	**Threat Level** Moderate threat level to personal safety, take extra precautions here.	**Threat Level** The Department of Gracias a Dios, Chamelećon, Choloma and Cofradia, reconsider your need to travel.				**Latitude / Longitude** 15.199999, -86.241905 **GPS Position** 15° 11' 59.9964" N 86° 14' 30.858" W

Crime	● Violent crime, often involving street gangs, is widespread. Carjackers and armed robbers may target people travelling to and from the airport or at traffic lights. Arrive and depart the airport in daylight. Always keep vehicle doors and windows locked. Don't walk or travel alone or after dark. ● Cross-border drug smuggling increases the risk of violent crime in remote and border areas. Use only official border crossings. Cross during daytime. ● Incidents of food and drink spiking are increasing. Never leave your food or drinks unattended. ● Petty crime, including robbery at ATMs, is common. Only use ATMs in secure areas, such as hotels, banks and shopping centres, during daytime. ● Demonstrations can turn violent. It's illegal for foreigners to take part in political protests. Avoid large public gatherings. ● Protests can happen anywhere in Honduras. Although normally peaceful, these can rapidly turn violent with a general breakdown in law and order, including looting. The police have frequently responded with tear gas and there have been deaths and injuries. ● There are high levels of crime in Honduras. Most serious crime does not affect tourists, but there have been attacks on foreigners, including armed robbery and sexual assault. Attacks can take place anywhere at any time. ● Petty theft is a problem in cities and tourist areas, including the Bay Islands (Roatán, Utila and Guanaja). Avoid walking around Tegucigalpa, San Pedro Sula and other main towns and cities in mainland Honduras. Be particularly careful at bus stations, airports, isolated beaches, tourist sites and on public transport. Keep your valuables locked away in a safe if possible. Avoid displaying valuable items like jewellery, cameras, tablets, laptops and mobile phones. ● Take care if you're travelling alone. In remote areas it may be safer to travel with others or join a tour. Do not accept lifts from strangers or hitchhike.
Crime	● Criminals have robbed foreigners after they've withdrawn money at ATMs. ATMs are available in the major towns. Check with your hotel which ATMs to use, especially in Roatán. It is safer to withdraw money from ATMs in shopping centres and to change money in hotels or banks. Check ATMs for evidence of tampering, although affected machines may not be easy to spot. Do not withdraw a lot of money at one time and avoid withdrawals at night. People have been killed and injured resisting criminals. It is useful to carry a small amount of money to hand out if you're robbed. ● There have been violent attacks on people in cars and buses. Using a reputable tour company for longer journeys may reduce the risks. For shorter distances, use radio-dispatched taxis or hotel taxis. It is generally safer to travel on main roads between major cities and tourist destinations. ● Avoid travelling on public buses (repainted US school buses). There has been an increase in armed attacks by local gangs on bus drivers and conductors, often resulting in serious injury or death. There have been violent muggings, rape and assault against foreigners on these buses. Private intercity coach services are safer but not immune from attack. There have been attacks on roads: From Limones to La Union, from Olancho via Salama to Saba, from Gualaco to San Esteban, from La Esperanza to Gracias, in the Department of Santa Barbara, in and around Tela, La Ceiba, Trujillo and El Progreso. ● Scam artists target foreign visitors and residents. The scams come in many forms and can cause great financial loss. Warn your friends and family to be sceptical if they're asked to transfer funds to you in Honduras. Tell them to contact you to check that you've made this request. ● As part of its plan to address extortion, the Honduras government announced a state of exception (emergency) in December 2022. This measure has been repeatedly extended and remains in place, affecting over 100 municipalities across the country. During this time there may be restrictions on freedom of movement and other rights in the affected municipalities. Get more advice from your travel operator. You must always carry ID and be prepared for checkpoints.
Laws	● Don't use or carry illegal drugs. Penalties for drug offences are severe and include long prison sentences. ● Understand the rules on exporting and importing. It's illegal to import religious materials. It's also illegal to export firearms, pre-colonial antiques or artefacts, and some birds, feathers, plants and animals. ● To enter or exit Honduras, people aged 20 and under travelling alone or with only one parent or legal guardian must have a notarised letter in Spanish from the parents or guardians not travelling with them. ● It's illegal to photograph public buildings in Honduras. Ask an official before you take photos. ● Get permission before photographing anyone, especially women and children. ● You will get a 30-day visit entry stamp in your passport when you arrive. Make sure the border control officer puts a stamp in your passport otherwise you may get a fine.
Health Risks	● Zika virus is widespread. If you're pregnant, discuss your travel plans with your doctor before you leave. ● Malaria is a risk throughout Honduras, including the Bay Islands. This increases during the rainy season (May to November). Consider taking anti-malaria medication. ● Other insect-borne diseases include dengue and chikungunya. Use insect repellent. Ensure your accommodation is insect-proof. ● HIV/AIDS is common. Take precautions if you're taking part in high-risk activities. ● Other infectious diseases include hepatitis and typhoid. Drink boiled or bottled water. Avoid raw or undercooked food. ● Air pollution is severe during the dry season. If you have breathing problems, talk to your doctor before you travel.
Weather	● The hurricane season is June to November. Hurricanes can cause landslides, mudslides and flooding. Know where your nearest shelter is. ● Drought, forest fires and flash flooding are common in Honduras. ● Earthquakes are a risk in Honduras.

Other

● If you're a tourist and staying less than 90 days, you don't need a visa. If you're travelling for other purposes, you'll need a visa. Contact the nearest embassy or consulate of Honduras for details.
● Everyone aged over 12 years must pay an airport service fee when leaving the country. Check if your ticket includes this. If not, pay at the airport using US dollars or local currency.
● You'll need to show your yellow fever vaccination certificate if you're arriving from a country where it's a risk. Get vaccinated before you travel.
● Both sides of the Honduras-Nicaragua border have unmarked minefields. Don't leave known safe roads and areas.
● Use only airport or pre-booked taxis. Avoid hailing taxis from the street and public transport. Vehicles are often poorly serviced and drivers aren't trained.
● Take care when travelling by sea. Honduras and Nicaragua have an ongoing maritime boundary dispute. Criminals also operate in Honduran waters.

Mexico

	Threat Level Moderate threat level to personal safety, take extra precautions here.	**Threat Level** Tamaulipas, Michoacán (except the cities of Morelia, Lázaro Cardenas and the Monarch butterfly reserves), reconsider your need to travel.	**Threat Level** Michoacán (except the cities of Morelia, The Sierra Madre Occidental Mountains in southern Chihuahua, north-eastern Sinaloa, north-western Durango and south-eastern Sonora (except the Chihuahua-Pacific Railway), Lázaro Cardenas and the Monarch butterfly reserves), reconsider your need to travel.		**Latitude / Longitude** 23.634501, -102.552784 **GPS Position** 23° 38' 4.2036'' N 102° 33' 10.0224'' W

Crime

● Avoid protests and large public gatherings. These can become violent. It's also against the law for foreigners to participate in political activity.
● Mexico has a high risk of violent crime, such as murder, armed robbery, sexual assault and kidnapping. Don't travel at night outside major cities.
● Kidnapping is a serious risk. Don't draw attention to your money or business affairs. Only use ATMs in shopping centres during daytime.
● Drug-related violence is widespread. Stop at all roadblocks or you risk being killed.
● Crime is a risk to foreign nationals in Mexico, particularly in major cities and tourist resort areas. Street crime is a serious issue in these places. Many Mexican and foreign businesses choose to hire private security. You should: Research your destination thoroughly, only travel during daylight hours when possible, monitor local media, tell trusted contacts your travel plans.
● Take care withdrawing money from ATMs or using exchange offices (bureau de change). Criminals have targeted people using these services. It's generally safer to use ATMs during daylight hours inside shops or malls. Avoid withdrawing large amounts and watch who is around you while you are at an ATM.
● Pickpocketing and theft are common, including on public transport. You should: Avoid wearing expensive-looking clothing, jewellery or watches, limit the amount of cash or credit and debit cards you carry, watch your luggage, even in apparently secure places like the lobby of your hotel.
● Be wary of criminals posing as police officers and trying to fine or arrest you for no reason. They have targeted travellers driving rental cars. Some genuine police officers have extorted money from tourists for alleged minor offences or traffic violations.
● Do not leave food and drinks unattended in bars and restaurants. Criminals have robbed or assaulted travellers after drugging them.
● Tainted alcohol has caused illness or blackouts. If you have any concerns, get advice from your tour operator or the local authorities.

● Sexual offences have been reported in tourist areas. Take care even in areas close to hotels, and especially after dark.
● Kidnapping is more common in some areas of Mexico than others. See Regional risks for areas of higher risk. While tourists are not usually targeted, you should always remain aware of your surroundings. Short-term opportunistic kidnapping (called 'express kidnapping') can happen, particularly in urban areas. Kidnappers force victims to withdraw money at an ATM to secure their release.
● Drug-related violence in Mexico has increased over recent years. Do not become involved with drugs of any kind. Some areas of Mexico have a high crime rate due to fighting between rival organised crime gangs. In these areas, there is a risk of being caught in the crossfire or of being mistaken for a gang member. While risks are lower in tourist areas, you should: Take advice from local authorities or your hotel, be aware of your surroundings at all times, use reputable tourism or transport companies, travel during the daytime where possible.
● Stay away from isolated roads and use toll roads ('cuotas') whenever possible. Keep car doors locked and windows closed, especially at traffic lights. Violent carjackings and robberies happen along the Pacific Highway. If you suspect someone is following or watching you, drive to a police station or another safe place. Criminals have targeted large camper vans and sports utility vehicles (SUVs). Criminals can deliberately cause traffic accidents to make insurance claims or get cash from the other party. They sometimes threaten violence or intimidation. Contact the authorities for support if necessary.
● In remote areas, you may come across unofficial roadblocks, including on main roads. Local groups seeking money for an unofficial toll control these roadblocks. They can become violent and deny entry.

● Unlicensed taxi drivers have robbed and assaulted passengers, including in Mexico City. Use the better regulated 'sitio' taxis from authorised taxi ranks or ask your hotel to order you a taxi. At airports, only use authorised pre-paid airport taxi services. Licensed taxi drivers protesting about Uber have blocked roads near Cancun's hotels. The protesters have pulled tourists from Uber taxis. Tourists have also missed flights due to roadblocks. Protests can happen without notice. Look for local announcements and follow your hotel's advice on how to avoid protests.
● Be alert on public transport, at airports and in bus stations. Theft on buses is common, so keep your belongings safe. There is a risk of bus hijacking. Try to travel on first-class buses using toll roads, which have a lower rate of incidents than second and third-class buses travelling on the less secure free ('libre') roads. Most first-class bus companies perform security checks when passengers board the bus. Women travelling alone on public transport have been harassed, robbed and sexually assaulted.
● The Mexican government makes efforts to protect major tourist destinations, including: Cancun, Tulum, Cozumel, Los Cabos, Nuevo Vallarta, Playa del Carmen, Puerto Vallarta. Criminals have physically and sexually assaulted British travellers in these locations. In some cases, hotel employees, taxi drivers and security personnel were involved. Hotel staff have sometimes been unhelpful and tried to convince victims not to contact police. Rival criminal gangs have clashed in popular Cancun tourist destinations and surrounding areas. Gangs have not targeted tourists, but violent incidents could affect anyone nearby. Since 2021, several shootings have affected tourists. Be very cautious after dark in downtown areas of Cancun, Tulum and Playa del Carmen. Stay in well-lit pedestrian streets and tourist zones. Follow advice from the local authorities and your tour operator.

Laws

● Get legal advice before buying or investing in property. This includes time-shares. Mexican property law is complex.
● Some activities are illegal for foreigners in Mexico. These include political activity, driving without insurance, and failing to report a road accident. Ensure you understand and follow local laws.
● It is illegal to bring e-cigarettes, vaping devices and solutions into Mexico or to buy and sell them.
● Possessing or exporting ancient Mexican artefacts and carrying firearms or ammunition without a permit are also illegal. Apply for a firearm permit at a Mexican embassy or consulate before you arrive.
● It is illegal for foreign nationals to participate in political activities in Mexico. If you join demonstrations, the Mexican authorities may detain and deport you.

Health Risks

● Malaria and Zika virus are risks in Mexico. If you're pregnant, ask your doctor about the risk of Zika virus before you travel.
● Mexico has insect-borne diseases, such as dengue fever, chikungunya, Chagas disease and leishmaniasis. Ensure your accommodation is insect-proof. Use insect repellent.
● Parts of Mexico are at high altitudes. Air pollution can also cause health issues, particularly over winter (December to February). Talk to your doctor before you travel if you have heart, lung or breathing issues.
● In some hotels, balcony railings are low and there is a risk of falling.
● Shark attacks are rare in Mexico, but you should take care, particularly when surfing. Research the area and follow local advice. Crocodiles normally live in lagoons and coastal areas in Mexico, including Cancun and Pacific coast resorts. Respect warning signs around lagoons in these areas and do not walk close to the water. Crocodiles have attacked and seriously injured tourists in the past.

Weather

● The hurricane season in Mexico normally runs from June to November and can affect the Pacific and Atlantic coasts. Tropical storms and hurricanes cause floods, landslides and disruption to local services, including transport networks. After a hurricane there can still be continued flooding, high winds and rainfall. In 2023, Hurricane Otis hit the south coast near Acapulco. This Category 5 hurricane seriously damaged infrastructure along the coast, in Acapulco and between Zihuatenejo and Punta Maldonado. Reconstruction efforts continue to disrupt tourism, and the security situation is unpredictable. FCDO advises against all but essential travel to the city of Acapulco.
● There is a risk of earthquakes in most parts of Mexico. Tremors happen regularly, particularly in the states of Oaxaca and Guerrero.
● The volcanoes Popocatépetl and Colima are active and closed to the public. The danger zones around both volcanoes change depending on the current level of activity. There is currently a 7-mile (12km) exclusion zone around Popocatépetl and the alert level is level 2 of the amber tier. Ash fall from Popocatépetl has previously disrupted air travel and caused flight cancellations at Benito Juarez International Airport in Mexico City. Check your flight status with your airline or operator. You can also follow Benito Juárez airport on X. Falling volcanic ash and toxic fumes can affect your health, especially if you suffer from a respiratory condition.

Other

● Ensure you understand Mexico's entry requirements. If you're visiting for 180 days or less, you generally won't need a visa.
● Make sure you get your passport stamped on entry and exit.
● Check the requirements if you're travelling with children. Minors with Mexican dual nationality or residency will need a specific form (SAM) from the Embassy of Mexico.
● Exchange other currencies for US dollars before you travel. Tourist areas and resorts accept US dollars, but you generally can't exchange Australian and Canadian dollars and traveller's cheques.
● Most international hotels and tourist facilities accept credit and debit cards. ATMs are widely available in urban areas, but carry cash if you're travelling to rural areas.
● To drive in Mexico you need either a valid driver's licence. Learn local road safety and driving laws before driving.
● If you're taking public transport or taxis, use only first-class buses and official taxis. Crime levels on intercity buses are high, especially after dark.
● You may need to pay a departure tax when leaving Mexico by air or land. The cost can vary, and some airports or border crossings only accept cash.

Nicaragua

Threat Level
Moderate threat level to personal safety, take extra precautions here.

Latitude / Longitude
12.865416, -85.207229

GPS Position
12° 51' 55.4976'' N
85° 12' 26.0244'' W

Crime	● Nicaragua has a high crime rate, including armed robbery, assault and express kidnapping. There aren't many police outside major urban areas. Avoid remote locations. Don't go out alone or at night. Only travel to tourist areas. ● Violent crime occurs in unofficial taxis. Use only official taxis with a red number plate, or radio-dispatched taxis. Avoid public transport. ● Armed gangs operate along the Honduran border. Only use highways that cross the border at Guassaule, El Espino or Las Manos. ● Violent protests that began in April 2018 have eased. But tension remains. Avoid large public gatherings and anti-government activities. ● Demonstrations and gatherings can turn violent. It is illegal for foreigners to take part in any sort of political activity in Nicaragua. ● Foreign nationals have been affected by violent crime in Nicaragua. Criminals often carry out attacks on people in vehicles. To reduce the risk to yourself and your belongings: Keep the windows of your car closed and the doors locked, avoid public transport after dark. ● Take care when walking around markets, bus stations, around the old cathedral in Managua and in the poorer areas of towns. Do not visit these areas after dark on foot. If you are robbed, do not resist, as many criminals carry weapons. If you report the incident to the police, get a signed and stamped copy of the police report. ● There is a risk of 'express kidnapping' if you use an unauthorised taxi. You could be taken hostage and forced to pay cash for your release. Reduce the risk by: Using a radio-dispatched taxi or an authorised taxi with red plates, making sure the driver's ID number, name and photograph are clearly visible on the dashboard, making a note of the colour and number of the vehicle before you get in. ● It is a common local practice to share taxis with strangers, but tourists have been robbed when taking taxis called by strangers. Do not take a taxi if it has been called for you by someone you do not know well. You should also avoid using 'colectivos' (minibuses).
Laws	● Don't use or carry illegal drugs. Penalties for drug offences are severe. They include long prison sentences. ● It's illegal to photograph official buildings. Check with officials before taking photos. ● Take care when driving. If you kill or injure someone in an accident, officials may detain you until your court case finishes. ● There is a ban on electronic smoking devices such as e-cigarettes in Nicaragua. You cannot import, export, sell, store or use these devices, with or without nicotine. ● You must pay an arrival tax of 10 US dollars in cash. There is also a departure tax of 35 US dollars, which is normally included in the price of your air ticket. ● There is a prohibition on the possession and use of drones. Law 1230 introduced in December 2024 requires people in possession of drones to hand them in to the authorities.
Health Risks	● Malaria is a risk in rural areas, including the outskirts of Managua. Consider taking anti-malaria medication. ● Insect-borne diseases, including dengue, chikungunya, Chagas disease and leishmaniasis, are widespread. Ensure your accommodation is insect-proof. Use insect repellent. ● Zika virus is also widespread. If you're pregnant, discuss your travel plans with your doctor. ● Foodborne, waterborne and other infectious diseases are common. These include tuberculosis, typhoid, hepatitis and rabies. Drink only boiled or bottled water. Avoid raw or undercooked food. If you're bitten or scratched by an animal, get immediate medical help. ● Medical facilities are good in Managua, but very limited elsewhere. There are no emergency ambulance services. If you're seriously ill or injured, you may need medical evacuation out of the country. Ensure your travel insurance covers this. ● There have been fatalities from scuba diving off Nicaragua's Caribbean coast. If you want to dive, contact a reputable diving company to find out about Nicaraguan waters. Nicaragua's only hyperbaric chamber is in Puerto Cabezas, a 5-hour speedboat ride from Corn Island.
Weather	● Hurricane season is from June to November. Hurricanes can cause flooding and disrupt services. Know your hotel or cruise ship's evacuation plan. Find your nearest shelter. ● A group of volcanoes, several of which are active, stretches the length of the country, in particular San Cristóbal, Masaya, Cerro Negro, and Telica and Concepción on Ometepe Island. Follow media reports and listen to local authorities if you intend to visit the area. Don't hike near volcanoes or visit remote areas without an experienced guide. ● There is a risk of earthquakes.
Other	● If you're a tourist, you can visit for up to 90 days. Purchase a tourist card (CA-4 visa) at the airport. ● If you're visiting for another reason, you'll need a visa. Contact the Nicaraguan Embassy in Japan for details. ● You may need a yellow fever vaccination certificate to enter Nicaragua. ● If you're travelling via the US or Canada, you must meet their entry or transit requirements. Check these with the US Embassy or Canadian High Commission. ● Have multiple ways to access money. The only foreign currency you can exchange in Nicaragua is US dollars. ATMs have low daily withdrawal limits. ● Pacific coast beaches have strong currents and undertows. Check conditions with locals before swimming. ● Driving in Nicaragua can be dangerous. Travel only during daylight hours. Don't leave main roads in the northern border region, as there are unmarked landmines.

Panama

Threat Level
Moderate threat level to personal safety, take extra precautions here.

Threat Level
Darien Gap beyond Yaviza, do not travel.

Latitude / Longitude
8.537981, -80.782127

GPS Position
8° 32' 16.7316'' N
80° 46' 55.6572'' W

Crime	● Panama has high crime rates. Petty crime is more common than violent crime. Take care of your belongings, especially in transport hubs. ● Violent crime includes armed robbery and muggings. Avoid high-crime areas of Panama City. Only use ATMs in banks or shopping centres. Don't go out alone. ● Colombian guerrilla groups and drug traffickers are active in the Darien Gap, near the Colombian border. Violent crime is common. Don't travel to this area. ● Popular protest areas include the University of Panama, the National Assembly, the Presidential Palace, and main roads. Protests can turn violent. Avoid large public gatherings. ● If you're the victim of a crime in Panama and want to report the incident, do so before you leave the country, otherwise the police may not investigate. Street crime can happen anywhere, but these areas of Panama City have higher levels of crime: San Miguelito, El Chorrillo, Río Abajo, 24 de Diciembre, Santa Ana, Juan Diaz. ● There is a risk of pickpocketing in busy areas, on buses and at bus stations. ● People have been attacked after withdrawing cash from ATMs. Where possible, use an ATM inside a bank or shopping centre. Take sensible precautions to avoid mugging, particularly in main shopping areas and tourist sites, including: Albrook Mall in Panama City, Via España and Avenida Central in Panama City, the area of Calidonia in Panama City, the old town (Casco Viejo) in Panama City, the old Panama ruins (Panama Viejo) in Panama City, the Madden Dam area – off the main Panama to Colón road, the city of Colón ● Be wary if visitors approach you to get access to your accommodation. Criminal gangs have used this method to commit burglaries. If you're in any doubt, call the police. ● There have been incidents of targeted gang assassinations, some in tourist areas. Most of these crimes are between members of rival drug gangs.
Laws	● Don't use or carry illegal drugs. Penalties for drug offences are severe. They include long prison sentences. Officials may also arrest you if you're with someone who's using drugs. ● You can visit Panama for up to 3 months without a visa if you arrive by land or air. There are different visa requirements for sea arrivals. ● Always carry photo identification, such as a certified copy of your passport. ● Understand and follow local laws. It's illegal to take photos of official buildings. If you're in a traffic accident, you must wait with your vehicle until traffic police arrive. ● Ask for permission before photographing anyone, especially women and children. ● At Panamanian border control, you may need to: Give the address of your accommodation and a contact telephone number, show a return or onward ticket – particularly if you arrive by land from Costa Rica and are not a legal resident of Costa Rica, prove you have at least 1000 US dollars (or the same amount in other currencies) or a credit card. ● In August 2024, Panama introduced a night-time curfew for unaccompanied minors under the age of 18 in Colón province. Limited exceptions apply. This is part of government efforts to tackle criminal groups and organised crime. In Colón the curfew is from Sundays to Thursdays from 8pm to 4am and on Fridays and Saturdays from 9pm to 5am. Unaccompanied minors who do not comply with the curfew face arrest by the police.

Health Risks	● Yellow fever is widespread. Get vaccinated before you travel. ● Malaria is a year-round risk in Bocas del Toro, Darien and San Blas. It's not a risk in Panama City. Consider taking anti-malarial medication. ● Other insect-borne diseases include Zika virus, dengue and chikungunya. Ensure your accommodation is insect-proof. Use insect repellent. ● HIV/AIDS is common. Take precautions if you're taking part in high-risk activities. ● Waterborne, foodborne and other infectious diseases include hantavirus, hepatitis, tuberculosis, rabies and brucellosis. Drink boiled or bottled water. Avoid raw or undercooked food. If you're bitten or scratched by an animal, get immediate medical help. ● Some private hospitals and clinics are good. Facilities outside Panama City are limited. If you're seriously ill or injured, you'll need medical evacuation to the United States (US). Ensure your travel insurance covers this.
Weather	● The hurricane season is from June to November, but storms can happen year-round. They can cause flooding and landslides, and disrupt services. Know your hotel or cruise ship's evacuation plan. Find your nearest shelter. ● Panama experiences earthquakes. Tsunamis can also happen. Know the tsunami warning signs and move immediately to high ground. Don't wait for official alerts.
Other	● If you arrive by air or land, you'll be granted a 180-day stay on arrival. Ensure you have a return or onward ticket and at least $US500. ● If you're arriving by cruise ship, you'll be granted a 90-day stay on arrival. If you're arriving by any other sea vessel, you'll need a visa. Contact your nearest Panamanian embassy or consulate for details. ● Carry your yellow fever vaccination certificate. You may need it to enter Panama. ● The local coin currency is the Panama Balboa. The banknote currency is the US dollar. Beware of counterfeit currency, especially US$50 and US$100 notes. ● Avoid public transport. Local buses don't follow set routes and they're poorly maintained. ● The Bay of Panama is highly polluted. There are also strong rips and currents. Check conditions with locals before swimming. Never swim alone.

3 North America

Bermuda

	Threat Level N/A	**Latitude / Longitude** 32.307800, -64.7505 **GPS Position** 32° 18' 28.08'' N 64° 45' 1.8'' W

Health Risks		
Weather	● The hurricane season in Bermuda normally runs from June to November. Tropical storms and hurricanes regularly hit the island which may bring hazardous sea and weather conditions to Bermuda. All those in Bermuda should closely monitor the process of storms on the Bermuda Weather and National Hurricane Centre websites.	
Other		

Canada

	Threat Level Exercise normal safety precautions.	**Latitude / Longitude** 56.130366, -106.346771 **GPS Position** 56° 7' 49.3176'' N 106° 20' 48.3756'' W
Crime	● Canada has a similar crime rate to Australia and the U.S. Crime is more likely to occur in larger cities. ● Petty crime can occur in tourist areas and on public transport. Look after your belongings. ● Theft from cars is common in larger cities. Don't leave valuables in your car. ● Credit card scams and fraud occur. Check your statements often.	
Laws	● The legal drinking age varies across the country. Check local laws before buying or drinking alcohol. ● It's legal to use marijuana (cannabis) in Canada, subject to local restrictions. Check local laws on legal age, possession and other restrictions. It's illegal to take marijuana out of the country. ● Canada recognises dual nationality. Travel on your Canadian passport. Make sure your passports are valid for your entire trip.	
Health Risks	● Health risks in Canada are similar to those in Australia and the U.S. ● Australia and Canada don't have a reciprocal health care agreement. You won't get free health care unless you're a local resident. Ensure your travel insurance covers medical costs.	
Weather	● Canada can experience severe weather. This includes tornadoes and hurricanes in summer, and severe cold, ice and heavy snowfalls in winter. Monitor the media and official sources for weather alerts.	
Other	● Get an electronic travel authorisation (eTA) before you travel to Canada by air. If you have a criminal record, including a drink driving conviction, you may not be allowed into the country. ● If you're travelling to Canada through the US, you must meet US entry and transit requirements. Check with an embassy or consulate of the US. ● You may need documents to travel with children or pets, or bring goods into Canada. Check with the Canada Border Services Agency (CBSA). ● Driving in winter can be dangerous. Use snow tyres and drive to conditions. Carry food, water and blankets. ● If you're travelling to the Arctic by ship, ask about on-board medical facilities. It can take several days for emergency help to arrive. Ensure your travel insurance covers evacuation, treatment, and the cost of returning home. ● Bears and other dangerous wildlife live in forested areas. Get local advice before hiking. ● Winter sports can be dangerous, even fatal. Some areas experience avalanches. Check that your travel insurance covers your chosen activity. Follow the advice of local officials.	

United States of America

	Threat Level Exercise normal safety precautions.	**Latitude / Longitude** 37.090240, -95.712891 **GPS Position** 37° 5' 24.864'' N 95° 42' 46.4076'' W

Crime	● The US has a heightened risk of terrorist attacks. Terrorists may use vehicles, knives, homemade bombs, and poisons or toxins. Be alert, particularly in public places and at events. ● Violent crime is more common than in Australia and Canada and gun crime is possible in all areas. Follow local guidance and instructions. If you live in the US, learn active shooter drills. ● Thieves target travellers. Take care on public transport. Don't leave valuables in your rental car. ● Protests and demonstrations are common. They can turn violent. Monitor the news for information. Avoid protests and obey any local restrictions or curfews.
Laws	● Check local drug laws, including on the possession and use of marijuana. These vary across states. It's illegal to possess prescription medication without a prescription. Penalties include mandatory minimum sentences. ● The federal age for buying and drinking alcohol is 21, but it may vary in different states. Check relevant state laws. ● Get legal advice before you enter into a commercial surrogacy arrangement. ● Some states have laws that may affect LGBTI travellers. ● Dual nationality is recognised. Travel with both your passports. Enter and exit the US on your US passport.
Health Risks	● Insect-borne illnesses are a risk in parts of the US. These include West Nile virus, Heartland virus and Zika virus. Make sure your accommodation is insect-proof. Use insect repellent. ● The US is currently experiencing outbreaks of measles. Make sure your vaccinations are up-to-date before you travel and follow advice from local health authorities. ● Medical costs are high. You may need to pay up-front. Ensure you have comprehensive travel insurance.
Weather	● Extreme weather and natural hazards include earthquakes and tsunamis, wildfires, hurricanes and floods, tornadoes, volcanic eruptions, and blizzards. Monitor weather conditions and follow any mandatory evacuation orders.
Other	● Check US entry, transit and exit requirements. If you're visiting for less than 90 days, you may be eligible for the Electronic System for Travel Authorisation (ESTA) and be able to enter under the Visa Waiver Program. If you're not eligible, you'll need a visa. ● Each traveller, including children, must have their own ESTA and visa waiver, or visa. ● The US restricts travel to and from Cuba. Make sure you meet all requirements. US authorities may question you when you arrive in the US. ● Most places accept credit and debit cards. ● To drive in the US, you need an International Driving Permit (IDP). Get your IDP before you leave your country. Some states may let you drive on an Australian driver's licence. Learn local traffic rules and driving conditions before you drive.

4 South America

Argentina

Threat Level
Exercise normal safety precautions.

Latitude / Longitude
-38.416097, -63.616672

GPS Position
38° 24' 57.9492'' S
63° 37' 0.0192'' W

Crime	● Petty crime, such as robbery and bag snatching, is common. Take care on public transport and in tourist areas. ● Violent crimes are common in the tourist areas of Buenos Aires, Rosario and Mendoza. These include armed robbery and express kidnapping. Only use ATMs in banks and shopping centres. If you're held up, don't resist. ● Thieves often target cars stopped at traffic lights. Crime also occurs in taxis. Use only 'radio taxis'. Keep doors and windows locked when driving. ● Protests are common, especially in major cities. These can turn violent. In Buenos Aires, protests often occur in Plaza De Mayo and Congreso. Avoid large public gatherings.
Laws	● Don't use or carry illegal drugs. Penalties for drug offences are severe and include long prison sentences. ● Respect national symbols. Offences committed against them carry a penalty of 6 months to 4 years in jail. ● Dual nationals staying in Argentina for more than 180 days must leave Argentina on an Argentine passport. Make sure you have one before you travel.
Health Risks	● Insect-borne diseases are common the north of Argentina. These include dengue and chikungunya. Ensure your accommodation is insect-proof. Use insect repellent. ● Zika virus occurs in some regions. If you're pregnant, discuss your travel plans with your doctor before you leave. ● Yellow fever is a risk in Misiones and Corrientes. If you're travelling there, get vaccinated before you leave. ● Hantavirus is widespread in some regions. It's spread through contact with infected rodents. Avoid contact with live or dead rodents, nests, burrows and droppings. ● Parts of Argentina are at high altitudes. You can develop altitude sickness above 2500m. If you're travelling to these areas, consult your doctor before you leave. Ensure your travel insurance covers mountain rescue.
Weather	
Other	● Tourists can stay for up to 90 days without a visa. You'll need a visa to work or study in Argentina. You'll also need one if you're travelling on a diplomatic or official passport. ● Some entry ports collect biometric data. Your thumbprint will be scanned and your face photographed. ● Some airlines require a valid yellow fever vaccination certificate to depart Argentina. Check the yellow fever requirements for Argentina and all countries you'll enter or transit through. ● Have multiple ways to access money. Most major hotels in Buenos Aires will exchange US dollars. They may not accept traveller's cheques. Carry a copy of your passport if you plan to use a credit card. You may need to show this to use it. ● Hiking in the mountains can be dangerous. Research your destination. Register your details with local park authorities. Carry emergency and first aid equipment. ● People with disabilities may have trouble with accessibility in Argentina. Check with your accommodation provider before you travel.

Bolivia

Threat Level
Moderate threat level to personal safety, take extra precautions here.

Latitude / Longitude
-16.290154, -63.588653

GPS Position
16° 17' 24.5544'' S

Crime	● Political tensions are ongoing. Roadblocks, demonstrations, violent protests and strikes could occur at any time. Don't cross roadblocks set up by protesters. Avoid crowds. They could become violent. ● Anti-narcotics activities in coca-growing areas can lead to violence. Chapare and the Yungas regions are most affected. Take care in these areas.Travellers can be victims of drug-related crime near the Brazil border. Take extra precautions in this area. ● Petty theft is common in tourist areas and bus stations. Be alert to attempts to distract your attention from your luggage.Violent crime against foreigners has increased. This includes armed robbery, assault, and food and drink spiking. Don't leave your food or drink unattended. ● Use experienced, well-known tour guides for hiking trips. ● Criminals can pose as taxi drivers. Use only well-known radio taxi companies with the phone number displayed on the vehicle's roof. Don't hail taxis off the streets.

Laws	● Don't use or carry illegal drugs. Penalties for drug offences are severe and include long prison sentences. ● You must carry photo identification. This can be a photocopy of your passport. ● Understand local laws. It's illegal to remove local treasures. It's also illegal to excavate or collect fossils without written approval. ● Dual national males older than 18 must complete military service upon arrival. Contact an embassy or consulate of Bolivia for details. ● Photography may upset locals. Ask permission before taking photos of children and in remote areas. ● Same-sex relationships are legal, but aren't widely accepted. Consider limiting public displays of affection.
Health Risks	● Yellow fever is a risk. Get vaccinated before you travel. ● Zika virus is also a risk. If you're pregnant, discuss your travel plans with your doctor before you leave. ● In areas below 2500m, there's a risk of malaria and dengue. Ensure your accommodation is insect-proof. Use insect repellent. Consider taking anti-malaria medication. ● Other infectious diseases include hepatitis, tuberculosis, typhoid and rabies. Drink only boiled or bottled water. Avoid raw or undercooked food. If an animal bites or scratches you, get urgent medical help. ● Many parts of Bolivia are at high altitudes. You can suffer altitude sickness above 2500m. If you plan to travel to these areas, consult your doctor before you leave. Get travel insurance to cover emergency evacuation from altitude and related medical costs.
Weather	● Landslides, blocked roads and flooding are common in the rainy season from November to March. Follow local officials' advice.
Other	● If you're visiting for less than 90 days, you won't need a visa. Contact an embassy or consulate of Bolivia for details. If you're travelling via the US, you must meet US entry or transit requirements. Check these with a US embassy or consulate in advance. ● Carry your yellow fever vaccination certificate. You may need to show it to enter and leave the country. ● Have different ways to access money. US dollars are the most easily exchangeable foreign currency. ATMs are in most cities. Many businesses accept international credit cards. ● If you're visiting the Uyuni salt plains, choose a tour operator with a CB radio or satellite phone. There's limited mobile phone coverage. Be prepared for delays from melting snow and snowfalls. ● Know the local traffic laws before you drive. It's illegal to drive with a blood alcohol level greater than zero. ● Avoid public transport where possible. It's often unsafe due to poor roads, driving and vehicle maintenance standards.

Brazil

Threat Level
Moderate threat level to personal safety, take extra precautions here.

Latitude / Longitude
-14.235004, -51.92528

GPS Position
14° 14' 6.0144" S
51° 55' 31.008" W

Crime	● Violent crime, such as mugging, armed robbery and carjacking, is common. It occurs more often in large cities and during festivals, such as Carnaval. Don't go out alone or at night. Avoid isolated areas, including beaches. ● Crime rates are particularly high in shanty towns, or 'favelas'. Don't enter favelas, even with a tour group, especially at night. ● Crime on roads and in taxis is common. Use only prepaid or official taxis. Taxi Apps sucha s uber nand cabify are a safe option. If you're driving, keep doors and windows locked. Ensure your route avoids favelas. ● Large-scale protests and strikes are common, especially around holidays. These can turn violent. Avoid large public gatherings.
Laws	● Don't use or carry illegal drugs. Penalties for drug offences are severe and include long prison sentences. ● You must have proof of identity. Always carry a photocopy of your passport and some original photo ID, such as a driver's licence. ● Dual nationals must enter Brazil on their Brazilian passport. If you're male and aged over 18, you may need to do military service. Contact a Brazilian embassy or consulate for advice. ● Same-sex relationships are legal, but aren't always accepted in rural communities. Avoid public displays of affection.
Health Risks	● There's currently a yellow fever outbreak in Brazil. Get vaccinated at least 10 days before you travel. ● Common insect-borne diseases include Zika virus, malaria, dengue, chikungunya, filariasis and leishmaniasis. Ensure your accommodation is insect-proof and use insect repellent. Consider taking anti-malarial medication. ● HIV/AIDS is a serious risk. Take precautions if you're taking part in high-risk activities. ● There's a current measles outbreak in Brazil. Check your vaccination status with your doctor before you travel. ● Foodborne, waterborne and other infectious diseases include cholera, typhoid and hepatitis. Drink boiled or bottled water. Avoid raw or undercooked food. Don't swim in fresh water.
Weather	● The rainy season is from December to March. Landslides and flooding can occur. Severe storms often delay flights. Be prepared to adjust your travel plans.
Other	● You don't need a visa to enter Brazil for tourism, business, transit or artistic and sporting activities. For other types of visit, apply for a visa through an embassy or consulate of Brazil. ● Carry your yellow fever vaccination certificate. You may need it to enter Brazil.and fr regional /onwards travel. ● The local currency is the Brazilian Real. US dollars are the easiest currency to exchange. Many places accept credit cards, but ATMs can be unreliable. Have multiple ways to access money. ● Use an experienced guide if you travel to remote areas, including the Amazon border regions and the Pantanal wetlands. You may get lost or injured without one. ● Public transport vehicles are often poorly maintained. There's also a risk of petty crime. Be alert when using public transport, especially during busy times and at night.

Chile

Threat Level
Exercise normal safety precautions.

Latitude / Longitude
-35.675147, -71.542969

GPS Position
35° 40' 30.5292" S
71° 32' 34.6884" W

Crime	● Protests have occurred in the areas of Las Condes, Providencia and Vitacura. Take care around the area of Plaza Baquedano/Plaza Italia in central Santiago, and the centre of Valparaiso. ● Local law prohibits political activity by foreign nationals. Participation in protests or demonstrations may result in detention or deportation. Avoid protests and large public gatherings. These can become violent. Authorities may use tear gas and water cannons. ● Mugging, armed robbery, pickpocketing and bag snatching are common. Don't walk alone, especially at night. ● Domestic terrorist acts sometimes occur, mostly by anarchist groups in Santiago. They may use explosives. Be alert and report anything suspicious. ● Robberies can occur on inter-city buses, while passengers are sleeping. Keep valuables with you and check everything before you leave the bus.
Laws	● Don't use or carry illegal drugs. Drug offences carry severe penalties, including long prison terms. ● Chile doesn't recognise dual nationality. Check your citizenship status and any entry or exit requirements with an Embassy or Consulate of Chile. Do this before you travel.

Chile

Health Risks	● Altitude sickness is a risk to anyone travelling above 2,500 metres. Get advice from your doctor. Make sure your travel insurance covers medical evacuation from high altitude. ● Easter Island has had outbreaks of Zika virus and dengue. If you're pregnant, ask your doctor about the risk of Zika virus before you travel. Make sure your accommodation is insect-proof. Use insect repellent. ● Common infectious diseases include hepatitis, typhoid, influenza and rabies. Drink only boiled or bottled water. Avoid raw or undercooked food. If you're bitten or scratched by an animal, get medical help straight away. ● Levels of air pollution are high in Santiago from April to October. Dust levels can be high between December and March. If you have breathing problems, take care when there's an air contamination alert. ● Private hospital facilities are good in Santiago and other major cities. Treatment is expensive. You may need to pay cash before treatment.
Weather	● Natural disasters such as fires, earthquakes, volcanic eruptions, flooding and tsunamis occur. Monitor local media and follow the advice of local authorities.
Other	● If you're visiting Chile for tourism for 90 days or less, you can get a visa on arrival. ● You may need extra documents if you're travelling with a child aged under 18 years. Check entry and exit requirements. ● Land mines are a danger in some northern border areas. Get local advice before you travel. Obey all warning signs. ● Prepaid official taxis are available at the airport. You can also use rideshare apps. Don't hail taxis on the street. Ask your hotel to book you a taxi. Make sure they use their meter and check your change.

Colombia

Threat Level Moderate threat level to personal safety, take extra precautions here.	**Threat Level** The departments of Antioquia (except Medellín), Arauca, Caquetá, Cauca (except Popayan), Chocó (except its capital Quibdó and the whale-watching towns of Nuqui, Bania Solano and Capurganá), Guainía, Guaviare, Meta, (except Villavicencio and the tourist site of Caño Cristales), Nariño (except Pasto and the border crossing of Ipiales), Norte de Santander, Putumayo, Valle	**Threat Level** Areas within 20 kms of Venezu and Ecuador, except the Pa American Highway crossing Ipiales, Cities of Buenaventur and Tumaco do not travel		**Latitude / Longitude** 4.570868, -74.297333 **GPS Position** 4° 34' 15.1248'' N 74° 17' 50.3988'' W

Crime	● Demonstrations continue across the country. Avoid protests and large gatherings, as they can turn violent. Expect traffic and transport disruptions in major cities. Contact your airline or tour operator. Be prepared to adjust your travel plans. Monitor local media and follow advice from local authorities. ● Violent crime and gang activity is common. Criminals may pose as police officers or spike drinks and food. Don't travel alone or at night. Don't accept food or drink from strangers. ● Drug-related crime, terrorism and civil unrest make some areas very dangerous. These include the regions within 20km of the Venezuelan and Ecuadorian borders, and the cities of Buenaventura and Tumaco. Avoid these areas. ● There's a high risk of terrorism. Groups often target government infrastructure and Western companies. Be alert to possible threats. Follow official advice. ● Colombia has one of the highest rates of kidnappings in the world. If you're travelling to an area with a high risk of kidnapping, seek professional security advice. ● Hikers are sometimes robbed at gunpoint. Hire a reputable, experienced guide. Petty crime, such as theft, occurs in tourist areas.
Laws	● Don't use or carry illegal drugs. Penalties are severe and include long prison sentences. ● It's illegal to photograph military bases and strategic sites. Check with officials before taking photos. ● If you're a dual national, you must enter on your Colombian passport. If you're male and aged over 18, you may need to complete national service. Contact the Embassy of Colombia for details.
Health Risks	● Yellow fever is widespread. Get vaccinated before you travel. ● Zika virus is also widespread. If you're pregnant, discuss your travel plans with your doctor. ● Malaria is a risk in areas below 800m. This doesn't include Bogotá. Consider taking anti-malarial medication if travelling to these areas. ● Altitude sickness is a risk to anyone above 2500m. Get advice from your doctor. Make sure your travel insurance covers medical evacuation from high altitude. ● HIV/AIDS is widespread. Take precautions if you're taking part in high-risk activities. ● The standard of private hospitals in Bogotá and other major cities is reasonable. Medical facilities are limited elsewhere. You'll need to pay upfront. Check your travel insurance covers medical evacuation.
Weather	
Other	● If you're visiting for tourism and staying less than 90 days, you generally won't need a visa. Ensure you have a return or onward ticket. For other types of visits, you'll need a visa. Contact a Colombian embassy or consulate for details. ● Carry your yellow fever vaccination certificate. You'll need it to enter Colombia. ● The Puente Internacional de Rumichaca border crossing between Colombia and Ecuador closes from 10pm to 6am. Allow enough time for border-crossing formalities. ● The local currency is the Colombian Peso. Exchange US dollars at official exchange bureaus or banks. Major hotels and tourist facilities accept credit cards. ● You can drive in Colombia with an Australian driver's licence and an International Driving Permit (IDP). Get your IDP before you travel. ● Criminals target taxis. Use a phone dispatch service or taxi service app to book a licensed taxi.

Ecuador

Threat Level Moderate threat level to personal safety, take extra precautions here.	**Threat Level** Sucumbios province, reconsider your need to travel.	**Threat Level** Areas within 20 kilometres of Colombia, except the official border crossing at Tulcán, do not travel.		**Latitude / Longitude** -1.831239, -78.183406 **GPS Position** 1° 49' 52.4604'' S 78° 11' 0.2616'' W

Crime	● Violent crime and theft are common. Thieves target travellers. Distraction is a common tactic. Be careful when using ATMs and credit cards. ● The risk of violent crime increases when you travel alone or after dark. Criminals target taxis, buses, transport hubs and crowded areas. Northern regions bordering Colombia and Peru are particularly dangerous. Avoid going out at night. Keep vehicle doors and windows locked, and valuables out of sight, even when moving. ● Kidnappings for ransom happen in major cities and places frequented by foreigners. If you decide to travel to an area where there's a threat of kidnapping, get professional security advice. ● Ayahuasca tourism is a growing industry. Serious assaults and robbery occur. Thoroughly research ayahuasca tour operators before you sign up. ● Political activity by foreigners is illegal. This includes joining protests. If you take part, officials may detain or deport you. Avoid large public gatherings.
Laws	● Don't use or carry illegal drugs. Penalties for drug offences are severe and include long prison sentences. ● Always carry photo ID. Officials may detain you if you don't have it. ● Male dual nationals must complete compulsory military service. Seek advice from an embassy or consulate of Ecuador well before you travel.

Health Risks	● Many parts of Ecuador are at high altitudes. You can develop altitude sickness above 2500m. If you're travelling to these areas, consult your doctor before you leave. Ensure your travel insurance covers emergency evacuation from altitude and related medical costs. ● Yellow fever is common. Get vaccinated before you travel. ● In areas below 1500m, there's a risk of other insect-borne diseases. These include malaria and dengue. Ensure your accommodation is insect-proof. Use insect repellent. Consider taking anti-malaria medication. ● Zika virus is widespread. If you're pregnant, discuss your travel plans with your doctor before you leave. ● HIV/AIDS is common. Take precautions before doing anything that puts you at risk of infection.
Weather	● Ecuador has several active volcanoes. Before you travel to the areas around Tungurahua volcano, including Baños, check with local officials. If you're in Baños, make sure you know evacuation procedures.
Other	● Passport holders can stay for up to 90 days without a visa. Get a visa before you travel if you want to stay longer. ● You can visit the Galapagos Islands for tourism for up to 60 days. For other reasons, you must get a visa or special permission before you arrive in Ecuador. ● Get your passport stamped on entry. If it isn't stamped, you could be deported or delayed leaving. ● Carry your yellow fever vaccination certificate. You may need it to enter and leave the country. Check your countries re-entry requirements following exposure to yellow fever. ● The US Dollar is the official currency. ATMs are available, but many places won't change large banknotes. Restaurants and tourist facilities usually accept credit cards. ● Unmarked minefields are in the Cordillera del Condor region near the Peruvian border. Seek local advice before travelling there.

Guyana

	**Threat Level** Moderate threat level to personal safety, take extra precautions here.							**Latitude / Longitude** 4.860416, -58.93018 **GPS Position** 4° 51' 37.4976'' N 58° 55' 48.648'' W

Crime	● Violent crime such as armed robberies, kidnapping, shootings and carjackings are a risk. These can result in injury or death. Risks increase after dark. Take care around crime hotspots. ● Hotels may not meet fire safety standards. Know your hotel's evacuation plans and talk to hotel staff.
Laws	● Drug offences can lead to long prison terms in local jails. Conditions are harsh, and pre-trial detention can last for years. ● Guyana doesn't recognise same-sex marriage. Same-sex relationships are illegal. You will have no legal protection from discrimination. ● Serious crimes, such as murder, can attract the death penalty. ● Guyana recognises dual nationality.
Health Risks	● Malaria is a risk at all times of year. Risk of other insect-borne diseases increases in the rainy seasons. Make sure your accommodation is insect-proof. Use insect repellent. ● HIV/AIDS is common. Take precautions to protect yourself from the risk of infection. ● Waterborne, foodborne and other infectious diseases are common. This includes typhoid, hepatitis, leptospirosis, rabies. Boil drinking water or drink bottled water. Avoid undercooked food. ● Medical facilities have poor hygiene standards, lack equipment and trained staff. You may need to seek treatment outside Guyana.
Weather	● Rainy seasons can cause flooding, particularly in coastal areas. Roads may not be safe. Follow the advice of local authorities.
Other	● You'll need a yellow fever vaccination certificate. You have to present one when you arrive in Guyana, if you're travelling from a country where yellow fever is widespread. Some airlines require one before you can board flights out of Guyana. ● Border disputes take place on the Suriname–Guyana and Venezuela–Guyana borders. Only use official crossing points. ● Road travel can be dangerous, due to aggressive drivers and poor quality roads and cars. Crime increases at night, especially between Georgetown and the international airport. Avoid travelling at night. ● Don't use minibuses. They are involved in most road accidents, including fatal ones. ● Piracy occurs along Guyana's coast. Don't use a water taxi to travel to another country.

Paraguay

	**Threat Level** Moderate threat level to personal safety, take extra precautions here.						**Latitude / Longitude** -23.442503, -58.443832 **GPS Position** 23° 26' 33.0108'' S 58° 26' 37.7952'' W

Crime	● Theft, armed assault, kidnapping and other violent crimes occur in Paraguay. This includes in tourist areas. Pickpocketing and drug trafficking are also common. Ask your hotel about areas to avoid. Secure your valuables. ● Avoid large public gatherings and protests. These can turn violent. They may also lead to roadblocks and congestion. Don't cross roadblocks, even if they're unattended. ● Be alert when travelling to the interior parts of the country, including San Pedro and Concepción. A small guerrilla-style group, Ejercito del Pueblo Paraguayo (EEP), operates in these regions. Kidnappings have also occurred.
Laws	● Same-sex relationships are legal in Paraguay. However, the country is very conservative. Same-sex marriages aren't recognised. Discrimination based on sexual orientation and gender identity isn't illegal. Avoid public displays of affection. ● Paraguay has severe penalties for drug offences. These include prison sentences and heavy fines. Don't use or carry illegal drugs. ● Don't photograph airports, military sites, police stations or government buildings. It's illegal. ● Other illegal activities include importing or exporting firearms, medications, toys that look like weapons and protected species. ● Check if you're a dual citizen. Paraguay doesn't recognise dual nationality.
Health Risks	● There's a risk of yellow fever in Paraguay. Yellow fever can be fatal. Get vaccinated before you travel. ● Travellers are also at risk of other insect-borne diseases, like malaria and dengue. The worst outbreaks have occurred in Asunción, Concepción and Ciudad del Este. Check that your accommodation is insect-proof. Use insect repellent. ● Zika virus is common in Paraguay. If you're pregnant, discuss your travel plans with your doctor before you leave. ● HIV/AIDS is a significant risk. Take precautions if you're engaging in high-risk activities. ● Foodborne, waterborne and other infectious diseases are prevalent. These include hepatitis A, typhoid and rabies. Check your vaccinations are up to date before you travel. Boil drinking water or drink bottled water. Avoid ice cubes.
Weather	

Paraguay	
Other	● You need a visa to enter Paraguay. If you enter the country at Asunción International Airport, you can pay cash for a 90-day multiple-entry visa. Otherwise, you'll need to get a visa before you arrive. Contact an embassy or consulate of Paraguay for up-to-date visa regulations. ● Children aged under 18 travelling alone or with one parent may need special documents. Check with the nearest embassy or consulate of Paraguay. ● Check the yellow fever entry requirements by contacting the nearest embassy or consulate of Paraguay. Some airlines may want to see your yellow fever vaccination certificate as you leave. ● Check US entry or transit requirements if you're travelling to or from Paraguay via the US. ● Fake bank notes are common. Use only registered banks or exchange bureaus to change money.Carry identification with you. You may need to show it when paying with a credit or debit card. Traveller's cheques aren't widely accepted. ● Use only registered taxi companies. Book taxis at major hotels or by phone, especially after dark.Some unregistered taxis may appear to be official. Passengers have been robbed in unregistered taxis

Peru

Peru							
	**Threat Level** Moderate threat level to personal safety, take extra precautions here.	**Threat Level** Areas bordering Ecuador in the regions of Loreto, Amazonas and Cajamarca, reconsider your need to travel	**Threat Level** Areas bordering Colombia (within 80kms), do not travel.				**Latitude / Longitude** -9.189967, -75.015152 **GPS Position** 9° 11' 23.8812'' S 75° 0' 54.5472'' W

Peru	
Crime	● Violent crime is common, particularly in Lima, Cusco and Arequipa. Don't go out alone, especially at night. Petty crime is common in public areas, hotels and restaurants. Thieves are often well-dressed. Keep your belongings close. ● Travellers using unlicensed taxis have been victims of robbery, assault and rape. Don't hail taxis from the street. Criminals target cars stopped at traffic lights. Keep your doors and windows locked, even when moving. ● Robberies and assaults occur on intercity buses. Avoid placing personal belongings on overhead racks or under your seats. Use only reputable bus companies. ● Ayahuasca tourism is a growing industry. Serious assaults and robbery occur. Thoroughly research ayahuasca tour operators before you book. ● Members of a local terrorist group may still be active in areas of the Southern Highlands. Take care when travelling to this region. ● The Inca Trail closes in February each year for maintenance. Heavy rainfall can make parts of it impassable and dangerous. Use an experienced guide.
Laws	● Don't use or carry illegal drugs. Penalties for drug offences are severe and include long prison sentences. Officials use up-to-date technology to detect drugs. ● You must carry photo identification. ● Be careful when taking photos. It's illegal to photograph infrastructure, and military or police sites and personnel. ● Always behave respectfully. Indecent behaviour, such as not showing respect at cultural, historical or sacred sites, is against the law. ● It's illegal to export antiques and artefacts from pre-colonial Peru. If you want to buy and export a reproduction, use a reputable dealer who can provide the right documents. ● Dual nationals aged under 18 must travel with both their passports.
Health Risks	● Many parts of Peru are at high altitudes. You can develop altitude sickness above 2500m. If you're travelling to these areas, consult your doctor before you leave. Ensure your travel insurance covers emergency evacuation from altitude and related medical costs. ● Yellow fever is widespread. Get vaccinated before you travel. ● Zika virus is common. If you're pregnant, discuss your travel plans with your doctor before you leave. ● Malaria, dengue and other insect-borne diseases are also common. Use insect repellent. Make sure your accommodation is insect-proof. Consider taking medication to prevent malaria. ● Other infectious diseases include cholera, hepatitis, tuberculosis, typhoid and rabies. Drink boiled or bottled water. Avoid raw or undercooked food. If an animal bites or scratches you, get immediate medical help.
Weather	
Other	● If you're a tourist, you can stay up to 6 months without a visa. You can't extend this. For other types of visits, contact an embassy or consulate of Peru. ● Get your passport stamped by immigration when you arrive. If you don't, you may have trouble leaving. You could also face fines. ● Carry your yellow fever vaccination certificate. You may need to show it to enter and leave Peru. You may also need to show it to re-enter your country. ● Landmines are a threat in some regions, especially near the Ecuador border. Only cross Peru's borders at official checkpoints. ● Light aircraft and helicopter flights can be dangerous. Only book scenic flights with licensed operators with good safety records.

Suriname

Suriname

Uruguay

Uruguay							
	**Threat Level** Exercise normal safety precautions.						**Latitude / Longitude** -32.522779, -55.765835 **GPS Position** 32° 31' 22.0044'' S 55° 45' 57.006'' W

Crime	● Petty crime, such as pickpocketing and bag snatching, occurs in Uruguay. Avoid using ATMs on the street. ● Thieves often target cars stopped at traffic lights. Lock doors and keep windows up, even when moving. Don't leave valuables in your car. ● During summer (December to March), thieves target resort areas such as Punta del Este. Other crime hotspots in Montevideo include Plaza Independencia, La Ciudad Vieja and Avenida 18 de Julio. Avoid the Cerro neighbourhood. Don't walk alone in the downtown or port area. ● Protests can turn violent. Avoid large public gatherings.
Laws	● Don't use or carry illegal drugs. Penalties for drug offences are severe. They include long prison sentences and heavy fines. ● Don't buy, use or carry marijuana. Since 2013, Uruguayan citizens and permanent residents can legally cultivate and sell marijuana. However, it's still illegal for visitors to buy or possess it. ● Uruguay has strict import and export laws. If you plan to import or export goods, ensure you understand local customs laws. Officials enforce these laws. ● Same-sex relationships and marriage are legal in Uruguay. There are also laws banning discrimination based on sexual orientation.
Health Risks	● HIV/AIDS is a significant risk. Take precautions if you're taking part in activities that may expose you to infection. ● Foodborne, waterborne and other infectious diseases include typhoid, hepatitis and rabies. Drink boiled or bottled water. Avoid raw or undercooked food. If you're bitten or scratched by an animal, get medical attention straight away. ● Make sure you have comprehensive travel insurance. Medical care is expensive and you may have to pay upfront, even in an emergency.
Weather	● Floods may disrupt local transport and damage roads. Check weather forecasts when you plan your travel.
Other	● Tourists can stay in Uruguay without a visa for up to 90 days. If you're visiting for other reasons, contact your nearest Uruguayan embassy or consulate for visa advice. ● You don't need a yellow fever vaccination to enter or leave Uruguay. But you need it for other countries in the region. ● If you're travelling via the US, you must meet US entry and transit requirements. Contact your nearest US embassy or consulate for advice. ● Bring your driver's licence with you. You may be able to use it to drive in Uruguay for one year after entry. You must be at least 21 years old to rent a car. ● Learn the local road rules before you drive. By law, you must use dimmed headlights when driving during the day. ● Access for people with disabilities to buildings, footpaths and road crossings may be difficult. When you book your hotel, check it's accessible.

Venezuela

	Threat Level High threat level to personal safety, take a range of extra precautions here.	**Threat Level** Border areas with Colombia (within 80kms), do not travel				**Latitude / Longitude** 6.423750, -66.58973 **GPS Position** 6° 25' 25.5" N 66° 35' 23.028" W

Crime	● Common violent crime includes murder, armed robbery, drive-by shootings, sexual assault and carjackings. Criminals are often armed. Avoid walking in isolated areas, especially at night. ● Kidnapping is a serious threat. The risk is higher along airport routes and in border regions. Only use official taxis organised through your hotel. Avoid kidnapping hotspots. ● Venezuela's political situation is volatile. Demonstrations and protests are common and can turn violent. If you're in an affected area, leave if it's safe to do so. ● Shortages of basic goods can result in long line-ups at stores. This can lead to fighting, looting and theft. Be ready to change travel plans. Keep extra supplies of food, water, medicines and other necessities. ● Terrorist groups and criminal gangs are active along Venezuela's borders with Colombia, Brazil and Guyana.
Laws	● Don't use or carry illegal drugs. Severe penalties for drug offences include long jail sentences. Carrying even a small amount of marijuana can result in jail time. Jails in Venezuela are dangerous and among the worst in the world. ● Drug trafficking in Venezuela is a big problem. Authorities screen travellers at the airport when they arrive and leave. ● It's illegal to photograph military sites and installations, sites of strategic importance and airports. Be careful when taking photos.
Health Risks	● Most pharmacies in Venezuela no longer stock basic medicines due to short supply. Take extra medicine to last longer than your expected stay. ● Serious outbreaks of insect-borne diseases can occur, including yellow fever and malaria. Get vaccinated against yellow fever. Consider taking medicine to prevent malaria. Use insect repellent. ● Zika virus can occur. If you're pregnant, talk to your doctor about the risk of Zika virus. HIV/AIDS is common. Take steps to reduce your risk of exposure to the virus. ● Other infectious diseases include typhoid, hepatitis, tuberculosis, Venezuelan haemorrhagic fever, measles, mumps, rubella, bilharzia and rabies. Boil drinking water or drink bottled water. Don't swim in fresh water. ● Medical services, medical supplies, medicines and emergency services are limited. Private hospitals are good but expensive. Get appropriate travel insurance. If you become seriously ill or injured, you'll need to be evacuated. Make sure your insurance covers medical evacuation.
Weather	● Severe weather, earthquakes, hurricanes, tropical storms, flooding and landslides can occur. The rainy season is from May to December. Monitor local media and the Global Disaster Alert and Coordination System for updates.
Other	● If you travel to Venezuela and you're travelling via the US, you must meet all US entry and transit requirements. Contact your nearest US embassy or consulate for advice. ● Carry your yellow fever vaccination certificate. You may need to show it to enter Venezuelaand fro regional / onwards travel. ● In some cases, a child cannot enter or exit Venezuela without written permission from both parents. If you're travelling with a child, you may need a letter of consent for travel. ● Driving in Venezuela is dangerous. Police and National Guard checkpoints are common. Slow down at checkpoints or stop as directed. Ask for local advice about your route before you drive.

3 Africa

The African region. The colour shading and travel advice on the map is the advice given by the Australian Government and is accurate as of the 20th Feb 2025. However countries risk ratings rarely change so this could be considered accurate advice going into the forseeable future.

