc == (locale_t) 0)
45517     abort ();
45518 /* Get the "loc2" data. */
45519 new_loc = newlocale (LC_TIME_MASK, "loc2", loc);
45520 if (new_loc != (locale_t) 0)
45521     /* We don't abort if this fails. In this case this
45522        simply used to unchanged locale object. */
45523     loc = new_loc;
45524 ...
```

45525 Freeing up a Locale Object

45526 The following example shows a code fragment to free a locale object created by *newlocale()*:

```
45527 #include <locale.h>
45528 ...
45529 /* Every locale object allocated with newlocale() should be
45530    * freed using freelocale():
45531    */
45532 locale_t loc;
45533 /* Get the locale. */
45534 loc = newlocale (LC_CTYPE_MASK | LC_TIME_MASK, "locname", (locale_t)0); |
45535 /* ... Use the locale object ... */
45536 ...
45537 /* Free the locale object resources. */
45538 freelocale (loc);
```

APPLICATION USAGE

Handles for locale objects created by the *newlocale()* function should either be released by a corresponding call to *freelocale()*, or be used as a base locale to another *newlocale()* call.

The special locale object LC_GLOBAL_LOCALE must not be passed for the *base* argument, even when returned by the *uselocale()* function.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 7.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0403 [227], XSH/TC1-2008/0404 [283], + XSH/TC1-2008/0405 [295], and XSH/TC1-2008/0406 [227] are applied.

45555 **NAME**

45556 nextafter, nextafterf, nextafterl, nexttoward, nexttowardf, nexttowardl — next representable
 45557 floating-point number

45558 **SYNOPSIS**

```
45559       #include <math.h>

45560       double nextafter(double x, double y);
45561       float nextafterf(float x, float y);
45562       long double nextafterl(long double x, long double y);
45563       double nexttoward(double x, long double y);
45564       float nexttowardf(float x, long double y);
45565       long double nexttowardl(long double x, long double y);
```

45566 **DESCRIPTION**

45567 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any
 45568 conflict between the requirements described here and the ISO C standard is unintentional. This
 45569 volume of POSIX.1-2008 defers to the ISO C standard.

45570 The *nextafter()*, *nextafterf()*, and *nextafterl()* functions shall compute the next representable
 45571 floating-point value following *x* in the direction of *y*. Thus, if *y* is less than *x*, *nextafter()* shall
 45572 return the largest representable floating-point number less than *x*. The *nextafter()*, *nextafterf()*,
 45573 and *nextafterl()* functions shall return *y* if *x* equals *y*.

45574 The *nexttoward()*, *nexttowardf()*, and *nexttowardl()* functions shall be equivalent to the
 45575 corresponding *nextafter()* functions, except that the second parameter shall have type **long**
 45576 **double** and the functions shall return *y* converted to the type of the function if *x* equals *y*.

45577 An application wishing to check for error situations should set *errno* to zero and call
 45578 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 45579 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 45580 zero, an error has occurred.

45581 **RETURN VALUE**

45582 Upon successful completion, these functions shall return the next representable floating-point
 45583 value following *x* in the direction of *y*.

45584 If *x*=*y*, *y* (of the type *x*) shall be returned.

45585 If *x* is finite and the correct function value would overflow, a range error shall occur and
 45586 ±HUGE_VAL, ±HUGE_VALF, and ±HUGE_VALL (with the same sign as *x*) shall be returned as
 45587 appropriate for the return type of the function.

45588 **MX** If *x* or *y* is NaN, a NaN shall be returned.

45589 **MX** If *x*!=*y* and the correct function value is subnormal, zero, or underflows, a range error shall
 45590 occur, and

45591 **MXX** the correct function value (if representable) or

45592 **MX** 0.0 shall be returned.

45593 **ERRORS**

45594 These functions shall fail if:

45595 Range Error The correct value overflows.

45596 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 45597 then *errno* shall be set to [ERANGE]. If the integer expression
 45598 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the overflow
 45599 floating-point exception shall be raised.

45600 MX **Range Error** The correct value is subnormal or underflows.
 45601 If the integer expression *(math_errhandling & MATH_ERRNO)* is non-zero,
 45602 then *errno* shall be set to [ERANGE]. If the integer expression
 45603 *(math_errhandling & MATH_ERREXCEPT)* is non-zero, then the underflow
 45604 floating-point exception shall be raised.

45605 EXAMPLES

45606 None.

45607 APPLICATION USAGE

45608 On error, the expressions *(math_errhandling & MATH_ERRNO)* and *(math_errhandling &*
 45609 *MATH_ERREXCEPT)* are independent of each other, but at least one of them must be non-zero.

45610 When `<tgmath.h>` is included, note that the return type of *nextafter()* depends on the generic +
 45611 typing deduced from both arguments, while the return type of *nexttoward()* depends only on the +
 45612 generic typing of the first argument.

45613 RATIONALE

45614 None.

45615 FUTURE DIRECTIONS

45616 None.

NAME

nftw — walk a file tree

SYNOPSIS

```
XSI      #include <ftw.h>

int nftw(const char *path, int (*fn)(const char *,
    const struct stat *, int, struct FTW *), int fd_limit, int flags);
```

DESCRIPTION

The *nftw()* function shall recursively descend the directory hierarchy rooted in *path*. The *nftw()* function has a similar effect to *ftw()* except that it takes an additional argument *flags*, which is a bitwise-inclusive OR of zero or more of the following flags:

FTW_CHDIR If set, *nftw()* shall change the current working directory to each directory as it reports files in that directory. If clear, *nftw()* shall not change the current working directory.

FTW_DEPTH If set, *nftw()* shall report all files in a directory before reporting the directory itself. If clear, *nftw()* shall report any directory before reporting the files in that directory.

FTW_MOUNT If set, *nftw()* shall only report files in the same file system as *path*. If clear, *nftw()* shall report all files encountered during the walk.

FTW_PHYS If set, *nftw()* shall perform a physical walk and shall not follow symbolic links.

If **FTW_PHYS** is clear and **FTW_DEPTH** is set, *nftw()* shall follow links instead of reporting them, but shall not report any directory that would be a descendant of itself. If **FTW_PHYS** is clear and **FTW_DEPTH** is clear, *nftw()* shall follow links instead of reporting them, but shall not report the contents of any directory that would be a descendant of itself.

At each file it encounters, *nftw()* shall call the user-supplied function *fn* with four arguments:

- The first argument is the pathname of the object.
- The second argument is a pointer to the **stat** buffer containing information on the object, filled in as if *fstatat()*, *stat()*, or *lstat()* had been called to retrieve the information.
- The third argument is an integer giving additional information. Its value is one of the following:

FTW_D The object is a directory.

FTW_DNR The object is a directory that cannot be read. The *fn* function shall not be called for any of its descendants.

FTW_DP The object is a directory and subdirectories have been visited. (This condition shall only occur if the **FTW_DEPTH** flag is included in *flags*.)

FTW_F The object is a non-directory file.

FTW_NS The *stat()* function failed on the object because of lack of appropriate permission. The **stat** buffer passed to *fn* is undefined. Failure of *stat()* for any other reason is considered an error and *nftw()* shall return -1 .

FTW_SL The object is a symbolic link. (This condition shall only occur if the **FTW_PHYS** flag is included in *flags*.)

45675 FTW_SLN The object is a symbolic link that does not name an existing file. (This
45676 condition shall only occur if the FTW_PHYS flag is not included in *flags*.)

- 45677 • The fourth argument is a pointer to an **FTW** structure. The value of **base** is the offset of the
45678 object's filename in the pathname passed as the first argument to *fn*. The value of **level**
45679 indicates depth relative to the root of the walk, where the root level is 0.

45680 The results are unspecified if the application-supplied *fn* function does not preserve the current
45681 working directory.

45682 The argument *fd_limit* sets the maximum number of file descriptors that shall be used by *nftw()*
45683 while traversing the file tree. At most one file descriptor shall be used for each directory level.

45684 The *nftw()* function need not be thread-safe.

45685 RETURN VALUE

45686 The *nftw()* function shall continue until the first of the following conditions occurs:

- 45687 • An invocation of *fn* shall return a non-zero value, in which case *nftw()* shall return that
45688 value.
- 45689 • The *nftw()* function detects an error other than [EACCES] (see FTW_DNR and FTW_NS
45690 above), in which case *nftw()* shall return -1 and set *errno* to indicate the error.
- 45691 • The tree is exhausted, in which case *nftw()* shall return 0.

45692 ERRORS

45693 The *nftw()* function shall fail if:

45694 [EACCES] Search permission is denied for any component of *path* or read permission is
45695 denied for *path*, or *fn* returns -1 and does not reset *errno*.

45696 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*
45697 argument.

45698 [ENAMETOOLONG]
45699 The length of a component of a pathname is longer than {NAME_MAX}.

45700 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.

45701 [ENOTDIR] A component of *path* names an existing file that is neither a directory nor a
45702 symbolic link to a directory.

45703 [EOVERFLOW] A field in the **stat** structure cannot be represented correctly in the current
45704 programming environment for one or more files found in the file hierarchy.

45705 The *nftw()* function may fail if:

45706 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
45707 resolution of the *path* argument.

45708 [EMFILE] All file descriptors available to the process are currently open.

45709 [ENAMETOOLONG]
45710 The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a
45711 symbolic link produced an intermediate result with a length that exceeds
45712 {PATH_MAX}.

45713 [ENFILE] Too many files are currently open in the system.

45714 In addition, *errno* may be set if the function pointed to by *fn* causes *errno* to be set.

EXAMPLES

The following program traverses the directory tree under the path named in its first command-line argument, or under the current directory if no argument is supplied. It displays various information about each file. The second command-line argument can be used to specify characters that control the value assigned to the *flags* argument when calling *nftw()*.

```
#include <ftw.h>
#include <stdio.h>
#include <stdlib.h>
#include <string.h>
#include <stdint.h>

static int
display_info(const char *fpath, const struct stat *sb,
             int tflag, struct FTW *ftwbuf)
{
    printf("%-3s %2d %7jd    %-40s %d %s\n",
           (tflag == FTW_D) ? "d" : (tflag == FTW_DNR) ? "dnr" :
           (tflag == FTW_DP) ? "dp" : (tflag == FTW_F) ?
           (S_ISBLK(sb->st_mode) ? "f b" :
            S_ISCHR(sb->st_mode) ? "f c" :
            S_ISFIFO(sb->st_mode) ? "f p" :
            S_ISREG(sb->st_mode) ? "f r" :
            S_ISSOCK(sb->st_mode) ? "f s" : "f ?") :
           (tflag == FTW_NS) ? "ns" : (tflag == FTW_SL) ? "sl" :
           (tflag == FTW_SLN) ? "sln" : "?",
           ftwbuf->level, (intmax_t) sb->st_size,
           fpath, ftwbuf->base, fpath + ftwbuf->base);
    return 0; /* To tell nftw() to continue */
}

int
main(int argc, char *argv[])
{
    int flags = 0;

    if (argc > 2 && strchr(argv[2], 'd') != NULL)
        flags |= FTW_DEPTH;
    if (argc > 2 && strchr(argv[2], 'p') != NULL)
        flags |= FTW_PHYS;

    if (nftw((argc < 2) ? "." : argv[1], display_info, 20, flags) == -1)
    {
        perror("nftw");
        exit(EXIT_FAILURE);
    }

    exit(EXIT_SUCCESS);
}
```

APPLICATION USAGE

The *nftw()* function may allocate dynamic storage during its operation. If *nftw()* is forcibly terminated, such as by *longjmp()* or *siglongjmp()* being executed by the function pointed to by *fn* or an interrupt routine, *nftw()* does not have a chance to free that storage, so it remains permanently allocated. A safe way to handle interrupts is to store the fact that an interrupt has

45763 occurred, and arrange to have the function pointed to by *fn* return a non-zero value at its next
 45764 invocation.

45765 **RATIONALE**

45766 None.

45767 **FUTURE DIRECTIONS**

45768 None.

45773 First released in Issue 4, Version 2.

45774 **Issue 5**

45775 Moved from X/OPEN UNIX extension to BASE.

45776 In the DESCRIPTION, the definition of the *depth* argument is clarified.

45777 **Issue 6**

45778 The Open Group Base Resolution bwg97-003 is applied.

45779 The ERRORS section is updated as follows:

- 45780 • The wording of the mandatory [ELOOP] error condition is updated.
- 45781 • A second optional [ELOOP] error condition is added.
- 45782 • The [EOVERFLOW] mandatory error condition is added.

45783 Text is added to the DESCRIPTION to say that the *nftw()* function need not be reentrant and that
 45784 the results are unspecified if the application-supplied *fn* function does not preserve the current
 45785 working directory.

45786 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/64 is applied, changing the argument
 45787 *depth* to *fd_limit* throughout and changing “to a maximum of 5 levels deep” to “using a
 45788 maximum of 5 file descriptors” in the EXAMPLES section.

45789 **Issue 7**

45790 Austin Group Interpretations 1003.1-2001 #143 and #156 are applied.

45791 SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.

45792 SD5-XBD-ERN-61 is applied.

45793 APPLICATION USAGE is added and the EXAMPLES section is replaced with a new example.

45794 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0409 [403], XSH/TC1-2008/0410 [324], +
 45795 and XSH/TC1-2008/0411 [403] are applied.

NAME

nice — change the nice value of a process

SYNOPSIS

```
#include <unistd.h>

int nice(int incr);
```

DESCRIPTION

The *nice()* function shall add the value of *incr* to the nice value of the calling process. A nice value of a process is a non-negative number for which a more positive value shall result in less favorable scheduling.

A maximum nice value of $2 \times \{\text{NZERO}\} - 1$ and a minimum nice value of 0 shall be imposed by the system. Requests for values above or below these limits shall result in the nice value being set to the corresponding limit. Only a process with appropriate privileges can lower the nice value.

PS|TPS Calling the *nice()* function has no effect on the priority of processes or threads with policy SCHED_FIFO or SCHED_RR. The effect on processes or threads with other scheduling policies is implementation-defined.

The nice value set with *nice()* shall be applied to the process. If the process is multi-threaded, the nice value shall affect all system scope threads in the process.

As -1 is a permissible return value in a successful situation, an application wishing to check for error situations should set *errno* to 0, then call *nice()*, and if it returns -1 , check to see whether *errno* is non-zero.

RETURN VALUE

Upon successful completion, *nice()* shall return the new nice value $-\{\text{NZERO}\}$. Otherwise, -1 shall be returned, the nice value of the process shall not be changed, and *errno* shall be set to indicate the error.

ERRORS

The *nice()* function shall fail if:

[EPERM] The *incr* argument is negative and the calling process does not have appropriate privileges.

EXAMPLES**Changing the Nice Value**

The following example adds the value of the *incr* argument, -20 , to the nice value of the calling process.

```
#include <unistd.h>
...
int incr = -20;
int ret;

ret = nice(incr);
```

APPLICATION USAGE

NAME

nl_langinfo, nl_langinfo_l — language information

SYNOPSIS

```
#include <langinfo.h>
```

```
char *nl_langinfo(nl_item item);
```

```
char *nl_langinfo_l(nl_item item, locale_t locale);
```

DESCRIPTION

The *nl_langinfo()* and *nl_langinfo_l()* functions shall return a pointer to a string containing information relevant to the particular language or cultural area defined in the current locale, or in the locale represented by *locale*, respectively (see <langinfo.h>). The manifest constant names and values of *item* are defined in <langinfo.h>. For example:

```
nl_langinfo(ABDAY_1)
```

would return a pointer to the string "Dom" if the identified language was Portuguese, and "Sun" if the identified language was English.

```
nl_langinfo_l(ABDAY_1, loc)
```

would return a pointer to the string "Dom" if the identified language of the locale represented by *loc* was Portuguese, and "Sun" if the identified language of the locale represented by *loc* was English.

The *nl_langinfo()* function need not be thread-safe.

The behavior is undefined if the *locale* argument to *nl_langinfo_l()* is the special locale object LC_GLOBAL_LOCALE or is not a valid locale object handle.

RETURN VALUE

In a locale where *langinfo* data is not defined, these functions shall return a pointer to the corresponding string in the POSIX locale. In all locales, these functions shall return a pointer to an empty string if *item* contains an invalid setting.

The application shall not modify the string returned. The pointer returned by *nl_langinfo()* might be invalidated or the string content might be overwritten by a subsequent call to *nl_langinfo()* in any thread or to *nl_langinfo_l()* in the same thread or the initial thread, by subsequent calls to *setlocale()* with a category corresponding to the category of *item* (see <langinfo.h>) or the category LC_ALL, or by subsequent calls to *uselocale()* which change the category corresponding to the category of *item*. The pointer returned by *nl_langinfo_l()* might be invalidated or the string content might be overwritten by a subsequent call to *nl_langinfo_l()* in the same thread or to *nl_langinfo()* in any thread, or by subsequent calls to *freelocale()* or *newlocale()* which free or modify the locale object that was passed to *nl_langinfo_l()*.

ERRORS

No errors are defined.

EXAMPLES**Getting Date and Time Formatting Information**

The following example returns a pointer to a string containing date and time formatting information, as defined in the *LC_TIME* category of the current locale.

```
#include <time.h>
#include <langinfo.h>
...
strftime(datestring, sizeof(datestring), nl_langinfo(D_T_FMT), tm);
...
```

APPLICATION USAGE

The array pointed to by the return value should not be modified by the program, but may be modified by further calls to these functions.

RATIONALE

The possible interactions between internal data used by *nl_langinfo()* and *nl_langinfo_l()* are complicated by the fact that *nl_langinfo_l()* must be thread-safe but *nl_langinfo()* need not be. The various implementation choices are:

1. *nl_langinfo_l()* and *nl_langinfo()* use separate buffers, or at least one of them does not use an internal string buffer. In this case there are no interactions.
2. *nl_langinfo_l()* and *nl_langinfo()* share an internal per-thread buffer. There can be interactions, but only in the same thread.
3. *nl_langinfo_l()* uses an internal per-thread buffer, and *nl_langinfo()* uses (in all threads) the same buffer that *nl_langinfo_l()* uses in the initial thread. There can be interactions, but only when *nl_langinfo_l()* is called in the initial thread.

FUTURE DIRECTIONS

None.

45928 long nrnd48(unsigned short xsubi[3]);

45929 **DESCRIPTION**45930 Refer to *drnd48()*.

45931 **NAME**

45932 ntohl, ntohs — convert values between host and network byte order

45933 **SYNOPSIS**

45934 #include <arpa/inet.h>

45935 uint32_t ntohl(uint32_t *netlong*);45936 uint16_t ntohs(uint16_t *netshort*);45937 **DESCRIPTION**45938 Refer to *htonl()*.

NAME

open, openat — open file relative to directory file descriptor

SYNOPSIS

```
#include <sys/stat.h>
#include <fcntl.h>

int open(const char *path, int oflag, ...);
int openat(int fd, const char *path, int oflag, ...);
```

DESCRIPTION

The *open()* function shall establish the connection between a file and a file descriptor. It shall create an open file description that refers to a file and a file descriptor that refers to that open file description. The file descriptor is used by other I/O functions to refer to that file. The *path* argument points to a pathname naming the file.

The *open()* function shall return a file descriptor for the named file that is the lowest file descriptor not currently open for that process. The open file description is new, and therefore the file descriptor shall not share it with any other process in the system. The FD_CLOEXEC file descriptor flag associated with the new file descriptor shall be cleared unless the O_CLOEXEC flag is set in *oflag*.

The file offset used to mark the current position within the file shall be set to the beginning of the file.

The file status flags and file access modes of the open file description shall be set according to the value of *oflag*.

Values for *oflag* are constructed by a bitwise-inclusive OR of flags from the following list, defined in **<fcntl.h>**. Applications shall specify exactly one of the first five values (file access modes) below in the value of *oflag*:

O_EXEC Open for execute only (non-directory files). The result is unspecified if this flag is applied to a directory.

O_RDONLY Open for reading only.

O_RDWR Open for reading and writing. The result is undefined if this flag is applied to a FIFO.

O_SEARCH Open directory for search only. The result is unspecified if this flag is applied to a non-directory file.

O_WRONLY Open for writing only.

Any combination of the following may be used:

O_APPEND If set, the file offset shall be set to the end of the file prior to each write.

O_CLOEXEC If set, the FD_CLOEXEC flag for the new file descriptor shall be set.

O_CREAT If the file exists, this flag has no effect except as noted under **O_EXCL** below. Otherwise, the file shall be created; the user ID of the file shall be set to the effective user ID of the process; the group ID of the file shall be set to the group ID of the file's parent directory or to the effective group ID of the process; and the access permission bits (see **<sys/stat.h>**) of the file mode shall be set to the value of the argument following the *oflag* argument taken as type **mode_t** modified as follows: a bitwise AND is performed on the file-mode bits and the corresponding bits in the complement of the process' file mode creation mask. Thus, all bits in the

45983		file mode whose corresponding bit in the file mode creation mask is set	
45984		are cleared. When bits other than the file permission bits are set, the effect	
45985		is unspecified. The argument following the <i>oflag</i> argument does not affect	
45986		whether the file is open for reading, writing, or for both. Implementations	
45987		shall provide a way to initialize the file's group ID to the group ID of the	
45988		parent directory. Implementations may, but need not, provide an	
45989		implementation-defined way to initialize the file's group ID to the	
45990		effective group ID of the calling process.	
45991	O_DIRECTORY	If <i>path</i> resolves to a non-directory file, fail and set <i>errno</i> to [ENOTDIR].	
45992	SIO O_DSYNC	Write I/O operations on the file descriptor shall complete as defined by	
45993		synchronized I/O data integrity completion.	
45994	O_EXCL	If O_CREAT and O_EXCL are set, <i>open()</i> shall fail if the file exists. The	
45995		check for the existence of the file and the creation of the file if it does not	
45996		exist shall be atomic with respect to other threads executing <i>open()</i>	
45997		naming the same filename in the same directory with O_EXCL and	
45998		O_CREAT set. If O_EXCL and O_CREAT are set, and <i>path</i> names a	
45999		symbolic link, <i>open()</i> shall fail and set <i>errno</i> to [EEXIST], regardless of the	
46000		contents of the symbolic link. If O_EXCL is set and O_CREAT is not set,	
46001		the result is undefined.	
46002	O_NOCTTY	If set and <i>path</i> identifies a terminal device, <i>open()</i> shall not cause the	
46003		terminal device to become the controlling terminal for the process. If <i>path</i>	
46004		does not identify a terminal device, O_NOCTTY shall be ignored.	
46005	O_NOFOLLOW	If <i>path</i> names a symbolic link, fail and set <i>errno</i> to [ELOOP].	
46006	O_NONBLOCK	When opening a FIFO with O_RDONLY or O_WRONLY set:	
46007		• If O_NONBLOCK is set, an <i>open()</i> for reading-only shall return	
46008		without delay. An <i>open()</i> for writing-only shall return an error if no	
46009		process currently has the file open for reading.	
46010		• If O_NONBLOCK is clear, an <i>open()</i> for reading-only shall block the	
46011		calling thread until a thread opens the file for writing. An <i>open()</i> for	
46012		writing-only shall block the calling thread until a thread opens the	
46013		file for reading.	
46014		When opening a block special or character special file that supports non-	
46015		blocking opens:	
46016		• If O_NONBLOCK is set, the <i>open()</i> function shall return without	
46017		blocking for the device to be ready or available. Subsequent	
46018		behavior of the device is device-specific.	
46019		• If O_NONBLOCK is clear, the <i>open()</i> function shall block the calling	
46020		thread until the device is ready or available before returning.	
46021		Otherwise, the O_NONBLOCK flag shall not cause an error, but it is	
46022		unspecified whether the file status flags will include the O_NONBLOCK	
46023		flag.	
46024	SIO O_RSYNC	Read I/O operations on the file descriptor shall complete at the same	
46025		level of integrity as specified by the O_DSYNC and O_SYNC flags. If both	
46026		O_DSYNC and O_RSYNC are set in <i>oflag</i> , all I/O operations on the file	
46027		descriptor shall complete as defined by synchronized I/O data integrity	

46028			completion. If both O_SYNC and O_RSYNC are set in flags, all I/O	
46029			operations on the file descriptor shall complete as defined by	
46030			synchronized I/O file integrity completion.	
46031	XSI SIO	O_SYNC	Write I/O operations on the file descriptor shall complete as defined by	
46032			synchronized I/O file integrity completion.	
46033	XSI		The O_SYNC flag shall be supported for regular files, even if the	
46034			Synchronized Input and Output option is not supported.	
46035		O_TRUNC	If the file exists and is a regular file, and the file is successfully opened	
46036			O_RDWR or O_WRONLY, its length shall be truncated to 0, and the mode	
46037			and owner shall be unchanged. It shall have no effect on FIFO special files	
46038			or terminal device files. Its effect on other file types is implementation-	
46039			defined. The result of using O_TRUNC without either O_RDWR or	
46040			O_WRONLY is undefined.	
46041		O_TTY_INIT	If <i>path</i> identifies a terminal device other than a pseudo-terminal, the	
46042			device is not already open in any process, and either O_TTY_INIT is set in	
46043			<i>oflag</i> or O_TTY_INIT has the value zero, <i>open()</i> shall set any non-standard	
46044			termios structure terminal parameters to a state that provides conforming	
46045			behavior; see XBD Section 11.2 (on page 205). It is unspecified whether	
46046			O_TTY_INIT has any effect if the device is already open in any process. If	
46047			<i>path</i> identifies the slave side of a pseudo-terminal that is not already open	
46048			in any process, <i>open()</i> shall set any non-standard termios structure	
46049			terminal parameters to a state that provides conforming behavior,	
46050			regardless of whether O_TTY_INIT is set. If <i>path</i> does not identify a	
46051			terminal device, O_TTY_INIT shall be ignored.	
46052			If O_CREAT is set and the file did not previously exist, upon successful completion, <i>open()</i> shall	
46053			mark for update the last data access, last data modification, and last file status change	
46054			timestamps of the file and the last data modification and last file status change timestamps of	
46055			the parent directory.	
46056			If O_TRUNC is set and the file did previously exist, upon successful completion, <i>open()</i> shall	
46057			mark for update the last data modification and last file status change timestamps of the file.	
46058	SIO		If both the O_SYNC and O_DSYNC flags are set, the effect is as if only the O_SYNC flag was set.	
46059	OB XSR		If <i>path</i> refers to a STREAMS file, <i>oflag</i> may be constructed from O_NONBLOCK OR'ed with	
46060			either O_RDONLY, O_WRONLY, or O_RDWR. Other flag values are not applicable to STREAMS	
46061			devices and shall have no effect on them. The value O_NONBLOCK affects the operation of	
46062			STREAMS drivers and certain functions applied to file descriptors associated with STREAMS	
46063			files. For STREAMS drivers, the implementation of O_NONBLOCK is device-specific.	
46064			The application shall ensure that it specifies the O_TTY_INIT flag on the first open of a terminal	
46065			device since system boot or since the device was closed by the process that last had it open. The	
46066	XSI		application need not specify the O_TTY_INIT flag when opening pseudo-terminals. If <i>path</i>	
46067			names the master side of a pseudo-terminal device, then it is unspecified whether <i>open()</i> locks	
46068			the slave side so that it cannot be opened. Conforming applications shall call <i>unlockpt()</i> before	
46069			opening the slave side.	
46070			The largest value that can be represented correctly in an object of type off_t shall be established	
46071			as the offset maximum in the open file description.	
46072			The <i>openat()</i> function shall be equivalent to the <i>open()</i> function except in the case where <i>path</i>	

46073 specifies a relative path. In this case the file to be opened is determined relative to the directory
 46074 associated with the file descriptor *fd* instead of the current working directory. If the file
 46075 descriptor was opened without O_SEARCH, the function shall check whether directory searches
 46076 are permitted using the current permissions of the directory underlying the file descriptor. If the
 46077 file descriptor was opened with O_SEARCH, the function shall not perform the check.

46078 The *oflag* parameter and the optional fourth parameter correspond exactly to the parameters of
 46079 *open()*.

46080 If *openat()* is passed the special value AT_FDCWD in the *fd* parameter, the current working
 46081 directory shall be used and the behavior shall be identical to a call to *open()*.

46082 RETURN VALUE

46083 Upon successful completion, these functions shall open the file and return a non-negative
 46084 integer representing the lowest numbered unused file descriptor. Otherwise, these functions
 46085 shall return -1 and set *errno* to indicate the error. If -1 is returned, no files shall be created or
 46086 modified.

46087 ERRORS

46088 These functions shall fail if:

46089 [EACCES] Search permission is denied on a component of the path prefix, or the file
 46090 exists and the permissions specified by *oflag* are denied, or the file does not
 46091 exist and write permission is denied for the parent directory of the file to be
 46092 created, or O_TRUNC is specified and write permission is denied.

46093 [EEXIST] O_CREAT and O_EXCL are set, and the named file exists.

46094 [EINTR] A signal was caught during *open()*.

46095 SIO [EINVAL] The implementation does not support synchronized I/O for this file.

46096 OB XSR [EIO] The *path* argument names a STREAMS file and a hangup or error occurred
 46097 during the *open()*.

46098 [EISDIR] The named file is a directory and *oflag* includes O_WRONLY or O_RDWR.

46099 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*
 46100 argument, or O_NOFOLLOW was specified and the *path* argument names a
 46101 symbolic link.

46102 [EMFILE] All file descriptors available to the process are currently open.

46103 [ENAMETOOLONG]

46104 The length of a component of a pathname is longer than {NAME_MAX}.

46105 [ENFILE] The maximum allowable number of files is currently open in the system.

46106 [ENOENT] O_CREAT is not set and a component of *path* does not name an existing file, or
 46107 O_CREAT is set and a component of the path prefix of *path* does not name an
 46108 existing file, or *path* points to an empty string.

46109 [ENOENT] or [ENOTDIR]

46110 O_CREAT is set, and the *path* argument contains at least one non-*<slash>*
 46111 character and ends with one or more trailing *<slash>* characters. If *path* names
 46112 an existing file, an [ENOENT] error shall not occur.

46113 OB XSR [ENOSR] The *path* argument names a STREAMS-based file and the system is unable to
 46114 allocate a STREAM.

46115		[ENOSPC]	The directory or file system that would contain the new file cannot be expanded, the file does not exist, and O_CREAT is specified.	
46116				
46117		[ENOTDIR]	A component of the path prefix names an existing file that is neither a directory nor a symbolic link to a directory; or O_CREAT and O_EXCL are not specified, the <i>path</i> argument contains at least one non- <code><slash></code> character and ends with one or more trailing <code><slash></code> characters, and the last pathname component names an existing file that is neither a directory nor a symbolic link to a directory; or O_DIRECTORY was specified and the <i>path</i> argument resolves to a non-directory file.	
46118				
46119				
46120				
46121				
46122				
46123				
46124		[ENXIO]	O_NONBLOCK is set, the named file is a FIFO, O_WRONLY is set, and no process has the file open for reading.	
46125				
46126		[ENXIO]	The named file is a character special or block special file, and the device associated with this special file does not exist.	
46127				
46128		[EOVERFLOW]	The named file is a regular file and the size of the file cannot be represented correctly in an object of type <code>off_t</code> .	
46129				
46130		[EROFS]	The named file resides on a read-only file system and either O_WRONLY, O_RDWR, O_CREAT (if the file does not exist), or O_TRUNC is set in the <i>oflag</i> argument.	
46131				
46132				
46133		The <i>openat()</i> function shall fail if:		
46134		[EACCES]	<i>fd</i> was not opened with O_SEARCH and the permissions of the directory underlying <i>fd</i> do not permit directory searches.	
46135				
46136		[EBADF]	The <i>path</i> argument does not specify an absolute path and the <i>fd</i> argument is neither AT_FDCWD nor a valid file descriptor open for reading or searching.	
46137				
46138		[ENOTDIR]	The <i>path</i> argument is not an absolute path and <i>fd</i> is a file descriptor associated with a non-directory file.	+
46139				
46140		These functions may fail if:		
46141	XSI	[EAGAIN]	The <i>path</i> argument names the slave side of a pseudo-terminal device that is locked.	
46142				
46143		[EINVAL]	The value of the <i>oflag</i> argument is not valid.	
46144		[ELOOP]	More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the <i>path</i> argument.	
46145				
46146		[ENAMETOOLONG]	The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a symbolic link produced an intermediate result with a length that exceeds {PATH_MAX}.	
46147				
46148				
46149				
46150	OB XSR	[ENOMEM]	The <i>path</i> argument names a STREAMS file and the system is unable to allocate resources.	
46151				
46152		[ETXTBSY]	The file is a pure procedure (shared text) file that is being executed and <i>oflag</i> is O_WRONLY or O_RDWR.	
46153				

46154 **EXAMPLES**46155 **Opening a File for Writing by the Owner**

46156 The following example opens the file `/tmp/file`, either by creating it (if it does not already exist),
 46157 or by truncating its length to 0 (if it does exist). In the former case, if the call creates a new file,
 46158 the access permission bits in the file mode of the file are set to permit reading and writing by the
 46159 owner, and to permit reading only by group members and others.

46160 If the call to `open()` is successful, the file is opened for writing.

```
46161 #include <fcntl.h>
46162 ...
46163 int fd;
46164 mode_t mode = S_IRUSR | S_IWUSR | S_IRGRP | S_IROTH;
46165 char *pathname = "/tmp/file";
46166 ...
46167 fd = open(pathname, O_WRONLY | O_CREAT | O_TRUNC, mode);
46168 ...
```

46169 **Opening a File Using an Existence Check**

46170 The following example uses the `open()` function to try to create the **LOCKFILE** file and open it
 46171 for writing. Since the `open()` function specifies the `O_EXCL` flag, the call fails if the file already
 46172 exists. In that case, the program assumes that someone else is updating the password file and
 46173 exits.

```
46174 #include <fcntl.h>
46175 #include <stdio.h>
46176 #include <stdlib.h>
46177 #define LOCKFILE "/etc/ptmp"
46178 ...
46179 int pfd; /* Integer for file descriptor returned by open() call. */
46180 ...
46181 if ((pfd = open(LOCKFILE, O_WRONLY | O_CREAT | O_EXCL,
46182               S_IRUSR | S_IWUSR | S_IRGRP | S_IROTH)) == -1)
46183 {
46184     fprintf(stderr, "Cannot open /etc/ptmp. Try again later.\n");
46185     exit(1);
46186 }
46187 ...
```

46188 **Opening a File for Writing**

46189 The following example opens a file for writing, creating the file if it does not already exist. If the
 46190 file does exist, the system truncates the file to zero bytes.

```
46191 #include <fcntl.h>
46192 #include <stdio.h>
46193 #include <stdlib.h>
46194 #define LOCKFILE "/etc/ptmp"
46195 ...
46196 int pfd;
```

```

46197 char pathname[PATH_MAX+1];
46198 ...
46199 if ((pfd = open(pathname, O_WRONLY | O_CREAT | O_TRUNC,
46200 S_IRUSR | S_IWUSR | S_IRGRP | S_IROTH)) == -1)
46201 {
46202     perror("Cannot open output file\n"); exit(1);
46203 }
46204 ...

```

APPLICATION USAGE

POSIX.1-2008 does not require that terminal parameters be automatically set to any state on first open, nor that they be reset after the last close. It is possible for a non-conforming application to leave a terminal device in a state where the next process to use that device finds it in a non-conforming state, but has no way of determining this. To ensure that the device is set to a conforming initial state, applications which perform a first open of a terminal (other than a pseudo-terminal) should do so using the `O_TTY_INIT` flag to set the parameters associated with the terminal to a conforming state.

Except as specified in this volume of POSIX.1-2008, the flags allowed in *oflag* are not mutually-exclusive and any number of them may be used simultaneously. Not all combinations of flags make sense. For example, using `O_SEARCH | O_CREAT` will successfully open a pre-existing directory for searching, but if there is no existing file by that name, then it is unspecified whether a regular file will be created. Likewise, if a non-directory file descriptor is successfully returned, it is unspecified whether that descriptor will have execute permissions as if by `O_EXEC` (note that it is unspecified whether `O_EXEC` and `O_SEARCH` have the same value).

RATIONALE

Some implementations permit opening FIFOs with `O_RDWR`. Since FIFOs could be implemented in other ways, and since two file descriptors can be used to the same effect, this possibility is left as undefined.

See [getgroups\(\)](#) about the group of a newly created file.

The use of `open()` to create a regular file is preferable to the use of `creat()`, because the latter is redundant and included only for historical reasons.

The use of the `O_TRUNC` flag on FIFOs and directories (pipes cannot be `open()`-ed) must be permissible without unexpected side-effects (for example, `creat()` on a FIFO must not remove data). Since terminal special files might have type-ahead data stored in the buffer, `O_TRUNC` should not affect their content, particularly if a program that normally opens a regular file should open the current controlling terminal instead. Other file types, particularly implementation-defined ones, are left implementation-defined.

POSIX.1-2008 permits `[EACCES]` to be returned for conditions other than those explicitly listed.

The `O_NOCTTY` flag was added to allow applications to avoid unintentionally acquiring a controlling terminal as a side-effect of opening a terminal file. This volume of POSIX.1-2008 does not specify how a controlling terminal is acquired, but it allows an implementation to provide this on `open()` if the `O_NOCTTY` flag is not set and other conditions specified in XBD [Chapter 11](#) (on page 199) are met.

In historical implementations the value of `O_RDONLY` is zero. Because of that, it is not possible to detect the presence of `O_RDONLY` and another option. Future implementations should encode `O_RDONLY` and `O_WRONLY` as bit flags so that:

```
O_RDONLY | O_WRONLY == O_RDWR
```

O_EXEC and O_SEARCH are specified as two of the five file access modes. Since O_EXEC does not apply to directories, and O_SEARCH only applies to directories, their values need not be distinct. Since O_RDONLY has historically had the value zero, implementations are not able to distinguish between O_SEARCH and O_SEARCH | O_RDONLY, and similarly for O_EXEC.

In general, the *open()* function follows the symbolic link if *path* names a symbolic link. However, the *open()* function, when called with O_CREAT and O_EXCL, is required to fail with [EEXIST] if *path* names an existing symbolic link, even if the symbolic link refers to a nonexistent file. This behavior is required so that privileged applications can create a new file in a known location without the possibility that a symbolic link might cause the file to be created in a different location.

For example, a privileged application that must create a file with a predictable name in a user-writable directory, such as the user's home directory, could be compromised if the user creates a symbolic link with that name that refers to a nonexistent file in a system directory. If the user can influence the contents of a file, the user could compromise the system by creating a new system configuration or spool file that would then be interpreted by the system. The test for a symbolic link which refers to a nonexistent file must be atomic with the creation of a new file.

In addition, the *open()* function refuses to open non-directories if the O_DIRECTORY flag is set. This avoids race conditions whereby a user might compromise the system by substituting a hard link to a sensitive file (e.g., a device or a FIFO) while a privileged application is running, where opening a file even for read access might have undesirable side-effects.

In addition, the *open()* function does not follow symbolic links if the O_NOFOLLOW flag is set. This avoids race conditions whereby a user might compromise the system by substituting a symbolic link to a sensitive file (e.g., a device) while a privileged application is running, where opening a file even for read access might have undesirable side-effects.

The POSIX.1-1990 standard required that the group ID of a newly created file be set to the group ID of its parent directory or to the effective group ID of the creating process. FIPS 151-2 required that implementations provide a way to have the group ID be set to the group ID of the containing directory, but did not prohibit implementations also supporting a way to set the group ID to the effective group ID of the creating process. Conforming applications should not assume which group ID will be used. If it matters, an application can use *chown()* to set the group ID after the file is created, or determine under what conditions the implementation will set the desired group ID.

The purpose of the *openat()* function is to enable opening files in directories other than the current working directory without exposure to race conditions. Any part of the path of a file could be changed in parallel to a call to *open()*, resulting in unspecified behavior. By opening a file descriptor for the target directory and using the *openat()* function it can be guaranteed that the opened file is located relative to the desired directory. Some implementations use the *openat()* function for other purposes as well. In some cases, if the *oflag* parameter has the O_XATTR bit set, the returned file descriptor provides access to extended attributes. This functionality is not standardized here.

FUTURE DIRECTIONS

None.

XBD Chapter 11 (on page 199), [<fcntl.h>](#), [<sys/stat.h>](#), [<sys/types.h>](#)

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX Threads Extension.

Large File Summit extensions are added.

Issue 6

In the SYNOPSIS, the optional include of the `<sys/types.h>` header is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- In the DESCRIPTION, `O_CREAT` is amended to state that the group ID of the file is set to the group ID of the file's parent directory or to the effective group ID of the process. This is a FIPS requirement.
- In the DESCRIPTION, text is added to indicate setting of the offset maximum in the open file description. This change is to support large files.
- In the ERRORS section, the `[EOVERFLOW]` condition is added. This change is to support large files.
- The `[ENXIO]` mandatory error condition is added.
- The `[EINVAL]`, `[ENAMETOOLONG]`, and `[ETXTBSY]` optional error conditions are added.

The DESCRIPTION and ERRORS sections are updated so that items related to the optional XSI STREAMS Option Group are marked.

The following changes were made to align with the IEEE P1003.1a draft standard:

- An explanation is added of the effect of the `O_CREAT` and `O_EXCL` flags when the path refers to a symbolic link.
- The `[ELOOP]` optional error condition is added.

The normative text is updated to avoid use of the term “must” for application requirements.

The DESCRIPTION of `O_EXCL` is updated in response to IEEE PASC Interpretation 1003.1c #48.

Issue 7

Austin Group Interpretations 1003.1-2001 #113 and #143 are applied.

Austin Group Interpretation 1003.1-2001 #144 is applied, adding the `O_TTY_INIT` flag.

Austin Group Interpretation 1003.1-2001 #171 is applied, adding support to set the `FD_CLOEXEC` flag atomically at `open()`, and adding the `F_DUPFD_CLOEXEC` flag.

SD5-XBD-ERN-4 is applied, changing the definition of the `[EMFILE]` error.

This page is revised and the `openat()` function is added from The Open Group Technical Standard, 2006, Extended API Set Part 2.

Functionality relating to the XSI STREAMS option is marked obsolescent.

Changes are made related to support for finegrained timestamps.

46329 Changes are made to allow a directory to be opened for searching.

NAME

open_memstream, open_wmemstream — open a dynamic memory buffer stream

SYNOPSIS

```
CX      #include <stdio.h>
FILE *open_memstream(char **bufp, size_t *sizep);
#include <wchar.h>
FILE *open_wmemstream(wchar_t **bufp, size_t *sizep);
```

DESCRIPTION

The *open_memstream()* and *open_wmemstream()* functions shall create an I/O stream associated with a dynamically allocated memory buffer. The stream shall be opened for writing and shall be seekable.

The stream associated with a call to *open_memstream()* shall be byte-oriented.

The stream associated with a call to *open_wmemstream()* shall be wide-oriented.

The stream shall maintain a current position in the allocated buffer and a current buffer length. The position shall be initially set to zero (the start of the buffer). Each write to the stream shall start at the current position and move this position by the number of successfully written bytes for *open_memstream()* or the number of successfully written wide characters for *open_wmemstream()*. The length shall be initially set to zero. If a write moves the position to a value larger than the current length, the current length shall be set to this position. In this case a null character for *open_memstream()* or a null wide character for *open_wmemstream()* shall be appended to the current buffer. For both functions the terminating null is not included in the calculation of the buffer length.

After a successful *fflush()* or *fclose()*, the pointer referenced by *bufp* shall contain the address of the buffer, and the variable pointed to by *sizep* shall contain the smaller of the current buffer length and the number of bytes for *open_memstream()*, or the number of wide characters for *open_wmemstream()*, between the beginning of the buffer and the current file position indicator.

After a successful *fflush()* the pointer referenced by *bufp* and the variable referenced by *sizep* remain valid only until the next write operation on the stream or a call to *fclose()*.

RETURN VALUE

Upon successful completion, these functions shall return a pointer to the object controlling the stream. Otherwise, a null pointer shall be returned, and *errno* shall be set to indicate the error.

ERRORS

These functions may fail if:

[EINVAL]	<i>bufp</i> or <i>sizep</i> are NULL.
[EMFILE]	{FOPEN_MAX} streams are currently open in the calling process.
[ENOMEM]	Memory for the stream or the buffer could not be allocated.

EXAMPLES

```

#include <stdio.h>
#include <stdlib.h>

int
main (void)
{
    FILE *stream;
    char *buf;
    size_t len;
    off_t eob;

    stream = open_memstream (&buf, &len);
    if (stream == NULL)
        /* handle error */ ;
    fprintf (stream, "hello my world");
    fflush (stream);
    printf ("buf=%s, len=%zu\n", buf, len);
    eob = ftello(stream);
    fseeko (stream, 0, SEEK_SET);
    fprintf (stream, "good-bye");
    fseeko (stream, eob, SEEK_SET);
    fclose (stream);
    printf ("buf=%s, len=%zu\n", buf, len);
    free (buf);
    return 0;
}

```

This program produces the following output:

```

buf=hello my world, len=14
buf=good-bye world, len=14

```

APPLICATION USAGE

The buffer created by these functions should be freed by the application after closing the stream, by means of a call to *free()*.

RATIONALE

These functions are similar to *fmemopen()* except that the memory is always allocated dynamically by the function, and the stream is opened only for output.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 7.

46412 **NAME**

46413 openat — open file relative to directory file descriptor

46414 **SYNOPSIS**

46415 #include <fcntl.h>

46416 int openat(int *fd*, const char **path*, int *oflag*, ...);46417 **DESCRIPTION**46418 Refer to *open()*.

NAME

opendir — open directory associated with file descriptor

SYNOPSIS

```
#include <dirent.h>
```

```
DIR *opendir(const char *dirname);
```

DESCRIPTION

Refer to *fdopendir()*.

46426 **NAME**

46427 openlog — open a connection to the logging facility

46428 **SYNOPSIS**

46429 XSI #include <syslog.h>

46430 void openlog(const char **ident*, int *logopt*, int *facility*);46431 **DESCRIPTION**46432 Refer to *closelog()*.

46433 **NAME**

46434 optarg, opterr, optind, optopt — options parsing variables

46435 **SYNOPSIS**

46436 #include <unistd.h>

46437 extern char *optarg;

46438 extern int opterr, optind, optopt;

46439 **DESCRIPTION**46440 Refer to *getopt()*.

46441 **NAME**

46442 pathconf — get configurable pathname variables

46443 **SYNOPSIS**

46444 #include <unistd.h>

46445 long pathconf(const char **path*, int *name*);46446 **DESCRIPTION**46447 Refer to *fpathconf()*.

46448 **NAME**

46449 pause — suspend the thread until a signal is received

46450 **SYNOPSIS**

46451 #include <unistd.h>

46452 int pause(void);

46453 **DESCRIPTION**

46454 The *pause()* function shall suspend the calling thread until delivery of a signal whose action is
46455 either to execute a signal-catching function or to terminate the process.

46456 If the action is to terminate the process, *pause()* shall not return.

46457 If the action is to execute a signal-catching function, *pause()* shall return after the signal-catching
46458 function returns.

46459 **RETURN VALUE**

46460 Since *pause()* suspends thread execution indefinitely unless interrupted by a signal, there is no
46461 successful completion return value. A value of -1 shall be returned and *errno* set to indicate the
46462 error.

46463 **ERRORS**

46464 The *pause()* function shall fail if:

46465 [EINTR] A signal is caught by the calling process and control is returned from the
46466 signal-catching function.

46467 **EXAMPLES**

46468 None.

46469 **APPLICATION USAGE**

46470 Many common uses of *pause()* have timing windows. The scenario involves checking a
46471 condition related to a signal and, if the signal has not occurred, calling *pause()*. When the signal
46472 occurs between the check and the call to *pause()*, the process often blocks indefinitely. The
46473 *sigprocmask()* and *sigsuspend()* functions can be used to avoid this type of problem.

46474 **RATIONALE**

46475 None.

46476 **FUTURE DIRECTIONS**

46477 None.

46478 **SEE ALSO**

46482 First released in Issue 1. Derived from Issue 1 of the SVID.

46483 **Issue 5**

46484 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

46485 **Issue 6**

46486 The APPLICATION USAGE section is added.

NAME

pclose — close a pipe stream to or from a process

SYNOPSIS

```
CX      #include <stdio.h>
int pclose(FILE *stream);
```

DESCRIPTION

The *pclose()* function shall close a stream that was opened by *popen()*, wait for the command to terminate, and return the termination status of the process that was running the command language interpreter. However, if a call caused the termination status to be unavailable to *pclose()*, then *pclose()* shall return -1 with *errno* set to [ECHILD] to report this situation. This can happen if the application calls one of the following functions:

- *wait()*
- *waitpid()* with a *pid* argument less than or equal to 0 or equal to the process ID of the command line interpreter
- Any other function not defined in this volume of POSIX.1-2008 that could do one of the above

In any case, *pclose()* shall not return before the child process created by *popen()* has terminated.

If the command language interpreter cannot be executed, the child termination status returned by *pclose()* shall be as if the command language interpreter terminated using *exit*(127) or *_exit*(127).

The *pclose()* function shall not affect the termination status of any child of the calling process other than the one created by *popen()* for the associated stream.

If the argument *stream* to *pclose()* is not a pointer to a stream created by *popen()*, the result of *pclose()* is undefined.

RETURN VALUE

Upon successful return, *pclose()* shall return the termination status of the command language interpreter. Otherwise, *pclose()* shall return -1 and set *errno* to indicate the error.

ERRORS

The *pclose()* function shall fail if:

[ECHILD] The status of the child process could not be obtained, as described above.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

There is a requirement that *pclose()* not return before the child process terminates. This is intended to disallow implementations that return [EINTR] if a signal is received while waiting. If *pclose()* returned before the child terminated, there would be no way for the application to discover which child used to be associated with the stream, and it could not do the cleanup itself.

If the stream pointed to by *stream* was not created by *popen()*, historical implementations of *pclose()* return -1 without setting *errno*. To avoid requiring *pclose()* to set *errno* in this case, POSIX.1-2008 makes the behavior unspecified. An application should not use *pclose()* to close

any stream that was not created by *popen()*.

Some historical implementations of *pclose()* either block or ignore the signals SIGINT, SIGQUIT, and SIGHUP while waiting for the child process to terminate. Since this behavior is not described for the *pclose()* function in POSIX.1-2008, such implementations are not conforming. Also, some historical implementations return [EINTR] if a signal is received, even though the child process has not terminated. Such implementations are also considered non-conforming.

Consider, for example, an application that uses:

```
popen("command", "r")
```

to start *command*, which is part of the same application. The parent writes a prompt to its standard output (presumably the terminal) and then reads from the *popen()*ed stream. The child reads the response from the user, does some transformation on the response (pathname expansion, perhaps) and writes the result to its standard output. The parent process reads the result from the pipe, does something with it, and prints another prompt. The cycle repeats. Assuming that both processes do appropriate buffer flushing, this would be expected to work.

To conform to POSIX.1-2008, *pclose()* must use *waitpid()*, or some similar function, instead of *wait()*.

The code sample below illustrates how the *pclose()* function might be implemented on a system conforming to POSIX.1-2008.

```
int pclose(FILE *stream)
{
    int stat;
    pid_t pid;

    pid = <pid for process created for stream by popen()>
    (void) fclose(stream);
    while (waitpid(pid, &stat, 0) == -1) {
        if (errno != EINTR) {
            stat = -1;
            break;
        }
    }
    return(stat);
}
```

FUTURE DIRECTIONS

None.

XBD <stdio.h>

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

46569 **NAME**

46570 perror — write error messages to standard error

46571 **SYNOPSIS**

46572 #include <stdio.h>

46573 void perror(const char *s);

46574 **DESCRIPTION**

46575 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 46576 conflict between the requirements described here and the ISO C standard is unintentional. This
 46577 volume of POSIX.1-2008 defers to the ISO C standard.

46578 The *perror()* function shall map the error number accessed through the symbol *errno* to a
 46579 language-dependent error message, which shall be written to the standard error stream as
 46580 follows:

- 46581 • First (if *s* is not a null pointer and the character pointed to by *s* is not the null byte), the
 46582 string pointed to by *s* followed by a <colon> and a <space>.
- 46583 • Then an error message string followed by a <newline>.

46584 The contents of the error message strings shall be the same as those returned by *strerror()* with
 46585 argument *errno*.

46586 CX The *perror()* function shall mark for update the last data modification and last file status change
 46587 timestamps of the file associated with the standard error stream at some time between its
 46588 successful completion and *exit()*, *abort()*, or the completion of *fflush()* or *fclose()* on *stderr*.

46589 The *perror()* function shall not change the orientation of the standard error stream.

46590 On error, *perror()* shall set the error indicator for the stream to which *stderr* points, and shall set
 46591 *errno* to indicate the error.

46592 Since no value is returned, an application wishing to check for error situations should call
 46593 *clearerr(stderr)* before calling *perror()*, then if *ferror(stderr)* returns non-zero, the value of *errno*
 46594 indicates which error occurred.

46595 **RETURN VALUE**46596 The *perror()* function shall not return a value.46597 **ERRORS**46598 CX Refer to *fputc()*.46599 **EXAMPLES**46600 **Printing an Error Message for a Function**

46601 The following example replaces *bufptr* with a buffer that is the necessary size. If an error occurs,
 46602 the *perror()* function prints a message and the program exits.

```

46603 #include <stdio.h>
46604 #include <stdlib.h>
46605 ...
46606 char *bufptr;
46607 size_t szbuf;
46608 ...
46609 if ((bufptr = malloc(szbuf)) == NULL) {
46610     perror("malloc"); exit(2);
46611 }
```

46612 . . .

46613 **APPLICATION USAGE**

46614 Application writers may prefer to use alternative interfaces instead of *perror()*, such as |
46615 *strerror_r()* in combination with *fprintf()*.

46616 **RATIONALE**

46617 None.

46618 **FUTURE DIRECTIONS**

46619 None.

46620 **SEE ALSO**

46621 *fprintf()*, *fputc()*, *psiginfo()*, *strerror()*

46622 XBD <stdio.h>

46623 **CHANGE HISTORY**

46624 First released in Issue 1. Derived from Issue 1 of the SVID.

46625 **Issue 5**

46626 A paragraph is added to the DESCRIPTION indicating that *perror()* does not change the
46627 orientation of the standard error stream.

46628 **Issue 6**

46629 Extensions beyond the ISO C standard are marked.

46630 **Issue 7**

46631 SD5-XSH-ERN-95 is applied.

46632 Changes are made related to support for finegrained timestamps.

46633 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0429 [389,401], XSH/TC1-2008/0430 +
46634 [389], and XSH/TC1-2008/0431 [389,401] are applied.

46635 **NAME**

46636 pipe — create an interprocess channel

46637 **SYNOPSIS**

46638 #include <unistd.h>

46639 int pipe(int *fildes*[2]);46640 **DESCRIPTION**

46641 The *pipe()* function shall create a pipe and place two file descriptors, one each into the
 46642 arguments *fildes*[0] and *fildes*[1], that refer to the open file descriptions for the read and write
 46643 ends of the pipe. Their integer values shall be the two lowest available at the time of the *pipe()*
 46644 call. The O_NONBLOCK and FD_CLOEXEC flags shall be clear on both file descriptors. (The
 46645 *fcntl()* function can be used to set both these flags.)

46646 Data can be written to the file descriptor *fildes*[1] and read from the file descriptor *fildes*[0]. A
 46647 read on the file descriptor *fildes*[0] shall access data written to the file descriptor *fildes*[1] on a
 46648 first-in-first-out basis. It is unspecified whether *fildes*[0] is also open for writing and whether
 46649 *fildes*[1] is also open for reading.

46650 A process has the pipe open for reading (correspondingly writing) if it has a file descriptor open
 46651 that refers to the read end, *fildes*[0] (write end, *fildes*[1]).

46652 The pipe's user ID shall be set to the effective user ID of the calling process.

46653 The pipe's group ID shall be set to the effective group ID of the calling process.

46654 Upon successful completion, *pipe()* shall mark for update the last data access, last data
 46655 modification, and last file status change timestamps of the pipe.

46656 **RETURN VALUE**

46657 Upon successful completion, 0 shall be returned; otherwise, -1 shall be returned and *errno* set to
 46658 indicate the error.

46659 **ERRORS**

46660 The *pipe()* function shall fail if:

46661 [EMFILE] All, or all but one, of the file descriptors available to the process are currently
 46662 open.

46663 [ENFILE] The number of simultaneously open files in the system would exceed a
 46664 system-imposed limit.

46665 **EXAMPLES**46666 **Using a Pipe to Pass Data Between a Parent Process and a Child Process**

46667 The following example demonstrates the use of a pipe to transfer data between a parent process
 46668 and a child process. Error handling is excluded, but otherwise this code demonstrates good
 46669 practice when using pipes: after the *fork()* the two processes close the unused ends of the pipe
 46670 before they commence transferring data.

46671 #include <stdlib.h>

46672 #include <unistd.h>

46673 ...

46674 int fildes[2];

46675 const int BSIZE = 100;

46676 char buf[BSIZE];

46677 ssize_t nbytes;

```

46678     int status;
46679     status = pipe(fildes);
46680     if (status == -1 ) {
46681         /* an error occurred */
46682         ...
46683     }
46684     switch (fork()) {
46685     case -1: /* Handle error */
46686         break;
46687     case 0: /* Child - reads from pipe */
46688         close(fildes[1]); /* Write end is unused */
46689         nbytes = read(fildes[0], buf, BSIZE); /* Get data from pipe */
46690         /* At this point, a further read would see end of file ... */
46691         close(fildes[0]); /* Finished with pipe */
46692         exit(EXIT_SUCCESS);
46693     default: /* Parent - writes to pipe */
46694         close(fildes[0]); /* Read end is unused */
46695         write(fildes[1], "Hello world\n", 12); /* Write data on pipe */
46696         close(fildes[1]); /* Child will see EOF */
46697         exit(EXIT_SUCCESS);
46698     }

```

APPLICATION USAGE

None.

RATIONALE

The wording carefully avoids using the verb “to open” in order to avoid any implication of use of *open()*; see also *write()*.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The DESCRIPTION is updated to indicate that certain dispositions of *fildes[0]* and *fildes[1]* are unspecified.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/65 is applied, adding the example to the EXAMPLES section.

Issue 7

SD5-XSH-ERN-156 is applied, updating the DESCRIPTION to state the setting of the pipe's user ID and group ID.

Changes are made related to support for finegrained timestamps.

46722 NAME

46723 poll — input/output multiplexing

46724 SYNOPSIS

46725 #include <poll.h>

46726 int poll(struct pollfd *fds*[], nfds_t *nfds*, int *timeout*);

46727 DESCRIPTION

46728 The *poll()* function provides applications with a mechanism for multiplexing input/output over
 46729 a set of file descriptors. For each member of the array pointed to by *fds*, *poll()* shall examine the
 46730 given file descriptor for the event(s) specified in *events*. The number of **pollfd** structures in the
 46731 *fds* array is specified by *nfds*. The *poll()* function shall identify those file descriptors on which an
 46732 application can read or write data, or on which certain events have occurred.

46733 The *fds* argument specifies the file descriptors to be examined and the events of interest for each
 46734 file descriptor. It is a pointer to an array with one member for each open file descriptor of
 46735 interest. The array's members are **pollfd** structures within which *fd* specifies an open file
 46736 descriptor and *events* and *revents* are bitmasks constructed by OR'ing a combination of the
 46737 following event flags:

46738	POLLIN	Data other than high-priority data may be read without blocking.
46739	OB XSR	For STREAMS, this flag is set in <i>revents</i> even if the message is of zero length.
46740		This flag shall be equivalent to POLLRDNORM POLLRDBAND.
46741	POLLRDNORM	Normal data may be read without blocking.
46742	OB XSR	For STREAMS, data on priority band 0 may be read without blocking. This
46743		flag is set in <i>revents</i> even if the message is of zero length.
46744	POLLRDBAND	Priority data may be read without blocking.
46745	OB XSR	For STREAMS, data on priority bands greater than 0 may be read without
46746		blocking. This flag is set in <i>revents</i> even if the message is of zero length.
46747	POLLPRI	High-priority data may be read without blocking.
46748	OB XSR	For STREAMS, this flag is set in <i>revents</i> even if the message is of zero length.
46749	POLLOUT	Normal data may be written without blocking.
46750	OB XSR	For STREAMS, data on priority band 0 may be written without blocking.
46751	POLLWRNORM	Equivalent to POLLOUT.
46752	POLLWRBAND	Priority data may be written.
46753	OB XSR	For STREAMS, data on priority bands greater than 0 may be written without
46754		blocking. If any priority band has been written to on this STREAM, this event
46755		only examines bands that have been written to at least once.
46756	POLLERR	An error has occurred on the device or stream. This flag is only valid in the
46757		<i>revents</i> bitmask; it shall be ignored in the <i>events</i> member.
46758	POLLHUP	A device has been disconnected, or a pipe or FIFO has been closed by the last
46759		process that had it open for writing. Once set, the hangup state of a FIFO shall
46760		persist until some process opens the FIFO for writing or until all read-only file
46761		descriptors for the FIFO are closed. This event and POLLOUT are mutually-
46762		exclusive; a stream can never be writable if a hangup has occurred. However,
46763		this event and POLLIN, POLLRDNORM, POLLRDBAND, or POLLPRI are
46764		not mutually-exclusive. This flag is only valid in the <i>revents</i> bitmask; it shall be

46765		ignored in the <i>events</i> member.
46766	POLLNVAL	The specified <i>fd</i> value is invalid. This flag is only valid in the <i>revents</i> member;
46767		it shall ignored in the <i>events</i> member.
46768		The significance and semantics of normal, priority, and high-priority data are file and device-
46769		specific.
46770		If the value of <i>fd</i> is less than 0, <i>events</i> shall be ignored, and <i>revents</i> shall be set to 0 in that entry on
46771		return from <i>poll()</i> .
46772		In each pollfd structure, <i>poll()</i> shall clear the <i>revents</i> member, except that where the application
46773		requested a report on a condition by setting one of the bits of <i>events</i> listed above, <i>poll()</i> shall set
46774		the corresponding bit in <i>revents</i> if the requested condition is true. In addition, <i>poll()</i> shall set the
46775		POLLHUP, POLLERR, and POLLNVAL flag in <i>revents</i> if the condition is true, even if the
46776		application did not set the corresponding bit in <i>events</i> .
46777		If none of the defined events have occurred on any selected file descriptor, <i>poll()</i> shall wait at
46778		least <i>timeout</i> milliseconds for an event to occur on any of the selected file descriptors. If the value
46779		of <i>timeout</i> is 0, <i>poll()</i> shall return immediately. If the value of <i>timeout</i> is -1, <i>poll()</i> shall block until
46780		a requested event occurs or until the call is interrupted.
46781		Implementations may place limitations on the granularity of timeout intervals. If the requested
46782		timeout interval requires a finer granularity than the implementation supports, the actual
46783		timeout interval shall be rounded up to the next supported value.
46784		The <i>poll()</i> function shall not be affected by the O_NONBLOCK flag.
46785		The <i>poll()</i> function shall support regular files, terminal and pseudo-terminal devices, FIFOs,
46786	OB XSR	pipes, sockets and STREAMS-based files . The behavior of <i>poll()</i> on elements of <i>fds</i> that refer to
46787		other types of file is unspecified.
46788		Regular files shall always poll TRUE for reading and writing.
46789		A file descriptor for a socket that is listening for connections shall indicate that it is ready for
46790		reading, once connections are available. A file descriptor for a socket that is connecting
46791		asynchronously shall indicate that it is ready for writing, once a connection has been established.
46792	RETURN VALUE	
46793		Upon successful completion, <i>poll()</i> shall return a non-negative value. A positive value indicates
46794		the total number of file descriptors that have been selected (that is, file descriptors for which the
46795		<i>revents</i> member is non-zero). A value of 0 indicates that the call timed out and no file descriptors
46796		have been selected. Upon failure, <i>poll()</i> shall return -1 and set <i>errno</i> to indicate the error.
46797	ERRORS	
46798		The <i>poll()</i> function shall fail if:
46799	[EAGAIN]	The allocation of internal data structures failed but a subsequent request may
46800		succeed.
46801	[EINTR]	A signal was caught during <i>poll()</i> .
46802	OB XSR [EINVAL]	The <i>nfds</i> argument is greater than {OPEN_MAX}, or one of the <i>fd</i> members
46803		refers to a STREAM or multiplexer that is linked (directly or indirectly)
46804		downstream from a multiplexer.

46805 **EXAMPLES**46806 **Checking for Events on a Stream**

46807 The following example opens a pair of STREAMS devices and then waits for either one to
 46808 become writable. This example proceeds as follows:

- 46809 1. Sets the *timeout* parameter to 500 milliseconds.
 - 46810 2. Opens the STREAMS devices */dev/dev0* and */dev/dev1*, and then polls them, specifying
 46811 POLLOUT and POLLWRBAND as the events of interest.
- 46812 The STREAMS device names */dev/dev0* and */dev/dev1* are only examples of how
 46813 STREAMS devices can be named; STREAMS naming conventions may vary among
 46814 systems conforming to the POSIX.1-2008.
- 46815 3. Uses the *ret* variable to determine whether an event has occurred on either of the two
 46816 STREAMS. The *poll()* function is given 500 milliseconds to wait for an event to occur (if it
 46817 has not occurred prior to the *poll()* call).
 - 46818 4. Checks the returned value of *ret*. If a positive value is returned, one of the following can
 46819 be done:
 - 46820 a. Priority data can be written to the open STREAM on priority bands greater than 0,
 46821 because the POLLWRBAND event occurred on the open STREAM (*fds[0]* or *fds[1]*).
 - 46822 b. Data can be written to the open STREAM on priority-band 0, because the
 46823 POLLOUT event occurred on the open STREAM (*fds[0]* or *fds[1]*).
 - 46824 5. If the returned value is not a positive value, permission to write data to the open
 46825 STREAM (on any priority band) is denied.
 - 46826 6. If the POLLHUP event occurs on the open STREAM (*fds[0]* or *fds[1]*), the device on the
 46827 open STREAM has disconnected.

```

46828 #include <stropts.h>
46829 #include <poll.h>
46830 ...
46831 struct pollfd fds[2];
46832 int timeout_msecs = 500;
46833 int ret;
46834     int i;

46835 /* Open STREAMS device. */
46836 fds[0].fd = open("/dev/dev0", ...);
46837 fds[1].fd = open("/dev/dev1", ...);
46838 fds[0].events = POLLOUT | POLLWRBAND;
46839 fds[1].events = POLLOUT | POLLWRBAND;

46840 ret = poll(fds, 2, timeout_msecs);

46841 if (ret > 0) {
46842     /* An event on one of the fds has occurred. */
46843     for (i=0; i<2; i++) {
46844         if (fds[i].revents & POLLWRBAND) {
46845             /* Priority data may be written on device number i. */
46846             ...
46847         }
46848         if (fds[i].revents & POLLOUT) {

```

```

46849             /* Data may be written on device number i. */
46850         ...
46851     }
46852     if (fds[i].revents & POLLHUP) {
46853         /* A hangup has occurred on device number i. */
46854         ...
46855     }
46856 }
46857 }

```

APPLICATION USAGE

None.

RATIONALE

The POLLHUP event does not occur for FIFOs just because the FIFO is not open for writing. It only occurs when the FIFO is closed by the last writer and persists until some process opens the FIFO for writing or until all read-only file descriptors for the FIFO are closed.

FUTURE DIRECTIONS

None.

SEE ALSO

Section 2.6 (on page 499), *getmsg()*, *pselect()*, *putmsg()*, *read()*, *write()*

XBD <poll.h>, <stropts.h>

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

The description of POLLWRBAND is updated.

Issue 6

Text referring to sockets is added to the DESCRIPTION.

Functionality relating to the XSI STREAMS Option Group is marked.

The Open Group Corrigendum U055/3 is applied, updating the DESCRIPTION of POLLWRBAND.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/66 is applied, correcting the spacing in the EXAMPLES section.

Issue 7

Austin Group Interpretation 1003.1-2001 #209 is applied, clarifying the POLLHUP event.

The *poll()* function is moved from the XSI option to the Base.

Functionality relating to the XSI STREAMS option is marked obsolescent.

NAME

popen — initiate pipe streams to or from a process

SYNOPSIS

```
CX      #include <stdio.h>
FILE *popen(const char *command, const char *mode);
```

DESCRIPTION

The *popen()* function shall execute the command specified by the string *command*. It shall create a pipe between the calling program and the executed command, and shall return a pointer to a stream that can be used to either read from or write to the pipe.

The environment of the executed command shall be as if a child process were created within the *popen()* call using the *fork()* function, and the child invoked the *sh* utility using the call:

```
execl(shell path, "sh", "-c", command, (char *)0);
```

where *shell path* is an unspecified pathname for the *sh* utility.

The *popen()* function shall ensure that any streams from previous *popen()* calls that remain open in the parent process are closed in the new child process.

The *mode* argument to *popen()* is a string that specifies I/O mode:

1. If *mode* is *r*, when the child process is started, its file descriptor `STDOUT_FILENO` shall be the writable end of the pipe, and the file descriptor *fileno(stream)* in the calling process, where *stream* is the stream pointer returned by *popen()*, shall be the readable end of the pipe.
2. If *mode* is *w*, when the child process is started its file descriptor `STDIN_FILENO` shall be the readable end of the pipe, and the file descriptor *fileno(stream)* in the calling process, where *stream* is the stream pointer returned by *popen()*, shall be the writable end of the pipe.
3. If *mode* is any other value, the result is unspecified.

After *popen()*, both the parent and the child process shall be capable of executing independently before either terminates.

Pipe streams are byte-oriented.

RETURN VALUE

Upon successful completion, *popen()* shall return a pointer to an open stream that can be used to read or write to the pipe. Otherwise, it shall return a null pointer and may set *errno* to indicate the error.

ERRORS

The *popen()* function shall fail if:

[EMFILE] {STREAM_MAX} streams are currently open in the calling process.

The *popen()* function may fail if:

[EMFILE] {FOPEN_MAX} streams are currently open in the calling process.

[EINVAL] The *mode* argument is invalid.

The *popen()* function may also set *errno* values as described by *fork()* or *pipe()*.

EXAMPLES

Using popen() to Obtain a List of Files from the ls Utility

The following example demonstrates the use of *popen()* and *pclose()* to execute the command *ls* in order to obtain a list of files in the current directory:

```
#include <stdio.h>
...

FILE *fp;
int status;
char path[PATH_MAX];

fp = popen("ls *", "r");
if (fp == NULL)
    /* Handle error */;

while (fgets(path, PATH_MAX, fp) != NULL)
    printf("%s", path);

status = pclose(fp);
if (status == -1) {
    /* Error reported by pclose() */
    ...
} else {
    /* Use macros described under wait() to inspect 'status' in order
       to determine success/failure of command executed by popen() */
    ...
}
```

APPLICATION USAGE

Since open files are shared, a mode *r* command can be used as an input filter and a mode *w* command as an output filter.

Buffered reading before opening an input filter may leave the standard input of that filter mispositioned. Similar problems with an output filter may be prevented by careful buffer flushing; for example, with *fflush()*.

A stream opened by *popen()* should be closed by *pclose()*.

The behavior of *popen()* is specified for values of *mode* of *r* and *w*. Other modes such as *rb* and *wb* might be supported by specific implementations, but these would not be portable features. Note that historical implementations of *popen()* only check to see if the first character of *mode* is *r*. Thus, a *mode* of *robert the robot* would be treated as *mode r*, and a *mode* of *anything else* would be treated as *mode w*.

If the application calls *waitpid()* or *waitid()* with a *pid* argument greater than 0, and it still has a stream that was called with *popen()* open, it must ensure that *pid* does not refer to the process started by *popen()*.

To determine whether or not the environment specified in the Shell and Utilities volume of POSIX.1-2008 is present, use the function call:

```
sysconf(_SC_2_VERSION)
```

(See *sysconf()*).

RATIONALE

The *popen()* function should not be used by programs that have set user (or group) ID privileges. The *fork()* and *exec* family of functions (except *execlp()* and *execvp()*), should be used instead. This prevents any unforeseen manipulation of the environment of the user that could cause execution of commands not anticipated by the calling program.

If the original and *popen()*ed processes both intend to read or write or read and write a common file, and either will be using FILE-type C functions (*fread()*, *fwrite()*, and so on), the rules for sharing file handles must be observed (see [Section 2.5.1](#), on page 496).

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

A statement is added to the DESCRIPTION indicating that pipe streams are byte-oriented.

Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The optional [EMFILE] error condition is added.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/67 is applied, adding the example to the EXAMPLES section.

Issue 7

Austin Group Interpretation 1003.1-2001 #029 is applied, clarifying the values for *mode* in the DESCRIPTION.

SD5-XSH-ERN-149 is applied, changing the {STREAM_MAX} [EMFILE] error condition from a “may fail” to a “shall fail”.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0432 [14] is applied.

+

NAME

posix_fadvise — file advisory information (**ADVANCED REALTIME**)

SYNOPSIS

```
#include <fcntl.h>

int posix_fadvise(int fd, off_t offset, off_t len, int advice);
```

DESCRIPTION

The *posix_fadvise()* function shall advise the implementation on the expected behavior of the application with respect to the data in the file associated with the open file descriptor, *fd*, starting at *offset* and continuing for *len* bytes. The specified range need not currently exist in the file. If *len* is zero, all data following *offset* is specified. The implementation may use this information to optimize handling of the specified data. The *posix_fadvise()* function shall have no effect on the semantics of other operations on the specified data, although it may affect the performance of other operations.

The advice to be applied to the data is specified by the *advice* parameter and may be one of the following values:

POSIX_FADV_NORMAL

Specifies that the application has no advice to give on its behavior with respect to the specified data. It is the default characteristic if no advice is given for an open file.

POSIX_FADV_SEQUENTIAL

Specifies that the application expects to access the specified data sequentially from lower offsets to higher offsets.

POSIX_FADV_RANDOM

Specifies that the application expects to access the specified data in a random order.

POSIX_FADV_WILLNEED

Specifies that the application expects to access the specified data in the near future.

POSIX_FADV_DONTNEED

Specifies that the application expects that it will not access the specified data in the near future.

POSIX_FADV_NOREUSE

Specifies that the application expects to access the specified data once and then not reuse it thereafter.

These values are defined in **<fcntl.h>**.

RETURN VALUE

Upon successful completion, *posix_fadvise()* shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *posix_fadvise()* function shall fail if:

[EBADF]	The <i>fd</i> argument is not a valid file descriptor.
[EINVAL]	The value of <i>advice</i> is invalid, or the value of <i>len</i> is less than zero.
[ESPIPE]	The <i>fd</i> argument is associated with a pipe or FIFO.

47036 EXAMPLES

47037 None.

47038 APPLICATION USAGE

47039 The *posix_fadvise()* function is part of the Advisory Information option and need not be
47040 provided on all implementations.

47041 RATIONALE

47042 None.

47043 FUTURE DIRECTIONS

47044 None.

47045 SEE ALSO

47047 XBD **<fcntl.h>**

47048 CHANGE HISTORY

47049 First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

47050 In the SYNOPSIS, the inclusion of **<sys/types.h>** is no longer required.

47051 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/68 is applied, changing the function
47052 prototype in the SYNOPSIS section. The previous prototype was not large file-aware, and the
47053 standard developers felt it acceptable to make this change before implementations of this
47054 function become widespread.

47055 Issue 7

47056 Austin Group Interpretation 1003.1-2001 #024 is applied, changing the definition of the
47057 [EINVAL] error.

47058 **NAME**47059 posix_fallocate — file space control (**ADVANCED REALTIME**)47060 **SYNOPSIS**

```
47061 ADV    #include <fcntl.h>
47062        int posix_fallocate(int fd, off_t offset, off_t len);
```

47063 **DESCRIPTION**

47064 The *posix_fallocate()* function shall ensure that any required storage for regular file data starting
 47065 at *offset* and continuing for *len* bytes is allocated on the file system storage media. If
 47066 *posix_fallocate()* returns successfully, subsequent writes to the specified file data shall not fail due
 47067 to the lack of free space on the file system storage media.

47068 If the *offset+len* is beyond the current file size, then *posix_fallocate()* shall adjust the file size to
 47069 *offset+len*. Otherwise, the file size shall not be changed.

47070 It is implementation-defined whether a previous *posix_fadvise()* call influences allocation
 47071 strategy.

47072 Space allocated via *posix_fallocate()* shall be freed by a successful call to *creat()* or *open()* that
 47073 truncates the size of the file. Space allocated via *posix_fallocate()* may be freed by a successful call
 47074 to *ftruncate()* that reduces the file size to a size smaller than *offset+len*.

47075 **RETURN VALUE**

47076 Upon successful completion, *posix_fallocate()* shall return zero; otherwise, an error number shall
 47077 be returned to indicate the error.

47078 **ERRORS**

47079 The *posix_fallocate()* function shall fail if:

47080	[EBADF]	The <i>fd</i> argument is not a valid file descriptor.
47081	[EBADF]	The <i>fd</i> argument references a file that was opened without write permission.
47082	[EFBIG]	The value of <i>offset+len</i> is greater than the maximum file size.
47083	[EINTR]	A signal was caught during execution.
47084	[EINVAL]	The <i>len</i> argument is less than zero, or the <i>offset</i> argument is less than zero, or the underlying file system does not support this operation.
47085		
47086	[EIO]	An I/O error occurred while reading from or writing to a file system.
47087	[ENODEV]	The <i>fd</i> argument does not refer to a regular file.
47088	[ENOSPC]	There is insufficient free space remaining on the file system storage media.
47089	[ESPIPE]	The <i>fd</i> argument is associated with a pipe or FIFO.
47090		The <i>posix_fallocate()</i> function may fail if:
47091	[EINVAL]	The <i>len</i> argument is zero.

47092 EXAMPLES

47093 None.

47094 APPLICATION USAGE

47095 The *posix_fallocate()* function is part of the Advisory Information option and need not be
47096 provided on all implementations.

NAME

posix_madvise — memory advisory information and alignment control (**ADVANCED REALTIME**)

SYNOPSIS

```
#include <sys/mman.h>

int posix_madvise(void *addr, size_t len, int advice);
```

DESCRIPTION

The *posix_madvise()* function shall advise the implementation on the expected behavior of the application with respect to the data in the memory starting at address *addr*, and continuing for *len* bytes. The implementation may use this information to optimize handling of the specified data. The *posix_madvise()* function shall have no effect on the semantics of access to memory in the specified range, although it may affect the performance of access.

The implementation may require that *addr* be a multiple of the page size, which is the value returned by *sysconf()* when the name value *_SC_PAGESIZE* is used.

The advice to be applied to the memory range is specified by the *advice* parameter and may be one of the following values:

POSIX_MADV_NORMAL

Specifies that the application has no advice to give on its behavior with respect to the specified range. It is the default characteristic if no advice is given for a range of memory.

POSIX_MADV_SEQUENTIAL

Specifies that the application expects to access the specified range sequentially from lower addresses to higher addresses.

POSIX_MADV_RANDOM

Specifies that the application expects to access the specified range in a random order.

POSIX_MADV_WILLNEED

Specifies that the application expects to access the specified range in the near future.

POSIX_MADV_DONTNEED

Specifies that the application expects that it will not access the specified range in the near future.

These values are defined in the **<sys/mman.h>** header.

RETURN VALUE

Upon successful completion, *posix_madvise()* shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *posix_madvise()* function shall fail if:

[EINVAL] The value of *advice* is invalid.

[ENOMEM] Addresses in the range starting at *addr* and continuing for *len* bytes are partly or completely outside the range allowed for the address space of the calling process.

47153 The *posix_madvise()* function may fail if:

47154 [EINVAL] The value of *addr* is not a multiple of the value returned by *sysconf()* when the
47155 name value *_SC_PAGESIZE* is used.

47156 [EINVAL] The value of *len* is zero.

47157 **EXAMPLES**

47158 None.

47159 **APPLICATION USAGE**

47160 The *posix_madvise()* function is part of the Advisory Information option and need not be
47161 provided on all implementations.

47171 IEEE PASC Interpretation 1003.1 #102 is applied.

NAME

posix_mem_offset — find offset and length of a mapped typed memory block (ADVANCED REALTIME)

SYNOPSIS

```
#include <sys/mman.h>

int posix_mem_offset(const void *restrict addr, size_t len,
    off_t *restrict off, size_t *restrict contig_len,
    int *restrict fildes);
```

DESCRIPTION

The *posix_mem_offset()* function shall return in the variable pointed to by *off* a value that identifies the offset (or location), within a memory object, of the memory block currently mapped at *addr*. The function shall return in the variable pointed to by *fildes*, the descriptor used (via *mmap()*) to establish the mapping which contains *addr*. If that descriptor was closed since the mapping was established, the returned value of *fildes* shall be -1. The *len* argument specifies the length of the block of the memory object the user wishes the offset for; upon return, the value pointed to by *contig_len* shall equal either *len*, or the length of the largest contiguous block of the memory object that is currently mapped to the calling process starting at *addr*, whichever is smaller.

If the memory object mapped at *addr* is a typed memory object, then if the *off* and *contig_len* values obtained by calling *posix_mem_offset()* are used in a call to *mmap()* with a file descriptor that refers to the same memory pool as *fildes* (either through the same port or through a different port), and that was opened with neither the POSIX_TYPED_MEM_ALLOCATE nor the POSIX_TYPED_MEM_ALLOCATE_CONTIG flag, the typed memory area that is mapped shall be exactly the same area that was mapped at *addr* in the address space of the process that called *posix_mem_offset()*.

If the memory object specified by *fildes* is not a typed memory object, then the behavior of this function is implementation-defined.

RETURN VALUE

Upon successful completion, the *posix_mem_offset()* function shall return zero; otherwise, the corresponding error status value shall be returned.

ERRORS

The *posix_mem_offset()* function shall fail if:

[EACCES] The process has not mapped a memory object supported by this function at the given address *addr*.

This function shall not return an error code of [EINTR].

47220 **NAME**

47221 posix_memalign — aligned memory allocation (ADVANCED REALTIME)

47222 **SYNOPSIS**

```
47223 ADV    #include <stdlib.h>
47224        int posix_memalign(void **memptr, size_t alignment, size_t size);
```

47225 **DESCRIPTION**

47226 The *posix_memalign()* function shall allocate *size* bytes aligned on a boundary specified by
 47227 *alignment*, and shall return a pointer to the allocated memory in *memptr*. The value of *alignment*
 47228 shall be a power of two multiple of *sizeof(void *)*.

47229 Upon successful completion, the value pointed to by *memptr* shall be a multiple of *alignment*.

47230 If the size of the space requested is 0, the behavior is implementation-defined; the value returned
 47231 in *memptr* shall be either a null pointer or a unique pointer.

47232 CX The *free()* function shall deallocate memory that has previously been allocated by
 47233 *posix_memalign()*.

47234 **RETURN VALUE**

47235 Upon successful completion, *posix_memalign()* shall return zero; otherwise, an error number
 47236 shall be returned to indicate the error.

47237 **ERRORS**

47238 The *posix_memalign()* function shall fail if:

47239 [EINVAL] The value of the alignment parameter is not a power of two multiple of
 47240 *sizeof(void *)*.

47241 [ENOMEM] There is insufficient memory available with the requested alignment.

47242 **EXAMPLES**

NAME

posix_openpt — open a pseudo-terminal device

SYNOPSIS

```
#include <stdlib.h>
#include <fcntl.h>

int posix_openpt(int oflag);
```

DESCRIPTION

The *posix_openpt()* function shall establish a connection between a master device for a pseudo-terminal and a file descriptor. The file descriptor is used by other I/O functions that refer to that pseudo-terminal.

The file status flags and file access modes of the open file description shall be set according to the value of *oflag*.

Values for *oflag* are constructed by a bitwise-inclusive OR of flags from the following list, defined in *<fcntl.h>*:

O_RDWR	Open for reading and writing.
O_NOCTTY	If set <i>posix_openpt()</i> shall not cause the terminal device to become the controlling terminal for the process.

The behavior of other values for the *oflag* argument is unspecified.

RETURN VALUE

Upon successful completion, the *posix_openpt()* function shall open a master pseudo-terminal device and return a non-negative integer representing the lowest numbered unused file descriptor. Otherwise, -1 shall be returned and *errno* set to indicate the error.

ERRORS

The *posix_openpt()* function shall fail if:

[EMFILE]	All file descriptors available to the process are currently open.
[ENFILE]	The maximum allowable number of files is currently open in the system.

The *posix_openpt()* function may fail if:

[EINVAL]	The value of <i>oflag</i> is not valid.
[EAGAIN]	Out of pseudo-terminal resources.

[ENOSR]	Out of STREAMS resources.

EXAMPLES

Opening a Pseudo-Terminal and Returning the Name of the Slave Device and a File Descriptor

```
#include <fcntl.h>
#include <stdio.h>

int masterfd, slavefd;
char *slavedevice;

masterfd = posix_openpt(O_RDWR|O_NOCTTY);

if (masterfd == -1
    || grantpt (masterfd) == -1
```

```

47302         || unlockpt (masterfd) == -1
47303         || (slavedevice = ptsname (masterfd)) == NULL)
47304         return -1;

47305     printf("slave device is: %s\n", slavedevice);

47306     slavefd = open(slavedevice, O_RDWR|O_NOCTTY);
47307     if (slavefd < 0)
47308         return -1;

```

APPLICATION USAGE

This function is a method for portably obtaining a file descriptor of a master terminal device for a pseudo-terminal. The *grantpt()* and *ptsname()* functions can be used to manipulate mode and ownership permissions, and to obtain the name of the slave device, respectively.

RATIONALE

The standard developers considered the matter of adding a special device for cloning master pseudo-terminals: the */dev/ptmx* device. However, consensus could not be reached, and it was felt that adding a new function would permit other implementations. The *posix_openpt()* function is designed to complement the *grantpt()*, *ptsname()*, and *unlockpt()* functions.

On implementations supporting the */dev/ptmx* clone device, opening the master device of a pseudo-terminal is simply:

```

47320     mfdp = open("/dev/ptmx", oflag );
47321     if (mfdp < 0)
47322         return -1;

```

FUTURE DIRECTIONS

None.

SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.

SD5-XSH-ERN-51 is applied, correcting an error in the EXAMPLES section.

NAME

posix_spawn, posix_spawnp — spawn a process (**ADVANCED REALTIME**)

SYNOPSIS

```
#include <spawn.h>

int posix_spawn(pid_t *restrict pid, const char *restrict path,
               const posix_spawn_file_actions_t *file_actions,
               const posix_spawnattr_t *restrict attrp,
               char *const argv[restrict], char *const envp[restrict]);
int posix_spawnp(pid_t *restrict pid, const char *restrict file,
               const posix_spawn_file_actions_t *file_actions,
               const posix_spawnattr_t *restrict attrp,
               char *const argv[restrict], char *const envp[restrict]);
```

DESCRIPTION

The *posix_spawn()* and *posix_spawnp()* functions shall create a new process (child process) from the specified process image. The new process image shall be constructed from a regular executable file called the new process image file.

When a C program is executed as the result of this call, it shall be entered as a C-language function call as follows:

```
int main(int argc, char *argv[]);
```

where *argc* is the argument count and *argv* is an array of character pointers to the arguments themselves. In addition, the following variable:

```
extern char **environ;
```

shall be initialized as a pointer to an array of character pointers to the environment strings.

The argument *argv* is an array of character pointers to null-terminated strings. The last member of this array shall be a null pointer and is not counted in *argc*. These strings constitute the argument list available to the new process image. The value in *argv*[0] should point to a filename string that is associated with the process image being started by the *posix_spawn()* or *posix_spawnp()* function.

The argument *envp* is an array of character pointers to null-terminated strings. These strings constitute the environment for the new process image. The environment array is terminated by a null pointer.

The number of bytes available for the combined argument and environment lists of the child process is {ARG_MAX}. The implementation shall specify in the system documentation (see XBD Chapter 2, on page 15) whether any list overhead, such as length words, null terminators, pointers, or alignment bytes, is included in this total.

The *path* argument to *posix_spawn()* is a pathname that identifies the new process image file to execute.

The *file* parameter to *posix_spawnp()* shall be used to construct a pathname that identifies the new process image file. If the *file* parameter contains a <slash> character, the *file* parameter shall be used as the pathname for the new process image file. Otherwise, the path prefix for this file shall be obtained by a search of the directories passed as the environment variable *PATH* (see XBD Chapter 8, on page 173). If this environment variable is not defined, the results of the search are implementation-defined.

If *file_actions* is a null pointer, then file descriptors open in the calling process shall remain open

in the child process, except for those whose close-on-exec flag `FD_CLOEXEC` is set (see `fcntl()`). For those file descriptors that remain open, all attributes of the corresponding open file descriptions, including file locks (see `fcntl()`), shall remain unchanged.

If `file_actions` is not NULL, then the file descriptors open in the child process shall be those open in the calling process as modified by the spawn file actions object pointed to by `file_actions` and the `FD_CLOEXEC` flag of each remaining open file descriptor after the spawn file actions have been processed. The effective order of processing the spawn file actions shall be:

1. The set of open file descriptors for the child process shall initially be the same set as is open for the calling process. All attributes of the corresponding open file descriptions, including file locks (see `fcntl()`), shall remain unchanged.
2. The signal mask, signal default actions, and the effective user and group IDs for the child process shall be changed as specified in the attributes object referenced by `attrp`.
3. The file actions specified by the spawn file actions object shall be performed in the order in which they were added to the spawn file actions object.
4. Any file descriptor that has its `FD_CLOEXEC` flag set (see `fcntl()`) shall be closed.

If file descriptor 0, 1, or 2 would otherwise be closed in the new process image created by `posix_spawn()` or `posix_spawnnp()`, implementations may open an unspecified file for the file descriptor in the new process image. If a standard utility or a conforming application is executed with file descriptor 0 not open for reading or with file descriptor 1 or 2 not open for writing, the environment in which the utility or application is executed shall be deemed non-conforming, and consequently the utility or application might not behave as described in this standard.

The `posix_spawnattr_t` spawn attributes object type is defined in `<spawn.h>`. It shall contain at least the attributes defined below.

If the `POSIX_SPAWN_SETPGROUP` flag is set in the `spawn-flgs` attribute of the object referenced by `attrp`, and the `spawn-pgroup` attribute of the same object is non-zero, then the child's process group shall be as specified in the `spawn-pgroup` attribute of the object referenced by `attrp`.

As a special case, if the `POSIX_SPAWN_SETPGROUP` flag is set in the `spawn-flgs` attribute of the object referenced by `attrp`, and the `spawn-pgroup` attribute of the same object is set to zero, then the child shall be in a new process group with a process group ID equal to its process ID.

If the `POSIX_SPAWN_SETPGROUP` flag is not set in the `spawn-flgs` attribute of the object referenced by `attrp`, the new child process shall inherit the parent's process group.

PS If the `POSIX_SPAWN_SETSCHEDPARAM` flag is set in the `spawn-flgs` attribute of the object referenced by `attrp`, but `POSIX_SPAWN_SETSCHEDULER` is not set, the new process image shall initially have the scheduling policy of the calling process with the scheduling parameters specified in the `spawn-schedparam` attribute of the object referenced by `attrp`.

If the `POSIX_SPAWN_SETSCHEDULER` flag is set in the `spawn-flgs` attribute of the object referenced by `attrp` (regardless of the setting of the `POSIX_SPAWN_SETSCHEDPARAM` flag), the new process image shall initially have the scheduling policy specified in the `spawn-schedpolicy` attribute of the object referenced by `attrp` and the scheduling parameters specified in the `spawn-schedparam` attribute of the same object.

The `POSIX_SPAWN_RESETPID` flag in the `spawn-flgs` attribute of the object referenced by `attrp` governs the effective user ID of the child process. If this flag is not set, the child process shall inherit the effective user ID of the parent process. If this flag is set, the effective user ID of the child process shall be reset to the parent's real user ID. In either case, if the set-user-ID mode bit of the new process image file is set, the effective user ID of the child process shall become that

file's owner ID before the new process image begins execution.

The POSIX_SPAWN_RESETPID flag in the *spawn_flags* attribute of the object referenced by *attrp* also governs the effective group ID of the child process. If this flag is not set, the child process shall inherit the effective group ID of the parent process. If this flag is set, the effective group ID of the child process shall be reset to the parent's real group ID. In either case, if the set-group-ID mode bit of the new process image file is set, the effective group ID of the child process shall become that file's group ID before the new process image begins execution.

If the POSIX_SPAWN_SETSIGMASK flag is set in the *spawn_flags* attribute of the object referenced by *attrp*, the child process shall initially have the signal mask specified in the *spawn-sigmask* attribute of the object referenced by *attrp*.

If the POSIX_SPAWN_SETSIGDEF flag is set in the *spawn_flags* attribute of the object referenced by *attrp*, the signals specified in the *spawn-sigdefault* attribute of the same object shall be set to their default actions in the child process. Signals set to the default action in the parent process shall be set to the default action in the child process.

Signals set to be caught by the calling process shall be set to the default action in the child process.

Except for SIGCHLD, signals set to be ignored by the calling process image shall be set to be ignored by the child process, unless otherwise specified by the POSIX_SPAWN_SETSIGDEF flag being set in the *spawn_flags* attribute of the object referenced by *attrp* and the signals being indicated in the *spawn-sigdefault* attribute of the object referenced by *attrp*.

If the SIGCHLD signal is set to be ignored by the calling process, it is unspecified whether the SIGCHLD signal is set to be ignored or to the default action in the child process, unless otherwise specified by the POSIX_SPAWN_SETSIGDEF flag being set in the *spawn_flags* attribute of the object referenced by *attrp* and the SIGCHLD signal being indicated in the *spawn-sigdefault* attribute of the object referenced by *attrp*.

If the value of the *attrp* pointer is NULL, then the default values are used.

All process attributes, other than those influenced by the attributes set in the object referenced by *attrp* as specified above or by the file descriptor manipulations specified in *file_actions*, shall appear in the new process image as though *fork()* had been called to create a child process and then a member of the *exec* family of functions had been called by the child process to execute the new process image.

It is implementation-defined whether the fork handlers are run when *posix_spawn()* or *posix_spawnnp()* is called.

RETURN VALUE

Upon successful completion, *posix_spawn()* and *posix_spawnnp()* shall return the process ID of the child process to the parent process, in the variable pointed to by a non-NULL *pid* argument, and shall return zero as the function return value. Otherwise, no child process shall be created, the value stored into the variable pointed to by a non-NULL *pid* is unspecified, and an error number shall be returned as the function return value to indicate the error. If the *pid* argument is a null pointer, the process ID of the child is not returned to the caller.

ERRORS

These functions may fail if:

[EINVAL] The value specified by *file_actions* or *attrp* is invalid.

If this error occurs after the calling process successfully returns from the *posix_spawn()* or *posix_spawnnp()* function, the child process may exit with exit status 127.

If *posix_spawn()* or *posix_spawnnp()* fail for any of the reasons that would cause *fork()* or one of the *exec* family of functions to fail, an error value shall be returned as described by *fork()* and *exec*, respectively (or, if the error occurs after the calling process successfully returns, the child process shall exit with exit status 127).

If POSIX_SPAWN_SETPGROUP is set in the *spawn_flags* attribute of the object referenced by *attrp*, and *posix_spawn()* or *posix_spawnnp()* fails while changing the child's process group, an error value shall be returned as described by *setpgid()* (or, if the error occurs after the calling process successfully returns, the child process shall exit with exit status 127).

PS If POSIX_SPAWN_SETSCHEDPARAM is set and POSIX_SPAWN_SETSCHEDULER is not set in the *spawn_flags* attribute of the object referenced by *attrp*, then if *posix_spawn()* or *posix_spawnnp()* fails for any of the reasons that would cause *sched_setparam()* to fail, an error value shall be returned as described by *sched_setparam()* (or, if the error occurs after the calling process successfully returns, the child process shall exit with exit status 127).

If POSIX_SPAWN_SETSCHEDULER is set in the *spawn_flags* attribute of the object referenced by *attrp*, and if *posix_spawn()* or *posix_spawnnp()* fails for any of the reasons that would cause *sched_setscheduler()* to fail, an error value shall be returned as described by *sched_setscheduler()* (or, if the error occurs after the calling process successfully returns, the child process shall exit with exit status 127).

If the *file_actions* argument is not NULL, and specifies any *close*, *dup2*, or *open* actions to be performed, and if *posix_spawn()* or *posix_spawnnp()* fails for any of the reasons that would cause *close()*, *dup2()*, or *open()* to fail, an error value shall be returned as described by *close()*, *dup2()*, and *open()*, respectively (or, if the error occurs after the calling process successfully returns, the child process shall exit with exit status 127). An open file action may, by itself, result in any of the errors described by *close()* or *dup2()*, in addition to those described by *open()*.

EXAMPLES

None.

APPLICATION USAGE

These functions are part of the Spawn option and need not be provided on all implementations.

See also the APPLICATION USAGE section for *exec*.

+

RATIONALE

The *posix_spawn()* function and its close relation *posix_spawnnp()* have been introduced to overcome the following perceived difficulties with *fork()*: the *fork()* function is difficult or impossible to implement without swapping or dynamic address translation.

- Swapping is generally too slow for a realtime environment.
- Dynamic address translation is not available everywhere that POSIX might be useful.
- Processes are too useful to simply option out of POSIX whenever it must run without address translation or other MMU services.

Thus, POSIX needs process creation and file execution primitives that can be efficiently implemented without address translation or other MMU services.

The *posix_spawn()* function is implementable as a library routine, but both *posix_spawn()* and *posix_spawnnp()* are designed as kernel operations. Also, although they may be an efficient replacement for many *fork()/exec* pairs, their goal is to provide useful process creation primitives for systems that have difficulty with *fork()*, not to provide drop-in replacements for *fork()/exec*.

This view of the role of *posix_spawn()* and *posix_spawnnp()* influenced the design of their API. It

does not attempt to provide the full functionality of *fork()/exec* in which arbitrary user-specified operations of any sort are permitted between the creation of the child process and the execution of the new process image; any attempt to reach that level would need to provide a programming language as parameters. Instead, *posix_spawn()* and *posix_spawnnp()* are process creation primitives like the *Start_Process* and *Start_Process_Search* Ada language bindings package *POSIX_Process_Primitives* and also like those in many operating systems that are not UNIX systems, but with some POSIX-specific additions.

To achieve its coverage goals, *posix_spawn()* and *posix_spawnnp()* have control of six types of inheritance: file descriptors, process group ID, user and group ID, signal mask, scheduling, and whether each signal ignored in the parent will remain ignored in the child, or be reset to its default action in the child.

Control of file descriptors is required to allow an independently written child process image to access data streams opened by and even generated or read by the parent process without being specifically coded to know which parent files and file descriptors are to be used. Control of the process group ID is required to control how the job control of the child process relates to that of the parent.

Control of the signal mask and signal defaulting is sufficient to support the implementation of *system()*. Although support for *system()* is not explicitly one of the goals for *posix_spawn()* and *posix_spawnnp()*, it is covered under the “at least 50%” coverage goal.

The intention is that the normal file descriptor inheritance across *fork()*, the subsequent effect of the specified spawn file actions, and the normal file descriptor inheritance across one of the *exec* family of functions should fully specify open file inheritance. The implementation need make no decisions regarding the set of open file descriptors when the child process image begins execution, those decisions having already been made by the caller and expressed as the set of open file descriptors and their *FD_CLOEXEC* flags at the time of the call and the spawn file actions object specified in the call. We have been assured that in cases where the POSIX *Start_Process* Ada primitives have been implemented in a library, this method of controlling file descriptor inheritance may be implemented very easily.

We can identify several problems with *posix_spawn()* and *posix_spawnnp()*, but there does not appear to be a solution that introduces fewer problems. Environment modification for child process attributes not specifiable via the *attrp* or *file_actions* arguments must be done in the parent process, and since the parent generally wants to save its context, it is more costly than similar functionality with *fork()/exec*. It is also complicated to modify the environment of a multi-threaded process temporarily, since all threads must agree when it is safe for the environment to be changed. However, this cost is only borne by those invocations of *posix_spawn()* and *posix_spawnnp()* that use the additional functionality. Since extensive modifications are not the usual case, and are particularly unlikely in time-critical code, keeping much of the environment control out of *posix_spawn()* and *posix_spawnnp()* is appropriate design.

The *posix_spawn()* and *posix_spawnnp()* functions do not have all the power of *fork()/exec*. This is to be expected. The *fork()* function is a wonderfully powerful operation. We do not expect to duplicate its functionality in a simple, fast function with no special hardware requirements. It is worth noting that *posix_spawn()* and *posix_spawnnp()* are very similar to the process creation operations on many operating systems that are not UNIX systems.

Requirements

The requirements for *posix_spawn()* and *posix_spawnnp()* are:

- They must be implementable without an MMU or unusual hardware.
- They must be compatible with existing POSIX standards.

Additional goals are:

- They should be efficiently implementable.
- They should be able to replace at least 50% of typical executions of *fork()*.
- A system with *posix_spawn()* and *posix_spawnnp()* and without *fork()* should be useful, at least for realtime applications.
- A system with *fork()* and the *exec* family should be able to implement *posix_spawn()* and *posix_spawnnp()* as library routines.

Two-Syntax

POSIX *exec* has several calling sequences with approximately the same functionality. These appear to be required for compatibility with existing practice. Since the existing practice for the *posix_spawn*()* functions is otherwise substantially unlike POSIX, we feel that simplicity outweighs compatibility. There are, therefore, only two names for the *posix_spawn*()* functions.

The parameter list does not differ between *posix_spawn()* and *posix_spawnnp()*; *posix_spawnnp()* interprets the second parameter more elaborately than *posix_spawn()*.

Compatibility with POSIX.5 (Ada)

The *Start_Process* and *Start_Process_Search* procedures from the *POSIX_Process_Primitives* package from the Ada language binding to POSIX.1 encapsulate *fork()* and *exec* functionality in a manner similar to that of *posix_spawn()* and *posix_spawnnp()*. Originally, in keeping with our simplicity goal, the standard developers had limited the capabilities of *posix_spawn()* and *posix_spawnnp()* to a subset of the capabilities of *Start_Process* and *Start_Process_Search*; certain non-default capabilities were not supported. However, based on suggestions by the ballot group to improve file descriptor mapping or drop it, and on the advice of an Ada Language Bindings working group member, the standard developers decided that *posix_spawn()* and *posix_spawnnp()* should be sufficiently powerful to implement *Start_Process* and *Start_Process_Search*. The rationale is that if the Ada language binding to such a primitive had already been approved as an IEEE standard, there can be little justification for not approving the functionally-equivalent parts of a C binding. The only three capabilities provided by *posix_spawn()* and *posix_spawnnp()* that are not provided by *Start_Process* and *Start_Process_Search* are optionally specifying the child's process group ID, the set of signals to be reset to default signal handling in the child process, and the child's scheduling policy and parameters.

For the Ada language binding for *Start_Process* to be implemented with *posix_spawn()*, that binding would need to explicitly pass an empty signal mask and the parent's environment to *posix_spawn()* whenever the caller of *Start_Process* allowed these arguments to default, since *posix_spawn()* does not provide such defaults. The ability of *Start_Process* to mask user-specified signals during its execution is functionally unique to the Ada language binding and must be dealt with in the binding separately from the call to *posix_spawn()*.

Process Group

The process group inheritance field can be used to join the child process with an existing process group. By assigning a value of zero to the *spawn-pgroup* attribute of the object referenced by *attrp*, the *setpgid()* mechanism will place the child process in a new process group.

Threads

Without the *posix_spawn()* and *posix_spawnnp()* functions, systems without address translation can still use threads to give an abstraction of concurrency. In many cases, thread creation suffices, but it is not always a good substitute. The *posix_spawn()* and *posix_spawnnp()* functions are considerably “heavier” than thread creation. Processes have several important attributes that threads do not. Even without address translation, a process may have base-and-bound memory protection. Each process has a process environment including security attributes and file capabilities, and powerful scheduling attributes. Processes abstract the behavior of non-uniform-memory-architecture multi-processors better than threads, and they are more convenient to use for activities that are not closely linked.

The *posix_spawn()* and *posix_spawnnp()* functions may not bring support for multiple processes to every configuration. Process creation is not the only piece of operating system support required to support multiple processes. The total cost of support for multiple processes may be quite high in some circumstances. Existing practice shows that support for multiple processes is uncommon and threads are common among “tiny kernels”. There should, therefore, probably continue to be AEPs for operating systems with only one process.

Asynchronous Error Notification

A library implementation of *posix_spawn()* or *posix_spawnnp()* may not be able to detect all possible errors before it forks the child process. POSIX.1-2008 provides for an error indication returned from a child process which could not successfully complete the spawn operation via a special exit status which may be detected using the status value returned by *wait()*, *waitid()*, and *waitpid()*.

The *stat_val* interface and the macros used to interpret it are not well suited to the purpose of returning API errors, but they are the only path available to a library implementation. Thus, an implementation may cause the child process to exit with exit status 127 for any error detected during the spawn process after the *posix_spawn()* or *posix_spawnnp()* function has successfully returned.

The standard developers had proposed using two additional macros to interpret *stat_val*. The first, *WIFSPAWNFAIL*, would have detected a status that indicated that the child exited because of an error detected during the *posix_spawn()* or *posix_spawnnp()* operations rather than during actual execution of the child process image; the second, *WSPAWNERRNO*, would have extracted the error value if *WIFSPAWNFAIL* indicated a failure. Unfortunately, the ballot group strongly opposed this because it would make a library implementation of *posix_spawn()* or *posix_spawnnp()* dependent on kernel modifications to *waitpid()* to be able to embed special information in *stat_val* to indicate a spawn failure.

The 8 bits of child process exit status that are guaranteed by POSIX.1-2008 to be accessible to the waiting parent process are insufficient to disambiguate a spawn error from any other kind of error that may be returned by an arbitrary process image. No other bits of the exit status are required to be visible in *stat_val*, so these macros could not be strictly implemented at the library level. Reserving an exit status of 127 for such spawn errors is consistent with the use of this value by *system()* and *popen()* to signal failures in these operations that occur after the function has returned but before a shell is able to execute. The exit status of 127 does not uniquely

identify this class of error, nor does it provide any detailed information on the nature of the failure. Note that a kernel implementation of *posix_spawn()* or *posix_spawnnp()* is permitted (and encouraged) to return any possible error as the function value, thus providing more detailed failure information to the parent process.

Thus, no special macros are available to isolate asynchronous *posix_spawn()* or *posix_spawnnp()* errors. Instead, errors detected by the *posix_spawn()* or *posix_spawnnp()* operations in the context of the child process before the new process image executes are reported by setting the child's exit status to 127. The calling process may use the WIFEXITED and WEXITSTATUS macros on the *stat_val* stored by the *wait()* or *waitpid()* functions to detect spawn failures to the extent that other status values with which the child process image may exit (before the parent can conclusively determine that the child process image has begun execution) are distinct from exit status 127.

CHANGE HISTORY

First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

IEEE PASC Interpretation 1003.1 #103 is applied, noting that the signal default actions are changed as well as the signal mask in step 2.

IEEE PASC Interpretation 1003.1 #132 is applied.

Issue 7

Functionality relating to the Threads option is moved to the Base.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0433 [291], XSH/TC1-2008/0434 [173], + and XSH/TC1-2008/0435 [173] are applied.

47672 **NAME**

47673 `posix_spawn_file_actions_addclose`, `posix_spawn_file_actions_addopen` — add close or open
 47674 action to spawn file actions object (**ADVANCED REALTIME**)

47675 **SYNOPSIS**

```
47676 SPN      #include <spawn.h>
47677
47677      int posix_spawn_file_actions_addclose(posix_spawn_file_actions_t
47678          *file_actions, int fildes);
47679      int posix_spawn_file_actions_addopen(posix_spawn_file_actions_t
47680          *restrict file_actions, int fildes,
47681          const char *restrict path, int oflag, mode_t mode);
```

47682 **DESCRIPTION**

47683 These functions shall add or delete a close or open action to a spawn file actions object.

47684 A spawn file actions object is of type **posix_spawn_file_actions_t** (defined in **<spawn.h>**) and is
 47685 used to specify a series of actions to be performed by a *posix_spawn()* or *posix_spawnnp()*
 47686 operation in order to arrive at the set of open file descriptors for the child process given the set
 47687 of open file descriptors of the parent. POSIX.1-2008 does not define comparison or assignment
 47688 operators for the type **posix_spawn_file_actions_t**.

47689 A spawn file actions object, when passed to *posix_spawn()* or *posix_spawnnp()*, shall specify how
 47690 the set of open file descriptors in the calling process is transformed into a set of potentially open
 47691 file descriptors for the spawned process. This transformation shall be as if the specified sequence
 47692 of actions was performed exactly once, in the context of the spawned process (prior to execution
 47693 of the new process image), in the order in which the actions were added to the object;
 47694 additionally, when the new process image is executed, any file descriptor (from this new set)
 47695 which has its FD_CLOEXEC flag set shall be closed (see *posix_spawn()*).

47696 The *posix_spawn_file_actions_addclose()* function shall add a *close* action to the object referenced
 47697 by *file_actions* that shall cause the file descriptor *fildes* to be closed (as if *close(fildes)* had been
 47698 called) when a new process is spawned using this file actions object.

47699 The *posix_spawn_file_actions_addopen()* function shall add an *open* action to the object referenced
 47700 by *file_actions* that shall cause the file named by *path* to be opened (as if *open(path, oflag, mode)*
 47701 had been called, and the returned file descriptor, if not *fildes*, had been changed to *fildes*) when a
 47702 new process is spawned using this file actions object. If *fildes* was already an open file descriptor,
 47703 it shall be closed before the new file is opened.

47704 The string described by *path* shall be copied by the *posix_spawn_file_actions_addopen()* function.

47705 **RETURN VALUE**

47706 Upon successful completion, these functions shall return zero; otherwise, an error number shall
 47707 be returned to indicate the error.

47708 **ERRORS**

47709 The *posix_spawn_file_actions_addopen()* function shall fail if:

47710 [EBADF] The value specified by *fildes* is negative or greater than or equal to
 47711 {OPEN_MAX}.

47712 The *posix_spawn_file_actions_addclose()* function shall fail if:

47713 [EBADF] The value specified by *fildes* is negative.

47714 These functions may fail if:

47715 [EINVAL] The value specified by *file_actions* is invalid.

47716 [ENOMEM] Insufficient memory exists to add to the spawn file actions object.

47717 It shall not be considered an error for the *fildev* argument passed to these functions to specify a
47718 file descriptor for which the specified operation could not be performed at the time of the call.
47719 Any such error will be detected when the associated file actions object is later used during a
47720 *posix_spawn()* or *posix_spawnnp()* operation.

47721 EXAMPLES

47722 None.

47723 APPLICATION USAGE

47724 These functions are part of the Spawn option and need not be provided on all implementations.

47725 Implementations may use file descriptors that must be inherited into child processes for the
47726 child process to remain conforming, such as for message catalog or tracing purposes. Therefore,
47727 an application that calls *posix_spawn_file_actions_addclose()* with an arbitrary integer risks non-
47728 conforming behavior, and this function can only portably be used to close file descriptor values
47729 that the application has obtained through explicit actions, or for the three file descriptors
47730 corresponding to the standard file streams. In order to avoid a race condition of leaking an
47731 unintended file descriptor into a child process, an application should consider opening all file
47732 descriptors with the FD_CLOEXEC bit set unless the file descriptor is intended to be inherited
47733 across *exec*.

47734 RATIONALE

47735 A spawn file actions object may be initialized to contain an ordered sequence of *close()*, *dup2()*,
47736 and *open()* operations to be used by *posix_spawn()* or *posix_spawnnp()* to arrive at the set of open
47737 file descriptors inherited by the spawned process from the set of open file descriptors in the
47738 parent at the time of the *posix_spawn()* or *posix_spawnnp()* call. It had been suggested that the
47739 *close()* and *dup2()* operations alone are sufficient to rearrange file descriptors, and that files
47740 which need to be opened for use by the spawned process can be handled either by having the
47741 calling process open them before the *posix_spawn()* or *posix_spawnnp()* call (and close them after),
47742 or by passing pathnames to the spawned process (in *argv*) so that it may open them itself. The
47743 standard developers recommend that applications use one of these two methods when practical,
47744 since detailed error status on a failed open operation is always available to the application this
47745 way. However, the standard developers feel that allowing a spawn file actions object to specify
47746 open operations is still appropriate because:

- 47747 1. It is consistent with equivalent POSIX.5 (Ada) functionality.
- 47748 2. It supports the I/O redirection paradigm commonly employed by POSIX programs
47749 designed to be invoked from a shell. When such a program is the child process, it may not
47750 be designed to open files on its own.
- 47751 3. It allows file opens that might otherwise fail or violate file ownership/access rights if
47752 executed by the parent process.

47753 Regarding 2. above, note that the spawn open file action provides to *posix_spawn()* and
47754 *posix_spawnnp()* the same capability that the shell redirection operators provide to *system()*, only
47755 without the intervening execution of a shell; for example:

47756 `system ("myprog <file1 3<file2");`

47757 Regarding 3. above, note that if the calling process needs to open one or more files for access by
47758 the spawned process, but has insufficient spare file descriptors, then the open action is necessary

to allow the *open()* to occur in the context of the child process after other file descriptors have been closed (that must remain open in the parent).

Additionally, if a parent is executed from a file having a “set-user-id” mode bit set and the POSIX_SPAWN_RESETPIDS flag is set in the spawn attributes, a file created within the parent process will (possibly incorrectly) have the parent’s effective user ID as its owner, whereas a file created via an *open()* action during *posix_spawn()* or *posix_spawnnp()* will have the parent’s real ID as its owner; and an open by the parent process may successfully open a file to which the real user should not have access or fail to open a file to which the real user should have access.

File Descriptor Mapping

The standard developers had originally proposed using an array which specified the mapping of child file descriptors back to those of the parent. It was pointed out by the ballot group that it is not possible to reshuffle file descriptors arbitrarily in a library implementation of *posix_spawn()* or *posix_spawnnp()* without provision for one or more spare file descriptor entries (which simply may not be available). Such an array requires that an implementation develop a complex strategy to achieve the desired mapping without inadvertently closing the wrong file descriptor at the wrong time.

It was noted by a member of the Ada Language Bindings working group that the approved Ada Language *Start_Process* family of POSIX process primitives use a caller-specified set of file actions to alter the normal *fork()/exec* semantics for inheritance of file descriptors in a very flexible way, yet no such problems exist because the burden of determining how to achieve the final file descriptor mapping is completely on the application. Furthermore, although the file actions interface appears frightening at first glance, it is actually quite simple to implement in either a library or the kernel.

The *posix_spawn_file_actions_addclose()* function is not required to check whether the file descriptor is less than {OPEN_MAX} because on some implementations {OPEN_MAX} reflects the RLIMIT_NOFILE soft limit and therefore calling *setrlimit()* to reduce this limit can result in an {OPEN_MAX} value less than or equal to an already open file descriptor. Applications need to be able to close such file descriptors on spawn. On implementations where {OPEN_MAX} does not change, it is recommended that *posix_spawn_file_actions_addclose()* should return [EBADF] if *filides* is greater than or equal to {OPEN_MAX}.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

IEEE PASC Interpretation 1003.1 #105 is applied, adding a note to the DESCRIPTION that the string pointed to by *path* is copied by the *posix_spawn_file_actions_addopen()* function.

Issue 7

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0436 [418], XSH/TC1-2008/0437 [149], XSH/TC1-2008/0438 [291], and XSH/TC1-2008/0439 [418] are applied.

NAME

posix_spawn_file_actions_adddup2 — add dup2 action to spawn file actions object (ADVANCED REALTIME)

SYNOPSIS

```
#include <spawn.h>

int posix_spawn_file_actions_adddup2(posix_spawn_file_actions_t
    *file_actions, int fildes, int newfildes);
```

DESCRIPTION

The *posix_spawn_file_actions_adddup2()* function shall add a *dup2()* action to the object referenced by *file_actions* that shall cause the file descriptor *fildes* to be duplicated as *newfildes* (as if *dup2(fildes, newfildes)* had been called) when a new process is spawned using this file actions object.

A spawn file actions object is as defined in *posix_spawn_file_actions_addclose()*.

RETURN VALUE

Upon successful completion, the *posix_spawn_file_actions_adddup2()* function shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *posix_spawn_file_actions_adddup2()* function shall fail if:

[EBADF] The value specified by *fildes* or *newfildes* is negative or greater than or equal to {OPEN_MAX}.

[ENOMEM] Insufficient memory exists to add to the spawn file actions object.

The *posix_spawn_file_actions_adddup2()* function may fail if:

[EINVAL] The value specified by *file_actions* is invalid.

It shall not be considered an error for the *fildes* argument passed to the *posix_spawn_file_actions_adddup2()* function to specify a file descriptor for which the specified operation could not be performed at the time of the call. Any such error will be detected when the associated file actions object is later used during a *posix_spawn()* or *posix_spawnnp()* operation.

EXAMPLES

None.

APPLICATION USAGE

The *posix_spawn_file_actions_adddup2()* function is part of the Spawn option and need not be provided on all implementations.

Implementations may use file descriptors that must be inherited into child processes for the child process to remain conforming, such as for message catalog or tracing purposes. Therefore, an application that calls *posix_spawn_file_actions_adddup2()* with an arbitrary integer for *newfildes* risks non-conforming behavior, and this function can only portably be used to overwrite file descriptor values that the application has obtained through explicit actions, or for the three file descriptors corresponding to the standard file streams. In order to avoid a race condition of leaking an unintended file descriptor into a child process, an application should consider opening all file descriptors with the FD_CLOEXEC bit set unless the file descriptor is intended to be inherited across *exec*.

47857 NAME

47858 posix_spawn_file_actions_addopen — add open action to spawn file actions object
47859 (ADVANCED REALTIME)

47860 SYNOPSIS

```
47861 SPN    #include <spawn.h>
47862
47862    int posix_spawn_file_actions_addopen(posix_spawn_file_actions_t
47863        *restrict file_actions, int fildes,
47864        const char *restrict path, int oflag, mode_t mode);
```

47865 DESCRIPTION

47866 Refer to [posix_spawn_file_actions_addclose\(\)](#).

47867 **NAME**

47868 posix_spawn_file_actions_destroy, posix_spawn_file_actions_init — destroy and initialize
 47869 spawn file actions object (**ADVANCED REALTIME**)

47870 **SYNOPSIS**

```
47871 SPN      #include <spawn.h>
47872
47873      int posix_spawn_file_actions_destroy(posix_spawn_file_actions_t
47874      *file_actions);
47875      int posix_spawn_file_actions_init(posix_spawn_file_actions_t
47876      *file_actions);
```

47876 **DESCRIPTION**

47877 The *posix_spawn_file_actions_destroy()* function shall destroy the object referenced by *file_actions*;
 47878 the object becomes, in effect, uninitialized. An implementation may cause
 47879 *posix_spawn_file_actions_destroy()* to set the object referenced by *file_actions* to an invalid value. A
 47880 destroyed spawn file actions object can be reinitialized using *posix_spawn_file_actions_init()*; the
 47881 results of otherwise referencing the object after it has been destroyed are undefined.

47882 The *posix_spawn_file_actions_init()* function shall initialize the object referenced by *file_actions* to
 47883 contain no file actions for *posix_spawn()* or *posix_spawnnp()* to perform.

47884 A spawn file actions object is as defined in *posix_spawn_file_actions_addclose()*.

47885 The effect of initializing an already initialized spawn file actions object is undefined.

47886 **RETURN VALUE**

47887 Upon successful completion, these functions shall return zero; otherwise, an error number shall
 47888 be returned to indicate the error.

47889 **ERRORS**

47890 The *posix_spawn_file_actions_init()* function shall fail if:

47891 [ENOMEM] Insufficient memory exists to initialize the spawn file actions object.

47892 The *posix_spawn_file_actions_destroy()* function may fail if:

47893 [EINVAL] The value specified by *file_actions* is invalid.

47894 **EXAMPLES**

47895 None.

47896 **APPLICATION USAGE**

47897 These functions are part of the Spawn option and need not be provided on all implementations.

CHANGE HISTORY

- 47905
- 47906 First released in Issue 6. Derived from IEEE Std 1003.1d-1999.
- 47907 In the SYNOPSIS, the inclusion of **<sys/types.h>** is no longer required.

NAME

posix_spawnattr_destroy, posix_spawnattr_init — destroy and initialize spawn attributes object
(**ADVANCED REALTIME**)

SYNOPSIS

```
SPN      #include <spawn.h>

int posix_spawnattr_destroy(posix_spawnattr_t *attr);
int posix_spawnattr_init(posix_spawnattr_t *attr);
```

DESCRIPTION

The *posix_spawnattr_destroy()* function shall destroy a spawn attributes object. A destroyed *attr* attributes object can be reinitialized using *posix_spawnattr_init()*; the results of otherwise referencing the object after it has been destroyed are undefined. An implementation may cause *posix_spawnattr_destroy()* to set the object referenced by *attr* to an invalid value.

The *posix_spawnattr_init()* function shall initialize a spawn attributes object *attr* with the default value for all of the individual attributes used by the implementation. Results are undefined if *posix_spawnattr_init()* is called specifying an already initialized *attr* attributes object.

A spawn attributes object is of type **posix_spawnattr_t** (defined in **<spawn.h>**) and is used to specify the inheritance of process attributes across a spawn operation. POSIX.1-2008 does not define comparison or assignment operators for the type **posix_spawnattr_t**.

Each implementation shall document the individual attributes it uses and their default values unless these values are defined by POSIX.1-2008. Attributes not defined by POSIX.1-2008, their default values, and the names of the associated functions to get and set those attribute values are implementation-defined.

The resulting spawn attributes object (possibly modified by setting individual attribute values), is used to modify the behavior of *posix_spawn()* or *posix_spawnnp()*. After a spawn attributes object has been used to spawn a process by a call to a *posix_spawn()* or *posix_spawnnp()*, any function affecting the attributes object (including destruction) shall not affect any process that has been spawned in this way.

RETURN VALUE

Upon successful completion, *posix_spawnattr_destroy()* and *posix_spawnattr_init()* shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *posix_spawnattr_init()* function shall fail if:

[ENOMEM] Insufficient memory exists to initialize the spawn attributes object.

The *posix_spawnattr_destroy()* function may fail if:

[EINVAL] The value specified by *attr* is invalid.

EXAMPLES

None.

APPLICATION USAGE

These functions are part of the Spawn option and need not be provided on all implementations.

RATIONALE

The original spawn interface proposed in POSIX.1-2008 defined the attributes that specify the inheritance of process attributes across a spawn operation as a structure. In order to be able to separate optional individual attributes under their appropriate options (that is, the *spawn-schedparam* and *spawn-schedpolicy* attributes depending upon the Process Scheduling option), and

also for extensibility and consistency with the newer POSIX interfaces, the attributes interface has been changed to an opaque data type. This interface now consists of the type **posix_spawnattr_t**, representing a spawn attributes object, together with associated functions to initialize or destroy the attributes object, and to set or get each individual attribute. Although the new object-oriented interface is more verbose than the original structure, it is simple to use, more extensible, and easy to implement.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

IEEE PASC Interpretation 1003.1 #106 is applied, noting that the effect of initializing an already initialized spawn attributes option is undefined.

47969 **NAME**

47970 `posix_spawnattr_getflags`, `posix_spawnattr_setflags` — get and set the spawn-flags attribute of a
 47971 spawn attributes object (**ADVANCED REALTIME**)

47972 **SYNOPSIS**

```
47973 SPN    #include <spawn.h>
47974
47975    int posix_spawnattr_getflags(const posix_spawnattr_t *restrict attr,
47976                                short *restrict flags);
47976    int posix_spawnattr_setflags(posix_spawnattr_t *attr, short flags);
```

47977 **DESCRIPTION**

47978 The `posix_spawnattr_getflags()` function shall obtain the value of the *spawn-flags* attribute from the
 47979 attributes object referenced by *attr*.

47980 The `posix_spawnattr_setflags()` function shall set the *spawn-flags* attribute in an initialized
 47981 attributes object referenced by *attr*.

47982 The *spawn-flags* attribute is used to indicate which process attributes are to be changed in the
 47983 new process image when invoking `posix_spawn()` or `posix_spawnnp()`. It is the bitwise-inclusive
 47984 OR of zero or more of the following flags:

```
47985 POSIX_SPAWN_RESETIDS
47986 POSIX_SPAWN_SETPGROUP
47987 POSIX_SPAWN_SETSIGDEF
47988 POSIX_SPAWN_SETSIGMASK
47989 PS  POSIX_SPAWN_SETSCHEDPARAM
47990    POSIX_SPAWN_SETSCHEDULER
```

47991 These flags are defined in **<spawn.h>**. The default value of this attribute shall be as if no flags
 47992 were set.

47993 **RETURN VALUE**

47994 Upon successful completion, `posix_spawnattr_getflags()` shall return zero and store the value of
 47995 the *spawn-flags* attribute of *attr* into the object referenced by the *flags* parameter; otherwise, an
 47996 error number shall be returned to indicate the error.

47997 Upon successful completion, `posix_spawnattr_setflags()` shall return zero; otherwise, an error
 47998 number shall be returned to indicate the error.

47999 **ERRORS**

48000 These functions may fail if:

48001 [EINVAL] The value specified by *attr* is invalid.

48002 The `posix_spawnattr_setflags()` function may fail if:

48003 [EINVAL] The value of the attribute being set is not valid.

48004 EXAMPLES

48005 None.

48006 APPLICATION USAGE

48007 These functions are part of the Spawn option and need not be provided on all implementations.

NAME

posix_spawnattr_getpgroup, posix_spawnattr_setpgroup — get and set the spawn-pgroup attribute of a spawn attributes object (**ADVANCED REALTIME**)

SYNOPSIS

```
#include <spawn.h>

int posix_spawnattr_getpgroup(const posix_spawnattr_t *restrict attr,
    pid_t *restrict pgroup);
int posix_spawnattr_setpgroup(posix_spawnattr_t *attr, pid_t pgroup);
```

DESCRIPTION

The *posix_spawnattr_getpgroup()* function shall obtain the value of the *spawn-pgroup* attribute from the attributes object referenced by *attr*.

The *posix_spawnattr_setpgroup()* function shall set the *spawn-pgroup* attribute in an initialized attributes object referenced by *attr*.

The *spawn-pgroup* attribute represents the process group to be joined by the new process image in a spawn operation (if `POSIX_SPAWN_SETPGROUP` is set in the *spawn-flags* attribute). The default value of this attribute shall be zero.

RETURN VALUE

Upon successful completion, *posix_spawnattr_getpgroup()* shall return zero and store the value of the *spawn-pgroup* attribute of *attr* into the object referenced by the *pgroup* parameter; otherwise, an error number shall be returned to indicate the error.

Upon successful completion, *posix_spawnattr_setpgroup()* shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

These functions may fail if:

[EINVAL] The value specified by *attr* is invalid.

The *posix_spawnattr_setpgroup()* function may fail if:

48106	First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

48107 **NAME**

48108 posix_spawnattr_getschedpolicy, posix_spawnattr_setschedpolicy — get and set the spawn-
 48109 schedpolicy attribute of a spawn attributes object (**ADVANCED REALTIME**)

48110 **SYNOPSIS**

```
48111 SPN PS #include <spawn.h>
48112         #include <sched.h>

48113         int posix_spawnattr_getschedpolicy(const posix_spawnattr_t
48114             *restrict attr, int *restrict schedpolicy);
48115         int posix_spawnattr_setschedpolicy(posix_spawnattr_t *attr,
48116             int schedpolicy);
```

48117 **DESCRIPTION**

48118 The *posix_spawnattr_getschedpolicy()* function shall obtain the value of the *spawn-schedpolicy*
 48119 attribute from the attributes object referenced by *attr*.

48120 The *posix_spawnattr_setschedpolicy()* function shall set the *spawn-schedpolicy* attribute in an
 48121 initialized attributes object referenced by *attr*.

48122 The *spawn-schedpolicy* attribute represents the scheduling policy to be assigned to the new
 48123 process image in a spawn operation (if POSIX_SPAWN_SETSCHEDULER is set in the *spawn-*
 48124 *flags* attribute). The default value of this attribute is unspecified.

48125 **RETURN VALUE**

48126 Upon successful completion, *posix_spawnattr_getschedpolicy()* shall return zero and store the
 48127 value of the *spawn-schedpolicy* attribute of *attr* into the object referenced by the *schedpolicy*
 48128 parameter; otherwise, an error number shall be returned to indicate the error.

48129 Upon successful completion, *posix_spawnattr_setschedpolicy()* shall return zero; otherwise, an
 48130 error number shall be returned to indicate the error.

48131 **ERRORS**

48132 These functions may fail if:

48133 [EINVAL] The value specified by *attr* is invalid.

48134 The *posix_spawnattr_setschedpolicy()* function may fail if:

48135 [EINVAL] The value of the attribute being set is not valid.

48136 **EXAMPLES**

48137 None.

48138 **APPLICATION USAGE**

48139 These functions are part of the Spawn and Process Scheduling options and need not be provided
 48140 on all implementations.

48141 **RATIONALE**

48142 None.

48143 **FUTURE DIRECTIONS**

48144 None.

48145 **SEE ALSO**

48150	CHANGE HISTORY
48151	First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

NAME

posix_spawnattr_getsigdefault, posix_spawnattr_setsigdefault — get and set the spawn-sigdefault attribute of a spawn attributes object (**ADVANCED REALTIME**)

SYNOPSIS

```
SPN      #include <signal.h>
          #include <spawn.h>

          int posix_spawnattr_getsigdefault(const posix_spawnattr_t
          *restrict attr, sigset_t *restrict sigdefault);
          int posix_spawnattr_setsigdefault(posix_spawnattr_t *restrict attr,
          const sigset_t *restrict sigdefault);
```

DESCRIPTION

The *posix_spawnattr_getsigdefault()* function shall obtain the value of the *spawn-sigdefault* attribute from the attributes object referenced by *attr*.

The *posix_spawnattr_setsigdefault()* function shall set the *spawn-sigdefault* attribute in an initialized attributes object referenced by *attr*.

The *spawn-sigdefault* attribute represents the set of signals to be forced to default signal handling in the new process image (if *POSIX_SPAWN_SETSIGDEF* is set in the *spawn-flags* attribute) by a spawn operation. The default value of this attribute shall be an empty signal set.

RETURN VALUE

Upon successful completion, *posix_spawnattr_getsigdefault()* shall return zero and store the value of the *spawn-sigdefault* attribute of *attr* into the object referenced by the *sigdefault* parameter; otherwise, an error number shall be returned to indicate the error.

Upon successful completion, *posix_spawnattr_setsigdefault()* shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

These functions may fail if:

[EINVAL] The value specified by *attr* is invalid.

The *posix_spawnattr_setsigdefault()* function may fail if:

[EINVAL] The value of the attribute being set is not valid.

EXAMPLES

None.

APPLICATION USAGE

These functions are part of the Spawn option and need not be provided on all implementations.

RATIONALE

None.

FUTURE DIRECTIONS

None.

48193	CHANGE HISTORY First released in Issue 6. Derived from IEEE Std 1003.1d-1999.
48194	

48195 **NAME**

48196 `posix_spawnattr_getsigmask`, `posix_spawnattr_setsigmask` — get and set the spawn-sigmask
 48197 attribute of a spawn attributes object (**ADVANCED REALTIME**)

48198 **SYNOPSIS**

```
48199 SPN      #include <signal.h>
48200           #include <spawn.h>

48201           int posix_spawnattr_getsigmask(const posix_spawnattr_t *restrict attr,
48202           sigset_t *restrict sigmask);
48203           int posix_spawnattr_setsigmask(posix_spawnattr_t *restrict attr,
48204           const sigset_t *restrict sigmask);
```

48205 **DESCRIPTION**

48206 The `posix_spawnattr_getsigmask()` function shall obtain the value of the *spawn-sigmask* attribute
 48207 from the attributes object referenced by *attr*.

48208 The `posix_spawnattr_setsigmask()` function shall set the *spawn-sigmask* attribute in an initialized
 48209 attributes object referenced by *attr*.

48210 The *spawn-sigmask* attribute represents the signal mask in effect in the new process image of a
 48211 spawn operation (if `POSIX_SPAWN_SETSIGMASK` is set in the *spawn-flags* attribute). The
 48212 default value of this attribute is unspecified.

48213 **RETURN VALUE**

48214 Upon successful completion, `posix_spawnattr_getsigmask()` shall return zero and store the value
 48215 of the *spawn-sigmask* attribute of *attr* into the object referenced by the *sigmask* parameter;
 48216 otherwise, an error number shall be returned to indicate the error.

48217 Upon successful completion, `posix_spawnattr_setsigmask()` shall return zero; otherwise, an error
 48218 number shall be returned to indicate the error.

48219 **ERRORS**

48220 These functions may fail if:

48221 [EINVAL] The value specified by *attr* is invalid.

48222 The `posix_spawnattr_setsigmask()` function may fail if:

48223 [EINVAL] The value of the attribute being set is not valid.

48224 **EXAMPLES**

48225 None.

48226 **APPLICATION USAGE**

48227 These functions are part of the Spawn option and need not be provided on all implementations.

48228 **RATIONALE**

48229 None.

48230 **FUTURE DIRECTIONS**

48231 None.

48238	First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

48239 **NAME**

48240 posix_spawnattr_init — initialize the spawn attributes object (ADVANCED REALTIME)

48241 **SYNOPSIS**48242 SPN `#include <spawn.h>`48243 `int posix_spawnattr_init(posix_spawnattr_t *attr);`48244 **DESCRIPTION**48245 Refer to *posix_spawnattr_destroy()*.

48246 NAME

48247 posix_spawnattr_setflags — set the spawn-flags attribute of a spawn attributes object
48248 (ADVANCED REALTIME)

48249 SYNOPSIS

```
48250 SPN    #include <spawn.h>  
48251        int posix_spawnattr_setflags(posix_spawnattr_t *attr, short flags);
```

48252 DESCRIPTION

48253 Refer to *posix_spawnattr_getflags()*.

48254 **NAME**

48255 **posix_spawnattr_setpgroup** — set the spawn-pgroup attribute of a spawn attributes object
48256 (**ADVANCED REALTIME**)

48257 **SYNOPSIS**

48258 SPN `#include <spawn.h>`
48259 `int posix_spawnattr_setpgroup(posix_spawnattr_t *attr, pid_t pgroup);`

48260 **DESCRIPTION**

48261 Refer to *posix_spawnattr_getpgroup()*.

48262 NAME

48263 posix_spawnattr_setschedparam — set the spawn-schedparam attribute of a spawn attributes
48264 object (**ADVANCED REALTIME**)

48265 SYNOPSIS

```
48266 SPN PS #include <sched.h>  
48267 #include <spawn.h>  
  
48268 int posix_spawnattr_setschedparam(posix_spawnattr_t *restrict attr,  
48269     const struct sched_param *restrict schedparam);
```

48270 DESCRIPTION

48271 Refer to [*posix_spawnattr_getschedparam\(\)*](#).

48272 NAME

48273 `posix_spawnattr_setschedpolicy` — set the spawn-schedpolicy attribute of a spawn attributes
48274 object (**ADVANCED REALTIME**)

48275 SYNOPSIS

```
48276 SPN PS  #include <sched.h>  
48277          #include <spawn.h>  
  
48278          int posix_spawnattr_setschedpolicy(posix_spawnattr_t *attr,  
48279          int schedpolicy);
```

48280 DESCRIPTION

48281 Refer to *[posix_spawnattr_getschedpolicy\(\)](#)*.

NAME

posix_spawnattr_setsigdefault — set the spawn-sigdefault attribute of a spawn attributes object
(ADVANCED REALTIME)

SYNOPSIS

```
SPN      #include <signal.h>
          #include <spawn.h>

          int posix_spawnattr_setsigdefault(posix_spawnattr_t *restrict attr,
          const sigset_t *restrict sigdefault);
```

DESCRIPTION

Refer to *posix_spawnattr_getsigdefault()*.

48292 **NAME**

48293 posix_spawnattr_setsigmask — set the spawn-sigmask attribute of a spawn attributes object
48294 (**ADVANCED REALTIME**)

48295 **SYNOPSIS**

```
48296 SPN      #include <signal.h>  
48297          #include <spawn.h>  
  
48298          int posix_spawnattr_setsigmask(posix_spawnattr_t *restrict attr,  
48299          const sigset_t *restrict sigmask);
```

48300 **DESCRIPTION**

48301 Refer to *posix_spawnattr_getsigmask()*.

48302 **NAME**48303 posix_spawn — spawn a process (**ADVANCED REALTIME**)48304 **SYNOPSIS**

```
48305 SPN      #include <spawn.h>
48306          int posix_spawn(pid_t *restrict pid, const char *restrict file,
48307                        const posix_spawn_file_actions_t *file_actions,
48308                        const posix_spawnattr_t *restrict attrp,
48309                        char *const argv[restrict], char *const envp[restrict]);
```

48310 **DESCRIPTION**48311 Refer to *posix_spawn()*.

48312 **NAME**

48313 `posix_trace_attr_destroy`, `posix_trace_attr_init` — destroy and initialize the trace stream
 48314 attributes object (**TRACING**)

48315 **SYNOPSIS**

```
48316 OB TRC  #include <trace.h>
48317          int posix_trace_attr_destroy(trace_attr_t *attr);
48318          int posix_trace_attr_init(trace_attr_t *attr);
```

48319 **DESCRIPTION**

48320 The `posix_trace_attr_destroy()` function shall destroy an initialized trace attributes object. A
 48321 destroyed *attr* attributes object can be reinitialized using `posix_trace_attr_init()`; the results of
 48322 otherwise referencing the object after it has been destroyed are undefined.

48323 The `posix_trace_attr_init()` function shall initialize a trace attributes object *attr* with the default
 48324 value for all of the individual attributes used by a given implementation. The read-only
 48325 *generation-version* and *clock-resolution* attributes of the newly initialized trace attributes object
 48326 shall be set to their appropriate values (see [Section 2.11.1.2](#), on page 540).

48327 Results are undefined if `posix_trace_attr_init()` is called specifying an already initialized *attr*
 48328 attributes object.

48329 Implementations may add extensions to the trace attributes object structure as permitted in XBD
 48330 [Chapter 2](#) (on page 15).

48331 The resulting attributes object (possibly modified by setting individual attributes values), when
 48332 used by `posix_trace_create()`, defines the attributes of the trace stream created. A single attributes
 48333 object can be used in multiple calls to `posix_trace_create()`. After one or more trace streams have
 48334 been created using an attributes object, any function affecting that attributes object, including
 48335 destruction, shall not affect any trace stream previously created. An initialized attributes object
 48336 also serves to receive the attributes of an existing trace stream or trace log when calling the
 48337 `posix_trace_get_attr()` function.

48338 **RETURN VALUE**

48339 Upon successful completion, these functions shall return a value of zero. Otherwise, they shall
 48340 return the corresponding error number.

48341 **ERRORS**

48342 The `posix_trace_attr_destroy()` function may fail if:

48343 [EINVAL] The value of *attr* is invalid.

48344 The `posix_trace_attr_init()` function shall fail if:

48345 [ENOMEM] Insufficient memory exists to initialize the trace attributes object.

48346 **EXAMPLES**

48347 None.

48348 **APPLICATION USAGE**

48349 None.

48350 **RATIONALE**

48351 None.

48352 FUTURE DIRECTIONS

48353 The *posix_trace_attr_destroy()* and *posix_trace_attr_init()* functions may be removed in a future
48354 version.

48355 SEE ALSO

48356 *posix_trace_create()*, *posix_trace_get_attr()*, *uname()*

48357 XBD <trace.h>

48358 CHANGE HISTORY

48359 First released in Issue 6. Derived from IEEE Std 1003.1q-2000.

48360 IEEE PASC Interpretation 1003.1 #123 is applied.

48361 Issue 7

48362 The *posix_trace_attr_destroy()* and *posix_trace_attr_init()* functions are marked obsolescent.

NAME

posix_trace_attr_getclockres, posix_trace_attr_getcreatetime, posix_trace_attr_getgenversion, posix_trace_attr_getname, posix_trace_attr_setname — retrieve and set information about a trace stream (**TRACING**)

SYNOPSIS

```
OB TRC #include <time.h>
#include <trace.h>

int posix_trace_attr_getclockres(const trace_attr_t *attr,
    struct timespec *resolution);
int posix_trace_attr_getcreatetime(const trace_attr_t *attr,
    struct timespec *createtime);

#include <trace.h>

int posix_trace_attr_getgenversion(const trace_attr_t *attr,
    char *genversion);
int posix_trace_attr_getname(const trace_attr_t *attr,
    char *tracename);
int posix_trace_attr_setname(trace_attr_t *attr,
    const char *tracename);
```

DESCRIPTION

The *posix_trace_attr_getclockres()* function shall copy the clock resolution of the clock used to generate timestamps from the *clock-resolution* attribute of the attributes object pointed to by the *attr* argument into the structure pointed to by the *resolution* argument.

The *posix_trace_attr_getcreatetime()* function shall copy the trace stream creation time from the *creation-time* attribute of the attributes object pointed to by the *attr* argument into the structure pointed to by the *createtime* argument. The *creation-time* attribute shall represent the time of creation of the trace stream.

The *posix_trace_attr_getgenversion()* function shall copy the string containing version information from the *generation-version* attribute of the attributes object pointed to by the *attr* argument into the string pointed to by the *genversion* argument. The *genversion* argument shall be the address of a character array which can store at least {TRACE_NAME_MAX} characters.

The *posix_trace_attr_getname()* function shall copy the string containing the trace name from the *trace-name* attribute of the attributes object pointed to by the *attr* argument into the string pointed to by the *tracename* argument. The *tracename* argument shall be the address of a character array which can store at least {TRACE_NAME_MAX} characters.

The *posix_trace_attr_setname()* function shall set the name in the *trace-name* attribute of the attributes object pointed to by the *attr* argument, using the trace name string supplied by the *tracename* argument. If the supplied string contains more than {TRACE_NAME_MAX} characters, the name copied into the *trace-name* attribute may be truncated to one less than the length of {TRACE_NAME_MAX} characters. The default value is a null string.

RETURN VALUE

Upon successful completion, these functions shall return a value of zero. Otherwise, they shall return the corresponding error number.

If successful, the *posix_trace_attr_getclockres()* function stores the *clock-resolution* attribute value in the object pointed to by *resolution*. Otherwise, the content of this object is unspecified.

If successful, the *posix_trace_attr_getcreatetime()* function stores the trace stream creation time in

48408 the object pointed to by *createtime*. Otherwise, the content of this object is unspecified.

48409 If successful, the *posix_trace_attr_getgenversion()* function stores the trace version information in

48410 the string pointed to by *genversion*. Otherwise, the content of this string is unspecified.

48411 If successful, the *posix_trace_attr_getname()* function stores the trace name in the string pointed

48412 to by *tracename*. Otherwise, the content of this string is unspecified.

48413 ERRORS

48414 The *posix_trace_attr_getclockres()*, *posix_trace_attr_getcreatetime()*, *posix_trace_attr_getgenversion()*,

48415 and *posix_trace_attr_getname()* functions may fail if:

48416 [EINVAL] The value specified by one of the arguments is invalid.

48417 EXAMPLES

48418 None.

48419 APPLICATION USAGE

48420 None.

48421 RATIONALE

48422 None.

48423 FUTURE DIRECTIONS

48424 The *posix_trace_attr_getclockres()*, *posix_trace_attr_getcreatetime()*, *posix_trace_attr_getgenversion()*,

48425 *posix_trace_attr_getname()*, and *posix_trace_attr_setname()* functions may be removed in a future

48426 version.

48427 SEE ALSO

48434 *posix_trace_attr_getname()*, and *posix_trace_attr_setname()* functions are marked obsolescent.

48435 **NAME**

48436 posix_trace_attr_getinherited, posix_trace_attr_getlogfullpolicy,
 48437 posix_trace_attr_getstreamfullpolicy, posix_trace_attr_setinherited,
 48438 posix_trace_attr_setlogfullpolicy, posix_trace_attr_setstreamfullpolicy — retrieve and set the
 48439 behavior of a trace stream (**TRACING**)

48440 **SYNOPSIS**

```
48441 OB TRC  #include <trace.h>

48442 TRI     int posix_trace_attr_getinherited(const trace_attr_t *restrict attr,
48443                                     int *restrict inheritancepolicy);
48444 TRL     int posix_trace_attr_getlogfullpolicy(const trace_attr_t *restrict attr,
48445                                     int *restrict logpolicy);
48446         int posix_trace_attr_getstreamfullpolicy(const trace_attr_t *restrict
48447         attr, int *restrict streampolicy);
48448 TRI     int posix_trace_attr_setinherited(trace_attr_t *attr,
48449                                     int inheritancepolicy);
48450 TRL     int posix_trace_attr_setlogfullpolicy(trace_attr_t *attr,
48451                                     int logpolicy);
48452         int posix_trace_attr_setstreamfullpolicy(trace_attr_t *attr,
48453         int streampolicy);
```

48454 **DESCRIPTION**

48455 TRI The *posix_trace_attr_getinherited()* and *posix_trace_attr_setinherited()* functions, respectively, shall
 48456 get and set the inheritance policy stored in the *inheritance* attribute for traced processes across the
 48457 *fork()* and *spawn()* operations. The *inheritance* attribute of the attributes object pointed to by the
 48458 *attr* argument shall be set to one of the following values defined by manifest constants in the
 48459 **<trace.h>** header:

48460 **POSIX_TRACE_CLOSE_FOR_CHILD**

48461 After a *fork()* or *spawn()* operation, the child shall not be traced, and tracing of the parent
 48462 shall continue.

48463 **POSIX_TRACE_INHERITED**

48464 After a *fork()* or *spawn()* operation, if the parent is being traced, its child shall be
 48465 concurrently traced using the same trace stream.

48466 The default value for the *inheritance* attribute is **POSIX_TRACE_CLOSE_FOR_CHILD**.

48467 TRL The *posix_trace_attr_getlogfullpolicy()* and *posix_trace_attr_setlogfullpolicy()* functions,
 48468 respectively, shall get and set the trace log full policy stored in the *log-full-policy* attribute of the
 48469 attributes object pointed to by the *attr* argument.

48470 The *log-full-policy* attribute shall be set to one of the following values defined by manifest
 48471 constants in the **<trace.h>** header:

48472 **POSIX_TRACE_LOOP**

48473 The trace log shall loop until the associated trace stream is stopped. This policy means that
 48474 when the trace log gets full, the file system shall reuse the resources allocated to the oldest
 48475 trace events that were recorded. In this way, the trace log will always contain the most
 48476 recent trace events flushed.

48477 **POSIX_TRACE_UNTIL_FULL**

48478 The trace stream shall be flushed to the trace log until the trace log is full. This condition can
 48479 be deduced from the *posix_log_full_status* member status (see the **posix_trace_status_info**
 48480 structure defined in **<trace.h>**). The last recorded trace event shall be the
 48481 **POSIX_TRACE_STOP** trace event.

POSIX_TRACE_APPEND

The associated trace stream shall be flushed to the trace log without log size limitation. If the application specifies POSIX_TRACE_APPEND, the implementation shall ignore the *log-max-size* attribute.

The default value for the *log-full-policy* attribute is POSIX_TRACE_LOOP.

The *posix_trace_attr_getstreamfullpolicy()* and *posix_trace_attr_setstreamfullpolicy()* functions, respectively, shall get and set the trace stream full policy stored in the *stream-full-policy* attribute of the attributes object pointed to by the *attr* argument.

The *stream-full-policy* attribute shall be set to one of the following values defined by manifest constants in the **<trace.h>** header:

POSIX_TRACE_LOOP

The trace stream shall loop until explicitly stopped by the *posix_trace_stop()* function. This policy means that when the trace stream is full, the trace system shall reuse the resources allocated to the oldest trace events recorded. In this way, the trace stream will always contain the most recent trace events recorded.

POSIX_TRACE_UNTIL_FULL

The trace stream will run until the trace stream resources are exhausted. Then the trace stream will stop. This condition can be deduced from *posix_stream_status* and *posix_stream_full_status* (see the **posix_trace_status_info** structure defined in **<trace.h>**). When this trace stream is read, a POSIX_TRACE_STOP trace event shall be reported after reporting the last recorded trace event. The trace system shall reuse the resources allocated to any trace events already reported—see the *posix_trace_getnext_event()*, *posix_trace_trygetnext_event()*, and *posix_trace_timedgetnext_event()* functions—or already flushed for an active trace stream with log if the Trace Log option is supported; see the *posix_trace_flush()* function. The trace system shall restart the trace stream when it is empty and may restart it sooner. A POSIX_TRACE_START trace event shall be reported before reporting the next recorded trace event.

POSIX_TRACE_FLUSH

If the Trace Log option is supported, this policy is identical to the POSIX_TRACE_UNTIL_FULL trace stream full policy except that the trace stream shall be flushed regularly as if *posix_trace_flush()* had been explicitly called. Defining this policy for an active trace stream without log shall be invalid.

The default value for the *stream-full-policy* attribute shall be POSIX_TRACE_LOOP for an active trace stream without log.

If the Trace Log option is supported, the default value for the *stream-full-policy* attribute shall be POSIX_TRACE_FLUSH for an active trace stream with log.

RETURN VALUE

Upon successful completion, these functions shall return a value of zero. Otherwise, they shall return the corresponding error number.

If successful, the *posix_trace_attr_getinherited()* function shall store the *inheritance* attribute value in the object pointed to by *inheritancepolicy*. Otherwise, the content of this object is undefined.

If successful, the *posix_trace_attr_getlogfullpolicy()* function shall store the *log-full-policy* attribute value in the object pointed to by *logpolicy*. Otherwise, the content of this object is undefined.

If successful, the *posix_trace_attr_getstreamfullpolicy()* function shall store the *stream-full-policy* attribute value in the object pointed to by *streampolicy*. Otherwise, the content of this object is undefined.

ERRORS

These functions may fail if:

[EINVAL] The value specified by at least one of the arguments is invalid.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

The following functions:

posix_trace_attr_getinherited()
posix_trace_attr_getlogfullpolicy()
posix_trace_attr_getstreamfullpolicy()
posix_trace_attr_setinherited()
posix_trace_attr_setlogfullpolicy()
posix_trace_attr_setstreamfullpolicy()

may be removed in a future version.

CHANGE HISTORY

First released in Issue 6. Derived from IEEE Std 1003.1q-2000.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/39 is applied, adding the TRL and TRC margin codes to the *posix_trace_attr_setlogfullpolicy()* function.

Issue 7

SD5-XSH-ERN-116 is applied, adding the missing **restrict** keyword to the *posix_trace_attr_getstreamfullpolicy()* function declaration.

These functions are marked obsolescent.

NAME

posix_trace_attr_getlogsize, posix_trace_attr_getmaxdatasize, posix_trace_attr_getmaxsystemeventsize, posix_trace_attr_getmaxusereventsize, posix_trace_attr_getstreamsize, posix_trace_attr_setlogsize, posix_trace_attr_setmaxdatasize, posix_trace_attr_setstreamsize — retrieve and set trace stream size attributes (TRACING)

SYNOPSIS

```
#include <sys/types.h>
#include <trace.h>

int posix_trace_attr_getlogsize(const trace_attr_t *restrict attr,
    size_t *restrict logsize);

int posix_trace_attr_getmaxdatasize(const trace_attr_t *restrict attr,

int posix_trace_attr_getmaxsystemeventsize(
    const trace_attr_t *restrict attr,
    size_t *restrict eventsize);

int posix_trace_attr_getmaxusereventsize(
    const trace_attr_t *restrict attr,
    size_t data_len, size_t *restrict eventsize);

int posix_trace_attr_getstreamsize(const trace_attr_t *restrict attr,
    size_t *restrict streamsize);

int posix_trace_attr_setlogsize(trace_attr_t *attr,
    size_t logsize);

int posix_trace_attr_setmaxdatasize(trace_attr_t *attr,
    size_t maxdatasize);

int posix_trace_attr_setstreamsize(trace_attr_t *attr,
    size_t streamsize);
```

DESCRIPTION

The *posix_trace_attr_getlogsize()* function shall copy the log size, in bytes, from the *log-max-size* attribute of the attributes object pointed to by the *attr* argument into the variable pointed to by the *logsize* argument. This log size is the maximum total of bytes that shall be allocated for system and user trace events in the trace log. The default value for the *log-max-size* attribute is implementation-defined.

The *posix_trace_attr_setlogsize()* function shall set the maximum allowed size, in bytes, in the *log-max-size* attribute of the attributes object pointed to by the *attr* argument, using the size value supplied by the *logsize* argument.

The trace log size shall be used if the *log-full-policy* attribute is set to *POSIX_TRACE_LOOP* or *POSIX_TRACE_UNTIL_FULL*. If the *log-full-policy* attribute is set to *POSIX_TRACE_APPEND*, the implementation shall ignore the *log-max-size* attribute.

The *posix_trace_attr_getmaxdatasize()* function shall copy the maximum user trace event data size, in bytes, from the *max-data-size* attribute of the attributes object pointed to by the *attr* argument into the variable pointed to by the *maxdatasize* argument. The default value for the *max-data-size* attribute is implementation-defined.

The *posix_trace_attr_getmaxsystemeventsize()* function shall calculate the maximum memory size, in bytes, required to store a single system trace event. This value is calculated for the trace stream attributes object pointed to by the *attr* argument and is returned in the variable pointed to by the *eventsize* argument.

The values returned as the maximum memory sizes of the user and system trace events shall be such that if the sum of the maximum memory sizes of a set of the trace events that may be

recorded in a trace stream is less than or equal to the *stream-min-size* attribute of that trace stream, the system provides the necessary resources for recording all those trace events, without loss.

The *posix_trace_attr_getmaxusereventsize()* function shall calculate the maximum memory size, in bytes, required to store a single user trace event generated by a call to *posix_trace_event()* with a *data_len* parameter equal to the *data_len* value specified in this call. This value is calculated for the trace stream attributes object pointed to by the *attr* argument and is returned in the variable pointed to by the *eventsize* argument.

The *posix_trace_attr_getstreamsize()* function shall copy the stream size, in bytes, from the *stream-min-size* attribute of the attributes object pointed to by the *attr* argument into the variable pointed to by the *streamsize* argument.

This stream size is the current total memory size reserved for system and user trace events in the trace stream. The default value for the *stream-min-size* attribute is implementation-defined. The stream size refers to memory used to store trace event records. Other stream data (for example, trace attribute values) shall not be included in this size.

The *posix_trace_attr_setmaxdatasize()* function shall set the maximum allowed size, in bytes, in the *max-data-size* attribute of the attributes object pointed to by the *attr* argument, using the size value supplied by the *maxdatasize* argument. This maximum size is the maximum allowed size for the user data argument which may be passed to *posix_trace_event()*. The implementation shall be allowed to truncate data passed to *trace_user_event* which is longer than *maxdatasize*.

The *posix_trace_attr_setstreamsize()* function shall set the minimum allowed size, in bytes, in the *stream-min-size* attribute of the attributes object pointed to by the *attr* argument, using the size value supplied by the *streamsize* argument.

RETURN VALUE

Upon successful completion, these functions shall return a value of zero. Otherwise, they shall return the corresponding error number.

TRL The *posix_trace_attr_getlogsize()* function stores the maximum trace log allowed size in the object pointed to by *logsize*, if successful.

The *posix_trace_attr_getmaxdatasize()* function stores the maximum trace event record memory size in the object pointed to by *maxdatasize*, if successful.

The *posix_trace_attr_getmaxsystemeventsize()* function stores the maximum memory size to store a single system trace event in the object pointed to by *eventsize*, if successful.

The *posix_trace_attr_getmaxusereventsize()* function stores the maximum memory size to store a single user trace event in the object pointed to by *eventsize*, if successful.

The *posix_trace_attr_getstreamsize()* function stores the maximum trace stream allowed size in the object pointed to by *streamsize*, if successful.

ERRORS

These functions may fail if:

[EINVAL] The value specified by one of the arguments is invalid.

NAME

posix_trace_clear — clear trace stream and trace log (TRACING)

SYNOPSIS

```
OB TRC  #include <sys/types.h>
         #include <trace.h>
         int posix_trace_clear(trace_id_t trid);
```

DESCRIPTION

The *posix_trace_clear()* function shall reinitialize the trace stream identified by the argument *trid* as if it were returning from the *posix_trace_create()* function, except that the same allocated resources shall be reused, the mapping of trace event type identifiers to trace event names shall be unchanged, and the trace stream status shall remain unchanged (that is, if it was running, it remains running and if it was suspended, it remains suspended).

All trace events in the trace stream recorded before the call to *posix_trace_clear()* shall be lost. The *posix_stream_full_status* status shall be set to `POSIX_TRACE_NOT_FULL`. There is no guarantee that all trace events that occurred during the *posix_trace_clear()* call are recorded; the behavior with respect to trace points that may occur during this call is unspecified.

OB TRL If the Trace Log option is supported and the trace stream has been created with a log, the *posix_trace_clear()* function shall reinitialize the trace stream with the same behavior as if the trace stream was created without the log, plus it shall reinitialize the trace log associated with the trace stream identified by the argument *trid* as if it were returning from the *posix_trace_create_withlog()* function, except that the same allocated resources, for the trace log, may be reused and the associated trace stream status remains unchanged. The first trace event recorded in the trace log after the call to *posix_trace_clear()* shall be the same as the first trace event recorded in the active trace stream after the call to *posix_trace_clear()*. The *posix_log_full_status* status shall be set to `POSIX_TRACE_NOT_FULL`. There is no guarantee that all trace events that occurred during the *posix_trace_clear()* call are recorded in the trace log; the behavior with respect to trace points that may occur during this call is unspecified. If the log full policy is `POSIX_TRACE_APPEND`, the effect of a call to this function is unspecified for the trace log associated with the trace stream identified by the *trid* argument.

RETURN VALUE

Upon successful completion, the *posix_trace_clear()* function shall return a value of zero. Otherwise, it shall return the corresponding error number.

ERRORS

The *posix_trace_clear()* function shall fail if:

[EINVAL] The value of the *trid* argument does not correspond to an active trace stream.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

The *posix_trace_clear()* function may be removed in a future version.

48794 **SEE ALSO**48795 *posix_trace_attr_destroy()*, *posix_trace_create()*, *posix_trace_get_attr()*

48796 XBD <sys/types.h>, <trace.h>

48797 **CHANGE HISTORY**

48798 First released in Issue 6. Derived from IEEE Std 1003.1q-2000.

48799 IEEE PASC Interpretation 1003.1 #123 is applied.

48800 **Issue 7**48801 The *posix_trace_clear()* function is marked obsolescent.

NAME

posix_trace_close, posix_trace_open, posix_trace_rewind — trace log management (**TRACING**)

SYNOPSIS

```
#include <trace.h>
```

```
int posix_trace_close(trace_id_t trid);
int posix_trace_open(int file_desc, trace_id_t *trid);
int posix_trace_rewind(trace_id_t trid);
```

DESCRIPTION

The *posix_trace_close()* function shall deallocate the trace log identifier indicated by *trid*, and all of its associated resources. If there is no valid trace log pointed to by the *trid*, this function shall fail.

The *posix_trace_open()* function shall allocate the necessary resources and establish the connection between a trace log identified by the *file_desc* argument and a trace stream identifier identified by the object pointed to by the *trid* argument. The *file_desc* argument should be a valid open file descriptor that corresponds to a trace log. The *file_desc* argument shall be open for reading. The current trace event timestamp, which specifies the timestamp of the trace event that will be read by the next call to *posix_trace_getnext_event()*, shall be set to the timestamp of the oldest trace event recorded in the trace log identified by *trid*.

The *posix_trace_open()* function shall return a trace stream identifier in the variable pointed to by the *trid* argument, that may only be used by the following functions:

<i>posix_trace_close()</i>	<i>posix_trace_get_attr()</i>
<i>posix_trace_eventid_equal()</i>	<i>posix_trace_get_status()</i>
<i>posix_trace_eventid_get_name()</i>	<i>posix_trace_getnext_event()</i>
<i>posix_trace_eventtypelist_getnext_id()</i>	<i>posix_trace_rewind()</i>
<i>posix_trace_eventtypelist_rewind()</i>	

In particular, notice that the operations normally used by a trace controller process, such as *posix_trace_start()*, *posix_trace_stop()*, or *posix_trace_shutdown()*, cannot be invoked using the trace stream identifier returned by the *posix_trace_open()* function.

The *posix_trace_rewind()* function shall reset the current trace event timestamp, which specifies the timestamp of the trace event that will be read by the next call to *posix_trace_getnext_event()*, to the timestamp of the oldest trace event recorded in the trace log identified by *trid*.

RETURN VALUE

Upon successful completion, these functions shall return a value of zero. Otherwise, they shall return the corresponding error number.

If successful, the *posix_trace_open()* function stores the trace stream identifier value in the object pointed to by *trid*.

ERRORS

The *posix_trace_open()* function shall fail if:

[EINTR]	The operation was interrupted by a signal and thus no trace log was opened.
[EINVAL]	The object pointed to by <i>file_desc</i> does not correspond to a valid trace log.

48842 The *posix_trace_close()* and *posix_trace_rewind()* functions may fail if:

48843 [EINVAL] The object pointed to by *trid* does not correspond to a valid trace log.

48844 **EXAMPLES**

48845 None.

48846 **APPLICATION USAGE**

48847 None.

48848 **RATIONALE**

48849 None.

48850 **FUTURE DIRECTIONS**

48851 The *posix_trace_close()*, *posix_trace_open()*, and *posix_trace_rewind()* functions may be removed in
48852 a future version.

48853 **SEE ALSO**

48854 *posix_trace_get_attr()*, *posix_trace_get_filter()*, *posix_trace_getnext_event()*

48860 The *posix_trace_close()*, *posix_trace_open()*, and *posix_trace_rewind()* functions are marked
48861 obsolescent.

NAME

posix_trace_create, posix_trace_create_withlog, posix_trace_flush, posix_trace_shutdown — trace stream initialization, flush, and shutdown from a process (TRACING)

SYNOPSIS

```
#include <sys/types.h>
#include <trace.h>

int posix_trace_create(pid_t pid,
    const trace_attr_t *restrict attr,
    trace_id_t *restrict trid);
int posix_trace_create_withlog(pid_t pid,
    const trace_attr_t *restrict attr, int file_desc,
    trace_id_t *restrict trid);
int posix_trace_flush(trace_id_t trid);
int posix_trace_shutdown(trace_id_t trid);
```

DESCRIPTION

The *posix_trace_create()* function shall create an active trace stream. It allocates all the resources needed by the trace stream being created for tracing the process specified by *pid* in accordance with the *attr* argument. The *attr* argument represents the initial attributes of the trace stream and shall have been initialized by the function *posix_trace_attr_init()* prior to the *posix_trace_create()* call. If the argument *attr* is NULL, the default attributes shall be used. The *attr* attributes object shall be manipulated through a set of functions described in the *posix_trace_attr* family of functions. If the attributes of the object pointed to by *attr* are modified later, the attributes of the trace stream shall not be affected. The *creation-time* attribute of the newly created trace stream shall be set to the value of the system clock, if the Timers option is not supported, or to the value of the CLOCK_REALTIME clock, if the Timers option is supported.

The *pid* argument represents the target process to be traced. If the process executing this function does not have appropriate privileges to trace the process identified by *pid*, an error shall be returned. If the *pid* argument is zero, the calling process shall be traced.

The *posix_trace_create()* function shall store the trace stream identifier of the new trace stream in the object pointed to by the *trid* argument. This trace stream identifier shall be used in subsequent calls to control tracing. The *trid* argument may only be used by the following functions:

<i>posix_trace_clear()</i>	<i>posix_trace_getnext_event()</i>
<i>posix_trace_eventid_equal()</i>	<i>posix_trace_shutdown()</i>
<i>posix_trace_eventid_get_name()</i>	<i>posix_trace_start()</i>
<i>posix_trace_eventtypelist_getnext_id()</i>	<i>posix_trace_stop()</i>
<i>posix_trace_eventtypelist_rewind()</i>	<i>posix_trace_timedgetnext_event()</i>
<i>posix_trace_get_attr()</i>	<i>posix_trace_trid_eventid_open()</i>
<i>posix_trace_get_status()</i>	<i>posix_trace_trygetnext_event()</i>

If the Trace Event Filter option is supported, the following additional functions may use the *trid* argument:

posix_trace_get_filter() *posix_trace_set_filter()*

In particular, notice that the operations normally used by a trace analyzer process, such as *posix_trace_rewind()* or *posix_trace_close()*, cannot be invoked using the trace stream identifier returned by the *posix_trace_create()* function.

48907	TEF	A trace stream shall be created in a suspended state.	If the Trace Event Filter option is
48908		supported, its trace event type filter shall be empty.	

The `posix_trace_create()` function may be called multiple times from the same or different processes, with the system-wide limit indicated by the runtime invariant value `{TRACE_SYS_MAX}`, which has the minimum value `{_POSIX_TRACE_SYS_MAX}`.

The trace stream identifier returned by the `posix_trace_create()` function in the argument pointed to by `trid` is valid only in the process that made the function call. If it is used from another process, that is a child process, in functions defined in POSIX.1-2008, these functions shall return with the error [EINVAL].

48916 TRL The *posix_trace_create_withlog()* function shall be equivalent to *posix_trace_create()*, except that it
48917 associates a trace log with this stream. The *file_desc* argument shall be the file descriptor
48918 designating the trace log destination. The function shall fail if this file descriptor refers to a file
48919 with a file type that is not compatible with the log policy associated with the trace log. The list of
48920 the appropriate file types that are compatible with each log policy is implementation-defined.

The `posix_trace_create_withlog()` function shall return in the parameter pointed to by `trid` the trace stream identifier, which uniquely identifies the newly created trace stream, and shall be used in subsequent calls to control tracing. The `trid` argument may only be used by the following functions:

48925	<i>posix_trace_clear()</i>	<i>posix_trace_get_status()</i>
48926	<i>posix_trace_eventid_equal()</i>	<i>posix_trace_getnext_event()</i>
48927	<i>posix_trace_eventid_get_name()</i>	<i>posix_trace_shutdown()</i>
48928	<i>posix_trace_eventtypelist_getnext_id()</i>	<i>posix_trace_start()</i>
48929	<i>posix_trace_eventtypelist_rewind()</i>	<i>posix_trace_stop()</i>
48930	<i>posix_trace_flush()</i>	<i>posix_trace_timedgetnext_event()</i>
48931	<i>posix_trace_get_attr()</i>	<i>posix_trace_trid_eventid_open()</i>

48932	TEF	TRL	If the Trace Event Filter option is supported, the following additional functions may use the <i>trid</i> argument:
48933			

48934 *posix_trace_get_filter()* *posix_trace_set_filter()*

In particular, notice that the operations normally used by a trace analyzer process, such as `posix_trace_rewind()` or `posix_trace_close()`, cannot be invoked using the trace stream identifier returned by the `posix_trace_create_withlog()` function.

The *posix_trace_flush()* function shall initiate a flush operation which copies the contents of the trace stream identified by the argument *trid* into the trace log associated with the trace stream at the creation time. If no trace log has been associated with the trace stream pointed to by *trid*, this function shall return an error. The termination of the flush operation can be polled by the *posix_trace_get_status()* function. During the flush operation, it shall be possible to trace new trace events up to the point when the trace stream becomes full. After flushing is completed, the space used by the flushed trace events shall be available for tracing new trace events.

48945 If flushing the trace stream causes the resulting trace log to become full, the trace log full policy
48946 shall be applied. If the trace *log-full-policy* attribute is set, the following occurs:

48947 POSIX TRACE UNTIL FULL

48948 The trace events that have not yet been flushed shall be discarded.

48949 POSIX_TRACE_LOOP
 48950 The trace events that have not yet been flushed shall be written to the beginning of the trace
 48951 log, overwriting previous trace events stored there.

48952 POSIX_TRACE_APPEND
 48953 The trace events that have not yet been flushed shall be appended to the trace log.

48954 The *posix_trace_shutdown()* function shall stop the tracing of trace events in the trace stream
 48955 identified by *trid*, as if *posix_trace_stop()* had been invoked. The *posix_trace_shutdown()* function
 48956 shall free all the resources associated with the trace stream.

48957 The *posix_trace_shutdown()* function shall not return until all the resources associated with the
 48958 trace stream have been freed. When the *posix_trace_shutdown()* function returns, the *trid*
 48959 argument becomes an invalid trace stream identifier. A call to this function shall unconditionally
 48960 deallocate the resources regardless of whether all trace events have been retrieved by the
 48961 analyzer process. Any thread blocked on one of the *trace_getnext_event()* functions (which
 48962 specified this *trid*) before this call is unblocked with the error [EINVAL].

48963 If the process exits, invokes a member of the *exec* family of functions, or is terminated, the trace
 48964 streams that the process had created and that have not yet been shut down, shall be
 48965 automatically shut down as if an explicit call were made to the *posix_trace_shutdown()* function.

48966 TRL For an active trace stream with log, when the *posix_trace_shutdown()* function is called, all trace
 48967 events that have not yet been flushed to the trace log shall be flushed, as in the
 48968 *posix_trace_flush()* function, and the trace log shall be closed.

48969 When a trace log is closed, all the information that may be retrieved later from the trace log
 48970 through the trace interface shall have been written to the trace log. This information includes the
 48971 trace attributes, the list of trace event types (with the mapping between trace event names and
 48972 trace event type identifiers), and the trace status.

48973 In addition, unspecified information shall be written to the trace log to allow detection of a valid
 48974 trace log during the *posix_trace_open()* operation.

48975 The *posix_trace_shutdown()* function shall not return until all trace events have been flushed.

48976 RETURN VALUE

48977 Upon successful completion, these functions shall return a value of zero. Otherwise, they shall
 48978 return the corresponding error number.

48979 TRL The *posix_trace_create()* and *posix_trace_create_withlog()* functions store the trace stream
 48980 identifier value in the object pointed to by *trid*, if successful.

48981 ERRORS

48982 TRL The *posix_trace_create()* and *posix_trace_create_withlog()* functions shall fail if:

48983 [EAGAIN] No more trace streams can be started now. {TRACE_SYS_MAX} has been
 48984 exceeded.

48985 [EINTR] The operation was interrupted by a signal. No trace stream was created.

48986 [EINVAL] One or more of the trace parameters specified by the *attr* parameter is invalid.

48987 [ENOMEM] The implementation does not currently have sufficient memory to create the
 48988 trace stream with the specified parameters.

48989 [EPERM] The caller does not have appropriate privileges to trace the process specified
 48990 by *pid*.

48991 [ESRCH] The *pid* argument does not refer to an existing process.

48992 TRL The *posix_trace_create_withlog()* function shall fail if:

48993 [EBADF] The *file_desc* argument is not a valid file descriptor open for writing.

48994 [EINVAL] The *file_desc* argument refers to a file with a file type that does not support the

48995 log policy associated with the trace log.

48996 [ENOSPC] No space left on device. The device corresponding to the argument *file_desc*

48997 does not contain the space required to create this trace log.

48998 TRL The *posix_trace_flush()* and *posix_trace_shutdown()* functions shall fail if:

48999 [EINVAL] The value of the *trid* argument does not correspond to an active trace stream

49000 with log.

49001 [EFBIG] The trace log file has attempted to exceed an implementation-defined

49002 maximum file size.

49003 [ENOSPC] No space left on device.

49004 EXAMPLES

49005 None.

49006 APPLICATION USAGE

49007 None.

49008 RATIONALE

49009 None.

49010 FUTURE DIRECTIONS

49011 The *posix_trace_create()*, *posix_trace_create_withlog()*, *posix_trace_flush()*, and

49012 *posix_trace_shutdown()* functions may be removed in a future version.

49019 First released in Issue 6. Derived from IEEE Std 1003.1q-2000.

49020 Issue 7

49021 These functions are marked obsolescent.

49022 SD5-XSH-ERN-154 is applied, updating the DESCRIPTION to remove the

49023 *posix_trace_trygetnext_event()* function from the list of functions that use the *trid* argument.

49024 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0441 [358] is applied.

+

NAME

posix_trace_event, posix_trace_eventid_open — trace functions for instrumenting application code (TRACING)

SYNOPSIS

```
OB TRC #include <sys/types.h>
#include <trace.h>

void posix_trace_event(trace_event_id_t event_id,
    const void *restrict data_ptr, size_t data_len);
int posix_trace_eventid_open(const char *restrict event_name,
    trace_event_id_t *restrict event_id);
```

DESCRIPTION

The *posix_trace_event()* function shall record the *event_id* and the user data pointed to by *data_ptr* in the trace stream into which the calling process is being traced and in which *event_id* is not filtered out. If the total size of the user trace event data represented by *data_len* is not greater than the declared maximum size for user trace event data, then the *truncation-status* attribute of the trace event recorded is POSIX_TRACE_NOT_TRUNCATED. Otherwise, the user trace event data is truncated to this declared maximum size and the *truncation-status* attribute of the trace event recorded is POSIX_TRACE_TRUNCATED_RECORD.

If there is no trace stream created for the process or if the created trace stream is not running, or if the trace event specified by *event_id* is filtered out in the trace stream, the *posix_trace_event()* function shall have no effect.

The *posix_trace_eventid_open()* function shall associate a user trace event name with a trace event type identifier for the calling process. The trace event name is the string pointed to by the argument *event_name*. It shall have a maximum of {TRACE_EVENT_NAME_MAX} characters (which has the minimum value {POSIX_TRACE_EVENT_NAME_MAX}). The number of user trace event type identifiers that can be defined for any given process is limited by the maximum value {TRACE_USER_EVENT_MAX}, which has the minimum value {POSIX_TRACE_USER_EVENT_MAX}.

If the Trace Inherit option is not supported, the *posix_trace_eventid_open()* function shall associate the user trace event name pointed to by the *event_name* argument with a trace event type identifier that is unique for the traced process, and is returned in the variable pointed to by the *event_id* argument. If the user trace event name has already been mapped for the traced process, then the previously assigned trace event type identifier shall be returned. If the per-process user trace event name limit represented by {TRACE_USER_EVENT_MAX} has been reached, the pre-defined POSIX_TRACE_UNNAMED_USEREVENT (see Table 2-7, on page 544) user trace event shall be returned.

TRI

If the Trace Inherit option is supported, the *posix_trace_eventid_open()* function shall associate the user trace event name pointed to by the *event_name* argument with a trace event type identifier that is unique for all the processes being traced in this same trace stream, and is returned in the variable pointed to by the *event_id* argument. If the user trace event name has already been mapped for the traced processes, then the previously assigned trace event type identifier shall be returned. If the per-process user trace event name limit represented by {TRACE_USER_EVENT_MAX} has been reached, the pre-defined POSIX_TRACE_UNNAMED_USEREVENT (Table 2-7, on page 544) user trace event shall be returned.

Note: The above procedure, together with the fact that multiple processes can only be traced into the same trace stream by inheritance, ensure that all the processes that are traced into a trace stream have the same mapping of trace event names to trace event type identifiers.

49073 If there is no trace stream created, the *posix_trace_eventid_open()* function shall store this
49074 information for future trace streams created for this process.

49075 RETURN VALUE

49076 No return value is defined for the *posix_trace_event()* function.

49077 Upon successful completion, the *posix_trace_eventid_open()* function shall return a value of zero.
49078 Otherwise, it shall return the corresponding error number. The *posix_trace_eventid_open()*
49079 function stores the trace event type identifier value in the object pointed to by *event_id*, if
49080 successful.

49081 ERRORS

49082 The *posix_trace_eventid_open()* function shall fail if:

49083 [ENAMETOOLONG]

49084 The size of the name pointed to by the *event_name* argument was longer than
49085 the implementation-defined value {TRACE_EVENT_NAME_MAX}.

49086 EXAMPLES

49087 None.

49088 APPLICATION USAGE

49089 None.

49090 RATIONALE

49091 None.

49092 FUTURE DIRECTIONS

49093 The *posix_trace_event()* and *posix_trace_eventid_open()* functions may be removed in a future
49094 version.

49104 The *posix_trace_event()* and *posix_trace_eventid_open()* functions are marked obsolescent.

NAME

posix_trace_eventid_equal, posix_trace_eventid_get_name, posix_trace_trid_eventid_open — manipulate the trace event type identifier (TRACING)

SYNOPSIS

```
OB TRC  #include <trace.h>

int posix_trace_eventid_equal(trace_id_t trid, trace_event_id_t event1,
    trace_event_id_t event2);
int posix_trace_eventid_get_name(trace_id_t trid,
    trace_event_id_t event, char *event_name);
TEF int posix_trace_trid_eventid_open(trace_id_t trid,
    const char *restrict event_name,
    trace_event_id_t *restrict event);
```

DESCRIPTION

The *posix_trace_eventid_equal()* function shall compare the trace event type identifiers *event1* and *event2* from the same trace stream or the same trace log identified by the *trid* argument. If the trace event type identifiers *event1* and *event2* are from different trace streams, the return value shall be unspecified.

The *posix_trace_eventid_get_name()* function shall return, in the argument pointed to by *event_name*, the trace event name associated with the trace event type identifier identified by the argument *event*, for the trace stream or for the trace log identified by the *trid* argument. The name of the trace event shall have a maximum of {TRACE_EVENT_NAME_MAX} characters (which has the minimum value {_POSIX_TRACE_EVENT_NAME_MAX}). Successive calls to this function with the same trace event type identifier and the same trace stream identifier shall return the same event name.

TEF The *posix_trace_trid_eventid_open()* function shall associate a user trace event name with a trace event type identifier for a given trace stream. The trace stream is identified by the *trid* argument, and it shall be an active trace stream. The trace event name is the string pointed to by the argument *event_name*. It shall have a maximum of {TRACE_EVENT_NAME_MAX} characters (which has the minimum value {_POSIX_TRACE_EVENT_NAME_MAX}). The number of user trace event type identifiers that can be defined for any given process is limited by the maximum value {TRACE_USER_EVENT_MAX}, which has the minimum value {_POSIX_TRACE_USER_EVENT_MAX}.

If the Trace Inherit option is not supported, the *posix_trace_trid_eventid_open()* function shall associate the user trace event name pointed to by the *event_name* argument with a trace event type identifier that is unique for the process being traced in the trace stream identified by the *trid* argument, and is returned in the variable pointed to by the *event* argument. If the user trace event name has already been mapped for the traced process, then the previously assigned trace event type identifier shall be returned. If the per-process user trace event name limit represented by {TRACE_USER_EVENT_MAX} has been reached, the pre-defined POSIX_TRACE_UNNAMED_USEREVENT (see [Table 2-7](#), on page 544) user trace event shall be returned.

TEF TRI If the Trace Inherit option is supported, the *posix_trace_trid_eventid_open()* function shall associate the user trace event name pointed to by the *event_name* argument with a trace event type identifier that is unique for all the processes being traced in the trace stream identified by the *trid* argument, and is returned in the variable pointed to by the *event* argument. If the user trace event name has already been mapped for the traced processes, then the previously assigned trace event type identifier shall be returned. If the per-process user trace event name limit represented by {TRACE_USER_EVENT_MAX} has been reached, the pre-defined

49153 POSIX_TRACE_UNNAMED_USEREVENT (see Table 2-7, on page 544) user trace event shall be
 49154 returned.

49155 RETURN VALUE

49156 TEF Upon successful completion, the `posix_trace_eventid_get_name()` and
 49157 `posix_trace_trid_eventid_open()` functions shall return a value of zero. Otherwise, they shall return
 49158 the corresponding error number.

49159 The `posix_trace_eventid_equal()` function shall return a non-zero value if *event1* and *event2* are
 49160 equal; otherwise, a value of zero shall be returned. No errors are defined. If either *event1* or
 49161 *event2* are not valid trace event type identifiers for the trace stream specified by *trid* or if the *trid*
 49162 is invalid, the behavior shall be unspecified.

49163 The `posix_trace_eventid_get_name()` function stores the trace event name value in the object
 49164 pointed to by *event_name*, if successful.

49165 TEF The `posix_trace_trid_eventid_open()` function stores the trace event type identifier value in the
 49166 object pointed to by *event*, if successful.

49167 ERRORS

49168 TEF The `posix_trace_eventid_get_name()` and `posix_trace_trid_eventid_open()` functions shall fail if:

49169 [EINVAL] The *trid* argument was not a valid trace stream identifier.

49170 TEF The `posix_trace_trid_eventid_open()` function shall fail if:

49171 TEF [ENAMETOOLONG]

49172 The size of the name pointed to by the *event_name* argument was longer than
 49173 the implementation-defined value {TRACE_EVENT_NAME_MAX}.

49174 The `posix_trace_eventid_get_name()` function shall fail if:

49175 [EINVAL] The trace event type identifier *event* was not associated with any name.

49176 EXAMPLES

49177 None.

49178 APPLICATION USAGE

49179 None.

49180 RATIONALE

49181 None.

49182 FUTURE DIRECTIONS

49183 The `posix_trace_eventid_equal()`, `posix_trace_eventid_get_name()`, and
 49184 `posix_trace_trid_eventid_open()` functions may be removed in a future version.

49192 These functions are marked obsolescent.

NAME

posix_trace_eventid_open — trace functions for instrumenting application code (**TRACING**)

SYNOPSIS

```
OB TRC #include <sys/types.h>
#include <trace.h>

int posix_trace_eventid_open(const char *restrict event_name,
    trace_event_id_t *restrict event_id);
```

DESCRIPTION

Refer to *posix_trace_event()*.

NAME

posix_trace_eventset_add, posix_trace_eventset_del, posix_trace_eventset_empty,
 posix_trace_eventset_fill, posix_trace_eventset_ismember — manipulate trace event type sets
 (TRACING)

SYNOPSIS

```
#include <trace.h>

int posix_trace_eventset_add(trace_event_id_t event_id,
    trace_event_set_t *set);
int posix_trace_eventset_del(trace_event_id_t event_id,
    trace_event_set_t *set);
int posix_trace_eventset_empty(trace_event_set_t *set);
int posix_trace_eventset_fill(trace_event_set_t *set, int what);
int posix_trace_eventset_ismember(trace_event_id_t event_id,
    const trace_event_set_t *restrict set, int *restrict ismember);
```

DESCRIPTION

These primitives manipulate sets of trace event types. They operate on data objects addressable by the application, not on the current trace event filter of any trace stream.

The *posix_trace_eventset_add()* and *posix_trace_eventset_del()* functions, respectively, shall add or delete the individual trace event type specified by the value of the argument *event_id* to or from the trace event type set pointed to by the argument *set*. Adding a trace event type already in the set or deleting a trace event type not in the set shall not be considered an error.

The *posix_trace_eventset_empty()* function shall initialize the trace event type set pointed to by the *set* argument such that all trace event types defined, both system and user, shall be excluded from the set.

The *posix_trace_eventset_fill()* function shall initialize the trace event type set pointed to by the argument *set*, such that the set of trace event types defined by the argument *what* shall be included in the set. The value of the argument *what* shall consist of one of the following values, as defined in the **<trace.h>** header:

POSIX_TRACE_WOPID_EVENTS

All the process-independent implementation-defined system trace event types are included in the set.

POSIX_TRACE_SYSTEM_EVENTS

All the implementation-defined system trace event types are included in the set, as are those defined in POSIX.1-2008.

POSIX_TRACE_ALL_EVENTS

All trace event types defined, both system and user, are included in the set.

Applications shall call either *posix_trace_eventset_empty()* or *posix_trace_eventset_fill()* at least once for each object of type **trace_event_set_t** prior to any other use of that object. If such an object is not initialized in this way, but is nonetheless supplied as an argument to any of the *posix_trace_eventset_add()*, *posix_trace_eventset_del()*, or *posix_trace_eventset_ismember()* functions, the results are undefined.

The *posix_trace_eventset_ismember()* function shall test whether the trace event type specified by the value of the argument *event_id* is a member of the set pointed to by the argument *set*. The value returned in the object pointed to by *ismember* argument is zero if the trace event type identifier is not a member of the set and a value different from zero if it is a member of the set.

49247 RETURN VALUE

49248 Upon successful completion, these functions shall return a value of zero. Otherwise, they shall
49249 return the corresponding error number.

49250 ERRORS

49251 These functions may fail if:

49252 [EINVAL] The value of one of the arguments is invalid.

49253 EXAMPLES

49254 None.

49255 APPLICATION USAGE

49256 None.

49257 RATIONALE

49258 None.

49259 FUTURE DIRECTIONS

49260 The `posix_trace_eventset_add()`, `posix_trace_eventset_del()`, `posix_trace_eventset_empty()`,
49261 `posix_trace_eventset_fill()`, and `posix_trace_eventset_ismember()` functions may be removed in a
49262 future version.

49266 CHANGE HISTORY

49267 First released in Issue 6. Derived from IEEE Std 1003.1q-2000.

49268 Issue 7

49269 The `posix_trace_eventset_add()`, `posix_trace_eventset_del()`, `posix_trace_eventset_empty()`,
49270 `posix_trace_eventset_fill()`, and `posix_trace_eventset_ismember()` functions are marked obsolescent.

49271 **NAME**

49272 `posix_trace_eventtypelist_getnext_id`, `posix_trace_eventtypelist_rewind` — iterate over a
 49273 mapping of trace event types (**TRACING**)

49274 **SYNOPSIS**

```
49275 OB TRC #include <trace.h>
49276
49276     int posix_trace_eventtypelist_getnext_id(trace_id_t trid,
49277         trace_event_id_t *restrict event, int *restrict unavailable);
49278     int posix_trace_eventtypelist_rewind(trace_id_t trid);
```

49279 **DESCRIPTION**

49280 The first time `posix_trace_eventtypelist_getnext_id()` is called, the function shall return in the
 49281 variable pointed to by *event* the first trace event type identifier of the list of trace events of the
 49282 trace stream identified by the *trid* argument. Successive calls to
 49283 `posix_trace_eventtypelist_getnext_id()` return in the variable pointed to by *event* the next trace
 49284 event type identifier in that same list. Each time a trace event type identifier is successfully
 49285 written into the variable pointed to by the *event* argument, the variable pointed to by the
 49286 *unavailable* argument shall be set to zero. When no more trace event type identifiers are available,
 49287 and so none is returned, the variable pointed to by the *unavailable* argument shall be set to a
 49288 value different from zero.

49289 The `posix_trace_eventtypelist_rewind()` function shall reset the next trace event type identifier to
 49290 be read to the first trace event type identifier from the list of trace events used in the trace stream
 49291 identified by *trid*.

49292 **RETURN VALUE**

49293 Upon successful completion, these functions shall return a value of zero. Otherwise, they shall
 49294 return the corresponding error number.

49295 The `posix_trace_eventtypelist_getnext_id()` function stores the trace event type identifier value in
 49296 the object pointed to by *event*, if successful.

49297 **ERRORS**

49298 These functions shall fail if:

49299 [EINVAL] The *trid* argument was not a valid trace stream identifier.

49300 **EXAMPLES**

49301 None.

49302 **APPLICATION USAGE**

49303 None.

49304 **RATIONALE**

49305 None.

49306 **FUTURE DIRECTIONS**

49307 The `posix_trace_eventtypelist_getnext_id()` and `posix_trace_eventtypelist_rewind()` functions may be
 49308 removed in a future version.

```

DESCRIPTION

The *posix_trace_get_attr()* function shall copy the attributes of the active trace stream identified by *trid* into the object pointed to by the *attr* argument. If the Trace Log option is supported, *trid* may represent a pre-recorded trace log.

The *posix_trace_get_status()* function shall return, in the structure pointed to by the *statusinfo* argument, the current trace status for the trace stream identified by the *trid* argument. These status values returned in the structure pointed to by *statusinfo* shall have been appropriately read to ensure that the returned values are consistent. If the Trace Log option is supported and the *trid* argument refers to a pre-recorded trace stream, the status shall be the status of the completed trace stream.

Each time the *posix_trace_get_status()* function is used, the overrun status of the trace stream shall be reset to POSIX_TRACE_NO_OVERRUN immediately after the call completes. If the Trace Log option is supported, the *posix_trace_get_status()* function shall behave the same as when the option is not supported except for the following differences:

- If the *trid* argument refers to a trace stream with log, each time the *posix_trace_get_status()* function is used, the log overrun status of the trace stream shall be reset to POSIX_TRACE_NO_OVERRUN and the *flush_error* status shall be reset to zero immediately after the call completes.
- If the *trid* argument refers to a pre-recorded trace stream, the status returned shall be the status of the completed trace stream and the status values of the trace stream shall not be reset.

RETURN VALUE

Upon successful completion, these functions shall return a value of zero. Otherwise, they shall return the corresponding error number.

The *posix_trace_get_attr()* function stores the trace attributes in the object pointed to by *attr*, if successful.

The *posix_trace_get_status()* function stores the trace status in the object pointed to by *statusinfo*, if successful.

ERRORS

These functions shall fail if:

[EINVAL]	The trace stream argument <i>trid</i> does not correspond to a valid active trace stream or a valid trace log.

NAME

posix_trace_get_filter, posix_trace_set_filter — retrieve and set the filter of an initialized trace stream (TRACING)

SYNOPSIS

```
OB TRC #include <trace.h>

TEF int posix_trace_get_filter(trace_id_t trid, trace_event_set_t *set);
int posix_trace_set_filter(trace_id_t trid,
    const trace_event_set_t *set, int how);
```

DESCRIPTION

The *posix_trace_get_filter()* function shall retrieve, into the argument pointed to by *set*, the actual trace event filter from the trace stream specified by *trid*.

The *posix_trace_set_filter()* function shall change the set of filtered trace event types after a trace stream identified by the *trid* argument is created. This function may be called prior to starting the trace stream, or while the trace stream is active. By default, if no call is made to *posix_trace_set_filter()*, all trace events shall be recorded (that is, none of the trace event types are filtered out).

If this function is called while the trace is in progress, a special system trace event, POSIX_TRACE_FILTER, shall be recorded in the trace indicating both the old and the new sets of filtered trace event types (see Table 2-4 (on page 542) and Table 2-6, on page 543).

If the *posix_trace_set_filter()* function is interrupted by a signal, an error shall be returned and the filter shall not be changed. In this case, the state of the trace stream shall not be changed.

The value of the argument *how* indicates the manner in which the set is to be changed and shall have one of the following values, as defined in the **<trace.h>** header:

POSIX_TRACE_SET_EVENTSET

The resulting set of trace event types to be filtered shall be the trace event type set pointed to by the argument *set*.

POSIX_TRACE_ADD_EVENTSET

The resulting set of trace event types to be filtered shall be the union of the current set and the trace event type set pointed to by the argument *set*.

POSIX_TRACE_SUB_EVENTSET

The resulting set of trace event types to be filtered shall be all trace event types in the current set that are not in the set pointed to by the argument *set*; that is, remove each element of the specified set from the current filter.

RETURN VALUE

Upon successful completion, these functions shall return a value of zero. Otherwise, they shall return the corresponding error number.

The *posix_trace_get_filter()* function stores the set of filtered trace event types in *set*, if successful.

ERRORS

These functions shall fail if:

- [EINVAL] The value of the *trid* argument does not correspond to an active trace stream or the value of the argument pointed to by *set* is invalid.
- [EINTR] The operation was interrupted by a signal.

NAME

posix_trace_getnext_event, posix_trace_timedgetnext_event, posix_trace_trygetnext_event — retrieve a trace event (**TRACING**)

SYNOPSIS

```
#include <sys/types.h>
#include <trace.h>

int posix_trace_getnext_event(trace_id_t trid,
    struct posix_trace_event_info *restrict event,
    void *restrict data, size_t num_bytes,
    size_t *restrict data_len, int *restrict unavailable);
int posix_trace_timedgetnext_event(trace_id_t trid,
    struct posix_trace_event_info *restrict event,
    void *restrict data, size_t num_bytes,
    size_t *restrict data_len, int *restrict unavailable,
    const struct timespec *restrict abstime);
int posix_trace_trygetnext_event(trace_id_t trid,
    struct posix_trace_event_info *restrict event,
    void *restrict data, size_t num_bytes,
    size_t *restrict data_len, int *restrict unavailable);
```

DESCRIPTION

The *posix_trace_getnext_event()* function shall report a recorded trace event either from an active trace stream without log or a pre-recorded trace stream identified by the *trid* argument. The *posix_trace_trygetnext_event()* function shall report a recorded trace event from an active trace stream without log identified by the *trid* argument.

The trace event information associated with the recorded trace event shall be copied by the function into the structure pointed to by the argument *event* and the data associated with the trace event shall be copied into the buffer pointed to by the *data* argument.

The *posix_trace_getnext_event()* function shall block if the *trid* argument identifies an active trace stream and there is currently no trace event ready to be retrieved. When returning, if a recorded trace event was reported, the variable pointed to by the *unavailable* argument shall be set to zero. Otherwise, the variable pointed to by the *unavailable* argument shall be set to a value different from zero.

The *posix_trace_timedgetnext_event()* function shall attempt to get another trace event from an active trace stream without log, as in the *posix_trace_getnext_event()* function. However, if no trace event is available from the trace stream, the implied wait shall be terminated when the timeout specified by the argument *abstime* expires, and the function shall return the error [ETIMEDOUT].

The timeout shall expire when the absolute time specified by *abstime* passes, as measured by the clock upon which timeouts are based (that is, when the value of that clock equals or exceeds *abstime*), or if the absolute time specified by *abstime* has already passed at the time of the call.

The timeout shall be based on the CLOCK_REALTIME clock. The resolution of the timeout shall be the resolution of the clock on which it is based. The **timespec** data type is defined in the **<time.h>** header.

Under no circumstance shall the function fail with a timeout if a trace event is immediately available from the trace stream. The validity of the *abstime* argument need not be checked if a trace event is immediately available from the trace stream.

49496 The behavior of this function for a pre-recorded trace stream is unspecified.

49497 TRL The *posix_trace_trygetnext_event()* function shall not block. This function shall return an error if
 49498 the *trid* argument identifies a pre-recorded trace stream. If a recorded trace event was reported,
 49499 the variable pointed to by the *unavailable* argument shall be set to zero. Otherwise, if no trace
 49500 event was reported, the variable pointed to by the *unavailable* argument shall be set to a value
 49501 different from zero.

49502 The argument *num_bytes* shall be the size of the buffer pointed to by the *data* argument. The
 49503 argument *data_len* reports to the application the length in bytes of the data record just
 49504 transferred. If *num_bytes* is greater than or equal to the size of the data associated with the trace
 49505 event pointed to by the *event* argument, all the recorded data shall be transferred. In this case,
 49506 the *truncation-status* member of the trace event structure shall be either
 49507 POSIX_TRACE_NOT_TRUNCATED, if the trace event data was recorded without truncation
 49508 while tracing, or POSIX_TRACE_TRUNCATED_RECORD, if the trace event data was truncated
 49509 when it was recorded. If the *num_bytes* argument is less than the length of recorded trace event
 49510 data, the data transferred shall be truncated to a length of *num_bytes*, the value stored in the
 49511 variable pointed to by *data_len* shall be equal to *num_bytes*, and the *truncation-status* member of
 49512 the *event* structure argument shall be set to POSIX_TRACE_TRUNCATED_READ (see the
 49513 **posix_trace_event_info** structure defined in <trace.h>).

49514 The report of a trace event shall be sequential starting from the oldest recorded trace event. Trace
 49515 events shall be reported in the order in which they were generated, up to an implementation-
 49516 defined time resolution that causes the ordering of trace events occurring very close to each
 49517 other to be unknown. Once reported, a trace event cannot be reported again from an active trace
 49518 stream. Once a trace event is reported from an active trace stream without log, the trace stream
 49519 shall make the resources associated with that trace event available to record future generated
 49520 trace events.

49521 **RETURN VALUE**

49522 Upon successful completion, these functions shall return a value of zero. Otherwise, they shall
 49523 return the corresponding error number.

49524 If successful, these functions store:

- 49525 • The recorded trace event in the object pointed to by *event*
- 49526 • The trace event information associated with the recorded trace event in the object pointed
 49527 to by *data*
- 49528 • The length of this trace event information in the object pointed to by *data_len*
- 49529 • The value of zero in the object pointed to by *unavailable*

49530 **ERRORS**

49531 These functions shall fail if:

49532 [EINVAL] The trace stream identifier argument *trid* is invalid.

49533 The *posix_trace_getnext_event()* and *posix_trace_timedgetnext_event()* functions shall fail if:

49534 [EINTR] The operation was interrupted by a signal, and so the call had no effect.

49535 The *posix_trace_trygetnext_event()* function shall fail if:

49536 [EINVAL] The trace stream identifier argument *trid* does not correspond to an active
 49537 trace stream.

49538 The *posix_trace_timedgetnext_event()* function shall fail if:

49539 [EINVAL] There is no trace event immediately available from the trace stream, and the

49540 *timeout* argument is invalid.

49541 [ETIMEDOUT] No trace event was available from the trace stream before the specified

49542 timeout *timeout* expired.

49543 EXAMPLES

49544 None.

49545 APPLICATION USAGE

49546 None.

49547 RATIONALE

49561 NAME

49562 posix_trace_open, posix_trace_rewind — trace log management (TRACING)

49563 SYNOPSIS

```
49564 OB TRC #include <trace.h>
49565 TRL     int posix_trace_open(int file_desc, trace_id_t *trid);
49566         int posix_trace_rewind(trace_id_t trid);
```

49567 DESCRIPTION

49568 Refer to *posix_trace_close()*.

49569 **NAME**49570 posix_trace_set_filter — set filter of an initialized trace stream (**TRACING**)49571 **SYNOPSIS**

```
49572 OB TRC  #include <trace.h>
49573 TEF      int posix_trace_set_filter(trace_id_t trid,
49574                                     const trace_event_set_t *set, int how);
```

49575 **DESCRIPTION**49576 Refer to *posix_trace_get_filter()*.

49577 NAME

49578 posix_trace_shutdown — trace stream shutdown from a process (**TRACING**)

49579 SYNOPSIS

```
49580 OB TRC #include <sys/types.h>  
49581 #include <trace.h>  
49582 int posix_trace_shutdown(trace_id_t trid);
```

49583 DESCRIPTION

49584 Refer to *posix_trace_create()*.

49585 **NAME**

49586 posix_trace_start, posix_trace_stop — trace start and stop (TRACING)

49587 **SYNOPSIS**

```
49588 OB TRC  #include <trace.h>
49589         int posix_trace_start(trace_id_t trid);
49590         int posix_trace_stop (trace_id_t trid);
```

49591 **DESCRIPTION**

49592 The *posix_trace_start()* and *posix_trace_stop()* functions, respectively, shall start and stop the trace
 49593 stream identified by the argument *trid*.

49594 The effect of calling the *posix_trace_start()* function shall be recorded in the trace stream as the
 49595 POSIX_TRACE_START system trace event and the status of the trace stream shall become
 49596 POSIX_TRACE_RUNNING. If the trace stream is in progress when this function is called, the
 49597 POSIX_TRACE_START system trace event shall not be recorded and the trace stream shall
 49598 continue to run. If the trace stream is full, the POSIX_TRACE_START system trace event shall
 49599 not be recorded and the status of the trace stream shall not be changed.

49600 The effect of calling the *posix_trace_stop()* function shall be recorded in the trace stream as the
 49601 POSIX_TRACE_STOP system trace event and the status of the trace stream shall become
 49602 POSIX_TRACE_SUSPENDED. If the trace stream is suspended when this function is called, the
 49603 POSIX_TRACE_STOP system trace event shall not be recorded and the trace stream shall remain
 49604 suspended. If the trace stream is full, the POSIX_TRACE_STOP system trace event shall not be
 49605 recorded and the status of the trace stream shall not be changed.

49606 **RETURN VALUE**

49607 Upon successful completion, these functions shall return a value of zero. Otherwise, they shall
 49608 return the corresponding error number.

49609 **ERRORS**

49610 These functions shall fail if:

49611	[EINVAL]	The value of the argument <i>trid</i> does not correspond to an active trace stream
49612		and thus no trace stream was started or stopped.
49613	[EINTR]	The operation was interrupted by a signal and thus the trace stream was not
49614		necessarily started or stopped.

NAME

posix_typed_mem_get_info — query typed memory information (ADVANCED REALTIME)

SYNOPSIS

```
#include <sys/mman.h>

int posix_typed_mem_get_info(int fildes,
    struct posix_typed_mem_info *info);
```

DESCRIPTION

The *posix_typed_mem_get_info()* function shall return, in the *posix_tmi_length* field of the **posix_typed_mem_info** structure pointed to by *info*, the maximum length which may be successfully allocated by the typed memory object designated by *fildes*. This maximum length shall take into account the flag `POSIX_TYPED_MEM_ALLOCATE` or `POSIX_TYPED_MEM_ALLOCATE_CONTIG` specified when the typed memory object represented by *fildes* was opened. The maximum length is dynamic; therefore, the value returned is valid only while the current mapping of the corresponding typed memory pool remains unchanged.

If *fildes* represents a typed memory object opened with neither the `POSIX_TYPED_MEM_ALLOCATE` flag nor the `POSIX_TYPED_MEM_ALLOCATE_CONTIG` flag specified, the returned value of *info*->*posix_tmi_length* is unspecified.

The *posix_typed_mem_get_info()* function may return additional implementation-defined information in other fields of the **posix_typed_mem_info** structure pointed to by *info*.

If the memory object specified by *fildes* is not a typed memory object, then the behavior of this function is undefined.

RETURN VALUE

Upon successful completion, the *posix_typed_mem_get_info()* function shall return zero; otherwise, the corresponding error status value shall be returned.

ERRORS

The *posix_typed_mem_get_info()* function shall fail if:

- [EBADF] The *fildes* argument is not a valid open file descriptor.
- [ENODEV] The *fildes* argument is not connected to a memory object supported by this function.

This function shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

An application that needs to allocate a block of typed memory with length dependent upon the amount of memory currently available must either query the typed memory object to obtain the amount available, or repeatedly invoke *mmap()* attempting to guess an appropriate length. While the latter method is existing practice with *malloc()*, it is awkward and imprecise. The *posix_typed_mem_get_info()* function allows an application to immediately determine available memory. This is particularly important for typed memory objects that may in some cases be scarce resources. Note that when a typed memory pool is a shared resource, some form of mutual-exclusion or synchronization may be required while typed memory is being queried and

49707 allocated to prevent race conditions.

49708 The existing *fstat()* function is not suitable for this purpose. We realize that implementations
49709 may wish to provide other attributes of typed memory objects (for example, alignment
49710 requirements, page size, and so on). The *fstat()* function returns a structure which is not
49711 extensible and, furthermore, contains substantial information that is inappropriate for typed
49712 memory objects.

49713 **FUTURE DIRECTIONS**

49714 None.

49715 **SEE ALSO**

49716 *fstat()*, *mmap()*, *posix_typed_mem_open()*

49717 XBD <sys/mman.h>

49718 **CHANGE HISTORY**

49719 First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

NAME

posix_typed_mem_open — open a typed memory object (**ADVANCED REALTIME**)

SYNOPSIS

```
#include <sys/mman.h>

int posix_typed_mem_open(const char *name, int oflag, int tflag);
```

DESCRIPTION

The *posix_typed_mem_open()* function shall establish a connection between the typed memory object specified by the string pointed to by *name* and a file descriptor. It shall create an open file description that refers to the typed memory object and a file descriptor that refers to that open file description. The file descriptor is used by other functions to refer to that typed memory object. It is unspecified whether the name appears in the file system and is visible to other functions that take pathnames as arguments. The *name* argument conforms to the construction rules for a pathname, except that the interpretation of <slash> characters other than the leading <slash> character in *name* is implementation-defined, and that the length limits for the *name* argument are implementation-defined and need not be the same as the pathname limits {PATH_MAX} and {NAME_MAX}. If *name* begins with the <slash> character, then processes calling *posix_typed_mem_open()* with the same value of *name* shall refer to the same typed memory object. If *name* does not begin with the <slash> character, the effect is implementation-defined.

Each typed memory object supported in a system shall be identified by a name which specifies not only its associated typed memory pool, but also the path or port by which it is accessed. That is, the same typed memory pool accessed via several different ports shall have several different corresponding names. The binding between names and typed memory objects is established in an implementation-defined manner. Unlike shared memory objects, there is no way within POSIX.1-2008 for a program to create a typed memory object.

The value of *tflag* shall determine how the typed memory object behaves when subsequently mapped by calls to *mmap()*. At most, one of the following flags defined in **<sys/mman.h>** may be specified:

POSIX_TYPED_MEM_ALLOCATE

Allocate on *mmap()*.

POSIX_TYPED_MEM_ALLOCATE_CONTIG

Allocate contiguously on *mmap()*.

POSIX_TYPED_MEM_MAP_ALLOCATABLE

Map on *mmap()*, without affecting allocatability.

If *tflag* has the flag POSIX_TYPED_MEM_ALLOCATE specified, any subsequent call to *mmap()* using the returned file descriptor shall result in allocation and mapping of typed memory from the specified typed memory pool. The allocated memory may be a contiguous previously unallocated area of the typed memory pool or several non-contiguous previously unallocated areas (mapped to a contiguous portion of the process address space). If *tflag* has the flag POSIX_TYPED_MEM_ALLOCATE_CONTIG specified, any subsequent call to *mmap()* using the returned file descriptor shall result in allocation and mapping of a single contiguous previously unallocated area of the typed memory pool (also mapped to a contiguous portion of the process address space). If *tflag* has none of the flags POSIX_TYPED_MEM_ALLOCATE or POSIX_TYPED_MEM_ALLOCATE_CONTIG specified, any subsequent call to *mmap()* using the returned file descriptor shall map an application-chosen area from the specified typed memory pool such that this mapped area becomes unavailable for allocation until unmapped by all processes. If *tflag* has the flag POSIX_TYPED_MEM_MAP_ALLOCATABLE specified, any

subsequent call to *mmap()* using the returned file descriptor shall map an application-chosen area from the specified typed memory pool without an effect on the availability of that area for allocation; that is, mapping such an object leaves each byte of the mapped area unallocated if it was unallocated prior to the mapping or allocated if it was allocated prior to the mapping. Appropriate privileges to specify the `POSIX_TYPED_MEM_MAP_ALLOCATABLE` flag are implementation-defined.

If successful, *posix_typed_mem_open()* shall return a file descriptor for the typed memory object that is the lowest numbered file descriptor not currently open for that process. The open file description is new, and therefore the file descriptor shall not share it with any other processes. It is unspecified whether the file offset is set. The `FD_CLOEXEC` file descriptor flag associated with the new file descriptor shall be cleared.

The behavior of *msync()*, *ftruncate()*, and all file operations other than *mmap()*, *posix_mem_offset()*, *posix_typed_mem_get_info()*, *fstat()*, *dup()*, *dup2()*, and *close()*, is unspecified when passed a file descriptor connected to a typed memory object by this function.

The file status flags of the open file description shall be set according to the value of *oflag*. Applications shall specify exactly one of the three access mode values described below and defined in the `<fcntl.h>` header, as the value of *oflag*.

<code>O_RDONLY</code>	Open for read access only.
<code>O_WRONLY</code>	Open for write access only.
<code>O_RDWR</code>	Open for read or write access.

RETURN VALUE

Upon successful completion, the *posix_typed_mem_open()* function shall return a non-negative integer representing the lowest numbered unused file descriptor. Otherwise, it shall return `-1` and set *errno* to indicate the error.

ERRORS

The *posix_typed_mem_open()* function shall fail if:

<code>[EACCES]</code>	The typed memory object exists and the permissions specified by <i>oflag</i> are denied.	

<code>[EINTR]</code>	The <i>posix_typed_mem_open()</i> operation was interrupted by a signal.	

<code>[EINVAL]</code>	The flags specified in <i>tflag</i> are invalid (more than one of <code>POSIX_TYPED_MEM_ALLOCATE</code> , <code>POSIX_TYPED_MEM_ALLOCATE_CONTIG</code> , or <code>POSIX_TYPED_MEM_MAP_ALLOCATABLE</code> is specified).	

<code>[EMFILE]</code>	All file descriptors available to the process are currently open.	

<code>[ENFILE]</code>	Too many file descriptors are currently open in the system.	+

<code>[ENOENT]</code>	The named typed memory object does not exist.	+

<code>[EPERM]</code>	The caller lacks appropriate privileges to specify the <code>POSIX_TYPED_MEM_MAP_ALLOCATABLE</code> flag in the <i>tflag</i> argument.	+

	The <i>posix_typed_mem_open()</i> function may fail if:	+

<code>[ENAMETOOLONG]</code>		

	The length of the <i>name</i> argument exceeds <code>{_POSIX_PATH_MAX}</code> on systems that do not support the XSI option <code>or exceeds <code>{_XOPEN_PATH_MAX}</code> on XSI systems,</code> or has a pathname component that is longer than	

49810 XSI { _POSIX_NAME_MAX } on systems that do not support the XSI option or
 49811 longer than { _XOPEN_NAME_MAX } on XSI systems. -

49824 CHANGE HISTORY

49825 First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

49826 Issue 7

49827 Austin Group Interpretation 1003.1-2001 #143 is applied.

49828 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0442 [119,428] is applied. +

49829 **NAME**

49830 pow, powf, powl — power function

49831 **SYNOPSIS**

```
49832 #include <math.h>
49833 double pow(double x, double y);
49834 float powf(float x, float y);
49835 long double powl(long double x, long double y);
```

49836 **DESCRIPTION**

49837 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 49838 conflict between the requirements described here and the ISO C standard is unintentional. This
 49839 volume of POSIX.1-2008 defers to the ISO C standard.

49840 These functions shall compute the value of x raised to the power y , x^y . If x is negative, the
 49841 application shall ensure that y is an integer value.

49842 An application wishing to check for error situations should set *errno* to zero and call
 49843 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 49844 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 49845 zero, an error has occurred.

49846 **RETURN VALUE**

49847 Upon successful completion, these functions shall return the value of x raised to the power y .

49848 MX For finite values of $x < 0$, and finite non-integer values of y , a domain error shall occur and
 49849 either a NaN (if representable), or an implementation-defined value shall be returned.

49850 If the correct value would cause overflow, a range error shall occur and *pow()*, *powf()*, and
 49851 *powl()* shall return $\pm\text{HUGE\_VAL}$, $\pm\text{HUGE\_VALF}$, and $\pm\text{HUGE\_VALL}$, respectively, with the
 49852 same sign as the correct value of the function.

49853 MXX If the correct value would cause underflow, and is not representable, a range error may occur, |
 49854 MXX and *pow()*, *powf()*, and *powl()* shall return 0.0, or (if IEC 60559 Floating-Point is not supported) |
 49855 an implementation-defined value no greater in magnitude than DBL_MIN, FLT_MIN, and |
 49856 LDBL_MIN, respectively.

49857 CX For $y < 0$, if x is zero, a pole error may occur and *pow()*, *powf()*, and *powl()* shall return |
 49858 MX $\pm\text{HUGE\_VAL}$, $\pm\text{HUGE\_VALF}$, and $\pm\text{HUGE\_VALL}$, respectively. On systems that support the |
 49859 IEC 60559 Floating-Point option, if x is ± 0 , a pole error shall occur and *pow()*, *powf()*, and *powl()* |
 49860 shall return $\pm\text{HUGE\_VAL}$, $\pm\text{HUGE\_VALF}$, and $\pm\text{HUGE\_VALL}$, respectively if y is an odd integer, +
 49861 or HUGE_VAL , HUGE_VALF , and HUGE_VALL , respectively if y is not an odd integer.

49862 MX If x or y is a NaN, a NaN shall be returned (unless specified elsewhere in this description).

49863 For any value of y (including NaN), if x is +1, 1.0 shall be returned.

49864 For any value of x (including NaN), if y is ± 0 , 1.0 shall be returned.

49865 For any odd integer value of $y > 0$, if x is ± 0 , ± 0 shall be returned.

49866 For $y > 0$ and not an odd integer, if x is ± 0 , +0 shall be returned.

49867 If x is -1, and y is $\pm\text{Inf}$, 1.0 shall be returned.

49868 For $|x| < 1$, if y is $-\text{Inf}$, $+\text{Inf}$ shall be returned.

49869 For $|x| > 1$, if y is $-\text{Inf}$, +0 shall be returned.

49870 For $|x| < 1$, if y is $+\text{Inf}$, +0 shall be returned.

49871 For $|x| > 1$, if y is $+\text{Inf}$, $+\text{Inf}$ shall be returned.

49872 For y an odd integer < 0 , if x is $-\text{Inf}$, -0 shall be returned.

49873 For $y < 0$ and not an odd integer, if x is $-\text{Inf}$, $+0$ shall be returned.

49874 For y an odd integer > 0 , if x is $-\text{Inf}$, $-\text{Inf}$ shall be returned.

49875 For $y > 0$ and not an odd integer, if x is $-\text{Inf}$, $+\text{Inf}$ shall be returned.

49876 For $y < 0$, if x is $+\text{Inf}$, $+0$ shall be returned.

49877 For $y > 0$, if x is $+\text{Inf}$, $+\text{Inf}$ shall be returned.

49878 MXX If the correct value would cause underflow, and is representable, a range error may occur and
49879 the correct value shall be returned.

ERRORS

49880 These functions shall fail if:

49881

49882 Domain Error The value of x is negative and y is a finite non-integer.

49883 If the integer expression $(\text{math\_errhandling} \ \& \ \text{MATH\_ERRNO})$ is non-zero,
49884 then *errno* shall be set to [EDOM]. If the integer expression $(\text{math\_errhandling}$
49885 $\ \& \ \text{MATH\_ERREXCEPT})$ is non-zero, then the invalid floating-point exception
49886 shall be raised.

49887 MX Pole Error The value of x is zero and y is negative.

49888 If the integer expression $(\text{math\_errhandling} \ \& \ \text{MATH\_ERRNO})$ is non-zero,
49889 then *errno* shall be set to [ERANGE]. If the integer expression
49890 $(\text{math\_errhandling} \ \& \ \text{MATH\_ERREXCEPT})$ is non-zero, then the divide-by-zero
49891 floating-point exception shall be raised.

49892 Range Error The result overflows.

49893 If the integer expression $(\text{math\_errhandling} \ \& \ \text{MATH\_ERRNO})$ is non-zero,
49894 then *errno* shall be set to [ERANGE]. If the integer expression
49895 $(\text{math\_errhandling} \ \& \ \text{MATH\_ERREXCEPT})$ is non-zero, then the overflow
49896 floating-point exception shall be raised.

49897 These functions may fail if:

49898 Pole Error The value of x is zero and y is negative.

49899 If the integer expression $(\text{math\_errhandling} \ \& \ \text{MATH\_ERRNO})$ is non-zero,
49900 then *errno* shall be set to [ERANGE]. If the integer expression
49901 $(\text{math\_errhandling} \ \& \ \text{MATH\_ERREXCEPT})$ is non-zero, then the divide-by-zero
49902 floating-point exception shall be raised.

49903 Range Error The result underflows.

49904 If the integer expression $(\text{math\_errhandling} \ \& \ \text{MATH\_ERRNO})$ is non-zero,
49905 then *errno* shall be set to [ERANGE]. If the integer expression
49906 $(\text{math\_errhandling} \ \& \ \text{MATH\_ERREXCEPT})$ is non-zero, then the underflow
49907 floating-point exception shall be raised.

EXAMPLES

None.

APPLICATION USAGE

On error, the expressions `(math_errhandling & MATH_ERRNO)` and `(math_errhandling & MATH_ERREXCEPT)` are independent of each other, but at least one of them must be non-zero.

RATIONALE

None.

FUTURE DIRECTIONS

None.

XBD Section 4.19 (on page 116), `<math.h>`

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated to indicate how an application should check for an error. This text was previously published in the APPLICATION USAGE section.

Issue 6

The normative text is updated to avoid use of the term “must” for application requirements.

The `powf()` and `powl()` functions are added for alignment with the ISO/IEC 9899:1999 standard.

The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899:1999 standard.

IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are marked.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/42 is applied, correcting the third paragraph in the RETURN VALUE section.

Issue 7

ISO/IEC 9899:1999 standard, Technical Corrigendum 2 #51 (SD5-XSH-ERN-81) is applied.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0443 [68], XSH/TC1-2008/0444 [148], + and XSH/TC1-2008/0445 [68] are applied.

NAME

pselect, select — synchronous I/O multiplexing

SYNOPSIS

```
#include <sys/select.h>

int pselect(int nfds, fd_set *restrict readfds,
            fd_set *restrict writefds, fd_set *restrict errorfds,
            const struct timespec *restrict timeout,
            const sigset_t *restrict sigmask);
int select(int nfds, fd_set *restrict readfds,
            fd_set *restrict writefds, fd_set *restrict errorfds,
            struct timeval *restrict timeout);
void FD_CLR(int fd, fd_set *fdset);
int FD_ISSET(int fd, fd_set *fdset);
void FD_SET(int fd, fd_set *fdset);
void FD_ZERO(fd_set *fdset);
```

DESCRIPTION

The *pselect()* function shall examine the file descriptor sets whose addresses are passed in the *readfds*, *writefds*, and *errorfds* parameters to see whether some of their descriptors are ready for reading, are ready for writing, or have an exceptional condition pending, respectively.

The *select()* function shall be equivalent to the *pselect()* function, except as follows:

- For the *select()* function, the timeout period is given in seconds and microseconds in an argument of type **struct timeval**, whereas for the *pselect()* function the timeout period is given in seconds and nanoseconds in an argument of type **struct timespec**.
- The *select()* function has no *sigmask* argument; it shall behave as *pselect()* does when *sigmask* is a null pointer.
- Upon successful completion, the *select()* function may modify the object pointed to by the *timeout* argument.

The *pselect()* and *select()* functions shall support regular files, terminal and pseudo-terminal devices, **STREAMS-based files**, FIFOs, pipes, and sockets. The behavior of *pselect()* and *select()* on file descriptors that refer to other types of file is unspecified.

The *nfds* argument specifies the range of descriptors to be tested. The first *nfds* descriptors shall be checked in each set; that is, the descriptors from zero through *nfds*–1 in the descriptor sets shall be examined.

If the *readfds* argument is not a null pointer, it points to an object of type **fd_set** that on input specifies the file descriptors to be checked for being ready to read, and on output indicates which file descriptors are ready to read.

If the *writefds* argument is not a null pointer, it points to an object of type **fd_set** that on input specifies the file descriptors to be checked for being ready to write, and on output indicates which file descriptors are ready to write.

If the *errorfds* argument is not a null pointer, it points to an object of type **fd_set** that on input specifies the file descriptors to be checked for error conditions pending, and on output indicates which file descriptors have error conditions pending.

Upon successful completion, the *pselect()* or *select()* function shall modify the objects pointed to by the *readfds*, *writefds*, and *errorfds* arguments to indicate which file descriptors are ready for reading, ready for writing, or have an error condition pending, respectively, and shall return the total number of ready descriptors in all the output sets. For each file descriptor less than *nfds*, the

49998 corresponding bit shall be set upon successful completion if it was set on input and the
 49999 associated condition is true for that file descriptor.

50000 If none of the selected descriptors are ready for the requested operation, the *pselect()* or *select()*
 50001 function shall block until at least one of the requested operations becomes ready, until the
 50002 *timeout* occurs, or until interrupted by a signal. The *timeout* parameter controls how long the
 50003 *pselect()* or *select()* function shall take before timing out. If the *timeout* parameter is not a null
 50004 pointer, it specifies a maximum interval to wait for the selection to complete. If the specified
 50005 time interval expires without any requested operation becoming ready, the function shall return.
 50006 If the *timeout* parameter is a null pointer, then the call to *pselect()* or *select()* shall block
 50007 indefinitely until at least one descriptor meets the specified criteria. To effect a poll, the *timeout*
 50008 parameter should not be a null pointer, and should point to a zero-valued **timespec** structure.

50009 The use of a timeout does not affect any pending timers set up by *alarm()* or *setitimer()*.

50010 Implementations may place limitations on the maximum timeout interval supported. All
 50011 implementations shall support a maximum timeout interval of at least 31 days. If the *timeout*
 50012 argument specifies a timeout interval greater than the implementation-defined maximum value,
 50013 the maximum value shall be used as the actual timeout value. Implementations may also place
 50014 limitations on the granularity of timeout intervals. If the requested timeout interval requires a
 50015 finer granularity than the implementation supports, the actual timeout interval shall be rounded
 50016 up to the next supported value.

50017 If *sigmask* is not a null pointer, then the *pselect()* function shall replace the signal mask of the
 50018 caller by the set of signals pointed to by *sigmask* before examining the descriptors, and shall
 50019 restore the signal mask of the calling thread before returning.

50020 A descriptor shall be considered ready for reading when a call to an input function with
 50021 O_NONBLOCK clear would not block, whether or not the function would transfer data
 50022 successfully. (The function might return data, an end-of-file indication, or an error other than
 50023 one indicating that it is blocked, and in each of these cases the descriptor shall be considered
 50024 ready for reading.)

50025 A descriptor shall be considered ready for writing when a call to an output function with
 50026 O_NONBLOCK clear would not block, whether or not the function would transfer data
 50027 successfully.

50028 If a socket has a pending error, it shall be considered to have an exceptional condition pending.
 50029 Otherwise, what constitutes an exceptional condition is file type-specific. For a file descriptor for
 50030 use with a socket, it is protocol-specific except as noted below. For other file types it is
 50031 implementation-defined. If the operation is meaningless for a particular file type, *pselect()* or
 50032 *select()* shall indicate that the descriptor is ready for read or write operations, and shall indicate
 50033 that the descriptor has no exceptional condition pending.

50034 If a descriptor refers to a socket, the implied input function is the *recvmsg()* function with
 50035 parameters requesting normal and ancillary data, such that the presence of either type shall
 50036 cause the socket to be marked as readable. The presence of out-of-band data shall be checked if
 50037 the socket option SO_OOBINLINE has been enabled, as out-of-band data is enqueued with
 50038 normal data. If the socket is currently listening, then it shall be marked as readable if an
 50039 incoming connection request has been received, and a call to the *accept()* function shall complete
 50040 without blocking.

50041 If a descriptor refers to a socket, the implied output function is the *sendmsg()* function supplying
 50042 an amount of normal data equal to the current value of the SO_SNDLOWAT option for the
 50043 socket. If a non-blocking call to the *connect()* function has been made for a socket, and the
 50044 connection attempt has either succeeded or failed leaving a pending error, the socket shall be

50045 marked as writable.

50046 A socket shall be considered to have an exceptional condition pending if a receive operation
 50047 with `O_NONBLOCK` clear for the open file description and with the `MSG_OOB` flag set would
 50048 return out-of-band data without blocking. (It is protocol-specific whether the `MSG_OOB` flag
 50049 would be used to read out-of-band data.) A socket shall also be considered to have an
 50050 exceptional condition pending if an out-of-band data mark is present in the receive queue. Other
 50051 circumstances under which a socket may be considered to have an exceptional condition
 50052 pending are protocol-specific and implementation-defined.

50053 If the *readfds*, *writfds*, and *errorfds* arguments are all null pointers and the *timeout* argument is
 50054 not a null pointer, the *pselect()* or *select()* function shall block for the time specified, or until
 50055 interrupted by a signal. If the *readfds*, *writfds*, and *errorfds* arguments are all null pointers and
 50056 the *timeout* argument is a null pointer, the *pselect()* or *select()* function shall block until
 50057 interrupted by a signal.

50058 File descriptors associated with regular files shall always select true for ready to read, ready to
 50059 write, and error conditions.

50060 On failure, the objects pointed to by the *readfds*, *writfds*, and *errorfds* arguments shall not be
 50061 modified. If the timeout interval expires without the specified condition being true for any of the
 50062 specified file descriptors, the objects pointed to by the *readfds*, *writfds*, and *errorfds* arguments
 50063 shall have all bits set to 0.

50064 File descriptor masks of type **fd_set** can be initialized and tested with *FD_CLR()*, *FD_ISSET()*,
 50065 *FD_SET()*, and *FD_ZERO()*. It is unspecified whether each of these is a macro or a function. If a
 50066 macro definition is suppressed in order to access an actual function, or a program defines an
 50067 external identifier with any of these names, the behavior is undefined.

50068 *FD_CLR(fd, fdsetp)* shall remove the file descriptor *fd* from the set pointed to by *fdsetp*. If *fd* is not
 50069 a member of this set, there shall be no effect on the set, nor will an error be returned.

50070 *FD_ISSET(fd, fdsetp)* shall evaluate to non-zero if the file descriptor *fd* is a member of the set
 50071 pointed to by *fdsetp*, and shall evaluate to zero otherwise.

50072 *FD_SET(fd, fdsetp)* shall add the file descriptor *fd* to the set pointed to by *fdsetp*. If the file
 50073 descriptor *fd* is already in this set, there shall be no effect on the set, nor will an error be
 50074 returned.

50075 *FD_ZERO(fdsetp)* shall initialize the descriptor set pointed to by *fdsetp* to the null set. No error is
 50076 returned if the set is not empty at the time *FD_ZERO()* is invoked.

50077 The behavior of these macros is undefined if the *fd* argument is less than 0 or greater than or
 50078 equal to `FD_SETSIZE`, or if *fd* is not a valid file descriptor, or if any of the arguments are
 50079 expressions with side-effects.

50080 If a thread gets canceled during a *pselect()* call, the signal mask in effect when executing the
 50081 registered cleanup functions is either the original signal mask or the signal mask installed as part
 50082 of the *pselect()* call.

50083 **RETURN VALUE**

50084 Upon successful completion, the *pselect()* and *select()* functions shall return the total number of
 50085 bits set in the bit masks. Otherwise, `-1` shall be returned, and *errno* shall be set to indicate the
 50086 error.

50087 *FD_CLR()*, *FD_SET()*, and *FD_ZERO()* do not return a value. *FD_ISSET()* shall return a non-
 50088 zero value if the bit for the file descriptor *fd* is set in the file descriptor set pointed to by *fdset*, and
 50089 0 otherwise.

ERRORS

Under the following conditions, *pselect()* and *select()* shall fail and set *errno* to:

[EBADF] One or more of the file descriptor sets specified a file descriptor that is not a valid open file descriptor.

[EINTR] The function was interrupted before any of the selected events occurred and before the timeout interval expired.

If SA_RESTART has been set for the interrupting signal, it is implementation-defined whether the function restarts or returns with [EINTR].

[EINVAL] An invalid timeout interval was specified.

[EINVAL] The *nfds* argument is less than 0 or greater than FD_SETSIZE.

[EINVAL] One of the specified file descriptors refers to a STREAM or multiplexer that is linked (directly or indirectly) downstream from a multiplexer.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

In earlier versions of the Single UNIX Specification, the *select()* function was defined in the **<sys/time.h>** header. This is now changed to **<sys/select.h>**. The rationale for this change was as follows: the introduction of the *pselect()* function included the **<sys/select.h>** header and the **<sys/select.h>** header defines all the related definitions for the *pselect()* and *select()* functions. Backwards-compatibility to existing XSI implementations is handled by allowing **<sys/time.h>** to include **<sys/select.h>**.

Code which wants to avoid the ambiguity of the signal mask for thread cancellation handlers can install an additional cancellation handler which resets the signal mask to the expected value.

```
void cleanup(void *arg)
{
    sigset_t *ss = (sigset_t *) arg;
    pthread_sigmask(SIG_SETMASK, ss, NULL);
}

int call_pselect(int nfds, fd_set *readfds, fd_set *writefds,
    fd_set errorfds, const struct timespec *timeout,
    const sigset_t *sigmask)
{
    sigset_t oldmask;
    int result;
    pthread_sigmask(SIG_SETMASK, NULL, &oldmask);
    pthread_cleanup_push(cleanup, &oldmask);
    result = pselect(nfds, readfds, writefds, errorfds, timeout, sigmask);
    pthread_cleanup_pop(0);
    return result;
}
```

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

In the ERRORS section, the text has been changed to indicate that [EINVAL] is returned when *nfds* is less than 0 or greater than FD_SETSIZE. It previously stated less than 0, or greater than or equal to FD_SETSIZE.

Text about *timeout* is moved from the APPLICATION USAGE section to the DESCRIPTION.

Issue 6

The Open Group Corrigendum U026/6 is applied, changing the occurrences of *readfs* and *writefs* in the *select()* DESCRIPTION to be *readfds* and *writefds*.

Text referring to sockets is added to the DESCRIPTION.

The DESCRIPTION and ERRORS sections are updated so that references to STREAMS are marked as part of the XSI STREAMS Option Group.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- These functions are now mandatory.

The *pselect()* function is added for alignment with IEEE Std 1003.1g-2000 and additional detail related to sockets semantics is added to the DESCRIPTION.

The *select()* function now requires inclusion of **<sys/select.h>**.

The **restrict** keyword is added to the *select()* prototype for alignment with the ISO/IEC 9899:1999 standard.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/70 is applied, updating the DESCRIPTION to reference the signal mask in terms of the calling thread rather than the process.

Issue 7

SD5-XSH-ERN-122 is applied, adding text to the DESCRIPTION for when a thread is canceled during a call to *pselect()*, and adding example code to the RATIONALE.

Functionality relating to the XSI STREAMS option is marked obsolescent.

Functionality relating to the Threads option is moved to the Base.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0446 [372] is applied.

+

NAME

psiginfo, psignal — print signal information to standard error

SYNOPSIS

```
CX      #include <signal.h>

void psiginfo(const siginfo_t *pinfo, const char *message);
void psignal(int signum, const char *message);
```

DESCRIPTION

The *psiginfo()* and *psignal()* functions shall print a message out on *stderr* associated with a signal number. If *message* is not null and is not the empty string, then the string pointed to by the *message* argument shall be printed first, followed by a <colon>, a <space>, and the signal description string indicated by *signum*, or by the signal associated with *pinfo*. If the *message* argument is null or points to an empty string, then only the signal description shall be printed. For *psiginfo()*, the argument *pinfo* references a valid **siginfo_t** structure. For *psignal()*, if *signum* is not a valid signal number, the behavior is implementation-defined.

The *psiginfo()* and *psignal()* functions shall not change the orientation of the standard error stream.

The *psiginfo()* and *psignal()* functions shall mark for update the last data modification and last file status change timestamps of the file associated with the standard error stream at some time between their successful completion and *exit()*, *abort()*, or the completion of *fflush()* or *fclose()* on *stderr*.

The *psiginfo()* and *psignal()* functions shall not change the setting of *errno* if successful. +

On error, the *psiginfo()* and *psignal()* functions shall set the error indicator for the stream to + which *stderr* points, and shall set *errno* to indicate the error. +

Since no value is returned, an application wishing to check for error situations should set *errno* + to 0, then call *psiginfo()* or *psignal()*, then check *errno*. +

RETURN VALUE

These functions shall not return a value.

ERRORS

Refer to *fputc()*.

EXAMPLES

None.

APPLICATION USAGE

As an alternative to setting *errno* to zero before the call and checking if it is non-zero afterwards, applications can use *ferror()* to detect whether *psiginfo()* or *psignal()* encountered an error. |

An application wishing to use this method to check for error situations should call *clearerr(stderr)* before calling *psiginfo()* or *psignal()*, then if *ferror(stderr)* returns non-zero, the value of *errno* indicates which error occurred. |

RATIONALE

System V historically has *psignal()* and *psiginfo()* in **<siginfo.h>**. However, the **<siginfo.h>** header is not specified in the Base Definitions volume of POSIX.1-2008, and the type **siginfo_t** is defined in **<signal.h>**.

50209 FUTURE DIRECTIONS

50210 None.

NAME

pthread_atfork — register fork handlers

SYNOPSIS

```
#include <pthread.h>

int pthread_atfork(void (*prepare)(void), void (*parent)(void),
void (*child)(void));
```

DESCRIPTION

The *pthread_atfork()* function shall declare fork handlers to be called before and after *fork()*, in the context of the thread that called *fork()*. The *prepare* fork handler shall be called before *fork()* processing commences. The *parent* fork handler shall be called after *fork()* processing completes in the parent process. The *child* fork handler shall be called after *fork()* processing completes in the child process. If no handling is desired at one or more of these three points, the corresponding fork handler address(es) may be set to NULL.

The order of calls to *pthread_atfork()* is significant. The *parent* and *child* fork handlers shall be called in the order in which they were established by calls to *pthread_atfork()*. The *prepare* fork handlers shall be called in the opposite order.

RETURN VALUE

Upon successful completion, *pthread_atfork()* shall return a value of zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_atfork()* function shall fail if:

[ENOMEM] Insufficient table space exists to record the fork handler addresses.

The *pthread_atfork()* function shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

There are at least two serious problems with the semantics of *fork()* in a multi-threaded program. One problem has to do with state (for example, memory) covered by mutexes. Consider the case where one thread has a mutex locked and the state covered by that mutex is inconsistent while another thread calls *fork()*. In the child, the mutex is in the locked state (locked by a nonexistent thread and thus can never be unlocked). Having the child simply reinitialize the mutex is unsatisfactory since this approach does not resolve the question about how to correct or otherwise deal with the inconsistent state in the child.

It is suggested that programs that use *fork()* call an *exec* function very soon afterwards in the child process, thus resetting all states. In the meantime, only a short list of async-signal-safe library routines are promised to be available.

Unfortunately, this solution does not address the needs of multi-threaded libraries. Application programs may not be aware that a multi-threaded library is in use, and they feel free to call any number of library routines between the *fork()* and *exec* calls, just as they always have. Indeed, they may be extant single-threaded programs and cannot, therefore, be expected to obey new restrictions imposed by the threads library.

On the other hand, the multi-threaded library needs a way to protect its internal state during *fork()* in case it is re-entered later in the child process. The problem arises especially in multi-

threaded I/O libraries, which are almost sure to be invoked between the *fork()* and *exec* calls to effect I/O redirection. The solution may require locking mutex variables during *fork()*, or it may entail simply resetting the state in the child after the *fork()* processing completes.

The *pthread_atfork()* function was intended to provide multi-threaded libraries with a means to protect themselves from innocent application programs that call *fork()*, and to provide multi-threaded application programs with a standard mechanism for protecting themselves from *fork()* calls in a library routine or the application itself.

The expected usage was that the prepare handler would acquire all mutex locks and the other two fork handlers would release them.

For example, an application could have supplied a prepare routine that acquires the necessary mutexes the library maintains and supplied child and parent routines that release those mutexes, thus ensuring that the child would have got a consistent snapshot of the state of the library (and that no mutexes would have been left stranded). This is good in theory, but in reality not practical. Each and every mutex and lock in the process must be located and locked. Every component of a program including third-party components must participate and they must agree who is responsible for which mutex or lock. This is especially problematic for mutexes and locks in dynamically allocated memory. All mutexes and locks internal to the implementation must be locked, too. This possibly delays the thread calling *fork()* for a long time or even indefinitely since uses of these synchronization objects may not be under control of the application. A final problem to mention here is the problem of locking streams. At least the streams under control of the system (like *stdin*, *stdout*, *stderr*) must be protected by locking the stream with *flockfile()*. But the application itself could have done that, possibly in the same thread calling *fork()*. In this case, the process will deadlock.

Alternatively, some libraries might have been able to supply just a *child* routine that reinitializes the mutexes in the library and all associated states to some known value (for example, what it was when the image was originally executed). This approach is not possible, though, because implementations are allowed to fail **_init()* and **_destroy()* calls for mutexes and locks if the mutex or lock is still locked. In this case, the *child* routine is not able to reinitialize the mutexes and locks.

When *fork()* is called, only the calling thread is duplicated in the child process. Synchronization variables remain in the same state in the child as they were in the parent at the time *fork()* was called. Thus, for example, mutex locks may be held by threads that no longer exist in the child process, and any associated states may be inconsistent. The intention was that the parent process could have avoided this by explicit code that acquires and releases locks critical to the child via *pthread_atfork()*. In addition, any critical threads would have needed to be recreated and reinitialized to the proper state in the child (also via *pthread_atfork()*).

A higher-level package may acquire locks on its own data structures before invoking lower-level packages. Under this scenario, the order specified for fork handler calls allows a simple rule of initialization for avoiding package deadlock: a package initializes all packages on which it depends before it calls the *pthread_atfork()* function for itself.

As explained, there is no suitable solution for functionality which requires non-atomic operations to be protected through mutexes and locks. This is why the POSIX.1 standard since the 1996 release requires that the child process after *fork()* in a multi-threaded process only calls *async-signal-safe* interfaces.

NAME

pthread_attr_destroy, pthread_attr_init — destroy and initialize the thread attributes object

SYNOPSIS

```
#include <pthread.h>
```

```
int pthread_attr_destroy(pthread_attr_t *attr);
```

```
int pthread_attr_init(pthread_attr_t *attr);
```

DESCRIPTION

The *pthread_attr_destroy()* function shall destroy a thread attributes object. An implementation may cause *pthread_attr_destroy()* to set *attr* to an implementation-defined invalid value. A destroyed *attr* attributes object can be reinitialized using *pthread_attr_init()*; the results of otherwise referencing the object after it has been destroyed are undefined.

The *pthread_attr_init()* function shall initialize a thread attributes object *attr* with the default value for all of the individual attributes used by a given implementation.

The resulting attributes object (possibly modified by setting individual attribute values) when used by *pthread_create()* defines the attributes of the thread created. A single attributes object can be used in multiple simultaneous calls to *pthread_create()*. Results are undefined if *pthread_attr_init()* is called specifying an already initialized *attr* attributes object.

The behavior is undefined if the value specified by the *attr* argument to *pthread_attr_destroy()* does not refer to an initialized thread attributes object.

RETURN VALUE

Upon successful completion, *pthread_attr_destroy()* and *pthread_attr_init()* shall return a value of 0; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_attr_init()* function shall fail if:

[ENOMEM] Insufficient memory exists to initialize the thread attributes object.

These functions shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

Attributes objects are provided for threads, mutexes, and condition variables as a mechanism to support probable future standardization in these areas without requiring that the function itself be changed.

Attributes objects provide clean isolation of the configurable aspects of threads. For example, “stack size” is an important attribute of a thread, but it cannot be expressed portably. When porting a threaded program, stack sizes often need to be adjusted. The use of attributes objects can help by allowing the changes to be isolated in a single place, rather than being spread across every instance of thread creation.

Attributes objects can be used to set up “classes” of threads with similar attributes; for example, “threads with large stacks and high priority” or “threads with minimal stacks”. These classes can be defined in a single place and then referenced wherever threads need to be created. Changes to “class” decisions become straightforward, and detailed analysis of each *pthread_create()* call is not required.

The attributes objects are defined as opaque types as an aid to extensibility. If these objects had been specified as structures, adding new attributes would force recompilation of all multi-threaded programs when the attributes objects are extended; this might not be possible if different program components were supplied by different vendors.

Additionally, opaque attributes objects present opportunities for improving performance. Argument validity can be checked once when attributes are set, rather than each time a thread is created. Implementations often need to cache kernel objects that are expensive to create. Opaque attributes objects provide an efficient mechanism to detect when cached objects become invalid due to attribute changes.

Since assignment is not necessarily defined on a given opaque type, implementation-defined default values cannot be defined in a portable way. The solution to this problem is to allow attributes objects to be initialized dynamically by attributes object initialization functions, so that default values can be supplied automatically by the implementation.