Cameroon

	**Threat Level** Moderate threat level to personal safety, take extra precautions here.	**Threat Level** North and Adamaoua regions, Northwest and Southwest regions, reconsider your need to travel.	**Threat Level** Far North region and within 40 kms of borders with Central African Republic, within 40 kms of the border with Nigeria in the Bakassi Peninsula region, Chad and Nigeria's Adamawa state, do not travel				**Latitude / Longitude** 7.369722, 12.354722 **GPS Position** 7° 22' 10.9992'' N 12° 21' 16.9992'' E
Crime	● Terrorists from Nigeria's Boko Haram group are active in the far north. This includes around Lake Chad and the Nigerian border. Public places and government buildings are potential targets. Be very alert to suspicious behaviour and unattended items. ● Kidnapping and ongoing violence occurs, especially in the Far North, Northwest and Southwest regions, and near the Nigerian border. Avoid these areas. If you do travel there, take personal safety measures. ● Violent crime is common in residential centres and on rural highways. Avoid travel after dark, especially outside city limits. Keep car doors locked, windows up and valuables out of sight. ● Commercial and internet fraud often comes from West African countries, such as Cameroon. Scams can lead to physical and financial harm. Be wary of requests to send money to or meet someone in Cameroon. ● Ask local authorities before climbing Mount Cameroon. It may experience volcanic explosions and lava flows.						
Laws	● Always carry proof of your identity. This can be your residence permit or a certified copy of your passport. ● Same-sex relationships are illegal. Penalties include 6 months to 5 years jail and a fine of 20,000 to 200,000 francs. ● Be careful when taking photos. It's illegal to photograph military zones, assets or personnel. Taking photos of government buildings, airports and ports is also illegal. ● Dress and behaviour standards are conservative. Always dress appropriately.						
Health Risks	● Malaria is widespread throughout the year. Consider taking medicine to prevent it. ● Other insect-borne diseases include dengue, African sleeping sickness, loiasis and river blindness. Use insect repellent. Ensure your accommodation is insect-proof. ● Yellow fever occurs in Cameroon. It can be fatal. Get vaccinated before you travel. ● Cameroon has a high rate of HIV/AIDS infection. Take precautions if you're engaging in high-risk activities. ● Other infectious diseases include cholera, hepatitis and tuberculosis. Boil drinking water or drink bottled water. Avoid ice cubes.						
Weather							

Other	● Show a valid yellow fever vaccination certificate to enter Cameroon and neighbouring countries. ● Hotels accept US dollars and Euros. You can exchange them for local currency. Some hotels accept traveller's cheques. ● Most ATMs don't accept foreign cards. You can't use credit cards in many places. ● The land border with Gabon is difficult to cross due to very poor road conditions. Plan carefully and travel in convoy if possible. Take a VHF radio and satellite phone. ● Consider avoiding taxis due to high crime levels. If you choose to travel by taxi, use only trusted taxis. Arrange for someone to meet you on arrival at the airport.

Central African Republic

	Threat Level Extreme threat to personal safety, recommended not to travel here.						**Latitude / Longitude** 6.611111, 20.939444 **GPS Position** 6° 36' 39.9996'' N 20° 56' 21.9984'' E

Crime	● Leave the Central African Republic (CAR) if you can. Tensions are high. Armed groups operate across the country. They've killed foreigners, including aid workers and peacekeepers. Areas outside the capital are lawless. ● If you do stay, take personal safety measures. Law enforcement and peacekeepers can't ensure your safety. ● The Lord's Resistance Army (LRA) regularly attacks civilians in the southeast of the CAR, especially Haut-Mbomou province. Be alert to possible threats. ● Kidnapping and violent crime occur. Kidnappers can target foreigners. Seek professional security advice. ● Bandit groups are common. They target aid groups to get cash, vehicles and equipment. Be very careful when carrying large amounts of cash. If possible, split it between your travelling companions.
Laws	● Always carry proof of identity. This can be a notarised copy. Police might detain or fine you if you can't show them your documents. ● You need a government permit to take photos. Unauthorised photography is illegal. Don't photograph military zones, assets or personnel, government buildings or mining leases. ● You need a licence to buy or sell gems. There are heavy penalties for illegally exporting precious gems.
Health Risks	● Medical facilities in the CAR are limited. If you're seriously ill or injured, you may need to be evacuated. Check your travel insurance covers this. ● Yellow fever is widespread. It can be fatal. Get vaccinated before you travel. You must show a valid vaccination certificate to enter the CAR. ● Insect-borne diseases, including malaria, filariasis and African sleeping sickness, are common. Use insect repellent. Ensure your accommodation is insect-proof. ● Infectious diseases are widespread. These include hepatitis, typhoid and cholera. Boil drinking water or drink bottled water. Avoid ice and raw or undercooked food.
Weather	
Other	● If you decide to travel to the CAR, contact the nearest Embassy or Consulate of the Central African Republic for details of visa and entry requirements. The Consulate-General of France in Sydney may be able to help you get your visas for the CAR. ● Land border crossings may close at short notice. Plan your travel accordingly. ● Bangui is the only city where you can change money. You can usually convert euros or US dollars into local currency. Keep alert when changing money. ● There are very few ATMs and banks in Bangui. There are several Western Union offices. You'll need to pay cash in hotels and restaurants. ● Travel throughout the CAR is dangerous. Military personnel and civilians have been killed while travelling in convoys. Take security precautions when travelling.

Chad

	Threat Level Extreme threat to personal safety, recommended not to travel here.	**Threat Level** N'Djamena, reconsider your need to travel					**Latitude / Longitude** 15.454166, 18.732207 **GPS Position** 15° 27' 14.9976'' N 18° 43' 55.9452'' E

Crime	● Chad is extremely dangerous due to the risk of terrorism, kidnapping, unrest and violent crime. If you decide to go anyway, seek professional security advice. ● Terrorist attacks are a major risk in Chad, especially by the Nigerian militant group Boko Haram. Be alert to possible threats. Use effective personal security measures. ● Kidnapping is a risk in remote areas. Kidnappers may target aid workers. Seek professional security advice. ● Security in Chad is volatile. Hotspots include the country's east and near the borders with Libya, Sudan and the Central African Republic. Protests can turn violent. Avoid large public gatherings. ● Violent crime, such as armed robbery and carjacking, is increasing. Local security forces, or people posing as them, may try to extort money from foreigners. Don't carry large amounts of cash. Avoid travelling at night. Don't walk around N'Djamena, even for short distances. ● There is a state of emergency is in place in the western Tibesti region bordering Niger and the eastern Sila and Ouaddai regions bordering Sudan.
Laws	● Don't use or carry illegal drugs. Penalties are severe. ● Chad is a mainly Muslim country with conservative standards. Dress and behave discreetly. ● Always carry identification. You must produce it if asked by the police. ● Be careful when taking photos. You must get a government permit to take any type of photo. Even with one, it's illegal to photograph military and police assets and personnel, airports and government buildings. ● It's illegal to perform some sexual acts between members of the same sex. Same-sex relationships aren't widely accepted. Avoid public displays of affection. ● Be aware of laws regarding precious gems. It's illegal to buy or sell them without a licence or export them without permission.
Health Risks	● Yellow fever is common. Get vaccinated before you travel. ● Malaria is widespread year-round. Consider taking anti-malarial medication. ● Other insect-borne diseases include filariasis and African sleeping sickness. Ensure your accommodation is insect-proof. Use insect repellent. ● HIV/AIDS is widespread. Take precautions if you're taking part in high-risk activities. ● Waterborne, foodborne and other infectious diseases include typhoid, cholera, tuberculosis and rabies. Drink only boiled or bottled water. Avoid raw or undercooked food. If you're bitten or scratched by an animal, get immediate medical help. ● N'Djamena has a private hospital with international-standard facilities. Other medical facilities are poor. Ensure your travel insurance covers medical evacuation.
Weather	
Other	● If you decide to travel to Chad, you need a visa. Contact your nearest embassy or consulate of Chad for up-to-date advice. ● Carry your yellow fever vaccination certificate. You'll need it to enter the country. ● Chad's official currency is the Central African CFA Franc. US dollars and euros are also accepted. Chad is a mainly cash economy. Only Air France and some hotels in N'Djamena accept credit cards or traveller's cheques. Bring enough cash to meet all your needs. ● Driving in Chad is dangerous due to crime, flooding and other hazards. If you intend to travel by road, hire a car and driver from a reputable company.

Democratic Republic of the Congo

	Threat Level High threat level to personal safety, take a range of extra precautions here.	**Threat Level** Provinces of Kasai, Kasai Central, Kasai Oriental, Sud-Kivu, Nord-Kivu, Ituri, Maniema, Tanganyika, Bas-Uélé and Haut-Uélé, do not travel.						**Latitude / Longitude** -4.038333, 21.758664 **GPS Position** 4° 2' 17.9988'' S 21° 45' 31.1904'' E
Crime	● The security situation in the Democratic Republic of the Congo (DRC) is volatile. Conflict between government forces and armed groups is ongoing. Regularly review your contingency plans and be ready to leave the country at short notice. ● Large-scale protests could occur at any time. These can turn violent quickly. Avoid large public gatherings. ● Kidnappers often target foreigners. The risk is highest in the east and north-east regions. If you're travelling to these areas, seek professional security advice. ● Crime rates are very high, especially in Kinshasa and the country's east. Risks increase after dark. Ensure your accommodation is secure. Don't walk alone in Kinshasa, even during the day.								
Laws	● The death penalty applies to a number of offences. ● Always carry your passport and visa or immigration permit. It's illegal not to show them if officials ask. ● Be careful when taking photos. It's illegal to photograph presidential or official motorcades. It's also illegal to take photos near government buildings or other infrastructure, including airports. ● If you're walking or driving, stop for motorcades and flag ceremonies. Failing to stop is illegal. ● The DRC doesn't recognise dual nationality. If you're a dual national, make sure you enter and exit the country on the same passport.								
Health Risks	● There is an ongoing Ebola virus disease (EVD) outbreak in eastern DRC, primarily affecting North Kivu, South Kivu, and Ituri provinces. In July 2019, the WHO classified this outbreak as a 'Public Health Emergency of International Concern'. There's no vaccine or effective treatment. Avoid contact with EVD patients as the disease is spread through bodily fluids. ● Ensure you've been vaccinated against polio before you travel. Carry proof of vaccination with you. ● Some insect-borne disease such as yellow fever and malaria are widespread. Ensure your accommodation is insect-proof and use insect repellent. ● HIV/AIDS is widespread. Take precautions if you're taking part in high-risk activities. ● Foodborne, waterborne and other infectious diseases include cholera, typhoid and hepatitis. Drink only boiled or bottled water. Avoid raw or undercooked food. Don't swim in fresh water. ● Medical facilities are basic in Kinshasa and inadequate elsewhere. If you're seriously ill or injured, you'll need medical evacuation. Ensure your travel insurance covers this.								
Weather	● The DRC has active volcanoes. If there's an eruption, avoid contact with ash. Seek medical help if you have breathing problems. ● In the rainy season, landslides and flooding can disrupt transport networks. Be prepared to change your travel plans.								
Other	● If you decide to travel to DRC you'll need a visa. Get one from your nearest DRC embassy before you travel. ● Carry your yellow fever vaccination certificate. You'll need it to enter the country. ● Military and police roadblocks are common. Always carry your government-issued identification, insurance card (carte rose), registration (carte grise) and driver's licence. ● Don't use public transport. Bus and rail services are unsafe due to poor safety standards and crime.								

Equatorial Guinea

	Threat Level N/A								**Latitude / Longitude** 1.650801, 10.267895 **GPS Position** 1° 39' 2.8836'' N 10° 16' 4.422'' E

Gabon

	Threat Level Moderate threat level to personal safety, take extra precautions here.							**Latitude / Longitude** -0.803689, 11.609444 **GPS Position** 0° 48' 13.2804'' S 11° 36' 33.9984'' E
Crime	● Petty crime, including pickpocketing, bag snatching and vehicle break-ins, is common in Gabon. Keep your valuables out of sight. ● Violent crime, including robberies and armed attacks, occurs, especially in Libreville and Port Gentil. Don't walk alone or at night. Avoid isolated areas, including beaches. ● There has been a military presence on the streets since a failed coup in January 2019. Protests can turn violent. Avoid large public gatherings.							
Laws	● Don't use or carry illegal drugs. Penalties include long prison sentences. ● Be careful when taking photos. It's illegal to photograph military sites, government buildings, border posts, airports and the Presidential Palace. ● Don't buy or sell endangered wildlife products, including rhino horn and ivory. It's illegal to do so without a licence. ● Same-sex relations are legal, but same-sex relationships aren't legally recognised. There have been attempts to charge people in same-sex marriages under public order and obscenity laws. Avoid public displays of affection.							
Health Risks	● Insect-borne diseases such as yellow fever and malaria occur throughout the year. Ensure your accommodation is insect-proof and use insect repellent. ● Gabon has had cases of Zika virus. If you're pregnant, discuss your travel plans with your doctor. ● HIV/AIDS is common. Take precautions if you're taking part in high-risk activities. ● Foodborne, waterborne and other infectious diseases include cholera, typhoid and hepatitis. Drink only boiled or bottled water. Avoid raw or undercooked food. ● Medical facilities are adequate in major cities, but basic or unavailable in rural areas. If you're seriously ill or injured, you'll need medical evacuation. Ensure your travel insurance covers this.							
Weather	● Flooding occurs during the rainy seasons. Check local conditions before driving. You may need a 4WD vehicle on some roads.							

Other	• You need a visa to enter Gabon. Contact your nearest embassy or consulate of Gabon for advice. • Carry proof of your yellow fever and cholera vaccinations. • Gabon is a largely cash-based economy. The local currency is the Central African CFA franc (XAF). Credit cards are not widely accepted. There are ATMs in major centres. • Be prepared if you're planning to drive in rural areas. Travel outside of major urban centres usually requires a 4WD vehicle. Towing and repair services aren't common outside Libreville. • Taxis are generally safe, but they often pick up multiple passengers and take indirect routes. Negotiate the fare with the driver before entering the taxi. • Piracy and armed robbery occurs in Gabon's coastal waters and in the Gulf of Guinea. Check International Maritime Bureau piracy reports before you travel.

Burundi

	**Threat Level** Extreme threat to personal safety, recommended not to travel here.						**Latitude / Longitude** -3.373056, 29.918886 **GPS Position** 3° 22' 23.0016'' S 29° 55' 7.9896'' E

Crime	• The security situation is unstable. Violent attacks on individuals are common. Get expert security advice or leave as soon as possible. • Terrorism is a significant threat. Arrange personal security measures and be alert to threats. • Violent crime is widespread and often involves weapons. Foreigners can be a target of kidnapping. Be alert to carjacking and other threats. Don't travel after dark.
Laws	• Penalties for drug offences are severe and include long prison terms and large fines. • It's illegal to take photos of sensitive buildings in Burundi. Don't photograph airports, military sites or government buildings. • Same-sex relationships are illegal and penalties include jail terms. Avoid public displays of affection.
Health Risks	• Yellow fever is common. You'll need a valid yellow fever vaccination certificate to enter Burundi. • HIV/AIDS is widespread. Take precautions to reduce your risk of infection. • Outbreaks of cholera and malaria occurred in 2017 and 2018. Waterborne, foodborne and other infectious diseases are common. Use insect repellent. Only drink boiled or bottled water. • Health facilities are limited. If you're ill or injured, you'll need to be evacuated. Make sure your insurance covers this.
Weather	• Earthquakes occur. Flash flooding and mudslides are common from February to mid-May.
Other	• If you decide to travel to Burundi you'll need a visa to enter. Apply before you leave. • The Burundi international airport and land borders can close without warning. Contact your airline for advice on how you can leave the country. • Landmines have exploded in areas popular with travellers. • Travelling by road is dangerous. Traffic accidents and crime are common. Check local security and road conditions. Get security advice from an expert.

Comoros

Comoros

	**Threat Level** N/A	**Latitude / Longitude** -11.645500, 43.3333 **GPS Position** 11° 38' 43.8'' S 43° 19' 59.88'' E
Crime		
Laws		
Health Risks	N/A	
Weather	● All oceanic regions of the world can experience tsunamis, but in the Indian and Pacific Oceans, there is a more frequent occurrence of large, destructive tsunamis because of the many large earthquakes along major tectonic plate boundaries and ocean trenches. If an earthquake, tsunamis or other natural disaster occurs, follow the advice of local authorities.	
Other		

Djibouti

	**Threat Level** Moderate threat level to personal safety, take extra precautions here.	**Threat Level** Within 10 kilometres of the border with Eritrea , do not travel.		**Latitude / Longitude** 11.825138, 42.590275 **GPS Position** 11° 49' 30.4968'' N 42° 35' 24.99'' E
Crime	● Militant group Al-Shabaab intends to target Djibouti. Public places, tourist areas, embassies and airports are potential terrorist targets. Check security alerts before you visit potential targets. ● There's a high risk of kidnapping within 10km of Djibouti's border with Somalia. Don't travel to this area. ● Regional conflict can cause unrest. Public gatherings can turn violent. Avoid protests. ● Petty crime occurs. Risks increase at night and in isolated locations. Don't walk alone after dark. ● Bandit groups operate in lawless areas outside the capital. Only drive outside the capital during daylight hours and in a convoy.			
Laws	● Don't use or carry illegal drugs. Penalties for drug offences are severe. The narcotic khat is legal in Djibouti, but is illegal in many other countries. ● Understand and follow local laws. Hunting, being drunk in public, and photographing infrastructure or military personnel are illegal. ● Follow local customs. Djibouti is a mostly Muslim country. It has conservative dress and behavioural standards. ● Same-sex relationships are legal, but locals don't accept them. ● The Islamic holy month of Ramadan is one of Djibouti's most important religious dates. Don't eat, drink or smoke in public or around people who are fasting.			
Health Risks	● Insect-borne diseases, including malaria, dengue and filariasis are prevalent. Use insect repellent. Ensure your accommodation is insect-proof. ● Recent polio outbreaks have occurred in countries across the Horn of Africa. If you aren't vaccinated, complete the full course of vaccinations before you travel. ● HIV/AIDS is widespread. Take precautions if you're taking part in high-risk activities. ● Djibouti's high temperatures can cause dehydration and heat stroke. Drink plenty of water.			
Weather	● From May to October, Djibouti can experience dust storms and temperatures over 50°C. Be prepared for impacts to essential services, including food and water availability.			
Other	● You need a visa to visit Djibouti. See the official e-visa portal for information. ● You may need a valid yellow fever vaccination certificate to enter the country. ● You can exchange traveller's cheques at major banks. Credit cards aren't widely accepted. There aren't many ATMs and they often don't work. Have several ways to access money. ● Djibouti is a 'mine-safe' country. This means landmines have been identified and marked, but haven't been removed. Remain on sealed roads. ● Remote areas aren't safe. Don't travel within 10 km of the borders with Somalia or Eritrea. Avoid other remote areas, including the region bordering Ethiopia. ● There's a high risk of piracy in Djibouti's coastal waters and the Gulf of Aden. Check the International Maritime Bureau's piracy reports if you're planning boat travel.			

Eritrea

	**Threat Level** High threat level to personal safety, take a range of extra precautions here.	**Threat Level** Regions bordering Ethiopia, Sudan and Djibouti, do not travel.		**Latitude / Longitude** 15.367007, 38.950120 **GPS Position** 15° 22' 1.2252'' N 38° 57' 0.432'' E
Crime	● Public protests can turn violent. Avoid large public gatherings. ● There's a risk of kidnapping in Eritrea. If you choose to travel to high-risk regions, get professional security advice. ● Landmines are found within 25km of Eritrea's border with Ethiopia, except for the town of Senafe. Take care when walking or hiking in rural areas due to unmarked minefields. ● There's a high risk of robbery, violence and bomb attacks in areas bordering Sudan, except for the road to, and main town of, Teseney. ● Military tensions exist between Eritrea and Djibouti. Robbery and violence are common within 25km of the border. ● Street crime is rare but occurs. Don't walk alone late at night. ● Robbery and violence are common along the coast north of Massawa and on some rural roads. Take care when travelling in these areas.			
Laws	● Serious crimes may attract the death penalty or physical punishment. ● Understand local laws. Same-sex relationships and taking photos of government buildings or military sites are illegal. ● Eritrea doesn't recognise dual nationality. Male dual nationals may need to enter military service when they return to Eritrea. Get advice from the nearest embassy or consulate of Eritrea before you travel. ● Eritrea has strict standards of dress and behaviour. Dress appropriately.			

GEOGRAPHY	Africa	East Africa	Eritrea	**Health Risks**	● Parts of Eritrea, including Asmara, are at high altitudes. This can lead to altitude sickness. If you have a heart condition or high blood pressure, get medical advice before you travel. ● Malaria occurs throughout the year. Yellow fever is also a risk. Consider taking anti-malarial medication. Get vaccinated for yellow fever before you travel. ● Other insect-borne diseases include dengue fever and filariasis. Use insect repellent. Ensure your accommodation is insect-proof. ● HIV/AIDS is a risk. Take precautions if you're doing anything that might expose you to infection. ● Polio outbreaks have occurred across the Horn of Africa. Check your vaccination status with a doctor before you travel. ● Other infectious diseases include cholera and hepatitis. Boil drinking water or drink bottled water. Avoid raw or undercooked foods. ● There are currently drinking water supply problems being experienced across Eritrea due to the closure by the Eritrean Government of many of the water purification and bottling plants. You should be aware of this shortage when planning your visit. ● Medications are often unavailable and can be expensive. Carry a comprehensive medical pack if you travel away from large towns.
GEOGRAPHY	Africa	East Africa	Eritrea	**Weather**	
GEOGRAPHY	Africa	East Africa	Eritrea	**Other**	● You need a visa to enter Eritrea. Contact the nearest embassy of Eritrea for details. ● Carry your yellow fever vaccination certificate. You may need to show it when you arrive in and leave Eritrea. ● You need an exit permit to leave Eritrea. It can take a long time to get one. Apply well before your departure date. ● There are no ATMs in Eritrea. You can't use credit cards, except in some hotels. Check with your hotel before travelling to find out the best way to pay. ● Change foreign currency at a branch of the state foreign currency exchange in Himbol. It's illegal to use foreign currencies or to change foreign currency anywhere else. ● You may not be able to get international roaming on your mobile phone. Contact your phone provider before you travel. ● You need a permit to leave Asmara and the surrounding province of Zoba Maekel. Apply before you travel. Permits usually take around 24 hours to process. ● Tourists may not be able to use public transport to travel outside of Asmara. You may need to rent a limousine or use a private taxi. ● If you're travelling to Eritrea by sea, get permission and an entry visa before you arrive. Take precautions against piracy. There's a high threat in Eritrean coastal waters.

Ethiopia

GEOGRAPHY	Africa	East Africa	Ethiopia						
				(flag)	**Threat Level** High threat level to personal safety, take a range of extra precautions here.	**Threat Level** Border areas with Sudan and South Sudan, including the Gambella region, Border area with Eritrea, including the Danakil desert area, Border areas with Somalia and Kenya, including the Somali region, do not travel.			**Latitude / Longitude** 9.145000, 40.489673 **GPS Position** 9° 8' 42'' N 40° 29' 22.8228'' E

GEOGRAPHY	Africa	East Africa	Ethiopia	**Crime**	● Protests and events that draw large crowds can turn violent. Expect heightened security measures and disruption to services. ● Terrorists have reportedly been planning attacks in Ethiopia. Possible targets include hotels, markets, places of worship, government buildings, transport hubs and aircraft. Be alert when near possible targets and on days of national significance. Take official warnings seriously. ● The risk of kidnapping is high in the Somali region and near the borders with South Sudan and Kenya. If you're travelling to an area where there's a threat of kidnapping, get professional security advice. ● Violent assaults can accur and foreigners are often targets. Be aware in areas around the Hilton and Sheraton hotels, Entoto and the Bole Road. Don't walk alone or at night. ● Highway robberies and armed carjackings have occurred outside the main urban centres. Keep your doors and windows locked, even when moving. Keep valuables out of sight.
GEOGRAPHY	Africa	East Africa	Ethiopia	**Laws**	● Ethiopian family and business law can be quite different from Australia, the U.K, Canada and the U.S. Get professional advice if you're involved in business or family law matters. ● If you're in a road accident, don't move your vehicle before a police officer arrives. It's illegal to do so. ● Understand and follow local laws. It's illegal to buy or remove cultural artefacts without a permit, or export certain amounts of precious stones. It's also illegal to own ivory or to interact with beggars or vendors in traffic. ● Be careful when taking photos. It's illegal to photograph the Presidential Palace, and military sites and personnel. ● Same-sex sexual acts are illegal. Ethiopia also has conservative dress and behaviour standards. ● Parts of Ethiopia use different calendars and time measurements. To avoid confusion, always check bookings and appointments.
GEOGRAPHY	Africa	East Africa	Ethiopia	**Health Risks**	● Yellow fever is widespread in Ethiopia. Get vaccinated before you travel. Malaria is present everywhere in Ethiopia except Addis Ababa and areas above 2000m. Consider taking anti-malarial medication. ● HIV/AIDS is widespread. Take precautions if you're taking part in high-risk activities. ● Ethiopia's polio outbreak has ended. However, the disease may still come in from nearby countries. Check your vaccinations are up to date before you travel. ● Parts of Ethiopia are at high altitudes. Altitude sickness can affect anyone, even healthy people. If you get severe altitude sickness, get to lower ground as soon as possible. ● Health facilities are limited in Addis Ababa. In rural areas, facilities are inadequate. If you're seriously ill or injured, you'll need medical evacuation out of the country. Ensure your health insurance covers this.
GEOGRAPHY	Africa	East Africa	Ethiopia	**Weather**	● Ethiopia can experience extreme weather. Parts of the country are in severe drought, leading to food and water shortages. In the rainy season (July to September), flooding can cut off roads. Monitor local media and follow official advice.
GEOGRAPHY	Africa	East Africa	Ethiopia	**Other**	● If you enter the country at Bole International Airport, you can get a visitor visa on arrival. If you're arriving elsewhere or you're not a tourist, get a visa before you travel. USD or Euros are required. Contact the Embassy of Ethiopia for details. ● All travellers are screened for Ebola virus on entry. If you have a high temperature, you may be quarantined. ● Carry your yellow fever vaccination certificate. You may need to show it to enter and leave the country. ● The official currency is the Ethiopian Birr (ETB). You can exchange US dollars at the international airport, major banks and hotels. Major banks will change traveller's cheques. ATMs issue small amounts of local currency, not many places accept credit cards. Have multiple ways to access money. ● Landmines are a hazard in the border areas with Eritrea, Sudan and Somalia. If you travel near these borders stick to well-travelled roads.

Kenya

GEOGRAPHY	Africa	East Africa	Kenya						
				(flag)	**Threat Level** Moderate threat level to personal safety, take extra precautions here.	**Threat Level** Coastal areas from Lamu county to Mombasa and outskirts, A2 highway from Isiolo to Moyale, reconsider your need to travel.	**Threat Level** Border regions with Somalia, South Sudan and Ethiopia, do not travel.		**Latitude / Longitude** -0.023559, 37.906193 **GPS Position** 0° 1' 24.8124'' S 37° 54' 22.2948'' E

GEOGRAPHY	Africa	East Africa	Kenya	**Crime**	● There is a high threat of terrorist attack. Extremists may target Westerners. Risky areas include Nairobi, coastal areas, Naivasha and Nanyuk. Be alert in public places. Avoid areas prone to attack. ● Westerners are kidnapping targets. The borders with Somalia, Ethiopia and South Sudan are high-risk areas. Don't travel to these regions. If you do go there, get professional security advice. ● Westerners in Nairobi are the targets of violent crime, including armed carjackings, kidnapping and home invasions. Don't walk after dark. If you live in Kenya, invest in strong personal security measures. ● Scams are common. Criminals often use fake police, hotel or government identification to extort money from travellers. Be wary of anyone asking for money, even if they seem official.

Laws	● It's illegal to work or volunteer without a valid work permit. To work in the charity sector, get a valid work permit through the Charity Register. ● Know and follow local laws. It's illegal to destroy local currency. It's also illegal to smoke outside designated areas, possess ivory, and distribute religious material without a licence.Its illegal to use single-use plastic bags. ● Get advice before taking photos. It's illegal to take photos of official buildings. ● It's illegal for men to have same-sex relations. ● Kenya recognises dual nationality, but it hasn't fully enacted laws around this.
Health Risks	● Malaria is widespread except in Nairobi and places above 2500m. Consider taking anti-malarial medication.Yellow Fever is widespread.Get Vaccinated before you travel. ● Other insect-borne diseases include dengue, Rift Valley fever, filariasis and African sleeping sickness. Ensure your accommodation is insect-proof. Use insect repellent. ● HIV/AIDS infection rates are high. Take precautions if you're taking part in high-risk activities. ● Polio outbreaks occur in Kenya. Check your vaccinations are up to date at least 6 weeks before you travel. ● Foodborne, waterborne and other infectious diseases include hepatitis, meningococcal disease, measles and cholera. Drink only boiled or bottled water. Avoid raw or undercooked food.
Weather	● Kenya can experience natural disasters and severe weather. Know the warning signs and safety measures for earthquakes and tsunamis.
Other	● You need a visa to travel to Kenya. Kenya has an e-visa portal for tourists and other visitors. Contact the Kenyan High Commission for further details. ● Carry your yellow fever vaccination certificate. You may need to show it to enter and leave the country. ● If you're a foreign resident, always carry your alien identity card. You could be fined or detained you if you don't. ● Only use radio taxis via callout. Always use a reputable tour or taxi company, especially to and from Nairobi's airports at night. ● Piracy occurs in the waters off northern Kenya. Don't sail within 1000 nautical miles (1850km) of the Somali coast.

Madagascar

Threat Level Moderate threat level to personal safety, take extra precautions here.	**Threat Level** Batterie Beach, do not travel.			**Latitude / Longitude** -18.766947, 46.869107 **GPS Position** 18° 46' 1.0092'' S 46° 52' 8.7852'' E

Crime	● Political unrest can erupt without warning. Avoid large public gatherings. ● Violent clashes between bandit groups and security forces are common in the southern region of Anosy. Bandits have also attacked people in the Ankazoabo region. Get local security advice before you travel to these areas. ● Violent crime includes kidnapping, armed robbery, carjackings and home invasions.
Laws	● Don't use or carry illegal drugs. Penalties include prison sentences. ● Always carry original photo identification. Police may ask you for it, especially if you're out late at night. ● Know and follow local laws. It's illegal to take photos of military installations or wear military-style clothing. There are also strict laws around exporting protected plants or animals, gemstones and vanilla. ● Same-sex relationships are legal but not widely accepted in Malagasy society, so avoid public displays of affection. The age of consent for same-sex relations is 21.
Health Risks	● Bubonic and pneumonic plague are both widespread. Pneumonic plague is fatal if left untreated. If you have flu-like symptoms, visit a doctor right away. ● Measles outbreaks can occur in the country. Make sure your vaccinations are up to date before you travel. ● Malaria and other insect-borne diseases (including dengue and chikungunya) are common. Ensure your accommodation is insect-proof and use insect repellent. ● HIV/AIDS is widespread. Take precautions if you're taking part in high-risk activities. ● Foodborne, waterborne and other infectious diseases include cholera, hepatitis and bilharzia are common. Drink only boiled or bottled water. Avoid raw or undercooked food. Don't swim in fresh water. ● Medical facilities in Antananarivo and elsewhere are limited. Most visitors seek treatment at private clinics that require up-front payments. If you're seriously ill or injured, you'll need medical evacuation, usually to South Africa or Réunion. Ensure your travel insurance covers this.
Weather	● The cyclone season is from November to April. Cyclones can disrupt essential services. Know your accommodation or cruise ship's evacuation plan. ● Madagascar can experience tsunamis. Know the warning signs and move immediately to high ground. Don't wait for official alerts.
Other	● You can get a tourist visa when you arrive, for a non-resident this can be extending up to 90 days. Ensure you have proof of onward travel. If you're travelling for other reasons, apply for a visa through a Malagasy embassy or consulate before you travel. ● Carry your yellow fever vaccination certificate if you're coming from a country where yellow fever is present. You may need to show it when you arrive and leave. ● Only use hire cars and limousines from providers with a good reputation. Avoid 'taxi be' and 'taxi brousse' due to the risk of bandit attacks. ● Avoid public transport. It's often unsafe and poorly maintained. ● Piracy occurs in the waters north of Madagascar, especially near Somalia and the Gulf of Aden. Don't sail within 1000 nautical miles (1850km) off the Somali coast.

Malawi

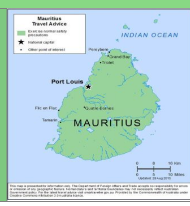
Threat Level Exercise normal safety precautions.	**Threat Level** Mulanje district, exercise a high degree of caution.			**Latitude / Longitude** -13.254308, 34.301525 **GPS Position** 13° 15' 15.5088'' S 34° 18' 5.49'' E

Crime	● Petty crime, such as bag snatching and theft, is common, including on public transport. Keep your valuables out of sight. ● Violent crime includes burglary, carjacking and food and drink spiking. Crime hotspots include bus and ferry terminals, and the walk between Lilongwe Old Town and the Capital City. Avoid walking at night, particularly in urban areas. Don't accept food or drink from strangers. ● The Mulanje district is a high-risk area for crime. Dangers include unrest, property damage, intimidation and violence. Before climbing Mount Mulanje, contact the Mountain Club of Malawi for safety advice. ● Protests often occur in market areas. They can turn violent. Avoid large public gatherings.
Laws	● Don't use or carry illegal drugs, including cannabis. Penalties include long prison sentences. ● Always carry your passport and visa or immigration permit with you. You'll need to show it if a police officer or immigration official asks. ● Follow local laws. It's illegal to buy or export uncut precious stones, import ivory or import pornography. ● Take care when taking photos. It's illegal to photograph government buildings, airports, places of worship, bridges and military installations. ● Same-sex relationships are illegal. Avoid public displays of affection. ● Some areas have conservative dress and behaviour standards. If you're a woman, wear loose-fitting clothing that covers your legs and shoulders.

Health Risks	• Malaria is common and occurs year-round. Consider taking anti-malarial medication. • Other insect-borne diseases include filariasis, plague and African sleeping sickness. Ensure your accommodation is insect-proof. Use insect repellent. • Lake Malawi contains schistosomiasis. Take precautions if you visit the lake region. • The risk of HIV/AIDS is high. Take precautions if you're taking part in activities that could expose you to the virus. • Foodborne, waterborne and other infectious diseases include cholera, hepatitis, tuberculosis and rabies. Drink only boiled or bottled water. Avoid raw or undercooked foods. • Public medical facilities are limited. Private facilities in Lilongwe and Blantyre may not meet first world standards. If you're seriously ill or injured, you'll need medical evacuation. Ensure your travel insurance covers this.
Weather	
Other	• Visitor visas can be purchased on arrival in Malawi. For further information on fees see Department of Immigration and Citizenship Services Republic of Malawi. • If you're coming from a country where yellow fever is present, carry your yellow fever vaccination certificate. You'll need to show it to enter Malawi. • The local currency is the Malawi Kwacha (MWK). Declare all your foreign currency when you arrive and depart. When you leave, officials will take any that you didn't declare on entry. • You might be able to drive in Malawi with your current driver's licence and an International Driving Permit (IDP). Get your IDP before leaving your country. • While driving, always carry your driver's licence and a copy of your passport and visa or residence permit. You may need to show them if you're stopped at a police roadblock. • Use local guides on Mount Mulanje.

Mauritius

Threat Level
Exercise normal safety precautions.



Latitude / Longitude
-20.348404, 57.552152

GPS Position
20° 20' 54.2544'' S
57° 33' 7.7472'' E

Crime	• Crime levels are low. But petty crime occurs, including pickpocketing and bag snatching. Don't walk alone after dark. Use ATMs in banks, hotels and shops, not on the street. • Some travellers have been robbed and assaulted in unregistered beachside bungalows. Stay in accommodation that's registered by local authorities. • Rallies and protests occur sometimes. These can turn violent. Avoid large public gatherings.
Laws	• Don't use or carry illegal drugs. Penalties for drug offences include prison sentences of up to 60 years and heavy fines. • Know and follow local laws. It's illegal to buy counterfeit or pirated goods. It's also illegal to own cigarette papers or rolling machines used to make cigarettes. • If you break the law, you may need to stay in Mauritius to wait for your court hearing. • Same-sex relations are legal, but it's illegal to take part in sodomy, regardless of gender. • Mauritius has conservative dress and behaviour standards. Take care not to offend, especially when visiting rural areas or religious sites, and attending religious events.
Health Risks	• Insect-borne diseases include dengue, malaria and chikungunya. The risk of malaria is low. Ensure your accommodation is insect-proof. Use insect repellent. Consider taking anti-malarial medication. • HIV/AIDS is a risk. Take precautions if you're taking part in high-risk activities. • Swine flu (influenza H1N1), occurs. Consider getting vaccinated before you travel. • Foodborne, waterborne and other infectious diseases include hepatitis and tuberculosis. Drink only boiled or bottled water. Avoid raw or undercoooked food. • The standard of public medical facilities varies. Most travellers go to private doctors or clinics. If you're seriously ill or injured, you may need medical evacuation. Ensure your travel insurance covers this.
Weather	• Cyclone season is from November to May, but cyclones can happen at any time. Cyclones and heavy rainfall can cause flooding and disrupt services. Know how to evacuate from your hotel or cruise ship. • Mauritius can experience tsunamis. Know the warning signs and move to high ground straight away. Don't wait for official alerts.
Other	• You can get a 'free of charge' visa on arrival if you're staying less than 60 days. For other types of visits, you'll need a visa. Contact your nearest Mauritian embassy or consulate for details. • If you can't show proof of an accommodation booking, immigration officials may not let you enter Mauritius. • If you've come from a country known to have malaria, the Mauritian Health Department will ask you to do a blood test. • Carry your yellow fever vaccination certificate if you're coming from a country where yellow fever is present. You'll need to show it to enter. • Transport and tour operators may not follow safety or maintenance standards. For water-based activities, ask if your operator has a valid Ministry of Tourism permit. Also ask if they are able to contact the coast guard if necessary. • There have been no pirate attacks in Mauritius's waters, however piracy is a major threat in the Indian Ocean. If you're travelling by boat, check the International Maritime Bureau's piracy reports.

Mozambique

Threat Level
Moderate threat level to personal safety, take extra precautions here.

Threat Level
EN1 between the Save River and Muxungue and from Gorongosa to Caia, EN6 between Beira and Chimoio, reconsider your need to travel.

Latitude / Longitude
-18.665695, 35.529562

GPS Position
18° 39' 56.502'' S
35° 31' 46.4232'' E

Crime	• Kidnapping is a danger in Maputo, Beira and Cabo Delgado. If you're travelling to these areas, get professional security advice. • Political tensions have triggered armed clashes, especially in Cabo Delgado. Protests can occur with little warning and can turn violent. Avoid large public gatherings. • Violent attacks, including sexual assaults, occur. Crime increases at night and during holidays. Don't go out after dark, even in tourist areas, and avoid isolated locations. Armed robbery, break-ins and carjackings are common. Keep your accommodation and car doors locked. • Petty crime, such as bag snatching, is common. Carry only what you need, leaving valuables in a secure place. • Kidnapping is a danger in Maputo and Beira. If you're travelling to these areas, get professional security advice.
Laws	• Don't use or carry illegal drugs. Penalties for drug offences are severe and include prison sentences. • Always carry photo identification with you. You must do so by law. • Be careful when taking photos. You must have permission from the Ministry of Information to photograph officials, government buildings and other infrastructure. • Don't buy endangered wildlife products, such as ivory and rhino horn. It's illegal to purchase or trade them without a licence. • It's illegal to import or export local currency. • Same-sex relations are legal, but there are local sensitivities. Avoid public displays of affection.
Health Risks	• Malaria occurs year-round, particularly outside Maputo. Consider taking anti-malarial medication. • Other insect-borne diseases include filariasis, plague and African sleeping sickness. Ensure your accommodation is insect-proof. Use insect repellent. • The HIV/AIDS risk is high. Take precautions if you're taking part in high-risk activities. • Foodborne, waterborne and other infectious diseases include cholera, hepatitis, tuberculosis and rabies. Drink only boiled or bottled water. Avoid raw or undercooked food. • Medical facilities are limited. If you're seriously ill or injured, you'll need medical evacuation to South Africa. Ensure your travel insurance covers this.

Mozambique	
Weather	● Mozambique experiences flooding, cyclones, mudslides and earthquakes. These can disrupt services. The rainy season is November to April. Know your hotel or cruise ship's evacuation plan and safety measures.
Other	● You'll need a visa to enter Mozambique. You may be able to get one on arrival. Contact your nearest Mozambique embassy or consulate for details. ● Carry your yellow fever vaccination certificate if you're coming from a country where yellow fever is present. You may need it to enter Mozambique. ● If you're travelling via South Africa, you may need to bring extra documents. See our South Africa travel advisory. ● Although all known minefields have been cleared, there's still a risk of landmines. Stick to well-travelled roads, particularly in the central and southern provinces. ● If you plan to travel outside Maputo during the rainy season, you'll need a 4WD vehicle. Get local advice on road conditions before you leave. ● Piracy is a threat in the Indian Ocean. If you're planning boat travel, check the International Maritime Bureau's piracy reports.

Reunion

	**Threat Level** N/A							**Latitude / Longitude** -21.115141, 55.536384 **GPS Position** 21° 6' 54.5076'' S 55° 32' 10.9824'' E

Reunion	
Crime	
Laws	N/A
Health Risks	● Chikungunya
Weather	● All oceanic regions of the world can experience tsunamis, but in the Indian and Pacific Oceans, there is a more frequent occurrence of large, destructive tsunamis because of the many large earthquakes along major tectonic plate boundaries and ocean trenches.
Other	

Rwanda

	**Threat Level** Moderate threat level to personal safety, take extra precautions here.	**Threat Level** Within 10 kilometres of the border with Burundi, within 10 kilometres of the border the Democratic Republic of the Congo, including towns of Gisenyi, Kibuye and Cyangugu, reconsider your need to travel.					**Latitude / Longitude** -1.940278, 29.873888 **GPS Position** 1° 56' 25.0008'' S 29° 52' 25.9968'' E

Rwanda	
Crime	● The security situation near Rwanda's borders with Burundi and the Democratic Republic of the Congo is volatile. Reconsider your need to travel within 10km of these borders. Don't cross the borders. ● There's a risk of rebel attack in the Volcanoes National Park (Parc National des Volcans). Only visit the park as part of an organised tour group. ● Grenade attacks and other violent incidents occur from time to time, including in Kigali. Targets include genocide memorials, markets and transport hubs. Be alert to possible threats. ● Petty crime is quite rare, but theft from hotel rooms, homes and vehicles can occur. Keep valuables out of sight. When driving, lock your windows and doors.
Laws	● Don't use or carry illegal drugs. Penalties include long prison sentences and heavy fines. ● Same-sex relations are legal. However, LGBTI travellers may be harassed by the public and police. Avoid public displays of affection. ● Be careful when taking photos. It's illegal to photograph government buildings. ● Plastic bags are banned. Officials may fine you for having them.
Health Risks	● Medical facilities are very limited. If you're ill or injured, you may need medical evacuation to Kenya. Check your travel insurance covers this. ● Malaria occurs across the country, including in Kigali. Consider taking anti-malaria medication. ● Other insect-borne diseases also occur. Ensure your accommodation is insect-proof. Use insect repellent. ● HIV/AIDS occurs. Take precautions if you're taking part in high-risk activities. ● Foodborne, waterborne and other infectious diseases include meningitis, meningococcal disease, tuberculosis and rabies. Drink only boiled or bottled water. Avoid raw or undercooked food.
Weather	● The rainy seasons are from February to May and September to December. Flooding and mudslides can make roads unusable. Be prepared to alter your travel plans.
Other	● You can get a visa when you arrive. You'll have to pay a fee. Contact the High Commission of Rwanda in Singapore for visa information. ● Carry your yellow fever vaccination certificate if you're coming from a country with a risk of yellow fever. You'll need to show it to enter Rwanda. ● Carry cash, as Rwanda is a cash-based society. Only large hotels accept credit cards. Not many ATMs accept international cards. You can only exchange traveller's cheques at commercial banks. ● Main roads between Kigali and other major towns are generally good. You'll probably need a 4WD on unsealed roads. Don't drive at night, especially outside Kigali. ● Use only licensed orange-striped taxis. Avoid minivans (shared taxis) and motorbikes as they're often unsafe. ● The border between Rwanda and Uganda regularly closes for extended periods.

Seychelles

	**Threat Level** Exercise normal safety precautions.					**Latitude / Longitude** -4.679574, 55.491977 **GPS Position** 4° 40' 46.4664'' S 55° 29' 31.1172'' E

Seychelles	
Crime	● There's a risk of theft, especially in tourist hubs, such as Beau Vallon and the capital, Victoria. Thieves also target parked cars. Pay attention to your belongings. ● Violent crime is less common but can occur, especially on beaches and walking trails. Avoid back streets. Avoid beaches after dark.
Laws	● Don't use or carry illegal drugs. Penalties for drug offences, including using and smuggling, are severe. ● Seychelles recognises dual citizenship. ● Same-sex relations are legal in the Seychelles. However, the society is conservative. All travellers, regardless of gender or sexuality, should avoid public displays of affection. ● Public nudity isn't accepted. Don't sunbathe topless or naked on beaches.

Health Risks	• Insect-borne diseases, including dengue and chikungunya, are common. Ensure your accommodation is insect-proof. Use insect repellent. • Medication available over the counter or by prescription may be illegal in the Seychelles. Check if your medication is legal before you travel and carry copies of your prescription and a letter from your doctor. • Medical facilities in the Seychelles are limited, especially on the more-remote islands. The island of Mahé has several clinics and a state-owned hospital. The main hospital is in Victoria. • If you're seriously ill or injured, you'll need medical evacuation to Mauritius, South Africa or India. Ensure your travel insurance covers this.
Weather	• Seychelles' beaches, including Beau Vallon, often have strong currents and rips. Drownings occur at popular tourist beaches. There may not be safety information at beaches. Get local advice before swimming. • The Seychelles can experience severe weather, especially during the wet season (December to February). The country is prone to tsunamis. Know the tsunami warning signs and move to high ground straight away. Don't wait for official alerts.
Other	• You don't need a visa to enter the Seychelles as a tourist. You will receive a visitor's permit on arrival which can be extended to a maximum period of 6 months. Carry proof of your hotel booking as you may need to show it on entry. For other situations, contact your nearest Seychelles embassy or consulate for visa details. • Carry your yellow fever vaccination certificate if you're coming from a country where yellow fever is present. You may need it to enter the Seychelles. • The currency of the Seychelles is the Seychellois Rupee (SCR). Most tourist services, including hotels, accept euros. Exchange money at banks, the international airport, licensed bureaus, hotels and resorts. ATMs are not generally found outside the major tourist destinations of Mahé, Praslin or La Dique, and will only dispense SCR. • You might be able to drive in the Seychelles with a driver's licence or an International Driving Permit (IDP). Get your IDP before you travel. However, driving is only practical on the islands of Mahé and Praslin. Roads are mountainous, narrow and winding. Don't drink and drive or you will be subject to a fine or imprisonment. • Piracy is a threat in the Indian Ocean. There have been attacks inside the Seychelles' exclusive economic zone (EEZ). Avoid sailing more than 12 nautical miles from the shore.

Somalia

Threat Level
Extreme threat to personal safety, recommended not to travel here.

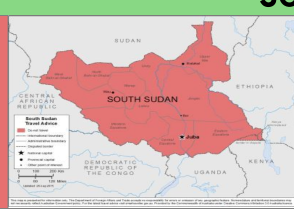
Latitude / Longitude
5.152149, 46.199616

GPS Position
5° 9' 7.7364'' N
46° 11' 58.6176'' E

Crime	• Terror attacks happen often in Somalia. Possible targets include Mogadishu International Airport, government officials and buildings, hotels, restaurants, foreigners and foreign interests, and UN workers. Don't travel to Somalia. If you're in the country, leave as soon as possible. If you decide to stay, get professional security advice. • The kidnapping risk is very high in all parts of Somalia. This includes Puntland and Somaliland. Vary your routines so your movements aren't predictable. • Residential areas and markets in south-central Somalia have experienced shootings and grenade attacks. Avoid areas of conflict and large public gatherings. • Somalia has no effective police force. Law and order has broken down. Drought, food shortages and military attacks have compounded the unstable security situation. Arrange personal security measures and seek professional advice.
Laws	• Courts operate under both Somali and sharia law. In areas under Al-Shabaab control, sentences include flogging and the death penalty. Get local legal advice, especially on matters such as divorce, child custody and child support. • Don't use or carry illegal drugs. Penalties for drug offences are severe. They include prison sentences and heavy fines. • Same-sex relations are illegal in Somalia. Under sharia law, punishments include flogging and death. • It's illegal to preach a religion other than Islam in Somaliland and Puntland. • Dual nationals are treated as Somali. Consular help may be limited.
Health Risks	• Malaria occurs across the country. Consider taking anti-malaria medication. • Other insect-borne diseases include dengue, yellow fever, filariasis and leishmaniasis. Ensure your accommodation is insect-proof. Use insect repellent. Get vaccinated against yellow fever before you travel. • Somalia continues to have cases of polio. Ensure your vaccinations are up to date before you travel. Carry proof of vaccination. • Somalia has a high rate of HIV/AIDS. Take precautions if you're taking part in high-risk activities. If you're a victim of violent crime, including rape, get medical help as soon as possible. • Foodborne, waterborne and other infectious diseases include cholera, hepatitis and meningococcal disease. Drink only boiled or bottled water. Avoid raw or undercooked food. • Medical facilities in Somalia are extremely limited. If you're ill or injured, you'll need medical evacuation out of the country. This is expensive and difficult to organise.
Weather	• Somalia has extreme weather, including severe droughts, heatwaves and floods. It's also prone to tsunamis. During a natural disaster, monitor local and international media. Follow local advice.
Other	• Visa conditions and validity can change. Your visa might not be recognised in areas where the central government's authority is challenged. • The local currency is the Somali Shilling (SOS). Most other currencies, credit cards and traveller's cheques aren't accepted. US dollars are widely accepted. • Road travel is dangerous due to terrorism, poor conditions, landmines and crime. • Piracy is a serious threat in and around Somalia's waters, the Indian Ocean and the Gulf of Aden. Don't travel in Somali waters. Stay more than 1000 nautical miles (1850km) from the coast of the Horn of Africa.

South Sudan

Threat Level
Extreme threat to personal safety, recommended not to travel here.



Latitude / Longitude
6.876992, 31.306979

GPS Position
6° 52' 37.1712'' N
31° 18' 25.1244'' E

Crime	• Fighting and instability continues across the country. The situation is volatile and can worsen without warning. Border areas are especially dangerous. If you're in South Sudan, leave as soon as possible. • Kidnapping, murder, shootings, home invasions, armed robbery, carjacking and sexual assault are common throughout South Sudan, including in Juba. Get professional security advice. • Petty crime, such as theft and fraudulent currency exchange, is common. Safeguard your belongings. • Terrorist attacks could occur without warning. Public places, hotels, restaurants and government buildings are targets. Airports and transport hubs may also be targets. Be alert in public places. Report any suspicious items or activity to police.
Laws	• Don't use or carry illegal drugs. Penalties for drug offences are severe. They may include the death penalty. • The legal systems in South Sudan are basic. Penalties for criminal offences include long jail sentences, corporal punishment and the death penalty. Get professional advice if you're involved in local legal matters, especially regarding family law. • It's illegal to perform same-sex sexual acts. LGBTI travellers may be harassed by the public or the police. • It's illegal to take any photos, including on a mobile phone, without a permit from the Ministry of Information. • The South Sudanese Government recognises dual nationality but considers its dual citizens as South Sudanese first.

GEOGRAPHY | Africa | East Africa | South Sudan

Health Risks	● There are ongoing polio outbreaks in South Sudan and other countries across the Horn of Africa. Check your vaccinations are up to date at least 8 weeks before you travel. ● Yellow fever is widespread, so get vaccinated before you travel. Malaria is common year-round. Consider taking anti-malarial medication. ● Other insect-borne diseases include dengue, filariasis and leishmaniasis. Ensure your accommodation is insect-proof. Use insect repellent. ● HIV/AIDS is common. Take precautions if you're taking part in high-risk activity. If you're a victim of a violent crime, seek immediate medical assistance. ● Waterborne, foodborne, parasitic and other infectious diseases include typhoid, cholera and hepatitis. Drink only boiled or bottled water. Avoid raw or undercooked food. Don't swim in fresh water. ● Medical facilities are basic in Juba and extremely limited elsewhere. If you're seriously ill or injured, you'll need medical evacuation.
Weather	● Be prepared for extreme weather. Flooding occurs during the rainy season (July to November). It can disrupt services and cause disease outbreaks. In summer, temperatures in northern areas can reach 50˚C.
Other	● If you travel to South Sudan get a visa before you go. You can't fly to Juba without one. ● Carry your yellow fever vaccination certificate. You may need it to enter the country. ● South Sudan's borders can close with little or no warning. Check with your security provider for updates and security assessments on entry points to South Sudan. ● Landmines and unexploded remnants of war are a danger throughout South Sudan. Use only main roads and paths labelled as cleared by a competent de-mining authority. ● Road travel is very dangerous due to poor road conditions and the security environment. If you need to travel by road, seek professional security advice.

Tanzania

GEOGRAPHY | Africa | East Africa | Tanzania

Threat Level
Moderate threat level to personal safety, take extra precautions here.

Latitude / Longitude
-6.369028, 34.888822

GPS Position
6° 22' 8.5008'' S
34° 53' 19.7592'' E

Crime	● Violent armed robbery, petty theft and threats of violence are common in Tanzania, especially in Dar es Salaam. Be extra careful in and around Arusha in northern Tanzania. Armed robberies, carjackings and home invasions have happened. Bag snatching from moving vehicles is increasing. Victims can be injured or killed by being dragged behind vehicles. Don't resist bag-snatch attempts. ● Only use registered taxis. Travellers have been targeted by criminals while using unlicensed taxis. ● Bandit attacks occur along the borders with Rwanda, Burundi and the Democratic Republic of the Congo. Armed bandits have also been reported in the provinces of Kigoma and Kagera and around Mount Kilimanjaro and the Serengeti and Arusha National Parks. Pay attention to your personal security.
Laws	● Don't use or carry illegal drugs. Penalties for drug offences are severe and include long prison sentences. ● It's illegal to possess pornographic material. ● Plastic bags are banned in Tanzania. ● Same-sex relations are illegal and punishable by up to 30 years in jail. Authorities have targeted LGBTI rights activists. ● Don't photograph military zones, weapons or personnel. It's illegal. ● Dress and behaviour standards are conservative in Tanzania, especially in Zanzibar. If you're female, don't wear shorts or sleeveless tops outside resorts.
Health Risks	● Medical facilities are limited and medicines are often not available. If you get injured or become ill, you may need to be evacuated to another country. This is expensive. ● Malaria, including chloroquine-resistant strains, occurs year-round, except in areas above 1800m. Consider taking anti-malarial medication. ● Yellow fever occurs, so get vaccinated before you travel. Other insect-borne diseases include Zika virus, dengue, filariasis and East African trypanosomiasis (sleeping sickness). Ensure your accommodation is insect-proof. Use insect repellent. ● HIV/AIDS is widespread. Take precautions if you're taking part in high-risk activities. ● Altitude sickness can affect anyone at heights over 2500m. If you plan to climb Mt Kilimanjaro (5895m), make sure you're physically fit and in good health. Talk to your doctor before you travel.
Weather	● During the rainy seasons (March to May and November to December) floods can block roads. The monsoon occurs in coastal and island areas from July to October. Cyclones can also happen in coastal areas. Follow the advice of local officials.
Other	● You need a visa to enter Tanzania. Contact your nearest embassy or consulate of Tanzania for details. ● Carry your yellow fever vaccination certificate. You'll need it to enter Tanzania. ● There's a risk of credit card fraud. Be careful when using credit cards and always keep your credit card in sight. Don't use ATMs on the street. ● Use only well-maintained public transport and taxis. This includes long-distance buses. Ferries can be unseaworthy. Don't board any vessel that's overloaded or in bad condition. ● All ships, cruise liners and commercial vessels are targets for Somali pirates. Many attacks and kidnappings have happened off the Tanzanian coast. Be alert and exercise extreme caution anywhere in coastal waters. Don't leave sight of the coastline. ● Follow local wildlife laws. Keep a safe and legal distance when looking at animals. Don't swim in lakes and rivers due to the risk of animal attack and waterborne disease.

Uganda

GEOGRAPHY | Africa | East Africa | Uganda

Threat Level
Moderate threat level to personal safety, take extra precautions here.

Threat Level
Within 50 kilometres of the border with the Democratic Republic of the Congo, reconsider your need to travel.

Threat Level
Within 50 kilometres of the border with South Sudan, Karamoja region, do not travel.

Latitude / Longitude
1.373333, 32.290275

GPS Position
1° 22' 23.9988'' N
32° 17' 24.99'' E

Crime	● Uganda has increased security arrangements in public places due to the threat of terrorist attacks. Expect body, car and luggage checks when travelling. Take official warnings seriously and follow advice. ● Violent protests occur. These have included clashes between armed groups and security forces, between political opponents, and between tribal groups. Avoid affected areas and follow advice from local authorities. ● Security is usually required when gorilla trekking due to the risk of armed attack. For your safety, don't take gorilla trekking tours that cross into the Democratic Republic of the Congo (DRC). ● Petty crime and violent crime can happen. Always be alert. Don't walk in isolated areas or along dark streets at night. ● The security situation in the neighbouring DRC is very unstable and volatile. You may be kidnapped or caught up in violence. If you're travelling near the border, seek professional security advice.
Laws	● Penalties are severe for possession, use or trafficking of illegal drugs. If you're convicted, you'll face a long jail sentence and heavy fines. ● Serious crimes can attract the death penalty or corporal punishment. It's illegal to perform same-sex sexual acts, take photos of certain buildings and areas, or wear military-style or camouflage clothing.
Health Risks	● Many medications are in short supply or not available in Uganda. Take enough legal medicine for your trip. ● The first cases of Ebola were detected in Western Uganda in June 2019. Protect yourself against the disease by practising good hygiene. ● Yellow fever and malaria are common. Other insect-borne diseases can occur. Make sure your accommodation is insect proof. Use insect repellent. ● Cases of avian influenza (H5N1, 'bird flu') occurred in parts of Uganda in 2017. Avoid contact with dead and living birds. ● HIV/AIDS is a risk. Take steps to reduce your risk of exposure to the virus. ● Medical facilities are very limited outside Kampala. If you become seriously ill or injured, you'll be evacuated to Kenya or another destination. Make sure your insurance covers this.

GEOGRAPHY | Africa | East Africa | Uganda

Weather	
Other	● You need a visa to visit Uganda. Use Uganda's online visa application. ● You may need a valid yellow fever vaccination certificate to enter and leave Uganda. ● You must declare all foreign currency on arrival. If you don't, you may have issues taking it when you leave. ● It may be difficult to access money. Traveller's cheques, credit cards and debit cards aren't widely accepted. Bring enough cash with you. ● Long-distance bus travel can be dangerous. Accidents are common and some overnight buses have been robbed.

GEOGRAPHY | Africa | East Africa | Zambia

Zambia

		Threat Level Exercise normal safety precautions.	**Threat Level** Border areas with the Democratic Republic of Congo, Angola and Mozambique, reconsider your need to travel.				**Latitude / Longitude** -13.133897, 27.849332 **GPS Position** 13° 8' 2.0292'' S 27° 50' 57.5952'' E

Crime	● Crime is common. Security risks increase after dark, especially in tourist areas and city centres. Stay alert to your surroundings. Avoid walking alone or travelling after dark. ● Avoid all demonstrations, political rallies and large public gatherings as they can turn violent. ● There have been violent robberies (some involving fatalities) along the Cairo Road area of Lusaka, including Chachacha, Freedom Way and Lumumba Roads. Keep vehicle doors locked, windows up and valuables out of sight, even when moving. ● Date-rape drugs have been used in bars and restaurants in Lusaka. Always keep a close eye on your food and drinks. If you're not sure it's safe, leave it. ● Commercial fraud scams are common in Zambia. Don't send money to anyone in Zambia until you've undertaken proper checks.
Laws	● You are subject to all local laws and penalties. ● Zambian authorities don't always contact your embassy when they detain or arrest travellers. ● Police and border officials can ask to see your passport and immigration stamp or visa at any time. They could detain or arrest you if you don't have them. ● Same-sex sexual activity is illegal in Zambia.
Health Risks	● Medications containing diphenhydramine are illegal in Zambia. ● The rate of HIV/AIDS infection in Zambia is high. Take steps to reduce your risk of exposure to the virus. If you're the victim of a violent crime, see a doctor straight away. ● Malaria and other insect-borne diseases occur. Use insect repellent. ● Cholera and other infectious diseases are common. Boil all drinking water or drink bottled water in rural areas. Avoid contact with animals. Don't swim in fresh water. ● The standard of medical facilities in Zambia is poor and medical supplies are limited. Make sure you know your blood type. Carry a medical kit.
Weather	
Other	● You need a visa to enter Zambia. For short stays of under 90 days, get a 30-day visa when you arrive. You can extend it twice. In other cases, you'll need to apply for an entry visa before you go. ● You need a valid yellow fever vaccination certificate if you're arriving from a country with widespread yellow fever. ● If you're travelling from an Ebola-affected area, you may be subject to a medical check at the Zambian border. ● Landmines and other remnants of war make Zambia's borders with the Democratic Republic of Congo, Angola and Mozambique unsafe. Off-road travel is dangerous. Ask local authorities about possible routes.