The following proposal was provided as a suggested alternative to the supplied attributes:

1. Maintain the style of passing a parameter formed by the bitwise-inclusive OR of flags to the initialization routines (*pthread_create()*, *pthread_mutex_init()*, *pthread_cond_init()*). The parameter containing the flags should be an opaque type for extensibility. If no flags are set in the parameter, then the objects are created with default characteristics. An implementation may specify implementation-defined flag values and associated behavior.
2. If further specialization of mutexes and condition variables is necessary, implementations may specify additional procedures that operate on the **pthread_mutex_t** and **pthread_cond_t** objects (instead of on attributes objects).

The difficulties with this solution are:

1. A bitmask is not opaque if bits have to be set into bitvector attributes objects using explicitly-coded bitwise-inclusive OR operations. If the set of options exceeds an **int**, application programmers need to know the location of each bit. If bits are set or read by encapsulation (that is, *get* and *set* functions), then the bitmask is merely an implementation of attributes objects as currently defined and should not be exposed to the programmer.
2. Many attributes are not Boolean or very small integral values. For example, scheduling policy may be placed in 3-bit or 4-bit, but priority requires 5-bit or more, thereby taking up at least 8 bits out of a possible 16 bits on machines with 16-bit integers. Because of this, the bitmask can only reasonably control whether particular attributes are set or not, and it cannot serve as the repository of the value itself. The value needs to be specified as a function parameter (which is non-extensible), or by setting a structure field (which is non-opaque), or by *get* and *set* functions (making the bitmask a redundant addition to the attributes objects).

Stack size is defined as an optional attribute because the very notion of a stack is inherently machine-dependent. Some implementations may not be able to change the size of the stack, for example, and others may not need to because stack pages may be discontinuous and can be allocated and released on demand.

The attribute mechanism has been designed in large measure for extensibility. Future extensions to the attribute mechanism or to any attributes object defined in this volume of POSIX.1-2008 has to be done with care so as not to affect binary-compatibility.

Attributes objects, even if allocated by means of dynamic allocation functions such as *malloc()*,

may have their size fixed at compile time. This means, for example, a *pthread_create()* in an implementation with extensions to **pthread_attr_t** cannot look beyond the area that the binary application assumes is valid. This suggests that implementations should maintain a size field in the attributes object, as well as possibly version information, if extensions in different directions (possibly by different vendors) are to be accommodated.

If an implementation detects that the value specified by the *attr* argument to *pthread_attr_destroy()* does not refer to an initialized thread attributes object, it is recommended that the function should fail and report an [EINVAL] error.

If an implementation detects that the value specified by the *attr* argument to *pthread_attr_init()* refers to an already initialized thread attributes object, it is recommended that the function should fail and report an [EBUSY] error.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6

The *pthread_attr_destroy()* and *pthread_attr_init()* functions are marked as part of the Threads option.

IEEE PASC Interpretation 1003.1 #107 is applied, noting that the effect of initializing an already initialized thread attributes object is undefined.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/71 is applied, updating the ERRORS section to add the optional [EINVAL] error for the *pthread_attr_destroy()* function, and the optional [EBUSY] error for the *pthread_attr_init()* function.

Issue 7

The *pthread_attr_destroy()* and *pthread_attr_init()* functions are moved from the Threads option to the Base.

The [EINVAL] error for an uninitialized thread attributes object is removed; this condition results in undefined behavior.

The [EBUSY] error for an already initialized thread attributes object is removed; this condition results in undefined behavior.

NAME

pthread_attr_getdetachstate, pthread_attr_setdetachstate — get and set the detachstate attribute

SYNOPSIS

```
#include <pthread.h>

int pthread_attr_getdetachstate(const pthread_attr_t *attr,
                               int *detachstate);
int pthread_attr_setdetachstate(pthread_attr_t *attr, int detachstate);
```

DESCRIPTION

The *detachstate* attribute controls whether the thread is created in a detached state. If the thread is created detached, then use of the ID of the newly created thread by the *pthread_detach()* or *pthread_join()* function is an error.

The *pthread_attr_getdetachstate()* and *pthread_attr_setdetachstate()* functions, respectively, shall get and set the *detachstate* attribute in the *attr* object.

For *pthread_attr_getdetachstate()*, *detachstate* shall be set to either PTHREAD_CREATE_DETACHED or PTHREAD_CREATE_JOINABLE.

For *pthread_attr_setdetachstate()*, the application shall set *detachstate* to either PTHREAD_CREATE_DETACHED or PTHREAD_CREATE_JOINABLE.

A value of PTHREAD_CREATE_DETACHED shall cause all threads created with *attr* to be in the detached state, whereas using a value of PTHREAD_CREATE_JOINABLE shall cause all threads created with *attr* to be in the joinable state. The default value of the *detachstate* attribute shall be PTHREAD_CREATE_JOINABLE.

The behavior is undefined if the value specified by the *attr* argument to *pthread_attr_getdetachstate()* or *pthread_attr_setdetachstate()* does not refer to an initialized thread attributes object.

RETURN VALUE

Upon successful completion, *pthread_attr_getdetachstate()* and *pthread_attr_setdetachstate()* shall return a value of 0; otherwise, an error number shall be returned to indicate the error.

The *pthread_attr_getdetachstate()* function stores the value of the *detachstate* attribute in *detachstate* if successful.

ERRORS

The *pthread_attr_setdetachstate()* function shall fail if:

[EINVAL] The value of *detachstate* was not valid

These functions shall not return an error code of [EINTR].

EXAMPLES**Retrieving the detachstate Attribute**

This example shows how to obtain the *detachstate* attribute of a thread attribute object.

```
#include <pthread.h>

pthread_attr_t thread_attr;
int detachstate;
int rc;

/* code initializing thread_attr */
...
```

```

50486     rc = pthread_attr_getdetachstate (&thread_attr, &detachstate);
50487     if (rc!=0) {
50488         /* handle error */
50489         ...
50490     }
50491     else {
50492         /* legal values for detachstate are:
50493          * PTHREAD_CREATE_DETACHED or PTHREAD_CREATE_JOINABLE
50494          */
50495         ...
50496     }

```

APPLICATION USAGE

None.

RATIONALE

If an implementation detects that the value specified by the *attr* argument to *pthread_attr_getdetachstate()* or *pthread_attr_setdetachstate()* does not refer to an initialized thread attributes object, it is recommended that the function should fail and report an [EINVAL] error.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6

The *pthread_attr_setdetachstate()* and *pthread_attr_getdetachstate()* functions are marked as part of the Threads option.

The normative text is updated to avoid use of the term “must” for application requirements.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/72 is applied, adding the example to the EXAMPLES section.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/73 is applied, updating the ERRORS section to include the optional [EINVAL] error.

Issue 7

The *pthread_attr_setdetachstate()* and *pthread_attr_getdetachstate()* functions are moved from the Threads option to the Base.

The [EINVAL] error for an uninitialized thread attributes object is removed; this condition results in undefined behavior.

NAME

pthread_attr_getguardsize, pthread_attr_setguardsize — get and set the thread guardsize attribute

SYNOPSIS

```
#include <pthread.h>

int pthread_attr_getguardsize(const pthread_attr_t *restrict attr,
                             size_t *restrict guardsize);
int pthread_attr_setguardsize(pthread_attr_t *attr,
                             size_t guardsize);
```

DESCRIPTION

The *pthread_attr_getguardsize()* function shall get the *guardsize* attribute in the *attr* object. This attribute shall be returned in the *guardsize* parameter.

The *pthread_attr_setguardsize()* function shall set the *guardsize* attribute in the *attr* object. The new value of this attribute shall be obtained from the *guardsize* parameter. If *guardsize* is zero, a guard area shall not be provided for threads created with *attr*. If *guardsize* is greater than zero, a guard area of at least size *guardsize* bytes shall be provided for each thread created with *attr*.

The *guardsize* attribute controls the size of the guard area for the created thread's stack. The *guardsize* attribute provides protection against overflow of the stack pointer. If a thread's stack is created with guard protection, the implementation allocates extra memory at the overflow end of the stack as a buffer against stack overflow of the stack pointer. If an application overflows into this buffer an error shall result (possibly in a SIGSEGV signal being delivered to the thread).

A conforming implementation may round up the value contained in *guardsize* to a multiple of the configurable system variable {PAGESIZE} (see <sys/mman.h>). If an implementation rounds up the value of *guardsize* to a multiple of {PAGESIZE}, a call to *pthread_attr_getguardsize()* specifying *attr* shall store in the *guardsize* parameter the guard size specified by the previous *pthread_attr_setguardsize()* function call.

The default value of the *guardsize* attribute is implementation-defined.

If the *stackaddr* attribute has been set (that is, the caller is allocating and managing its own thread stacks), the *guardsize* attribute shall be ignored and no protection shall be provided by the implementation. It is the responsibility of the application to manage stack overflow along with stack allocation and management in this case.

The behavior is undefined if the value specified by the *attr* argument to *pthread_attr_getguardsize()* or *pthread_attr_setguardsize()* does not refer to an initialized thread attributes object.

RETURN VALUE

If successful, the *pthread_attr_getguardsize()* and *pthread_attr_setguardsize()* functions shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

These functions shall fail if:

[EINVAL] The parameter *guardsize* is invalid.

These functions shall not return an error code of [EINTR].

EXAMPLES**Retrieving the guardsize Attribute**

This example shows how to obtain the *guardsize* attribute of a thread attribute object.

```
#include <pthread.h>

pthread_attr_t thread_attr;
size_t guardsize;
int rc;

/* code initializing thread_attr */
...

rc = pthread_attr_getguardsize (&thread_attr, &guardsize);
if (rc != 0) {
    /* handle error */
    ...
}
else {
    if (guardsize > 0) {
        /* a guard area of at least guardsize bytes is provided */
        ...
    }
    else {
        /* no guard area provided */
        ...
    }
}
```

APPLICATION USAGE

None.

RATIONALE

The *guardsize* attribute is provided to the application for two reasons:

1. Overflow protection can potentially result in wasted system resources. An application that creates a large number of threads, and which knows its threads never overflow their stack, can save system resources by turning off guard areas.
2. When threads allocate large data structures on the stack, large guard areas may be needed to detect stack overflow.

The default size of the guard area is left implementation-defined since on systems supporting very large page sizes, the overhead might be substantial if at least one guard page is required by default.

If an implementation detects that the value specified by the *attr* argument to *pthread_attr_getguardsize()* or *pthread_attr_setguardsize()* does not refer to an initialized thread attributes object, it is recommended that the function should fail and report an [EINVAL] error.

FUTURE DIRECTIONS

None.

SEE ALSO

XBD [<pthread.h>](#), [<sys/mman.h>](#)

CHANGE HISTORY

First released in Issue 5.

Issue 6

In the ERRORS section, a third [EINVAL] error condition is removed as it is covered by the second error condition.

The **restrict** keyword is added to the *pthread_attr_getguardsize()* prototype for alignment with the ISO/IEC 9899:1999 standard.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/74 is applied, updating the ERRORS section to remove the [EINVAL] error ("The attribute *attr* is invalid."), and replacing it with the optional [EINVAL] error.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/76 is applied, adding the example to the EXAMPLES section.

Issue 7

SD5-XSH-ERN-111 is applied, removing the reference to the *stack* attribute in the DESCRIPTION.

SD5-XSH-ERN-175 is applied, updating the DESCRIPTION to note that the default size of the guard area is implementation-defined.

The *pthread_attr_getguardsize()* and *pthread_attr_setguardsize()* functions are moved from the XSI option to the Base.

The [EINVAL] error for an uninitialized thread attributes object is removed; this condition results in undefined behavior.

NAME

pthread_attr_getinheritsched, pthread_attr_setinheritsched — get and set the inheritsched attribute (**REALTIME THREADS**)

SYNOPSIS

```
#include <pthread.h>

int pthread_attr_getinheritsched(const pthread_attr_t *restrict attr,
    int *restrict inheritsched);
int pthread_attr_setinheritsched(pthread_attr_t *attr,
    int inheritsched);
```

DESCRIPTION

The *pthread_attr_getinheritsched()* and *pthread_attr_setinheritsched()* functions, respectively, shall get and set the *inheritsched* attribute in the *attr* argument.

When the attributes objects are used by *pthread_create()*, the *inheritsched* attribute determines how the other scheduling attributes of the created thread shall be set.

The supported values of *inheritsched* shall be:

PTHREAD_INHERIT_SCHED

Specifies that the thread scheduling attributes shall be inherited from the creating thread, and the scheduling attributes in this *attr* argument shall be ignored.

PTHREAD_EXPLICIT_SCHED

Specifies that the thread scheduling attributes shall be set to the corresponding values from this attributes object.

The symbols **PTHREAD_INHERIT_SCHED** and **PTHREAD_EXPLICIT_SCHED** are defined in the **<pthread.h>** header.

The following thread scheduling attributes defined by POSIX.1-2008 are affected by the *inheritsched* attribute: scheduling policy (*schedpolicy*), scheduling parameters (*schedparam*), and scheduling contention scope (*contentionscope*).

The behavior is undefined if the value specified by the *attr* argument to *pthread_attr_getinheritsched()* or *pthread_attr_setinheritsched()* does not refer to an initialized thread attributes object.

RETURN VALUE

If successful, the *pthread_attr_getinheritsched()* and *pthread_attr_setinheritsched()* functions shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_attr_setinheritsched()* function shall fail if: +

[ENOTSUP] An attempt was made to set the attribute to an unsupported value. +

The *pthread_attr_setinheritsched()* function may fail if:

[EINVAL] The value of *inheritsched* is not valid. -

These functions shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

After these attributes have been set, a thread can be created with the specified attributes using *pthread_create()*. Using these routines does not affect the current running thread.

See [Section 2.9.4](#) (on page 514) for further details on thread scheduling attributes and their default settings.

RATIONALE

If an implementation detects that the value specified by the *attr* argument to *pthread_attr_getinheritsched()* or *pthread_attr_setinheritsched()* does not refer to an initialized thread attributes object, it is recommended that the function should fail and report an [EINVAL] error.

FUTURE DIRECTIONS

None.

SEE ALSO

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Marked as part of the Realtime Threads Feature Group.

Issue 6

The *pthread_attr_getinheritsched()* and *pthread_attr_setinheritsched()* functions are marked as part of the Threads and Thread Execution Scheduling options.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Thread Execution Scheduling option.

The **restrict** keyword is added to the *pthread_attr_getinheritsched()* prototype for alignment with the ISO/IEC 9899:1999 standard.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/75 is applied, clarifying the values of *inheritsched* in the DESCRIPTION and adding two optional [EINVAL] errors to the ERRORS section for checking when *attr* refers to an uninitialized thread attribute object.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/77 is applied, adding a reference to [Section 2.9.4](#) (on page 514) in the APPLICATION USAGE section.

Issue 7

The *pthread_attr_getinheritsched()* and *pthread_attr_setinheritsched()* functions are moved from the Threads option.

The [EINVAL] error for an uninitialized thread attributes object is removed; this condition results in undefined behavior.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0450 [314] is applied.

NAME

pthread_attr_getschedparam, pthread_attr_setschedparam — get and set the schedparam attribute

SYNOPSIS

```
#include <pthread.h>

int pthread_attr_getschedparam(const pthread_attr_t *restrict attr,
                               struct sched_param *restrict param);
int pthread_attr_setschedparam(pthread_attr_t *restrict attr,
                               const struct sched_param *restrict param);
```

DESCRIPTION

The *pthread_attr_getschedparam()* and *pthread_attr_setschedparam()* functions, respectively, shall get and set the scheduling parameter attributes in the *attr* argument. The contents of the *param* structure are defined in the **<sched.h>** header. For the SCHED_FIFO and SCHED_RR policies, the only required member of *param* is *sched_priority*.

TSP

For the SCHED_SPORADIC policy, the required members of the *param* structure are *sched_priority*, *sched_ss_low_priority*, *sched_ss_repl_period*, *sched_ss_init_budget*, and *sched_ss_max_repl*. The specified *sched_ss_repl_period* must be greater than or equal to the specified *sched_ss_init_budget* for the function to succeed; if it is not, then the function shall fail. The value of *sched_ss_max_repl* shall be within the inclusive range [1, {SS_REPL_MAX}] for the function to succeed; if not, the function shall fail. It is unspecified whether the *sched_ss_repl_period* and *sched_ss_init_budget* values are stored as provided by this function or are rounded to align with the resolution of the clock being used.

The behavior is undefined if the value specified by the *attr* argument to *pthread_attr_getschedparam()* or *pthread_attr_setschedparam()* does not refer to an initialized thread attributes object.

RETURN VALUE

If successful, the *pthread_attr_getschedparam()* and *pthread_attr_setschedparam()* functions shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_attr_setschedparam()* function shall fail if:

[ENOTSUP] An attempt was made to set the attribute to an unsupported value.

The *pthread_attr_setschedparam()* function may fail if:

[EINVAL] The value of *param* is not valid.

These functions shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

After these attributes have been set, a thread can be created with the specified attributes using *pthread_create()*. Using these routines does not affect the current running thread.

RATIONALE

If an implementation detects that the value specified by the *attr* argument to *pthread_attr_getschedparam()* or *pthread_attr_setschedparam()* does not refer to an initialized thread attributes object, it is recommended that the function should fail and report an [EINVAL] error.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6

The *pthread_attr_getschedparam()* and *pthread_attr_setschedparam()* functions are marked as part of the Threads option.

The SCHED_SPORADIC scheduling policy is added for alignment with IEEE Std 1003.1d-1999.

The **restrict** keyword is added to the *pthread_attr_getschedparam()* and *pthread_attr_setschedparam()* prototypes for alignment with the ISO/IEC 9899:1999 standard.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/78 is applied, updating the ERRORS section to include optional errors for the case when *attr* refers to an uninitialized thread attribute object.

Issue 7

The *pthread_attr_getschedparam()* and *pthread_attr_setschedparam()* functions are moved from the Threads option to the Base.

Austin Group Interpretation 1003.1-2001 #119 is applied, clarifying the accuracy requirements for the *sched_ss_repl_period* and *sched_ss_init_budget* values.

The [EINVAL] error for an uninitialized thread attributes object is removed; this condition results in undefined behavior.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0451 [314] is applied.

+

50772 **NAME**

50773 pthread_attr_getschedpolicy, pthread_attr_setschedpolicy — get and set the schedpolicy
 50774 attribute (**REALTIME THREADS**)

50775 **SYNOPSIS**

```
50776 TPS    #include <pthread.h>
50777
50777     int pthread_attr_getschedpolicy(const pthread_attr_t *restrict attr,
50778                                     int *restrict policy);
50779     int pthread_attr_setschedpolicy(pthread_attr_t *attr, int policy);
```

50780 **DESCRIPTION**

50781 The *pthread_attr_getschedpolicy()* and *pthread_attr_setschedpolicy()* functions, respectively, shall
 50782 get and set the *schedpolicy* attribute in the *attr* argument.

50783 The supported values of *policy* shall include SCHED_FIFO, SCHED_RR, and SCHED_OTHER,
 50784 which are defined in the **<sched.h>** header. When threads executing with the scheduling policy
 50785 TSP SCHED_FIFO, SCHED_RR, or SCHED_SPORADIC are waiting on a mutex, they shall acquire
 50786 the mutex in priority order when the mutex is unlocked.

50787 The behavior is undefined if the value specified by the *attr* argument to
 50788 *pthread_attr_getschedpolicy()* or *pthread_attr_setschedpolicy()* does not refer to an initialized thread
 50789 attributes object.

50790 **RETURN VALUE**

50791 If successful, the *pthread_attr_getschedpolicy()* and *pthread_attr_setschedpolicy()* functions shall
 50792 return zero; otherwise, an error number shall be returned to indicate the error.

50793 **ERRORS**

50794 The *pthread_attr_setschedpolicy()* function shall fail if: +

50795 [ENOTSUP] An attempt was made to set the attribute to an unsupported value. +

50796 The *pthread_attr_setschedpolicy()* function may fail if:

50797 [EINVAL] The value of *policy* is not valid. -

50798 These functions shall not return an error code of [EINTR].

50799 **EXAMPLES**

50800 None.

50801 **APPLICATION USAGE**

50802 After these attributes have been set, a thread can be created with the specified attributes using
 50803 *pthread_create()*. Using these routines does not affect the current running thread.

50804 See [Section 2.9.4](#) (on page 514) for further details on thread scheduling attributes and their
 50805 default settings.

50806 **RATIONALE**

50807 If an implementation detects that the value specified by the *attr* argument to
 50808 *pthread_attr_getschedpolicy()* or *pthread_attr_setschedpolicy()* does not refer to an initialized thread
 50809 attributes object, it is recommended that the function should fail and report an [EINVAL] error.

50810 **FUTURE DIRECTIONS**

50811 None.

NAME

pthread_attr_getscope, pthread_attr_setscope — get and set the contentionscope attribute (REALTIME THREADS)

SYNOPSIS

```

#include <pthread.h>

int pthread_attr_getscope(const pthread_attr_t *restrict attr,
    int *restrict contentionscope);
int pthread_attr_setscope(pthread_attr_t *attr, int contentionscope);

```

DESCRIPTION

The *pthread_attr_getscope()* and *pthread_attr_setscope()* functions, respectively, shall get and set the *contentionscope* attribute in the *attr* object.

The *contentionscope* attribute may have the values PTHREAD_SCOPE_SYSTEM, signifying system scheduling contention scope, or PTHREAD_SCOPE_PROCESS, signifying process scheduling contention scope. The symbols PTHREAD_SCOPE_SYSTEM and PTHREAD_SCOPE_PROCESS are defined in the **<pthread.h>** header.

The behavior is undefined if the value specified by the *attr* argument to *pthread_attr_getscope()* or *pthread_attr_setscope()* does not refer to an initialized thread attributes object.

RETURN VALUE

If successful, the *pthread_attr_getscope()* and *pthread_attr_setscope()* functions shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_attr_setscope()* function shall fail if:

[ENOTSUP] An attempt was made to set the attribute to an unsupported value.

The *pthread_attr_setscope()* function may fail if:

[EINVAL] The value of *contentionscope* is not valid.

These functions shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

After these attributes have been set, a thread can be created with the specified attributes using *pthread_create()*. Using these routines does not affect the current running thread.

See [Section 2.9.4](#) (on page 514) for further details on thread scheduling attributes and their default settings.

RATIONALE

If an implementation detects that the value specified by the *attr* argument to *pthread_attr_getscope()* or *pthread_attr_setscope()* does not refer to an initialized thread attributes object, it is recommended that the function should fail and report an [EINVAL] error.

NAME

pthread_attr_getstack, pthread_attr_setstack — get and set stack attributes

SYNOPSIS

```
TSA TSS #include <pthread.h>
```

```
int pthread_attr_getstack(const pthread_attr_t *restrict attr,
    void **restrict stackaddr, size_t *restrict stacksize);
int pthread_attr_setstack(pthread_attr_t *attr, void *stackaddr,
    size_t stacksize);
```

DESCRIPTION

The *pthread_attr_getstack()* and *pthread_attr_setstack()* functions, respectively, shall get and set the thread creation stack attributes *stackaddr* and *stacksize* in the *attr* object.

The stack attributes specify the area of storage to be used for the created thread's stack. The base (lowest addressable byte) of the storage shall be *stackaddr*, and the size of the storage shall be *stacksize* bytes. The *stacksize* shall be at least {PTHREAD_STACK_MIN}. The *pthread_attr_setstack()* function may fail with [EINVAL] if *stackaddr* does not meet implementation-defined alignment requirements. All pages within the stack described by *stackaddr* and *stacksize* shall be both readable and writable by the thread.

If the *pthread_attr_getstack()* function is called before the *stackaddr* attribute has been set, the behavior is unspecified.

The behavior is undefined if the value specified by the *attr* argument to *pthread_attr_getstack()* or *pthread_attr_setstack()* does not refer to an initialized thread attributes object.

RETURN VALUE

Upon successful completion, these functions shall return a value of 0; otherwise, an error number shall be returned to indicate the error.

The *pthread_attr_getstack()* function shall store the stack attribute values in *stackaddr* and *stacksize* if successful.

ERRORS

The *pthread_attr_setstack()* function shall fail if:

[EINVAL] The value of *stacksize* is less than {PTHREAD_STACK_MIN} or exceeds an implementation-defined limit.

The *pthread_attr_setstack()* function may fail if:

[EINVAL] The value of *stackaddr* does not have proper alignment to be used as a stack, or ((**char** *)*stackaddr* + *stacksize*) lacks proper alignment.

[EACCES] The stack page(s) described by *stackaddr* and *stacksize* are not both readable and writable by the thread.

These functions shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

These functions are appropriate for use by applications in an environment where the stack for a thread must be placed in some particular region of memory.

While it might seem that an application could detect stack overflow by providing a protected page outside the specified stack region, this cannot be done portably. Implementations are free to place the thread's initial stack pointer anywhere within the specified region to accommodate the machine's stack pointer behavior and allocation requirements. Furthermore, on some architectures, such as the IA-64, "overflow" might mean that two separate stack pointers allocated within the region will overlap somewhere in the middle of the region.

After a successful call to *pthread_attr_setstack()*, the storage area specified by the *stackaddr* parameter is under the control of the implementation, as described in [Section 2.9.8](#) (on page 521).

The specification of the *stackaddr* attribute presents several ambiguities that make portable use of these functions impossible. For example, the standard allows implementations to impose arbitrary alignment requirements on *stackaddr*. Applications cannot assume that a buffer obtained from *malloc()* is suitably aligned. Note that although the *stacksize* value passed to *pthread_attr_setstack()* must satisfy alignment requirements, the same is not true for *pthread_attr_setstacksize()* where the implementation must increase the specified size if necessary to achieve the proper alignment.

RATIONALE

If an implementation detects that the value specified by the *attr* argument to *pthread_attr_getstack()* or *pthread_attr_setstack()* does not refer to an initialized thread attributes object, it is recommended that the function should fail and report an [EINVAL] error.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 6. Developed as part of the XSI option and brought into the BASE by IEEE PASC Interpretation 1003.1 #101.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/83 is applied, updating the APPLICATION USAGE section to refer to [Section 2.9.8](#) (on page 521).

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC/D6/84 is applied, updating the ERRORS section to include optional errors for the case when *attr* refers to an uninitialized thread attribute object.

Issue 7

SD5-XSH-ERN-66 is applied, correcting the use of *attr* in the [EINVAL] error condition.

Austin Group Interpretation 1003.1-2001 #057 is applied, clarifying the behavior if the function is called before the *stackaddr* attribute is set.

SD5-XSH-ERN-157 is applied, updating the APPLICATION USAGE section.

The description of the *stackaddr* attribute is updated in the DESCRIPTION and APPLICATION USAGE sections.

50982
50983

The [EINVAL] error for an uninitialized thread attributes object is removed; this condition results in undefined behavior.

50984 **NAME**

50985 pthread_attr_getstacksize, pthread_attr_setstacksize — get and set the stacksize attribute

50986 **SYNOPSIS**

```

50987 TSS      #include <pthread.h>
50988
50988      int pthread_attr_getstacksize(const pthread_attr_t *restrict attr,
50989                                   size_t *restrict stacksize);
50990      int pthread_attr_setstacksize(pthread_attr_t *attr, size_t stacksize);

```

50991 **DESCRIPTION**

50992 The *pthread_attr_getstacksize()* and *pthread_attr_setstacksize()* functions, respectively, shall get and
 50993 set the thread creation *stacksize* attribute in the *attr* object.

50994 The *stacksize* attribute shall define the minimum stack size (in bytes) allocated for the created
 50995 threads stack.

50996 The behavior is undefined if the value specified by the *attr* argument to
 50997 *pthread_attr_getstacksize()* or *pthread_attr_setstacksize()* does not refer to an initialized thread
 50998 attributes object.

50999 **RETURN VALUE**

51000 Upon successful completion, *pthread_attr_getstacksize()* and *pthread_attr_setstacksize()* shall
 51001 return a value of 0; otherwise, an error number shall be returned to indicate the error.

51002 The *pthread_attr_getstacksize()* function stores the *stacksize* attribute value in *stacksize* if
 51003 successful.

51004 **ERRORS**

51005 The *pthread_attr_setstacksize()* function shall fail if:

51006 [EINVAL] The value of *stacksize* is less than {PTHREAD_STACK_MIN} or exceeds a
 51007 system-imposed limit.

51008 These functions shall not return an error code of [EINTR].

51009 **EXAMPLES**

51010 None.

51011 **APPLICATION USAGE**

51012 None.

51013 **RATIONALE**

51014 If an implementation detects that the value specified by the *attr* argument to
 51015 *pthread_attr_getstacksize()* or *pthread_attr_setstacksize()* does not refer to an initialized thread
 51016 attributes object, it is recommended that the function should fail and report an [EINVAL] error.

51017 **FUTURE DIRECTIONS**

51018 None.

51019 **SEE ALSO**

51022 **CHANGE HISTORY**

51023 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

51024 Issue 6

51025 The *pthread_attr_getstacksize()* and *pthread_attr_setstacksize()* functions are marked as part of the
51026 Threads and Thread Stack Size Attribute options.

51027 The **restrict** keyword is added to the *pthread_attr_getstacksize()* prototype for alignment with the
51028 ISO/IEC 9899:1999 standard.

51029 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/43 is applied, correcting the margin code
51030 in the SYNOPSIS from TSA to TSS and updating the CHANGE HISTORY from “Thread Stack
51031 Address Attribute” option to “Thread Stack Size Attribute” option.

51032 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/87 is applied, updating the ERRORS
51033 section to include optional errors for the case when *attr* refers to an uninitialized thread attribute
51034 object.

51035 Issue 7

51036 The *pthread_attr_getstacksize()* and *pthread_attr_setstacksize()* functions are moved from the
51037 Threads option.

51038 The [EINVAL] error for an uninitialized thread attributes object is removed; this condition
51039 results in undefined behavior.

51040 **NAME**

51041 pthread_attr_init — initialize the thread attributes object

51042 **SYNOPSIS**

51043 #include <pthread.h>

51044 int pthread_attr_init(pthread_attr_t *attr);

51045 **DESCRIPTION**51046 Refer to *pthread_attr_destroy()*.

51047 **NAME**

51048 pthread_attr_setdetachstate — set the detachstate attribute

51049 **SYNOPSIS**

51050 #include <pthread.h>

51051 int pthread_attr_setdetachstate(pthread_attr_t *attr, int detachstate);

51052 **DESCRIPTION**

51053 Refer to *pthread_attr_getdetachstate()*.

51054 **NAME**

51055 pthread_attr_setguardsize — set the thread guardsize attribute

51056 **SYNOPSIS**

51057 #include <pthread.h>

51058 int pthread_attr_setguardsize(pthread_attr_t *attr,
51059 size_t guardsize);51060 **DESCRIPTION**51061 Refer to *pthread_attr_getguardsize()*.

51062 NAME

51063 pthread_attr_setinheritsched — set the inheritsched attribute (**REALTIME THREADS**)

51064 SYNOPSIS

```
51065 TPS    #include <pthread.h>
51066
51066    int pthread_attr_setinheritsched(pthread_attr_t *attr,
51067    int inheritsched);
```

51068 DESCRIPTION

51069 Refer to *pthread_attr_getinheritsched()*.

51070 **NAME**

51071 pthread_attr_setschedparam — set the schedparam attribute

51072 **SYNOPSIS**

51073 #include <pthread.h>

```
51074 int pthread_attr_setschedparam(pthread_attr_t *restrict attr,  
51075                               const struct sched_param *restrict param);
```

51076 **DESCRIPTION**51077 Refer to *pthread_attr_getschedparam()*.

51078 NAME

51079 pthread_attr_setschedpolicy — set the schedpolicy attribute (**REALTIME THREADS**)

51080 SYNOPSIS

```
51081 TPS    #include <pthread.h>
51082        int pthread_attr_setschedpolicy(pthread_attr_t *attr, int policy);
```

51083 DESCRIPTION

51084 Refer to *pthread_attr_getschedpolicy()*.

51085 **NAME**51086 pthread_attr_setscope — set the contention scope attribute (**REALTIME THREADS**)51087 **SYNOPSIS**

```
51088 TPS    #include <pthread.h>
51089        int pthread_attr_setscope(pthread_attr_t *attr, int contention_scope);
```

51090 **DESCRIPTION**51091 Refer to *pthread_attr_getscope()*.

51092 NAME

51093 pthread_attr_setstack — set the stack attribute

51094 SYNOPSIS

51095 TSA TSS `#include <pthread.h>`

```
51096 int pthread_attr_setstack(pthread_attr_t *attr, void *stackaddr,  
51097                          size_t stacksize);
```

51098 DESCRIPTION

51099 Refer to *pthread_attr_getstack()*.

51100 **NAME**

51101 pthread_attr_setstacksize — set the stacksize attribute

51102 **SYNOPSIS**51103 TSS `#include <pthread.h>`51104 `int pthread_attr_setstacksize(pthread_attr_t *attr, size_t stacksize);`51105 **DESCRIPTION**51106 Refer to *pthread_attr_getstacksize()*.

51107 **NAME**

51108 pthread_barrier_destroy, pthread_barrier_init — destroy and initialize a barrier object

51109 **SYNOPSIS**

```
51110 #include <pthread.h>
51111 int pthread_barrier_destroy(pthread_barrier_t *barrier);
51112 int pthread_barrier_init(pthread_barrier_t *restrict barrier,
51113     const pthread_barrierattr_t *restrict attr, unsigned count);
```

51114 **DESCRIPTION**

51115 The *pthread_barrier_destroy()* function shall destroy the barrier referenced by *barrier* and release
 51116 any resources used by the barrier. The effect of subsequent use of the barrier is undefined until
 51117 the barrier is reinitialized by another call to *pthread_barrier_init()*. An implementation may use
 51118 this function to set *barrier* to an invalid value. The results are undefined if
 51119 *pthread_barrier_destroy()* is called when any thread is blocked on the barrier, or if this function is
 51120 called with an uninitialized barrier.

51121 The *pthread_barrier_init()* function shall allocate any resources required to use the barrier
 51122 referenced by *barrier* and shall initialize the barrier with attributes referenced by *attr*. If *attr* is
 51123 NULL, the default barrier attributes shall be used; the effect is the same as passing the address of
 51124 a default barrier attributes object. The results are undefined if *pthread_barrier_init()* is called
 51125 when any thread is blocked on the barrier (that is, has not returned from the
 51126 *pthread_barrier_wait()* call). The results are undefined if a barrier is used without first being
 51127 initialized. The results are undefined if *pthread_barrier_init()* is called specifying an already
 51128 initialized barrier.

51129 The *count* argument specifies the number of threads that must call *pthread_barrier_wait()* before
 51130 any of them successfully return from the call. The value specified by *count* must be greater than
 51131 zero.

51132 If the *pthread_barrier_init()* function fails, the barrier shall not be initialized and the contents of
 51133 *barrier* are undefined.

51134 Only the object referenced by *barrier* may be used for performing synchronization. The result of
 51135 referring to copies of that object in calls to *pthread_barrier_destroy()* or *pthread_barrier_wait()* is
 51136 undefined.

51137 **RETURN VALUE**

51138 Upon successful completion, these functions shall return zero; otherwise, an error number shall
 51139 be returned to indicate the error.

51140 **ERRORS**

51141 The *pthread_barrier_init()* function shall fail if:

51142 [EAGAIN] The system lacks the necessary resources to initialize another barrier.

51143 [EINVAL] The value specified by *count* is equal to zero.

51144 [ENOMEM] Insufficient memory exists to initialize the barrier.

51145 These functions shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

If an implementation detects that the value specified by the *barrier* argument to *pthread_barrier_destroy()* does not refer to an initialized barrier object, it is recommended that the function should fail and report an [EINVAL] error.

If an implementation detects that the value specified by the *attr* argument to *pthread_barrier_init()* does not refer to an initialized barrier attributes object, it is recommended that the function should fail and report an [EINVAL] error.

If an implementation detects that the value specified by the *barrier* argument to *pthread_barrier_destroy()* or *pthread_barrier_init()* refers to a barrier that is in use (for example, in a *pthread_barrier_wait()* call) by another thread, or detects that the value specified by the *barrier* argument to *pthread_barrier_init()* refers to an already initialized barrier object, it is recommended that the function should fail and report an [EBUSY] error.

FUTURE DIRECTIONS

None.

SEE ALSO

CHANGE HISTORY

First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

Issue 7

The *pthread_barrier_destroy()* and *pthread_barrier_init()* functions are moved from the Barriers option to the Base.

The [EINVAL] error for an uninitialized barrier object and an uninitialized barrier attributes object is removed; this condition results in undefined behavior.

The [EBUSY] error for a barrier that is in use or an already initialized barrier object is removed; this condition results in undefined behavior.

51176 **NAME**

51177 pthread_barrier_wait — synchronize at a barrier

51178 **SYNOPSIS**

51179 #include <pthread.h>

51180 int pthread_barrier_wait(pthread_barrier_t *barrier);

51181 **DESCRIPTION**

51182 The *pthread_barrier_wait()* function shall synchronize participating threads at the barrier
51183 referenced by *barrier*. The calling thread shall block until the required number of threads have
51184 called *pthread_barrier_wait()* specifying the barrier.

51185 When the required number of threads have called *pthread_barrier_wait()* specifying the barrier,
51186 the constant PTHREAD_BARRIER_SERIAL_THREAD shall be returned to one unspecified
51187 thread and zero shall be returned to each of the remaining threads. At this point, the barrier shall
51188 be reset to the state it had as a result of the most recent *pthread_barrier_init()* function that
51189 referenced it.

51190 The constant PTHREAD_BARRIER_SERIAL_THREAD is defined in <pthread.h> and its value
51191 shall be distinct from any other value returned by *pthread_barrier_wait()*.

51192 The results are undefined if this function is called with an uninitialized barrier.

51193 If a signal is delivered to a thread blocked on a barrier, upon return from the signal handler the
51194 thread shall resume waiting at the barrier if the barrier wait has not completed (that is, if the
51195 required number of threads have not arrived at the barrier during the execution of the signal
51196 handler); otherwise, the thread shall continue as normal from the completed barrier wait. Until
51197 the thread in the signal handler returns from it, it is unspecified whether other threads may
51198 proceed past the barrier once they have all reached it.

51199 A thread that has blocked on a barrier shall not prevent any unblocked thread that is eligible to
51200 use the same processing resources from eventually making forward progress in its execution.
51201 Eligibility for processing resources shall be determined by the scheduling policy.

51202 **RETURN VALUE**

51203 Upon successful completion, the *pthread_barrier_wait()* function shall return
51204 PTHREAD_BARRIER_SERIAL_THREAD for a single (arbitrary) thread synchronized at the
51205 barrier and zero for each of the other threads. Otherwise, an error number shall be returned to
51206 indicate the error.

51207 **ERRORS**

51208 This function shall not return an error code of [EINTR].

51209 **EXAMPLES**

51210 None.

51211 **APPLICATION USAGE**

51212 Applications using this function may be subject to priority inversion, as discussed in XBD
51213 [Section 3.287](#) (on page 79).

51214 **RATIONALE**

51215 If an implementation detects that the value specified by the *barrier* argument to
51216 *pthread_barrier_wait()* does not refer to an initialized barrier object, it is recommended that the
51217 function should fail and report an [EINVAL] error.

51218 **FUTURE DIRECTIONS**

51219 None.

51220 **SEE ALSO**51221 [*pthread_barrier_destroy\(\)*](#)51222 XBD [Section 3.287](#) (on page 79), [Section 4.11](#) (on page 110), [**<pthread.h>**](#)51223 **CHANGE HISTORY**

51224 First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

51225 In the SYNOPSIS, the inclusion of **<sys/types.h>** is no longer required.51226 **Issue 7**51227 The *pthread_barrier_wait()* function is moved from the Barriers option to the Base.51228 The [EINVAL] error for an uninitialized barrier object is removed; this condition results in
51229 undefined behavior.

NAME

pthread_barrierattr_destroy, pthread_barrierattr_init — destroy and initialize the barrier attributes object

SYNOPSIS

```
#include <pthread.h>

int pthread_barrierattr_destroy(pthread_barrierattr_t *attr);
int pthread_barrierattr_init(pthread_barrierattr_t *attr);
```

DESCRIPTION

The *pthread_barrierattr_destroy()* function shall destroy a barrier attributes object. A destroyed *attr* attributes object can be reinitialized using *pthread_barrierattr_init()*; the results of otherwise referencing the object after it has been destroyed are undefined. An implementation may cause *pthread_barrierattr_destroy()* to set the object referenced by *attr* to an invalid value.

The *pthread_barrierattr_init()* function shall initialize a barrier attributes object *attr* with the default value for all of the attributes defined by the implementation.

If *pthread_barrierattr_init()* is called specifying an already initialized *attr* attributes object, the results are undefined.

After a barrier attributes object has been used to initialize one or more barriers, any function affecting the attributes object (including destruction) shall not affect any previously initialized barrier.

The behavior is undefined if the value specified by the *attr* argument to *pthread_barrierattr_destroy()* does not refer to an initialized barrier attributes object.

RETURN VALUE

If successful, the *pthread_barrierattr_destroy()* and *pthread_barrierattr_init()* functions shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_barrierattr_init()* function shall fail if:

[ENOMEM] Insufficient memory exists to initialize the barrier attributes object.

These functions shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

If an implementation detects that the value specified by the *attr* argument to *pthread_barrierattr_destroy()* does not refer to an initialized barrier attributes object, it is recommended that the function should fail and report an [EINVAL] error.

FUTURE DIRECTIONS

None.

SEE ALSO

pthread_barrierattr_getpshared()

XBD <pthread.h>

CHANGE HISTORY

51271 First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

51272 In the SYNOPSIS, the inclusion of **<sys/types.h>** is no longer required.

Issue 7

51274 The *pthread_barrierattr_destroy()* and *pthread_barrierattr_init()* functions are moved from the Barriers option to the Base.

51275 The [EINVAL] error for an uninitialized barrier attributes object is removed; this condition
51276 results in undefined behavior.

NAME

pthread_barrierattr_getpshared, pthread_barrierattr_setpshared — get and set the process-shared attribute of the barrier attributes object

SYNOPSIS

```
TSH #include <pthread.h>

int pthread_barrierattr_getpshared(const pthread_barrierattr_t
    *restrict attr, int *restrict pshared);
int pthread_barrierattr_setpshared(pthread_barrierattr_t *attr,
    int pshared);
```

DESCRIPTION

The *pthread_barrierattr_getpshared()* function shall obtain the value of the *process-shared* attribute from the attributes object referenced by *attr*. The *pthread_barrierattr_setpshared()* function shall set the *process-shared* attribute in an initialized attributes object referenced by *attr*.

The *process-shared* attribute is set to `PTHREAD_PROCESS_SHARED` to permit a barrier to be operated upon by any thread that has access to the memory where the barrier is allocated. If the *process-shared* attribute is `PTHREAD_PROCESS_PRIVATE`, the barrier shall only be operated upon by threads created within the same process as the thread that initialized the barrier; if threads of different processes attempt to operate on such a barrier, the behavior is undefined. The default value of the attribute shall be `PTHREAD_PROCESS_PRIVATE`. Both constants `PTHREAD_PROCESS_SHARED` and `PTHREAD_PROCESS_PRIVATE` are defined in `<pthread.h>`.

Additional attributes, their default values, and the names of the associated functions to get and set those attribute values are implementation-defined.

The behavior is undefined if the value specified by the *attr* argument to *pthread_barrierattr_getpshared()* or *pthread_barrierattr_setpshared()* does not refer to an initialized barrier attributes object.

RETURN VALUE

If successful, the *pthread_barrierattr_getpshared()* function shall return zero and store the value of the *process-shared* attribute of *attr* into the object referenced by the *pshared* parameter. Otherwise, an error number shall be returned to indicate the error.

If successful, the *pthread_barrierattr_setpshared()* function shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_barrierattr_setpshared()* function may fail if:

[EINVAL] The new value specified for the *process-shared* attribute is not one of the legal values `PTHREAD_PROCESS_SHARED` or `PTHREAD_PROCESS_PRIVATE`.

These functions shall not return an error code of [EINTR].

51316 EXAMPLES

51317 None.

51318 APPLICATION USAGE

51319 The *pthread_barrierattr_getpshared()* and *pthread_barrierattr_setpshared()* functions are part of the
51320 Thread Process-Shared Synchronization option and need not be provided on all
51321 implementations.

51322 RATIONALE

51323 If an implementation detects that the value specified by the *attr* argument to
51324 *pthread_barrierattr_getpshared()* or *pthread_barrierattr_setpshared()* does not refer to an initialized
51325 barrier attributes object, it is recommended that the function should fail and report an [EINVAL]
51326 error.

51327 FUTURE DIRECTIONS

51328 None.

51329 SEE ALSO

51330 *pthread_barrier_destroy()*, *pthread_barrierattr_destroy()*

51331 XBD <pthread.h>

51332 CHANGE HISTORY

51333 First released in Issue 6. Derived from IEEE Std 1003.1j-2000

51334 Issue 7

51335 The *pthread_barrierattr_getpshared()* and *pthread_barrierattr_setpshared()* functions are moved from
51336 the Barriers option.

51337 The [EINVAL] error for an uninitialized barrier attributes object is removed; this condition
51338 results in undefined behavior.

51339 NAME

51340 pthread_barrierattr_init — initialize the barrier attributes object

51341 SYNOPSIS

51342 #include <pthread.h>

51343 int pthread_barrierattr_init(pthread_barrierattr_t *attr);

51344 DESCRIPTION

51345 Refer to *pthread_barrierattr_destroy()*.

51346 **NAME**

51347 pthread_barrierattr_setpshared — set the process-shared attribute of the barrier attributes object

51348 **SYNOPSIS**

```
51349 TSH      #include <pthread.h>
51350          int pthread_barrierattr_setpshared(pthread_barrierattr_t *attr,
51351          int pshared);
```

51352 **DESCRIPTION**51353 Refer to *pthread_barrierattr_getpshared()*.

51354 **NAME**

51355 pthread_cancel — cancel execution of a thread

51356 **SYNOPSIS**

51357 #include <pthread.h>

51358 int pthread_cancel(pthread_t thread);

51359 **DESCRIPTION**

51360 The *pthread_cancel()* function shall request that *thread* be canceled. The target thread's
51361 cancelability state and type determines when the cancellation takes effect. When the cancellation
51362 is acted on, the cancellation cleanup handlers for *thread* shall be called. When the last
51363 cancellation cleanup handler returns, the thread-specific data destructor functions shall be called
51364 for *thread*. When the last destructor function returns, *thread* shall be terminated.

51365 The cancellation processing in the target thread shall run asynchronously with respect to the
51366 calling thread returning from *pthread_cancel()*.

51367 **RETURN VALUE**

51368 If successful, the *pthread_cancel()* function shall return zero; otherwise, an error number shall be
51369 returned to indicate the error.

51370 **ERRORS**51371 The *pthread_cancel()* function shall not return an error code of [EINTR].51372 **EXAMPLES**

51373 None.

51374 **APPLICATION USAGE**

51375 None.

51376 **RATIONALE**

51377 Two alternative functions were considered for sending the cancellation notification to a thread.
51378 One would be to define a new SIGCANCEL signal that had the cancellation semantics when
51379 delivered; the other was to define the new *pthread_cancel()* function, which would trigger the
51380 cancellation semantics.

51381 The advantage of a new signal was that so much of the delivery criteria were identical to that
51382 used when trying to deliver a signal that making cancellation notification a signal was seen as
51383 consistent. Indeed, many implementations implement cancellation using a special signal. On the
51384 other hand, there would be no signal functions that could be used with this signal except
51385 *pthread_kill()*, and the behavior of the delivered cancellation signal would be unlike any
51386 previously existing defined signal.

51387 The benefits of a special function include the recognition that this signal would be defined
51388 because of the similar delivery criteria and that this is the only common behavior between a
51389 cancellation request and a signal. In addition, the cancellation delivery mechanism does not
51390 have to be implemented as a signal. There are also strong, if not stronger, parallels with
51391 language exception mechanisms than with signals that are potentially obscured if the delivery
51392 mechanism is visibly closer to signals.

51393 In the end, it was considered that as there were so many exceptions to the use of the new signal
51394 with existing signals functions it would be misleading. A special function has resolved this
51395 problem. This function was carefully defined so that an implementation wishing to provide the
51396 cancellation functions on top of signals could do so. The special function also means that
51397 implementations are not obliged to implement cancellation with signals.

51398 If an implementation detects use of a thread ID after the end of its lifetime, it is recommended
51399 that the function should fail and report an [ESRCH] error.

51400 **FUTURE DIRECTIONS**

51401 None.

51402 **SEE ALSO**51403 *pthread_exit()*, *pthread_cond_timedwait()*, *pthread_join()*, *pthread_setcancelstate()*

51404 XBD <pthread.h>

51405 **CHANGE HISTORY**

51406 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

51407 **Issue 6**51408 The *pthread_cancel()* function is marked as part of the Threads option.51409 **Issue 7**51410 The *pthread_cancel()* function is moved from the Threads option to the Base.

51411 Austin Group Interpretation 1003.1-2001 #142 is applied, removing the [ESRCH] error condition.

51412 **NAME**

51413 pthread_cleanup_pop, pthread_cleanup_push — establish cancellation handlers

51414 **SYNOPSIS**

```
51415 #include <pthread.h>
51416 void pthread_cleanup_pop(int execute);
51417 void pthread_cleanup_push(void (*routine)(void*), void *arg);
```

51418 **DESCRIPTION**

51419 The *pthread_cleanup_pop()* function shall remove the routine at the top of the calling thread's
 51420 cancellation cleanup stack and optionally invoke it (if *execute* is non-zero).

51421 The *pthread_cleanup_push()* function shall push the specified cancellation cleanup handler *routine*
 51422 onto the calling thread's cancellation cleanup stack. The cancellation cleanup handler shall be
 51423 popped from the cancellation cleanup stack and invoked with the argument *arg* when:

- 51424 • The thread exits (that is, calls *pthread_exit()*).
- 51425 • The thread acts upon a cancellation request.
- 51426 • The thread calls *pthread_cleanup_pop()* with a non-zero *execute* argument.

51427 These functions may be implemented as macros. The application shall ensure that they appear
 51428 as statements, and in pairs within the same lexical scope (that is, the *pthread_cleanup_push()*
 51429 macro may be thought to expand to a token list whose first token is '{' with
 51430 *pthread_cleanup_pop()* expanding to a token list whose last token is the corresponding '}').

51431 The effect of calling *longjmp()* or *siglongjmp()* is undefined if there have been any calls to
 51432 *pthread_cleanup_push()* or *pthread_cleanup_pop()* made without the matching call since the jump
 51433 buffer was filled. The effect of calling *longjmp()* or *siglongjmp()* from inside a cancellation
 51434 cleanup handler is also undefined unless the jump buffer was also filled in the cancellation
 51435 cleanup handler.

51436 The effect of the use of **return**, **break**, **continue**, and **goto** to prematurely leave a code block
 51437 described by a pair of *pthread_cleanup_push()* and *pthread_cleanup_pop()* functions calls is
 51438 undefined.

51439 **RETURN VALUE**

51440 The *pthread_cleanup_push()* and *pthread_cleanup_pop()* functions shall not return a value.

51441 **ERRORS**

51442 No errors are defined.

51443 These functions shall not return an error code of [EINTR].

51444 **EXAMPLES**

51445 The following is an example using thread primitives to implement a cancelable, writers-priority
 51446 read-write lock:

```
51447 typedef struct {
51448     pthread_mutex_t lock;
51449     pthread_cond_t rcond,
51450     wcond;
51451     int lock_count; /* < 0 .. Held by writer. */
51452                   /* > 0 .. Held by lock_count readers. */
51453                   /* = 0 .. Held by nobody. */
51454     int waiting_writers; /* Count of waiting writers. */
51455 } rwlock;
```

```

51456 void
51457 waiting_reader_cleanup(void *arg)
51458 {
51459     rwlock *l;
51460
51461     l = (rwlock *) arg;
51462     pthread_mutex_unlock(&l->lock);
51463
51464 void
51465 lock_for_read(rwlock *l)
51466 {
51467     pthread_mutex_lock(&l->lock);
51468     pthread_cleanup_push(waiting_reader_cleanup, l);
51469     while ((l->lock_count < 0) || (l->waiting_writers != 0))
51470         pthread_cond_wait(&l->rcond, &l->lock);
51471     l->lock_count++;
51472     /*
51473      * Note the pthread_cleanup_pop executes
51474      * waiting_reader_cleanup.
51475      */
51476     pthread_cleanup_pop(1);
51477
51478 void
51479 release_read_lock(rwlock *l)
51480 {
51481     pthread_mutex_lock(&l->lock);
51482     if (--l->lock_count == 0)
51483         pthread_cond_signal(&l->wcond);
51484     pthread_mutex_unlock(&l->lock);
51485
51486 void
51487 waiting_writer_cleanup(void *arg)
51488 {
51489     rwlock *l;
51490
51491     l = (rwlock *) arg;
51492     if ((--l->waiting_writers == 0) && (l->lock_count >= 0)) {
51493         /*
51494          * This only happens if we have been canceled. If the
51495          * lock is not held by a writer, there may be readers who
51496          * were blocked because waiting_writers was positive; they
51497          * can now be unblocked.
51498          */
51499         pthread_cond_broadcast(&l->rcond);
51500     }
51501     pthread_mutex_unlock(&l->lock);
51502
51503 void
51504 lock_for_write(rwlock *l)
51505 {
51506     pthread_mutex_lock(&l->lock);

```

```

51505         l->waiting_writers++;
51506         pthread_cleanup_push(waiting_writer_cleanup, l);
51507         while (l->lock_count != 0)
51508             pthread_cond_wait(&l->wcond, &l->lock);
51509         l->lock_count = -1;
51510     /*
51511      * Note the pthread_cleanup_pop executes
51512      * waiting_writer_cleanup.
51513      */
51514     pthread_cleanup_pop(1);
51515 }

51516 void
51517 release_write_lock(rwlock *l)
51518 {
51519     pthread_mutex_lock(&l->lock);
51520     l->lock_count = 0;
51521     if (l->waiting_writers == 0)
51522         pthread_cond_broadcast(&l->rcond);
51523     else
51524         pthread_cond_signal(&l->wcond);
51525     pthread_mutex_unlock(&l->lock);
51526 }

51527 /*
51528  * This function is called to initialize the read/write lock.
51529  */
51530 void
51531 initialize_rwlock(rwlock *l)
51532 {
51533     pthread_mutex_init(&l->lock, pthread_mutexattr_default);
51534     pthread_cond_init(&l->wcond, pthread_condattr_default);
51535     pthread_cond_init(&l->rcond, pthread_condattr_default);
51536     l->lock_count = 0;
51537     l->waiting_writers = 0;
51538 }

51539 reader_thread()
51540 {
51541     lock_for_read(&lock);
51542     pthread_cleanup_push(release_read_lock, &lock);
51543     /*
51544      * Thread has read lock.
51545      */
51546     pthread_cleanup_pop(1);
51547 }

51548 writer_thread()
51549 {
51550     lock_for_write(&lock);
51551     pthread_cleanup_push(release_write_lock, &lock);
51552     /*
51553      * Thread has write lock.
51554      */

```

```

51555     pthread_cleanup_pop(1);
51556 }

```

51557 APPLICATION USAGE

51558 The two routines that push and pop cancellation cleanup handlers, *pthread_cleanup_push()* and
 51559 *pthread_cleanup_pop()*, can be thought of as left and right-parentheses. They always need to be
 51560 matched.

51561 RATIONALE

51562 The restriction that the two routines that push and pop cancellation cleanup handlers,
 51563 *pthread_cleanup_push()* and *pthread_cleanup_pop()*, have to appear in the same lexical scope
 51564 allows for efficient macro or compiler implementations and efficient storage management. A
 51565 sample implementation of these routines as macros might look like this:

```

51566 #define pthread_cleanup_push(rtn,arg) { \
51567     struct _pthread_handler_rec __cleanup_handler, *__head; \
51568     __cleanup_handler.rtn = rtn; \
51569     __cleanup_handler.arg = arg; \
51570     (void) pthread_getspecific(_pthread_handler_key, &__head); \
51571     __cleanup_handler.next = *__head; \
51572     *__head = &__cleanup_handler;
51573
51574 #define pthread_cleanup_pop(ex) \
51575     *__head = __cleanup_handler.next; \
51576     if (ex) (*__cleanup_handler.rtn)(__cleanup_handler.arg); \
51577 }

```

51577 A more ambitious implementation of these routines might do even better by allowing the
 51578 compiler to note that the cancellation cleanup handler is a constant and can be expanded inline.

51579 This volume of POSIX.1-2008 currently leaves unspecified the effect of calling *longjmp()* from a
 51580 signal handler executing in a POSIX System Interfaces function. If an implementation wants to
 51581 allow this and give the programmer reasonable behavior, the *longjmp()* function has to call all
 51582 cancellation cleanup handlers that have been pushed but not popped since the time *setjmp()* was
 51583 called.

51584 Consider a multi-threaded function called by a thread that uses signals. If a signal were
 51585 delivered to a signal handler during the operation of *qsort()* and that handler were to call
 51586 *longjmp()* (which, in turn, did *not* call the cancellation cleanup handlers) the helper threads
 51587 created by the *qsort()* function would not be canceled. Instead, they would continue to execute
 51588 and write into the argument array even though the array might have been popped off the stack.

51589 Note that the specified cleanup handling mechanism is especially tied to the C language and,
 51590 while the requirement for a uniform mechanism for expressing cleanup is language-
 51591 independent, the mechanism used in other languages may be quite different. In addition, this
 51592 mechanism is really only necessary due to the lack of a real exception mechanism in the C
 51593 language, which would be the ideal solution.

51594 There is no notion of a cancellation cleanup-safe function. If an application has no cancellation
 51595 points in its signal handlers, blocks any signal whose handler may have cancellation points
 51596 while calling async-unsafe functions, or disables cancellation while calling async-unsafe
 51597 functions, all functions may be safely called from cancellation cleanup routines.

NAME

pthread_cond_broadcast, pthread_cond_signal — broadcast or signal a condition

SYNOPSIS

```
#include <pthread.h>

int pthread_cond_broadcast(pthread_cond_t *cond);
int pthread_cond_signal(pthread_cond_t *cond);
```

DESCRIPTION

These functions shall unblock threads blocked on a condition variable.

The *pthread_cond_broadcast()* function shall unblock all threads currently blocked on the specified condition variable *cond*.

The *pthread_cond_signal()* function shall unblock at least one of the threads that are blocked on the specified condition variable *cond* (if any threads are blocked on *cond*).

If more than one thread is blocked on a condition variable, the scheduling policy shall determine the order in which threads are unblocked. When each thread unblocked as a result of a *pthread_cond_broadcast()* or *pthread_cond_signal()* returns from its call to *pthread_cond_wait()* or *pthread_cond_timedwait()*, the thread shall own the mutex with which it called *pthread_cond_wait()* or *pthread_cond_timedwait()*. The thread(s) that are unblocked shall contend for the mutex according to the scheduling policy (if applicable), and as if each had called *pthread_mutex_lock()*.

The *pthread_cond_broadcast()* or *pthread_cond_signal()* functions may be called by a thread whether or not it currently owns the mutex that threads calling *pthread_cond_wait()* or *pthread_cond_timedwait()* have associated with the condition variable during their waits; however, if predictable scheduling behavior is required, then that mutex shall be locked by the thread calling *pthread_cond_broadcast()* or *pthread_cond_signal()*.

The *pthread_cond_broadcast()* and *pthread_cond_signal()* functions shall have no effect if there are no threads currently blocked on *cond*.

The behavior is undefined if the value specified by the *cond* argument to *pthread_cond_broadcast()* or *pthread_cond_signal()* does not refer to an initialized condition variable.

RETURN VALUE

If successful, the *pthread_cond_broadcast()* and *pthread_cond_signal()* functions shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

These functions shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

The *pthread_cond_broadcast()* function is used whenever the shared-variable state has been changed in a way that more than one thread can proceed with its task. Consider a single producer/multiple consumer problem, where the producer can insert multiple items on a list that is accessed one item at a time by the consumers. By calling the *pthread_cond_broadcast()* function, the producer would notify all consumers that might be waiting, and thereby the application would receive more throughput on a multi-processor. In addition, *pthread_cond_broadcast()* makes it easier to implement a read-write lock. The *pthread_cond_broadcast()* function is needed in order to wake up all waiting readers when a writer releases its lock. Finally, the two-phase commit algorithm can use this broadcast function to notify all clients of an impending transaction commit.

It is not safe to use the *pthread_cond_signal()* function in a signal handler that is invoked asynchronously. Even if it were safe, there would still be a race between the test of the Boolean *pthread_cond_wait()* that could not be efficiently eliminated.

Mutexes and condition variables are thus not suitable for releasing a waiting thread by signaling from code running in a signal handler.

RATIONALE

If an implementation detects that the value specified by the *cond* argument to *pthread_cond_broadcast()* or *pthread_cond_signal()* does not refer to an initialized condition variable, it is recommended that the function should fail and report an [EINVAL] error.

Multiple Awakenings by Condition Signal

On a multi-processor, it may be impossible for an implementation of *pthread_cond_signal()* to avoid the unblocking of more than one thread blocked on a condition variable. For example, consider the following partial implementation of *pthread_cond_wait()* and *pthread_cond_signal()*, executed by two threads in the order given. One thread is trying to wait on the condition variable, another is concurrently executing *pthread_cond_signal()*, while a third thread is already waiting.

```
pthread_cond_wait(mutex, cond):
    value = cond->value; /* 1 */
    pthread_mutex_unlock(mutex); /* 2 */
    pthread_mutex_lock(cond->mutex); /* 10 */
    if (value == cond->value) { /* 11 */
        me->next_cond = cond->waiter;
        cond->waiter = me;
        pthread_mutex_unlock(cond->mutex);
        unable_to_run(me);
    } else
        pthread_mutex_unlock(cond->mutex); /* 12 */
    pthread_mutex_lock(mutex); /* 13 */

pthread_cond_signal(cond):
    pthread_mutex_lock(cond->mutex); /* 3 */
    cond->value++; /* 4 */
    if (cond->waiter) { /* 5 */
        sleeper = cond->waiter; /* 6 */
        cond->waiter = sleeper->next_cond; /* 7 */
        able_to_run(sleeper); /* 8 */
    }
    pthread_mutex_unlock(cond->mutex); /* 9 */
```

The effect is that more than one thread can return from its call to *pthread_cond_wait()* or *pthread_cond_timedwait()* as a result of one call to *pthread_cond_signal()*. This effect is called “spurious wakeup”. Note that the situation is self-correcting in that the number of threads that are so awakened is finite; for example, the next thread to call *pthread_cond_wait()* after the sequence of events above blocks.

While this problem could be resolved, the loss of efficiency for a fringe condition that occurs only rarely is unacceptable, especially given that one has to check the predicate associated with a condition variable anyway. Correcting this problem would unnecessarily reduce the degree of concurrency in this basic building block for all higher-level synchronization operations.

An added benefit of allowing spurious wakeups is that applications are forced to code a

51710 predicate-testing-loop around the condition wait. This also makes the application tolerate
51711 superfluous condition broadcasts or signals on the same condition variable that may be coded in
51712 some other part of the application. The resulting applications are thus more robust. Therefore,
51713 POSIX.1-2008 explicitly documents that spurious wakeups may occur.

51714 FUTURE DIRECTIONS

51715 None.

51719 CHANGE HISTORY

51720 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

51721 Issue 6

51722 The *pthread_cond_broadcast()* and *pthread_cond_signal()* functions are marked as part of the
51723 Threads option.

51724 The APPLICATION USAGE section is added.

51725 Issue 7

51726 The *pthread_cond_broadcast()* and *pthread_cond_signal()* functions are moved from the Threads
51727 option to the Base.

51728 The [EINVAL] error for an uninitialized condition variable is removed; this condition results in
51729 undefined behavior.

NAME

pthread_cond_destroy, pthread_cond_init — destroy and initialize condition variables

SYNOPSIS

```
#include <pthread.h>

int pthread_cond_destroy(pthread_cond_t *cond);
int pthread_cond_init(pthread_cond_t *restrict cond,
    const pthread_condattr_t *restrict attr);
pthread_cond_t cond = PTHREAD_COND_INITIALIZER;
```

DESCRIPTION

The *pthread_cond_destroy()* function shall destroy the given condition variable specified by *cond*; the object becomes, in effect, uninitialized. An implementation may cause *pthread_cond_destroy()* to set the object referenced by *cond* to an invalid value. A destroyed condition variable object can be reinitialized using *pthread_cond_init()*; the results of otherwise referencing the object after it has been destroyed are undefined.

It shall be safe to destroy an initialized condition variable upon which no threads are currently blocked. Attempting to destroy a condition variable upon which other threads are currently blocked results in undefined behavior.

The *pthread_cond_init()* function shall initialize the condition variable referenced by *cond* with attributes referenced by *attr*. If *attr* is NULL, the default condition variable attributes shall be used; the effect is the same as passing the address of a default condition variable attributes object. Upon successful initialization, the state of the condition variable shall become initialized.

Only *cond* itself may be used for performing synchronization. The result of referring to copies of *cond* in calls to *pthread_cond_wait()*, *pthread_cond_timedwait()*, *pthread_cond_signal()*, *pthread_cond_broadcast()*, and *pthread_cond_destroy()* is undefined.

Attempting to initialize an already initialized condition variable results in undefined behavior.

In cases where default condition variable attributes are appropriate, the macro PTHREAD_COND_INITIALIZER can be used to initialize condition variables. The effect shall be equivalent to dynamic initialization by a call to *pthread_cond_init()* with parameter *attr* specified as NULL, except that no error checks are performed.

The behavior is undefined if the value specified by the *cond* argument to *pthread_cond_destroy()* does not refer to an initialized condition variable.

The behavior is undefined if the value specified by the *attr* argument to *pthread_cond_init()* does not refer to an initialized condition variable attributes object.

RETURN VALUE

If successful, the *pthread_cond_destroy()* and *pthread_cond_init()* functions shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_cond_init()* function shall fail if:

[EAGAIN] The system lacked the necessary resources (other than memory) to initialize another condition variable.

[ENOMEM] Insufficient memory exists to initialize the condition variable.

These functions shall not return an error code of [EINTR].

EXAMPLES

A condition variable can be destroyed immediately after all the threads that are blocked on it are awakened. For example, consider the following code:

```

struct list {
    pthread_mutex_t lm;
    ...
}

struct elt {
    key k;
    int busy;
    pthread_cond_t notbusy;
    ...
}

/* Find a list element and reserve it. */
struct elt *
list_find(struct list *lp, key k)
{
    struct elt *ep;

    pthread_mutex_lock(&lp->lm);
    while ((ep = find_elt(l, k) != NULL) && ep->busy)
        pthread_cond_wait(&ep->notbusy, &lp->lm);
    if (ep != NULL)
        ep->busy = 1;
    pthread_mutex_unlock(&lp->lm);
    return(ep);
}

delete_elt(struct list *lp, struct elt *ep)
{
    pthread_mutex_lock(&lp->lm);
    assert(ep->busy);
    ... remove ep from list ...
    ep->busy = 0; /* Paranoid. */
    (A) pthread_cond_broadcast(&ep->notbusy);
    pthread_mutex_unlock(&lp->lm);
    (B) pthread_cond_destroy(&ep->notbusy);
    free(ep);
}

```

In this example, the condition variable and its list element may be freed (line B) immediately after all threads waiting for it are awakened (line A), since the mutex and the code ensure that no other thread can touch the element to be deleted.

APPLICATION USAGE

None.

RATIONALE

If an implementation detects that the value specified by the *cond* argument to *pthread_cond_destroy()* does not refer to an initialized condition variable, it is recommended that the function should fail and report an [EINVAL] error.

If an implementation detects that the value specified by the *cond* argument to

51819 *pthread_cond_destroy()* or *pthread_cond_init()* refers to a condition variable that is in use (for
51820 example, in a *pthread_cond_wait()* call) by another thread, or detects that the value specified by
51821 the *cond* argument to *pthread_cond_init()* refers to an already initialized condition variable, it is
51822 recommended that the function should fail and report an [EBUSY] error.

51823 If an implementation detects that the value specified by the *attr* argument to *pthread_cond_init()*
51824 does not refer to an initialized condition variable attributes object, it is recommended that the
51825 function should fail and report an [EINVAL] error.

51826 See also *pthread_mutex_destroy()*.

51827 FUTURE DIRECTIONS

51828 None.

51829 SEE ALSO

51830 *pthread_cond_broadcast()*, *pthread_cond_timedwait()*, *pthread_mutex_destroy()*

51853 **DESCRIPTION**51854 Refer to *pthread_cond_broadcast()*.

NAME

pthread_cond_timedwait, pthread_cond_wait — wait on a condition

SYNOPSIS

```
#include <pthread.h>

int pthread_cond_timedwait(pthread_cond_t *restrict cond,
    pthread_mutex_t *restrict mutex,
    const struct timespec *restrict abstime);
int pthread_cond_wait(pthread_cond_t *restrict cond,
    pthread_mutex_t *restrict mutex);
```

DESCRIPTION

The *pthread_cond_timedwait()* and *pthread_cond_wait()* functions shall block on a condition variable. The application shall ensure that these functions are called with *mutex* locked by the calling thread; otherwise, an error (for PTHREAD_MUTEX_ERRORCHECK and robust mutexes) or undefined behavior (for other mutexes) results.

These functions atomically release *mutex* and cause the calling thread to block on the condition variable *cond*; atomically here means “atomically with respect to access by another thread to the mutex and then the condition variable”. That is, if another thread is able to acquire the mutex after the about-to-block thread has released it, then a subsequent call to *pthread_cond_broadcast()* or *pthread_cond_signal()* in that thread shall behave as if it were issued after the about-to-block thread has blocked.

Upon successful return, the mutex shall have been locked and shall be owned by the calling thread. If *mutex* is a robust mutex where an owner terminated while holding the lock and the state is recoverable, the mutex shall be acquired even though the function returns an error code.

When using condition variables there is always a Boolean predicate involving shared variables associated with each condition wait that is true if the thread should proceed. Spurious wakeups from the *pthread_cond_timedwait()* or *pthread_cond_wait()* functions may occur. Since the return from *pthread_cond_timedwait()* or *pthread_cond_wait()* does not imply anything about the value of this predicate, the predicate should be re-evaluated upon such return.

When a thread waits on a condition variable, having specified a particular mutex to either the *pthread_cond_timedwait()* or the *pthread_cond_wait()* operation, a dynamic binding is formed between that mutex and condition variable that remains in effect as long as at least one thread is blocked on the condition variable. During this time, the effect of an attempt by any thread to wait on that condition variable using a different mutex is undefined. Once all waiting threads have been unblocked (as by the *pthread_cond_broadcast()* operation), the next wait operation on that condition variable shall form a new dynamic binding with the mutex specified by that wait operation. Even though the dynamic binding between condition variable and mutex may be removed or replaced between the time a thread is unblocked from a wait on the condition variable and the time that it returns to the caller or begins cancellation cleanup, the unblocked thread shall always re-acquire the mutex specified in the condition wait operation call from which it is returning.

A condition wait (whether timed or not) is a cancellation point. When the cancelability type of a thread is set to PTHREAD_CANCEL_DEFERRED, a side-effect of acting upon a cancellation request while in a condition wait is that the mutex is (in effect) re-acquired before calling the first cancellation cleanup handler. The effect is as if the thread were unblocked, allowed to execute up to the point of returning from the call to *pthread_cond_timedwait()* or *pthread_cond_wait()*, but at that point notices the cancellation request and instead of returning to the caller of *pthread_cond_timedwait()* or *pthread_cond_wait()*, starts the thread cancellation activities, which includes calling cancellation cleanup handlers.

A thread that has been unblocked because it has been canceled while blocked in a call to *pthread_cond_timedwait()* or *pthread_cond_wait()* shall not consume any condition signal that may be directed concurrently at the condition variable if there are other threads blocked on the condition variable.

The *pthread_cond_timedwait()* function shall be equivalent to *pthread_cond_wait()*, except that an error is returned if the absolute time specified by *abstime* passes (that is, system time equals or exceeds *abstime*) before the condition *cond* is signaled or broadcasted, or if the absolute time specified by *abstime* has already been passed at the time of the call. When such timeouts occur, *pthread_cond_timedwait()* shall nonetheless release and re-acquire the mutex referenced by *mutex*, and may consume a condition signal directed concurrently at the condition variable.

The condition variable shall have a clock attribute which specifies the clock that shall be used to measure the time specified by the *abstime* argument. The *pthread_cond_timedwait()* function is also a cancellation point.

If a signal is delivered to a thread waiting for a condition variable, upon return from the signal handler the thread resumes waiting for the condition variable as if it was not interrupted, or it shall return zero due to spurious wakeup.

The behavior is undefined if the value specified by the *cond* or *mutex* argument to these functions does not refer to an initialized condition variable or an initialized mutex object, respectively.

51922 RETURN VALUE

Except in the case of [ETIMEDOUT], all these error checks shall act as if they were performed immediately at the beginning of processing for the function and shall cause an error return, in effect, prior to modifying the state of the mutex specified by *mutex* or the condition variable specified by *cond*.

Upon successful completion, a value of zero shall be returned; otherwise, an error number shall be returned to indicate the error.

51929 ERRORS

These functions shall fail if:

[ENOTRECOVERABLE]

The state protected by the mutex is not recoverable.

[EOWNERDEAD]

The mutex is a robust mutex and the process containing the previous owning thread terminated while holding the mutex lock. The mutex lock shall be acquired by the calling thread and it is up to the new owner to make the state consistent.

[EPERM]

The mutex type is PTHREAD_MUTEX_ERRORCHECK or the mutex is a robust mutex, and the current thread does not own the mutex.

The *pthread_cond_timedwait()* function shall fail if:

[ETIMEDOUT] The time specified by *abstime* to *pthread_cond_timedwait()* has passed.

[EINVAL] The *abstime* argument specified a nanosecond value less than zero or greater than or equal to 1000 million.

51944 These functions may fail if:

51945 [EOWNERDEAD]

51946 The mutex is a robust mutex and the previous owning thread terminated
51947 while holding the mutex lock. The mutex lock shall be acquired by the calling
51948 thread and it is up to the new owner to make the state consistent.

51949 These functions shall not return an error code of [EINTR].

51950 EXAMPLES

51951 None.

51952 APPLICATION USAGE

51953 Applications that have assumed that non-zero return values are errors will need updating for
51954 use with robust mutexes, since a valid return for a thread acquiring a mutex which is protecting
51955 a currently inconsistent state is [EOWNERDEAD]. Applications that do not check the error
51956 returns, due to ruling out the possibility of such errors arising, should not use robust mutexes. If
51957 an application is supposed to work with normal and robust mutexes, it should check all return
51958 values for error conditions and if necessary take appropriate action.

51959 RATIONALE

51960 If an implementation detects that the value specified by the *cond* argument to
51961 *pthread_cond_timedwait()* or *pthread_cond_wait()* does not refer to an initialized condition
51962 variable, or detects that the value specified by the *mutex* argument to *pthread_cond_timedwait()* or
51963 *pthread_cond_wait()* does not refer to an initialized mutex object, it is recommended that the
51964 function should fail and report an [EINVAL] error.

51965 Condition Wait Semantics

51966 It is important to note that when *pthread_cond_wait()* and *pthread_cond_timedwait()* return
51967 without error, the associated predicate may still be false. Similarly, when
51968 *pthread_cond_timedwait()* returns with the timeout error, the associated predicate may be true
51969 due to an unavoidable race between the expiration of the timeout and the predicate state change.

51970 The application needs to recheck the predicate on any return because it cannot be sure there is
51971 another thread waiting on the thread to handle the signal, and if there is not then the signal is
51972 lost. The burden is on the application to check the predicate.

51973 Some implementations, particularly on a multi-processor, may sometimes cause multiple
51974 threads to wake up when the condition variable is signaled simultaneously on different
51975 processors.

51976 In general, whenever a condition wait returns, the thread has to re-evaluate the predicate
51977 associated with the condition wait to determine whether it can safely proceed, should wait
51978 again, or should declare a timeout. A return from the wait does not imply that the associated
51979 predicate is either true or false.

51980 It is thus recommended that a condition wait be enclosed in the equivalent of a “while loop”
51981 that checks the predicate.

Timed Wait Semantics

An absolute time measure was chosen for specifying the timeout parameter for two reasons. First, a relative time measure can be easily implemented on top of a function that specifies absolute time, but there is a race condition associated with specifying an absolute timeout on top of a function that specifies relative timeouts. For example, assume that `clock_gettime()` returns the current time and `cond_relative_timed_wait()` uses relative timeouts:

```
clock_gettime(CLOCK_REALTIME, &now)
reltime = sleep_til_this_absolute_time - now;
cond_relative_timed_wait(c, m, &reltime);
```

If the thread is preempted between the first statement and the last statement, the thread blocks for too long. Blocking, however, is irrelevant if an absolute timeout is used. An absolute timeout also need not be recomputed if it is used multiple times in a loop, such as that enclosing a condition wait.

For cases when the system clock is advanced discontinuously by an operator, it is expected that implementations process any timed wait expiring at an intervening time as if that time had actually occurred.

Cancellation and Condition Wait

A condition wait, whether timed or not, is a cancellation point. That is, the functions `pthread_cond_wait()` or `pthread_cond_timedwait()` are points where a pending (or concurrent) cancellation request is noticed. The reason for this is that an indefinite wait is possible at these points—whatever event is being waited for, even if the program is totally correct, might never occur; for example, some input data being awaited might never be sent. By making condition wait a cancellation point, the thread can be canceled and perform its cancellation cleanup handler even though it may be stuck in some indefinite wait.

A side-effect of acting on a cancellation request while a thread is blocked on a condition variable is to re-acquire the mutex before calling any of the cancellation cleanup handlers. This is done in order to ensure that the cancellation cleanup handler is executed in the same state as the critical code that lies both before and after the call to the condition wait function. This rule is also required when interfacing to POSIX threads from languages, such as Ada or C++, which may choose to map cancellation onto a language exception; this rule ensures that each exception handler guarding a critical section can always safely depend upon the fact that the associated mutex has already been locked regardless of exactly where within the critical section the exception was raised. Without this rule, there would not be a uniform rule that exception handlers could follow regarding the lock, and so coding would become very cumbersome.

Therefore, since *some* statement has to be made regarding the state of the lock when a cancellation is delivered during a wait, a definition has been chosen that makes application coding most convenient and error free.

When acting on a cancellation request while a thread is blocked on a condition variable, the implementation is required to ensure that the thread does not consume any condition signals directed at that condition variable if there are any other threads waiting on that condition variable. This rule is specified in order to avoid deadlock conditions that could occur if these two independent requests (one acting on a thread and the other acting on the condition variable) were not processed independently.

Performance of Mutexes and Condition Variables

Mutexes are expected to be locked only for a few instructions. This practice is almost automatically enforced by the desire of programmers to avoid long serial regions of execution (which would reduce total effective parallelism).

When using mutexes and condition variables, one tries to ensure that the usual case is to lock the mutex, access shared data, and unlock the mutex. Waiting on a condition variable should be a relatively rare situation. For example, when implementing a read-write lock, code that acquires a read-lock typically needs only to increment the count of readers (under mutual-exclusion) and return. The calling thread would actually wait on the condition variable only when there is already an active writer. So the efficiency of a synchronization operation is bounded by the cost of mutex lock/unlock and not by condition wait. Note that in the usual case there is no context switch.

This is not to say that the efficiency of condition waiting is unimportant. Since there needs to be at least one context switch per Ada rendezvous, the efficiency of waiting on a condition variable is important. The cost of waiting on a condition variable should be little more than the minimal cost for a context switch plus the time to unlock and lock the mutex.

Features of Mutexes and Condition Variables

It had been suggested that the mutex acquisition and release be decoupled from condition wait. This was rejected because it is the combined nature of the operation that, in fact, facilitates realtime implementations. Those implementations can atomically move a high-priority thread between the condition variable and the mutex in a manner that is transparent to the caller. This can prevent extra context switches and provide more deterministic acquisition of a mutex when the waiting thread is signaled. Thus, fairness and priority issues can be dealt with directly by the scheduling discipline. Furthermore, the current condition wait operation matches existing practice.

Scheduling Behavior of Mutexes and Condition Variables

Synchronization primitives that attempt to interfere with scheduling policy by specifying an ordering rule are considered undesirable. Threads waiting on mutexes and condition variables are selected to proceed in an order dependent upon the scheduling policy rather than in some fixed order (for example, FIFO or priority). Thus, the scheduling policy determines which thread(s) are awakened and allowed to proceed.

Timed Condition Wait

The `pthread_cond_timedwait()` function allows an application to give up waiting for a particular condition after a given amount of time. An example of its use follows:

```
(void) pthread_mutex_lock(&t.mn);
    t.waiters++;
    clock_gettime(CLOCK_REALTIME, &ts);
    ts.tv_sec += 5;
    rc = 0;
    while (! mypredicate(&t) && rc == 0)
        rc = pthread_cond_timedwait(&t.cond, &t.mn, &ts);
    t.waiters--;
    if (rc == 0 || mypredicate(&t))
        setmystate(&t);
(void) pthread_mutex_unlock(&t.mn);
```

By making the timeout parameter absolute, it does not need to be recomputed each time the program checks its blocking predicate. If the timeout was relative, it would have to be recomputed before each call. This would be especially difficult since such code would need to take into account the possibility of extra wakeups that result from extra broadcasts or signals on the condition variable that occur before either the predicate is true or the timeout is due.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6

The *pthread_cond_timedwait()* and *pthread_cond_wait()* functions are marked as part of the Threads option.

The Open Group Corrigendum U021/9 is applied, correcting the prototype for the *pthread_cond_wait()* function.

The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by adding semantics for the Clock Selection option.

The ERRORS section has an additional case for [EPERM] in response to IEEE PASC Interpretation 1003.1c #28.

The **restrict** keyword is added to the *pthread_cond_timedwait()* and *pthread_cond_wait()* prototypes for alignment with the ISO/IEC 9899:1999 standard.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/89 is applied, updating the DESCRIPTION for consistency with the *pthread_cond_destroy()* function that states it is safe to destroy an initialized condition variable upon which no threads are currently blocked.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/90 is applied, updating words in the DESCRIPTION from “the cancelability enable state” to “the cancelability type”.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/91 is applied, updating the ERRORS section to remove the error case related to *abstime* from the *pthread_cond_wait()* function, and to make the error case related to *abstime* mandatory for *pthread_cond_timedwait()* for consistency with other functions.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/92 is applied, adding a new paragraph to the RATIONALE section stating that an application should check the predicate on any return from this function.

Issue 7

SD5-XSH-ERN-44 is applied, changing the definition of the “shall fail” case of the [EINVAL] error.

Changes are made from The Open Group Technical Standard, 2006, Extended API Set Part 3.

The *pthread_cond_timedwait()* and *pthread_cond_wait()* functions are moved from the Threads option to the Base.

The [EINVAL] error for an uninitialized condition variable or uninitialized mutex object is removed; this condition results in undefined behavior"

- 52113 The [EPERM] error is revised and moved to the “shall fail” list of error conditions for the
52114 *pthread_cond_timedwait()* function.
- 52115 The DESCRIPTION is updated to clarify the behavior when *mutex* is a robust mutex.
- 52116 The ERRORS section is updated to include “shall fail” cases for
52117 PTHREAD_MUTEX_ERRORCHECK mutexes.
- 52118 The DESCRIPTION is rewritten to clarify that undefined behavior occurs only for mutexes
52119 where the [EPERM] error is not mandated.
- 52120 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0456 [91,286,437] and +
52121 XSH/TC1-2008/0457 [239] are applied.

NAME

pthread_condattr_destroy, pthread_condattr_init — destroy and initialize the condition variable attributes object

SYNOPSIS

```
#include <pthread.h>

int pthread_condattr_destroy(pthread_condattr_t *attr);
int pthread_condattr_init(pthread_condattr_t *attr);
```

DESCRIPTION

The *pthread_condattr_destroy()* function shall destroy a condition variable attributes object; the object becomes, in effect, uninitialized. An implementation may cause *pthread_condattr_destroy()* to set the object referenced by *attr* to an invalid value. A destroyed *attr* attributes object can be reinitialized using *pthread_condattr_init()*; the results of otherwise referencing the object after it has been destroyed are undefined.

The *pthread_condattr_init()* function shall initialize a condition variable attributes object *attr* with the default value for all of the attributes defined by the implementation.

Results are undefined if *pthread_condattr_init()* is called specifying an already initialized *attr* attributes object.

After a condition variable attributes object has been used to initialize one or more condition variables, any function affecting the attributes object (including destruction) shall not affect any previously initialized condition variables.

This volume of POSIX.1-2008 requires two attributes, the *clock* attribute and the *process-shared* attribute.

Additional attributes, their default values, and the names of the associated functions to get and set those attribute values are implementation-defined.

The behavior is undefined if the value specified by the *attr* argument to *pthread_condattr_destroy()* does not refer to an initialized condition variable attributes object.

RETURN VALUE

If successful, the *pthread_condattr_destroy()* and *pthread_condattr_init()* functions shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_condattr_init()* function shall fail if:

[ENOMEM] Insufficient memory exists to initialize the condition variable attributes object.

These functions shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

A *process-shared* attribute has been defined for condition variables for the same reason it has been defined for mutexes.

If an implementation detects that the value specified by the *attr* argument to *pthread_condattr_destroy()* does not refer to an initialized condition variable attributes object, it is recommended that the function should fail and report an [EINVAL] error.

52165 See also *pthread_attr_destroy()* and *pthread_mutex_destroy()*.

52166 FUTURE DIRECTIONS

52167 None.

52172 CHANGE HISTORY

52173 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

52174 Issue 6

52175 The *pthread_condattr_destroy()* and *pthread_condattr_init()* functions are marked as part of the
52176 Threads option.

52177 Issue 7

52178 The *pthread_condattr_destroy()* and *pthread_condattr_init()* functions are moved from the Threads
52179 option to the Base.

52180 The [EINVAL] error for an uninitialized condition variable attributes object is removed; this
52181 condition results in undefined behavior.

52182 **NAME**

52183 pthread_condattr_getclock, pthread_condattr_setclock — get and set the clock selection
 52184 condition variable attribute

52185 **SYNOPSIS**

```
52186 #include <pthread.h>

52187 int pthread_condattr_getclock(const pthread_condattr_t *restrict attr,
52188 clockid_t *restrict clock_id);
52189 int pthread_condattr_setclock(pthread_condattr_t *attr,
52190 clockid_t clock_id);
```

52191 **DESCRIPTION**

52192 The *pthread_condattr_getclock()* function shall obtain the value of the *clock* attribute from the
 52193 attributes object referenced by *attr*.

52194 The *pthread_condattr_setclock()* function shall set the *clock* attribute in an initialized attributes
 52195 object referenced by *attr*. If *pthread_condattr_setclock()* is called with a *clock_id* argument that
 52196 refers to a CPU-time clock, the call shall fail.

52197 The *clock* attribute is the clock ID of the clock that shall be used to measure the timeout service of
 52198 *pthread_cond_timedwait()*. The default value of the *clock* attribute shall refer to the system clock.

52199 The behavior is undefined if the value specified by the *attr* argument to
 52200 *pthread_condattr_getclock()* or *pthread_condattr_setclock()* does not refer to an initialized condition
 52201 variable attributes object.

52202 **RETURN VALUE**

52203 If successful, the *pthread_condattr_getclock()* function shall return zero and store the value of the
 52204 clock attribute of *attr* into the object referenced by the *clock_id* argument. Otherwise, an error
 52205 number shall be returned to indicate the error.

52206 If successful, the *pthread_condattr_setclock()* function shall return zero; otherwise, an error
 52207 number shall be returned to indicate the error.

52208 **ERRORS**

52209 The *pthread_condattr_setclock()* function may fail if:

52210 [EINVAL] The value specified by *clock_id* does not refer to a known clock, or is a CPU-
 52211 time clock.

52212 These functions shall not return an error code of [EINTR].

52213 **EXAMPLES**

52214 None.

52215 **APPLICATION USAGE**

52216 None.

52217 **RATIONALE**

52218 If an implementation detects that the value specified by the *attr* argument to
 52219 *pthread_condattr_getclock()* or *pthread_condattr_setclock()* does not refer to an initialized condition
 52220 variable attributes object, it is recommended that the function should fail and report an
 52221 [EINVAL] error.

52222 **FUTURE DIRECTIONS**

52223 None.

SEE ALSO

pthread_condattr_getpshared(), *pthread_create()*, *pthread_mutex_destroy()*

XBD <pthread.h>

CHANGE HISTORY

First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

Issue 7

The *pthread_condattr_getclock()* and *pthread_condattr_setclock()* functions are moved from the Clock Selection option to the Base.

The [EINVAL] error for an uninitialized condition variable attributes object is removed; this condition results in undefined behavior.

NAME

pthread_condattr_getpshared, pthread_condattr_setpshared — get and set the process-shared condition variable attributes

SYNOPSIS

```
TSH #include <pthread.h>

int pthread_condattr_getpshared(const pthread_condattr_t *restrict attr,
    int *restrict pshared);
int pthread_condattr_setpshared(pthread_condattr_t *attr,
    int pshared);
```

DESCRIPTION

The *pthread_condattr_getpshared()* function shall obtain the value of the *process-shared* attribute from the attributes object referenced by *attr*.

The *pthread_condattr_setpshared()* function shall set the *process-shared* attribute in an initialized attributes object referenced by *attr*.

The *process-shared* attribute is set to `PTHREAD_PROCESS_SHARED` to permit a condition variable to be operated upon by any thread that has access to the memory where the condition variable is allocated, even if the condition variable is allocated in memory that is shared by multiple processes. If the *process-shared* attribute is `PTHREAD_PROCESS_PRIVATE`, the condition variable shall only be operated upon by threads created within the same process as the thread that initialized the condition variable; if threads of differing processes attempt to operate on such a condition variable, the behavior is undefined. The default value of the attribute is `PTHREAD_PROCESS_PRIVATE`.

The behavior is undefined if the value specified by the *attr* argument to *pthread_condattr_getpshared()* or *pthread_condattr_setpshared()* does not refer to an initialized condition variable attributes object.

RETURN VALUE

If successful, the *pthread_condattr_setpshared()* function shall return zero; otherwise, an error number shall be returned to indicate the error.

If successful, the *pthread_condattr_getpshared()* function shall return zero and store the value of the *process-shared* attribute of *attr* into the object referenced by the *pshared* parameter. Otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_condattr_setpshared()* function may fail if:

[EINVAL] The new value specified for the attribute is outside the range of legal values for that attribute.

These functions shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

If an implementation detects that the value specified by the *attr* argument to *pthread_condattr_getpshared()* or *pthread_condattr_setpshared()* does not refer to an initialized condition variable attributes object, it is recommended that the function should fail and report an [EINVAL] error.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6

The *pthread_condattr_getpshared()* and *pthread_condattr_setpshared()* functions are marked as part of the Threads and Thread Process-Shared Synchronization options.

The **restrict** keyword is added to the *pthread_condattr_getpshared()* prototype for alignment with the ISO/IEC 9899:1999 standard.

Issue 7

The *pthread_condattr_getpshared()* and *pthread_condattr_setpshared()* functions are moved from the Threads option.

The [EINVAL] error for an uninitialized condition variable attributes object is removed; this condition results in undefined behavior.

52297 **NAME**

52298 pthread_condattr_init — initialize the condition variable attributes object

52299 **SYNOPSIS**

52300 #include <pthread.h>

52301 int pthread_condattr_init(pthread_condattr_t *attr);

52302 **DESCRIPTION**52303 Refer to *pthread_condattr_destroy()*.

52304 NAME

52305 pthread_condattr_setclock — set the clock selection condition variable attribute

52306 SYNOPSIS

52307 #include <pthread.h>

52308 int pthread_condattr_setclock(pthread_condattr_t *attr,
52309 clockid_t clock_id);

52310 DESCRIPTION

52311 Refer to *pthread_condattr_getclock()*.

52312 **NAME**

52313 pthread_condattr_setpshared — set the process-shared condition variable attribute

52314 **SYNOPSIS**

```
52315 TSH      #include <pthread.h>
52316          int pthread_condattr_setpshared(pthread_condattr_t *attr,
52317          int pshared);
```

52318 **DESCRIPTION**52319 Refer to *pthread_condattr_getpshared()*.

52320 **NAME**

52321 pthread_create — thread creation

52322 **SYNOPSIS**

52323 #include <pthread.h>

```
52324 int pthread_create(pthread_t *restrict thread,
52325                   const pthread_attr_t *restrict attr,
52326                   void *(*start_routine)(void*), void *restrict arg);
```

52327 **DESCRIPTION**

52328 The *pthread_create()* function shall create a new thread, with attributes specified by *attr*, within a
 52329 process. If *attr* is NULL, the default attributes shall be used. If the attributes specified by *attr* are
 52330 modified later, the thread's attributes shall not be affected. Upon successful completion,
 52331 *pthread_create()* shall store the ID of the created thread in the location referenced by *thread*.

52332 The thread is created executing *start_routine* with *arg* as its sole argument. If the *start_routine*
 52333 returns, the effect shall be as if there was an implicit call to *pthread_exit()* using the return value
 52334 of *start_routine* as the exit status. Note that the thread in which *main()* was originally invoked
 52335 differs from this. When it returns from *main()*, the effect shall be as if there was an implicit call to
 52336 *exit()* using the return value of *main()* as the exit status.

52337 The signal state of the new thread shall be initialized as follows:

- 52338 • The signal mask shall be inherited from the creating thread.
- 52339 • The set of signals pending for the new thread shall be empty.

52340 XSI The thread-local current locale and the alternate stack shall not be inherited. +

52341 The floating-point environment shall be inherited from the creating thread.

52342 If *pthread_create()* fails, no new thread is created and the contents of the location referenced by
 52343 *thread* are undefined.

52344 TCT If _POSIX_THREAD_CPUTIME is defined, the new thread shall have a CPU-time clock
 52345 accessible, and the initial value of this clock shall be set to zero.

52346 The behavior is undefined if the value specified by the *attr* argument to *pthread_create()* does not
 52347 refer to an initialized thread attributes object.

52348 **RETURN VALUE**

52349 If successful, the *pthread_create()* function shall return zero; otherwise, an error number shall be
 52350 returned to indicate the error.

52351 **ERRORS**

52352 The *pthread_create()* function shall fail if:

52353 [EAGAIN] The system lacked the necessary resources to create another thread, or the
 52354 system-imposed limit on the total number of threads in a process
 52355 {PTHREAD_THREADS_MAX} would be exceeded.

52356 [EPERM] The caller does not have appropriate privileges to set the required scheduling
 52357 parameters or scheduling policy.

52358 The *pthread_create()* function shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

There is no requirement on the implementation that the ID of the created thread be available before the newly created thread starts executing. The calling thread can obtain the ID of the created thread through the return value of the *pthread_create()* function, and the newly created thread can obtain its ID by a call to *pthread_self()*.

RATIONALE

A suggested alternative to *pthread_create()* would be to define two separate operations: create and start. Some applications would find such behavior more natural. Ada, in particular, separates the “creation” of a task from its “activation”.

Splitting the operation was rejected by the standard developers for many reasons:

- The number of calls required to start a thread would increase from one to two and thus place an additional burden on applications that do not require the additional synchronization. The second call, however, could be avoided by the additional complication of a start-up state attribute.
- An extra state would be introduced: “created but not started”. This would require the standard to specify the behavior of the thread operations when the target has not yet started executing.
- For those applications that require such behavior, it is possible to simulate the two separate steps with the facilities that are currently provided. The *start_routine()* can synchronize by waiting on a condition variable that is signaled by the start operation.

An Ada implementor can choose to create the thread at either of two points in the Ada program: when the task object is created, or when the task is activated (generally at a “begin”). If the first approach is adopted, the *start_routine()* needs to wait on a condition variable to receive the order to begin “activation”. The second approach requires no such condition variable or extra synchronization. In either approach, a separate Ada task control block would need to be created when the task object is created to hold rendezvous queues, and so on.

An extension of the preceding model would be to allow the state of the thread to be modified between the create and start. This would allow the thread attributes object to be eliminated. This has been rejected because:

- All state in the thread attributes object has to be able to be set for the thread. This would require the definition of functions to modify thread attributes. There would be no reduction in the number of function calls required to set up the thread. In fact, for an application that creates all threads using identical attributes, the number of function calls required to set up the threads would be dramatically increased. Use of a thread attributes object permits the application to make one set of attribute setting function calls. Otherwise, the set of attribute setting function calls needs to be made for each thread creation.
- Depending on the implementation architecture, functions to set thread state would require kernel calls, or for other implementation reasons would not be able to be implemented as macros, thereby increasing the cost of thread creation.
- The ability for applications to segregate threads by class would be lost.

Another suggested alternative uses a model similar to that for process creation, such as “thread fork”. The fork semantics would provide more flexibility and the “create” function can be implemented simply by doing a thread fork followed immediately by a call to the desired “start

routine” for the thread. This alternative has these problems:

- For many implementations, the entire stack of the calling thread would need to be duplicated, since in many architectures there is no way to determine the size of the calling frame.
- Efficiency is reduced since at least some part of the stack has to be copied, even though in most cases the thread never needs the copied context, since it merely calls the desired start routine.

If an implementation detects that the value specified by the *attr* argument to *pthread_create()* does not refer to an initialized thread attributes object, it is recommended that the function should fail and report an [EINVAL] error.

FUTURE DIRECTIONS

None.

XBD Section 4.11 (on page 110), **<pthread.h>**

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6

The *pthread_create()* function is marked as part of the Threads option.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The [EPERM] mandatory error condition is added.

The thread CPU-time clock semantics are added for alignment with IEEE Std 1003.1d-1999.

The **restrict** keyword is added to the *pthread_create()* prototype for alignment with the ISO/IEC 9899:1999 standard.

The DESCRIPTION is updated to make it explicit that the floating-point environment is inherited from the creating thread.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/44 is applied, adding text that the alternate stack is not inherited.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/93 is applied, updating the ERRORS section to remove the mandatory [EINVAL] error (“The value specified by *attr* is invalid”), and adding the optional [EINVAL] error (“The attributes specified by *attr* are invalid”).

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/94 is applied, adding the APPLICATION USAGE section.

Issue 7

The *pthread_create()* function is moved from the Threads option to the Base.

The [EINVAL] error for an uninitialized thread attributes object is removed; this condition results in undefined behavior.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0458 [302] is applied.

+

52444 **NAME**

52445 pthread_detach — detach a thread

52446 **SYNOPSIS**

52447 #include <pthread.h>

52448 int pthread_detach(pthread_t thread);

52449 **DESCRIPTION**

52450 The *pthread_detach()* function shall indicate to the implementation that storage for the thread
52451 *thread* can be reclaimed when that thread terminates. If *thread* has not terminated,
52452 *pthread_detach()* shall not cause it to terminate.

52453 The behavior is undefined if the value specified by the *thread* argument to *pthread_detach()* does
52454 not refer to a joinable thread.

52455 **RETURN VALUE**

52456 If the call succeeds, *pthread_detach()* shall return 0; otherwise, an error number shall be returned
52457 to indicate the error.

52458 **ERRORS**52459 The *pthread_detach()* function shall not return an error code of [EINTR].52460 **EXAMPLES**

52461 None.

52462 **APPLICATION USAGE**

52463 None.

52464 **RATIONALE**

52465 The *pthread_join()* or *pthread_detach()* functions should eventually be called for every thread that
52466 is created so that storage associated with the thread may be reclaimed.

52467 It has been suggested that a “detach” function is not necessary; the *detachstate* thread creation
52468 attribute is sufficient, since a thread need never be dynamically detached. However, need arises
52469 in at least two cases:

- 52470 1. In a cancellation handler for a *pthread_join()* it is nearly essential to have a
52471 *pthread_detach()* function in order to detach the thread on which *pthread_join()* was
52472 waiting. Without it, it would be necessary to have the handler do another *pthread_join()* to
52473 attempt to detach the thread, which would both delay the cancellation processing for an
52474 unbounded period and introduce a new call to *pthread_join()*, which might itself need a
52475 cancellation handler. A dynamic detach is nearly essential in this case.
- 52476 2. In order to detach the “initial thread” (as may be desirable in processes that set up server
52477 threads).

52478 If an implementation detects that the value specified by the *thread* argument to *pthread_detach()*
52479 does not refer to a joinable thread, it is recommended that the function should fail and report an
52480 [EINVAL] error.

52481 If an implementation detects use of a thread ID after the end of its lifetime, it is recommended
52482 that the function should fail and report an [ESRCH] error.

52483 **FUTURE DIRECTIONS**

52484 None.

52487 XBD <pthread.h>

52488 **CHANGE HISTORY**

52489 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

52490 **Issue 6**52491 The *pthread_detach()* function is marked as part of the Threads option.52492 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/95 is applied, updating the ERRORS
52493 section so that the [EINVAL] and [ESRCH] error cases become optional.52494 **Issue 7**52495 The *pthread_detach()* function is moved from the Threads option to the Base.

52496 Austin Group Interpretation 1003.1-2001 #142 is applied, removing the [ESRCH] error condition.

52497 The [EINVAL] error for a non-joinable thread is removed; this condition results in undefined
52498 behavior.

52499 **NAME**

52500 pthread_equal — compare thread IDs

52501 **SYNOPSIS**

52502 #include <pthread.h>

52503 int pthread_equal(pthread_t t1, pthread_t t2);

52504 **DESCRIPTION**52505 This function shall compare the thread IDs *t1* and *t2*.52506 **RETURN VALUE**52507 The *pthread_equal()* function shall return a non-zero value if *t1* and *t2* are equal; otherwise, zero
52508 shall be returned.52509 If either *t1* or *t2* are not valid thread IDs, the behavior is undefined.52510 **ERRORS**

52511 No errors are defined.

52512 The *pthread_equal()* function shall not return an error code of [EINTR].52513 **EXAMPLES**

52514 None.

52515 **APPLICATION USAGE**

52516 None.

52517 **RATIONALE**52518 Implementations may choose to define a thread ID as a structure. This allows additional
52519 flexibility and robustness over using an **int**. For example, a thread ID could include a sequence
52520 number that allows detection of “dangling IDs” (copies of a thread ID that has been detached).
52521 Since the C language does not support comparison on structure types, the *pthread_equal()*
52522 function is provided to compare thread IDs.52523 **FUTURE DIRECTIONS**

52524 None.

52525 **SEE ALSO**52526 *pthread_create()*, *pthread_self()*

52530 **Issue 6**52531 The *pthread_equal()* function is marked as part of the Threads option.52532 **Issue 7**52533 The *pthread_equal()* function is moved from the Threads option to the Base.

NAME

pthread_exit — thread termination

SYNOPSIS

```
#include <pthread.h>
```

```
void pthread_exit(void *value_ptr);
```

DESCRIPTION

The *pthread_exit()* function shall terminate the calling thread and make the value *value_ptr* available to any successful join with the terminating thread. Any cancellation cleanup handlers that have been pushed and not yet popped shall be popped in the reverse order that they were pushed and then executed. After all cancellation cleanup handlers have been executed, if the thread has any thread-specific data, appropriate destructor functions shall be called in an unspecified order. Thread termination does not release any application visible process resources, including, but not limited to, mutexes and file descriptors, nor does it perform any process-level cleanup actions, including, but not limited to, calling any *atexit()* routines that may exist.

An implicit call to *pthread_exit()* is made when a thread other than the thread in which *main()* was first invoked returns from the start routine that was used to create it. The function's return value shall serve as the thread's exit status.

The behavior of *pthread_exit()* is undefined if called from a cancellation cleanup handler or destructor function that was invoked as a result of either an implicit or explicit call to *pthread_exit()*.

After a thread has terminated, the result of access to local (auto) variables of the thread is undefined. Thus, references to local variables of the exiting thread should not be used for the *pthread_exit()* *value_ptr* parameter value.

The process shall exit with an exit status of 0 after the last thread has been terminated. The behavior shall be as if the implementation called *exit()* with a zero argument at thread termination time.

RETURN VALUE

The *pthread_exit()* function cannot return to its caller.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

The normal mechanism by which a thread terminates is to return from the routine that was specified in the *pthread_create()* call that started it. The *pthread_exit()* function provides the capability for a thread to terminate without requiring a return from the start routine of that thread, thereby providing a function analogous to *exit()*.

Regardless of the method of thread termination, any cancellation cleanup handlers that have been pushed and not yet popped are executed, and the destructors for any existing thread-specific data are executed. This volume of POSIX.1-2008 requires that cancellation cleanup handlers be popped and called in order. After all cancellation cleanup handlers have been executed, thread-specific data destructors are called, in an unspecified order, for each item of thread-specific data that exists in the thread. This ordering is necessary because cancellation cleanup handlers may rely on thread-specific data.

52580 As the meaning of the status is determined by the application (except when the thread has been
52581 canceled, in which case it is PTHREAD_CANCELED), the implementation has no idea what an
52582 illegal status value is, which is why no address error checking is done.

52583 **FUTURE DIRECTIONS**

52584 None.

52592 **Issue 7**

52593 The *pthread_exit()* function is moved from the Threads option to the Base.

NAME

pthread_getconcurrency, pthread_setconcurrency — get and set the level of concurrency

SYNOPSIS

```
OB XSI #include <pthread.h>

int pthread_getconcurrency(void);
int pthread_setconcurrency(int new_level);
```

DESCRIPTION

Unbound threads in a process may or may not be required to be simultaneously active. By default, the threads implementation ensures that a sufficient number of threads are active so that the process can continue to make progress. While this conserves system resources, it may not produce the most effective level of concurrency.

The *pthread_setconcurrency()* function allows an application to inform the threads implementation of its desired concurrency level, *new_level*. The actual level of concurrency provided by the implementation as a result of this function call is unspecified.

If *new_level* is zero, it causes the implementation to maintain the concurrency level at its discretion as if *pthread_setconcurrency()* had never been called.

The *pthread_getconcurrency()* function shall return the value set by a previous call to the *pthread_setconcurrency()* function. If the *pthread_setconcurrency()* function was not previously called, this function shall return zero to indicate that the implementation is maintaining the concurrency level.

A call to *pthread_setconcurrency()* shall inform the implementation of its desired concurrency level. The implementation shall use this as a hint, not a requirement.

If an implementation does not support multiplexing of user threads on top of several kernel-scheduled entities, the *pthread_setconcurrency()* and *pthread_getconcurrency()* functions are provided for source code compatibility but they shall have no effect when called. To maintain the function semantics, the *new_level* parameter is saved when *pthread_setconcurrency()* is called so that a subsequent call to *pthread_getconcurrency()* shall return the same value.

RETURN VALUE

If successful, the *pthread_setconcurrency()* function shall return zero; otherwise, an error number shall be returned to indicate the error.

The *pthread_getconcurrency()* function shall always return the concurrency level set by a previous call to *pthread_setconcurrency()*. If the *pthread_setconcurrency()* function has never been called, *pthread_getconcurrency()* shall return zero.

ERRORS

The *pthread_setconcurrency()* function shall fail if:

[EINVAL] The value specified by *new_level* is negative.

[EAGAIN] The value specified by *new_level* would cause a system resource to be exceeded.

The *pthread_setconcurrency()* function shall not return an error code of [EINTR].

52633 EXAMPLES

52634 None.

52635 APPLICATION USAGE

52636 Application developers should note that an implementation can always ignore any calls to
52637 *pthread_setconcurrency()* and return a constant for *pthread_getconcurrency()*. For this reason, it is
52638 not recommended that portable applications use this function.

52639 RATIONALE

52640 None.

52641 FUTURE DIRECTIONS

52642 These functions may be removed in a future version.

52645 CHANGE HISTORY

52646 First released in Issue 5.

52647 Issue 7

52648 SD5-XSH-ERN-184 is applied.

52649 The *pthread_getconcurrency()* and *pthread_setconcurrency()* functions are marked obsolescent.

NAME

pthread_getcpuclockid — access a thread CPU-time clock (**ADVANCED REALTIME THREADS**)

SYNOPSIS

```
TCT    #include <pthread.h>
        #include <time.h>

        int pthread_getcpuclockid(pthread_t thread_id, clockid_t *clock_id);
```

DESCRIPTION

The *pthread_getcpuclockid()* function shall return in *clock_id* the clock ID of the CPU-time clock of the thread specified by *thread_id*, if the thread specified by *thread_id* exists.

RETURN VALUE

Upon successful completion, *pthread_getcpuclockid()* shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

The *pthread_getcpuclockid()* function is part of the Thread CPU-Time Clocks option and need not be provided on all implementations.

RATIONALE

If an implementation detects use of a thread ID after the end of its lifetime, it is recommended that the function should fail and report an [ESRCH] error.

FUTURE DIRECTIONS

None.

SEE ALSO

CHANGE HISTORY

First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

In the SYNOPSIS, the inclusion of **<sys/types.h>** is no longer required.

Issue 7

The *pthread_getcpuclockid()* function is moved from the Threads option.

Austin Group Interpretation 1003.1-2001 #142 is applied, removing the [ESRCH] error condition.

NAME

pthread_getschedparam, pthread_setschedparam — dynamic thread scheduling parameters access (**REALTIME THREADS**)

SYNOPSIS

```

#include <pthread.h>

int pthread_getschedparam(pthread_t thread, int *restrict policy,
    struct sched_param *restrict param);
int pthread_setschedparam(pthread_t thread, int policy,
    const struct sched_param *param);

```

DESCRIPTION

The *pthread_getschedparam()* and *pthread_setschedparam()* functions shall, respectively, get and set the scheduling policy and parameters of individual threads within a multi-threaded process to be retrieved and set. For SCHED_FIFO and SCHED_RR, the only required member of the **sched_param** structure is the priority *sched_priority*. For SCHED_OTHER, the affected scheduling parameters are implementation-defined.

The *pthread_getschedparam()* function shall retrieve the scheduling policy and scheduling parameters for the thread whose thread ID is given by *thread* and shall store those values in *policy* and *param*, respectively. The priority value returned from *pthread_getschedparam()* shall be the value specified by the most recent *pthread_setschedparam()*, *pthread_setschedprio()*, or *pthread_create()* call affecting the target thread. It shall not reflect any temporary adjustments to its priority as a result of any priority inheritance or ceiling functions. The *pthread_setschedparam()* function shall set the scheduling policy and associated scheduling parameters for the thread whose thread ID is given by *thread* to the policy and associated parameters provided in *policy* and *param*, respectively.

The *policy* parameter may have the value SCHED_OTHER, SCHED_FIFO, or SCHED_RR. The scheduling parameters for the SCHED_OTHER policy are implementation-defined. The SCHED_FIFO and SCHED_RR policies shall have a single scheduling parameter, *priority*.

If **_POSIX_THREAD_SPORADIC_SERVER** is defined, then the *policy* argument may have the value SCHED_SPORADIC, with the exception for the *pthread_setschedparam()* function that if the scheduling policy was not SCHED_SPORADIC at the time of the call, it is implementation-defined whether the function is supported; in other words, the implementation need not allow the application to dynamically change the scheduling policy to SCHED_SPORADIC. The sporadic server scheduling policy has the associated parameters *sched_ss_low_priority*, *sched_ss_repl_period*, *sched_ss_init_budget*, *sched_priority*, and *sched_ss_max_repl*. The specified *sched_ss_repl_period* shall be greater than or equal to the specified *sched_ss_init_budget* for the function to succeed; if it is not, then the function shall fail. The value of *sched_ss_max_repl* shall be within the inclusive range [1,{SS_REPL_MAX}] for the function to succeed; if not, the function shall fail. It is unspecified whether the *sched_ss_repl_period* and *sched_ss_init_budget* values are stored as provided by this function or are rounded to align with the resolution of the clock being used.

If the *pthread_setschedparam()* function fails, the scheduling parameters shall not be changed for the target thread.

RETURN VALUE

If successful, the *pthread_getschedparam()* and *pthread_setschedparam()* functions shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_setschedparam()* function shall fail if:

[ENOTSUP] An attempt was made to set the policy or scheduling parameters to an unsupported value.

[ENOTSUP] An attempt was made to dynamically change the scheduling policy to SCHED_SPORADIC, and the implementation does not support this change.

The *pthread_setschedparam()* function may fail if:

[EINVAL] The value specified by *policy* or one of the scheduling parameters associated with the scheduling policy *policy* is invalid.

[EPERM] The caller does not have appropriate privileges to set either the scheduling parameters or the scheduling policy of the specified thread.

[EPERM] The implementation does not allow the application to modify one of the parameters to the value specified.

These functions shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

If an implementation detects use of a thread ID after the end of its lifetime, it is recommended that the function should fail and report an [ESRCH] error.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6

The *pthread_getschedparam()* and *pthread_setschedparam()* functions are marked as part of the Threads and Thread Execution Scheduling options.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Thread Execution Scheduling option.

The Open Group Corrigendum U026/2 is applied, correcting the prototype for the *pthread_setschedparam()* function so that its second argument is of type **int**.

The SCHED_SPORADIC scheduling policy is added for alignment with IEEE Std 1003.1d-1999.

The **restrict** keyword is added to the *pthread_getschedparam()* prototype for alignment with the ISO/IEC 9899:1999 standard.

The Open Group Corrigendum U047/1 is applied.

IEEE PASC Interpretation 1003.1 #96 is applied, noting that priority values can also be set by a call to the *pthread_setschedprio()* function.

52770 **Issue 7**

52771 The *pthread_getschedparam()* and *pthread_setschedparam()* functions are moved from the Threads
52772 option.

52773 Austin Group Interpretation 1003.1-2001 #119 is applied, clarifying the accuracy requirements
52774 for the *sched_ss_repl_period* and *sched_ss_init_budget* values.

52775 Austin Group Interpretation 1003.1-2001 #142 is applied, removing the [ESRCH] error condition.

52776 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0459 [314] is applied.

+

NAME

pthread_getspecific, pthread_setspecific — thread-specific data management

SYNOPSIS

```
#include <pthread.h>
```

```
void *pthread_getspecific(pthread_key_t key);
int pthread_setspecific(pthread_key_t key, const void *value);
```

DESCRIPTION

The *pthread_getspecific()* function shall return the value currently bound to the specified *key* on behalf of the calling thread.

The *pthread_setspecific()* function shall associate a thread-specific *value* with a *key* obtained via a previous call to *pthread_key_create()*. Different threads may bind different values to the same key. These values are typically pointers to blocks of dynamically allocated memory that have been reserved for use by the calling thread.

The effect of calling *pthread_getspecific()* or *pthread_setspecific()* with a *key* value not obtained from *pthread_key_create()* or after *key* has been deleted with *pthread_key_delete()* is undefined.

Both *pthread_getspecific()* and *pthread_setspecific()* may be called from a thread-specific data destructor function. A call to *pthread_getspecific()* for the thread-specific data key being destroyed shall return the value NULL, unless the value is changed (after the destructor starts) by a call to *pthread_setspecific()*. Calling *pthread_setspecific()* from a thread-specific data destructor routine may result either in lost storage (after at least PTHREAD_DESTRUCTOR_ITERATIONS attempts at destruction) or in an infinite loop.

Both functions may be implemented as macros.

RETURN VALUE

The *pthread_getspecific()* function shall return the thread-specific data value associated with the given *key*. If no thread-specific data value is associated with *key*, then the value NULL shall be returned.

If successful, the *pthread_setspecific()* function shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

No errors are returned from *pthread_getspecific()*.

The *pthread_setspecific()* function shall fail if:

[ENOMEM] Insufficient memory exists to associate the non-NULL value with the key.

The *pthread_setspecific()* function shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

Performance and ease-of-use of *pthread_getspecific()* are critical for functions that rely on maintaining state in thread-specific data. Since no errors are required to be detected by it, and since the only error that could be detected is the use of an invalid key, the function to *pthread_getspecific()* has been designed to favor speed and simplicity over error reporting.

If an implementation detects that the value specified by the *key* argument to *pthread_setspecific()* does not refer to a key value obtained from *pthread_key_create()* or refers to a key that has been

52821 deleted with *pthread_key_delete()*, it is recommended that the function should fail and report an
52822 [EINVAL] error.

52823 FUTURE DIRECTIONS

52824 None.

52825 SEE ALSO

52826 *pthread_key_create()*

52827 XBD <pthread.h>

52828 CHANGE HISTORY

52829 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

52830 Issue 6

52831 The *pthread_getspecific()* and *pthread_setspecific()* functions are marked as part of the Threads
52832 option.

52833 IEEE PASC Interpretation 1003.1c #3 (Part 6) is applied, updating the DESCRIPTION.

52834 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/96 is applied, updating the ERRORS
52835 section so that the [ENOMEM] error case is changed from “to associate the value with the key”
52836 to “to associate the non-NULL value with the key”.

52837 Issue 7

52838 Austin Group Interpretation 1003.1-2001 #063 is applied, updating the ERRORS section.

52839 The *pthread_getspecific()* and *pthread_setspecific()* functions are moved from the Threads option to
52840 the Base.

52841 The [EINVAL] error for a key value not obtained from *pthread_key_create()* or a key deleted with
52842 *pthread_key_delete()* is removed; this condition results in undefined behavior.

52843 **NAME**

52844 pthread_join — wait for thread termination

52845 **SYNOPSIS**

52846 #include <pthread.h>

52847 int pthread_join(pthread_t thread, void **value_ptr);

52848 **DESCRIPTION**

52849 The *pthread_join()* function shall suspend execution of the calling thread until the target *thread*
 52850 terminates, unless the target *thread* has already terminated. On return from a successful
 52851 *pthread_join()* call with a non-NULL *value_ptr* argument, the value passed to *pthread_exit()* by
 52852 the terminating thread shall be made available in the location referenced by *value_ptr*. When a
 52853 *pthread_join()* returns successfully, the target thread has been terminated. The results of multiple
 52854 simultaneous calls to *pthread_join()* specifying the same target thread are undefined. If the
 52855 thread calling *pthread_join()* is canceled, then the target thread shall not be detached.

52856 It is unspecified whether a thread that has exited but remains unjoined counts against
 52857 {PTHREAD_THREADS_MAX}.

52858 The behavior is undefined if the value specified by the *thread* argument to *pthread_join()* does not
 52859 refer to a joinable thread.

52860 The behavior is undefined if the value specified by the *thread* argument to *pthread_join()* refers to
 52861 the calling thread.

52862 **RETURN VALUE**

52863 If successful, the *pthread_join()* function shall return zero; otherwise, an error number shall be
 52864 returned to indicate the error.

52865 **ERRORS**52866 The *pthread_join()* function may fail if:

52867 [EDEADLK] A deadlock was detected.

52868 The *pthread_join()* function shall not return an error code of [EINTR].52869 **EXAMPLES**

52870 An example of thread creation and deletion follows:

```

52871 typedef struct {
52872     int *ar;
52873     long n;
52874 } subarray;

52875 void *
52876 incer(void *arg)
52877 {
52878     long i;

52879     for (i = 0; i < ((subarray *)arg)->n; i++)
52880         ((subarray *)arg)->ar[i]++;
52881 }

52882 int main(void)
52883 {
52884     int          ar[1000000];
52885     pthread_t    th1, th2;
52886     subarray     sb1, sb2;

```

```

52887     sb1.ar = &ar[0];
52888     sb1.n  = 500000;
52889     (void) pthread_create(&th1, NULL, incer, &sb1);

52890     sb2.ar = &ar[500000];
52891     sb2.n  = 500000;
52892     (void) pthread_create(&th2, NULL, incer, &sb2);

52893     (void) pthread_join(th1, NULL);
52894     (void) pthread_join(th2, NULL);
52895     return 0;
52896 }

```

APPLICATION USAGE

None.

RATIONALE

The *pthread_join()* function is a convenience that has proven useful in multi-threaded applications. It is true that a programmer could simulate this function if it were not provided by passing extra state as part of the argument to the *start_routine()*. The terminating thread would set a flag to indicate termination and broadcast a condition that is part of that state; a joining thread would wait on that condition variable. While such a technique would allow a thread to wait on more complex conditions (for example, waiting for multiple threads to terminate), waiting on individual thread termination is considered widely useful. Also, including the *pthread_join()* function in no way precludes a programmer from coding such complex waits. Thus, while not a primitive, including *pthread_join()* in this volume of POSIX.1-2008 was considered valuable.

The *pthread_join()* function provides a simple mechanism allowing an application to wait for a thread to terminate. After the thread terminates, the application may then choose to clean up resources that were used by the thread. For instance, after *pthread_join()* returns, any application-provided stack storage could be reclaimed.

The *pthread_join()* or *pthread_detach()* function should eventually be called for every thread that is created with the *detachstate* attribute set to *PTHREAD_CREATE_JOINABLE* so that storage associated with the thread may be reclaimed.

The interaction between *pthread_join()* and cancellation is well-defined for the following reasons:

- The *pthread_join()* function, like all other non-async-cancel-safe functions, can only be called with deferred cancelability type.
- Cancellation cannot occur in the disabled cancelability state.

Thus, only the default cancelability state need be considered. As specified, either the *pthread_join()* call is canceled, or it succeeds, but not both. The difference is obvious to the application, since either a cancellation handler is run or *pthread_join()* returns. There are no race conditions since *pthread_join()* was called in the deferred cancelability state.

If an implementation detects that the value specified by the *thread* argument to *pthread_join()* does not refer to a joinable thread, it is recommended that the function should fail and report an [EINVAL] error.

If an implementation detects that the value specified by the *thread* argument to *pthread_join()* refers to the calling thread, it is recommended that the function should fail and report an [EDEADLK] error.

If an implementation detects use of a thread ID after the end of its lifetime, it is recommended

52932 that the function should fail and report an [ESRCH] error.

52933 **FUTURE DIRECTIONS**

52934 None.

52938 **CHANGE HISTORY**

52939 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

52940 **Issue 6**

52941 The *pthread_join()* function is marked as part of the Threads option.

52942 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/97 is applied, updating the ERRORS
52943 section so that the [EINVAL] error is made optional and the words “the implementation has
52944 detected” are removed from it.

52945 **Issue 7**

52946 The *pthread_join()* function is moved from the Threads option to the Base.

52947 Austin Group Interpretation 1003.1-2001 #142 is applied, removing the [ESRCH] error condition.

52948 The [EINVAL] error for a non-joinable thread is removed; this condition results in undefined
52949 behavior.

52950 The [EDEADLK] error for the calling thread is removed; this condition results in undefined
52951 behavior.

NAME

pthread_key_create — thread-specific data key creation

SYNOPSIS

```
#include <pthread.h>
```

```
int pthread_key_create(pthread_key_t *key, void (*destructor)(void*));
```

DESCRIPTION

The *pthread_key_create()* function shall create a thread-specific data key visible to all threads in the process. Key values provided by *pthread_key_create()* are opaque objects used to locate thread-specific data. Although the same key value may be used by different threads, the values bound to the key by *pthread_setspecific()* are maintained on a per-thread basis and persist for the life of the calling thread.

Upon key creation, the value NULL shall be associated with the new key in all active threads. Upon thread creation, the value NULL shall be associated with all defined keys in the new thread.

An optional destructor function may be associated with each key value. At thread exit, if a key value has a non-NULL destructor pointer, and the thread has a non-NULL value associated with that key, the value of the key is set to NULL, and then the function pointed to is called with the previously associated value as its sole argument. The order of destructor calls is unspecified if more than one destructor exists for a thread when it exits.

If, after all the destructors have been called for all non-NULL values with associated destructors, there are still some non-NULL values with associated destructors, then the process is repeated. If, after at least {PTHREAD_DESTRUCTOR_ITERATIONS} iterations of destructor calls for outstanding non-NULL values, there are still some non-NULL values with associated destructors, implementations may stop calling destructors, or they may continue calling destructors until no non-NULL values with associated destructors exist, even though this might result in an infinite loop.

RETURN VALUE

If successful, the *pthread_key_create()* function shall store the newly created key value at **key* and shall return zero. Otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_key_create()* function shall fail if:

[EAGAIN] The system lacked the necessary resources to create another thread-specific data key, or the system-imposed limit on the total number of keys per process {PTHREAD_KEYS_MAX} has been exceeded.

[ENOMEM] Insufficient memory exists to create the key.

The *pthread_key_create()* function shall not return an error code of [EINTR].

EXAMPLES

The following example demonstrates a function that initializes a thread-specific data key when it is first called, and associates a thread-specific object with each calling thread, initializing this object when necessary.

```
static pthread_key_t key;
static pthread_once_t key_once = PTHREAD_ONCE_INIT;

static void
make_key()
{
```

```

52997         (void) pthread_key_create(&key, NULL);
52998     }
52999     func()
53000     {
53001         void *ptr;
53002         (void) pthread_once(&key_once, make_key);
53003         if ((ptr = pthread_getspecific(key)) == NULL) {
53004             ptr = malloc(OBJECT_SIZE);
53005             ...
53006             (void) pthread_setspecific(key, ptr);
53007         }
53008         ...
53009     }

```

Note that the key has to be initialized before *pthread_getspecific()* or *pthread_setspecific()* can be used. The *pthread_key_create()* call could either be explicitly made in a module initialization routine, or it can be done implicitly by the first call to a module as in this example. Any attempt to use the key before it is initialized is a programming error, making the code below incorrect.

```

53014     static pthread_key_t key;
53015     func()
53016     {
53017         void *ptr;
53018         /* KEY NOT INITIALIZED!!! THIS WON'T WORK!!! */
53019         if ((ptr = pthread_getspecific(key)) == NULL &&
53020             pthread_setspecific(key, NULL) != 0) {
53021             pthread_key_create(&key, NULL);
53022             ...
53023         }
53024     }

```

APPLICATION USAGE

None.

RATIONALE

Destructor Functions

Normally, the value bound to a key on behalf of a particular thread is a pointer to storage allocated dynamically on behalf of the calling thread. The destructor functions specified with *pthread_key_create()* are intended to be used to free this storage when the thread exits. Thread cancellation cleanup handlers cannot be used for this purpose because thread-specific data may persist outside the lexical scope in which the cancellation cleanup handlers operate.

If the value associated with a key needs to be updated during the lifetime of the thread, it may be necessary to release the storage associated with the old value before the new value is bound. Although the *pthread_setspecific()* function could do this automatically, this feature is not needed often enough to justify the added complexity. Instead, the programmer is responsible for freeing the stale storage:

```

53039     pthread_getspecific(key, &old);
53040     new = allocate();
53041     destructor(old);

```

53042 pthread_setspecific(key, new);

53043 **Note:** The above example could leak storage if run with asynchronous cancellation enabled. No such
 53044 problems occur in the default cancellation state if no cancellation points occur between the get
 53045 and set.

53046 There is no notion of a destructor-safe function. If an application does not call *pthread_exit()*
 53047 from a signal handler, or if it blocks any signal whose handler may call *pthread_exit()* while
 53048 calling async-unsafe functions, all functions may be safely called from destructors.

53049 Non-Idempotent Data Key Creation

53050 There were requests to make *pthread_key_create()* idempotent with respect to a given *key* address
 53051 parameter. This would allow applications to call *pthread_key_create()* multiple times for a given
 53052 *key* address and be guaranteed that only one key would be created. Doing so would require the
 53053 key value to be previously initialized (possibly at compile time) to a known null value and
 53054 would require that implicit mutual-exclusion be performed based on the address and contents of
 53055 the *key* parameter in order to guarantee that exactly one key would be created.

53056 Unfortunately, the implicit mutual-exclusion would not be limited to only *pthread_key_create()*.
 53057 On many implementations, implicit mutual-exclusion would also have to be performed by
 53058 *pthread_getspecific()* and *pthread_setspecific()* in order to guard against using incompletely stored
 53059 or not-yet-visible key values. This could significantly increase the cost of important operations,
 53060 particularly *pthread_getspecific()*.

53061 Thus, this proposal was rejected. The *pthread_key_create()* function performs no implicit
 53062 synchronization. It is the responsibility of the programmer to ensure that it is called exactly once
 53063 per key before use of the key. Several straightforward mechanisms can already be used to
 53064 accomplish this, including calling explicit module initialization functions, using mutexes, and
 53065 using *pthread_once()*. This places no significant burden on the programmer, introduces no
 53066 possibly confusing *ad hoc* implicit synchronization mechanism, and potentially allows
 53067 commonly used thread-specific data operations to be more efficient.

NAME

pthread_key_delete — thread-specific data key deletion

SYNOPSIS

```
#include <pthread.h>
```

```
int pthread_key_delete(pthread_key_t key);
```

DESCRIPTION

The *pthread_key_delete()* function shall delete a thread-specific data key previously returned by *pthread_key_create()*. The thread-specific data values associated with *key* need not be NULL at the time *pthread_key_delete()* is called. It is the responsibility of the application to free any application storage or perform any cleanup actions for data structures related to the deleted key or associated thread-specific data in any threads; this cleanup can be done either before or after *pthread_key_delete()* is called. Any attempt to use *key* following the call to *pthread_key_delete()* results in undefined behavior.

The *pthread_key_delete()* function shall be callable from within destructor functions. No destructor functions shall be invoked by *pthread_key_delete()*. Any destructor function that may have been associated with *key* shall no longer be called upon thread exit.

RETURN VALUE

If successful, the *pthread_key_delete()* function shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_key_delete()* function shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

A thread-specific data key deletion function has been included in order to allow the resources associated with an unused thread-specific data key to be freed. Unused thread-specific data keys can arise, among other scenarios, when a dynamically loaded module that allocated a key is unloaded.

Conforming applications are responsible for performing any cleanup actions needed for data structures associated with the key to be deleted, including data referenced by thread-specific data values. No such cleanup is done by *pthread_key_delete()*. In particular, destructor functions are not called. There are several reasons for this division of responsibility:

1. The associated destructor functions used to free thread-specific data at thread exit time are only guaranteed to work correctly when called in the thread that allocated the thread-specific data. (Destructors themselves may utilize thread-specific data.) Thus, they cannot be used to free thread-specific data in other threads at key deletion time. Attempting to have them called by other threads at key deletion time would require other threads to be asynchronously interrupted. But since interrupted threads could be in an arbitrary state, including holding locks necessary for the destructor to run, this approach would fail. In general, there is no safe mechanism whereby an implementation could free thread-specific data at key deletion time.
2. Even if there were a means of safely freeing thread-specific data associated with keys to be deleted, doing so would require that implementations be able to enumerate the threads with non-NULL data and potentially keep them from creating more thread-

specific data while the key deletion is occurring. This special case could cause extra synchronization in the normal case, which would otherwise be unnecessary.

For an application to know that it is safe to delete a key, it has to know that all the threads that might potentially ever use the key do not attempt to use it again. For example, it could know this if all the client threads have called a cleanup procedure declaring that they are through with the module that is being shut down, perhaps by setting a reference count to zero.

If an implementation detects that the value specified by the *key* argument to *pthread_key_delete()* does not refer to a key value obtained from *pthread_key_create()* or refers to a key that has been deleted with *pthread_key_delete()*, it is recommended that the function should fail and report an [EINVAL] error.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6

The *pthread_key_delete()* function is marked as part of the Threads option.

Issue 7

The *pthread_key_delete()* function is moved from the Threads option to the Base.

The [EINVAL] error for a key value not obtained from *pthread_key_create()* or a key deleted with *pthread_key_delete()* is removed; this condition results in undefined behavior.

NAME

pthread_kill — send a signal to a thread

SYNOPSIS

```
#include <signal.h>
```

```
int pthread_kill(pthread_t thread, int sig);
```

DESCRIPTION

The *pthread_kill()* function shall request that a signal be delivered to the specified thread.

As in *kill()*, if *sig* is zero, error checking shall be performed but no signal shall actually be sent.

RETURN VALUE

Upon successful completion, the function shall return a value of zero. Otherwise, the function shall return an error number. If the *pthread_kill()* function fails, no signal shall be sent.

ERRORS

The *pthread_kill()* function shall fail if:

[EINVAL] The value of the *sig* argument is an invalid or unsupported signal number.

The *pthread_kill()* function shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

The *pthread_kill()* function provides a mechanism for asynchronously directing a signal at a thread in the calling process. This could be used, for example, by one thread to affect broadcast delivery of a signal to a set of threads.

Note that *pthread_kill()* only causes the signal to be handled in the context of the given thread; the signal action (termination or stopping) affects the process as a whole.

RATIONALE

If an implementation detects use of a thread ID after the end of its lifetime, it is recommended that the function should fail and report an [ESRCH] error.

FUTURE DIRECTIONS

None.

The APPLICATION USAGE section is added.

Issue 7

The *pthread_kill()* function is moved from the Threads option to the Base.

Austin Group Interpretation 1003.1-2001 #142 is applied, removing the [ESRCH] error condition.

53188 NAME

53189 pthread_mutex_consistent — mark state protected by robust mutex as consistent

53190 SYNOPSIS

53191 #include <pthread.h>

53192 int pthread_mutex_consistent(pthread_mutex_t *mutex);

53193 DESCRIPTION

53194 If *mutex* is a robust mutex in an inconsistent state, the *pthread_mutex_consistent()* function can be
 53195 used to mark the state protected by the mutex referenced by *mutex* as consistent again.

53196 If an owner of a robust mutex terminates while holding the mutex, the mutex becomes
 53197 inconsistent and the next thread that acquires the mutex lock shall be notified of the state by the
 53198 return value [EOWNERDEAD]. In this case, the mutex does not become normally usable again
 53199 until the state is marked consistent.

53200 If the thread which acquired the mutex lock with the return value [EOWNERDEAD] terminates
 53201 before calling either *pthread_mutex_consistent()* or *pthread_mutex_unlock()*, the next thread that
 53202 acquires the mutex lock shall be notified about the state of the mutex by the return value
 53203 [EOWNERDEAD].

53204 The behavior is undefined if the value specified by the *mutex* argument to
 53205 *pthread_mutex_consistent()* does not refer to an initialized mutex.

53206 RETURN VALUE

53207 Upon successful completion, the *pthread_mutex_consistent()* function shall return zero.
 53208 Otherwise, an error value shall be returned to indicate the error.

53209 ERRORS

53210 The *pthread_mutex_consistent()* function shall fail if:

53211 [EINVAL] The mutex object referenced by *mutex* is not robust or does not protect an
 53212 inconsistent state.

53213 These functions shall not return an error code of [EINTR].

53214 EXAMPLES

53215 None.

53216 APPLICATION USAGE

53217 The *pthread_mutex_consistent()* function is only responsible for notifying the implementation that
 53218 the state protected by the mutex has been recovered and that normal operations with the mutex
 53219 can be resumed. It is the responsibility of the application to recover the state so it can be reused.
 53220 If the application is not able to perform the recovery, it can notify the implementation that the
 53221 situation is unrecoverable by a call to *pthread_mutex_unlock()* without a prior call to
 53222 *pthread_mutex_consistent()*, in which case subsequent threads that attempt to lock the mutex will
 53223 fail to acquire the lock and be returned [ENOTRECOVERABLE].

53224 RATIONALE

53225 If an implementation detects that the value specified by the *mutex* argument to
 53226 *pthread_mutex_consistent()* does not refer to an initialized mutex, it is recommended that the
 53227 function should fail and report an [EINVAL] error.

53228 FUTURE DIRECTIONS

53229 None.

53233 **CHANGE HISTORY**

53234 First released in Issue 7.

NAME

pthread_mutex_destroy, pthread_mutex_init — destroy and initialize a mutex

SYNOPSIS

```
#include <pthread.h>

int pthread_mutex_destroy(pthread_mutex_t *mutex);
int pthread_mutex_init(pthread_mutex_t *restrict mutex,
    const pthread_mutexattr_t *restrict attr);
pthread_mutex_t mutex = PTHREAD_MUTEX_INITIALIZER;
```

DESCRIPTION

The *pthread_mutex_destroy()* function shall destroy the mutex object referenced by *mutex*; the mutex object becomes, in effect, uninitialized. An implementation may cause *pthread_mutex_destroy()* to set the object referenced by *mutex* to an invalid value.

A destroyed mutex object can be reinitialized using *pthread_mutex_init()*; the results of otherwise referencing the object after it has been destroyed are undefined.

It shall be safe to destroy an initialized mutex that is unlocked. Attempting to destroy a locked mutex or a mutex that is referenced (for example, while being used in a *pthread_cond_timedwait()* or *pthread_cond_wait()*) by another thread results in undefined behavior.

The *pthread_mutex_init()* function shall initialize the mutex referenced by *mutex* with attributes specified by *attr*. If *attr* is NULL, the default mutex attributes are used; the effect shall be the same as passing the address of a default mutex attributes object. Upon successful initialization, the state of the mutex becomes initialized and unlocked.

Only *mutex* itself may be used for performing synchronization. The result of referring to copies of *mutex* in calls to *pthread_mutex_lock()*, *pthread_mutex_trylock()*, *pthread_mutex_unlock()*, and *pthread_mutex_destroy()* is undefined.

Attempting to initialize an already initialized mutex results in undefined behavior.

In cases where default mutex attributes are appropriate, the macro PTHREAD_MUTEX_INITIALIZER can be used to initialize mutexes. The effect shall be equivalent to dynamic initialization by a call to *pthread_mutex_init()* with parameter *attr* specified as NULL, except that no error checks are performed.

The behavior is undefined if the value specified by the *mutex* argument to *pthread_mutex_destroy()* does not refer to an initialized mutex.

The behavior is undefined if the value specified by the *attr* argument to *pthread_mutex_init()* does not refer to an initialized mutex attributes object.

RETURN VALUE

If successful, the *pthread_mutex_destroy()* and *pthread_mutex_init()* functions shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_mutex_init()* function shall fail if:

[EAGAIN]	The system lacked the necessary resources (other than memory) to initialize another mutex.
[ENOMEM]	Insufficient memory exists to initialize the mutex.
[EPERM]	The caller does not have the privilege to perform the operation.

53277 The *pthread_mutex_init()* function may fail if:
53278 [EINVAL] The attributes object referenced by *attr* has the robust mutex attribute set
53279 without the process-shared attribute being set.

53280 These functions shall not return an error code of [EINTR].

53281 EXAMPLES

53282 None.

53283 APPLICATION USAGE

53284 None.

53285 RATIONALE

53286 If an implementation detects that the value specified by the *mutex* argument to
53287 *pthread_mutex_destroy()* does not refer to an initialized mutex, it is recommended that the
53288 function should fail and report an [EINVAL] error.

53289 If an implementation detects that the value specified by the *mutex* argument to
53290 *pthread_mutex_destroy()* or *pthread_mutex_init()* refers to a locked mutex or a mutex that is
53291 referenced (for example, while being used in a *pthread_cond_timedwait()* or *pthread_cond_wait()*)
53292 by another thread, or detects that the value specified by the *mutex* argument to
53293 *pthread_mutex_init()* refers to an already initialized mutex, it is recommended that the function
53294 should fail and report an [EBUSY] error.

53295 If an implementation detects that the value specified by the *attr* argument to
53296 *pthread_mutex_init()* does not refer to an initialized mutex attributes object, it is recommended
53297 that the function should fail and report an [EINVAL] error.

53298 Alternate Implementations Possible

53299 This volume of POSIX.1-2008 supports several alternative implementations of mutexes. An
53300 implementation may store the lock directly in the object of type **pthread_mutex_t**. Alternatively,
53301 an implementation may store the lock in the heap and merely store a pointer, handle, or unique
53302 ID in the mutex object. Either implementation has advantages or may be required on certain
53303 hardware configurations. So that portable code can be written that is invariant to this choice, this
53304 volume of POSIX.1-2008 does not define assignment or equality for this type, and it uses the
53305 term “initialize” to reinforce the (more restrictive) notion that the lock may actually reside in the
53306 mutex object itself.

53307 Note that this precludes an over-specification of the type of the mutex or condition variable and
53308 motivates the opaqueness of the type.

53309 An implementation is permitted, but not required, to have *pthread_mutex_destroy()* store an
53310 illegal value into the mutex. This may help detect erroneous programs that try to lock (or
53311 otherwise reference) a mutex that has already been destroyed.

53312 Tradeoff Between Error Checks and Performance Supported

53313 Many error conditions that can occur are not required to be detected by the implementation in
53314 order to let implementations trade off performance *versus* degree of error checking according to
53315 the needs of their specific applications and execution environment. As a general rule, conditions
53316 caused by the system (such as insufficient memory) are required to be detected, but conditions
53317 caused by an erroneously coded application (such as failing to provide adequate
53318 synchronization to prevent a mutex from being deleted while in use) are specified to result in
53319 undefined behavior.

53320 A wide range of implementations is thus made possible. For example, an implementation

intended for application debugging may implement all of the error checks, but an implementation running a single, provably correct application under very tight performance constraints in an embedded computer might implement minimal checks. An implementation might even be provided in two versions, similar to the options that compilers provide: a full-checking, but slower version; and a limited-checking, but faster version. To forbid this optionality would be a disservice to users.

By carefully limiting the use of “undefined behavior” only to things that an erroneous (badly coded) application might do, and by defining that resource-not-available errors are mandatory, this volume of POSIX.1-2008 ensures that a fully-conforming application is portable across the full range of implementations, while not forcing all implementations to add overhead to check for numerous things that a correct program never does. When the behavior is undefined, no error number is specified to be returned on implementations that do detect the condition. This is because undefined behavior means *anything* can happen, which includes returning with any value (which might happen to be a valid, but different, error number). However, since the error number might be useful to application developers when diagnosing problems during application development, a recommendation is made in rationale that implementors should return a particular error number if their implementation does detect the condition.

Why No Limits are Defined

Defining symbols for the maximum number of mutexes and condition variables was considered but rejected because the number of these objects may change dynamically. Furthermore, many implementations place these objects into application memory; thus, there is no explicit maximum.

Static Initializers for Mutexes and Condition Variables

Providing for static initialization of statically allocated synchronization objects allows modules with private static synchronization variables to avoid runtime initialization tests and overhead. Furthermore, it simplifies the coding of self-initializing modules. Such modules are common in C libraries, where for various reasons the design calls for self-initialization instead of requiring an explicit module initialization function to be called. An example use of static initialization follows.

Without static initialization, a self-initializing routine *foo()* might look as follows:

```
static pthread_once_t foo_once = PTHREAD_ONCE_INIT;
static pthread_mutex_t foo_mutex;

void foo_init()
{
    pthread_mutex_init(&foo_mutex, NULL);
}

void foo()
{
    pthread_once(&foo_once, foo_init);
    pthread_mutex_lock(&foo_mutex);
    /* Do work. */
    pthread_mutex_unlock(&foo_mutex);
}
```

With static initialization, the same routine could be coded as follows:

```
static pthread_mutex_t foo_mutex = PTHREAD_MUTEX_INITIALIZER;
```

```
53366 void foo()  
53367 {  
53368     pthread_mutex_lock(&foo_mutex);  
53369     /* Do work. */  
53370     pthread_mutex_unlock(&foo_mutex);  
53371 }
```

53372 Note that the static initialization both eliminates the need for the initialization test inside
53373 *pthread_once()* and the fetch of *&foo_mutex* to learn the address to be passed to
53374 *pthread_mutex_lock()* or *pthread_mutex_unlock()*.

53375 Thus, the C code written to initialize static objects is simpler on all systems and is also faster on a
53376 large class of systems; those where the (entire) synchronization object can be stored in
53377 application memory.

53378 Yet the locking performance question is likely to be raised for machines that require mutexes to
53379 be allocated out of special memory. Such machines actually have to have mutexes and possibly
53380 condition variables contain pointers to the actual hardware locks. For static initialization to work
53381 on such machines, *pthread_mutex_lock()* also has to test whether or not the pointer to the actual
53382 lock has been allocated. If it has not, *pthread_mutex_lock()* has to initialize it before use. The
53383 reservation of such resources can be made when the program is loaded, and hence return codes
53384 have not been added to mutex locking and condition variable waiting to indicate failure to
53385 complete initialization.

53386 This runtime test in *pthread_mutex_lock()* would at first seem to be extra work; an extra test is
53387 required to see whether the pointer has been initialized. On most machines this would actually
53388 be implemented as a fetch of the pointer, testing the pointer against zero, and then using the
53389 pointer if it has already been initialized. While the test might seem to add extra work, the extra
53390 effort of testing a register is usually negligible since no extra memory references are actually
53391 done. As more and more machines provide caches, the real expenses are memory references, not
53392 instructions executed.

53393 Alternatively, depending on the machine architecture, there are often ways to eliminate *all*
53394 overhead in the most important case: on the lock operations that occur *after* the lock has been
53395 initialized. This can be done by shifting more overhead to the less frequent operation:
53396 initialization. Since out-of-line mutex allocation also means that an address has to be
53397 dereferenced to find the actual lock, one technique that is widely applicable is to have static
53398 initialization store a bogus value for that address; in particular, an address that causes a machine
53399 fault to occur. When such a fault occurs upon the first attempt to lock such a mutex, validity
53400 checks can be done, and then the correct address for the actual lock can be filled in. Subsequent
53401 lock operations incur no extra overhead since they do not “fault”. This is merely one technique
53402 that can be used to support static initialization, while not adversely affecting the performance of
53403 lock acquisition. No doubt there are other techniques that are highly machine-dependent.

53404 The locking overhead for machines doing out-of-line mutex allocation is thus similar for
53405 modules being implicitly initialized, where it is improved for those doing mutex allocation
53406 entirely inline. The inline case is thus made much faster, and the out-of-line case is not
53407 significantly worse.

53408 Besides the issue of locking performance for such machines, a concern is raised that it is possible
53409 that threads would serialize contending for initialization locks when attempting to finish
53410 initializing statically allocated mutexes. (Such finishing would typically involve taking an
53411 internal lock, allocating a structure, storing a pointer to the structure in the mutex, and releasing
53412 the internal lock.) First, many implementations would reduce such serialization by hashing on
53413 the mutex address. Second, such serialization can only occur a bounded number of times. In

particular, it can happen at most as many times as there are statically allocated synchronization objects. Dynamically allocated objects would still be initialized via *pthread_mutex_init()* or *pthread_cond_init()*.

Finally, if none of the above optimization techniques for out-of-line allocation yields sufficient performance for an application on some implementation, the application can avoid static initialization altogether by explicitly initializing all synchronization objects with the corresponding *pthread_*_init()* functions, which are supported by all implementations. An implementation can also document the tradeoffs and advise which initialization technique is more efficient for that particular implementation.

Destroying Mutexes

A mutex can be destroyed immediately after it is unlocked. For example, consider the following code:

```
struct obj {
    pthread_mutex_t om;
    int refcnt;
    ...
};

obj_done(struct obj *op)
{
    pthread_mutex_lock(&op->om);
    if (--op->refcnt == 0) {
        pthread_mutex_unlock(&op->om);
        (A) pthread_mutex_destroy(&op->om);
        (B) free(op);
    } else
        (C) pthread_mutex_unlock(&op->om);
}
```

In this case *obj* is reference counted and *obj_done()* is called whenever a reference to the object is dropped. Implementations are required to allow an object to be destroyed and freed and potentially unmapped (for example, lines A and B) immediately after the object is unlocked (line C).

Robust Mutexes

Implementations are required to provide robust mutexes for mutexes with the process-shared attribute set to *PTHREAD_PROCESS_SHARED*. Implementations are allowed, but not required, to provide robust mutexes when the process-shared attribute is set to *PTHREAD_PROCESS_PRIVATE*.

FUTURE DIRECTIONS

None.

SEE ALSO

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6

The *pthread_mutex_destroy()* and *pthread_mutex_init()* functions are marked as part of the Threads option.

The *pthread_mutex_timedlock()* function is added to the SEE ALSO section for alignment with IEEE Std 1003.1d-1999.

IEEE PASC Interpretation 1003.1c #34 is applied, updating the DESCRIPTION.

The **restrict** keyword is added to the *pthread_mutex_init()* prototype for alignment with the ISO/IEC 9899:1999 standard.

Issue 7

Changes are made from The Open Group Technical Standard, 2006, Extended API Set Part 3.

The *pthread_mutex_destroy()* and *pthread_mutex_init()* functions are moved from the Threads option to the Base.

The [EINVAL] error for an uninitialized mutex or an uninitialized mutex attributes object is removed; this condition results in undefined behavior.

The [EBUSY] error for a locked mutex, a mutex that is referenced, or an already initialized mutex is removed; this condition results in undefined behavior.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0460 [70,428] is applied.

+

53475 **NAME**

53476 pthread_mutex_getprioceiling, pthread_mutex_setprioceiling — get and set the priority ceiling
 53477 of a mutex (**REALTIME THREADS**)

53478 **SYNOPSIS**

```
53479 RPP|TPP #include <pthread.h>

53480 int pthread_mutex_getprioceiling(const pthread_mutex_t *restrict mutex,
53481 int *restrict prioceiling);
53482 int pthread_mutex_setprioceiling(pthread_mutex_t *restrict mutex,
53483 int prioceiling, int *restrict old_ceiling);
```

53484 **DESCRIPTION**

53485 The *pthread_mutex_getprioceiling()* function shall return the current priority ceiling of the mutex.

53486 The *pthread_mutex_setprioceiling()* function shall attempt to lock the mutex as if by a call to
 53487 *pthread_mutex_lock()*, except that the process of locking the mutex need not adhere to the priority
 53488 protect protocol. On acquiring the mutex it shall change the mutex's priority ceiling and then
 53489 release the mutex as if by a call to *pthread_mutex_unlock()*. When the change is successful, the
 53490 previous value of the priority ceiling shall be returned in *old_ceiling*.

53491 If the *pthread_mutex_setprioceiling()* function fails, the mutex priority ceiling shall not be
 53492 changed.

53493 **RETURN VALUE**

53494 If successful, the *pthread_mutex_getprioceiling()* and *pthread_mutex_setprioceiling()* functions shall
 53495 return zero; otherwise, an error number shall be returned to indicate the error.

53496 **ERRORS**

53497 These functions shall fail if:

53498	[EINVAL]	The protocol attribute of <i>mutex</i> is PTHREAD_PRIO_NONE.
53499	[EPERM]	The implementation requires appropriate privileges to perform the operation
53500		and the caller does not have appropriate privileges.

53501 The *pthread_mutex_setprioceiling()* function shall fail if:

53502	[EAGAIN]	The mutex could not be acquired because the maximum number of recursive
53503		locks for <i>mutex</i> has been exceeded.

53504	[EDEADLK]	The mutex type is PTHREAD_MUTEX_ERRORCHECK and the current
53505		thread already owns the mutex.

53506	[EINVAL]	The mutex was created with the protocol attribute having the value
53507		PTHREAD_PRIO_PROTECT and the calling thread's priority is higher than
53508		the mutex's current priority ceiling, and the implementation adheres to the
53509		priority protect protocol in the process of locking the mutex.

53510	[ENOTRECOVERABLE]	

53511		The mutex is a robust mutex and the state protected by the mutex is not
53512		recoverable.

53513	[EOWNERDEAD]	

53514		The mutex is a robust mutex and the process containing the previous owning
53515		thread terminated while holding the mutex lock. The mutex lock shall be
53516		acquired by the calling thread and it is up to the new owner to make the state
53517		consistent (see <i>pthread_mutex_lock()</i>).

53518 The *pthread_mutex_setprioceiling()* function may fail if:

53519 [EDEADLK] A deadlock condition was detected.

53520 [EINVAL] The priority requested by *prioceiling* is out of range.

53521 [EOWNERDEAD]

53522 The mutex is a robust mutex and the previous owning thread terminated

53523 while holding the mutex lock. The mutex lock shall be acquired by the calling

53524 thread and it is up to the new owner to make the state consistent (see

53525 *pthread_mutex_lock()*).

53526 These functions shall not return an error code of [EINTR].

53527 EXAMPLES

53528 None.

53529 APPLICATION USAGE

53530 None.

53531 RATIONALE

53532 None.

53538 CHANGE HISTORY

53539 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

53540 Marked as part of the Realtime Threads Feature Group.

53541 Issue 6

53542 The *pthread_mutex_getprioceiling()* and *pthread_mutex_setprioceiling()* functions are marked as

53543 part of the Threads and Thread Priority Protection options.

53544 The [ENOSYS] error conditions have been removed.

53545 The *pthread_mutex_timedlock()* function is added to the SEE ALSO section for alignment with

53546 IEEE Std 1003.1d-1999.

53547 The **restrict** keyword is added to the *pthread_mutex_getprioceiling()* and

53548 *pthread_mutex_setprioceiling()* prototypes for alignment with the ISO/IEC 9899:1999 standard.

53549 Issue 7

53550 SD5-XSH-ERN-39 is applied.

53551 Austin Group Interpretation 1003.1-2001 #052 is applied, adding [EDEADLK] as a “may fail”

53552 error.

53553 SD5-XSH-ERN-158 is applied, updating the ERRORS section to include a “shall fail” error case

53554 for when the protocol attribute of *mutex* is PTHREAD_PRIO_NONE.

53555 The *pthread_mutex_getprioceiling()* and *pthread_mutex_setprioceiling()* functions are moved from

53556 the Threads option to require support of either the Robust Mutex Priority Protection option or

53557 the Non-Robust Mutex Priority Protection option.

53558
53559

The DESCRIPTION and ERRORS sections are updated to account properly for all of the various mutex types.

53560 NAME

53561 pthread_mutex_init — destroy and initialize a mutex

53562 SYNOPSIS

```
53563     #include <pthread.h>

53564     int pthread_mutex_init(pthread_mutex_t *restrict mutex,
53565         const pthread_mutexattr_t *restrict attr);
53566     pthread_mutex_t mutex = PTHREAD_MUTEX_INITIALIZER;
```

53567 DESCRIPTION

53568 Refer to *pthread_mutex_destroy()*.

NAME

pthread_mutex_lock, pthread_mutex_trylock, pthread_mutex_unlock — lock and unlock a mutex

SYNOPSIS

```
#include <pthread.h>

int pthread_mutex_lock(pthread_mutex_t *mutex);
int pthread_mutex_trylock(pthread_mutex_t *mutex);
int pthread_mutex_unlock(pthread_mutex_t *mutex);
```

DESCRIPTION

The mutex object referenced by *mutex* shall be locked by a call to *pthread_mutex_lock()* that returns zero or [EOWNERDEAD]. If the mutex is already locked by another thread, the calling thread shall block until the mutex becomes available. This operation shall return with the mutex object referenced by *mutex* in the locked state with the calling thread as its owner. If a thread attempts to relock a mutex that it has already locked, *pthread_mutex_lock()* shall behave as described in the **Relock** column of the following table. If a thread attempts to unlock a mutex that it has not locked or a mutex which is unlocked, *pthread_mutex_unlock()* shall behave as described in the **Unlock When Not Owner** column of the following table.

Mutex Type	Robustness	Relock	Unlock When Not Owner
NORMAL	non-robust	deadlock	undefined behavior
NORMAL	robust	deadlock	error returned
ERRORCHECK	either	error returned	error returned
RECURSIVE	either	recursive (see below)	error returned
DEFAULT	non-robust	undefined behavior†	undefined behavior†
DEFAULT	robust	undefined behavior†	error returned

† If the mutex type is PTHREAD_MUTEX_DEFAULT, the behavior of *pthread_mutex_lock()* may correspond to one of the three other standard mutex types as described in the table above. If it does not correspond to one of those three, the behavior is undefined for the cases marked †.

Where the table indicates recursive behavior, the mutex shall maintain the concept of a lock count. When a thread successfully acquires a mutex for the first time, the lock count shall be set to one. Every time a thread relocks this mutex, the lock count shall be incremented by one. Each time the thread unlocks the mutex, the lock count shall be decremented by one. When the lock count reaches zero, the mutex shall become available for other threads to acquire.

The *pthread_mutex_trylock()* function shall be equivalent to *pthread_mutex_lock()*, except that if the mutex object referenced by *mutex* is currently locked (by any thread, including the current thread), the call shall return immediately. If the mutex type is PTHREAD_MUTEX_RECURSIVE and the mutex is currently owned by the calling thread, the mutex lock count shall be incremented by one and the *pthread_mutex_trylock()* function shall immediately return success.

The *pthread_mutex_unlock()* function shall release the mutex object referenced by *mutex*. The manner in which a mutex is released is dependent upon the mutex's type attribute. If there are threads blocked on the mutex object referenced by *mutex* when *pthread_mutex_unlock()* is called, resulting in the mutex becoming available, the scheduling policy shall determine which thread shall acquire the mutex.

53615 (In the case of PTHREAD_MUTEX_RECURSIVE mutexes, the mutex shall become available
53616 when the count reaches zero and the calling thread no longer has any locks on this mutex.)

53617 If a signal is delivered to a thread waiting for a mutex, upon return from the signal handler the
53618 thread shall resume waiting for the mutex as if it was not interrupted.

53619 If *mutex* is a robust mutex and the process containing the owning thread terminated while
53620 holding the mutex lock, a call to *pthread_mutex_lock()* shall return the error value
53621 [EOWNERDEAD]. If *mutex* is a robust mutex and the owning thread terminated while holding
53622 the mutex lock, a call to *pthread_mutex_lock()* may return the error value [EOWNERDEAD] even
53623 if the process in which the owning thread resides has not terminated. In these cases, the mutex is
53624 locked by the thread but the state it protects is marked as inconsistent. The application should
53625 ensure that the state is made consistent for reuse and when that is complete call
53626 *pthread_mutex_consistent()*. If the application is unable to recover the state, it should unlock the
53627 mutex without a prior call to *pthread_mutex_consistent()*, after which the mutex is marked
53628 permanently unusable.

53629 If *mutex* does not refer to an initialized mutex object, the behavior of *pthread_mutex_lock()*,
53630 *pthread_mutex_trylock()*, and *pthread_mutex_unlock()* is undefined.

53631 RETURN VALUE

53632 If successful, the *pthread_mutex_lock()*, *pthread_mutex_trylock()*, and *pthread_mutex_unlock()*
53633 functions shall return zero; otherwise, an error number shall be returned to indicate the error. -

53634 ERRORS

53635 The *pthread_mutex_lock()* and *pthread_mutex_trylock()* functions shall fail if:

53636 [EAGAIN] The mutex could not be acquired because the maximum number of recursive
53637 locks for *mutex* has been exceeded.

53638 RPP|TPP [EINVAL] The *mutex* was created with the protocol attribute having the value
53639 PTHREAD_PRIO_PROTECT and the calling thread's priority is higher than
53640 the mutex's current priority ceiling.

53641 [ENOTRECOVERABLE]
53642 The state protected by the mutex is not recoverable.

53643 [EOWNERDEAD]
53644 The mutex is a robust mutex and the process containing the previous owning
53645 thread terminated while holding the mutex lock. The mutex lock shall be
53646 acquired by the calling thread and it is up to the new owner to make the state
53647 consistent.

53648 The *pthread_mutex_lock()* function shall fail if:

53649 [EDEADLK] The mutex type is PTHREAD_MUTEX_ERRORCHECK and the current
53650 thread already owns the mutex.

53651 The *pthread_mutex_trylock()* function shall fail if:

53652 [EBUSY] The *mutex* could not be acquired because it was already locked.

53653 The *pthread_mutex_unlock()* function shall fail if:

53654 [EPERM] The mutex type is PTHREAD_MUTEX_ERRORCHECK or |
53655 PTHREAD_MUTEX_RECURSIVE, or the mutex is a robust mutex, and the |
53656 current thread does not own the mutex.

53657 The *pthread_mutex_lock()* and *pthread_mutex_trylock()* functions may fail if:

[EOWNERDEAD]

The mutex is a robust mutex and the previous owning thread terminated while holding the mutex lock. The mutex lock shall be acquired by the calling thread and it is up to the new owner to make the state consistent.

The *pthread_mutex_lock()* function may fail if:

[EDEADLK] A deadlock condition was detected.

These functions shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

Applications that have assumed that non-zero return values are errors will need updating for use with robust mutexes, since a valid return for a thread acquiring a mutex which is protecting a currently inconsistent state is [EOWNERDEAD]. Applications that do not check the error returns, due to ruling out the possibility of such errors arising, should not use robust mutexes. If an application is supposed to work with normal and robust mutexes it should check all return values for error conditions and if necessary take appropriate action.

RATIONALE

Mutex objects are intended to serve as a low-level primitive from which other thread synchronization functions can be built. As such, the implementation of mutexes should be as efficient as possible, and this has ramifications on the features available at the interface.

The mutex functions and the particular default settings of the mutex attributes have been motivated by the desire to not preclude fast, inlined implementations of mutex locking and unlocking.

Since most attributes only need to be checked when a thread is going to be blocked, the use of attributes does not slow the (common) mutex-locking case.

Likewise, while being able to extract the thread ID of the owner of a mutex might be desirable, it would require storing the current thread ID when each mutex is locked, and this could incur unacceptable levels of overhead. Similar arguments apply to a *mutex_tryunlock* operation.

For further rationale on the extended mutex types, see XRAT [Threads Extensions](#) (on page 3601).

If an implementation detects that the value specified by the *mutex* argument does not refer to an initialized mutex object, it is recommended that the function should fail and report an [EINVAL] error.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6

The *pthread_mutex_lock()*, *pthread_mutex_trylock()*, and *pthread_mutex_unlock()* functions are marked as part of the Threads option.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The behavior when attempting to relock a mutex is defined.

The *pthread_mutex_timedlock()* function is added to the SEE ALSO section for alignment with IEEE Std 1003.1d-1999.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/98 is applied, updating the ERRORS section so that the [EDEADLK] error includes detection of a deadlock condition. The RATIONALE section is also reworded to take into account non-XSI-conformant systems.

Issue 7

SD5-XSH-ERN-43 is applied, marking the “shall fail” case of the [EINVAL] error as dependent on the Thread Priority Protection option.

Changes are made from The Open Group Technical Standard, 2006, Extended API Set Part 3.

The *pthread_mutex_lock()*, *pthread_mutex_trylock()*, and *pthread_mutex_unlock()* functions are moved from the Threads option to the Base.

The following extended mutex types are moved from the XSI option to the Base:

```
PTHREAD_MUTEX_NORMAL
PTHREAD_MUTEX_ERRORCHECK
PTHREAD_MUTEX_RECURSIVE
PTHREAD_MUTEX_DEFAULT
```

The DESCRIPTION is updated to clarify the behavior when *mutex* does not refer to an initialized mutex.

The ERRORS section is updated to account properly for all of the various mutex types.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0461 [121], XSH/TC1-2008/0462 + [92,428], and XSH/TC1-2008/0463 [121] are applied.

53725 **NAME**

53726 pthread_mutex_setprioceiling — change the priority ceiling of a mutex (**REALTIME**
53727 **THREADS**)

53728 **SYNOPSIS**

```
53729 RPP|TPP #include <pthread.h>  
53730 int pthread_mutex_setprioceiling(pthread_mutex_t *restrict mutex,  
53731 int prioceiling, int *restrict old_ceiling);
```

53732 **DESCRIPTION**

53733 Refer to *pthread_mutex_getprioceiling()*.

NAME

pthread_mutex_timedlock — lock a mutex

SYNOPSIS

```
#include <pthread.h>
#include <time.h>

int pthread_mutex_timedlock(pthread_mutex_t *restrict mutex,
    const struct timespec *restrict abstime);
```

DESCRIPTION

The *pthread_mutex_timedlock()* function shall lock the mutex object referenced by *mutex*. If the mutex is already locked, the calling thread shall block until the mutex becomes available as in the *pthread_mutex_lock()* function. If the mutex cannot be locked without waiting for another thread to unlock the mutex, this wait shall be terminated when the specified timeout expires.

The timeout shall expire when the absolute time specified by *abstime* passes, as measured by the clock on which timeouts are based (that is, when the value of that clock equals or exceeds *abstime*), or if the absolute time specified by *abstime* has already been passed at the time of the call.

The timeout shall be based on the CLOCK_REALTIME clock. The resolution of the timeout shall be the resolution of the clock on which it is based. The **timespec** data type is defined in the **<time.h>** header.

Under no circumstance shall the function fail with a timeout if the mutex can be locked immediately. The validity of the *abstime* parameter need not be checked if the mutex can be locked immediately.

RPI | TPI

As a consequence of the priority inheritance rules (for mutexes initialized with the PRIO_INHERIT protocol), if a timed mutex wait is terminated because its timeout expires, the priority of the owner of the mutex shall be adjusted as necessary to reflect the fact that this thread is no longer among the threads waiting for the mutex.

If *mutex* is a robust mutex and the process containing the owning thread terminated while holding the mutex lock, a call to *pthread_mutex_timedlock()* shall return the error value [EOWNERDEAD]. If *mutex* is a robust mutex and the owning thread terminated while holding the mutex lock, a call to *pthread_mutex_timedlock()* may return the error value [EOWNERDEAD] even if the process in which the owning thread resides has not terminated. In these cases, the mutex is locked by the thread but the state it protects is marked as inconsistent. The application should ensure that the state is made consistent for reuse and when that is complete call *pthread_mutex_consistent()*. If the application is unable to recover the state, it should unlock the mutex without a prior call to *pthread_mutex_consistent()*, after which the mutex is marked permanently unusable.

If *mutex* does not refer to an initialized mutex object, the behavior is undefined.

RETURN VALUE

If successful, the *pthread_mutex_timedlock()* function shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_mutex_timedlock()* function shall fail if:

[EAGAIN] The mutex could not be acquired because the maximum number of recursive locks for *mutex* has been exceeded.

53778	[EDEADLK]	The mutex type is PTHREAD_MUTEX_ERRORCHECK and the current thread already owns the mutex.
53779		
53780	[EINVAL]	The mutex was created with the protocol attribute having the value PTHREAD_PRIO_PROTECT and the calling thread's priority is higher than the mutex' current priority ceiling.
53781		
53782		
53783	[EINVAL]	The process or thread would have blocked, and the <i>abstime</i> parameter specified a nanoseconds field value less than zero or greater than or equal to 1 000 million.
53784		
53785		
53786	[ENOTRECOVERABLE]	
53787		The state protected by the mutex is not recoverable.
53788	[EOWNERDEAD]	
53789		The mutex is a robust mutex and the process containing the previous owning thread terminated while holding the mutex lock. The mutex lock shall be acquired by the calling thread and it is up to the new owner to make the state consistent.
53790		
53791		
53792		
53793	[ETIMEDOUT]	The mutex could not be locked before the specified timeout expired.
53794		The <i>pthread_mutex_timedlock()</i> function may fail if:
53795	[EDEADLK]	A deadlock condition was detected.
53796	[EOWNERDEAD]	
53797		The mutex is a robust mutex and the previous owning thread terminated while holding the mutex lock. The mutex lock shall be acquired by the calling thread and it is up to the new owner to make the state consistent.
53798		
53799		
53800		This function shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

Applications that have assumed that non-zero return values are errors will need updating for use with robust mutexes, since a valid return for a thread acquiring a mutex which is protecting a currently inconsistent state is [EOWNERDEAD]. Applications that do not check the error returns, due to ruling out the possibility of such errors arising, should not use robust mutexes. If an application is supposed to work with normal and robust mutexes, it should check all return values for error conditions and if necessary take appropriate action.

53830 **NAME**

53831 pthread_mutex_trylock, pthread_mutex_unlock — lock and unlock a mutex

53832 **SYNOPSIS**

53833 #include <pthread.h>

53834 int pthread_mutex_trylock(pthread_mutex_t *mutex);

53835 int pthread_mutex_unlock(pthread_mutex_t *mutex);

53836 **DESCRIPTION**53837 Refer to *pthread_mutex_lock()*.

NAME

pthread_mutexattr_destroy, pthread_mutexattr_init — destroy and initialize the mutex attributes object

SYNOPSIS

```
#include <pthread.h>

int pthread_mutexattr_destroy(pthread_mutexattr_t *attr);
int pthread_mutexattr_init(pthread_mutexattr_t *attr);
```

DESCRIPTION

The *pthread_mutexattr_destroy()* function shall destroy a mutex attributes object; the object becomes, in effect, uninitialized. An implementation may cause *pthread_mutexattr_destroy()* to set the object referenced by *attr* to an invalid value.

A destroyed *attr* attributes object can be reinitialized using *pthread_mutexattr_init()*; the results of otherwise referencing the object after it has been destroyed are undefined.

The *pthread_mutexattr_init()* function shall initialize a mutex attributes object *attr* with the default value for all of the attributes defined by the implementation.

Results are undefined if *pthread_mutexattr_init()* is called specifying an already initialized *attr* attributes object.

After a mutex attributes object has been used to initialize one or more mutexes, any function affecting the attributes object (including destruction) shall not affect any previously initialized mutexes.

The behavior is undefined if the value specified by the *attr* argument to *pthread_mutexattr_destroy()* does not refer to an initialized mutex attributes object.

RETURN VALUE

Upon successful completion, *pthread_mutexattr_destroy()* and *pthread_mutexattr_init()* shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_mutexattr_init()* function shall fail if:

[ENOMEM] Insufficient memory exists to initialize the mutex attributes object.

These functions shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

If an implementation detects that the value specified by the *attr* argument to *pthread_mutexattr_destroy()* does not refer to an initialized mutex attributes object, it is recommended that the function should fail and report an [EINVAL] error.

See *pthread_attr_destroy()* for a general explanation of attributes. Attributes objects allow implementations to experiment with useful extensions and permit extension of this volume of POSIX.1-2008 without changing the existing functions. Thus, they provide for future extensibility of this volume of POSIX.1-2008 and reduce the temptation to standardize prematurely on semantics that are not yet widely implemented or understood.

Examples of possible additional mutex attributes that have been discussed are *spin_only*, *limited_spin*, *no_spin*, *recursive*, and *metered*. (To explain what the latter attributes might mean:

recursive mutexes would allow for multiple re-locking by the current owner; metered mutexes would transparently keep records of queue length, wait time, and so on.) Since there is not yet wide agreement on the usefulness of these resulting from shared implementation and usage experience, they are not yet specified in this volume of POSIX.1-2008. Mutex attributes objects, however, make it possible to test out these concepts for possible standardization at a later time.

Mutex Attributes and Performance

Care has been taken to ensure that the default values of the mutex attributes have been defined such that mutexes initialized with the defaults have simple enough semantics so that the locking and unlocking can be done with the equivalent of a test-and-set instruction (plus possibly a few other basic instructions).

There is at least one implementation method that can be used to reduce the cost of testing at lock-time if a mutex has non-default attributes. One such method that an implementation can employ (and this can be made fully transparent to fully conforming POSIX applications) is to secretly pre-lock any mutexes that are initialized to non-default attributes. Any later attempt to lock such a mutex causes the implementation to branch to the “slow path” as if the mutex were unavailable; then, on the slow path, the implementation can do the “real work” to lock a non-default mutex. The underlying unlock operation is more complicated since the implementation never really wants to release the pre-lock on this kind of mutex. This illustrates that, depending on the hardware, there may be certain optimizations that can be used so that whatever mutex attributes are considered “most frequently used” can be processed most efficiently.

Process Shared Memory and Synchronization

The existence of memory mapping functions in this volume of POSIX.1-2008 leads to the possibility that an application may allocate the synchronization objects from this section in memory that is accessed by multiple processes (and therefore, by threads of multiple processes).

In order to permit such usage, while at the same time keeping the usual case (that is, usage within a single process) efficient, a *process-shared* option has been defined.

If an implementation supports the `_POSIX_THREAD_PROCESS_SHARED` option, then the *process-shared* attribute can be used to indicate that mutexes or condition variables may be accessed by threads of multiple processes.

The default setting of `PTHREAD_PROCESS_PRIVATE` has been chosen for the *process-shared* attribute so that the most efficient forms of these synchronization objects are created by default.

Synchronization variables that are initialized with the `PTHREAD_PROCESS_PRIVATE` *process-shared* attribute may only be operated on by threads in the process that initialized them. Synchronization variables that are initialized with the `PTHREAD_PROCESS_SHARED` *process-shared* attribute may be operated on by any thread in any process that has access to it. In particular, these processes may exist beyond the lifetime of the initializing process. For example, the following code implements a simple counting semaphore in a mapped file that may be used by many processes.

```
/* sem.h */
struct semaphore {
    pthread_mutex_t lock;
    pthread_cond_t nonzero;
    unsigned count;
};
typedef struct semaphore semaphore_t;
```

```

53927 semaphore_t *semaphore_create(char *semaphore_name);
53928 semaphore_t *semaphore_open(char *semaphore_name);
53929 void semaphore_post(semaphore_t *semap);
53930 void semaphore_wait(semaphore_t *semap);
53931 void semaphore_close(semaphore_t *semap);

53932 /* sem.c */
53933 #include <sys/types.h>
53934 #include <sys/stat.h>
53935 #include <sys/mman.h>
53936 #include <fcntl.h>
53937 #include <pthread.h>
53938 #include "sem.h"

53939 semaphore_t *
53940 semaphore_create(char *semaphore_name)
53941 {
53942     int fd;
53943     semaphore_t *semap;
53944     pthread_mutexattr_t psharedm;
53945     pthread_condattr_t psharedc;

53946     fd = open(semaphore_name, O_RDWR | O_CREAT | O_EXCL, 0666);
53947     if (fd < 0)
53948         return (NULL);
53949     (void) ftruncate(fd, sizeof(semaphore_t));
53950     (void) pthread_mutexattr_init(&psharedm);
53951     (void) pthread_mutexattr_setpshared(&psharedm,
53952         PTHREAD_PROCESS_SHARED);
53953     (void) pthread_condattr_init(&psharedc);
53954     (void) pthread_condattr_setpshared(&psharedc,
53955         PTHREAD_PROCESS_SHARED);
53956     semap = (semaphore_t *) mmap(NULL, sizeof(semaphore_t),
53957         PROT_READ | PROT_WRITE, MAP_SHARED,
53958         fd, 0);
53959     close (fd);
53960     (void) pthread_mutex_init(&semap->lock, &psharedm);
53961     (void) pthread_cond_init(&semap->nonzero, &psharedc);
53962     semap->count = 0;
53963     return (semap);
53964 }

53965 semaphore_t *
53966 semaphore_open(char *semaphore_name)
53967 {
53968     int fd;
53969     semaphore_t *semap;

53970     fd = open(semaphore_name, O_RDWR, 0666);
53971     if (fd < 0)
53972         return (NULL);
53973     semap = (semaphore_t *) mmap(NULL, sizeof(semaphore_t),
53974         PROT_READ | PROT_WRITE, MAP_SHARED,
53975         fd, 0);

```

```

53976         close (fd);
53977         return (semap);
53978     }

53979 void
53980 semaphore_post(semaphore_t *semap)
53981 {
53982     pthread_mutex_lock(&semap->lock);
53983     if (semap->count == 0)
53984         pthread_cond_signal(&semap->nonzero);
53985     semap->count++;
53986     pthread_mutex_unlock(&semap->lock);
53987 }

53988 void
53989 semaphore_wait(semaphore_t *semap)
53990 {
53991     pthread_mutex_lock(&semap->lock);
53992     while (semap->count == 0)
53993         pthread_cond_wait(&semap->nonzero, &semap->lock);
53994     semap->count--;
53995     pthread_mutex_unlock(&semap->lock);
53996 }

53997 void
53998 semaphore_close(semaphore_t *semap)
53999 {
54000     munmap((void *) semap, sizeof(semaphore_t));
54001 }

```

The following code is for three separate processes that create, post, and wait on a semaphore in the file **/tmp/semaphore**. Once the file is created, the post and wait programs increment and decrement the counting semaphore (waiting and waking as required) even though they did not initialize the semaphore.

```

54006 /* create.c */
54007 #include "pthread.h"
54008 #include "sem.h"

54009 int
54010 main()
54011 {
54012     semaphore_t *semap;

54013     semap = semaphore_create("/tmp/semaphore");
54014     if (semap == NULL)
54015         exit(1);
54016     semaphore_close(semap);
54017     return (0);
54018 }

54019 /* post */
54020 #include "pthread.h"
54021 #include "sem.h"

54022 int

```

```

54023     main()
54024     {
54025         semaphore_t *semaph;
54026
54027         semaph = semaphore_open("/tmp/semaphore");
54028         if (semaph == NULL)
54029             exit(1);
54030         semaphore_post(semaph);
54031         semaphore_close(semaph);
54032         return (0);
54033     }
54034
54035     /* wait */
54036     #include "pthread.h"
54037     #include "sem.h"
54038
54039     int
54040     main()
54041     {
54042         semaphore_t *semaph;
54043
54044         semaph = semaphore_open("/tmp/semaphore");
54045         if (semaph == NULL)
54046             exit(1);
54047         semaphore_wait(semaph);
54048         semaphore_close(semaph);
54049         return (0);
54050     }

```

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6

The *pthread_mutexattr_destroy()* and *pthread_mutexattr_init()* functions are marked as part of the Threads option.

IEEE PASC Interpretation 1003.1c #27 is applied, updating the ERRORS section.

Issue 7

The *pthread_mutexattr_destroy()* and *pthread_mutexattr_init()* functions are moved from the Threads option to the Base.

The [EINVAL] error for an uninitialized mutex attributes object is removed; this condition results in undefined behavior.

NAME

pthread_mutexattr_getprioceiling, pthread_mutexattr_setprioceiling — get and set the prioceiling attribute of the mutex attributes object (**REALTIME THREADS**)

SYNOPSIS

```
RPP|TPP #include <pthread.h>
```

```
int pthread_mutexattr_getprioceiling(const pthread_mutexattr_t
    *restrict attr, int *restrict prioceiling);
int pthread_mutexattr_setprioceiling(pthread_mutexattr_t *attr,
    int prioceiling);
```

DESCRIPTION

The *pthread_mutexattr_getprioceiling()* and *pthread_mutexattr_setprioceiling()* functions, respectively, shall get and set the priority ceiling attribute of a mutex attributes object pointed to by *attr* which was previously created by the function *pthread_mutexattr_init()*.

The *prioceiling* attribute contains the priority ceiling of initialized mutexes. The values of *prioceiling* are within the maximum range of priorities defined by SCHED_FIFO.

The *prioceiling* attribute defines the priority ceiling of initialized mutexes, which is the minimum priority level at which the critical section guarded by the mutex is executed. In order to avoid priority inversion, the priority ceiling of the mutex shall be set to a priority higher than or equal to the highest priority of all the threads that may lock that mutex. The values of *prioceiling* are within the maximum range of priorities defined under the SCHED_FIFO scheduling policy.

The behavior is undefined if the value specified by the *attr* argument to *pthread_mutexattr_getprioceiling()* or *pthread_mutexattr_setprioceiling()* does not refer to an initialized mutex attributes object.

RETURN VALUE

Upon successful completion, the *pthread_mutexattr_getprioceiling()* and *pthread_mutexattr_setprioceiling()* functions shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

These functions may fail if:

[EINVAL] The value specified by *prioceiling* is invalid.

[EPERM] The caller does not have the privilege to perform the operation.

These functions shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

If an implementation detects that the value specified by the *attr* argument to *pthread_mutexattr_getprioceiling()* or *pthread_mutexattr_setprioceiling()* does not refer to an initialized mutex attributes object, it is recommended that the function should fail and report an [EINVAL] error.

54104 **FUTURE DIRECTIONS**

54105 None.

54106 **SEE ALSO**54107 *pthread_cond_destroy()*, *pthread_create()*, *pthread_mutex_destroy()*

54109 **CHANGE HISTORY**

54110 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

54111 Marked as part of the Realtime Threads Feature Group.

54112 **Issue 6**54113 The *pthread_mutexattr_getprioceiling()* and *pthread_mutexattr_setprioceiling()* functions are marked
54114 as part of the Threads and Thread Priority Protection options.54115 The [ENOSYS] error condition has been removed as stubs need not be provided if an
54116 implementation does not support the Thread Priority Protection option.54117 The [ENOTSUP] error condition has been removed since these functions do not have a *protocol*
54118 argument.54119 The **restrict** keyword is added to the *pthread_mutexattr_getprioceiling()* prototype for alignment
54120 with the ISO/IEC 9899:1999 standard.54121 **Issue 7**54122 The *pthread_mutexattr_getprioceiling()* and *pthread_mutexattr_setprioceiling()* functions are moved
54123 from the Threads option to require support of either the Robust Mutex Priority Protection option
54124 or the Non-Robust Mutex Priority Protection option.54125 The [EINVAL] error for an uninitialized mutex attributes object is removed; this condition
54126 results in undefined behavior.

54127 **NAME**

54128 pthread_mutexattr_getprotocol, pthread_mutexattr_setprotocol — get and set the protocol
 54129 attribute of the mutex attributes object (**REALTIME THREADS**)

54130 **SYNOPSIS**

```
54131 MC1      #include <pthread.h>

54132      int pthread_mutexattr_getprotocol(const pthread_mutexattr_t
54133          *restrict attr, int *restrict protocol);
54134      int pthread_mutexattr_setprotocol(pthread_mutexattr_t *attr,
54135          int protocol);
```

54136 **DESCRIPTION**

54137 The *pthread_mutexattr_getprotocol()* and *pthread_mutexattr_setprotocol()* functions, respectively,
 54138 shall get and set the protocol attribute of a mutex attributes object pointed to by *attr* which was
 54139 previously created by the function *pthread_mutexattr_init()*.

54140 The *protocol* attribute defines the protocol to be followed in utilizing mutexes. The value of
 54141 *protocol* may be one of:

```
54142 RPI | TPI  PTHREAD_PRIO_INHERIT
54143 MC1        PTHREAD_PRIO_NONE
54144 RPP | TPP  PTHREAD_PRIO_PROTECT
```

54145 which are defined in the **<pthread.h>** header. The default value of the attribute shall be
 54146 PTHREAD_PRIO_NONE.

54147 When a thread owns a mutex with the PTHREAD_PRIO_NONE *protocol* attribute, its priority
 54148 and scheduling shall not be affected by its mutex ownership.

54149 RPI When a thread is blocking higher priority threads because of owning one or more robust
 54150 mutexes with the PTHREAD_PRIO_INHERIT *protocol* attribute, it shall execute at the higher of
 54151 its priority or the priority of the highest priority thread waiting on any of the robust mutexes
 54152 owned by this thread and initialized with this protocol.

54153 TPI When a thread is blocking higher priority threads because of owning one or more non-robust
 54154 mutexes with the PTHREAD_PRIO_INHERIT *protocol* attribute, it shall execute at the higher of
 54155 its priority or the priority of the highest priority thread waiting on any of the non-robust
 54156 mutexes owned by this thread and initialized with this protocol.

54157 RPP When a thread owns one or more robust mutexes initialized with the
 54158 PTHREAD_PRIO_PROTECT protocol, it shall execute at the higher of its priority or the highest
 54159 of the priority ceilings of all the robust mutexes owned by this thread and initialized with this
 54160 attribute, regardless of whether other threads are blocked on any of these robust mutexes or not.

54161 TPP When a thread owns one or more non-robust mutexes initialized with the
 54162 PTHREAD_PRIO_PROTECT protocol, it shall execute at the higher of its priority or the highest
 54163 of the priority ceilings of all the non-robust mutexes owned by this thread and initialized with
 54164 this attribute, regardless of whether other threads are blocked on any of these non-robust
 54165 mutexes or not.

54166 While a thread is holding a mutex which has been initialized with the
 54167 PTHREAD_PRIO_INHERIT or PTHREAD_PRIO_PROTECT protocol attributes, it shall not be
 54168 subject to being moved to the tail of the scheduling queue at its priority in the event that its
 54169 original priority is changed, such as by a call to *sched_setparam()*. Likewise, when a thread

54170 unlocks a mutex that has been initialized with the PTHREAD_PRIO_INHERIT or
54171 PTHREAD_PRIO_PROTECT protocol attributes, it shall not be subject to being moved to the tail
54172 of the scheduling queue at its priority in the event that its original priority is changed.

54173 If a thread simultaneously owns several mutexes initialized with different protocols, it shall
54174 execute at the highest of the priorities that it would have obtained by each of these protocols.

54175 RPI | TPI When a thread makes a call to *pthread_mutex_lock()*, the mutex was initialized with the protocol
54176 attribute having the value PTHREAD_PRIO_INHERIT, when the calling thread is blocked
54177 because the mutex is owned by another thread, that owner thread shall inherit the priority level
54178 of the calling thread as long as it continues to own the mutex. The implementation shall update
54179 its execution priority to the maximum of its assigned priority and all its inherited priorities.
54180 Furthermore, if this owner thread itself becomes blocked on another mutex with the *protocol*
54181 attribute having the value PTHREAD_PRIO_INHERIT, the same priority inheritance effect shall
54182 be propagated to this other owner thread, in a recursive manner.

54183 The behavior is undefined if the value specified by the *attr* argument to
54184 *pthread_mutexattr_getprotocol()* or *pthread_mutexattr_setprotocol()* does not refer to an initialized
54185 mutex attributes object.

54186 RETURN VALUE

54187 Upon successful completion, the *pthread_mutexattr_getprotocol()* and
54188 *pthread_mutexattr_setprotocol()* functions shall return zero; otherwise, an error number shall be
54189 returned to indicate the error.

54190 ERRORS

54191 The *pthread_mutexattr_setprotocol()* function shall fail if:

54192 [ENOTSUP] The value specified by *protocol* is an unsupported value.

54193 The *pthread_mutexattr_getprotocol()* and *pthread_mutexattr_setprotocol()* functions may fail if:

54194 [EINVAL] The value specified by *protocol* is invalid.

54195 [EPERM] The caller does not have the privilege to perform the operation.

54196 These functions shall not return an error code of [EINTR].

54197 EXAMPLES

54198 None.

54199 APPLICATION USAGE

54200 None.

54201 RATIONALE

54202 If an implementation detects that the value specified by the *attr* argument to
54203 *pthread_mutexattr_getprotocol()* or *pthread_mutexattr_setprotocol()* does not refer to an initialized
54204 mutex attributes object, it is recommended that the function should fail and report an [EINVAL]
54205 error.

54226 SD5-XSH-ERN-188 is applied, updating the DESCRIPTION.

54227 The *pthread_mutexattr_getprotocol()* and *pthread_mutexattr_setprotocol()* functions are moved from
54228 the Threads option to require support of either the Non-Robust Mutex Priority Protection option
54229 or the Non-Robust Mutex Priority Inheritance option or the Robust Mutex Priority Protection
54230 option or the Robust Mutex Priority Inheritance option.

54231 The [EINVAL] error for an uninitialized mutex attributes object is removed; this condition
54232 results in undefined behavior.

NAME

pthread_mutexattr_getpshared, pthread_mutexattr_setpshared — get and set the process-shared attribute

SYNOPSIS

```
TSH #include <pthread.h>

int pthread_mutexattr_getpshared(const pthread_mutexattr_t
    *restrict attr, int *restrict pshared);
int pthread_mutexattr_setpshared(pthread_mutexattr_t *attr,
    int pshared);
```

DESCRIPTION

The *pthread_mutexattr_getpshared()* function shall obtain the value of the *process-shared* attribute from the attributes object referenced by *attr*.

The *pthread_mutexattr_setpshared()* function shall set the *process-shared* attribute in an initialized attributes object referenced by *attr*.

The *process-shared* attribute is set to `PTHREAD_PROCESS_SHARED` to permit a mutex to be operated upon by any thread that has access to the memory where the mutex is allocated, even if the mutex is allocated in memory that is shared by multiple processes. If the *process-shared* attribute is `PTHREAD_PROCESS_PRIVATE`, the mutex shall only be operated upon by threads created within the same process as the thread that initialized the mutex; if threads of differing processes attempt to operate on such a mutex, the behavior is undefined. The default value of the attribute shall be `PTHREAD_PROCESS_PRIVATE`.

The behavior is undefined if the value specified by the *attr* argument to *pthread_mutexattr_getpshared()* or *pthread_mutexattr_setpshared()* does not refer to an initialized mutex attributes object.

RETURN VALUE

Upon successful completion, *pthread_mutexattr_setpshared()* shall return zero; otherwise, an error number shall be returned to indicate the error.

Upon successful completion, *pthread_mutexattr_getpshared()* shall return zero and store the value of the *process-shared* attribute of *attr* into the object referenced by the *pshared* parameter. Otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_mutexattr_setpshared()* function may fail if:

[EINVAL] The new value specified for the attribute is outside the range of legal values for that attribute.

These functions shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

If an implementation detects that the value specified by the *attr* argument to *pthread_mutexattr_getpshared()* or *pthread_mutexattr_setpshared()* does not refer to an initialized mutex attributes object, it is recommended that the function should fail and report an [EINVAL] error.

54277 **FUTURE DIRECTIONS**

54278 None.

54279 **SEE ALSO**54280 *pthread_cond_destroy()*, *pthread_create()*, *pthread_mutex_destroy()*, *pthread_mutexattr_destroy()*

54281 XBD <pthread.h>

54282 **CHANGE HISTORY**

54283 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

54284 **Issue 6**54285 The *pthread_mutexattr_getpshared()* and *pthread_mutexattr_setpshared()* functions are marked as
54286 part of the Threads and Thread Process-Shared Synchronization options.54287 The **restrict** keyword is added to the *pthread_mutexattr_getpshared()* prototype for alignment
54288 with the ISO/IEC 9899:1999 standard.54289 **Issue 7**54290 The *pthread_mutexattr_getpshared()* and *pthread_mutexattr_setpshared()* functions are moved from
54291 the Threads option.54292 The [EINVAL] error for an uninitialized mutex attributes object is removed; this condition
54293 results in undefined behavior.

NAME

pthread_mutexattr_getrobust, pthread_mutexattr_setrobust — get and set the mutex robust attribute

SYNOPSIS

```
#include <pthread.h>

int pthread_mutexattr_getrobust(const pthread_mutexattr_t *restrict
    attr, int *restrict robust);
int pthread_mutexattr_setrobust(pthread_mutexattr_t *attr,
    int robust);
```

DESCRIPTION

The *pthread_mutexattr_getrobust()* and *pthread_mutexattr_setrobust()* functions, respectively, shall get and set the mutex *robust* attribute. This attribute is set in the *robust* parameter. Valid values for *robust* include:

PTHREAD_MUTEX_STALLED

No special actions are taken if the owner of the mutex is terminated while holding the mutex lock. This can lead to deadlocks if no other thread can unlock the mutex.

This is the default value.

PTHREAD_MUTEX_ROBUST

If the process containing the owning thread of a robust mutex terminates while holding the mutex lock, the next thread that acquires the mutex shall be notified about the termination by the return value [EOWNERDEAD] from the locking function. If the owning thread of a robust mutex terminates while holding the mutex lock, the next thread that acquires the mutex may be notified about the termination by the return value [EOWNERDEAD]. The notified thread can then attempt to mark the state protected by the mutex as consistent again by a call to *pthread_mutex_consistent()*. After a subsequent successful call to *pthread_mutex_unlock()*, the mutex lock shall be released and can be used normally by other threads. If the mutex is unlocked without a call to *pthread_mutex_consistent()*, it shall be in a permanently unusable state and all attempts to lock the mutex shall fail with the error [ENOTRECOVERABLE]. The only permissible operation on such a mutex is *pthread_mutex_destroy()*.

The behavior is undefined if the value specified by the *attr* argument to *pthread_mutexattr_getrobust()* or *pthread_mutexattr_setrobust()* does not refer to an initialized mutex attributes object.

RETURN VALUE

Upon successful completion, the *pthread_mutexattr_getrobust()* function shall return zero and store the value of the *robust* attribute of *attr* into the object referenced by the *robust* parameter. Otherwise, an error value shall be returned to indicate the error. If successful, the *pthread_mutexattr_setrobust()* function shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_mutexattr_setrobust()* function shall fail if:

[EINVAL] The value of *robust* is invalid.

These functions shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

The actions required to make the state protected by the mutex consistent again are solely dependent on the application. If it is not possible to make the state of a mutex consistent, robust mutexes can be used to notify this situation by calling *pthread_mutex_unlock()* without a prior call to *pthread_mutex_consistent()*.

If the state is declared inconsistent by calling *pthread_mutex_unlock()* without a prior call to *pthread_mutex_consistent()*, a possible approach could be to destroy the mutex and then reinitialize it. However, it should be noted that this is possible only in certain situations where the state protected by the mutex has to be reinitialized and coordination achieved with other threads blocked on the mutex, because otherwise a call to a locking function with a reference to a mutex object invalidated by a call to *pthread_mutex_destroy()* results in undefined behavior.

RATIONALE

If an implementation detects that the value specified by the *attr* argument to *pthread_mutexattr_getrobust()* or *pthread_mutexattr_setrobust()* does not refer to an initialized mutex attributes object, it is recommended that the function should fail and report an [EINVAL] error.

FUTURE DIRECTIONS

None.

XBD <pthread.h>

CHANGE HISTORY

First released in Issue 7.

NAME

pthread_mutexattr_gettype, pthread_mutexattr_settype — get and set the mutex type attribute

SYNOPSIS

```
#include <pthread.h>

int pthread_mutexattr_gettype(const pthread_mutexattr_t *restrict attr,
    int *restrict type);
int pthread_mutexattr_settype(pthread_mutexattr_t *attr, int type);
```

DESCRIPTION

The *pthread_mutexattr_gettype()* and *pthread_mutexattr_settype()* functions, respectively, shall get and set the mutex *type* attribute. This attribute is set in the *type* parameter to these functions. The default value of the *type* attribute is PTHREAD_MUTEX_DEFAULT.

The type of mutex is contained in the *type* attribute of the mutex attributes. Valid mutex types include:

PTHREAD_MUTEX_NORMAL	
PTHREAD_MUTEX_ERRORCHECK	
PTHREAD_MUTEX_RECURSIVE	
PTHREAD_MUTEX_DEFAULT	

The mutex type affects the behavior of calls which lock and unlock the mutex. See *pthread_mutex_lock()* for details. An implementation may map PTHREAD_MUTEX_DEFAULT to one of the other mutex types.

The behavior is undefined if the value specified by the *attr* argument to *pthread_mutexattr_gettype()* or *pthread_mutexattr_settype()* does not refer to an initialized mutex attributes object.

RETURN VALUE

Upon successful completion, the *pthread_mutexattr_gettype()* function shall return zero and store the value of the *type* attribute of *attr* into the object referenced by the *type* parameter. Otherwise, an error shall be returned to indicate the error.

If successful, the *pthread_mutexattr_settype()* function shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_mutexattr_settype()* function shall fail if:

[EINVAL] The value *type* is invalid.

These functions shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

It is advised that an application should not use a PTHREAD_MUTEX_RECURSIVE mutex with condition variables because the implicit unlock performed for a *pthread_cond_timedwait()* or *pthread_cond_wait()* may not actually release the mutex (if it had been locked multiple times). If this happens, no other thread can satisfy the condition of the predicate.

RATIONALE

If an implementation detects that the value specified by the *attr* argument to *pthread_mutexattr_gettype()* or *pthread_mutexattr_settype()* does not refer to an initialized mutex attributes object, it is recommended that the function should fail and report an [EINVAL] error.

54406 **FUTURE DIRECTIONS**

54407 None.

54408 **SEE ALSO**54409 *pthread_cond_timedwait()*, *pthread_mutex_lock()*

54410 XBD <pthread.h>

54411 **CHANGE HISTORY**

54412 First released in Issue 5.

54413 **Issue 6**

54414 The Open Group Corrigendum U033/3 is applied. The SYNOPSIS for
54415 *pthread_mutexattr_gettype()* is updated so that the first argument is of type **const**
54416 **pthread_mutexattr_t** *.

54417 The **restrict** keyword is added to the *pthread_mutexattr_gettype()* prototype for alignment with
54418 the ISO/IEC 9899:1999 standard.

54419 **Issue 7**

54420 The *pthread_mutexattr_gettype()* and *pthread_mutexattr_settype()* functions are moved from the
54421 XSI option to the Base.

54422 The [EINVAL] error for an uninitialized mutex attributes object is removed; this condition
54423 results in undefined behavior.

54424 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0464 [121] is applied.

54425 NAME

54426 pthread_mutexattr_init — initialize the mutex attributes object

54427 SYNOPSIS

54428 #include <pthread.h>

54429 int pthread_mutexattr_init(pthread_mutexattr_t *attr);

54430 DESCRIPTION

54431 Refer to *pthread_mutexattr_destroy()*.

54432 **NAME**

54433 pthread_mutexattr_setprioceiling — set the prioceiling attribute of the mutex attributes object
54434 (**REALTIME THREADS**)

54435 **SYNOPSIS**

```
54436 RPP|TPP #include <pthread.h>  
54437 int pthread_mutexattr_setprioceiling(pthread_mutexattr_t *attr,  
54438 int prioceiling);
```

54439 **DESCRIPTION**

54440 Refer to *pthread_mutexattr_getprioceiling()*.

54441 NAME

54442 pthread_mutexattr_setprotocol — set the protocol attribute of the mutex attributes object
54443 (REALTIME THREADS)

54444 SYNOPSIS

```
54445 MC1 #include <pthread.h>  
54446 int pthread_mutexattr_setprotocol(pthread_mutexattr_t *attr,  
54447 int protocol);
```

54448 DESCRIPTION

54449 Refer to *pthread_mutexattr_getprotocol()*.

54450 **NAME**

54451 pthread_mutexattr_setpshared — set the process-shared attribute

54452 **SYNOPSIS**

```
54453 TSH      #include <pthread.h>
54454          int pthread_mutexattr_setpshared(pthread_mutexattr_t *attr,
54455          int pshared);
```

54456 **DESCRIPTION**54457 Refer to *pthread_mutexattr_getpshared()*.

54458 NAME

54459 pthread_mutexattr_setrobust — get and set the mutex robust attribute

54460 SYNOPSIS

```
54461     #include <pthread.h>
54462     int pthread_mutexattr_setrobust(pthread_mutexattr_t *attr,
54463                                     int robust);
```

54464 DESCRIPTION

54465 Refer to *pthread_mutexattr_getrobust()*.

54466 **NAME**

54467 pthread_mutexattr_settype — set the mutex type attribute

54468 **SYNOPSIS**

54469 #include <pthread.h>

54470 int pthread_mutexattr_settype(pthread_mutexattr_t *attr, int type);

54471 **DESCRIPTION**54472 Refer to *pthread_mutexattr_gettype()*.

NAME

pthread_once — dynamic package initialization

SYNOPSIS

```
#include <pthread.h>

int pthread_once(pthread_once_t *once_control,
                 void (*init_routine)(void));

pthread_once_t once_control = PTHREAD_ONCE_INIT;
```

DESCRIPTION

The first call to *pthread_once()* by any thread in a process, with a given *once_control*, shall call the *init_routine* with no arguments. Subsequent calls of *pthread_once()* with the same *once_control* shall not call the *init_routine*. On return from *pthread_once()*, *init_routine* shall have completed. The *once_control* parameter shall determine whether the associated initialization routine has been called.

The *pthread_once()* function is not a cancellation point. However, if *init_routine* is a cancellation point and is canceled, the effect on *once_control* shall be as if *pthread_once()* was never called.

The constant PTHREAD_ONCE_INIT is defined in the **<pthread.h>** header.

The behavior of *pthread_once()* is undefined if *once_control* has automatic storage duration or is not initialized by PTHREAD_ONCE_INIT.

RETURN VALUE

Upon successful completion, *pthread_once()* shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_once()* function shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

Some C libraries are designed for dynamic initialization. That is, the global initialization for the library is performed when the first procedure in the library is called. In a single-threaded program, this is normally implemented using a static variable whose value is checked on entry to a routine, as follows:

```
static int random_is_initialized = 0;
extern int initialize_random();

int random_function()
{
    if (random_is_initialized == 0) {
        initialize_random();
        random_is_initialized = 1;
    }
    ... /* Operations performed after initialization. */
}
```

To keep the same structure in a multi-threaded program, a new primitive is needed. Otherwise, library initialization has to be accomplished by an explicit call to a library-exported initialization function prior to any use of the library.

For dynamic library initialization in a multi-threaded process, a simple initialization flag is not sufficient; the flag needs to be protected against modification by multiple threads simultaneously calling into the library. Protecting the flag requires the use of a mutex; however, mutexes have to be initialized before they are used. Ensuring that the mutex is only initialized once requires a recursive solution to this problem.

The use of *pthread_once()* not only supplies an implementation-guaranteed means of dynamic initialization, it provides an aid to the reliable construction of multi-threaded and realtime systems. The preceding example then becomes:

```
#include <pthread.h>
static pthread_once_t random_is_initialized = PTHREAD_ONCE_INIT;
extern int initialize_random();

int random_function()
{
    (void) pthread_once(&random_is_initialized, initialize_random);
    ... /* Operations performed after initialization. */
}
```

Note that a **pthread_once_t** cannot be an array because some compilers do not accept the construct **&<array_name>**.

If an implementation detects that the value specified by the *once_control* argument to *pthread_once()* does not refer to a **pthread_once_t** object initialized by **PTHREAD_ONCE_INIT**, it is recommended that the function should fail and report an [EINVAL] error.

FUTURE DIRECTIONS

None.

SEE ALSO

XBD [<pthread.h>](#)

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6

The *pthread_once()* function is marked as part of the Threads option.

The [EINVAL] error is added as a “may fail” case for if either argument is invalid.

Issue 7

The *pthread_once()* function is moved from the Threads option to the Base.

The [EINVAL] error for an uninitialized **pthread_once_t** object is removed; this condition results in undefined behavior.

NAME

pthread_rwlock_destroy, pthread_rwlock_init — destroy and initialize a read-write lock object

SYNOPSIS

```
#include <pthread.h>

int pthread_rwlock_destroy(pthread_rwlock_t *rwlock);
int pthread_rwlock_init(pthread_rwlock_t *restrict rwlock,
    const pthread_rwlockattr_t *restrict attr);
pthread_rwlock_t rwlock = PTHREAD_RWLOCK_INITIALIZER;
```

DESCRIPTION

The *pthread_rwlock_destroy()* function shall destroy the read-write lock object referenced by *rwlock* and release any resources used by the lock. The effect of subsequent use of the lock is undefined until the lock is reinitialized by another call to *pthread_rwlock_init()*. An implementation may cause *pthread_rwlock_destroy()* to set the object referenced by *rwlock* to an invalid value. Results are undefined if *pthread_rwlock_destroy()* is called when any thread holds *rwlock*. Attempting to destroy an uninitialized read-write lock results in undefined behavior.

The *pthread_rwlock_init()* function shall allocate any resources required to use the read-write lock referenced by *rwlock* and initializes the lock to an unlocked state with attributes referenced by *attr*. If *attr* is NULL, the default read-write lock attributes shall be used; the effect is the same as passing the address of a default read-write lock attributes object. Once initialized, the lock can be used any number of times without being reinitialized. Results are undefined if *pthread_rwlock_init()* is called specifying an already initialized read-write lock. Results are undefined if a read-write lock is used without first being initialized.

If the *pthread_rwlock_init()* function fails, *rwlock* shall not be initialized and the contents of *rwlock* are undefined.

Only the object referenced by *rwlock* may be used for performing synchronization. The result of referring to copies of that object in calls to *pthread_rwlock_destroy()*, *pthread_rwlock_rdlock()*, *pthread_rwlock_timedrdlock()*, *pthread_rwlock_timedwrlock()*, *pthread_rwlock_tryrdlock()*, *pthread_rwlock_trywrlock()*, *pthread_rwlock_unlock()*, or *pthread_rwlock_wrlock()* is undefined.

In cases where default read-write lock attributes are appropriate, the macro PTHREAD_RWLOCK_INITIALIZER can be used to initialize read-write locks. The effect shall be equivalent to dynamic initialization by a call to *pthread_rwlock_init()* with the *attr* parameter specified as NULL, except that no error checks are performed.

The behavior is undefined if the value specified by the *attr* argument to *pthread_rwlock_init()* does not refer to an initialized read-write lock attributes object.

RETURN VALUE

If successful, the *pthread_rwlock_destroy()* and *pthread_rwlock_init()* functions shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_rwlock_init()* function shall fail if:

- [EAGAIN] The system lacked the necessary resources (other than memory) to initialize another read-write lock.
- [ENOMEM] Insufficient memory exists to initialize the read-write lock.
- [EPERM] The caller does not have the privilege to perform the operation.

These functions shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

Applications using these and related read-write lock functions may be subject to priority inversion, as discussed in XBD [Section 3.287](#) (on page 79).

RATIONALE

If an implementation detects that the value specified by the *rwlock* argument to *pthread_rwlock_destroy()* does not refer to an initialized read-write lock object, it is recommended that the function should fail and report an [EINVAL] error.

If an implementation detects that the value specified by the *attr* argument to *pthread_rwlock_init()* does not refer to an initialized read-write lock attributes object, it is recommended that the function should fail and report an [EINVAL] error.

If an implementation detects that the value specified by the *rwlock* argument to *pthread_rwlock_destroy()* or *pthread_rwlock_init()* refers to a locked read-write lock object, or detects that the value specified by the *rwlock* argument to *pthread_rwlock_init()* refers to an already initialized read-write lock object, it is recommended that the function should fail and report an [EBUSY] error.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 5.

Issue 6

The following changes are made for alignment with IEEE Std 1003.1j-2000:

- The margin code in the SYNOPSIS is changed to THR to indicate that the functionality is now part of the Threads option (previously it was part of the Read-Write Locks option in IEEE Std 1003.1j-2000 and also part of the XSI extension). The initializer macro is also deleted from the SYNOPSIS.
- The DESCRIPTION is updated as follows:
 - It explicitly notes allocation of resources upon initialization of a read-write lock object.
 - A paragraph is added specifying that copies of read-write lock objects may not be used.
- An [EINVAL] error is added to the ERRORS section for *pthread_rwlock_init()*, indicating that the *rwlock* value is invalid.
- The SEE ALSO section is updated.

The **restrict** keyword is added to the *pthread_rwlock_init()* prototype for alignment with the ISO/IEC 9899:1999 standard.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/45 is applied, adding APPLICATION USAGE relating to priority inversion.

Issue 7

Austin Group Interpretation 1003.1-2001 #048 is applied, adding the PTHREAD_RWLOCK_INITIALIZER macro.

The *pthread_rwlock_destroy()* and *pthread_rwlock_init()* functions are moved from the Threads option to the Base.

The [EINVAL] error for an uninitialized read-write lock object or read-write lock attributes object is removed; this condition results in undefined behavior.

The [EBUSY] error for a locked read-write lock object or an already initialized read-write lock object is removed; this condition results in undefined behavior.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0465 [70] is applied.

+

NAME

pthread_rwlock_rdlock, pthread_rwlock_tryrdlock — lock a read-write lock object for reading

SYNOPSIS

```
#include <pthread.h>

int pthread_rwlock_rdlock(pthread_rwlock_t *rwlock);
int pthread_rwlock_tryrdlock(pthread_rwlock_t *rwlock);
```

DESCRIPTION

The *pthread_rwlock_rdlock()* function shall apply a read lock to the read-write lock referenced by *rwlock*. The calling thread acquires the read lock if a writer does not hold the lock and there are no writers blocked on the lock.

TPS

If the Thread Execution Scheduling option is supported, and the threads involved in the lock are executing with the scheduling policies SCHED_FIFO or SCHED_RR, the calling thread shall not acquire the lock if a writer holds the lock or if writers of higher or equal priority are blocked on the lock; otherwise, the calling thread shall acquire the lock.

TPS TSP

If the Thread Execution Scheduling option is supported, and the threads involved in the lock are executing with the SCHED_SPORADIC scheduling policy, the calling thread shall not acquire the lock if a writer holds the lock or if writers of higher or equal priority are blocked on the lock; otherwise, the calling thread shall acquire the lock.

If the Thread Execution Scheduling option is not supported, it is implementation-defined whether the calling thread acquires the lock when a writer does not hold the lock and there are writers blocked on the lock. If a writer holds the lock, the calling thread shall not acquire the read lock. If the read lock is not acquired, the calling thread shall block until it can acquire the lock. The calling thread may deadlock if at the time the call is made it holds a write lock.

A thread may hold multiple concurrent read locks on *rwlock* (that is, successfully call the *pthread_rwlock_rdlock()* function *n* times). If so, the application shall ensure that the thread performs matching unlocks (that is, it calls the *pthread_rwlock_unlock()* function *n* times).

The maximum number of simultaneous read locks that an implementation guarantees can be applied to a read-write lock shall be implementation-defined. The *pthread_rwlock_rdlock()* function may fail if this maximum would be exceeded.

The *pthread_rwlock_tryrdlock()* function shall apply a read lock as in the *pthread_rwlock_rdlock()* function, with the exception that the function shall fail if the equivalent *pthread_rwlock_rdlock()* call would have blocked the calling thread. In no case shall the *pthread_rwlock_tryrdlock()* function ever block; it always either acquires the lock or fails and returns immediately.

Results are undefined if any of these functions are called with an uninitialized read-write lock.

If a signal is delivered to a thread waiting for a read-write lock for reading, upon return from the signal handler the thread resumes waiting for the read-write lock for reading as if it was not interrupted.

RETURN VALUE

If successful, the *pthread_rwlock_rdlock()* function shall return zero; otherwise, an error number shall be returned to indicate the error.

The *pthread_rwlock_tryrdlock()* function shall return zero if the lock for reading on the read-write lock object referenced by *rwlock* is acquired. Otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_rwlock_tryrdlock()* function shall fail if:

[EBUSY] The read-write lock could not be acquired for reading because a writer holds the lock or a writer with the appropriate priority was blocked on it.

The *pthread_rwlock_rdlock()* and *pthread_rwlock_tryrdlock()* functions may fail if:

[EAGAIN] The read lock could not be acquired because the maximum number of read locks for *rwlock* has been exceeded.

The *pthread_rwlock_rdlock()* function may fail if:

[EDEADLK] A deadlock condition was detected or the current thread already owns the read-write lock for writing.

These functions shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

Applications using these functions may be subject to priority inversion, as discussed in XBD [Section 3.287](#) (on page 79).

RATIONALE

If an implementation detects that the value specified by the *rwlock* argument to *pthread_rwlock_rdlock()* or *pthread_rwlock_tryrdlock()* does not refer to an initialized read-write lock object, it is recommended that the function should fail and report an [EINVAL] error.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 5.

Issue 6

The following changes are made for alignment with IEEE Std 1003.1j-2000:

- The margin code in the SYNOPSIS is changed to THR to indicate that the functionality is now part of the Threads option (previously it was part of the Read-Write Locks option in IEEE Std 1003.1j-2000 and also part of the XSI extension).
- The DESCRIPTION is updated as follows:
 - Conditions under which writers have precedence over readers are specified.
 - Failure of *pthread_rwlock_tryrdlock()* is clarified.
 - A paragraph on the maximum number of read locks is added.
- In the ERRORS sections, [EBUSY] is modified to take into account write priority, and [EDEADLK] is deleted as a *pthread_rwlock_tryrdlock()* error.

- 54731 • The SEE ALSO section is updated.
- 54732 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/101 is applied, updating the ERRORS
- 54733 section so that the [EDEADLK] error includes detection of a deadlock condition.
- 54734 **Issue 7**
- 54735 The *pthread_rwlock_rdlock()* and *pthread_rwlock_tryrdlock()* functions are moved from the Threads
- 54736 option to the Base.
- 54737 The [EINVAL] error for an uninitialized read-write lock object is removed; this condition results
- 54738 in undefined behavior.

NAME

pthread_rwlock_timedrdlock — lock a read-write lock for reading

SYNOPSIS

```
#include <pthread.h>
#include <time.h>
```

```
int pthread_rwlock_timedrdlock(pthread_rwlock_t *restrict rwlock,
    const struct timespec *restrict abstime);
```

DESCRIPTION

The *pthread_rwlock_timedrdlock()* function shall apply a read lock to the read-write lock referenced by *rwlock* as in the *pthread_rwlock_rdlock()* function. However, if the lock cannot be acquired without waiting for other threads to unlock the lock, this wait shall be terminated when the specified timeout expires. The timeout shall expire when the absolute time specified by *abstime* passes, as measured by the clock on which timeouts are based (that is, when the value of that clock equals or exceeds *abstime*), or if the absolute time specified by *abstime* has already been passed at the time of the call.

The timeout shall be based on the CLOCK_REALTIME clock. The resolution of the timeout shall be the resolution of the CLOCK_REALTIME clock. The **timespec** data type is defined in the **<time.h>** header. Under no circumstances shall the function fail with a timeout if the lock can be acquired immediately. The validity of the *abstime* parameter need not be checked if the lock can be immediately acquired.

If a signal that causes a signal handler to be executed is delivered to a thread blocked on a read-write lock via a call to *pthread_rwlock_timedrdlock()*, upon return from the signal handler the thread shall resume waiting for the lock as if it was not interrupted.

The calling thread may deadlock if at the time the call is made it holds a write lock on *rwlock*. The results are undefined if this function is called with an uninitialized read-write lock.

RETURN VALUE

The *pthread_rwlock_timedrdlock()* function shall return zero if the lock for reading on the read-write lock object referenced by *rwlock* is acquired. Otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_rwlock_timedrdlock()* function shall fail if:

[ETIMEDOUT] The lock could not be acquired before the specified timeout expired.

The *pthread_rwlock_timedrdlock()* function may fail if:

[EAGAIN] The read lock could not be acquired because the maximum number of read locks for lock would be exceeded.

[EDEADLK] A deadlock condition was detected or the calling thread already holds a write lock on *rwlock*.

[EINVAL] The *abstime* nanosecond value is less than zero or greater than or equal to 1 000 million.

This function shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

Applications using this function may be subject to priority inversion, as discussed in XBD Section 3.287 (on page 79).

RATIONALE

If an implementation detects that the value specified by the *rwlock* argument to *pthread_rwlock_timedrdlock()* does not refer to an initialized read-write lock object, it is recommended that the function should fail and report an [EINVAL] error.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/102 is applied, updating the ERRORS section so that the [EDEADLK] error includes detection of a deadlock condition.

Issue 7

The *pthread_rwlock_timedrdlock()* function is moved from the Timeouts option to the Base.

The [EINVAL] error for an uninitialized read-write lock object is removed; this condition results in undefined behavior.

NAME

pthread_rwlock_timedwrlock — lock a read-write lock for writing

SYNOPSIS

```
#include <pthread.h>
#include <time.h>
```

```
int pthread_rwlock_timedwrlock(pthread_rwlock_t *restrict rwlock,
    const struct timespec *restrict abstime);
```

DESCRIPTION

The *pthread_rwlock_timedwrlock()* function shall apply a write lock to the read-write lock referenced by *rwlock* as in the *pthread_rwlock_wrlock()* function. However, if the lock cannot be acquired without waiting for other threads to unlock the lock, this wait shall be terminated when the specified timeout expires. The timeout shall expire when the absolute time specified by *abstime* passes, as measured by the clock on which timeouts are based (that is, when the value of that clock equals or exceeds *abstime*), or if the absolute time specified by *abstime* has already been passed at the time of the call.

The timeout shall be based on the CLOCK_REALTIME clock. The resolution of the timeout shall be the resolution of the CLOCK_REALTIME clock. The **timespec** data type is defined in the **<time.h>** header. Under no circumstances shall the function fail with a timeout if the lock can be acquired immediately. The validity of the *abstime* parameter need not be checked if the lock can be immediately acquired.

If a signal that causes a signal handler to be executed is delivered to a thread blocked on a read-write lock via a call to *pthread_rwlock_timedwrlock()*, upon return from the signal handler the thread shall resume waiting for the lock as if it was not interrupted.

The calling thread may deadlock if at the time the call is made it holds the read-write lock. The results are undefined if this function is called with an uninitialized read-write lock.

RETURN VALUE

The *pthread_rwlock_timedwrlock()* function shall return zero if the lock for writing on the read-write lock object referenced by *rwlock* is acquired. Otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_rwlock_timedwrlock()* function shall fail if:

[ETIMEDOUT] The lock could not be acquired before the specified timeout expired.

The *pthread_rwlock_timedwrlock()* function may fail if:

[EDEADLK] A deadlock condition was detected or the calling thread already holds the *rwlock*.

[EINVAL] The *abstime* nanosecond value is less than zero or greater than or equal to 1 000 million.

This function shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

Applications using this function may be subject to priority inversion, as discussed in XBD [Section 3.287](#) (on page 79).

RATIONALE

If an implementation detects that the value specified by the *rwlock* argument to *pthread_rwlock_timedwrlock()* does not refer to an initialized read-write lock object, it is recommended that the function should fail and report an [EINVAL] error.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/103 is applied, updating the ERRORS section so that the [EDEADLK] error includes detection of a deadlock condition.

Issue 7

The *pthread_rwlock_timedwrlock()* function is moved from the Timeouts option to the Base.

The [EINVAL] error for an uninitialized read-write lock object is removed; this condition results in undefined behavior.

54863 NAME

54864 pthread_rwlock_tryrdlock — lock a read-write lock object for reading

54865 SYNOPSIS

54866 #include <pthread.h>

54867 int pthread_rwlock_tryrdlock(pthread_rwlock_t *rwlock);

54868 DESCRIPTION

54869 Refer to *pthread_rwlock_rdlock()*.

NAME

pthread_rwlock_trywrlock, pthread_rwlock_wrlock — lock a read-write lock object for writing

SYNOPSIS

```
#include <pthread.h>

int pthread_rwlock_trywrlock(pthread_rwlock_t *rwlock);
int pthread_rwlock_wrlock(pthread_rwlock_t *rwlock);
```

DESCRIPTION

The *pthread_rwlock_trywrlock()* function shall apply a write lock like the *pthread_rwlock_wrlock()* function, with the exception that the function shall fail if any thread currently holds *rwlock* (for reading or writing).

The *pthread_rwlock_wrlock()* function shall apply a write lock to the read-write lock referenced by *rwlock*. The calling thread acquires the write lock if no other thread (reader or writer) holds the read-write lock *rwlock*. Otherwise, the thread shall block until it can acquire the lock. The calling thread may deadlock if at the time the call is made it holds the read-write lock (whether a read or write lock).

Implementations may favor writers over readers to avoid writer starvation.

Results are undefined if any of these functions are called with an uninitialized read-write lock.

If a signal is delivered to a thread waiting for a read-write lock for writing, upon return from the signal handler the thread resumes waiting for the read-write lock for writing as if it was not interrupted.

RETURN VALUE

The *pthread_rwlock_trywrlock()* function shall return zero if the lock for writing on the read-write lock object referenced by *rwlock* is acquired. Otherwise, an error number shall be returned to indicate the error.

If successful, the *pthread_rwlock_wrlock()* function shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_rwlock_trywrlock()* function shall fail if:

[EBUSY] The read-write lock could not be acquired for writing because it was already locked for reading or writing.

The *pthread_rwlock_wrlock()* function may fail if:

[EDEADLK] A deadlock condition was detected or the current thread already owns the read-write lock for writing or reading.

These functions shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

Applications using these functions may be subject to priority inversion, as discussed in XBD [Section 3.287](#) (on page 79).

RATIONALE

If an implementation detects that the value specified by the *rwlock* argument to *pthread_rwlock_trywrlock()* or *pthread_rwlock_wrlock()* does not refer to an initialized read-write lock object, it is recommended that the function should fail and report an [EINVAL] error.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 5.

Issue 6

The following changes are made for alignment with IEEE Std 1003.1j-2000:

- The margin code in the SYNOPSIS is changed to THR to indicate that the functionality is now part of the Threads option (previously it was part of the Read-Write Locks option in IEEE Std 1003.1j-2000 and also part of the XSI extension).
- The [EDEADLK] error is deleted as a *pthread_rwlock_trywrlock()* error.
- The SEE ALSO section is updated.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/104 is applied, updating the ERRORS section so that the [EDEADLK] error includes detection of a deadlock condition.

Issue 7

The *pthread_rwlock_trywrlock()* and *pthread_rwlock_wrlock()* functions are moved from the Threads option to the Base.

The [EINVAL] error for an uninitialized read-write lock object is removed; this condition results in undefined behavior.

NAME

pthread_rwlock_unlock — unlock a read-write lock object

SYNOPSIS

```
#include <pthread.h>
```

```
int pthread_rwlock_unlock(pthread_rwlock_t *rwlock);
```

DESCRIPTION

The *pthread_rwlock_unlock()* function shall release a lock held on the read-write lock object referenced by *rwlock*. Results are undefined if the read-write lock *rwlock* is not held by the calling thread.

If this function is called to release a read lock from the read-write lock object and there are other read locks currently held on this read-write lock object, the read-write lock object remains in the read locked state. If this function releases the last read lock for this read-write lock object, the read-write lock object shall be put in the unlocked state with no owners.

If this function is called to release a write lock for this read-write lock object, the read-write lock object shall be put in the unlocked state.

TPS If there are threads blocked on the lock when it becomes available, the scheduling policy shall determine which thread(s) shall acquire the lock. If the Thread Execution Scheduling option is supported, when threads executing with the scheduling policies SCHED_FIFO, SCHED_RR, or SCHED_SPORADIC are waiting on the lock, they shall acquire the lock in priority order when the lock becomes available. For equal priority threads, write locks shall take precedence over read locks. If the Thread Execution Scheduling option is not supported, it is implementation-defined whether write locks take precedence over read locks.

Results are undefined if this function is called with an uninitialized read-write lock.

RETURN VALUE

If successful, the *pthread_rwlock_unlock()* function shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_rwlock_unlock()* function shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

If an implementation detects that the value specified by the *rwlock* argument to *pthread_rwlock_unlock()* does not refer to an initialized read-write lock object, it is recommended that the function should fail and report an [EINVAL] error.

If an implementation detects that the value specified by the *rwlock* argument to *pthread_rwlock_unlock()* refers to a read-write lock object for which the current thread does not hold a lock, it is recommended that the function should fail and report an [EPERM] error.

FUTURE DIRECTIONS

None.

pthread_rwlock_timedwrlock(), *pthread_rwlock_trywrlock()*

XBD Section 4.11 (on page 110), <pthread.h>

CHANGE HISTORY

First released in Issue 5.

Issue 6

The following changes are made for alignment with IEEE Std 1003.1j-2000:

- The margin code in the SYNOPSIS is changed to THR to indicate that the functionality is now part of the Threads option (previously it was part of the Read-Write Locks option in IEEE Std 1003.1j-2000 and also part of the XSI extension).
- The DESCRIPTION is updated as follows:
 - The conditions under which writers have precedence over readers are specified.
 - The concept of read-write lock owner is deleted.
- The SEE ALSO section is updated.

Issue 7

SD5-XSH-ERN-183 is applied.

The *pthread_rwlock_unlock()* function is moved from the Threads option to the Base.

The [EINVAL] error for an uninitialized read-write lock object is removed; this condition results in undefined behavior.

The [EPERM] error for a read-write lock object for which the current thread does not hold a lock is removed; this condition results in undefined behavior.

54998 **NAME**

54999 pthread_rwlock_wrlock — lock a read-write lock object for writing

55000 **SYNOPSIS**

55001 #include <pthread.h>

55002 int pthread_rwlock_wrlock(pthread_rwlock_t *rwlock);

55003 **DESCRIPTION**55004 Refer to *pthread_rwlock_trywrlock()*.

55005 **NAME**

55006 pthread_rwlockattr_destroy, pthread_rwlockattr_init — destroy and initialize the read-write
55007 lock attributes object

55008 **SYNOPSIS**

55009 #include <pthread.h>

55010 int pthread_rwlockattr_destroy(pthread_rwlockattr_t *attr);
55011 int pthread_rwlockattr_init(pthread_rwlockattr_t *attr);

55012 **DESCRIPTION**

55013 The *pthread_rwlockattr_destroy()* function shall destroy a read-write lock attributes object. A
55014 destroyed *attr* attributes object can be reinitialized using *pthread_rwlockattr_init()*; the results of
55015 otherwise referencing the object after it has been destroyed are undefined. An implementation
55016 may cause *pthread_rwlockattr_destroy()* to set the object referenced by *attr* to an invalid value.

55017 The *pthread_rwlockattr_init()* function shall initialize a read-write lock attributes object *attr* with
55018 the default value for all of the attributes defined by the implementation.

55019 Results are undefined if *pthread_rwlockattr_init()* is called specifying an already initialized *attr*
55020 attributes object.

55021 After a read-write lock attributes object has been used to initialize one or more read-write locks,
55022 any function affecting the attributes object (including destruction) shall not affect any previously
55023 initialized read-write locks.

55024 The behavior is undefined if the value specified by the *attr* argument to
55025 *pthread_rwlockattr_destroy()* does not refer to an initialized read-write lock attributes object.

55026 **RETURN VALUE**

55027 If successful, the *pthread_rwlockattr_destroy()* and *pthread_rwlockattr_init()* functions shall return
55028 zero; otherwise, an error number shall be returned to indicate the error.

55029 **ERRORS**

55030 The *pthread_rwlockattr_init()* function shall fail if:

55031 [ENOMEM] Insufficient memory exists to initialize the read-write lock attributes object.

55032 These functions shall not return an error code of [EINTR].

55033 **EXAMPLES**

55034 None.

55035 **APPLICATION USAGE**

55036 None.

55037 **RATIONALE**

55038 If an implementation detects that the value specified by the *attr* argument to
55039 *pthread_rwlockattr_destroy()* does not refer to an initialized read-write lock attributes object, it is
55040 recommended that the function should fail and report an [EINVAL] error.

55041 **FUTURE DIRECTIONS**

55042 None.

55043 **SEE ALSO**

55044 *pthread_rwlock_destroy()*, *pthread_rwlockattr_getpshared()*

55045 XBD <pthread.h>

55046 **CHANGE HISTORY**

55047 First released in Issue 5.

55048 **Issue 6**

55049 The following changes are made for alignment with IEEE Std 1003.1j-2000:

- 55050 • The margin code in the SYNOPSIS is changed to THR to indicate that the functionality is
- 55051 now part of the Threads option (previously it was part of the Read-Write Locks option in
- 55052 IEEE Std 1003.1j-2000 and also part of the XSI extension).
- 55053 • The SEE ALSO section is updated.

55054 **Issue 7**55055 The *pthread_rwlockattr_destroy()* and *pthread_rwlockattr_init()* functions are moved from the

55056 Threads option to the Base.

55057 The [EINVAL] error for an uninitialized read-write lock attributes object is removed; this

55058 condition results in undefined behavior.

NAME

pthread_rwlockattr_getpshared, pthread_rwlockattr_setpshared — get and set the process-shared attribute of the read-write lock attributes object

SYNOPSIS

```
TSH #include <pthread.h>

int pthread_rwlockattr_getpshared(const pthread_rwlockattr_t
    *restrict attr, int *restrict pshared);
int pthread_rwlockattr_setpshared(pthread_rwlockattr_t *attr,
    int pshared);
```

DESCRIPTION

The *pthread_rwlockattr_getpshared()* function shall obtain the value of the *process-shared* attribute from the initialized attributes object referenced by *attr*. The *pthread_rwlockattr_setpshared()* function shall set the *process-shared* attribute in an initialized attributes object referenced by *attr*.

The *process-shared* attribute shall be set to `PTHREAD_PROCESS_SHARED` to permit a read-write lock to be operated upon by any thread that has access to the memory where the read-write lock is allocated, even if the read-write lock is allocated in memory that is shared by multiple processes. If the *process-shared* attribute is `PTHREAD_PROCESS_PRIVATE`, the read-write lock shall only be operated upon by threads created within the same process as the thread that initialized the read-write lock; if threads of differing processes attempt to operate on such a read-write lock, the behavior is undefined. The default value of the *process-shared* attribute shall be `PTHREAD_PROCESS_PRIVATE`.

Additional attributes, their default values, and the names of the associated functions to get and set those attribute values are implementation-defined.

The behavior is undefined if the value specified by the *attr* argument to *pthread_rwlockattr_getpshared()* or *pthread_rwlockattr_setpshared()* does not refer to an initialized read-write lock attributes object.

RETURN VALUE

Upon successful completion, the *pthread_rwlockattr_getpshared()* function shall return zero and store the value of the *process-shared* attribute of *attr* into the object referenced by the *pshared* parameter. Otherwise, an error number shall be returned to indicate the error.

If successful, the *pthread_rwlockattr_setpshared()* function shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_rwlockattr_setpshared()* function may fail if:

[EINVAL] The new value specified for the attribute is outside the range of legal values for that attribute.

These functions shall not return an error code of [EINTR].

55096 **EXAMPLES**

55097 None.

55098 **APPLICATION USAGE**

55099 None.

55100 **RATIONALE**

55101 None.

55102 **FUTURE DIRECTIONS**

55103 None.

55104 **SEE ALSO**55105 *pthread_rwlock_destroy()*, *pthread_rwlockattr_destroy()*

55106 XBD <pthread.h>

55107 **CHANGE HISTORY**

55108 First released in Issue 5.

55109 **Issue 6**

55110 The following changes are made for alignment with IEEE Std 1003.1j-2000:

- 55111 • The margin code in the SYNOPSIS is changed to THR TSH to indicate that the
- 55112 functionality is now part of the Threads option (previously it was part of the Read-Write
- 55113 Locks option in IEEE Std 1003.1j-2000 and also part of the XSI extension).
- 55114 • The DESCRIPTION notes that additional attributes are implementation-defined.
- 55115 • The SEE ALSO section is updated.

55116 The **restrict** keyword is added to the *pthread_rwlockattr_getpshared()* prototype for alignment

55117 with the ISO/IEC 9899:1999 standard.

55118 **Issue 7**

55119 The *pthread_rwlockattr_getpshared()* and *pthread_rwlockattr_setpshared()* functions are moved from

55120 the Threads option.

55121 The [EINVAL] error for an uninitialized read-write lock attributes object is removed; this

55122 condition results in undefined behavior.

55123 NAME

55124 pthread_rwlockattr_init — initialize the read-write lock attributes object

55125 SYNOPSIS

55126 #include <pthread.h>

55127 int pthread_rwlockattr_init(pthread_rwlockattr_t *attr);

55128 DESCRIPTION

55129 Refer to *pthread_rwlockattr_destroy()*.

55130 **NAME**

55131 pthread_rwlockattr_setpshared — set the process-shared attribute of the read-write lock
55132 attributes object

55133 **SYNOPSIS**

```
55134 TSH      #include <pthread.h>
55135          int pthread_rwlockattr_setpshared(pthread_rwlockattr_t *attr,
55136          int pshared);
```

55137 **DESCRIPTION**

55138 Refer to *pthread_rwlockattr_getpshared()*.

55139 NAME

55140 pthread_self — get the calling thread ID

55141 SYNOPSIS

55142 #include <pthread.h>

55143 pthread_t pthread_self(void);

55144 DESCRIPTION

55145 The *pthread_self()* function shall return the thread ID of the calling thread.

55146 RETURN VALUE

55147 The *pthread_self()* function shall always be successful and no return value is reserved to indicate
55148 an error.

55149 ERRORS

55150 No errors are defined.

55151 EXAMPLES

55152 None.

55153 APPLICATION USAGE

55154 None.

55155 RATIONALE

55156 The *pthread_self()* function provides a capability similar to the *getpid()* function for processes
55157 and the rationale is the same: the creation call does not provide the thread ID to the created
55158 thread.

55159 FUTURE DIRECTIONS

55160 None.

55161 SEE ALSO

55162 *pthread_create()*, *pthread_equal()*

55163 XBD <pthread.h>

55164 CHANGE HISTORY

55165 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

55166 Issue 6

55167 The *pthread_self()* function is marked as part of the Threads option.

55168 Issue 7

55169 Austin Group Interpretation 1003.1-2001 #063 is applied, updating the RETURN VALUE section.

55170 The *pthread_self()* function is moved from the Threads option to the Base.

55171 **NAME**

55172 pthread_setcancelstate, pthread_setcanceltype, pthread_testcancel — set cancelability state

55173 **SYNOPSIS**

```
55174 #include <pthread.h>
55175 int pthread_setcancelstate(int state, int *oldstate);
55176 int pthread_setcanceltype(int type, int *oldtype);
55177 void pthread_testcancel(void);
```

55178 **DESCRIPTION**

55179 The *pthread_setcancelstate()* function shall atomically both set the calling thread's cancelability
 55180 state to the indicated *state* and return the previous cancelability state at the location referenced
 55181 by *oldstate*. Legal values for *state* are PTHREAD_CANCEL_ENABLE and
 55182 PTHREAD_CANCEL_DISABLE.

55183 The *pthread_setcanceltype()* function shall atomically both set the calling thread's cancelability
 55184 type to the indicated *type* and return the previous cancelability type at the location referenced by
 55185 *oldtype*. Legal values for *type* are PTHREAD_CANCEL_DEFERRED and
 55186 PTHREAD_CANCEL_ASYNCHRONOUS.

55187 The cancelability state and type of any newly created threads, including the thread in which
 55188 *main()* was first invoked, shall be PTHREAD_CANCEL_ENABLE and
 55189 PTHREAD_CANCEL_DEFERRED respectively.

55190 The *pthread_testcancel()* function shall create a cancellation point in the calling thread. The
 55191 *pthread_testcancel()* function shall have no effect if cancelability is disabled.

55192 **RETURN VALUE**

55193 If successful, the *pthread_setcancelstate()* and *pthread_setcanceltype()* functions shall return zero;
 55194 otherwise, an error number shall be returned to indicate the error.

55195 **ERRORS**

55196 The *pthread_setcancelstate()* function may fail if:

55197 [EINVAL] The specified state is not PTHREAD_CANCEL_ENABLE or
 55198 PTHREAD_CANCEL_DISABLE.

55199 The *pthread_setcanceltype()* function may fail if:

55200 [EINVAL] The specified type is not PTHREAD_CANCEL_DEFERRED or
 55201 PTHREAD_CANCEL_ASYNCHRONOUS.

55202 These functions shall not return an error code of [EINTR].

55203 **EXAMPLES**

55204 None.

55205 **APPLICATION USAGE**

55206 None.

55207 **RATIONALE**

55208 The *pthread_setcancelstate()* and *pthread_setcanceltype()* functions control the points at which a
 55209 thread may be asynchronously canceled. For cancellation control to be usable in modular
 55210 fashion, some rules need to be followed.

55211 An object can be considered to be a generalization of a procedure. It is a set of procedures and
 55212 global variables written as a unit and called by clients not known by the object. Objects may
 55213 depend on other objects.

55214 First, cancelability should only be disabled on entry to an object, never explicitly enabled. On

exit from an object, the cancelability state should always be restored to its value on entry to the object.

This follows from a modularity argument: if the client of an object (or the client of an object that uses that object) has disabled cancelability, it is because the client does not want to be concerned about cleaning up if the thread is canceled while executing some sequence of actions. If an object is called in such a state and it enables cancelability and a cancellation request is pending for that thread, then the thread is canceled, contrary to the wish of the client that disabled.

Second, the cancelability type may be explicitly set to either *deferred* or *asynchronous* upon entry to an object. But as with the cancelability state, on exit from an object the cancelability type should always be restored to its value on entry to the object.

Finally, only functions that are cancel-safe may be called from a thread that is asynchronously cancelable.

FUTURE DIRECTIONS

None.

55241 pthread_setconcurrency — set the level of concurrency

55242 **SYNOPSIS**55243 OB XSI `#include <pthread.h>`55244 `int pthread_setconcurrency(int new_level);`55245 **DESCRIPTION**55246 Refer to *pthread_getconcurrency()*.

55247 NAME

55248 pthread_setschedparam — dynamic thread scheduling parameters access (REALTIME
55249 THREADS)

55250 SYNOPSIS

```
55251 TPS    #include <pthread.h>
55252
55252    int pthread_setschedparam(pthread_t thread, int policy,
55253                               const struct sched_param *param);
```

55254 DESCRIPTION

55255 Refer to *pthread_getschedparam()*.

NAME

pthread_setschedprio — dynamic thread scheduling parameters access (REALTIME THREADS)

SYNOPSIS

```
#include <pthread.h>

int pthread_setschedprio(pthread_t thread, int prio);
```

DESCRIPTION

The *pthread_setschedprio()* function shall set the scheduling priority for the thread whose thread ID is given by *thread* to the value given by *prio*. See [Scheduling Policies](#) (on page 506) for a description on how this function call affects the ordering of the thread in the thread list for its new priority.

If the *pthread_setschedprio()* function fails, the scheduling priority of the target thread shall not be changed.

RETURN VALUE

If successful, the *pthread_setschedprio()* function shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_setschedprio()* function may fail if:

- [EINVAL] The value of *prio* is invalid for the scheduling policy of the specified thread. -
- [EPERM] The caller does not have appropriate privileges to set the scheduling priority of the specified thread. |

The *pthread_setschedprio()* function shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

The *pthread_setschedprio()* function provides a way for an application to temporarily raise its priority and then lower it again, without having the undesired side-effect of yielding to other threads of the same priority. This is necessary if the application is to implement its own strategies for bounding priority inversion, such as priority inheritance or priority ceilings. This capability is especially important if the implementation does not support the Thread Priority Protection or Thread Priority Inheritance options, but even if those options are supported it is needed if the application is to bound priority inheritance for other resources, such as semaphores.

The standard developers considered that while it might be preferable conceptually to solve this problem by modifying the specification of *pthread_setschedparam()*, it was too late to make such a change, as there may be implementations that would need to be changed. Therefore, this new function was introduced.

If an implementation detects use of a thread ID after the end of its lifetime, it is recommended that the function should fail and report an [ESRCH] error.

55297 **FUTURE DIRECTIONS**

55298 None.

55299 **SEE ALSO**55300 [Scheduling Policies](#) (on page 506), [pthread_getschedparam\(\)](#)55301 XBD [<pthread.h>](#)55302 **CHANGE HISTORY**

NAME

pthread_sigmask, sigprocmask — examine and change blocked signals

SYNOPSIS

```
CX      #include <signal.h>

55320      int pthread_sigmask(int how, const sigset_t *restrict set,
55321                          sigset_t *restrict oset);
55322      int sigprocmask(int how, const sigset_t *restrict set,
55323                      sigset_t *restrict oset);
```

DESCRIPTION

The *pthread_sigmask()* function shall examine or change (or both) the calling thread's signal mask, regardless of the number of threads in the process. The function shall be equivalent to *sigprocmask()*, without the restriction that the call be made in a single-threaded process.

In a single-threaded process, the *sigprocmask()* function shall examine or change (or both) the signal mask of the calling thread.

If the argument *set* is not a null pointer, it points to a set of signals to be used to change the currently blocked set.

The argument *how* indicates the way in which the set is changed, and the application shall ensure it consists of one of the following values:

SIG_BLOCK The resulting set shall be the union of the current set and the signal set pointed to by *set*.

SIG_SETMASK The resulting set shall be the signal set pointed to by *set*.

SIG_UNBLOCK The resulting set shall be the intersection of the current set and the complement of the signal set pointed to by *set*.

If the argument *oset* is not a null pointer, the previous mask shall be stored in the location pointed to by *oset*. If *set* is a null pointer, the value of the argument *how* is not significant and the thread's signal mask shall be unchanged; thus the call can be used to enquire about currently blocked signals.

If there are any pending unblocked signals after the call to *sigprocmask()*, at least one of those signals shall be delivered before the call to *sigprocmask()* returns.

It is not possible to block those signals which cannot be ignored. This shall be enforced by the system without causing an error to be indicated.

If any of the SIGFPE, SIGILL, SIGSEGV, or SIGBUS signals are generated while they are blocked, the result is undefined, unless the signal was generated by the action of another process, or by one of the functions *kill()*, *pthread_kill()*, *raise()*, or *sigqueue()*.

If *sigprocmask()* fails, the thread's signal mask shall not be changed.

The use of the *sigprocmask()* function is unspecified in a multi-threaded process.