GEOGRAPHY | Africa | East Africa | Zimbabwe

Zimbabwe

		Threat Level Moderate threat level to personal safety, take extra precautions here.					**Latitude / Longitude** -19.015438, 29.154857 **GPS Position** 19° 0' 55.5768'' S 29° 9' 17.4852'' E

Crime	● There are shortages of food, water, medicine and fuel. Basic services, such as electricity supply, are unreliable. The security situation is volatile. Violent protests are common. Avoid large public gatherings. ● Petty crime, such as mugging and bag snatching, is common. Don't carry bags that are easy to snatch. ● Violent crime, such as assault and armed robbery, occurs. The risk increases at night, in city centres and in open areas such as parks and fields. Keep your accommodation locked, even when you're in it. Don't walk at night. ● Land confiscation, wildlife poaching and violence against farmers has caused unrest. Get up-to-date security advice before you visit national parks, game farms, lodges or hunting areas. ● Theft from vehicles is common. Thieves target cars stopped at intersections, especially on the way to Harare Airport. Minimise the amount of time you have to stop. Approach red lights slowly. Keep vehicle doors locked and windows up.
Laws	● Always carry ID, such as a copy of your passport. Police and immigration officials may ask to see it. ● Understand and follow local laws. It's illegal to kill, capture or trade a protected animal or its parts without a licence. It's also illegal to wear camouflage clothing. Don't possess or trade counterfeit or pirated goods, or pornographic material. You must have paperwork to possess precious or semi-precious stones. ● Same-sex relations are illegal in Zimbabwe, and can attract criminal penalties. ● Be careful when taking photos. It's illegal to photograph airports, military establishments, government offices, the President's residence and security forces. ● Avoid political activity and any activities that officials could view as political. These include discussions, commentary and protests. It's illegal to criticise or insult the President or be in possession of material considered offensive to the President's office.
Health Risks	● Malaria is a risk everywhere except Harare and Bulawayo. Consider taking anti-malarial medication. ● Other parasitic and insect-borne diseases occur include filariasis and schistosomiasis. Ensure your accommodation is insect-proof. Use insect repellent. ● The rate of HIV/AIDS infection is very high. Take precautions if you're engaging in activities that expose you to risk of infection. ● Outbreaks of foodborne, waterborne, and other infectious diseases also occur. These include typhoid, hepatitis, tuberculosis and cholera. Drink only boiled or bottled water. Avoid raw or undercooked food. Ensure your vaccinations are up-to-date. ● Don't swim in lakes and rivers, due to the risk of waterborne diseases. ● Medical facilities are generally poor to average standard. Outside of Harare and Bulawayo facilities are even more limited. Public hospitals, including in Harare, suffer from serious shortages. If you're seriously ill or injured, you may need medical evacuation out of Zimbabwe. Ensure your travel insurance covers this.
Weather	● Flooding can occur during the rainy season (November to April). Eastern Zimbabwe is still recovering from Cyclone Idai, which hit in March 2019. Infrastructure remains damaged. If you're travelling to this area, take extra care.
Other	● You need a visa to enter Zimbabwe. Most travellers, including tourists, can get either a 30-day visa-on-arrival or a KAZA UniVisa. A KAZA UniVisa allows you to travel between Zimbabwe, Zambia and Botswana. Make sure the entry stamp in your passport is legible. Officials will ask to see it when you leave. Contact an embassy or consulate of Zimbabwe for details. ● The only legal tender in Zimbabwe is the 'Zimbabwe Dollar (ZWL)'. A limited number of vendors will accept payments using international credit cards. Zimbabwe is experiencing a cash crisis. You can't withdraw money from ATMs using an international card. Take enough cash to cover your stay. ● Check with hotels and other providers whether they accept card payments, especially outside of Harare. It is illegal to exchange foreign currency anywhere other than at officially licensed banks and bureaux de change. ● It is illegal to leave Zimbabwe with more than USD 2,000 (or equivalent) in cash. This amount is subject to change with little prior notice. ● Parts of the country have unexploded landmines. If you're driving in these areas, stick to main roads. ● Flight options into and out of Zimbabwe are limited. Air Zimbabwe is banned from flying into the EU due to safety concerns.

3 North Africa

Algeria

	**Threat Level** High threat level to personal safety, take a range of extra precautions here.	**Threat Level** Within 450 kilometres of borders with Mali and Niger, Within 100 kilometres of borders with Mauritania, Libya and Tunisia, do not travel.					**Latitude / Longitude** 28.033886, 1.659626 **GPS Position** 28° 2' 1.9896'' N 1° 39' 34.6536'' E

Crime	● Avoid large public gatherings and follow the advice of local authorities. ● There are frequent protests in Algeria that can become violent. Civil unrest is on the rise. Avoid political events, protests, and other public gatherings. Be careful before, during and after Friday prayers. ● Risk of terrorist attack is very high. Avoid travelling to remote areas. Monitor the news and other sources for information about threats. ● Risk of kidnapping is very high in some parts of Algeria. If you travel to these areas, seek professional security advice and have effective personal security measures in place. ● Be aware of bandits in deserted beach areas, even during daylight hours. Keep car doors locked and windows up, even when moving.
Laws	● Same-sex sexual activity is illegal. Photographing sensitive sites or military or security personnel is illegal. ● Algeria doesn't recognise dual nationality. ● Male Algerian nationals must complete a period of compulsory military service. This includes dual nationals. Make sure you understand your obligations before you travel to Algeria. ● Dress and behaviour standards are conservative. Men and women should avoid physical contact with each other in public. Women should consider wearing a headscarf.
Health Risks	● Insect-borne diseases include leishmaniasis, West Nile fever and malaria. Use insect repellent. Ensure your accommodation is insect-proof. Consider taking medication to prevent malaria. ● Tuberculosis, typhoid, hepatitis, meningitis, rabies are also common. Boil drinking water or drink bottled water. Avoid bathing in freshwater sources. ● The standard of medical facilities can vary. Medical facilities in remote areas are limited or non-existent. Consider carrying some medical supplies for personal use. If you're seriously ill or injured, you'll be evacuated. Get adequate travel insurance.
Weather	● Earthquakes and flooding can occur. Monitor the Global Disaster Alert and Coordination System for updates. Follow the advice of local authorities.
Other	● You need a visa to enter Algeria. Apply in advance. Contact the nearest embassy or consulate for entry and exit conditions. ● If you're travelling on a cruise ship, you can apply for your visa on arrival. ● You need a valid yellow fever vaccination certificate to enter Algeria if you arrive from a country where yellow fever is endemic. ● Only change money at an exchange bureau at international airports or in large hotels, and at commercial banks in major cities. ● Road and traffic conditions are very dangerous. Road accidents cause many deaths and injuries each year. Armed groups and bandits make road travel risky. Avoid travel by road.

Egypt

	**Threat Level** High threat level to personal safety, take a range of extra precautions here.	**Threat Level** Within 50kms of Egypt's border with Libya and Governorate of North Sinai, including the Taba-Suez Road , do not travel.					**Latitude / Longitude** 26.820553, 30.802498 **GPS Position** 26° 49' 13.9908'' N 30° 48' 8.9928'' E

Crime	● Terrorists have attacked places popular with tourists in recent years. People have been killed and injured. More attacks are likely. Be alert to possible threats. ● Terrorist groups in Egypt have also targeted Christians in recent years. Take care during major religious periods and at religious sites. ● Egypt enacted a state of emergency in April 2017. This gives authorities more powers to search, detain and arrest people. It also limits gatherings and demonstrations, and makes it illegal for foreigners to participate. Monitor local media for possible unrest. ● Kidnapping is a risk for travellers in Egypt. ● Violent crime can happen. Take extra care if you're a women and alone. Don't leave valuables unsecured in your hotel room or unattended in a public place.
Laws	● It can be illegal to make public comments that criticise the Egyptian government, security forces or religion. Police have arrested foreign visitors who published critical social media posts. ● Carrying illegal drugs can lead to the death penalty, long prison sentences or deportation. ● Egyptian family law differs from most first world law. Before you become involved in a local legal matter, get legal advice. This includes family and business legal matters. ● Same-sex relationships are legal in Egypt, but not socially tolerated. Sex outside of marriage is illegal. ● Dress standards are conservative, particularly for women. Wear modest clothes that cover your legs and upper arms.
Health Risks	● Infectious diseases are common. These include hepatitis, filariasis and rabies. Boil drinking water or drink bottled water. Avoid contact with dogs and cats. ● Don't swim in fresh water, including the Nile River, to avoid waterborne diseases, such as bilharzia (schistosomiasis). ● Dengue and malaria can occur. Make sure your accommodation is insect-proof. Use insect repellent. ● Cairo can have high levels of pollution and dust. If you suffer from breathing difficulties or a lung condition, seek medical advice.
Weather	
Other	● If you decide to travel to Egypt you'll need a visa to visit Egypt. Get a tourist visa online or on arrival. ● Foreign journalists must get accreditation from the Egyptian Press Centre before arrival. There are severe punishments for journalists working without accreditation. ● You need approval to bring satellite phones and radio communications equipment into Egypt. Apply to the Ministry of Communications and Information Technology before you leave. The use of other technology, including drones, is illegal. ● There are landmines in some areas. Get advice from local authorities before you travel. ● Be aware of checkpoints around Egypt. Foreigners are sometimes harassed and detained.

Libya

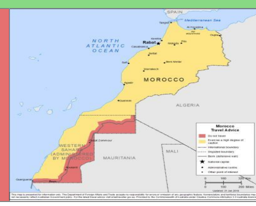
	**Threat Level** Extreme threat to personal safety, recommended not to travel here.							**Latitude / Longitude** 26.335100, 17.228331 **GPS Position** 26° 20' 6.36'' N 17° 13' 41.9916'' E

Crime	● Violent fighting is widespread and ongoing in Libya. The security situation is very unstable. There's a high threat of terrorist attack, kidnapping and crime. Don't travel to Libya. If you stay in Libya seek professional security advice. Monitor the media for possible risks. ● Areas of Libya that border with Algeria, Niger, Chad and Sudan are very dangerous. Bandits and armed tribal groups operate in these areas. There's also a very high threat of kidnapping. Avoid cross-border travel between Libya and these countries.

Laws	● The rule of law has not been re-established in Libya. Police services may not be operating in all parts of the country. ● Penalties for drug offences are severe. They include the death penalty or life in jail. More serious crimes may attract the death penalty. ● If you're involved in a business dispute, officials may seize your passport. They may not let you leave Libya until the dispute is settled. ● Many activities are illegal in Libya. This includes same-sex sexual activity and drinking alcohol. You could be jailed for having sex outside marriage. ● Islamic law decides child custody. A child born to a Libyan father is a Libyan citizen. They need their father's permission to leave Libya.
Health Risks	● Waterborne, foodborne, parasitic and other infectious diseases are common. They include typhoid, hepatitis, tuberculosis, plague and measles. Boil drinking water or drink bottled water. Don't swim in fresh water. ● Medical facilities in Libya are limited. Some medicines are in short supply. Carry some medical supplies for personal use. ● If you are seriously ill or injured, you may need to be evacuated to a place with better facilities. Make sure your insurance covers this.
Weather	● Libya experiences severe weather. If you travel to Libya follow regional weather forecasts and plan accordingly.
Other	● If you decide to travel to Libya ask your insurer if you need special travel insurance to cover your trip. ● Airports and land border crossings can close without warning. Plan for delays and temporary closures. ● Trying to leave Libya via land borders is very dangerous. There's a very high threat of kidnapping in regions bordering Algeria, Chad, Sudan and Niger. Don't try to leave Libya through these countries. ● Officials may detain you if you can't prove you entered Libya at an official border crossing. ● You must always carry ID documents. Register your passport with a police station. If you don't, you may be fined. You could have problems during your stay or on departure.

Morocco

	Threat Level Moderate threat level to personal safety, take extra precautions here.	**Threat Level** Within 30 kilometres of the northern or western side of the Berm, all areas of the Western Sahara south and east of the Berm, do not travel.				**Latitude / Longitude** 31.791702, -7.09262 **GPS Position** 31° 47' 30.1272'' N 7° 5' 33.432'' W



Crime	● Terrorism is a risk in Morocco. Tourist areas and public places are possible targets. Be alert to possible threats. Avoid known targets. ● Westerners are at risk of kidnapping across North Africa. In Morocco, the risk increases in remote mountain areas, the south and border areas. Get professional security advice if you travel to these areas. Don't hike alone in mountain areas. ● Petty crime, such as pickpocketing and bag snatching, is common. Tourists have been mugged when walking at night. Keep your belongings close. Don't walk in isolated areas or along dark streets at night. ● Tourists may face aggressive begging and harassment, particularly near ATMs. Female travellers may be sexually harassed. Take care when using ATMs. If you're female, avoid walking or travelling alone. ● Scams and fraud are common. These include double-charging credit cards, and replacing your purchased goods with lower-quality ones. Keep your credit card in sight during all transactions. Check all goods you buy. Don't send money to anyone in Morocco until you make proper checks. ● Large public gatherings and protests can turn violent. Avoid demonstrations. Take care on weekends and around Friday prayers.
Laws	● Morocco has the death penalty for serious crimes, including high treason, terrorism, multiple murder and rape. ● Sexual acts between members of the same sex, or outside marriage, are illegal. Possessing pornographic material is also illegal. ● Understand and follow local laws. Morocco has strict laws around religion, the monarchy, alcohol, photography and drone use. ● Morocco recognises dual nationality, but Moroccan citizenship takes precedence. This can affect child custody disputes and military service requirements. ● Moroccan society is conservative. Avoid public displays of affection. In some parts of Morocco, women should wear loose fitting clothes that cover their arms and legs.
Health Risks	● Common insect-borne diseases include leishmaniasis and typhus. Malaria is less common. Use insect repellent. Ensure your accommodation is insect-proof. ● Waterborne, foodborne and other infectious diseases are common. Boil drinking water or drink bottled water. Avoid raw or undercooked food. ● Avoid black henna temporary tattoos. These often contain a dye that can irritate the skin.
Weather	
Other	● You don't need a visa to visit Morocco if you're going for less than 3 months. For longer trips, you'll need one. Contact the Embassy of Morocco for details. ● Get your passport stamped when you enter Morocco. You may find it difficult to leave the country if you don't. ● The land border with Algeria is closed. Don't attempt to travel to Algeria by land. ● Only exchange currency at commercial banks and licensed exchange bureaus. You can use credit cards in larger towns and tourist areas. ATMs are widely available in cities and most larger towns. ● To drive in Morocco you need your driver's licence and an International Driving Permit (IDP). Get your IDP before you leave your country.

Sudan

	Threat Level High threat level to personal safety, take a range of extra precautions here.	**Threat Level** North, South and West Darfur, Abyei region, North and South Kordufan, Blue and White Nile State, Sennar State, Areas within 15km of the border with Eritrea and Ethiopia, do not travel.				**Latitude / Longitude** 12.862807, 30.217636 **GPS Position** 12° 51' 46.1052'' N 30° 13' 3.4896'' E

Crime	● There is a threat of terrorism. They could occur at any time. Avoid crowded areas and known targets. Be alert to possible threats. ● Political and anti-Western rallies can turn violent. Avoid large public gatherings. Avoid public spaces around Friday prayers. ● Sudan is currently under a state of emergency. The government has banned unauthorised public gatherings. Observe all curfews. ● Ongoing violence in Sudan includes border disputes with South Sudan, and clashes between government forces and rebels. Civilians and foreigners could be victims of violence directed at others. Avoid areas of unrest and take security measures. ● Kidnapping is a serious risk. Kidnappers often target foreigners. Seek professional security advice if you're travelling to high-risk areas. ● Violent crime is high risk, especially in Darfur. Don't travel to North, South and West Darfur. Outside Darfur, you're less likely to encounter violent crime.
Laws	● Sudan follows Islamic sharia law. Seek legal advice about family law matters, including divorce, custody and child support. ● Serious crimes attract the death penalty. Other crimes are punishable by lashes. Same-sex relations, extra-marital relations, importing or drinking alcohol, and trying to convert a Muslim to Christianity are all illegal. ● Be careful when taking photographs. You need a permit for any photography. Even with a permit, it's illegal to photograph certain areas, including military installations, infrastructure and slums. ● Sudan has strict Islamic dress codes. Women should wear a headscarf and loose clothing covering the arms and legs.
Health Risks	● Yellow fever is widespread in Sudan. Other insect-borne diseases include malaria, Zika virus and dengue. Ensure your accommodation is insect-proof. Get vaccinated against yellow fever. ● HIV/AIDS is common. Take precautions if you're engaging in high-risk activities. If you think you may have been infected, seek immediate medical help outside Sudan. ● Other infectious diseases, including cholera, hepatitis, typhoid and polio, are common. Drink only bottled water. Ensure your vaccinations are up to date. ● Medical facilities are basic in Khartoum and inadequate elsewhere. You may need to get medical help outside Sudan.
Weather	

Other	• You need a visa to enter Sudan. Getting one can take several months. You may be unable to enter the country if your passport has an Israeli visa, entry or exit stamp. Plan ahead. • You may need to show your yellow fever vaccination certificate when entering and leaving Sudan. Check your countries re-entry requirements following exposure to yellow fever. • Don't plan to travel to Sudan by land. The only open border crossing is the Wadi Halfa ferry across Lake Nasser from Egypt. This can close without notice. • It's illegal to import or export Sudanese currency. Bring US dollars to change when you arrive. You'll also need US dollars to pay in some hotels. You can't use credit cards, debit cards or traveller's cheques anywhere. • Landmines and unexploded remnants of war are a risk. Use main roads and paths labelled as cleared by a competent de-mining authority. • You may need a permit for all travel outside Khartoum. Register with local authorities within 24 hours of arriving anywhere outside Khartoum.

Tunisia

	**Threat Level** Moderate threat level to personal safety, take extra precautions here.	**Threat Level** Areas south of, and including, the towns of Nefta, Douz, Medenine, and Zaris, Governorates of Kasserine, Le Kef, Jendouba and Sidi Bouzid, reconsider your need to travel.	**Threat Level** Militarised zone south of the towns of El Borma and Dhehiba, Within 30 kilometres of the border with Algeria, Mount Chaambi National Park area, including the town of Kasserine, Within 30 kilometres of the rest of the Libya border area north of Dhehiba, including the town of Ben Guerdane and immediate surrounding area, do not travel.				**Latitude / Longitude** 33.886917, 9.537499 **GPS Position** 33° 53' 12.9012" N 9° 32' 14.9964" E

Crime	• Terrorist attacks are a high risk in Tunisia, including at tourist sites. Local authorities have increased security. Be alert to possible threats. • Instability in Libya and Algeria has made Tunisia less safe. Kidnapping is a high risk near the borders. If you plan to travel there, seek professional security advice. • Civil unrest is common and protests can turn violent. Avoid large public gatherings, especially on days of national significance and around Friday prayers. • There is a state of emergency currently in place. • Petty crime, including pickpocketing and bag-snatching, occurs. Don't leave valuables in parked cars or unsecured in your hotel room. • Women may be sexually harassed on the street. Take care when travelling alone or at night.
Laws	• It's illegal to live or stay as an unmarried couple, or to try to convert a Muslim to another religion. It's also illegal to import or export Tunisian currency. • Be careful when taking photos. It's illegal to take photos of government and military sites, infrastructure or places around them. • Same-sex sexual activity is illegal. Avoid public displays of affection. Victims of same-sex sexual assault may be charged and imprisoned. • Tunisian dress and behavioural standards are conservative. Dress appropriately. If you're visiting religious sites or remote areas, wear clothes that cover your arms and legs. • If you're a dual national, you may need to complete national service. Check with the Embassy or Consulate of Tunisia before you travel.
Health Risks	• Insect-borne diseases are common, including leishmaniasis and West Nile fever. Use insect repellent. Ensure your accommodation is insect-proof. • Other infectious diseases include typhoid, hepatitis and rabies. Boil drinking water or drink bottled water. Avoid ice cubes. • If a dog, monkey or other mammal bites or scratches you, get medical help at once. • Medical facilities in Tunisia's major centres are generally a good standard. French and Arabic are the main languages. Not many staff speak English. Medical care can be expensive. Get appropriate travel insurance.
Weather	
Other	• If you're visiting for 90 days or less, you could get a visa exemption. For all other travel, get a visa before you arrive. • Declare all foreign currency when you arrive in Tunisia. Keep the declaration receipt so you can change your Tunisian currency back before you depart. • You can exchange foreign currency for Tunisian dinars (TND) at authorised banks or dealers. Keep all receipts. • Libya and Algeria are becoming more dangerous. Border crossings with these countries may close at short notice. Consult local authorities and read the travel advisories for Algeria and Libya before deciding whether to travel. • Get permission from Tunisian authorities before travelling to desert areas in the south, including the Sahara. You must have a licensed guide.

4 Southern Africa

Botswana

	**Threat Level** Exercise normal safety precautions.								**Latitude / Longitude** -22.328474, 24.684866 **GPS Position** 22° 19' 42.5064" S 24° 41' 5.5176" E

Crime	• Attacks on tourists are rare. But violent crime, break-ins and carjackings can happen. Be alert, particularly if you're out after dark. • Criminals have robbed travellers around Gaborone Dam and Kgale Hill. Be careful in these areas. • Wildlife attacks and waterborne diseases can happen. Don't swim in freshwater lakes and rivers.
Laws	• Botswana has the death penalty for serious crimes, including murder and treason. • Exporting elephant hair, ivory, and rhinoceros horn products is illegal. You need a permit or receipt from a licensed store to export animal souvenirs or 'trophies'. • Some crimes, such as serious assaults, attract physical punishment. • It's illegal to possess pornography or take photos of military or government installations. • Same-sex relationships were decriminalised in June 2019. • Botswana only recognises dual nationality up to the age of 21.
Health Risks	• The HIV/AIDS infection rate is very high. Take steps to reduce your risk of exposure to the virus. If you're sexually or otherwise assaulted, seek medical help straight away. • A yellow fever vaccination certificate is required if you are over 1 year old and travelling from a country where yellow fever is widespread. Get vaccinated before you travel. • Malaria is present in Botswana and widespread in the north. Other insect-borne diseases including filariasis (commonly known as elephantiasis) occur. Make sure your accommodation is insect-proof. Use insect repellent. • Waterborne, foodborne and other infectious diseases are widespread. Boil drinking water or drink bottled water. Some drug-resistant tuberculosis cases have recently occurred in Botswana. • Medical facilities outside urban areas are limited. If you're seriously ill or injured, you may be evacuated.
Weather	
Other	• You don't need a visa if you're a tourist visiting for up to 90 days. If travelling with children you'll need extra documents. • You need a visa to travel to Botswana on an emergency passport. Apply at the nearest embassy or consulate of Botswana. • If you enter Botswana from Ebola-affected countries you may be screened. You may be denied entry or quarantined on arrival. • Immigration regulations apply to children younger than 18. If you don't comply with regulations, you might be deported on arrival or stopped from boarding your plane. • Special rules apply if you're going to or from Botswana through South Africa, including transiting. Read the Travel section of the travel advice for South Africa. • Respect wildlife laws and keep a safe and legal distance when watching wildlife. Only use reputable guides or tour operators. Follow park regulations and wardens advice.

Eswatini

	**Threat Level** Exercise normal safety precautions.		**Latitude / Longitude** -26.522503, 31.465866 **GPS Position** 26° 31' 21.0108'' S 31° 27' 57.1176'' E

Lesotho

	**Threat Level** Moderate threat level to personal safety, take extra precautions here.		**Latitude / Longitude** -29.609988, 28.233608 **GPS Position** 29° 36' 35.9568'' S 28° 14' 0.9888'' E

Crime	● Violent and petty crime is common in Lesotho. Gun-related crimes and break-ins have targeted travellers. Security risks increase at night and on weekends. Avoid walking alone or at night. If you're a victim of violent crime, including rape, seek immediate medical help. ● Political protests may occur in Maseru. Avoid demonstrations and large public gatherings as they can become violent.
Laws	● Penalties for drug offences are severe and include long prison sentences. ● Serious crimes, such as murder and rape, can attract the death penalty. ● Same-sex relationships are illegal. Avoid public displays of affection. ● It's illegal to take photos around military or government buildings.
Health Risks	● The rate of HIV/AIDS infection is very high. Take precautions if you engage in any high-risk activities. ● Waterborne, foodborne and other infectious diseases are common. Boil all drinking water. Drink bottled water with intact seals. ● Medication may be in short supply. Take enough legal medication for your trip. ● Medical facilities in Lesotho are basic. Use facilities in Bloemfontein, South Africa, 140km from Maseru. If you become seriously ill or injured, you will be evacuated. Make sure your travel insurance covers this.
Weather	
Other	● Tourists can visit Lesotho for up to 14 days without a visa. For other situations, apply for a visa before you go. ● You need a valid yellow fever vaccination certificate to enter Lesotho from a country where yellow fever occurs. ● The local currency is the Lesotho Loti (LSL). South African Rand is widely accepted. ● Road travel can be dangerous in the winter months. You may need a 4WD to drive in rural areas. Be prepared to drive on icy or snow-covered roads. Get updates on road conditions before driving in the mountains. ● Respect wildlife laws. Use reputable and professional guides or tour operators. Follow park regulations and the advice of the wardens.

Namibia

	**Threat Level** Exercise normal safety precautions.		**Latitude / Longitude** -22.957640, 18.49041 **GPS Position** 22° 57' 27.504'' S 18° 29' 25.476'' E

Crime	● Petty crime is common. It includes pickpocketing, bag-snatching and car break-ins. Don't leave valuables in your car. Always keep vehicle doors locked and windows up, even when moving. ● Violent crime includes muggings and robberies. Tourists have been robbed after stopping for hitchhikers or to help people. Avoid walking alone in large towns, particularly at night. Don't pick up strangers. ● Taxi drivers have robbed travellers. Don't hail unmarked taxis on the street. Use taxis with the Namibia Bus and Taxi Association logo. Book taxis through your hotel or a taxi company. ● Credit card skimming occurs. Always keep your card in sight. Check your statements often for fraudulent transactions.
Laws	● Don't use or carry illegal drugs. Penalties for drug offences are severe. They include long prison sentences. ● Ask permission before taking photos. It's illegal to take photos of government and military sites. ● Trading in endangered wildlife products, such as ivory and rhino horn, is illegal. ● Trading in diamonds and precious stones is against the law. Only buy from licensed shops. ● Namibia doesn't recognise dual nationality. This may limit the help we can give to dual nationals. ● Same-sex relationships are legal in Namibia, but they aren't widely accepted. Avoid public displays of affection.
Health Risks	● Anyone aged over 9 months and travelling from a country where yellow fever is widespread must present a yellow fever vaccination certificate on arrival. Get vaccinated before you travel. ● The rate of HIV/AIDS infection is very high. Take precautions if you engage in high risk activities. ● Malaria is common in northern Namibia. Consider taking anti-malarial medication if you're travelling to this area. ● Other insect-borne diseases include leishmaniasis. Ensure your accommodation is insect-proof. Use insect repellent. ● Waterborne, foodborne, parasitic and other infectious diseases are common. They include typhoid, hepatitis and meningitis. Drink only boiled or bottled water. Avoid raw or undercooked food. ● Medical facilities are limited outside major urban centres. If you're seriously ill or injured, you'll need evacuation, probably to South Africa. Ensure your travel insurance covers this.
Weather	● Flooding may happen in the rainy season from November to April. Floods can block roads. Follow local advice.

Other	● Tourists can visit for up to 3 months without a visa. For other situations, get a visa in advance. Contact the Namibian Consulate-General for advice. ● Children who aren't accompanied by one or both parents must carry a full birth certificate and an affidavit which must follow strict guidelines. Check the rules and requirements with the nearest Namibian High Commission or Consulate. ● Carry your yellow fever vaccination certificate if you're coming from a country where there's a risk of yellow fever. You'll need it to enter Namibia. ● The official currency is the Namibian Dollar (NAD). You can also use South African rand (ZAR). You can use credit cards in major centres. ATMs are available in cities, but not always in remote areas. ● Unexploded landmines are a danger in some parts of Namibia. These include East and West Kavango, the Zambezi regions in the north-east, and areas bordering Angola. ● Avoid public transport. Vehicles are often poorly maintained. Local buses don't follow permanent routes.

South Africa

Threat Level
Moderate threat level to personal safety, take extra precautions here.

Latitude / Longitude
-30.559482, 22.937506

GPS Position
30° 33' 34.1352" S
22° 56' 15.0216" E

Crime	● Crime and violence are serious issues in South Africa. Crimes include murder, rape, assault, food and drink spiking, robbery and carjacking. ● Criminals target travellers and their bags at airports and on public transport. Vehicles parked or stopped at intersections are often targeted. Criminals have posed as fake tourist police to extort and rob tourists. Be alert in major city centres and township areas after dark. ● ATM and credit card fraud are common. Criminals wait near ATMs to rob people who have withdrawn cash. Only withdraw small amounts. Keep your credit card with you at all times. ● Scams occur often. If you're a victim of a scam, don't travel to South Africa. The risk of assault is high. ● Avoid protests and large public gatherings. These can become violent. Don't take photos or video footage.
Laws	● Drug offences carry severe penalties, including long jail terms. ● Dual nationals must enter and exit South Africa on their South African passport. Penalties for travelling on another passport include fines, refusal of entry and jail.
Health Risks	● You must present a yellow fever vaccination certificate, if you're over 1 year old and travelling from a country where yellow fever is widespread. Get vaccinated before you travel. ● HIV/AIDS infection rates are high in South Africa. Take steps to reduce your risk of exposure. ● Malaria and other insect-borne diseases, such as filariasis, are common. Make sure your accommodation is insect-proof. Use insect repellent. ● Cholera is mostly a risk in rural areas. Other waterborne, food-borne and infectious diseases are prevalent. Boil drinking water or drink bottled water. Avoid raw or undercooked food. Avoid contact with animal tissues or blood at game reserves or farms. ● Private hospitals are generally better equipped than public facilities. Medical evacuation is your only option in remote areas.
Weather	
Other	● You don't need a visa if you're a tourist visiting for up to 90 days. If you're arriving with children, you'll need extra documents. Some visa regulations have changed. Check with the South African Department of Home Affairs. ● Rolling blackouts affect parts of South Africa. This can leave areas without power for hours and cause travel delays. ● Avoid using minibuses. Ask your hotel for advice on a reputable provider. Don't catch a rideshare service near metered taxis. Tensions between drivers can escalate to violence. ● To drive in South Africa, you must be 18 years old and have a valid driver's licence. Hazards on the road include speeding, poor driving, pedestrians and animals on roads, and drink driving. ● Respect local wildlife laws. Only use professional guides or tour operators. Follow park regulations and advice from wardens. Don't swim in lakes and rivers, due to the risk of wildlife attacks and disease.

5 West Africa

Benin

Threat Level
Moderate threat level to personal safety, take extra precautions here.

Latitude / Longitude
9.307690, 2.315834

GPS Position
9° 18' 27.684" N
2° 18' 57.0024" E

Crime	● Violent crime is common in Benin, especially in Cotonou and regions bordering Nigeria. Robberies, carjackings and pickpocketing also occur. Don't walk alone, after dark or in poorly lit areas. ● Scams and internet fraud are common in West African countries. Scam victims often lose money. Be wary of messages from people you don't know. Don't travel to Benin to meet someone you have only interacted with online. ● Terrorist activity and kidnappings in nearby countries may spill over into Benin. Be alert to possible threats, especially in public places. Take official warnings seriously and follow advice from local authorities.
Laws	● It's illegal to take photos of government buildings, military zones, assets and personnel. ● Benin recognises dual nationality. If you're a dual national, you may have to perform civil or military service in Benin. Check with an embassy or consulate of Benin before you travel. ● Benin is very conservative. Take care not to offend. ● Same-sex relationships aren't illegal, but locals are often intolerant of them. Avoid open displays of affection.
Health Risks	● Yellow fever, malaria and other tropical diseases are common. Get a yellow fever vaccination before you travel and consider taking medication to prevent malaria. Use insect repellent. ● HIV/AIDS infection rates are high. Take steps to reduce your risk of exposure to the virus. ● Infectious diseases can occur. There were 100s of cases of cholera in 2016. Boil drinking water or drink bottled water. Avoid ice cubes, raw and undercooked food. ● Medical facilities in major towns are limited. Rural areas may have basic care, or none at all. If you're seriously ill or injured, you'll be evacuated.
Weather	● During rainy seasons, severe weather and flooding can damage bridges and roads. Depending on the region, the rainy season can happen from April to October. Monitor the Global Disaster Alert and Coordination System for updates.
Other	

Burkina Faso

Threat Level
High threat level to personal safety, take a range of extra precautions here.

Threat Level
All areas along the border with Mali, W National Park, do not travel.

Latitude / Longitude
12.238333, -1.561593

GPS Position
12° 14' 17.9988" N
1° 33' 41.7348" W

Crime	● Terrorist attacks and kidnapping are high risks in Burkina Faso. Many people have been killed or injured in terrorist attacks and kidnappings in recent years. Follow advice from local authorities. Obey curfews. Get professional security advice. ● Protests or other civil unrest may occur. These can turn violent. ● Airports and land borders may close at short notice. You'll have limited access to consular help if this happens. ● Avoid rallies, protests and large crowds. Monitor the media for news of unrest. ● Petty crime and violent crime are common. Security risks increase at night. Avoid travelling alone or after dark.
Laws	● It's illegal to take photos of military zones, assets or personnel. ● Burkina Faso has conservative standards of dress and behaviour. ● Same-sex relationships are legal, but locals are often intolerant of them.
Health Risks	● The Ebola virus disease (EVD) outbreak in West Africa is now over, but more cases may occur. ● Yellow fever, malaria and other insect-borne diseases are common. Make sure your accommodation is insect-proof. Use insect repellent. ● The rate of HIV/AIDS infection is high. Take steps to reduce your risk of exposure. ● Medical facilities are poor and emergency services are very limited. If you become seriously ill or injured, you'll be evacuated. Get insurance to cover this.
Weather	
Other	● If you decide to travel to Burkina Faso contact an embassy or consulate of Burkina Faso for details about visas. Conditions can change at short notice. ● You need a valid yellow fever vaccination certificate to enter Burkina Faso. Some airlines may want to see one when you leave. ● It's illegal to export art without government approval. This can include old or traditional artist works and all old material of national cultural significance. ● Road travel is dangerous. Don't drive at night. Don't use public transport due to the risk of crime.

Cabo Verde

	**Threat Level** N/A								**Latitude / Longitude** 16.741155, -22.939825 **GPS Position** 16° 44' 28.158" N 22° 56' 23.37" W
Crime									
Laws	N/A								
Health Risks	● Zika Virus ● Dengue Fever								
Weather	N/A								
Other									

Côte d'Ivoire

	**Threat Level** Moderate threat level to personal safety, take extra precautions here.	**Threat Level** Dix-Huit Montagnes, Haut-Sassandra, Moyen-Cavally and Bas-Sassandra, reconsider your need to travel.						**Latitude / Longitude** 7.539989, -5.54708 **GPS Position** 7° 32' 23.9604" N 5° 32' 49.488" W
Crime	● Terrorist attacks are a risk. Follow the advice of local authorities. ● Violence due to civil unrest is a high risk. Public protests and events can turn violent. People have been killed in militia attacks near the Liberian border. Monitor the local media for updates. ● Armed robbery and violent crime are common. Armed bandits have attacked travellers along roads. Pedestrians have also been attacked. Plan road journeys carefully and take safety precautions. Conceal your valuables. ● Commercial and internet fraud occurs. Fake internet friendship, dating and marriage schemes also operate from some African countries. ● Swimming in beaches is dangerous due to strong coastal currents. Ask for local advice before entering the water.							
Laws	● Same-sex relationships are legal. However, members of the same sex can be convicted of an 'offence against public decency'. Penalties include fines and jail terms of up to two years. Avoid public displays of affection. ● It's illegal to take photos near sensitive areas, such as military sites and government buildings. ● Dual nationality isn't recognised in Côte d'Ivoire. ● Standards of dress and behaviour are conservative in Côte d'Ivoire. Take care not to offend.							
Health Risks	● Health facilities outside of Abidjan are very limited. If you become seriously ill or injured, you'll need to be evacuated. Make sure your insurance covers this. ● The rate of HIV/AIDS infection is high. Take precautions before you do anything that puts you at risk of infection. ● Yellow fever is widespread in Côte d'Ivoire. Malaria and other tropical diseases are common. Make sure your accommodation is insect proof. Use insect repellent.							
Weather								
Other	● To drive in Côte d'Ivoire, you must have an International Driving Permit (IDP), registration papers and Economic Community of West African States (ECOWAS) Brown Card insurance. Get your IDP before leaving your country. You need an exit permit from the National Museum to take art objects from Côte d'Ivoire. ● You need a valid yellow fever vaccination certificate to enter Côte d'Ivoire. Some airlines may want to see one when you leave. ● The ATMs in Abidjan may not be reliable. ATMs are rare outside of Abidjan. Bring enough cash with you.							

The Gambia

	**Threat Level** Moderate threat level to personal safety, take extra precautions here.	**Threat Level** Overland travel through the Casamance region in southern Senegal, reconsider your need to travel.					**Latitude / Longitude** 13.443182, -15.310139 **GPS Position** 13° 26' 35.4552" N 15° 18' 36.5004" W

Crime	● There's been an increased security presence in The Gambia since elections in 2017. The situation is now stable, but protests may turn violent. Avoid large public gatherings. ● Theft from hotel rooms and vehicles happens. Pickpocketing occurs in crowded market areas, on ferries and tourist beaches. Muggings sometimes occur on beaches at night. Avoid being alone outside at night, especially on beaches. Lock your hotel room, even when you're in it. ● Young men known as 'bumsters' may approach tourists, particularly on beaches. They often use romance to get money or other help from you. Politely decline their offers, advances or attempts at conversation. Take care not to offend. ● Credit card fraud is a risk. Always keep your card in sight when shopping. Check your statements often. ● Online friendship, romance or business scams often start in West Africa, including The Gambia. People who visit The Gambia to meet someone they've met online are at risk of kidnapping, assault or robbery. Be wary of contact from people you don't know. Don't send money to anyone in The Gambia until you've confirmed their identity.
Laws	● The Gambian Government often blocks consular access to foreigners in detention. ● Don't use or carry illegal drugs. Penalties include lengthy jail terms. Westerners have been jailed for up to 10 years for carrying small amounts of cannabis. ● The Gambia has the death penalty for serious crimes, including arson, murder and treason. Corporal punishment applies for some crimes, such as assault, sexual assault, theft and serious driving offences. ● Some prescription and over-the-counter drugs available in first world countries are illegal in The Gambia. It's illegal to import, use or carry medications containing certain ingredients, including codeine, diazepam and some corticosteroids. Penalties can include jail terms and heavy fines. Check your medication is legal with a high commission or consulate of The Gambia before you travel. ● Same-sex relations are illegal. Penalties include jail sentences ranging from five years to life. ● Dress and behaviour standards are conservative. Take care not to offend.
Health Risks	● Yellow fever is widespread. Get vaccinated before you travel. ● Malaria is common. Other insect-borne diseases include dengue. Ensure your accommodation is insect-proof. Use insect repellent. Consider taking anti-malarial medication. ● The HIV/AIDS infection rate is high. Take precautions if you engage in high-risk activities. ● Waterborne, foodborne, parasitic and other infectious diseases are common. These include typhoid, hepatitis, leptospirosis and bilharzia (schistosomiasis). Drink only boiled or bottled water. Avoid raw or undercooked food. Don't swim in fresh water. ● Medical facilities in The Gambia are limited. You'll probably have to pay cash up-front. If you're seriously ill or injured, you'll need medical evacuation. Ensure your travel insurance covers this.
Weather	● The rainy season is June to October. Floods may block roads. Follow the advice of local officials.
Other	● You may need a visa to enter The Gambia. Contact your nearest Gambian high commission or consulate for details. ● Carry your yellow fever vaccination certificate. You'll need it to enter the country. ● The local currency is the Gambian Dalasi (GMD). It can be difficult to exchange foreign currency other than British pounds sterling (GBP). The Gambia is a cash-based economy. Not many places accept credit cards and there aren't many ATMs. Ensure you have enough cash for your stay. ● You might be able to drive on your current driver's licence and an International Driving Permit (IDP). Get your IDP before you travel. Police roadblocks are common. Always carry photo ID and vehicle registration and ownership papers. ● There isn't much public transport available. Safety and maintenance standards are unreliable. ● Travel on river boats, including ferries and canoes, is dangerous. Avoid boat travel at night. Never board an overloaded boat. If the boat doesn't have proper safety equipment, use another operator or a different form of transport.

Ghana

Threat Level
Exercise normal safety precautions.

Threat Level
Bawku, Tamale municipality, Yendi District and Bimbilla area in northern Ghana, exercise a high degree of caution.

Latitude / Longitude
7.946527, -1.023194

GPS Position
7° 56' 47.4972" N
1° 1' 23.4984" W

Crime	● Large public events and intercommunity disputes can turn violent. Avoid demonstrations and protests. Be cautious around large crowds, like football matches. ● Travellers are a target for crime, including kidnapping and robbery. Security risks increase if you're a solo woman. Take particular care in and around Accra. ● Internet scams often originate in West African countries. Criminals may ask for details of safe bank accounts to transfer large amounts of money. Criminals often meet their victims through internet dating sites or chat rooms. Be wary of online contact from people you don't know. Don't send money until you've checked who you're sending it to. Don't travel to Ghana to get your money back or to get revenge. ● Power outages may occur after dark. This often leads to more crime, especially if street and traffic lights fail. ● Thieves may pose as police officers or airport staff. Legitimate airport staff wear a current ID card with their name and photograph.
Laws	● Penalties for drug offences are severe. They include mandatory jail terms. ● The death penalty can apply for serious offences, such as murder. ● Same-sex relations are illegal. Avoid open displays of affection, especially in rural areas. ● Ghana recognises dual nationality.
Health Risks	● Yellow fever, malaria and other insect-borne diseases are common. Make sure your accommodation is insect-proof. Use insect repellent. ● HIV/AIDS is common in Ghana. Take precautions if you're engaging in high-risk activities. ● Common waterborne, foodborne, and other infectious diseases include cholera, hepatitis, meningococcal meningitis, bilharzia (schistomiasis) and tuberculosis. Boil drinking water or drink bottled water. Avoid ice cubes, and raw and undercooked food. Don't swim in fresh water. ● Medical facilities are basic in urban areas and limited in rural areas. The standard of care may be less than what you would expect in first world countries. If you're seriously ill or injured, you may need to be evacuated.
Weather	
Other	● You need a visa to travel to Ghana. If you're staying for more than 90 days in 12 months, you must register for a National Identification Authority Non-citizen Ghanacard. Contact an embassy or high commission of Ghana for advice. ● You need to show a valid yellow fever vaccination certificate to enter Ghana. You may also need to show it when you leave. ● You can't exchange Australian dollars in Ghana. However, you can easily exchange US dollars and euros for GHS at commercial banks and exchange services. ● Road safety and driving in Ghana can be dangerous. Police roadblocks are common. Carry photo ID, vehicle registration and ownership papers. Be alert to hazards, especially at night. ● Ferry travel is risky due to low safety standards and adverse weather. Always wear a life jacket. ● Only use registered taxis and limousines. If you can, arrange these through your hotel. Don't use taxis hailed on the street, rideshares or public transport due to safety and security concerns.

Guinea

Threat Level
Moderate threat level to personal safety, take extra precautions here.

Threat Level
Border areas with Cote d'Ivoire, Liberia and Sierra Leone, reconsider your need to travel.

Latitude / Longitude
9.945587, -9.696645

GPS Position
9° 56' 44.1132" N
9° 41' 47.922" W

Crime	● Since 14 October, there have been violent protests in Conakry and other towns, resulting in several deaths. Avoid protests and public gatherings. ● Border regions are dangerous. Armed robbery, conflict, and cross-border military and rebel activity are common in these regions. ● There's a risk of violent and petty crime. Keep car windows up and doors locked, even when moving. Stay alert after dark or if there's a power outage. ● Internet scams often originate in West African countries. Be wary of online contact from people you don't know. Don't send money until you've checked who you're sending it to. Don't travel to Guinea to get your money back or to get revenge. ● Piracy has been reported in the coastal waters. Check the International Maritime Bureau for piracy reports.

Laws	• Always carry original ID documents with you. Police and law enforcement can ask to see them. • Serious crimes like murder and armed robbery can attract the death penalty. • Penalties for drug offences are severe and include prison sentences in local jails. • Same-sex relationships are illegal. Fines or jail sentences may apply. • You can't export precious stones from Guinea without a licence. If you can't show a licence, you may be jailed. It's also illegal to take photos or videos of military or government buildings.
Health Risks	• Yellow fever, malaria, filariasis and other insect-borne diseases are common. Make sure your accommodation is insect-proof. Use insect repellent. • HIV/AIDS is common in Guinea. Take precautions if engaging in high-risk activities. • Guinea has been Ebola-free since 1 June 2016. However, further ebola outbreaks could occur. • There's a lack of medical equipment and medicine in Guinea. If you are seriously ill or injured, you'll be evacuated for treatment. Make sure your insurance covers this.
Weather	
Other	• You need a valid yellow fever vaccination certificate to enter and exit Guinea. • Road travel can be dangerous, especially after dark. Robberies, accidents and fuel shortages are common. • Traveller's cheques and credit cards are accepted at most major hotels in Conakry. Outside of the capital, banks are limited and you may need to use cash.

Guinea-Bissau

	**Threat Level** N/A								**Latitude / Longitude** 11.803749, -15.180413 **GPS Position** 11° 48' 13.4964" N 15° 10' 49.4868" W

Liberia

	**Threat Level** Moderate threat level to personal safety, take extra precautions here.	**Threat Level** Grand Gedeh and River Gee counties, reconsider your need to travel.					**Latitude / Longitude** 6.428055, -9.429499 **GPS Position** 6° 25' 40.998" N 9° 25' 46.1964" W
Crime	• Liberia is recovering from civil war. Some sensitive political issues persist. Avoid public protests and large public gatherings. They can turn violent. Don't talk about political issues. • Armed groups operate in the areas bordering Côte d'Ivoire (Ivory Coast). Cross border attacks could happen. • Muggings, burglary and armed robbery can happen. The police can't always help or protect you. Be aware of your surroundings. Don't travel alone or after dark. • Internet scams often originate in West African countries. Be wary of online contact from people you don't know. Don't send money until you've checked who you're sending it to. Don't travel to Guinea to get your money back or to get revenge.						
Laws	• Illegal drug offences attract serious penalties, including large fines and long jail terms. • Same-sex relationships are illegal. Avoid public displays of affection. • It's illegal to have pornographic material. It's illegal to take photos around military and government buildings, airports and ports. It's illegal to export diamonds, unless you follow local export laws. • Society is conservative, especially in areas outside Monrovia. Take care not to offend. • Local women wear loose-fitting clothes that cover the upper arms and legs. Consider modest clothing choices.						
Health Risks	• The World Health Organization (WHO) declared Liberia free from Ebola virus disease on 9 June 2016. However, further Ebola outbreaks are expected to occur. • The rate of HIV/AIDS infection is high. Take precautions to reduce your risk of exposure to the virus. • Yellow fever is widespread. Get vaccinated before you travel. • Malaria and other mosquito-borne illnesses are also common. Make sure your accommodation is insect-proof. Use insect repellent. Consider taking anti-malarial medication. • Common waterborne, foodborne, parasitic and other infectious diseases can occur. Boil drinking water or drink bottled water. Don't swim in fresh water.						
Weather							
Other	• Be prepared for health checks at border crossings. If you have a fever or Ebola-like symptoms, you may be quarantined and denied entry or exit. • You need a valid yellow fever vaccination certificate to enter Liberia. Some airlines may want to see one when you leave. • Always carry photo ID. Officials at security checkpoints will ask to see it. • Driving in Liberia is dangerous, especially after dark. Make sure your insurance covers you for this.						

Mali

	**Threat Level** Extreme threat to personal safety, recommended not to travel here.	**Threat Level** Koulikoro, except the capital, Bamako, Kayes, Sikasso and the region of Segou south of the Niger River, reconsider your need to travel.					**Latitude / Longitude** 17.570692, -3.996166 **GPS Position** 17° 34' 14.4912" N 3° 59' 46.1976" W

Mali

Crime	● Mali is currently under a state of emergency. There's a heavy security presence, including global peacekeepers. The security situation is volatile, especially in the northern and central regions. Be ready to leave the country at short notice. ● Terrorist attacks have increased since 2015. Most target security forces and peacekeepers. Venues used by foreigners are also targets. Avoid public places. Take official warnings seriously. ● There's a high risk of kidnapping in Mali. Armed robbery and carjackings also occur, particularly in the north. Several groups target foreigners. Ransoms paid to kidnappers fund terrorism. Get professional security advice before you travel. Keep vehicle doors and windows locked, even when moving. ● Fake internet friendship, dating and marriage schemes operate from Mali. These scams usually start via internet dating sites or chat rooms. People have been assaulted, kidnapped or killed after travelling to Mali to meet someone they met online. Be wary of contact from people you don't know in Mali.
Laws	● Don't use or carry illegal drugs. Penalties include heavy fines and long prison sentences. ● Inciting rebellion against the government attracts the death penalty. ● Be careful when taking photos. It's illegal to photograph military zones, assets and personnel. It's also illegal to take photos of transport facilities and government buildings. ● Same-sex sexual activity isn't explicitly illegal. However, it's illegal to act in a way that's 'contrary to accepted standards of behaviour.' Same-sex relations may fall into this category. ● Mali recognises dual nationality. ● Islamic codes of dress and behaviour apply. Take care not to offend.
Health Risks	● Yellow fever occurs throughout Mali. Get vaccinated before you travel. ● Other insect-borne diseases include dengue and malaria. Ensure your accommodation is insect-proof. Use insect repellent. Consider taking anti-malarial medication. ● The HIV/AIDS infection rate is high. Take precautions if you're taking part in high-risk activities. ● Common waterborne, foodborne, parasitic and other infectious diseases include cholera, hepatitis and meningitis. Drink only boiled or bottled water. Avoid raw or undercooked food. ● Medical facilities and expertise in Bamako are limited. They're worse in rural areas. If you're seriously ill or injured, you'll need medical evacuation. Ensure you have enough money to cover this.
Weather	● Flooding can disrupt services during the rainy season (June to September). Follow local advice.
Other	● If you decide to travel to Mali, you'll need to get a visa. Contact your nearest Malian embassy for details. ● Carry your yellow fever vaccination certificate. You'll need it to enter Mali. ● The local currency is the West African CFA Franc (XOF). Exchange traveller's cheques at major banks. ATMs are limited. Some major hotels in Bamako accept credit cards, but not many places outside the capital do. Make sure you have enough cash. ● To drive you need a driver's licence and an International Driving Permit (IDP). Get your IDP before you travel. Only travel by road if you have proper security measures in place. Get professional security advice. ● Public transport is dangerous due to the security environment. Don't use it.

Mauritania

Threat Level High threat level to personal safety, take a range of extra precautions here.	**Threat Level** Provinces of Tiris Zemmour, Adrar, Tagant, Hidh ech Chargui, Hodh El Gharbi, Assaba and Guidimaka, Within 25 kilometres of Mauritania's northern border with Western Sahara, do not travel.					**Latitude / Longitude** 21.007890, -10.940835 **GPS Position** 21° 0' 28.404" N 10° 56' 27.006" W

Crime	● Terrorists could attack places popular with foreigners or linked to the government. Avoid places visited by foreigners. Don't sit in open terraces or cafes. ● Kidnapping is a threat across the country. Westerners are mainly kidnapped from remote or desert areas. If you decide to travel to Mauritania, get professional security advice. Avoid unnecessary travel to remote areas. Arrange personal security measures. ● Armed thieves often attack people in cars and beach areas. Carjackings by people smugglers are increasing. Keep car doors locked and windows up, even when moving. ● Pickpocketing and other petty crimes are common. Keep valuables out of sight. Pay close attention to your personal safety. ● Fake internet friendship, dating and marriage schemes operate from West African countries. Be wary of requests to send money or travel to Mauritania from someone you met online. ● Protests have happened across Mauritania since 2012, including in the capital, Nouakchott. These can turn violent. Avoid large public gatherings.
Laws	● Don't use or carry illegal drugs. Penalties can include heavy fines or prison sentences, including for possessing small amounts of drugs. ● Same-sex sexual activity is illegal. ● Be careful when taking photos. It's illegal to photograph military sites, airports, and government and religious buildings without permission. ● Mauritania has strict religious laws. It's illegal to import non-Islamic religious materials or preach non-Islamic religion. ● Importing alcohol, pork products or firearms is against the law. It's also illegal for anyone to transport any form of alcohol, unless authorised. ● Dress and behaviour standards are conservative, especially for women. Avoid physical contact between men and women in public. Take care not to offend.
Health Risks	● Get full travel insurance before you leave, including medical costs and evacuation. You'll likely need a special policy that covers travel to high-risk places. Most policies won't cover you for travel to Mauritania. ● Malaria is a risk year-round in most areas. Consider taking anti-malarial medication. ● Other insect-borne diseases include dengue, Rift Valley fever and yellow fever. Ensure your accommodation is insect-proof. Use insect repellent. Get vaccinated against yellow fever before you travel. ● HIV/AIDS is a risk. Take precautions if you engage in high-risk activities. ● Waterborne, foodborne, parasitic and other infectious diseases are common. They include cholera, typhoid and hepatitis. Drink only boiled or bottled water. Avoid raw or undercooked food. Don't swim in fresh water. ● Medical facilities are limited, particularly outside Nouakchott. If you're seriously ill or injured, you'll need medical evacuation. Make sure your insurance covers this.
Weather	
Other	● Contact your nearest Mauritanian embassy for visa details. ● Carry your yellow fever vaccination certificate. You'll need it to enter the country. ● The local currency is the Mauritanian Ouguiya (UM). Some businesses that serve foreigners may accept euros, but most shops and restaurants prefer ouguiyas. ● Mauritania is a mainly cash economy. Not many places accept credit cards. You can't exchange traveller's cheques. Some ATMs in Nouakchott accept foreign cards. ● If you're travelling beyond Nouakchott register your plans with the local police or gendarmes. All travel outside of Nouakchott should be in a convoy with proper security. Check the credentials and references of desert guides. ● Unexploded landmines near the Western Sahara border can shift in sandstorms. Stick to well-travelled roads.

Niger

Threat Level Extreme threat to personal safety, recommended not to travel here.	**Threat Level** Niamey and areas south of the latitude of Niamey in the regions of Dosso and Tillaberi, reconsider your need to travel.					**Latitude / Longitude** 17.607789, 8.081666 **GPS Position** 17° 36' 28.0404" N 8° 4' 53.9976" E

Crime	● Terrorists are planning attacks against Westerners in Niger, including in Niamey. Terrorists could target places visited by foreigners, including hotels, cafes and restaurants. If you decide to travel to Niger avoid possible targets. Be alert to threats. Take official warnings seriously. ● Kidnapping is a risk across Niger, especially outside Niamey. Westerners are particularly at risk. Foreigners may be kidnapped from their homes, vehicles and workplaces. Get professional security advice. Arrange personal security measures. ● Violent clashes have occurred between security forces and armed groups in Agadez, Diffa, Zinder, Maradi and Tahoua. Many towns have curfews. Obey all curfews. ● Violent crime, including armed home invasions, kidnapping, carjacking and mugging, is common. Don't travel alone or after dark. ● Scams are common in West African countries, including Niger. Don't give out personal data or throw away personal documents.
Laws	● Don't use, carry or traffic illegal drugs. Severe penalties include heavy fines and long prison sentences. ● Always carry your passport with a valid visa or residence permit. ● Be careful when taking photos. It's illegal to photograph military personnel, zones and assets, radio and television stations, and airports. It's also illegal to take photos of the Presidency Building and diplomatic buildings, the Kennedy Bridge and political demonstrations. Ask permission before taking photos of locals. ● Niger doesn't recognise dual nationality. ● Standards of dress and behaviour are conservative. If you're a woman, wear a headscarf and loose clothes that cover your arms and legs.
Health Risks	● Yellow fever and malaria are common. Ensure your accommodation is insect-proof. Use insect repellent. Get vaccinated against yellow fever before you travel. Consider taking anti-malarial medication. ● The HIV/AIDS infection rate is high. Take precautions if you engage in high-risk activities. ● Waterborne, foodborne and other infectious diseases are common. These include cholera, rabies, hepatitis, polio and bilharzia. Drink only boiled or bottled water. Avoid raw or undercooked food. Don't swim in fresh water. Ensure your polio vaccinations are up to date. ● Medial facilities in Niamey, including emergency help, are limited and poor-quality. Outside the capital, they're inadequate or non-existent. If you're seriously ill or injured, you'll need medical evacuation. ● Get full travel insurance that covers medical costs and evacuation. You'll probably need a special policy that covers travel to high-risk places. Most policies won't cover you for travel to Niger.
Weather	● Floods and landslides may block roads during the rainy season (June to October). During the dry season (November to May), Niger can be affected by the Harmattan. This seasonal wind causes sand and dust storms. It may affect you if you have a breathing condition. Follow the advice of local officials.
Other	● If you travel to Niger you'll need a visa. Contact your nearest Nigerien embassy or consulate for details. ● Carry your yellow fever vaccination certificate. You'll need it to enter the country. ● Niger is a cash-based society. You generally can't use credit cards, even in hotels and restaurants. There aren't any ATMs. Bring enough cash to cover your needs. ● Landmines are a risk throughout the country, including in Niamey. Talak Plains and the Agadez region are dangerous. ● You'll need a 4WD to travel outside the capital. If you decide to travel outside south-west Niger, drive in a convoy with a local guide. Only travel during daylight. Carry a satellite phone and first-aid kit. ● Taxis are old and in poor condition. Don't use public transport due to poor road conditions and the risk of violent crime. Hire a private car with a professional driver.

Nigeria

	Threat Level Edo, Ekiti, Kwara, Lagos, Ogun, Ondo, Osun and Oyo states, exercise a high degree of caution.	**Threat Level** High threat level to personal safety, take a range of extra precautions here.	**Threat Level** Adamawa, Bauchi, Borno, Gombe, Kano, Kaduna and Yobe states, Riverine areas (coastal) of Akwa Ibom, Bayelsa, Cross Rivers, Delta and Rivers states, do not travel.	 	**Latitude / Longitude** 9.081999, 8.675277 **GPS Position** 9° 4' 55.1964'' N 8° 40' 30.9972'' E

Crime	● There's a high risk of terrorist attacks in Nigeria by militant groups. Possible targets include government and security sites, international organisations, embassies, oil infrastructure, tourist and public areas, transport and airports. Avoid popular hotels and crowds. If you must visit a crowded place, have a clear exit plan. ● The kidnapping threat is high. If you travel to a high-risk area, get professional security advice. ● Political gatherings and protests happen often in major cities. Long-standing tribal, religious, political and community arguments may also turn violent. Be prepared for disruptions. Avoid large gatherings. ● Nigeria's crime rate is high. Crime increases at night and includes assault, armed robbery, home invasions and carjacking. Assaults and robberies are common on public transport and in taxis. Petty crime is common in crowds. Don't travel after dark. Don't visit banks or use ATMs alone. ● Criminals may pose as police or military, or company representatives at airports and hotels. Arrange pick-ups with someone you know. Always keep your car doors locked and windows up, even when moving. ● Internet romance, friendship and employment scams often start in Nigeria. If you travel to Nigeria as a scam victim, you may be in danger. Be wary of online contact from people you don't know. Don't send money until you've checked who you're sending it to.
Laws	● Don't use or carry illegal drugs. Penalties for drug offences are severe. They include long prison sentences and large fines. ● Serious crimes, such as murder and armed robbery, can attract the death penalty. ● Nigeria has strict laws against same-sex activity. Avoid public displays of affection and cross-dressing. Under Sharia law, same-sex activity is punishable by death in many northern states. There are also harsh punishments for stealing and adultery. ● Be careful when taking photos. It's illegal to photograph government or military sites, diplomatic premises, airports and bridges. Smoking in public and littering are also against the law. ● Get written permission from the Department of Antiquities if you want to export African art or antiques. Nigeria also has restrictions on importing some foods and drinks, as well as textiles, jewellery and precious metals. ● Behave and dress conservatively, especially outside of urban areas.
Health Risks	● HIV/AIDS is common. Take precautions if you engage in high-risk activities. ● Yellow fever is widespread. Get vaccinated before you travel. ● Other common insect-borne diseases include malaria and dengue. Ensure your accommodation is insect-proof. Use insect repellent. Consider taking anti-malarial medication. ● Lassa fever may be a risk in several states. Foodborne, waterborne and other infectious diseases include cholera, typhoid, hepatitis and monkeypox. Drink only boiled or bottled water. Avoid raw or undercooked food. Don't swim in fresh water. ● Polio is widespread. Check your vaccinations are up to date before you travel. ● Medical facilities outside Nigeria's major cities are basic. You may need to pay up-front. If you're seriously ill or injured, you'll need medical evacuation. Ensure your travel insurance covers this.
Weather	
Other	● You need a visa or residence permit to visit Nigeria. Some travellers can get a visa on arrival. But you need to get a letter of approval before you travel. Contact a Nigerian embassy or consulate for advice. ● If you have HIV/AIDS, you may not be able to enter Nigeria. You may need an HIV test if you plan to marry a Nigerian citizen. Carry your yellow fever vaccination certificate. ● The local currency is the Nigerian Naira (NGN). Nigeria is a mainly cash economy. It's difficult to change traveller's cheques or Australian dollars. Exchange US dollars at major hotels, banks and foreign exchange services. You generally can't use foreign credit and debit cards. ● Get a local driver's licence if you want to drive. Always carry your ID and car registration to show at checkpoints. Carry extra fuel and don't drive at night. When travelling outside major cities, carry bottled water, a full first aid kit and multiple ways to communicate. ● Regular taxis and motorcycle taxis are dangerous. Use car hire services with a local driver. These are available at most major hotels. Don't use public transport due to safety issues and the risk of crime. ● Piracy, hijacking, kidnapping and armed robbery occur in Nigerian waters. Check the International Maritime Bureau's piracy reports.

Senegal

	Threat Level Moderate threat level to personal safety, take extra precautions here.	**Threat Level** Casamance region of southern Senegal, except Cap Skirring, Ziguinchor and the main road between these cities, reconsider your need to travel.						**Latitude / Longitude** 14.497401, -14.452362 **GPS Position** 14° 29' 50.6436'' N 14° 27' 8.5032'' W

Crime	● Protests are common near government buildings and in public areas. These can turn violent. Avoid large public gatherings. ● Civil unrest occurs near the border with Guinea. Military operations sometimes happen. Take care if you travel to this area. ● Armed bandits and separatist groups operate in the Casamance region. Landmines are in this area, especially near the Guinea-Bissau border. The risk is lower in the cities of Cap Skirring and Ziguinchor. If you travel to these cities, travel directly by air, sea or only on the main road between them. If you travel elsewhere in the Casamance region, don't travel after dark. Be aware of your personal security. ● Pickpockets, bag snatchers and thieves on motorbikes are common in large crowds. Muggings and robberies occur. Criminals target foreigners, especially at night. Don't walk after dark. Always lock your doors, even when you're inside. ● Online friendship, romance and business scams often start in West Africa, including Senegal. Scammers may ask you to send money or meet them in Africa. Be wary of online contact from people you don't know. Don't send money until you've checked who you're sending it to. ● Terrorism is a threat. Possible targets include hotels and other places Westerners visit. Remote regions are also vulnerable to terror attacks, including near the borders with Mauritania and Mali. Always have an exit plan if you have to visit a possible terror target.
Laws	● Don't use or carry illegal drugs. Penalties for drug offences are severe. They include long jail terms. ● Always carry photo ID. Officials can detain you if you can't show it on request. ● Don't drink and drive. Driving after drinking any amount of alcohol is illegal. ● Same-sex relations are against the law. ● Be careful when taking photos. It's illegal to photograph government buildings, official facilities and airports. ● Get customs approval if you want to import auto parts, computers and computer parts, stereo equipment or video cameras. ● Senegal's dress and behaviour standards are conservative. If in doubt, seek local advice.
Health Risks	● Yellow fever is common in Senegal. Get vaccinated before you travel. ● Other insect-borne diseases include malaria and dengue. Ensure your accommodation is insect-proof. Use insect repellent. Consider taking anti-malarial medication. ● The rate of HIV/AIDS infection is high. Take precautions if you're taking part in high-risk activities. ● Common waterborne, foodborne and other infectious diseases include cholera, typhoid and hepatitis. Drink only boiled or bottled water. Avoid raw or undercooked food. ● Medical facilities in Senegal are limited, especially outside Dakar. You may need to pay cash up-front, even in an emergency. If you're seriously ill or injured, you'll need medical evacuation. Ensure your travel insurance covers this.
Weather	
Other	● Carry your yellow fever vaccination certificate. You'll need it to enter the country. ● The local currency is the Central African Franc (CFA Franc or XAF). ● It's difficult to exchange Australian dollars. Exchange US dollars and euros at commercial banks and exchange services. Major hotels in Dakar accept credit cards. There are ATMs in Dakar, but not outside the capital. Bring enough cash to cover your stay. ● Only use registered taxis and limousines. Arrange these through your hotel. ● Don't use public transport. Vehicles are poorly maintained and roads are unsafe. ● Ferry travel is risky due to low safety standards and bad weather. There may be too many passengers and not enough life jackets. Always wear a life jacket, even if others don't.

Sierra Leone

	Threat Level Moderate threat level to personal safety, take extra precautions here.							**Latitude / Longitude** 8.460555, -11.779889 **GPS Position** 8° 27' 37.998'' N 11° 46' 47.6004'' W

Crime	● Crime levels are high, including in Freetown. Common crimes include armed robbery, violent assault, burglary, pickpocketing and bag snatching. Crime increases at night. Criminals sometimes target foreigners. Don't walk in isolated areas or along dark streets. Lock your doors, even when you're inside. ● Refugees and displaced people cross the border between Sierra Leone and Guinea. Smugglers and criminal gangs operate in border areas. Violent clashes can occur. There's also unrest near the border with Liberia. ● Online friendship, romance or business scams often start in West Africa, including Sierra Leone. People who travel to meet someone they've met online are at risk of kidnapping, assault or robbery. Be wary of contact from people you don't know in Sierra Leone. Don't send money to anyone in Sierra Leone until you've confirmed their identity.
Laws	● Don't use or carry illegal drugs. Penalties for drug offences include mandatory jail terms. ● It's illegal to export precious minerals without a licence from the Ministry of Mines and Resources. ● Be careful when taking photos. It's illegal to take photos or videos of government buildings, airports or bridges. These areas may not have signs. If you're unsure, don't take photos. ● It's illegal to engage in same-sex relationships. ● Sierra Leone doesn't recognise dual nationality. ● Dress and behaviour standards are conservative, particularly for women. Take care not to offend.
Health Risks	● Lassa fever is a risk in all West African countries. The virus can be fatal and there's no vaccine. It passes to humans via contact with food or household items contaminated with rodent droppings. Avoid contact with rodents. Ensure food is well-cooked and covered. ● In 2016, an Ebola outbreak occurred. If there's another outbreak, your access to medical care may be severely limited. Ensure your insurance covers healthcare or medical evacuation costs if you get Ebola. ● Yellow fever, malaria and other insect-borne diseases are common. Ensure your accommodation is insect-proof. Use insect repellent. Get vaccinated before you travel. Consider taking anti-malarial medication. ● The HIV/AIDS infection rate is high. Take precautions if you engage in high-risk activities. ● Common foodborne, waterborne, parasitic and other infectious diseases include cholera, hepatitis, bilharzia (schistosomiasis) and tuberculosis. Drink only boiled or bottled water. Avoid raw or undercooked food. Don't swim in fresh water. ● Medical facilities are limited in Sierra Leone. You'll have to pay up-front. If you're seriously ill or injured, you'll need medical evacuation. Ensure your travel insurance covers this.
Weather	● Sierra Leone has strong coastal currents. There are no lifeguards or emergency services to rescue swimmers. Get local advice before swimming. Don't swim alone. ● The rainy season is November to May. Floods can block roads, destroy infrastructure and displace people. Monitor weather reports and be prepared to change your travel plans.
Other	● You'll need a visa to enter Sierra Leone. Contact your nearest embassy or consulate of Sierra Leone for details. ● Carry your yellow fever vaccination certificate. You'll need it to enter the country. ● The local currency is the Sierra Leone Leone (SLL). Euros and US dollars are the easiest foreign currencies to exchange. Only exchange money at banks and official exchange bureaus. Most places won't accept credit cards. There aren't many ATMs in Freetown. Ensure you have enough cash to meet your needs. ● All transport options between Lungi International Airport and Freetown carry risks, including overcrowding, poor maintenance and crime. Risks increase after dark. If you arrive at night, stay overnight at Lungi and transfer to Freetown the next morning. Arrange airport accommodation and transfers before you travel. ● Road travel outside the Freetown Peninsula is dangerous, especially at night. Always carry ID, vehicle registration and ownership papers. Keep your windows up and doors locked, even when moving. ● Ferry travel is risky due to low safety standards, overcrowding and bad weather. Always wear a life jacket, even if others don't.

4 Asia

The Asian region. The colour shading and travel advice on the map is the advice given by the Australian Government and is accurate as of the 20th Feb 2025. However countries risk ratings rarely change so this could be considered accurate advice going into the forseeable future.

Subheadings

		1. Central Asia		**2. North Asia**	**3. South Asia**	**4. South East Asia**		

1 Central Asia

Kazakhstan

	Threat Level Exercise normal safety precautions.							**Latitude / Longitude** 48.019573, 66.923684 **GPS Position** 48° 1' 10.4628" N 66° 55' 25.2624" E

Crime	● Theft, pickpocketing, bag-snatching, assaults, drink spiking and carjacking occur. The risk of crime increases at night. Avoid walking alone at night. Monitor the media for new safety risks. Never leave your drink or food unattended. ● Expats have been the victims of violent attacks and muggings. Criminals have targeted expat communities in Atyrau and Aktau in western Kazakhstan. ● Thieves posing as police officers or 'meet-and-greet' drivers at airports have robbed travellers. Pre-arrange your transport if you can. If approached by a police officer, driver or official, ask to see their ID. ● There have been tensions around the border with the Kyrgyz Republic. Avoid large gatherings and protests. Keep up to date on new security risks in the border regions. ● Terrorism is a threat in Kazakhstan. Targets may include places popular with foreigners. Be alert to possible threats, especially in public places. Monitor the media for new threats.
Laws	● Penalties for drug offences are severe and include long prison sentences. Serious crimes, such as murder, may attract the death penalty. ● Be careful when taking photos. It's illegal to take photos of airport facilities, near military and security establishments and near border areas. It's also illegal to take photos near some official buildings. Some places, including larger shops and supermarkets, ban photography. ● You may need to get official documents before you travel if you plan to live or work for long periods in Kazakhstan or you plan to marry there. Contact an embassy or consulate of Kazakhstan before you travel. ● Always carry your passport or a certified copy with your registration. Identity checks by police are common. ● It's illegal to drive if your blood alcohol exceeds 0%. ● Kazakhstan doesn't recognise dual nationality. This may limit the consular help you can access.
Health Risks	● Ticks are common in forested areas, especially from spring to autumn. Tick bites can expose you to disease. Regularly check your body for ticks during and after visits to forest areas. ● Declare all prescription medication and other restricted items on arrival. You could face charges if you don't declare medication or if you exceed the legal limit. ● HIV/AIDS is prevalent. Take precautions if engaging in activities that expose you to the virus. ● Other infectious diseases include typhoid, hepatitis, haemorrhagic fever, tuberculosis, brucellosis, leishmaniasis and rabies. Drink only boiled or bottled water. Avoid ice cubes in rural areas. Avoid unpasteurised dairy products and raw or undercooked food. If an animal bites or scratches you, get immediate medical help. ● Medical facilities in Kazakhstan are below first world standards. Basic drugs and equipment are in short supply. You may need to pay up-front for treatment, including for emergency care.
Weather	● Earthquakes and severe weather occur. People have died in snow-related accidents in recent years. Monitor local media and other sources, such as the Global Disaster Alert and Coordination System.
Other	● You don't need a visa to stay up to 30 days. For longer stays, you'll need to get a visa before you travel. You'll also need a medical certificate of a negative HIV test. If you overstay your visa or breach your visa conditions, authorities may fine, imprison or deport you. Contact the nearest embassy or consulate for details. ● Officials will issue you with a migration card when you enter. You'll need it to check into hotels, to conduct any official business and to leave Kazakhstan. If you didn't get a migration card or your card contains only 1 stamp, contact the nearest Migration Police office. ● Strict border controls apply to road travel between Almaty in Kazakhstan and Bishkek in the Kyrgyz Republic. You need permission from the Kazakh government before you travel to certain regions and towns. ● Declare amounts over $US10,000 on arrival and departure. Cash payments are preferred. Only change your money at commercial banks and exchange bureaus. ● Use only registered taxis and limousines. Avoid public transport. Local buses and mini-buses have poor safety standards and maintenance. Rail travel can be unreliable and dangerous due to petty crime.

Kyrgyz Republic

	**Threat Level** Moderate threat level to personal safety, take extra precautions here.	**Threat Level** Kyrgyz-Uzbek and Kyrgyz-Tajik border areas and the Ferghana Valley, reconsider your need to travel.				**Latitude / Longitude** 41.204380, 74.766098 **GPS Position** 41° 12' 15.768'' N 74° 45' 57.9528'' E

Crime	● Security is volatile in the Kyrgyz-Uzbek and Kyrgyz-Tajik border areas. This includes the Ferghana Valley. Crime, civil unrest, terrorist activity, clashes and landmines are a risk. Security forces monitor border areas and often conduct operations there. ● Violent crime, kidnapping, robbery, mugging and pickpocketing occur. Criminals can pose as police or 'meet-and-greet' drivers at the airport. The risk of crime increases at night. Always be alert to your surroundings. Avoid walking at night, especially if you're alone. ● Terrorist attacks have happened in Kyrgyzstan. Targets have included places popular with foreigners. Be alert to possible threats, especially in public places. ● Cases of unauthorised withdrawals are reported after people have used ATMs or EFTPOS machines. Use ATMs in controlled areas, such as in banks or large hotels. Check for skimming devices. Keep your credit card in sight when paying for things. ● Drink spiking is a risk. Don't accept food, drinks, gum or cigarettes from strangers. Never leave your food or drink unattended.
Laws	● Don't use or carry illegal drugs. Severe penalties include long prison sentences and heavy fines. ● You need a Certificate of No Impediment to Marriage if you're planning to get married in the Kyrgyz Republic. ● It's illegal to drive with a blood alcohol reading over 0%. It's illegal to take photos of military and security establishments. Always carry your passport, or a certified copy, at all times. It's the law and ID checks by police are common. ● Standards of dress and behaviour are conservative. Displays of affection, even between married couples, can offend. Police may harass or detain you. Take care not to offend. If in doubt, dress modestly and seek local advice.
Health Risks	● Malaria is common in the southern and western parts of the country. Other insect-borne diseases occur, including leishmaniasis. Use insect repellent. Make sure your accommodation is insect-proof. Consider taking anti-malarial medication. ● Ticks carrying encephalitis are common in forested areas from spring to autumn. Check your body for ticks during and after visits to forest areas. ● Other infectious diseases include typhoid, hepatitis, meningitis, tuberculosis, brucellosis and rabies. Drink only boiled or bottled water. Avoid raw or undercooked food and unpasteurised dairy products. If an animal bites or scratches you, get immediate medical help. ● Medical facilities in Bishkek are limited. In remote areas, they're basic. Medical equipment and medicines are in short supply.
Weather	● There's a high risk of earthquakes in the Kyrgyz Republic. Tremors, avalanches and landslides are common. People have died in snow-related accidents in recent years. Monitor local media and other sources, such as the Global Disaster Alert and Coordination System.
Other	● You don't need a tourist visa to stay up to 60 days. You can apply for an e-visa for tourism and business for up to 90 days. You may need to register your details with the State Registration Service if you'll stay longer than 60 days. ● There are some HIV/AIDS restrictions for visitors and residents. You'll need an HIV test to apply for a work visa. Check with an embassy or consulate of the Kyrgyz Republic before you travel. ● Kyrgyzstan's borders can close without notice. Strict border controls apply on the road between Bishkek and Almaty in Kazakhstan. Expect delays at border crossings. Check the border conditions with local authorities. ● The economy is mostly cash-based. Only a few of the major hotels accept traveller's cheques and credit cards. ● Local buses, minibuses and taxis are often poorly maintained. Use registered taxis or authorised limousines arranged through your hotel.

Tajikistan

	**Threat Level** Moderate threat level to personal safety, take extra precautions here.	**Threat Level** Border regions with the Kyrgyz Republic, Uzbekistan and Afghanistan, Gorno Badakhshan Autonomous Oblast, reconsider your need to travel.				**Latitude / Longitude** 38.861034, 71.276093 **GPS Position** 38° 51' 39.7224'' N 71° 16' 33.9348'' E

Crime	● Terrorist attacks have happened in Tajikistan. There have also been explosions in some locations, including Dushanbe, in recent years. Be alert to possible threats, especially in public places. Be cautious when visiting possible terrorist targets. Take official warnings seriously and follow the advice of local authorities. ● Political violence has happened in the Gorno-Badakhshan Autonomous Oblast (GBAO). Extra security measures are in place. ● Clashes have occurred in north-east Afghanistan close to the border with Tajikistan. The region bordering Afghanistan is also a transit point for drugs and other smuggled goods. Armed conflict continues and may affect regions of Tajikistan. ● Pickpocketing is common in Dushanbe and on international rail services. Women can be verbally and physically harassed. Criminal activity increases after dark. Take particular care if travelling alone or at night.
Laws	● Don't use or carry illegal drugs. Penalties for drug offences include lengthy imprisonment in local jails. ● You must carry a copy of your current passport and visa at all times. ● It's illegal to drive with a blood alcohol level above zero. It's illegal to smoke on the street. It's illegal to take artefacts or cultural items out of Tajikistan without official permission. ● Be careful when taking photos. It's illegal to photograph sensitive sites, including transport facilities, government buildings and military zones, assets and personnel. ● Tajikistan doesn't recognise dual nationality. Tajik authorities may insist you enter Tajikistan on your Tajik passport.
Health Risks	● Some sleeping tablets and medication containing codeine are restricted in Tajikistan. If you intend to bring medication, confirm it's legal and check the rules that apply. Declare all medications and other restricted items on arrival. If you don't, or if the amount you're carrying is over the legal limits, you could face charges. ● Malaria is a risk. Ticks are very common in forests and country areas from spring to autumn. Check your body for ticks during and after travel in forests. Ensure your accommodation is insect-proof. Use insect repellent. ● Other infectious diseases include tuberculosis, cholera, typhoid, brucellosis, hepatitis and rabies. Drink only boiled or bottled water. Avoid raw or undercooked food. If an animal bites or scratches you, get immediate medical help. ● Unprotected uranium and pesticide waste dumps in the northern Sughd Region may pose a health risk. Seek local advice. ● Medical facilities and services are limited in Tajikistan, and there's a shortage of equipment and medications. Hygiene is poor. Doctors require up-front payment before providing treatment.
Weather	● Earthquakes, avalanches, mudslides and floods happen in Tajikistan. Closely monitor local media and other sources, like the Global Disaster Alert and Coordination System. Follow the advice of local authorities.
Other	● You need a visa to visit Tajikistan. Your passport must be valid for at least 6 months and have 2 empty pages. You can get a standard sticker visa at an embassy or consulate of Tajikistan, or an electronic visa through eVisa system. ● You need to register with the local Visa and Registration Office if you're staying in Tajikistan for more than 3 days and haven't entered on a 30-day tourist visa. You can also ask your hotel to register you. ● You need a permit to visit the GBAO. If you decide to travel to Tajikistan apply at the Ministry of Foreign Affairs or OVIR in Tajikistan. ● Tajikistan's borders can close without notice. Ask local authorities which border crossings are open and if you can use them. ● Declare any money you bring into Tajikistan on arrival. Present your customs declaration form when you leave. ● Public transport is often overcrowded and unsafe. Bus and train services are unreliable. Train travel can also be dangerous due to criminal activity. Use taxis booked through your hotel.

Turkmenistan

	**Threat Level** Exercise normal safety precautions.	**Threat Level** Turkmenistan/Afghanistan Border, do not travel.				**Latitude / Longitude** 38.969719, 59.556278 **GPS Position** 38° 58' 10.9884'' N 59° 33' 22.6008'' E

Crime	● Pickpocketing, mugging and theft occur. The risk is higher on trains and at markets. Don't go out alone, especially at night. ● Criminals target travellers using unofficial taxis. Always book a licensed taxi. Don't get into taxis that are already occupied. ● Police and other local officials have reportedly harassed, mistreated and extorted foreigners. ● Bandit gangs are active in the south-eastern area of the country. ● If you travel to the region bordering Afghanistan monitor local and international media for updates. The security situation is extremely dangerous. Consular help is extremely limited.
Laws	● You must always carry ID. Security officials often ask for proof of identity. Ask for identification if you are unsure the person is an official. ● Penalties for drug offences are severe. They include long prison sentences. ● It's illegal to have sexual relations between males. It's illegal to drive with a blood alcohol reading over 0%. It's illegal to smoke in restaurants, hotels and public spaces or gift tobacco. ● It's illegal to photograph sensitive sites. Take care when taking photos of infrastructure. Always check with local authorities beforehand. ● Turkmenistan doesn't recognise dual nationality. This may limit consular help we can give to dual nationals who travel on a Turkmen passport. ● Obvious displays of affection, even between married couples, may offend. Police may harass or detain you.
Health Risks	● Some sleeping tablets and medications containing codeine may be restricted. Check legal limits before you travel and declare all prescription medication and other restricted items on arrival. ● Infectious diseases include cholera, hepatitis, measles, tuberculosis and typhoid. Drink only boiled or bottled water. Avoid raw or undercooked food. ● Medical facilities are limited. Medicines and equipment are often in short supply. You may need to pay cash up-front to receive treatment.
Weather	● Earthquakes are a higher risk in the south-west and north-east regions. Register with the Global Disaster Alert and Coordination System to receive alerts on major disasters.
Other	● You need a visa for Turkmenistan, even if you're only transiting. Get a visa before you arrive. There are penalties for overstaying your visa. ● When you arrive, you must present a migration card. Pay a registration fee and register with the State Migration Service within 3 working days of arrival. ● If you're travelling with a child, you may need evidence of parental, custodial or access rights. You may also need a letter of consent from any non-travelling parent. ● Customs rules control the import or export of items, including jewellery, musical instruments, antiques and protected animals. It's illegal to export artefacts or cultural items, including carpets, without a certificate from the Ministry of Culture. ● You must declare any foreign currency when you arrive and depart. Exchange any unspent local currency before you leave. You may not be able to exchange local currency outside Turkmenistan. ● Designated restricted zones are closed to foreigners who don't have government permission.

Uzbekistan

	**Threat Level** Moderate threat level to personal safety, take extra precautions here.	**Threat Level** Andijan and the eastern region of the Ferghana Valley; Regions bordering Tajikistan, Kyrgyz Republic and Afghanistan, reconsider your need to travel.				**Latitude / Longitude** 41.377491, 64.585262 **GPS Position** 41° 22' 38.9676'' N 64° 35' 6.9432'' E

Crime	● Terrorist attacks have happened in Uzbekistan. Future terrorist attacks could target places popular with foreigners. Be alert to possible threats, especially in public places. ● Security threats are more severe in Uzbekistan's border regions. Landmines are also a risk. If you decide to travel to border regions pay close attention to your personal security. Monitor the media for new risks. ● Demonstrations can turn violent. Violent protests are more common in Andijan and the eastern region of the Ferghana Valley. Avoid large gatherings and protests. Follow the advice of local authorities. ● Pickpocketing and robbery can occur. Thieves target travellers. The risk is higher on trains and in unofficial taxis. More crimes happen at night. Carry only what you need and don't walk alone. ● Some criminals pose as police officers to rob people. There have been reports of harassment, mistreatment and extortion by police and other local officials.
Laws	● Penalties for drug offences are severe and include long jail terms. ● Always carry your passport and visa. Police often ask for proof of identity. ● It's illegal to have sex outside of marriage or to have same-sex relations. ● It's illegal to take photos of government or military buildings and public transport sites. ● Uzbekistan doesn't recognise dual citizenship. This may limit the consular help we can provide. Dual nationals need a permit to depart Uzbekistan. They may also need to do national service. ● Standards of behaviour and dress are conservative. Take care not to offend. If in doubt, ask locals for advice.
Health Risks	● Uzbekistan has strict controls on importing certain medicines, including psychotropic medication. Sleeping tablets or medicines containing codeine may also be restricted. Declare all medication and other restricted items on arrival. ● HIV/AIDS is prevalent. Take steps to reduce your risk of exposure to the virus. ● Malaria and other insect-borne diseases occur. Use insect repellent. Make sure your accommodation is insect-proof. Consider taking anti-malarial medication. ● Ticks are active in country areas from spring to autumn. They can spread disease. Regularly check your body for ticks during and after visits to forest areas. Remove ticks from your body as soon as possible. ● Other infectious diseases include tuberculosis, typhoid, brucellosis, hepatitis and rabies. Drink only boiled or bottled water. Avoid raw or undercooked food. If an animal bites or scratches you, get immediate medical help. ● Medical facilities are limited and medicines and equipment are often in short supply. You may need to pay cash up-front before receiving treatment.
Weather	
Other	● You can enter Uzbekistan once and stay up to 30 days without a visa. You'll need a visa if you're staying longer than 30 days or if you need multiple entries. Check your visa details when you get it. The length of stay on your visa might differ from the length you applied for. ● If you'll stay 3 or more days, you'll need to register with local authorities. Register in each city you stay in. Check if your hotel has done this for you. ● Borders with neighbouring countries can close without notice. Some border crossings may only be open to local residents. Ask local authorities about border conditions before you travel.

2 North Asia

China

	Threat Level Exercise normal safety precautions.	**Threat Level** Tibet, Xinjiang, exercise a high degree of caution.				**Latitude / Longitude** 35.861660, 104.195397 **GPS Position** 35° 51' 41.976" N 104° 11' 43.4292" E

Crime	● Petty crime occurs. Criminals target travellers in crowded areas, including on public transport. Resisting can lead to violence. ● Scams targeting travellers can lead to loss of money, violence and serious assault. Report scams to the nearest police station. ● Armed attacks are a risk in remote border regions. Be careful if travelling in these areas. ● The Chinese Government strictly controls demonstrations. Authorities may arrest protesters. Avoid protests and large gatherings. Don't photograph or video protests. ● Security in the Xinjiang region is unstable due to ethnic tensions. Increased security measures are in place. Be ready to show photo ID if asked. ● There's civil unrest and political tension in Tibet. Get permission from Chinese authorities before you go. You can only travel to Tibet as part of an organised tour.
Laws	● Governments can't intervene in the Chinese justice process and can't help if you're a dual national and you don't travel on your other passport. ● Chinese law, treats a person aged 14 years and older as an adult. China has strict laws and severe punishments for crime including the death penalty and life imprisonment. ● You must always carry identification and show it to police if they ask. ● Chinese authorities undertake random drug testing on foreign nationals and can prosecute individuals who return a positive test result regardless of when or where drugs were taken. ● Many business and employment issues may be considered criminal matters in China. Penalties are severe. Get professional legal advice before entering into any employment or commercial contract in China. ● If you're a former Chinese citizen, authorities may treat you as a citizen and refuse access to consular services. Get legal advice if you're not sure of your citizenship status under Chinese law.
Health Risks	● Tap water in China may not be safe to drink, depending on your location. Drink only bottled water with intact seals. ● People have died from bird flu in China. Stay away from live poultry. When preparing food, handle poultry properly and make sure it is thoroughly cooked. ● HIV/AIDS is a significant risk in China. Take precautions if engaging in activities that expose you to risk of infection. Ask for sterilised equipment when receiving medical treatment. ● Animal and human rabies and hand, foot and mouth disease are common. Be careful with both wild and domestic animals in China. Wash your hands carefully and regularly. Take other hygiene precautions. ● High pollution levels are a problem in major cities. Follow advice from local authorities on days with bad pollution.
Weather	
Other	● You may need a full visa for travel to China, even as a tourist. Make sure you leave China before your visa expires. Strict penalties can apply. ● Authorities may not allow you to leave China if you're involved in a local legal matter. Get legal advice and be aware of your rights and responsibilities. ● If you're planning to visit Hong Kong or Macau from mainland China, you may need a new visa to re-enter mainland China. ● You must register your place of residence with the local Public Security Bureau. If you're staying at a hotel, this will be part of the normal check-in process. ● Authorities restrict travel by foreigners in China. If you plan to travel outside major tourist areas, check that the area is 'open to foreigners'.

Hong Kong

	Threat Level Exercise normal safety precautions.						**Latitude / Longitude** 22.396428, 114.109497 **GPS Position** 22° 23' 47.1408" N 114° 6' 34.1892" E

Crime	● Protests continue. There's a risk of violent confrontation between protesters and police, opposing groups or criminally-linked individuals. 'Flash mob' demonstrations can take place with little or no warning, with instances of violence and vandalism. Police have used tear gas, live ammunition, rubber bullets and pepper spray, including in popular tourist, residential and enclosed areas. ● Road closures, transport disruptions, including to the MTR and Airport Express, and closures of shopping centres and businesses can happen at short notice. If you are in Hong Kong, be alert. Plan ahead to avoid demonstrations by monitoring local media, including key online sources. If there are signs of disorder, move away quickly to a safe place. ● Violent crime is rare, but some petty crime happens. Thieves target tourist spots and crowded places, such as markets and trains. Take care of your belongings. ● Travellers have had drinks spiked in bars and nightclubs. This may lead to theft or credit card fraud. Don't accept food, drink, cigarettes or gum from strangers. Don't leave your drinks unattended. ● Scams are increasing. Scammers may ask for help carrying luggage, or ask for money. Fake arrests, lotteries, or schemes involving property, holiday clubs or timeshares occur. Never carry anything for someone you don't know. Do thorough research. Get legal advice before sending money or signing documents.
Laws	● Don't use, carry or traffic illegal drugs. Penalties include heavy fines and jail time. ● It's illegal to take part in public demonstrations without government approval. Avoid large public gatherings. ● Strict laws control importing or possessing weapons and items that look like weapons. Get a permit if you want to buy or carry such items legally. ● Importing or re-exporting elephant ivory products is illegal. Penalties include fines and jail time. ● Chinese law doesn't recognise dual nationality. But Hong Kong law allows dual nationals of Chinese descent to register their nationality with the Immigration Department.
Health Risks	● It's illegal to carry sleeping tablets and some medication without a prescription. Carry a copy of your prescription or a letter from your doctor. ● Hong Kong has very high humidity from May to October. Reduce physical and outdoor activities on very humid days. ● Hong Kong can have very high pollution levels. If you have a heart or breathing condition, do less physical activity when the air quality index health risk is high. ● Hand, foot and mouth disease (HFMD) is common. It mostly affects children aged under 10 years, but adult cases occur, particularly in young adults. Wash your hands thoroughly and often. ● Waterborne, foodborne and other infectious diseases including bird flu sometimes occur. Drink only boiled or bottled water from bottles with sealed lids. Avoid raw or undercooked food. Avoid contact with animals. ● Hong Kong's Department of Health checks for Middle East respiratory syndrome coronavirus at border control points. If you have flu-like symptoms, officials may send you to a public hospital until you test negative for it.
Weather	● Hong Kong experiences typhoons. If the warning level is Typhoon 8 or above, businesses, transport services and consulates will close. Follow advice from local officials. Contact your travel operator about delays.
Other	● Hong Kong has separate immigration regulations to China. You generally won't need a tourist visa if you stay less than 90 days. In all other cases, you'll need a visa. Contact the Hong Kong Economic and Trade Office in Sydney for details. ● If you're travelling from Hong Kong to the China (PRC), you'll need a PRC visa. If you enter the Shenzhen Special Economic Zone, you can apply for a visa at the Shenzhen-Hong Kong border. ● Cheap unlicensed guesthouses operate in Hong Kong. They may not have the same safety and security standards as licensed ones. If you stay in a guesthouse, make sure it's licensed. ● Use only licensed taxis and reputable limousine services. Insist taxi drivers use the meter. If you have a dispute with a taxi driver about the fare, ask for a receipt. Record the taxi driver's licence number and contact the police.

Japan

	**Threat Level** Exercise normal safety precautions.	**Threat Level** Areas 1 and 2 near the Fukushima Dai-ichi power plant, exercise a high degree of caution.	**Threat Level** Area 3 near the Fukushima Dai-ichi power plant, do not travel.			**Latitude / Longitude** 36.204824, 138.252924 **GPS Position** 36° 12' 17.3664'' N 138° 15' 10.5264'' E

Crime	● You must carry your passport (or Japanese residency card) at all times. ● Regional tensions, including with North Korea, could worsen with little warning. Review Japan's preparing for emergencies advice. ● Japan has a low crime rate. Petty theft happens, such as bag snatching at popular tourist attractions. ● There's a risk of crime in bars and nightclubs. Crimes include overcharging, credit card fraud, drink spiking and assault. Avoid street touts who try to get you into venues. Don't carry credit cards or lots of cash to bars, clubs or parties.
Laws	● Don't use or carry illegal drugs. Authorities can charge you if they find trace amounts of illegal drugs in your blood or urine. ● Japanese family law, including divorce and child custody, is very different to first world law. If you're involved in custody or other family disputes, consult a lawyer before you leave your country. ● Some employment agents mislead and encourage foreigners to work in Japan without the correct paperwork. If you want to work in Japan, verify the work offered. Get the correct visa. Get legal advice before signing a contract. ● If you're visiting for less than 90 days, always carry your passport. If you live in Japan, always carry your residence card. ● Japan has strict alcohol laws. The legal drinking age is 20. It's illegal to drive with any alcohol in your bloodstream. Allowing someone who has been drinking to drive is also illegal. ● Smoking on the street is illegal in Tokyo and some other cities. ● It's illegal to fly drones without a permit in many areas of Japan. ● Laws introduced in 2019 restrict alcohol consumption in specific areas on certain days, such as in Shibuya on Halloween night (31 October) and New Year's Eve.
Health Risks	● Japan has strict rules about bringing medicine into the country, including some ingredients in ADHD and cold and flu medication. If you plan to bring medication, check if it's legal before you travel. ● Restricted zones exist around the Fukushima Dai-ichi nuclear power plant. The 2011 earthquake caused the release of lethal radiation. Radiation levels in most parts of Japan, including Tokyo, are within the normal range. ● Japanese encephalitis occurs in rural areas. Ensure your accommodation is insect-proof. Get vaccinated against Japanese encephalitis. ● Outbreaks of measles and rubella have been reported in recent years. Make sure your vaccinations are up to date before you travel. ● Medical facilities are of a high standard. You can find English-speaking medical staff in most major cities. You may need to pay up-front before you're treated.
Weather	● The typhoon season is from May to November. Follow local media updates. Maintain a basic emergency supply kit. Know where your nearest shelter is. ● There's a constant risk of earthquakes and tsunamis. Get emergency plans for your area from local or prefectural government offices. Know where your local shelter is. Move to higher ground straight away if you're in a coastal region after a major earthquake. ● Japan experiences heavy snowfalls and extremely low temperatures in winter. If you're skiing in Japan, use protective equipment. Only visit areas that local authorities mark as safe.
Other	● In some cases, you don't need a visa if you're visiting for fewer than 90 days. These include tourism, business or family visits. Carry proof of your funding, an onward or return ticket, and your accommodation bookings. ● For other situations, contact the nearest Japanese embassy or consulate to check if you need a visa. If you work in Japan on a tourist visa, authorities could prosecute you. ● The local currency is the Japanese Yen (JPY). Most places prefer cash. Hotels accept major credit cards, but many shops and services don't, especially outside major cities. Some ATMs at banks and convenience stores don't accept foreign cards. ● Don't climb Mount Fuji from September to June. This is when it's most dangerous. ● You can drive for up to 1 year with a driver's licence and an International Driving Permit. If you're staying longer, get a local licence. Heavy snowfalls and ice in the winter can make driving dangerous.

Macau

	Threat Level Exercise normal safety precautions.		**Latitude / Longitude** 22.198745, 113.543873 **GPS Position** 22° 11' 55.482'' N 113° 32' 37.9428'' E

Crime	● Violent crime is low in Macau. Pickpocketing and bag snatching occurs. Thieves target people in crowded places, such as shopping centres, markets, the airport and casinos. Watch your belongings, especially in crowds. ● Drink spiking happens. Don't accept food, drink, cigarettes or gum from strangers. Don't leave your food or drinks unattended. ● Be careful when using ATMs, as theft happens. Use ATMs in shops or banks rather than on the street. If someone approaches you, cancel your transaction before talking to them. ● Protests can turn violent. It's illegal to protest without government approval. Avoid large public gatherings.
Laws	● Don't use or carry illegal drugs. Penalties include heavy fines and jail terms. ● Macau has strict laws around importing and possessing weapons and items that resemble weapons. Get a permit if you want to import, carry or buy these items, including in local markets. ● Be careful when taking photos. It's illegal to photograph military sites. ● Always stay in licensed accommodation. If you don't, authorities may fine you. ● If you're a dual national of Chinese descent, you can register your citizenship with the Macau Identification Bureau. If you're travelling to mainland China, use your own countries passport.
Health Risks	● Macau can have severe air pollution. If you have a heart or breathing condition, avoid exercising or going outside on days of high pollution. ● Macau sometimes has outbreaks of dengue. Japanese encephalitis is also a risk. Ensure your accommodation is insect-proof. Get vaccinated against Japanese encephalitis before you travel. ● Hand, foot and mouth disease is common. It mostly affects children younger than 10, but adult cases occur, particularly in young adults. Wash your hands thoroughly and often. ● Waterborne, foodborne and other infectious diseases include tuberculosis and hepatitis. Avoid raw or undercooked food. ● Macau's medical facilities are adequate. You may need to pay up-front. If you're seriously ill or injured, you may need medical evacuation to Hong Kong. Ensure your travel insurance covers this.
Weather	● Macau experiences typhoons and severe weather. These can disrupt transport and essential services. Typhoon season is between May and October. Follow the advice of local officials.
Other	● Macau has separate immigration rules to China and Hong Kong. Tourists visiting for less than 30 days generally won't need a visa. In other situations, get a visa from your nearest PRC embassy or consulate. ● You must have a visa to travel between Macau and mainland China. Get a multiple-entry visa for China if you plan to return there after visiting Macau. ● The local currency is the Macanese Pataca (MOP). Some shops also accept Hong Kong dollars and Chinese yuan. Most places accept credit cards. ● Only use licensed taxis or reputable limousine services. Insist on using the meter. Ridesharing services are illegal. ● Public buses are cheap and frequent, but they can be hard to find outside tourist areas.

Mongolia

	Threat Level Exercise normal safety precautions.		**Latitude / Longitude** 46.862496, 103.846656 **GPS Position** 46° 51' 44.9856'' N 103° 50' 47.9616'' E

Crime	● Violent crime is increasing in Mongolia, particularly in Ulaanbaatar. Criminals have assaulted and sexually harassed foreigners during the day and in busy areas. Crime is more common during major festivals and the summer tourist season. Be aware of your surroundings. ● Pickpocketing and bag snatching are common, especially on public transport and in crowded areas. Criminals posing as police have robbed travellers in the Sukhbaatar Square area of Ulaanbaatar. Be alert to thieves, especially on public transport. ● Protests can turn violent. Avoid large public gatherings.
Laws	● Don't use or carry illegal drugs. Severe penalties include long jail terms. ● Always carry your passport. If you live in Mongolia, also carry your residency card. ● Mongolia doesn't recognise dual nationality. Always travel on your primary passport. Dual nationals living in Mongolia may need to do national service. Contact the nearest Mongolian embassy for details. ● Same-sex relationships are legal. However, LGBTI travellers may face violence, discrimination and harassment. Avoid public displays of affection.
Health Risks	● Rabies is a risk. It's fatal without immediate treatment. Avoid dogs, monkeys and other mammals. Get medical help straight away if an animal bites or scratches you. ● HIV/AIDS is common. Take precautions if engaging in activities that expose you to the virus. ● Waterborne, foodborne and other infectious diseases are common. These include hand, foot and mouth disease (HFMD), hepatitis and measles. Drink only boiled or bottled water. Avoid raw or undercooked food. ● During winter, the air in Ulaanbaatar is very polluted. If you have breathing problems, speak to your doctor before you travel. ● The standard of medical care is poor, particularly outside Ulaanbaatar. Bring basic medical supplies with you. You'll have to pay up-front, even in an emergency. If you're seriously ill or injured, you'll need medical evacuation. Ensure your travel insurance covers this.
Weather	● Mongolia's weather is extreme. Temperatures vary from 35°C in summer to -40°C in winter. Winter lasts from October to March. Snowstorms can also happen outside winter months. Make sure you have adequate clothing and footwear year-round. Weather conditions can change quickly. ● Earthquakes, flooding and fires sometimes occur. Follow the advice of local officials.
Other	● You need a visa to enter. Contact the nearest Mongolian embassy for details. Carry proof of your onward or return ticket. You'll need it to enter the country. ● If you're staying longer than 30 days, register with the Office of Immigration in Ulaanbaatar. You must do this within 7 days of arriving. If you're on a working visa, ensure your employer has registered for you. Working visa holders must de-register before leaving the country. ● If you're travelling to Mongolia by car, get approval from Mongolian Customs Office (English) before you enter. ● Most driver's licences and international driving permits aren't valid in Mongolia. For short trips, use taxis or hire a car with a driver. If you're staying more than 12 months, apply for a Mongolian driver's licence. ● Take care as a pedestrian. Drivers don't always give way, even at marked pedestrian crossings. Heavy snow can cause black ice on footpaths and road crossings. ● Authorities sometimes restrict access to some regional districts for quarantine reasons. Speak to Mongolian authorities or the nearest Embassy of Mongolia if you plan to travel to regional areas.

North Korea

	Threat Level High threat level to personal safety, take a range of extra precautions here.		**Latitude / Longitude** 40.339852, 127.510093 **GPS Position** 40° 20' 23.4672'' N 127° 30' 36.3348'' E

Crime	● North Korea and South Korea are technically at war. Military exchanges are rare, but tensions are still high. They could increase with little warning. North Korea sometimes conducts missile tests or other provocations. Monitor developments. ● The North Korean Government restricts information, especially about domestic politics and international relations. You can usually access international satellite TV channels at tourist hotels. However, if the government shuts these down in a crisis, you may not know what's happening. If you travel to North Korea, don't stay long. Monitor state broadcasts and, if possible, international media for signs of increasing tensions. ● Crime against travellers is rare. However, some travellers have reported petty crimes. Keep your passport and belongings close, especially at Pyongyang Airport and in public markets.
Laws	● Travelling as part of a tour or with a guide doesn't give you special protection from North Korean laws. Authorities may arrest, detain or expel you for activities that aren't crimes in your country. They may also search your belongings and monitor your communications. ● Don't use or carry illegal drugs. Penalties for drug offences are severe and parole is unlikely. Drug traffickers can get indefinite jail sentences. ● Authorities may judge many activities as spying. Be very careful when taking photos. It's illegal to photograph anything other than designated public tourist sites. Always ask your North Korean guide for permission before taking photos. ● North Korea has strict laws about what you can bring into the country. It's illegal to bring in religious, pornographic or political items. Declare all published material and electronic devices when you arrive. It's also illegal to knowingly or unknowingly possess items that breach North Korean law. ● Be careful who you talk to and what you say. It's illegal to show disrespect or make jokes about North Korea, current or former leaders or their families. It's also illegal to talk to North Koreans without authorisation. Authorities may consider it spying if you do. Only shop at stores designated for foreigners. ● Same-sex relations are legal, but authorities don't accept them. Avoid public displays of affection.
Health Risks	● Medications can be very hard to get in North Korea. If you plan to bring medication, check if it's legal. Take enough legal medicine for your trip. ● Malaria is a risk, especially in the south from May to September. Japanese encephalitis is also a risk. Ensure your accommodation is insect-proof. Consider taking anti-malarial medication. Get vaccinated against Japanese encephalitis before you travel. ● Waterborne, foodborne, and other infectious diseases include tuberculosis, typhoid and hepatitis. Intestinal worm infections, such as roundworm, are also common. Drink only boiled or bottled water. Avoid raw or undercooked food. Get advice on preventative medication for intestinal worms. ● Hand, foot and mouth disease (HFMD) is common. It mostly affects children younger than 10, but adult cases occur. Wash your hands thoroughly and often. ● From March to May, strong winds carry yellow dust to the Korean Peninsula from Mongolia and China. This can cause eye, nose, mouth and throat irritations. Get medical advice if you have heart or breathing problems. ● Medical facilities are basic, including in Pyongyang, and hygiene is poor. Avoid surgery unless you need it to leave North Korea. If you're seriously ill or injured, you'll need medical evacuation to China. Contact the Swedish Embassy in Pyongyang to arrange it. Medical evacuations are very expensive and difficult to organise. Ensure your travel insurance covers this.
Weather	● The monsoon season is from late June to late August. Typhoons can occur between August and September. Flooding may disrupt essential services. Know your hotel's evacuation plan. ● Some countries near North Korea experience large earthquakes. This makes destructive tsunamis more likely. Don't wait for official warnings, alarms or sirens. Know the tsunami warning signs and move to high ground straight away if you're on the coast.
Other	● You need a visa for all types of travel to North Korea. You may need to travel to another country, such as China, to get your visa. If you're travelling for business, you'll need a North Korean sponsor and permission from the Ministry of Foreign Affairs. Journalists must get a special visa. ● You'll probably have to travel via Beijing. Get a double- or multiple-entry visa for China. ● Travellers must register with government authorities within 24 hours of arriving. Do this through your host organisation or hotel. ● The local currency is the North Korean Won. Foreigners can't use it. The Euro is the most widely accepted foreign currency. US dollars and Chinese yuan are also widely accepted. Exchanging currencies is difficult. You can't use ATMs, traveller's cheques, or debit and credit cards. Take enough foreign currency for your trip, in small denominations. ● You can only travel on an official tour. An official guide must always accompany you. Charges for travel can be high, including for taxis, guides, tolls and permits. ● Assume authorities are monitoring all your phone conversations, including your mobile. It's not possible to phone South Korea. Internet access is severely restricted. ● Tourists generally can't drive. Tour operators or sponsors usually provide road transport. Delays for checkpoints are common. ● Flights are often delayed. North Korean airlines are affected by sanctions. Check with your tour operator or airline before you travel.

South Korea

Threat Level
Exercise normal safety precautions.

Latitude / Longitude
35.907757, 127.766922

GPS Position
35° 54' 27.9252'' N
127° 46' 0.9192'' E

Crime	● South Korea and North Korea are technically at war. Military exchanges are rare, but tensions are still high. The situation could worsen with little warning. North Korea sometimes conducts missile tests or other provocations. Monitor developments. Consider downloading the South Korean Government's 'Emergency Ready' app. ● Large-scale public gatherings and protests are common, particularly in Seoul. These can turn violent. Avoid large public gatherings. ● The crime rate in South Korea is low. However, petty crime happens, especially in major cities such as Seoul and Busan. Watch your belongings. ● Travellers have reported sexual assaults, drink spiking and other violent crimes. Don't accept food, drink, gum or cigarettes from strangers. Take care when walking alone at night.
Laws	● Don't use, carry or traffic illegal drugs. Penalties include long jail sentences, heavy fines and deportation. ● It's illegal to work or volunteer in South Korea if it's not specified in your visa. If you plan to work, arrange a work visa through a South Korean embassy or consulate before you travel. ● Disputes over expected working and living conditions for teaching English in South Korea is common. Research your employer and employment agent. Get legal advice before you sign a contract. ● Be careful when taking photos. It's illegal to photograph military zones, assets or personnel and official buildings. ● South Korea has strict anti-corruption laws for officials. Public officials and their spouses can't accept meals, gifts or other benefits above set limits. ● This includes journalists, teachers and employees of government-owned or funded companies. Get legal advice to make sure you don't breach these laws. ● South Korea doesn't recognise dual nationality. If you're a male South Korean dual national, you may have to do military service when you arrive. This could happen even if you travel on your countries passport. Get advice from an embassy or consulate of the Republic of Korea before you travel.
Health Risks	● There's an outbreak of Hepatitis A in South Korea. Boil tap water before drinking or cooking. ● Malaria is a risk in the demilitarised zone and rural areas in the north of Gyonggi and Gangwon provinces. Japanese encephalitis is also a risk. Ensure your accommodation is insect-proof. Get vaccinated against Japanese encephalitis before you travel. Consider taking anti-malarial medication. ● Waterborne, foodborne, and other infectious diseases include tuberculosis, typhoid and hepatitis. When outside major cities, drink only boiled, bottled or filtered water, and avoid raw or undercooked food. ● Hand, foot and mouth disease is common. It mostly affects children younger than 10, but adult cases occur. Wash your hands thoroughly and often. ● South Korea is susceptible to high levels of pollution from March to May. During this time, strong winds from Mongolia and China also carry yellow dust to the Korean Peninsula. This can cause eye, nose, mouth and throat irritations. Get medical advice if you have heart or breathing problems. ● The standard of medical facilities in South Korea is usually good, but few staff speak English. You'll probably have to pay up-front. Ensure your travel insurance covers all medical costs. ● South Korea is a popular destination for medical tourism. If you're travelling for a procedure, research and choose your medical service providers carefully. Don't use discount or uncertified providers. Ensure your travel insurance covers complications from surgery.
Weather	● The monsoon season is from late June to late August. Typhoons can happen in August and September. Flooding and mudslides may happen. Identify your local shelter (identified by the word 대피소). Follow the advice of local officials. ● Earthquakes and tsunamis are a risk. Know the tsunami warning signs and move to high ground straight away. Don't wait for official alerts, warnings or sirens.

Other	● You can get a visa on arrival for stays of up to 90 days. For other situations, get a visa before you travel. Contact your nearest embassy or consulate of the Republic of Korea for details. ● The local currency is the Korean Won (KRW). Exchange your dollars at banks or money changers. ATMs are available in cities and larger towns, but they may not accept some debit cards. Hotels, restaurants and high-end shops usually accept credit cards. Be aware of card skimming. ● You can drive with a licence and an International Driving Permit (IDP). Get your IDP before you travel. If you live in South Korea or are staying more than 90 days, get a local licence. ● South Korea has one of the highest rates of traffic deaths for a developed country, especially for pedestrians. If you're walking, look out for motorcyclists, even on footpaths. Don't expect traffic to stop at pedestrian crossings. ● Always insist the driver uses the meter. International taxi services may have English-speaking drivers. ● Public transportation in and between major urban areas is good. Most major transportation systems have signs in English. ● Ferry services operate between most large coastal cities and other domestic and international ports. Safety standards have improved since the Sewol ferry disaster.

Taiwan

Threat Level
Exercise normal safety precautions.

Latitude / Longitude
23.697810, 120.960515

GPS Position
23° 41' 52.116" N
120° 57' 37.854" E

Crime	● Protests happen sometimes. They're usually peaceful but can turn violent. Avoid large public gatherings. ● Crime rates are low, including for petty crime. Taxi drivers have sometimes assaulted passengers. However, taxis are usually safe. Use radio taxis, or arrange taxis online or through your hotel. ● Extortion scams occur. These include minor car accidents and claims of sexual assault at nightclubs. Report suspicious behaviour.
Laws	● Don't use or carry illegal drugs, including illegal prescription medication. Penalties for drug offences are severe. They include the death penalty, life in prison, long jail terms and heavy fines. ● Taiwan recognises dual nationality. Taiwanese males older than 18 years must do military service. Some exemptions are available to overseas residents. If you're not exempt, you may have to serve when you arrive.
Health Risks	● Some prescription medications are illegal in Taiwan. Authorities may jail or fine you if you have them. Before you travel, check Taiwan Customs for limits and documents you'll need. ● Dengue occurs, especially in the tropical southern and central regions. Japanese encephalitis is also a risk. Ensure your accommodation is insect-proof. Get vaccinated against Japanese encephalitis before you travel. ● Cases of Zika virus were reported in 2016. If you're pregnant, discuss your travel plans with your doctor. ● Hand, foot and mouth disease is common. It mostly affects children younger than 10, but adult cases occur, particularly in young adults. Wash your hands thoroughly and often. ● Waterborne, foodborne and other infectious diseases are common. Drink only boiled or bottled water. Avoid ice cubes. ● The standard of public hospitals in major cities is good. Wait times are often long. Some hospitals have English-speaking private clinics, but these can be expensive. You may have to pay up-front, even for emergency care. Ensure your travel insurance covers all medical costs.
Weather	● The typhoon season is May to November. Flooding and mudslides are common. Businesses and government offices close on 'typhoon days'. Follow local advice to prepare for a disaster. Listen to FM100.7 for English-language updates. ● Earthquakes happen often. Get advice on being in an earthquake-prone region. Tsunamis also happen. Know the tsunami warning signs and move to high ground straight away. Don't wait for official alerts.
Other	● You don't need a tourist or business visa to stay up to 90 days. Ensure you have a return or onward ticket and your passport is valid for at least 6 months. In other situations, you'll need a visa. Contact the Taipei Economic and Cultural Office for details. ● The local currency is the New Taiwan Dollar (NTD). ATMs are available in cities and provincial centres. Hotels, restaurants and higher-end shops usually accept credit cards. Be aware of card skimming. ● You can drive for up to 30 days with a driver's licence and an International Driving Permit (IDP). Get your IDP before you travel. You need a local or international motorcycle licence to hire a motorbike. ● Although roads and vehicles are well-maintained, scotters and motorcycles often weave in and out of traffic and vehicles might not stop at pedestrian crossings. Look before stepping onto the road. ● Taiwan has well-developed rail and bus services. Petty crime happens, so take care of your belongings.

3 South Asia

Afghanistan

Threat Level
Extreme threat to personal safety, recommended not to travel here.

Latitude / Longitude
33.939110, 67.709953

GPS Position
33° 56' 20.796" N
67° 42' 35.8308" E

Crime	● Afghanistan is extremely dangerous. If you travel to or stay in Afghanistan despite our strong advice, consult a reputable security company. Arrange personal security measures, including at your accommodation. Monitor local information sources and have a plan in place if you need to leave quickly. ● Avoid large public gatherings. If you're caught in an affected area, find a safe place and stay indoors. ● The frequency of attacks in Kabul, and across the country, has continued to increase with many killed and wounded. There are credible reports of imminent attacks. Large scale attacks in July, August and September 2019 resulted in hundreds killed and injured in each instance. ● Kidnapping is a serious and ongoing threat. Terrorists and criminal groups target foreigners. Get professional security advice. ● Aid workers are not safe from the threat of terrorism. Attacks continue to target both local and foreign NGO operations across the country and within Kabul. This includes through both politically motivated and kidnap-for-ransom abductions.
Laws	● De facto relationships, close contact between unmarried men and women, adultery and same-sex relations are illegal. Penalties are severe. ● Preaching a religion other than Islam and renouncing Islam is illegal. ● Be careful when taking photos. It's illegal to photograph checkpoints, government buildings, palaces, and security or military sites. Ask permission before taking photos of people. ● Afghanistan has strict rules that control importing alcohol and pork products. ● There are strong codes of dress and behaviour. Avoid public displays of affection. Wear clothing that covers the legs. Cover your arms and consider wearing a headscarf if you're a woman. ● During the Islamic holy month of Ramadan, avoid eating, drinking and smoking in public.
Health Risks	● Get comprehensive travel insurance before you leave. Your policy needs to cover all overseas medical costs, including medical evacuation. You'll probably need a special insurance policy for high-risk destinations. ● Medical facilities are limited. Sanitation and hygiene are poor. Some private medical clinics in Kabul are fine for routine health issues. If you're seriously ill or injured, you'll need medical evacuation. Ensure your travel insurance covers this. ● Malaria outbreaks, including chloroquine-resistant strains, can occur between April and September. Consider taking anti-malarial medication. ● Other insect-borne diseases, including leishmaniasis, are common. Ensure your accommodation is insect-proof. Use insect repellent. ● Waterborne, foodborne, parasitic and other infectious diseases are widespread. These include typhoid, hepatitis, measles and tuberculosis. Drink only boiled or bottled water with sealed lids. Avoid raw or undercooked food. ● Polio is widespread. Before you travel, make sure your polio vaccinations are up to date. Carry proof of vaccination if you're staying longer than 4 weeks.
Weather	● Flooding and landslides can occur between March and June. Avalanches and heavy snowfalls occur in some mountain areas. Follow the advice of local officials.

Other	• Visa conditions can change at short notice. Contact your nearest embassy of Afghanistan for details. If you're planning to travel via Pakistan, get a multiple-entry visa for Pakistan. Get entry and exit stamps in your passport at the border. If you don't, you could find it difficult to leave Afghanistan. • The local currency is the Afghani (AFN). Many places also accept US dollars. There are very few ATMs in Kabul. Few places accept credit cards and it is unlikely Traveller's Cheques will be accepted. • If you're travelling by road, only travel in secure transport using reputable local drivers and guides. Have evacuation plans. Unexploded weapons and landmines are dangers on and near roads. Don't leave sealed roads. • Kabul International Airport may close at short notice. The roads leading to the Airport are a potential terror attack target. Check with your airline before going to the airport.

Bangladesh

Threat Level
High threat level to personal safety, take a range of extra precautions here.

Latitude / Longitude
23.684994, 90.356331

GPS Position
23° 41' 5.9784'' N
90° 21' 22.7916'' E

Crime	• Exercise a high degree of caution in Bangladesh. Pay close attention to your personal security at all times. Monitor media for the latest information about safety and security risks. • Avoid protests, demonstrations and rallies, as these can turn violent without warning. • Random attacks with small improvised explosive devices happen from time to time. Avoid large public gatherings. Be alert around nationally significant dates. • We continue to receive information indicating terrorists may be planning attacks in Bangladesh. Attacks could occur anywhere, anytime. Bangladesh authorities continue to arrest terrorists in the advanced stages of attack planning. Be particularly vigilant at places of worship and during significant national holidays. • Political violence and kidnapping happen in the Chittagong Hill Tracts region. Reconsider your need to travel to this area. • Violence and robberies are common across Bangladesh. Petty crime, such as pickpocketing and snatch-and-grab attacks, is also common. Thieves target rickshaws, taxis and motorised rickshaws. Keep your doors, windows and gates locked, even if you have a security guard. Keep your car doors locked and windows up, even when moving.
Laws	• Don't use or carry illegal drugs. Severe penalties include mandatory sentences for small amounts and the death penalty. Hookah or smoking pipes are common and may be spiked with illegal drugs. Avoid using these pipes. • Bangladesh has the death penalty for some serious crimes. Corporal punishment (whipping) is a possible sentence. • Local authorities can demand to see your ID. Always carry a copy of your passport, even if you're a dual national. • The Bangladeshi Government may consider you a Bangladeshi citizen if you or your parents are of Bangladeshi origin, even if you've never held a Bangladeshi passport. It's illegal for Bangladeshi citizens to purchase, carry, possess, transport or consume alcohol without a permit. • Dress and behaviour standards are conservative. Don't wear shorts. If you're a woman, wear a scarf around your neck and shoulders. Avoid public displays of affection. • During Ramadan, Muslims must not eat, drink and smoke between sunrise and sunset. Authorities can detain you if you eat, drink or smoke in public during this time. They may even deport you.
Health Risks	• Insect-borne diseases occur, including chikungunya, malaria, dengue, Japanese encephalitis and Zika virus. Ensure your accommodation is insect-proof. Use insect repellent. Get vaccinated against Japanese encephalitis before you travel. Consider taking anti-malarial medication. If you're pregnant, discuss your travel plans with your doctor. • HIV/AIDS is a risk. Take precautions if you engage in high-risk activities. • Waterborne, foodborne and other infectious diseases include cholera, typhoid and hepatitis. Drink only boiled or bottled water. Avoid raw or undercooked food. • Outbreaks of coetaneous anthrax have occurred in the past and may occur again. Avoid handling raw meat. Only eat fully cooked beef from reliable suppliers. • Avoid temporary black henna tattoos. They often contain a dye that can cause serious skin reactions. • The standard of medical facilities is poor. Medical facilities outside Dhaka are very limited. You'll probably need to pay up-front. If you're seriously ill or injured, you'll need medical evacuation. Ensure your travel insurance covers this.
Weather	• The monsoon season is from June to September. The cyclone seasons are from May to June and from October to November. During these times, flooding and landslides can happen with little warning. They can disrupt essential services. Be prepared for major emergencies. Keep an emergency kit on hand.
Other	• You need a visa to enter Bangladesh. Arrange it before you travel. Contact the Bangladesh High Commission for details. • If you're working, make sure you get either an Income Tax Clearance Certificate or an Income Tax Exemption Certificate. You'll need to show it each time you leave the country. • The local currency is the Bangladesh Taka (BDT). You can use credit cards and ATM facilities in major centres. Be aware of credit card fraud. Check your statements often. • Driving can be dangerous due to chaotic traffic, road closures and severe weather. Don't drive at night if possible. • Don't use public transport, taxis or ride-sharing service due to safety issues. Be careful if travelling on boats. Boats may be overloaded and not have life-saving equipment. Fatal accidents are common. Piracy occurs in coastal areas. • Hazrat Shahjalal International Airport has extra security measures. Leave enough time to clear checkpoints.

Bhutan

Threat Level
Exercise normal safety precautions.

Latitude / Longitude
27.514162, 90.433601

GPS Position
27° 30' 50.9832'' N
90° 26' 0.9636'' E

Crime	• Bhutan's crime rate is low. Violent crime is rare. Petty crime happens, such as burglary, theft, pickpocketing and bag snatching. Look after your belongings. Use licensed tour operators. • Rebels are active in southern border regions. Armed groups could clash with Bhutanese and Indian security forces or kidnap foreigners. Exercise a high degree of caution in the border regions with India and China.
Laws	• Don't use or carry illegal drugs. Severe penalties include long jail terms and heavy fines. • It's illegal to sell and buy tobacco products. You can take a limited amount of tobacco products for personal use. You'll pay a sales tax and customs duty. Keep the receipt. • Same-sex sexual activity is illegal, but prosecutions are rare. Avoid public displays of affection. • Standards of dress and behaviour are conservative, especially at religious sites. Dress modestly. Long pants are best for men and long skirts for women.
Health Risks	• Altitude sickness is a risk above 2500m. It can be life-threatening. It can affect anyone, even people who are physically fit. If you plan to travel to high-altitude areas, discuss your travel plans with a doctor. Ensure your travel insurance covers medical evacuation from altitude. • Outbreaks of dengue and malaria occur. Ensure your accommodation is insect-proof. Use insect repellent. Consider taking anti-malarial medication. • Hospital and medical facilities are fine for routine procedures. If you're seriously ill or injured, you may need medical evacuation. Make sure your travel insurance covers this.
Weather	• Flooding and landslides happen. In the monsoon season from June to September, transport and services can be affected. Check with your tour operator for possible disruptions. Earthquakes can happen at any time. Follow the advice of local officials.