RETURN VALUE

Upon successful completion *pthread_sigmask()* shall return 0; otherwise, it shall return the corresponding error number.

Upon successful completion, *sigprocmask()* shall return 0; otherwise, -1 shall be returned, *errno* shall be set to indicate the error, and the signal mask of the process shall be unchanged.

ERRORS

The *pthread_sigmask()* and *sigprocmask()* functions shall fail if:

[EINVAL] The value of the *how* argument is not equal to one of the defined values.

The *pthread_sigmask()* function shall not return an error code of [EINTR].

EXAMPLES**Signaling in a Multi-Threaded Process**

This example shows the use of *pthread_sigmask()* in order to deal with signals in a multi-threaded process. It provides a fairly general framework that could be easily adapted/extended.

```
#include <stdio.h>
#include <stdlib.h>
#include <pthread.h>
#include <signal.h>
#include <string.h>
#include <errno.h>
...

static sigset_t  signal_mask; /* signals to block          */

int main (int argc, char *argv[])
{
    pthread_t  sig_thr_id;      /* signal handler thread ID */
    int        rc;              /* return code              */

    sigemptyset (&signal_mask);
    sigaddset (&signal_mask, SIGINT);
    sigaddset (&signal_mask, SIGTERM);
    rc = pthread_sigmask (SIG_BLOCK, &signal_mask, NULL);
    if (rc != 0) {
        /* handle error */
        ...
    }
    /* any newly created threads inherit the signal mask */

    rc = pthread_create (&sig_thr_id, NULL, signal_thread, NULL);
    if (rc != 0) {
        /* handle error */
        ...
    }

    /* APPLICATION CODE */
    ...
}

void *signal_thread (void *arg)
{
    int        sig_caught;      /* signal caught            */
    int        rc;              /* returned code            */

    rc = sigwait (&signal_mask, &sig_caught);
    if (rc != 0) {
        /* handle error */
    }
}
```

```

55402         switch (sig_caught)
55403         {
55404             case SIGINT:      /* process SIGINT */
55405                 ...
55406                 break;
55407             case SIGTERM:     /* process SIGTERM */
55408                 ...
55409                 break;
55410             default:          /* should normally not happen */
55411                 fprintf (stderr, "\nUnexpected signal %d\n", sig_caught);
55412                 break;
55413         }
55414     }

```

APPLICATION USAGE

None.

RATIONALE

When a thread's signal mask is changed in a signal-catching function that is installed by *sigaction()*, the restoration of the signal mask on return from the signal-catching function overrides that change (see *sigaction()*). If the signal-catching function was installed with *signal()*, it is unspecified whether this occurs.

See *kill()* for a discussion of the requirement on delivery of signals.

FUTURE DIRECTIONS

None.

XBD <signal.h>

CHANGE HISTORY

First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

The *pthread_sigmask()* function is added for alignment with the POSIX Threads Extension.

Issue 6

The *pthread_sigmask()* function is marked as part of the Threads option.

The SYNOPSIS for *sigprocmask()* is marked as a CX extension to note that the presence of this function in the <signal.h> header is an extension to the ISO C standard.

The following changes are made for alignment with the ISO POSIX-1:1996 standard:

- The DESCRIPTION is updated to explicitly state the functions which may generate the signal.

The normative text is updated to avoid use of the term “must” for application requirements.

The **restrict** keyword is added to the *pthread_sigmask()* and *sigprocmask()* prototypes for alignment with the ISO/IEC 9899:1999 standard.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/105 is applied, updating “process’ signal mask” to “thread’s signal mask” in the DESCRIPTION and RATIONALE sections.

55446	IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/106 is applied, adding the example to the EXAMPLES section.	
55447		
55448	Issue 7	
55449	The <i>pthread_sigmask()</i> function is moved from the Threads option to the Base.	
55450	POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0467 [319] is applied.	+

NAME

pthread_spin_destroy, pthread_spin_init — destroy or initialize a spin lock object

SYNOPSIS

```
#include <pthread.h>
```

```
int pthread_spin_destroy(pthread_spinlock_t *lock);
```

```
int pthread_spin_init(pthread_spinlock_t *lock, int pshared);
```

DESCRIPTION

The *pthread_spin_destroy()* function shall destroy the spin lock referenced by *lock* and release any resources used by the lock. The effect of subsequent use of the lock is undefined until the lock is reinitialized by another call to *pthread_spin_init()*. The results are undefined if *pthread_spin_destroy()* is called when a thread holds the lock, or if this function is called with an uninitialized thread spin lock.

The *pthread_spin_init()* function shall allocate any resources required to use the spin lock referenced by *lock* and initialize the lock to an unlocked state.

TSH

If the Thread Process-Shared Synchronization option is supported and the value of *pshared* is `PTHREAD_PROCESS_SHARED`, the implementation shall permit the spin lock to be operated upon by any thread that has access to the memory where the spin lock is allocated, even if it is allocated in memory that is shared by multiple processes.

If the Thread Process-Shared Synchronization option is supported and the value of *pshared* is `PTHREAD_PROCESS_PRIVATE`, or if the option is not supported, the spin lock shall only be operated upon by threads created within the same process as the thread that initialized the spin lock. If threads of differing processes attempt to operate on such a spin lock, the behavior is undefined.

The results are undefined if *pthread_spin_init()* is called specifying an already initialized spin lock. The results are undefined if a spin lock is used without first being initialized.

If the *pthread_spin_init()* function fails, the lock is not initialized and the contents of *lock* are undefined.

Only the object referenced by *lock* may be used for performing synchronization.

The result of referring to copies of that object in calls to *pthread_spin_destroy()*, *pthread_spin_lock()*, *pthread_spin_trylock()*, or *pthread_spin_unlock()* is undefined.

RETURN VALUE

Upon successful completion, these functions shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_spin_init()* function shall fail if:

[EAGAIN] The system lacks the necessary resources to initialize another spin lock.

[ENOMEM] Insufficient memory exists to initialize the lock.

These functions shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

If an implementation detects that the value specified by the *lock* argument to *pthread_spin_destroy()* does not refer to an initialized spin lock object, it is recommended that the function should fail and report an [EINVAL] error.

If an implementation detects that the value specified by the *lock* argument to *pthread_spin_destroy()* or *pthread_spin_init()* refers to a locked spin lock object, or detects that the value specified by the *lock* argument to *pthread_spin_init()* refers to an already initialized spin lock object, it is recommended that the function should fail and report an [EBUSY] error.

FUTURE DIRECTIONS

None.

SEE ALSO

pthread_spin_lock(), *pthread_spin_unlock()*

XBD <pthread.h>

CHANGE HISTORY

First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

In the SYNOPSIS, the inclusion of <sys/types.h> is no longer required.

Issue 7

The *pthread_spin_destroy()* and *pthread_spin_init()* functions are moved from the Spin Locks option to the Base.

The [EINVAL] error for an uninitialized spin lock object is removed; this condition results in undefined behavior.

The [EBUSY] error for a locked spin lock object or an already initialized spin lock object is removed; this condition results in undefined behavior.

55516 NAME

55517 pthread_spin_lock, pthread_spin_trylock — lock a spin lock object

55518 SYNOPSIS

55519 #include <pthread.h>
55520 int pthread_spin_lock(pthread_spinlock_t *lock);
55521 int pthread_spin_trylock(pthread_spinlock_t *lock);

55522 DESCRIPTION

55523 The *pthread_spin_lock()* function shall lock the spin lock referenced by *lock*. The calling thread
55524 shall acquire the lock if it is not held by another thread. Otherwise, the thread shall spin (that is,
55525 shall not return from the *pthread_spin_lock()* call) until the lock becomes available. The results are
55526 undefined if the calling thread holds the lock at the time the call is made. The
55527 *pthread_spin_trylock()* function shall lock the spin lock referenced by *lock* if it is not held by any
55528 thread. Otherwise, the function shall fail.

55529 The results are undefined if any of these functions is called with an uninitialized spin lock.

55530 RETURN VALUE

55531 Upon successful completion, these functions shall return zero; otherwise, an error number shall
55532 be returned to indicate the error.

55533 ERRORS

55534 The *pthread_spin_lock()* function may fail if:

55535 [EDEADLK] A deadlock condition was detected.

55536 The *pthread_spin_trylock()* function shall fail if:

55537 [EBUSY] A thread currently holds the lock.

55538 These functions shall not return an error code of [EINTR].

55539 EXAMPLES

55540 None.

55541 APPLICATION USAGE

55542 Applications using this function may be subject to priority inversion, as discussed in XBD
55543 [Section 3.287](#) (on page 79).

55544 RATIONALE

55545 If an implementation detects that the value specified by the *lock* argument to *pthread_spin_lock()*
55546 or *pthread_spin_trylock()* does not refer to an initialized spin lock object, it is recommended that
55547 the function should fail and report an [EINVAL] error.

55548 If an implementation detects that the value specified by the *lock* argument to *pthread_spin_lock()*
55549 refers to a spin lock object for which the calling thread already holds the lock, it is recommended
55550 that the function should fail and report an [EDEADLK] error.

55551 FUTURE DIRECTIONS

55552 None.

55553 SEE ALSO

55554 [pthread_spin_destroy\(\)](#), [pthread_spin_unlock\(\)](#)

55555 XBD [Section 3.287](#) (on page 79), [Section 4.11](#) (on page 110), [<pthread.h>](#)

CHANGE HISTORY

55556 First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

55558 In the SYNOPSIS, the inclusion of **<sys/types.h>** is no longer required.

55559 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/107 is applied, updating the ERRORS
55560 section so that the [EDEADLK] error includes detection of a deadlock condition.

Issue 7

55562 The *pthread_spin_lock()* and *pthread_spin_trylock()* functions are moved from the Spin Locks
55563 option to the Base.

55564 The [EINVAL] error for an uninitialized spin lock object is removed; this condition results in
55565 undefined behavior.

55566 The [EDEADLK] error for a spin lock object for which the calling thread already holds the lock is
55567 removed; this condition results in undefined behavior.

55568 **NAME**

55569 pthread_spin_unlock — unlock a spin lock object

55570 **SYNOPSIS**

55571 #include <pthread.h>

55572 int pthread_spin_unlock(pthread_spinlock_t *lock);

55573 **DESCRIPTION**55574 The *pthread_spin_unlock()* function shall release the spin lock referenced by *lock* which was
55575 locked via the *pthread_spin_lock()* or *pthread_spin_trylock()* functions.

55576 The results are undefined if the lock is not held by the calling thread.

55577 If there are threads spinning on the lock when *pthread_spin_unlock()* is called, the lock becomes
55578 available and an unspecified spinning thread shall acquire the lock.

55579 The results are undefined if this function is called with an uninitialized thread spin lock.

55580 **RETURN VALUE**55581 Upon successful completion, the *pthread_spin_unlock()* function shall return zero; otherwise, an
55582 error number shall be returned to indicate the error.55583 **ERRORS**

55584 This function shall not return an error code of [EINTR].

55585 **EXAMPLES**

55586 None.

55587 **APPLICATION USAGE**

55588 None.

55589 **RATIONALE**55590 If an implementation detects that the value specified by the *lock* argument to
55591 *pthread_spin_unlock()* does not refer to an initialized spin lock object, it is recommended that the
55592 function should fail and report an [EINVAL] error.55593 If an implementation detects that the value specified by the *lock* argument to
55594 *pthread_spin_unlock()* refers to a spin lock object for which the current thread does not hold the
55595 lock, it is recommended that the function should fail and report an [EPERM] error.55596 **FUTURE DIRECTIONS**

55597 None.

55598 **SEE ALSO**55599 *pthread_spin_destroy()*, *pthread_spin_lock()*

55608
55609

The [EPERM] error for a spin lock object for which the current thread does not hold the lock is removed; this condition results in undefined behavior.

55610 NAME

55611 pthread_testcancel — set cancelability state

55612 SYNOPSIS

55613 #include <pthread.h>

55614 void pthread_testcancel(void);

55615 DESCRIPTION

55616 Refer to *pthread_setcancelstate()*.

55617 **NAME**

55618 ptsname — get name of the slave pseudo-terminal device

55619 **SYNOPSIS**

```
55620 XSI      #include <stdlib.h>
55621          char *ptsname(int fildes);
```

55622 **DESCRIPTION**

55623 The *ptsname()* function shall return the name of the slave pseudo-terminal device associated
 55624 with a master pseudo-terminal device. The *fildes* argument is a file descriptor that refers to the
 55625 master device. The *ptsname()* function shall return a pointer to a string containing the pathname
 55626 of the corresponding slave device.

55627 The *ptsname()* function need not be thread-safe.

55628 **RETURN VALUE**

55629 Upon successful completion, *ptsname()* shall return a pointer to a string which is the name of the
 55630 pseudo-terminal slave device. Upon failure, *ptsname()* shall return a null pointer. This could
 55631 occur if *fildes* is an invalid file descriptor or if the slave device name does not exist in the file
 55632 system.

55633 The application shall not modify the string returned. The returned pointer might be invalidated +
 55634 or the string content might be overwritten by a subsequent call to *ptsname()*.

55635 **ERRORS**

55636 No errors are defined.

55637 **EXAMPLES**

55638 None.

55639 **APPLICATION USAGE**

55640 None. -

55641 **RATIONALE**

55642 See the RATIONALE section for *posix_openpt()*. +

55643 **FUTURE DIRECTIONS**

55644 None.

NAME

putc — put a byte on a stream

SYNOPSIS

```
#include <stdio.h>
```

```
int putc(int c, FILE *stream);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

The *putc()* function shall be equivalent to *fputc()*, except that if it is implemented as a macro it may evaluate *stream* more than once, so the argument should never be an expression with side-effects.

RETURN VALUE

Refer to *fputc()*.

ERRORS

Refer to *fputc()*.

EXAMPLES

None.

APPLICATION USAGE

Since it may be implemented as a macro, *putc()* may treat a *stream* argument with side-effects incorrectly. In particular, *putc(c,*f++)* does not necessarily work correctly. Therefore, use of this function is not recommended in such situations; *fputc()* should be used instead.

RATIONALE

None.

FUTURE DIRECTIONS

None.

NAME

putenv — change or add a value to an environment

SYNOPSIS

```
XSI      #include <stdlib.h>
int putenv(char *string);
```

DESCRIPTION

The *putenv()* function shall use the *string* argument to set environment variable values. The *string* argument should point to a string of the form "*name=value*". The *putenv()* function shall make the value of the environment variable *name* equal to *value* by altering an existing variable or creating a new one. In either case, the string pointed to by *string* shall become part of the environment, so altering the string shall change the environment.

The *putenv()* function need not be thread-safe.

RETURN VALUE

Upon successful completion, *putenv()* shall return 0; otherwise, it shall return a non-zero value and set *errno* to indicate the error.

ERRORS

The *putenv()* function may fail if:

[ENOMEM] Insufficient memory was available.

EXAMPLES**Changing the Value of an Environment Variable**

The following example changes the value of the *HOME* environment variable to the value */usr/home*.

```
#include <stdlib.h>
...
static char *var = "HOME=/usr/home";
int ret;

ret = putenv(var);
```

APPLICATION USAGE

The *putenv()* function manipulates the environment pointed to by *environ*, and can be used in conjunction with *getenv()*.

See *exec()* for restrictions on changing the environment in multi-threaded applications.

This routine may use *malloc()* to enlarge the environment.

A potential error is to call *putenv()* with an automatic variable as the argument, then return from the calling function while *string* is still part of the environment.

Although the space used by *string* is no longer used once a new string which defines *name* is passed to *putenv()*, if any thread in the application has used *getenv()* to retrieve a pointer to this variable, it should not be freed by calling *free()*. If the changed environment variable is one known by the system (such as the locale environment variables) the application should never free the buffer used by earlier calls to *putenv()* for the same variable.

The *setenv()* function is preferred over this function. One reason is that *putenv()* is optional and therefore less portable. Another is that using *putenv()* can slow down environment searches, as explained in the RATIONALE section for *getenv()*.

55775 **RATIONALE**55776 Refer to the RATIONALE section in *setenv()*.55777 **FUTURE DIRECTIONS**

55778 None.

55795 XSH/TC1-2008/0474 [273,438], and XSH/TC1-2008/0475 [273] are applied.

NAME

putmsg, putpmsg — send a message on a STREAM (STREAMS)

SYNOPSIS

```
#include <stropts.h>

int putmsg(int fildes, const struct strbuf *ctlptr,
            const struct strbuf *dataptr, int flags);
int putpmsg(int fildes, const struct strbuf *ctlptr,
             const struct strbuf *dataptr, int band, int flags);
```

DESCRIPTION

The *putmsg()* function shall create a message from a process buffer(s) and send the message to a STREAMS file. The message may contain either a data part, a control part, or both. The data and control parts are distinguished by placement in separate buffers, as described below. The semantics of each part are defined by the STREAMS module that receives the message.

The *putpmsg()* function is equivalent to *putmsg()*, except that the process can send messages in different priority bands. Except where noted, all requirements on *putmsg()* also pertain to *putpmsg()*.

The *fildes* argument specifies a file descriptor referencing an open STREAM. The *ctlptr* and *dataptr* arguments each point to a **strbuf** structure.

The *ctlptr* argument points to the structure describing the control part, if any, to be included in the message. The *buf* member in the **strbuf** structure points to the buffer where the control information resides, and the *len* member indicates the number of bytes to be sent. The *maxlen* member is not used by *putmsg()*. In a similar manner, the argument *dataptr* specifies the data, if any, to be included in the message. The *flags* argument indicates what type of message should be sent and is described further below.

To send the data part of a message, the application shall ensure that *dataptr* is not a null pointer and the *len* member of *dataptr* is 0 or greater. To send the control part of a message, the application shall ensure that the corresponding values are set for *ctlptr*. No data (control) part shall be sent if either *dataptr(ctlptr)* is a null pointer or the *len* member of *dataptr(ctlptr)* is set to -1.

For *putmsg()*, if a control part is specified and *flags* is set to RS_HIPRI, a high priority message shall be sent. If no control part is specified, and *flags* is set to RS_HIPRI, *putmsg()* shall fail and set *errno* to [EINVAL]. If *flags* is set to 0, a normal message (priority band equal to 0) shall be sent. If a control part and data part are not specified and *flags* is set to 0, no message shall be sent and 0 shall be returned.

For *putpmsg()*, the flags are different. The *flags* argument is a bitmask with the following mutually-exclusive flags defined: MSG_HIPRI and MSG_BAND. If *flags* is set to 0, *putpmsg()* shall fail and set *errno* to [EINVAL]. If a control part is specified and *flags* is set to MSG_HIPRI and *band* is set to 0, a high-priority message shall be sent. If *flags* is set to MSG_HIPRI and either no control part is specified or *band* is set to a non-zero value, *putpmsg()* shall fail and set *errno* to [EINVAL]. If *flags* is set to MSG_BAND, then a message shall be sent in the priority band specified by *band*. If a control part and data part are not specified and *flags* is set to MSG_BAND, no message shall be sent and 0 shall be returned.

55838 The *putmsg()* function shall block if the STREAM write queue is full due to internal flow control
 55839 conditions, with the following exceptions:

- 55840 • For high-priority messages, *putmsg()* shall not block on this condition and continues
 55841 processing the message.
- 55842 • For other messages, *putmsg()* shall not block but shall fail when the write queue is full and
 55843 O_NONBLOCK is set.

55844 The *putmsg()* function shall also block, unless prevented by lack of internal resources, while
 55845 waiting for the availability of message blocks in the STREAM, regardless of priority or whether
 55846 O_NONBLOCK has been specified. No partial message shall be sent.

55847 RETURN VALUE

55848 Upon successful completion, *putmsg()* and *putpmsg()* shall return 0; otherwise, they shall return
 55849 -1 and set *errno* to indicate the error.

55850 ERRORS

55851 The *putmsg()* and *putpmsg()* functions shall fail if:

55852 55853 55854	[EAGAIN]	A non-priority message was specified, the O_NONBLOCK flag is set, and the STREAM write queue is full due to internal flow control conditions; or buffers could not be allocated for the message that was to be created.
55855	[EBADF]	<i>fildev</i> is not a valid file descriptor open for writing.
55856	[EINTR]	A signal was caught during <i>putmsg()</i> .
55857 55858 55859 55860 55861	[EINVAL]	An undefined value is specified in <i>flags</i> , or <i>flags</i> is set to RS_HIPRI or MSG_HIPRI and no control part is supplied, or the STREAM or multiplexer referenced by <i>fildev</i> is linked (directly or indirectly) downstream from a multiplexer, or <i>flags</i> is set to MSG_HIPRI and <i>band</i> is non-zero (for <i>putpmsg()</i> only).
55862 55863	[ENOSR]	Buffers could not be allocated for the message that was to be created due to insufficient STREAMS memory resources.
55864	[ENOSTR]	A STREAM is not associated with <i>fildev</i> .
55865	[ENXIO]	A hangup condition was generated downstream for the specified STREAM.
55866 55867	[EPIPE] or [EIO]	The <i>fildev</i> argument refers to a STREAMS-based pipe and the other end of the pipe is closed. A SIGPIPE signal is generated for the calling thread.
55868 55869 55870 55871 55872 55873	[ERANGE]	The size of the data part of the message does not fall within the range specified by the maximum and minimum packet sizes of the topmost STREAM module. This value is also returned if the control part of the message is larger than the maximum configured size of the control part of a message, or if the data part of a message is larger than the maximum configured size of the data part of a message.

55874 In addition, *putmsg()* and *putpmsg()* shall fail if the STREAM head had processed an
 55875 asynchronous error before the call. In this case, the value of *errno* does not reflect the result of
 55876 *putmsg()* or *putpmsg()*, but reflects the prior error.

55877 **EXAMPLES**55878 **Sending a High-Priority Message**

55879 The value of *fd* is assumed to refer to an open STREAMS file. This call to *putmsg()* does the
 55880 following:

- 55881 1. Creates a high-priority message with a control part and a data part, using the buffers
 55882 pointed to by *ctrlbuf* and *databuf*, respectively.
- 55883 2. Sends the message to the STREAMS file identified by *fd*.

```
55884 #include <stropts.h>
55885 #include <string.h>
55886 ...
55887 int fd;
55888 char *ctrlbuf = "This is the control part";
55889 char *databuf = "This is the data part";
55890 struct strbuf ctrl;
55891 struct strbuf data;
55892 int ret;

55893 ctrl.buf = ctrlbuf;
55894 ctrl.len = strlen(ctrlbuf);

55895 data.buf = databuf;
55896 data.len = strlen(databuf);

55897 ret = putmsg(fd, &ctrl, &data, MSG_HIPRI);
```

55898 **Using putpmsg()**

55899 This example has the same effect as the previous example. In this example, however, the
 55900 *putpmsg()* function creates and sends the message to the STREAMS file.

```
55901 #include <stropts.h>
55902 #include <string.h>
55903 ...
55904 int fd;
55905 char *ctrlbuf = "This is the control part";
55906 char *databuf = "This is the data part";
55907 struct strbuf ctrl;
55908 struct strbuf data;
55909 int ret;

55910 ctrl.buf = ctrlbuf;
55911 ctrl.len = strlen(ctrlbuf);

55912 data.buf = databuf;
55913 data.len = strlen(databuf);

55914 ret = putpmsg(fd, &ctrl, &data, 0, MSG_HIPRI);
```

55915 **APPLICATION USAGE**

55916 None.

55917 **RATIONALE**

55918 None.

55919 **FUTURE DIRECTIONS**55920 The *putmsg()* and *putpmsg()* functions may be removed in a future version.55921 **SEE ALSO**55922 [Section 2.6](#) (on page 499), *getmsg()*, *poll()*, *read()*, *write()*55923 XBD [<stropts.h>](#)55924 **CHANGE HISTORY**

55925 First released in Issue 4, Version 2.

55926 **Issue 5**

55927 Moved from X/OPEN UNIX extension to BASE.

55928 The following text is removed from the DESCRIPTION: “The STREAM head guarantees that the
55929 control part of a message generated by *putmsg()* is at least 64 bytes in length”.

55930 **Issue 6**

55931 This function is marked as part of the XSI STREAMS Option Group.

55932 The normative text is updated to avoid use of the term “must” for application requirements.

55933 **Issue 7**55934 The *putmsg()* and *putpmsg()* functions are marked obsolescent.

55935 **NAME**

55936 puts — put a string on standard output

55937 **SYNOPSIS**

55938 #include <stdio.h>

55939 int puts(const char *s);

55940 **DESCRIPTION**

55941 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 55942 conflict between the requirements described here and the ISO C standard is unintentional. This
 55943 volume of POSIX.1-2008 defers to the ISO C standard.

55944 The *puts()* function shall write the string pointed to by *s*, followed by a <newline>, to the
 55945 standard output stream *stdout*. The terminating null byte shall not be written.

55946 CX The last data modification and last file status change timestamps of the file shall be marked for
 55947 update between the successful execution of *puts()* and the next successful completion of a call to
 55948 *fflush()* or *fclose()* on the same stream or a call to *exit()* or *abort()*.

55949 **RETURN VALUE**

55950 Upon successful completion, *puts()* shall return a non-negative number. Otherwise, it shall
 55951 CX return EOF, shall set an error indicator for the stream, and *errno* shall be set to indicate the error.

55952 **ERRORS**55953 Refer to *fputc()*.55954 **EXAMPLES**55955 **Printing to Standard Output**

55956 The following example gets the current time, converts it to a string using *localtime()* and
 55957 *asctime()*, and prints it to standard output using *puts()*. It then prints the number of minutes to
 55958 an event for which it is waiting.

```
55959 #include <time.h>
55960 #include <stdio.h>
55961 ...
55962 time_t now;
55963 int minutes_to_event;
55964 ...
55965 time(&now);
55966 printf("The time is ");
55967 puts(asctime(localtime(&now)));
55968 printf("There are %d minutes to the event.\n",
55969     minutes_to_event);
55970 ...
```

55971 **APPLICATION USAGE**55972 The *puts()* function appends a <newline>, while *fputs()* does not.

55973 This volume of POSIX.1-2008 requires that successful completion simply return a non-negative +
 55974 integer. There are at least three known different implementation conventions for this +
 55975 requirement: +

- 55976 • Return a constant value. +

55977	• Return the last character written.	+
55978	• Return the number of bytes written. Note that this implementation convention cannot be	+
55979	adhered to for strings longer than {INT_MAX} bytes as the value would not be	+
55980	representable in the return type of the function. For backwards compatibility,	+
55981	implementations can return the number of bytes for strings of up to {INT_MAX} bytes, and	+
55982	return {INT_MAX} for all longer strings.	+
55983	RATIONALE	
55984	None.	
55985	FUTURE DIRECTIONS	
55986	None.

55998 NAME

55999 pututxline — put an entry into the user accounting database

56000 SYNOPSIS

```
56001 XSI      #include <utmpx.h>  
56002      struct utmpx *pututxline(const struct utmpx *utmpx);
```

56003 DESCRIPTION

56004 Refer to *endutxent()*.

56005 **NAME**

56006 putwc — put a wide character on a stream

56007 **SYNOPSIS**

56008 #include <stdio.h>

56009 #include <wchar.h>

56010 wint_t putwc(wchar_t *wc*, FILE **stream*);56011 **DESCRIPTION**

56012 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 56013 conflict between the requirements described here and the ISO C standard is unintentional. This
 56014 volume of POSIX.1-2008 defers to the ISO C standard.

56015 The *putwc()* function shall be equivalent to *fputwc()*, except that if it is implemented as a macro
 56016 it may evaluate *stream* more than once, so the argument should never be an expression with
 56017 side-effects.

56018 **RETURN VALUE**56019 Refer to *fputwc()*.56020 **ERRORS**56021 Refer to *fputwc()*.56022 **EXAMPLES**

56023 None.

56024 **APPLICATION USAGE**

56025 Since it may be implemented as a macro, *putwc()* may treat a *stream* argument with side-effects
 56026 incorrectly. In particular, *putwc(wc,*f++)* need not work correctly. Therefore, use of this function
 56027 is not recommended; *fputwc()* should be used instead.

56028 **RATIONALE**

56029 None.

56030 **FUTURE DIRECTIONS**

56031 None.

56032 **SEE ALSO**56033 [Section 2.5](#) (on page 495), *fputwc()*56034 XBD [<stdio.h>](#), [<wchar.h>](#)56035 **CHANGE HISTORY**

56068 **CHANGE HISTORY**

56069 First released in Issue 4.

56070 **Issue 5**

56071 Aligned with ISO/IEC 9899:1990/Amendment 1:1995 (E). Specifically, the type of argument *wc*
56072 is changed from **wint_t** to **wchar_t**.

56073 **Issue 7**

56074 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0479 [14] is applied.

+

56075 **NAME**

56076 pwrite — write on a file

56077 **SYNOPSIS**

56078 #include <unistd.h>

```
56079       ssize_t pwrite(int fildes, const void *buf, size_t nbyte,  
56080                   off_t offset);
```

56081 **DESCRIPTION**56082 Refer to *write()*.

NAME

qsort — sort a table of data

SYNOPSIS

```
#include <stdlib.h>
```

```
void qsort(void *base, size_t nel, size_t width,
           int (*compar)(const void *, const void *));
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

The *qsort()* function shall sort an array of *nel* objects, the initial element of which is pointed to by *base*. The size of each object, in bytes, is specified by the *width* argument. If the *nel* argument has the value zero, the comparison function pointed to by *compar* shall not be called and no rearrangement shall take place.

The application shall ensure that the comparison function pointed to by *compar* does not alter the contents of the array. The implementation may reorder elements of the array between calls to the comparison function, but shall not alter the contents of any individual element.

When the same objects (consisting of *width* bytes, irrespective of their current positions in the array) are passed more than once to the comparison function, the results shall be consistent with one another. That is, they shall define a total ordering on the array.

The contents of the array shall be sorted in ascending order according to a comparison function. The *compar* argument is a pointer to the comparison function, which is called with two arguments that point to the elements being compared. The application shall ensure that the function returns an integer less than, equal to, or greater than 0, if the first argument is considered respectively less than, equal to, or greater than the second. If two members compare as equal, their order in the sorted array is unspecified.

RETURN VALUE

The *qsort()* function shall not return a value.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

The comparison function need not compare every byte, so arbitrary data may be contained in the elements in addition to the values being compared.

RATIONALE

The requirement that each argument (hereafter referred to as *p*) to the comparison function is a pointer to elements of the array implies that for every call, for each argument separately, all of the following expressions are non-zero:

```
((char *)p - (char *)base) % width == 0
(char *)p >= (char *)base
(char *)p < (char *)base + nel * width
```

56125 **FUTURE DIRECTIONS**

56126 None.

56127 **SEE ALSO**56128 *alphasort()*

56129 XBD <stdlib.h>

56130 **CHANGE HISTORY**

56131 First released in Issue 1. Derived from Issue 1 of the SVID.

56132 **Issue 6**

56133 The normative text is updated to avoid use of the term “must” for application requirements.

56134 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/49 is applied, adding the last sentence to
56135 the first non-shaded paragraph in the DESCRIPTION, and the following two paragraphs. The
56136 RATIONALE is also updated. These changes are for alignment with the ISO C standard.

56137 **NAME**

56138 raise — send a signal to the executing process

56139 **SYNOPSIS**

56140 #include <signal.h>

56141 int raise(int sig);

56142 **DESCRIPTION**

56143 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 56144 conflict between the requirements described here and the ISO C standard is unintentional. This
 56145 volume of POSIX.1-2008 defers to the ISO C standard.

56146 CX The *raise()* function shall send the signal *sig* to the executing thread or process. If a signal
 56147 handler is called, the *raise()* function shall not return until after the signal handler does.

56148 CX The effect of the *raise()* function shall be equivalent to calling:

56149 pthread_kill(pthread_self(), sig);

56150 **RETURN VALUE**

56151 CX Upon successful completion, 0 shall be returned. Otherwise, a non-zero value shall be returned
 56152 and *errno* shall be set to indicate the error.

56153 **ERRORS**

56154 The *raise()* function shall fail if:

56155 CX [EINVAL] The value of the *sig* argument is an invalid signal number.

56156 **EXAMPLES**

56157 None.

56158 **APPLICATION USAGE**

56159 None.

56160 **RATIONALE**

56161 The term “thread” is an extension to the ISO C standard.

56162 **FUTURE DIRECTIONS**

56163 None.

56164 **SEE ALSO**

56165 *kill()*, *sigaction()*

56166 XBD <signal.h>, <sys/types.h>

56167 **CHANGE HISTORY**

56168 First released in Issue 4. Derived from the ANSI C standard.

56169 **Issue 5**

56170 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

56171 **Issue 6**

56172 Extensions beyond the ISO C standard are marked.

56173 The following new requirements on POSIX implementations derive from alignment with the
 56174 Single UNIX Specification:

- 56175 • In the RETURN VALUE section, the requirement to set *errno* on error is added.

- 56176
- The [EINVAL] error condition is added.
- 56177
- Issue 7**
- 56178
- Functionality relating to the Threads option is moved to the Base.

56179 **NAME**

56180 rand, rand_r, srand — pseudo-random number generator

56181 **SYNOPSIS**

56182 #include <stdlib.h>

56183 int rand(void);

56184 OB CX int rand_r(unsigned *seed);

56185 void srand(unsigned seed);

56186 **DESCRIPTION**

56187 CX For *rand()* and *srand()*: The functionality described on this reference page is aligned with the
 56188 ISO C standard. Any conflict between the requirements described here and the ISO C standard is
 56189 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

56190 The *rand()* function shall compute a sequence of pseudo-random integers in the range
 56191 XSI [0,{RAND_MAX}] with a period of at least 2^{32} .

56192 CX The *rand()* function need not be thread-safe.

56193 OB CX The *rand_r()* function shall compute a sequence of pseudo-random integers in the range
 56194 [0,{RAND_MAX}]. (The value of the {RAND_MAX} macro shall be at least 32767.)

56195 If *rand_r()* is called with the same initial value for the object pointed to by *seed* and that object is
 56196 not modified between successive returns and calls to *rand_r()*, the same sequence shall be
 56197 generated.

56198 The *srand()* function uses the argument as a seed for a new sequence of pseudo-random
 56199 numbers to be returned by subsequent calls to *rand()*. If *srand()* is then called with the same
 56200 seed value, the sequence of pseudo-random numbers shall be repeated. If *rand()* is called before
 56201 any calls to *srand()* are made, the same sequence shall be generated as when *srand()* is first
 56202 called with a seed value of 1.

56203 The implementation shall behave as if no function defined in this volume of POSIX.1-2008 calls
 56204 *rand()* or *srand()*.

56205 **RETURN VALUE**56206 The *rand()* function shall return the next pseudo-random number in the sequence.56207 OB CX The *rand_r()* function shall return a pseudo-random integer.56208 The *srand()* function shall not return a value.56209 **ERRORS**

56210 No errors are defined.

56211 **EXAMPLES**56212 **Generating a Pseudo-Random Number Sequence**

56213 The following example demonstrates how to generate a sequence of pseudo-random numbers.

56214 #include <stdio.h>

56215 #include <stdlib.h>

56216 ...

56217 long count, i;

56218 char *keystr;

56219 int elementlen, len;

56220 char c;

56221 ...

```

56222      /* Initial random number generator. */
56223      srand(1);

56224      /* Create keys using only lowercase characters */
56225      len = 0;
56226      for (i=0; i<count; i++) {
56227          while (len < elementlen) {
56228              c = (char) (rand() % 128);
56229              if (islower(c))
56230                  keystr[len++] = c;
56231          }

56232          keystr[len] = '\\0';
56233          printf("%s Element%0*ld\\n", keystr, elementlen, i);
56234          len = 0;
56235      }

```

Generating the Same Sequence on Different Machines

The following code defines a pair of functions that could be incorporated into applications wishing to ensure that the same sequence of numbers is generated across different machines.

```

56239      static unsigned long next = 1;
56240      int myrand(void) /* RAND_MAX assumed to be 32767. */
56241      {
56242          next = next * 1103515245 + 12345;
56243          return((unsigned) (next/65536) % 32768);
56244      }

56245      void mysrand(unsigned seed)
56246      {
56247          next = seed;
56248      }

```

APPLICATION USAGE

The *drand48()* function provides a much more elaborate random number generator.

The limitations on the amount of state that can be carried between one function call and another mean the *rand_r()* function can never be implemented in a way which satisfies all of the requirements on a pseudo-random number generator. Therefore this function should be avoided whenever non-trivial requirements (including safety) have to be fulfilled.

RATIONALE

The ISO C standard *rand()* and *srand()* functions allow per-process pseudo-random streams shared by all threads. Those two functions need not change, but there has to be mutual-exclusion that prevents interference between two threads concurrently accessing the random number generator.

With regard to *rand()*, there are two different behaviors that may be wanted in a multi-threaded program:

1. A single per-process sequence of pseudo-random numbers that is shared by all threads that call *rand()*
2. A different sequence of pseudo-random numbers for each thread that calls *rand()*

This is provided by the modified thread-safe function based on whether the seed value is global

- 56266 to the entire process or local to each thread.
- 56267 This does not address the known deficiencies of the *rand()* function implementations, which
- 56268 have been approached by maintaining more state. In effect, this specifies new thread-safe forms
- 56269 of a deficient function.
- 56270 **FUTURE DIRECTIONS**
- 56271 The *rand_r()* function may be removed in a future version.

56286 **NAME**

56287 random — generate pseudo-random number

56288 **SYNOPSIS**56289 XSI `#include <stdlib.h>`56290 `long random(void);`56291 **DESCRIPTION**56292 Refer to *initstate()*.

NAME

pread, read — read from a file

SYNOPSIS

```
#include <unistd.h>
```

```
ssize_t pread(int fildes, void *buf, size_t nbyte, off_t offset);
ssize_t read(int fildes, void *buf, size_t nbyte);
```

DESCRIPTION

The *read()* function shall attempt to read *nbyte* bytes from the file associated with the open file descriptor, *fildes*, into the buffer pointed to by *buf*. The behavior of multiple concurrent reads on the same pipe, FIFO, or terminal device is unspecified.

Before any action described below is taken, and if *nbyte* is zero, the *read()* function may detect and return errors as described below. In the absence of errors, or if error detection is not performed, the *read()* function shall return zero and have no other results.

On files that support seeking (for example, a regular file), the *read()* shall start at a position in the file given by the file offset associated with *fildes*. The file offset shall be incremented by the number of bytes actually read.

Files that do not support seeking—for example, terminals—always read from the current position. The value of a file offset associated with such a file is undefined.

No data transfer shall occur past the current end-of-file. If the starting position is at or after the end-of-file, 0 shall be returned. If the file refers to a device special file, the result of subsequent *read()* requests is implementation-defined.

If the value of *nbyte* is greater than {SSIZE_MAX}, the result is implementation-defined.

When attempting to read from an empty pipe or FIFO:

- If no process has the pipe open for writing, *read()* shall return 0 to indicate end-of-file.
- If some process has the pipe open for writing and O_NONBLOCK is set, *read()* shall return -1 and set *errno* to [EAGAIN].
- If some process has the pipe open for writing and O_NONBLOCK is clear, *read()* shall block the calling thread until some data is written or the pipe is closed by all processes that had the pipe open for writing.

When attempting to read a file (other than a pipe or FIFO) that supports non-blocking reads and has no data currently available:

- If O_NONBLOCK is set, *read()* shall return -1 and set *errno* to [EAGAIN].
- If O_NONBLOCK is clear, *read()* shall block the calling thread until some data becomes available.
- The use of the O_NONBLOCK flag has no effect if there is some data available.

The *read()* function reads data previously written to a file. If any portion of a regular file prior to the end-of-file has not been written, *read()* shall return bytes with value 0. For example, *lseek()* allows the file offset to be set beyond the end of existing data in the file. If data is later written at this point, subsequent reads in the gap between the previous end of data and the newly written data shall return bytes with value 0 until data is written into the gap.

Upon successful completion, where *nbyte* is greater than 0, *read()* shall mark for update the last data access timestamp of the file, and shall return the number of bytes read. This number shall never be greater than *nbyte*. The value returned may be less than *nbyte* if the number of bytes

56336		left in the file is less than <i>nbyte</i> , if the <i>read()</i> request was interrupted by a signal, or if the file is a
56337		pipe or FIFO or special file and has fewer than <i>nbyte</i> bytes immediately available for reading.
56338		For example, a <i>read()</i> from a file associated with a terminal may return one typed line of data.
56339		If a <i>read()</i> is interrupted by a signal before it reads any data, it shall return -1 with <i>errno</i> set to
56340		[EINTR].
56341		If a <i>read()</i> is interrupted by a signal after it has successfully read some data, it shall return the
56342		number of bytes read.
56343		For regular files, no data transfer shall occur past the offset maximum established in the open
56344		file description associated with <i>filides</i> .
56345		If <i>filides</i> refers to a socket, <i>read()</i> shall be equivalent to <i>recv()</i> with no flags set.
56346	SIO	If the O_DSYNC and O_RSYNC bits have been set, read I/O operations on the file descriptor
56347		shall complete as defined by synchronized I/O data integrity completion. If the O_SYNC and
56348		O_RSYNC bits have been set, read I/O operations on the file descriptor shall complete as
56349		defined by synchronized I/O file integrity completion.
56350	SHM	If <i>filides</i> refers to a shared memory object, the result of the <i>read()</i> function is unspecified.
56351	TYM	If <i>filides</i> refers to a typed memory object, the result of the <i>read()</i> function is unspecified.
56352	OB XSR	A <i>read()</i> from a STREAMS file can read data in three different modes: <i>byte-stream</i> mode, <i>message-</i>
56353		<i>nondiscard</i> mode, and <i>message-discard</i> mode. The default shall be byte-stream mode. This can be
56354		changed using the I_SRDOPT <i>ioctl()</i> request, and can be tested with I_GRDOPT <i>ioctl()</i> . In byte-
56355		stream mode, <i>read()</i> shall retrieve data from the STREAM until as many bytes as were requested
56356		are transferred, or until there is no more data to be retrieved. Byte-stream mode ignores
56357		message boundaries.
56358		In STREAMS message-nondiscard mode, <i>read()</i> shall retrieve data until as many bytes as were
56359		requested are transferred, or until a message boundary is reached. If <i>read()</i> does not retrieve all
56360		the data in a message, the remaining data shall be left on the STREAM, and can be retrieved by
56361		the next <i>read()</i> call. Message-discard mode also retrieves data until as many bytes as were
56362		requested are transferred, or a message boundary is reached. However, unread data remaining
56363		in a message after the <i>read()</i> returns shall be discarded, and shall not be available for a
56364		subsequent <i>read()</i> , <i>getmsg()</i> , or <i>getpmsg()</i> call.
56365		How <i>read()</i> handles zero-byte STREAMS messages is determined by the current read mode
56366		setting. In byte-stream mode, <i>read()</i> shall accept data until it has read <i>nbyte</i> bytes, or until there
56367		is no more data to read, or until a zero-byte message block is encountered. The <i>read()</i> function
56368		shall then return the number of bytes read, and place the zero-byte message back on the
56369		STREAM to be retrieved by the next <i>read()</i> , <i>getmsg()</i> , or <i>getpmsg()</i> . In message-nondiscard
56370		mode or message-discard mode, a zero-byte message shall return 0 and the message shall be
56371		removed from the STREAM. When a zero-byte message is read as the first message on a
56372		STREAM, the message shall be removed from the STREAM and 0 shall be returned, regardless
56373		of the read mode.
56374		A <i>read()</i> from a STREAMS file shall return the data in the message at the front of the STREAM
56375		head read queue, regardless of the priority band of the message.
56376		By default, STREAMs are in control-normal mode, in which a <i>read()</i> from a STREAMS file can
56377		only process messages that contain a data part but do not contain a control part. The <i>read()</i> shall
56378		fail if a message containing a control part is encountered at the STREAM head. This default
56379		action can be changed by placing the STREAM in either control-data mode or control-discard
56380		mode with the I_SRDOPT <i>ioctl()</i> command. In control-data mode, <i>read()</i> shall convert any
56381		control part to data and pass it to the application before passing any data part originally present

56382 in the same message. In control-discard mode, *read()* shall discard message control parts but
 56383 return to the process any data part in the message.

56384 In addition, *read()* shall fail if the STREAM head had processed an asynchronous error before
 56385 the call. In this case, the value of *errno* shall not reflect the result of *read()*, but reflect the prior
 56386 error. If a hangup occurs on the STREAM being read, *read()* shall continue to operate normally
 56387 until the STREAM head read queue is empty. Thereafter, it shall return 0.

56388 The *pread()* function shall be equivalent to *read()*, except that it shall read from a given position
 56389 in the file without changing the file pointer. The first three arguments to *pread()* are the same as
 56390 *read()* with the addition of a fourth argument *offset* for the desired position inside the file. An
 56391 attempt to perform a *pread()* on a file that is incapable of seeking shall result in an error.

56392 RETURN VALUE

56393 Upon successful completion, these functions shall return a non-negative integer indicating the
 56394 number of bytes actually read. Otherwise, the functions shall return -1 and set *errno* to indicate
 56395 the error.

56396 ERRORS

56397 These functions shall fail if:

56398 [EAGAIN] The file is neither a pipe, nor a FIFO, nor a socket, the O_NONBLOCK flag is
 56399 set for the file descriptor, and the thread would be delayed in the read
 56400 operation.

56401 [EBADF] The *fildev* argument is not a valid file descriptor open for reading.

56402 OB XSR [EBADMSG] The file is a STREAM file that is set to control-normal mode and the message
 56403 waiting to be read includes a control part.

56404 [EINTR] The read operation was terminated due to the receipt of a signal, and no data
 56405 was transferred.

56406 OB XSR [EINVAL] The STREAM or multiplexer referenced by *fildev* is linked (directly or
 56407 indirectly) downstream from a multiplexer.

56408 [EIO] The process is a member of a background process group attempting to read
 56409 from its controlling terminal, and either the calling thread is blocking
 56410 SIGTTIN or the process is ignoring SIGTTIN or the process group of the
 56411 process is orphaned. This error may also be generated for implementation-
 56412 defined reasons.

56413 XSI [EISDIR] The *fildev* argument refers to a directory and the implementation does not
 56414 allow the directory to be read using *read()* or *pread()*. The *readdir()* function
 56415 should be used instead.

56416 [EOVERFLOW] The file is a regular file, *nbyte* is greater than 0, the starting position is before
 56417 the end-of-file, and the starting position is greater than or equal to the offset
 56418 maximum established in the open file description associated with *fildev*.

56419 The *pread()* function shall fail if: +

56420 [EINVAL] The file is a regular file or block special file, and the *offset* argument is +
 56421 negative. The file pointer shall remain unchanged. +

56422 [ESPIPE] The file is a pipe, FIFO, or socket. +

56423 The *read()* function shall fail if:

56424 [EAGAIN] The file is a pipe or FIFO, the O_NONBLOCK flag is set for the file descriptor, +
 56425 and the thread would be delayed in the read operation.

56426 [EAGAIN] or [EWOULDBLOCK]
 56427 The file is a socket, the O_NONBLOCK flag is set for the file descriptor, and |
 56428 the thread would be delayed in the read operation.

56429 [ECONNRESET] A read was attempted on a socket and the connection was forcibly closed by
 56430 its peer.

56431 [ENOTCONN] A read was attempted on a socket that is not connected.

56432 [ETIMEDOUT] A read was attempted on a socket and a transmission timeout occurred.

56433 These functions may fail if:

56434 [EIO] A physical I/O error has occurred.

56435 [ENOBUFFS] Insufficient resources were available in the system to perform the operation.

56436 [ENOMEM] Insufficient memory was available to fulfill the request.

56437 [ENXIO] A request was made of a nonexistent device, or the request was outside the
 56438 capabilities of the device.

56439 EXAMPLES

56440 Reading Data into a Buffer

56441 The following example reads data from the file associated with the file descriptor *fd* into the
 56442 buffer pointed to by *buf*.

```
56443 #include <sys/types.h>
56444 #include <unistd.h>
56445 ...
56446 char buf[20];
56447 size_t nbytes;
56448 ssize_t bytes_read;
56449 int fd;
56450 ...
56451 nbytes = sizeof(buf);
56452 bytes_read = read(fd, buf, nbytes);
56453 ...
```

56454 APPLICATION USAGE

56455 None.

56456 RATIONALE

56457 This volume of POSIX.1-2008 does not specify the value of the file offset after an error is
 56458 returned; there are too many cases. For programming errors, such as [EBADF], the concept is
 56459 meaningless since no file is involved. For errors that are detected immediately, such as
 56460 [EAGAIN], clearly the pointer should not change. After an interrupt or hardware error, however,
 56461 an updated value would be very useful and is the behavior of many implementations.

56462 Note that a *read()* of zero bytes does not modify the last data access timestamp. A *read()* that
 56463 requests more than zero bytes, but returns zero, is required to modify the last data access
 56464 timestamp.

Implementations are allowed, but not required, to perform error checking for *read()* requests of zero bytes.

Input and Output

The use of I/O with large byte counts has always presented problems. Ideas such as *lread()* and *lwrite()* (using and returning **longs**) were considered at one time. The current solution is to use abstract types on the ISO C standard function to *read()* and *write()*. The abstract types can be declared so that existing functions work, but can also be declared so that larger types can be represented in future implementations. It is presumed that whatever constraints limit the maximum range of **size_t** also limit portable I/O requests to the same range. This volume of POSIX.1-2008 also limits the range further by requiring that the byte count be limited so that a signed return value remains meaningful. Since the return type is also a (signed) abstract type, the byte count can be defined by the implementation to be larger than an **int** can hold.

The standard developers considered adding atomicity requirements to a pipe or FIFO, but recognized that due to the nature of pipes and FIFOs there could be no guarantee of atomicity of reads of {PIPE_BUF} or any other size that would be an aid to applications portability.

This volume of POSIX.1-2008 requires that no action be taken for *read()* or *write()* when *nbyte* is zero. This is not intended to take precedence over detection of errors (such as invalid buffer pointers or file descriptors). This is consistent with the rest of this volume of POSIX.1-2008, but the phrasing here could be misread to require detection of the zero case before any other errors. A value of zero is to be considered a correct value, for which the semantics are a no-op.

I/O is intended to be atomic to ordinary files and pipes and FIFOs. Atomic means that all the bytes from a single operation that started out together end up together, without interleaving from other I/O operations. It is a known attribute of terminals that this is not honored, and terminals are explicitly (and implicitly permanently) excepted, making the behavior unspecified. The behavior for other device types is also left unspecified, but the wording is intended to imply that future standards might choose to specify atomicity (or not).

There were recommendations to add format parameters to *read()* and *write()* in order to handle networked transfers among heterogeneous file system and base hardware types. Such a facility may be required for support by the OSI presentation of layer services. However, it was determined that this should correspond with similar C-language facilities, and that is beyond the scope of this volume of POSIX.1-2008. The concept was suggested to the developers of the ISO C standard for their consideration as a possible area for future work.

In 4.3 BSD, a *read()* or *write()* that is interrupted by a signal before transferring any data does not by default return an [EINTR] error, but is restarted. In 4.2 BSD, 4.3 BSD, and the Eighth Edition, there is an additional function, *select()*, whose purpose is to pause until specified activity (data to read, space to write, and so on) is detected on specified file descriptors. It is common in applications written for those systems for *select()* to be used before *read()* in situations (such as keyboard input) where interruption of I/O due to a signal is desired.

The issue of which files or file types are interruptible is considered an implementation design issue. This is often affected primarily by hardware and reliability issues.

There are no references to actions taken following an “unrecoverable error”. It is considered beyond the scope of this volume of POSIX.1-2008 to describe what happens in the case of hardware errors.

Earlier versions of this standard allowed two very different behaviors with regard to the handling of interrupts. In order to minimize the resulting confusion, it was decided that POSIX.1-2008 should support only one of these behaviors. Historical practice on AT&T-derived

systems was to have *read()* and *write()* return `-1` and set *errno* to `[EINTR]` when interrupted after some, but not all, of the data requested had been transferred. However, the US Department of Commerce FIPS 151-1 and FIPS 151-2 require the historical BSD behavior, in which *read()* and *write()* return the number of bytes actually transferred before the interrupt. If `-1` is returned when any data is transferred, it is difficult to recover from the error on a seekable device and impossible on a non-seekable device. Most new implementations support this behavior. The behavior required by POSIX.1-2008 is to return the number of bytes transferred.

POSIX.1-2008 does not specify when an implementation that buffers *read()*s actually moves the data into the user-supplied buffer, so an implementation may choose to do this at the latest possible moment. Therefore, an interrupt arriving earlier may not cause *read()* to return a partial byte count, but rather to return `-1` and set *errno* to `[EINTR]`.

Consideration was also given to combining the two previous options, and setting *errno* to `[EINTR]` while returning a short count. However, not only is there no existing practice that implements this, it is also contradictory to the idea that when *errno* is set, the function responsible shall return `-1`.

This volume of POSIX.1-2008 intentionally does not specify any *pread()* errors related to pipes, + FIFOs, and sockets other than `[ESPIPE]`.

FUTURE DIRECTIONS

None.

XBD Chapter 11 (on page 199), `<stropts.h>`, `<sys/uio.h>`, `<unistd.h>`

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX Threads Extension.

Large File Summit extensions are added.

The *pread()* function is added.

Issue 6

The DESCRIPTION and ERRORS sections are updated so that references to STREAMS are marked as part of the XSI STREAMS Option Group.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The DESCRIPTION now states that if *read()* is interrupted by a signal after it has successfully read some data, it returns the number of bytes read. In Issue 3, it was optional whether *read()* returned the number of bytes read, or whether it returned `-1` with *errno* set to `[EINTR]`. This is a FIPS requirement.
- In the DESCRIPTION, text is added to indicate that for regular files, no data transfer occurs past the offset maximum established in the open file description associated with *files*. This change is to support large files.
- The `[EOVERFLOW]` mandatory error condition is added.

- The [ENXIO] optional error condition is added.

Text referring to sockets is added to the DESCRIPTION.

The following changes were made to align with the IEEE P1003.1a draft standard:

- The effect of reading zero bytes is clarified.

The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that *read()* results are unspecified for typed memory objects.

New RATIONALE is added to explain the atomicity requirements for input and output operations.

The following error conditions are added for operations on sockets: [EAGAIN], [ECONNRESET], [ENOTCONN], and [ETIMEDOUT].

The [EIO] error is made optional.

The following error conditions are added for operations on sockets: [ENOBUFS] and [ENOMEM].

The *readv()* function is split out into a separate reference page.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/108 is applied, updating the [EAGAIN] error in the ERRORS section from “the process would be delayed” to “the thread would be delayed”.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/109 is applied, making an editorial correction in the RATIONALE section.

Issue 7

The *pread()* function is moved from the XSI option to the Base.

Functionality relating to the XSI STREAMS option is marked obsolescent.

Changes are made related to support for finegrained timestamps.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0480 [218], XSH/TC1-2008/0481 [79], + XSH/TC1-2008/0482 [218], XSH/TC1-2008/0483 [218], XSH/TC1-2008/0484 [218], and + XSH/TC1-2008/0485 [218,428] are applied.

NAME

readdir, readdir_r — read a directory

SYNOPSIS

```
#include <dirent.h>

struct dirent *readdir(DIR *dirp);
int readdir_r(DIR *restrict dirp, struct dirent *restrict entry,
              struct dirent **restrict result);
```

DESCRIPTION

The type **DIR**, which is defined in the **<dirent.h>** header, represents a *directory stream*, which is an ordered sequence of all the directory entries in a particular directory. Directory entries represent files; files may be removed from a directory or added to a directory asynchronously to the operation of *readdir()*.

The *readdir()* function shall return a pointer to a structure representing the directory entry at the current position in the directory stream specified by the argument *dirp*, and position the directory stream at the next entry. It shall return a null pointer upon reaching the end of the directory stream. The structure **dirent** defined in the **<dirent.h>** header describes a directory entry. The value of the structure's *d_ino* member shall be set to the file serial number of the file named by the *d_name* member. If the *d_name* member names a symbolic link, the value of the *d_ino* member shall be set to the file serial number of the symbolic link itself.

The *readdir()* function shall not return directory entries containing empty names. If entries for dot or dot-dot exist, one entry shall be returned for dot and one entry shall be returned for dot-dot; otherwise, they shall not be returned.

The application shall not modify the structure to which the return value of *readdir()* points, nor any storage areas pointed to by pointers within the structure. The returned pointer, and pointers within the structure, might be invalidated or the structure or the storage areas might be overwritten by a subsequent call to *readdir()* on the same directory stream. They shall not be affected by a call to *readdir()* on a different directory stream.

If a file is removed from or added to the directory after the most recent call to *opendir()* or *rewinddir()*, whether a subsequent call to *readdir()* returns an entry for that file is unspecified.

The *readdir()* function may buffer several directory entries per actual read operation; *readdir()* shall mark for update the last data access timestamp of the directory each time the directory is actually read.

After a call to *fork()*, either the parent or child (but not both) may continue processing the directory stream using *readdir()*, *rewinddir()*, or *seekdir()*. If both the parent and child processes use these functions, the result is undefined.

The *readdir()* function need not be thread-safe.

Applications wishing to check for error situations should set *errno* to 0 before calling *readdir()*. If *errno* is set to non-zero on return, an error occurred.

The *readdir_r()* function shall initialize the **dirent** structure referenced by *entry* to represent the directory entry at the current position in the directory stream referred to by *dirp*, store a pointer to this structure at the location referenced by *result*, and position the directory stream at the next entry.

The storage pointed to by *entry* shall be large enough for a **dirent** with an array of **char** *d_name* members containing at least {NAME_MAX}+1 elements.

Upon successful return, the pointer returned at **result* shall have the same value as the argument

entry. Upon reaching the end of the directory stream, this pointer shall have the value NULL.

The *readdir_r()* function shall not return directory entries containing empty names.

If a file is removed from or added to the directory after the most recent call to *opendir()* or *rewinddir()*, whether a subsequent call to *readdir_r()* returns an entry for that file is unspecified.

The *readdir_r()* function may buffer several directory entries per actual read operation; *readdir_r()* shall mark for update the last data access timestamp of the directory each time the directory is actually read.

RETURN VALUE

Upon successful completion, *readdir()* shall return a pointer to an object of type **struct dirent**. When an error is encountered, a null pointer shall be returned and *errno* shall be set to indicate the error. When the end of the directory is encountered, a null pointer shall be returned and *errno* is not changed.

If successful, the *readdir_r()* function shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

These functions shall fail if:

[EOVERFLOW] One of the values in the structure to be returned cannot be represented correctly.

These functions may fail if:

[EBADF] The *dirp* argument does not refer to an open directory stream.

[ENOENT] The current position of the directory stream is invalid.

EXAMPLES

The following sample program searches the current directory for each of the arguments supplied on the command line.

```
#include <dirent.h>
#include <errno.h>
#include <stdio.h>
#include <string.h>

static void lookup(const char *arg)
{
    DIR *dirp;
    struct dirent *dp;

    if ((dirp = opendir(".")) == NULL) {
        perror("couldn't open '.');
        return;
    }

    do {
        errno = 0;
        if ((dp = readdir(dirp)) != NULL) {
            if (strcmp(dp->d_name, arg) != 0)
                continue;

            (void) printf("found %s\n", arg);
            (void) closedir(dirp);
            return;
        }
    } while (1);
}
```

```

56668         }
56669     } while (dp != NULL);
56670
56671     if (errno != 0)
56672         perror("error reading directory");
56673     else
56674         (void) printf("failed to find %s\n", arg);
56675     (void) closedir(dirp);
56676     return;
56677 }
56678
56679 int main(int argc, char *argv[])
56680 {
56681     int i;
56682     for (i = 1; i < argc; i++)
56683         lookup(argv[i]);
56684     return (0);
56685 }

```

APPLICATION USAGE

The *readdir()* function should be used in conjunction with *opendir()*, *closedir()*, and *rewinddir()* to examine the contents of the directory.

The *readdir_r()* function is thread-safe and shall return values in a user-supplied buffer instead of possibly using a static data area that may be overwritten by each call.

RATIONALE

The returned value of *readdir()* merely *represents* a directory entry. No equivalence should be inferred.

Historical implementations of *readdir()* obtain multiple directory entries on a single read operation, which permits subsequent *readdir()* operations to operate from the buffered information. Any wording that required each successful *readdir()* operation to mark the directory last data access timestamp for update would disallow such historical performance-oriented implementations.

When returning a directory entry for the root of a mounted file system, some historical implementations of *readdir()* returned the file serial number of the underlying mount point, rather than of the root of the mounted file system. This behavior is considered to be a bug, since the underlying file serial number has no significance to applications.

Since *readdir()* returns NULL when it detects an error and when the end of the directory is encountered, an application that needs to tell the difference must set *errno* to zero before the call and check it if NULL is returned. Since the function must not change *errno* in the second case and must set it to a non-zero value in the first case, a zero *errno* after a call returning NULL indicates end-of-directory; otherwise, an error.

Routines to deal with this problem more directly were proposed:

```

56707 int derror (dirp)
56708 DIR *dirp;
56709
56710 void clearerr (dirp)
56711 DIR *dirp;

```

The first would indicate whether an error had occurred, and the second would clear the error indication. The simpler method involving *errno* was adopted instead by requiring that *readdir()* not change *errno* when end-of-directory is encountered.

56714 An error or signal indicating that a directory has changed while open was considered but
56715 rejected.

56716 The thread-safe version of the directory reading function returns values in a user-supplied buffer
56717 instead of possibly using a static data area that may be overwritten by each call. Either the
56718 {NAME_MAX} compile-time constant or the corresponding *pathconf()* option can be used to
56719 determine the maximum sizes of returned pathnames.

56720 FUTURE DIRECTIONS

56721 None.

56722 SEE ALSO

56724 XBD <dirent.h>, <sys/types.h>

56725 CHANGE HISTORY

56726 First released in Issue 2.

56727 Issue 5

56728 Large File Summit extensions are added.

56729 The *readdir_r()* function is included for alignment with the POSIX Threads Extension.

56730 A note indicating that the *readdir()* function need not be reentrant is added to the
56731 DESCRIPTION.

56732 Issue 6

56733 The *readdir_r()* function is marked as part of the Thread-Safe Functions option.

56734 The Open Group Corrigendum U026/7 is applied, correcting the prototype for *readdir_r()*.

56735 The Open Group Corrigendum U026/8 is applied, clarifying the wording of the successful
56736 return for the *readdir_r()* function.

56737 The following new requirements on POSIX implementations derive from alignment with the
56738 Single UNIX Specification:

- 56739 • The requirement to include <sys/types.h> has been removed. Although <sys/types.h> was
56740 required for conforming implementations of previous POSIX specifications, it was not
56741 required for UNIX applications.
- 56742 • A statement is added to the DESCRIPTION indicating the disposition of certain fields in
56743 **struct dirent** when an entry refers to a symbolic link.
- 56744 • The [EOVERFLOW] mandatory error condition is added. This change is to support large
56745 files.
- 56746 • The [ENOENT] optional error condition is added.

56747 The APPLICATION USAGE section is updated to include a note on the thread-safe function and
56748 its avoidance of possibly using a static data area.

56749 The **restrict** keyword is added to the *readdir_r()* prototype for alignment with the
56750 ISO/IEC 9899:1999 standard.

56751 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/50 is applied, replacing the EXAMPLES
56752 section with a new example.

56753 **Issue 7**

56754 Austin Group Interpretation 1003.1-2001 #059 is applied, updating the ERRORS section.

56755 Austin Group Interpretation 1003.1-2001 #156 is applied.

56756 The *readdir_r()* function is moved from the Thread-Safe Functions option to the Base.

56757 Changes are made related to support for finegrained timestamps.

56758 The value of the *d_ino* member is no longer unspecified for symbolic links.

56759 SD5-XSH-ERN-193 is applied.

56760 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0486 [75] is applied.

+

NAME

readlink, readlinkat — read the contents of a symbolic link

SYNOPSIS

```
#include <unistd.h>

ssize_t readlink(const char *restrict path, char *restrict buf,
                 size_t bufsize);
ssize_t readlinkat(int fd, const char *restrict path,
                  char *restrict buf, size_t bufsize);
```

DESCRIPTION

The *readlink()* function shall place the contents of the symbolic link referred to by *path* in the buffer *buf* which has size *bufsize*. If the number of bytes in the symbolic link is less than *bufsize*, the contents of the remainder of *buf* are unspecified. If the *buf* argument is not large enough to contain the link content, the first *bufsize* bytes shall be placed in *buf*.

If the value of *bufsize* is greater than {SSIZE_MAX}, the result is implementation-defined.

Upon successful completion, *readlink()* shall mark for update the last data access timestamp of the symbolic link.

The *readlinkat()* function shall be equivalent to the *readlink()* function except in the case where *path* specifies a relative path. In this case the symbolic link whose content is read is relative to the directory associated with the file descriptor *fd* instead of the current working directory. If the file descriptor was opened without O_SEARCH, the function shall check whether directory searches are permitted using the current permissions of the directory underlying the file descriptor. If the file descriptor was opened with O_SEARCH, the function shall not perform the check.

If *readlinkat()* is passed the special value AT_FDCWD in the *fd* parameter, the current working directory shall be used and the behavior shall be identical to a call to *readlink()*.

RETURN VALUE

Upon successful completion, these functions shall return the count of bytes placed in the buffer. Otherwise, these functions shall return a value of -1, leave the buffer unchanged, and set *errno* to indicate the error.

ERRORS

These functions shall fail if:

[EACCES]	Search permission is denied for a component of the path prefix of <i>path</i> .
[EINVAL]	The <i>path</i> argument names a file that is not a symbolic link.
[EIO]	An I/O error occurred while reading from the file system.
[ELOOP]	A loop exists in symbolic links encountered during resolution of the <i>path</i> argument.
[ENAMETOOLONG]	The length of a component of a pathname is longer than {NAME_MAX}.
[ENOENT]	A component of <i>path</i> does not name an existing file or <i>path</i> is an empty string.
[ENOTDIR]	A component of the path prefix names an existing file that is neither a directory nor a symbolic link to a directory, or the <i>path</i> argument contains at least one non- <i><slash></i> character and ends with one or more trailing <i><slash></i> characters and the last pathname component names an existing file that is neither a directory nor a symbolic link to a directory.

56804 The *readlinkat()* function shall fail if:

56805 [EACCES] *fd* was not opened with O_SEARCH and the permissions of the directory
56806 underlying *fd* do not permit directory searches.

56807 [EBADF] The *path* argument does not specify an absolute path and the *fd* argument is
56808 neither AT_FDCWD nor a valid file descriptor open for reading or searching.

56809 [ENOTDIR] The *path* argument is not an absolute path and *fd* is a file descriptor associated +
56810 with a non-directory file.

56811 These functions may fail if:

56812 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
56813 resolution of the *path* argument.

56814 [ENAMETOOLONG]
56815 The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a
56816 symbolic link produced an intermediate result with a length that exceeds
56817 {PATH_MAX}.

56818 EXAMPLES

56819 Reading the Name of a Symbolic Link

56820 The following example shows how to read the name of a symbolic link named */modules/pass1*.

```
56821 #include <unistd.h>
56822 char buf[1024];
56823 ssize_t len;
56824 ...
56825 if ((len = readlink("/modules/pass1", buf, sizeof(buf)-1)) != -1)
56826     buf[len] = '\0';
```

56827 APPLICATION USAGE

56828 Confirming applications should not assume that the returned contents of the symbolic link are
56829 null-terminated.

56830 RATIONALE

56831 The type associated with *bufsiz* is a **size_t** in order to be consistent with both the ISO C standard -
56832 and the definition of *read()*. The behavior specified for *readlink()* when *bufsiz* is zero represents
56833 historical practice. For this case, the standard developers considered a change whereby *readlink()*
56834 would return the number of non-null bytes contained in the symbolic link with the buffer *buf*
56835 remaining unchanged; however, since the **stat** structure member *st_size* value can be used to
56836 determine the size of buffer necessary to contain the contents of the symbolic link as returned by
56837 *readlink()*, this proposal was rejected, and the historical practice retained.

56838 The purpose of the *readlinkat()* function is to read the content of symbolic links in directories
56839 other than the current working directory without exposure to race conditions. Any part of the
56840 path of a file could be changed in parallel to a call to *readlink()*, resulting in unspecified behavior.
56841 By opening a file descriptor for the target directory and using the *readlinkat()* function it can be
56842 guaranteed that the symbolic link read is located relative to the desired directory.

56843 FUTURE DIRECTIONS

56844 None.

SEE ALSO*fstatat()*, *symlink()*

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Issue 6The return type is changed to **ssize_t**, to align with the IEEE P1003.1a draft standard.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- This function is made mandatory.
- In this function it is possible for the return value to exceed the range of the type **ssize_t** (since **size_t** has a larger range of positive values than **ssize_t**). A sentence restricting the size of the **size_t** object is added to the description to resolve this conflict.

The following changes are made for alignment with the ISO POSIX-1: 1996 standard:

- The FUTURE DIRECTIONS section is changed to None.

The following changes were made to align with the IEEE P1003.1a draft standard:

- The [ELOOP] optional error condition is added.

The **restrict** keyword is added to the *readlink()* prototype for alignment with the ISO/IEC 9899: 1999 standard.**Issue 7**

Austin Group Interpretation 1003.1-2001 #143 is applied.

SD5-XSH-ERN-189 is applied, updating the ERRORS section.

The *readlinkat()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 2.

The [EACCES] error is removed from the “may fail” error conditions.

Changes are made to allow a directory to be opened for searching.

The [ENOTDIR] error condition is clarified to cover the condition where the last component of a pathname exists but is not a directory or a symbolic link to a directory.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0487 [120], XSH/TC1-2008/0488 [461], +

 applied.

NAME

readv — read a vector

SYNOPSIS

```
XSI      #include <sys/uio.h>
        ssize_t readv(int fildes, const struct iovec *iov, int iovcnt);
```

DESCRIPTION

The *readv()* function shall be equivalent to *read()*, except as described below. The *readv()* function shall place the input data into the *iovcnt* buffers specified by the members of the *iov* array: *iov*[0], *iov*[1], ..., *iov*[*iovcnt*−1]. The *iovcnt* argument is valid if greater than 0 and less than or equal to {IOV_MAX}.

Each *iovec* entry specifies the base address and length of an area in memory where data should be placed. The *readv()* function shall always fill an area completely before proceeding to the next.

Upon successful completion, *readv()* shall mark for update the last data access timestamp of the file.

RETURN VALUE

Refer to *read()*.

ERRORS

Refer to *read()*.

In addition, the *readv()* function shall fail if:

[EINVAL] The sum of the *iov_len* values in the *iov* array overflowed an *ssize_t*.

The *readv()* function may fail if:

[EINVAL] The *iovcnt* argument was less than or equal to 0, or greater than {IOV_MAX}.

EXAMPLES**Reading Data into an Array**

The following example reads data from the file associated with the file descriptor *fd* into the buffers specified by members of the *iov* array.

```
#include <sys/types.h>
#include <sys/uio.h>
#include <unistd.h>
...
ssize_t bytes_read;
int fd;
char buf0[20];
char buf1[30];
char buf2[40];
int iovcnt;
struct iovec iov[3];

iov[0].iov_base = buf0;
iov[0].iov_len = sizeof(buf0);
iov[1].iov_base = buf1;
iov[1].iov_len = sizeof(buf1);
iov[2].iov_base = buf2;
```

```
56922         iov[2].iov_len = sizeof(buf2);
56923         ...
56924         iovcnt = sizeof(iov) / sizeof(struct iovec);
56925         bytes_read = readv(fd, iov, iovcnt);
56926         ...
```

56927 **APPLICATION USAGE**
56928 None.

56929 **RATIONALE**
56930 Refer to *read()*.

56931 **FUTURE DIRECTIONS**
56932 None.

56936 **CHANGE HISTORY**
56937 First released in Issue 4, Version 2.

56938 **Issue 6**
56939 Split out from the *read()* reference page.

56940 **Issue 7**
56941 Changes are made related to support for finegrained timestamps.

56942 **NAME**

56943 realloc — memory reallocator

56944 **SYNOPSIS**

56945 #include <stdlib.h>

56946 void *realloc(void *ptr, size_t size);

56947 **DESCRIPTION**

56948 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 56949 conflict between the requirements described here and the ISO C standard is unintentional. This
 56950 volume of POSIX.1-2008 defers to the ISO C standard.

56951 The *realloc()* function shall deallocate the old object pointed to by *ptr* and return a pointer to a
 56952 new object that has the size specified by *size*. The contents of the new object shall be the same as
 56953 that of the old object prior to deallocation, up to the lesser of the new and old sizes. Any bytes in
 56954 the new object beyond the size of the old object have indeterminate values. If the size of the
 56955 space requested is zero, the behavior shall be implementation-defined: either a null pointer is
 56956 returned, or the behavior shall be as if the size were some non-zero value, except that the
 56957 returned pointer shall not be used to access an object. If the space cannot be allocated, the object
 56958 shall remain unchanged.

56959 If *ptr* is a null pointer, *realloc()* shall be equivalent to *malloc()* for the specified size.

56960 If *ptr* does not match a pointer returned earlier by *calloc()*, *malloc()*, or *realloc()* or if the space has
 56961 previously been deallocated by a call to *free()* or *realloc()*, the behavior is undefined.

56962 The order and contiguity of storage allocated by successive calls to *realloc()* is unspecified. The
 56963 pointer returned if the allocation succeeds shall be suitably aligned so that it may be assigned to
 56964 a pointer to any type of object and then used to access such an object in the space allocated (until
 56965 the space is explicitly freed or reallocated). Each such allocation shall yield a pointer to an object
 56966 disjoint from any other object. The pointer returned shall point to the start (lowest byte address)
 56967 of the allocated space. If the space cannot be allocated, a null pointer shall be returned.

56968 **RETURN VALUE**

56969 Upon successful completion, *realloc()* shall return a pointer to the (possibly moved) allocated
 56970 space. If *size* is 0, either:

- 56971 CX • A null pointer shall be returned and *errno* set to an implementation-defined value.
- 56972 • A unique pointer that can be successfully passed to *free()* shall be returned, and the
 56973 memory object pointed to by *ptr* shall be freed. The application shall ensure that the
 56974 pointer is not used to access an object.

56975 CX If there is not enough available memory, *realloc()* shall return a null pointer and set *errno* to
 56976 CX [ENOMEM]. If *realloc()* returns a null pointer and *errno* has been set to [ENOMEM], the
 56977 memory referenced by *ptr* shall not be changed. +

56978 **ERRORS**

56979 The *realloc()* function shall fail if:

56980 CX [ENOMEM] Insufficient memory is available.

EXAMPLES

None.

APPLICATION USAGE

The description of `realloc()` has been modified from previous versions of this standard to align with the ISO/IEC 9899:1999 standard. Previous versions explicitly permitted a call to `realloc(p, 0)` to free the space pointed to by `p` and return a null pointer. While this behavior could be interpreted as permitted by this version of the standard, the C language committee have indicated that this interpretation is incorrect. Applications should assume that if `realloc()` returns a null pointer, the space pointed to by `p` has not been freed. Since this could lead to double-frees, implementations should also set `errno` if a null pointer actually indicates a failure, and applications should only free the space if `errno` was changed.

RATIONALE

None.

FUTURE DIRECTIONS

This standard defers to the ISO C standard. While that standard currently has language that might permit `realloc(p, 0)`, where `p` is not a null pointer, to free `p` while still returning a null pointer, the committee responsible for that standard is considering clarifying the language to explicitly prohibit that alternative.

SEE ALSO

`calloc()`, `free()`, `malloc()`

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

Extensions beyond the ISO C standard are marked.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In the RETURN VALUE section, if there is not enough available memory, the setting of `errno` to [ENOMEM] is added.
- The [ENOMEM] error condition is added.

Issue 7

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0495 [400], XSH/TC1-2008/0496 [400], XSH/TC1-2008/0497 [400], and XSH/TC1-2008/0498 [400] are applied.

57013 **NAME**57014 `realpath` — resolve a pathname57015 **SYNOPSIS**

```
57016 XSI      #include <stdlib.h>
57017
57017      char *realpath(const char *restrict file_name,
57018                    char *restrict resolved_name);
```

57019 **DESCRIPTION**

57020 The `realpath()` function shall derive, from the pathname pointed to by *file_name*, an absolute
 57021 pathname that resolves to the same directory entry, whose resolution does not involve '.',
 57022 '..', or symbolic links. If *resolved_name* is a null pointer, the generated pathname shall be
 57023 stored as a null-terminated string in a buffer allocated as if by a call to `malloc()`. Otherwise, if
 57024 {PATH_MAX} is defined as a constant in the `<limits.h>` header, then the generated pathname
 57025 shall be stored as a null-terminated string, up to a maximum of {PATH_MAX} bytes, in the
 57026 buffer pointed to by *resolved_name*.

57027 If *resolved_name* is not a null pointer and {PATH_MAX} is not defined as a constant in the
 57028 `<limits.h>` header, the behavior is undefined.

57029 **RETURN VALUE**

57030 Upon successful completion, `realpath()` shall return a pointer to the buffer containing the
 57031 resolved name. Otherwise, `realpath()` shall return a null pointer and set *errno* to indicate the
 57032 error.

57033 If the *resolved_name* argument is a null pointer, the pointer returned by `realpath()` can be passed
 57034 to `free()`.

57035 If the *resolved_name* argument is not a null pointer and the `realpath()` function fails, the contents
 57036 of the buffer pointed to by *resolved_name* are undefined.

57037 **ERRORS**

57038 The `realpath()` function shall fail if:

57039	[EACCES]	Search permission was denied for a component of the path prefix of <i>file_name</i> .	
57040	[EINVAL]	The <i>file_name</i> argument is a null pointer.	
57041	[EIO]	An error occurred while reading from the file system.	
57042	[ELOOP]	A loop exists in symbolic links encountered during resolution of the <i>file_name</i> argument.	
57043			
57044	[ENAMETOOLONG]		
57045		The length of a component of a pathname is longer than {NAME_MAX}.	
57046	[ENOENT]	A component of <i>file_name</i> does not name an existing file or <i>file_name</i> points to an empty string.	
57047			
57048	[ENOTDIR]	A component of the path prefix names an existing file that is neither a	
57049		directory nor a symbolic link to a directory, or the <i>file_name</i> argument contains	
57050		at least one non- <code><slash></code> character and ends with one or more trailing <code><slash></code>	
57051		characters and the last pathname component names an existing file that is	
57052		neither a directory nor a symbolic link to a directory.	

57053 The *realpath()* function may fail if:

57054 [EACCES] The *file_name* argument does not begin with a <slash> and none of the +
 57055 symbolic links (if any) processed during pathname resolution of *file_name* had +
 57056 contents that began with a <slash>, and either search permission was denied +
 57057 for the current directory or read or search permission was denied for a +
 57058 directory above the current directory in the file hierarchy.

57059 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
 57060 resolution of the *file_name* argument.

57061 [ENAMETOOLONG]
 57062 The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a
 57063 symbolic link produced an intermediate result with a length that exceeds
 57064 {PATH_MAX}.

57065 [ENOMEM] Insufficient storage space is available.

57066 EXAMPLES

57067 Generating an Absolute Pathname

57068 The following example generates an absolute pathname for the file identified by the *symlinkpath*
 57069 argument. The generated pathname is stored in the buffer pointed to by *actualpath*.

```
57070 #include <stdlib.h>
57071 ...
57072 char *symlinkpath = "/tmp/symlink/file";
57073 char *actualpath;

57074 actualpath = realpath(symlinkpath, NULL);
57075 if (actualpath != NULL)
57076 {
57077     ... use actualpath ...

57078     free(actualpath);
57079 }
57080 else
57081 {
57082     ... handle error ...
57083 }
```

57084 APPLICATION USAGE

57085 For functions that allocate memory as if by *malloc()*, the application should release such memory
 57086 when it is no longer required by a call to *free()*. For *realpath()*, this is the return value.

57087 RATIONALE

57088 Since *realpath()* has no *length* argument, if {PATH_MAX} is not defined as a constant in
 57089 <limits.h>, applications have no way of determining how large a buffer they need to allocate for
 57090 it to be safe to pass to *realpath()*. A {PATH_MAX} value obtained from a prior *pathconf()* call is
 57091 out-of-date by the time *realpath()* is called. Hence the only reliable way to use *realpath()* when
 57092 {PATH_MAX} is not defined in <limits.h> is to pass a null pointer for *resolved_name* so that
 57093 *realpath()* will allocate a buffer of the necessary size.

57094 **FUTURE DIRECTIONS**

57095 None.

NAME

recv — receive a message from a connected socket

SYNOPSIS

```
#include <sys/socket.h>
```

```
ssize_t recv(int socket, void *buffer, size_t length, int flags);
```

DESCRIPTION

The *recv()* function shall receive a message from a connection-mode or connectionless-mode socket. It is normally used with connected sockets because it does not permit the application to retrieve the source address of received data.

The *recv()* function takes the following arguments:

socket Specifies the socket file descriptor.

buffer Points to a buffer where the message should be stored.

length Specifies the length in bytes of the buffer pointed to by the *buffer* argument.

flags Specifies the type of message reception. Values of this argument are formed by logically OR'ing zero or more of the following values:

MSG_PEEK Peeks at an incoming message. The data is treated as unread and the next *recv()* or similar function shall still return this data.

MSG_OOB Requests out-of-band data. The significance and semantics of out-of-band data are protocol-specific.

MSG_WAITALL On SOCK_STREAM sockets this requests that the function block until the full amount of data can be returned. The function may return the smaller amount of data if the socket is a message-based socket, if a signal is caught, if the connection is terminated, if MSG_PEEK was specified, or if an error is pending for the socket.

The *recv()* function shall return the length of the message written to the buffer pointed to by the *buffer* argument. For message-based sockets, such as SOCK_DGRAM and SOCK_SEQPACKET, the entire message shall be read in a single operation. If a message is too long to fit in the supplied buffer, and MSG_PEEK is not set in the *flags* argument, the excess bytes shall be discarded. For stream-based sockets, such as SOCK_STREAM, message boundaries shall be ignored. In this case, data shall be returned to the user as soon as it becomes available, and no data shall be discarded.

If the MSG_WAITALL flag is not set, data shall be returned only up to the end of the first message.

If no messages are available at the socket and O_NONBLOCK is not set on the socket's file descriptor, *recv()* shall block until a message arrives. If no messages are available at the socket and O_NONBLOCK is set on the socket's file descriptor, *recv()* shall fail and set *errno* to [EAGAIN] or [EWOULDBLOCK].

RETURN VALUE

Upon successful completion, *recv()* shall return the length of the message in bytes. If no messages are available to be received and the peer has performed an orderly shutdown, *recv()* shall return 0. Otherwise, -1 shall be returned and *errno* set to indicate the error.

ERRORS

The *recv()* function shall fail if:

[EAGAIN] or [EWOULDBLOCK]

The socket's file descriptor is marked O_NONBLOCK and no data is waiting to be received; or MSG_OOB is set and no out-of-band data is available and either the socket's file descriptor is marked O_NONBLOCK or the socket does not support blocking to await out-of-band data.

[EBADF] The *socket* argument is not a valid file descriptor.

[ECONNRESET] A connection was forcibly closed by a peer.

[EINTR] The *recv()* function was interrupted by a signal that was caught, before any data was available.

[EINVAL] The MSG_OOB flag is set and no out-of-band data is available.

[ENOTCONN] A receive is attempted on a connection-mode socket that is not connected.

[ENOTSOCK] The *socket* argument does not refer to a socket.

[EOPNOTSUPP] The specified flags are not supported for this socket type or protocol.

[ETIMEDOUT] The connection timed out during connection establishment, or due to a transmission timeout on active connection.

The *recv()* function may fail if:

[EIO] An I/O error occurred while reading from or writing to the file system.

[ENOBUFS] Insufficient resources were available in the system to perform the operation.

[ENOMEM] Insufficient memory was available to fulfill the request.

EXAMPLES

None.

APPLICATION USAGE

The *recv()* function is equivalent to *recvfrom()* with null pointer *address* and *address_len* arguments, and to *read()* if the *socket* argument refers to a socket and the *flags* argument is 0.

The *select()* and *poll()* functions can be used to determine when data is available to be received.

RATIONALE

None.

FUTURE DIRECTIONS

None.

NAME

recvfrom — receive a message from a socket

SYNOPSIS

```
#include <sys/socket.h>

ssize_t recvfrom(int socket, void *restrict buffer, size_t length,
                 int flags, struct sockaddr *restrict address,
                 socklen_t *restrict address_len);
```

DESCRIPTION

The *recvfrom()* function shall receive a message from a connection-mode or connectionless-mode socket. It is normally used with connectionless-mode sockets because it permits the application to retrieve the source address of received data.

The *recvfrom()* function takes the following arguments:

<i>socket</i>	Specifies the socket file descriptor.
<i>buffer</i>	Points to the buffer where the message should be stored.
<i>length</i>	Specifies the length in bytes of the buffer pointed to by the <i>buffer</i> argument.
<i>flags</i>	Specifies the type of message reception. Values of this argument are formed by logically OR'ing zero or more of the following values:

MSG_PEEK	Peeks at an incoming message. The data is treated as unread and the next <i>recvfrom()</i> or similar function shall still return this data.

MSG_OOB	Requests out-of-band data. The significance and semantics of out-of-band data are protocol-specific.

MSG_WAITALL	On SOCK_STREAM sockets this requests that the function block until the full amount of data can be returned. The function may return the smaller amount of data if the socket is a message-based socket, if a signal is caught, if the connection is terminated, if MSG_PEEK was specified, or if an error is pending for the socket.

<i>address</i>	A null pointer, or points to a sockaddr structure in which the sending address is to be stored. The length and format of the address depend on the address family of the socket.

<i>address_len</i>	Either a null pointer, if <i>address</i> is a null pointer, or a pointer to a socklen_t object which on input specifies the length of the supplied sockaddr structure, and on output specifies the length of the stored address.

The *recvfrom()* function shall return the length of the message written to the buffer pointed to by the *buffer* argument. For message-based sockets, such as **SOCK_RAW**, **SOCK_DGRAM**, and **SOCK_SEQPACKET**, the entire message shall be read in a single operation. If a message is too long to fit in the supplied buffer, and MSG_PEEK is not set in the *flags* argument, the excess bytes shall be discarded. For stream-based sockets, such as **SOCK_STREAM**, message boundaries shall be ignored. In this case, data shall be returned to the user as soon as it becomes available, and no data shall be discarded.

If the MSG_WAITALL flag is not set, data shall be returned only up to the end of the first message.

Not all protocols provide the source address for messages. If the *address* argument is not a null

57245 pointer and the protocol provides the source address of messages, the source address of the
 57246 received message shall be stored in the **sockaddr** structure pointed to by the *address* argument,
 57247 and the length of this address shall be stored in the object pointed to by the *address_len*
 57248 argument.

57249 If the actual length of the address is greater than the length of the supplied **sockaddr** structure,
 57250 the stored address shall be truncated.

57251 If the *address* argument is not a null pointer and the protocol does not provide the source address
 57252 of messages, the value stored in the object pointed to by *address* is unspecified.

57253 If no messages are available at the socket and O_NONBLOCK is not set on the socket's file
 57254 descriptor, *recvfrom()* shall block until a message arrives. If no messages are available at the
 57255 socket and O_NONBLOCK is set on the socket's file descriptor, *recvfrom()* shall fail and set *errno*
 57256 to [EAGAIN] or [EWOULDBLOCK].

57257 RETURN VALUE

57258 Upon successful completion, *recvfrom()* shall return the length of the message in bytes. If no
 57259 messages are available to be received and the peer has performed an orderly shutdown,
 57260 *recvfrom()* shall return 0. Otherwise, the function shall return -1 and set *errno* to indicate the
 57261 error.

57262 ERRORS

57263 The *recvfrom()* function shall fail if:

57264 [EAGAIN] or [EWOULDBLOCK]

57265 The socket's file descriptor is marked O_NONBLOCK and no data is waiting
 57266 to be received; or MSG_OOB is set and no out-of-band data is available and
 57267 either the socket's file descriptor is marked O_NONBLOCK or the socket does
 57268 not support blocking to await out-of-band data.

57269 [EBADF] The *socket* argument is not a valid file descriptor.

57270 [ECONNRESET] A connection was forcibly closed by a peer.

57271 [EINTR] A signal interrupted *recvfrom()* before any data was available.

57272 [EINVAL] The MSG_OOB flag is set and no out-of-band data is available.

57273 [ENOTCONN] A receive is attempted on a connection-mode socket that is not connected.

57274 [ENOTSOCK] The *socket* argument does not refer to a socket.

57275 [EOPNOTSUPP] The specified flags are not supported for this socket type.

57276 [ETIMEDOUT] The connection timed out during connection establishment, or due to a
 57277 transmission timeout on active connection.

57278 The *recvfrom()* function may fail if:

57279 [EIO] An I/O error occurred while reading from or writing to the file system.

57280 [ENOBUFS] Insufficient resources were available in the system to perform the operation.

57281 [ENOMEM] Insufficient memory was available to fulfill the request.

57282 **EXAMPLES**

57283 None.

57284 **APPLICATION USAGE**57285 The *select()* and *poll()* functions can be used to determine when data is available to be received.57286 **RATIONALE**

57297 NAME

57298 recvmsg — receive a message from a socket

57299 SYNOPSIS

57300 #include <sys/socket.h>

57301 ssize_t recvmsg(int socket, struct msghdr *message, int flags);

57302 DESCRIPTION

57303 The *recvmsg()* function shall receive a message from a connection-mode or connectionless-mode
 57304 socket. It is normally used with connectionless-mode sockets because it permits the application
 57305 to retrieve the source address of received data.

57306 The *recvmsg()* function takes the following arguments:

57307	<i>socket</i>	Specifies the socket file descriptor.
57308	<i>message</i>	Points to a msghdr structure, containing both the buffer to store the source address and the buffers for the incoming message. The length and format of the address depend on the address family of the socket. The <i>msg_flags</i> member is ignored on input, but may contain meaningful values on output.
57312	<i>flags</i>	Specifies the type of message reception. Values of this argument are formed by logically OR'ing zero or more of the following values:
57314	MSG_OOB	Requests out-of-band data. The significance and semantics of out-of-band data are protocol-specific.
57316	MSG_PEEK	Peeks at the incoming message.
57317	MSG_WAITALL	On SOCK_STREAM sockets this requests that the function block until the full amount of data can be returned. The function may return the smaller amount of data if the socket is a message-based socket, if a signal is caught, if the connection is terminated, if MSG_PEEK was specified, or if an error is pending for the socket.

57323 The *recvmsg()* function shall receive messages from unconnected or connected sockets and shall
 57324 return the length of the message.

57325 The *recvmsg()* function shall return the total length of the message. For message-based sockets,
 57326 such as SOCK_DGRAM and SOCK_SEQPACKET, the entire message shall be read in a single
 57327 operation. If a message is too long to fit in the supplied buffers, and MSG_PEEK is not set in the
 57328 *flags* argument, the excess bytes shall be discarded, and MSG_TRUNC shall be set in the
 57329 *msg_flags* member of the **msghdr** structure. For stream-based sockets, such as SOCK_STREAM,
 57330 message boundaries shall be ignored. In this case, data shall be returned to the user as soon as it
 57331 becomes available, and no data shall be discarded.

57332 If the MSG_WAITALL flag is not set, data shall be returned only up to the end of the first
 57333 message.

57334 If no messages are available at the socket and O_NONBLOCK is not set on the socket's file
 57335 descriptor, *recvmsg()* shall block until a message arrives. If no messages are available at the
 57336 socket and O_NONBLOCK is set on the socket's file descriptor, the *recvmsg()* function shall fail
 57337 and set *errno* to [EAGAIN] or [EWOULDBLOCK].

57338 In the **msghdr** structure, the *msg_name* member may be a null pointer if the source address is not
 57339 required. Otherwise, if the socket is unconnected, the *msg_name* member points to a **sockaddr**
 57340 structure in which the source address is to be stored, and the *msg_namelen* member on input
 57341 specifies the length of the supplied **sockaddr** structure and on output specifies the length of the

stored address. If the actual length of the address is greater than the length of the supplied **sockaddr** structure, the stored address shall be truncated. If the socket is connected, the *msg_name* and *msg_namelen* members shall be ignored. The *msg_iov* and *msg_iovlen* fields are used to specify where the received data shall be stored. The *msg_iov* member points to an array of **iovec** structures; the *msg_iovlen* member shall be set to the dimension of this array. In each **iovec** structure, the *iov_base* field specifies a storage area and the *iov_len* field gives its size in bytes. Each storage area indicated by *msg_iov* is filled with received data in turn until all of the received data is stored or all of the areas have been filled.

Upon successful completion, the *msg_flags* member of the message header shall be the bitwise-inclusive OR of all of the following flags that indicate conditions detected for the received message:

MSG_EOR	End-of-record was received (if supported by the protocol).
MSG_OOB	Out-of-band data was received.
MSG_TRUNC	Normal data was truncated.
MSG_CTRUNC	Control data was truncated.

RETURN VALUE

Upon successful completion, *recvmsg()* shall return the length of the message in bytes. If no messages are available to be received and the peer has performed an orderly shutdown, *recvmsg()* shall return 0. Otherwise, -1 shall be returned and *errno* set to indicate the error.

ERRORS

The *recvmsg()* function shall fail if:

[EAGAIN] or [EWOULDBLOCK]

The socket's file descriptor is marked O_NONBLOCK and no data is waiting to be received; or MSG_OOB is set and no out-of-band data is available and either the socket's file descriptor is marked O_NONBLOCK or the socket does not support blocking to await out-of-band data.

[EBADF] The *socket* argument is not a valid open file descriptor.

[ECONNRESET] A connection was forcibly closed by a peer.

[EINTR] This function was interrupted by a signal before any data was available.

[EINVAL] The sum of the *iov_len* values overflows a **ssize_t**, or the MSG_OOB flag is set and no out-of-band data is available.

[EMSGSIZE] The *msg_iovlen* member of the **msghdr** structure pointed to by *message* is less than or equal to 0, or is greater than {IOV_MAX}.

[ENOTCONN] A receive is attempted on a connection-mode socket that is not connected.

[ENOTSOCK] The *socket* argument does not refer to a socket.

[EOPNOTSUPP] The specified flags are not supported for this socket type.

[ETIMEDOUT] The connection timed out during connection establishment, or due to a transmission timeout on active connection.

The *recvmsg()* function may fail if:

[EIO] An I/O error occurred while reading from or writing to the file system.

57382 [ENOBUFS] Insufficient resources were available in the system to perform the operation.

57383 [ENOMEM] Insufficient memory was available to fulfill the request.

57384 **EXAMPLES**

57385 None.

57386 **APPLICATION USAGE**

57387 The *select()* and *poll()* functions can be used to determine when data is available to be received.

NAME

regcomp, regerror, regex, regfree — regular expression matching

SYNOPSIS

```
#include <regex.h>

int regcomp(regex_t *restrict preg, const char *restrict pattern,
            int cflags);
size_t regerror(int errcode, const regex_t *restrict preg,
               char *restrict errbuf, size_t errbuf_size);
int regex(const regex_t *restrict preg, const char *restrict string,
          size_t nmatch, regmatch_t pmatch[restrict], int eflags);
void regfree(regex_t *preg);
```

DESCRIPTION

These functions interpret *basic* and *extended* regular expressions as described in XBD [Chapter 9](#) (on page 181).

The **regex_t** structure is defined in **<regex.h>** and contains at least the following member:

Member Type	Member Name	Description
size_t	<i>re_nsub</i>	Number of parenthesized subexpressions.

The **regmatch_t** structure is defined in **<regex.h>** and contains at least the following members:

Member Type	Member Name	Description
regoff_t	<i>rm_so</i>	Byte offset from start of <i>string</i> to start of substring.
regoff_t	<i>rm_eo</i>	Byte offset from start of <i>string</i> of the first character after the end of substring.

The *regcomp()* function shall compile the regular expression contained in the string pointed to by the *pattern* argument and place the results in the structure pointed to by *preg*. The *cflags* argument is the bitwise-inclusive OR of zero or more of the following flags, which are defined in the **<regex.h>** header:

REG_EXTENDED Use Extended Regular Expressions.

REG_ICASE Ignore case in match (see XBD [Chapter 9](#), on page 181).

REG_NOSUB Report only success/fail in *regex()*.

REG_NEWLINE Change the handling of <newline> characters, as described in the text.

The default regular expression type for *pattern* is a Basic Regular Expression. The application can specify Extended Regular Expressions using the **REG_EXTENDED** *cflags* flag.

If the **REG_NOSUB** flag was not set in *cflags*, then *regcomp()* shall set *re_nsub* to the number of parenthesized subexpressions (delimited by "*\(\)*" in basic regular expressions or "*()*" in extended regular expressions) found in *pattern*.

The *regex()* function compares the null-terminated string specified by *string* with the compiled regular expression *preg* initialized by a previous call to *regcomp()*. If it finds a match, *regex()* shall return 0; otherwise, it shall return non-zero indicating either no match or an error. The *eflags* argument is the bitwise-inclusive OR of zero or more of the following flags, which are defined in the **<regex.h>** header:

- 57441 REG_NOTBOL The first character of the string pointed to by *string* is not the beginning of
 57442 the line. Therefore, the <circumflex> character ('^'), when taken as a
 57443 special character, shall not match the beginning of *string*.
- 57444 REG_NOTEOL The last character of the string pointed to by *string* is not the end of the
 57445 line. Therefore, the <dollar-sign> ('\$'), when taken as a special character,
 57446 shall not match the end of *string*.
- 57447 If *nmatch* is 0 or REG_NOSUB was set in the *cflags* argument to *regcomp()*, then *regexexec()* shall
 57448 ignore the *pmatch* argument. Otherwise, the application shall ensure that the *pmatch* argument
 57449 points to an array with at least *nmatch* elements, and *regexexec()* shall fill in the elements of that
 57450 array with offsets of the substrings of *string* that correspond to the parenthesized subexpressions
 57451 of *pattern*: *pmatch[i].rm_so* shall be the byte offset of the beginning and *pmatch[i].rm_eo* shall be
 57452 one greater than the byte offset of the end of substring *i*. (Subexpression *i* begins at the *i*th
 57453 matched open parenthesis, counting from 1.) Offsets in *pmatch[0]* identify the substring that
 57454 corresponds to the entire regular expression. Unused elements of *pmatch* up to *pmatch[nmatch-1]*
 57455 shall be filled with -1. If there are more than *nmatch* subexpressions in *pattern* (*pattern* itself
 57456 counts as a subexpression), then *regexexec()* shall still do the match, but shall record only the first
 57457 *nmatch* substrings.
- 57458 When matching a basic or extended regular expression, any given parenthesized subexpression
 57459 of *pattern* might participate in the match of several different substrings of *string*, or it might not
 57460 match any substring even though the pattern as a whole did match. The following rules shall be
 57461 used to determine which substrings to report in *pmatch* when matching regular expressions:
- 57462 1. If subexpression *i* in a regular expression is not contained within another subexpression,
 57463 and it participated in the match several times, then the byte offsets in *pmatch[i]* shall
 57464 delimit the last such match.
 - 57465 2. If subexpression *i* is not contained within another subexpression, and it did not
 57466 participate in an otherwise successful match, the byte offsets in *pmatch[i]* shall be -1. A
 57467 subexpression does not participate in the match when:
 57468 ' * ' or " \{ \} " appears immediately after the subexpression in a basic regular
 57469 expression, or ' * ', ' ? ', or " { } " appears immediately after the subexpression in
 57470 an extended regular expression, and the subexpression did not match (matched 0
 57471 times)
- 57472 or:
- 57473 ' | ' is used in an extended regular expression to select this subexpression or
 57474 another, and the other subexpression matched.
- 57475 3. If subexpression *i* is contained within another subexpression *j*, and *i* is not contained
 57476 within any other subexpression that is contained within *j*, and a match of subexpression *j*
 57477 is reported in *pmatch[j]*, then the match or non-match of subexpression *i* reported in
 57478 *pmatch[i]* shall be as described in 1. and 2. above, but within the substring reported in
 57479 *pmatch[j]* rather than the whole string. The offsets in *pmatch[i]* are still relative to the start
 57480 of *string*.
 - 57481 4. If subexpression *i* is contained in subexpression *j*, and the byte offsets in *pmatch[j]* are -1,
 57482 then the pointers in *pmatch[i]* shall also be -1.
 - 57483 5. If subexpression *i* matched a zero-length string, then both byte offsets in *pmatch[i]* shall be
 57484 the byte offset of the character or null terminator immediately following the zero-length
 57485 string.

57486 If, when *regexexec()* is called, the locale is different from when the regular expression was
57487 compiled, the result is undefined.

57488 If REG_NEWLINE is not set in *cflags*, then a <newline> in *pattern* or *string* shall be treated as an
57489 ordinary character. If REG_NEWLINE is set, then <newline> shall be treated as an ordinary
57490 character except as follows:

- 57491 1. A <newline> in *string* shall not be matched by a <period> outside a bracket expression or
57492 by any form of a non-matching list (see XBD [Chapter 9](#), on page 181).
- 57493 2. A <circumflex> (' ^ ') in *pattern*, when used to specify expression anchoring (see XBD
57494 [Section 9.3.8](#), on page 187), shall match the zero-length string immediately after a
57495 <newline> in *string*, regardless of the setting of REG_NOTBOL.
- 57496 3. A <dollar-sign> (' \$ ') in *pattern*, when used to specify expression anchoring, shall match
57497 the zero-length string immediately before a <newline> in *string*, regardless of the setting
57498 of REG_NOTEOL.

57499 The *regfree()* function frees any memory allocated by *regcomp()* associated with *preg*.

57500 The following constants are defined as the minimum set of error return values, although other
57501 errors listed as implementation extensions in <regex.h> are possible:

57502	REG_BADBR	Content of "\{\}" invalid: not a number, number too large, more than
57503		two numbers, first larger than second.
57504	REG_BADPAT	Invalid regular expression.
57505	REG_BADRPT	'?', '*', or '+' not preceded by valid regular expression.
57506	REG_EBRACE	"\{\}" imbalance.
57507	REG_EBRACK	"[]" imbalance.
57508	REG_ECOLLATE	Invalid collating element referenced.
57509	REG_ECTYPE	Invalid character class type referenced.
57510	REG_EESCAPE	Trailing <backslash> character in pattern.
57511	REG_EPAREN	"\(\)" or "()" imbalance.
57512	REG_ERANGE	Invalid endpoint in range expression.
57513	REG_ESPACE	Out of memory.
57514	REG_ESUBREG	Number in "\digit" invalid or in error.
57515	REG_NOMATCH	<i>regexexec()</i> failed to match.

57516 If more than one error occurs in processing a function call, any one of the possible constants may
57517 be returned, as the order of detection is unspecified.

57518 The *regerror()* function provides a mapping from error codes returned by *regcomp()* and
57519 *regexexec()* to unspecified printable strings. It generates a string corresponding to the value of the
57520 *errcode* argument, which the application shall ensure is the last non-zero value returned by
57521 *regcomp()* or *regexexec()* with the given value of *preg*. If *errcode* is not such a value, the content of
57522 the generated string is unspecified.

57523 If *preg* is a null pointer, but *errcode* is a value returned by a previous call to *regexexec()* or *regcomp()*,
57524 the *regerror()* still generates an error string corresponding to the value of *errcode*, but it might not
57525 be as detailed under some implementations.

If the *errbuf_size* argument is not 0, *regerror()* shall place the generated string into the buffer of size *errbuf_size* bytes pointed to by *errbuf*. If the string (including the terminating null) cannot fit in the buffer, *regerror()* shall truncate the string and null-terminate the result.

If *errbuf_size* is 0, *regerror()* shall ignore the *errbuf* argument, and return the size of the buffer needed to hold the generated string.

If the *preg* argument to *regexec()* or *regfree()* is not a compiled regular expression returned by *regcomp()*, the result is undefined. A *preg* is no longer treated as a compiled regular expression after it is given to *regfree()*.

57534 RETURN VALUE

Upon successful completion, the *regcomp()* function shall return 0. Otherwise, it shall return an integer value indicating an error as described in **<regex.h>**, and the content of *preg* is undefined. If a code is returned, the interpretation shall be as given in **<regex.h>**.

If *regcomp()* detects an invalid RE, it may return REG_BADPAT, or it may return one of the error codes that more precisely describes the error.

Upon successful completion, the *regexec()* function shall return 0. Otherwise, it shall return REG_NOMATCH to indicate no match.

Upon successful completion, the *regerror()* function shall return the number of bytes needed to hold the entire generated string, including the null termination. If the return value is greater than *errbuf_size*, the string returned in the buffer pointed to by *errbuf* has been truncated.

The *regfree()* function shall not return a value.

57546 ERRORS

No errors are defined.

57548 EXAMPLES

```
57549 #include <regex.h>
57550 /*
57551  * Match string against the extended regular expression in
57552  * pattern, treating errors as no match.
57553  *
57554  * Return 1 for match, 0 for no match.
57555  */
57556 int
57557 match(const char *string, char *pattern)
57558 {
57559     int    status;
57560     regex_t re;
57561     if (regcomp(&re, pattern, REG_EXTENDED|REG_NOSUB) != 0) {
57562         return(0);        /* Report error. */
57563     }
57564     status = regexec(&re, string, (size_t) 0, NULL, 0);
57565     regfree(&re);
57566     if (status != 0) {
57567         return(0);        /* Report error. */
57568     }
57569     return(1);
57570 }
```

The following demonstrates how the REG_NOTBOL flag could be used with *regexexec()* to find all substrings in a line that match a pattern supplied by a user. (For simplicity of the example, very little error checking is done.)

```
(void) regcomp (&re, pattern, 0);
/* This call to regexexec() finds the first match on the line. */
error = regexexec (&re, &buffer[0], 1, &pm, 0);
while (error == 0) { /* While matches found. */
    /* Substring found between pm.rm_so and pm.rm_eo. */
    /* This call to regexexec() finds the next match. */
    error = regexexec (&re, buffer + pm.rm_eo, 1, &pm, REG_NOTBOL);
}
```

APPLICATION USAGE

An application could use:

```
regerror(code, preg, (char *)NULL, (size_t)0)
```

to find out how big a buffer is needed for the generated string, *malloc()* a buffer to hold the string, and then call *regerror()* again to get the string. Alternatively, it could allocate a fixed, static buffer that is big enough to hold most strings, and then use *malloc()* to allocate a larger buffer if it finds that this is too small.

To match a pattern as described in XCU [Section 2.13](#) (on page 2354), use the *fnmatch()* function.

RATIONALE

The *regexexec()* function must fill in all *nmatch* elements of *pmatch*, where *nmatch* and *pmatch* are supplied by the application, even if some elements of *pmatch* do not correspond to subexpressions in *pattern*. The application developer should note that there is probably no reason for using a value of *nmatch* that is larger than *preg->re_nsub*+1.

The REG_NEWLINE flag supports a use of RE matching that is needed in some applications like text editors. In such applications, the user supplies an RE asking the application to find a line that matches the given expression. An anchor in such an RE anchors at the beginning or end of any line. Such an application can pass a sequence of <newline>-separated lines to *regexexec()* as a single long string and specify REG_NEWLINE to *regcomp()* to get the desired behavior. The application must ensure that there are no explicit <newline> characters in *pattern* if it wants to ensure that any match occurs entirely within a single line.

The REG_NEWLINE flag affects the behavior of *regexexec()*, but it is in the *cflags* parameter to *regcomp()* to allow flexibility of implementation. Some implementations will want to generate the same compiled RE in *regcomp()* regardless of the setting of REG_NEWLINE and have *regexexec()* handle anchors differently based on the setting of the flag. Other implementations will generate different compiled REs based on the REG_NEWLINE.

The REG_ICASE flag supports the operations taken by the *grep -i* option and the historical implementations of *ex* and *vi*. Including this flag will make it easier for application code to be written that does the same thing as these utilities.

The substrings reported in *pmatch[]* are defined using offsets from the start of the string rather than pointers. This allows type-safe access to both constant and non-constant strings.

The type **regoff_t** is used for the elements of *pmatch[]* to ensure that the application can represent large arrays in memory (important for an application conforming to the Shell and Utilities volume of POSIX.1-2008).

The 1992 edition of this standard required **regoff_t** to be at least as wide as **off_t**, to facilitate future extensions in which the string to be searched is taken from a file. However, these future

extensions have not appeared. The requirement rules out popular implementations with 32-bit **regoff_t** and 64-bit **off_t**, so it has been removed.

The standard developers rejected the inclusion of a *regsub()* function that would be used to do substitutions for a matched RE. While such a routine would be useful to some applications, its utility would be much more limited than the matching function described here. Both RE parsing and substitution are possible to implement without support other than that required by the ISO C standard, but matching is much more complex than substituting. The only difficult part of substitution, given the information supplied by *regexexec()*, is finding the next character in a string when there can be multi-byte characters. That is a much larger issue, and one that needs a more general solution.

The *errno* variable has not been used for error returns to avoid filling the *errno* name space for this feature.

The interface is defined so that the matched substrings *rm_sp* and *rm_ep* are in a separate **regmatch_t** structure instead of in **regex_t**. This allows a single compiled RE to be used simultaneously in several contexts; in *main()* and a signal handler, perhaps, or in multiple threads of lightweight processes. (The *preg* argument to *regexexec()* is declared with type **const**, so the implementation is not permitted to use the structure to store intermediate results.) It also allows an application to request an arbitrary number of substrings from an RE. The number of subexpressions in the RE is reported in *re_nsub* in *preg*. With this change to *regexexec()*, consideration was given to dropping the REG_NOSUB flag since the user can now specify this with a zero *nmatch* argument to *regexexec()*. However, keeping REG_NOSUB allows an implementation to use a different (perhaps more efficient) algorithm if it knows in *regcomp()* that no subexpressions need be reported. The implementation is only required to fill in *pmatch* if *nmatch* is not zero and if REG_NOSUB is not specified. Note that the **size_t** type, as defined in the ISO C standard, is unsigned, so the description of *regexexec()* does not need to address negative values of *nmatch*.

REG_NOTBOL was added to allow an application to do repeated searches for the same pattern in a line. If the pattern contains a <circumflex> character that should match the beginning of a line, then the pattern should only match when matched against the beginning of the line. Without the REG_NOTBOL flag, the application could rewrite the expression for subsequent matches, but in the general case this would require parsing the expression. The need for REG_NOTEOL is not as clear; it was added for symmetry.

The addition of the *regerror()* function addresses the historical need for conforming application programs to have access to error information more than “Function failed to compile/match your RE for unknown reasons”.

This interface provides for two different methods of dealing with error conditions. The specific error codes (REG_EBRACE, for example), defined in <**regex.h**>, allow an application to recover from an error if it is so able. Many applications, especially those that use patterns supplied by a user, will not try to deal with specific error cases, but will just use *regerror()* to obtain a human-readable error message to present to the user.

The *regerror()* function uses a scheme similar to *confstr()* to deal with the problem of allocating memory to hold the generated string. The scheme used by *strerror()* in the ISO C standard was considered unacceptable since it creates difficulties for multi-threaded applications.

The *preg* argument is provided to *regerror()* to allow an implementation to generate a more descriptive message than would be possible with *errcode* alone. An implementation might, for example, save the character offset of the offending character of the pattern in a field of *preg*, and then include that in the generated message string. The implementation may also ignore *preg*.

A REG_FILENAME flag was considered, but omitted. This flag caused *regexexec()* to match patterns as described in XCU Section 2.13 (on page 2354) instead of REs. This service is now provided by the *fnmatch()* function.

Notice that there is a difference in philosophy between the ISO POSIX-2:1993 standard and POSIX.1-2008 in how to handle a “bad” regular expression. The ISO POSIX-2:1993 standard says that many bad constructs “produce undefined results”, or that “the interpretation is undefined”. POSIX.1-2008, however, says that the interpretation of such REs is unspecified. The term “undefined” means that the action by the application is an error, of similar severity to passing a bad pointer to a function.

The *regcomp()* and *regexexec()* functions are required to accept any null-terminated string as the *pattern* argument. If the meaning of the string is “undefined”, the behavior of the function is “unspecified”. POSIX.1-2008 does not specify how the functions will interpret the pattern; they might return error codes, or they might do pattern matching in some completely unexpected way, but they should not do something like abort the process.

FUTURE DIRECTIONS

None.

fnmatch(), *glob()*

XBD Chapter 9 (on page 181), *<regex.h>*, *<sys/types.h>*

XCUI Section 2.13 (on page 2354)

CHANGE HISTORY

First released in Issue 4. Derived from the ISO POSIX-2 standard.

Issue 5

Moved from POSIX2 C-language Binding to BASE.

Issue 6

In the SYNOPSIS, the optional include of the *<sys/types.h>* header is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include *<sys/types.h>* has been removed. Although *<sys/types.h>* was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.

The normative text is updated to avoid use of the term “must” for application requirements.

The REG_ENOSYS constant is removed.

The **restrict** keyword is added to the *regcomp()*, *regerror()*, and *regexexec()* prototypes for alignment with the ISO/IEC 9899:1999 standard.

Issue 7

Austin Group Interpretation 1003.1-2001 #134 is applied, clarifying that if more than one error occurs in processing a function call, any one of the possible constants may be returned.

SD5-XBD-ERN-60 is applied.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0505 [305] is applied.

+

57704 **NAME**

57705 remainder, remainderf, remainderl — remainder function

57706 **SYNOPSIS**

57707 #include <math.h>

57708 double remainder(double x, double y);

57709 float remainderf(float x, float y);

57710 long double remainderl(long double x, long double y);

57711 **DESCRIPTION**

57712 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 57713 conflict between the requirements described here and the ISO C standard is unintentional. This
 57714 volume of POSIX.1-2008 defers to the ISO C standard.

57715 These functions shall return the floating-point remainder $r=x-ny$ when y is non-zero. The value
 57716 n is the integral value nearest the exact value x/y . When $|n-x/y|=\frac{1}{2}$, the value n is chosen to
 57717 be even.

57718 The behavior of *remainder()* shall be independent of the rounding mode.

57719 **RETURN VALUE**

57720 Upon successful completion, these functions shall return the floating-point remainder $r=x-ny$
 57721 when y is non-zero.

57722 On systems that do not support the IEC 60559 Floating-Point option, if y is zero, it is
 57723 implementation-defined whether a domain error occurs or zero is returned.

57724 MX If x or y is NaN, a NaN shall be returned.

57725 If x is infinite or y is 0 and the other is non-NaN, a domain error shall occur, and a NaN shall be
 57726 returned.

57727 **ERRORS**

57728 These functions shall fail if:

57729 MX **Domain Error** The x argument is $\pm\text{Inf}$, or the y argument is ± 0 and the other argument is non-
 57730 NaN.

57731 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 57732 then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling*
 57733 & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
 57734 shall be raised.

57735 These functions may fail if:

57736 **Domain Error** The y argument is zero.

57737 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 57738 then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling*
 57739 & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
 57740 shall be raised.

57741 **EXAMPLES**

57742 None.

57743 **APPLICATION USAGE**

57744 On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* &
 57745 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

57746 **RATIONALE**

57747 None.

57748 **FUTURE DIRECTIONS**

57749 None.

57752 XBD Section 4.19 (on page 116), <math.h>

57753 **CHANGE HISTORY**

57754 First released in Issue 4, Version 2.

57755 **Issue 5**

57756 Moved from X/OPEN UNIX extension to BASE.

57757 **Issue 6**57758 The *remainder()* function is no longer marked as an extension.

57759 The *remainderf()* and *remainderl()* functions are added for alignment with the ISO/IEC 9899:1999
 57760 standard.

57761 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are
 57762 revised to align with the ISO/IEC 9899:1999 standard.

57763 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are
 57764 marked.

57765 **Issue 7**

57766 ISO/IEC 9899:1999 standard, Technical Corrigendum 2 #55 (SD5-XSH-ERN-82) is applied.

57767 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0506 [320] is applied.

+

57768 **NAME**

57769 remove — remove a file

57770 **SYNOPSIS**

57771 #include <stdio.h>

57772 int remove(const char *path);

57773 **DESCRIPTION**

57774 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 57775 conflict between the requirements described here and the ISO C standard is unintentional. This
 57776 volume of POSIX.1-2008 defers to the ISO C standard.

57777 The *remove()* function shall cause the file named by the pathname pointed to by *path* to be no
 57778 longer accessible by that name. A subsequent attempt to open that file using that name shall fail,
 57779 unless it is created anew.

57780 CX If *path* does not name a directory, *remove(path)* shall be equivalent to *unlink(path)*.

57781 If *path* names a directory, *remove(path)* shall be equivalent to *rmdir(path)*.

57782 **RETURN VALUE**57783 CX Refer to *rmdir()* or *unlink()*.57784 **ERRORS**57785 CX Refer to *rmdir()* or *unlink()*.57786 **EXAMPLES**57787 **Removing Access to a File**57788 The following example shows how to remove access to a file named */home/cnd/old_mods*.

57789 #include <stdio.h>

57790 int status;

57791 ...

57792 status = remove("/home/cnd/old_mods");

57793 **APPLICATION USAGE**

57794 None.

57795 **RATIONALE**

57796 None.

57797 **FUTURE DIRECTIONS**

57798 None.

57799 **SEE ALSO**57800 *rmdir()*, *unlink()*

57801 XBD <stdio.h>

57802 **CHANGE HISTORY**

57803 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard and the ISO C
 57804 standard.

57805 **Issue 6**

57806 Extensions beyond the ISO C standard are marked.

57807
57808

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

57809
57810
57811

- The DESCRIPTION, RETURN VALUE, and ERRORS sections are updated so that if *path* is not a directory, *remove()* is equivalent to *unlink()*, and if it is a directory, it is equivalent to *rmdir()*.

57812 **NAME**

57813 remque — remove an element from a queue

57814 **SYNOPSIS**

57815 XSI `#include <search.h>`

57816 `void remque(void *element);`

57817 **DESCRIPTION**

57818 Refer to *insque()*.

57819 **NAME**

57820 remquo, remquof, remquol — remainder functions

57821 **SYNOPSIS**

```
57822 #include <math.h>
57823 double remquo(double x, double y, int *quo);
57824 float remquof(float x, float y, int *quo);
57825 long double remquol(long double x, long double y, int *quo);
```

57826 **DESCRIPTION**

57827 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 57828 conflict between the requirements described here and the ISO C standard is unintentional. This
 57829 volume of POSIX.1-2008 defers to the ISO C standard.

57830 The *remquo()*, *remquof()*, and *remquol()* functions shall compute the same remainder as the
 57831 *remainder()*, *remainderf()*, and *remainderl()* functions, respectively. In the object pointed to by *quo*,
 57832 they store a value whose sign is the sign of x/y and whose magnitude is congruent modulo 2^n to
 57833 the magnitude of the integral quotient of x/y , where n is an implementation-defined integer
 57834 greater than or equal to 3. If y is zero, the value stored in the object pointed to by *quo* is
 57835 unspecified.

57836 An application wishing to check for error situations should set *errno* to zero and call
 57837 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 57838 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 57839 zero, an error has occurred.

57840 **RETURN VALUE**57841 These functions shall return $x \text{ REM } y$.

57842 On systems that do not support the IEC 60559 Floating-Point option, if y is zero, it is
 57843 implementation-defined whether a domain error occurs or zero is returned.

57844 MX If x or y is NaN, a NaN shall be returned.

57845 If x is $\pm\text{Inf}$ or y is zero and the other argument is non-NaN, a domain error shall occur, and a
 57846 NaN shall be returned.

57847 **ERRORS**

57848 These functions shall fail if:

57849 MX **Domain Error** The x argument is $\pm\text{Inf}$, or the y argument is ± 0 and the other argument is non-
 57850 NaN.

57851 If the integer expression $(\text{math\_errhandling} \ \& \ \text{MATH\_ERRNO})$ is non-zero,
 57852 then *errno* shall be set to [EDOM]. If the integer expression $(\text{math\_errhandling}$
 57853 $\ \& \ \text{MATH\_ERREXCEPT})$ is non-zero, then the invalid floating-point exception
 57854 shall be raised.

57855 These functions may fail if:

57856 **Domain Error** The y argument is zero.

57857 If the integer expression $(\text{math\_errhandling} \ \& \ \text{MATH\_ERRNO})$ is non-zero,
 57858 then *errno* shall be set to [EDOM]. If the integer expression $(\text{math\_errhandling}$
 57859 $\ \& \ \text{MATH\_ERREXCEPT})$ is non-zero, then the invalid floating-point exception
 57860 shall be raised.

57861 **EXAMPLES**

57862 None.

57863 **APPLICATION USAGE**

57864 On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* &
57865 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

57866 **RATIONALE**

57867 These functions are intended for implementing argument reductions which can exploit a few
57868 low-order bits of the quotient. Note that *x* may be so large in magnitude relative to *y* that an
57869 exact representation of the quotient is not practical.

57870 **FUTURE DIRECTIONS**

57871 None.

57874 XBD Section 4.19 (on page 116), <math.h>

57875 **CHANGE HISTORY**

57876 First released in Issue 6. Derived from the ISO/IEC 9899: 1999 standard.

57877 **Issue 7**

57878 ISO/IEC 9899: 1999 standard, Technical Corrigendum 2 #56 (SD5-XSH-ERN-83) is applied.

57879 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0507 [320] is applied. +

57880 **NAME**57881 `rename, renameat` — rename file relative to directory file descriptor57882 **SYNOPSIS**57883 `#include <stdio.h>`57884 `int rename(const char *old, const char *new);`57885 CX `int renameat(int oldfd, const char *old, int newfd,`
57886 `const char *new);`57887 **DESCRIPTION**57888 CX For `rename()`: The functionality described on this reference page is aligned with the ISO C
57889 standard. Any conflict between the requirements described here and the ISO C standard is
57890 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.57891 The `rename()` function shall change the name of a file. The *old* argument points to the pathname
57892 CX of the file to be renamed. The *new* argument points to the new pathname of the file. If the *new*
57893 argument does not resolve to an existing directory entry for a file of type directory and the *new*
57894 argument contains at least one non-`<slash>` character and ends with one or more trailing
57895 `<slash>` characters after all symbolic links have been processed, `rename()` shall fail.57896 If either the *old* or *new* argument names a symbolic link, `rename()` shall operate on the symbolic
57897 link itself, and shall not resolve the last component of the argument. If the *old* argument and the
57898 *new* argument resolve to either the same existing directory entry or different directory entries for
57899 the same existing file, `rename()` shall return successfully and perform no other action.57900 If the *old* argument points to the pathname of a file that is not a directory, the *new* argument shall
57901 not point to the pathname of a directory. If the link named by the *new* argument exists, it shall be
57902 removed and *old* renamed to *new*. In this case, a link named *new* shall remain visible to other
57903 processes throughout the renaming operation and refer either to the file referred to by *new* or *old*
57904 before the operation began. Write access permission is required for both the directory containing
57905 *old* and the directory containing *new*.57906 If the *old* argument points to the pathname of a directory, the *new* argument shall not point to the
57907 pathname of a file that is not a directory. If the directory named by the *new* argument exists, it
57908 shall be removed and *old* renamed to *new*. In this case, a link named *new* shall exist throughout
57909 the renaming operation and shall refer either to the directory referred to by *new* or *old* before the
57910 operation began. If *new* names an existing directory, it shall be required to be an empty directory.57911 If either *pathname* argument refers to a path whose final component is either dot or dot-dot,
57912 `rename()` shall fail.57913 If the *old* argument points to a pathname of a symbolic link, the symbolic link shall be renamed.
57914 If the *new* argument points to a pathname of a symbolic link, the symbolic link shall be removed.57915 The *old* pathname shall not name an ancestor directory of the *new* pathname. Write access
57916 permission is required for the directory containing *old* and the directory containing *new*. If the
57917 *old* argument points to the pathname of a directory, write access permission may be required for
57918 the directory named by *old*, and, if it exists, the directory named by *new*.57919 If the link named by the *new* argument exists and the file's link count becomes 0 when it is
57920 removed and no process has the file open, the space occupied by the file shall be freed and the
57921 file shall no longer be accessible. If one or more processes have the file open when the last link is
57922 removed, the link shall be removed before `rename()` returns, but the removal of the file contents
57923 shall be postponed until all references to the file are closed.57924 Upon successful completion, `rename()` shall mark for update the last data modification and last

57925 file status change timestamps of the parent directory of each file.

57926 If the `rename()` function fails for any reason other than [EIO], any file named by *new* shall be
 57927 unaffected.

57928 The `renameat()` function shall be equivalent to the `rename()` function except in the case where
 57929 either *old* or *new* specifies a relative path. If *old* is a relative path, the file to be renamed is located
 57930 relative to the directory associated with the file descriptor *oldfd* instead of the current working
 57931 directory. If *new* is a relative path, the same happens only relative to the directory associated
 57932 with *newfd*. If the file descriptor was opened without O_SEARCH, the function shall check
 57933 whether directory searches are permitted using the current permissions of the directory
 57934 underlying the file descriptor. If the file descriptor was opened with O_SEARCH, the function
 57935 shall not perform the check.

57936 If `renameat()` is passed the special value AT_FDCWD in the *oldfd* or *newfd* parameter, the current
 57937 working directory shall be used in the determination of the file for the respective *path* parameter.

57938 RETURN VALUE

57939 CX Upon successful completion, the `rename()` function shall return 0. Otherwise, it shall return `-1`,
 57940 `errno` shall be set to indicate the error, and neither the file named by *old* nor the file named by
 57941 *new* shall be changed or created.

57942 CX Upon successful completion, the `renameat()` function shall return 0. Otherwise, it shall return `-1`
 57943 and set `errno` to indicate the error.

57944 ERRORS

57945 CX The `rename()` and `renameat()` functions shall fail if:

57946 CX [EACCES] A component of either path prefix denies search permission; or one of the
 57947 directories containing *old* or *new* denies write permissions; or, write
 57948 permission is required and is denied for a directory pointed to by the *old* or
 57949 *new* arguments.

57950 CX [EBUSY] The directory named by *old* or *new* is currently in use by the system or another
 57951 process, and the implementation considers this an error.

57952 CX [EEXIST] or [ENOTEMPTY]
 57953 The link named by *new* is a directory that is not an empty directory.

57954 CX [EINVAL] The *old* pathname names an ancestor directory of the *new* pathname, or either
 57955 pathname argument contains a final component that is dot or dot-dot.

57956 CX [EIO] A physical I/O error has occurred.

57957 CX [EISDIR] The *new* argument points to a directory and the *old* argument points to a file
 57958 that is not a directory.

57959 CX [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*
 57960 argument.

57961 CX [EMLINK] The file named by *old* is a directory, and the link count of the parent directory
 57962 of *new* would exceed {LINK_MAX}.

57963 CX [ENAMETOOLONG]
 57964 The length of a component of a pathname is longer than {NAME_MAX}.

57965 CX [ENOENT] The link named by *old* does not name an existing file, a component of the path
 57966 prefix of *new* does not exist, or either *old* or *new* points to an empty string.

57967	CX	[ENOSPC]	The directory that would contain <i>new</i> cannot be extended.	
57968	CX	[ENOTDIR]	A component of either path prefix names an existing file that is neither a directory nor a symbolic link to a directory; or the <i>old</i> argument names a directory and the <i>new</i> argument names a non-directory file; or the <i>old</i> argument contains at least one non- <code><slash></code> character and ends with one or more trailing <code><slash></code> characters and the last pathname component names an existing file that is neither a directory nor a symbolic link to a directory; or the <i>old</i> argument names an existing non-directory file and the <i>new</i> argument names a nonexistent file, contains at least one non- <code><slash></code> character, and ends with one or more trailing <code><slash></code> characters; or the <i>new</i> argument names an existing non-directory file, contains at least one non- <code><slash></code> character, and ends with one or more trailing <code><slash></code> characters.

57972				
57973				
57974				+
57975				+
57976				
57977				
57978				
57979	XSI	[EPERM] or [EACCES]	The <code>S_ISVTX</code> flag is set on the directory containing the file referred to by <i>old</i> and the process does not satisfy the criteria specified in XBD Section 4.2 (on page 107) with respect to <i>old</i> ; or <i>new</i> refers to an existing file, the <code>S_ISVTX</code> flag is set on the directory containing this file, and the process does not satisfy the criteria specified in XBD Section 4.2 with respect to this file.	
57980				
57981				
57982				
57983				
57984				
57985	CX	[EROFS]	The requested operation requires writing in a directory on a read-only file system.	
57986				
57987	CX	[EXDEV]	The links named by <i>new</i> and <i>old</i> are on different file systems and the implementation does not support links between file systems.	
57988				
57989	CX	In addition, the <code>renameat()</code> function shall fail if:		
57990		[EACCES]	<i>oldfd</i> or <i>newfd</i> was not opened with <code>O_SEARCH</code> and the permissions of the directory underlying <i>oldfd</i> or <i>newfd</i> respectively do not permit directory searches.	
57991				
57992				
57993		[EBADF]	The <i>old</i> argument does not specify an absolute path and the <i>oldfd</i> argument is neither <code>AT_FDCWD</code> nor a valid file descriptor open for reading or searching, or the <i>new</i> argument does not specify an absolute path and the <i>newfd</i> argument is neither <code>AT_FDCWD</code> nor a valid file descriptor open for reading or searching.	
57994				
57995				
57996				
57997				
57998		[ENOTDIR]	The <i>old</i> or <i>new</i> argument is not an absolute path and <i>oldfd</i> or <i>newfd</i> , respectively, is a file descriptor associated with a non-directory file.	+
57999				
58000	CX	The <code>rename()</code> and <code>renameat()</code> functions may fail if:		
58001	OB XSR	[EBUSY]	The file named by the <i>old</i> or <i>new</i> arguments is a named STREAM.	
58002	CX	[ELOOP]	More than <code>{SYMLOOP_MAX}</code> symbolic links were encountered during resolution of the <i>path</i> argument.	
58003				
58004	CX	[ENAMETOOLONG]	The length of a pathname exceeds <code>{PATH_MAX}</code> , or pathname resolution of a symbolic link produced an intermediate result with a length that exceeds <code>{PATH_MAX}</code> .	
58005				
58006				
58007				
58008	CX	[ETXTBSY]	The file named by <i>new</i> exists and is the last directory entry to a pure procedure (shared text) file that is being executed.	
58009				

EXAMPLES**Renaming a File**

The following example shows how to rename a file named `/home/cnd/mod1` to `/home/cnd/mod2`.

```
#include <stdio.h>

int status;
...
status = rename("/home/cnd/mod1", "/home/cnd/mod2");
```

APPLICATION USAGE

Some implementations mark for update the last file status change timestamp of renamed files and some do not. Applications which make use of the last file status change timestamp may behave differently with respect to renamed files unless they are designed to allow for either behavior.

RATIONALE

This `rename()` function is equivalent for regular files to that defined by the ISO C standard. Its inclusion here expands that definition to include actions on directories and specifies behavior when the *new* parameter names a file that already exists. That specification requires that the action of the function be atomic.

One of the reasons for introducing this function was to have a means of renaming directories while permitting implementations to prohibit the use of `link()` and `unlink()` with directories, thus constraining links to directories to those made by `mkdir()`.

The specification that if *old* and *new* refer to the same file is intended to guarantee that:

```
rename("x", "x");
```

does not remove the file.

Renaming dot or dot-dot is prohibited in order to prevent cyclical file system paths.

See also the descriptions of [ENOTEMPTY] and [ENAMETOOLONG] in `rmdir()` and [EBUSY] in `unlink()`. For a discussion of [EXDEV], see `link()`.

The purpose of the `renameat()` function is to rename files in directories other than the current working directory without exposure to race conditions. Any part of the path of a file could be changed in parallel to a call to `rename()`, resulting in unspecified behavior. By opening file descriptors for the source and target directories and using the `renameat()` function it can be guaranteed that that renamed file is located correctly and the resulting file is in the desired directory.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

Issue 5

The [EBUSY] error is added to the optional part of the ERRORS section.

Issue 6

Extensions beyond the ISO C standard are marked.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The [EIO] mandatory error condition is added.
- The [ELOOP] mandatory error condition is added.
- A second [ENAMETOOLONG] is added as an optional error condition.
- The [ETXTBSY] optional error condition is added.

The following changes were made to align with the IEEE P1003.1a draft standard:

- Details are added regarding the treatment of symbolic links.
- The [ELOOP] optional error condition is added.

The normative text is updated to avoid use of the term “must” for application requirements.

Issue 7

Austin Group Interpretation 1003.1-2001 #016 is applied, changing the definition of the [ENOTDIR] error.

Austin Group Interpretation 1003.1-2001 #076 is applied, clarifying the behavior if the final component of a path is either dot or dot-dot, and adding the associated [EINVAL] error case.

Austin Group Interpretation 1003.1-2001 #143 is applied.

Austin Group Interpretation 1003.1-2001 #145 is applied, clarifying that the [ENOENT] error condition also applies to the case in which a component of *new* does not exist.

Austin Group Interpretations 1003.1-2001 #174 and #181 are applied.

The *renameat()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 2.

Changes are made related to support for finegrained timestamps.

Changes are made to allow a directory to be opened for searching.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0508 [324], XSH/TC1-2008/0509 [147], + XSH/TC1-2008/0510 [379], XSH/TC1-2008/0511 [278], and XSH/TC1-2008/0512 [278] are + applied.

58080 **NAME**

58081 rewind — reset the file position indicator in a stream

58082 **SYNOPSIS**

58083 #include <stdio.h>

58084 void rewind(FILE *stream);

58085 **DESCRIPTION**

58086 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 58087 conflict between the requirements described here and the ISO C standard is unintentional. This
 58088 volume of POSIX.1-2008 defers to the ISO C standard.

58089 The call:

58090 rewind(stream)

58091 shall be equivalent to:

58092 (void) fseek(stream, 0L, SEEK_SET)

58093 except that *rewind()* shall also clear the error indicator.

58094 CX Since *rewind()* does not return a value, an application wishing to detect errors should clear *errno*,
 58095 then call *rewind()*, and if *errno* is non-zero, assume an error has occurred.

58096 **RETURN VALUE**58097 The *rewind()* function shall not return a value.58098 **ERRORS**58099 CX Refer to *fseek()* with the exception of [EINVAL] which does not apply.58100 **EXAMPLES**

58101 None.

58102 **APPLICATION USAGE**

58103 None.

58104 **RATIONALE**

58105 None.

58106 **FUTURE DIRECTIONS**

58107 None.

58108 **SEE ALSO**58109 Section 2.5 (on page 495), *fseek()*

58110 XBD <stdio.h>

58111 **CHANGE HISTORY**

58112 First released in Issue 1. Derived from Issue 1 of the SVID.

58113 **Issue 6**

58114 Extensions beyond the ISO C standard are marked.

58115 **Issue 7**

58116 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0513 [14] is applied.

+

58117 **NAME**

58118 rewinddir — reset the position of a directory stream to the beginning of a directory

58119 **SYNOPSIS**

58120 #include <dirent.h>

58121 void rewinddir(DIR *dirp);

58122 **DESCRIPTION**

58123 The *rewinddir()* function shall reset the position of the directory stream to which *dirp* refers to the
 58124 beginning of the directory. It shall also cause the directory stream to refer to the current state of
 58125 the corresponding directory, as a call to *opendir()* would have done. If *dirp* does not refer to a
 58126 directory stream, the effect is undefined.

58127 After a call to the *fork()* function, either the parent or child (but not both) may continue
 58128 XSI processing the directory stream using *readdir()*, *rewinddir()*, or *seekdir()*. If both the parent and
 58129 child processes use these functions, the result is undefined.

58130 **RETURN VALUE**58131 The *rewinddir()* function shall not return a value.58132 **ERRORS**

58133 No errors are defined.

58134 **EXAMPLES**

58135 None.

58136 **APPLICATION USAGE**

58137 The *rewinddir()* function should be used in conjunction with *opendir()*, *readdir()*, and *closedir()* to
 58138 examine the contents of the directory. This method is recommended for portability.

58139 **RATIONALE**

58140 None.

58141 **FUTURE DIRECTIONS**

58142 None.

58143 **SEE ALSO**58144 *closedir()*, *fdopendir()*, *readdir()*

58145 XBD <dirent.h>, <sys/types.h>

58146 **CHANGE HISTORY**

58147 First released in Issue 2.

58148 **Issue 6**

58149 In the SYNOPSIS, the optional include of the <sys/types.h> header is removed.

58150 The following new requirements on POSIX implementations derive from alignment with the
 58151 Single UNIX Specification:

- 58152 • The requirement to include <sys/types.h> has been removed. Although <sys/types.h> was
 58153 required for conforming implementations of previous POSIX specifications, it was not
 58154 required for UNIX applications.

58155 **NAME**

58156 rint, rintf, rintl — round-to-nearest integral value

58157 **SYNOPSIS**

```
58158 #include <math.h>
58159 double rint(double x);
58160 float rintf(float x);
58161 long double rintl(long double x);
```

58162 **DESCRIPTION**

58163 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 58164 conflict between the requirements described here and the ISO C standard is unintentional. This
 58165 volume of POSIX.1-2008 defers to the ISO C standard.

58166 These functions shall return the integral value (represented as a **double**) nearest x in the
 58167 direction of the current rounding mode. The current rounding mode is implementation-defined.

58168 If the current rounding mode rounds toward negative infinity, then *rint()* shall be equivalent to
 58169 *floor()*. If the current rounding mode rounds toward positive infinity, then *rint()* shall be
 58170 equivalent to *ceil()*. If the current rounding mode rounds towards zero, then *rint()* shall be
 58171 MX equivalent to *trunc()*. If the current rounding mode rounds towards nearest, then *rint()* differs
 58172 from *round()* in that halfway cases are rounded to even rather than away from zero.

58173 These functions differ from the *nearbyint()*, *nearbyintf()*, and *nearbyintl()* functions only in that
 58174 they may raise the inexact floating-point exception if the result differs in value from the
 58175 argument.

58176 An application wishing to check for error situations should set *errno* to zero and call
 58177 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 58178 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 58179 zero, an error has occurred.

58180 **RETURN VALUE**

58181 Upon successful completion, these functions shall return the integer (represented as a double
 58182 MX precision number) nearest x in the direction of the current rounding mode. The result shall have
 58183 the same sign as x .

58184 MX If x is NaN, a NaN shall be returned.

58185 If x is ± 0 or $\pm \text{Inf}$, x shall be returned.

58186 **ERRORS**

58187 No errors are defined.

58188 **EXAMPLES**

58189 None.

58190 **APPLICATION USAGE**

58191 The integral value returned by these functions need not be expressible as an **intmax_t**. The
 58192 return value should be tested before assigning it to an integer type to avoid the undefined
 58193 results of an integer overflow.

58194 **RATIONALE**

58195 None.

58196 **FUTURE DIRECTIONS**

58197 None.

58198 **SEE ALSO**58199 *abs()*, *ceil()*, *feclearexcept()*, *fetestexcept()*, *floor()*, *isnan()*, *nearbyint()*58200 XBD [Section 4.19](#) (on page 116), **<math.h>**58201 **CHANGE HISTORY**

58202 First released in Issue 4, Version 2.

58203 **Issue 5**

58204 Moved from X/OPEN UNIX extension to BASE.

58205 **Issue 6**

58206 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- 58207 • The *rintf()* and *rintl()* functions are added.
- 58208 • The *rint()* function is no longer marked as an extension.
- 58209 • The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are
- 58210 revised to align with the ISO/IEC 9899:1999 standard.
- 58211 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard
- 58212 are marked.

58213 **Issue 7**

58214 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0514 [346], XSH/TC1-2008/0515 [346], +
 58215 XSH/TC1-2008/0516 [346], XSH/TC1-2008/0517 [346], and XSH/TC1-2008/0518 [346] are +
 58216 applied.

NAME

rmdir — remove a directory

SYNOPSIS

```
#include <unistd.h>
```

```
int rmdir(const char *path);
```

DESCRIPTION

The *rmdir()* function shall remove a directory whose name is given by *path*. The directory shall be removed only if it is an empty directory.

If the directory is the root directory or the current working directory of any process, it is unspecified whether the function succeeds, or whether it shall fail and set *errno* to [EBUSY].

If *path* names a symbolic link, then *rmdir()* shall fail and set *errno* to [ENOTDIR].

If the *path* argument refers to a path whose final component is either dot or dot-dot, *rmdir()* shall fail.

If the directory's link count becomes 0 and no process has the directory open, the space occupied by the directory shall be freed and the directory shall no longer be accessible. If one or more processes have the directory open when the last link is removed, the dot and dot-dot entries, if present, shall be removed before *rmdir()* returns and no new entries may be created in the directory, but the directory shall not be removed until all references to the directory are closed.

If the directory is not an empty directory, *rmdir()* shall fail and set *errno* to [EEXIST] or [ENOTEMPTY].

Upon successful completion, *rmdir()* shall mark for update the last data modification and last file status change timestamps of the parent directory.

RETURN VALUE

Upon successful completion, the function *rmdir()* shall return 0. Otherwise, -1 shall be returned, and *errno* set to indicate the error. If -1 is returned, the named directory shall not be changed.

ERRORS

The *rmdir()* function shall fail if:

[EACCES] Search permission is denied on a component of the path prefix, or write permission is denied on the parent directory of the directory to be removed.

[EBUSY] The directory to be removed is currently in use by the system or some process and the implementation considers this to be an error.

[EEXIST] or [ENOTEMPTY]

The *path* argument names a directory that is not an empty directory, or there are hard links to the directory other than dot or a single entry in dot-dot.

[EINVAL] The *path* argument contains a last component that is dot.

[EIO] A physical I/O error has occurred.

[ELOOP] A loop exists in symbolic links encountered during resolution of the *path* argument.

[ENAMETOOLONG]

The length of a component of a pathname is longer than {NAME_MAX}.

[ENOENT] A component of *path* does not name an existing file, or the *path* argument names a nonexistent directory or points to an empty string.

58259 [ENOTDIR] A component of *path* names an existing file that is neither a directory nor a
 58260 symbolic link to a directory.

58261 XSI [EPERM] or [EACCES]
 58262 The S_ISVTX flag is set on the directory containing the file referred to by the
 58263 *path* argument and the process does not satisfy the criteria specified in XBD
 58264 [Section 4.2](#) (on page 107).

58265 [EROFS] The directory entry to be removed resides on a read-only file system.

58266 The `rmdir()` function may fail if:

58267 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
 58268 resolution of the *path* argument.

58269 [ENAMETOOLONG]
 58270 The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a
 58271 symbolic link produced an intermediate result with a length that exceeds
 58272 {PATH_MAX}.

58273 EXAMPLES

58274 Removing a Directory

58275 The following example shows how to remove a directory named `/home/cnd/mod1`.

```
58276 #include <unistd.h>
58277 int status;
58278 ...
58279 status = rmdir("/home/cnd/mod1");
```

58280 APPLICATION USAGE

58281 None.

58282 RATIONALE

58283 The `rmdir()` and `rename()` functions originated in 4.2 BSD, and they used [ENOTEMPTY] for the
 58284 condition when the directory to be removed does not exist or *new* already exists. When the 1984
 58285 /usr/group standard was published, it contained [EEXIST] instead. When these functions were
 58286 adopted into System V, the 1984 /usr/group standard was used as a reference. Therefore,
 58287 several existing applications and implementations support/use both forms, and no agreement
 58288 could be reached on either value. All implementations are required to supply both [EEXIST] and
 58289 [ENOTEMPTY] in `<errno.h>` with distinct values, so that applications can use both values in C-
 58290 language **case** statements.

58291 The meaning of deleting *pathname/dot* is unclear, because the name of the file (directory) in the
 58292 parent directory to be removed is not clear, particularly in the presence of multiple links to a
 58293 directory.

58294 The POSIX.1-1990 standard was silent with regard to the behavior of `rmdir()` when there are
 58295 multiple hard links to the directory being removed. The requirement to set *errno* to [EEXIST] or
 58296 [ENOTEMPTY] clarifies the behavior in this case.

58297 If the current working directory of the process is being removed, that should be an allowed
 58298 error.

58299 Virtually all existing implementations detect [ENOTEMPTY] or the case of dot-dot. The text in
 58300 [Section 2.3](#) (on page 481) about returning any one of the possible errors permits that behavior to
 58301 continue. The [ELOOP] error may be returned if more than {SYMLOOP_MAX} symbolic links

58302 are encountered during resolution of the *path* argument.

58303 FUTURE DIRECTIONS

58304 None.

58305 SEE ALSO

58306 [Section 2.3](#) (on page 481), *mkdir()*, *remove()*, *rename()*, *unlink()*

58307 XBD [Section 4.2](#) (on page 107), [<unistd.h>](#)

58308 CHANGE HISTORY

58309 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

58310 Issue 6

58311 The following new requirements on POSIX implementations derive from alignment with the
58312 Single UNIX Specification:

- 58313 • The DESCRIPTION is updated to indicate the results of naming a symbolic link in *path*.
- 58314 • The [EIO] mandatory error condition is added.
- 58315 • The [ELOOP] mandatory error condition is added.
- 58316 • A second [ENAMETOOLONG] is added as an optional error condition.

58317 The following changes were made to align with the IEEE P1003.1a draft standard:

- 58318 • The [ELOOP] optional error condition is added.

58319 Issue 7

58320 Austin Group Interpretation 1003.1-2001 #143 is applied.

58321 Austin Group Interpretation 1003.1-2001 #181 is applied, updating the requirements for
58322 operations when the S_ISVTX bit is set.

58323 Changes are made related to support for finegrained timestamps.

58324 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0519 [324] is applied.

+

58325 **NAME**

58326 round, roundf, roundl — round to the nearest integer value in a floating-point format

58327 **SYNOPSIS**

```
58328 #include <math.h>
58329 double round(double x);
58330 float roundf(float x);
58331 long double roundl(long double x);
```

58332 **DESCRIPTION**

58333 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 58334 conflict between the requirements described here and the ISO C standard is unintentional. This
 58335 volume of POSIX.1-2008 defers to the ISO C standard.

58336 These functions shall round their argument to the nearest integer value in floating-point format,
 58337 rounding halfway cases away from zero, regardless of the current rounding direction. -

58338 **RETURN VALUE**

58339 MX Upon successful completion, these functions shall return the rounded integer value. The result
 58340 shall have the same sign as x . +

58341 MX If x is NaN, a NaN shall be returned.

58342 If x is ± 0 or $\pm \text{Inf}$, x shall be returned. -

58343 **ERRORS**

58344 No errors are defined. |

58345 **EXAMPLES**

58346 None.

58347 **APPLICATION USAGE**

58348 The integral value returned by these functions need not be expressible as an `intmax_t`. The
 58349 return value should be tested before assigning it to an integer type to avoid the undefined
 58350 results of an integer overflow. |

58351 These functions may raise the inexact floating-point exception if the result differs in value from
 58352 the argument. |

58353 **RATIONALE**

58354 None.

58355 **FUTURE DIRECTIONS**

58356 None.

58357 **SEE ALSO**

58358 [*feclearexcept\(\)*](#), [*fetestexcept\(\)*](#)

58359 XBD [Section 4.19](#) (on page 116), [`<math.h>`](#)

58360 **CHANGE HISTORY**

58361 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

58362 **Issue 7**

58363 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0520 [346] is applied. +

58364 **NAME**

58365 scalbln, scalblnf, scalblnl, scalbn, scalbnf, scalbnl — compute exponent using FLT_RADIX

58366 **SYNOPSIS**

```
58367 #include <math.h>
58368 double scalbln(double x, long n);
58369 float scalblnf(float x, long n);
58370 long double scalblnl(long double x, long n);
58371 double scalbn(double x, int n);
58372 float scalbnf(float x, int n);
58373 long double scalbnl(long double x, int n);
```

58374 **DESCRIPTION**

58375 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 58376 conflict between the requirements described here and the ISO C standard is unintentional. This
 58377 volume of POSIX.1-2008 defers to the ISO C standard.

58378 These functions shall compute $x * \text{FLT\_RADIX}^n$ efficiently, not normally by computing
 58379 FLT_RADIX^n explicitly.

58380 An application wishing to check for error situations should set *errno* to zero and call
 58381 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 58382 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 58383 zero, an error has occurred.

58384 **RETURN VALUE**

58385 Upon successful completion, these functions shall return $x * \text{FLT\_RADIX}^n$.

58386 If the result would cause overflow, a range error shall occur and these functions shall return
 58387 $\pm\text{HUGE\_VAL}$, $\pm\text{HUGE\_VALF}$, and $\pm\text{HUGE\_VALL}$ (according to the sign of *x*) as appropriate for
 58388 the return type of the function.

58389 MXX If the correct value would cause underflow, and is not representable, a range error may occur, |
 58390 MXX and *scalbln*(), *scalblnf*(), *scalblnl*(), *scalbn*(), *scalbnf*(), and *scalbnl*() shall return 0.0, or (if IEC |
 58391 60559 Floating-Point is not supported) an implementation-defined value no greater in |
 58392 magnitude than DBL_MIN, FLT_MIN, LDBL_MIN, DBL_MIN, FLT_MIN, and LDBL_MIN, |
 58393 respectively.

58394 MX If *x* is NaN, a NaN shall be returned.

58395 If *x* is ± 0 or $\pm\text{Inf}$, *x* shall be returned.

58396 If *n* is 0, *x* shall be returned.

58397 MXX If the correct value would cause underflow, and is representable, a range error may occur and
 58398 the correct value shall be returned.

58399 **ERRORS**

58400 These functions shall fail if:

58401 Range Error The result overflows.

58402 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 58403 then *errno* shall be set to [ERANGE]. If the integer expression
 58404 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the overflow
 58405 floating-point exception shall be raised.

58406 These functions may fail if:

58407 Range Error The result underflows.

58408 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 58409 then *errno* shall be set to [ERANGE]. If the integer expression
 58410 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the underflow
 58411 floating-point exception shall be raised.

58412 EXAMPLES

58413 None.

58414 APPLICATION USAGE

58415 On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* &
 58416 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

58417 RATIONALE

58418 These functions are named so as to avoid conflicting with the historical definition of the *scalb()*
 58419 function from the Single UNIX Specification. The difference is that the *scalb()* function has a
 58420 second argument of **double** instead of **int**. The *scalb()* function is not part of the ISO C standard.
 58421 The three functions whose second type is **long** are provided because the factor required to scale
 58422 from the smallest positive floating-point value to the largest finite one, on many
 58423 implementations, is too large to represent in the minimum-width **int** format.

58424 FUTURE DIRECTIONS

58425 None.

NAME

sched_get_priority_max, sched_get_priority_min — get priority limits (**REALTIME**)

SYNOPSIS

```
PS|TPS    #include <sched.h>

int sched_get_priority_max(int policy);
int sched_get_priority_min(int policy);
```

DESCRIPTION

The *sched_get_priority_max()* and *sched_get_priority_min()* functions shall return the appropriate maximum or minimum, respectively, for the scheduling policy specified by *policy*.

The value of *policy* shall be one of the scheduling policy values defined in **<sched.h>**.

RETURN VALUE

If successful, the *sched_get_priority_max()* and *sched_get_priority_min()* functions shall return the appropriate maximum or minimum values, respectively. If unsuccessful, they shall return a value of -1 and set *errno* to indicate the error.

ERRORS

The *sched_get_priority_max()* and *sched_get_priority_min()* functions shall fail if:

[EINVAL]	The value of the <i>policy</i> parameter does not represent a defined scheduling policy.

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6

These functions are marked as part of the Process Scheduling option.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Process Scheduling option.

The [ESRCH] error condition has been removed since these functions do not take a *pid* argument.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/52 is applied, changing the PS margin code in the SYNOPSIS to PS|TPS.

NAME

sched_getparam — get scheduling parameters (**REALTIME**)

SYNOPSIS

```
#include <sched.h>

int sched_getparam(pid_t pid, struct sched_param *param);
```

DESCRIPTION

The *sched_getparam()* function shall return the scheduling parameters of a process specified by *pid* in the **sched_param** structure pointed to by *param*.

If a process specified by *pid* exists, and if the calling process has permission, the scheduling parameters for the process whose process ID is equal to *pid* shall be returned.

If *pid* is zero, the scheduling parameters for the calling process shall be returned. The behavior of the *sched_getparam()* function is unspecified if the value of *pid* is negative.

RETURN VALUE

Upon successful completion, the *sched_getparam()* function shall return zero. If the call to *sched_getparam()* is unsuccessful, the function shall return a value of -1 and set *errno* to indicate the error.

ERRORS

The *sched_getparam()* function shall fail if:

[EPERM] The requesting process does not have permission to obtain the scheduling parameters of the specified process.

[ESRCH] No process can be found corresponding to that specified by *pid*.

NAME

sched_getscheduler — get scheduling policy (**REALTIME**)

SYNOPSIS

```
#include <sched.h>

int sched_getscheduler(pid_t pid);
```

DESCRIPTION

The *sched_getscheduler()* function shall return the scheduling policy of the process specified by *pid*. If the value of *pid* is negative, the behavior of the *sched_getscheduler()* function is unspecified.

The values that can be returned by *sched_getscheduler()* are defined in the **<sched.h>** header.

If a process specified by *pid* exists, and if the calling process has permission, the scheduling policy shall be returned for the process whose process ID is equal to *pid*.

If *pid* is zero, the scheduling policy shall be returned for the calling process.

RETURN VALUE

Upon successful completion, the *sched_getscheduler()* function shall return the scheduling policy of the specified process. If unsuccessful, the function shall return -1 and set *errno* to indicate the error.

ERRORS

The *sched_getscheduler()* function shall fail if:

[EPERM]	The requesting process does not have permission to determine the scheduling policy of the specified process.
[ESRCH]	No process can be found corresponding to that specified by <i>pid</i> .

NAME

sched_rr_get_interval — get execution time limits (**REALTIME**)

SYNOPSIS

```
PS|TPS    #include <sched.h>
```

```
int sched_rr_get_interval(pid_t pid, struct timespec *interval);
```

DESCRIPTION

The *sched_rr_get_interval()* function shall update the **timespec** structure referenced by the *interval* argument to contain the current execution time limit (that is, time quantum) for the process specified by *pid*. If *pid* is zero, the current execution time limit for the calling process shall be returned.

RETURN VALUE

If successful, the *sched_rr_get_interval()* function shall return zero. Otherwise, it shall return a value of -1 and set *errno* to indicate the error.

ERRORS

The *sched_rr_get_interval()* function shall fail if:

[ESRCH] No process can be found corresponding to that specified by *pid*.

NAME

sched_setparam — set scheduling parameters (**REALTIME**)

SYNOPSIS

```

#include <sched.h>

int sched_setparam(pid_t pid, const struct sched_param *param);

```

DESCRIPTION

The *sched_setparam()* function shall set the scheduling parameters of the process specified by *pid* to the values specified by the **sched_param** structure pointed to by *param*. The value of the *sched_priority* member in the **sched_param** structure shall be any integer within the inclusive priority range for the current scheduling policy of the process specified by *pid*. Higher numerical values for the priority represent higher priorities. If the value of *pid* is negative, the behavior of the *sched_setparam()* function is unspecified.

If a process specified by *pid* exists, and if the calling process has permission, the scheduling parameters shall be set for the process whose process ID is equal to *pid*.

If *pid* is zero, the scheduling parameters shall be set for the calling process.

The conditions under which one process has permission to change the scheduling parameters of another process are implementation-defined.

Implementations may require the requesting process to have appropriate privileges to set its own scheduling parameters or those of another process.

See [Scheduling Policies](#) (on page 506) for a description on how this function affects the scheduling of the threads within the target process.

If the current scheduling policy for the target process is not **SCHED_FIFO**, **SCHED_RR**, or **SCHED_SPORADIC**, the result is implementation-defined; this case includes the **SCHED_OTHER** policy.

The specified *sched_ss_repl_period* shall be greater than or equal to the specified *sched_ss_init_budget* for the function to succeed; if it is not, then the function shall fail.

The value of *sched_ss_max_repl* shall be within the inclusive range [1,{**SS_REPL_MAX**}] for the function to succeed; if not, the function shall fail. It is unspecified whether the *sched_ss_repl_period* and *sched_ss_init_budget* values are stored as provided by this function or are rounded to align with the resolution of the clock being used.

This function is not atomic with respect to other threads in the process. Threads may continue to execute while this function call is in the process of changing the scheduling policy for the underlying kernel-scheduled entities used by the process contention scope threads.

RETURN VALUE

If successful, the *sched_setparam()* function shall return zero.

If the call to *sched_setparam()* is unsuccessful, the priority shall remain unchanged, and the function shall return a value of **-1** and set *errno* to indicate the error.

ERRORS

The *sched_setparam()* function shall fail if:

[EINVAL] One or more of the requested scheduling parameters is outside the range defined for the scheduling policy of the specified *pid*.

58644 [EPERM] The requesting process does not have permission to set the scheduling
 58645 parameters for the specified process, or does not have appropriate privileges
 58646 to invoke *sched_setparam()*.

58647 [ESRCH] No process can be found corresponding to that specified by *pid*.

58660 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

58661 Issue 6

58662 The *sched_setparam()* function is marked as part of the Process Scheduling option.

58663 The [ENOSYS] error condition has been removed as stubs need not be provided if an
 58664 implementation does not support the Process Scheduling option.

58665 The following new requirements on POSIX implementations derive from alignment with the
 58666 Single UNIX Specification:

58667 • In the DESCRIPTION, the effect of this function on a thread's scheduling parameters is
 58668 added.

58669 • Sections describing two-level scheduling and atomicity of the function are added.

58670 The SCHED_SPORADIC scheduling policy is added for alignment with IEEE Std 1003.1d-1999.

58671 IEEE PASC Interpretation 1003.1 #100 is applied.

58672 Issue 7

58673 Austin Group Interpretation 1003.1-2001 #061 is applied, updating the DESCRIPTION.

58674 Austin Group Interpretation 1003.1-2001 #119 is applied, clarifying the accuracy requirements
 58675 for the *sched_ss_repl_period* and *sched_ss_init_budget* values.

NAME

sched_setscheduler — set scheduling policy and parameters (**REALTIME**)

SYNOPSIS

```
#include <sched.h>

int sched_setscheduler(pid_t pid, int policy,
    const struct sched_param *param);
```

DESCRIPTION

The *sched_setscheduler()* function shall set the scheduling policy and scheduling parameters of the process specified by *pid* to *policy* and the parameters specified in the **sched_param** structure pointed to by *param*, respectively. The value of the *sched_priority* member in the **sched_param** structure shall be any integer within the inclusive priority range for the scheduling policy specified by *policy*. If the value of *pid* is negative, the behavior of the *sched_setscheduler()* function is unspecified.

The possible values for the *policy* parameter are defined in the **<sched.h>** header.

If a process specified by *pid* exists, and if the calling process has permission, the scheduling policy and scheduling parameters shall be set for the process whose process ID is equal to *pid*.

If *pid* is zero, the scheduling policy and scheduling parameters shall be set for the calling process.

The conditions under which one process has appropriate privileges to change the scheduling parameters of another process are implementation-defined.

Implementations may require that the requesting process have permission to set its own scheduling parameters or those of another process. Additionally, implementation-defined restrictions may apply as to the appropriate privileges required to set the scheduling policy of the process, or the scheduling policy of another process, to a particular value.

The *sched_setscheduler()* function shall be considered successful if it succeeds in setting the scheduling policy and scheduling parameters of the process specified by *pid* to the values specified by *policy* and the structure pointed to by *param*, respectively.

See [Scheduling Policies](#) (on page 506) for a description on how this function affects the scheduling of the threads within the target process.

SS If the current scheduling policy for the target process is not SCHED_FIFO, SCHED_RR, or SCHED_SPORADIC, the result is implementation-defined; this case includes the SCHED_OTHER policy.

SS The specified *sched_ss_repl_period* shall be greater than or equal to the specified *sched_ss_init_budget* for the function to succeed; if it is not, then the function shall fail.

The value of *sched_ss_max_repl* shall be within the inclusive range [1,{SS_REPL_MAX}] for the function to succeed; if not, the function shall fail. It is unspecified whether the *sched_ss_repl_period* and *sched_ss_init_budget* values are stored as provided by this function or are rounded to align with the resolution of the clock being used.

This function is not atomic with respect to other threads in the process. Threads may continue to execute while this function call is in the process of changing the scheduling policy and associated scheduling parameters for the underlying kernel-scheduled entities used by the process contention scope threads.

RETURN VALUE

Upon successful completion, the function shall return the former scheduling policy of the specified process. If the *sched_setscheduler()* function fails to complete successfully, the policy and scheduling parameters shall remain unchanged, and the function shall return a value of -1 and set *errno* to indicate the error.

ERRORS

The *sched_setscheduler()* function shall fail if:

- [EINVAL] The value of the *policy* parameter is invalid, or one or more of the parameters contained in *param* is outside the valid range for the specified scheduling policy.
- [EPERM] The requesting process does not have permission to set either or both of the scheduling parameters or the scheduling policy of the specified process.
- [ESRCH] No process can be found corresponding to that specified by *pid*.

EXAMPLES

None.

APPLICATION USAGE

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6

The *sched_setscheduler()* function is marked as part of the Process Scheduling option.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Process Scheduling option.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In the DESCRIPTION, the effect of this function on a thread's scheduling parameters is added.
- Sections describing two-level scheduling and atomicity of the function are added.

The SCHED_SPORADIC scheduling policy is added for alignment with IEEE Std 1003.1d-1999.

Issue 7

Austin Group Interpretation 1003.1-2001 #061 is applied, updating the DESCRIPTION.

Austin Group Interpretation 1003.1-2001 #119 is applied, clarifying the accuracy requirements for the *sched_ss_repl_period* and *sched_ss_init_budget* values.

58758 **NAME**

58759 sched_yield — yield the processor

58760 **SYNOPSIS**

58761 #include <sched.h>

58762 int sched_yield(void);

58763 **DESCRIPTION**

58764 The *sched_yield()* function shall force the running thread to relinquish the processor until it again
58765 becomes the head of its thread list. It takes no arguments.

58766 **RETURN VALUE**

58767 The *sched_yield()* function shall return 0 if it completes successfully; otherwise, it shall return a
58768 value of -1 and set *errno* to indicate the error.

58769 **ERRORS**

58770 No errors are defined.

58771 **EXAMPLES**

58772 None.

58773 **APPLICATION USAGE**

58774 The conceptual model for scheduling semantics in POSIX.1-2008 defines a set of thread lists. This
58775 set of thread lists is always present regardless of the scheduling options supported by the
58776 system. On a system where the Process Scheduling option is not supported, portable
58777 applications should not make any assumptions regarding whether threads from other processes
58778 will be on the same thread list.

58779 **RATIONALE**

58780 None.

58781 **FUTURE DIRECTIONS**

58782 None.

58783 **SEE ALSO**

58784 XBD [<sched.h>](#)

58785 **CHANGE HISTORY**

58786 First released in Issue 5. Included for alignment with the POSIX Realtime Extension and the
58787 POSIX Threads Extension.

58788 **Issue 6**

58789 The *sched_yield()* function is now marked as part of the Process Scheduling and Threads options.

58790 **Issue 7**

58791 SD5-XSH-ERN-120 is applied, adding APPLICATION USAGE.

58792 The *sched_yield()* function is moved to the Base.

58793 **NAME**

58794 seed48 — seed a uniformly distributed pseudo-random non-negative long integer generator

58795 **SYNOPSIS**58796 XSI `#include <stdlib.h>`58797 `unsigned short *seed48(unsigned short seed16v[3]);`58798 **DESCRIPTION**58799 Refer to *drand48()*.

NAME

seekdir — set the position of a directory stream

SYNOPSIS

```
XSI      #include <dirent.h>
void seekdir(DIR *dirp, long loc);
```

DESCRIPTION

The *seekdir()* function shall set the position of the next *readdir()* operation on the directory stream specified by *dirp* to the position specified by *loc*. The value of *loc* should have been returned from an earlier call to *telldir()* using the same directory stream. The new position reverts to the one associated with the directory stream when *telldir()* was performed.

If the value of *loc* was not obtained from an earlier call to *telldir()*, or if a call to *rewinddir()* occurred between the call to *telldir()* and the call to *seekdir()*, the results of subsequent calls to *readdir()* are unspecified.

RETURN VALUE

The *seekdir()* function shall not return a value.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

The original standard developers perceived that there were restrictions on the use of the *seekdir()* and *telldir()* functions related to implementation details, and for that reason these functions need not be supported on all POSIX-conforming systems. They are required on implementations supporting the XSI option.

One of the perceived problems of implementation is that returning to a given point in a directory is quite difficult to describe formally, in spite of its intuitive appeal, when systems that use B-trees, hashing functions, or other similar mechanisms to order their directories are considered. The definition of *seekdir()* and *telldir()* does not specify whether, when using these interfaces, a given directory entry will be seen at all, or more than once.

On systems not supporting these functions, their capability can sometimes be accomplished by saving a filename found by *readdir()* and later using *rewinddir()* and a loop on *readdir()* to relocate the position from which the filename was saved.

FUTURE DIRECTIONS

None.

SEE ALSO

fdopendir(), *readdir()*, *telldir()*

XBD *<dirent.h>*, *<sys/types.h>*

CHANGE HISTORY

First released in Issue 2.

58841 **Issue 6**

58842 In the SYNOPSIS, the inclusion of `<sys/types.h>` is no longer required.

58843 **Issue 7**

58844 SD5-XSH-ERN-200 is applied, updating the DESCRIPTION to note that the value of *loc* should
58845 have been returned from an earlier call to *telldir()* using the same directory stream.

58846 NAME

58847 select — synchronous I/O multiplexing

58848 SYNOPSIS

```
58849       #include <sys/select.h>

58850       int select(int nfds, fd_set *restrict readfds,
58851                fd_set *restrict writefds, fd_set *restrict errorfds,
58852                struct timeval *restrict timeout);
```

58853 DESCRIPTION

58854 Refer to *pselect()*.

58855 NAME

58856 sem_close — close a named semaphore

58857 SYNOPSIS

```
58858 #include <semaphore.h>
58859 int sem_close(sem_t *sem);
```

58860 DESCRIPTION

58861 The *sem_close()* function shall indicate that the calling process is finished using the named
 58862 semaphore indicated by *sem*. The effects of calling *sem_close()* for an unnamed semaphore (one
 58863 created by *sem_init()*) are undefined. The *sem_close()* function shall deallocate (that is, make
 58864 available for reuse by a subsequent *sem_open()* by this process) any system resources allocated
 58865 by the system for use by this process for this semaphore. The effect of subsequent use of the
 58866 semaphore indicated by *sem* by this process is undefined. If the semaphore has not been
 58867 removed with a successful call to *sem_unlink()*, then *sem_close()* has no effect on the state of the
 58868 semaphore. If the *sem_unlink()* function has been successfully invoked for *name* after the most
 58869 recent call to *sem_open()* with O_CREAT for this semaphore, then when all processes that have
 58870 opened the semaphore close it, the semaphore is no longer accessible.

58871 RETURN VALUE

58872 Upon successful completion, a value of zero shall be returned. Otherwise, a value of -1 shall be
 58873 returned and *errno* set to indicate the error.

58874 ERRORS

58875 The *sem_close()* function may fail if:

58876 [EINVAL] The *sem* argument is not a valid semaphore descriptor.

58877 EXAMPLES

58878 None.

58879 APPLICATION USAGE

58880 None.

58881 RATIONALE

58882 None.

58883 FUTURE DIRECTIONS

58884 None.

58888 CHANGE HISTORY

58889 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

58890 Issue 6

58891 The *sem_close()* function is marked as part of the Semaphores option.

58892 The [ENOSYS] error condition has been removed as stubs need not be provided if an
 58893 implementation does not support the Semaphores option.

58894 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/113 is applied, updating the ERRORS
 58895 section so that the [EINVAL] error becomes optional.

58896 **Issue 7**

58897 The *sem_close()* function is moved from the Semaphores option to the Base.

58898 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0523 [37] is applied.

+

58899 NAME

58900 sem_destroy — destroy an unnamed semaphore

58901 SYNOPSIS

```
58902 #include <semaphore.h>
58903 int sem_destroy(sem_t *sem);
```

58904 DESCRIPTION

58905 The *sem_destroy()* function shall destroy the unnamed semaphore indicated by *sem*. Only a
 58906 semaphore that was created using *sem_init()* may be destroyed using *sem_destroy()*; the effect of
 58907 calling *sem_destroy()* with a named semaphore is undefined. The effect of subsequent use of the
 58908 semaphore *sem* is undefined until *sem* is reinitialized by another call to *sem_init()*.

58909 It is safe to destroy an initialized semaphore upon which no threads are currently blocked. The
 58910 effect of destroying a semaphore upon which other threads are currently blocked is undefined.

58911 RETURN VALUE

58912 Upon successful completion, a value of zero shall be returned. Otherwise, a value of -1 shall be
 58913 returned and *errno* set to indicate the error.

58914 ERRORS

58915 The *sem_destroy()* function may fail if:

58916	[EINVAL]	The <i>sem</i> argument is not a valid semaphore.
58917	[EBUSY]	There are currently processes blocked on the semaphore.

58918 EXAMPLES

58919 None.

58928 XBD [<semaphore.h>](#)

58929 CHANGE HISTORY

58930 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

58931 Issue 6

58932 The *sem_destroy()* function is marked as part of the Semaphores option.

58933 The [ENOSYS] error condition has been removed as stubs need not be provided if an
 58934 implementation does not support the Semaphores option.

58935 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/114 is applied, updating the ERRORS
 58936 section so that the [EINVAL] error becomes optional.

58937 Issue 7

58938 The *sem_destroy()* function is moved from the Semaphores option to the Base.

58939 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0524 [37] is applied.

58940 **NAME**

58941 sem_getvalue — get the value of a semaphore

58942 **SYNOPSIS**

58943 #include <semaphore.h>

58944 int sem_getvalue(sem_t *restrict sem, int *restrict sval);

58945 **DESCRIPTION**

58946 The *sem_getvalue()* function shall update the location referenced by the *sval* argument to have
58947 the value of the semaphore referenced by *sem* without affecting the state of the semaphore. The
58948 updated value represents an actual semaphore value that occurred at some unspecified time
58949 during the call, but it need not be the actual value of the semaphore when it is returned to the
58950 calling process.

58951 If *sem* is locked, then the object to which *sval* points shall either be set to zero or to a negative
58952 number whose absolute value represents the number of processes waiting for the semaphore at
58953 some unspecified time during the call.

58954 **RETURN VALUE**

58955 Upon successful completion, the *sem_getvalue()* function shall return a value of zero. Otherwise,
58956 it shall return a value of -1 and set *errno* to indicate the error.

58957 **ERRORS**58958 The *sem_getvalue()* function may fail if:58959 [EINVAL] The *sem* argument does not refer to a valid semaphore.58960 **EXAMPLES**

58961 None.

58962 **APPLICATION USAGE**

58963 None.

58966 **FUTURE DIRECTIONS**

58967 None.

58968 **SEE ALSO**58969 *semctl()*, *semget()*, *semop()*, *sem_post()*, *sem_timedwait()*, *sem_trywait()*

58970 XBD <semaphore.h>

58971 **CHANGE HISTORY**

58972 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

58973 **Issue 6**58974 The *sem_getvalue()* function is marked as part of the Semaphores option.

58975 The [ENOSYS] error condition has been removed as stubs need not be provided if an
58976 implementation does not support the Semaphores option.

58977 The *sem_timedwait()* function is added to the SEE ALSO section for alignment with IEEE Std
58978 1003.1d-1999.

58979 The **restrict** keyword is added to the *sem_getvalue()* prototype for alignment with the
58980 ISO/IEC 9899:1999 standard.

58981 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/54 is applied.

- 58982 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/115 is applied, updating the ERRORS
58983 section so that the [EINVAL] error becomes optional.
- 58984 **Issue 7**
58985 The *sem_getvalue()* function is moved from the Semaphores option to the Base.
58986 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0525 [37] is applied. +

58987 **NAME**

58988 sem_init — initialize an unnamed semaphore

58989 **SYNOPSIS**

58990 #include <semaphore.h>

58991 int sem_init(sem_t *sem, int pshared, unsigned value);

58992 **DESCRIPTION**

58993 The *sem_init()* function shall initialize the unnamed semaphore referred to by *sem*. The value of
 58994 the initialized semaphore shall be *value*. Following a successful call to *sem_init()*, the semaphore
 58995 may be used in subsequent calls to *sem_wait()*, *sem_timedwait()*, *sem_trywait()*, *sem_post()*, and
 58996 *sem_destroy()*. This semaphore shall remain usable until the semaphore is destroyed.

58997 If the *pshared* argument has a non-zero value, then the semaphore is shared between processes;
 58998 in this case, any process that can access the semaphore *sem* can use *sem* for performing
 58999 *sem_wait()*, *sem_timedwait()*, *sem_trywait()*, *sem_post()*, and *sem_destroy()* operations.

59000 Only *sem* itself may be used for performing synchronization. The result of referring to copies of
 59001 *sem* in calls to *sem_wait()*, *sem_timedwait()*, *sem_trywait()*, *sem_post()*, and *sem_destroy()* is
 59002 undefined.

59003 If the *pshared* argument is zero, then the semaphore is shared between threads of the process; any
 59004 thread in this process can use *sem* for performing *sem_wait()*, *sem_timedwait()*, *sem_trywait()*,
 59005 *sem_post()*, and *sem_destroy()* operations. The use of the semaphore by threads other than those
 59006 created in the same process is undefined.

59007 Attempting to initialize an already initialized semaphore results in undefined behavior.

59008 **RETURN VALUE**

59009 Upon successful completion, the *sem_init()* function shall initialize the semaphore in *sem* and
 59010 return 0. Otherwise, it shall return -1 and set *errno* to indicate the error.

59011 **ERRORS**

59012 The *sem_init()* function shall fail if:

59013	[EINVAL]	The <i>value</i> argument exceeds {SEM_VALUE_MAX}.
59014	[ENOSPC]	A resource required to initialize the semaphore has been exhausted, or the limit on semaphores ({SEM_NSEMS_MAX}) has been reached.
59015		
59016	[EPERM]	The process lacks appropriate privileges to initialize the semaphore.

59017 **EXAMPLES**

59018 None.

59019 **APPLICATION USAGE**

59020 None.

59021 **RATIONALE**

59022 None.

59023 **FUTURE DIRECTIONS**

59024 None.

59025 **SEE ALSO**

+

NAME

sem_open — initialize and open a named semaphore

SYNOPSIS

```
#include <semaphore.h>
```

```
sem_t *sem_open(const char *name, int oflag, ...);
```

DESCRIPTION

The *sem_open()* function shall establish a connection between a named semaphore and a process. Following a call to *sem_open()* with semaphore name *name*, the process may reference the semaphore associated with *name* using the address returned from the call. This semaphore may be used in subsequent calls to *sem_wait()*, *sem_timedwait()*, *sem_trywait()*, *sem_post()*, and *sem_close()*. The semaphore remains usable by this process until the semaphore is closed by a successful call to *sem_close()*, *_exit()*, or one of the *exec* functions.

The *oflag* argument controls whether the semaphore is created or merely accessed by the call to *sem_open()*. The following flag bits may be set in *oflag*:

O_CREAT This flag is used to create a semaphore if it does not already exist. If **O_CREAT** is set and the semaphore already exists, then **O_CREAT** has no effect, except as noted under **O_EXCL**. Otherwise, *sem_open()* creates a named semaphore. The **O_CREAT** flag requires a third and a fourth argument: *mode*, which is of type **mode_t**, and *value*, which is of type **unsigned**. The semaphore is created with an initial value of *value*. Valid initial values for semaphores are less than or equal to {SEM_VALUE_MAX}.

The user ID of the semaphore shall be set to the effective user ID of the process. The group ID of the semaphore shall be set to the effective group ID of the process; however, if the *name* argument is visible in the file system, the group ID may be set to the group ID of the containing directory. The permission bits of the semaphore are set to the value of the *mode* argument except those set in the file mode creation mask of the process. When bits in *mode* other than the file permission bits are specified, the effect is unspecified.

After the semaphore named *name* has been created by *sem_open()* with the **O_CREAT** flag, other processes can connect to the semaphore by calling *sem_open()* with the same value of *name*.

O_EXCL If **O_EXCL** and **O_CREAT** are set, *sem_open()* fails if the semaphore *name* exists. The check for the existence of the semaphore and the creation of the semaphore if it does not exist are atomic with respect to other processes executing *sem_open()* with **O_EXCL** and **O_CREAT** set. If **O_EXCL** is set and **O_CREAT** is not set, the effect is undefined.

If flags other than **O_CREAT** and **O_EXCL** are specified in the *oflag* parameter, the effect is unspecified.

The *name* argument points to a string naming a semaphore object. It is unspecified whether the name appears in the file system and is visible to functions that take pathnames as arguments. The *name* argument conforms to the construction rules for a pathname, except that the interpretation of <slash> characters other than the leading <slash> character in *name* is implementation-defined, and that the length limits for the *name* argument are implementation-defined and need not be the same as the pathname limits {PATH_MAX} and {NAME_MAX}. If *name* begins with the <slash> character, then processes calling *sem_open()* with the same value of *name* shall refer to the same semaphore object, as long as that name has not been removed. If *name* does not begin with the <slash> character, the effect is implementation-defined.

59089 If a process makes multiple successful calls to *sem_open()* with the same value for *name*, the same
 59090 semaphore address shall be returned for each such successful call, provided that there have been
 59091 no calls to *sem_unlink()* for this semaphore, and at least one previous successful *sem_open()* call
 59092 for this semaphore has not been matched with a *sem_close()* call.

59093 References to copies of the semaphore produce undefined results.

59094 RETURN VALUE

59095 Upon successful completion, the *sem_open()* function shall return the address of the semaphore.
 59096 Otherwise, it shall return a value of SEM_FAILED and set *errno* to indicate the error. The symbol
 59097 SEM_FAILED is defined in the **<semaphore.h>** header. No successful return from *sem_open()*
 59098 shall return the value SEM_FAILED.

59099 ERRORS

59100 If any of the following conditions occur, the *sem_open()* function shall return SEM_FAILED and
 59101 set *errno* to the corresponding value:

59102 [EACCES] The named semaphore exists and the permissions specified by *oflag* are
 59103 denied, or the named semaphore does not exist and permission to create the
 59104 named semaphore is denied.

59105 [EEXIST] O_CREAT and O_EXCL are set and the named semaphore already exists.

59106 [EINTR] The *sem_open()* operation was interrupted by a signal.

59107 [EINVAL] The *sem_open()* operation is not supported for the given name, or O_CREAT
 59108 was specified in *oflag* and *value* was greater than {SEM_VALUE_MAX}.

59109 [EMFILE] Too many semaphore descriptors or file descriptors are currently in use by this
 59110 process.

59111 [ENFILE] Too many semaphores are currently open in the system.

59112 [ENOENT] O_CREAT is not set and the named semaphore does not exist.

59113 [ENOMEM] There is insufficient memory for the creation of the new named semaphore.

59114 [ENOSPC] There is insufficient space on a storage device for the creation of the new
 59115 named semaphore.

59116 If any of the following conditions occur, the *sem_open()* function may return SEM_FAILED and
 59117 set *errno* to the corresponding value:

59118 [ENAMETOOLONG]

59119 The length of the *name* argument exceeds {_POSIX_PATH_MAX} on systems
 59120 XSI that do not support the XSI option or exceeds {_XOPEN_PATH_MAX} on XSI
 59121 systems, or has a pathname component that is longer than
 59122 XSI {_POSIX_NAME_MAX} on systems that do not support the XSI option or
 59123 longer than {_XOPEN_NAME_MAX} on XSI systems.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

Early drafts required an error return value of -1 with the type **sem_t** * for the *sem_open()* function, which is not guaranteed to be portable across implementations. The revised text provides the symbolic error code SEM_FAILED to eliminate the type conflict.

FUTURE DIRECTIONS

A future version might require the *sem_open()* and *sem_unlink()* functions to have semantics similar to normal file system operations.

semctl(), *semget()*, *semop()*, *sem_close()*, *sem_post()*, *sem_timedwait()*, *sem_trywait()*, *sem_unlink()*

XBD <**semaphore.h**>

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6

The *sem_open()* function is marked as part of the Semaphores option.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Semaphores option.

The *sem_timedwait()* function is added to the SEE ALSO section for alignment with IEEE Std 1003.1d-1999.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/117 is applied, updating the DESCRIPTION to add the *sem_timedwait()* function for alignment with IEEE Std 1003.1d-1999.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/118 is applied, updating the DESCRIPTION to describe the conditions to return the same semaphore address on a call to *sem_open()*. The words “and at least one previous successful *sem_open()* call for this semaphore has not been matched with a *sem_close()* call” are added.

Issue 7

Austin Group Interpretation 1003.1-2001 #066 is applied, updating the [ENOSPC] error case and adding the [ENOMEM] error case.

Austin Group Interpretation 1003.1-2001 #077 is applied, clarifying the *name* argument and adding [ENAMETOOLONG] as a “may fail” error.

Austin Group Interpretation 1003.1-2001 #141 is applied, adding FUTURE DIRECTIONS.

SD5-XSH-ERN-170 is applied, updating the DESCRIPTION to clarify the wording for setting the user ID and group ID of the semaphore.

The *sem_open()* function is moved from the Semaphores option to the Base.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0527 [37] is applied.

59162 **NAME**

59163 sem_post — unlock a semaphore

59164 **SYNOPSIS**

59165 #include <semaphore.h>

59166 int sem_post(sem_t *sem);

59167 **DESCRIPTION**

59168 The *sem_post()* function shall unlock the semaphore referenced by *sem* by performing a
 59169 semaphore unlock operation on that semaphore.

59170 If the semaphore value resulting from this operation is positive, then no threads were blocked
 59171 waiting for the semaphore to become unlocked; the semaphore value is simply incremented.

59172 If the value of the semaphore resulting from this operation is zero, then one of the threads
 59173 blocked waiting for the semaphore shall be allowed to return successfully from its call to
 59174 PS *sem_wait()*. If the Process Scheduling option is supported, the thread to be unblocked shall be
 59175 chosen in a manner appropriate to the scheduling policies and parameters in effect for the
 59176 blocked threads. In the case of the schedulers SCHED_FIFO and SCHED_RR, the highest
 59177 priority waiting thread shall be unblocked, and if there is more than one highest priority thread
 59178 blocked waiting for the semaphore, then the highest priority thread that has been waiting the
 59179 longest shall be unblocked. If the Process Scheduling option is not defined, the choice of a thread
 59180 to unblock is unspecified.

59181 SS If the Process Sporadic Server option is supported, and the scheduling policy is
 59182 SCHED_SPORADIC, the semantics are as per SCHED_FIFO above.

59183 The *sem_post()* function shall be async-signal-safe and may be invoked from a signal-catching
 59184 function.

59185 **RETURN VALUE**

59186 If successful, the *sem_post()* function shall return zero; otherwise, the function shall return -1
 59187 and set *errno* to indicate the error.

59188 **ERRORS**

59189 The *sem_post()* function may fail if:

59190 [EINVAL] The *sem* argument does not refer to a valid semaphore.

59191 **EXAMPLES**

59192 See *sem_timedwait()*.

59193 **APPLICATION USAGE**

59194 None.

59195 **RATIONALE**

59196 None.

59197 **FUTURE DIRECTIONS**

59198 None.

59202 **CHANGE HISTORY**

59203 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

59204 **Issue 6**

59205 The *sem_post()* function is marked as part of the Semaphores option.

59206 The [ENOSYS] error condition has been removed as stubs need not be provided if an
59207 implementation does not support the Semaphores option.

59208 The *sem_timedwait()* function is added to the SEE ALSO section for alignment with IEEE Std
59209 1003.1d-1999.

59210 SCHED_SPORADIC is added to the list of scheduling policies for which the thread that is to be
59211 unblocked is specified for alignment with IEEE Std 1003.1d-1999.

59212 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/119 is applied, updating the ERRORS
59213 section so that the [EINVAL] error becomes optional.

59214 **Issue 7**

59215 Austin Group Interpretation 1003.1-2001 #156 is applied.

59216 The *sem_post()* function is moved from the Semaphores option to the Base.

59217 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0528 [37] is applied.

+

NAME

sem_timedwait — lock a semaphore

SYNOPSIS

```
#include <semaphore.h>
#include <time.h>

int sem_timedwait(sem_t *restrict sem,
                  const struct timespec *restrict abstime);
```

DESCRIPTION

The *sem_timedwait()* function shall lock the semaphore referenced by *sem* as in the *sem_wait()* function. However, if the semaphore cannot be locked without waiting for another process or thread to unlock the semaphore by performing a *sem_post()* function, this wait shall be terminated when the specified timeout expires.

The timeout shall expire when the absolute time specified by *abstime* passes, as measured by the clock on which timeouts are based (that is, when the value of that clock equals or exceeds *abstime*), or if the absolute time specified by *abstime* has already been passed at the time of the call.

The timeout shall be based on the CLOCK_REALTIME clock. The resolution of the timeout shall be the resolution of the clock on which it is based. The **timespec** data type is defined as a structure in the **<time.h>** header.

Under no circumstance shall the function fail with a timeout if the semaphore can be locked immediately. The validity of the *abstime* need not be checked if the semaphore can be locked immediately.

RETURN VALUE

The *sem_timedwait()* function shall return zero if the calling process successfully performed the semaphore lock operation on the semaphore designated by *sem*. If the call was unsuccessful, the state of the semaphore shall be unchanged, and the function shall return a value of -1 and set *errno* to indicate the error.

ERRORS

The *sem_timedwait()* function shall fail if:

[EINVAL] The process or thread would have blocked, and the *abstime* parameter specified a nanoseconds field value less than zero or greater than or equal to 1 000 million.

[ETIMEDOUT] The semaphore could not be locked before the specified timeout expired.

The *sem_timedwait()* function may fail if:

[EDEADLK] A deadlock condition was detected.

[EINTR] A signal interrupted this function.

[EINVAL] The *sem* argument does not refer to a valid semaphore.

EXAMPLES

The program shown below operates on an unnamed semaphore. The program expects two command-line arguments. The first argument specifies a seconds value that is used to set an alarm timer to generate a SIGALRM signal. This handler performs a *sem_post*(3) to increment the semaphore that is being waited on in *main*() using *sem_timedwait*(). The second command-line argument specifies the length of the timeout, in seconds, for *sem_timedwait*().

```

#include <unistd.h>
#include <stdio.h>
#include <stdlib.h>
#include <semaphore.h>
#include <time.h>
#include <assert.h>
#include <errno.h>
#include <signal.h>

sem_t sem;

static void
handler(int sig)
{
    int sav_errno = errno;
    static const char info_msg[] = "sem_post() from handler\n";
    write(STDOUT_FILENO, info_msg, sizeof info_msg - 1);
    if (sem_post(&sem) == -1) {
        static const char err_msg[] = "sem_post() failed\n";
        write(STDERR_FILENO, err_msg, sizeof err_msg - 1);
        _exit(EXIT_FAILURE);
    }
    errno = sav_errno;
}

int
main(int argc, char *argv[])
{
    struct sigaction sa;
    struct timespec ts;
    int s;

    if (argc != 3) {
        fprintf(stderr, "Usage: %s <alarm-secs> <wait-secs>\n",
            argv[0]);
        exit(EXIT_FAILURE);
    }

    if (sem_init(&sem, 0, 0) == -1) {
        perror("sem_init");
        exit(EXIT_FAILURE);
    }

    /* Establish SIGALRM handler; set alarm timer using argv[1] */
    sa.sa_handler = handler;
    sigemptyset(&sa.sa_mask);
    sa.sa_flags = 0;
    if (sigaction(SIGALRM, &sa, NULL) == -1) {

```

```

59303         perror("sigaction");
59304         exit(EXIT_FAILURE);
59305     }
59306     alarm(atoi(argv[1]));
59307     /* Calculate relative interval as current time plus
59308        number of seconds given argv[2] */
59309     if (clock_gettime(CLOCK_REALTIME, &ts) == -1) {
59310         perror("clock_gettime");
59311         exit(EXIT_FAILURE);
59312     }
59313     ts.tv_sec += atoi(argv[2]);
59314     printf("main() about to call sem_timedwait()\n");
59315     while ((s = sem_timedwait(&sem, &ts)) == -1 && errno == EINTR)
59316         continue;          /* Restart if interrupted by handler */
59317     /* Check what happened */
59318     if (s == -1) {
59319         if (errno == ETIMEDOUT)
59320             printf("sem_timedwait() timed out\n");
59321         else
59322             perror("sem_timedwait");
59323     } else
59324         printf("sem_timedwait() succeeded\n");
59325     exit((s == 0) ? EXIT_SUCCESS : EXIT_FAILURE);
59326 }

```

APPLICATION USAGE

Applications using these functions may be subject to priority inversion, as discussed in XBD [Section 3.287](#) (on page 79).

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/120 is applied, updating the ERRORS section so that the [EINVAL] error becomes optional.

Issue 7

The *sem_timedwait()* function is moved from the Semaphores option to the Base.

Functionality relating to the Timers option is moved to the Base.

An example is added.

59345

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0529 [138] is applied.

+

NAME

sem_trywait, sem_wait — lock a semaphore

SYNOPSIS

```
#include <semaphore.h>

int sem_trywait(sem_t *sem);
int sem_wait(sem_t *sem);
```

DESCRIPTION

The *sem_trywait()* function shall lock the semaphore referenced by *sem* only if the semaphore is currently not locked; that is, if the semaphore value is currently positive. Otherwise, it shall not lock the semaphore.

The *sem_wait()* function shall lock the semaphore referenced by *sem* by performing a semaphore lock operation on that semaphore. If the semaphore value is currently zero, then the calling thread shall not return from the call to *sem_wait()* until it either locks the semaphore or the call is interrupted by a signal.

Upon successful return, the state of the semaphore shall be locked and shall remain locked until the *sem_post()* function is executed and returns successfully.

The *sem_wait()* function is interruptible by the delivery of a signal.

RETURN VALUE

The *sem_trywait()* and *sem_wait()* functions shall return zero if the calling process successfully performed the semaphore lock operation on the semaphore designated by *sem*. If the call was unsuccessful, the state of the semaphore shall be unchanged, and the function shall return a value of -1 and set *errno* to indicate the error.

ERRORS

The *sem_trywait()* function shall fail if:

[EAGAIN] The semaphore was already locked, so it cannot be immediately locked by the *sem_trywait()* operation.

The *sem_trywait()* and *sem_wait()* functions may fail if:

[EDEADLK] A deadlock condition was detected.

[EINTR] A signal interrupted this function.

[EINVAL] The *sem* argument does not refer to a valid semaphore.

EXAMPLES

None.

APPLICATION USAGE

Applications using these functions may be subject to priority inversion, as discussed in XBD [Section 3.287](#) (on page 79).

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6

The *sem_trywait()* and *sem_wait()* functions are marked as part of the Semaphores option.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Semaphores option.

The *sem_timedwait()* function is added to the SEE ALSO section for alignment with IEEE Std 1003.1d-1999.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/121 is applied, updating the ERRORS section so that the [EINVAL] error becomes optional.

Issue 7

SD5-XSH-ERN-54 is applied, removing the *sem_wait()* function from the “shall fail” error cases.

The *sem_trywait()* and *sem_wait()* functions are moved from the Semaphores option to the Base.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0530 [37] is applied.

+

59402 **NAME**

59403 sem_unlink — remove a named semaphore

59404 **SYNOPSIS**

59405 #include <semaphore.h>

59406 int sem_unlink(const char *name);

59407 **DESCRIPTION**

59408 The *sem_unlink()* function shall remove the semaphore named by the string *name*. If the
 59409 semaphore named by *name* is currently referenced by other processes, then *sem_unlink()* shall
 59410 have no effect on the state of the semaphore. If one or more processes have the semaphore open
 59411 when *sem_unlink()* is called, destruction of the semaphore is postponed until all references to the
 59412 semaphore have been destroyed by calls to *sem_close()*, *_exit()*, or *exec*. Calls to *sem_open()* to
 59413 recreate or reconnect to the semaphore refer to a new semaphore after *sem_unlink()* is called. The
 59414 *sem_unlink()* call shall not block until all references have been destroyed; it shall return
 59415 immediately.

59416 **RETURN VALUE**

59417 Upon successful completion, the *sem_unlink()* function shall return a value of 0. Otherwise, the
 59418 semaphore shall not be changed and the function shall return a value of -1 and set *errno* to
 59419 indicate the error.

59420 **ERRORS**59421 The *sem_unlink()* function shall fail if:

59422 [EACCES] Permission is denied to unlink the named semaphore.

59423 [ENOENT] The named semaphore does not exist.

59424 The *sem_unlink()* function may fail if:

59425 [ENAMETOOLONG]

59426 The length of the *name* argument exceeds {_POSIX_PATH_MAX} on systems
 59427 XSI that do not support the XSI option or exceeds {_XOPEN_PATH_MAX} on XSI
 59428 systems, or has a pathname component that is longer than
 59429 XSI {_POSIX_NAME_MAX} on systems that do not support the XSI option or
 59430 longer than {_XOPEN_NAME_MAX} on XSI systems. A call to *sem_unlink()*
 59431 with a *name* argument that contains the same semaphore name as was
 59432 previously used in a successful *sem_open()* call shall not give an
 59433 [ENAMETOOLONG] error.

59434 **EXAMPLES**

59435 None.

59436 **APPLICATION USAGE**

59437 None.

59438 **RATIONALE**

59439 None.

59440 **FUTURE DIRECTIONS**

59441 A future version might require the *sem_open()* and *sem_unlink()* functions to have semantics
 59442 similar to normal file system operations.

59443 **SEE ALSO**59444 *semctl()*, *semget()*, *semop()*, *sem_close()*, *sem_open()*

59445 XBD <semaphore.h>

59446 **CHANGE HISTORY**

59447 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

59448 **Issue 6**

59449 The *sem_unlink()* function is marked as part of the Semaphores option.

59450 The [ENOSYS] error condition has been removed as stubs need not be provided if an
59451 implementation does not support the Semaphores option.

59452 **Issue 7**

59453 Austin Group Interpretation 1003.1-2001 #077 is applied, changing [ENAMETOOLONG] from a
59454 “shall fail” to a “may fail” error.

59455 Austin Group Interpretation 1003.1-2001 #141 is applied, adding FUTURE DIRECTIONS.

59456 The *sem_unlink()* function is moved from the Semaphores option to the Base.

59457 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0531 [37] is applied.

+

59458 **NAME**

59459 sem_wait — lock a semaphore

59460 **SYNOPSIS**

59461 #include <semaphore.h>

59462 int sem_wait(sem_t *sem);

59463 **DESCRIPTION**59464 Refer to *sem_trywait()*.

59465 **NAME**

59466 semctl — XSI semaphore control operations

59467 **SYNOPSIS**

```
59468 XSI      #include <sys/sem.h>
59469      int semctl(int semid, int semnum, int cmd, ...);
```

59470 **DESCRIPTION**

59471 The *semctl()* function operates on XSI semaphores (see XBD [Section 4.16](#), on page 113). It is
 59472 unspecified whether this function interoperates with the realtime interprocess communication
 59473 facilities defined in [Section 2.8](#) (on page 502).

59474 The *semctl()* function provides a variety of semaphore control operations as specified by *cmd*.
 59475 The fourth argument is optional and depends upon the operation requested. If required, it is of
 59476 type **union semun**, which the application shall explicitly declare:

```
59477 union semun {
59478     int val;
59479     struct semid_ds *buf;
59480     unsigned short *array;
59481 } arg;
```

59482 The following semaphore control operations as specified by *cmd* are executed with respect to the
 59483 semaphore specified by *semid* and *semnum*. The level of permission required for each operation
 59484 is shown with each command; see [Section 2.7](#) (on page 501). The symbolic names for the values
 59485 of *cmd* are defined in the **<sys/sem.h>** header:

59486	GETVAL	Return the value of <i>semval</i> ; see <sys/sem.h> . Requires read permission.
59487	SETVAL	Set the value of <i>semval</i> to <i>arg.val</i> , where <i>arg</i> is the value of the fourth argument 59488 to <i>semctl()</i> . When this command is successfully executed, the <i>semadj</i> value 59489 corresponding to the specified semaphore in all processes is cleared. Also, the 59490 <i>sem_ctime</i> timestamp shall be set to the current time, as described in Section 59491 2.7.1 (on page 501). Requires alter permission; see Section 2.7 (on page 501).

59492	GETPID	Return the value of <i>sempid</i> . Requires read permission.

59493	GETNCNT	Return the value of <i>semncnt</i> . Requires read permission.

59494	GETZCNT	Return the value of <i>semzcnt</i> . Requires read permission.

59495 The following values of *cmd* operate on each *semval* in the set of semaphores:

59496	GETALL	Return the value of <i>semval</i> for each semaphore in the semaphore set and place 59497 into the array pointed to by <i>arg.array</i> , where <i>arg</i> is the fourth argument to 59498 <i>semctl()</i> . Requires read permission.

59499	SETALL	Set the value of <i>semval</i> for each semaphore in the semaphore set according to 59500 the array pointed to by <i>arg.array</i> , where <i>arg</i> is the fourth argument to <i>semctl()</i> . 59501 When this command is successfully executed, the <i>semadj</i> values corresponding 59502 to each specified semaphore in all processes are cleared. Also, the <i>sem_ctime</i> 59503 timestamp shall be set to the current time, as described in Section 2.7.1 (on 59504 page 501). Requires alter permission.

59505 The following values of *cmd* are also available:

59506 IPC_STAT Place the current value of each member of the **semid_ds** data structure
59507 associated with *semid* into the structure pointed to by *arg.buf*, where *arg* is the
59508 fourth argument to *semctl()*. The contents of this structure are defined in
59509 **<sys/sem.h>**. Requires read permission.

59510 IPC_SET Set the value of the following members of the **semid_ds** data structure
59511 associated with *semid* to the corresponding value found in the structure
59512 pointed to by *arg.buf*, where *arg* is the fourth argument to *semctl()*:

59513 sem_perm.uid
59514 sem_perm.gid
59515 sem_perm.mode

59516 The mode bits specified in [Section 2.7.1](#) (on page 501) are copied into the
59517 corresponding bits of the *sem_perm.mode* associated with *semid*. The stored
59518 values of any other bits are unspecified. The *sem_ctime* timestamp shall be set
59519 to the current time, as described in [Section 2.7.1](#) (on page 501).

59520 This command can only be executed by a process that has an effective user ID
59521 equal to either that of a process with appropriate privileges or to the value of
59522 *sem_perm.cuid* or *sem_perm.uid* in the **semid_ds** data structure associated with
59523 *semid*.

59524 IPC_RMID Remove the semaphore identifier specified by *semid* from the system and
59525 destroy the set of semaphores and **semid_ds** data structure associated with it.
59526 This command can only be executed by a process that has an effective user ID
59527 equal to either that of a process with appropriate privileges or to the value of
59528 *sem_perm.cuid* or *sem_perm.uid* in the **semid_ds** data structure associated with
59529 *semid*.

59530 RETURN VALUE

59531 If successful, the value returned by *semctl()* depends on *cmd* as follows:

59532 GETVAL The value of *semval*.
59533 GETPID The value of *sempid*.
59534 GETNCNT The value of *semmcnt*.
59535 GETZCNT The value of *semzcnt*.
59536 All others 0.

59537 Otherwise, *semctl()* shall return -1 and set *errno* to indicate the error.

59538 ERRORS

59539 The *semctl()* function shall fail if:

59540 [EACCES] Operation permission is denied to the calling process; see [Section 2.7](#) (on page
59541 501).
59542 [EINVAL] The value of *semid* is not a valid semaphore identifier, or the value of *semnum*
59543 is less than 0 or greater than or equal to *sem_nsems*, or the value of *cmd* is not a
59544 valid command.
59545 [EPERM] The argument *cmd* is equal to IPC_RMID or IPC_SET and the effective user ID
59546 of the calling process is not equal to that of a process with appropriate
59547 privileges and it is not equal to the value of *sem_perm.cuid* or *sem_perm.uid* in

59548 the data structure associated with *semid*.
 59549 [ERANGE] The argument *cmd* is equal to SETVAL or SETALL and the value to which
 59550 *semval* is to be set is greater than the system-imposed maximum.

59551 EXAMPLES

59552 Refer to *semop()*.

59553 APPLICATION USAGE

59554 The fourth parameter in the SYNOPSIS section is now specified as ". . ." in order to avoid a
 59555 clash with the ISO C standard when referring to the union *semun* (as defined in Issue 3) and for
 59556 backwards-compatibility.

59557 The POSIX Realtime Extension defines alternative interfaces for interprocess communication.
 59558 Application developers who need to use IPC should design their applications so that modules
 59559 using the IPC routines described in [Section 2.7](#) (on page 501) can be easily modified to use the
 59560 alternative interfaces.

59561 RATIONALE

59562 None.

NAME

semget — get set of XSI semaphores

SYNOPSIS

```
XSI    #include <sys/sem.h>
      int semget(key_t key, int nsems, int semflg);
```

DESCRIPTION

The *semget()* function operates on XSI semaphores (see XBD [Section 4.16](#), on page 113). It is unspecified whether this function interoperates with the realtime interprocess communication facilities defined in [Section 2.8](#) (on page 502).

The *semget()* function shall return the semaphore identifier associated with *key*.

A semaphore identifier with its associated **semid_ds** data structure and its associated set of *nsems* semaphores (see **<sys/sem.h>**) is created for *key* if one of the following is true:

- The argument *key* is equal to `IPC_PRIVATE`.
- The argument *key* does not already have a semaphore identifier associated with it and (*semflg* & `IPC_CREAT`) is non-zero.

Upon creation, the **semid_ds** data structure associated with the new semaphore identifier is initialized as follows:

- In the operation permissions structure *sem_perm.cuid*, *sem_perm.uid*, *sem_perm.cgid*, and *sem_perm.gid* shall be set to the effective user ID and effective group ID, respectively, of the calling process.
- The low-order 9 bits of *sem_perm.mode* shall be set to the low-order 9 bits of *semflg*.
- The variable *sem_nsems* shall be set to the value of *nsems*.
- The variable *sem_otime* shall be set to 0 and *sem_ctime* shall be set to the current time, as described in [Section 2.7.1](#) (on page 501).
- The data structure associated with each semaphore in the set need not be initialized. The *semctl()* function with the command `SETVAL` or `SETALL` can be used to initialize each semaphore.

RETURN VALUE

Upon successful completion, *semget()* shall return a non-negative integer, namely a semaphore identifier; otherwise, it shall return `-1` and set *errno* to indicate the error.

ERRORS

The *semget()* function shall fail if:

[EACCES]	A semaphore identifier exists for <i>key</i> , but operation permission as specified by the low-order 9 bits of <i>semflg</i> would not be granted; see Section 2.7 (on page 501).
[EEXIST]	A semaphore identifier exists for the argument <i>key</i> but ((<i>semflg</i> & <code>IPC_CREAT</code>) && (<i>semflg</i> & <code>IPC_EXCL</code>)) is non-zero.
[EINVAL]	The value of <i>nsems</i> is either less than or equal to 0 or greater than the system-imposed limit, or a semaphore identifier exists for the argument <i>key</i> , but the number of semaphores in the set associated with it is less than <i>nsems</i> and <i>nsems</i> is not equal to 0.

59618 [ENOENT] A semaphore identifier does not exist for the argument *key* and (*semflg*
 59619 &IPC_CREAT) is equal to 0.

59620 [ENOSPC] A semaphore identifier is to be created but the system-imposed limit on the
 59621 maximum number of allowed semaphores system-wide would be exceeded.

59622 EXAMPLES

59623 Refer to *semop()*.

59624 APPLICATION USAGE

59625 The POSIX Realtime Extension defines alternative interfaces for interprocess communication.
 59626 Application developers who need to use IPC should design their applications so that modules
 59627 using the IPC routines described in [Section 2.7](#) (on page 501) can be easily modified to use the
 59628 alternative interfaces.

59629 RATIONALE

59630 None.

59631 FUTURE DIRECTIONS

59632 A future version may require that the value of the *semval*, *sempid*, *semncnt*, and *semzcnt* members
 59633 of all semaphores in a semaphore set be initialized to zero when a call to *semget()* creates a
 59634 semaphore set. Many semaphore implementations already do this and it greatly simplifies what
 59635 an application must do to initialize a semaphore set.

NAME

semop — XSI semaphore operations

SYNOPSIS

```
XSI    #include <sys/sem.h>
int semop(int semid, struct sembuf *sops, size_t nsops);
```

DESCRIPTION

The *semop()* function operates on XSI semaphores (see XBD [Section 4.16](#), on page 113). It is unspecified whether this function interoperates with the realtime interprocess communication facilities defined in [Section 2.8](#) (on page 502).

The *semop()* function shall perform atomically a user-defined array of semaphore operations in array order on the set of semaphores associated with the semaphore identifier specified by the argument *semid*.

The argument *sops* is a pointer to a user-defined array of semaphore operation structures. The implementation shall not modify elements of this array unless the application uses implementation-defined extensions.

The argument *nsops* is the number of such structures in the array.

Each structure, **sembuf**, includes the following members:

Member Type	Member Name	Description
unsigned short	<i>sem_num</i>	Semaphore number.
short	<i>sem_op</i>	Semaphore operation.
short	<i>sem_flg</i>	Operation flags.

Each semaphore operation specified by *sem_op* is performed on the corresponding semaphore specified by *semid* and *sem_num*.

The variable *sem_op* specifies one of three semaphore operations:

1. If *sem_op* is a negative integer and the calling process has alter permission, one of the following shall occur:
 - If *semval* (see **<sys/sem.h>**) is greater than or equal to the absolute value of *sem_op*, the absolute value of *sem_op* is subtracted from *semval*. Also, if (*sem_flg* & SEM_UNDO) is non-zero, the absolute value of *sem_op* shall be added to the *semadj* value of the calling process for the specified semaphore.
 - If *semval* is less than the absolute value of *sem_op* and (*sem_flg* & IPC_NOWAIT) is non-zero, *semop()* shall return immediately.
 - If *semval* is less than the absolute value of *sem_op* and (*sem_flg* & IPC_NOWAIT) is 0, *semop()* shall increment the *semncnt* associated with the specified semaphore and suspend execution of the calling thread until one of the following conditions occurs:
 - The value of *semval* becomes greater than or equal to the absolute value of *sem_op*. When this occurs, the value of *semncnt* associated with the specified semaphore shall be decremented, the absolute value of *sem_op* shall be subtracted from *semval* and, if (*sem_flg* & SEM_UNDO) is non-zero, the absolute value of *sem_op* shall be added to the *semadj* value of the calling process for the specified semaphore.

- 59693 — The *semid* for which the calling thread is awaiting action is removed from the
59694 system. When this occurs, *errno* shall be set to [EIDRM] and -1 shall be
59695 returned.
- 59696 — The calling thread receives a signal that is to be caught. When this occurs, the
59697 value of *semncnt* associated with the specified semaphore shall be
59698 decremented, and the calling thread shall resume execution in the manner
59699 prescribed in [sigaction\(\)](#).
- 59700 2. If *sem_op* is a positive integer and the calling process has alter permission, the value of
59701 *sem_op* shall be added to *semval* and, if (*sem_flg* & SEM_UNDO) is non-zero, the value of
59702 *sem_op* shall be subtracted from the *semadj* value of the calling process for the specified
59703 semaphore.
- 59704 3. If *sem_op* is 0 and the calling process has read permission, one of the following shall occur:
59705
 - If *semval* is 0, *semop()* shall return immediately.
 - 59706 • If *semval* is non-zero and (*sem_flg* & IPC_NOWAIT) is non-zero, *semop()* shall return
59707 immediately.
 - 59708 • If *semval* is non-zero and (*sem_flg* & IPC_NOWAIT) is 0, *semop()* shall increment the
59709 *semzcnt* associated with the specified semaphore and suspend execution of the
59710 calling thread until one of the following occurs:
 - 59711 — The value of *semval* becomes 0, at which time the value of *semzcnt* associated
59712 with the specified semaphore shall be decremented.
 - 59713 — The *semid* for which the calling thread is awaiting action is removed from the
59714 system. When this occurs, *errno* shall be set to [EIDRM] and -1 shall be
59715 returned.
 - 59716 — The calling thread receives a signal that is to be caught. When this occurs, the
59717 value of *semzcnt* associated with the specified semaphore shall be
59718 decremented, and the calling thread shall resume execution in the manner
59719 prescribed in [sigaction\(\)](#).
- 59720 Upon successful completion, the value of *sempid* for each semaphore specified in the array
59721 pointed to by *sops* shall be set to the process ID of the calling process. Also, the *sem_otime*
59722 timestamp shall be set to the current time, as described in [Section 2.7.1](#) (on page 501).

59723 RETURN VALUE

59724 Upon successful completion, *semop()* shall return 0; otherwise, it shall return -1 and set *errno* to
59725 indicate the error.

59726 ERRORS

59727 The *semop()* function shall fail if:

- 59728 [E2BIG] The value of *nsops* is greater than the system-imposed maximum.
- 59729 [EACCES] Operation permission is denied to the calling process; see [Section 2.7](#) (on page
59730 501).
- 59731 [EAGAIN] The operation would result in suspension of the calling process but (*sem_flg*
59732 & IPC_NOWAIT) is non-zero.
- 59733 [EFBIG] The value of *sem_num* is greater than or equal to the number of semaphores in
59734 the set associated with *semid*.

59735	[EIDRM]	The semaphore identifier <i>semid</i> is removed from the system.
59736	[EINTR]	The <i>semop()</i> function was interrupted by a signal.
59737	[EINVAL]	The value of <i>semid</i> is not a valid semaphore identifier, or the number of individual semaphores for which the calling process requests a SEM_UNDO would exceed the system-imposed limit.
59738		
59739		
59740	[ENOSPC]	The limit on the number of individual processes requesting a SEM_UNDO would be exceeded.
59741		
59742	[ERANGE]	An operation would cause a <i>semval</i> to overflow the system-imposed limit, or an operation would cause a <i>semadj</i> value to overflow the system-imposed limit.
59743		
59744		

59745 EXAMPLES

59746 Setting Values in Semaphores

59747 The following example sets the values of the two semaphores associated with the *semid* identifier
 59748 to the values contained in the *sb* array.

```

59749 #include <sys/sem.h>
59750 ...
59751 int semid;
59752 struct sembuf sb[2];
59753 int nsops = 2;
59754 int result;

59755 /* Code to initialize semid. */
59756 ...
59757 /* Adjust value of semaphore in the semaphore array semid. */
59758 sb[0].sem_num = 0;
59759 sb[0].sem_op = -1;
59760 sb[0].sem_flg = SEM_UNDO | IPC_NOWAIT;
59761 sb[1].sem_num = 1;
59762 sb[1].sem_op = 1;
59763 sb[1].sem_flg = 0;
59764 result = semop(semid, sb, nsops);

```

59765 Creating a Semaphore Identifier

59766 The following example gets a unique semaphore key using the *ftok()* function, then gets a
 59767 semaphore ID associated with that key using the *semget()* function (the first call also tests to
 59768 make sure the semaphore exists). If the semaphore does not exist, the program creates it, as
 59769 shown by the second call to *semget()*. In creating the semaphore for the queuing process, the
 59770 program attempts to create one semaphore with read/write permission for all. It also uses the
 59771 IPC_EXCL flag, which forces *semget()* to fail if the semaphore already exists.

59772 After creating the semaphore, the program uses calls to *semctl()* and *semop()* to initialize it to the
 59773 values in the *sbuf* array. The number of processes that can execute concurrently without queuing
 59774 is initially set to 2. The final call to *semget()* creates a semaphore identifier that can be used later
 59775 in the program.

59776 Processes that obtain *semid* without creating it check that *sem_otime* is non-zero, to ensure that
 59777 the creating process has completed the *semop()* initialization.

```

59778 The final call to semop() acquires the semaphore and waits until it is free; the SEM_UNDO
59779 option releases the semaphore when the process exits, waiting until there are less than two
59780 processes running concurrently.

59781 #include <stdio.h>
59782 #include <sys/sem.h>
59783 #include <sys/stat.h>
59784 #include <errno.h>
59785 #include <stdlib.h>
59786 ...
59787 key_t semkey;
59788 int semid;
59789 struct sembuf sbuf;
59790 union semun {
59791     int val;
59792     struct semid_ds *buf;
59793     unsigned short *array;
59794 } arg;
59795 struct semid_ds ds;
59796 ...
59797 /* Get unique key for semaphore. */
59798 if ((semkey = ftok("/tmp", 'a')) == (key_t) -1) {
59799     perror("IPC error: ftok"); exit(1);
59800 }

59801 /* Get semaphore ID associated with this key. */
59802 if ((semid = semget(semkey, 0, 0)) == -1) {

59803     /* Semaphore does not exist - Create. */
59804     if ((semid = semget(semkey, 1, IPC_CREAT | IPC_EXCL | S_IRUSR |
59805         S_IWUSR | S_IRGRP | S_IWGRP | S_IROTH | S_IWOTH)) != -1)
59806     {
59807         /* Initialize the semaphore. */
59808         arg.val = 0;
59809         sbuf.sem_num = 0;
59810         sbuf.sem_op = 2; /* This is the number of runs without queuing. */
59811         sbuf.sem_flg = 0;
59812         if (semctl(semid, 0, SETVAL, arg) == -1
59813             || semop(semid, &sbuf, 1) == -1) {
59814             perror("IPC error: semop"); exit(1);
59815         }
59816     }
59817     else if (errno == EEXIST) {
59818         if ((semid = semget(semkey, 0, 0)) == -1) {
59819             perror("IPC error 1: semget"); exit(1);
59820         }
59821         goto check_init;
59822     }
59823     else {
59824         perror("IPC error 2: semget"); exit(1);
59825     }
59826 }
59827 else

```

```

59828     {
59829         /* Check that semid has completed initialization. */
59830         /* An application can use a retry loop at this point rather than
59831            exiting. */
59832         check_init:
59833         arg.buf = &ds;
59834         if (semctl(semid, 0, IPC_STAT, arg) < 0) {
59835             perror("IPC error 3: semctl"); exit(1);
59836         }
59837         if (ds.sem_otime == 0) {
59838             perror("IPC error 4: semctl"); exit(1);
59839         }
59840     }
59841     ...
59842     sbuf.sem_num = 0;
59843     sbuf.sem_op = -1;
59844     sbuf.sem_flg = SEM_UNDO;
59845     if (semop(semid, &sbuf, 1) == -1) {
59846         perror("IPC Error: semop"); exit(1);
59847     }

```

APPLICATION USAGE

The POSIX Realtime Extension defines alternative interfaces for interprocess communication. Application developers who need to use IPC should design their applications so that modules using the IPC routines described in [Section 2.7](#) (on page 501) can be easily modified to use the alternative interfaces.

Issue 7

SD5-XSH-ERN-171 is applied, updating the DESCRIPTION to clarify the order in which the operations in *sops* will be performed when there are multiple operations.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0538 [329,429], XSH/TC1-2008/0539 [345,428], XSH/TC1-2008/0540 [329,429], XSH/TC1-2008/0541 [335], and XSH/TC1-2008/0542 [291,429] are applied.

59873 **NAME**

59874 send — send a message on a socket

59875 **SYNOPSIS**

59876 #include <sys/socket.h>

59877 ssize_t send(int *socket*, const void **buffer*, size_t *length*, int *flags*);59878 **DESCRIPTION**

59879 The *send()* function shall initiate transmission of a message from the specified socket to its peer.
 59880 The *send()* function shall send a message only when the socket is connected. If the socket is a
 59881 connectionless-mode socket, the message shall be sent to the pre-specified peer address.

59882 The *send()* function takes the following arguments:59883 *socket* Specifies the socket file descriptor.59884 *buffer* Points to the buffer containing the message to send.59885 *length* Specifies the length of the message in bytes.

59886 *flags* Specifies the type of message transmission. Values of this argument are
 59887 formed by logically OR'ing zero or more of the following flags:

59888 MSG_EOR Terminates a record (if supported by the protocol).

59889 MSG_OOB Sends out-of-band data on sockets that support out-of-
 59890 band communications. The significance and semantics
 59891 of out-of-band data are protocol-specific.

59892 MSG_NOSIGNAL Requests not to send the SIGPIPE signal if an attempt to
 59893 send is made on a stream-oriented socket that is no
 59894 longer connected. The [EPIPE] error shall still be
 59895 returned.

59896 The length of the message to be sent is specified by the *length* argument. If the message is too
 59897 long to pass through the underlying protocol, *send()* shall fail and no data shall be transmitted.

59898 Successful completion of a call to *send()* does not guarantee delivery of the message. A return
 59899 value of -1 indicates only locally-detected errors.

59900 If space is not available at the sending socket to hold the message to be transmitted, and the
 59901 socket file descriptor does not have O_NONBLOCK set, *send()* shall block until space is
 59902 available. If space is not available at the sending socket to hold the message to be transmitted,
 59903 and the socket file descriptor does have O_NONBLOCK set, *send()* shall fail. The *select()* and
 59904 *poll()* functions can be used to determine when it is possible to send more data.

59905 The socket in use may require the process to have appropriate privileges to use the *send()*
 59906 function.

59907 **RETURN VALUE**

59908 Upon successful completion, *send()* shall return the number of bytes sent. Otherwise, -1 shall be
 59909 returned and *errno* set to indicate the error.

59910 **ERRORS**59911 The *send()* function shall fail if:

59912 [EAGAIN] or [EWOULDBLOCK]

59913 The socket's file descriptor is marked O_NONBLOCK and the requested
 59914 operation would block.

59915	[EBADF]	The <i>socket</i> argument is not a valid file descriptor.
59916	[ECONNRESET]	A connection was forcibly closed by a peer.
59917	[EDESTADDRREQ]	
59918		The socket is not connection-mode and no peer address is set.
59919	[EINTR]	A signal interrupted <i>send()</i> before any data was transmitted.
59920	[EMSGSIZE]	The message is too large to be sent all at once, as the socket requires.
59921	[ENOTCONN]	The socket is not connected.
59922	[ENOTSOCK]	The <i>socket</i> argument does not refer to a socket.
59923	[EOPNOTSUPP]	The <i>socket</i> argument is associated with a socket that does not support one or more of the values set in <i>flags</i> .
59924		
59925	[EPIPE]	The socket is shut down for writing, or the socket is connection-mode and is no longer connected. In the latter case, and if the socket is of type SOCK_STREAM or SOCK_SEQPACKET and the MSG_NOSIGNAL flag is not set, the SIGPIPE signal is generated to the calling thread.
59926		
59927		
59928		
59929		The <i>send()</i> function may fail if:
59930	[EACCES]	The calling process does not have appropriate privileges.
59931	[EIO]	An I/O error occurred while reading from or writing to the file system.
59932	[ENETDOWN]	The local network interface used to reach the destination is down.
59933	[ENETUNREACH]	
59934		No route to the network is present.
59935	[ENOBUFS]	Insufficient resources were available in the system to perform the operation.

59936 EXAMPLES

59937 None.

59938 APPLICATION USAGE

59939 If the *socket* argument refers to a connection-mode socket, the *send()* function is equivalent to
 59940 *sendto()* (with any value for the *dest_addr* and *dest_len* arguments, as they are ignored in this
 59941 case). If the *socket* argument refers to a socket and the *flags* argument is 0, the *send()* function is
 59942 equivalent to *write()*.

59943 RATIONALE

59944 None.

59945 FUTURE DIRECTIONS

59946 None.

59951 CHANGE HISTORY

59952 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

59953 **Issue 7**

59954 Austin Group Interpretation 1003.1-2001 #035 is applied, updating the DESCRIPTION to clarify
59955 the behavior when the socket is a connectionless-mode socket.

59956 The MSG_NOSIGNAL flag is added from The Open Group Technical Standard, 2006, Extended
59957 API Set Part 2.

59958 The [EPIPE] error is modified.

59959 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0543 [463] is applied.

+

59960 **NAME**59961 `sendmsg` — send a message on a socket using a message structure59962 **SYNOPSIS**59963 `#include <sys/socket.h>`59964 `ssize_t sendmsg(int socket, const struct msghdr *message, int flags);`59965 **DESCRIPTION**

59966 The `sendmsg()` function shall send a message through a connection-mode or connectionless-mode socket. If the socket is a connectionless-mode socket, the message shall be sent to the address specified by **msghdr** if no pre-specified peer address has been set. If a peer address has been pre-specified, either the message shall be sent to the address specified in **msghdr** (overriding the pre-specified peer address), or the function shall return `-1` and set `errno` to `[EISCONN]`. If the socket is connection-mode, the destination address in **msghdr** shall be ignored.

59973 The `sendmsg()` function takes the following arguments:

59974	<i>socket</i>	Specifies the socket file descriptor.
59975	<i>message</i>	Points to a msghdr structure, containing both the destination address and the buffers for the outgoing message. The length and format of the address depend on the address family of the socket. The <i>msg_flags</i> member is ignored.
59976		
59977		
59978	<i>flags</i>	Specifies the type of message transmission. The application may specify 0 or the following flag:
59979		
59980	<code>MSG_EOR</code>	Terminates a record (if supported by the protocol).
59981	<code>MSG_OOB</code>	Sends out-of-band data on sockets that support out-of-band data. The significance and semantics of out-of-band data are protocol-specific.
59982		
59983		
59984	<code>MSG_NOSIGNAL</code>	Requests not to send the SIGPIPE signal if an attempt to send is made on a stream-oriented socket that is no longer connected. The <code>[EPIPE]</code> error shall still be returned.
59985		
59986		
59987		

59988 The *msg_iov* and *msg_iovlen* fields of *message* specify zero or more buffers containing the data to be sent. *msg_iov* points to an array of **iovec** structures; *msg_iovlen* shall be set to the dimension of this array. In each **iovec** structure, the *iov_base* field specifies a storage area and the *iov_len* field gives its size in bytes. Some of these sizes can be zero. The data from each storage area indicated by *msg_iov* is sent in turn.

59993 Successful completion of a call to `sendmsg()` does not guarantee delivery of the message. A return value of `-1` indicates only locally-detected errors.

59995 If space is not available at the sending socket to hold the message to be transmitted and the socket file descriptor does not have `O_NONBLOCK` set, the `sendmsg()` function shall block until space is available. If space is not available at the sending socket to hold the message to be transmitted and the socket file descriptor does have `O_NONBLOCK` set, the `sendmsg()` function shall fail.

60000 If the socket protocol supports broadcast and the specified address is a broadcast address for the socket protocol, `sendmsg()` shall fail if the `SO_BROADCAST` option is not set for the socket.

60002 The socket in use may require the process to have appropriate privileges to use the `sendmsg()` function.

60004 **RETURN VALUE**

60005 Upon successful completion, *sendmsg()* shall return the number of bytes sent. Otherwise, *-1*
60006 shall be returned and *errno* set to indicate the error.

60007 **ERRORS**

60008 The *sendmsg()* function shall fail if:

60009 [EAGAIN] or [EWOULDBLOCK]

60010 The socket's file descriptor is marked O_NONBLOCK and the requested
60011 operation would block.

60012 [EAFNOSUPPORT]

60013 Addresses in the specified address family cannot be used with this socket.

60014 [EBADF] The *socket* argument is not a valid file descriptor.

60015 [ECONNRESET] A connection was forcibly closed by a peer.

60016 [EINTR] A signal interrupted *sendmsg()* before any data was transmitted.

60017 [EINVAL] The sum of the *iov_len* values overflows an *ssize_t*.

60018 [EMSGSIZE] The message is too large to be sent all at once (as the socket requires), or the
60019 *msg_iovlen* member of the **msghdr** structure pointed to by *message* is less than
60020 or equal to 0 or is greater than {IOV_MAX}.

60021 [ENOTCONN] The socket is connection-mode but is not connected.

60022 [ENOTSOCK] The *socket* argument does not refer to a socket.

60023 [EOPNOTSUPP] The *socket* argument is associated with a socket that does not support one or
60024 more of the values set in *flags*.

60025 [EPIPE] The socket is shut down for writing, or the socket is connection-mode and is
60026 no longer connected. In the latter case, and if the socket is of type
60027 SOCK_STREAM or SOCK_SEQPACKET and the MSG_NOSIGNAL flag is not
60028 set, the SIGPIPE signal is generated to the calling thread.

60029 If the address family of the socket is AF_UNIX, then *sendmsg()* shall fail if:

60030 [EIO] An I/O error occurred while reading from or writing to the file system.

60031 [ELOOP] A loop exists in symbolic links encountered during resolution of the pathname
60032 in the socket address.

60033 [ENAMETOOLONG]

60034 The length of a component of a pathname is longer than {NAME_MAX}.

60035 [ENOENT] A component of the pathname does not name an existing file or the path name
60036 is an empty string.

60037 [ENOTDIR] A component of the path prefix of the pathname in the socket address names
60038 an existing file that is neither a directory nor a symbolic link to a directory, or
60039 the pathname in the socket address contains at least one non-*<slash>* character
60040 and ends with one or more trailing *<slash>* characters and the last pathname
60041 component names an existing file that is neither a directory nor a symbolic
60042 link to a directory.

60043 The *sendmsg()* function may fail if:

60044 [EACCES] Search permission is denied for a component of the path prefix; or write access
60045 to the named socket is denied.

60046 [EDESTADDRREQ]
60047 The socket is not connection-mode and does not have its peer address set, and
60048 no destination address was specified.

60049 [EHOSTUNREACH]
60050 The destination host cannot be reached (probably because the host is down or
60051 a remote router cannot reach it).

60052 [EIO] An I/O error occurred while reading from or writing to the file system.

60053 [EISCONN] A destination address was specified and the socket is already connected.

60054 [ENETDOWN] The local network interface used to reach the destination is down.

60055 [ENETUNREACH]
60056 No route to the network is present.

60057 [ENOBUFS] Insufficient resources were available in the system to perform the operation.

60058 [ENOMEM] Insufficient memory was available to fulfill the request.

60059 If the address family of the socket is AF_UNIX, then *sendmsg()* may fail if:

60060 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
60061 resolution of the pathname in the socket address.

60062 [ENAMETOOLONG]
60063 The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a
60064 symbolic link produced an intermediate result with a length that exceeds
60065 {PATH_MAX}.

EXAMPLES

60066 Done.

APPLICATION USAGE

60068 The *select()* and *poll()* functions can be used to determine when it is possible to send more data.

60089 **NAME**60090 `sendto` — send a message on a socket60091 **SYNOPSIS**

```
60092 #include <sys/socket.h>
60093 ssize_t sendto(int socket, const void *message, size_t length,
60094               int flags, const struct sockaddr *dest_addr,
60095               socklen_t dest_len);
```

60096 **DESCRIPTION**

60097 The `sendto()` function shall send a message through a connection-mode or connectionless-mode
 60098 socket.

60099 If the socket is a connectionless-mode socket, the message shall be sent to the address specified
 60100 by `dest_addr` if no pre-specified peer address has been set. If a peer address has been pre-
 60101 specified, either the message shall be sent to the address specified by `dest_addr` (overriding the
 60102 pre-specified peer address), or the function shall return `-1` and set `errno` to `[EISCONN]`.

60103 If the socket is connection-mode, `dest_addr` shall be ignored.

60104 The `sendto()` function takes the following arguments:

60105	<i>socket</i>	Specifies the socket file descriptor.
60106	<i>message</i>	Points to a buffer containing the message to be sent.
60107	<i>length</i>	Specifies the size of the message in bytes.
60108	<i>flags</i>	Specifies the type of message transmission. Values of this argument are 60109 formed by logically OR'ing zero or more of the following flags:
60110		MSG_EOR Terminates a record (if supported by the protocol).
60111		MSG_OOB Sends out-of-band data on sockets that support out-of- 60112 band data. The significance and semantics of out-of- 60113 band data are protocol-specific.
60114		MSG_NOSIGNAL Requests not to send the SIGPIPE signal if an attempt to 60115 send is made on a stream-oriented socket that is no 60116 longer connected. The <code>[EPIPE]</code> error shall still be 60117 returned.
60118	<i>dest_addr</i>	Points to a sockaddr structure containing the destination address. The length 60119 and format of the address depend on the address family of the socket.
60120	<i>dest_len</i>	Specifies the length of the sockaddr structure pointed to by the <code>dest_addr</code> 60121 argument.

60122 If the socket protocol supports broadcast and the specified address is a broadcast address for the
 60123 socket protocol, `sendto()` shall fail if the `SO_BROADCAST` option is not set for the socket.

60124 The `dest_addr` argument specifies the address of the target.

60125 The `length` argument specifies the length of the message.

60126 Successful completion of a call to `sendto()` does not guarantee delivery of the message. A return
 60127 value of `-1` indicates only locally-detected errors.

60128 If space is not available at the sending socket to hold the message to be transmitted and the
 60129 socket file descriptor does not have `O_NONBLOCK` set, `sendto()` shall block until space is
 60130 available. If space is not available at the sending socket to hold the message to be transmitted

60131 and the socket file descriptor does have O_NONBLOCK set, *sendto()* shall fail.
 60132 The socket in use may require the process to have appropriate privileges to use the *sendto()*
 60133 function.

60134 **RETURN VALUE**

60135 Upon successful completion, *sendto()* shall return the number of bytes sent. Otherwise, -1 shall
 60136 be returned and *errno* set to indicate the error.

60137 **ERRORS**

60138 The *sendto()* function shall fail if:

60139 [EAFNOSUPPORT]

60140 Addresses in the specified address family cannot be used with this socket.

60141 [EAGAIN] or [EWOULDBLOCK]

60142 The socket's file descriptor is marked O_NONBLOCK and the requested
 60143 operation would block.

60144 [EBADF] The *socket* argument is not a valid file descriptor.

60145 [ECONNRESET] A connection was forcibly closed by a peer.

60146 [EINTR] A signal interrupted *sendto()* before any data was transmitted.

60147 [EMSGSIZE] The message is too large to be sent all at once, as the socket requires.

60148 [ENOTCONN] The socket is connection-mode but is not connected.

60149 [ENOTSOCK] The *socket* argument does not refer to a socket.

60150 [EOPNOTSUPP] The *socket* argument is associated with a socket that does not support one or
 60151 more of the values set in *flags*.

60152 [EPIPE] The socket is shut down for writing, or the socket is connection-mode and is
 60153 no longer connected. In the latter case, and if the socket is of type
 60154 SOCK_STREAM or SOCK_SEQPACKET and the MSG_NOSIGNAL flag is not
 60155 set, the SIGPIPE signal is generated to the calling thread.

60156 If the address family of the socket is AF_UNIX, then *sendto()* shall fail if:

60157 [EIO] An I/O error occurred while reading from or writing to the file system.

60158 [ELOOP] A loop exists in symbolic links encountered during resolution of the pathname
 60159 in the socket address.

60160 [ENAMETOOLONG]

60161 The length of a component of a pathname is longer than {NAME_MAX}.

60162 [ENOENT] A component of the pathname does not name an existing file or the pathname
 60163 is an empty string.

60164 [ENOTDIR] A component of the path prefix of the pathname in the socket address names
 60165 an existing file that is neither a directory nor a symbolic link to a directory, or
 60166 the pathname in the socket address contains at least one non-*<slash>* character
 60167 and ends with one or more trailing *<slash>* characters and the last pathname
 60168 component names an existing file that is neither a directory nor a symbolic
 60169 link to a directory.

60170 The *sendto()* function may fail if:

60171 [EACCES] Search permission is denied for a component of the path prefix; or write access
60172 to the named socket is denied.

60173 [EDESTADDRREQ]
60174 The socket is not connection-mode and does not have its peer address set, and
60175 no destination address was specified.

60176 [EHOSTUNREACH]
60177 The destination host cannot be reached (probably because the host is down or
60178 a remote router cannot reach it).

60179 [EINVAL] The *dest_len* argument is not a valid length for the address family.

60180 [EIO] An I/O error occurred while reading from or writing to the file system.

60181 [EISCONN] A destination address was specified and the socket is already connected.

60182 [ENETDOWN] The local network interface used to reach the destination is down.

60183 [ENETUNREACH]
60184 No route to the network is present.

60185 [ENOBUFS] Insufficient resources were available in the system to perform the operation.

60186 [ENOMEM] Insufficient memory was available to fulfill the request.

60187 If the address family of the socket is AF_UNIX, then *sendto()* may fail if:

60188 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
60189 resolution of the pathname in the socket address.

60190 [ENAMETOOLONG]
60191 The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a
60192 symbolic link produced an intermediate result with a length that exceeds
60193 {PATH_MAX}.