Bhutan	
Other	● You need a visa to visit Bhutan. Government-licensed tour operators must arrange this. The Tourism Council of Bhutan publishes a list of licensed tour operators. You can't travel by yourself unless you have a long-term visa. ● The official currency is the Bhutanese Ngultrum (BTN). The Indian Rupee (INR) is also legal tender. ATMs are common in towns. EFTPOS is available, including at most hotels. Major hotels accept credit cards. ● You're not allowed to trek alone. Use reputable trekking companies with professional guides. Ensure your travel insurance covers emergency evacuation. ● You have to live in Bhutan for at least 1 month to get your driver's licence endorsed. Travellers usually use organised tours and local drivers. ● Flights to and from Paro Airport only occur in daylight hours. They depend on good weather conditions. Contact your airline or tour operator to find out if your travel has been disrupted.

India

	**Threat Level** Moderate threat level to personal safety, take extra precautions here.	**Threat Level** North-eastern states (Assam (except Guwahati), Nagaland and Manipur) and Chhattisgarh and the border areas of neighbouring states, Cities of Jammu and Srinagar, reconsider your need to travel.	**Threat Level** State of Jammu and Kashmir (except Ladakh region, Jammu and Srinagar) and India-Pakistan border (except Atari crossing), do not travel.			**Latitude / Longitude** 20.593684, 78.96288 **GPS Position** 20° 35' 37.2624'' N 78° 57' 46.368'' E

India	
Crime	● Terrorist attacks could occur anywhere at any time. They may target foreigners and popular tourist areas. Avoid possible targets. Take official warnings seriously. ● Violent protests sometimes occur throughout India. Large crowds at religious ceremonies and gatherings can also be dangerous. People have been killed in stampedes. Avoid large public gatherings. ● Women may be verbally and physically harassed or sexually assaulted. Avoid travelling alone, even in major cities and tourist sites. ● Travellers have been robbed and assaulted after consuming spiked drinks or food. Don't leave your food or drinks unattended. Don't accept food or drinks from strangers. ● Petty theft is common in crowded areas such as markets and on public transport. Thieves on motorbikes snatch bags and jewellery. Carry only what you need. Pay close attention to your belongings. ● Scams are common. These can involve fake tour guides, ATM and credit card skimming, and fraudulent access to government services. If you're a scam victim, report it to police to get an official report for your travel insurer.
Laws	● Always carry your passport and ensure you have a valid visa. It's illegal not to. Conducting missionary work without a proper visa is also illegal. ● Don't use or carry illegal drugs. Penalties for drug offences include mandatory sentences and the death penalty. ● Check local alcohol laws before you visit. Laws on the legal drinking age and alcohol purchase vary between states. It's illegal to fly drones and other unmanned aircraft without official permission. Contact local police for advice. It's illegal to carry or export antiquities without a permit. Contact your nearest Indian embassy or consulate for advice. It's illegal to photograph airports, military sites and dams. Some places of worship also prohibit photography. ● Cows roam freely in India. It's illegal to deliberately maim or kill them. In some states, the penalty is up to 5 years in jail. ● India has strict dress and behaviour codes, especially at religious sites. Physical contact between men and women in public might be considered inappropriate.
Health Risks	● Swine flu is widespread during winter. Talk to your doctor about flu shots before you travel. ● Malaria is a risk in many parts of India, including major cities. Dengue is widespread during monsoon season. Zika virus cases are increasing in Rajasthan and surrounding states. Other insect-borne diseases include Japanese encephalitis, chikungunya and filariasis. Ensure your accommodation is insect-proof. Use insect repellent. Get vaccinated before you travel. If you're pregnant, discuss your travel plans with your doctor. ● HIV/AIDS is widespread. Take precautions if you engage in high-risk activities. ● Waterborne, foodborne, parasitic and other infectious diseases are very common. These include cholera, typhoid and hepatitis. Drink only treated or bottled water. Avoid raw or undercooked food. ● Air pollution can reach dangerous levels, especially in winter. It can disrupt transport and cause breathing problems. If you have an existing health condition, discuss your travel plans with a doctor. ● Foreigners travelling for medical tourism at discount or uncertified clinics have had life-threatening complications. Research and choose your medical providers carefully.
Weather	● Severe weather is common. This includes heatwaves and dust storms in summer, and flooding during the monsoon season. Check with your tour operator for possible disruptions.
Other	● You need a visa to enter India. Arrange it before you travel.You can only enter on an e-Visa at certain airports. ● If you're planning to stay more than 180 days, register within 14 days of arrival. If you don't, you could be fined or jailed. ● The local currency is the Indian Rupee (INR). ATMs that accept international cards are common in major cities and towns. They're hard to find in rural areas and may have cash shortages. Beware of counterfeit currency. ● Touts at airports, bus stations and train stations may pressure you to buy tour tickets. They may overcharge you. Always check the operator's credentials and safety standards before you book. ● You may need permission from Indian authorities to visit some areas, particularly in the north-east. Apply at least 4 weeks in advance. ● Use a pre-paid taxi service when you arrive at the airport. Use taxis booked from hotels or taxi stands. Don't hail taxis on the street or use private vehicles as taxis.

Maldives

	**Threat Level** Exercise normal safety precautions.	**Threat Level** Malé Island, exercise a high degree of caution.						**Latitude / Longitude** 3.202778, 73.22068 **GPS Position** 3° 12' 10.0008'' N 73° 13' 14.448'' E

Maldives	
Crime	● Malé has frequent protests and demonstrations. Avoid affected areas. ● Drug-related crime and gang-related violence occurs in urban areas, including Malé. Petty theft happens on beaches and in hotel rooms. Leave your valuables in a secure location. Monitor local media to avoid trouble spots.
Laws	● Don't use or carry illegal drugs. Penalties for drug offences are severe and can include life imprisonment. ● Serious crimes, such as murder, can attract the death penalty. ● It's illegal to import or drink alcohol unless you're on a resort island. ● It's illegal to publicly observe any religion other than Islam. Don't import pornography or pork products. ● The Maldives doesn't recognise dual citizenship. We may only be able to give limited consular help if you're arrested or detained. ● Standards of dress and behaviour are conservative in Male and non-resort islands. Dress modestly in Malé and non-resort islands. Take care not to offend. Same-sex relationships are against the law.
Health Risks	● Insect-borne diseases are a risk, including dengue, Zika virus and chikungunya. Use insect repellent. ● Hepatitis and rabies (including from dogs) are also a risk. Boil drinking water or drink bottled water. ● Medical services, including emergency services and decompression chambers, are limited. It can take several hours to reach medical facilities. If you become ill or injured, you'll need to be evacuated. This can be very expensive.
Weather	● The monsoon season is from mid-May to November. Strong winds, rough seas and torrential rain can occur. Tsunamis can also occur. Keep in contact with friends and family. Follow the advice of local authorities. ● The sea around the Maldives can have strong tidal currents. Take appropriate precautions.
Other	● You can get a 30-day tourist visa on arrival, but conditions apply. In other situations, you'll need to get a visa before you travel. ● The local currency is the Maldivian Rufiyaa (MVR). ● You can change money and use ATMs in Malé and many larger islands. Take cash if you're travelling to other areas. ● If you ride a motorbike, always wear a helmet.

Nepal

NP

Threat Level
Moderate threat level to personal safety, take extra precautions here.

Latitude / Longitude
28.394857, 84.124008

GPS Position
28° 23' 41.4852'' N
84° 7' 26.4288'' E

Crime

- Small-scale explosive attacks occur throughout Nepal, including in Kathmandu. In November 2019, there have been a number of small-scale explosions in Pokhara. Attacks increase during periods of political tension, such as elections. Don't visit government buildings during political unrest.
- Political protests and strikes sometimes happen. Strikes can disrupt essential services. During strikes, make sure you have enough water, food, batteries, cash and medication.
- Pickpocketing and petty theft is common. Bag-snatching and 'snatch-and-grab' attacks by thieves on motorbikes occur. Keep your belongings close. Don't travel alone, especially if you're female.
- Travellers have been victims of armed robberies and assaults, including sexual assaults. Drink spiking often occurs before sexual assault. Never accept food, drinks, gum or cigarettes from strangers. Don't leave your food or drinks unattended.

Laws

- Don't use or carry illegal drugs. You may be offered illegal drugs in tourist areas. Penalties for drug offences are severe, including for possessing small amounts.
- Be careful when taking photos. It's illegal to photograph army barracks, checkpoints and military personnel.
- It's illegal to convert people from their religion. Punishment can include jail. If you're suspected of trying to convert people, you will likely be deported and banned from re-entering Nepal.
- Same-sex relations are legal. However, society is conservative. LGBTI travellers have reported harassment and discrimination. Avoid public displays of affection.
- Nepal doesn't recognise dual nationality.
- Tourist areas of Kathmandu and Pokhara have relatively relaxed dress codes. Other parts of the country are more conservative. Dress modestly.

Health Risks

- Some towns, including Kathmandu, experience high levels of seasonal smog and pollution. Get medical advice if you have breathing difficulties.
- Altitude sickness is a risk above 2500m. It can be life-threatening. It can affect anyone, even people who are physically fit. Discuss your plans with your doctor. Ensure your travel insurance covers medical evacuation from altitude.
- Malaria is a risk in the Terai (plains) and Hill districts and Chitwan National Park. Consider taking anti-malarial medicine for these areas. Other mosquito-borne diseases occur, including in Kathmandu. These include dengue and Japanese encephalitis. Ensure your accommodation is insect-proof. Get vaccinated against Japanese encephalitis before you travel.
- HIV/AIDS is common. Take steps to reduce your risk of exposure to the virus. Waterborne, foodborne, parasitic and other infectious diseases are common. These include typhoid, cholera and hepatitis. Drink only boiled or bottled water. Avoid raw or undercooked food.
- Rabies is common. It's fatal without immediate treatment. Avoid dogs, monkeys and other mammals. Get medical help straight away if an animal bites or scratches you.
- Medical facilities in Nepal are very limited, especially outside Kathmandu. In Kathmandu, treatment at high-standard clinics is expensive. If you're seriously ill or injured, you'll need medical evacuation. Ensure your travel insurance covers this.

Weather

- Nepal experiences earthquakes, landslides, floods and severe weather. Be prepared for a major emergency. Keep an emergency kit that includes first aid supplies and bottled water.

Other

- You need a visa to enter Nepal. You can get a tourist visa when you arrive. The maximum stay is 150 days per calendar year. In other situations, get a visa before you travel. Contact an embassy or consulate of Nepal for details. You need a valid visa in your passport to leave Nepal.
- The local currency is the Nepalese Rupee (NPR). Exchange foreign currency for NPR at banks and exchange bureaus in major centres. Major hotels and commercial centres accept credit cards. ATMs are uncommon in remote areas. Carry enough cash to cover your needs.
- Some trekking companies or guides may offer condensed treks. These may not give you enough time to get used to high altitude. Research trekking conditions, permits and routes. Hire a company with a good reputation and professional guides. Don't trek alone.
- If you become ill while trekking, confirm if your insurance covers evacuation costs. Do this yourself if possible, before you agree to a helicopter evacuation. Sometimes guides pressure trekkers into taking expensive helicopter evacuations.
- Only use registered taxis and authorised limousines. Taxi drivers often refuse to use meters and overcharge travellers. Negotiate the fare with the driver before you go. Avoid public buses and vans. They're overcrowded and poorly maintained. Intercity buses often have serious accidents. Women may be harassed on public buses.
- Domestic flight cancellations and delays are common, especially during tourist seasons and in bad weather. The monsoon season is from June to September. Always check flights with your airline or tour operator. Due to safety concerns, the European Union has banned all Nepali airlines from flying in its airspace.

Pakistan

Threat Level
High threat level to personal safety, take a range of extra precautions here.

Threat Level
Balochistan, Federally-Administered Tribal Areas, Khyber-Pakhtunkhwa (excluding Chitral district), Border areas with Afghanistan and India (excluding Lahore, Wagah, Kasur, Narowal and Sialkot), do not travel.

Latitude / Longitude
30.375321, 69.345116

GPS Position
30° 22' 31.1556'' N
69° 20' 42.4176'' E

Crime

- Many terrorist groups hostile to Western interests operate in Pakistan. Don't travel to Balochistan or Khyber-Pakhtunkhwa (except Chitral district) where the risk of attacks is highest. If you travel to other parts of Pakistan, be cautious. Avoid crowded places and possible targets. Always have an exit plan.
- Violent crime, including armed robbery, assault, carjacking and kidnapping, occurs across Pakistan. The risk of kidnapping is very high in Balochistan and Khyber-Pakhtunkhwa. If you travel to these areas, get professional security advice. If you must go to Chitral district or Gilgit Baltistan, travel by commercial aircraft and not by road.
- Political and religious protests are common and can turn violent. Political, sectarian and gang violence occurs often in Karachi. Avoid large public gatherings. If you're caught in a rally, find a safe place and stay indoors.
- The Afghanistan border area is volatile. Foreigners must not travel within 50km of the Afghanistan border in Gilgit Baltistan or within 15km of the Kashmir Line of Control or the entire border with India except at official crossings. If you're in an area close to the border, consider leaving.
- Firing guns into the air in celebration is illegal but common. People have died as a result. Be careful of celebratory gunfire, especially around major holidays, celebrations and after sporting victories.

Laws

- Don't use or carry illegal drugs. Penalties for drug offences are severe. They include the death penalty, large fines and long prison sentences.
- Corporal punishment applies for some offences, including robbery, public drunkenness, and drinking alcohol if you're Muslim.
- Same-sex relations are illegal. It's also illegal for unmarried heterosexual couples to live together.
- Be aware of religious sensitivities. It's illegal to import alcohol or pork products. It's illegal to try to convert a Muslim or to encourage them to abandon their religion. Blasphemy can attract the death penalty.
- Strong Islamic codes of dress and behaviour exist in Pakistan. Don't wear shorts or short-sleeved clothes. Avoid physical contact between men and women in public. Women may be harassed, especially if they're alone.
- People of Pakistani origin have sometimes had trouble leaving Pakistan with their children. This occurs when one parent refuses to let the children return to another country and keeps their passports. If you think this could happen to you, get legal advice before leaving.

Health Risks

- Pakistan is experiencing an outbreak of extensively drug-resistant typhoid fever. Before you travel, ask your doctor about getting vaccinated. Avoid anyone who is or has recently been sick.
- Insect-borne diseases including malaria, dengue, Japanese encephalitis and Crimean-Congo haemorrhagic fever occur. Drug-resistant strains of malaria have been reported. Consider taking anti-malarial medication. Ensure your accommodation is insect-proof. Use insect repellent. Consider getting vaccinated against Japanese encephalitis.
- HIV/AIDS is common. Take precautions if you engage in high-risk activities.
- Polio is endemic. Ensure your vaccinations are up to date. If you're staying longer than 4 weeks, carry evidence of your polio vaccination.
- Waterborne, foodborne, parasitic and other infectious diseases are prevalent. They include hepatitis, tuberculosis and measles. Drink only boiled or bottled water listed as 'safe' by the Pakistan Council of Research in Water Resources. Avoid raw or undercooked food.
- Facilities at some clinics and hospitals in major cities are close to Western standards. In most towns, and in rural and remote areas, medical facilities are extremely limited. If you're seriously ill or injured, you may need medical evacuation. Ensure your travel insurance covers this.

Weather	• Earthquakes are common. Flooding, landslides and tsunamis can occur. Essential services may be disrupted and the risk of disease can increase during the monsoon season (July to September). Follow the advice of local officials.
Other	• Carry your yellow fever vaccination certificate if you're coming from a country with a risk of yellow fever. You may need it to enter Pakistan. • Some provinces and cities require you to register with local authorities when you arrive. Check and follow local registration procedures. • The local currency is the Pakistan Rupee (PKR). US dollars and euros are the easiest currency to convert. Pakistan is a mostly cash-based economy. Have enough cash to meet your needs. • Don't use taxis or public transport due to safety and security concerns. Never hail a taxi on the street. Use transport services from accredited tour operators and hotels.

Sri Lanka

Threat Level
Exercise normal safety precautions.

Latitude / Longitude
7.873054, 80.771797

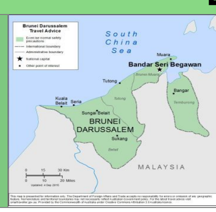
GPS Position
7° 52' 22.9944'' N
80° 46' 18.4692'' E

Crime	• Terrorism is a threat in Sri Lanka. Attacks could happen anywhere at any time. Terrorists may target tourist areas. Avoid crowds. Follow the advice of local officials. • Security has increased across the country following the 21 April 2019 terrorist attacks. Always carry travel and identification documents. Allow additional time to clear security checks, especially at airports. • There are marked and unmarked minefields and unexploded weapons in the Northern Province and parts of the Eastern Province. Stay on main roads. Pay close attention to landmine warning signs. • Violent crime, including sexual assault, harassment and robbery, occurs. If you're a woman travelling alone, arrange travel through a reputable company. • Scams and fraud are common, including credit card fraud, overcharging and fake goods. Be alert to fake goods, especially jewellery and gems. Check your bank statements often.
Laws	• Always carry photo identification. If you don't, officials may detain you. It's illegal to cover your face in a way that prevents identification. • The legal drinking age is 21. It is illegal to drink alcohol or smoke in public. • Be careful when taking photos. You must not photograph or video inside High-Security Zones (HSZs). These include military sites, some government buildings and official residences. HSZs aren't always marked. • Respect the local culture. It's illegal to mistreat Buddhist images. This includes posing for photos with Buddha statues, or wearing tattoos, clothing or jewellery associated with Buddhism. Get local advice before photographing places of worship. • Sri Lanka has conservative dress and behaviour standards. Take care not to offend.
Health Risks	• Outbreaks of dengue are common. Use mosquito repellent. If you have a fever, get medical help. • Other insect-borne diseases include chikungunya, Japanese encephalitis and filariasis. Use mosquito and insect repellent. Get vaccinated for Japanese encephalitis before you travel. • Foodborne, waterborne and other infectious diseases include typhoid, hepatitis, leptospirosis. Drink only boiled or bottled water. Rabies is present in dogs, monkeys and bats. • Medical services in Colombo are below first world standards. Outside Colombo, they're limited. If you're seriously ill or injured, you'll need medical evacuation. Ensure your travel insurance covers this.
Weather	• Flooding and landslides occur during the monsoon season. This is December to March in the north-east and May to October in the south-west. Be prepared to change your travel plans.
Other	• You need an Electronic Travel Authority (ETA) to travel to Sri Lanka. Select the correct visa category for your travel. If you breach your visa conditions, authorities could detain or deport you. • Carry your yellow fever vaccination certificate if you're coming from a country with a risk of yellow fever. You'll need it to enter Sri Lanka. If you're coming from a country with cholera, you'll need to show you've been vaccinated. • The local currency is the Sri Lankan Rupee (LKR). Exchange dollars at the airport or commercial banks in major centres. Most major towns and cities have ATMs, but not all accept international cards. Hotels and major shops accept credit cards. • To drive in Sri Lanka, you need either an International Driving Permit (IDP) or a temporary Sri Lankan licence. Your IDP must be endorsed by the Automobile Association of Sri Lanka. Get your temporary licence from the Department of Motor Traffic in Colombo.

4 South East Asia

Brunei Darussalam

Threat Level
Exercise normal safety precautions.



Latitude / Longitude
4.535277, 114.727669

GPS Position
4° 32' 6.9972'' N
114° 43' 39.6084'' E

Crime	• Serious crime is rare in Brunei. Travellers are sometimes victims of petty crime such as theft and burglary. Keep your valuables secure. Lock your accommodation, even when you're in. • Civil unrest is rare, but all protests have the potential to turn violent. Avoid large public gatherings.
Laws	• Brunei is a Muslim country and has strict religious laws. These include laws around fasting during Ramadan, preaching other religions, and Muslim religious observance. Know and follow these laws. • Brunei's Sharia (Syariah) Penal Code took full effect in April 2019. It applies to everyone, including foreigners and non-Muslims. Some crimes, including blasphemy, sodomy and adultery attract the death penalty under sharia law. Understand the law before you travel. • Selling alcohol is against the law. Smoking is illegal in most public places. It's also illegal to import alcohol and tobacco products above legal limits. If you import alcohol, keep the paperwork to prove it's legal. Check with the Brunei Customs and Excise Department before brining alcohol or tobacco into to Brunei. • Don't use or carry illegal drugs. Some drug offences have mandatory death penalty sentences. Other penalties include long prison sentences or physical punishment.
Health Risks	• Smoke haze is usual from June to October, but can occur at any time of year. • Insect-borne diseases occur. Make sure your accommodation is insect-proof. Use insect repellent. Get vaccinated before you travel. • HIV/AIDS is a risk. Take precautions if you engage in high-risk activities. • Foodborne, waterborne and other infectious diseases include hepatitis, hand, foot and mouth disease (HFMD) and tuberculosis. Avoid raw and undercooked foods. • When red algae reaches dangerous levels, local authorities may issue Red Tide warnings. These include warnings about swimming in certain areas or eating certain types of seafood. Check local media for Red Tide alerts. • Brunei's public hospitals are of reasonable standard. Private hospitals are of a high standard. If you're seriously ill or injured, you may need medical evacuation to Singapore or Australia. Ensure your travel insurance covers this.
Weather	• Flooding and mudslides are common during the wet seasons (September to January and May to July). During a natural disaster, follow local officials' advice. Keep your passport in a secure, waterproof place.

Other	• Visa and other entry and exit conditions can change at short notice. Contact the nearest Brunei High Commission or Brunei Ministry of Foreign Affairs • The local currency is the Brunei Dollar (BND). You can also use Singapore dollars. You can use credit cards in some places. Exchange dollars in banks, hotels and authorised bureaus. • You can drive for up to a year with a driver's licence and an International Driving Permit (IDP). Get your IDP before you travel. Get a local licence if you're staying longer than a year. • Only use registered taxis and authorised limousines arranged via your hotel, the Brunei International Airport or DART Taxi online.

Cambodia

Threat Level
Exercise normal safety precautions.

Latitude / Longitude
12.565679, 104.990963

GPS Position
12° 33' 56.4444'' N
104° 59' 27.4668'' E

Crime	• 'Snatch-and-grab' crimes against travellers are common. Thieves often travel on motorbikes and target pedestrians or people in open taxis. Don't carry bags that are easy to steal. Walk away from the curb with your bag on the opposite side to the traffic. • Theft from hotel rooms and luggage in buses is common. Always keep an eye on your belongings. • Sexual assault occurs in tourist areas. Stick with people you trust in nightclubs, bars and taxis. • Many people in Cambodia own guns. Gun crime, violent disputes and shootouts are common. • Don't travel alone at night. At night, travel only in well-lit public areas. Use cars rather than motorcycle taxis or tuktuks. • Scams, credit card fraud and ATM fraud are common. Check for card-skimming devices before using ATMs. • Be wary of invitations from strangers. Never carry parcels or luggage for others. Check for card-skimming devices before using ATMs. • Protests can turn violent. Avoid large public gatherings. Officials may deport foreigners involved in protests.
Laws	• Don't use or carry illegal drugs. Penalties for drug offences are severe. They include long prison sentences, even for small amounts. • Understand and follow local laws. It's illegal to criticise or insult the King. Lying to police, public nudity, and possessing or producing pornography are illegal. • Child sex offences are punishable under Cambodian law. • Cambodian authorities enforce 'modesty' laws at religious sites, such as Angkor Wat. Wear clothing that covers your knees and shoulders. • Be careful when taking photos. Don't photograph people, including monks, without permission. Don't take photos near sensitive sites, such as military areas, transport hubs or government buildings.
Health Risks	• Take care buying medication in Cambodia. Local pharmacies may sell fake medication. Carry enough medication for your trip. • Don't drink homemade or unlabelled alcohol in Cambodia. It may contain harmful substances, particularly methanol. Get medical help if you have symptoms of methanol poisoning, including fatigue, headaches, nausea and vision problems. • Insect-borne diseases include dengue, Japanese encephalitis and malaria. Use insect repellent. Get vaccinated before you travel and ensure your accommodation is insect-proof. Consider taking anti-malarial medication. • Animals across Cambodia carry rabies. Rabies is fatal without immediate treatment. Get medical attention straight away if an animal scratches or bites you. • Outbreaks of hand, foot and mouth disease (HFMD) are common. It mainly affects children and young adults. Other foodborne, waterborne, parasitic and infectious diseases include hepatitis, tuberculosis and typhoid. Drink only boiled or bottled water. Avoid raw or undercooked food. Don't swim in fresh water. • Avoid elective and cosmetic surgery in Cambodia. Medical care doesn't meet international standards and can lead to life-threatening complications.
Weather	• Severe storms and flooding can occur during the wet season (July to November). These can disrupt services and travel, including on the Mekong River. Check with your tour operator for updates.
Other	• You need a visa to enter Cambodia. Tourists can apply for an e-visa online or get a tourist visa on arrival. These are valid for 30 days. For longer stays or other situations, get a visa through an embassy or consulate of Cambodia. Don't overstay your visa. This is a serious offence. Penalties include fines, prison sentences and deportation. • Be careful when visiting regions near the border with Thailand. Landmines and unexploded remnants of war are a risk. Stay on marked roads if you're travelling in the north and north-west. • The official currency is the Cambodian Riel (KHR). US dollars are also legal tender. You'll need US dollars for most purchases. Take enough US dollars for basic expenses. You may not be able to find ATMs or use credit cards outside tourist areas. • Check your travel insurance covers motorcycles. Under Cambodian law, you can ride a motorcycle up to 125cc engine capacity without a licence. For larger motorcycles, get a local licence. • Official metered taxis are generally safe and convenient. Before using a moto, tuktuk or rickshaw, agree on the fare or use a ride sharing app.

Indonesia

Threat Level
Moderate threat level to personal safety, take extra precautions here.

Threat Level
Central Sulawesi, Papua and West Papua provinces, reconsider your need to travel.

Latitude / Longitude
-0.789275, 113.921327

GPS Position
0° 47' 21.39'' S
113° 55' 16.7772'' E

Crime	• There's a high risk of terrorist attack in Indonesia. Many have been killed and injured in past attacks. Be aware of dates and places that could be terrorist targets. • There has been increased tension, including demonstrations and violence, in towns in Papua and West Papua provinces since August 2019. • Petty and violent crime occur in Indonesia. Drinks may be spiked or mixed with toxic substances. Crimes involving taxis and taxi drivers occur. Solo women are at higher risk. Be alert in taxis, crowds, bars and nightclubs. • Legal disputes over real estate are common. Before entering into an agreement or providing financial details, do your research and get legal advice.
Laws	• Penalties for drug offences include heavy fines, long prison sentences and the death penalty. Police target tourist destinations. • The death penalty exists for many crimes in Indonesia. • Gambling is illegal. • Standards of dress and behaviour are conservative in many parts of Indonesia. Learn about local customs. Take care not to offend. • Aceh province upholds some aspects of sharia law. Sharia law applies to everyone, including travellers. Inform yourself about the laws. If in doubt, seek local advice.
Health Risks	• Some medications, including drugs for attention deficit hyperactivity disorder (ADHD), are illegal in Indonesia. Harsh penalties can apply even if you have a prescription. Make sure your medication is legal in Indonesia. • Polio, measles and rabies occur in Indonesia. Make sure your vaccinations are up to date. Avoid direct contact with animals, including dogs and monkeys. • Don't consume magic mushrooms. They're illegal and can make you seriously ill. • Zika virus, malaria and other insect-borne illnesses can occur. Protect yourself from mosquito bites. If you're pregnant, ask your doctor about the risk of Zika virus before you travel. • HIV/AIDS is a risk for travellers, particularly in Bali. Take steps to reduce your risk of exposure to the virus.
Weather	• Natural disasters such as floods, earthquakes, volcanoes and tsunamis occur. Domestic and international flights can be disrupted. Follow the advice of local authorities. Monitor media for updates.

Other	● You can visit visa-free for up to 30 days or pay for a visa for up to 60 days. Apply for the right visa if you plan to stay longer. ● You may not be allowed into Indonesia if you have a criminal record. Contact an embassy or consulate of Indonesia before you travel. ● If you're staying in a private residence, not a hotel, register when you arrive with the local Rukun Tetangga Office and police. ● You need a permit to travel to some areas of Papua and West Papua. ● Motorcycle accidents have killed and injured many. If you hire a motorbike, make sure your insurance policy covers you. Always wear a helmet. ● Travel by ferry or boat can be dangerous. Make sure any boat you board has appropriate safety equipment and life jackets.

Laos

Threat Level Exercise normal safety precautions.	**Threat Level** Travel in Xaisomboun Province, east of Vang Vieng, reconsider your need to travel.			**Latitude / Longitude** 19.856270, 102.495496 **GPS Position** 19° 51' 22.572" N 102° 29' 43.7856" E

Crime	● Opportunistic violent crime, such as robbery, occurs occasionally in urban areas. Muggings and sexual assaults are reported. Pay attention to your personal security, especially at night. ● Petty crime, such as theft and bag snatching, is common in tourist areas. Theft and violent crime increase in the lead-up to festivals, such as Lao New Year in April. Safeguard your belongings in crowded areas. ● Several fatal shootings and explosions have occurred in Xaisomboun province, east of Vang Vieng. Reconsider your need to travel there. ● Some restaurants sell food and drink containing potentially harmful drugs. Travellers have been assaulted after accepting spiked food or drinks. Some have died from drug-related incidents. Never accept food or drinks from strangers. Don't leave food or drinks unattended. ● Scams and fraud are common Some motorbike rental companies run scams that could cost you 1000s of dollars. Use a well-known hire company. ● Don't use your passport as a deposit or guarantee. Check for skimming machines before using ATMs and keep your credit card protected at all times. ● Protests and demonstrations are illegal in Laos. Avoid any protests, demonstrations or political activity.
Laws	● Don't use or carry illegal drugs. Severe penalties for drug offences include the death sentence. ● Intimate relationships between Lao citizens and foreigners who are not married are illegal. This includes sexual relationships and living together. Marriages between Lao citizens and foreigners must be pre-approved. If you don't register a relationship, authorities could fine or jail you. ● Be careful when taking photos. It's illegal to photograph or visit military sites. ● Preaching religion without permission, including giving out religious material, is illegal. It's also illegal to visit temples or cultural sites after 10.30pm, and to publish material or speak against Laos. ● Don't camp in public spaces, along riverbanks or near forests. Public nudity is also illegal. ● Laos doesn't recognise dual nationality.
Health Risks	● Malaria is a risk in rural areas. Dengue is a risk everywhere in Laos, especially in the wet season from May to November. Other insect-borne diseases include Zika virus and Japanese encephalitis. Take precautions and protect yourself from disease. ● Tropical storms, typhoons, flooding and landslides happen during the wet season from May to November. Follow the advice of local officials. ● HIV/AIDS is common. Take precautions if you engage in high-risk activities. ● Dogs throughout Laos carry rabies. Rabies is fatal if you don't get vaccinated or don't get medical treatment quickly. See a doctor straight away if an animal scratches or bites you. ● Common waterborne, foodborne and other infectious diseases include cholera, hepatitis and tuberculosis. Drink only boiled or bottled water. Avoid raw or undercooked food. ● Medical facilities are extremely basic. Travel to medical services in Thailand if you can. If you're seriously ill or injured, you'll need medical evacuation to Thailand. Ensure your travel insurance covers this.
Weather	
Other	● You need a visa to enter Laos. You may be able to get a 30-day visa on arrival at Vientiane or Luang Prabang international airports. They're also available at some land border crossings. You can apply for these visas through the Lao government e-visa website. Lao immigration authorities will stop issuing on-arrival visas at a number of entry points from 31 December 2019. Apply for other visas from an embassy of Laos before you travel. ● The local currency is the Lao Kip (LAK). Only exchange money at official outlets. ATMs are available in major cities. High-end hotels and restaurants accept credit cards. ● Take extra care along the Mekong Riverbank in Vientiane. It's the border between Laos and Thailand, and a known smuggling route. If you're in the area after 10.30pm, authorities could fine, question, arrest or detain you. ● Many parts of Laos have unexploded bombs. High-risk areas include Xieng Khouang province and the Lao-Vietnamese border areas along the Ho Chi Minh Trail. Always stay on established walking paths and roads. Don't touch unknown metal objects. ● You can drive in Laos with a driver's licence and an International Driving Permit (IDP). Road travel in Laos can be dangerous. This includes travelling by long-distance bus. The number of road accidents and deaths is increasing each year. Avoid driving at night if you can, especially on rural roads. ● Boat travel can be dangerous. Boats travelling on the Mekong River in the 'Golden Triangle' area have been robbed and shot at. 'Fast boats' can be dangerous due to excessive speed and natural hazards. Wear a life jacket, even if others don't.

Malaysia

Threat Level Exercise normal safety precautions.	**Threat Level** Coastal region of eastern Sabah including nearby islands and dive sites, reconsider your need to travel.		**Latitude / Longitude** 4.210484, 101.975766 **GPS Position** 4° 12' 37.7424" N 101° 58' 32.7576" E

Crime	● There's an ongoing threat of terrorism, including in Kuala Lumpur and other major cities. Be alert to possible threats, especially in public places. Take official warnings seriously. ● There's a high threat of kidnapping in the coastal areas of eastern Sabah. There have been a number of attempted and successful kidnappings. This includes islands, dive sites and tourist facilities. The risk increases on the water and waterfront after dark. If you travel to these areas, get professional security advice. Obey all local governments' curfews. ● Petty crime is common. Bag-snatching including by thieves on motorbikes happens often. When walking hold your bag on the opposite side to the traffic. Safeguard your belongings, especially in shopping centres, at the airport and on trains. Credit card fraud is common. Always keep your credit card in sight when paying for purchases. ● Drink spiking can occur, even at reputable places. Never accept food, drinks, cigarettes or gum from strangers. Don't leave your food or drinks unattended. ● Taxi drivers have assaulted travellers, especially in downtown Kuala Lumpur. Book taxis by phone at a shopping centre taxi desk. Don't hail them on the street. Check the driver's licence details. Sit in the back seat. ● Piracy in South-East Asian waters is an ongoing problem. Reconsider your need to travel by boat in the southern Sulu Sea. If you travel in the region by boat check the International Maritime Bureau's piracy reports. Arrange personal security measures.
Laws	● Don't use, carry or traffic illegal drugs. Punishments include the death penalty. ● It's unclear if surrogacy is legal under Malaysian civil law and what conditions apply. Get legal advice before arranging a surrogacy. ● Malaysia is a multicultural but mostly Islamic country. Many areas have conservative standards of dress and behaviour. This includes at religious sites. Get advice on local customs. ● Malaysia enforces some aspects of sharia law. Kelantan and Terengganu states are stricter than others. These laws apply to all Muslims, including visitors. Research laws that apply to you before you travel. ● Same-sex relations are illegal for both men and women. Punishment can include whipping and up to 20 years in jail. ● It's illegal to drive after drinking any amount of alcohol. Authorities strictly enforce these laws. ● Malaysia doesn't recognise dual nationality. If Malaysian authorities find out you're a dual citizen, you may need to renounce one of your citizenships immediately.

Health Risks	● Strict rules control the importation of prescription and non-prescription medication. If you plan to bring medication, check if it's legal in Malaysia. ● Smoke haze often happens from June to October, but it can happen at any time. Limit outdoor activity when haze levels are high. ● Dengue is common, including in major urban areas. Zika virus is also a risk. If you're pregnant, discuss your travel plans with your doctor. ● Malaria is a risk in rural areas. It's less common in urban and coastal areas. Consider taking anti-malarial medication. ● Other insect-borne diseases include chikungunya, filariasis and Japanese encephalitis. Ensure your accommodation is insect-proof. Use insect repellent. Get vaccinated against Japanese encephalitis before you travel. ● Rabies is present in Malaysia. The most recent cases were in Sarawak. It's fatal without immediate treatment. Avoid dogs, monkeys and other mammals. Get medical help straight away if an animal bites or scratches you. ● Waterborne, foodborne, parasitic and other infectious diseases are common. These include hepatitis, tuberculosis, typhoid and cholera. Drink only boiled or bottled water. Avoid raw or undercooked food. ● Private hospitals in major cities are of an international standard. You'll need to pay up-front at all hospitals. Services are more limited in rural areas. ● Medical tourism, including for cosmetic surgery, is common. Surgery at discount or uncertified clinics can lead to life-threatening complications. Research and choose medical service providers carefully. Check your travel insurance covers complications from surgery.
Weather	
Other	● You might be able to get a 90-day tourist visa on arrival with a passport. In other situations, get a visa before you travel. Contact your nearest Malaysian embassy or high commission for details. ● Local authorities require you to always carry photo ID. You need your passport to travel between Peninsular Malaysia and East Malaysia (Sabah and Sarawak). ● The official currency is the Malaysian Ringgit (MYR). ATMs are widely available. ● You can drive in Malaysia with a driver's licence and an International Driving Permit (IDP). Get your IDP before you travel. If you don't have an IDP, apply for a local licence. ● Ask taxi drivers to use the meter, or agree the fare, before you go. Take note of the driver's name, vehicle number and taxi company number. The taxi regulator has an English-language hotline for reporting problems. ● If you plan to travel by bus, choose a company with a good reputation. Avoid overnight travel. Long-distance tour buses have had fatal accidents, especially at night and in bad weather. ● Before booking tickets on a passenger ferry, speedboat or other vessel, check there's appropriate safety equipment available. Don't travel on any vessel that looks overloaded or in poor condition. Always wear a life jacket. ● National parks are protected areas. Some are home to ethnic minority groups. Respect the law and customs in these areas. If in doubt, seek local advice.

Myanmar

	**Threat Level** Cities of Yangon, Mandalay, Bagan, Nay Pyi Taw and Inle Lake, exercise normal safety precautions.	**Threat Level** Moderate threat level to personal safety, take extra precautions here.	**Threat Level** Rakhine State (except resort areas at Ngapali Beach); Northern and Central Shan State, Kachin State, Areas bordering China, Laos, Thailand, Bangladesh and India, Paletwa township, southern Chin State, reconsider your need to travel.	**Threat Level** Townships of Maungdaw, Buthidaung and Rathedaung in northern Rakhine State, do not travel.		**Latitude / Longitude** 21.916221, 95.955974 **GPS Position** 21° 54' 58.3956'' N 95° 57' 21.5064'' E

Crime	● Protests happen often in Myanmar, including in tourist areas. Authorities sometimes respond with force. Political violence also happens, often on or around public holidays. Avoid large public gatherings. Don't take photos of rallies, the military or police. ● There are several active conflicts between armed groups and security forces. Some townships in Rakhine State, southern Chin State and northern Shan State are particularly dangerous. There's also been armed conflict in Kachin State and a risk of conflict in southern Rakhine State. ● Armed groups operate along Myanmar's borders with China, Thailand, Laos, Bangladesh and India. This includes at official border crossings. There are also unmarked landmines. If you choose to travel there despite the risks, carefully assess the security situation, including curfews and travel restrictions. Stick to main highways and urban areas. ● Myanmar has experienced terrorist attacks. Be alert to possible threats. Take official warnings seriously. ● Crime rates in Myanmar are lower than many nearby countries. But some crime, such as mugging, petty theft and burglary, occurs. Safeguard your belongings, especially in crowds. Check for skimming devices before you use credit cards.
Laws	● Don't use or carry illegal drugs. Punishments include the death penalty. Drinking alcohol in public places, such as parks, religious buildings or compounds, is illegal. ● Same-sex relations and adultery are illegal. ● Be careful when taking photos. It's illegal to photograph military personnel or sites. Myanmar has strict communications laws. Don't post negative comments about individuals or Myanmar on social media. ● Myanmar has strict religious laws. It's illegal to take religious materials in or out of the country without approval. Preaching or handing out religious material without approval is also illegal. There's also a law against 'insulting religion', including mistreating images of Buddha. Cover any Buddha tattoos. ● People in Myanmar are deeply respectful of their religious and cultural traditions. Don't wear shorts or sleeveless tops, especially at religious sites. Always remove your shoes and socks before entering a site. ● Customs rules are restrictive. Seek prior permission to import drones or radio equipment. Drones have been seized by customs officials and tourists have been arrested for operating drones. ● There are also strict rules about exporting gems, antiques and images of Buddha. Check items are legal before you buy them.
Health Risks	● Get comprehensive travel insurance before you leave. If you travel to high-risk areas you may need a special insurance policy. Most policies won't cover you. ● Medical facilities in Myanmar are extremely limited, particularly outside Yangon. If you're seriously ill or injured, you'll need medical evacuation. Ensure your travel insurance covers this. Be cautious if you have an existing medical condition. ● Medicines sold in Myanmar can be fake. Take enough legal medication for your trip. ● Common insect-borne diseases include malaria, dengue, chikungunya and Japanese encephalitis. Ensure your accommodation is insect-proof. Consider taking anti-malarial medicine. Get vaccinated against Japanese encephalitis before you travel. ● Many animals in Myanmar carry rabies. It's fatal without immediate treatment. Don't feed, pat or tease dogs or monkeys. Get medical help straight away if an animal bites or scratches you. ● Polio is a risk. Hepatitis-A and typhoid also occur. Talk to your doctor about vaccinations before you travel. If you're staying for more than 4 weeks, carry proof of your polio vaccination. Waterborne, foodborne and other infectious diseases such as hepatitis, typhoid and tuberculosis are common. Drink only boiled or bottled water. Avoid raw or undercooked food. HIV/AIDS is common. Take steps to reduce your risk of exposure to the virus.
Weather	● Severe storms, floods, landslides and cyclones can happen during the monsoon season from May to October. These can disrupt transport and essential services. Take official warnings seriously. Myanmar is sometimes subject to serious earthquakes. Know your hotel's evacuation plans.
Other	● You need a visa to enter Myanmar. Apply for one at your nearest Myanmar embassy or consulate. If you're travelling for tourism or business, you can apply for an e-Visa online. Beware of unofficial websites that claim to offer e-Visas. You can apply for a tourist visa on arrival at Yangon, Mandalay and Naypyitaw airports. Ppeople who were born in Myanmar are not eligible for visa on arrival. ● Travellers must stay in registered hotels and guesthouses. Register your address with immigration authorities if you're staying for more than 90 days. ● Let them know if you change hotels or will be away from your address. ● The government restricts travel in parts of the country, including to and from land border crossings. If you plan to visit areas other than popular tourist areas, check the list of restricted areas. Carry your passport or Foreigners Registration Card. Officials may ask to see it. ● It's illegal to drive cars or motorbikes on another countries or international licence. Apply for a local licence through the Road Transport Administration Department (Burmese). Don't drive in the countryside at night, including on the Yangon–Naypyitaw–Mandalay highway. Don't leave the scene of an accident. ● Public transport, including buses, boats and trains, doesn't meet international safety standards. Fatal accidents have occurred, especially on overnight trips.

Philippines

	Threat Level Moderate threat level to personal safety, take extra precautions here.	**Threat Level** Eastern Mindanao, reconsider your need to travel.	**Threat Level** Central and western Mindanao, including the Zamboanga Peninsula, and the Sulu Archipelago and southern Sulu Sea area, do not travel.			**Latitude / Longitude** 12.419866, 122.574646 **GPS Position** 12° 25' 11.5176'' N 122° 34' 28.7256'' E

Crime	● Terrorist attacks could occur anywhere in the Philippines. Possible targets include public transport, hotels, shopping malls, restaurants, schools, events, places of worship and tourist areas. Be alert to possible threats. ● The threat of kidnapping and piracy in the southern Philippines is very high, especially in coastal resorts, coastal waters and isolated locations. Kidnappers may target popular tourist areas. If you travel to the southern Philippines get professional security advice. Ensure your accommodation has proper security measures. Don't travel by boat. ● Protests can turn violent. It's illegal to take part in political rallies if you're not Filipino. Avoid large public gatherings. ● Violent and other serious crime is common. Many crimes involve guns. Gunfights between criminals and police are common. Gangs often drug tourists before robbing or assaulting them. Pickpocketing, bag snatching and scams are common. Don't leave food or drinks unattended. Don't use public transport. Be careful in crowded shopping malls and other public places. Only use ATMs in secure locations.
Laws	● If you're accused of a crime, authorities may not let you leave the Philippines until investigations and legal proceedings are finished. These can take a long time, sometimes years. ● Don't use or carry illegal drugs. Penalties are severe and police are strictly enforcing laws. Mandatory sentences are common for possessing small amounts of drugs. ● The Philippines has strong laws against child sex crimes and human trafficking. ● Local laws don't protect LGBTI rights. Consider avoiding public displays of affection.
Health Risks	● Medical facilities are adequate in major cities. However, facilities are limited in country areas and remote islands. Ensure your travel insurance covers medical evacuation. ● There are measles and polio outbreaks across the country, including in Manila. Get vaccinated before you travel. ● Malaria and dengue are common, especially in many provincial areas. Zika virus is widespread. Other insect-borne diseases include Japanese encephalitis and filariasis. Consider taking anti-malarial medication. Ensure your accommodation is insect-proof. Use insect repellent. Get vaccinated against Japanese encephalitis before you travel. If you're pregnant, discuss your travel plans with your doctor. ● Foodborne, waterborne and other infectious diseases include cholera, typhoid and hepatitis. Drink only boiled or bottled water. Avoid raw or undercooked food. Don't swim in lakes or rivers. ● Bird flu occurs in farm birds. Don't visit live bird and animal markets, including 'wet' markets and poultry farms. Cook all poultry thoroughly. ● HIV/AIDS is a risk. Transmission rates between men who have sex with men are high. Take precautions if you engage in high-risk activities.
Weather	● Severe currents and rips are common in coastal areas. Many travellers have drowned, including in popular resorts. Some swimmers also get ill from pollution. Get local advice before swimming. Don't swim where there are red flags on the beach. ● Philippines experiences typhoons, tropical storms, flooding, landslides, earthquakes, volcanic eruptions and tsunamis. These may disrupt essential services. Know your accommodation's evacuation plan. Monitor the media and follow the advice of local officials.
Other	● You won't need a visa for business or tourist trips of less than 30 days. If you're travelling for another reason or staying longer, get a visa from your nearest Philippines embassy or consulate. ● Keep your visa up-to-date or risk lengthy detention for overstaying or violating your visa. ● Carry proof of your onward or return ticket. Immigration officials may ask to see it. ● You can drive for up to 90 days using a driver's licence. After that, get a Philippines licence. ● Roads are often congested. Drivers often break the road rules. Stick to national highways and other sealed roads, especially at night. Always wear a helmet when riding a motorcycle as accidents are common. ● Use rideshare apps and Grab taxis sourced from hotels. They're more reliable than taxis hailed on the street. ● Avoid ferries if you can. If you must travel by ferry, use a ferry service with a good reputation and well-maintained vessels. Take your own life jacket.

Singapore

	Threat Level Exercise normal safety precautions.						**Latitude / Longitude** 1.352083, 103.819836 **GPS Position** 1° 21' 7.4988'' N 103° 49' 11.4096'' E

Crime	● Unauthorised public demonstrations are illegal. You need a police permit for public gatherings of more than 4 people. If you're travelling as a group of 5 or more, be careful to not get in the way of others. Public demonstrations are only allowed at Speakers' Corner in Hong Lim Park. If you're not a permanent resident, you need a permit to join these. ● Violent crime against tourists is rare. Petty crime, such as theft and pickpocketing, happens at the airport, in tourist areas and on public transport. Safeguard your belongings. ● Scammers pretend to be landlords on property websites and offer fake rental properties. Research the property and landlord before agreeing to a property rental or sale contract. ● Terrorism is a threat. Possible targets include businesses and public areas popular with foreigners. Take official warnings seriously.
Laws	● Don't use or carry illegal drugs. It's illegal to have drugs in your system. You can be charged for consuming drugs even if you took them outside Singapore. Penalties include caning and the death sentence for serious drug offences. ● Singapore has strict laws for 'outrage of modesty' offences. These include offences as a result of being drunk, men behaving inappropriately towards women, swearing and inappropriate touching. Penalties include jail, fines and caning. ● Singapore has strict laws and penalties for things that are legal or are minor offences in other countries. These include smoking in public places or restaurants, spitting, importing or chewing gum, chewing tobacco, littering and jaywalking. Be careful when taking photos. It's illegal to photograph official buildings where there are signs banning photos. ● Penalties are severe for crimes that affect social, racial or ethnic harmony. These include racial insults, and promoting ill-will and hostility between different races or classes. Apply for a Miscellaneous Work Pass from the Ministry of Manpower if you want to speak publicly on racial, communal, religious or political topics. ● Strict laws control alcohol and e-cigarettes or vaporisers. It's illegal to drink in public between 10:30pm and 7am, or in Liquor Control Zones. Importing vaporisers, including for your own use, is also illegal. ● Same-sex acts between men are illegal. Penalties include jail sentences. There is no specific law against same-sex acts between women, but there are local sensitivities. Behaviour standards are conservative. Public displays of affection may offend.
Health Risks	● Singapore restricts some substances in medications. The Singapore Health Sciences Authority has a list of controlled substances and explains how to get approval. Carry your permit with you. ● Zika virus is a risk. If you're pregnant, discuss your travel plans with your doctor. Other insect-borne diseases include dengue, chikungunya and Japanese encephalitis. Ensure your accommodation is insect-proof. Use insect repellent. Get vaccinated against Japanese encephalitis before you travel. ● Cases of dengue have significantly increased in 2019. Follow the National Environment Agency's advice for the prevention and identification of dengue infection. ● Smoke haze happens from June to October. The National Environment Agency gives updates and health warnings. ● Hand, foot and mouth disease (HFMD) is common. Outbreaks usually start in March or April and peak in May but can continue until October. It mainly affects children aged under 10, but can also affect adults. Wash your hands thoroughly and often. ● Singaporean officials screen passengers for Middle East respiratory syndrome coronavirus (MERS-CoV) at Changi Airport. If you have symptoms, they may send you to hospital you until you test negative for MERS-CoV. If you've been in close contact with someone who has symptoms, authorities may quarantine you. ● The standard of medical facilities and care is similar to or higher than in first world countries however the cost is much higher. Ensure your travel insurance covers medical costs.
Weather	● Strong winds and heavy rain happen during the monsoon seasons from December to March and from June to September. Follow the advice of local officials.

Other	● You won't need a tourist or business visa to stay up to 90 days. For work or study, apply for a visa before you travel. Contact the nearest embassy or consulate of Singapore for details. ● The local currency is the Singapore Dollar (SGD). You can easily exchange dollars. ATMs are available across the country. Hotels, restaurants and shops accept international credit cards. ● You can drive for up to 12 months with a driver's licence. After this time, you'll need to get a local licence. Road conditions and driving practices are similar to those found in first world cities. ● Safe, metered taxis are available from official taxi ranks. Rideshare services are legal. ● Singapore has an efficient public transport network, including rail and bus services. ● Piracy occurs in the coastal areas around Singapore. If you're travelling by boat, take safety precautions.

GEOGRAPHY / Asia / South East Asia / Thailand

Thailand

Threat Level
Moderate threat level to personal safety, take extra precautions here.

Threat Level
Yala, Pattani, Narathiwat and Songkhla, do not travel.

Latitude / Longitude
15.870032, 100.992541

GPS Position
15° 52' 12.1152" N
100° 59' 33.1476" E

Crime	● Popular tourist areas in Thailand may be the target of terrorist attacks. Thai authorities have warned of possible bombings on symbolic dates or holidays. Be alert to possible threats. Take official warnings seriously and follow the advice of local authorities. ● The security situation in Thailand can be unpredictable. Protests have turned violent, causing deaths and injuries. Avoid public gatherings. Take official warnings seriously and follow the advice of local authorities. ● Border areas near Cambodia, Myanmar and Malaysia are dangerous due to violence, armed conflict and landmines. Pay close attention to your personal security. ● Don't travel to the 4 most southern provinces of the Thailand-Malaysia border: Yala, Pattani, Narathiwat and Songkhla. These areas experience frequent violence and bombings. If you're there, consider leaving. ● Sexual assault, assault, robbery and drink spiking can happen to tourists. Never leave your drink unattended. Stick with people you trust at parties, in bars, nightclubs and taxis.
Laws	● Penalties for drug offences are severe. They include the death penalty. ● Commercial surrogacy is illegal. E-cigarettes, e-baraku, vaporisers and refills are illegal. Smoking on some beaches is illegal. Travel without carrying identification is illegal. ● Penalties for breaking the law can apply to anyone aged under 18 years. Penalties for children can include detention in a juvenile or adult prison. ● Thailand has the death penalty for serious crimes, including murder, attempted murder and rape. Crimes against the state and offences against the monarchy can also attract the death penalty. Take care not to cause offence about the monarchy, including on social media.
Health Risks	● Travellers have been arrested for carrying medicine they bought at a Thai pharmacy without a prescription. Get medical advice before buying medicine. ● Insect-borne diseases include malaria, Zika virus, dengue, chikungunya, Japanese encephalitis and filariasis. Use insect repellent. Ensure your accommodation is insect-proof as possible. ● Animals in parts of Thailand can carry rabies. Don't ever feed, pat or tease monkeys. If you're bitten or scratched by a dog, monkey or other animal, get treatment immediately. ● Thailand has high levels of air pollution. Air pollution can make bronchial, sinus or asthma conditions worse. Check air quality levels on the World Air Quality Index. ● Medical tourism is common. Avoid discount and uncertified medical establishments. Their standards can be poor. Research medical service providers and choose with care.
Weather	
Other	● Tourists might be able to get a visa exemption for up to 30 days. In other circumstances, you'll need to apply for a visa before you travel. ● If you overstay your visa, you'll need to pay a fine before you can leave. You may also be arrested, prosecuted, jailed and deported. ● Safety standards for adventure activities may not be adequate. Make sure you have adequate travel insurance. Always insist on, and use, safety equipment. ● Thailand has one of the highest traffic-related fatality rates in the world. Be extra careful during holidays. Don't drink and drive. ● Motorcyclists are most at risk on the road. If you're in an accident, police may detain or arrest you. If you hire a motorbike, make sure you have a valid motorcycle licence and insurance. Always wear a helmet.

GEOGRAPHY / Asia / South East Asia / Timor-Leste

Timor-Leste

Threat Level
Moderate threat level to personal safety, take extra precautions here.

Latitude / Longitude
-8.874217, 125.727539

GPS Position
8° 52' 27.1812" S
125° 43' 39.1404" E

Crime	● Local unrest happens, including street gang fighting and political demonstrations. Minor disputes can become violent. Tourists have been harassed because of their nationality. Avoid large public gatherings. In Dili, be careful around Tasi Tolu, Comoro and other crowded areas. ● Violent and petty crime aren't common. But the risk increases at night and if you're travelling alone. Criminals sometimes target foreigners. Lock your accommodation, even when you're in it. Drive with doors locked and windows up. ● Travellers can experience sexual harassment, including lewd remarks and indecent exposure. Although offenders mostly target women, they may harass men. Sexual assault can happen in public places, such as Beach Road in Dili. Travel as a group if you can, including when exercising outdoors. Don't use public transport or taxis alone, especially at night. ● Crocodile attacks are reported in the eastern districts and along the southern coast. Crocodiles have been seen on beaches and inland waterways, including in Dili. Follow local advice.
Laws	● Don't use or carry illegal drugs. There are serious penalties for drug offences. ● Don't interfere in local political processes or take part in political activity. If you do, you'll face fines, detention or deportation. ● Timor-Leste doesn't recognise de facto or same-sex relationships. Social and cultural attitudes towards same-sex relationships are conservative. Avoid public displays of affection. ● Dress and behaviour standards are conservative. Don't wear revealing clothing in public places, churches or markets. Public displays of affection aren't socially acceptable. Loud noise and foolish behaviour on religious days are offensive.
Health Risks	● While cases of malaria are not common, other mosquito-borne disease can be found in Timor-Leste. Ensure your accommodation is insect-proof. ● Rabies is not confirmed in Timor-Leste, but it's found on neighbouring islands. Doctors have treated suspected cases in Dili. Rabies is fatal without immediate treatment. Avoid dogs, monkeys and other mammals. Get medical help straight away if an animal bites or scratches you. ● Waterborne, foodborne and other infectious diseases are widespread. These include gastroenteritis, typhoid and hepatitis. Drink only boiled or bottled water. Avoid raw or undercooked food. ● Tuberculosis is widespread. Healthcare workers are at risk. If you're a healthcare worker, get tested for tuberculosis before you travel and after you leave. ● Fish sold on the roadside may be contaminated with formaldehyde. Follow local warnings and advice. ● Medical facilities are limited, including at Dili National Hospital, which treats most emergency cases. Dental facilities are extremely limited. If you're seriously ill or injured, you'll need medical evacuation. Ensure your travel insurance covers this.
Weather	● Severe storms occur during the wet season, from November to April. Flooding and landslides can damage roads and disrupt services. Follow the advice of local officials. ● Timor-Leste can experience earthquakes and tsunamis. Know the tsunami warning signs and move to high ground straight away. Don't wait for official alerts.

GEOGRAPHY | Asia | South East Asia | Timor-Leste

Other	● For a fee in US dollars, tourists can get a 30-day visa on arrival if they enter through Nicolau Lobato International Airport or Dili Seaport. In other situations, you'll need to get a visa before you arrive. Contact your nearest Timorese embassy or consulate for details. ● The official currency is the US Dollar (USD). You can't use notes issued before 2000. Most places won't take credit cards, including hotels, shops and restaurants. Bring enough USD in cash to meet your needs. You may not be able to exchange Australian dollars. ● You need permission to visit some places that have special religious or cultural importance. Check with local authorities before you visit. ● You can drive for up to 3 months with a driver's licence and an International Driving Permit (IDP). Get your IDP before you travel. After 3 months, get a local licence. Outside of Dili, travel in convoy if you can. Don't drive at night. ● Many taxis are in poor condition. You're at risk of robbery, sexual harassment and sexual assault in taxis. Avoid using taxis, especially if you're female. ● Boats are often unsafe and overcrowded. Before booking sea travel, make sure that the company has good maintenance and safety standards. Always wear a life jacket. Don't board or stay on an overcrowded vessel.

Vietnam

GEOGRAPHY | Asia | South East Asia | Vietnam

Threat Level
Exercise normal safety precautions.

Latitude / Longitude
14.058324, 108.277199

GPS Position
14° 3' 29.9664" N
108° 16' 37.9164" E

Crime	● Road accidents are a major cause of injury. Be alert at all times on the roads. ● Petty theft, including bag slashing, is common in tourist areas and crowded places, especially at holiday times. Snatch-and-grab theft by thieves on motorcycles is also common. Hold bags and backpacks in front of you to make them harder to steal. Be aware of motorbikes approaching as you walk. ● Aggravated theft, sexual assault and assault happen. Travellers have been assaulted after having their food or drinks spiked. Pay attention when your drinks are being mixed. Get urgent medical help if you suspect drink spiking. ● Personal or commercial disputes sometimes lead to threats of physical violence or death. Have a clear agreement on the expected level of service. Report any threats to police. ● Travellers have been robbed withdrawing money from ATMs. Credit and debit card fraud and card skimming happen across Vietnam. Taxi and gambling scams are also common. Only use ATMs in banks and shopping centres. Always keep your credit card in sight. Use official or prearranged taxis, especially at airports. Report gambling scams to police.
Laws	● Don't use or carry illegal drugs, including marijuana. Penalties for drug offences include the death penalty and life imprisonment. Never carry parcels or luggage for others. ● Get professional legal advice before signing any contract. If you're in a business or civil dispute, officials could stop you leaving Vietnam until it's resolved. ● It's illegal to gamble in non government-licensed casino or possess pornography. Non-state sanctioned political or religious activity or material is also illegal. It's illegal to export antiques without a permit. Get a permit from the Ministry of Culture, Sports and Tourism (Vietnamese). It's illegal to photograph border areas or military sites. Be careful when taking photos. ● Vietnam recognises dual nationality in limited situations. You may need to do compulsory military service. Contact your nearest Vietnamese embassy or consulate for details.
Health Risks	● Zika virus is a risk. Other insect-borne diseases include dengue, Japanese encephalitis and malaria. If you're pregnant, discuss your travel plans with your doctor. Use insect repellent. Get vaccinated before you travel. Consider taking anti-malarial medication. ● Rabies occurs in Vietnam, especially in the north. It's fatal without treatment. If you're bitten or scratched by an animal, get medical help straight away. ● HIV/AIDS is a risk. Take precautions if you're taking part in high-risk activities. ● Hand, foot and mouth disease (HFMD) is common. It mainly affects children and young adults. Foodborne, waterborne, parasitic and other infectious diseases include cholera, hepatitis and typhoid. Wash your hands well and often. Drink only boiled or bottled water. Avoid raw or undercooked food. ● Foreign private medical clinics may not meet first world standards. Public hospitals are of poor standard. You'll need to pay up-front, even for emergencies. If you're seriously ill or injured, you may need medical evacuation. Ensure your travel insurance covers this.
Weather	● During the rainy season (June to November), floods, typhoons and severe weather can disrupt essential services. Follow the advice of local officials.
Other	● To enter Vietnam you need either a visa, a visa exemption certificate or approval for a visa-on-arrival. Apply via the e-visa portal or via a Vietnamese embassy or consulate. Only apply for visas through official Vietnamese Government websites or offices. Travellers have been scammed by private online visa services and travel agents. ● Vietnam restricts how much prescription medication you can import and export. Check with your nearest Vietnamese embassy or consulate for details. ● Register your place of residence with the local police within 24 hours of arrival. Check that your hotel does this as part of the check-in process. Register at the local police station if you're staying in private accommodation. ● Unexploded weapons and landmines are a danger in former battlefields, especially in central Vietnam and along the Laos border. Stick to marked roads and paths. ● You must have a valid Vietnamese driver's licence to drive in Vietnam. This includes for motorcycles of 50cc or more. If you're in an accident, you could face criminal charges even if you're not at fault. If you're not familiar with local conditions, don't drive or ride a motorbike. ● You need to show your luggage tags when leaving Vietnamese airports. Always carry your airline luggage receipt.

GEOGRAPHY | Europe

5 Europe

The European region. The colour shading and travel advice on the map is the advice given by the Australian Government and is accurate as of the 20th Feb 2025. However countries risk ratings rarely change so this could be considered accurate advice going into the forseeable future.