+

NAME

setbuf — assign buffering to a stream

SYNOPSIS

```
#include <stdio.h>
```

```
void setbuf(FILE *restrict stream, char *restrict buf);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

Except that it returns no value, the function call:

```
setbuf(stream, buf)
```

shall be equivalent to:

```
setvbuf(stream, buf, _IOFBF, BUFSIZ)
```

if *buf* is not a null pointer, or to:

```
setvbuf(stream, buf, _IONBF, BUFSIZ)
```

if *buf* is a null pointer.

RETURN VALUE

The *setbuf()* function shall not return a value.

ERRORS

Although the *setvbuf()* interface may set *errno* in defined ways, the value of *errno* after a call to *setbuf()* is unspecified.

EXAMPLES

None.

APPLICATION USAGE

A common source of error is allocating buffer space as an “automatic” variable in a code block, and then failing to close the stream in the same block.

With *setbuf()*, allocating a buffer of BUFSIZ bytes does not necessarily imply that all of BUFSIZ bytes are used for the buffer area.

Since *errno* is not required to be unchanged on success, in order to correctly detect and possibly recover from errors, applications should use *setvbuf()* instead of *setbuf()*.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

60258 **Issue 6**

60259 The prototype for *setbuf()* is updated for alignment with the ISO/IEC 9899:1999 standard.

60260 **Issue 7**

60261 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0546 [397], XSH/TC1-2008/0547 [397], +
60262 and XSH/TC1-2008/0548 [14] are applied.

NAME

setegid — set the effective group ID

SYNOPSIS

```
#include <unistd.h>
```

```
int setegid(gid_t gid);
```

DESCRIPTION

If *gid* is equal to the real group ID or the saved set-group-ID, or if the process has appropriate privileges, *setegid()* shall set the effective group ID of the calling process to *gid*; the real group ID, saved set-group-ID, and any supplementary group IDs shall remain unchanged.

The *setegid()* function shall not affect the supplementary group list in any way.

RETURN VALUE

Upon successful completion, 0 shall be returned; otherwise, -1 shall be returned and *errno* set to indicate the error.

ERRORS

The *setegid()* function shall fail if:

[EINVAL]	The value of the <i>gid</i> argument is invalid and is not supported by the implementation.
[EPERM]	The process does not have appropriate privileges and <i>gid</i> does not match the real group ID or the saved set-group-ID.

EXAMPLES

None.

APPLICATION USAGE

CHANGE HISTORY

First released in Issue 6. Derived from the IEEE P1003.1a draft standard.

NAME

setenv — add or change environment variable

SYNOPSIS

```
#include <stdlib.h>

int setenv(const char *envname, const char *envval, int overwrite);
```

DESCRIPTION

The *setenv()* function shall update or add a variable in the environment of the calling process. The *envname* argument points to a string containing the name of an environment variable to be added or altered. The environment variable shall be set to the value to which *envval* points. The function shall fail if *envname* points to a string which contains an '=' character. If the environment variable named by *envname* already exists and the value of *overwrite* is non-zero, the function shall return success and the environment shall be updated. If the environment variable named by *envname* already exists and the value of *overwrite* is zero, the function shall return success and the environment shall remain unchanged.

The *setenv()* function shall update the list of pointers to which *environ* points.

The strings described by *envname* and *envval* are copied by this function.

The *setenv()* function need not be thread-safe.

RETURN VALUE

Upon successful completion, zero shall be returned. Otherwise, -1 shall be returned, *errno* set to indicate the error, and the environment shall be unchanged.

ERRORS

The *setenv()* function shall fail if:

[EINVAL] The *envname* argument points to an empty string or points to a string containing an '=' character.

[ENOMEM] Insufficient memory was available to add a variable or its value to the environment.

EXAMPLES

None.

APPLICATION USAGE

See *exec()* for restrictions on changing the environment in multi-threaded applications.

RATIONALE

Unanticipated results may occur if *setenv()* changes the external variable *environ*. In particular, if the optional *envp* argument to *main()* is present, it is not changed, and thus may point to an obsolete copy of the environment (as may any other copy of *environ*). However, other than the aforementioned restriction, the standard developers intended that the traditional method of walking through the environment by way of the *environ* pointer must be supported.

It was decided that *setenv()* should be required by this version because it addresses a piece of missing functionality, and does not impose a significant burden on the implementor.

There was considerable debate as to whether the System V *putenv()* function or the BSD *setenv()* function should be required as a mandatory function. The *setenv()* function was chosen because it permitted the implementation of the *unsetenv()* function to delete environmental variables, without specifying an additional interface. The *putenv()* function is available as part of the XSI option.

60338 The standard developers considered requiring that *setenv()* indicate an error when a call to it
60339 would result in exceeding {ARG_MAX}. The requirement was rejected since the condition might
60340 be temporary, with the application eventually reducing the environment size. The ultimate
60341 success or failure depends on the size at the time of a call to *exec*, which returns an indication of
60342 this error condition.

60343 See also the RATIONALE section in *getenv()*.

NAME

seteuid — set effective user ID

SYNOPSIS

```
#include <unistd.h>
```

```
int seteuid(uid_t uid);
```

DESCRIPTION

If *uid* is equal to the real user ID or the saved set-user-ID, or if the process has appropriate privileges, *seteuid()* shall set the effective user ID of the calling process to *uid*; the real user ID and saved set-user-ID shall remain unchanged.

The *seteuid()* function shall not affect the supplementary group list in any way.

RETURN VALUE

Upon successful completion, 0 shall be returned; otherwise, -1 shall be returned and *errno* set to indicate the error.

ERRORS

The *seteuid()* function shall fail if:

[EINVAL] The value of the *uid* argument is invalid and is not supported by the implementation.

[EPERM] The process does not have appropriate privileges and *uid* does not match the real user ID or the saved set-user-ID.

60391 **NAME**

60392 setgid — set-group-ID

60393 **SYNOPSIS**

60394 #include <unistd.h>

60395 int setgid(gid_t *gid*);60396 **DESCRIPTION**60397 If the process has appropriate privileges, *setgid()* shall set the real group ID, effective group ID,
60398 and the saved set-group-ID of the calling process to *gid*.60399 If the process does not have appropriate privileges, but *gid* is equal to the real group ID or the
60400 saved set-group-ID, *setgid()* shall set the effective group ID to *gid*; the real group ID and saved
60401 set-group-ID shall remain unchanged.60402 The *setgid()* function shall not affect the supplementary group list in any way.

60403 Any supplementary group IDs of the calling process shall remain unchanged.

60404 **RETURN VALUE**60405 Upon successful completion, 0 is returned. Otherwise, -1 shall be returned and *errno* set to
60406 indicate the error.60407 **ERRORS**60408 The *setgid()* function shall fail if:60409 [EINVAL] The value of the *gid* argument is invalid and is not supported by the
60410 implementation.60411 [EPERM] The process does not have appropriate privileges and *gid* does not match the
60412 real group ID or the saved set-group-ID.60413 **EXAMPLES**

60414 None.

60415 **APPLICATION USAGE**

60416 None.

60417 **RATIONALE**60418 Refer to the RATIONALE section in *setuid()*.60419 **FUTURE DIRECTIONS**

60420 None.

60421 **SEE ALSO**60422 *exec*, *getegid()*, *geteuid()*, *getgid()*, *getuid()*, *setegid()*, *seteuid()*, *setregid()*, *setreuid()*, *setuid()*

60423 XBD <sys/types.h>, <unistd.h>

60424 **CHANGE HISTORY**

60425 First released in Issue 1. Derived from Issue 1 of the SVID.

60426 **Issue 6**

60427 In the SYNOPSIS, the optional include of the <sys/types.h> header is removed.

60428 The following new requirements on POSIX implementations derive from alignment with the
60429 Single UNIX Specification:

- 60430 • The requirement to include <sys/types.h> has been removed. Although <sys/types.h> was
60431 required for conforming implementations of previous POSIX specifications, it was not
60432 required for UNIX applications.

- 60433 • Functionality associated with `_POSIX_SAVED_IDS` is now mandated. This is a FIPS
60434 requirement.

60435 The following changes were made to align with the IEEE P1003.1a draft standard:

- 60436 • The effects of `setgid()` in processes without appropriate privileges are changed.
- 60437 • A requirement that the supplementary group list is not affected is added.

60438 **NAME**

60439 setgrent — reset the group database to the first entry

60440 **SYNOPSIS**

```
60441 XSI      #include <grp.h>
60442          void setgrent(void);
```

60443 **DESCRIPTION**60444 Refer to *endgrent()*.

60445 **NAME**
60446 sethostent — network host database functions

60447 **SYNOPSIS**
60448 #include <netdb.h>
60449 void sethostent(int *stayopen*);

60450 **DESCRIPTION**
60451 Refer to *endhostent()*.

60452 **NAME**

60453 setitimer — set the value of an interval timer

60454 **SYNOPSIS**

60455 OB XSI #include <sys/time.h>

```
60456       int setitimer(int which, const struct itimerval *restrict value,  
60457                    struct itimerval *restrict ovalue);
```

60458 **DESCRIPTION**60459 Refer to *getitimer()*.

NAME

setjmp — set jump point for a non-local goto

SYNOPSIS

```
#include <setjmp.h>
```

```
int setjmp(jmp_buf env);
```

DESCRIPTION

The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

A call to *setjmp()* shall save the calling environment in its *env* argument for later use by *longjmp()*.

It is unspecified whether *setjmp()* is a macro or a function. If a macro definition is suppressed in order to access an actual function, or a program defines an external identifier with the name *setjmp*, the behavior is undefined.

An application shall ensure that an invocation of *setjmp()* appears in one of the following contexts only:

- The entire controlling expression of a selection or iteration statement
- One operand of a relational or equality operator with the other operand an integral constant expression, with the resulting expression being the entire controlling expression of a selection or iteration statement
- The operand of a unary '!' operator with the resulting expression being the entire controlling expression of a selection or iteration
- The entire expression of an expression statement (possibly cast to **void**)

If the invocation appears in any other context, the behavior is undefined.

RETURN VALUE

If the return is from a direct invocation, *setjmp()* shall return 0. If the return is from a call to *longjmp()*, *setjmp()* shall return a non-zero value.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

In general, *sigsetjmp()* is more useful in dealing with errors and interrupts encountered in a low-level subroutine of a program.

RATIONALE

None.

FUTURE DIRECTIONS

None.

60501	CHANGE HISTORY
60502	First released in Issue 1. Derived from Issue 1 of the SVID.
60503	Issue 6
60504	The normative text is updated to avoid use of the term “must” for application requirements.

NAME

setkey — set encoding key (**CRYPT**)

SYNOPSIS

```
XSI      #include <stdlib.h>
void setkey(const char *key);
```

DESCRIPTION

The *setkey()* function provides access to an implementation-defined encoding algorithm. The argument of *setkey()* is an array of length 64 bytes containing only the bytes with numerical value of 0 and 1. If this string is divided into groups of 8, the low-order bit in each group is ignored; this gives a 56-bit key which is used by the algorithm. This is the key that shall be used with the algorithm to encode a string *block* passed to *encrypt()*.

The *setkey()* function shall not change the setting of *errno* if successful. An application wishing to check for error situations should set *errno* to 0 before calling *setkey()*. If *errno* is non-zero on return, an error has occurred.

The *setkey()* function need not be thread-safe.

RETURN VALUE

No values are returned.

ERRORS

The *setkey()* function shall fail if:

[ENOSYS] The functionality is not supported on this implementation.

EXAMPLES

None.

APPLICATION USAGE

Decoding need not be implemented in all environments. This is related to government restrictions in some countries on encryption and decryption routines. Historical practice has been to ship a different version of the encryption library without the decryption feature in the routines supplied. Thus the exported version of *encrypt()* does encoding but not decoding.

RATIONALE

None.

FUTURE DIRECTIONS

None.

Austin Group Interpretation 1003.1-2001 #156 is applied.

60545 **NAME**

60546 setlocale — set program locale

60547 **SYNOPSIS**

60548 #include <locale.h>

60549 char *setlocale(int *category*, const char **locale*);60550 **DESCRIPTION**

60551 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 60552 conflict between the requirements described here and the ISO C standard is unintentional. This
 60553 volume of POSIX.1-2008 defers to the ISO C standard.

60554 The *setlocale()* function selects the appropriate piece of the global locale, as specified by the
 60555 *category* and *locale* arguments, and can be used to change or query the entire global locale or
 60556 portions thereof. The value LC_ALL for *category* names the entire global locale; other values for
 60557 *category* name only a part of the global locale:

60558 LC_COLLATE Affects the behavior of regular expressions and the collation functions.

60559 LC_CTYPE Affects the behavior of regular expressions, character classification, character
 60560 conversion functions, and wide-character functions.

60561 CX LC_MESSAGES Affects the affirmative and negative response expressions returned by
 60562 *nl_langinfo()* and the way message catalogs are located. It may also affect the
 60563 behavior of functions that return or write message strings.

60564 LC_MONETARY Affects the behavior of functions that handle monetary values.

60565 LC_NUMERIC Affects the behavior of functions that handle numeric values.

60566 LC_TIME Affects the behavior of the time conversion functions.

60567 The *locale* argument is a pointer to a character string containing the required setting of *category*.
 60568 The contents of this string are implementation-defined. In addition, the following preset values
 60569 of *locale* are defined for all settings of *category*:

60570 CX "POSIX" Specifies the minimal environment for C-language translation called the
 60571 POSIX locale. The POSIX locale is the default global locale at entry to *main()*.

60572 "C" Equivalent to "POSIX".

60573 CX "" Specifies an implementation-defined native environment. The determination
 60574 of the name of the new locale for the specified category depends on the value
 60575 of the associated environment variables, *LC_** and *LANG*; see XBD Chapter 7
 60576 (on page 135) and Chapter 8 (on page 173).

60577 A null pointer Directs *setlocale()* to query the current global locale setting and return the
 60578 name of the locale if *category* is not LC_ALL, or a string which encodes the
 60579 locale name(s) for all of the individual categories if *category* is LC_ALL.

60580 CX Setting all of the categories of the global locale is similar to successively setting each individual
 60581 category of the global locale, except that all error checking is done before any actions are
 60582 performed. To set all the categories of the global locale, *setlocale()* can be invoked as:

60583 setlocale(LC_ALL, "");

60584 In this case, *setlocale()* shall first verify that the values of all the environment variables it needs
 60585 according to the precedence rules (described in XBD Chapter 8, on page 173) indicate supported
 60586 locales. If the value of any of these environment variable searches yields a locale that is not
 60587 supported (and non-null), *setlocale()* shall return a null pointer and the global locale shall not be

changed. If all environment variables name supported locales, *setlocale()* shall proceed as if it had been called for each category, using the appropriate value from the associated environment variable or from the implementation-defined default if there is no such value.

The global locale established using *setlocale()* shall only be used in threads for which no current locale has been set using *uselocale()* or whose current locale has been set to the global locale using *uselocale(LC_GLOBAL_LOCALE)*.

The implementation shall behave as if no function defined in this volume of POSIX.1-2008 calls *setlocale()*.

RETURN VALUE

Upon successful completion, *setlocale()* shall return the string associated with the specified category for the new locale. Otherwise, *setlocale()* shall return a null pointer and the global locale shall not be changed.

A null pointer for *locale* shall cause *setlocale()* to return a pointer to the string associated with the specified *category* for the current global locale. The global locale shall not be changed.

The string returned by *setlocale()* is such that a subsequent call with that string and its associated *category* shall restore that part of the global locale. The application shall not modify the string returned. The returned string pointer might be invalidated or the string content might be overwritten by a subsequent call to *setlocale()*.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

The following code illustrates how a program can initialize the international environment for one language, while selectively modifying the global locale such that regular expressions and string operations can be applied to text recorded in a different language:

```
setlocale(LC_ALL, "De");
setlocale(LC_COLLATE, "Fr@dict");
```

Internationalized programs can initiate language operation according to environment variable settings (see XBD [Section 8.2](#), on page 174) by calling *setlocale()* as follows:

```
setlocale(LC_ALL, "");
```

Changing the setting of *LC_MESSAGES* has no effect on catalogs that have already been opened by calls to *catopen()*.

In order to make use of different locale settings while multiple threads are running, applications should use *uselocale()* in preference to *setlocale()*.

RATIONALE

References to the international environment or locale in the following text relate to the global locale for the process. This can be overridden for individual threads using *uselocale()*.

The ISO C standard defines a collection of functions to support internationalization. One of the most significant aspects of these functions is a facility to set and query the *international environment*. The international environment is a repository of information that affects the behavior of certain functionality, namely:

1. Character handling
2. Collating
3. Date/time formatting
4. Numeric editing
5. Monetary formatting
6. Messaging

The `setlocale()` function provides the application developer with the ability to set all or portions, called *categories*, of the international environment. These categories correspond to the areas of functionality mentioned above. The syntax for `setlocale()` is as follows:

```
char *setlocale(int category, const char *locale);
```

where *category* is the name of one of following categories, namely:

```
LC_COLLATE
LC_CTYPE
LC_MESSAGES
LC_MONETARY
LC_NUMERIC
LC_TIME
```

In addition, a special value called `LC_ALL` directs `setlocale()` to set all categories.

There are two primary uses of `setlocale()`:

1. Querying the international environment to find out what it is set to
2. Setting the international environment, or *locale*, to a specific value

The behavior of `setlocale()` in these two areas is described below. Since it is difficult to describe the behavior in words, examples are used to illustrate the behavior of specific uses.

To query the international environment, `setlocale()` is invoked with a specific category and the null pointer as the locale. The null pointer is a special directive to `setlocale()` that tells it to query rather than set the international environment. The following syntax is used to query the name of the international environment:

```
setlocale({LC_ALL, LC_COLLATE, LC_CTYPE, LC_MESSAGES, LC_MONETARY, \
          LC_NUMERIC, LC_TIME}, (char *) NULL);
```

The `setlocale()` function shall return the string corresponding to the current international environment. This value may be used by a subsequent call to `setlocale()` to reset the international environment to this value. However, it should be noted that the return value from `setlocale()` may be a pointer to a static area within the function and is not guaranteed to remain unchanged (that is, it may be modified by a subsequent call to `setlocale()`). Therefore, if the purpose of calling `setlocale()` is to save the value of the current international environment so it can be changed and reset later, the return value should be copied to an array of `char` in the calling program.

There are three ways to set the international environment with `setlocale()`:

`setlocale(category, string)`

This usage sets a specific *category* in the international environment to a specific value corresponding to the value of the *string*. A specific example is provided below:

```
60671     setlocale(LC_ALL, "fr_FR.ISO-8859-1");
```

60672 In this example, all categories of the international environment are set to the locale
60673 corresponding to the string "fr_FR.ISO-8859-1", or to the French language as spoken in
60674 France using the ISO/IEC 8859-1:1998 standard codeset.

60675 If the string does not correspond to a valid locale, *setlocale()* shall return a null pointer and
60676 the international environment is not changed. Otherwise, *setlocale()* shall return the name of
60677 the locale just set.

```
60678     setlocale(category, "C")
```

60679 The ISO C standard states that one locale must exist on all conforming implementations.
60680 The name of the locale is C and corresponds to a minimal international environment needed
60681 to support the C programming language.

```
60682     setlocale(category, "")
```

60683 This sets a specific category to an implementation-defined default. This corresponds to the
60684 value of the environment variables.

60685 FUTURE DIRECTIONS

60686 None.

60713 applied.

60714 **NAME**

60715 setlogmask — set the log priority mask

60716 **SYNOPSIS**60717 XSI `#include <syslog.h>`60718 `int setlogmask(int maskpri);`60719 **DESCRIPTION**60720 Refer to *closelog()*.

60721 **NAME**

60722 setnetent — network database function

60723 **SYNOPSIS**

60724 #include <netdb.h>

60725 void setnetent(int *stayopen*);

60726 **DESCRIPTION**

60727 Refer to *endnetent()*.

60728 **NAME**

60729 setpgid — set process group ID for job control

60730 **SYNOPSIS**

60731 #include <unistd.h>

60732 int setpgid(pid_t pid, pid_t pgid);

60733 **DESCRIPTION**60734 The *setpgid()* function shall either join an existing process group or create a new process group within the session of the calling process.

60736 The process group ID of a session leader shall not change.

60737 Upon successful completion, the process group ID of the process with a process ID that matches *pid* shall be set to *pgid*.60739 As a special case, if *pid* is 0, the process ID of the calling process shall be used. Also, if *pgid* is 0, the process ID of the indicated process shall be used.60741 **RETURN VALUE**60742 Upon successful completion, *setpgid()* shall return 0; otherwise, -1 shall be returned and *errno* shall be set to indicate the error.60744 **ERRORS**60745 The *setpgid()* function shall fail if:60746 [EACCES] The value of the *pid* argument matches the process ID of a child process of the calling process and the child process has successfully executed one of the *exec* functions.60749 [EINVAL] The value of the *pgid* argument is less than 0, or is not a value supported by the implementation.60751 [EPERM] The process indicated by the *pid* argument is a session leader.60752 [EPERM] The value of the *pid* argument matches the process ID of a child process of the calling process and the child process is not in the same session as the calling process.60755 [EPERM] The value of the *pgid* argument is valid but does not match the process ID of the process indicated by the *pid* argument and there is no process with a process group ID that matches the value of the *pgid* argument in the same session as the calling process.60759 [ESRCH] The value of the *pid* argument does not match the process ID of the calling process or of a child process of the calling process.60761 **EXAMPLES**

60762 None.

60763 **APPLICATION USAGE**

60764 None.

60765 **RATIONALE**60766 The *setpgid()* function shall group processes together for the purpose of signaling, placement in foreground or background, and other job control actions.60768 The *setpgid()* function is similar to the *setpgrp()* function of 4.2 BSD, except that 4.2 BSD allowed the specified new process group to assume any value. This presents certain security problems and is more flexible than necessary to support job control.

To provide tighter security, *setpgid()* only allows the calling process to join a process group already in use inside its session or create a new process group whose process group ID was equal to its process ID.

When a job control shell spawns a new job, the processes in the job must be placed into a new process group via *setpgid()*. There are two timing constraints involved in this action:

1. The new process must be placed in the new process group before the appropriate program is launched via one of the *exec* functions.
2. The new process must be placed in the new process group before the shell can correctly send signals to the new process group.

To address these constraints, the following actions are performed. The new processes call *setpgid()* to alter their own process groups after *fork()* but before *exec*. This satisfies the first constraint. Under 4.3 BSD, the second constraint is satisfied by the synchronization property of *vfork()*; that is, the shell is suspended until the child has completed the *exec*, thus ensuring that the child has completed the *setpgid()*. A new version of *fork()* with this same synchronization property was considered, but it was decided instead to merely allow the parent shell process to adjust the process group of its child processes via *setpgid()*. Both timing constraints are now satisfied by having both the parent shell and the child attempt to adjust the process group of the child process; it does not matter which succeeds first.

Since it would be confusing to an application to have its process group change after it began executing (that is, after *exec*), and because the child process would already have adjusted its process group before this, the [EACCES] error was added to disallow this.

One non-obvious use of *setpgid()* is to allow a job control shell to return itself to its original process group (the one in effect when the job control shell was executed). A job control shell does this before returning control back to its parent when it is terminating or suspending itself as a way of restoring its job control “state” back to what its parent would expect. (Note that the original process group of the job control shell typically matches the process group of its parent, but this is not necessarily always the case.)

FUTURE DIRECTIONS

None.

SEE ALSO

exec, *getpgrp()*, *setsid()*, *tcsetpgrp()*

XBD [`<sys/types.h>`](#), [`<unistd.h>`](#)

CHANGE HISTORY

First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

Issue 6

In the SYNOPSIS, the optional include of the [`<sys/types.h>`](#) header is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include [`<sys/types.h>`](#) has been removed. Although [`<sys/types.h>`](#) was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- The *setpgid()* function is mandatory since `_POSIX_JOB_CONTROL` is required to be defined in this version. This is a FIPS requirement.

60814
60815
60816
60817

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/56 is applied, changing the wording in the DESCRIPTION from “the process group ID of the indicated process shall be used” to “the process ID of the indicated process shall be used”. This change reverts the wording to as in the ISO POSIX-1: 1996 standard; it appeared to be an unintentional change.

60818 **NAME**

60819 setpgrp — set the process group ID

60820 **SYNOPSIS**

```
60821 OB XSI  #include <unistd.h>
60822         pid_t setpgrp(void);
```

60823 **DESCRIPTION**

60824 If the calling process is not already a session leader, *setpgrp()* sets the process group ID of the
60825 calling process to the process ID of the calling process. If *setpgrp()* creates a new session, then the
60826 new session has no controlling terminal.

60827 The *setpgrp()* function has no effect when the calling process is a session leader.

60828 **RETURN VALUE**

60829 Upon completion, *setpgrp()* shall return the process group ID.

60830 **ERRORS**

60831 No errors are defined.

60832 **EXAMPLES**

60833 None.

60834 **APPLICATION USAGE**

60835 It is unspecified whether this function behaves as *setpgid(0,0)* or *setsid()* unless the process is
60836 already a session leader. Therefore, applications are encouraged to use *setpgid()* or *setsid()* as
60837 appropriate.

60838 **RATIONALE**

60839 None.

60840 **FUTURE DIRECTIONS**

60841 The *setpgrp()* function may be removed in a future version.

60842 **SEE ALSO**

60848 Moved from X/OPEN UNIX extension to BASE.

60849 **Issue 7**

60850 The *setpgrp()* function is marked obsolescent.

60851 **NAME**

60852 setpriority — set the nice value

60853 **SYNOPSIS**

```
60854 XSI      #include <sys/resource.h>
60855          int setpriority(int which, id_t who, int nice);
```

60856 **DESCRIPTION**60857 Refer to *getpriority()*.

60858 **NAME**

60859 setprotoent — network protocol database functions

60860 **SYNOPSIS**

60861 #include <netdb.h>

60862 void setprotoent(int *stayopen*);

60863 **DESCRIPTION**

60864 Refer to *endprotoent()*.

60865 **NAME**

60866 setpwent — user database function

60867 **SYNOPSIS**

60868 XSI #include <pwd.h>

60869 void setpwent(void);

60870 **DESCRIPTION**60871 Refer to *endpwent()*.

NAME

setregid — set real and effective group IDs

SYNOPSIS

```
XSI      #include <unistd.h>
int setregid(gid_t rgid, gid_t egid);
```

DESCRIPTION

The *setregid()* function shall set the real and effective group IDs of the calling process.

If *rgid* is -1 , the real group ID shall not be changed; if *egid* is -1 , the effective group ID shall not be changed.

The real and effective group IDs may be set to different values in the same call.

Only a process with appropriate privileges can set the real group ID and the effective group ID to any valid value.

A non-privileged process can set either the real group ID to the saved set-group-ID from one of the *exec* family of functions, or the effective group ID to the saved set-group-ID or the real group ID.

If the real group ID is being set (*rgid* is not -1), or the effective group ID is being set to a value not equal to the real group ID, then the saved set-group-ID of the current process shall be set equal to the new effective group ID.

Any supplementary group IDs of the calling process remain unchanged.

RETURN VALUE

Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to indicate the error, and neither of the group IDs are changed.

ERRORS

The *setregid()* function shall fail if:

[EINVAL]	The value of the <i>rgid</i> or <i>egid</i> argument is invalid or out-of-range.
[EPERM]	The process does not have appropriate privileges and a change other than changing the real group ID to the saved set-group-ID, or changing the effective group ID to the real group ID or the saved set-group-ID, was requested.

EXAMPLES

None.

APPLICATION USAGE

If a non-privileged set-group-ID process sets its effective group ID to its real group ID, it can only set its effective group ID back to the previous value if *rgid* was -1 in the *setregid()* call, since the saved-group-ID is not changed in that case. If *rgid* was equal to the real group ID in the *setregid()* call, then the saved set-group-ID will also have been changed to the real user ID.

RATIONALE

Earlier versions of this standard did not specify whether the saved set-group-ID was affected by *setregid()* calls. This version specifies common existing practice that constitutes an important security feature. The ability to set both the effective group ID and saved set-group-ID to be the same as the real group ID means that any security weakness in code that is executed after that point cannot result in malicious code being executed with the previous effective group ID. Privileged applications could already do this using just *setgid()*, but for non-privileged

60915 applications the only standard method available is to use this feature of *setregid()*.

60916 **FUTURE DIRECTIONS**

60917 None.

60918 **SEE ALSO**

60919 *exec*, *getegid()*, *geteuid()*, *getgid()*, *getuid()*, *setegid()*, *seteuid()*, *setgid()*, *setreuid()*, *setuid()*

60920 XBD <**unistd.h**>

60921 **CHANGE HISTORY**

60922 First released in Issue 4, Version 2.

60923 **Issue 5**

60924 Moved from X/OPEN UNIX extension to BASE.

60925 The DESCRIPTION is updated to indicate that the saved set-group-ID can be set by any of the
60926 *exec* family of functions, not just *execve()*.

60927 **Issue 7**

60928 SD5-XSH-ERN-177 is applied, adding the ability to set both the effective group ID and saved set-
60929 group-ID to be the same as the real group ID.

NAME

setreuid — set real and effective user IDs

SYNOPSIS

```
XSI      #include <unistd.h>
int setreuid(uid_t ruid, uid_t euid);
```

DESCRIPTION

The *setreuid()* function shall set the real and effective user IDs of the current process to the values specified by the *ruid* and *euid* arguments. If *ruid* or *euid* is *-1*, the corresponding effective or real user ID of the current process shall be left unchanged.

A process with appropriate privileges can set either ID to any value. An unprivileged process can only set the effective user ID if the *euid* argument is equal to either the real, effective, or saved user ID of the process.

If the real user ID is being set (*ruid* is not *-1*), or the effective user ID is being set to a value not equal to the real user ID, then the saved set-user-ID of the current process shall be set equal to the new effective user ID.

It is unspecified whether a process without appropriate privileges is permitted to change the real user ID to match the current effective user ID or saved set-user-ID of the process.

RETURN VALUE

Upon successful completion, 0 shall be returned. Otherwise, *-1* shall be returned and *errno* set to indicate the error.

ERRORS

The *setreuid()* function shall fail if:

[EINVAL]	The value of the <i>ruid</i> or <i>euid</i> argument is invalid or out-of-range.
[EPERM]	The current process does not have appropriate privileges, and either an attempt was made to change the effective user ID to a value other than the real user ID or the saved set-user-ID or an attempt was made to change the real user ID to a value not permitted by the implementation.

EXAMPLES**Setting the Effective User ID to the Real User ID**

The following example sets the effective user ID of the calling process to the real user ID, so that files created later will be owned by the current user. It also sets the saved set-user-ID to the real user ID, so any future attempt to set the effective user ID back to its previous value will fail.

```
#include <unistd.h>
#include <sys/types.h>
...
setreuid(getuid(), getuid());
...
```

APPLICATION USAGE

None.

RATIONALE

Earlier versions of this standard did not specify whether the saved set-user-ID was affected by *setreuid()* calls. This version specifies common existing practice that constitutes an important security feature. The ability to set both the effective user ID and saved set-user-ID to be the same as the real user ID means that any security weakness in code that is executed after that point cannot result in malicious code being executed with the previous effective user ID. Privileged applications could already do this using just *setuid()*, but for non-privileged applications the only standard method available is to use this feature of *setreuid()*.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Issue 7

SD5-XSH-ERN-177 is applied, adding the ability to set both the effective user ID and the saved set-user-ID to be the same as the real user ID.

60989 NAME

60990 setrlimit — control maximum resource consumption

60991 SYNOPSIS

60992 XSI `#include <sys/resource.h>`

60993 `int setrlimit(int resource, const struct rlimit *rlp);`

60994 DESCRIPTION

60995 Refer to *getrlimit()*.

60996 **NAME**

60997 setservent — network services database functions

60998 **SYNOPSIS**

60999 #include <netdb.h>

61000 void setservent(int *stayopen*);61001 **DESCRIPTION**61002 Refer to *endservent()*.

61003 **NAME**

61004 setsid — create session and set process group ID

61005 **SYNOPSIS**

61006 #include <unistd.h>

61007 pid_t setsid(void);

61008 **DESCRIPTION**

61009 The *setsid()* function shall create a new session, if the calling process is not a process group
 61010 leader. Upon return the calling process shall be the session leader of this new session, shall be
 61011 the process group leader of a new process group, and shall have no controlling terminal. The
 61012 process group ID of the calling process shall be set equal to the process ID of the calling process.
 61013 The calling process shall be the only process in the new process group and the only process in
 61014 the new session.

61015 **RETURN VALUE**

61016 Upon successful completion, *setsid()* shall return the value of the new process group ID of the
 61017 calling process. Otherwise, it shall return -1 and set *errno* to indicate the error.

61018 **ERRORS**61019 The *setsid()* function shall fail if:

61020 [EPERM] The calling process is already a process group leader, or the process group ID
 61021 of a process other than the calling process matches the process ID of the
 61022 calling process.

61023 **EXAMPLES**

61024 None.

61025 **APPLICATION USAGE**

61026 None.

61027 **RATIONALE**

61028 The *setsid()* function is similar to the *setpgid()* function of System V. System V, without job
 61029 control, groups processes into process groups and creates new process groups via *setpgid()*; only
 61030 one process group may be part of a login session.

61031 Job control allows multiple process groups within a login session. In order to limit job control
 61032 actions so that they can only affect processes in the same login session, this volume of
 61033 POSIX.1-2008 adds the concept of a session that is created via *setsid()*. The *setsid()* function also
 61034 creates the initial process group contained in the session. Additional process groups can be
 61035 created via the *setpgid()* function. A System V process group would correspond to a POSIX
 61036 System Interfaces session containing a single POSIX process group. Note that this function
 61037 requires that the calling process not be a process group leader. The usual way to ensure this is
 61038 true is to create a new process with *fork()* and have it call *setsid()*. The *fork()* function
 61039 guarantees that the process ID of the new process does not match any existing process group ID.

61040 **FUTURE DIRECTIONS**

61041 None.

61042 **SEE ALSO**61043 *getsid()*, *setpgid()*, *setpgid()*

61044 XBD <sys/types.h>, <unistd.h>

CHANGE HISTORY

61045 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

Issue 6

61047 In the SYNOPSIS, the optional include of the `<sys/types.h>` header is removed.

61049 The following new requirements on POSIX implementations derive from alignment with the
61050 Single UNIX Specification:

- 61051 • The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was
61052 required for conforming implementations of previous POSIX specifications, it was not
61053 required for UNIX applications.

Issue 7

61054 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0570 [421] is applied.

+

NAME

setsockopt — set the socket options

SYNOPSIS

```
#include <sys/socket.h>

int setsockopt(int socket, int level, int option_name,
               const void *option_value, socklen_t option_len);
```

DESCRIPTION

The *setsockopt()* function shall set the option specified by the *option_name* argument, at the protocol level specified by the *level* argument, to the value pointed to by the *option_value* argument for the socket associated with the file descriptor specified by the *socket* argument.

The *level* argument specifies the protocol level at which the option resides. To set options at the socket level, specify the *level* argument as SOL_SOCKET. To set options at other levels, supply the appropriate *level* identifier for the protocol controlling the option. For example, to indicate that an option is interpreted by the TCP (Transport Control Protocol), set *level* to IPPROTO_TCP as defined in the **<netinet/in.h>** header.

The *option_name* argument specifies a single option to set. It can be one of the socket-level options defined in **<sys/socket.h>** and described in [Section 2.10.16](#) (on page 527). If *option_name* is equal to SO_RCVTIMEO or SO_SNDTIMEO and the implementation supports setting the option, it is unspecified whether the **struct timeval** pointed to by *option_value* is stored as provided by this function or is rounded up to align with the resolution of the clock being used. If *setsockopt()* is called with *option_name* equal to SO_ACCEPTCONN, SO_ERROR, or SO_TYPE, the behavior is unspecified.

RETURN VALUE

Upon successful completion, *setsockopt()* shall return 0. Otherwise, -1 shall be returned and *errno* set to indicate the error.

ERRORS

The *setsockopt()* function shall fail if:

- [EBADF] The *socket* argument is not a valid file descriptor.
- [EDOM] The send and receive timeout values are too big to fit into the timeout fields in the socket structure.
- [EINVAL] The specified option is invalid at the specified socket level or the socket has been shut down.
- [EISCONN] The socket is already connected, and a specified option cannot be set while the socket is connected.
- [ENOPROTOOPT] The option is not supported by the protocol.
- [ENOTSOCK] The *socket* argument does not refer to a socket.

The *setsockopt()* function may fail if:

- [ENOMEM] There was insufficient memory available for the operation to complete.
- [ENOBUFS] Insufficient resources are available in the system to complete the call.

61096 EXAMPLES

61097 None.

61098 APPLICATION USAGE

61099 The *setsockopt()* function provides an application program with the means to control socket
61100 behavior. An application program can use *setsockopt()* to allocate buffer space, control timeouts,
61101 or permit socket data broadcasts. The **<sys/socket.h>** header defines the socket-level options
61102 available to *setsockopt()*.

61103 Options may exist at multiple protocol levels. The SO_ options are always present at the
61104 uppermost socket level.

61105 RATIONALE

61106 None.

61107 FUTURE DIRECTIONS

61108 None.

61109 SEE ALSO

61112 CHANGE HISTORY

61113 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

61114 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/125 is applied, updating the SO_LINGER
61115 option in the DESCRIPTION to refer to the calling thread rather than the process.

61116 Issue 7

61117 Austin Group Interpretation 1003.1-2001 #158 is applied, removing text relating to socket options
61118 that is now in [Section 2.10.16](#) (on page 527).

61119 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0571 [369] is applied.

+

61120 NAME

61121 setstate — switch pseudo-random number generator state arrays

61122 SYNOPSIS

```
61123 XSI       #include <stdlib.h>  
61124       char *setstate(char *state);
```

61125 DESCRIPTION

61126 Refer to *initstate()*.

61127 **NAME**

61128 setuid — set user ID

61129 **SYNOPSIS**

61130 #include <unistd.h>

61131 int setuid(uid_t uid);

61132 **DESCRIPTION**

61133 If the process has appropriate privileges, *setuid()* shall set the real user ID, effective user ID, and
 61134 the saved set-user-ID of the calling process to *uid*.

61135 If the process does not have appropriate privileges, but *uid* is equal to the real user ID or the
 61136 saved set-user-ID, *setuid()* shall set the effective user ID to *uid*; the real user ID and saved set-
 61137 user-ID shall remain unchanged.

61138 The *setuid()* function shall not affect the supplementary group list in any way.

61139 **RETURN VALUE**

61140 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to
 61141 indicate the error.

61142 **ERRORS**

61143 The *setuid()* function shall fail, return -1, and set *errno* to the corresponding value if one or more
 61144 of the following are true:

61145 [EINVAL] The value of the *uid* argument is invalid and not supported by the
 61146 implementation.

61147 [EPERM] The process does not have appropriate privileges and *uid* does not match the
 61148 real user ID or the saved set-user-ID.

61149 **EXAMPLES**

61150 None.

61151 **APPLICATION USAGE**

61152 None.

61153 **RATIONALE**

61154 The various behaviors of the *setuid()* and *setgid()* functions when called by non-privileged
 61155 processes reflect the behavior of different historical implementations. For portability, it is
 61156 recommended that new non-privileged applications use the *seteuid()* and *setegid()* functions
 61157 instead.

61158 The saved set-user-ID capability allows a program to regain the effective user ID established at
 61159 the last *exec* call. Similarly, the saved set-group-ID capability allows a program to regain the
 61160 effective group ID established at the last *exec* call. These capabilities are derived from System V.
 61161 Without them, a program might have to run as superuser in order to perform the same
 61162 functions, because superuser can write on the user's files. This is a problem because such a
 61163 program can write on any user's files, and so must be carefully written to emulate the
 61164 permissions of the calling process properly. In System V, these capabilities have traditionally
 61165 been implemented only via the *setuid()* and *setgid()* functions for non-privileged processes. The
 61166 fact that the behavior of those functions was different for privileged processes made them
 61167 difficult to use. The POSIX.1-1990 standard defined the *setuid()* function to behave differently
 61168 for privileged and unprivileged users. When the caller had appropriate privileges, the function
 61169 set the real user ID, effective user ID, and saved set-user ID of the calling process on
 61170 implementations that supported it. When the caller did not have appropriate privileges, the
 61171 function set only the effective user ID, subject to permission checks. The former use is generally
 61172 needed for utilities like *login* and *su*, which are not conforming applications and thus outside the

scope of POSIX.1-2008. These utilities wish to change the user ID irrevocably to a new value, generally that of an unprivileged user. The latter use is needed for conforming applications that are installed with the set-user-ID bit and need to perform operations using the real user ID.

POSIX.1-2008 augments the latter functionality with a mandatory feature named `_POSIX_SAVED_IDS`. This feature permits a set-user-ID application to switch its effective user ID back and forth between the values of its *exec*-time real user ID and effective user ID. Unfortunately, the POSIX.1-1990 standard did not permit a conforming application using this feature to work properly when it happened to be executed with (implementation-defined) appropriate privileges. Furthermore, the application did not even have a means to tell whether it had this privilege. Since the saved set-user-ID feature is quite desirable for applications, as evidenced by the fact that NIST required it in FIPS 151-2, it has been mandated by POSIX.1-2008. However, there are implementors who have been reluctant to support it given the limitation described above.

The 4.3BSD system handles the problem by supporting separate functions: *setuid()* (which always sets both the real and effective user IDs, like *setuid()* in POSIX.1-2008 for privileged users), and *seteuid()* (which always sets just the effective user ID, like *setuid()* in POSIX.1-2008 for non-privileged users). This separation of functionality into distinct functions seems desirable. 4.3BSD does not support the saved set-user-ID feature. It supports similar functionality of switching the effective user ID back and forth via *setreuid()*, which permits reversing the real and effective user IDs. This model seems less desirable than the saved set-user-ID because the real user ID changes as a side-effect. The current 4.4BSD includes saved effective IDs and uses them for *seteuid()* and *setegid()* as described above. The *setreuid()* and *setregid()* functions will be deprecated or removed.

The solution here is:

- Require that all implementations support the functionality of the saved set-user-ID, which is set by the *exec* functions and by privileged calls to *setuid()*.
- Add the *seteuid()* and *setegid()* functions as portable alternatives to *setuid()* and *setgid()* for non-privileged and privileged processes.

Historical systems have provided two mechanisms for a set-user-ID process to change its effective user ID to be the same as its real user ID in such a way that it could return to the original effective user ID: the use of the *setuid()* function in the presence of a saved set-user-ID, or the use of the BSD *setreuid()* function, which was able to swap the real and effective user IDs. The changes included in POSIX.1-2008 provide a new mechanism using *seteuid()* in conjunction with a saved set-user-ID. Thus, all implementations with the new *seteuid()* mechanism will have a saved set-user-ID for each process, and most of the behavior controlled by `_POSIX_SAVED_IDS` has been changed to agree with the case where the option was defined. The *kill()* function is an exception. Implementors of the new *seteuid()* mechanism will generally be required to maintain compatibility with the older mechanisms previously supported by their systems. However, compatibility with this use of *setreuid()* and with the `_POSIX_SAVED_IDS` behavior of *kill()* is unfortunately complicated. If an implementation with a saved set-user-ID allows a process to use *setreuid()* to swap its real and effective user IDs, but were to leave the saved set-user-ID unmodified, the process would then have an effective user ID equal to the original real user ID, and both real and saved set-user-ID would be equal to the original effective user ID. In that state, the real user would be unable to kill the process, even though the effective user ID of the process matches that of the real user, if the *kill()* behavior of `_POSIX_SAVED_IDS` was used. This is obviously not acceptable. The alternative choice, which is used in at least one implementation, is to change the saved set-user-ID to the effective user ID during most calls to *setreuid()*. The standard developers considered that alternative to be less correct than the retention of the old behavior of *kill()* in such systems. Current conforming applications shall

61222 accommodate either behavior from *kill()*, and there appears to be no strong reason for *kill()* to
61223 check the saved set-user-ID rather than the effective user ID.

61224 FUTURE DIRECTIONS

61225 None.

61226 SEE ALSO

61228 XBD **<sys/types.h>**, **<unistd.h>**

61229 CHANGE HISTORY

61230 First released in Issue 1. Derived from Issue 1 of the SVID.

61231 Issue 6

61232 In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.

61233 The following new requirements on POSIX implementations derive from alignment with the
61234 Single UNIX Specification:

- 61235 • The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was
61236 required for conforming implementations of previous POSIX specifications, it was not
61237 required for UNIX applications.
- 61238 • The functionality associated with `_POSIX_SAVED_IDS` is now mandatory. This is a FIPS
61239 requirement.

61240 The following changes were made to align with the IEEE P1003.1a draft standard:

- 61241 • The effects of *setuid()* in processes without appropriate privileges are changed.
- 61242 • A requirement that the supplementary group list is not affected is added.

61243 **NAME**

61244 setutxent — reset the user accounting database to the first entry

61245 **SYNOPSIS**

```
61246 XSI      #include <utmpx.h>
61247         void setutxent(void);
```

61248 **DESCRIPTION**61249 Refer to *endutxent()*.

61250 **NAME**

61251 setvbuf — assign buffering to a stream

61252 **SYNOPSIS**

61253 #include <stdio.h>

```
61254       int setvbuf(FILE *restrict stream, char *restrict buf, int type,
61255                   size_t size);
```

61256 **DESCRIPTION**

61257 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 61258 conflict between the requirements described here and the ISO C standard is unintentional. This
 61259 volume of POSIX.1-2008 defers to the ISO C standard.

61260 The *setvbuf()* function may be used after the stream pointed to by *stream* is associated with an
 61261 open file but before any other operation (other than an unsuccessful call to *setvbuf()*) is
 61262 performed on the stream. The argument *type* determines how *stream* shall be buffered, as
 61263 follows:

- 61264 • {_IOFBF} shall cause input/output to be fully buffered.
- 61265 • {_IOLBF} shall cause input/output to be line buffered.
- 61266 • {_IONBF} shall cause input/output to be unbuffered.

61267 If *buf* is not a null pointer, the array it points to may be used instead of a buffer allocated by
 61268 *setvbuf()* and the argument *size* specifies the size of the array; otherwise, *size* may determine the
 61269 size of a buffer allocated by the *setvbuf()* function. The contents of the array at any time are
 61270 unspecified.

61271 For information about streams, see [Section 2.5](#) (on page 495).

61272 **RETURN VALUE**

61273 Upon successful completion, *setvbuf()* shall return 0. Otherwise, it shall return a non-zero value
 61274 CX if an invalid value is given for *type* or if the request cannot be honored, and may set *errno* to
 61275 indicate the error.

61276 **ERRORS**

61277 The *setvbuf()* function may fail if:

61278 CX [EBADF] The file descriptor underlying *stream* is not valid.

61279 **EXAMPLES**

61280 None.

61281 **APPLICATION USAGE**

61282 A common source of error is allocating buffer space as an “automatic” variable in a code block,
 61283 and then failing to close the stream in the same block.

61284 With *setvbuf()*, allocating a buffer of *size* bytes does not necessarily imply that all of *size* bytes are
 61285 used for the buffer area.

61286 Applications should note that many implementations only provide line buffering on input from
 61287 terminal devices.

61288 **RATIONALE**

61289 None.

61290 **FUTURE DIRECTIONS**

61291 None.

61292 **SEE ALSO**61293 [Section 2.5](#) (on page 495), [fopen\(\)](#), [setbuf\(\)](#)61294 XBD [<stdio.h>](#)61295 **CHANGE HISTORY**

61296 First released in Issue 1. Derived from Issue 1 of the SVID.

61297 **Issue 6**

61298 Extensions beyond the ISO C standard are marked.

61299 The *setvbuf()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

61300 **NAME**61301 shm_open — open a shared memory object (**REALTIME**)61302 **SYNOPSIS**

```
61303 SHM    #include <sys/mman.h>
61304        int shm_open(const char *name, int oflag, mode_t mode);
```

61305 **DESCRIPTION**

61306 The *shm_open()* function shall establish a connection between a shared memory object and a file
 61307 descriptor. It shall create an open file description that refers to the shared memory object and a
 61308 file descriptor that refers to that open file description. The file descriptor is used by other
 61309 functions to refer to that shared memory object. The *name* argument points to a string naming a
 61310 shared memory object. It is unspecified whether the name appears in the file system and is
 61311 visible to other functions that take pathnames as arguments. The *name* argument conforms to the
 61312 construction rules for a pathname, except that the interpretation of <slash> characters other than
 61313 the leading <slash> character in *name* is implementation-defined, and that the length limits for
 61314 the *name* argument are implementation-defined and need not be the same as the pathname limits
 61315 {PATH_MAX} and {NAME_MAX}. If *name* begins with the <slash> character, then processes
 61316 calling *shm_open()* with the same value of *name* refer to the same shared memory object, as long
 61317 as that name has not been removed. If *name* does not begin with the <slash> character, the effect
 61318 is implementation-defined.

61319 If successful, *shm_open()* shall return a file descriptor for the shared memory object that is the
 61320 lowest numbered file descriptor not currently open for that process. The open file description is
 61321 new, and therefore the file descriptor does not share it with any other processes. It is unspecified
 61322 whether the file offset is set. The FD_CLOEXEC file descriptor flag associated with the new file
 61323 descriptor is set.

61324 The file status flags and file access modes of the open file description are according to the value
 61325 of *oflag*. The *oflag* argument is the bitwise-inclusive OR of the following flags defined in the
 61326 <fcntl.h> header. Applications specify exactly one of the first two values (access modes) below
 61327 in the value of *oflag*:

61328 O_RDONLY Open for read access only.
 61329 O_RDWR Open for read or write access.

61330 Any combination of the remaining flags may be specified in the value of *oflag*:

61331 O_CREAT If the shared memory object exists, this flag has no effect, except as noted
 61332 under O_EXCL below. Otherwise, the shared memory object is created. The
 61333 user ID of the shared memory object shall be set to the effective user ID of the
 61334 process. The group ID of the shared memory object shall be set to the effective
 61335 group ID of the process; however, if the *name* argument is visible in the file
 61336 system, the group ID may be set to the group ID of the containing directory.
 61337 The permission bits of the shared memory object shall be set to the value of
 61338 the *mode* argument except those set in the file mode creation mask of the
 61339 process. When bits in *mode* other than the file permission bits are set, the effect
 61340 is unspecified. The *mode* argument does not affect whether the shared memory
 61341 object is opened for reading, for writing, or for both. The shared memory
 61342 object has a size of zero.

61343 O_EXCL If O_EXCL and O_CREAT are set, *shm_open()* fails if the shared memory
 61344 object exists. The check for the existence of the shared memory object and the
 61345 creation of the object if it does not exist is atomic with respect to other

61346		processes executing <i>shm_open()</i> naming the same shared memory object with
61347		O_EXCL and O_CREAT set. If O_EXCL is set and O_CREAT is not set, the
61348		result is undefined.
61349	O_TRUNC	If the shared memory object exists, and it is successfully opened O_RDWR, the
61350		object shall be truncated to zero length and the mode and owner shall be
61351		unchanged by this function call. The result of using O_TRUNC with
61352		O_RDONLY is undefined.
61353		When a shared memory object is created, the state of the shared memory object, including all
61354		data associated with the shared memory object, persists until the shared memory object is
61355		unlinked and all other references are gone. It is unspecified whether the name and shared
61356		memory object state remain valid after a system reboot.
61357	RETURN VALUE	
61358		Upon successful completion, the <i>shm_open()</i> function shall return a non-negative integer
61359		representing the lowest numbered unused file descriptor. Otherwise, it shall return -1 and set
61360		<i>errno</i> to indicate the error.
61361	ERRORS	
61362		The <i>shm_open()</i> function shall fail if:
61363	[EACCES]	The shared memory object exists and the permissions specified by <i>oflag</i> are
61364		denied, or the shared memory object does not exist and permission to create
61365		the shared memory object is denied, or O_TRUNC is specified and write
61366		permission is denied.
61367	[EEXIST]	O_CREAT and O_EXCL are set and the named shared memory object already
61368		exists.
61369	[EINTR]	The <i>shm_open()</i> operation was interrupted by a signal.
61370	[EINVAL]	The <i>shm_open()</i> operation is not supported for the given name.
61371	[EMFILE]	All file descriptors available to the process are currently open.
61372	[ENFILE]	Too many shared memory objects are currently open in the system.
61373	[ENOENT]	O_CREAT is not set and the named shared memory object does not exist.
61374	[ENOSPC]	There is insufficient space for the creation of the new shared memory object.
61375		The <i>shm_open()</i> function may fail if:
61376	[ENAMETOOLONG]	
61377		The length of the <i>name</i> argument exceeds {_POSIX_PATH_MAX} on systems
61378	XSI	that do not support the XSI option or exceeds {_XOPEN_PATH_MAX} on XSI
61379		systems, or has a pathname component that is longer than
61380	XSI	{_POSIX_NAME_MAX} on systems that do not support the XSI option or
61381		longer than {_XOPEN_NAME_MAX} on XSI systems.

61382 **EXAMPLES**61383 **Creating and Mapping a Shared Memory Object**

61384 The following code segment demonstrates the use of *shm_open()* to create a shared memory
 61385 object which is then sized using *ftruncate()* before being mapped into the process address space
 61386 using *mmap()*:

```
61387 #include <unistd.h>
61388 #include <sys/mman.h>
61389 ...
61390 #define MAX_LEN 10000
61391 struct region {          /* Defines "structure" of shared memory */
61392     int len;
61393     char buf[MAX_LEN];
61394 };
61395 struct region *rptr;
61396 int fd;
61397
61398 /* Create shared memory object and set its size */
61399 fd = shm_open("/myregion", O_CREAT | O_RDWR, S_IRUSR | S_IWUSR);
61400 if (fd == -1)
61401     /* Handle error */;
61402
61403 if (ftruncate(fd, sizeof(struct region)) == -1)
61404     /* Handle error */;
61405
61406 /* Map shared memory object */
61407 rptr = mmap(NULL, sizeof(struct region),
61408             PROT_READ | PROT_WRITE, MAP_SHARED, fd, 0);
61409 if (rptr == MAP_FAILED)
61410     /* Handle error */;
61411
61412 /* Now we can refer to mapped region using fields of rptr;
61413    for example, rptr->len */
61414 ...
```

61411 **APPLICATION USAGE**

61412 None.

61413 **RATIONALE**

61414 When the Memory Mapped Files option is supported, the normal *open()* call is used to obtain a
 61415 descriptor to a file to be mapped according to existing practice with *mmap()*. When the Shared
 61416 Memory Objects option is supported, the *shm_open()* function shall obtain a descriptor to the
 61417 shared memory object to be mapped.

61418 There is ample precedent for having a file descriptor represent several types of objects. In the
 61419 POSIX.1-1990 standard, a file descriptor can represent a file, a pipe, a FIFO, a tty, or a directory.
 61420 Many implementations simply have an operations vector, which is indexed by the file descriptor
 61421 type and does very different operations. Note that in some cases the file descriptor passed to
 61422 generic operations on file descriptors is returned by *open()* or *creat()* and in some cases returned
 61423 by alternate functions, such as *pipe()*. The latter technique is used by *shm_open()*.

61424 Note that such shared memory objects can actually be implemented as mapped files. In both
 61425 cases, the size can be set after the open using *ftruncate()*. The *shm_open()* function itself does not

create a shared object of a specified size because this would duplicate an extant function that set the size of an object referenced by a file descriptor.

On implementations where memory objects are implemented using the existing file system, the *shm_open()* function may be implemented using a macro that invokes *open()*, and the *shm_unlink()* function may be implemented using a macro that invokes *unlink()*.

For implementations without a permanent file system, the definition of the name of the memory objects is allowed not to survive a system reboot. Note that this allows systems with a permanent file system to implement memory objects as data structures internal to the implementation as well.

On implementations that choose to implement memory objects using memory directly, a *shm_open()* followed by an *ftruncate()* and *close()* can be used to preallocate a shared memory area and to set the size of that preallocation. This may be necessary for systems without virtual memory hardware support in order to ensure that the memory is contiguous.

The set of valid open flags to *shm_open()* was restricted to *O_RDONLY*, *O_RDWR*, *O_CREAT*, and *O_TRUNC* because these could be easily implemented on most memory mapping systems. This volume of POSIX.1-2008 is silent on the results if the implementation cannot supply the requested file access because of implementation-defined reasons, including hardware ones.

The error conditions [EACCES] and [ENOTSUP] are provided to inform the application that the implementation cannot complete a request.

[EACCES] indicates for implementation-defined reasons, probably hardware-related, that the implementation cannot comply with a requested mode because it conflicts with another requested mode. An example might be that an application desires to open a memory object two times, mapping different areas with different access modes. If the implementation cannot map a single area into a process space in two places, which would be required if different access modes were required for the two areas, then the implementation may inform the application at the time of the second open.

[ENOTSUP] indicates for implementation-defined reasons, probably hardware-related, that the implementation cannot comply with a requested mode at all. An example would be that the hardware of the implementation cannot support write-only shared memory areas.

On all implementations, it may be desirable to restrict the location of the memory objects to specific file systems for performance (such as a RAM disk) or implementation-defined reasons (shared memory supported directly only on certain file systems). The *shm_open()* function may be used to enforce these restrictions. There are a number of methods available to the application to determine an appropriate name of the file or the location of an appropriate directory. One way is from the environment via *getenv()*. Another would be from a configuration file.

This volume of POSIX.1-2008 specifies that memory objects have initial contents of zero when created. This is consistent with current behavior for both files and newly allocated memory. For those implementations that use physical memory, it would be possible that such implementations could simply use available memory and give it to the process uninitialized. This, however, is not consistent with standard behavior for the uninitialized data area, the stack, and of course, files. Finally, it is highly desirable to set the allocated memory to zero for security reasons. Thus, initializing memory objects to zero is required.

FUTURE DIRECTIONS

A future version might require the *shm_open()* and *shm_unlink()* functions to have semantics similar to normal file system operations.

CHANGE HISTORY

61474 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6

61476 The *shm_open()* function is marked as part of the Shared Memory Objects option.

61478 The [ENOSYS] error condition has been removed as stubs need not be provided if an
61479 implementation does not support the Shared Memory Objects option.

61480 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/126 is applied, adding the example to the
61481 EXAMPLES section.

Issue 7

61482 Austin Group Interpretation 1003.1-2001 #077 is applied, clarifying the *name* argument and
61483 changing [ENAMETOOLONG] from a “shall fail” to a “may fail” error.

61485 Austin Group Interpretation 1003.1-2001 #141 is applied, adding FUTURE DIRECTIONS.

61486 SD5-XSH-ERN-170 is applied, updating the DESCRIPTION to clarify the wording for setting the
61487 user ID and group ID of the shared memory object.

61488 **NAME**61489 shm_unlink — remove a shared memory object (**REALTIME**)61490 **SYNOPSIS**

```
61491 SHM    #include <sys/mman.h>
61492      int shm_unlink(const char *name);
```

61493 **DESCRIPTION**

61494 The *shm_unlink()* function shall remove the name of the shared memory object named by the
 61495 string pointed to by *name*.

61496 If one or more references to the shared memory object exist when the object is unlinked, the
 61497 name shall be removed before *shm_unlink()* returns, but the removal of the memory object
 61498 contents shall be postponed until all open and map references to the shared memory object have
 61499 been removed.

61500 Even if the object continues to exist after the last *shm_unlink()*, reuse of the name shall
 61501 subsequently cause *shm_open()* to behave as if no shared memory object of this name exists (that
 61502 is, *shm_open()* will fail if O_CREAT is not set, or will create a new shared memory object if
 61503 O_CREAT is set).

61504 **RETURN VALUE**

61505 Upon successful completion, a value of zero shall be returned. Otherwise, a value of -1 shall be
 61506 returned and *errno* set to indicate the error. If -1 is returned, the named shared memory object
 61507 shall not be changed by this function call.

61508 **ERRORS**

61509 The *shm_unlink()* function shall fail if:

61510 [EACCES] Permission is denied to unlink the named shared memory object.

61511 [ENOENT] The named shared memory object does not exist.

61512 The *shm_unlink()* function may fail if:

61513 [ENAMETOOLONG]

61514 The length of the *name* argument exceeds {_POSIX_PATH_MAX} on systems
 61515 XSI that do not support the XSI option or exceeds {_XOPEN_PATH_MAX} on XSI
 61516 systems, or has a pathname component that is longer than
 61517 XSI {_POSIX_NAME_MAX} on systems that do not support the XSI option or
 61518 longer than {_XOPEN_NAME_MAX} on XSI systems. A call to *shm_unlink()*
 61519 with a *name* argument that contains the same shared memory object name as
 61520 was previously used in a successful *shm_open()* call shall not give an
 61521 [ENAMETOOLONG] error.

61522 **EXAMPLES**

61523 None.

61524 **APPLICATION USAGE**

61525 Names of memory objects that were allocated with *open()* are deleted with *unlink()* in the usual
 61526 fashion. Names of memory objects that were allocated with *shm_open()* are deleted with
 61527 *shm_unlink()*. Note that the actual memory object is not destroyed until the last close and
 61528 unmap on it have occurred if it was already in use.

61529 RATIONALE

61530 None.

61531 FUTURE DIRECTIONS

61532 A future version might require the *shm_open()* and *shm_unlink()* functions to have semantics
61533 similar to normal file system operations.

61534 SEE ALSO

61535 *close()*, *mmap()*, *munmap()*, *shmat()*, *shmctl()*, *shmdt()*, *shm_open()*

61536 XBD <sys/mman.h>

61537 CHANGE HISTORY

61538 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

61539 Issue 6

61540 The *shm_unlink()* function is marked as part of the Shared Memory Objects option.

61541 In the DESCRIPTION, text is added to clarify that reusing the same name after a *shm_unlink()*
61542 will not attach to the old shared memory object.

61543 The [ENOSYS] error condition has been removed as stubs need not be provided if an
61544 implementation does not support the Shared Memory Objects option.

61545 Issue 7

61546 Austin Group Interpretation 1003.1-2001 #077 is applied, changing [ENAMETOOLONG] from a
61547 “shall fail” to a “may fail” error.

61548 Austin Group Interpretation 1003.1-2001 #141 is applied, adding FUTURE DIRECTIONS.

61549 **NAME**

61550 shmat — XSI shared memory attach operation

61551 **SYNOPSIS**

```
61552 XSI      #include <sys/shm.h>
61553      void *shmat(int shmid, const void *shmaddr, int shmflg);
```

61554 **DESCRIPTION**

61555 The *shmat()* function operates on XSI shared memory (see XBD [Section 3.342](#), on page 88). It is
 61556 unspecified whether this function interoperates with the realtime interprocess communication
 61557 facilities defined in [Section 2.8](#) (on page 502).

61558 The *shmat()* function attaches the shared memory segment associated with the shared memory
 61559 identifier specified by *shmid* to the address space of the calling process. The segment is attached
 61560 at the address specified by one of the following criteria:

- 61561 • If *shmaddr* is a null pointer, the segment is attached at the first available address as selected
 61562 by the system.
- 61563 • If *shmaddr* is not a null pointer and (*shmflg* &SHM_RND) is non-zero, the segment is
 61564 attached at the address given by (*shmaddr* - ((uintptr_t)*shmaddr* %SHMLBA)). The character
 61565 ' % ' is the C-language remainder operator.
- 61566 • If *shmaddr* is not a null pointer and (*shmflg* &SHM_RND) is 0, the segment is attached at
 61567 the address given by *shmaddr*.
- 61568 • The segment is attached for reading if (*shmflg* &SHM_RDONLY) is non-zero and the
 61569 calling process has read permission; otherwise, if it is 0 and the calling process has read
 61570 and write permission, the segment is attached for reading and writing.

61571 **RETURN VALUE**

61572 Upon successful completion, *shmat()* shall increment the value of *shm_nattch* in the data
 61573 structure associated with the shared memory ID of the attached shared memory segment and
 61574 return the segment's start address. Also, the *shm_atime* timestamp shall be set to the current +
 61575 time, as described in [Section 2.7.1](#) (on page 501).

61576 Otherwise, the shared memory segment shall not be attached, *shmat()* shall return -1, and *errno*
 61577 shall be set to indicate the error.

61578 **ERRORS**

61579 The *shmat()* function shall fail if:

61580 61581	[EACCES]	Operation permission is denied to the calling process; see Section 2.7 (on page 501).
61582 61583 61584 61585 61586	[EINVAL]	The value of <i>shmid</i> is not a valid shared memory identifier, the <i>shmaddr</i> is not a null pointer, and the value of (<i>shmaddr</i> - ((uintptr_t) <i>shmaddr</i> %SHMLBA)) is an illegal address for attaching shared memory; or the <i>shmaddr</i> is not a null pointer, (<i>shmflg</i> &SHM_RND) is 0, and the value of <i>shmaddr</i> is an illegal address for attaching shared memory.
61587 61588	[EMFILE]	The number of shared memory segments attached to the calling process would exceed the system-imposed limit.
61589 61590	[ENOMEM]	The available data space is not large enough to accommodate the shared memory segment.

61591 EXAMPLES

61592 None.

61593 APPLICATION USAGE

61594 The POSIX Realtime Extension defines alternative interfaces for interprocess communication.
61595 Application developers who need to use IPC should design their applications so that modules
61596 using the IPC routines described in [Section 2.7](#) (on page 501) can be easily modified to use the
61597 alternative interfaces.

61598 RATIONALE

+

61616 **NAME**

61617 shmctl — XSI shared memory control operations

61618 **SYNOPSIS**

```
61619 XSI      #include <sys/shm.h>
61620      int shmctl(int shmid, int cmd, struct shm_id *buf);
```

61621 **DESCRIPTION**

61622 The *shmctl()* function operates on XSI shared memory (see XBD [Section 3.342](#), on page 88). It is
 61623 unspecified whether this function interoperates with the realtime interprocess communication
 61624 facilities defined in [Section 2.8](#) (on page 502).

61625 The *shmctl()* function provides a variety of shared memory control operations as specified by
 61626 *cmd*. The following values for *cmd* are available:

61627 **IPC_STAT** Place the current value of each member of the **shm_id** data structure
 61628 associated with *shmid* into the structure pointed to by *buf*. The contents of the
 61629 structure are defined in **<sys/shm.h>**.

61630 **IPC_SET** Set the value of the following members of the **shm_id** data structure
 61631 associated with *shmid* to the corresponding value found in the structure
 61632 pointed to by *buf*:

```
61633     shm_perm.uid
61634     shm_perm.gid
61635     shm_perm.mode      Low-order nine bits.
```

61636 Also, the *shm_ctime* timestamp shall be set to the current time, as described in +
 61637 [Section 2.7.1](#) (on page 501). +

61638 IPC_SET can only be executed by a process that has an effective user ID equal
 61639 to either that of a process with appropriate privileges or to the value of
 61640 *shm_perm.cuid* or *shm_perm.uid* in the **shm_id** data structure associated with
 61641 *shmid*.

61642 **IPC_RMID** Remove the shared memory identifier specified by *shmid* from the system and
 61643 destroy the shared memory segment and **shm_id** data structure associated
 61644 with it. IPC_RMID can only be executed by a process that has an effective user
 61645 ID equal to either that of a process with appropriate privileges or to the value
 61646 of *shm_perm.cuid* or *shm_perm.uid* in the **shm_id** data structure associated
 61647 with *shmid*.

61648 **RETURN VALUE**

61649 Upon successful completion, *shmctl()* shall return 0; otherwise, it shall return -1 and set *errno* to
 61650 indicate the error.

61651 **ERRORS**

61652 The *shmctl()* function shall fail if:

61653 [EACCES] The argument *cmd* is equal to IPC_STAT and the calling process does not have
 61654 read permission; see [Section 2.7](#) (on page 501).

61655 [EINVAL] The value of *shmid* is not a valid shared memory identifier, or the value of *cmd*
 61656 is not a valid command.

61657 [EPERM] The argument *cmd* is equal to IPC_RMID or IPC_SET and the effective user ID
 61658 of the calling process is not equal to that of a process with appropriate
 61659 privileges and it is not equal to the value of *shm_perm.cuid* or *shm_perm.uid* in

61660 the data structure associated with *shmid*.

61661 The *shmctl()* function may fail if:

61662 [EOVERFLOW] The *cmd* argument is IPC_STAT and the *gid* or *uid* value is too large to be
61663 stored in the structure pointed to by the *buf* argument.

61664 EXAMPLES

NAME

shmdt — XSI shared memory detach operation

SYNOPSIS

```
XSI    #include <sys/shm.h>
      int shmdt(const void *shmaddr);
```

DESCRIPTION

The *shmdt()* function operates on XSI shared memory (see XBD [Section 3.342](#), on page 88). It is unspecified whether this function interoperates with the realtime interprocess communication facilities defined in [Section 2.8](#) (on page 502).

The *shmdt()* function detaches the shared memory segment located at the address specified by *shmaddr* from the address space of the calling process.

RETURN VALUE

Upon successful completion, *shmdt()* shall decrement the value of *shm_nattch* in the data structure associated with the shared memory ID of the attached shared memory segment and return 0. Also, the *shm_dtime* timestamp shall be set to the current time, as described in [Section 2.7.1](#) (on page 501).

Otherwise, the shared memory segment shall not be detached, *shmdt()* shall return -1, and *errno* shall be set to indicate the error.

ERRORS

The *shmdt()* function shall fail if:

[EINVAL]	The value of <i>shmaddr</i> is not the data segment start address of a shared memory segment.

EXAMPLES

None.

APPLICATION USAGE

The POSIX Realtime Extension defines alternative interfaces for interprocess communication. Application developers who need to use IPC should design their applications so that modules using the IPC routines described in [Section 2.7](#) (on page 501) can be easily modified to use the alternative interfaces.

61732 **NAME**

61733 shmget — get an XSI shared memory segment

61734 **SYNOPSIS**

```
61735 XSI      #include <sys/shm.h>
61736      int shmget(key_t key, size_t size, int shmflg);
```

61737 **DESCRIPTION**

61738 The *shmget()* function operates on XSI shared memory (see XBD [Section 3.342](#), on page 88). It is
 61739 unspecified whether this function interoperates with the realtime interprocess communication
 61740 facilities defined in [Section 2.8](#) (on page 502).

61741 The *shmget()* function shall return the shared memory identifier associated with *key*.

61742 A shared memory identifier, associated data structure, and shared memory segment of at least
 61743 *size* bytes (see **<sys/shm.h>**) are created for *key* if one of the following is true:

- 61744 • The argument *key* is equal to `IPC_PRIVATE`.
- 61745 • The argument *key* does not already have a shared memory identifier associated with it and
 61746 (*shmflg* & `IPC_CREAT`) is non-zero.

61747 Upon creation, the data structure associated with the new shared memory identifier shall be
 61748 initialized as follows:

- 61749 • The values of *shm_perm.cuid*, *shm_perm.uid*, *shm_perm.cgid*, and *shm_perm.gid* are set to the |
 61750 effective user ID and effective group ID, respectively, of the calling process.
- 61751 • The low-order nine bits of *shm_perm.mode* are set to the low-order nine bits of *shmflg*. |
- 61752 • The value of *shm_segsz* is set to the value of *size*. |
- 61753 • The values of *shm_lpid*, *shm_nattch*, *shm_atime*, and *shm_dtime* are set to 0. |
- 61754 • The value of *shm_ctime* is set to the current time, as described in [Section 2.7.1](#) (on page 501). |

61755 When the shared memory segment is created, it shall be initialized with all zero values.

61756 **RETURN VALUE**

61757 Upon successful completion, *shmget()* shall return a non-negative integer, namely a shared
 61758 memory identifier; otherwise, it shall return `-1` and set *errno* to indicate the error.

61759 **ERRORS**

61760 The *shmget()* function shall fail if:

61761 61762 61763	[EACCES]	A shared memory identifier exists for <i>key</i> but operation permission as specified by the low-order nine bits of <i>shmflg</i> would not be granted; see Section 2.7 (on page 501).
61764 61765	[EEXIST]	A shared memory identifier exists for the argument <i>key</i> but (<i>shmflg</i> & <code>IPC_CREAT</code>) && (<i>shmflg</i> & <code>IPC_EXCL</code>) is non-zero.
61766 61767	[EINVAL]	A shared memory segment is to be created and the value of <i>size</i> is less than the system-imposed minimum or greater than the system-imposed maximum.
61768 61769	[EINVAL]	No shared memory segment is to be created and a shared memory segment exists for <i>key</i> but the size of the segment associated with it is less than <i>size</i> .
61770 61771	[ENOENT]	A shared memory identifier does not exist for the argument <i>key</i> and (<i>shmflg</i> & <code>IPC_CREAT</code>) is 0.

61772 [ENOMEM] A shared memory identifier and associated shared memory segment shall be
 61773 created, but the amount of available physical memory is not sufficient to fill
 61774 the request.

61775 [ENOSPC] A shared memory identifier is to be created, but the system-imposed limit on
 61776 the maximum number of allowed shared memory identifiers system-wide
 61777 would be exceeded.

61778 EXAMPLES

61779 None.

61780 APPLICATION USAGE

61781 The POSIX Realtime Extension defines alternative interfaces for interprocess communication.
 61782 Application developers who need to use IPC should design their applications so that modules
 61783 using the IPC routines described in [Section 2.7](#) (on page 501) can be easily modified to use the
 61784 alternative interfaces.

61802 **NAME**

61803 shutdown — shut down socket send and receive operations

61804 **SYNOPSIS**

61805 #include <sys/socket.h>

61806 int shutdown(int *socket*, int *how*);61807 **DESCRIPTION**61808 The *shutdown()* function shall cause all or part of a full-duplex connection on the socket
61809 associated with the file descriptor *socket* to be shut down.61810 The *shutdown()* function takes the following arguments:61811 *socket* Specifies the file descriptor of the socket.61812 *how* Specifies the type of shutdown. The values are as follows:

61813 SHUT_RD Disables further receive operations.

61814 SHUT_WR Disables further send operations.

61815 SHUT_RDWR Disables further send and receive operations.

61816 The *shutdown()* function disables subsequent send and/or receive operations on a socket,
61817 depending on the value of the *how* argument.61818 **RETURN VALUE**61819 Upon successful completion, *shutdown()* shall return 0; otherwise, -1 shall be returned and *errno*
61820 set to indicate the error.61821 **ERRORS**61822 The *shutdown()* function shall fail if:61823 [EBADF] The *socket* argument is not a valid file descriptor.61824 [EINVAL] The *how* argument is invalid.

61825 [ENOTCONN] The socket is not connected.

61826 [ENOTSOCK] The *socket* argument does not refer to a socket.61827 The *shutdown()* function may fail if:

61828 [ENOBUFS] Insufficient resources were available in the system to perform the operation.

61841	CHANGE HISTORY
61842	First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

NAME

sigaction — examine and change a signal action

SYNOPSIS

```
CX      #include <signal.h>

      int sigaction(int sig, const struct sigaction *restrict act,
                    struct sigaction *restrict oact);
```

DESCRIPTION

The *sigaction()* function allows the calling process to examine and/or specify the action to be associated with a specific signal. The argument *sig* specifies the signal; acceptable values are defined in *<signal.h>*.

The structure **sigaction**, used to describe an action to be taken, is defined in the *<signal.h>* header to include at least the following members:

Member Type	Member Name	Description
void(*) (int)	<i>sa_handler</i>	Pointer to a signal-catching function or one of the macros SIG_IGN or SIG_DFL.
sigset_t	<i>sa_mask</i>	Additional set of signals to be blocked during execution of signal-catching function.
int	<i>sa_flags</i>	Special flags to affect behavior of signal.
void(*) (int, siginfo_t *, void *)	<i>sa_sigaction</i>	Pointer to a signal-catching function.

The storage occupied by *sa_handler* and *sa_sigaction* may overlap, and a conforming application shall not use both simultaneously.

If the argument *act* is not a null pointer, it points to a structure specifying the action to be associated with the specified signal. If the argument *oact* is not a null pointer, the action previously associated with the signal is stored in the location pointed to by the argument *oact*. If the argument *act* is a null pointer, signal handling is unchanged; thus, the call can be used to enquire about the current handling of a given signal. The SIGKILL and SIGSTOP signals shall not be added to the signal mask using this mechanism; this restriction shall be enforced by the system without causing an error to be indicated.

If the SA_SIGINFO flag (see below) is cleared in the *sa_flags* field of the **sigaction** structure, the *sa_handler* field identifies the action to be associated with the specified signal. If the SA_SIGINFO flag is set in the *sa_flags* field, the *sa_sigaction* field specifies a signal-catching function.

The *sa_flags* field can be used to modify the behavior of the specified signal.

The following flags, defined in the *<signal.h>* header, can be set in *sa_flags*:

XSI	SA_NOCLDSTOP	Do not generate SIGCHLD when children stop or stopped children continue.
		If <i>sig</i> is SIGCHLD and the SA_NOCLDSTOP flag is not set in <i>sa_flags</i> , and the implementation supports the SIGCHLD signal, then a SIGCHLD signal shall be generated for the calling process whenever any of its child processes stop and a SIGCHLD signal may be generated for the calling process whenever any of its stopped child processes are continued. If <i>sig</i> is SIGCHLD and the SA_NOCLDSTOP flag is set in <i>sa_flags</i> , then the implementation shall not generate a SIGCHLD signal in this way.

61888	XSI	SA_ONSTACK	If set and an alternate signal stack has been declared with <i>sigaltstack()</i> , the signal shall be delivered to the calling process on that stack. Otherwise, the signal shall be delivered on the current stack.
61889			
61890			
61891		SA_RESETHAND	If set, the disposition of the signal shall be reset to SIG_DFL and the SA_SIGINFO flag shall be cleared on entry to the signal handler.
61892			
61893			Note: SIGILL and SIGTRAP cannot be automatically reset when delivered; the system silently enforces this restriction.
61894			
61895			Otherwise, the disposition of the signal shall not be modified on entry to the signal handler.
61896			
61897			In addition, if this flag is set, <i>sigaction()</i> may behave as if the SA_NODEFER flag were also set.
61898			
61899		SA_RESTART	This flag affects the behavior of interruptible functions; that is, those specified to fail with <i>errno</i> set to [EINTR]. If set, and a function specified as interruptible is interrupted by this signal, the function shall restart and shall not fail with [EINTR] unless otherwise specified. If an interruptible function which uses a timeout is restarted, the duration of the timeout following the restart is set to an unspecified value that does not exceed the original timeout value. If the flag is not set, interruptible functions interrupted by this signal shall fail with <i>errno</i> set to [EINTR].
61900			
61901			
61902			
61903			
61904			
61905			
61906			
61907		SA_SIGINFO	If cleared and the signal is caught, the signal-catching function shall be entered as:
61908			
61909			<pre>void func(int signo);</pre>
61910			where <i>signo</i> is the only argument to the signal-catching function. In this case, the application shall use the <i>sa_handler</i> member to describe the signal-catching function and the application shall not modify the <i>sa_sigaction</i> member.
61911			
61912			
61913			
61914			If SA_SIGINFO is set and the signal is caught, the signal-catching function shall be entered as:
61915			
61916			<pre>void func(int signo, siginfo_t *info, void *context);</pre>
61917			where two additional arguments are passed to the signal-catching function. The second argument shall point to an object of type siginfo_t explaining the reason why the signal was generated; the third argument can be cast to a pointer to an object of type ucontext_t to refer to the receiving thread's context that was interrupted when the signal was delivered. In this case, the application shall use the <i>sa_sigaction</i> member to describe the signal-catching function and the application shall not modify the <i>sa_handler</i> member.
61918			
61919			
61920			
61921			
61922			
61923			
61924			
61925			The <i>si_signo</i> member contains the system-generated signal number.
61926	XSI		The <i>si_errno</i> member may contain implementation-defined additional error information; if non-zero, it contains an error number identifying the condition that caused the signal to be generated.
61927			
61928			
61929			The <i>si_code</i> member contains a code identifying the cause of the signal, as described in Section 2.4.3 (on page 490).
61930			

61931 SA_NOCLDWAIT If set, and *sig* equals SIGCHLD, child processes of the calling processes
 61932 shall not be transformed into zombie processes when they terminate. If
 61933 the calling process subsequently waits for its children, and the process has
 61934 no unwaited-for children that were transformed into zombie processes, it
 61935 shall block until all of its children terminate, and *wait()*, *waitid()*, and
 61936 *waitpid()* shall fail and set *errno* to [ECHILD]. Otherwise, terminating
 61937 child processes shall be transformed into zombie processes, unless
 61938 SIGCHLD is set to SIG_IGN.

61939 SA_NODEFER If set and *sig* is caught, *sig* shall not be added to the thread's signal mask
 61940 on entry to the signal handler unless it is included in *sa_mask*. Otherwise,
 61941 *sig* shall always be added to the thread's signal mask on entry to the
 61942 signal handler.

61943 When a signal is caught by a signal-catching function installed by *sigaction()*, a new signal mask
 61944 is calculated and installed for the duration of the signal-catching function (or until a call to either
 61945 *sigprocmask()* or *sigsuspend()* is made). This mask is formed by taking the union of the current
 61946 signal mask and the value of the *sa_mask* for the signal being delivered, and unless
 61947 SA_NODEFER or SA_RESETHAND is set, then including the signal being delivered. If and
 61948 when the user's signal handler returns normally, the original signal mask is restored.

61949 Once an action is installed for a specific signal, it shall remain installed until another action is
 61950 explicitly requested (by another call to *sigaction()*), until the SA_RESETHAND flag causes
 61951 resetting of the handler, or until one of the *exec* functions is called.

61952 If the previous action for *sig* had been established by *signal()*, the values of the fields returned in
 61953 the structure pointed to by *oact* are unspecified, and in particular *oact->sa_handler* is not
 61954 necessarily the same value passed to *signal()*. However, if a pointer to the same structure or a
 61955 copy thereof is passed to a subsequent call to *sigaction()* via the *act* argument, handling of the
 61956 signal shall be as if the original call to *signal()* were repeated.

61957 If *sigaction()* fails, no new signal handler is installed.

61958 It is unspecified whether an attempt to set the action for a signal that cannot be caught or
 61959 ignored to SIG_DFL is ignored or causes an error to be returned with *errno* set to [EINVAL].

61960 If SA_SIGINFO is not set in *sa_flags*, then the disposition of subsequent occurrences of *sig* when
 61961 it is already pending is implementation-defined; the signal-catching function shall be invoked
 61962 with a single argument. If SA_SIGINFO is set in *sa_flags*, then subsequent occurrences of *sig*
 61963 generated by *sigqueue()* or as a result of any signal-generating function that supports the
 61964 specification of an application-defined value (when *sig* is already pending) shall be queued in
 61965 FIFO order until delivered or accepted; the signal-catching function shall be invoked with three
 61966 arguments. The application specified value is passed to the signal-catching function as the
 61967 *si_value* member of the **siginfo_t** structure.

61968 The result of the use of *sigaction()* and a *sigwait()* function concurrently within a process on the
 61969 same signal is unspecified.

61970 RETURN VALUE

61971 Upon successful completion, *sigaction()* shall return 0; otherwise, -1 shall be returned, *errno* shall
 61972 be set to indicate the error, and no new signal-catching function shall be installed.

ERRORS

The *sigaction()* function shall fail if:

[EINVAL] The *sig* argument is not a valid signal number or an attempt is made to catch a signal that cannot be caught or ignore a signal that cannot be ignored.

[ENOTSUP] The SA_SIGINFO bit flag is set in the *sa_flags* field of the **sigaction** structure.

The *sigaction()* function may fail if:

[EINVAL] An attempt was made to set the action to SIG_DFL for a signal that cannot be caught or ignored (or both).

In addition, the *sigaction()* function may fail if the SA_SIGINFO flag is set in the *sa_flags* field of the **sigaction** structure for a signal not in the range SIGRTMIN to SIGRTMAX.

EXAMPLES**Establishing a Signal Handler**

The following example demonstrates the use of *sigaction()* to establish a handler for the SIGINT signal.

```
#include <signal.h>

static void handler(int signum)
{
    /* Take appropriate actions for signal delivery */
}

int main()
{
    struct sigaction sa;

    sa.sa_handler = handler;
    sigemptyset(&sa.sa_mask);
    sa.sa_flags = SA_RESTART; /* Restart functions if
                               interrupted by handler */
    if (sigaction(SIGINT, &sa, NULL) == -1)
        /* Handle error */;

    /* Further code */
}
```

APPLICATION USAGE

The *sigaction()* function supersedes the *signal()* function, and should be used in preference. In particular, *sigaction()* and *signal()* should not be used in the same process to control the same signal. The behavior of async-signal-safe functions, as defined in their respective DESCRIPTION sections, is as specified by this volume of POSIX.1-2008, regardless of invocation from a signal-catching function. This is the only intended meaning of the statement that async-signal-safe functions may be used in signal-catching functions without restrictions. Applications must still consider all effects of such functions on such things as data structures, files, and process state. In particular, application developers need to consider the restrictions on interactions when interrupting *sleep()* and interactions among multiple handles for a file description. The fact that any specific function is listed as async-signal-safe does not necessarily mean that invocation of that function from a signal-catching function is recommended.

In order to prevent errors arising from interrupting non-async-signal-safe function calls, applications should protect calls to these functions either by blocking the appropriate signals or

through the use of some programmatic semaphore (see [*semget\(\)*](#), [*sem_init\(\)*](#), [*sem_open\(\)*](#), and so on). Note in particular that even the “safe” functions may modify *errno*; the signal-catching function, if not executing as an independent thread, should save and restore its value in order to avoid the possibility that delivery of a signal in between an error return from a function that sets *errno* and the subsequent examination of *errno* could result in the signal-catching function changing the value of *errno*. Naturally, the same principles apply to the async-signal-safety of application routines and asynchronous data access. Note that [*longjmp\(\)*](#) and [*siglongjmp\(\)*](#) are not in the list of async-signal-safe functions. This is because the code executing after [*longjmp\(\)*](#) and [*siglongjmp\(\)*](#) can call any unsafe functions with the same danger as calling those unsafe functions directly from the signal handler. Applications that use [*longjmp\(\)*](#) and [*siglongjmp\(\)*](#) from within signal handlers require rigorous protection in order to be portable. Many of the other functions that are excluded from the list are traditionally implemented using either [*malloc\(\)*](#) or [*free\(\)*](#) functions or the standard I/O library, both of which traditionally use data structures in a non-async-signal-safe manner. Since any combination of different functions using a common data structure can cause async-signal-safety problems, this volume of POSIX.1-2008 does not define the behavior when any unsafe function is called in a signal handler that interrupts an unsafe function.

Usually, the signal is executed on the stack that was in effect before the signal was delivered. An alternate stack may be specified to receive a subset of the signals being caught.

When the signal handler returns, the receiving thread resumes execution at the point it was interrupted unless the signal handler makes other arrangements. If [*longjmp\(\)*](#) or [*_longjmp\(\)*](#) is used to leave the signal handler, then the signal mask must be explicitly restored.

This volume of POSIX.1-2008 defines the third argument of a signal handling function when [*SA_SIGINFO*](#) is set as a **void *** instead of a **ucontext_t ***, but without requiring type checking. New applications should explicitly cast the third argument of the signal handling function to **ucontext_t ***.

The BSD optional four argument signal handling function is not supported by this volume of POSIX.1-2008. The BSD declaration would be:

```
void handler(int sig, int code, struct sigcontext *scp,
             char *addr);
```

where *sig* is the signal number, *code* is additional information on certain signals, *scp* is a pointer to the **sigcontext** structure, and *addr* is additional address information. Much the same information is available in the objects pointed to by the second argument of the signal handler specified when [*SA_SIGINFO*](#) is set.

Since the [*sigaction\(\)*](#) function is allowed but not required to set [*SA_NODEFER*](#) when the application sets the [*SA_RESETHAND*](#) flag, applications which depend on the [*SA_RESETHAND*](#) functionality for the newly installed signal handler must always explicitly set [*SA_NODEFER*](#) when they set [*SA_RESETHAND*](#) in order to be portable.

See also the rationale for Realtime Signal Generation and Delivery in XRAT [Section B.2.4.2](#) (on page 3538).

RATIONALE

Although this volume of POSIX.1-2008 requires that signals that cannot be ignored shall not be added to the signal mask when a signal-catching function is entered, there is no explicit requirement that subsequent calls to [*sigaction\(\)*](#) reflect this in the information returned in the *oact* argument. In other words, if [*SIGKILL*](#) is included in the *sa_mask* field of *act*, it is unspecified whether or not a subsequent call to [*sigaction\(\)*](#) returns with [*SIGKILL*](#) included in the *sa_mask* field of *oact*.

The SA_NOCLDSTOP flag, when supplied in the *act->sa_flags* parameter, allows overloading SIGCHLD with the System V semantics that each SIGCHLD signal indicates a single terminated child. Most conforming applications that catch SIGCHLD are expected to install signal-catching functions that repeatedly call the *waitpid()* function with the WNOHANG flag set, acting on each child for which status is returned, until *waitpid()* returns zero. If stopped children are not of interest, the use of the SA_NOCLDSTOP flag can prevent the overhead from invoking the signal-catching routine when they stop.

Some historical implementations also define other mechanisms for stopping processes, such as the *ptrace()* function. These implementations usually do not generate a SIGCHLD signal when processes stop due to this mechanism; however, that is beyond the scope of this volume of POSIX.1-2008.

This volume of POSIX.1-2008 requires that calls to *sigaction()* that supply a NULL *act* argument succeed, even in the case of signals that cannot be caught or ignored (that is, SIGKILL or SIGSTOP). The System V *signal()* and BSD *sigvec()* functions return [EINVAL] in these cases and, in this respect, their behavior varies from *sigaction()*.

This volume of POSIX.1-2008 requires that *sigaction()* properly save and restore a signal action set up by the ISO C standard *signal()* function. However, there is no guarantee that the reverse is true, nor could there be given the greater amount of information conveyed by the **sigaction** structure. Because of this, applications should avoid using both functions for the same signal in the same process. Since this cannot always be avoided in case of general-purpose library routines, they should always be implemented with *sigaction()*.

It was intended that the *signal()* function should be implementable as a library routine using *sigaction()*.

The POSIX Realtime Extension extends the *sigaction()* function as specified by the POSIX.1-1990 standard to allow the application to request on a per-signal basis via an additional signal action flag that the extra parameters, including the application-defined signal value, if any, be passed to the signal-catching function.

FUTURE DIRECTIONS

None.

XBD <signal.h>

CHANGE HISTORY

First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and POSIX Threads Extension.

In the DESCRIPTION, the second argument to *func* when SA_SIGINFO is set is no longer permitted to be NULL, and the description of permitted **siginfo_t** contents is expanded by reference to <signal.h>.

Since the X/OPEN UNIX Extension functionality is now folded into the BASE, the [ENOTSUP] error is deleted.

Issue 6

The Open Group Corrigendum U028/7 is applied. In the paragraph entitled “Signal Effects on Other Functions”, a reference to *sigpending()* is added.

In the DESCRIPTION, the text “Signal Generation and Delivery”, “Signal Actions”, and “Signal Effects on Other Functions” are moved to a separate section of this volume of POSIX.1-2008.

Text describing functionality from the Realtime Signals Extension option is marked.

The following changes are made for alignment with the ISO POSIX-1: 1996 standard:

- The [ENOTSUP] error condition is added.

The normative text is updated to avoid use of the term “must” for application requirements.

The **restrict** keyword is added to the *sigaction()* prototype for alignment with the ISO/IEC 9899: 1999 standard.

References to the *wait3()* function are removed.

The SYNOPSIS is marked CX since the presence of this function in the **<signal.h>** header is an extension over the ISO C standard.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/57 is applied, changing text in the table describing the **sigaction** structure.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/127 is applied, removing text from the DESCRIPTION duplicated later in the same section.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/128 is applied, updating the DESCRIPTION and APPLICATION USAGE sections. Changes are made to refer to the thread rather than the process.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/129 is applied, adding the example to the EXAMPLES section.

Issue 7

Austin Group Interpretation 1003.1-2001 #004 is applied.

Austin Group Interpretations 1003.1-2001 #065 and #084 are applied, clarifying the role of the SA_NODEFER flag with respect to the signal mask, and clarifying the SA_RESTART flag for interrupted functions which use timeouts.

Austin Group Interpretation 1003.1-2001 #156 is applied.

SD5-XSH-ERN-167 is applied, updating the APPLICATION USAGE section.

SD5-XSH-ERN-172 is applied, updating the DESCRIPTION to make optional the requirement that when the SA_RESETHAND flag is set, *sigaction()* shall behave as if the SA_NODEFER flag were also set.

Functionality relating to the Realtime Signals Extension option is moved to the Base.

The description of the *si_code* member is replaced with a reference to [Section 2.4.3](#) (on page 490).

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0578 [66] and XSH/TC1-2008/0579 + [140] are applied.

62145 **NAME**

62146 sigaddset — add a signal to a signal set

62147 **SYNOPSIS**

```
62148 CX    #include <signal.h>
62149    int sigaddset(sigset_t *set, int signo);
```

62150 **DESCRIPTION**

62151 The *sigaddset()* function adds the individual signal specified by the *signo* to the signal set pointed
 62152 to by *set*.

62153 Applications shall call either *sigemptyset()* or *sigfillset()* at least once for each object of type
 62154 **sigset_t** prior to any other use of that object. If such an object is not initialized in this way, but is
 62155 nonetheless supplied as an argument to any of *pthread_sigmask()*, *sigaction()*, *sigaddset()*,
 62156 *sigdelset()*, *sigismember()*, *sigpending()*, *sigprocmask()*, *sigsuspend()*, *sigtimedwait()*, *sigwait()*, or
 62157 *sigwaitinfo()*, the results are undefined.

62158 **RETURN VALUE**

62159 Upon successful completion, *sigaddset()* shall return 0; otherwise, it shall return -1 and set *errno*
 62160 to indicate the error.

62161 **ERRORS**

62162 The *sigaddset()* function may fail if:

62163 [EINVAL] The value of the *signo* argument is an invalid or unsupported signal number.

62164 **EXAMPLES**

62165 None.

62166 **APPLICATION USAGE**

62167 None.

62168 **RATIONALE**

62169 None.

62176 **CHANGE HISTORY**

62177 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

62178 **Issue 5**

62179 The last paragraph of the DESCRIPTION was included as an APPLICATION USAGE note in
 62180 previous issues.

62181 **Issue 6**

62182 The normative text is updated to avoid use of the term “must” for application requirements.

62183 The SYNOPSIS is marked CX since the presence of this function in the **<signal.h>** header is an
 62184 extension over the ISO C standard.

NAME

sigaltstack — set and get signal alternate stack context

SYNOPSIS

```
#include <signal.h>

int sigaltstack(const stack_t *restrict ss, stack_t *restrict oss);
```

DESCRIPTION

The *sigaltstack()* function allows a process to define and examine the state of an alternate stack for signal handlers for the current thread. Signals that have been explicitly declared to execute on the alternate stack shall be delivered on the alternate stack.

If *ss* is not a null pointer, it points to a **stack_t** structure that specifies the alternate signal stack that shall take effect upon return from *sigaltstack()*. The *ss_flags* member specifies the new stack state. If it is set to *SS_DISABLE*, the stack is disabled and *ss_sp* and *ss_size* are ignored. Otherwise, the stack shall be enabled, and the *ss_sp* and *ss_size* members specify the new address and size of the stack.

The range of addresses starting at *ss_sp* up to but not including *ss_sp+ss_size* is available to the implementation for use as the stack. This function makes no assumptions regarding which end is the stack base and in which direction the stack grows as items are pushed.

If *oss* is not a null pointer, upon successful completion it shall point to a **stack_t** structure that specifies the alternate signal stack that was in effect prior to the call to *sigaltstack()*. The *ss_sp* and *ss_size* members specify the address and size of that stack. The *ss_flags* member specifies the stack's state, and may contain one of the following values:

SS_ONSTACK The process is currently executing on the alternate signal stack. Attempts to modify the alternate signal stack while the process is executing on it fail. This flag shall not be modified by processes.

SS_DISABLE The alternate signal stack is currently disabled.

The value *SIGSTKSZ* is a system default specifying the number of bytes that would be used to cover the usual case when manually allocating an alternate stack area. The value *MINSIGSTKSZ* is defined to be the minimum stack size for a signal handler. In computing an alternate stack size, a program should add that amount to its stack requirements to allow for the system implementation overhead. The constants *SS_ONSTACK*, *SS_DISABLE*, *SIGSTKSZ*, and *MINSIGSTKSZ* are defined in **<signal.h>**.

After a successful call to one of the *exec* functions, there are no alternate signal stacks in the new process image.

In some implementations, a signal (whether or not indicated to execute on the alternate stack) shall always execute on the alternate stack if it is delivered while another signal is being caught using the alternate stack.

Use of this function by library threads that are not bound to kernel-scheduled entities results in undefined behavior.

RETURN VALUE

Upon successful completion, *sigaltstack()* shall return 0; otherwise, it shall return -1 and set *errno* to indicate the error.

ERRORS

The *sigaltstack()* function shall fail if:

- [EINVAL] The *ss* argument is not a null pointer, and the *ss_flags* member pointed to by *ss* contains flags other than *SS_DISABLE*.
- [ENOMEM] The size of the alternate stack area is less than *MINSIGSTKSZ*.
- [EPERM] An attempt was made to modify an active stack.

EXAMPLES**Allocating Memory for an Alternate Stack**

The following example illustrates a method for allocating memory for an alternate stack.

```
#include <signal.h>
...
if ((sigstk.ss_sp = malloc(SIGSTKSZ)) == NULL)
    /* Error return. */
sigstk.ss_size = SIGSTKSZ;
sigstk.ss_flags = 0;
if (sigaltstack(&sigstk, (stack_t *)0) < 0)
    perror("sigaltstack");
```

APPLICATION USAGE

On some implementations, stack space is automatically extended as needed. On those implementations, automatic extension is typically not available for an alternate stack. If the stack overflows, the behavior is undefined.

RATIONALE

None.

FUTURE DIRECTIONS

None.

Moved from X/OPEN UNIX extension to BASE.

The last sentence of the DESCRIPTION was included as an APPLICATION USAGE note in previous issues.

Issue 6

The normative text is updated to avoid use of the term “must” for application requirements.

The **restrict** keyword is added to the *sigaltstack()* prototype for alignment with the ISO/IEC 9899:1999 standard.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/58 is applied, updating the first sentence to include “for the current thread”.

NAME

sigdelset — delete a signal from a signal set

SYNOPSIS

```
CX #include <signal.h>

int sigdelset(sigset_t *set, int signo);
```

DESCRIPTION

The *sigdelset()* function deletes the individual signal specified by *signo* from the signal set pointed to by *set*.

Applications should call either *sigemptyset()* or *sigfillset()* at least once for each object of type **sigset_t** prior to any other use of that object. If such an object is not initialized in this way, but is nonetheless supplied as an argument to any of *pthread_sigmask()*, *sigaction()*, *sigaddset()*, *sigdelset()*, *sigismember()*, *sigpending()*, *sigprocmask()*, *sigsuspend()*, *sigtimedwait()*, *sigwait()*, or *sigwaitinfo()*, the results are undefined.

RETURN VALUE

Upon successful completion, *sigdelset()* shall return 0; otherwise, it shall return -1 and set *errno* to indicate the error.

ERRORS

The *sigdelset()* function may fail if:

[EINVAL]	The <i>signo</i> argument is not a valid signal number, or is an unsupported signal number.

NAME

sigemptyset — initialize and empty a signal set

SYNOPSIS

```
CX      #include <signal.h>
int sigemptyset(sigset_t *set);
```

DESCRIPTION

The *sigemptyset()* function initializes the signal set pointed to by *set*, such that all signals defined in POSIX.1-2008 are excluded.

RETURN VALUE

Upon successful completion, *sigemptyset()* shall return 0; otherwise, it shall return -1 and set *errno* to indicate the error.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

The implementation of the *sigemptyset()* (or *sigfillset()*) function could quite trivially clear (or set) all the bits in the signal set. Alternatively, it would be reasonable to initialize part of the structure, such as a version field, to permit binary-compatibility between releases where the size of the set varies. For such reasons, either *sigemptyset()* or *sigfillset()* must be called prior to any other use of the signal set, even if such use is read-only (for example, as an argument to *sigpending()*). This function is not intended for dynamic allocation.

The *sigfillset()* and *sigemptyset()* functions require that the resulting signal set include (or exclude) all the signals defined in this volume of POSIX.1-2008. Although it is outside the scope of this volume of POSIX.1-2008 to place this requirement on signals that are implemented as extensions, it is recommended that implementation-defined signals also be affected by these functions. However, there may be a good reason for a particular signal not to be affected. For example, blocking or ignoring an implementation-defined signal may have undesirable side-effects, whereas the default action for that signal is harmless. In such a case, it would be preferable for such a signal to be excluded from the signal set returned by *sigfillset()*.

In early proposals there was no distinction between invalid and unsupported signals (the names of optional signals that were not supported by an implementation were not defined by that implementation). The [EINVAL] error was thus specified as a required error for invalid signals. With that distinction, it is not necessary to require implementations of these functions to determine whether an optional signal is actually supported, as that could have a significant performance impact for little value. The error could have been required for invalid signals and optional for unsupported signals, but this seemed unnecessarily complex. Thus, the error is optional in both cases.

FUTURE DIRECTIONS

None.

NAME

sighold, sigignore, sigpause, sigrelse, sigset — signal management

SYNOPSIS

```
#include <signal.h>

int sighold(int sig);
int sigignore(int sig);
int sigpause(int sig);
int sigrelse(int sig);
void (*sigset(int sig, void (*disp)(int)))(int);
```

DESCRIPTION

Use of any of these functions is unspecified in a multi-threaded process.

The *sighold()*, *sigignore()*, *sigpause()*, *sigrelse()*, and *sigset()* functions provide simplified signal management.

The *sigset()* function shall modify signal dispositions. The *sig* argument specifies the signal, which may be any signal except SIGKILL and SIGSTOP. The *disp* argument specifies the signal's disposition, which may be SIG_DFL, SIG_IGN, or the address of a signal handler. If *sigset()* is used, and *disp* is the address of a signal handler, the system shall add *sig* to the signal mask of the calling process before executing the signal handler; when the signal handler returns, the system shall restore the signal mask of the calling process to its state prior to the delivery of the signal. In addition, if *sigset()* is used, and *disp* is equal to SIG_HOLD, *sig* shall be added to the signal mask of the calling process and *sig*'s disposition shall remain unchanged. If *sigset()* is used, and *disp* is not equal to SIG_HOLD, *sig* shall be removed from the signal mask of the calling process.

The *sighold()* function shall add *sig* to the signal mask of the calling process.

The *sigrelse()* function shall remove *sig* from the signal mask of the calling process.

The *sigignore()* function shall set the disposition of *sig* to SIG_IGN.

The *sigpause()* function shall remove *sig* from the signal mask of the calling process and suspend the calling process until a signal is received. The *sigpause()* function shall restore the signal mask of the process to its original state before returning.

If the action for the SIGCHLD signal is set to SIG_IGN, child processes of the calling processes shall not be transformed into zombie processes when they terminate. If the calling process subsequently waits for its children, and the process has no unwaited-for children that were transformed into zombie processes, it shall block until all of its children terminate, and *wait()*, *waitid()*, and *waitpid()* shall fail and set *errno* to [ECHILD].

RETURN VALUE

Upon successful completion, *sigset()* shall return SIG_HOLD if the signal had been blocked and the signal's previous disposition if it had not been blocked. Otherwise, SIG_ERR shall be returned and *errno* set to indicate the error.

The *sigpause()* function shall suspend execution of the thread until a signal is received, whereupon it shall return -1 and set *errno* to [EINTR].

For all other functions, upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to indicate the error.

ERRORS

These functions shall fail if:

[EINVAL] The *sig* argument is an illegal signal number.

The *sigset*() and *sigignore*() functions shall fail if:

[EINVAL] An attempt is made to catch a signal that cannot be caught, or to ignore a signal that cannot be ignored.

EXAMPLES

None.

APPLICATION USAGE

The *sigaction*() function provides a more comprehensive and reliable mechanism for controlling signals; new applications should use the *sigaction*() function instead of the obsolescent *sigset*() function.

The *sighold*() function, in conjunction with *sigrelse*() or *sigpause*(), may be used to establish critical regions of code that require the delivery of a signal to be temporarily deferred. For broader portability, the *pthread_sigmask*() or *sigprocmask*() functions should be used instead of the obsolescent *sighold*() and *sigrelse*() functions.

For broader portability, the *sigsuspend*() function should be used instead of the obsolescent *sigpause*() function.

RATIONALE

Each of these historic functions has a direct analog in the other functions which are required to be per-thread and thread-safe (aside from *sigprocmask*(), which is replaced by *pthread_sigmask*()). The *sigset*() function can be implemented as a simple wrapper for *sigaction*(). The *sighold*() function is equivalent to *sigprocmask*() or *pthread_sigmask*() with SIG_BLOCK set. The *sigignore*() function is equivalent to *sigaction*() with SIG_IGN set. The *sigpause*() function is equivalent to *sigsuspend*(). The *sigrelse*() function is equivalent to *sigprocmask*() or *pthread_sigmask*() with SIG_UNBLOCK set.

FUTURE DIRECTIONS

These functions may be removed in a future version.

SEE ALSO

Section 2.4 (on page 488), *exec*, *pause*(), *pthread_sigmask*(), *sigaction*(), *signal*(), *sigsuspend*(), *wait*(), *waitid*()

XBD <signal.h>

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

The DESCRIPTION is updated to indicate that the *sigpause*() function restores the signal mask of the process to its original state before returning.

The RETURN VALUE section is updated to indicate that the *sigpause*() function suspends execution of the process until a signal is received, whereupon it returns -1 and sets *errno* to [EINTR].

62470 Issue 6

62471 The normative text is updated to avoid use of the term “must” for application requirements.

62472 References to the *wait3()* function are removed.

62473 The XSI functions are split out into their own reference page.

62474 Issue 7

62475 SD5-XSH-ERN-113 and SD5-XSH-ERN-42 are applied, marking these functions obsolescent and
62476 updating the APPLICATION USAGE and RATIONALE sections.

NAME

siginterrupt — allow signals to interrupt functions

SYNOPSIS

```
#include <signal.h>
```

```
int siginterrupt(int sig, int flag);
```

DESCRIPTION

The *siginterrupt()* function shall change the restart behavior when a function is interrupted by the specified signal. The function *siginterrupt(sig, flag)* has an effect as if implemented as:

```
int siginterrupt(int sig, int flag) {
    int ret;
    struct sigaction act;

    (void) sigaction(sig, NULL, &act);
    if (flag)
        act.sa_flags &= ~SA_RESTART;
    else
        act.sa_flags |= SA_RESTART;
    ret = sigaction(sig, &act, NULL);
    return ret;
}
```

RETURN VALUE

Upon successful completion, *siginterrupt()* shall return 0; otherwise, -1 shall be returned and *errno* set to indicate the error.

ERRORS

The *siginterrupt()* function shall fail if:

[EINVAL] The *sig* argument is not a valid signal number.

EXAMPLES

None.

APPLICATION USAGE

The *siginterrupt()* function supports programs written to historical system interfaces. Applications should use the *sigaction()* with the SA_RESTART flag instead of the obsolescent *siginterrupt()* function.

RATIONALE

None.

FUTURE DIRECTIONS

None.

First released in Issue 4, Version 2.

62517 **Issue 5**

62518 Moved from X/OPEN UNIX extension to BASE.

62519 **Issue 6**

62520 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/59 is applied, correcting the declaration in
62521 the sample implementation given in the DESCRIPTION.

62522 **Issue 7**

62523 The *siginterrupt()* function is marked obsolescent.

62524 **NAME**

62525 sigismember — test for a signal in a signal set

62526 **SYNOPSIS**

```
62527 CX    #include <signal.h>
62528    int sigismember(const sigset_t *set, int signo);
```

62529 **DESCRIPTION**

62530 The *sigismember()* function shall test whether the signal specified by *signo* is a member of the set
 62531 pointed to by *set*.

62532 Applications should call either *sigemptyset()* or *sigfillset()* at least once for each object of type
 62533 **sigset_t** prior to any other use of that object. If such an object is not initialized in this way, but is
 62534 nonetheless supplied as an argument to any of *pthread_sigmask()*, *sigaction()*, *sigaddset()*,
 62535 *sigdelset()*, *sigismember()*, *sigpending()*, *sigprocmask()*, *sigsuspend()*, *sigtimedwait()*, *sigwait()*, or
 62536 *sigwaitinfo()*, the results are undefined.

62537 **RETURN VALUE**

62538 Upon successful completion, *sigismember()* shall return 1 if the specified signal is a member of
 62539 the specified set, or 0 if it is not. Otherwise, it shall return -1 and set *errno* to indicate the error.

62540 **ERRORS**

62541 The *sigismember()* function may fail if:

62542	[EINVAL]	The <i>signo</i> argument is not a valid signal number, or is an unsupported signal number.

62555 XBD [<signal.h>](#)

62556 **CHANGE HISTORY**

62557 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

62558 **Issue 5**

62559 The last paragraph of the DESCRIPTION was included as an APPLICATION USAGE note in
 62560 previous issues.

62561 **Issue 6**

62562 The SYNOPSIS is marked CX since the presence of this function in the **<signal.h>** header is an
 62563 extension over the ISO C standard.

62564 **NAME**

62565 siglongjmp — non-local goto with signal handling

62566 **SYNOPSIS**

```
62567 CX    #include <setjmp.h>
62568      void siglongjmp(sigjmp_buf env, int val);
```

62569 **DESCRIPTION**62570 The *siglongjmp()* function shall be equivalent to the *longjmp()* function, except as follows:

- 62571 • References to *setjmp()* shall be equivalent to *sigsetjmp()*.
- 62572 • The *siglongjmp()* function shall restore the saved signal mask if and only if the *env*
- 62573 argument was initialized by a call to *sigsetjmp()* with a non-zero *savemask* argument.

62574 **RETURN VALUE**

62575 After *siglongjmp()* is completed, program execution shall continue as if the corresponding

62576 invocation of *sigsetjmp()* had just returned the value specified by *val*. The *siglongjmp()* function

62577 shall not cause *sigsetjmp()* to return 0; if *val* is 0, *sigsetjmp()* shall return the value 1.

62578 **ERRORS**

62579 No errors are defined.

62580 **EXAMPLES**

62581 None.

62582 **APPLICATION USAGE**

62583 The distinction between *setjmp()* or *longjmp()* and *sigsetjmp()* or *siglongjmp()* is only significant

62584 for programs which use *sigaction()*, *sigprocmask()*, or *sigsuspend()*.

62585 **RATIONALE**

62586 None.

62587 **FUTURE DIRECTIONS**

62588 None.

62589 **SEE ALSO**62590 *longjmp()*, *pthread_sigmask()*, *setjmp()*, *sigsetjmp()*, *sigsuspend()*

62591 XBD <setjmp.h>

62592 **CHANGE HISTORY**

62593 First released in Issue 3. Included for alignment with the ISO POSIX-1 standard.

62594 **Issue 5**

62595 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

62596 **Issue 6**62597 The DESCRIPTION is rewritten in terms of *longjmp()*.

62598 The SYNOPSIS is marked CX since the presence of this function in the <setjmp.h> header is an

62599 extension over the ISO C standard.

62600 **NAME**

62601 signal — signal management

62602 **SYNOPSIS**

62603 #include <signal.h>

62604 void (*signal(int sig, void (*func)(int)))(int);

62605 **DESCRIPTION**

62606 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 62607 conflict between the requirements described here and the ISO C standard is unintentional. This
 62608 volume of POSIX.1-2008 defers to the ISO C standard.

62609 Use of this function is unspecified in a multi-threaded process.

62610 The *signal()* function chooses one of three ways in which receipt of the signal number *sig* is to be
 62611 subsequently handled. If the value of *func* is *SIG_DFL*, default handling for that signal shall
 62612 occur. If the value of *func* is *SIG_IGN*, the signal shall be ignored. Otherwise, the application
 62613 shall ensure that *func* points to a function to be called when that signal occurs. An invocation of
 62614 such a function because of a signal, or (recursively) of any further functions called by that
 62615 invocation (other than functions in the standard library), is called a “signal handler”.

62616 When a signal occurs, and *func* points to a function, it is implementation-defined whether the
 62617 equivalent of a:

62618 signal(*sig*, *SIG_DFL*);

62619 is executed or the implementation prevents some implementation-defined set of signals (at least
 62620 including *sig*) from occurring until the current signal handling has completed. (If the value of *sig*
 62621 is *SIGILL*, the implementation may alternatively define that no action is taken.) Next the
 62622 equivalent of:

62623 (*func)(*sig*);

62624 is executed. If and when the function returns, if the value of *sig* was *SIGFPE*, *SIGILL*, or
 62625 *SIGSEGV* or any other implementation-defined value corresponding to a computational
 62626 exception, the behavior is undefined. Otherwise, the program shall resume execution at the
 62627 point it was interrupted. The ISO C standard places a restriction on applications relating to the
 62628 CX use of *raise()* from signal handlers. This restriction does not apply to POSIX applications, as
 62629 POSIX.1-2008 requires *raise()* to be async-signal-safe (see [Section 2.4.3](#), on page 490).

62630 CX If the process is multi-threaded, or if the process is single-threaded and a signal handler is
 62631 executed other than as the result of:

- 62632 CX • The process calling *abort()*, *raise()*, *kill()*, *pthread_kill()*, or *sigqueue()* to generate a signal
 62633 that is not blocked
- 62634 CX • A pending signal being unblocked and being delivered before the call that unblocked it
 62635 returns

62636 CX the behavior is undefined if the signal handler refers to any object other than *errno* with static
 62637 storage duration other than by assigning a value to an object declared as *volatile sig_atomic_t*,
 62638 CX or if the signal handler calls any function defined in this standard other than one of the
 62639 functions listed in [Section 2.4](#) (on page 488).

62640 At program start-up, the equivalent of:

62641 signal(*sig*, *SIG_IGN*);

62642 is executed for some signals, and the equivalent of:

```
62643      signal(sig, SIG_DFL);
```

62644 CX is executed for all other signals (see *exec*).

62645 The *signal()* function shall not change the setting of *errno* if successful.

62646 RETURN VALUE

62647 If the request can be honored, *signal()* shall return the value of *func* for the most recent call to
62648 *signal()* for the specified signal *sig*. Otherwise, SIG_ERR shall be returned and a positive value
62649 shall be stored in *errno*.

62650 **ERRORS**

62651 The *signal()* function shall fail if:

62652	CX	[EINVAL]	The <i>sig</i> argument is not a valid signal number or an attempt is made to catch a
62653			signal that cannot be caught or ignore a signal that cannot be ignored.

62654 The *signal()* function may fail if:

62655	CX	[EINVAL]	An attempt was made to set the action to SIG_DFL for a signal that cannot be
62656			caught or ignored (or both).

62657 **EXAMPLES**

62658 None.

62659 APPLICATION USAGE

62660 The *sigaction()* function provides a more comprehensive and reliable mechanism for controlling
62661 signals; new applications should use *sigaction()* rather than *signal()*.

62662 RATIONALE

62663 None.

62664 FUTURE DIRECTIONS

62665 None.

62669 CHANGE HISTORY

62670 First released in Issue 1. Derived from Issue 1 of the SVID.

62671 **Issue 5**

62672 Moved from X/OPEN UNIX extension to BASE.

62673 The DESCRIPTION is updated to indicate that the *sigpause()* function restores the signal mask of
62674 the process to its original state before returning.

62675 The RETURN VALUE section is updated to indicate that the *sigpause()* function suspends
62676 execution of the process until a signal is received, whereupon it returns `-1` and sets *errno* to
62677 `[EINTR]`.

62678 **Issue 6**

62679 Extensions beyond the ISO C standard are marked.

62680 The normative text is updated to avoid use of the term “must” for application requirements.

62681 The DESCRIPTION is updated for alignment with the ISO/IEC 9899:1999 standard.

62682 References to the *wait3()* function are removed.

62683 The *sighold()*, *sigignore()*, *sigrelse()*, and *sigset()* functions are split out onto their own reference

62684	page.
62685	Issue 7
62686	POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0580 [275], XSH/TC1-2008/0581 [66], +
62687	and XSH/TC1-2008/0582 [105] are applied.

62688 **NAME**

62689 signbit — test sign

62690 **SYNOPSIS**

62691 #include <math.h>

62692 int signbit(real-floating x);

62693 **DESCRIPTION**

62694 CX The functionality described on this reference page is aligned with the ISO C standard. Any
62695 conflict between the requirements described here and the ISO C standard is unintentional. This
62696 volume of POSIX.1-2008 defers to the ISO C standard.

62697 The *signbit()* macro shall determine whether the sign of its argument value is negative. NaNs,
62698 zeros, and infinities have a sign bit.

62699 **RETURN VALUE**

62700 The *signbit()* macro shall return a non-zero value if and only if the sign of its argument value is
62701 negative.

62702 **ERRORS**

62703 No errors are defined.

62704 **EXAMPLES**

```

62722 **DESCRIPTION**62723 Refer to *lgamma()*.

NAME

sigpause — remove a signal from the signal mask and suspend the thread

SYNOPSIS

```
OB XSI #include <signal.h>
int sigpause(int sig);
```

DESCRIPTION

Refer to *sighold()*.

62731 **NAME**

62732 sigpending — examine pending signals

62733 **SYNOPSIS**

```
62734 CX    #include <signal.h>
62735    int sigpending(sigset_t *set);
```

62736 **DESCRIPTION**

62737 The *sigpending()* function shall store, in the location referenced by the *set* argument, the set of
 62738 signals that are blocked from delivery to the calling thread and that are pending on the process
 62739 or the calling thread.

62740 **RETURN VALUE**

62741 Upon successful completion, *sigpending()* shall return 0; otherwise, -1 shall be returned and
 62742 *errno* set to indicate the error.

62743 **ERRORS**

62744 No errors are defined.

62760 **Issue 6**

62761 The SYNOPSIS is marked CX since the presence of this function in the **<signal.h>** header is an
 62762 extension over the ISO C standard.

62763 NAME

62764 sigprocmask — examine and change blocked signals

62765 SYNOPSIS

```
62766 CX      #include <signal.h>
62767          int sigprocmask(int how, const sigset_t *restrict set,
62768                          sigset_t *restrict oset);
```

62769 DESCRIPTION

62770 Refer to *pthread_sigmask()*.

62771 **NAME**

62772 sigqueue — queue a signal to a process

62773 **SYNOPSIS**

```
62774 CX #include <signal.h>
62775 int sigqueue(pid_t pid, int signo, const union sigval value);
```

62776 **DESCRIPTION**

62777 The *sigqueue()* function shall cause the signal specified by *signo* to be sent with the value
 62778 specified by *value* to the process specified by *pid*. If *signo* is zero (the null signal), error checking
 62779 is performed but no signal is actually sent. The null signal can be used to check the validity of
 62780 *pid*.

62781 The conditions required for a process to have permission to queue a signal to another process are
 62782 the same as for the *kill()* function.

62783 The *sigqueue()* function shall return immediately. If SA_SIGINFO is set for *signo* and if the
 62784 resources were available to queue the signal, the signal shall be queued and sent to the receiving
 62785 process. If SA_SIGINFO is not set for *signo*, then *signo* shall be sent at least once to the receiving
 62786 process; it is unspecified whether *value* shall be sent to the receiving process as a result of this
 62787 call.

62788 If the value of *pid* causes *signo* to be generated for the sending process, and if *signo* is not blocked
 62789 for the calling thread and if no other thread has *signo* unblocked or is waiting in a *sigwait()*
 62790 function for *signo*, either *signo* or at least the pending, unblocked signal shall be delivered to the
 62791 calling thread before the *sigqueue()* function returns. Should any multiple pending signals in the
 62792 range SIGRTMIN to SIGRTMAX be selected for delivery, it shall be the lowest numbered one.
 62793 The selection order between realtime and non-realtime signals, or between multiple pending
 62794 non-realtime signals, is unspecified.

62795 **RETURN VALUE**

62796 Upon successful completion, the specified signal shall have been queued, and the *sigqueue()*
 62797 function shall return a value of zero. Otherwise, the function shall return a value of -1 and set
 62798 *errno* to indicate the error.

62799 **ERRORS**

62800 The *sigqueue()* function shall fail if:

62801	[EAGAIN]	No resources are available to queue the signal. The process has already queued {SIGQUEUE_MAX} signals that are still pending at the receiver(s), or a system-wide resource limit has been exceeded.
62802		
62803		
62804	[EINVAL]	The value of the <i>signo</i> argument is an invalid or unsupported signal number.
62805	[EPERM]	The process does not have appropriate privileges to send the signal to the receiving process.
62806		
62807	[ESRCH]	The process <i>pid</i> does not exist.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

The *sigqueue()* function allows an application to queue a realtime signal to itself or to another process, specifying the application-defined value. This is common practice in realtime applications on existing realtime systems. It was felt that specifying another function in the *sig...* name space already carved out for signals was preferable to extending the interface to *kill()*.

Such a function became necessary when the put/get event function of the message queues was removed. It should be noted that the *sigqueue()* function implies reduced performance in a security-conscious implementation as the access permissions between the sender and receiver have to be checked on each send when the *pid* is resolved into a target process. Such access checks were necessary only at message queue open in the previous interface.

The standard developers required that *sigqueue()* have the same semantics with respect to the null signal as *kill()*, and that the same permission checking be used. But because of the difficulty of implementing the “broadcast” semantic of *kill()* (for example, to process groups) and the interaction with resource allocation, this semantic was not adopted. The *sigqueue()* function queues a signal to a single process specified by the *pid* argument.

The *sigqueue()* function can fail if the system has insufficient resources to queue the signal. An explicit limit on the number of queued signals that a process could send was introduced. While the limit is “per-sender”, this volume of POSIX.1-2008 does not specify that the resources be part of the state of the sender. This would require either that the sender be maintained after exit until all signals that it had sent to other processes were handled or that all such signals that had not yet been acted upon be removed from the queue(s) of the receivers. This volume of POSIX.1-2008 does not preclude this behavior, but an implementation that allocated queuing resources from a system-wide pool (with per-sender limits) and that leaves queued signals pending after the sender exits is also permitted.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension and the POSIX Threads Extension.

Issue 6

The *sigqueue()* function is marked as part of the Realtime Signals Extension option.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Realtime Signals Extension option.

Issue 7

The *sigqueue()* function is moved from the Realtime Signals Extension option to the Base.

62851 **NAME**

62852 sigrelse, sigset — signal management

62853 **SYNOPSIS**

```
62854 OB XSI #include <signal.h>
62855 int sigrelse(int sig);
62856 void (*sigset(int sig, void (*disp)(int)))(int);
```

62857 **DESCRIPTION**62858 Refer to *sighold()*.

NAME

sigsetjmp — set jump point for a non-local goto

SYNOPSIS

```
CX      #include <setjmp.h>
int sigsetjmp(sigjmp_buf env, int savemask);
```

DESCRIPTION

The *sigsetjmp()* function shall be equivalent to the *setjmp()* function, except as follows:

- References to *setjmp()* are equivalent to *sigsetjmp()*.
- References to *longjmp()* are equivalent to *siglongjmp()*.
- If the value of the *savemask* argument is not 0, *sigsetjmp()* shall also save the current signal mask of the calling thread as part of the calling environment.

RETURN VALUE

If the return is from a successful direct invocation, *sigsetjmp()* shall return 0. If the return is from a call to *siglongjmp()*, *sigsetjmp()* shall return a non-zero value.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

The distinction between *setjmp()/longjmp()* and *sigsetjmp()/siglongjmp()* is only significant for programs which use *sigaction()*, *sigprocmask()*, or *sigsuspend()*.

Note that since this function is defined in terms of *setjmp()*, if *savemask* is zero, it is unspecified whether the signal mask is saved.

RATIONALE

The ISO C standard specifies various restrictions on the usage of the *setjmp()* macro in order to permit implementors to recognize the name in the compiler and not implement an actual function. These same restrictions apply to the *sigsetjmp()* macro.

There are processors that cannot easily support these calls, but this was not considered a sufficient reason to exclude them.

4.2 BSD, 4.3 BSD, and XSI-conformant systems provide functions named *_setjmp()* and *_longjmp()* that, together with *setjmp()* and *longjmp()*, provide the same functionality as *sigsetjmp()* and *siglongjmp()*. On those systems, *setjmp()* and *longjmp()* save and restore signal masks, while *_setjmp()* and *_longjmp()* do not. On System V Release 3 and in corresponding issues of the SVID, *setjmp()* and *longjmp()* are explicitly defined not to save and restore signal masks. In order to permit existing practice in both cases, the relation of *setjmp()* and *longjmp()* to signal masks is not specified, and a new set of functions is defined instead.

The *longjmp()* and *siglongjmp()* functions operate as in the previous issue provided the matching *setjmp()* or *sigsetjmp()* has been performed in the same thread. Non-local jumps into contexts saved by other threads would be at best a questionable practice and were not considered worthy of standardization.

62899 FUTURE DIRECTIONS

62900 None.

62901 SEE ALSO

62902 *pthread_sigmask()*, *siglongjmp()*, *signal()*, *sigsuspend()*

62903 XBD **<setjmp.h>**

62904 CHANGE HISTORY

62905 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

62906 Issue 5

62907 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

62908 Issue 6

62909 The DESCRIPTION is reworded in terms of *setjmp()*.

62910 The SYNOPSIS is marked CX since the presence of this function in the **<setjmp.h>** header is an
62911 extension over the ISO C standard.

62912 **NAME**

62913 sigsuspend — wait for a signal

62914 **SYNOPSIS**

```
62915 CX      #include <signal.h>
62916      int sigsuspend(const sigset_t *sigmask);
```

62917 **DESCRIPTION**

62918 The *sigsuspend()* function shall replace the current signal mask of the calling thread with the set
 62919 of signals pointed to by *sigmask* and then suspend the thread until delivery of a signal whose
 62920 action is either to execute a signal-catching function or to terminate the process. This shall not
 62921 cause any other signals that may have been pending on the process to become pending on the
 62922 thread.

62923 If the action is to terminate the process then *sigsuspend()* shall never return. If the action is to
 62924 execute a signal-catching function, then *sigsuspend()* shall return after the signal-catching
 62925 function returns, with the signal mask restored to the set that existed prior to the *sigsuspend()*
 62926 call.

62927 It is not possible to block signals that cannot be ignored. This is enforced by the system without
 62928 causing an error to be indicated.

62929 **RETURN VALUE**

62930 Since *sigsuspend()* suspends thread execution indefinitely, there is no successful completion
 62931 return value. If a return occurs, *-1* shall be returned and *errno* set to indicate the error.