This map is presented for information only. The Department of Foreign Affairs and Trade accepts no responsibility for errors or omission of any geographic feature. Nomenclature and territorial boundaries may not necessarily reflect Australian Government policy. For the more detailed travel advice, including intra-country levels visit smartraveller.gov.au. 1 Eastern Europe

Armenia

	**Threat Level** Exercise normal safety precautions.	**Threat Level** Nagorno-Karabakh and surrounding military occupied areas, do not travel.				**Latitude / Longitude** 40.069099, 45.038189 **GPS Position** 40° 4' 8.7564'' N 45° 2' 17.4804'' E

Crime	● Protests occur in Yerevan, Gyumri and other major cities. These can turn violent. Avoid large public gatherings. ● Regular armed clashes occur in the buffer zone between the closed Armenia-Azerbaijan border and the ceasefire line. Conflict also occurs in the disputed enclave of Nagorno-Karabakh and its surrounding military zone. All these areas have unmarked landmines. If you travel to these areas, get professional security advice. ● Petty crime, such as pickpocketing and theft from cars, is common. Be careful on trains to and from Georgia.
Laws	● Don't use or carry illegal drugs. Penalties include long prison sentences. ● Some medicines are illegal in Armenia, such as some sleeping tablets and medicines containing codeine. Check your medication is legal before you travel. ● Always carry a copy of your passport. Show it to police if they ask. ● Be careful when taking photos. It's illegal to photograph government or military sites, monuments or officers in uniform. ● Armenia recognises dual nationality. A child born to an Armenian parent is automatically a dual citizen. If you're a dual national, you must travel on your Armenian passport. If you're male and aged between 18 and 27, you may need to do military service. Check with your nearest Armenian embassy or consulate before you travel. ● Same-sex relationships are legal but aren't socially acceptable. Discrimination against LGBTI people is common. Avoid public displays of affection.
Health Risks	● Malaria is a risk in the western border areas. Consider taking anti-malarial medication if you're travelling to these areas. Other insect-borne diseases are also a risk. Ensure your accommodation is insect-proof. Use insect repellent. ● Common foodborne, waterborne and other infectious diseases include typhoid, hepatitis and tuberculosis. Drink only boiled or bottled water. Avoid raw or undercooked food. ● HIV/AIDS is a risk. Take precautions if you engage in high-risk activities. ● Standards in public hospitals are basic, especially outside Yerevan. If you're seriously ill or injured, you'll need medical evacuation. Ensure your travel insurance covers this.
Weather	● Armenia is in an active earthquake zone. Landslides may occur. Follow the advice of local officials.
Other	● You don't need a visa if you're staying for 180 days or less. If you're staying longer, get a visa before you travel. You'll also need to register with the police when you arrive. Contact your nearest Armenian embassy or consulate for details. ● Armenia has strict import and export rules. These include for antiques, firearms, pornographic material, communication equipment and cash amounts over $US10,000. Get approval from the Armenian Ministry of Culture to export antiques or other items that could have historical value. Keep all receipts to show to customs officials when you leave. ● The local currency is the Armenian Dram (AMD). Exchange US dollars and euros at banks. ATMs and credit card facilities are available in Yerevan but are less common outside major towns. ● Armenia's land borders with Azerbaijan and Turkey are closed. The main road between Armenia and Georgia is also closed. Get local advice on different routes. To drive, you'll need both a driver's licence and an International Driving Permit. ● Use registered taxis. Get your hotel to arrange one. Don't hail taxis in the street. Sit in the back seat. ● Public transport is overcrowded and isn't well-maintained. Minibuses are particularly dangerous.

Azerbaijan

	**Threat Level** Exercise normal safety precautions.	**Threat Level** Nagorno-Karabakh and surrounding military occupied areas, Armenia-Azerbaijan border areas, do not travel.				**Latitude / Longitude** 40.143105, 47.576927 **GPS Position** 40° 8' 35.178'' N 47° 34' 36.9372'' E

Crime	● Protests can turn violent. Avoid large public gatherings. ● Regular armed clashes occur in the buffer zone between the closed Armenia-Azerbaijan border and the ceasefire line. Conflict also occurs in the disputed Armenian enclave of Nagorno-Karabakh and its surrounding military zone. It's illegal to enter Nagorno-Karabakh without a permit. All these areas have unmarked landmines. If you travel to these areas, get professional security advice. ● Violent crime is rare in Azerbaijan. But foreigners have reported serious crime, including home burglaries, robbery and assault. Be alert when walking after dark, including near hotels and in residential areas. Don't use unofficial taxis. Don't use ATMs on the street. ● Food and drink spiking occurs in bars and nightclubs in Baku. Don't leave your food or drinks unattended. ● Petty crime, such as pickpocketing, can happen. Take care at outdoor markets and on public transport. Thieves may pose as police officers and demand money.

Laws	● Don't use or carry illegal drugs. Penalties for drug offences are severe. They include long prison sentences and heavy fines. ● Always carry a copy of your passport and visa. The police can fine or detain you if you don't show a valid travel document when asked. ● Ensure you have the proper permits if you're buying antiques or cultural artefacts. It's also illegal to export them without an official certificate and receipt of purchase. Export rules apply to religious objects, carpets, artworks and caviar. Check with local authorities before you export any items. ● It's illegal to convert a person to another faith. ● Most of Azerbaijan is conservative. Public displays of affection may not be welcome. Same-sex relations are legal but aren't widely accepted. LGBTI people may face discrimination, intolerance or violence based on sexuality and gender identity.
Health Risks	● Malaria is a risk in the southern lowland areas. The risk is higher in summer from June to August. Consider taking anti-malarial medication if you're travelling to these areas. Ensure your accommodation is insect-proof. Use insect repellent. ● HIV/AIDS is common. Take precautions if you engage in high-risk activities. ● Foodborne, waterborne and other infectious diseases include typhoid, hepatitis and brucellosis. Drink only boiled or bottled water. Avoid raw or undercooked food. Avoid unpasteurised dairy products. ● Private hospitals in Baku are of similar standard to those in first world countries. Services in government hospitals and in rural areas are often limited. You'll probably have to pay up-front. If you're seriously ill or injured, you'll need medical evacuation. Ensure your travel insurance covers this.
Weather	
Other	● You need a visa to enter Azerbaijan. You can apply for an electronic visa (e-visa) for single entry, 30-day stays. Do this online through Azerbaijan's State Agency for Public Service and Social Innovations. Make sure your passport is valid for at least 3 months from the e-visa's expiry date. For other situations, contact your nearest Azerbaijani embassy or consulate. ● If you plan to stay in Azerbaijan for over 15 days, you must register with local police. Do this within 15 days of arrival. If you don't, you'll be fined and may have trouble leaving the country. ● Travel restrictions may apply to tourists planning to travel overland from Azerbaijan to neighbouring countries. Check with your nearest Azerbaijani embassy or consulate for any travel restrictions. Also check the rules of neighbouring countries. ● Learn the road rules before you drive. It's illegal to drive with a blood alcohol level over zero. Look out for pedestrians, livestock and farm equipment, particularly in rural areas. ● Azerbaijani domestic airlines may not meet international maintenance and safety standards. They can also be overcrowded and overbooked. Cancellations and delays are common.

Belarus

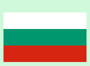
Threat Level
Exercise normal safety precautions.

Latitude / Longitude
53.709807, 27.953389

GPS Position
53° 42' 35.3052" N
27° 57' 12.2004" E

Crime	● Large protests occur in Minsk and other cities in Belarus. Avoid protests and obey local authorities. ● Crimes against travellers can happen. Take care on sleeper trains and in or near bars and hotels visited by foreigners. Watch out for drink or food-spiking. You're at higher risk of theft if you've been drugged. ● You may not be able to trust police and other local officials. People have reported harassment, mistreatment and extortion by officials. ● Terrorist attacks have occurred in Belarus. More attacks are possible in the future. ● People are injured or killed in snow-related accidents every winter from December to February. Take care in severe conditions.
Laws	● Serious crimes, such as murder, can attract the death penalty. Penalties for drug offences are severe. They include long prison sentences. ● Always carry your passport, original visa and migration card. Authorities can ask for ID at any time. They will not accept copies. ● It's illegal to drive with a blood alcohol level above zero. ● Some religious activities are illegal. ● It's illegal to take photos of certain sites, buildings, monuments and officials. Other rules or fees can apply to photography in public areas. ● Same-sex relationships are legal, but aren't widely accepted.
Health Risks	● You must have medical insurance to enter Belarus. Get comprehensive travel insurance before you travel. ● Ticks are common in forest and rural areas from spring to autumn. Tick-borne encephalitis and other tick-borne diseases are a risk. ● There's a radiation exclusion zone around Chernobyl. Authorities may restrict travel in this region. Foods may have high levels of radiation. Avoid eating local foods. ● Foodborne, waterborne and other diseases are common. Boil tap water or drink bottled water. Avoid ice cubes, unpasteurised dairy products, and raw and undercooked food. ● Healthcare in Belarus is below first world standard. If you become seriously ill or injured, you'll need medical evacuation. Make sure your travel insurance covers this.
Weather	
Other	● You can get a 30-day visa-free entry into Belarus. You can stay up to 90 days per calendar year. You must enter through Minsk International Airport. Other entry conditions apply, such as compulsory medical insurance. ● Belarus has strict entry and exit conditions. Visa-free entry does not apply to travellers coming from, or traveling to Russia. ● Authorities don't permit foreigners to cross the land border between Belarus and Russia. You must only travel between Belarus and Russia by air. ● Some areas in Belarus have limited entry border zones. To enter these zones, you need a special permit. ● Strict rules control the export of antiques, icons and items of historic significance.

Bulgaria



Threat Level
Exercise normal safety precautions.

Latitude / Longitude
42.733883, 25.48583

GPS Position
42° 44' 1.9788" N
25° 29' 8.988" E

Crime	● Pickpocketing and bag snatching occur in crowded areas and on public transport. Take care of your belongings. ● Car theft and break-ins are common. Park in secure car parks. Keep valuables out of sight. ● Watch out for drink spiking. Don't leave your food or drinks unattended. ● Bombings, shootouts and gang wars can occur. Always be aware of your surroundings. Monitor the media for risks.
Laws	● Don't use or carry illegal drugs. Penalties include heavy fines and prison sentences. ● Always carry original photo ID. ● It's illegal to cover your face in public. Don't wear a balaclava or full veil. ● It's also illegal to take photos of military sites. ● It's illegal to have sex with someone under 18. ● Same-sex relationships are legal in Bulgaria, but aren't widely accepted. Avoid public displays of affection.
Health Risks	● Rabies is common. Watch out for feral dogs. Get medical help straight away if you're bitten. ● Take care in forests and rural areas where ticks carry encephalitis. Ticks are active from April to October. ● Tuberculosis, typhoid, measles and hepatitis are common. Drink only boiled or bottled water. Avoid raw or undercooked food. ● West Nile virus can occur. There's no vaccine to prevent it. Use insect repellent. Make sure your accommodation is insect-proof. ● Health care standards are well below those in first world countries Medical supplies can be limited. Major cities have good hospitals. If you're seriously ill or injured, you may need to be evacuated. Make sure your insurance covers this.
Weather	● Earth tremors are common. Large earthquakes are rare. Avalanches, landslides and flooding can occur. Wildfires and fast-spreading fires occur from June to October. Monitor the media for updates.

Other	● If you're a tourist, you can stay up to 90 days without a visa. Get a visa for other situations. ● Bulgaria is part of the EU, but it's not in the Schengen area. Carry your passport when you cross borders. ● There are strict rules for children under 18, including dual nationals, who leave Bulgaria without both parents. Make sure you follow them. ● Driving on rural and secondary roads is hazardous due to poor conditions and driving standards. Police strictly enforce traffic laws and conduct frequent checks. These include radar speed checks.

Czech Republic

	**Threat Level** Exercise normal safety precautions.	 	**Latitude / Longitude** 49.817492, 15.472962 **GPS Position** 49° 49' 2.9712'' N 15° 28' 22.6632'' E

Crime	● Petty crime is common in Prague, including passport theft. Be wary of strangers who offer help or ask to see your passport. Only use ATMs in secure places, such as banks, shops and shopping centres. ● Drink spiking can happen. Keep an eye on your food and drink. Stay with people you trust in bars and nightclubs. ● Public protests and events that draw large groups of people can turn violent. Monitor the media for possible unrest. Avoid demonstrations and crowds. ● Terrorist attacks have occurred in some European cities. Be alert, especially in places known to be possible targets.
Laws	● Penalties for drug offences are severe and may include long prison sentences. ● It's illegal to photograph some buildings, including indoor shopping centres. If in doubt, ask local authorities before you take a photo.
Health Risks	● Ticks are common in forest and country areas from spring to autumn. They can cause disease, such as tick-borne encephalitis. Check your body for ticks and remove them quickly. ● The standard of medical facilities is similar to Australia and the U.S. However, you may need to pay for healthcare upfront, even in an emergency.
Weather	
Other	● The Czech Republic is a part of the Schengen area. In some cases you can enter without a visa. Contact the nearest embassy or consulate of the Czech Republic for details. ● Children under the age of 18 travelling alone must have a letter of consent from a parent. ● You need travel insurance with health cover to enter the Czech Republic. ● If you're staying for more than three days, you must register with the local Foreigner's Police Branch. It's usually part of the check-in process for paid accommodation. Make sure your host registers you. ● Border crossings can be strictly controlled. Carry your passport when crossing borders, even within the Schengen area. ● You need a motorway sticker on your car to travel on major highways. Buy the sticker at petrol stations.

Georgia

	**Threat Level** Exercise normal safety precautions.	**Threat Level** Pankisi Gorge north of Akhmeta, reconsider your need to travel.	**Threat Level** South Ossetia and Abkhazia (including adjacent areas) , do not travel.	 	**Latitude / Longitude** 42.177911, 43.512880 **GPS Position** 42° 10' 40.4796'' N 43° 30' 46.368'' E

Crime	● Political rallies are common in Georgia, including Tbilisi. They can turn violent. Monitor the media. Avoid public protests and rallies. ● Don't travel to South Ossetia or Abkhazia. There's a high risk of terrorist attack, unexploded landmines and violence in these regions. ● Violent crime can occur. Financial, import and export scams also occur. Be wary of strangers. Be extra careful when walking after dark.
Laws	● Penalties for drug offences are severe. They can include heavy fines and long prison sentences. ● If you plan to engage in surrogacy in Georgia, be aware of all the risks. Get legal advice. ● Always carry your passport, visa or migration card (or copies). ● It's illegal to take photos near military or strategic sites, such as airports. It's also illegal to export items of national heritage without a licence. ● Georgia doesn't recognise dual nationality. If you're a dual national, get advice from an embassy or consulate of Georgia before you travel.
Health Risks	● Malaria is a risk in south-eastern Georgia. Make sure your accommodation is insect-proof. Use insect repellent. ● Waterborne, foodborne, and other infectious diseases occur. Boil drinking water or drink bottled water. Avoid ice cubes, unpasteurised dairy products, and raw and undercooked food. ● Medical care is limited and of poor quality. If you become ill or injured, you may need to be evacuated. Make sure your travel insurance covers this.
Weather	● Earthquakes and floods can happen in Georgia. Monitor the media. Follow the advice of local authorities.
Other	● You need travel insurance in Georgia. Check the Ministry of Foreign Affairs of Georgia e-Visa Portal for details. ● You can visit Georgia for up to 12 months without a visa. You need a visa for longer stays. ● Children under 18 years travelling alone or with one parent need a copy of their birth certificate and passport. They may also need a letter of consent from the non-travelling parent or parents. Check with an embassy or consulate of Georgia. ● Don't enter or exit Georgia via land borders with Russia. It's illegal to enter Georgia via Abkhazia or South Ossetia. There's no official border control in these regions.

Hungary

	**Threat Level** Exercise normal safety precautions.	 	**Latitude / Longitude** 47.162494, 19.503304 **GPS Position** 47° 9' 44.9784'' N 19° 30' 11.8944'' E

Crime	● Petty crime occurs in Hungary. Theft from vehicles and highway robberies also happen. Be careful on public transport, in tourist areas, at petrol stations and in highway parking areas. Use secure parking facilities. ● Some clubs and restaurants overcharge. Disputes about overcharging can lead to violence. Always check the price of food and drinks before you order. Be aware that taxi drivers may get a commission for taking you to these places. ● Drink spiking can happen in Budapest bars and nightclubs. Stick with people you trust when you go out. Never accept food or drinks from strangers or leave your drink unattended. ● If you're travelling on overnight trains, always lock your cabin. Never leave your bags unattended.
Laws	● Penalties for drug crimes can be severe. They include long prison sentences and heavy fines. ● Local authorities can ask to see your ID at any time. Always carry your passport. A photocopy is not acceptable. ● Smoking is banned in some places. Large fines apply. ● Heavy fines exist for minor driving infringements. Penalties for serious driving offences include jail.

Health Risks	● Ticks are common in country and forested areas from spring to autumn. Tick-borne encephalitis is a risk. After visiting forests, check your body for ticks. Remove ticks as soon as possible. Watch tick sites for signs of infection. ● West Nile virus (WNV) occurs throughout Hungary. There's no vaccine to prevent it. Use insect repellent. Make sure your accommodation is insect-proof. ● Medical treatment is adequate but many medical facilities are below standard. Facilities are limited in rural and border areas. Doctors may expect up-front cash payment.
Weather	
Other	● Hungary is part of the Schengen area with some other European countries. In some cases, you can enter Hungary without a visa. Contact the nearest embassy or consulate of Hungary for advice. ● Hungary has strengthened border controls. Expect delays at these border crossings. Monitor the media. Ask transport providers about border conditions. ● Make sure you get a clear entry stamp in your passport. Get this when you enter any country in the Schengen area. ● You won't be allowed to enter if you have failed to pay a fine previously issued in Hungary. Contact the nearest embassy or consulate of Hungary for advice on paying fines before you travel. ● It's illegal to drive with a blood alcohol level above 0%. Police can take your licence away.

GEOGRAPHY – Europe – Eastern Europe – Hungary

Moldova

Threat Level Exercise normal safety precautions.	**Threat Level** Transnistria, reconsider your need to travel.			**Latitude / Longitude** 47.411631, 28.369885 **GPS Position** 47° 24' 41.8716'' N 28° 22' 11.586'' E

Crime	● Large political protests have occurred. Public protests and events can turn violent and attract a heavy police presence. Monitor the media. Avoid protests and rallies. ● The security situation in Transnistria is fragile. Transnistria is not controlled by the government. Reconsider non-essential travel to this region. ● Petty crime, including pickpocketing and bag snatching, is common, particularly in Chisinau. Criminals target trains and hotel rooms. Keep your personal belongings close. ● Police officers, or people posing as police, may ask for bribes. Ask to see ID. Offer to go to a police station to pay any fines. ● Online dating and marriage scams can happen. Be wary of business, dating or marriage proposals from people you've met online.
Laws	● Penalties for drug crimes are severe. They include long jail sentences and heavy fines. ● Always carry ID documents. If you can't show them when asked, police can detain and fine you. ● It's illegal to drive with a blood alcohol level over 0%. It's also illegal to take photos of military sites, government buildings and other infrastructure. ● It's illegal to operate a business without first registering it. Register with the State Registration Chamber of the Ministry of Informational Development. ● Same-sex relationships are legal in Moldova, but aren't widely accepted. Avoid public displays of affection.
Health Risks	● Tick-borne diseases are a risk. Ticks are active in forested areas from spring to autumn. Check your body for ticks if you travel to forests. ● Waterborne, foodborne and infectious diseases are common. Boil tap water or drink bottled water. Avoid ice cubes, unpasteurised dairy products, and raw or undercooked food. ● Medical facilities and supplies are limited. If you become seriously ill or injured, you'll need to be evacuated. Make sure your insurance covers this.
Weather	● Moldova is in an earthquake zone. Register with the Global Disaster Alert and Coordination System to receive alerts on major disasters.
Other	● Avoid entering or exiting through Transnistria. If you decide to travel through Transnistria ask your insurer if you need special travel insurance for your trip. ● If you're visiting for up to 90 days in a 6-month period, you won't need a visa. For longer stays, you'll need a visa. ● Record your entry date, and check your visa dates carefully. If you overstay, authorities may deport you. ● Strict regulations cover the export of antiques, artworks and items of historical significance. Get approval from the Moldovan Department of Monuments. ● Border controls can be strict. Always carry your passport when you cross. Monitor the media. Ask transport providers for updates on border conditions.

GEOGRAPHY – Europe – Eastern Europe – Moldova

Poland

Threat Level Exercise normal safety precautions.			**Latitude / Longitude** 51.919438, 19.145136 **GPS Position** 51° 55' 9.9768'' N 19° 8' 42.4896'' E

Crime	● Muggings, carjackings and theft from vehicles occur in large cities. Petty crime, such as pickpocketing, is common. Thieves often work in small groups. Take care in tourist areas and near hotels, markets, ATMs, currency exchange bureaus and public transport. ● Check your bank card statement often. Report any suspicious activity to your bank. ● Ask about the price of drinks before you order in bars and nightclubs. Check the bill amount and currency carefully. Some bars overcharge. ● Be careful of drink spiking. Don't leave drinks or food unattended. There have been reports of drink spiking and credit card overcharging in tourist hotspots. If you believe you are a victim, report it to local police and contact your bank.
Laws	● Penalties for drug offences include mandatory jail sentences. ● There are strict alcohol laws in Poland. There's zero tolerance for drink driving. The blood alcohol limit is 0.02%. It's illegal to drink or be drunk in public. You may be arrested or taken to a facility to sober up. ● It's illegal to take photos of some buildings. Look for signs on buildings that forbid photos and check with local authorities. ● Poland doesn't recognise dual nationality. This may limit the consular help we can provide. By law, dual nationals must enter and exit Poland on their Polish passport.
Health Risks	● Tick-borne encephalitis is a risk. Ticks are active in forests and rural areas from spring to autumn. Regularly check your body for ticks during and after visits to forest areas. ● H1NI (swine flu) has been reported. Get the annual seasonal flu shot to lower your risk. ● Air pollution levels can be very high in winter. Get medical advice if you have a heart or lung condition. ● Public hospitals are reasonable in large cities. Services are limited in rural and border regions. Most doctors and hospitals will need payment up-front or evidence of medical insurance, before treating you.
Weather	● Heavy snowfalls can disrupt train and road travel. Severe flooding happens, particularly in spring. Register with the Global Disaster Alert and Coordination System to receive alerts.
Other	● Poland is part of the Schengen area. This may allow you to enter without a visa in some cases. Carry your passport when crossing borders, even within the Schengen area. ● If you'll stay longer than 14 days, you must register within four days of arrival. Check that your hotel has registered you. ● Cross-border road and rail transport services can be disrupted. If travelling by road or train, allow extra time and expect delays. Make plans in case you can't cross the border. ● Road rules are different. If you drive, always keep your headlights on. Use winter tyres and carry chains in winter and in mountain areas. Know the road rules before you use any vehicle, to avoid fines and insurance issues. ● Unofficial taxis often overcharge passengers. Pre-book official taxis using an app or ask hotel staff to do it for you.

GEOGRAPHY – Europe – Eastern Europe – Poland

Romania

	Threat Level Exercise normal safety precautions.	

Latitude / Longitude	45.943161, 24.96676
GPS Position	45° 56' 35.3796'' N 24° 58' 0.336'' E
Crime	● Pickpocketing and bag-snatching occur. Thefts from hotel rooms are common. Assault and theft happen on intercity trains. Keep your personal belongings close. Lock hotel and train compartment doors from the inside. ● Drink spiking is an issue, especially in Bucharest's Old Town. Don't accept food, drinks, gum or cigarettes from people you've just met. ● Thieves posing as police officers may ask to see your ID and wallet. Romanian police won't stop you at random to do this. If you suspect someone is posing as a police office, ask to see their identification. ● Financial, dating and marriage scams occur. Only use ATMs in banks, shops and shopping centres, especially at night. Always keep your credit card in sight. Be wary of people you've met online.
Laws	● Penalties for drug offences are severe. They can include jail sentences of up to 20 years. By law, you must always carry photo ID. Keep your passport in a safe place. Carry a photocopy. ● It's illegal to take photos of airports, military sites or other secure locations. ● It's illegal to engage in sex work or have sexual relations with a person under 18. ● Same-sex relationships are legal in Romania, but not widely accepted.
Health Risks	● Rabies is widespread. Get vaccinated before you travel. If an animal scratches or bites you, get medical treatment immediately. ● Ticks are common in forests and country areas from spring to autumn. Tick-borne encephalitis is a risk. ● West Nile virus can occur. Make sure your accommodation is insect-proof. Use insect repellent. ● Measles has occurred in recent years. Ensure your vaccinations are up to date before you travel. ● Waterborne, foodborne and other infectious diseases are common. Drink boiled or bottled water. Avoid ice cubes and raw or undercooked food. ● Medical facilities and supplies are limited. If you become seriously ill or injured, you will need to be evacuated. Makes sure your insurance covers this.
Weather	
Other	● You don't need a visa if you're a tourist staying for less than 90 days. For other situations, you'll need to get a visa. ● Special rules apply to children aged under 18 who travel to Romania. A child must be accompanied by an adult and carry specific documents. ● Transport and tour operators don't always follow recommended safety standards. Always use available safety equipment. If appropriate safety equipment isn't available, use another provider. ● It's illegal to drive with a blood alcohol level above 0% or refuse to take a breathalyser test.

Russia

	Threat Level Moderate threat level to personal safety, take extra precautions here.	**Threat Level** Regions bordering the Ukrainian provinces of Donetsk, Lugansk and Kharkiv , reconsider your need to travel.	**Threat Level** North Caucasus, do not travel.	

Latitude / Longitude	61.524010, 105.318756
GPS Position	61° 31' 26.436'' N 105° 19' 7.5216'' E
Crime	● Terrorists have staged attacks in Russian cities, including Moscow and St Petersburg. More attacks are likely, particularly in the North Caucasus region and the Georgia-Russia border area. We may only be able to provide limited consular help in these areas. Targets may include tourist spots and transport. Always be alert to possible threats and have a clear exit plan. ● Protests are illegal in Russia. Avoid protests and rallies. ● Petty crime, pickpocketing, mugging and drink spiking are common. Thieves often steal passports. Don't accept food or drinks from strangers. Keep your belongings close, particularly in tourist areas. ● Money-exchange scams and credit card and ATM fraud are common. Large, organised internet dating scams operate from Russia. Only exchange money at banks. Only use ATMs inside banks. Be wary of people you meet in online chat rooms. ● Kidnapping is a risk in parts of the Northern Caucasus. If you travel here despite the risks, get professional security advice.
Laws	● Don't use or carry any illegal drugs. Penalties are severe. ● Carry your passport, visa and migration card. Authorities won't accept copies. ● Don't take photos of military places or sensitive areas, such as passport control. It's also illegal to use commercial film, television or camera equipment in public without permission. Hand-held video cameras are legal. ● Russia doesn't recognise dual nationals. We can only provide limited consular to dual nationals that are arrested or detained. You'll need a valid Russian passport to leave. ● Same-sex relationships are legal, but are not widely accepted. Violence against members of the LGBTI community occurs. Don't say anything to promote LGBTI issues. It could be illegal to do so.
Health Risks	● Laws about the import and use of medicines are strict. You need a doctor's letter and a notarised translation confirming your need for each medication that contains restricted substances. Contact the Embassy of Russia for details. ● Rabies and tick-borne encephalitis are on the rise. Ticks are common from April to October. Take care when travelling through forests. ● Infectious diseases such as typhoid, hepatitis, diphtheria, measles and tuberculosis are a risk. Boil drinking water or drink bottled water. ● Public medical facilities in Russian cities are below U.S. standards and basic in rural areas.
Weather	● Severe weather can disrupt travel. Wind, snow and ice-related accidents cause death and serious injury. Take care when walking in snow. Use winter tyres or chains when driving.
Other	● You need a visa to enter Russia, unless you're travelling on some commercial cruise ships. You may need to provide biometric fingerprints for your visa. Check that your visa type and all details are correct. You can't change visa details once you're in Russia. ● You'll get a migration card when you arrive. This covers both Russia and Belarus. If you receive a paper card, keep the stamped exit portion of the card with your passport. You'll need this when you leave. ● The government strictly controls the import of electrical and some high technology equipment. ● You can only travel between Russia and Belarus by air. Get visas for both countries before travelling. ● If you stay more than seven days, you have to register with the Russian Ministry of Internal Affairs. Your hotel should do this for you. Check that they have. ● Russia has strict regulations covering the export of antiques, artworks and items of historical significance. Keep your receipts. Make sure you have the relevant paperwork.

Slovakia

Threat Level	N/A
Latitude / Longitude	48.669026, 19.699024

Ukraine

	Threat Level Moderate threat level to personal safety, take extra precautions here.	**Threat Level** Crimea, Regions of Donetsk and Luhansk, do not travel.			**Latitude / Longitude** 48.379433, 31.16558 **GPS Position** 48° 22' 45.9588" N 31° 9' 56.088" E

Crime	● Ongoing armed conflict makes Donetsk and Luhansk dangerous. Foreigners have been threatened, detained and kidnapped in these regions. Landmines are present throughout Donetsk and Luhansk. Crimea is not under Ukrainian Government control and our ability to provide consular help in Crimea is extremely limited. If you're in these areas, leave by commercial means if it's safe to do so. If you're unable to leave, limit your movements. ● The security situation in Ukraine is generally calm, but it can deteriorate quickly. Assassinations involving guns or car bombs have occurred in Ukraine in recent years. Public protests and events that draw large groups of people can turn violent. Avoid large public gatherings. Check local media and follow advice from local authorities. ● Serious crime against foreigners is not frequent but robberies, pickpocketing and bag snatching do occur. Street crime and muggings increase at night. Cases of drink spiking are followed by robbery. Never accept food or drink from people you don't know. Don't leave food or drinks unattended. Don't carry bags that are easy to snatch. ● Be careful with your credit card. Scams occur, including with ATMs. Street scams are very common. Be aware of bogus internet friendship, dating and marriage schemes coming from Ukraine.
Laws	● Always carry your passport. Local police may ask to see your passport and visa. ● Ukraine doesn't recognise dual nationality. We may not be able to help you if you travel on a Ukrainian passport. Under Ukrainian law, you may be a Ukrainian citizen if you were either born in Ukraine or have a parent born in Ukraine. ● Same-sex activity is legal in Ukraine but local attitudes are less tolerant than in the U.S.A and Australia. Violence has occurred at some gay pride events and gay venues in Kyiv.
Health Risks	● Tick-borne diseases are a risk in forested areas. Ticks are common from spring to autumn. Use insect repellent. Check your body for ticks during and after travel in forested areas. ● HIV/AIDS is a risk. Take steps to reduce your risk of exposure to the virus. ● Other infectious diseases include tuberculosis, measles, diphtheria, hepatitis, rabies and polio. Drink only boiled or bottled water. Avoid raw or undercooked food. If an animal bites or scratches you, get immediate medical help. Check you're up to date with your polio vaccinations. ● Chernobyl is open to tourism but remains radioactive. If you visit, go with a reputable tour operator and obey safety instructions. In areas surrounding Chernobyl, avoid dairy products, wild fowl, game, fruit and vegetables unless they're imported. ● Outside major cities, the standard of state medical facilities is low. There are frequent shortages of medical supplies.
Weather	
Other	● You need a visa to enter Ukraine. You can't get visa on arrival. Apply for an e-Visa from the Ministry of Foreign Affairs. ● Foreigners who enter Ukraine through a separatist-controlled checkpoint won't be allowed through any government-controlled checkpoints that follow. You can't enter Ukrainian-controlled territory if you enter Crimea from any other country. ● Declare cash and jewellery on arrival in Ukraine. Customs rules apply to the export of currency, antiques, art and historic items. ● Don't travel to the crash site of Malaysia Airlines flight MH17 crash site, due to ongoing armed conflict. If you go to the crash site, take personal security measures.

2 Northern Europe

Denmark

	Threat Level Exercise normal safety precautions.						**Latitude / Longitude** 56.263920, 9.501785 **GPS Position** 56° 15' 50.112" N 9° 30' 6.426" E

Crime	● Denmark's terror threat level is 'significant'. Terrorists are likely to plan attacks. Be alert to possible threats, especially in public places. ● Pickpocketing is on the rise in tourist areas. Take care of your personal belongings, especially on public transport, at national landmarks, and in museums, railway stations and restaurants. ● Gang-related crime and civil unrest can happen in Copenhagen, especially in Christiania. There's a 'no photography' policy in Christiania. Travellers have been assaulted and robbed for taking photographs. Don't take photos in Christiania.
Laws	● Penalties for all drug offences are severe. Even possession of small amounts can attract heavy fines, jail or immediate deportation. ● Penalties for vandalism, such as graffiti, may include fines, jail or deportation. ● Penalties for drink driving or speeding may include heavy fines or jail. ● If you're convicted of a crime, you may be banned from entering the Schengen area for up to 6 years.
Health Risks	● The standard of medical facilities is similar to the U.S. and Australia. Major hospitals are in Copenhagen, Aarhus and the Odense area.
Weather	
Other	● Denmark is part of the Schengen area. You can enter Denmark without a visa in some cases. Check the Schengen Convention before you travel. ● Denmark has temporary border controls. This includes ports with ferry connections to Sweden and Germany. It also includes the Danish-German land border. Carry your passport or Danish residency permit when entering and exiting. ● Be careful of cyclists when driving. They might have the right of way. Take care not to walk on cycle lanes. ● The weather is extreme in Greenland. Flights can often be delayed or cancelled at short notice. There are no roads or railways between towns. Travel is by air, sea, ski, snowmobile or dogsled only.

Estonia

	Threat Level Exercise normal safety precautions.						**Latitude / Longitude** 58.595272, 25.013607 **GPS Position** 58° 35' 42.9792" N 25° 0' 48.9852" E

Crime	• Civil unrest is rare. But public protests and events that draw large groups of people can turn violent. Monitor local media for possible action. • Bag snatching, pickpocketing, mugging and petty theft occur. Pickpockets target people at airports, train stations, parks, routes to major hotels and the Old Town in Tallinn. They often work in small groups. Keep an eye on your belongings. • Credit card fraud occurs in tourist areas. Watch your credit card during transactions. • Drink spiking happens in bars and casinos. Don't leave drinks unattended. • Car theft is common, especially in Tallinn. Use secure, well-lit carparks. Don't leave valuables in vehicles. • Internet crimes have been reported. Be wary of online dating and scams involving money.
Laws	• Penalties for drug offences include heavy fines and jail, even for possession of small amounts. • Same-sex relationships are legal, but attitudes can be conservative. Avoid public displays of affection. • Estonia recognises dual nationality in some situations. This may limit consular help from us. Dual nationals may have to do military service.
Health Risks	• HIV/AIDS is widespread. Take precautions if you engage in high-risk activities. • Tick-borne encephalitis and other tick-borne diseases are a risk in forested areas. Ticks are common in spring from March to November. Use insect repellent. Wear long, loose, light-coloured clothing. • Infectious diseases include hepatitis and rabies. Water contamination may be a problem in rural areas. Drink only boiled or bottled water. Avoid raw or undercooked food. If an animal bites or scratches you, get immediate medical help. • Medical facilities at the main hospitals are good. However, facilities can be limited in rural areas. You may need to pay up-front before treatment.
Weather	
Other	• Estonia is part of the Schengen area. In some cases, you can enter Estonia without a visa. In other situations, you'll need a visa. Always carry your passport, even within the Schengen area. • You must have valid travel and health insurance that covers you for the equivalent of 30,000 euros during your stay. If can't prove you have the right insurance, immigration authorities might deny you entry. • By law, pedestrians must wear reflectors at night. If you don't, you may be fined. • Learn the road rules for Estonia. Headlights must always be on. Winter tyres must be fitted from 1 December to 1 March. There's zero tolerance for drink driving. If your blood alcohol content is greater than 0%, penalties include heavy fines and jail.

Finland

Threat Level
Exercise normal safety precautions.

Latitude / Longitude
61.924110, 25.748151

GPS Position
61° 55' 26.796'' N
25° 44' 53.3436'' E

Crime	• Finland's terrorist threat level is 'elevated' (level 2 of 4). Be alert to possible threats, especially in public places. • Protests or demonstrations could take place. They can turn violent. Monitor the media and avoid affected areas. • Pickpocketing and purse snatching is common. Credit card theft and skimming also happens. Check for card-skimming devices before using ATMs. Monitor the media for news on crime.
Laws	• Penalties for drug offences, even for possession of small amounts, include heavy fines and jail. • Dual nationals who are registered residents of Finland may need to do national service. Check with the Finnish Defence Forces.
Health Risks	• You can't bring some prescribed narcotics into Finland. Check rules with the Finnish Customs Authority. You can bring in up to a 3-month supply of personal medicine. • Ticks are common in rural and forest areas from March to November. Tick-borne encephalitis is a risk. If you visit these areas, check yourself and remove any ticks as soon as possible. Keep checking the tick site for infection. • The standard of medical facilities is similar to the U.S. and Australia. The main hospitals are in the Helsinki, Tampere and Turku area. • A reciprocal health care agreement allows tourists who visit for fewer than 90 days to access emergency medical services for free. This doesn't replace the need for travel insurance.
Weather	• Winters are extremely cold and there's heavy snowfall, including in metropolitan areas. Finland also experiences severe storms, rockslides, floods and strong winds. Monitor the media, and follow the advice of local authorities.
Other	• Finland is part of the Schengen area. You can enter Finland without a visa in some cases. Contact the nearest embassy or consulate of Finland for updates. • Always carry your passport. If you have one, always carry your Finnish residency permit. Authorities may ask you to verify your identity. • If you plan to drive, learn the local rules. Headlights must always be on, even during daylight hours. Winter tyres must be fitted.

Greenland

Threat Level
N/A

Latitude / Longitude
71.706936, -42.604303

GPS Position
71° 42' 24.9696'' N
42° 36' 15.4908'' W

Iceland

Threat Level
Exercise normal safety precautions.

Latitude / Longitude
64.963051, -19.020835

GPS Position
64° 57' 46.9836'' N
19° 1' 15.006'' W

Crime	• Petty theft can happen. Pay close attention to your belongings. • Peaceful demonstrations sometimes occur. Monitor the media and avoid affected areas. • Iceland's climate is unpredictable. Iceland experiences snow, sand storms and ash storms. Check local sources for weather and updates about road closures and other disruptions.

Laws	• Penalties for drug offences are severe. Even possession of a small amount of drugs can attract heavy fines, jail or deportation. • Always carry ID, such as your passport or driver's licence. • Penalties for driving infringements are severe and include heavy fines, jail and deportation.
Health Risks	• Health risks in Iceland are similar to those in first world countries. • The standard of health facilities and care is high. However, services can be limited in areas with fewer people. • Healthcare costs are the same as, or more expensive than, private treatment in the U.S. and Australia. Make sure you have adequate travel insurance.
Weather	• Iceland has active volcanoes. It's also in an active earthquake zone. Tsunamis are a threat in coastal areas. Monitor the local media. • Some places in the Arctic are a long way from help in an emergency. If you need help, you may have to wait a long time. Only book travel with companies that have on-board medical help.
Other	• Iceland is part of the Schengen area. This means you can enter Iceland without a visa in some cases. Contact an embassy or consulate of Iceland for details. • Hazards at natural attractions rarely have warning signs or safety barriers. Stay on marked paths. If you visit geysers, take care to avoid injuries from steam and hot water. • If you plan to do an adventure or trekking activity, get local advice on routes and the weather before setting out. Use an experienced and well-known trekking company.

GEOGRAPHY — Europe — Northern Europe — Iceland

Ireland

	Threat Level Exercise normal safety precautions.		**Latitude / Longitude** 53.142367, -7.692054 **GPS Position** 53° 8' 32.5212" N 7° 41' 31.3944" W

Crime	• Petty crime is common, particularly in urban areas and places popular with tourists. There's a moderate risk of serious violent crime. Watch your belongings, especially on public transport and in crowded places. Avoid secluded parks and unlit areas. • Car theft and break-ins are increasing. Thieves target rental cars, mostly in Dublin and tourist areas, especially in secluded scenic areas. Use secure parking lots and keep luggage and valuables out of sight. • Credit card fraud and ATM scams are becoming more common. Check ATMs before use. Don't use machines that look unusual. • Public protests and events that draw large groups of people can turn violent. Avoid protests and demonstrations.
Laws	• Having even a small amount of illegal drugs can lead to a long jail sentence. • Don't carry items for anyone when you enter or leave Ireland.
Health Risks	• Health risks in Ireland are similar to those in first world countries. • The standard of health care is similar to that in first world countries.
Weather	
Other	• You don't need a visa for tourist visits of less than 90 days. For longer visits, or if you want to work or study, you'll need to apply for your visa before you leave the country. • If you plan to work, you'll need an employment permit. • Immigration authorities have strict entry requirements for children under 18 years. Authorities may ask the child, or adults accompanying them, to show extra documents. • You can use a driver's licence for up to 12 months. After this, you'll need to get an Irish licence. Learn local road rules and practices. • Serious penalties for drink driving include heavy fines and jail sentences. • Dublin promotes a green bicycle culture. You can hire public bicycles to navigate the city. Ensure you follow road safety rules and are aware of other road users. Helmets are not compulsory but are highly recommended.

GEOGRAPHY — Europe — Northern Europe — Ireland

Latvia

	Threat Level Exercise normal safety precautions.		**Latitude / Longitude** 56.879635, 24.603189 **GPS Position** 56° 52' 46.686" N 24° 36' 11.4804" E

Crime	• Petty crime is common, particularly in Riga. This includes bag snatching, pickpocketing and muggings. Hotspots include Old Town, the central train and bus stations, the Central Market, parks, and routes to major hotels. Take care of your belongings. • Check the price of drinks before ordering. Tourists are sometimes overcharged. Credit card fraud also occurs in shops, restaurants, bars and nightclubs. Watch your card during transactions. Don't sign blank credit card slips. • Criminals may spike drinks in bars and casinos. Don't leave your drinks unattended. • Car theft is common. Use secure and well-lit car parks. Don't leave valuables in your vehicle.
Laws	• Don't use or carry illegal drugs. Penalties are severe, even for small amounts. They include jail terms and heavy fines. • Don't drink alcohol in public, except in designated areas. Authorities may fine you for carrying open beer or wine containers. • Check with local officials before you export religious materials or antiques. There are restrictions on what you can export. • Latvia recognises dual nationality. Contact the nearest Latvian embassy or consulate for details.
Health Risks	• Tick-borne encephalitis and other tick-borne diseases are a risk in forest areas. Ticks are active from March to November. Use insect repellent. Check your body for ticks during and after visits to forests. • Hepatitis A and tuberculosis are concerns in Latvia. Waterborne, foodborne, parasitic and other infectious diseases can also occur. Water contamination may be a problem in rural areas. Drink only boiled or bottled water. Avoid raw or undercooked food. • Public medical facilities are good in larger cities, but more limited in rural areas. Private facilities are of a similar standard to those in first world countries. You may need to pay up-front. If you're seriously ill or injured, you may need medical evacuation. Ensure your travel insurance covers this.
Weather	• Severe weather can disrupt transport and infrastructure. Latvia experiences extremely cold winters and heavy snowfall. Flooding can occur in spring, from March to May. Follow the advice of local authorities.
Other	• Latvia is part of the Schengen area, which means you may be able to enter without a visa. If you need one, the Austrian Embassy in Canberra issues Latvian visas. Carry your passport when you're entering and leaving Latvia, even if you're travelling from or to another Schengen country. • Always carry your passport and your Latvian residency permit if you have one. Officials may ask to see them. • Make sure you have a travel insurance policy with medical cover. You need it to enter Latvia. • Driving in winter can be dangerous due to icy roads and low visibility. Legally, you must fit winter tyres from around 1 December to 1 March. Always drive with your headlights on. Blood alcohol limits are 0.02% if you've been driving for less than 2 years, and 0.05% for everyone else.

GEOGRAPHY — Europe — Northern Europe — Latvia

Lithuania

	**Threat Level** Exercise normal safety precautions.		**Latitude / Longitude** 55.169438, 23.881275 **GPS Position** 55° 10' 9.9768'' N 23° 52' 52.59'' E

Crime	● Take care on public transport and at bars and restaurants, where pickpocketing and bag snatching can happen. Drink spiking is a problem. Don't accept food or drink from strangers. Be careful on trains where scammers may befriend you before robbing you. Keep your car locked, even when driving. ● Be aware of terrorism. Terrorists have attacked a number of European cities.
Laws	● Penalties for drug offences are severe. Don't use or carry illegal drugs. ● The blood alcohol limit is 0.04%. Penalties include heavy fines and imprisonment. Don't drink and drive. ● Lithuania recognises dual nationals in some situations. If you're a dual national, we can only give limited consular help if you're arrested or detained.
Health Risks	● Watch out for ticks in forests. Ticks are common from spring to autumn. ● Swine flu is a risk. Get the annual seasonal flu shot. ● Standards are good at private medical facilities but lower at public facilities. Doctors may need up-front payment before treating you.
Weather	● Winters are cold. Wind, snow and ice-related accidents cause death and injury. Take care when walking in snow or sleet. Use winter tyres or chains when driving.
Other	● Lithuania is part of the Schengen area. You can enter Lithuania without a tourist visa in some cases. In other situations, you'll need to get a visa. ● Rules apply to children who live in Lithuania travelling alone or with an unrelated adult. You must provide a consent letter from at least one of the parents. ● If you're a non-EU citizen, you must have travel insurance. If you do not already have insurance, you may be directed to buy it at the border. ● Border crossings may be delayed or temporarily blocked. Always carry your passport when crossing borders, even within the Schengen area. Check local media and transport providers for information on any border disruptions. ● Driving is dangerous, particularly in winter. Keep your headlights on. Use winter tyres from 10 November to 1 April.

Norway

	**Threat Level** Exercise normal safety precautions.		**Latitude / Longitude** 60.472024, 8.468946 **GPS Position** 60° 28' 19.2864'' N 8° 28' 8.2056'' E

Crime	● Terrorists have attacked some European cities. Targets have included public places that foreigners visit. Monitor the news and follow advice from local authorities. ● Serious crime is rare. However, there have been sexual assaults against foreigners and violent, gang-related crimes. Avoid walking alone in isolated places or at night. ● Petty crime is common. The risk rises during the peak tourist season from May to September. Thieves often work together and use tricks to distract travellers. Be careful in airports, train stations, hotel lobbies and restaurants.
Laws	● Penalties for drug offences include heavy fines and imprisonment. ● If you assault someone, however minor, you may face jail. ● The blood alcohol limit for drivers is 0.02%. There are frequent roadside checks for drink driving. ● Norway doesn't recognise dual nationality. If you're male and also a Norwegian citizen, you may have to do national service.
Health Risks	● Hospitals in cities offer a high standard of care. Many medical staff speak English. However, services are limited in rural and remote areas. ● If you need treatment in remote areas, you may need to be evacuated. Make sure you have appropriate travel insurance.
Weather	● Avalanches and rockslides can happen in some mountain areas. Extreme weather, floods and landslides can also occur. Check advice on weather and safety conditions before skiing or mountaineering. ● The northernmost parts of Norway are in the Arctic Circle. Be careful in these areas. Follow instructions from local authorities. If you're travelling by ship, check the onboard medical care.
Other	● Norway is part of the Schengen area. You can enter Norway without a visa in some situations. In other situations, you'll need a visa. ● The Norwegian territory of Svalbard is not part of the Schengen area. If you're travelling to Svalbard, you need a valid passport to enter. ● By law, when driving, headlights must be on at all times and it's illegal to use your mobile phone. Winter tyres must be fitted from 1 November to the first Monday after Easter Monday. ● In Svalbard, polar bears have killed travellers. Avalanches and accidents on glaciers and boats have also killed travellers. Follow local safety advice.

Sweden

	**Threat Level** Exercise normal safety precautions.		**Latitude / Longitude** 60.128161, 18.643501 **GPS Position** 60° 7' 41.3796'' N 18° 38' 36.6036'' E

Crime	● There's a threat of terrorist attack. Use caution in places that could be terrorist targets. Monitor the media for new threats. Take official warnings seriously. ● You might encounter protests or demonstrations. These can become violent. Monitor the media for possible unrest. Avoid crowds, protests and demonstrations. ● Petty crime is common. Take care in hotels and restaurants. Thieves may blend in and steal bags and purses when you're distracted.
Laws	● It's illegal to use physical punishment on children. This includes threatening a child with physical punishment. Local authorities can take custody of your child and prosecute you if you do. ● Penalties for drug offences, even possession of small amounts, include heavy fines and jail. ● Sweden recognises dual nationality.
Health Risks	● Ticks are very common in country areas from March to November. Tick-borne encephalitis and Lyme disease are risks. Check your body and remove any ticks as soon as you can. Monitor the tick site for signs of infection. ● You can bring a 3-month supply of medicine for personal use into Sweden. ● Swedish medical facilities have standards similar to first world countries. However, emergency services are limited in remote areas.
Weather	● Winter is extremely cold with heavy snowfalls. There can be severe transport delays and temporary closures of infrastructure. Check the media and other local sources for updates.
Other	● Sweden is part of the Schengen area. You can enter Sweden without a tourist visa in some situations. ● Border controls are in place in Sweden for people travelling to Denmark. ID checks apply at land and sea borders. Always carry your passport and/or Swedish residency permit when entering and exiting Sweden. ● When driving, keep your headlights on at all times. Winter tyres must be fitted from 1 December, or when it first snows, until 31 March or later if roads are still icy. The legal blood alcohol limit for drivers is 0.02%.

United Kingdom

Threat Level
Exercise normal safety precautions.

Latitude / Longitude
55.378051, -3.435973

GPS Position
55° 22' 40.9836'' N
3° 26' 9.5028'' W

Crime	● International terrorists have staged attacks in the UK. Extreme right-wing ideology and the status of Northern Ireland both contribute to the threat. ● Always be alert to terrorism. Take official warnings seriously. ● Violent clashes occur as a result of civil unrest. Tensions can rise in Northern Ireland from April to August. Take extra care in the weeks leading up to 12 July every year. Avoid all protests. ● Petty crime occurs. Beware of pickpockets in tourist areas, at restaurants and bars, and on transport. Take care when using ATMS and credit cards. ● Drink spiking happens. Don't accept drinks from strangers. Be aware of knife-related crime.
Laws	● Penalties for drug offences are severe. Don't use or carry illegal drugs.
Health Risks	● Health risks are similar to those in the U.S. and Australia. Measles occurs. Make sure your vaccinations are up to date. ● The standard of medical facilities is good. ● We have a reciprocal healthcare agreement with the UK. Some GP and hospital treatments are free if you're in the UK for a short visit. If you're staying more than 6 months, you'll pay a surcharge when you apply for your visa.
Weather	● Severe weather can disrupt transport. Monitor local weather reports.
Other	● If you're a tourist, you can stay up to 6 months without a visa. Get a visa if you're planning to do paid or unpaid work, volunteer or get married. ● Tourists older than 12 with an ePassport can use eGates on arrival in the UK. You don't need to complete a landing card. If you don't have an ePassport, you'll need to get your passport stamped. ● UK airports have strict security procedures. Allow extra times for screening and checks. ● If you're travelling to or from a non-European Union (EU) country, declare cash of 10,000 euros or more. ● You can drive a car or motorbike in the UK for up to 12 months with an Australian licence.

3 Southern Europe

Albania

Threat Level
Exercise normal safety precautions.

Latitude / Longitude
41.153332, 20.168331

GPS Position
41° 9' 11.9952'' N
20° 10' 5.9916'' E

Crime	● Political protests take place in central Tirana. Most demonstrations are peaceful, but they can turn violent. Monitor local media. ● Always be alert to terrorism. Terrorists have targeted European cities, including transport hubs and places visited by travellers. Take official warnings seriously. ● Theft from vehicles is common. Petty crime occurs. Take care of your belongings on public transport.
Laws	● Don't use or carry illegal drugs. Penalties are severe and can include jail sentences and heavy fines. ● Always carry identification. It's the law. ● It's illegal to take photos of military sites and personnel. ● The Albanian Government considers you an Albanian citizen if you were born in Albania or you have an Albanian parent. If you're a man, you may have to do military service. ● Same-sex relationships are legal in Albania, but aren't widely accepted. Avoid public displays of affection.
Health Risks	● Take care in forests and rural areas where ticks carry encephalitis. Ticks are active from spring to autumn. Check your body for ticks and remove them as soon as possible. ● Sandflies are active along the coast. They carry disease. Use insect repellent. Make sure your accommodation is insect-proof. ● Tuberculosis, typhoid, hepatitis, brucellosis and rabies are common. Drink only boiled or bottled water. Avoid raw or undercooked food. ● Medical facilities don't always have access to equipment, medicine and specialist doctors. Ambulances are limited. If you need to be evacuated, it can be expensive. Make sure your insurance covers this.
Weather	● Severe weather occurs, mainly from December to February. This may cause flooding, particularly in northern Albania. If this happens, monitor local media. Stay in touch with friends and family.
Other	● You don't need a visa for visits of up to 90 days. Get a visa for longer stays. ● The local currency is the Albanian Lek (ALL). Declare amounts equivalent to $US20,000 when you arrive or leave. ● You can find ATMs and credit card facilities in larger cities and tourist spots. Exchange currencies at banks and authorised bureaus. Many businesses prefer cash. Watch out for credit card fraud. ● Severe weather, flooding and snowfall may disrupt travel, particularly in northern Albania. Driving in Albania is hazardous. Use snow chains in winter. Take care from December to February and monitor local media for updates. ● Watch out for landmines in the north-east border areas, particularly near Kosovo. Look for and obey warning signs.

Bosnia and Herzegovina

GEOGRAPHY | Europe | Southern Europe | Bosnia and Herzegovina

	**Threat Level** Exercise normal safety precautions.		**Latitude / Longitude** 43.915886, 17.679076 **GPS Position** 43° 54' 57.1896" N 17° 40' 44.6736" E
Crime	● Ethnic and religious tensions may result in demonstrations. Stay away from protests as they could turn violent. ● Pickpocketing and bag snatching are common. Take care on public transport and in crowds. ● Many locals have firearms. You might be caught in the wrong place. Monitor the media for updates on areas with gun violence. ● Always be alert to terrorism. Terrorists have targeted European cities, including transport hubs and places visited by travellers. Take official warnings seriously.		
Laws	● Don't use or carry illegal drugs, including marijuana. Penalties include heavy fines and prison sentences. ● Always carry ID. ● It's illegal to take photos of military and police personnel, buildings, vehicles or equipment. ● Bosnia and Herzegovina recognises dual nationality only in certain circumstances. This limits the consular help we can give. ● Same-sex relationships are legal but not widely accepted. Avoid public displays of affection.		
Health Risks	● Take care in forests and rural areas where ticks carry encephalitis. Ticks are active from spring to autumn. Check your body for ticks and remove them as soon as possible. ● West Nile virus (WNV) can occur. There's no vaccine to prevent WNV. Use insect repellent. Make sure your accommodation is insect-proof. ● Hepatitis, trichinellosis, brucellosis and rabies are common. Avoid raw or undercooked food. ● Medical facilities in Bosnia and Herzegovina aren't up to first world standards. Check your insurance covers medical evacuation.		
Weather	● Earthquakes, flooding and landslides occur. Watch out for bush and forest fires in summer. Follow the advice of local authorities.		
Other	● You don't need a visa for visits of up to 90 days. Get a temporary residence permit for longer visits. ● Get your passport stamped when you enter the country. Otherwise you may have trouble leaving. ● Register with the local police within 48 hours of arriving. Check your hotel has done this for you. ● Avoid forests and isolated areas. Landmines are scattered throughout the country. ● Driving can be hazardous. Be careful in winter and spring when black ice, fog and landslides occur. Always have your headlights on. Use winter tyres or snow chains from 15 November to 15 April. You need to have the correct insurance cover to enter Bosnia and Herzegovina in a vehicle.		

Croatia

GEOGRAPHY | Europe | Southern Europe | Croatia

	**Threat Level** Exercise normal safety precautions.		**Latitude / Longitude** 45.100000, 15.2 **GPS Position** 45° 6' 0" N 15° 11' 60" E
Crime	● Pickpocketing and other petty crime can occur. Take care at tourist spots, the beach and on public transport. ● Drink spiking can happen. Don't leave food or drinks unattended. ● Avoid injuries. Don't jump off rocks and cliffs along the coast. Party boats and other venues, such as nightclubs, might not have the same safety standards as first world countries. ● If you intend to trek in the mountains or rock climb never do so alone.		
Laws	● Don't use or carry illegal drugs. Penalties include imprisonment. ● Police issue on-the-spot fines for some minor offences. They may hold your passport if you challenge them or don't pay. ● Dress codes apply in some popular tourist areas. Police may fine you if you're shirtless or wearing swimwear in towns with signs banning this. ● Foreigners have been involved in lengthy disputes about the validity of property titles. Get independent legal advice before signing a contract. ● Always carry ID. ● Same-sex sexual activity is legal, but attitudes can vary.		
Health Risks	● Health care on the mainland is generally good. Services on the islands are limited. If you need to be evacuated, this can be expensive. Make sure your travel insurance covers this. ● There are decompression chambers in Dubrovnik, Split, Rijeka and Pula. ● Take care in forests. Lyme disease and tick-borne encephalitis are risks. Ticks are more common from March to September. Check your body for ticks. Remove any whole ticks as soon as possible. ● West Nile virus can occur. There's no vaccine to prevent it. Use insect repellent. Make sure your accommodation is insect-proof.		
Weather	● Earthquakes, floods and landslides can occur. Forest fires are common from June to September. Monitor the media for updates.		
Other	● If you're a tourist, you don't need a visa to stay up to 90 days in 6 months. For other situations, contact an embassy or consulate of Croatia. ● Croatia is a member of the European Union but it is not part of the Schengen area. A passport is required to travel between Croatia and other European countries. ● You must register with local police within 48 hours of arriving. Check your hotel will do this for you. Failure to register may lead to fines or deportation from Croatia. ● Driving can be hazardous and traffic accidents are common. Many country roads lack guardrails. Use headlights from the last weekend in October to the last weekend in March. Use winter tyres from 15 November to 15 April.		

Cyprus

GEOGRAPHY | Europe | Southern Europe | Cyprus

	**Threat Level** Exercise normal safety precautions.		**Latitude / Longitude** 35.126413, 33.429859 **GPS Position** 35° 7' 35.0868" N 33° 25' 47.4924" E
Crime	● A UN peacekeeping force maintains a buffer zone between northern and southern Cyprus. The Government of the Republic of Cyprus controls the southern part of the island. The self-proclaimed 'Turkish Republic of Northern Cyprus' ('TRNC') controls the north. ● Violent incidents can occur in the UN buffer zone, especially during public demonstrations. Avoid protests. ● Watch out for bag-snatching and pickpocketing, particularly in tourist areas.		
Laws	● Cypriot authorities don't always advise your countries authorities when they arrest you. ● Don't use or carry illegal drugs. Carrying even small amounts can result in jail time. ● Property disputes are common. You could face criminal proceedings for intending to purchase a disputed property. Get legal advice before buying any property, particularly in the north. ● It's illegal to take photos of the military and installations or the UN buffer zone. ● You could be a national of Cyprus if you have a family connection to Cyprus. ● You may have to do military service if you have a family connection to Cyprus. Check with the Ministry of Foreign Affairs (Republic of Cyprus). If you have a Turkish Cypriot background, check with relevant authorities before you travel.		
Health Risks	● Make sure your insurance covers travel to both northern and southern parts of Cyprus. ● Avoid contact with rodents, bats and other vermin. They carry disease. There have been reported cases of West Nile Virus in Cyprus. ● Medical facilities in the Republic of Cyprus's main cities are adequate but expensive. Medical services in the north are basic.		

Weather	● Cyprus experiences earth tremors and violent storms. Forest fires are common from May to October. Monitor local media for updates.
Other	● You can stay up to 90 days in a 6-month period without a tourist visa. Get a visa if you plan to stay longer. ● You can only enter Cyprus through the south. It's illegal to enter or leave via northern Cyprus. If you arrive in Cyprus legally in the south, you can cross into the north through formal crossing points. Turkish-Cypriot authorities may stamp your passport. ● Authorities may not let you enter Cyprus if they have concerns about your travel to the north. They might be worried about your planned commercial, academic or employment activities. ● If you are carrying goods between the north and the south, be aware that strict controls apply. ● The official currency of the Republic of Cyprus is the Euro. In the north, it's the Turkish Lira. ● The UN restricts access to the roads in the UN buffer zone. Parts of the zone have landmines. You are only allowed to transit the UN Buffer Zone at formal crossing points.

Greece

Threat Level
Exercise normal safety precautions.

Latitude / Longitude
39.074208, 21.824312

GPS Position
39° 4' 27.1488'' N
21° 49' 27.5232'' E

Crime	● Petty crime and theft are serious issues in tourist areas and on buses and trains. Pickpocketing, bag snatching and slashing luggage to steal belongings are common. ● Physical and sexual assaults occur, particularly on the islands during summer. Don't walk alone in isolated areas at night. ● Drink spiking is a risk. Don't accept drinks from strangers or leave drinks unattended. ● Terrorists have attacked popular tourist areas in central Athens. Always be alert. Take official warnings seriously. ● Protests mainly take place in central Athens. Rioting can break out with little warning. Avoid affected areas. Take care on days of national significance.
Laws	● Don't use or carry illegal drugs. Even small amounts can lead to heavy fines and prison sentences. ● Always carry ID, such as a photocopy of your passport. ● It's illegal to take photos of military sites and personnel. It's also illegal to smoke indoors. ● If you're a male dual national, you may have to do military service. If you're of Greek descent born outside of Greece, get advice from the nearest Greek embassy or consulate before you travel. ● Same-sex relationships are legal in Greece, attitudes vary throughout the country. Avoid public displays of affection, especially in rural areas. Attitudes are generally more accepting on many Greek islands such as Mykonos and Ios.
Health Risks	● Medications such as codeine are subject to special rules. Carry a prescription and a letter from your doctor. ● Measles is common in Greece. Make sure your vaccinations are up-to-date. ● West Nile virus (WNV) can occur. There's no vaccine to prevent it. Use insect repellent. Make sure your accommodation is insect-proof. ● Foodborne diseases such as brucellosis occur. Avoid uncooked and undercooked food. ● The standard of medical care varies. Public hospitals are short on medical supplies and provide limited nursing care. Family or friends usually provide care. ● Private hospitals are expensive. If you're seriously ill or injured on an island, you might be evacuated to Athens. Make sure your travel insurance covers this.
Weather	● Bush and forest fires are common from June to September. Earthquakes can happen. Monitor the media for updates.
Other	● Greece is a part of the Schengen area. You can enter Greece without a visa in some cases. In other situations, you'll need a visa. ● You may have problems entering Greece if you were born in Greece at a place no longer recognised by Greece. You may also have problems if you're entering Greece from the Republic of North Macedonia. ● Driving in Greece is hazardous. Take care when crossing the road, even at pedestrian crossings. ● Quad bike accidents cause a lot of serious injuries and deaths. Always wear a helmet.

Italy

Threat Level
Exercise normal safety precautions.

Latitude / Longitude
41.871940, 12.56738

GPS Position
41° 52' 18.984'' N
12° 34' 2.568'' E

Crime	● Petty crime is common. Be aware of pickpockets and bag-snatchers at tourist spots and on transport. Thieves often work in groups on trains. Take care of your belongings. ● Serious assaults occur after food and drink spiking. Never accept drinks from strangers. Don't leave food and drinks unattended. ● Protests and strikes cause building closures and transport delays and cancellations. Check the Ministry of Infrastructure and Transport (Italian) for details on upcoming strikes. ● Bombings against political targets happen. Avoid protests and crowds. Monitor local news. ● Always be alert to terrorism. Terrorists have targeted European cities, including transport hubs and places visited by travellers. Take official warnings seriously.
Laws	● Don't use or carry drugs. Penalties are severe and include long jail sentences. ● You may be fined for littering, sitting, eating or drinking near churches and public buildings or in public spaces. Obey signs about conduct. ● Organised pub crawls are banned in some cities, including Rome. ● It's illegal to take photos of official buildings and military areas. Check with local authorities first. ● Don't buy fake brands and products from illegal street vendors. It's against the law.

GEOGRAPHY | Europe | Southern Europe | Italy

Health Risks	• Measles is on the rise. Make sure your vaccinations are up to date. • West Nile virus (WNV) can occur. There's no vaccine to prevent it. Use insect repellent. Make sure your accommodation is insect-proof. • Medical facilities are good in major cities and limited in rural areas. • We have a Reciprocal Health Care Agreement with Italy. You can get treated in public medical facilities if you show your Medicare card and passport. You still need travel insurance.
Weather	• Italy experiences earthquakes and volcanic activity. Large earthquakes cause landslides and avalanches. Forest fires are common from June to September. Monitor the media and follow the advice of local authorities.
Other	• Italy is part of the Schengen area. You can enter Italy without a visa in some cases. In other situations, you'll need to get a visa before you travel. • Apply for a 'Permit to Stay' (dichiarazione di presenza) if you're not staying in commercial accommodation. Do this at the local police station within 8 days of arriving. • Italy has a Working Holiday Visa program. Get the appropriate visa before you arrive. If you're staying more than 90 days, you might have to register with police. • Driving can be dangerous and chaotic. Always have your headlights on when you're on highways or main roads outside cities. Use snow chains in some mountainous regions. • Some cities have traffic restricted zones. Check with your hotel about traffic restrictions.

GEOGRAPHY | Europe | Southern Europe | Kosovo

Kosovo

Threat Level
Moderate threat level to personal safety, take extra precautions here.

Threat Level
Leposavic, Zubin Potok and Zvecan municipalities and North Mitrovica, reconsider your need to travel.

Latitude / Longitude
42.602636, 20.902977

GPS Position
42° 36' 9.4896'' N
20° 54' 10.7172'' E

Crime	• Two authorities work to maintain security — the Kosovo Police Force and the Kosovo Force, led by NATO. • Serious unrest exists between ethnic Serbs and Kosovo Albanians. Sudden, violent, armed conflict occurs. Reconsider travel to the city of Mitrovica and other places in the north. • Locals discharge firearms on holidays and other occasions. Be careful of celebratory gunfire, especially around major holidays, celebrations and after sporting victories. • Petty crime includes pickpocketing and bag snatching. Look after your belongings.
Laws	• It's illegal to take photos of military or police facilities and buildings. • Always carry photo ID. • Same-sex sexual activity is legal, but not widely accepted. Avoid public displays of affection.
Health Risks	• Air pollution is a problem, particularly in winter. If you have breathing difficulties, get medical advice before you travel. • Take care in forests. Tick-borne encephalitis and Crimean Congo haemorrhagic fever are risks. Ticks are common from spring to autumn. Check for ticks and carefully remove the whole tick. • West Nile virus can occur. There's no vaccine to prevent it. Use insect repellent. Make sure your accommodation is insect-proof. • Outbreaks of hepatitis A, trichinellosis, brucellosis and rabies can occur. Drink bottled water. Avoid raw and undercooked food. • Medical facilities are poor. If you become seriously ill or injured, you'll need to be evacuated. Make sure your travel insurance covers this.
Weather	• Bush and forest fires can occur from June to September. Large earthquakes are rare, but earth tremors are common. Monitor the news and follow the advice of local authorities.
Other	• You don't need a tourist visa to stay less than 90 days. You may need to show proof of the reason for your visit. • Security along the Kosovo-Serbia border is unpredictable. Serbia doesn't recognise entry points direct from Kosovo. Don't try to enter Serbia from Kosovo unless you initially travelled into Kosovo from Serbia. • Landmines are present. Don't travel off-road. Don't hike in woodlands. • You need compulsory third-party vehicle insurance to drive. If you hire a car in Kosovo, hire car companies might not let you cross the border.

GEOGRAPHY | Europe | Southern Europe | North Macedonia

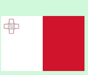
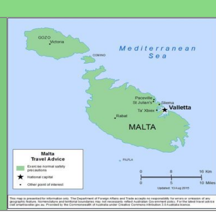
Malta



Threat Level
Exercise normal safety precautions.



Latitude / Longitude
35.937496, 14.375416

GPS Position
35° 56' 14.9856'' N
14° 22' 31.4976'' E

Crime	• Bag-snatching, pickpocketing and other petty crime occur. Be careful at ATMs, on buses and at popular tourist spots. • It can get rowdy around nightclubs. Stay with people you trust. Avoid confrontations. • Always be alert to terrorism. Terrorists have targeted European cities, including transport hubs and places visited by travellers. Take official warnings seriously.
Laws	• Don't use or carry illegal drugs. Penalties are severe. • Malta recognises dual nationals. Dual citizens don't have to do military service.
Health Risks	• Traffic congestion and dust storms from North Africa can cause bad pollution. This might cause breathing problems. Follow advice from local authorities. • Medical care and facilities are good in Malta. • We have a Reciprocal Health Care Agreement with Malta. This means you can get treated in public medical facilities. You still need travel insurance.

Weather	
Other	● Malta is part of the Schengen area. You can enter Malta without a visa in some cases. In other situations, you'll need to get a visa. ● Declare all amounts over 10,000 euros or foreign currency equivalent. ● Locals like to hunt with firearms. Hunting areas are rarely marked and can overlap with camping and public areas. Hunting seasons are in April, and September to January. Be aware of hunters. ● Use your driver's licence to drive in Malta for 1 year from your arrival. After that, you'll need a Maltese licence. ● Only use registered taxis and authorised limousines arranged through your hotel. Taxis don't have meters. You'll need to agree on a fare with the driver.

Montenegro

Threat Level
Exercise normal safety precautions.

Latitude / Longitude
42.708678, 19.37439

GPS Position
42° 42' 31.2408'' N
19° 22' 27.804'' E

Crime	● Security in the Kosovo border area is unpredictable. Take care if you are travelling there. ● Protests and rallies can occur. Avoid crowds and demonstrations. ● Petty crime and credit card fraud are common. Take care in crowded places. Always keep your credit card in sight. ● Targeted bomb attacks and gun violence can occur. Be alert to suspicious behaviour.
Laws	● Don't use or carry illegal drugs. Penalties are severe. ● It's illegal to photograph military and police personnel and facilities. ● Montenegro doesn't recognise dual nationality. ● Same sex relationships are legal but not widely accepted. Avoid public displays of affection.
Health Risks	● Medical facilities are poor. If you are seriously ill or injured, you may need to be evacuated. Make sure your travel insurance covers this.
Weather	● Earthquake tremors can occur. Bushfires occur in summer. Flooding happens in summer or autumn. Snow and ice can make the roads dangerous. Monitor local media for updates.
Other	● You can stay up to 90 days without a tourist visa. For longer stays, you'll need to apply for a Temporary Residence Permit. ● Register your local address with local police or a tourist organisation within 24 hours of arriving. If you are staying in a hotel they should do this for you. ● Always carry ID, such as a driver's licence or passport. ● You must declare cash and valuables valued over 10,000 euros, or foreign currency equivalent, on arrival.

Portugal

Threat Level
Exercise normal safety precautions.

Latitude / Longitude
39.399872, -8.224454

GPS Position
39° 23' 59.5392'' N
8° 13' 28.0344'' W

Crime	● Bag snatching, pickpocketing and theft from cars occur. Pay attention to your belongings at beaches, tourist spots and on public transport. ● Violent crime, such as robberies and assaults, happen. Drink spiking is also a risk. Don't accept drinks from strangers or leave drinks unattended. ● Be aware of accommodation scams, these are on the rise, use official websites when booking accommodation. ● Strikes and protests can affect transport. Avoid demonstrations and check local media. ● People drown at Portuguese beaches. Obey lifeguard warnings. A red flag means 'danger, don't enter the water'. Pay attention to signs about cliff erosion.
Laws	● Don't use or carry illegal drugs. ● Gambling is legal in official casinos and licensed venues. It's illegal elsewhere. Check that you're entering a licensed venue. ● Always carry photo identification. ● Don't ride an e-scooter or e-bike under the influence of alcohol. You can be fined. ● Portugal recognises dual nationality.
Health Risks	● You may need an import permit to get medications by post. ● Private medical facilities provide good quality care but may require payment upfront. Standards in public facilities and in rural areas vary. ● Medical treatment is expensive.
Weather	● Portugal experiences earthquakes. Bushfires are common inland. Monitor local media.
Other	● Portugal is part of the Schengen area. If you stay longer than 90 days, you may need a visa. ● Get a clear entry stamp when you first enter the Schengen area. You need proof of entry or airlines might refuse to transport you. ● Foreign bank cards aren't widely accepted in smaller shops, restaurants, towns or rural areas. You can use credit cards at larger places. ● Driving can be dangerous. Drivers speed. Roads are not always well marked. Occasional rock falls occur along the coast. Report traffic incidents to the police and avoid making compensation payments privately. ● Tuktuks are common in large tourist areas. Always use a seatbelt and make sure your insurance covers you.

Serbia

Serbia

	**Threat Level** Exercise normal safety precautions.	
		Latitude / Longitude 44.016521, 21.005859 **GPS Position** 44° 0' 59.4756" N 21° 0' 21.0924" E
Crime	● There have been regular protests in Belgrade and other towns since late 2018. They are usually peaceful, but any demonstration could turn violent. Avoid large crowds and demonstrations. Demonstrations might disrupt transport. Monitor local media for information. ● Serbia doesn't recognise Kosovo's independence. The security situation along the border can be volatile and unpredictable. Be cautious travelling in the Kosovo border area. ● The area of Southern Serbia bordering Kosovo has unexploded landmines. Only use well-known roads and paths. ● Violent attacks sometimes occur near nightclubs. Targeted bomb attacks and gun violence can occur. Many Serbians own guns. Be alert to suspicious behaviour and avoid trouble spots.	
Laws	● Don't use or carry illegal drugs. Penalties are severe. ● It's illegal to photograph military and police personnel and equipment. ● Serbia recognises dual nationality. You may have to complete outstanding military service obligations if you're a dual citizen. Check with an embassy or consulate of Serbia. ● Same-sex relationships are legal but not widely accepted. Avoid public displays of affection.	
Health Risks	● Air pollution has been measured as high in some cities in Serbia, including Belgrade. If you have a breathing condition, talk to your doctor before you travel. ● Tick-borne encephalitis is a risk. Ticks are common from spring to autumn. Check for ticks and carefully remove the whole tick. Take care in forests and fields in particular. ● West Nile virus can occur. There's no vaccine to prevent it. Use insect repellent. Make sure your accommodation is insect-proof. ● Outbreaks of trichinellosis, brucellosis and rabies sometimes occur. Avoid raw and undercooked food. ● Medical facilities are below first world standards. If you become seriously ill or injured, you may need to be evacuated. Make sure your insurance covers this.	
Weather	● Earth tremors and flooding can occur. Bushfires happen in summer. Snow and ice can be a danger in winter. Monitor the media for updates.	
Other	● As a tourist, you can stay up to 90 days without a visa. For other situations, contact an embassy or consulate of Serbia. ● Don't enter Serbia from Kosovo unless you first travelled into Kosovo from Serbia. ● Register your address at a police station within 24 hours of arriving. Or check that your hotel will do this. ● On arrival, declare currency and valuables with a value of 10,000 euros or equivalent. ● Driving can be dangerous due to poorly maintained vehicles, roads and poor driving habits. Take extra care after bad weather.

Spain

	**Threat Level** Exercise normal safety precautions.	
		Latitude / Longitude 40.463667, -3.74922 **GPS Position** 40° 27' 49.2012" N 3° 44' 57.192" W
Crime	● Terror attacks have occurred. Authorities have stopped some attacks. Spain's terrorism alert is at level 4 of 5 (high). Always be aware of possible threats. Take official warnings seriously. ● Demonstrations and strikes disrupt transport. Sometimes protesters clash with police. Avoid unrest. ● Watch out for bag snatching, pickpocketing and theft from cars in large cities. Petty crime is a serious problem in Barcelona. Take care at tourist spots, beaches and on transport. ● Taking part in the Running of the Bulls in Pamplona is dangerous. Check your travel insurance covers you.	
Laws	● Always carry personal ID. Police can detain you until they can confirm your identity. ● Don't photograph military sites. ● Spain doesn't recognise dual nationality.	
Health Risks	● Health risks are similar to those in first world countries. ● The standard of medical facilities is high.	
Weather	● Spain experiences earthquakes, severe storms and forest fires. Monitor local media for updates.	
Other	● Spain is part of the Schengen area. You can enter Spain without a visa in some cases. In other situations, you'll need a visa. ● Get a legible entry stamp when you first enter the Schengen area. ● If you're travelling to or from any non-European Union country, declare funds of 10,000 euros or more. ● Carry your passport when crossing borders, even within the Schengen area. ● If you're driving, carry 2 red warning triangles and a reflective jacket. You must use these if you have an accident or breakdown.	

Turkey

🇹🇷	**Threat Level** Moderate threat level to personal safety, take extra precautions here.	**Threat Level** Provinces of Batman, Bingol, Bitlis, Gaziantep, Hakkari, Hatay, Kilis, Mardin, Sanliurfa, Siirt, Sirnak, Tunceli and Van, Ankara and Istanbul, reconsider your need to travel.	**Threat Level** Areas within 10 kilometres of the border with Syria, Diyarbakir, do not travel.		**Latitude / Longitude** 38.963745, 35.243322 **GPS Position** 38° 57' 49.482'' N 35° 14' 35.9592'' E

Crime	● There's a high threat of terrorist attacks in Turkey, particularly in the south-east. Possible targets include diplomatic missions, tourist areas, transport networks, shopping malls, Western hotels and entertainment precincts. Avoid crowds and possible targets, especially on significant dates and anniversaries. ● The risk of violence and acts of war is high along the borders with Syria and Iraq. Threats include rocket attacks, terrorist attacks and kidnapping. If you decide to travel to these areas, seek professional security advice. ● Protests happen often in major cities. They can turn violent. Extremists have targeted political protests. Avoid large public gatherings. ● Muggings and assaults are common, especially in Istanbul's tourist areas. Avoid travelling alone, especially after dark. Be wary of new friends and acquaintances. ● Food and drink spiking is an issue. Don't accept food, drinks, gum or cigarettes from strangers. Don't leave your food or drinks unattended. ● Scams are common among restaurants, taxis and carpet traders. Be wary of friendly locals who offer to take you to a bar for food and drinks. Insist taxi drivers use the meter. Be wary of deals where a carpet trader offers to send you goods by post.
Laws	● Don't use or carry illegal drugs. Penalties for drug offences are severe and include long prison sentences. ● Always carry photo ID, such as a copy of your passport. Keep the original in a safe place. ● It's illegal to 'insult' Turkey, the Turkish flag, the President or government, and the country's founder, Mustafa Kemal Atatürk. Don't make insulting comments, including on social media. It's illegal to photograph military sites. ● Get a receipt and an official certificate if you want to export cultural artefacts or antiquities. Exporting them without a permit is illegal. Other illegal activities include using a metal detector to search for artefacts, and defacing or destroying Turkish currency. ● Turkey recognises dual citizenship, but dual nationals are viewed as Turkish citizens in legal matters. If you're a male dual national, you may have to do military service. Check with a Turkish embassy or consulate before you travel. ● Many parts of Turkey have conservative dress and behaviour standards. Dress modestly, particularly at mosques and shrines. Respect religious and social traditions. Avoid public displays of affection.
Health Risks	● Malaria is a risk from May to October in Amikova, Çukurova Plain and the south-east. Consider taking anti-malarial medication. ● Other insect-borne diseases include leishmaniasis and Crimean-Congo haemorrhagic fever. Ensure your accommodation is insect-proof. Use insect repellent. ● People have died from bird flu in Turkey. Ask your doctor about vaccination before you travel. ● Foodborne, waterborne and other infectious diseases include tuberculosis, typhoid, hepatitis, measles and rabies. Drink only boiled or bottled water. Avoid raw or undercooked foods. ● Alcoholic drinks may be mixed with toxic substances, including methanol. Drink only at reputable venues. Avoid home-made alcohol. Get medical help straight away if you suspect poisoning. ● Private hospitals in major cities often have good medical facilities. Services elsewhere are limited. If you're seriously ill or injured, you may need medical evacuation. Ensure your travel insurance covers this.
Weather	● Drought conditions in some cities can affect water supply. Running water may not be available in many places, including in hotels and accommodation.
Other	● You may be able to get an e-visa if staying for less than 90 days in a 180-day period. Apply through the official e-visa website only. Otherwise, arrange your visa through a Turkish embassy or consulate before you travel. ● Tourists arriving by sea may be able to stay for up to 72 hours without a visa. Ask your travel agent for details. ● Be prepared for a range of weather conditions at the Gallipoli Peninsula Peace Park and Anzac Cove. Winter storms and heavy traffic seriously affect many coastal roads in the region. Stay on marked roads and tracks. ● Don't ride motorcycles due to the poor standard of driving and road maintenance. ● Use only licensed taxis. Insist the driver uses the meter. Using a rideshare service is illegal and could result in fines. ● Accidents are common on Turkey's inter-city bus network. Train travel is usually safe and efficient. ● Security at major airports is tight due to terrorist attacks in recent years. This can cause crowds and delays. Ensure you leave plenty of time to check in.

4 Western Europe

Austria

🇦🇹	**Threat Level** Exercise normal safety precautions.						**Latitude / Longitude** 47.516231, 14.550072 **GPS Position** 47° 30' 58.4316'' N 14° 33' 0.2592'' E

Crime	● Always be alert to terrorism. Terrorists have targeted European cities, including transport hubs and places visited by travellers. Take official warnings seriously. ● Petty crime, such as bag snatching and pickpocketing, is on the rise. Be careful on public transport and in areas popular with tourists. Take care using ATMs.
Laws	● Don't carry or use illegal drugs. Penalties are severe. ● Always carry your ID. ● It's illegal to cover your face in public places to hide your identity. ● Dual nationals may have to complete national service. Check with the embassy or consulate of Austria.
Health Risks	● Take care in forests where tick-borne encephalitis is a risk. Ticks are active from spring to autumn. Check your body for ticks and remove them as soon as possible. ● West Nile virus can occur. There's no vaccine to prevent it. Use insect repellent. Make sure your accommodation is insect-proof. ● Health care standards are high. So are medical costs. Most doctors speak English.
Weather	● Avalanches, flash floods and mudslides occur in alpine areas. Monitor local weather. Follow the advice of local authorities. Stick to marked slopes and trails when skiing.
Other	● Austria is part of the Schengen area. You can enter Austria without a visa in some cases. In other situations, you'll need to get a visa. ● Get a clear entry stamp when you first enter the Schengen area. Some road and rail border crossings have immigration controls. Always carry your passport when you cross the border. ● A child travelling without both parents may need a letter of consent. Check with the embassy or consulate of Austria. ● Register the location with local authorities if you're staying in private accommodation for more than 3 days. ● Take care on alpine roads in winter. You must have winter tyres from 1 November to 15 April when driving in winter conditions. Carry snow chains if you're driving in the mountains.

Belgium

Belgium	**Threat Level** Moderate threat level to personal safety, take extra precautions here.		**Latitude / Longitude** 50.503887, 4.469936 **GPS Position** 50° 30' 13.9932'' N 4° 28' 11.7696'' E

Crime	● There's an ongoing threat of terrorism in Belgium. A higher threat applies in some areas. Terrorists have staged attacks and may plan more. Crowded places, such as tourist areas, shopping areas and transport hubs, are possible targets. Keep alert. Report anything suspicious to the police. ● Petty crime, such as mugging, pickpocketing and bag snatching, occur. Thieves often try to distract you. Take care at tourist spots, on public transport and at train stations. ● Demonstrations are common. Belgium hosts large international meetings. Increased security can disrupt transport. Avoid affected areas.
Laws	● Always carry your passport or Belgian government-issued ID.
Health Risks	● Medical care and facilities are similar to the U.S. and Australia.
Weather	
Other	● Belgium is part of the Schengen area. You can enter without a visa in some cases. In other situations, you'll need to get a visa. ● To drive, you'll need both an International Driving Permit and a valid driver's licence. ● Only use licensed, official taxis. Assaults and robberies have occurred in unlicensed taxis. ● There's increased security at airports and train stations. Contact your airline or travel agent for updates. ● In Belgium, vehicles must give way to the right at intersections or from side roads. Instances of road rage are common. Penalties for traffic infringements are severe. Learn local road rules before you drive.

France

France	**Threat Level** Moderate threat level to personal safety, take extra precautions here.		**Latitude / Longitude** 46.227638, 2.213749 **GPS Position** 46° 13' 39.4968'' N 2° 12' 49.4964'' E

Crime	● There's a high risk of terrorist attacks in France. Be cautious around locations known to be targets. Authorities have extra counter-terrorism powers. They may restrict your access to some places or search you. Take official warnings seriously. ● Large-scale strike action began on 5 December and may continue for some time. Expect significant disruptions to local transport, including train, air and cross-Channel ferry services. Eurostar and other international train services (including those to the Netherlands and Belgium) are also expected to be affected. Monitor local media and contact your travel provider for updates. Large demonstrations and gatherings are expected as part of the strike. Avoid protests and demonstrations, exercise caution and follow the advice of local authorities. ● Organised strikes happen often. They can disrupt transport, including flights. ● Violent attacks against tourists have increased, especially late at night in tourist areas. Don't walk in quiet or poorly lit streets at night. ● Violent theft on public transport has significantly increased, especially in Paris. Robbery and muggings are common on trains to Paris airports. Conceal your valuables. ● Vehicle crime is common in the south of France and on the Remembrance Trail. Always keep your windows up and doors locked. ● Credit card and ATM fraud is increasing. Check your bank statements often. Identity theft also occurs through accommodation scams. Only book travel through reputable providers.
Laws	● Don't use or carry illegal drugs. Penalties for drug offences include long prison sentences. ● Always carry photo ID, such as your passport. Police conduct random checks, particularly at borders. ● Stop to help if you witness an accident or if someone asks for help. Report all accidents to emergency services. If you fail to help, officials could charge you, unless helping will risk your or others' safety. ● It's illegal to cover your face in public places or to force someone else to. ● Be careful when taking photos. It's illegal to photograph security forces, including police.
Health Risks	● Health risks in France are similar to those in first world countries. ● West Nile virus (WNV) has occurred throughout France. Ensure your accommodation is insect-proof. Use insect repellent. ● The standard of medical facilities is similar to first world countries. Public hospital stays can be expensive. Ensure your travel insurance covers this.
Weather	● Natural hazards include avalanches, mudslides, forest fires and flash flooding. Follow the advice of local officials.
Other	● France is part of the Schengen area. This means you can enter without a visa in some circumstances. If you're travelling for more than 90 days or for reasons other than tourism, you may need a visa. Contact your nearest French embassy or consulate for details. ● Since 2015, asylum-seeker movements have put significant pressure on border controls in Europe. Always carry your passport when you cross borders, including in the Schengen area. ● To drive in France, you need a valid driver's licence. You may also need an International Driving Permit (IDP) to rent a car. Get your IDP before leaving your country. ● If you use public transport, keep your ticket until you exit the system. Inspectors conduct random checks and can fine you if you don't have it.

Germany

Germany	**Threat Level** Exercise normal safety precautions.		**Latitude / Longitude** 51.165691, 10.451526 **GPS Position** 51° 9' 56.4876'' N 10° 27' 5.4936'' E

Crime	● Terrorists have staged attacks and threaten more. Recent attacks have targeted transport hubs and places visited by foreigners, including Christmas markets. Always be alert. Report anything suspicious to the police. ● Violent crime isn't common but does happen. Petty crime, such as pickpocketing and theft from cars and trains, is common. Take care of your belongings. ● Racial harassment occurs. Take care in cities particularly in the former East Germany. ● Watch out for drink spiking. It can lead to sexual assault. Stick with people you trust in bars.
Laws	● Nazi symbols, salutes, songs or material, such as flags or memorabilia, are all illegal. ● Always carry photo ID.
Health Risks	● Take care in forests, particularly in Bavaria and Baden-Württemberg. Tick-borne encephalitis is a risk. Ticks are active from spring to autumn. Check your body for ticks and remove them as soon as possible. ● Medical care and facilities are good. ● If you don't have insurance, hospitals may ask for up-front payment. Costs are higher than in first world countries.
Weather	

Other	• Germany is part of the Schengen area. You can enter Germany without a visa in some cases. In other situations, you'll need to get a visa. • Always carry your passport when crossing or travelling near the border, even in the Schengen area. • Learn the road rules before you drive. You'll usually need winter tyres between October and Easter. Bicycles usually have the right of way.

Netherlands

	**Threat Level** Exercise normal safety precautions.		**Latitude / Longitude** 52.132633, 5.291266 **GPS Position** 52° 7' 57.4788" N 5° 17' 28.5576" E

Crime	• There's a significant threat of terrorism across the Netherlands. Terrorists have staged attacks. Tourist spots and public transport are possible targets. Always be alert. Report anything suspicious to the police. • Petty crime, such as pickpocketing and bag snatching, is common. Drink spiking is also a risk. • Watch out for thieves who pose as plain-clothes police officers. • Take care of your belongings, particularly at tourist spots and on public transport.
Laws	• Only Dutch residents can legally buy or use cannabis. It's against the law for non-residents. • Anyone aged over 14 years must carry ID.
Health Risks	• Medical care and facilities are good.
Weather	

Other	● The Netherlands is part of the Schengen area. You can enter the Netherlands without a visa in some cases. In other situations, you'll need a visa. ● Amsterdam's Schiphol Airport has strict security. Allow at least 2 hours for flights within Europe. Allow 3 hours for other international flights. ● A child travelling without both parents may need a 'Permission to Travel' form. ● Trams, cyclists and mopeds have right of way. Learn local road rules before you drive.

Switzerland

Threat Level
Exercise normal safety precautions.

Latitude / Longitude
46.818188, 8.227512

GPS Position
46° 49' 5.4768" N
8° 13' 39.0432" E

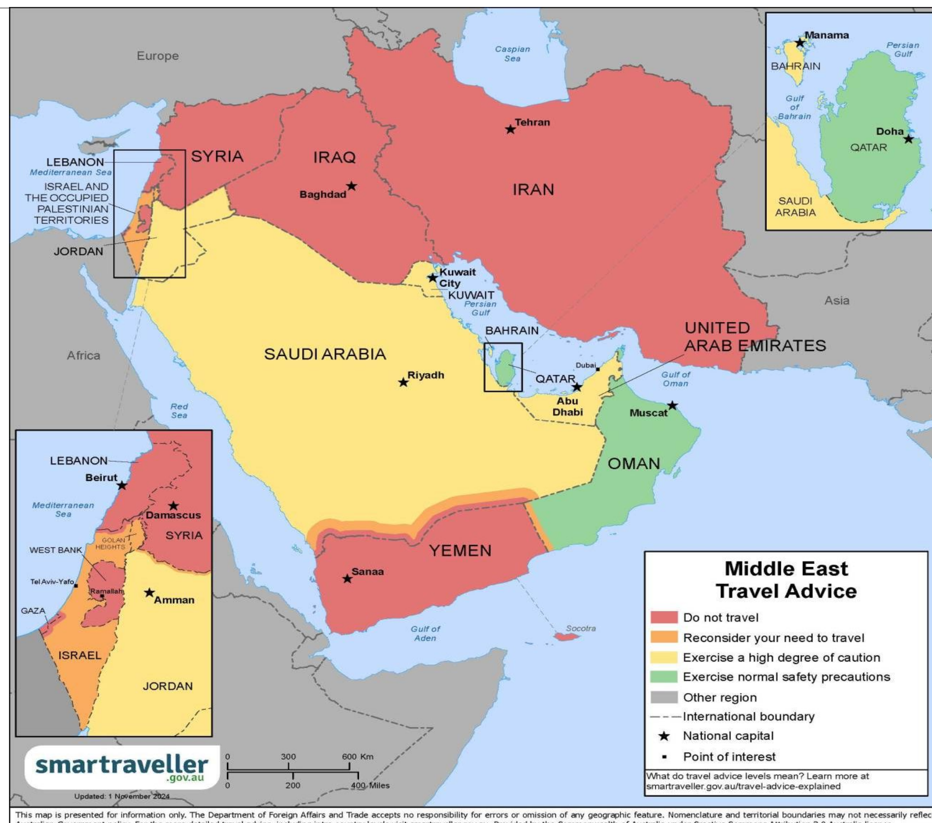
Crime	● Serious crime levels are low, but petty crime is on the rise. Take care at tourist spots and on transport, including overnight trains. Watch out for thieves who use distraction techniques. Keep your belongings close. ● Terrorists are likely to plan attacks targeting Switzerland. Terrorists have targeted European cities, including transport hubs and places visited by travellers. Always be alert. Take official warnings seriously.
Laws	● Don't use or carry drugs. Penalties are severe. ● If you're a foreigner convicted of a serious crime in Switzerland with at least a three year prison sentence, you can be deported. You might not be able to return for 5 to 15 years.
Health Risks	● Medical care and facilities are good. ● If you don't have insurance, hospitals may ask for up-front payment. Costs can be high.
Weather	● Avalanches, flash floods, rock falls and mudslides occur in alpine areas. Monitor local weather. Follow the advice of authorities. Stick to marked slopes and trails when skiing.
Other	● Switzerland is part of the Schengen area. You can enter and stay in Switzerland as a tourist without a visa for a period of 90 days in any 180-day period. In other situations, you'll need to get a visa. ● A child travelling without both parents may need a letter of consent. Check with the State Secretariat for Migration (SEM). ● Always carry your passport when crossing borders, even within the Schengen area. ● Road conditions are good. Be careful when driving in winter. Ask locals for advice on snow tyres and chains. Learn local road rules.

6 Middle East

The Middle East region.

The colour shading and travel advice on the map is the advice given by the Australian Government and is accurate as of the 20th Feb 2025.

However countries risk ratings rarely change so this could be considered accurate advice going into the forseeable future.



Middle East

Bahrain

Threat Level
High threat level to personal safety, take a range of extra precautions here.

Latitude / Longitude
26.066700, 50.5577

GPS Position
26° 4' 0.12" N
50° 33' 27.72" E

GEOGRAPHY | Middle East | Middle East

Bahrain

Crime	● Terrorist attacks have killed and injured people. Future attacks may happen. Avoid possible targets. Take official warnings seriously. ● Protests and clashes occur. Public rallies and meetings of large groups are illegal. Don't get caught up in demonstrations. Take care around Friday prayers due to the likelihood of unrest. ● The level of crime overall in Bahrain is low, although pickpocketing and bag snatching occur. Take care near the old market areas (souks).
Laws	● Always carry photo ID. You could be fined if you don't. ● Behaviour that's offensive but not criminal in your country can be illegal. Punishment may be severe. This applies even if you're transiting. Bahrain has the death penalty for murder and drug offences and corporal punishment for some offences such as stealing. ● It's illegal to publicly support Qatar. Don't speak against government policy, even on social media. It's also illegal to swear or make rude gestures. ● Dress modestly. Make sure you cover your elbows and knees. ● Same-sex relations are legal but aren't socially accepted. Avoid public displays of affection.
Health Risks	● Middle East respiratory syndrome coronavirus (MERS-CoV) is a risk. Other Middle Eastern countries have reported cases of MERS-CoV. ● The standard of medical care is high. ● You may have to pay up-front before doctors will treat you. Costs can be high. The government may ask you to repay the cost of emergency treatment. Ensure that your insurance can cover this.
Weather	● The weather is very hot from June to August. Sandstorms and dust storms are common. Monitor local media for updates.
Other	● You need a visa to enter Bahrain which can be obtained on-line. ● Authorities might not let you into Bahrain if you've been to Israel or have an emergency passport. ● The legal age of maturity in Bahrain is 21. A child of a Bahraini father does not need his permission to leave Bahrain unless there is a travel ban imposed on the child in connection with custody proceedings. ● Authorities may stop you from leaving Bahrain if you're involved in a business dispute. ● Bahrain's only land exit is into Saudi Arabia. The border can close without notice. ● Unsafe driving is common, especially speeding. Watch for roaming animals and drifting sands. Off-road driving can be dangerous. ● Sea travel can be hazardous due to territorial disputes and security issues. Piracy is a risk. If you travel by sea, monitor the International Maritime Bureau's piracy reports. Use safety equipment, even if others don't.

Iran

Threat Level Moderate threat level to personal safety, take extra precautions here.	**Threat Level** Border areas with Afghanistan, Pakistan and Iraq, do not travel.					**Latitude / Longitude** 32.427908, 53.688046 **GPS Position** 32° 25' 40.4688'' N 53° 41' 16.9656'' E

Crime	● Regional tensions have increased. This is due to the ongoing conflicts in Iraq and Syria, rising hostility between Iran and Israel and recent military tensions between Iran, the US and other countries in the Middle East. The Iran-Iraq border area is extremely dangerous. Don't travel to this area. ● Regional and international politics can trigger protests. These may target Western or UN diplomatic missions. They sometimes turn violent. Avoid large public gatherings. Be prepared to change your travel plans. ● Foreigners in Iran, risk arbitrary detention or arrest. The risk is greater if you're a dual citizen. We can't guarantee access to consular services or legal representation if you're detained or arrested. ● Terrorist attacks could happen anywhere in the country, including Tehran. They could occur at any time. Avoid possible targets and areas with a low level of security. Take official warnings seriously. ● Drug traffickers and bandits are active in the Afghanistan and Pakistan border areas. They often clash violently with security forces. Bombings and shootings occur. Be alert to your surroundings, especially at night. Outside these areas, the level of violent crime is low. ● Women can face unwanted attention and harassment. If you're a woman, take care when travelling alone, particularly at night.
Laws	● Don't use, carry or import illegal drugs. Punishments for drug offences are severe. They include the death penalty. ● Get professional advice if you're involved in local legal proceedings. In particular, seek advice on matters of family law, such as divorce, child custody and child support. ● Same-sex relations are illegal for both men and women. Penalties include corporal punishment and death. ● Iran has strict codes of dress and behaviour. Close contact between unmarried men and women is illegal, as is being in a de facto relationship. This is particularly the case for interactions between Muslims and non-Muslims. It's against the law to behave in a way that offends Islam, such as encouraging a Muslim to convert. ● Be careful when taking photos. It's illegal to photograph military or government sites, critical civil infrastructure and public protests. It's illegal to use drones without authorisation. ● Iran has strict importation laws. You can't import alcohol, pornography, pork products or short-wave radios. It's also illegal to import printed or recorded Western materials, including religious material. Get permission to bring in electronics, such as satellite phones, GPS trackers and walkie-talkies.
Health Risks	● Malaria is common outside major towns, especially in the south and west. Consider taking anti-malarial medication if you're travelling to these areas. ● Other insect-borne diseases are common, including leishmaniasis and tick-borne encephalitis. Ensure your accommodation is insect-proof. Use insect repellent. ● HIV/AIDS is a risk. Take precautions if you engage in high-risk activities. ● Waterborne, foodborne, parasitic and other infectious diseases occur. These include cholera, typhoid and hepatitis. Drink only boiled or bottled water. Avoid raw or undercooked food. ● Significant air pollution occurs in major cities. Sandstorms and dust storms happen often. Get medical advice if you have allergies or breathing difficulties.
Weather	
Other	● You'll need a visa to enter Iran. If you're a tourist, you can apply for a visa on arrival. You must be staying for 30 days or less and entering through an international airport. For other situations, get a visa before you travel. Contact your nearest Iranian embassy for details. ● If your passport contains Israeli stamps or visas, Iranian authorities will refuse you entry. ● The local currency is the Iranian Rial (IRR). Declare any foreign currency you have when you arrive in Iran. If you don't, authorities may confiscate it when you leave. You can exchange major currencies in all big cities. You can't use international credit or bank cards. You can't transfer money using commercial banks or money transfer companies. Bring enough cash to cover your stay. ● To drive in Iran, you need a driver's licence and an International Driving Permit (IDP). Get your IDP before you travel. Iran has one of the highest rates of road accidents in the world. Ensure you understand local road laws and practices before you drive. ● Public transport is limited. Consider hiring a car and driver for long-distance travel.

Iraq

Threat Level Extreme threat to personal safety, recommended not to travel here.						**Latitude / Longitude** 33.223191, 43.679291 **GPS Position** 33° 13' 23.4876'' N 43° 40' 45.4476'' E

Iraq

Crime

- The security situation is unstable. It could worsen with little warning. Leave as soon as possible. If you decide to travel to or stay in Iraq get professional security advice.
- There's a very high risk of kidnapping. Terrorists and criminal gangs may kidnap expats working in Iraq. Journalists and aid workers are at particular risk.
- Large, coordinated attacks by armed groups have killed and injured 1000s of people. Terrorist attacks occur often and without warning. Avoid possible targets. If you must visit them, always have an exit plan.
- Political rallies and protests often happen in Baghdad and other regions of Iraq. These grow quickly and can turn violent. Avoid large public gatherings. If you're caught in an affected area, stay indoors. Follow the advice of local authorities or your security provider.
- Violent crime and corruption are common. Crime includes kidnapping, murder and robbery. Organised criminal gangs, militia and tribal groups are significant threats. If you decide to travel to or stay in Iraq travel with your vehicle doors locked and windows up. Secure your accommodation against intruders.
- Be alert to scams. Scammers may claim to represent Iraqi governments, or say they're Iraqi importers. Get legal advice if an Iraqi importer contacts you or your company.

Laws

- Many laws in Iraq are different than in the U.S. and Australia. It's illegal to preach anywhere except in a place of worship. It's also illegal to attempt to convert a Muslim, or for Muslims to abandon their faith. Familiarise yourself before you go.
- Heavy penalities apply for murder, treason, drug offences and terrorism, including the death penalty.
- During the Islamic holy month of Ramadan, it's illegal to eat, drink or smoke in public during daylight hours.
- It's illegal to photograph or film government buildings, checkpoints, military bases and embassies. Get approval if you want to film in a public place. Journalists without approval have been arrested.
- The Minister for Foreign Affairs has declared Mosul an area where a terrorist organisation is taking part in a war-like activity.

Health Risks

- Get comprehensive travel insurance before you leave, including coverage for medical costs and evacuation. You'll probably need a special policy that covers travel to high-risk destinations. Most policies won't cover you.
- Insect-borne diseases are common. Malaria is widespread in the southern province of Basrah and areas below 1500m. Consider taking anti-malarial medicine if you're travelling to these areas. Ensure your accommodation is insect-proof. Use insect repellent.
- HIV/AIDS is common. Take steps to reduce your risk of exposure to the virus.
- Waterborne, foodborne and other infectious diseases are common. These include cholera, typhoid and hepatitis. Drink only boiled or bottled water. Avoid raw or undercooked food.
- Iraq is no longer affected by wild poliovirus. However, the disease may still come in from nearby countries. Ensure your vaccinations are up to date before you travel.
- Health facilities in major cities are limited. In remote areas, they're very basic or not available. If you're seriously ill or injured, you'll need medical evacuation. Make sure your travel insurance covers it.

Weather

Other

- If you're in Iraq, leave straight away. If you travel there get a visa issued by the Iraqi Government before you arrive. If you're only travelling to the Kurdistan region, you may be able to get a 30-day visa on arrival. Contact an Iraqi embassy or consulate for details.
- There are security checkpoints throughout Iraq. Follow the instructions of officials at checkpoints. Criminals and terrorists have used false security checkpoints to stage kidnappings, robberies and murders or launch attacks.
- The local currency is the Iraqi Dinar (IQD). US dollars and euros are the easiest foreign currencies to exchange. Do this at commercial banks and exchange bureaus.
- Road travel is dangerous. Risks include roadside bombs, attacks at checkpoints and robberies. If you need to travel by road, get professional security advice from a reputable company.
- Airport closures or flight suspensions may occur with little notice. Check your flights well in advance. Aviation safety and security standards may not meet those set by the International Civil Aviation Organization.

Israel, the Gaza Strip and the West Bank

Threat Level
Moderate threat level to personal safety, take extra precautions here.

Threat Level
The West Bank, including Bethlehem, Jericho and Ramallah; all parts of Golan Heights east of Route 98, Areas within 5 kms of the border with the Gaza Strip, reconsider your need to travel.

Threat Level
Gaza Strip, do not travel.

Latitude / Longitude
Israel
31.046051, 34.851612

Gaza Strip
31.354676, 34.308826

GPS Position
Israel
31° 2' 45.7836'' N
34° 51' 5.8032'' E

Crime

- Israel is a target for terrorism, rocket fire and military confrontation. Terrorist attacks could happen at anytime or anywhere. Always be alert. Have an exit plan. Tension and security risks exist close to Israel's borders with Lebanon, Syria and Egypt. Rocket attacks and military activity are threats.
- Security in the West Bank is unpredictable. This includes Bethlehem, Hebron, Jericho and Ramallah. Tensions are high. Violence occurs. Take care around West Bank checkpoints and the Old City in Jerusalem. If you're in the West Bank during military action or civil unrest, stay in a safe place indoors. Monitor the media.
- Gaza, the Gaza border and waters off the coast of Gaza are extremely dangerous. Injuries occur during clashes. Demonstrations are common. We may not be able to provide consular help in Gaza.
- The threat of civil unrest is high. Security could worsen without warning. The Israeli Defence Force (IDF) may declare an area a closed military zone. Authorities can arrest civilians in these zones. Check the IDF Home Front Command.
- Demonstrations could happen anywhere in Israel and the Palestinian Territories. Avoid demonstrations.
- Kidnapping is a risk in Gaza, in the West Bank and near the boarder with Syria.

Laws

- The Sabbath in Israel happens from sunset Friday until sunset Saturday. In Orthodox neighbourhoods, driving or using a mobile phone or digital camera on the Sabbath may offend.
- Don't use or carry illegal drugs. Penalties are severe.
- You must always carry originals or copies of your passport, visa or entry permit in the Palestinian Territories.
- Palestinian law has the death penalty for some crimes including treason, helping an enemy and murder.
- Gaza has Islamic law. Drinking alcohol and homosexual acts are illegal.
- Take care not to offend in Gaza and the West Bank. Avoid public displays of affection. Dress conservatively.

Health Risks

- Infectious diseases are a risk. Drink boiled or bottled water.
- West Nile virus can occur. There's no vaccine to prevent it. Use insect repellent. Make sure your accommodation is insect-proof.
- The standard of medical facilities in Israel is reasonable.
- Facilities in the West Bank and Gaza are limited. If you become seriously ill or injured, you may need to be evacuated. Make sure your travel insurance covers this.

Weather

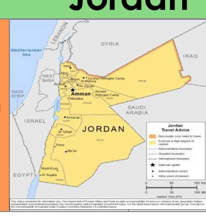
Other

- You can usually stay for up to 3 months without a tourist visa. Instead of an entry stamp, you'll get an entry card. Keep this with your passport.
- Authorities can subject you to a security and police record check when you're entering. They can refuse you entry or exit without a reason. They may question you at length and search your bags.
- Declare amounts of $US10,000 or more, or the equivalent in another currency.
- Take care when using public transport. It might not be safe.
- By law, you're considered Israeli if one or both of your parents are Israeli. Israeli citizens must enter ad leave on an Israeli passport. Authorities will consider you a Palestinian national if you currently hold, or used to hold, a Palestinian ID card. You may need to get a Palestinian travel document.
- Travel to Gaza is dangerous. Exiting can be difficult. Get a permit from Israeli authorities to use the Erez crossing. Get a permit from Egyptian authorities to use the Rafah crossing. We can only provide limited consular help in Gaza.

Jordan

Threat Level
Moderate threat level to personal safety, take extra precautions here.

Threat Level
Areas near the borders with Syria and Iraq, reconsider your need to travel.



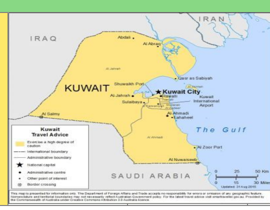
Latitude / Longitude
30.585164, 36.238414

GPS Position
30° 35' 6.5904'' N
36° 14' 18.2904'' E

Crime	● Protests are common in Jordan, including in Amman. They often occur after Friday midday prayers but can happen at other times. Most protests are peaceful, but some have turned violent. Avoid large public gatherings. ● Avoid Jordan's borders with Iraq and Syria. There's frequent military activity in these areas, including shelling and gunfire. ● Extremists plan to attack Westerners in Jordan. Stay at hotels with a visible security presence. Have an exit plan if you visit possible targets. ● Petty crime includes robbery with violence, bag snatching, theft from hotels and vehicles, and assault. Be alert in tourist areas, especially to pickpocketing, bag snatching and assault by unlicensed guides. ● Scammers operate in tourist areas. They often target single women. They promise companionship, marriage or offer joint business ideas. Credit card fraud, including card skimming, occurs. Be wary of approaches from friendly strangers. Always keep your card in sight when shopping. Check ATMs for card-skimming devices. ● Shooting guns to celebrate is illegal but common. It sometimes causes death and injury. Stay indoors and away from windows if people are celebrating with gunfire.
Laws	● Many laws in Jordan are different than in the U.S. and Australia, including for sex outside marriage, taking photos of embassies, military or security sites and religious activities. Familiarise yourself before you go. Get professional advice for local legal matters. You may be prevented from leaving the country until issues are resolved. ● Don't use or carry illegal drugs. Penalties for drug offences include life imprisonment. There are jail terms for possessing small amounts of drugs. Serious crimes attract the death penalty. These include terrorism, murder, treason and rape of a minor. Some offences, such as causing personal injury or property damage, are punishable by hard labour. ● Women may be verbally, sexually and physically harassed or sexually assaulted. Don't make eye contact with or talk to men you don't know. Don't walk or travel alone, especially after dark. Always ride in the back seat of taxis. ● Respect the Islamic holy month of Ramadan. During Ramadan, it's illegal to eat, drink and smoke in public during daylight hours. ● Local customs are conservative. Public affection between couples is unacceptable, as is unmarried couples living together or sharing accommodation. Same-sex relations are not socially acceptable. Always get consent before taking photos of people. ● If you're a dual national, authorities will consider you Jordanian. Men aged between 18 and 40 need to register for military service, although you don't have to complete it. If you don't register, authorities may not let you leave the country.
Health Risks	● Cases of Middle East respiratory syndrome coronavirus (MERS-CoV) are reported. Avoid consuming products contaminated with camel secretions. Wash hands regularly before and after touching animals. ● Waterborne, foodborne, insect-borne and other infectious diseases are prevalent. They include hepatitis, typhoid, measles and sandfly fever. Drink only boiled or bottled water. Avoid raw or undercooked foods. Ensure your accommodation is insect-proof. Use insect repellent. ● Amman has high-quality private medical services. Outside major cities, health services are basic. Paramedic and ambulance services are basic compared with first world countries. You may have to pay up-front. If you're seriously ill or injured, you might need medical evacuation. Ensure your travel insurance covers this.
Weather	
Other	● You need a visa to enter Jordan. Tourists can get a single-entry 30 days visa on arrival. These are available at airports or the Sheikh Hussein/North Border crossing from Israel. Register with the police if you're staying longer than 1 month. You may need to get medical and HIV tests. Carry your yellow fever vaccination certificate if you're coming from a country where yellow fever is a risk. In other situations, get a visa before you travel. ● Under Jordanian law, a husband can prevent his children from leaving Jordan. ● The local currency is the Jordanian Dinar (JOD). ATMs are available in Amman and in other major cities. They're less common in rural areas. Most petrol stations on major roads have ATMs. ● There are unexploded weapons and landmines in Jordan's border regions. Known minefields are usually fenced and marked, but warnings may not be obvious. Get local advice in these areas. ● Road rage incidents are common. They can escalate quickly. Road travel in remote desert areas is very risky. Don't drive outside cities at night. If you're in an accident, no matter how minor, stay at the scene until traffic police arrive. ● Use only licensed taxis or reputable limousine services arranged through your hotel. Avoid taxis that tout for business at airports, hotels and tourist attractions. They often try to charge high prices. Always insist drivers use the meter.

Kuwait

Threat Level
Moderate threat level to personal safety, take extra precautions here.



Latitude / Longitude
29.311660, 47.481766

GPS Position
29° 18' 41.976'' N
47° 28' 54.3576'' E

Crime	● Terrorist attacks are possible, especially against Western interests. Take official warnings seriously. Consider the level of security provided when visiting possible targets. ● Protests sometimes happen, usually on Fridays. They often occur in the Al-Qibla, Jahra and Sulaibaya areas. Protesters and security forces have clashed. Avoid large public gatherings. Take care around Friday prayer times. ● Kuwait's crime rate is low but rising. Women sometimes get verbally and physically harassed. In Jahra, attackers may be armed. Robberies are reported in Jleeb Al-Shuyoukh. Don't walk alone at night. If you're female, don't travel alone.
Laws	● Kuwaiti authorities don't normally notify the embasies if they detain or arrest tourists. Ask a family member, friend or colleague to inform the Embassy as soon as possible. ● Don't use or carry illegal drugs. Penalties include the death sentence. Get professional local legal advice for any business or family law matters. Some offences that aren't serious in other countries are extremely serious in Kuwait. ● Always carry ID, such as your passport or Kuwaiti civil ID card. Authorities conduct regular checks for illegal workers. ● Kuwait has strict laws regarding its Emir. It's illegal to challenge or insult the Emir in any way. It's also illegal to use social media to criticise regional political matters and figures, including the Emir. ● Kuwait has strict laws on relationships. Same-sex relations are illegal. It's against the law for unmarried couples to live together or stay together in hotel rooms. Public displays of affection are also illegal. ● Kuwait doesn't recognise dual nationality. ● Standards of dress and behaviour are conservative. Avoid wearing shorts or tight clothing if you're a woman. Take care in conservative areas like Jahra and Jleeb Al-Shuyoukh.
Health Risks	● Cases of Middle East respiratory syndrome coronavirus (MERS-CoV) are reported. Avoid contact with camels or products contaminated with camel secretions. ● Some Kuwaiti medical facilities offer high-quality services but other don't. Some hospitals, including some private hospitals, don't accept foreigners. If you're seriously ill or injured, you'll need medical evacuation. Ensure your travel insurance covers this.
Weather	● Be prepared for extreme weather. Sand and dust storms occur regularly. In the hottest months, the temperature is often above 50°C. Flooding can happen, usually between December and January.
Other	● You need a visa to enter Kuwait. You can get a visa on arrival that's valid for 3 months. Pay for it in Kuwaiti dinars. You can get tourist, business and work visas online through the Kuwait e-Visa website. You'll still have to pay for them at Kuwait International Airport. For employment or residency visas, contact a Kuwaiti embassy or consulate. ● You may have trouble entering Kuwait if your passport has evidence of travel to Israel. ● The local currency is the Kuwait Dinar (KWD). ATMs are common. Many places accept credit cards, although some banks and shops won't accept foreign cards. ● Kuwait has unexploded weapons, including landmines, in desert areas and on some beaches. Stay on well-travelled roads. Don't pick up strange objects on beaches. ● It's illegal and dangerous to travel near the Iraq and Saudi Arabia borders without authorisation. Armed guards patrol border areas. Don't travel to Iraq. If you go there make sure you have correct documents authorising your movements. Only use official border crossings.

Lebanon

	Threat Level High threat level to personal safety, take a range of extra precautions here.	**Threat Level** Southern suburbs (Dahiyeh) of Beirut, including west of the airport road. Areas within five kms of the border with Syria, South of the Litani River, with the exception of the city of Tyre. Palestinian refugee camps, Tripoli and northern Lebanon north of a line from Tripoli to Sir Ed Dinniyeh and Arsal. Northern		**Latitude / Longitude** 33.854721, 35.862285 **GPS Position** 33° 51' 16.9956" N 35° 51' 44.226" E
Crime	● Lebanon's security situation is uncertain. This is due to conflict in Syria, the threat of terrorism, and political and religious tensions. Ensure your travel documents are up to date and be prepared to leave Lebanon quickly if necessary. Ensure you have passports for children born in Lebanon and current passports for all family members travelling with you. You are responsible for your own departure. ● Large protests happen. Tear gas, water cannons and live ammunition may be used to break up crowds. Avoid large public gatherings. Celebratory gunfire often occurs during and after political speeches. If you're caught in civil unrest, stay inside. Follow the advice of local officials ● Extremists may target Westerners, including in Beirut. Terrorist attacks are likely and could happen at any time and place. Kidnapping has occurred. Targets have included foreigners. Be alert to your personal security. ● Clashes between Lebanese security forces and militants are possible in the north-eastern Beka'a Valley region. Suicide bombings, rocket and IED attacks, air raids and kidnappings occur in this area. ● Don't visit Palestinian refugee camps in any part of Lebanon. Extremist groups operate from camps. Armed clashes and violent crime are common. ● South of the Litani River, there's a high threat of armed conflict. The United Nations Interim Force in Lebanon (UNIFIL) has a peacekeeping presence there. Israeli forces occupy the southern border town of Ghajar. Tensions are still high in the surrounding region, including the Shebaa Farms. Shelling is reported. Avoid areas where military activity is occuring. Be ready to leave at short notice.			
Laws	● Religious law has the same standing as civil law. All family law matters are based on local religious laws. If you're involved in divorce, custody or other family disputes, speak to a lawyer before you leave your country. ● Don't use or carry illegal drugs. Penalties are severe and include mandatory jail terms. ● Serious crimes, such as murder and treason, may attract the death penalty. ● Lebanon recognises dual nationality. However, Lebanese authorities treat Lebanese dual nationals as Lebanese citizens. This may limit our ability to help you if you're arrested or detained. ● Standards of dress and behaviour are modest in parts of Lebanon, particularly at religious sites. Public displays of affection may cause offence. Some hotels won't rent rooms to couples without proof of marriage. ● Be careful when taking photos. It's illegal to photograph military personnel or sites, government buildings and major civil infrastructure, such as power stations.			
Health Risks	● There are health risks related to Lebanon's ongoing waste disposal dispute. These include possible water contamination, waterborne illnesses and air pollution caused by burning waste. Keep away from uncollected waste. Drink only boiled or bottled water from bottles with sealed lids. ● Cases of Middle East respiratory syndrome coronavirus (MERS-CoV) are reported. Avoid contact with camels, camel products and anything contaminated with camel secretions. ● The standard of medical facilities and care in many of Lebanon's large hospitals is as good as it is in first world countries. Most recommended hospitals are private and expensive. You'll probably have to pay up-front. ● Be careful when taking photos. It's illegal to photograph military personnel or sites, government buildings and major civil infrastructure, such as power stations.			
Weather				
Other	● You might be able to get a tourist visa on arrival. Contact your nearest Lebanese embassy or consulate for details. It's against Lebanese law to travel to Israel. If there is evidence you have travelled to Israel or intend to do so, authorities will refuse you entry to Lebanon or deport you. ● Always carry ID. You'll need to show it at road checkpoints. Lebanese Border Control will check your name against a database of people wanted for or convicted of an offence. If your name matches an entry, you may be detained. You'll have to prove it if the record doesn't relate to you. Carry supporting documents, such as a copy of your birth certificate or other official documents. ● There are unexploded weapons, including cluster bombs and landmines, throughout Lebanon. Most are in the south, especially south of the Litani River. Minefields aren't always clearly marked. Follow local advice. Stay on sealed roads. Don't walk or drive cross-country. ● Don't use service (shared) taxis or taxis hailed on the street, especially late at night. There's a risk of armed robbery.			

Oman

	Threat Level Exercise normal safety precautions.	**Threat Level** Border areas with Yemen, reconsider your need to travel.		**Latitude / Longitude** 21.473533, 55.975413 **GPS Position** 21° 28' 24.7188" N 55° 58' 31.4868" E
Crime	● International terrorist groups are active in the Arabian Peninsula. Attacks against targets in Oman may happen. Take official warnings seriously. ● Protests can turn violent. Avoid large public gatherings. Take care around the time of Friday prayers. ● Armed conflict is ongoing in neighbouring Yemen. If you travel to border areas, be alert to possible threats. Seek local advice on safe routes. ● Oman has a low crime rate. Tourists are sometimes targets for burglaries and theft. Women and travellers camping in isolated areas have been assaulted. The risks increase at night. Secure your accommodation. Don't camp in isolated areas.			
Laws	● Local laws reflect that Oman is an Islamic country. Respect local traditions, customs, laws and religions at all times. ● Don't use or carry illegal drugs. Severe penalties for drug offences include the death sentence. Possessing even a small amount of drugs attracts a minimum 12-month jail sentence. ● Get professional legal advice if you're involved in legal matters, especially family or business law. Authorities may not let you leave Oman if you're involved in a dispute or have legal proceedings underway. They also may not let you depart if you have unpaid debts. ● Same-sex relationships, having sex outside of marriage and possessing pornography are illegal. Hotels may refuse accommodation to couples who can't prove they're married. Oman has strict Islamic dress codes. Dress modestly in public areas away from tourist beaches, hotels and resorts. Choose loose-fitting clothes that cover your shoulders and legs. Women wearing shorts or tight-fitting clothes are likely to attract attention. Its illegal to wear military or similar clothing and accessories. ● Oman also has a strict code of behaviour. Don't disrespect Islam. Avoid bad language, rude gestures and public displays of affection. Respect restrictions on alcohol and pork products. Take care during Ramadan and Shia festivals. Avoid eating and drinking in public during Ramadan. ● Oman has strict laws on public speech, including on social media. It's illegal to use aggressive, obscene or abusive language or gestures in public. It's also illegal to make offensive remarks about Oman, the royal family, Islam, the local government and their policies or local officials. ● It's illegal to take photos of or near government buildings or other sensitive infrastructure, including oilfields. Ask permission before taking photos of people.			
Health Risks	● Dengue, leishmaniasis and other insect-borne diseases occur in Oman, especially on the Musandam Peninsula. Ensure your accommodation is insect-proof. Use insect repellent. ● Malaria is a risk due to Oman's high temperature and humidity. Consider taking anti-malarial medication. ● Dehydration and heat stroke are a risk during summer. Drink plenty of water. Avoid long periods in the heat. ● Cases of Middle East respiratory syndrome (MERS) are reported. Get medical advice if you have a fever, cough, breathing difficulties or diarrhoea. ● Waterborne, foodborne and other infectious diseases occur. Drink only boiled or bottled water from bottles with sealed lids. Avoid raw or undercooked food. ● Health care is generally good but can vary between regions. Hospitals and clinics in larger cities are better equipped but can be expensive. If you're seriously ill or injured, you'll need medical evacuation. Ensure your travel insurance covers this.			
Weather	● The monsoon season is from June to September. Flooding and cyclones can happen during this time. Sand and dust storms can occur during the drier months from October to May. Follow the advice of local officials.			

Other	● You need a visa to enter Oman. Apply for an e-visa online. Contact your nearest Omani embassy or consulate for updates. ● If your passport contains evidence of entry to Israel, authorities will deny you entry to Oman. They may not allow you to enter Oman from Yemen without prior approval. ● Carry your yellow fever vaccination certificate if you're coming from a country where yellow fever is a risk. ● The annual death toll on Omani roads is extremely high. The risk is higher if you drive outside major cities, especially after dark, and on unsealed roads. ● Use only registered taxis and limousines. Use metered taxis or agree on the fare before getting in the taxi. ● Sea travel near Oman is risky due to territorial disputes and security issues. The islands of Abu Musa and Tunbs in the southern Gulf are particularly dangerous. Piracy is a risk. Piracy occurs in the waters around Oman, Yemen and Saudi Arabia. If you travel by sea, monitor the International Maritime Bureau's piracy reports.