62932 **ERRORS**

62933 The *sigsuspend()* function shall fail if:

62934 [EINTR] A signal is caught by the calling process and control is returned from the
 62935 signal-catching function.

62936 **EXAMPLES**

62937 None.

62938 **APPLICATION USAGE**

62939 Normally, at the beginning of a critical code section, a specified set of signals is blocked using
 62940 the *sigprocmask()* function. When the thread has completed the critical section and needs to wait
 62941 for the previously blocked signal(s), it pauses by calling *sigsuspend()* with the mask that was
 62942 returned by the *sigprocmask()* call.

62943 **RATIONALE**

62944 Code which wants to avoid the ambiguity of the signal mask for thread cancellation handlers
 62945 can install an additional cancellation handler which resets the signal mask to the expected value.

```
62946 void cleanup(void *arg)
62947 {
62948     sigset_t *ss = (sigset_t *) arg;
62949     pthread_sigmask(SIG_SETMASK, ss, NULL);
62950 }
62951 int call_sigsuspend(const sigset_t *mask)
62952 {
62953     sigset_t oldmask;
62954     int result;
62955     pthread_sigmask(SIG_SETMASK, NULL, &oldmask);
62956     pthread_cleanup_push(cleanup, &oldmask);
```

```
62957         result = sigsuspend(sigmask);
62958         pthread_cleanup_pop(0);
62959         return result;
62960     }
```

62961 FUTURE DIRECTIONS

62962 None.

62966 CHANGE HISTORY

62967 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

62968 Issue 5

62969 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

62970 Issue 6

62971 The text in the RETURN VALUE section has been changed from “suspends process execution”
62972 to “suspends thread execution”. This reflects IEEE PASC Interpretation 1003.1c #40.

62973 Text in the APPLICATION USAGE section has been replaced.

62974 The SYNOPSIS is marked CX since the presence of this function in the [<signal.h>](#) header is an
62975 extension over the ISO C standard.

62976 Issue 7

62977 SD5-XSH-ERN-122 is applied, adding the example code in the RATIONALE.

NAME

sigtimedwait, sigwaitinfo — wait for queued signals

SYNOPSIS

```

#include <signal.h>

int sigtimedwait(const sigset_t *restrict set,
                 siginfo_t *restrict info,
                 const struct timespec *restrict timeout);
int sigwaitinfo(const sigset_t *restrict set,
                 siginfo_t *restrict info);

```

DESCRIPTION

The *sigtimedwait()* function shall be equivalent to *sigwaitinfo()* except that if none of the signals specified by *set* are pending, *sigtimedwait()* shall wait for the time interval specified in the **timespec** structure referenced by *timeout*. If the **timespec** structure pointed to by *timeout* is zero-valued and if none of the signals specified by *set* are pending, then *sigtimedwait()* shall return immediately with an error. If *timeout* is the null pointer, the behavior is unspecified. If the Monotonic Clock option is supported, the **CLOCK_MONOTONIC** clock shall be used to measure the time interval specified by the *timeout* argument.

The *sigwaitinfo()* function selects the pending signal from the set specified by *set*. Should any of multiple pending signals in the range SIGRTMIN to SIGRTMAX be selected, it shall be the lowest numbered one. The selection order between realtime and non-realtime signals, or between multiple pending non-realtime signals, is unspecified. If no signal in *set* is pending at the time of the call, the calling thread shall be suspended until one or more signals in *set* become pending or until it is interrupted by an unblocked, caught signal.

The *sigwaitinfo()* function shall be equivalent to the *sigwait()* function if the *info* argument is NULL. If the *info* argument is non-NULL, the *sigwaitinfo()* function shall be equivalent to *sigwait()*, except that the selected signal number shall be stored in the *si_signo* member, and the cause of the signal shall be stored in the *si_code* member. If any value is queued to the selected signal, the first such queued value shall be dequeued and, if the *info* argument is non-NULL, the value shall be stored in the *si_value* member of *info*. The system resource used to queue the signal shall be released and returned to the system for other use. If no value is queued, the content of the *si_value* member is undefined. If no further signals are queued for the selected signal, the pending indication for that signal shall be reset.

RETURN VALUE

Upon successful completion (that is, one of the signals specified by *set* is pending or is generated) *sigwaitinfo()* and *sigtimedwait()* shall return the selected signal number. Otherwise, the function shall return a value of -1 and set *errno* to indicate the error.

ERRORS

The *sigtimedwait()* function shall fail if:

[EAGAIN] No signal specified by *set* was generated within the specified timeout period.

The *sigtimedwait()* and *sigwaitinfo()* functions may fail if:

[EINTR] The wait was interrupted by an unblocked, caught signal. It shall be documented in system documentation whether this error causes these functions to fail.

63021 The *sigtimedwait()* function may also fail if:
 63022 [EINVAL] The *timeout* argument specified a *tv_nsec* value less than zero or greater than
 63023 or equal to 1 000 million.

63024 An implementation should only check for this error if no signal is pending in *set* and it is
 63025 necessary to wait.

63026 EXAMPLES

63027 None.

63028 APPLICATION USAGE

63029 The *sigtimedwait()* function times out and returns an [EAGAIN] error. Application developers
 63030 should note that this is inconsistent with other functions such as *pthread_cond_timedwait()* that
 63031 return [ETIMEDOUT].

63032 Note that in order to ensure that generated signals are queued and signal values passed to +
 63033 *sigqueue()* are available in *si_value*, applications which use *sigwaitinfo()* or *sigtimedwait()* need to +
 63034 set the SA_SIGINFO flag for each signal in the set (see [Section 2.4](#), on page 488). This means +
 63035 setting each signal to be handled by a three-argument signal-catching function, even if the +
 63036 handler will never be called. It is not possible (portably) to set a signal handler to SIG_DFL +
 63037 while setting the SA_SIGINFO flag, because assigning to the *sa_handler* member of **struct** +
 63038 **sigaction** instead of the *sa_sigaction* member would result in undefined behavior, and SIG_DFL +
 63039 need not be assignment-compatible with *sa_sigaction*. Even if an assignment of SIG_DFL to +
 63040 *sa_sigaction* is accepted by the compiler, the implementation need not treat this value as special— +
 63041 it could just be taken as the address of a signal-catching function.

63042 RATIONALE

63043 Existing programming practice on realtime systems uses the ability to pause waiting for a
 63044 selected set of events and handle the first event that occurs in-line instead of in a signal-handling
 63045 function. This allows applications to be written in an event-directed style similar to a state
 63046 machine. This style of programming is useful for largescale transaction processing in which the
 63047 overall throughput of an application and the ability to clearly track states are more important
 63048 than the ability to minimize the response time of individual event handling.

63049 It is possible to construct a signal-waiting macro function out of the realtime signal function
 63050 mechanism defined in this volume of POSIX.1-2008. However, such a macro has to include the
 63051 definition of a generalized handler for all signals to be waited on. A significant portion of the
 63052 overhead of handler processing can be avoided if the signal-waiting function is provided by the
 63053 kernel. This volume of POSIX.1-2008 therefore provides two signal-waiting functions—one that
 63054 waits indefinitely and one with a timeout—as part of the overall realtime signal function
 63055 specification.

63056 The specification of a function with a timeout allows an application to be written that can be
 63057 broken out of a wait after a set period of time if no event has occurred. It was argued that setting
 63058 a timer event before the wait and recognizing the timer event in the wait would also implement
 63059 the same functionality, but at a lower performance level. Because of the performance
 63060 degradation associated with the user-level specification of a timer event and the subsequent
 63061 cancellation of that timer event after the wait completes for a valid event, and the complexity
 63062 associated with handling potential race conditions associated with the user-level method, the
 63063 separate function has been included.

63064 Note that the semantics of the *sigwaitinfo()* function are nearly identical to that of the *sigwait()*
 63065 function defined by this volume of POSIX.1-2008. The only difference is that *sigwaitinfo()* returns
 63066 the queued signal value in the *value* argument. The return of the queued value is required so that
 63067 applications can differentiate between multiple events queued to the same signal number.

The two distinct functions are being maintained because some implementations may choose to implement the POSIX Threads Extension functions and not implement the queued signals extensions. Note, though, that *sigwaitinfo()* does not return the queued value if the *value* argument is NULL, so the POSIX Threads Extension *sigwait()* function can be implemented as a macro on *sigwaitinfo()*.

The *sigtimedwait()* function was separated from the *sigwaitinfo()* function to address concerns regarding the overloading of the *timeout* pointer to indicate indefinite wait (no timeout), timed wait, and immediate return, and concerns regarding consistency with other functions where the conditional and timed waits were separate functions from the pure blocking function. The semantics of *sigtimedwait()* are specified such that *sigwaitinfo()* could be implemented as a macro with a null pointer for *timeout*.

The *sigwait* functions provide a synchronous mechanism for threads to wait for asynchronously-generated signals. One important question was how many threads that are suspended in a call to a *sigwait()* function for a signal should return from the call when the signal is sent. Four choices were considered:

1. Return an error for multiple simultaneous calls to *sigwait* functions for the same signal.
2. One or more threads return.
3. All waiting threads return.
4. Exactly one thread returns.

Prohibiting multiple calls to *sigwait()* for the same signal was felt to be overly restrictive. The “one or more” behavior made implementation of conforming packages easy at the expense of forcing POSIX threads clients to protect against multiple simultaneous calls to *sigwait()* in application code in order to achieve predictable behavior. There was concern that the “all waiting threads” behavior would result in “signal broadcast storms”, consuming excessive CPU resources by replicating the signals in the general case. Furthermore, no convincing examples could be presented that delivery to all was either simpler or more powerful than delivery to one.

Thus, the consensus was that exactly one thread that was suspended in a call to a *sigwait* function for a signal should return when that signal occurs. This is not an onerous restriction as:

- A multi-way signal wait can be built from the single-way wait.
- Signals should only be handled by application-level code, as library routines cannot guess what the application wants to do with signals generated for the entire process.
- Applications can thus arrange for a single thread to wait for any given signal and call any needed routines upon its arrival.

In an application that is using signals for interprocess communication, signal processing is typically done in one place. Alternatively, if the signal is being caught so that process cleanup can be done, the signal handler thread can call separate process cleanup routines for each portion of the application. Since the application main line started each portion of the application, it is at the right abstraction level to tell each portion of the application to clean up.

Certainly, there exist programming styles where it is logical to consider waiting for a single signal in multiple threads. A simple *sigwait_multiple()* routine can be constructed to achieve this goal. A possible implementation would be to have each *sigwait_multiple()* caller registered as having expressed interest in a set of signals. The caller then waits on a thread-specific condition variable. A single server thread calls a *sigwait()* function on the union of all registered signals. When the *sigwait()* function returns, the appropriate state is set and condition variables are broadcast. New *sigwait_multiple()* callers may cause the pending *sigwait()* call to be canceled

63113 and reissued in order to update the set of signals being waited for.

63114 FUTURE DIRECTIONS

63115 None.

63120 CHANGE HISTORY

63121 First released in Issue 5. Included for alignment with the POSIX Realtime Extension and the
63122 POSIX Threads Extension.

63123 Issue 6

63124 These functions are marked as part of the Realtime Signals Extension option.

63125 The Open Group Corrigendum U035/3 is applied. The SYNOPSIS of the *sigwaitinfo()* function
63126 has been corrected so that the second argument is of type **siginfo_t** *.

63127 The [ENOSYS] error condition has been removed as stubs need not be provided if an
63128 implementation does not support the Realtime Signals Extension option.

63129 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that the
63130 CLOCK_MONOTONIC clock, if supported, is used to measure timeout intervals.

63131 The **restrict** keyword is added to the *sigtimedwait()* and *sigwaitinfo()* prototypes for alignment
63132 with the ISO/IEC 9899:1999 standard.

63133 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/130 is applied, restoring wording in the
63134 RETURN VALUE section to that in the original base document (“An implementation should
63135 only check for this error if no signal is pending in *set* and it is necessary to wait”).

63136 Issue 7

63137 The *sigtimedwait()* and *sigwaitinfo()* functions are moved from the Realtime Signals Extension
63138 option to the Base.

63139 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0583 [392] is applied.

+

NAME

sigwait — wait for queued signals

SYNOPSIS

```
#include <signal.h>

int sigwait(const sigset_t *restrict set, int *restrict sig);
```

DESCRIPTION

The *sigwait()* function shall select a pending signal from *set*, atomically clear it from the system's set of pending signals, and return that signal number in the location referenced by *sig*. If prior to the call to *sigwait()* there are multiple pending instances of a single signal number, it is implementation-defined whether upon successful return there are any remaining pending signals for that signal number. If the implementation supports queued signals and there are multiple signals queued for the signal number selected, the first such queued signal shall cause a return from *sigwait()* and the remainder shall remain queued. If no signal in *set* is pending at the time of the call, the thread shall be suspended until one or more becomes pending. The signals defined by *set* shall have been blocked at the time of the call to *sigwait()*; otherwise, the behavior is undefined. The effect of *sigwait()* on the signal actions for the signals in *set* is unspecified.

If more than one thread is using *sigwait()* to wait for the same signal, no more than one of these threads shall return from *sigwait()* with the signal number. If more than a single thread is blocked in *sigwait()* for a signal when that signal is generated for the process, it is unspecified which of the waiting threads returns from *sigwait()*. If the signal is generated for a specific thread, as by *pthread_kill()*, only that thread shall return.

Should any of the multiple pending signals in the range SIGRTMIN to SIGRTMAX be selected, it shall be the lowest numbered one. The selection order between realtime and non-realtime signals, or between multiple pending non-realtime signals, is unspecified.

RETURN VALUE

Upon successful completion, *sigwait()* shall store the signal number of the received signal at the location referenced by *sig* and return zero. Otherwise, an error number shall be returned to indicate the error.

ERRORS

The *sigwait()* function may fail if:

[EINVAL] The *set* argument contains an invalid or unsupported signal number.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

To provide a convenient way for a thread to wait for a signal, this volume of POSIX.1-2008 provides the *sigwait()* function. For most cases where a thread has to wait for a signal, the *sigwait()* function should be quite convenient, efficient, and adequate.

However, requests were made for a lower-level primitive than *sigwait()* and for semaphores that could be used by threads. After some consideration, threads were allowed to use semaphores and *sem_post()* was defined to be async-signal-safe.

In summary, when it is necessary for code run in response to an asynchronous signal to notify a thread, *sigwait()* should be used to handle the signal. Alternatively, if the implementation provides semaphores, they also can be used, either following *sigwait()* or from within a signal

63185 handling routine previously registered with *sigaction()*.

63186 FUTURE DIRECTIONS

63187 None.

63192 CHANGE HISTORY

63193 First released in Issue 5. Included for alignment with the POSIX Realtime Extension and the
63194 POSIX Threads Extension.

63195 Issue 6

63196 The **restrict** keyword is added to the *sigwait()* prototype for alignment with the
63197 ISO/IEC 9899:1999 standard.

63198 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/131 is applied, updating the
63199 DESCRIPTION to state that if more than a single thread is blocked in *sigwait()*, it is unspecified
63200 which of the waiting threads returns, and that if a signal is generated for a specific thread only
63201 that thread shall return.

63202 Issue 7

63203 Functionality relating to the Realtime Signals Extension option is moved to the Base.

63204 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0584 [76] is applied.

+

63205 **NAME**

63206 sigwaitinfo — wait for queued signals

63207 **SYNOPSIS**

```
63208 #include <signal.h>  
63209 int sigwaitinfo(const sigset_t *restrict set, siginfo_t *restrict info);
```

63210 **DESCRIPTION**

63211 Refer to *sigtimedwait()*.

63212 **NAME**

63213 sin, sinf, sinl — sine function

63214 **SYNOPSIS**

```
63215 #include <math.h>
63216 double sin(double x);
63217 float sinf(float x);
63218 long double sinl(long double x);
```

63219 **DESCRIPTION**

63220 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 63221 conflict between the requirements described here and the ISO C standard is unintentional. This
 63222 volume of POSIX.1-2008 defers to the ISO C standard.

63223 These functions shall compute the sine of their argument x , measured in radians.

63224 An application wishing to check for error situations should set *errno* to zero and call
 63225 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 63226 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 63227 zero, an error has occurred.

63228 **RETURN VALUE**

63229 Upon successful completion, these functions shall return the sine of x .

63230 MX If x is NaN, a NaN shall be returned.

63231 If x is ± 0 , x shall be returned.

63232 If x is subnormal, a range error may occur

63233 MXX and x should be returned.

63234 MX If x is not returned, *sin()*, *sinf()*, and *sinl()* shall return an implementation-defined value no
 63235 greater in magnitude than DBL_MIN, FLT_MIN, and LDBL_MIN, respectively.

63236 If x is $\pm\text{Inf}$, a domain error shall occur, and a NaN shall be returned.

63237 **ERRORS**

63238 These functions shall fail if:

63239 MX **Domain Error** The x argument is $\pm\text{Inf}$.

63240 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 63241 then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling*
 63242 & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
 63243 shall be raised.

63244 These functions may fail if:

63245 MX **Range Error** The value of x is subnormal

63246 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 63247 then *errno* shall be set to [ERANGE]. If the integer expression
 63248 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the underflow
 63249 floating-point exception shall be raised.

63250 **EXAMPLES**63251 **Taking the Sine of a 45-Degree Angle**

```

63252 #include <math.h>
63253 ...
63254 double radians = 45.0 * M_PI / 180;
63255 double result;
63256 ...
63257 result = sin(radians);

```

63258 **APPLICATION USAGE**

63259 These functions may lose accuracy when their argument is near a multiple of π or is far from 0.0.

63260 On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* &
 63261 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

63262 **RATIONALE**

63263 None.

63264 **FUTURE DIRECTIONS**

63265 None.

 63282 [320] are applied.

63283 **NAME**

63284 sinh, sinhf, sinh1 — hyperbolic sine functions

63285 **SYNOPSIS**

```
63286       #include <math.h>
63287       double sinh(double x);
63288       float  sinhf(float x);
63289       long double sinh1(long double x);
```

63290 **DESCRIPTION**

63291 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 63292 conflict between the requirements described here and the ISO C standard is unintentional. This
 63293 volume of POSIX.1-2008 defers to the ISO C standard.

63294 These functions shall compute the hyperbolic sine of their argument x .

63295 An application wishing to check for error situations should set *errno* to zero and call
 63296 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 63297 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 63298 zero, an error has occurred.

63299 **RETURN VALUE**

63300 Upon successful completion, these functions shall return the hyperbolic sine of x .

63301 If the result would cause an overflow, a range error shall occur and $\pm\text{HUGE\_VAL}$,
 63302 $\pm\text{HUGE\_VALF}$, and $\pm\text{HUGE\_VALL}$ (with the same sign as x) shall be returned as appropriate for
 63303 the type of the function.

63304 MX If x is NaN, a NaN shall be returned.

63305 If x is ± 0 or $\pm\text{Inf}$, x shall be returned.

63306 If x is subnormal, a range error may occur

63307 MXX and x should be returned.

63308 MX If x is not returned, *sinh*(), *sinhf*(), and *sinh1*() shall return an implementation-defined value no
 63309 greater in magnitude than DBL_MIN, FLT_MIN, and LDBL_MIN, respectively.

63310 **ERRORS**

63311 These functions shall fail if:

63312 Range Error The result would cause an overflow.

63313 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 63314 then *errno* shall be set to [ERANGE]. If the integer expression
 63315 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the overflow
 63316 floating-point exception shall be raised.

63317 These functions may fail if:

63318 MX Range Error The value x is subnormal.

63319 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 63320 then *errno* shall be set to [ERANGE]. If the integer expression
 63321 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the underflow
 63322 floating-point exception shall be raised.

63323 **EXAMPLES**

63324 None.

63325 **APPLICATION USAGE**

63326 On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* &
 63327 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

NAME

sleep — suspend execution for an interval of time

SYNOPSIS

```
#include <unistd.h>
```

```
unsigned sleep(unsigned seconds);
```

DESCRIPTION

The *sleep()* function shall cause the calling thread to be suspended from execution until either the number of realtime seconds specified by the argument *seconds* has elapsed or a signal is delivered to the calling thread and its action is to invoke a signal-catching function or to terminate the process. The suspension time may be longer than requested due to the scheduling of other activity by the system.

If a SIGALRM signal is generated for the calling process during execution of *sleep()* and if the SIGALRM signal is being ignored or blocked from delivery, it is unspecified whether *sleep()* returns when the SIGALRM signal is scheduled. If the signal is being blocked, it is also unspecified whether it remains pending after *sleep()* returns or it is discarded.

If a SIGALRM signal is generated for the calling process during execution of *sleep()*, except as a result of a prior call to *alarm()*, and if the SIGALRM signal is not being ignored or blocked from delivery, it is unspecified whether that signal has any effect other than causing *sleep()* to return.

If a signal-catching function interrupts *sleep()* and examines or changes either the time a SIGALRM is scheduled to be generated, the action associated with the SIGALRM signal, or whether the SIGALRM signal is blocked from delivery, the results are unspecified.

If a signal-catching function interrupts *sleep()* and calls *siglongjmp()* or *longjmp()* to restore an environment saved prior to the *sleep()* call, the action associated with the SIGALRM signal and the time at which a SIGALRM signal is scheduled to be generated are unspecified. It is also unspecified whether the SIGALRM signal is blocked, unless the signal mask of the process is restored as part of the environment.

XSI Interactions between *sleep()* and *setitimer()* are unspecified.

RETURN VALUE

If *sleep()* returns because the requested time has elapsed, the value returned shall be 0. If *sleep()* returns due to delivery of a signal, the return value shall be the “unslept” amount (the requested time minus the time actually slept) in seconds.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

There are two general approaches to the implementation of the *sleep()* function. One is to use the *alarm()* function to schedule a SIGALRM signal and then suspend the calling thread waiting for that signal. The other is to implement an independent facility. This volume of POSIX.1-2008 permits either approach.

In order to comply with the requirement that no primitive shall change a process attribute unless explicitly described by this volume of POSIX.1-2008, an implementation using SIGALRM must carefully take into account any SIGALRM signal scheduled by previous *alarm()* calls, the action

previously established for SIGALRM, and whether SIGALRM was blocked. If a SIGALRM has been scheduled before the *sleep()* would ordinarily complete, the *sleep()* must be shortened to that time and a SIGALRM generated (possibly simulated by direct invocation of the signal-catching function) before *sleep()* returns. If a SIGALRM has been scheduled after the *sleep()* would ordinarily complete, it must be rescheduled for the same time before *sleep()* returns. The action and blocking for SIGALRM must be saved and restored.

Historical implementations often implement the SIGALRM-based version using *alarm()* and *pause()*. One such implementation is prone to infinite hangups, as described in *pause()*. Another such implementation uses the C-language *setjmp()* and *longjmp()* functions to avoid that window. That implementation introduces a different problem: when the SIGALRM signal interrupts a signal-catching function installed by the user to catch a different signal, the *longjmp()* aborts that signal-catching function. An implementation based on *sigprocmask()*, *alarm()*, and *sigsuspend()* can avoid these problems.

Despite all reasonable care, there are several very subtle, but detectable and unavoidable, differences between the two types of implementations. These are the cases mentioned in this volume of POSIX.1-2008 where some other activity relating to SIGALRM takes place, and the results are stated to be unspecified. All of these cases are sufficiently unusual as not to be of concern to most applications.

See also the discussion of the term *realtime* in *alarm()*.

Since *sleep()* can be implemented using *alarm()*, the discussion about alarms occurring early under *alarm()* applies to *sleep()* as well.

Application developers should note that the type of the argument *seconds* and the return value of *sleep()* is **unsigned**. That means that a Strictly Conforming POSIX System Interfaces Application cannot pass a value greater than the minimum guaranteed value for {UINT_MAX}, which the ISO C standard sets as 65535, and any application passing a larger value is restricting its portability. A different type was considered, but historical implementations, including those with a 16-bit **int** type, consistently use either **unsigned** or **int**.

Scheduling delays may cause the process to return from the *sleep()* function significantly after the requested time. In such cases, the return value should be set to zero, since the formula (requested time minus the time actually spent) yields a negative number and *sleep()* returns an **unsigned**.

NAME

socketmark — determine whether a socket is at the out-of-band mark

SYNOPSIS

```
#include <sys/socket.h>
```

```
int socketmark(int s);
```

DESCRIPTION

The *socketmark()* function shall determine whether the socket specified by the descriptor *s* is at the out-of-band data mark (see [Section 2.10.12](#), on page 525). If the protocol for the socket supports out-of-band data by marking the stream with an out-of-band data mark, the *socketmark()* function shall return 1 when all data preceding the mark has been read and the out-of-band data mark is the first element in the receive queue. The *socketmark()* function shall not remove the mark from the stream.

RETURN VALUE

Upon successful completion, the *socketmark()* function shall return a value indicating whether the socket is at an out-of-band data mark. If the protocol has marked the data stream and all data preceding the mark has been read, the return value shall be 1; if there is no mark, or if data precedes the mark in the receive queue, the *socketmark()* function shall return 0. Otherwise, it shall return a value of -1 and set *errno* to indicate the error.

ERRORS

The *socketmark()* function shall fail if:

- [EBADF] The *s* argument is not a valid file descriptor.
- [ENOTTY] The file associated with the *s* argument is not a socket.

EXAMPLES

None.

APPLICATION USAGE

The use of this function between receive operations allows an application to determine which received data precedes the out-of-band data and which follows the out-of-band data.

There is an inherent race condition in the use of this function. On an empty receive queue, the current read of the location might well be at the “mark”, but the system has no way of knowing that the next data segment that will arrive from the network will carry the mark, and *socketmark()* will return false, and the next read operation will silently consume the mark.

Hence, this function can only be used reliably when the application already knows that the out-of-band data has been seen by the system or that it is known that there is data waiting to be read at the socket (via SIGURG or *select()*). See [Section 2.10.11](#) (on page 525), [Section 2.10.12](#) (on page 525), [Section 2.10.14](#) (on page 526), and *pselect()* for details.

RATIONALE

The *socketmark()* function replaces the historical SIOCATMARK command to *ioctl()* which implemented the same functionality on many implementations. Using a wrapper function follows the adopted conventions to avoid specifying commands to the *ioctl()* function, other than those now included to support XSI STREAMS. The *socketmark()* function could be implemented as follows:

```
#include <sys/ioctl.h>

int socketmark(int s)
{
    int val;
```

```

63496         if (ioctl(s, SIOCATMARK, &val) == -1)
63497             return (-1);
63498         return (val);
63499     }

```

63500 The use of [ENOTTY] to indicate an incorrect descriptor type matches the historical behavior of
63501 SIOCATMARK.

63502 FUTURE DIRECTIONS

63503 None.

NAME

socket — create an endpoint for communication

SYNOPSIS

```
#include <sys/socket.h>

int socket(int domain, int type, int protocol);
```

DESCRIPTION

The *socket()* function shall create an unbound socket in a communications domain, and return a file descriptor that can be used in later function calls that operate on sockets.

The *socket()* function takes the following arguments:

<i>domain</i>	Specifies the communications domain in which a socket is to be created.
<i>type</i>	Specifies the type of socket to be created.
<i>protocol</i>	Specifies a particular protocol to be used with the socket. Specifying a <i>protocol</i> of 0 causes <i>socket()</i> to use an unspecified default protocol appropriate for the requested socket type.

The *domain* argument specifies the address family used in the communications domain. The address families supported by the system are implementation-defined.

Symbolic constants that can be used for the domain argument are defined in the **<sys/socket.h>** header.

The *type* argument specifies the socket type, which determines the semantics of communication over the socket. The following socket types are defined; implementations may specify additional socket types:

SOCK_STREAM	Provides sequenced, reliable, bidirectional, connection-mode byte streams, and may provide a transmission mechanism for out-of-band data.
SOCK_DGRAM	Provides datagrams, which are connectionless-mode, unreliable messages of fixed maximum length.
SOCK_SEQPACKET	Provides sequenced, reliable, bidirectional, connection-mode transmission paths for records. A record can be sent using one or more output operations and received using one or more input operations, but a single operation never transfers part of more than one record. Record boundaries are visible to the receiver via the MSG_EOR flag.

If the *protocol* argument is non-zero, it shall specify a protocol that is supported by the address family. If the *protocol* argument is zero, the default protocol for this address family and type shall be used. The protocols supported by the system are implementation-defined.

The process may need to have appropriate privileges to use the *socket()* function or to create some sockets.

RETURN VALUE

Upon successful completion, *socket()* shall return a non-negative integer, the socket file descriptor. Otherwise, a value of -1 shall be returned and *errno* set to indicate the error.

ERRORS

The *socket()* function shall fail if:

[EAFNOSUPPORT]

The implementation does not support the specified address family.

[EMFILE]

All file descriptors available to the process are currently open.

[ENFILE]

No more file descriptors are available for the system.

[EPROTONOSUPPORT]

The protocol is not supported by the address family, or the protocol is not supported by the implementation.

[EPROTOTYPE] The socket type is not supported by the protocol.

The *socket()* function may fail if:

[EACCES]

The process does not have appropriate privileges.

[ENOBUFS]

Insufficient resources were available in the system to perform the operation.

[ENOMEM]

Insufficient memory was available to fulfill the request.

EXAMPLES

None.

APPLICATION USAGE

The documentation for specific address families specifies which protocols each address family supports. The documentation for specific protocols specifies which socket types each protocol supports.

The application can determine whether an address family is supported by trying to create a socket with *domain* set to the protocol in question.

RATIONALE

None.

FUTURE DIRECTIONS

None.

NAME

socketpair — create a pair of connected sockets

SYNOPSIS

```
#include <sys/socket.h>

int socketpair(int domain, int type, int protocol,
               int socket_vector[2]);
```

DESCRIPTION

The *socketpair()* function shall create an unbound pair of connected sockets in a specified *domain*, of a specified *type*, under the protocol optionally specified by the *protocol* argument. The two sockets shall be identical. The file descriptors used in referencing the created sockets shall be returned in *socket_vector*[0] and *socket_vector*[1].

The *socketpair()* function takes the following arguments:

<i>domain</i>	Specifies the communications domain in which the sockets are to be created.
<i>type</i>	Specifies the type of sockets to be created.
<i>protocol</i>	Specifies a particular protocol to be used with the sockets. Specifying a <i>protocol</i> of 0 causes <i>socketpair()</i> to use an unspecified default protocol appropriate for the requested socket type.
<i>socket_vector</i>	Specifies a 2-integer array to hold the file descriptors of the created socket pair.

The *type* argument specifies the socket type, which determines the semantics of communications over the socket. The following socket types are defined; implementations may specify additional socket types:

SOCK_STREAM	Provides sequenced, reliable, bidirectional, connection-mode byte streams, and may provide a transmission mechanism for out-of-band data.
SOCK_DGRAM	Provides datagrams, which are connectionless-mode, unreliable messages of fixed maximum length.
SOCK_SEQPACKET	Provides sequenced, reliable, bidirectional, connection-mode transmission paths for records. A record can be sent using one or more output operations and received using one or more input operations, but a single operation never transfers part of more than one record. Record boundaries are visible to the receiver via the MSG_EOR flag.

If the *protocol* argument is non-zero, it shall specify a protocol that is supported by the address family. If the *protocol* argument is zero, the default protocol for this address family and type shall be used. The protocols supported by the system are implementation-defined.

The process may need to have appropriate privileges to use the *socketpair()* function or to create some sockets.

RETURN VALUE

Upon successful completion, this function shall return 0; otherwise, *-1* shall be returned and *errno* set to indicate the error.

ERRORS

The *socketpair()* function shall fail if:

[EAFNOSUPPORT]

The implementation does not support the specified address family.

63625 [EMFILE] All, or all but one, of the file descriptors available to the process are currently
 63626 open.

63627 [ENFILE] No more file descriptors are available for the system.

63628 [EOPNOTSUPP] The specified protocol does not permit creation of socket pairs.

63629 [EPROTONOSUPPORT]
 63630 The protocol is not supported by the address family, or the protocol is not
 63631 supported by the implementation.

63632 [EPROTOYPE] The socket type is not supported by the protocol.

63633 The *socketpair()* function may fail if:

63634 [EACCES] The process does not have appropriate privileges.

63635 [ENOBUFS] Insufficient resources were available in the system to perform the operation.

63636 [ENOMEM] Insufficient memory was available to fulfill the request.

63637 EXAMPLES

63638 None.

63639 APPLICATION USAGE

63640 The documentation for specific address families specifies which protocols each address family
 63641 supports. The documentation for specific protocols specifies which socket types each protocol
 63642 supports.

63643 The *socketpair()* function is used primarily with UNIX domain sockets and need not be
 63644 supported for other domains.

63656 **NAME**

63657 sprintf — print formatted output

63658 **SYNOPSIS**

63659 #include <stdio.h>

63660 int sprintf(char *restrict *s*, const char *restrict *format*, ...);63661 **DESCRIPTION**63662 Refer to *fprintf()*.

63663 **NAME**

63664 sqrt, sqrtf, sqrtl — square root function

63665 **SYNOPSIS**

```
63666       #include <math.h>
63667       double sqrt(double x);
63668       float sqrtf(float x);
63669       long double sqrtl(long double x);
```

63670 **DESCRIPTION**

63671 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 63672 conflict between the requirements described here and the ISO C standard is unintentional. This
 63673 volume of POSIX.1-2008 defers to the ISO C standard.

63674 These functions shall compute the square root of their argument x , $\sqrt{x}$.

63675 An application wishing to check for error situations should set *errno* to zero and call
 63676 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 63677 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 63678 zero, an error has occurred.

63679 **RETURN VALUE**

63680 Upon successful completion, these functions shall return the square root of x .

63681 MX For finite values of $x < -0$, a domain error shall occur, and either a NaN (if supported), or an
 63682 implementation-defined value shall be returned.

63683 MX If x is NaN, a NaN shall be returned.

63684 If x is ± 0 or $+\text{Inf}$, x shall be returned.

63685 If x is $-\text{Inf}$, a domain error shall occur, and a NaN shall be returned.

63686 **ERRORS**

63687 These functions shall fail if:

63688 MX Domain Error The finite value of x is < -0 , or x is $-\text{Inf}$.

63689 If the integer expression *(math_errhandling & MATH_ERRNO)* is non-zero,
 63690 then *errno* shall be set to [EDOM]. If the integer expression *(math_errhandling*
 63691 *& MATH_ERREXCEPT)* is non-zero, then the invalid floating-point exception
 63692 shall be raised.

63693 **EXAMPLES**63694 **Taking the Square Root of 9.0**

```
63695       #include <math.h>
63696       ...
63697       double x = 9.0;
63698       double result;
63699       ...
63700       result = sqrt(x);
```

63701 **APPLICATION USAGE**

63702 On error, the expressions *(math_errhandling & MATH_ERRNO)* and *(math_errhandling &*
 63703 *MATH_ERREXCEPT)* are independent of each other, but at least one of them must be non-zero.

NAME

stderr, stdin, stdout — standard I/O streams

SYNOPSIS

```
#include <stdio.h>
```

```
extern FILE *stderr, *stdin, *stdout;
```

DESCRIPTION

The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

A file with associated buffering is called a *stream* and is declared to be a pointer to a defined type **FILE**. The *fopen()* function shall create certain descriptive data for a stream and return a pointer to designate the stream in all further transactions. Normally, there are three open streams with constant pointers declared in the **<stdio.h>** header and associated with the standard open files.

At program start-up, three streams shall be predefined and need not be opened explicitly: *standard input* (for reading conventional input), *standard output* (for writing conventional output), and *standard error* (for writing diagnostic output). When opened, the standard error stream is not fully buffered; the standard input and standard output streams are fully buffered if and only if the stream can be determined not to refer to an interactive device.

The following symbolic values in **<unistd.h>** define the file descriptors that shall be associated with the C-language *stdin*, *stdout*, and *stderr* when the application is started:

STDIN_FILENO Standard input value, *stdin*. Its value is 0.

STDOUT_FILENO Standard output value, *stdout*. Its value is 1.

STDERR_FILENO Standard error value, *stderr*. Its value is 2.

The *stderr* stream is expected to be open for reading and writing.

RETURN VALUE

63813 **SYNOPSIS**

63814 CX `#include <string.h>`

63815 `char *stpcpy(char *restrict s1, const char *restrict s2);`

63816 **DESCRIPTION**

63817 Refer to *strcpy()*.

63818 **NAME**

63819 stpncpy — copy fixed length string, returning a pointer to the array end

63820 **SYNOPSIS**63821 CX `#include <string.h>`63822 `char *stpncpy(char *restrict s1, const char *restrict s2, size_t size);`63823 **DESCRIPTION**63824 Refer to *strncpy()*.

NAME

strcasecmp, strcasecmp_l, strncasecmp, strncasecmp_l — case-insensitive string comparisons

SYNOPSIS

```
#include <strings.h>

int strcasecmp(const char *s1, const char *s2);
int strcasecmp_l(const char *s1, const char *s2,
    locale_t locale);
int strncasecmp(const char *s1, const char *s2, size_t n);
int strncasecmp_l(const char *s1, const char *s2,
    size_t n, locale_t locale);
```

DESCRIPTION

The *strcasecmp()* and *strcasecmp_l()* functions shall compare, while ignoring differences in case, the string pointed to by *s1* to the string pointed to by *s2*. The *strncasecmp()* and *strncasecmp_l()* functions shall compare, while ignoring differences in case, not more than *n* bytes from the string pointed to by *s1* to the string pointed to by *s2*.

The *strcasecmp()* and *strncasecmp()* functions use the current locale to determine the case of the characters.

The *strcasecmp_l()* and *strncasecmp_l()* functions use the locale represented by *locale* to determine the case of the characters.

When the *LC_CTYPE* category of the locale being used is from the POSIX locale, these functions shall behave as if the strings had been converted to lowercase and then a byte comparison performed. Otherwise, the results are unspecified.

The behavior is undefined if the *locale* argument to *strcasecmp_l()* or *strncasecmp_l()* is the special locale object *LC_GLOBAL_LOCALE* or is not a valid locale object handle.

RETURN VALUE

Upon completion, *strcasecmp()* and *strcasecmp_l()* shall return an integer greater than, equal to, or less than 0, if the string pointed to by *s1* is, ignoring case, greater than, equal to, or less than the string pointed to by *s2*, respectively.

Upon successful completion, *strncasecmp()* and *strncasecmp_l()* shall return an integer greater than, equal to, or less than 0, if the possibly null-terminated array pointed to by *s1* is, ignoring case, greater than, equal to, or less than the possibly null-terminated array pointed to by *s2*, respectively.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

NAME

strcmp — compare two strings

SYNOPSIS

```
#include <string.h>
```

```
int strcmp(const char *s1, const char *s2);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

The *strcmp()* function shall compare the string pointed to by *s1* to the string pointed to by *s2*.

The sign of a non-zero return value shall be determined by the sign of the difference between the values of the first pair of bytes (both interpreted as type **unsigned char**) that differ in the strings being compared.

RETURN VALUE

Upon completion, *strcmp()* shall return an integer greater than, equal to, or less than 0, if the string pointed to by *s1* is greater than, equal to, or less than the string pointed to by *s2*, respectively.

ERRORS

No errors are defined.

EXAMPLES**Checking a Password Entry**

The following example compares the information read from standard input to the value of the name of the user entry. If the *strcmp()* function returns 0 (indicating a match), a further check will be made to see if the user entered the proper old password. The *crypt()* function shall encrypt the old password entered by the user, using the value of the encrypted password in the **passwd** structure as the salt. If this value matches the value of the encrypted **passwd** in the structure, the entered password *oldpasswd* is the correct user's password. Finally, the program encrypts the new password so that it can store the information in the **passwd** structure.

```
#include <string.h>
#include <unistd.h>
#include <stdio.h>
...
int valid_change;
struct passwd *p;
char user[100];
char oldpasswd[100];
char newpasswd[100];
char savepasswd[100];
...
if (strcmp(p->pw_name, user) == 0) {
    if (strcmp(p->pw_passwd, crypt(oldpasswd, p->pw_passwd)) == 0) {
        strcpy(savepasswd, crypt(newpasswd, user));
        p->pw_passwd = savepasswd;
        valid_change = 1;
    }
    else {
```

```
63990         fprintf(stderr, "Old password is not valid\n");
63991     }
63992 }
63993 ...
```

63994 APPLICATION USAGE

64003 CHANGE HISTORY

64004 First released in Issue 1. Derived from Issue 1 of the SVID.

64005 Issue 6

64006 Extensions beyond the ISO C standard are marked.

64007 **NAME**

64008 strcoll, strcoll_l — string comparison using collating information

64009 **SYNOPSIS**

```
64010 #include <string.h>
64011 int strcoll(const char *s1, const char *s2);
64012 CX int strcoll_l(const char *s1, const char *s2,
64013 locale_t locale);
```

64014 **DESCRIPTION**

64015 CX For *strcoll()*: The functionality described on this reference page is aligned with the ISO C
 64016 standard. Any conflict between the requirements described here and the ISO C standard is
 64017 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

64018 CX The *strcoll()* and *strcoll_l()* functions shall compare the string pointed to by *s1* to the string
 64019 pointed to by *s2*, both interpreted as appropriate to the *LC_COLLATE* category of the current
 64020 locale, or of the locale represented by *locale*, respectively.

64021 CX The *strcoll()* and *strcoll_l()* functions shall not change the setting of *errno* if successful.

64022 Since no return value is reserved to indicate an error, an application wishing to check for error
 64023 CX situations should set *errno* to 0, then call *strcoll()*, or *strcoll_l()* then check *errno*.

64024 CX The behavior is undefined if the *locale* argument to *strcoll_l()* is the special locale object +
 64025 LC_GLOBAL_LOCALE or is not a valid locale object handle.

64026 **RETURN VALUE**

64027 Upon successful completion, *strcoll()* shall return an integer greater than, equal to, or less than 0,
 64028 according to whether the string pointed to by *s1* is greater than, equal to, or less than the string
 64029 CX pointed to by *s2* when both are interpreted as appropriate to the current locale. On error,
 64030 *strcoll()* may set *errno*, but no return value is reserved to indicate an error.

64031 Upon successful completion, *strcoll_l()* shall return an integer greater than, equal to, or less than
 64032 0, according to whether the string pointed to by *s1* is greater than, equal to, or less than the
 64033 string pointed to by *s2* when both are interpreted as appropriate to the locale represented by
 64034 *locale*. On error, *strcoll_l()* may set *errno*, but no return value is reserved to indicate an error.

64035 **ERRORS**

64036 These functions may fail if:

64037 CX [EINVAL] The *s1* or *s2* arguments contain characters outside the domain of the collating
 64038 sequence.

64039 **EXAMPLES**64040 **Comparing Nodes**

64041 The following example uses an application-defined function, *node_compare()*, to compare two
 64042 nodes based on an alphabetical ordering of the *string* field.

```
64043 #include <string.h>
64044 ...
64045 struct node { /* These are stored in the table. */
64046     char *string;
64047     int length;
64048 };
64049 ...
```

```

64050     int node_compare(const void *node1, const void *node2)
64051     {
64052         return strcoll(((const struct node *)node1)->string,
64053                        ((const struct node *)node2)->string);
64054     }
64055     ...

```

APPLICATION USAGE

The *strxfrm()* and *strcmp()* functions should be used for sorting large lists.

RATIONALE

None.

FUTURE DIRECTIONS

None.

alphasort(), *strcmp()*, *strxfrm()*

XBD <string.h>

CHANGE HISTORY

First released in Issue 3.

Issue 5

The DESCRIPTION is updated to indicate that *errno* does not change if the function is successful.

Issue 6

Extensions beyond the ISO C standard are marked.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The [EINVAL] optional error condition is added.

An example is added.

Issue 7

The *strcoll_l()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0593 [283] and XSH/TC1-2008/0594 + [283] are applied.

64080 **NAME**

64081 stpcpy, strcpy — copy a string and return a pointer to the end of the result

64082 **SYNOPSIS**

64083 #include <string.h>

64084 CX char *stpcpy(char *restrict s1, const char *restrict s2);

64085 char *strcpy(char *restrict s1, const char *restrict s2);

64086 **DESCRIPTION**64087 CX For *stpcpy()*: The functionality described on this reference page is aligned with the ISO C
64088 standard. Any conflict between the requirements described here and the ISO C standard is
64089 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.64090 CX The *stpcpy()* and *strcpy()* functions shall copy the string pointed to by s2 (including the
64091 terminating NUL character) into the array pointed to by s1.

64092 If copying takes place between objects that overlap, the behavior is undefined.

64093 **RETURN VALUE**64094 CX The *stpcpy()* function shall return a pointer to the terminating NUL character copied into the s1
64095 buffer.64096 The *strcpy()* function shall return s1.

64097 No return values are reserved to indicate an error.

64098 **ERRORS**

64099 No errors are defined.

64100 **EXAMPLES**64101 **Construction of a Multi-Part Message in a Single Buffer**

64102 #include <string.h>

64103 #include <stdio.h>

64104 int

64105 main (void)

64106 {

64107 char buffer [10];

64108 char *name = buffer;

64109 name = stpcpy (stpcpy (stpcpy (name, "ice"), "-"), "cream");

64110 puts (buffer);

64111 return 0;

64112 }

64113 **Initializing a String**64114 The following example copies the string "-----" into the *permstring* variable.

64115 #include <string.h>

64116 ...

64117 static char permstring[11];

64118 ...

64119 strcpy(permstring, "-----");

64120 ...

Storing a Key and Data

The following example allocates space for a key using *malloc()* then uses *strcpy()* to place the key there. Then it allocates space for data using *malloc()*, and uses *strcpy()* to place data there. (The user-defined function *dbfree()* frees memory previously allocated to an array of type **struct element** *.)

```
#include <string.h>
#include <stdlib.h>
#include <stdio.h>
...
/* Structure used to read data and store it. */
struct element {
    char *key;
    char *data;
};

struct element *tbl, *curtbl;
char *key, *data;
int count;
...
void dbfree(struct element *, int);
...
if ((curtbl->key = malloc(strlen(key) + 1)) == NULL) {
    perror("malloc"); dbfree(tbl, count); return NULL;
}
strcpy(curtbl->key, key);

if ((curtbl->data = malloc(strlen(data) + 1)) == NULL) {
    perror("malloc"); free(curtbl->key); dbfree(tbl, count); return NULL;
}
strcpy(curtbl->data, data);
...
```

APPLICATION USAGE

Character movement is performed differently in different implementations. Thus, overlapping moves may yield surprises.

This version is aligned with the ISO C standard; this does not affect compatibility with XPG3 applications. Reliable error detection by this function was never guaranteed.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

64164 **Issue 6**

64165 The *strcpy()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

64166 **Issue 7**

64167 The *strcpy()* function is added from The Open Group Technical Standard, 2006, Extended API
64168 Set Part 1.

64169 **NAME**

64170 strcspn — get the length of a complementary substring

64171 **SYNOPSIS**

64172 #include <string.h>

64173 size_t strcspn(const char *s1, const char *s2);

64174 **DESCRIPTION**

64175 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 64176 conflict between the requirements described here and the ISO C standard is unintentional. This
 64177 volume of POSIX.1-2008 defers to the ISO C standard.

64178 The *strcspn()* function shall compute the length (in bytes) of the maximum initial segment of the
 64179 string pointed to by *s1* which consists entirely of bytes *not* from the string pointed to by *s2*.

64180 **RETURN VALUE**

64181 The *strcspn()* function shall return the length of the computed segment of the string pointed to
 64182 by *s1*; no return value is reserved to indicate an error.

64183 **ERRORS**

64184 No errors are defined.

64185 **EXAMPLES**

64186 None.

64187 **APPLICATION USAGE**

64188 None.

64189 **RATIONALE**

64190 None.

64191 **FUTURE DIRECTIONS**

64192 None.

64193 **SEE ALSO**64194 [strspn\(\)](#)64195 XBD [<string.h>](#)64196 **CHANGE HISTORY**

64197 First released in Issue 1. Derived from Issue 1 of the SVID.

64198 **Issue 5**

64199 The RETURN VALUE section is updated to indicate that *strcspn()* returns the length of *s1*, and
 64200 not *s1* itself as was previously stated.

64201 **Issue 6**

64202 The Open Group Corrigendum U030/1 is applied. The text of the RETURN VALUE section is
 64203 updated to indicate that the computed segment length is returned, not the *s1* length.

NAME

strdup, strndup — duplicate a specific number of bytes from a string

SYNOPSIS

```
CX      #include <string.h>
char *strdup(const char *s);
char *strndup(const char *s, size_t size);
```

DESCRIPTION

The *strdup()* function shall return a pointer to a new string, which is a duplicate of the string pointed to by *s*. The returned pointer can be passed to *free()*. A null pointer is returned if the new string cannot be created.

The *strndup()* function shall be equivalent to the *strdup()* function, duplicating the provided *s* in a new block of memory allocated as if by using *malloc()*, with the exception being that *strndup()* copies at most *size* plus one bytes into the newly allocated memory, terminating the new string with a NUL character. If the length of *s* is larger than *size*, only *size* bytes shall be duplicated. If *size* is larger than the length of *s*, all bytes in *s* shall be copied into the new memory buffer, including the terminating NUL character. The newly created string shall always be properly terminated.

RETURN VALUE

The *strdup()* function shall return a pointer to a new string on success. Otherwise, it shall return a null pointer and set *errno* to indicate the error.

Upon successful completion, the *strndup()* function shall return a pointer to the newly allocated memory containing the duplicated string. Otherwise, it shall return a null pointer and set *errno* to indicate the error.

ERRORS

These functions shall fail if:

[ENOMEM] Storage space available is insufficient.

EXAMPLES

None.

APPLICATION USAGE

For functions that allocate memory as if by *malloc()*, the application should release such memory when it is no longer required by a call to *free()*. For *strdup()* and *strndup()*, this is the return value.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 4, Version 2.

64245 **Issue 5**

64246 Moved from X/OPEN UNIX extension to BASE.

64247 **Issue 7**64248 Austin Group Interpretation 1003.1-2001 #044 is applied, changing the “may fail” [ENOMEM]
64249 error to become a “shall fail” error.64250 The *strdup()* function is moved from the XSI option to the Base.64251 The *strndup()* function is added from The Open Group Technical Standard, 2006, Extended API
64252 Set Part 1.64253 The APPLICATION USAGE section is updated to clarify that memory is allocated as if by
64254 *malloc()*.

64255 NAME

64256 strerror, strerror_l, strerror_r — get error message string

64257 SYNOPSIS

64258 #include <string.h>

64259 char *strerror(int *errnum*);64260 CX char *strerror_l(int *errnum*, locale_t *locale*);64261 int strerror_r(int *errnum*, char **strerrbuf*, size_t *buflen*);

64262 DESCRIPTION

64263 CX For *strerror()*: The functionality described on this reference page is aligned with the ISO C
 64264 standard. Any conflict between the requirements described here and the ISO C standard is
 64265 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

64266 The *strerror()* function shall map the error number in *errnum* to a locale-dependent error
 64267 message string and shall return a pointer to it. Typically, the values for *errnum* come from *errno*,
 64268 but *strerror()* shall map any value of type *int* to a message.

64269 CX The application shall not modify the string returned. The returned string pointer might be
 64270 CX invalidated or the string content might be overwritten by a subsequent call to *strerror()*, or by a
 64271 subsequent call to *strerror_l()* in the same thread.

64272 CX The string may be overwritten by a subsequent call to *strerror_l()* in the same thread.

64273 The contents of the error message strings returned by *strerror()* should be determined by the
 64274 setting of the *LC_MESSAGES* category in the current locale.

64275 The implementation shall behave as if no function defined in this volume of POSIX.1-2008 calls
 64276 *strerror()*.

64277 CX The *strerror()* and *strerror_l()* functions shall not change the setting of *errno* if successful.

64278 Since no return value is reserved to indicate an error of *strerror()*, an application wishing to
 64279 check for error situations should set *errno* to 0, then call *strerror()*, then check *errno*. Similarly,
 64280 since *strerror_l()* is required to return a string for some errors, an application wishing to check
 64281 for all error situations should set *errno* to 0, then call *strerror_l()*, then check *errno*.

64282 The *strerror()* function need not be thread-safe.

64283 The *strerror_l()* function shall map the error number in *errnum* to a locale-dependent error
 64284 message string in the locale represented by *locale* and shall return a pointer to it.

64285 The *strerror_r()* function shall map the error number in *errnum* to a locale-dependent error
 64286 message string and shall return the string in the buffer pointed to by *strerrbuf*, with length
 64287 *buflen*.

64288 CX If the value of *errnum* is a valid error number, the message string shall indicate what error
 64289 occurred; if the value of *errnum* is zero, the message string shall either be an empty string or
 64290 indicate that no error occurred; otherwise, if these functions complete successfully, the message
 64291 string shall indicate that an unknown error occurred.

64292 CX The behavior is undefined if the *locale* argument to *strerror_l()* is the special locale object
 64293 *LC_GLOBAL_LOCALE* or is not a valid locale object handle.

64294 RETURN VALUE

64295 Upon completion, whether successful or not, *strerror()* shall return a pointer to the generated
 64296 CX message string. On error *errno* may be set, but no return value is reserved to indicate an error.

64297 Upon successful completion, *strerror_l()* shall return a pointer to the generated message string. If

64298 *errnum* is not a valid error number, *errno* may be set to [EINVAL], but a pointer to a message
 64299 string shall still be returned. If any other error occurs, *errno* shall be set to indicate the error and
 64300 a null pointer shall be returned.

64301 Upon successful completion, *strerror_r()* shall return 0. Otherwise, an error number shall be
 64302 returned to indicate the error.

64303 ERRORS

64304 These functions may fail if:

64305 CX [EINVAL] The value of *errnum* is neither a valid error number nor zero.

64306 The *strerror_r()* function may fail if:

64307 CX [ERANGE] Insufficient storage was supplied via *strrbuf* and *buflen* to contain the
 64308 generated message string.

64309 EXAMPLES

64310 None.

64311 APPLICATION USAGE

64312 Historically in some implementations, calls to *perror()* would overwrite the string that the
 64313 pointer returned by *strerror()* points to. Such implementations did not conform to the ISO C
 64314 standard; however, application developers should be aware of this behavior if they wish their
 64315 applications to be portable to such implementations.

64316 RATIONALE

64317 The *strerror_l()* function is required to be thread-safe, thereby eliminating the need for an
 64318 equivalent to the *strerror_r()* function.

64319 Earlier versions of this standard did not explicitly require that the error message strings returned
 64320 by *strerror()* and *strerror_r()* provide any information about the error. This version of the
 64321 standard requires a meaningful message for any successful completion.

64322 Since no return value is reserved to indicate a *strerror()* error, but all calls (whether successful or
 64323 not) must return a pointer to a message string, on error *strerror()* can return a pointer to an
 64324 empty string or a pointer to a meaningful string that can be printed.

64325 Note that the [EINVAL] error condition is a may fail error. If an invalid error number is supplied
 64326 as the value of *errnum*, applications should be prepared to handle any of the following:

- 64327 1. Error (with no meaningful message): *errno* is set to [EINVAL], the return value is a pointer
 64328 to an empty string.
- 64329 2. Successful completion: *errno* is unchanged and the return value points to a string like
 64330 "unknown error" or "error number xxx" (where xxx is the value of *errnum*).
- 64331 3. Combination of #1 and #2: *errno* is set to [EINVAL] and the return value points to a string
 64332 like "unknown error" or "error number xxx" (where xxx is the value of *errnum*).
 64333 Since applications frequently use the return value of *strerror()* as an argument to
 64334 functions like *fprintf()* (without checking the return value) and since applications have no
 64335 way to parse an error message string to determine whether *errnum* represents a valid
 64336 error number, implementations are encouraged to implement #3. Similarly,
 64337 implementations are encouraged to have *strerror_r()* return [EINVAL] and put a string
 64338 like "unknown error" or "error number xxx" in the buffer pointed to by *strrbuf*
 64339 when the value of *errnum* is not a valid error number.

64340 Some applications rely on being able to set *errno* to 0 before calling a function with no reserved +
 64341 value to indicate an error, then call *strerror(errno)* afterwards to detect whether an error occurred +

64342 (because *errno* changed) or to indicate success (because *errno* remained zero). This usage pattern +
 64343 requires that *strerror*(0) succeed with useful results. Previous versions of the standard did not +
 64344 specify the behavior when *errnum* is zero.

64345 FUTURE DIRECTIONS

64346 None.

64347 SEE ALSO

64348 *perror*()

64349 XBD <string.h>

64350 CHANGE HISTORY

64351 First released in Issue 3.

64352 Issue 5

64353 The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.

64354 A note indicating that the *strerror*() function need not be reentrant is added to the
 64355 DESCRIPTION.

64356 Issue 6

64357 Extensions beyond the ISO C standard are marked.

64358 The following new requirements on POSIX implementations derive from alignment with the
 64359 Single UNIX Specification:

- 64360 • In the RETURN VALUE section, the fact that *errno* may be set is added.
- 64361 • The [EINVAL] optional error condition is added.

64362 The normative text is updated to avoid use of the term “must” for application requirements.

64363 The *strerror_r*() function is added in response to IEEE PASC Interpretation 1003.1c #39.

64364 The *strerror_r*() function is marked as part of the Thread-Safe Functions option.

64365 Issue 7

64366 Austin Group Interpretation 1003.1-2001 #072 is applied, updating the ERRORS section.

64367 Austin Group Interpretation 1003.1-2001 #156 is applied.

64368 Austin Group Interpretation 1003.1-2001 #187 is applied, clarifying the behavior when the
 64369 generated error message is an empty string.

64370 SD5-XSH-ERN-191 is applied, updating the APPLICATION USAGE section.

64371 The *strerror_l*() function is added from The Open Group Technical Standard, 2006, Extended API
 64372 Set Part 4.

64373 The *strerror_r*() function is moved from the Thread-Safe Functions option to the Base.

 64375 XSH/TC1-2008/0597 [382,428], XSH/TC1-2008/0598 [283], XSH/TC1-2008/0599 [382,428], +
 64376 XSH/TC1-2008/0600 [283], and XSH/TC1-2008/0601 [382,428] are applied.

NAME

strfmon, strfmon_l — convert monetary value to a string

SYNOPSIS

```
#include <monetary.h>

ssize_t strfmon(char *restrict s, size_t maxsize,
               const char *restrict format, ...);
ssize_t strfmon_l(char *restrict s, size_t maxsize,
                 locale_t locale, const char *restrict format, ...);
```

DESCRIPTION

The *strfmon()* function shall place characters into the array pointed to by *s* as controlled by the string pointed to by *format*. No more than *maxsize* bytes are placed into the array.

The format is a character string, beginning and ending in its initial state, if any, that contains two types of objects: *plain characters*, which are simply copied to the output stream, and *conversion specifications*, each of which shall result in the fetching of zero or more arguments which are converted and formatted. The results are undefined if there are insufficient arguments for the format. If the format is exhausted while arguments remain, the excess arguments are simply ignored.

The application shall ensure that a conversion specification consists of the following sequence:

- A '%' character
- Optional flags
- Optional field width
- Optional left precision
- Optional right precision
- A required conversion specifier character that determines the conversion to be performed

The *strfmon_l()* function shall be equivalent to the *strfmon()* function, except that the locale data used is from the locale represented by *locale*.

Flags

One or more of the following optional flags can be specified to control the conversion:

- =f* An '=' followed by a single character *f* which is used as the numeric fill character. In order to work with precision or width counts, the fill character shall be a single byte character; if not, the behavior is undefined. The default numeric fill character is the <space>. This flag does not affect field width filling which always uses the <space>. This flag is ignored unless a left precision (see below) is specified.
- ^* Do not format the currency amount with grouping characters. The default is to insert the grouping characters if defined for the current locale.
- + or (* Specify the style of representing positive and negative currency amounts. Only one of '+' or '(' may be specified. If '+' is specified, the locale's equivalent of '+' and '-' are used (for example, in many locales, the empty string if positive and '-' if negative). If '(' is specified, negative amounts are enclosed within parentheses. If neither flag is specified, the '+' style is used.
- !* Suppress the currency symbol from the output conversion.

64418 – Specify the alignment. If this flag is present the result of the conversion is left-justified
 64419 (padded to the right) rather than right-justified. This flag shall be ignored unless a field
 64420 width (see below) is specified.

64421 Field Width

64422 *w* A decimal digit string *w* specifying a minimum field width in bytes in which the result
 64423 of the conversion is right-justified (or left-justified if the flag '*-*' is specified). The
 64424 default is 0.

64425 Left Precision

64426 *#n* A '*#*' followed by a decimal digit string *n* specifying a maximum number of digits
 64427 expected to be formatted to the left of the radix character. This option can be used to
 64428 keep the formatted output from multiple calls to the *strfmon()* function aligned in the
 64429 same columns. It can also be used to fill unused positions with a special character as in
 64430 "\$***123.45". This option causes an amount to be formatted as if it has the number
 64431 of digits specified by *n*. If more than *n* digit positions are required, this conversion
 64432 specification is ignored. Digit positions in excess of those actually required are filled
 64433 with the numeric fill character (see the *=f* flag above).

64434 If grouping has not been suppressed with the '*^*' flag, and it is defined for the current
 64435 locale, grouping separators are inserted before the fill characters (if any) are added.
 64436 Grouping separators are not applied to fill characters even if the fill character is a digit.

64437 To ensure alignment, any characters appearing before or after the number in the
 64438 formatted output such as currency or sign symbols are padded as necessary with
 64439 <space> characters to make their positive and negative formats an equal length.

64440 Right Precision

64441 *.p* A <period> followed by a decimal digit string *p* specifying the number of digits after
 64442 the radix character. If the value of the right precision *p* is 0, no radix character appears.
 64443 If a right precision is not included, a default specified by the current locale is used. The
 64444 amount being formatted is rounded to the specified number of digits prior to
 64445 formatting.

64446 Conversion Specifier Characters

64447 The conversion specifier characters and their meanings are:

64448 *i* The **double** argument is formatted according to the locale's international currency
 64449 format (for example, in the US: USD 1,234.56). If the argument is $\pm\text{Inf}$ or NaN, the result
 64450 of the conversion is unspecified.

64451 *n* The **double** argument is formatted according to the locale's national currency format
 64452 (for example, in the US: \$1,234.56). If the argument is $\pm\text{Inf}$ or NaN, the result of the
 64453 conversion is unspecified.

64454 *%* Convert to a '*%*'; no argument is converted. The entire conversion specification shall
 64455 be *%%*.

Locale Information

The `LC_MONETARY` category of the current locale affects the behavior of this function including the monetary radix character (which may be different from the numeric radix character affected by the `LC_NUMERIC` category), the grouping separator, the currency symbols, and formats. The international currency symbol should be conformant with the ISO 4217:2001 standard.

If the value of `maxsize` is greater than `{SSIZE_MAX}`, the result is implementation-defined.

The behavior is undefined if the `locale` argument to `strfmon_l()` is the special locale object `LC_GLOBAL_LOCALE` or is not a valid locale object handle.

RETURN VALUE

If the total number of resulting bytes including the terminating null byte is not more than `maxsize`, these functions shall return the number of bytes placed into the array pointed to by `s`, not including the terminating NUL character. Otherwise, `-1` shall be returned, the contents of the array are unspecified, and `errno` shall be set to indicate the error.

ERRORS

These functions shall fail if:

[E2BIG] Conversion stopped due to lack of space in the buffer.

EXAMPLES

Given a locale for the US and the values 123.45, -123.45, and 3456.781, the following output might be produced. Square brackets ("`[ ]`") are used in this example to delimit the output.

<code>%n</code>	<code>[\$123.45]</code> <code>[-\$123.45]</code> <code>[\$3,456.78]</code>	Default formatting
<code>%11n</code>	<code>[\$123.45]</code> <code>[-\$123.45]</code> <code>[\$3,456.78]</code>	Right align within an 11-character field
<code>%#5n</code>	<code>[\$ 123.45]</code> <code>[-\$ 123.45]</code> <code>[\$ 3,456.78]</code>	Aligned columns for values up to 99 999
<code>%=*#5n</code>	<code>[\$***123.45]</code> <code>[-\$***123.45]</code> <code>[\$*3,456.78]</code>	Specify a fill character
<code>%=0#5n</code>	<code>[\$000123.45]</code> <code>[-\$000123.45]</code> <code>[\$03,456.78]</code>	Fill characters do not use grouping even if the fill character is a digit
<code>%^#5n</code>	<code>[\$ 123.45]</code> <code>[-\$ 123.45]</code> <code>[\$ 3456.78]</code>	Disable the grouping separator
<code>%^#5.0n</code>	<code>[\$ 123]</code> <code>[-\$ 123]</code> <code>[\$ 3457]</code>	Round off to whole units
<code>%^#5.4n</code>	<code>[\$ 123.4500]</code> <code>[-\$ 123.4500]</code> <code>[\$ 3456.7810]</code>	Increase the precision
<code>%(#5n</code>	<code>[\$ 123.45]</code>	Use an alternative pos/neg style

```

64500          [ ($ 123.45) ]
64501          [ $ 3,456.78 ]

64502      %! (#5n  [ 123.45 ]      Disable the currency symbol
64503          [ ( 123.45) ]
64504          [ 3,456.78 ]

64505      %-14#5.4n [ $ 123.4500 ]      Left-justify the output
64506          [-$ 123.4500 ]
64507          [ $ 3,456.7810 ]

64508      %14#5.4n  [ $ 123.4500]      Corresponding right-justified output
64509          [-$ 123.4500]
64510          [ $ 3,456.7810]

```

64511 See also the EXAMPLES section in *fprintf()*.

64512 APPLICATION USAGE

64513 None.

64514 RATIONALE

64515 None.

64516 FUTURE DIRECTIONS

64517 Lowercase conversion characters are reserved for future standards use and uppercase for
 64518 implementation-defined use.

64519 SEE ALSO

64520 *fprintf()*, *localeconv()*

64521 XBD <monetary.h>

64522 CHANGE HISTORY

64523 First released in Issue 4.

64524 Issue 5

64525 Moved from ENHANCED I18N to BASE.

64526 The [ENOSYS] error is removed.

64527 Text is added to the DESCRIPTION warning about values of *maxsize* that are greater than
 64528 {SSIZE_MAX}.

64529 Issue 6

64530 The normative text is updated to avoid use of the term “must” for application requirements.

64531 The **restrict** keyword is added to the *strfmon()* prototype for alignment with the
 64532 ISO/IEC 9899:1999 standard.

64533 The EXAMPLES section is reworked, clarifying the output format.

64534 Issue 7

64535 SD5-XSH-ERN-29 is applied, updating the examples for % (#5n and %! (#5n.

64536 SD5-XSH-ERN-233 is applied, changing the definition of the '+' or '(' flags to refer to
 64537 multiple locales.

64538 The *strfmon()* function is moved from the XSI option to the Base.

64539 The *strfmon_l()* function is added from The Open Group Technical Standard, 2006, Extended API
64540 Set Part 4.

64541 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0602 [302], XSH/TC1-2008/0603 [283], +
64542 and XSH/TC1-2008/0604 [283] are applied.

64543 **NAME**64544 `strftime, strftime_l` — convert date and time to a string64545 **SYNOPSIS**

```
64546 #include <time.h>
64547 size_t strftime(char *restrict s, size_t maxsize,
64548               const char *restrict format, const struct tm *restrict timeptr);
64549 CX size_t strftime_l(char *restrict s, size_t maxsize,
64550                  const char *restrict format, const struct tm *restrict timeptr,
64551                  locale_t locale);
```

64552 **DESCRIPTION**

64553 CX For `strftime()`: The functionality described on this reference page is aligned with the ISO C
 64554 standard. Any conflict between the requirements described here and the ISO C standard is
 64555 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

64556 The `strftime()` function shall place bytes into the array pointed to by *s* as controlled by the string
 64557 pointed to by *format*. The format is a character string, beginning and ending in its initial shift
 64558 state, if any. The format string consists of zero or more conversion specifications and ordinary
 64559 characters.

64560 Each conversion specification is introduced by the `'%'` character after which the following
 64561 appear in sequence:

- 64562 CX
- An optional flag:
 - 64563 0 The zero character (`'0'`), which specifies that the character used as the padding
 64564 character is `'0'`,
 - 64565 + The `<plus-sign>` character (`'+'`), which specifies that the character used as the
 64566 padding character is `'0'`, and that if and only if the field being produced consumes
 64567 more than four bytes to represent a year (for `%F`, `%G`, or `%Y`) or more than two bytes to
 64568 represent the year divided by 100 (for `%C`) then a leading `<plus-sign>` character shall
 64569 be included if the year being processed is greater than or equal to zero or a leading
 64570 minus-sign character (`'-'`) shall be included if the year is less than zero.
 - 64571 The default padding character is unspecified.
 - An optional minimum field width. If the converted value, including any leading `'+'` or
 64572 `'-'` sign, has fewer bytes than the minimum field width and the padding character is not
 64573 the NUL character, the output shall be padded on the left (after any leading `'+'` or `'-'`
 64574 sign) with the padding character.
 - 64575
 - An optional `E` or `O` modifier.
 - 64576
 - A terminating conversion specifier character that indicates the type of conversion to be
 64577 applied.
 - 64578

64579 CX The results are unspecified if more than one flag character is specified, a flag character is
 64580 specified without a minimum field width; a minimum field width is specified without a flag
 64581 character; a modifier is specified with a flag or with a minimum field width; or if a minimum
 64582 field width is specified for any conversion specifier other than `C`, `F`, `G`, or `Y`.

64583 All ordinary characters (including the terminating NUL character) are copied unchanged into
 64584 the array. If copying takes place between objects that overlap, the behavior is undefined. No
 64585 more than *maxsize* bytes are placed into the array. Each conversion specifier is replaced by
 64586 appropriate characters as described in the following list. The appropriate characters are

determined using the *LC_TIME* category of the current locale and by the values of zero or more members of the broken-down time structure pointed to by *timeptr*, as specified in brackets in the description. If any of the specified values are outside the normal range, the characters stored are unspecified.

64591 CX The *strptime_l()* function shall be equivalent to the *strptime()* function, except that the locale data used is from the locale represented by *locale*.

64592

64593 Local timezone information is used as though *strptime()* called *tzset()*.

64594 The following conversion specifiers shall be supported:

64595 a Replaced by the locale's abbreviated weekday name. [*tm_wday*]

64596 A Replaced by the locale's full weekday name. [*tm_wday*]

64597 b Replaced by the locale's abbreviated month name. [*tm_mon*]

64598 B Replaced by the locale's full month name. [*tm_mon*]

64599 c Replaced by the locale's appropriate date and time representation. (See the Base Definitions volume of POSIX.1-2008, <**time.h**>.)

64600

64601 C Replaced by the year divided by 100 and truncated to an integer, as a decimal number.

64602 [*tm_year*]

64603 If a minimum field width is not specified, the number of characters placed into the

64604 array pointed to by *s* will be the number of digits in the year divided by 100 or two,

64605 CX whichever is greater. If a minimum field width is specified, the number of characters

64606 placed into the array pointed to by *s* will be the number of digits in the year divided by

64607 100 or the minimum field width, whichever is greater.

64608 d Replaced by the day of the month as a decimal number [01,31]. [*tm_mday*]

64609 D Equivalent to %m/%d/%Y. [*tm_mon, tm_mday, tm_year*]

64610 e Replaced by the day of the month as a decimal number [1,31]; a single digit is preceded

64611 by a space. [*tm_mday*]

64612 CX F Equivalent to %⁺⁴Y-%m-%d if no flag and no minimum field width are specified.

64613 [*tm_year, tm_mon, tm_mday*]

64614 CX If a minimum field width of *x* is specified, the year shall be output as if by the Y

64615 specifier (described below) with whatever flag was given and a minimum field width

64616 of *x*−6. If *x* is less than 6, the behavior shall be as if *x* equalled 6.

64617 If the minimum field width is specified to be 10, and the year is four digits long, then

64618 the output string produced will match the ISO 8601:2004 standard subclause 4.1.2.2

64619 complete representation, extended format date representation of a specific day. If a +

64620 flag is specified, a minimum field width of *x* is specified, and *x*−7 bytes are sufficient to

64621 hold the digits of the year (not including any needed sign character), then the output

64622 will match the ISO 8601:2004 standard subclause 4.1.2.4 complete representation,

64623 expanded format date representation of a specific day.

64624 g Replaced by the last 2 digits of the week-based year (see below) as a decimal number

64625 [00,99]. [*tm_year, tm_wday, tm_yday*]

64626 G Replaced by the week-based year (see below) as a decimal number (for example, 1977).

64627 [*tm_year, tm_wday, tm_yday*]

64628	CX	If a minimum field width is specified, the number of characters placed into the array pointed to by <i>s</i> will be the number of digits and leading sign characters (if any) in the year, or the minimum field width, whichever is greater.
64629		
64630		
64631	h	Equivalent to %b. [<i>tm_mon</i>]
64632	H	Replaced by the hour (24-hour clock) as a decimal number [00,23]. [<i>tm_hour</i>]
64633	I	Replaced by the hour (12-hour clock) as a decimal number [01,12]. [<i>tm_hour</i>]
64634	j	Replaced by the day of the year as a decimal number [001,366]. [<i>tm_yday</i>]
64635	m	Replaced by the month as a decimal number [01,12]. [<i>tm_mon</i>]
64636	M	Replaced by the minute as a decimal number [00,59]. [<i>tm_min</i>]
64637	n	Replaced by a <newline>.
64638	p	Replaced by the locale's equivalent of either a.m. or p.m. [<i>tm_hour</i>]
64639	CX	Replaced by the time in a.m. and p.m. notation; in the POSIX locale this shall be equivalent to %I:%M:%S %p. [<i>tm_hour</i> , <i>tm_min</i> , <i>tm_sec</i>]
64640		
64641	R	Replaced by the time in 24-hour notation (%H:%M). [<i>tm_hour</i> , <i>tm_min</i>]
64642	S	Replaced by the second as a decimal number [00,60]. [<i>tm_sec</i>]
64643	t	Replaced by a <tab>.
64644	T	Replaced by the time (%H:%M:%S). [<i>tm_hour</i> , <i>tm_min</i> , <i>tm_sec</i>]
64645	u	Replaced by the weekday as a decimal number [1,7], with 1 representing Monday. [<i>tm_wday</i>]
64646		
64647	U	Replaced by the week number of the year as a decimal number [00,53]. The first Sunday of January is the first day of week 1; days in the new year before this are in week 0. [<i>tm_year</i> , <i>tm_wday</i> , <i>tm_yday</i>]
64648		
64649		
64650	V	Replaced by the week number of the year (Monday as the first day of the week) as a decimal number [01,53]. If the week containing 1 January has four or more days in the new year, then it is considered week 1. Otherwise, it is the last week of the previous year, and the next week is week 1. Both January 4th and the first Thursday of January are always in week 1. [<i>tm_year</i> , <i>tm_wday</i> , <i>tm_yday</i>]
64651		
64652		
64653		
64654		
64655	w	Replaced by the weekday as a decimal number [0,6], with 0 representing Sunday. [<i>tm_wday</i>]
64656		
64657	W	Replaced by the week number of the year as a decimal number [00,53]. The first Monday of January is the first day of week 1; days in the new year before this are in week 0. [<i>tm_year</i> , <i>tm_wday</i> , <i>tm_yday</i>]
64658		
64659		
64660	x	Replaced by the locale's appropriate date representation. (See the Base Definitions volume of POSIX.1-2008, <time.h>.)
64661		
64662	X	Replaced by the locale's appropriate time representation. (See the Base Definitions volume of POSIX.1-2008, <time.h>.)
64663		
64664	y	Replaced by the last two digits of the year as a decimal number [00,99]. [<i>tm_year</i>]
64665	Y	Replaced by the year as a decimal number (for example, 1997). [<i>tm_year</i>]
64666	CX	If a minimum field width is specified, the number of characters placed into the array pointed to by <i>s</i> will be the number of digits and leading sign characters (if any) in the
64667		

64668		year, or the minimum field width, whichever is greater.
64669	z	Replaced by the offset from UTC in the ISO 8601:2004 standard format (+hhmm or -hhmm), or by no characters if no timezone is determinable. For example, "-0430"
64670		means 4 hours 30 minutes behind UTC (west of Greenwich). If <i>tm_isdst</i> is zero, the
64671	CX	standard time offset is used. If <i>tm_isdst</i> is greater than zero, the daylight savings time
64672		offset is used. If <i>tm_isdst</i> is negative, no characters are returned. [<i>tm_isdst</i>]
64673		
64674	Z	Replaced by the timezone name or abbreviation, or by no bytes if no timezone
64675		information exists. [<i>tm_isdst</i>]
64676	%	Replaced by %.
64677		If a conversion specification does not correspond to any of the above, the behavior is undefined.
64678	CX	If a struct tm broken-down time structure is created by <i>localtime()</i> or <i>localtime_r()</i> , or modified
64679		by <i>mktime()</i> , and the value of <i>TZ</i> is subsequently modified, the results of the %Z and %z
64680		<i>strptime()</i> conversion specifiers are undefined, when <i>strptime()</i> is called with such a broken-down
64681		time structure.
64682		If a struct tm broken-down time structure is created or modified by <i>gmtime()</i> or <i>gmtime_r()</i> , it is
64683		unspecified whether the result of the %Z and %z conversion specifiers shall refer to UTC or the
64684		current local timezone, when <i>strptime()</i> is called with such a broken-down time structure.
64685		Modified Conversion Specifiers
64686		Some conversion specifiers can be modified by the E or O modifier characters to indicate that an
64687		alternative format or specification should be used rather than the one normally used by the
64688		unmodified conversion specifier. If the alternative format or specification does not exist for the
64689		current locale (see ERA in XBD Section 7.3.5 , on page 159), the behavior shall be as if the
64690		unmodified conversion specification were used.
64691	%Ec	Replaced by the locale's alternative appropriate date and time representation.
64692	%EC	Replaced by the name of the base year (period) in the locale's alternative
64693		representation.
64694	%Ex	Replaced by the locale's alternative date representation.
64695	%EX	Replaced by the locale's alternative time representation.
64696	%Ey	Replaced by the offset from %EC (year only) in the locale's alternative representation.
64697	%EY	Replaced by the full alternative year representation.
64698	%Od	Replaced by the day of the month, using the locale's alternative numeric symbols, filled
64699		as needed with leading zeros if there is any alternative symbol for zero; otherwise, with
64700		leading <space> characters.
64701	%Oe	Replaced by the day of the month, using the locale's alternative numeric symbols, filled
64702		as needed with leading <space> characters.
64703	%OH	Replaced by the hour (24-hour clock) using the locale's alternative numeric symbols.
64704	%OI	Replaced by the hour (12-hour clock) using the locale's alternative numeric symbols.
64705	%Om	Replaced by the month using the locale's alternative numeric symbols.
64706	%OM	Replaced by the minutes using the locale's alternative numeric symbols.

64707 %OS Replaced by the seconds using the locale's alternative numeric symbols.

64708 %Ou Replaced by the weekday as a number in the locale's alternative representation
64709 (Monday=1).

64710 %OU Replaced by the week number of the year (Sunday as the first day of the week, rules
64711 corresponding to %U) using the locale's alternative numeric symbols.

64712 %OV Replaced by the week number of the year (Monday as the first day of the week, rules
64713 corresponding to %V) using the locale's alternative numeric symbols.

64714 %Ow Replaced by the number of the weekday (Sunday=0) using the locale's alternative
64715 numeric symbols.

64716 %OW Replaced by the week number of the year (Monday as the first day of the week) using
64717 the locale's alternative numeric symbols.

64718 %Oy Replaced by the year (offset from %C) using the locale's alternative numeric symbols.

64719 %g, %G, and %V give values according to the ISO 8601:2004 standard week-based year. In this
64720 system, weeks begin on a Monday and week 1 of the year is the week that includes January 4th,
64721 which is also the week that includes the first Thursday of the year, and is also the first week that
64722 contains at least four days in the year. If the first Monday of January is the 2nd, 3rd, or 4th, the
64723 preceding days are part of the last week of the preceding year; thus, for Saturday 2nd January
64724 1999, %G is replaced by 1998 and %V is replaced by 53. If December 29th, 30th, or 31st is a
64725 Monday, it and any following days are part of week 1 of the following year. Thus, for Tuesday
64726 30th December 1997, %G is replaced by 1998 and %V is replaced by 01.

64727 If a conversion specifier is not one of the above, the behavior is undefined.

64728 CX The behavior is undefined if the *locale* argument to *strftime_l()* is the special locale object +
64729 LC_GLOBAL_LOCALE or is not a valid locale object handle.

64730 RETURN VALUE

64731 If the total number of resulting bytes including the terminating null byte is not more than
64732 *maxsize*, these functions shall return the number of bytes placed into the array pointed to by *s*,
64733 not including the terminating NUL character. Otherwise, 0 shall be returned and the contents of
64734 the array are unspecified.

64735 ERRORS

64736 No errors are defined.

64737 EXAMPLES

64738 Getting a Localized Date String

64739 The following example first sets the locale to the user's default. The locale information will be
64740 used in the *nl_langinfo()* and *strftime()* functions. The *nl_langinfo()* function returns the localized
64741 date string which specifies how the date is laid out. The *strftime()* function takes this
64742 information and, using the **tm** structure for values, places the date and time information into
64743 *datestring*.

```
64744 #include <time.h>
64745 #include <locale.h>
64746 #include <langinfo.h>
64747 ...
64748 struct tm *tm;
64749 char datestring[256];
64750 ...
```

```

64751     setlocale (LC_ALL, "");
64752     ...
64753     strptime (datestring, sizeof(datestring), nl_langinfo (D_T_FMT), tm);
64754     ...

```

APPLICATION USAGE

The range of values for %S is [00,60] rather than [00,59] to allow for the occasional leap second.

Some of the conversion specifications are duplicates of others. They are included for compatibility with *nl_cxtime()* and *nl_ascxtime()*, which were published in Issue 2.

The %C, %F, %G, and %Y format specifiers in *strptime()* always print full values, but the *strptime()* %C, %F, and %Y format specifiers only scan two digits (assumed to be the first two digits of a four-digit year) for %C and four digits (assumed to be the entire (four-digit) year) for %F and %Y. This mimics the behavior of *printf()* and *scanf()*; that is:

```
printf("%2d", x = 1000);
```

prints "1000", but:

```
scanf("%2d", &x);
```

when given "1000" as input will only store 10 in x). Applications using extended ranges of years must be sure that the number of digits specified for scanning years with *strptime()* matches the number of digits that will actually be present in the input stream. Historic implementations of the %Y conversion specification (with no flags and no minimum field width) produced different output formats. Some always produced at least four digits (with 0 fill for years from 0 through 999) while others only produced the number of digits present in the year (with no fill and no padding). These two forms can be produced with the '0' flag and a minimum field width options using the conversions specifications %04Y and %01Y, respectively.

In the past, the C and POSIX standards specified that %F produced an ISO 8601:2004 standard date format, but didn't specify which one. For years in the range [0001,9999], POSIX.1-2008 requires that the output produced match the ISO 8601:2004 standard complete representation extended format (YYYY-MM-DD) and for years outside of this range produce output that matches the ISO 8601:2004 standard expanded representation extended format (<+/-><Underline>Y</Underline>YYYY-MM-DD). To fully meet ISO 8601:2004 standard requirements, the producer and consumer must agree on a date format that has a specific number of bytes reserved to hold the characters used to represent the years that is sufficiently large to hold all values that will be shared. For example, the %+13F conversion specification will produce output matching the format "<+/->YYYYYY-MM-DD" (a leading '+' or '-' sign; a six-digit, 0-filled year; a '-' ; a two-digit, leading 0-filled month; another '-' ; and the two-digit, leading 0-filled day within the month).

Note that if the year being printed is greater than 9999, the resulting string from the unadorned %F conversion specifications will not conform to the ISO 8601:2004 standard extended format, complete representation for a date and will instead be an extended format, expanded representation (presumably without the required agreement between the date's producer and consumer).

In the C locale, the E and O modifiers are ignored and the replacement strings for the following specifiers are:

- %a The first three characters of %A.
- %A One of Sunday, Monday, ..., Saturday.

64795	%b	The first three characters of %B.
64796	%B	One of January, February, ..., December.
64797	%C	Equivalent to %a %b %e %T %Y.
64798	%P	One of AM or PM.
64799	%r	Equivalent to %I:%M:%S %p.
64800	%x	Equivalent to %m/%d/%y.
64801	%X	Equivalent to %T.
64802	%Z	Implementation-defined.

64803 RATIONALE

64804 The %Y conversion specification to *strptime()* was frequently assumed to be a four-digit year, but
 64805 the ISO C standard does not specify that %Y is restricted to any subset of allowed values from the
 64806 *tm_year* field. Similarly, the %C conversion specification was assumed to be a two-digit field and
 64807 the first part of the output from the %F conversion specification was assumed to be a four-digit
 64808 field. With *tm_year* being a signed 32 or more-bit **int** and with many current implementations
 64809 supporting 64-bit **time_t** types in one or more programming environments, these assumptions
 64810 are clearly wrong.

64811 POSIX.1-2008 now allows the format specifications %0xC, %0xF, %0xG, and %0xY (where 'x' is
 64812 a string of decimal digits used to specify printing and scanning of a string of *x* decimal digits)
 64813 with leading zero fill characters. Allowing applications to set the field width enables them to
 64814 agree on the number of digits to be printed and scanned in the ISO 8601:2004 standard
 64815 expanded representation of a year (for %F, %G, and %Y) or all but the last two digits of the year
 64816 (for %C). This is based on a feature in some versions of GNU **libc**'s *strptime()*. The GNU version
 64817 allows specifying space, zero, or no-fill characters in *strptime()* format strings, but does not allow
 64818 any flags to be specified in *strptime()* format strings. These implementations also allow these
 64819 flags to be specified for any numeric field. POSIX.1-2008 only requires the zero fill flag ('0') and
 64820 only requires that it be recognized when processing %C, %F, %G, and %Y specifications when a
 64821 minimum field width is also specified. The '0' flag is the only flag needed to produce and scan
 64822 the ISO 8601:2004 standard year fields using the extended format forms. POSIX.1-2008 also
 64823 allows applications to specify the same flag and field width specifiers to be used in both
 64824 *strptime()* and *strptime()* format strings for symmetry. Systems may provide other flag characters
 64825 and may accept flags in conjunction with conversion specifiers other than %C, %F, %G, and %Y;
 64826 but portable applications cannot depend on such extensions.

64827 POSIX.1-2008 now also allows the format specifications %+xC, %+xF, %+xG, and %+xY (where
 64828 'x' is a string of decimal digits used to specify printing and scanning of a string of 'x' decimal
 64829 digits) with leading zero fill characters and a leading '+' sign character if the year being
 64830 converted is more than four digits or a minimum field width is specified that allows room for
 64831 more than four digits for the year. This allows date providers and consumers to agree on a
 64832 specific number of digits to represent a year as required by the ISO 8601:2004 standard
 64833 expanded representation formats. The expanded representation formats all require the year to
 64834 begin with a leading '+' or '-' sign. (All of these specifiers can also provide a leading '-'
 64835 sign for negative years. Since negative years and the year 0 don't fit well with the Gregorian or
 64836 Julian calendars, the normal ranges of dates start with year 1. The ISO C standard allows *tm_year*
 64837 to assume values corresponding to years before year 1, but the use of such years provided
 64838 unspecified results.)

64839 Some earlier version of this standard specified that applications wanting to use *strptime()* to scan
 64840 dates and times printed by *strptime()* should provide non-digit characters between fields to

separate years from months and days. It also supported %F to print and scan the ISO 8601:2004 standard extended format, complete representation date for years 1 through 9999 (i.e., YYYY-MM-DD). However, many applications were written to print (using *strptime()*) and scan (using *strptime()*) dates written using the basic format complete representation (four-digit years) and truncated representation (two-digit years) specified by the ISO 8601:2004 standard representation of dates and times which do not have any separation characters between fields. The ISO 8601:2004 standard also specifies basic format expanded representation where the creator and consumer of these fields agree beforehand to represent years as leading zero-filled strings of an agreed length of more than four digits to represent a year (again with no separation characters when year, month, and day are all displayed). Applications producing and consuming expanded representations are encouraged to use the '+' flag and an appropriate maximum field width to scan the year including the leading sign. Note that even without the '+' flag, years less than zero may be represented with a leading minus-sign for %F, %G, and %Y conversion specifications. Using negative years results in unspecified behavior.

If a format specification %x F with the field width *x* greater than 11 is specified and the width is large enough to display the full year, the output string produced will match the ISO 8601:2004 standard subclause 4.1.2.4 expanded representation, extended format date representation for a specific day. (For years in the range [1,99 999], %+12F is sufficient for an agreed five-digit year with a leading sign using the ISO 8601:2004 standard expanded representation, extended format for a specific day "<+/->YYYY-MM-DD".) Note also that years less than 0 may produce a leading minus-sign ('-') when using %Y or %C whether or not the '0' or '+' flags are used.

The difference between the '0' flag and the '+' flag is whether the leading '+' character will be provided for years >9999 as required for the ISO 8601:2004 standard extended representation format containing a year. For example:

Year	Conversion Specification	<i>strptime()</i> Output	<i>strptime()</i> Scan Back
1970	%Y	1970	1970
1970	%+4Y	1970	1970
27	%Y	27 or 0027	27
270	%Y	270 or 0270	270
270	%+4Y	0270	270
17	%C%y	0017	17
270	%C%y	0270	270
12345	%Y	12345	1234*
12345	%+4Y	+12345	123*
12345	%05Y	12345	12345
270	%+5Y or %+3C%y	+0270	270
12345	%+5Y or %+3C%y	+12345	1234*
12345	%06Y or %04C%y	012345	12345
12345	%+6Y or %+4C%y	+12345	12345
123456	%08Y or %06C%y	00123456	123456
123456	%+8Y or %+6C%y	+0123456	123456

In the cases above marked with a * in the *strptime()* scan back field, the implied or specified number of characters scanned by *strptime()* was less than the number of characters output by *strptime()* using the same format; so the remaining digits of the year were dropped when the output date produced by *strptime()* was scanned back in by *strptime()*.

FUTURE DIRECTIONS

None.

XBD Section 7.3.5 (on page 159), **<time.h>**

CHANGE HISTORY

First released in Issue 3.

Issue 5

The description of %OV is changed to be consistent with %V and defines Monday as the first day of the week.

The description of %Oy is clarified.

Issue 6

Extensions beyond the ISO C standard are marked.

The Open Group Corrigendum U033/8 is applied. The %V conversion specifier is changed from “Otherwise, it is week 53 of the previous year, and the next week is week 1” to “Otherwise, it is the last week of the previous year, and the next week is week 1”.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The %C, %D, %e, %h, %n, %r, %R, %t, and %T conversion specifiers are added.
- The modified conversion specifiers are added for consistency with the ISO POSIX-2 standard *date* utility.

The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- The *strptime()* prototype is updated.
- The DESCRIPTION is extensively revised.
- The %z conversion specifier is added.

An example is added.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/60 is applied.

Issue 7

Austin Group Interpretation 1003.1-2001 #163 is applied.

The *strptime_l()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0605 [283], XSH/TC1-2008/0606 [283], + XSH/TC1-2008/0607 [193], and XSH/TC1-2008/0608 [193] are applied.

64921 **NAME**

64922 strlen, strlen — get length of fixed size string

64923 **SYNOPSIS**

64924 #include <string.h>

64925 size_t strlen(const char *s);

64926 CX size_t strnlen(const char *s, size_t maxlen);

64927 **DESCRIPTION**

64928 CX For *strlen()*: The functionality described on this reference page is aligned with the ISO C
 64929 standard. Any conflict between the requirements described here and the ISO C standard is
 64930 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

64931 The *strlen()* function shall compute the number of bytes in the string to which *s* points, not
 64932 including the terminating NUL character.

64933 CX The *strnlen()* function shall compute the smaller of the number of bytes in the array to which *s*
 64934 points, not including the terminating NUL character, or the value of the *maxlen* argument. The
 64935 *strnlen()* function shall never examine more than *maxlen* bytes of the array pointed to by *s*.

64936 **RETURN VALUE**

64937 The *strlen()* function shall return the length of *s*; no return value shall be reserved to indicate an
 64938 error.

64939 CX The *strnlen()* function shall return an integer containing the smaller of either the length of the
 64940 string pointed to by *s* or *maxlen*.

64941 **ERRORS**

64942 No errors are defined.

64943 **EXAMPLES**64944 **Getting String Lengths**

64945 The following example sets the maximum length of *key* and *data* by using *strlen()* to get the
 64946 lengths of those strings.

```

64947     #include <string.h>
64948     ...
64949     struct element {
64950         char *key;
64951         char *data;
64952     };
64953     ...
64954     char *key, *data;
64955     int len;
64956
64957     *keylength = *datalength = 0;
64958     ...
64959     if ((len = strlen(key)) > *keylength)
64960         *keylength = len;
64961     if ((len = strlen(data)) > *datalength)
64962         *datalength = len;
64963     ...

```

64972 CHANGE HISTORY

64973 First released in Issue 1. Derived from Issue 1 of the SVID.

64974 Issue 5

64975 The RETURN VALUE section is updated to indicate that *strlen()* returns the length of *s*, and not
64976 *s* itself as was previously stated.

64977 Issue 7

64978 The *strnlen()* function is added from The Open Group Technical Standard, 2006, Extended API
64979 Set Part 1.

64980 **NAME**

64981 strncasecmp, strncasecmp_l — case-insensitive string comparisons

64982 **SYNOPSIS**

64983 #include <strings.h>

64984 int strncasecmp(const char *s1, const char *s2, size_t n);

64985 int strncasecmp_l(const char *s1, const char *s2,

64986 size_t n, locale_t locale);

64987 **DESCRIPTION**64988 Refer to *strcasecmp()*.

NAME

strncat — concatenate a string with part of another

SYNOPSIS

```
#include <string.h>
```

```
char *strncat(char *restrict s1, const char *restrict s2, size_t n);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

The *strncat()* function shall append not more than *n* bytes (a NUL character and bytes that follow it are not appended) from the array pointed to by *s2* to the end of the string pointed to by *s1*. The initial byte of *s2* overwrites the NUL character at the end of *s1*. A terminating NUL character is always appended to the result. If copying takes place between objects that overlap, the behavior is undefined.

RETURN VALUE

The *strncat()* function shall return *s1*; no return value shall be reserved to indicate an error.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

The *strncat()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

65022 **NAME**

65023 strncmp — compare part of two strings

65024 **SYNOPSIS**

65025 #include <string.h>

65026 int strncmp(const char *s1, const char *s2, size_t n);

65027 **DESCRIPTION**

65028 CX The functionality described on this reference page is aligned with the ISO C standard. Any
65029 conflict between the requirements described here and the ISO C standard is unintentional. This
65030 volume of POSIX.1-2008 defers to the ISO C standard.

65031 The *strncmp()* function shall compare not more than *n* bytes (bytes that follow a NUL character
65032 are not compared) from the array pointed to by *s1* to the array pointed to by *s2*.

65033 The sign of a non-zero return value is determined by the sign of the difference between the
65034 values of the first pair of bytes (both interpreted as type **unsigned char**) that differ in the strings
65035 being compared.

65036 **RETURN VALUE**

65037 Upon successful completion, *strncmp()* shall return an integer greater than, equal to, or less than
65038 0, if the possibly null-terminated array pointed to by *s1* is greater than, equal to, or less than the
65039 possibly null-terminated array pointed to by *s2* respectively.

65040 **ERRORS**

65041 No errors are defined.

65042 **EXAMPLES**

65043 None.

65044 **APPLICATION USAGE**

65045 None.

65046 **RATIONALE**

65047 None.

65053 **CHANGE HISTORY**

65054 First released in Issue 1. Derived from Issue 1 of the SVID.

65055 **Issue 6**

65056 Extensions beyond the ISO C standard are marked.

NAME

65057
65058 `stpncpy`, `strncpy` — copy fixed length string, returning a pointer to the array end

SYNOPSIS

65059
65060 `#include <string.h>`

65061 CX `char *stpncpy(char *restrict s1, const char *restrict s2, size_t n);`
65062 `char *strncpy(char *restrict s1, const char *restrict s2, size_t n);`

DESCRIPTION

65063
65064 CX For `strncpy()`: The functionality described on this reference page is aligned with the ISO C
65065 standard. Any conflict between the requirements described here and the ISO C standard is
65066 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

65067 CX The `stpncpy()` and `strncpy()` functions shall copy not more than *n* bytes (bytes that follow a NUL
65068 character are not copied) from the array pointed to by *s2* to the array pointed to by *s1*.

65069 If the array pointed to by *s2* is a string that is shorter than *n* bytes, NUL characters shall be
65070 appended to the copy in the array pointed to by *s1*, until *n* bytes in all are written.

65071 If copying takes place between objects that overlap, the behavior is undefined.

RETURN VALUE

65072
65073 CX If a NUL character is written to the destination, the `stpncpy()` function shall return the address of
65074 the first such NUL character. Otherwise, it shall return `&s1[n]`.

65075 The `strncpy()` function shall return *s1*.

65076 No return values are reserved to indicate an error.

ERRORS

65077
65078 No errors are defined.

EXAMPLES

65079
65080 None.

APPLICATION USAGE

65081
65082 Applications must provide the space in *s1* for the *n* bytes to be transferred, as well as ensure that
65083 the *s2* and *s1* arrays do not overlap.

65084 Character movement is performed differently in different implementations. Thus, overlapping
65085 moves may yield surprises.

65086 If there is no NUL character byte in the first *n* bytes of the array pointed to by *s2*, the result is not
65087 null-terminated.

RATIONALE

65088
65089 None.

FUTURE DIRECTIONS

65090
65091 None.

65096 First released in Issue 1. Derived from Issue 1 of the SVID.

65097 **Issue 6**

65098 The *strncpy()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

65099 **Issue 7**

65100 The *stpncpy()* function is added from The Open Group Technical Standard, 2006, Extended API
65101 Set Part 1.

65102 NAME

65103 strndup — duplicate a specific number of bytes from a string

65104 SYNOPSIS

```
65105 CX #include <string.h>  
65106 char *strndup(const char *s, size_t size);
```

65107 DESCRIPTION

65108 Refer to *strdup()*.

65109 **NAME**

65110 strnlen — get length of fixed size string

65111 **SYNOPSIS**65112 CX `#include <string.h>`65113 `size_t strnlen(const char *s, size_t maxlen);`65114 **DESCRIPTION**65115 Refer to *strlen()*.

65116 **NAME**

65117 strpbrk — scan a string for a byte

65118 **SYNOPSIS**

65119 #include <string.h>

65120 char *strpbrk(const char *s1, const char *s2);

65121 **DESCRIPTION**

65122 CX The functionality described on this reference page is aligned with the ISO C standard. Any
65123 conflict between the requirements described here and the ISO C standard is unintentional. This
65124 volume of POSIX.1-2008 defers to the ISO C standard.

65125 The *strpbrk()* function shall locate the first occurrence in the string pointed to by *s1* of any byte
65126 from the string pointed to by *s2*.

65127 **RETURN VALUE**

65128 Upon successful completion, *strpbrk()* shall return a pointer to the byte or a null pointer if no
65129 byte from *s2* occurs in *s1*.

65144 First released in Issue 1. Derived from Issue 1 of the SVID.

NAME

strptime — date and time conversion

SYNOPSIS

```
XSI    #include <time.h>

char *strptime(const char *restrict buf, const char *restrict format,
               struct tm *restrict tm);
```

DESCRIPTION

The *strptime()* function shall convert the character string pointed to by *buf* to values which are stored in the **tm** structure pointed to by *tm*, using the format specified by *format*.

The format is composed of zero or more directives. Each directive is composed of one of the following: one or more white-space characters (as specified by *isspace()*); an ordinary character (neither `' % '` nor a white-space character); or a conversion specification.

Each conversion specification is introduced by the `' % '` character after which the following appear in sequence:

- An optional flag, the zero character (`' 0 '`) or the `<plus-sign>` character (`' + '`), which is ignored.
- An optional field width. If a field width is specified, it shall be interpreted as a string of decimal digits that will determine the maximum number of bytes converted for the conversion rather than the number of bytes specified below in the description of the conversion specifiers.
- An optional `E` or `O` modifier.
- A terminating conversion specifier character that indicates the type of conversion to be applied.

The conversions are determined using the *LC_TIME* category of the current locale. The application shall ensure that there is white-space or other non-alphanumeric characters between any two conversion specifications unless all of the adjacent conversion specifications convert a known, fixed number of characters. In the following list, the maximum number of characters scanned (excluding the one matching the next directive) is as follows:

- If a maximum field width is specified, then that number
- Otherwise, the pattern `" { x } "` indicates that the maximum is *x*
- Otherwise, the pattern `" [ x, y ] "` indicates that the value shall fall within the range given (both bounds being inclusive), and the maximum number of characters scanned shall be the maximum required to represent any value in the range without leading zeros and without a leading `<plus-sign>`

The following conversion specifiers are supported.

The results are unspecified if a modifier is specified with a flag or with a minimum field width, or if a field width is specified for any conversion specifier other than `C`, `F`, or `Y`.

a	The day of the week, using the locale's weekday names; either the abbreviated or full name may be specified.
A	Equivalent to <code>%a</code> .

65185	b	The month, using the locale's month names; either the abbreviated or full name may be specified.
65186		
65187	B	Equivalent to %b.
65188	c	Replaced by the locale's appropriate date and time representation.
65189	C	All but the last two digits of the year {2}; leading zeros shall be permitted but shall not be required. A leading '+' or '-' character shall be permitted before any leading zeros but shall not be required.
65190		
65191		
65192	d	The day of the month [01,31]; leading zeros shall be permitted but shall not be required.
65193	D	The date as %m/%d/%y.
65194	e	Equivalent to %d.
65195	h	Equivalent to %b.
65196	H	The hour (24-hour clock) [00,23]; leading zeros shall be permitted but shall not be required.
65197		
65198	I	The hour (12-hour clock) [01,12]; leading zeros shall be permitted but shall not be required.
65199		
65200	j	The day number of the year [001,366]; leading zeros shall be permitted but shall not be required.
65201		
65202	m	The month number [01,12]; leading zeros shall be permitted but shall not be required.
65203	M	The minute [00,59]; leading zeros shall be permitted but shall not be required.
65204	n	Any white space.
65205	p	The locale's equivalent of a.m. or p.m.
65206	r	12-hour clock time using the AM/PM notation if t_fmt_ampm is not an empty string in the <i>LC_TIME</i> portion of the current locale; in the POSIX locale, this shall be equivalent to %I:%M:%S %p.
65207		
65208		
65209	R	The time as %H:%M.
65210	S	The seconds [00,60]; leading zeros shall be permitted but shall not be required.
65211	t	Any white space.
65212	T	The time as %H:%M:%S.
65213	U	The week number of the year (Sunday as the first day of the week) as a decimal number [00,53]; leading zeros shall be permitted but shall not be required.
65214		
65215	w	The weekday as a decimal number [0,6], with 0 representing Sunday.
65216	W	The week number of the year (Monday as the first day of the week) as a decimal number [00,53]; leading zeros shall be permitted but shall not be required.
65217		
65218	x	The date, using the locale's date format.
65219	X	The time, using the locale's time format.
65220	y	The last two digits of the year. When <i>format</i> contains neither a C conversion specifier nor a Y conversion specifier, values in the range [69,99] shall refer to years 1969 to 1999 inclusive and values in the range [00,68] shall refer to years 2000 to 2068 inclusive; leading zeros shall be permitted but shall not be required. A leading '+' or '-'
65221		
65222		
65223		

65224		character shall be permitted before any leading zeros but shall not be required.
65225	Note:	It is expected that in a future version of this standard the default century inferred
65226		from a 2-digit year will change. (This would apply to all commands accepting a
65227		2-digit year as input.)
65228	Y	The full year {4}; leading zeros shall be permitted but shall not be required. A leading
65229		'+' or '-' character shall be permitted before any leading zeros but shall not be
65230		required.
65231	%	Replaced by %.

65232 Modified Conversion Specifiers

65233 Some conversion specifiers can be modified by the E and O modifier characters to indicate that
 65234 an alternative format or specification should be used rather than the one normally used by the
 65235 unmodified conversion specifier. If the alternative format or specification does not exist in the
 65236 current locale, the behavior shall be as if the unmodified conversion specification were used.

65237	%Ec	The locale's alternative appropriate date and time representation.
65238	%EC	The name of the base year (period) in the locale's alternative representation.
65239	%Ex	The locale's alternative date representation.
65240	%EX	The locale's alternative time representation.
65241	%Ey	The offset from %EC (year only) in the locale's alternative representation.
65242	%EY	The full alternative year representation.
65243	%Od	The day of the month using the locale's alternative numeric symbols; leading zeros
65244		shall be permitted but shall not be required.
65245	%Oe	Equivalent to %Od.
65246	%OH	The hour (24-hour clock) using the locale's alternative numeric symbols.
65247	%OI	The hour (12-hour clock) using the locale's alternative numeric symbols.
65248	%Om	The month using the locale's alternative numeric symbols.
65249	%OM	The minutes using the locale's alternative numeric symbols.
65250	%OS	The seconds using the locale's alternative numeric symbols.
65251	%OU	The week number of the year (Sunday as the first day of the week) using the locale's
65252		alternative numeric symbols.
65253	%Ow	The number of the weekday (Sunday=0) using the locale's alternative numeric
65254		symbols.
65255	%OW	The week number of the year (Monday as the first day of the week) using the locale's
65256		alternative numeric symbols.
65257	%Oy	The year (offset from %C) using the locale's alternative numeric symbols.
65258		A conversion specification composed of white-space characters is executed by scanning input up
65259		to the first character that is not white-space (which remains unscanned), or until no more
65260		characters can be scanned.
65261		A conversion specification that is an ordinary character is executed by scanning the next
65262		character from the buffer. If the character scanned from the buffer differs from the one
65263		comprising the directive, the directive fails, and the differing and subsequent characters remain

65264 unscanned.

65265 A series of conversion specifications composed of %n, %t, white-space characters, or any
65266 combination is executed by scanning up to the first character that is not white space (which
65267 remains unscanned), or until no more characters can be scanned.

65268 Any other conversion specification is executed by scanning characters until a character matching
65269 the next directive is scanned, or until no more characters can be scanned. These characters,
65270 except the one matching the next directive, are then compared to the locale values associated
65271 with the conversion specifier. If a match is found, values for the appropriate **tm** structure
65272 members are set to values corresponding to the locale information. Case is ignored when
65273 matching items in *buf* such as month or weekday names. If no match is found, *strptime()* fails
65274 and no more characters are scanned.

65275 RETURN VALUE

65276 Upon successful completion, *strptime()* shall return a pointer to the character following the last
65277 character parsed. Otherwise, a null pointer shall be returned.

65278 ERRORS

65279 No errors are defined.

65280 EXAMPLES

65281 Convert a Data-Plus-Time String to Broken-Down Time and Then into Seconds

65282 The following example demonstrates the use of *strptime()* to convert a string into broken-down
65283 time. The broken-down time is then converted into seconds since the Epoch using *mktime()*.

```
65284 #include <time.h>
65285 ...
65286 struct tm tm;
65287 time_t t;
65288 if (strptime("6 Dec 2001 12:33:45", "%d %b %Y %H:%M:%S", &tm) == NULL)
65289     /* Handle error */;
65290 printf("year: %d; month: %d; day: %d;\n",
65291        tm.tm_year, tm.tm_mon, tm.tm_mday);
65292 printf("hour: %d; minute: %d; second: %d\n",
65293        tm.tm_hour, tm.tm_min, tm.tm_sec);
65294 printf("week day: %d; year day: %d\n", tm.tm_wday, tm.tm_yday);
65295 tm.tm_isdst = -1;          /* Not set by strptime(); tells mktime()
65296                            to determine whether daylight saving time
65297                            is in effect */
65298 t = mktime(&tm);
65299 if (t == -1)
65300     /* Handle error */;
65301 printf("seconds since the Epoch: %ld\n", (long) t);"
```

65302 APPLICATION USAGE

65303 Several “equivalent to” formats and the special processing of white-space characters are
65304 provided in order to ease the use of identical *format* strings for *strptime()* and *strptime()*.

65305 It should be noted that dates constructed by the *strptime()* function with the %Y or %C%y
65306 conversion specifiers may have values larger than 9999. If the *strptime()* function is used to read
65307 such values using %C%y or %Y, the year values will be truncated to four digits. Applications

should use `%+w%y` or `%+xY` with *w* and *x* set large enough to contain the full value of any years that will be printed or scanned.

See also the APPLICATION USAGE section in *strptime()*.

It is unspecified whether multiple calls to *strptime()* using the same **tm** structure will update the current contents of the structure or overwrite all contents of the structure. Conforming applications should make a single call to *strptime()* with a format and all data needed to completely specify the date and time being converted.

RATIONALE

See the RATIONALE section for *strptime()*.

FUTURE DIRECTIONS

None.

fprintf(), *fscanf()*, *strptime()*, *time()*

XBD **<time.h>**

CHANGE HISTORY

First released in Issue 4.

Issue 5

Moved from ENHANCED I18N to BASE.

The [ENOSYS] error is removed.

The exact meaning of the `%y` and `%0y` specifiers is clarified in the DESCRIPTION.

Issue 6

The Open Group Corrigendum U033/5 is applied. The `%r` specifier description is reworded.

The normative text is updated to avoid use of the term “must” for application requirements.

The **restrict** keyword is added to the *strptime()* prototype for alignment with the ISO/IEC 9899:1999 standard.

The Open Group Corrigendum U047/2 is applied.

The DESCRIPTION is updated to use the terms “conversion specifier” and “conversion specification” for consistency with *strptime()*.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/133 is applied, adding the example to the EXAMPLES section.

Issue 7

Austin Group Interpretation 1003.1-2001 #041 is applied, updating the DESCRIPTION and APPLICATION USAGE sections.

Austin Group Interpretation 1003.1-2001 #163 is applied.

SD5-XSH-ERN-67 is applied, correcting the APPLICATION USAGE to remove the impression that `%Y` is 4-digit years.

NAME

strrchr — string scanning operation

SYNOPSIS

```
#include <string.h>
```

```
char *strrchr(const char *s, int c);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

The *strrchr()* function shall locate the last occurrence of *c* (converted to a **char**) in the string pointed to by *s*. The terminating NUL character is considered to be part of the string.

RETURN VALUE

Upon successful completion, *strrchr()* shall return a pointer to the byte or a null pointer if *c* does not occur in the string.

ERRORS

No errors are defined.

EXAMPLES**Finding the Base Name of a File**

The following example uses *strrchr()* to get a pointer to the base name of a file. The *strrchr()* function searches backwards through the name of the file to find the last '/' character in *name*. This pointer (plus one) will point to the base name of the file.

```
#include <string.h>
...
const char *name;
char *basename;
...
basename = strrchr(name, '/') + 1;
...
```

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

strchr()

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

NAME

strsignal — get name of signal

SYNOPSIS

```
CX      #include <string.h>
char *strsignal(int signum);
```

DESCRIPTION

The *strsignal()* function shall map the signal number in *signum* to an implementation-defined string and shall return a pointer to it. It shall use the same set of messages as the *psignal()* function.

The application shall not modify the string returned. The returned pointer might be invalidated or the string content might be overwritten by a subsequent call to *strsignal()* or *setlocale()*.

The contents of the message strings returned by *strsignal()* should be determined by the setting of the *LC_MESSAGES* category in the current locale.

The implementation shall behave as if no function defined in this standard calls *strsignal()*.

Since no return value is reserved to indicate an error, an application wishing to check for error situations should set *errno* to 0, then call *strsignal()*, then check *errno*.

The *strsignal()* function need not be thread-safe.

RETURN VALUE

Upon successful completion, *strsignal()* shall return a pointer to a string. Otherwise, if *signum* is not a valid signal number, the return value is unspecified.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

If *signum* is not a valid signal number, some implementations return NULL, while for others the *strsignal()* function returns a pointer to a string containing an unspecified message denoting an unknown signal. POSIX.1-2008 leaves this return value unspecified.

FUTURE DIRECTIONS

None.

NAME

strtod, strtodf, strtold — convert a string to a double-precision number

SYNOPSIS

```
#include <stdlib.h>

double strtod(const char *restrict nptr, char **restrict endptr);
float strtodf(const char *restrict nptr, char **restrict endptr);
long double strtold(const char *restrict nptr, char **restrict endptr);
```

DESCRIPTION

The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

These functions shall convert the initial portion of the string pointed to by *nptr* to **double**, **float**, and **long double** representation, respectively. First, they decompose the input string into three parts:

1. An initial, possibly empty, sequence of white-space characters (as specified by *isspace()*)
2. A subject sequence interpreted as a floating-point constant or representing infinity or NaN
3. A final string of one or more unrecognized characters, including the terminating NUL character of the input string

Then they shall attempt to convert the subject sequence to a floating-point number, and return the result.

The expected form of the subject sequence is an optional '+' or '-' sign, then one of the following:

- A non-empty sequence of decimal digits optionally containing a radix character; then an optional exponent part consisting of the character 'e' or the character 'E', optionally followed by a '+' or '-' character, and then followed by one or more decimal digits
- A 0x or 0X, then a non-empty sequence of hexadecimal digits optionally containing a radix character; then an optional binary exponent part consisting of the character 'p' or the character 'P', optionally followed by a '+' or '-' character, and then followed by one or more decimal digits
- One of INF or INFINITY, ignoring case
- One of NAN or NAN(*n-char-sequence_{opt}*), ignoring case in the NAN part, where:

```
n-char-sequence:
    digit
    nondigit
    n-char-sequence digit
    n-char-sequence nondigit
```

The subject sequence is defined as the longest initial subsequence of the input string, starting with the first non-white-space character, that is of the expected form. The subject sequence contains no characters if the input string is not of the expected form.

If the subject sequence has the expected form for a floating-point number, the sequence of characters starting with the first digit or the decimal-point character (whichever occurs first) shall be interpreted as a floating constant of the C language, except that the radix character shall be used in place of a period, and that if neither an exponent part nor a radix character appears in

a decimal floating-point number, or if a binary exponent part does not appear in a hexadecimal floating-point number, an exponent part of the appropriate type with value zero is assumed to follow the last digit in the string. If the subject sequence begins with a minus-sign, the sequence shall be interpreted as negated. A character sequence INF or INFINITY shall be interpreted as an infinity, if representable in the return type, else as if it were a floating constant that is too large for the range of the return type. A character sequence NAN or NAN(*n-char-sequence_{opt}*) shall be interpreted as a quiet NaN, if supported in the return type, else as if it were a subject sequence part that does not have the expected form; the meaning of the *n-char* sequences is implementation-defined. A pointer to the final string is stored in the object pointed to by *endptr*, provided that *endptr* is not a null pointer.

If the subject sequence has the hexadecimal form and FLT_RADIX is a power of 2, the value resulting from the conversion is correctly rounded.

CX The radix character is defined in the current locale (category *LC_NUMERIC*). In the POSIX locale, or in a locale where the radix character is not defined, the radix character shall default to a <period> (' . ').

CX In other than the C or POSIX locales, other implementation-defined subject sequences may be accepted.

If the subject sequence is empty or does not have the expected form, no conversion shall be performed; the value of *nptr* is stored in the object pointed to by *endptr*, provided that *endptr* is not a null pointer.

These functions shall not change the setting of *errno* if successful.

Since 0 is returned on error and is also a valid return on success, an application wishing to check for error situations should set *errno* to 0, then call *strtod()*, *strtof()*, or *strtold()*, then check *errno*.

RETURN VALUE

Upon successful completion, these functions shall return the converted value. If no conversion could be performed, 0 shall be returned, and *errno* may be set to [EINVAL].

If the correct value is outside the range of representable values, $\pm$ HUGE_VAL, $\pm$ HUGE_VALF, or $\pm$ HUGE_VALL shall be returned (according to the sign of the value), and *errno* shall be set to [ERANGE].

If the correct value would cause an underflow, a value whose magnitude is no greater than the smallest normalized positive number in the return type shall be returned and *errno* set to [ERANGE].

ERRORS

These functions shall fail if:

CX [ERANGE] The value to be returned would cause overflow or underflow.

These functions may fail if:

CX [EINVAL] No conversion could be performed.

EXAMPLES

None.

APPLICATION USAGE

If the subject sequence has the hexadecimal form and FLT_RADIX is not a power of 2, and the result is not exactly representable, the result should be one of the two numbers in the appropriate internal format that are adjacent to the hexadecimal floating source value, with the extra stipulation that the error should have a correct sign for the current rounding direction.

If the subject sequence has the decimal form and at most DECIMAL_DIG (defined in `<float.h>`) significant digits, the result should be correctly rounded. If the subject sequence *D* has the decimal form and more than DECIMAL_DIG significant digits, consider the two bounding, adjacent decimal strings *L* and *U*, both having DECIMAL_DIG significant digits, such that the values of *L*, *D*, and *U* satisfy $L \leq D \leq U$. The result should be one of the (equal or adjacent) values that would be obtained by correctly rounding *L* and *U* according to the current rounding direction, with the extra stipulation that the error with respect to *D* should have a correct sign for the current rounding direction.

The changes to `strtod()` introduced by the ISO/IEC 9899:1999 standard can alter the behavior of well-formed applications complying with the ISO/IEC 9899:1990 standard and thus earlier versions of this standard. One such example would be:

```
int
what_kind_of_number (char *s)
{
    char *endp;
    double d;
    long l;

    d = strtod(s, &endp);
    if (s != endp && *endp == '\0')
        printf("It's a float with value %g\n", d);
    else
    {
        l = strtol(s, &endp, 0);
        if (s != endp && *endp == '\0')
            printf("It's an integer with value %ld\n", l);
        else
            return 1;
    }
    return 0;
}
```

If the function is called with:

```
what_kind_of_number ("0x10")
```

an ISO/IEC 9899:1990 standard-compliant library will result in the function printing:

```
It's an integer with value 16
```

With the ISO/IEC 9899:1999 standard, the result is:

```
It's a float with value 16
```

The change in behavior is due to the inclusion of floating-point numbers in hexadecimal notation without requiring that either a decimal point or the binary exponent be present.

65611 **RATIONALE**

65612 None.

65613 **FUTURE DIRECTIONS**

65614 None.

65615 **SEE ALSO**65616 *fscanf()*, *isspace()*, *localeconv()*, *setlocale()*, *strtol()*65617 XBD Chapter 7 (on page 135), *<float.h>*, *<stdlib.h>*65618 **CHANGE HISTORY**

65619 First released in Issue 1. Derived from Issue 1 of the SVID.

65620 **Issue 5**65621 The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.65622 **Issue 6**

65623 Extensions beyond the ISO C standard are marked.

65624 The following new requirements on POSIX implementations derive from alignment with the
65625 Single UNIX Specification:

- 65626 • In the RETURN VALUE and ERRORS sections, the [EINVAL] optional error condition is
- 65627 added if no conversion could be performed.

65628 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- 65629 • The *strtod()* function is updated.
- 65630 • The *strtof()* and *strtold()* functions are added.
- 65631 • The DESCRIPTION is extensively revised.

65632 ISO/IEC 9899:1999 standard, Technical Corrigendum 1 is incorporated.

65633 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/61 is applied, correcting the second
65634 paragraph in the RETURN VALUE section. This change clarifies the sign of the return value.65635 **Issue 7**

65636 Austin Group Interpretation 1003.1-2001 #015 is applied.

65637 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0610 [302], XSH/TC1-2008/0611 [94], +
65638 and XSH/TC1-2008/0612 [105] are applied.

NAME

strtoimax, strtoumax — convert string to integer type

SYNOPSIS

```
#include <inttypes.h>
```

```
intmax_t strtoimax(const char *restrict nptr, char **restrict endptr,
    int base);
```

```
uintmax_t strtoumax(const char *restrict nptr, char **restrict endptr,
    int base);
```