Qatar

Threat Level
Exercise normal safety precautions.

Latitude / Longitude
25.354826, 51.183884

GPS Position
25° 21' 17.3736" N
51° 11' 1.9824" E

Crime	● There's a risk of terrorist attack anywhere, including in Qatar. Consider the level of security provided when visiting possible targets. ● Qatar has a low crime rate. Pickpocketing, bag snatching and other petty crimes are rare but can happen. Keep an eye on your belongings, especially in crowded places. ● Bank and credit card fraud can occur. Always keep your credit card in sight when shopping. ● Women may be verbally and physically harassed. Take care, especially at night.
Laws	● Many things are against the law in Qatar that are legal in other countries. Penalties include corporal punishment. These include laws around eating and drinking, buying and drinking alcohol, intimacy and obscenity. Same-sex relationships are illegal, as are public displays of affection. Qatar has strict laws regarding imports. ● Don't use or carry illegal drugs. Penalties for drug offences include long jail terms. Authorities can detain and deport you if you carry medication to treat HIV and hepatitis. This can also happen if you test positive to either illness. ● If you're involved in a commercial civil dispute, local firms or courts may take your passport. Authorities can stop you leaving Qatar until the dispute is resolved. If you owe money, you may go to jail until you settle your debts. Qatar has strict fraud laws. Offences include presenting a cheque that bounces, and failing to pay loans, bills or fines. You could go to jail. ● Sex outside of marriage is illegal. If you're the victim of a sexual assault, authorities may arrest, detain or prosecute you for adultery. If you're sexually assaulted in Qatar, ask us for consular help. We'll give you advice on support services. ● Qatar has strict Islamic codes of dress and behaviour. Wear clothes that cover your shoulders and knees. If you're at tourist attractions, shopping malls and other public places, check the specific dress codes at the venue or online.
Health Risks	● Cases of Middle East respiratory syndrome coronavirus are reported in Qatar. Avoid contact with camels and products contaminated with camel secretions. ● Qatar has high levels of air pollution. Sand and dust storms can also worsen breathing issues. Talk to your doctor before you travel if you have concerns. ● Public medical facilities in major cities are adequate. You'll need to pay up-front. If you're seriously ill or injured, you'll need medical evacuation. Ensure your travel insurance covers this.
Weather	● Be prepared for extreme weather. From June to September, temperatures can reach over 50˚C. Flash flooding can sometimes happen. Follow the advice of local officials.
Other	● You can get a free 30-day visa on arrival if your passport is valid for at least 6 months. Make sure you have a confirmed onward or return ticket. For other visas, contact your nearest Qatari embassy or consulate. ● Driving in Qatar can be difficult and dangerous. Make sure you understand local laws and practices. It's illegal to use obscene language or hand gestures in traffic. It's also illegal to drive after drinking any amount of alcohol. ● Many areas of the Gulf are sensitive to security issues and territorial disputes. There's also a risk of piracy. If you're planning sea travel, refer to the International Maritime Bureau's piracy reports.

Saudi Arabia

Threat Level
High threat level to personal safety, take a range of extra precautions here.

Threat Level
Areas within 30 kilometres of the border with Yemen, do not travel.

Latitude / Longitude
23.885942, 45.079162

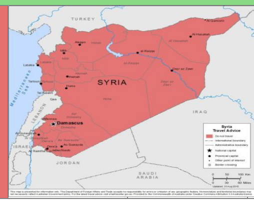
GPS Position
23° 53' 9.3912" N
45° 4' 44.9832" E

Crime	● Terrorists could strike anywhere, at any time. Attacks often target the minority Shia community. The threat is particularly high in and around the Eastern Province. If you go to Saudi Arabia despite the risks, avoid possible targets. Always have an exit plan. ● Saudi Arabia is in an ongoing conflict in Yemen. Cross-border action includes missile, rocket and drone attacks. Follow the advice of local officials. ● Protests are illegal but sometimes occur. They can turn violent. Avoid large public gatherings. Take care around Friday prayer times. ● Crime rates are low but theft happens, especially in crowded places and from vehicles. Keep vehicle doors locked and windows up, even when moving. Hide your valuables.
Laws	● Many laws in Saudi Arabia are different than in other countries. including for same-sex relations and abandoning the Islamic religion. Punishments include going to jail, public lashing and the death penalty. Familiarise yourself before you go. Get professional advice for local legal matters. You may be prevented from leaving the country until issues are resolved. ● It's illegal to mock, provoke or question public order, religious values or public morals. Criticising Saudi Arabia, the royal family, the leadership or Islam is also against the law. These laws extend to social media posts. ● It's against the law to have sexual relations or live together outside of marriage. If you're sexually assaulted, you may face criminal prosecution. Authorities may not consider you to be a victim of crime. ● Always carry your passport or residency card (iqama). There are checkpoints and identity checks can happen. It's an offence not to carry ID. ● The Saudi Government doesn't recognise dual nationality for its citizens. Authorities will seize extra passports if they find them. ● In Saudi Arabia, both men and women are asked to dress modestly in public. Avoid tight fitting clothes or clothes with profane language or images.
Health Risks	● Cases of Middle East respiratory syndrome are reported. Avoid contact with camels or products contaminated with camel secretions. ● Sandstorms and dust storms can cause allergies and breathing problems. Discuss your travel plans with a doctor if you have an existing condition. Malaria, including chloroquine-resistant strains, is present in south-western Saudi Arabia. Consider taking anti-malarial medication. ● Other insect-borne diseases include dengue and leishmaniasis. Ensure your accommodation is insect-proof. Use insect repellent. ● Foodborne, waterborne and other infectious diseases include typhoid, hepatitis, brucellosis and rabies. Drink only treated or bottled water. Avoid raw or undercooked food and unpasteurised dairy products. Don't swim in fresh water. ● Most medical facilities in major cities are of a high standard. Hospitals in minor towns and small cities can only do routine procedures. If you're seriously ill or injured, you may need medical evacuation. Ensure your travel insurance covers this.
Weather	● Be prepared for extreme weather. From June to August, temperatures can reach over 50°C. Sandstorms and dust storms are common. Driving can be hazardous. The annual road death toll is extremely high.

Other	● You need a visa to enter Saudi Arabia. You can apply for an online tourist visa. If you're visiting for Hajj or Umrah pilgrimage contact your nearest Saudi embassy or consulate for details. Check your visa conditions carefully. ● If you hold a work or residency permit, you'll need an exit/re-entry or final exit permit to leave the country. You'll need to apply through your sponsor to the Saudi Ministry of Interior. If you're on a single-visit or multiple entry business or tourist visa, you don't need one. ● Children up to the age of 21 living in Saudi households need permission from a male relative to leave Saudi Arabia. ● Carry your yellow fever vaccination certificate if you're coming from a country where yellow fever is a risk. You'll need it to enter Saudi Arabia. ● Authorities will scan your luggage on arrival for illegal items. These include alcohol, weapons, pork products and pornography – including images of scantily clad people. It's also illegal to import religious books and materials, other than those about Islam. ● If you're a woman travelling for the first time to Saudi Arabia to live and work, you may wish to arrange to be met by your work sponsor on arrival.

Syria

Threat Level
Extreme threat to personal safety, recommended not to travel here.



Latitude / Longitude
34.802075, 38.996815

GPS Position
34° 48' 7.47'' N
38° 59' 48.534'' E

Crime	● The security situation in Syria is extremely dangerous due to military conflict, including air strikes, and very high levels of violence, terrorism and kidnapping. Chemical weapons could be used in conflicts. If you're in Syria avoid possible terrorist targets. While you're there, seek professional security advice. Stay in a safe place and limit your movements. Keep stocks of food, water, fuel and toiletries. ● Many foreigners, especially aid workers and journalists, have been kidnapped. If you remain in Syria, vary your routines so your movements don't become obvious to others. ● Protests can turn violent. Authorities have arrested people near demonstrations, regardless of their citizenship. If you're in Syria avoid large public gatherings. This includes funerals and mourning processions. Avoid areas where people congregate after Friday prayers. ● Crime has increased, including violent robberies, kidnappings and carjackings. If you remain in Syria keep your vehicle doors locked and windows up, even when moving. Carry only what you need.
Laws	● Don't use or carry illegal drugs. Severe penalties for drug offences include the death sentence. ● Get local professional legal advice if you're involved in local legal matters, especially family or business law. ● Same-sex relations are illegal in Syria. ● Be careful when taking photos. It's illegal to photograph military and government buildings and other sensitive infrastructure. ● Always carry ID. It's against the law not to. ● Syria recognises dual nationality. If you're a male dual national, you may have to do military service if you go to Syria. Contact your nearest Syrian embassy or consulate for details.
Health Risks	● Get comprehensive travel insurance before you leave. Your policy needs to cover all overseas medical costs, including medical evacuation. You're likely to need a special insurance policy for travel to a high-risk destination. Some policies won't cover you. ● Medicines are in short supply. If you travel to Syria, carry enough medication for your trip. ● Cases of polio are reported. If you're staying longer than 4 weeks, you'll need to show proof on exit that you've had the polio vaccine or a booster within the past 12 months. ● Insect-borne diseases, such as leishmaniasis, are common. Malaria occurs in the northern border region, particularly Al Hasakah Province. Ensure your accommodation is insect-proof. Use insect repellent. Consider taking anti-malarial medication. ● Waterborne, foodborne, parasitic and other infectious diseases are common. These include brucellosis, typhoid and hepatitis. Drink only boiled or bottled water. Avoid raw or undercooked foods and unpasteurised dairy products. ● Access to hospitals may be limited due to the ongoing conflict. The quality of health care in Syria has deteriorated. If you're seriously ill or injured, you'll need medical evacuation. This could be difficult to arrange.
Weather	
Other	● Don't travel to Syria. If you travel to Syria without Syrian identity documents, you'll need a visa. This applies even if you're travelling to parts of the country not controlled by the government. Apply for a visa at your nearest Syrian embassy or consulate. ● Leave Syria immediately. Most commercial airlines have stopped flying to Syria. Other commercial air services and airports could be attacked or stop operating at any time. Roads and border crossings may be blocked without warning. Plan your exit carefully to minimise safety risks. ● Entry into Lebanon from Syria is restricted. ● The local currency is the Syrian Pound (SYP). It's illegal to change money on the streets. Some financial organisations have stopped doing business with Syrian companies due to sanctions. Your credit cards and ATM cards may not work. Carry enough US dollars or euros to cover your needs.

United Arab Emirates

Threat Level
Exercise normal safety precautions.

Latitude / Longitude
23.424076, 53.847818

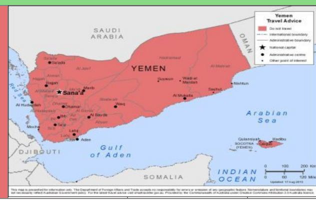
GPS Position
23° 25' 26.6736'' N
53° 50' 52.1448'' E

Crime	● Conflicts in the Middle East and Gulf region could affect the UAE. Monitor local and international media. If there's a security incident, follow the advice of local officials. ● Authorities have arrested several alleged terrorists for planning attacks. Avoid possible targets. Take official warnings seriously. ● The crime rate is low. Petty crime, such as pickpocketing and bag snatching, occurs but is rare. Drink spiking sometimes happens. Physical and verbal harassment and sexual assaults occur. Avoid walking alone after dark in isolated places, including pedestrian underpasses.
Laws	● Many things that are acceptable in other countries are illegal in the UAE. It's illegal to insult Islam, the UAE, the royal families/government officials or the UAE flag. Sex outside of marriage is illegal. It's illegal to share accommodation with someone of the opposite sex who isn't your spouse or a close relative. Punishments for same-sex relations and cross-dressing include prison sentences and fines. Familiarise yourself before you go. ● You can be charged with possession if trace amounts of drugs are found on your body, clothing or luggage. Penalties for drug offences include the death penalty or life in jail. ● Non-Muslim UAE residents need a liquor licence to buy, carry or drink alcohol, including drinking in your home. Only non-Muslim guests or licence-holders can drink in hotels. It's illegal to be drunk in public, including at airports across the UAE. It's illegal to consume alcohol in the Emirate of Sharjah. ● Be careful when taking photos. It's illegal to photograph airports and transport infrastructure, bridges, government buildings, embassies and palaces. It's also illegal to photograph anyone or post photos of people or their personal belongings (including vehicles) on social media without their consent. This includes people in the background of photos. ● The UAE doesn't recognise dual nationality. ● The UAE has strict dress and behaviour codes. Wear clothing that covers your shoulders and knees. Dress modestly, especially in the Emirates of Sharjah and Ajman, where Islamic law is strictly enforced. It's illegal to eat, drink or smoke in public between sunrise and sunset during Ramadan, the Islamic holy month.
Health Risks	● Cases of Middle East respiratory syndrome coronavirus (MERS-CoV) are reported. Avoid contact with camels and products contaminated with camel secretions. ● Waterborne, foodborne, parasitic and other infectious diseases sometimes occur. Get medical advice if you develop a fever or diarrhoea. ● Red algae or 'red tide' may sometimes affect beaches. This can cause skin and eye irritations, as well as breathing problems. Don't swim in affected water. ● The standard of public medical facilities in major cities is adequate. However, services might not be available in remote areas. You may have to pay up-front before treatment.
Weather	● Be prepared for extreme weather. Between June and September, temperatures can exceed 50°C. Sand and dust storms are also common. In extreme heat, stay out of the sun and drink plenty of water.

Other	● Some people can get a free 30-day tourist visitor visa on arrival. For other situations, contact your nearest UAE embassy or consulate-general. ● The UAE has strict laws about brining certain medications into the UAE. See Medications for more information. ● The UAE restricts the importation of certain items. These include pork, poppy seeds, pornography, weapons, items that resemble or display images of illegal substance such as marijuana, and some medication. ● The local currency is the United Arab Emirates Dirham (AED). ● You can drive in the UAE with an International Driving Permit (IDP). Get your IDP before you travel. If you're a UAE resident, you need a local licence. Drink-driving laws are strictly enforced. The blood alcohol limit is 0%. ● Many areas of the Gulf are sensitive to security issues and territorial disputes. There's also a risk of piracy. If you're planning sea travel, refer to the International Maritime Bureau's piracy reports.

Yemen

Threat Level
Extreme threat to personal safety, recommended not to travel here.



Latitude / Longitude
15.552727, 48.516388

GPS Position
15° 33' 9.8172'' N
48° 30' 58.9968'' E

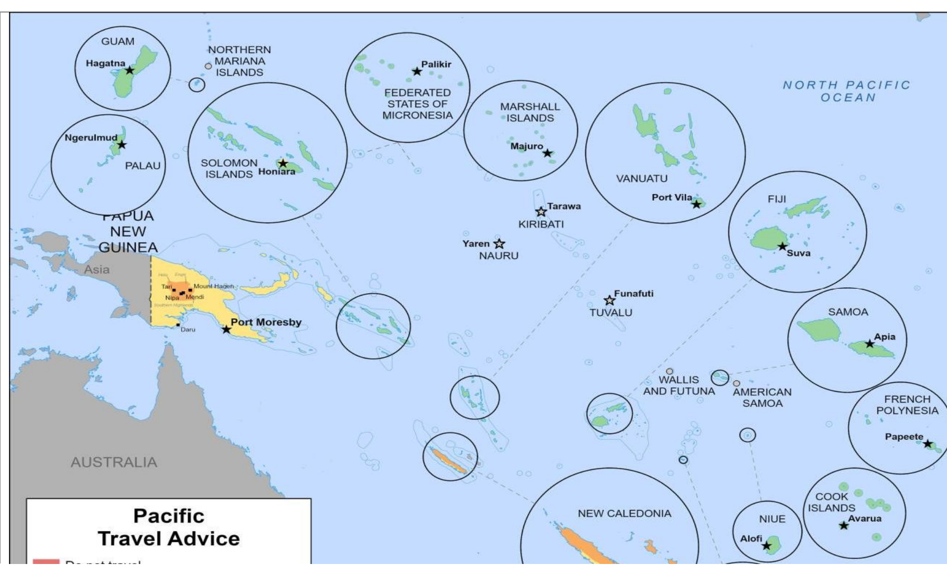
Crime	● Don't travel to Yemen because of the ongoing civil and international conflict. There's extreme political instability, military airstrikes and a very high threat of kidnapping and terrorism. You also may not be able to get enough food, water or medical care. ● Most international airlines no longer fly to Yemen. If you're in Yemen leave now. If you can't leave, shelter in a safe place. Follow the advice of local authorities or trusted security experts before trying to leave by road. ● There's a very high threat of kidnapping, including in Sana'a, Aden and Ta'iz. Keep a low profile and vary your routines and behaviours. There's also a very high threat of terrorism. Targets include Yemeni Government and Houthi interests, Westerners and Western interests. If you're in Yemen get professional security advice. Take extreme care near places that belong to Yemeni authorities. ● Important dates and political anniversaries, such as Unity Day on 22 May, can cause violence and civil unrest. Avoid large public gatherings. Be careful around Friday prayer times. ● Weapons are easily available. Tribes are often heavily armed. Armed carjacking is common. Always drive with your doors locked and windows up. Petty crime is rare.
Laws	● Get professional legal advice if you're involved in local legal matters, including family and business law. ● Don't use, carry or traffic illegal drugs. Severe penalties include jail terms and the death sentence. ● Same-sex relations are illegal. Penalties for acts of sodomy range from jail to death. ● Drinking alcohol in public, slander and adultery are all punishable by lashing. ● Be careful when taking photos. It's illegal to photograph government buildings, military personnel and sites, airports, equipment and other sensitive infrastructure. These may not be clearly marked. ● It's illegal to attempt to convert Muslims, or to preach a religion other than Islam, except in churches. Non-Muslims can't enter mosques. ● Yemen doesn't recognise dual nationality. Dual nationals may need to complete national service.
Health Risks	● Get comprehensive travel insurance before you leave. Your policy needs to cover all overseas medical costs, including medical evacuation. You'll probably need a special insurance policy that covers travel to high-risk destinations. Most policies won't cover you for travel to Yemen. ● Cases of Middle East respiratory syndrome coronavirus (MERS-CoV) are reported. Avoid contact with camels and products contaminated with camel secretions. ● The Sana'a region is at a high altitude. This may cause issues if you have lung, heart or chest problems. ● Malaria, including chloroquine-resistant strains, is common except in areas above 2000m. Other insect-borne diseases, such as dengue, filariasis and leishmaniasis, are common. Ensure your accommodation is insect-proof. Use insect repellent. Consider taking anti-malarial medication. ● Waterborne, foodborne, parasitic and other infectious diseases are common. These include cholera, typhoid, hepatitis and polio. Drink only boiled or bottled water. Avoid raw or undercooked food. Check your vaccinations are up to date before you travel. ● The standard of medical facilities is basic. It's difficult to access medical services in the current conflict, and medical facilities or services in Sana's, Aden, and elsewhere in the country may not be readily available or efficient. If you're seriously ill or injured, you'll need medical evacuation. This can be very expensive and difficult to arrange.
Weather	● Flooding can occur during the monsoon season from June to September. Sandstorms and dust storms also occur. Follow local advice.
Other	● We advise against all travel to Yemen, including the island of Socotra. If you're trying to leave, check exit requirements with local immigration authorities before you book your ticket. Tickets can take weeks to issue. ● A Yemeni husband may legally stop his wife from leaving the country, regardless of her nationality. Children aged under 18 years need their father's permission to leave the country, regardless of who has custody. ● Don't travel by road without expert local advice. You may need permission from local authorities to travel outside Sana'a and some other cities. Unexploded weapons and landmines are a high risk in the central highlands and southern and eastern regions, especially around Aden and in Sa'ada province. ● The waters around Yemen have sensitive security issues and territorial disputes. There's also a high threat of piracy in Yemeni waters and the Gulf of Aden. Get advice from authorities before entering Yemeni waters or ports.

7 Pacific

The Pacific region.

The colour shading and travel advice on the map is the advice given by the Australian Government and is accurate as of the 20th Feb 2025.

However countries risk ratings rarely change so this could be considered accurate advice going into the forseeable future.



Pacific

American Samoa

	**Threat Level** N/A								**Latitude / Longitude** -14.301830, -170.713119 **GPS Position** 14° 18' 6.588'' S 170° 42' 47.2284'' W
Crime									
Laws	N/A								
Health Risks	● Zika Virus ● Dengue Fever ● Chikungunya								
Weather	● Cyclone season is between November to April when flooding, landslides and disruptions to services can occur. However, tropical storms and cyclones may occur in other months. Tsunami Possibility.								
Other									

Australia

	**Threat Level** Exercise normal safety precautions.								**Latitude / Longitude** -25.274398, 133.775136 **GPS Position** 25° 16' 27.8328'' S 133° 46' 30.4896'' E
Crime	● Australia's crime rate is low.								
Laws	● Drug Penalties ● Homosexuality Legal								
Health Risks	● Venomous snakes and spiders are possible but rare to encounter in suburbia.								
Weather	● You could encounter tsunamis and severe weather in Australia.								
Other	Because the rest of the geographic information is from the Australian website - it does not cover Australia itself. However it is virtually the same recommendations as the United States.								

Cook Islands

	**Threat Level** Exercise normal safety precautions.								**Latitude / Longitude** -21.236736, -159.777671 **GPS Position** 21° 14' 12.2496'' S 159° 46' 39.6156'' W
Crime	● The Cook Islands' crime rate is low. Thieves sometimes target tourists, especially at the beach. Watch out for your belongings. Don't leave valuables in motor scooters or motorcycles.								
Laws	● If you're driving, monitor your alcohol intake. ● Same-sex sexual activity or 'acts of indecency' between men is illegal in the Cook Islands. Penalties include prison sentences of up to 7 years. ● The Cook Islands' standards of dress and behaviour are modest. Be careful not to offend, especially outside resort areas. Ask locals if you're unsure of customs.								
Health Risks	● Insect-borne illnesses include dengue and chikungunya. Ensure your accommodation is insect-proof. Use insect repellent. ● The Cook Islands has reported cases of Zika virus. If you're pregnant, discuss your travel plans with your doctor. ● Waterborne, foodborne, parasitic and other infectious diseases are common. Drink only boiled or bottled water. Avoid raw or undercooked food. ● Medical facilities are limited, especially on outer islands. If you're seriously ill or injured you'll need medical evacuation to New Zealand or Australia. Check your travel insurance covers this.								
Weather	● Cyclone season is November to April, but severe storms can happen at any time. Know your accommodation's evacuation plan and your nearest shelter. ● Earthquakes and tsunamis occur in the Cook Islands. Rarotonga has tsunami alert signs. If there's an alert, follow the advice of your host or hotel and local officials. Move to higher ground if you're near the beach or low-lying areas.								

Other	● If you're a tourist, you don't need a visa to stay up to 30 days. For other types of visits, get a visa before you travel. ● The Cook Islands has 2 official currencies: the Cook Islands Dollar and the New Zealand Dollar. You can't exchange Cook Islands dollars outside the country. The airport has a currency exchange bureau. ● Most shops and hotels accept credit cards. There aren't many ATMs outside Rarotonga and Aitutaki. Have several ways to access money. ● Plan your trip carefully. To enter the country you'll need an onward or return ticket. You'll also need to show you have enough money and accommodation booked. ● With an Australian driver's licence you can drive in the Cook Islands for up to 6 months. Only drive vehicles covered by your licence. ● You can get a temporary motorcycle or motor scooter licence in the Cook Islands. Apply at the police headquarters in Avarua. Check your travel insurance covers motorcycles before you apply.

Federated States of Micronesia

Threat Level
Exercise normal safety precautions.

Latitude / Longitude
6.883815, 158.235969

GPS Position
6° 53' 1.734" N
158° 14' 9.4884" E

Crime	● The crime rate is low, but travellers have reported sexual and other physical assaults. Avoid walking alone at isolated locations and beaches, and walking alone at night. ● Beach and sea conditions can be dangerous. Ask locals before swimming or surfing. When travelling by sea, take appropriate safety precautions.
Laws	● Dress and behaviour standards are conservative. If you're a woman, wear clothing that covers your knees outside of resorts. ● Anti-LGBTI sentiment exists. Public displays of affection between same-sex partners may attract negative attention.
Health Risks	● There have been no recent reports of Zika virus. However, serious outbreaks of this and dengue can happen. If you're pregnant, discuss the risks with your doctor. Use insect repellent. ● Mumps is steadily increasing. Get vaccinated before you leave. ● Leptospirosis is common. Avoid contact with muddy water and local rivers. Store food in closed containers. ● Hospital and medical facilities are limited. Medical evacuation planes for serious illness or injuries can take at least 24 hours to arrive. Get adequate travel insurance.
Weather	● Natural disasters including tropical storms, flooding, typhoons, earthquakes and tsunamis can occur. Monitor local media or the Global Disaster Alert and Coordination System for updates. ● Tropical storms and typhoons are common from July to November. Be prepared for impacts to essential services, including food and water availability.
Other	● Tourist visas are valid for 30 days. Get a tourist visa when you arrive. ● ATMs aren't available at most airports. Carry cash with you. You must pay a cash departure fee in US dollars when you leave. ● A child cannot enter or exit FSM without a parent or legal guardian, or their written permission. If you're travelling with a child who is not your own, get a certified letter. ● Unexploded remnants of war still exist. Take extra care boating or diving around Yap harbour and nearby channels.

Fiji

Threat Level
Exercise normal safety precautions.

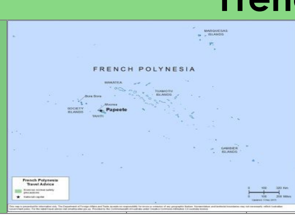
Latitude / Longitude
-17.713371, 178.065032

GPS Position
17° 42' 48.1356" S
178° 3' 54.1152" E

Crime	● Crime in Fiji includes robbery, theft, violent assault, sexual assault and home invasions. Most crime is opportunistic. The highest risk is in urban areas and at night. Be careful in downtown Suva after dark. ● Credit card fraud and ATM card skimming occur. Protect your PIN and be alert when using ATMs. Check your card and bank statements often for fraud. ● Avoid protests, street rallies and military activity areas. Protests can turn violent. Officials sometimes set up checkpoints and close roads. Follow their advice.
Laws	● Don't use or carry illegal drugs. Penalties include prison sentences, even for possessing small amounts of drugs. ● Fiji recognises dual nationality. ● Outside of tourist areas, Fiji's dress standards are conservative. Take care not to offend. ● Same-sex relationships are legal, but some locals don't accept them. Consider limiting public displays of affection, especially in rural areas.
Health Risks	● Get comprehensive travel insurance that covers medical evacuation, especially if you're going on a cruise. Some tourists have had to evacuate from cruise ships to Lautoka and Suva for medical care. ● Medical care standards in Fiji aren't as high as in first world countries. Medical facilities often lack services, equipment and drugs. You may have to pay up-front. If you're seriously ill or injured, you'll need medical evacuation to Australia. ● There's an outbreak of measles in Fiji. Make sure your vaccinations are up-to-date before you go. ● Mosquito-borne illnesses (including dengue fever and Zika) are common. Protect yourself against mosquito bites. ● Fiji has only one hyperbaric (decompression) chamber, located in Suva. It's undergoing long-term maintenance, so it may not be available. If you're diving, stay well within safety limits. ● Be careful if you're consuming kava. It can be dangerous if it reacts with alcohol or prescription medication, including antidepressants.
Weather	● November to April is cyclone season, but cyclones may occur at other times. They can cause flooding and disrupt essential services. Know your accommodation's evacuation plan. If a cyclone is approaching, find your nearest shelter and follow official advice. ● Flooding is common, especially in downtown Nadi and on the Coral Coast. Floods can cut off road access, including to the airport. Follow official advice.
Other	● If you're a tourist staying less than 4 months, you'll get a tourist visa on arrival. Carry proof of your accommodation booking and your return ticket. You may need a visa if you're travelling for other reasons. Contact your nearest embassy or consulate of Fiji for up-to-date details. ● There are strict customs regulations on importing food, weapons and sexually explicit material. Contact the Fiji Revenue and Customs Authority for details. ● The local currency in Fiji is the Fiji Dollar (FJD). You can easily exchange dollars at Nadi airport and local banks. ● ATMs are readily available at Nadi airport and shopping centres in Nadi, Suva and other larger towns. ● Always carry your driver's licence. You'll need an International Driving Permit to rent a vehicle. Get your IDP before you travel. ● Taxi and minibus quality varies. Use only licensed taxis and minibuses, which have yellow registration plates. Unlicensed minibuses may not have insurance.

French Polynesia

Threat Level
Exercise normal safety precautions.



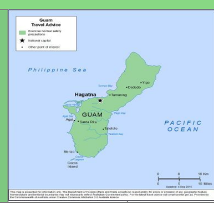
Latitude / Longitude
-17.679742, -149.406843

GPS Position
17° 40' 47.0712" S
149° 24' 24.6348" W

Crime	● Strikes and industrial disputes can lead to unrest and disrupt essential services including transport links. Protests can turn violent. Avoid large public gatherings. ● The rate of serious crime is low. But petty crime, including theft and drink spiking, occurs. Keep your belongings close, especially in crowded places. Don't leave food or drink unattended.
Laws	● Understand the local laws. French Polynesia is an overseas territory of France. A mix of French and local laws apply. ● Don't use or carry illegal drugs. You could face fines or imprisonment for having even small amounts. ● By law you must always have photo identification with you. ● Same-sex marriage is legal. However, outside the main tourist islands, you may encounter more conservative attitudes. ● Outside of tourist areas, standards of dress and behaviour are conservative. Take care not to offend.
Health Risks	● In April and July authorities declared a dengue type 2 epidemic on the island of Tahiti and Bora Bora. Other insect-borne diseases include chikungunya and filariasis. Ensure your accommodation is insect-proof. Use insect repellent. ● There have been cases of Zika virus. If you're pregnant, discuss your travel plans with your doctor before you travel. ● Leptospirosis occurs in French Polynesia. Wear closed-toed shoes when walking, and avoid contact with rivers or muddy water. Store food in sealed containers. ● Other infectious diseases include scabies, influenza and conjunctivitis. Attend to symptoms such as fever, itchiness and skin wounds. Tap water in Papeete is usually safe to drink. Avoid raw and undercooked food. Outside Papeete, drink boiled or bottled water. ● Medical facilities in Papeete are good, but those in outlying areas are basic. Ensure your travel insurance covers your condition and medical evacuation.
Weather	● French Polynesia has natural disasters, including cyclones, earthquakes and tsunamis. Check with the High Commission of France in French Polynesia (French) for updates. They also run a phone hotline during major emergencies. Your tour operator or accommodation provider may also be able to provide timely advice. ● Cyclone season is November to April. However, tropical storms and cyclones may occur at any time. Understand and follow French Polynesia's cyclone alert system. ● A tsunami can arrive within minutes of a tremor or earthquake. Get updates from the Pacific Tsunami Warning Center. Know the warning signs and move immediately to high ground.
Other	● If you're visiting for tourism for less than three months, you likely won't need a visa. In other situations, you may need one. Contact your nearest embassy or consulate of France for details. ● You can't bring certain goods into French Polynesia. Other goods require specific approvals or other formalities. Check local regulations before you travel. ● The local currency is the Pacific Franc. You can exchange dollars at most commercial banks, the international airport, licensed exchange bureaus, and hotels and resorts. You may not be able to use credit cards or find ATMs outside the main tourist areas. ● You can drive in French Polynesia with a valid driver's licence for up to one year after arrival. ● Hail taxis on the street in Papeete, at Centre Vaima station and at Boulevard Pomare station. Many outer islands don't have taxis. ● Major centres have a limited minibus network. Hail minibuses from the side of the road.

Guam

Threat Level
Exercise normal safety precautions.



Latitude / Longitude
13.444304, 144.793731

GPS Position
13° 26' 39.4944'' N
144° 47' 37.4316'' E

Crime	● Petty crime occurs in Guam. Use your common sense. ● Transport and tour operators may not follow safety precautions or maintain their equipment. Use reputable companies. Always use appropriate safety equipment.
Laws	● Penalties are severe for drug offences, including marijuana use. You may face a minimum mandatory jail term. ● The US recognises dual nationality. If you're an Australian-US dual citizen, you must travel with both passports and use your US passport to enter and exit Guam.
Health Risks	● Mosquitoes in Guam spread illnesses, including dengue. Use insect repellent. Make sure your accommodation is insect-proof. ● Medical costs in Guam are high. Get appropriate travel insurance. ● If you become seriously ill or injured, you may need to be evacuated. Make sure your travel insurance covers this. Medical evacuation can be delayed by limited flights leaving Guam.
Weather	● Guam can experience tropical storms, flooding, landslides, typhoons, earthquakes and tsunamis. Monitor the Global Disaster Alert and Coordination System for updates. Follow the advice of local authorities. ● Tropical storms and typhoons are most common from June to December. Know your evacuation plan and local shelter locations. Prepare for disruption to services, including air and sea travel.
Other	● Guam is an unincorporated US territory. You must meet US entry or transit requirements. ● Contact the nearest embassy or consulate of the United States for details of visa and entry requirements. ● Check the requirements for children travelling alone or with one parent or guardian. You may need a letter of travel permission. ● Driving in Guam can be dangerous. Avoid driving at night. Get appropriate travel insurance.

Marshall Islands

Threat Level
Exercise normal safety precautions.

Latitude / Longitude
7.371509, 168.760437

GPS Position
7° 22' 17.4324'' N
168° 45' 37.5732'' E

Crime	● The Marshall Islands' crime rate is low, but petty crime, such as break-ins and theft occur, assaults also occur. Pay attention to your security, especially at night and in isolated areas.
Laws	● Don't use or carry illegal drugs, including marijuana. Penalties for drug offences are severe. They include long prison sentences and heavy fines. ● Same-sex relationships are legal, but cultural attitudes are conservative. Avoid public displays of affection. ● The Marshall Islands has conservative dress and behaviour standards. Outside resorts, women should wear clothing that covers the knees.
Health Risks	● Insect-borne diseases, such as dengue, are present in the Marshall Islands. Ensure your accommodation is insect-proof. Use insect repellent. ● Outbreaks of Zika virus occur. If you're pregnant, discuss your travel plans with your doctor. ● Cases of hepatitis A have been reported since 2017. Get vaccinated at least 4 weeks before you travel. Know and follow health advice to reduce your risk of exposure to hepatitis A. ● Outbreaks of mumps occurred in 2017. Get the measles-mumps-rubella (MMR) vaccine before you travel. ● Hospital facilities and medical supplies are limited. Bring enough medication for your whole trip. Ensure your travel insurance covers medical evacuation.
Weather	● Typhoon season is July to November, with peaks in August and September. However, typhoons can occur at any time. Know your accommodation's evacuation plan and where your local shelter is. ● The Marshall Islands is at risk of tsunamis. Know the evacuation plans for your accommodation.
Other	● The RMI government is restricting travel to islands other than Majuro and Ebeye in order to limit the spread of dengue fever to those destinations. ● Australians get a 30-day visitor visa on arrival. Pay to extend your visa at the Division of Immigration. ● Kwajalein Island hosts a US military base. If you want to travel to Kwajalein, you must have an entry authorisation from the US military. ● If you're travelling via the US, you must meet US entry or transit requirements. Contact your nearest US embassy or consulate for details. ● The local currency is the US Dollar. ● You can drive using a licence or International Driving Permit for up to 30 days. After 30 days, you'll need a local licence. Carry your licence when you drive.

New Caledonia

	**Threat Level** Exercise normal safety precautions.		**Latitude / Longitude** -21.368737, 165.467649 **GPS Position** 21° 22' 7.4532'' S 165° 28' 3.5364'' E
Crime	● Roadside security incidents are rare but can occur without warning. Officials may also close roads. Strikes and industrial disputes can lead to unrest and disrupt essential services including transport links. Avoid large public gatherings and roadblocks. ● Serious crime is rare in New Caledonia, but car theft and vehicle break-ins occur. Look after your belongings and always lock your car.		
Laws	● Understand the local laws. New Caledonia is an overseas territory of France. A mix of French and local laws apply. By law, you must always have photo identification with you. ● Don't use or carry illegal drugs. Penalties include fines and prison sentences, even for small amounts. ● Same-sex marriage is legal, but same-sex relationships aren't widely accepted outside of Noumea. ● Outside of tourist areas, standards of dress and behaviour are conservative. Dress and behave appropriately. ● You need permission from customary authorities to visit certain areas. If in doubt, follow local advice.		
Health Risks	● New Caledonia is currently experiencing a dengue epidemic, especially in Greater Noumea. Ensure your accommodation is insect-proof. Use insect repellent. ● Other insect-borne diseases include Chikungunya and Zika viruses. If you're pregnant, discuss the risks of Zika virus with your doctor before you travel. ● Outbreaks of leptospirosis are common, especially after heavy rain. Wear closed-in shoes. Avoid swimming in rivers or muddy water. Store food in enclosed containers and use a straw when drinking from cans. ● Other foodborne, waterborne, parasitic and infectious diseases occur. These include influenza, scabies and conjunctivitis. Get treatment if you have itchiness or skin lesions. In rural areas, drink boiled or bottled water. Tap water is generally safe to drink in towns. ● The standard of medical facilities in Noumea is high, but those in outlying areas are basic. Medical treatment is expensive. Search and rescue facilities are limited. Some parts of New Caledonia don't have mobile phone coverage. Ensure your travel insurance your condition and covers medical evacuation.		
Weather	● Cyclone season is November to May, but cyclones can occur at any time. They can cause landslides and flooding, and may disrupt essential services. Ensure you understand New Caledonia's cyclone alert system. ● New Caledonia also experiences earthquakes, tsunamis and bushfires. A tsunami can arrive within minutes of a tremor or earthquake. Monitor the New Caledonian Department of Emergency Management and the New Caledonian Weather Bureau (both in French) for updates. Your tour operator or accommodation provider may also be able to provide timely advice.		
Other	● If you are visiting for tourism for less than three months, you likely won't need a visa. You'll need to have a return ticket. For other situations, you may need a visa and other authorisations. Contact your nearest embassy or consulate of France for details. ● You can't bring certain goods into New Caledonia. Other goods require specific approvals or other formalities. Check local regulations before you travel. ● The local currency is the Pacific Franc (XPF). Some businesses accept Australian dollars. Change Australian dollars at banks and authorised exchange bureaus. ● ATMs and credit card facilities are available in Noumea and other major centres. Carry cash if you're travelling to remote areas. ● You can drive in New Caledonia on a valid driver's licence for up to one year after your arrival. ● You can't hail taxis on the street. Use a taxi rank or make a phone booking. Book well in advance, as long delays are common.		

New Zealand

New Zealand									
	Threat Level Exercise normal safety precautions.								**Latitude / Longitude** -41.228525, 174.803574 **GPS Position** 41° 13' 42.69'' S 174° 48' 12.8664'' E
Crime	● Crime rates are similar to those in the U.S. and Australia. Thieves often target vehicles. Don't leave valuables in your car or campervan. ● Earthquakes are a constant risk. Large, damaging quakes can happen at any time. Know what to do during and after an earthquake. ● All of New Zealand's coastline is at risk of a tsunami. Know the tsunami warning signs and move to high ground immediately. Don't wait for official alerts.								
Laws	● Don't use or carry illegal drugs. Penalties may include fines and prison sentences, including for small amounts. ● Carry approved identification if you want to purchase alcohol or enter licensed premises. Approved ID includes your current passport, a current New Zealand driver's licence, or a Kiwi Access Card. You can't use external driver's licence.								
Health Risks	● There's an outbreak of measles in New Zealand. Make sure your vaccinations are up to date before you travel. ● Medical facilities and services are of a similar standard to those in first world countries.								
Weather	● New Zealand has several active volcanoes. A volcano erupted on White Island in the Bay of Plenty on 9 December 2019. Further eruptions are possible. Avoid the area and follow the advice of local authorities. ● Weather conditions can change quickly. Severe weather could leave you stranded or injured, especially in an isolated area. If you're climbing, hiking or in a remote area, register your trip with the Department of Conservation. Carry a personal locator beacon.								
Other	● Most Australian citizens and residents don't need a visa to enter. The exceptions are if you have a criminal record or if you've been deported from any country. From 1 October 2019, Australian permanent residents need a New Zealand Electronic Travel Authority (NZeTA). ● Australian permanent residents need to apply online for a New Zealand Electronic Travel Authority (NZeTA) to enter New Zealand. Australian citizens are exempt from this requirement. ● New Zealand has strict quarantine rules. Penalties for breaking them include heavy fines and prison sentences. ● The local currency is the New Zealand Dollar ($NZ). ATM availability is similar to the U.S. and Australia. You can use credit cards in most places. ● You can drive for up to 12 months with your Australian driver's licence. If you're staying longer, get a local licence. ● Drive to the conditions. Ice, snow, fog and high winds can be dangerous. Heavy rain can cause landslides across roads. There aren't many motorways outside major cities. Prepare for longer travel times than in Australia.								

Niue

Niue									
	Threat Level N/A								**Latitude / Longitude** -19.054445, -169.867233 **GPS Position** 19° 3' 16.002'' S 169° 52' 2.0388'' W
Crime									
Laws	N/A								
Health Risks	N/A								
Weather	● Tsunami Possibility. Cyclone season is between November to April when flooding, landslides and disruptions to services can occur. However, tropical storms and cyclones may occur in other months. The direction and strength of tropical cyclones can change with little warning.								
Other									

Northern Mariana Islands

Northern Mariana Islands									
	Threat Level N/A								**Latitude / Longitude** 15.170024, 145.733638 **GPS Position** 15° 10' 12.0864'' N 145° 44' 1.0968'' E
Crime									
Laws	N/A								
Health Risks	N/A								
Weather	● Typhoon season is between June and December when flooding, landslides and disruptions to services can occur. However, tropical storms and typhoons may occur in other months.								
Other									

Palau

Palau									
	Threat Level Exercise normal safety precautions.								**Latitude / Longitude** 7.514980, 134.58252 **GPS Position** 7° 30' 53.928'' N 134° 34' 57.072'' E
Crime	● Palau has a low crime rate, but petty crime occurs. Protect your valuables.								

Laws	● Don't use or carry illegal drugs. Penalties for drug offences are severe. They include a mandatory 25-year prison sentence for possessing any amount of 'hard drugs' (heroin, cocaine and synthetics). ● Follow local alcohol laws. The legal drinking age is 21. It's illegal to drink alcohol in public places. ● It's illegal to disturb or take historical items, including from sunken vessels. ● Counterfeit and pirated goods are widely available. Buying, selling or having these is illegal. Don't buy or accept pirated or counterfeit goods. ● Palau has conservative dress and behaviour standards. Take care not to offend. ● Same-sex relationships are legal, but cultural attitudes can be conservative. Avoid public displays of affection.
Health Risks	● Insect-borne diseases include dengue. Ensure your accommodation is insect-proof. Use insect repellent. ● Palau has had recent cases of Zika virus. If you're pregnant, discuss your travel plans with your doctor. ● Hospital and medical facilities are limited. If you're seriously ill or injured, you'll need medical evacuation, probably to Guam. Ensure your travel insurance covers this.
Weather	● Palau experiences tropical storms. These can disrupt services. Know your hotel or cruise ship's evacuation plan. Find your nearest shelter. ● Palau is at risk of tsunamis. Know the warning signs and move immediately to higher ground. Don't wait for official alerts.
Other	● If you're visiting for up to 30 days, get a visitor visa on arrival. Ensure you have a return or onward ticket. ● If you're travelling with a child, carry evidence of your relationship. You may also need additional documents. ● If you're arriving via sea, you'll need an entry permit. Contact Palau Port Control before you arrive. ● There is unexploded ordnance in Palau left from World War II, especially Peleliu and Angaur. Be careful when diving or exploring caves. ● Palau has saltwater crocodiles. Often there are no warning signs. Ask locals about safe places to swim. ● Use licensed taxis and hire-car services. Local taxis have fixed fares between locations. Ask for the fare list.

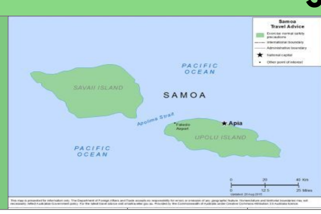
Papua New Guinea

Threat Level Moderate threat level to personal safety, take extra precautions here.	**Threat Level** Porgera Township, Tari in Hela Province, reconsider your need to travel.	**Latitude / Longitude** -6.314993, 143.95555 **GPS Position** 6° 18' 53.9748" S 143° 57' 19.98" E

Crime	● Voting in the Bougainville referendum will take place from 23 November to 7 December, with a 2 week period for counting to follow. Avoid political gatherings before, during and after the referendum. ● Risk of violent crime and sexual assault in PNG is high. Criminals often use 'bush knives' (machetes) and guns. Always be alert to your surroundings. ● Avoid going out after dark. ● Civil disorder and criminal activity has occurred at tourist resorts. Keep doors and windows locked, including when travelling by vehicle. Consider using private security. ● Civil unrest and violent tribal clashes can occur. Avoid protests and demonstrations. Check security conditions and tensions before travelling to new areas.
Laws	● PNG has the death penalty for serious crimes, including treason, piracy, murder, rape and robbery. ● Adultery and possessing or selling pornography or sex items are illegal. Same-sex relationships are illegal. Prison sentences may apply. ● PNG only recognises dual nationality in some situations. Our ability to help dual citizens may be limited. ● In PNG, the local custom of 'payback' includes violence or demands for money. ● Dress and behaviour standards are conservative. Take care not to offend. Ask permission before taking photos of people, cultural sites and spirit houses.
Health Risks	● Insect-borne diseases include malaria, Zika virus, dengue, chikungunya and Japanese encephalitis. Use insect repellent. Ensure your accommodation is insect-proof. If you're pregnant, ask your doctor about the risk of Zika virus before you travel. ● Poliovirus outbreaks have occurred. Make sure you're vaccinated against polio. ● Tuberculosis is common. Children under 5 years and people with with weakened immune systems are most at risk. If you think you have tuberculosis, get urgent medical treatment. ● HIV/AIDS and other sexually transmitted diseases are widespread. Take precautions to reduce your risk of infection. ● Dysentery, typhoid, hepatitis and waterborne parasites are also common. Boil drinking water or drink bottled water. Avoid bathing in freshwater sources. ● Medical facilities are poor.
Weather	● PNG can experience severe weather, heavy rains, flooding, landslides, earthquakes and tsunamis. Monitor the Global Disaster Alert and Coordination System for updates. Infrastructure can be damaged and roads can't be passed. Follow the advice of local authorities. ● Active volcanoes erupt regularly in PNG. Flights may be cancelled at short notice due to ash clouds. Check the Volcanic Ash Advisory Centre for updates.
Other	● You need a visa to enter PNG. You can get a tourist visa on arrival or can apply for tourist visas through the PNG eVisa portal. Contact embassy or consulate of Papua New Guinea for the latest visa and entry requirements. ● Permits are needed to trek the Kokoda track. Make sure you have a permit before you start trekking. Prepare for the demanding trek with extensive training. Get medical advice and fitness testing before you leave your country. ● Risks while trekking include dysentery, dehydration, serious crime, civil disorder and unexploded remnants of war. Use guides from reputable companies. Stay with your group. If you find a war remnant, don't touch it. ● Poor road maintenance and crime make road travel dangerous. Keep windows up and doors locked. Consider using a security escort. Avoid driving at night. Avoid travel by motorcycle, taxis and public transport. ● Travel by boat can be dangerous. Marine search and rescue services are limited in PNG. Consider alternative options.

Samoa

Threat Level Exercise normal safety precautions.	**Latitude / Longitude** -13.631734, -172.432159 **GPS Position** 13° 37' 54.2424" S 172° 25' 55.7724" W



Crime	● Crimes against travellers include robbery, assault, theft and break-ins. Avoid going out alone at night, especially in downtown Apia and harbour-front areas. ● Stray dogs are common. They can be vicious. Don't approach or touch dogs. ● Demonstrations sometimes happen. Protests can turn violent. Avoid large public gatherings.
Laws	● Don't use or carry illegal drugs, including marijuana. Penalties include prison sentences. It's also illegal to have equipment for making or using drugs. ● The legal drinking age is 21. Don't drink alcohol if you're under 21, even if you can legally drink in Australia where the legal drinking age is 18. ● Same-sex relationships are not recognised in Samoa and consensual sex between men is illegal. Samoan society is conservative. Avoid public displays of affection. ● Samoa has conservative dress and behaviour standards. Take care not to offend.
Health Risks	● There is a measles epidemic in Samoa. In response, the Government of Samoa declared a state of emergency, which is in effect until the end of December 2019. Make sure your vaccinations are up-to-date before you go. ● Hospital and medical facilities are limited in Samoa. The measles epidemic is placing an unprecedented burden on the Samoan health system. The hospital's focus is on treating measles cases. For medical emergencies patients may need to be medivaced to Australia or New Zealand. Make sure your travel insurance policy covers medical evacuations. ● Insect-borne diseases include dengue and chikungunya. Ensure your accommodation is insect-proof. Use insect repellent. ● Samoa has had outbreaks of Zika virus. If you're pregnant, discuss your travel plans with your doctor. ● Foodborne, waterborne and other infectious diseases include typhoid, hepatitis, filariasis and tuberculosis. Drink boiled or bottled water. Avoid raw or undercooked food.

Samoa	
Weather	• Cyclone season is November to April, but storms occur year-round. They can cause flooding and disrupt services. Know your hotel or cruise ship's evacuation plan. Find out where your local shelter is. • Earthquakes and aftershocks happen often. Ask your host or hotel about what to do if there's an earthquake. Samoa can experience tsunamis. Know the warning signs and move immediately to high ground. Don't wait for official alerts. • Samoa has strong tides and powerful currents. Ask locals about safe swimming areas.
Other	• If you're staying up to 90 days, you don't need a tourist visa. Ensure you have a return or onward ticket. Check that your passport will be valid for at least 6 months after you leave Samoa. • You can use credit cards at most resorts and large shops. Very few small retail businesses accept credit cards. Have multiple ways to access money. • If you want to drive in Samoa, buy a temporary Samoan licence. • Inter-island ferries may be old, overcrowded and unsafe. Check the operator's safety history and equipment before you book.

Solomon Islands

Threat Level
Exercise normal safety precautions.

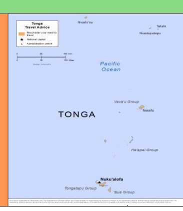
Latitude / Longitude
-9.645710, 160.156194

GPS Position
9° 38' 44.556'' S
160° 9' 22.2984'' E

Solomon Islands	
Crime	• Crimes that may affect you include petty crime, break-ins, robbery and sexual assault. Keep your accommodation locked. Lock your vehicle doors and windows, even while moving. • Political unrest can happen. It can happen during elections, sittings of Parliament, and times of political uncertainty. Demonstrations can turn violent. Avoid protests and political gatherings. • Be aware of local wildlife. Street dogs in Honiara can be vicious. Sharks and crocodiles are common. Get local advice before entering the water.
Laws	• It's illegal to import or possess pornographic material. • Dual nationality isn't recognised. We may only be able to offer limited consular assistance to dual nationals. • Solomon Islands society is conservative. Avoid swearing and being affectionate in public. Dress appropriately. • Solomon Islands law does not recognise same sex relationships. It is a criminal offence to engage in same-sex sexual activity and penalties include jail sentences.
Health Risks	• Measures are in place to ensure the measles outbreak in other Pacific countries does not spread to Solomon Islands. See Travel. • Malaria and dengue fever are widespread. Ensure your accommodation is insect-proof. Use insect repellent. • Fatal outbreaks of rotavirus have occurred. Children are most at risk but can be vaccinated. Wash your hands thoroughly with soap and water after going to the toilet and before preparing or eating food. • Zika virus is also present. If you're pregnant, discuss the risk of Zika virus with your doctor.
Weather	• Natural disasters, such as tropical cyclones, earthquakes and tsunamis, occur. Listen to Solomon Islands Broadcasting Corporation on radio station AM1035 for official updates.
Other	• From 28 December 2019, to enter Solomon Islands you will need to show proof of vaccination against measles. Failure to do so may result in deportation or being unable to board your inbound flight. Bring your official vaccination record with you. You must be vaccinated at least 15 days prior to arrival. • Solomon Islands like many other countries won't let you enter unless your passport is valid for 6 months after you plan to leave. • You can apply to get a visitor visa when you arrive if you're staying less than 90 days from Solomon Islands Immigration. • Only the major hotelsin Honiara accept international credit cards. Credit cards aren't usually accepted elsewhere. Have multiple ways to access money. • Some parts of the country still have unexploded weapons from World War II. Seek local advice and take care when hiking, boating or diving in these areas.

Tonga

Threat Level
High threat level to personal safety, take a range of extra precautions here.



Latitude / Longitude
-21.178986, -175.198242

GPS Position
21° 10' 44.3496'' S
175° 11' 53.6712'' W

Tonga	
Crime	• Crime in Tonga includes robbery, assault, theft and break-ins. Thieves often target mobile phones, tablets and other portable electronics. Keep doors, windows and gates locked. Don't go out alone at night. • Civil unrest is rare, but protests could turn violent. Avoid large public gatherings.
Laws	• Sabbath laws strictly limit Sunday activities. Unless you're at a resort, activities such as playing sport, dancing, listening to loud music, and fishing are illegal on Sundays. • The blood alcohol limit for driving in Tonga is 0.015%. Don't drink and drive. • Sodomy is a criminal offence, punishable with a prison term. • Tonga is a conservative country. Dress modestly to avoid unwanted attention.
Health Risks	• There's an outbreak of measles in Tonga. Make sure your vaccinations are up to date before you go. • Insect-borne diseases include dengue and chikungunya. Ensure your accommodation is insect-proof. Use insect repellent. • Tonga has had outbreaks of Zika virus. If you're pregnant, discuss your travel plans with your doctor. • Foodborne, waterborne and other infectious diseases include tuberculosis, typhoid and filariasis. Drink boiled or bottled water. Avoid raw or undercooked food. • Eating reef fish and shellfish can lead to poisoning from naturally occurring toxins. Get urgent medical help if you suspect poisoning. • Hospital and medical facilities are limited. You may need medical evacuation to Australia or New Zealand for even minor issues. Ensure your travel insurance covers this.
Weather	• Tongan beaches can have strong rips that make swimming dangerous. Ask locals about safe swimming areas. • The cyclone season is November to April, but storms can happen year-round. They can cause flooding and disrupt services. Know your hotel or cruise ship's evacuation plan. Find your nearest shelter. • Tonga experiences earthquakes. Ask your host or hotel about what to do if there's an earthquake. Tsunamis can happen soon after an earthquake. Know the warning signs and move to high ground straight away. Don't wait for official alerts.
Other	• If you're a tourist staying up to 31 days, you can get a visa on arrival. Ensure you have a return or onward ticket. If you're travelling for other reasons, contact the High Commission of Tonga for visa requirements. • The local currency is the Tongan Pa'anga. Exchange dollars at local banks. • You can access ATMs on the main island of Tongatapu. Be careful not to expose your PIN when using ATMs, as card fraud occurs. • Local boats may be old, overcrowded and unsafe. Check the operator's safety history and equipment before you book. • Tonga doesn't recognise driver's licences or International Driving Permits. Get a temporary Tongan driver's licence if you want to hire a car or motor scooter.

Tuvalu

	Threat Level N/A	**Latitude / Longitude** -8.504121, 179.122840 **GPS Position** 8° 30' 14.8356'' S 179° 7' 22.224'' E
Crime		
Laws	N/A	
Health Risks	N/A	
Weather	● Cyclone season is between November to April when flooding, landslides and disruptions to services can occur. However, tropical storms and cyclones may occur in other months.	
Other		

Vanuatu

	Threat Level Exercise normal safety precautions.		**Latitude / Longitude** -15.376706, 166.959158 **GPS Position** 15° 22' 36.1416'' S 166° 57' 32.9688'' E
Crime	● Crime in Vanuatu is low. But it does increase in the lead-up to holidays such as Christmas and Independence Day (30 July). The risk is also higher at night or in isolated locations. Don't go out alone after dark or to isolated locations, especially on foot.		
Laws	● Don't use or carry illegal drugs. If you're convicted of a drug offence, you could face fines or jail time. ● Know the local laws. There are strict rules regarding obscene material. Penalties include prison sentences. ● Be aware of laws around alcohol. It's illegal for supermarkets to sell alcohol between midday Saturday and 7am Monday. You can still buy alcohol in hotels, bars and clubs during this time. ● Vanuatu recognises dual nationality. ● Vanuatu's standards of dress and behaviour are conservative. Take care not to offend. ● Same-sex relationships are legal. However, local attitudes are conservative. Avoid public displays of affection.		
Health Risks	● Malaria occurs in some areas, especially in the north. Consider taking anti-malaria medication if you are travelling to affected areas. ● Other insect-borne diseases include dengue and filariasis. Ensure your accommodation is insect-proof. Use insect repellent. ● Vanuatu has had cases of Zika virus, rubella, mumps, measles and chickenpox. Check your vaccinations are up to date before you travel. ● Waterborne, foodborne and other infectious diseases include hepatitis, tuberculosis and sexually transmitted infections. Avoid raw or undercooked food. Tap water in Port Vila and Luganville is generally safe to drink. Outside these areas, drink boiled or bottled water. ● Reef fish contain the natural toxin ciguatera. Get urgent medical help if you suspect poisoning. ● Medical facilities are limited. If you're ill or injured, you may need medical evacuation to Australia or New Zealand. Check your travel insurance covers this.		
Weather	● The cyclone season is November to May. But cyclones can happen at any time. Flooding and landslides can damage infrastructure and disrupt services. Know your accommodation's evacuation plan and where your local shelter is. ● Earthquakes occur regularly. Tsunamis happen but are infrequent. Port Vila has a tsunami warning system. If there's a long and strong tremor or you hear the warning sirens, move to higher ground. ● Vanuatu has several active volcanoes, including under-sea volcanoes. Contact the Vanuatu Meteorological and Geo-Hazards Department or the Vanuatu Tourism Office for advice before travelling to volcanic areas.		
Other	● If you're going to Vanuatu as a tourist, you can apply for a visitor visa on arrival. You must be visiting for 30 days or less and have an onward or return ticket. If you're staying longer or travelling for work or other reasons, get a visa before you travel. ● Be aware of what you can and can't bring into the country. Customs officials strictly enforce rules regarding food, weapons and obscene material. ● The local currency is the Vanuatu Vatu. Small shops and market stalls will only accept vatu. Some larger hotels, restaurants and shops in Port Vila also accept U.S. and Australian dollars. ● Not all beaches are public. Ask local landowners before going to non-public areas, including beaches. Some may charge an access fee. ● There's no formal public transport system. In Port Vila, Luganville and some other areas, there's a network of private trucks, small buses and vans. But these may be poorly maintained. ● Be very careful if travelling by boat or ferry. Many vessels don't have a current seaworthy certificate. Don't trust their safety.		

Wallis and Futuna

	Threat Level N/A	**Latitude / Longitude** -14.293800, -178.1165 **GPS Position** 14° 17' 37.68'' S 178° 6' 59.4'' W
Crime		
Laws	N/A	
Health Risks	● Dengue Fever	
Weather	● Tsunami Possibility. ● Cyclone season is between November to April when flooding, landslides and disruptions to services can occur. However, tropical storms and cyclones may occur in other months.

Locations

Details the survival uses of modern buildings & vehicles

"Arrival at a new destination only occurs from leaving from current location."
Chris Hogan

Introduction

During disasters there will be chaos in the streets, destroyed and unstable buildings and it would likely be suicide to leave your house. Eventually your supplies will dwindle and if you plan on staying in the cities there are a lot of opportunities for scavenging what you need to survive. The following section contains a list of today's most common facilities and locations, and the potential loot they may contain. It also includes notable facts and information that may prove useful, such as how useful a shelter it would be. Know the difference between looting and scavenging.

Looting is the theft of someone else's property for personal gain, which they still own and are likely to return for later. Scavenging is the acquisition of discarded or abandoned items which you can utilize to survive. This guide does NOT condone looting in any form.

The section below provides a quick description of the terms used in the main content.

Usefulness The usefulness of this location in a post-disaster world.	1/5	2/5	3/5	4/5	5/5
Risk The risk this location will pose in a post-disaster world.	Very Low	Low	Moderate	High	Very High

Purpose	The aim of LOCATIONS is to inform the reader on the assets and equipment that can be found in the most common locations around the world, for the purposes of scavenging. It includes a component to help you to decide whether or not a location will be worth converting into a base of operations after the collapse.
Lost?	• For a complete list of the countries of the world, see GEOGRAPHY. • For information on utilizing different types of transport, see the TRANSPORT section. • For information on the different types of terrain, see the SURVIVAL section. • For information on setting up a town or base of operations, see LEADERSHIP. • For a list of locations to avoid, see the WARFARE > War Targets section. • For the navigation of modern cities without being seen, see the SECURITY section. • For a list of useful items to keep an eye out while scavenging, see the MATERIALS section.

Contents

1 Commercial Buildings

These buildings are used daily by the public and are often easily accessible.

Agricultural Buildings

Agricultural buildings will generally have stores of various foods on hand but will be quickly looted as people become hungry.

Barn

Usefulness
2/5
Loot: 2/5
Shelter: 2/5
Risk: 1/5

A barn is an agricultural building usually on farms and used for various purposes. In the North American area, a barn refers to structures that house livestock, including cattle and horses, as well as equipment and fodder, and often grain.

Recommendation	Loot Description	Resources	Shelter	Risk - Low
Not really worth looting except for animals if you're desperate for food. Not worth using as a shelter either.	Generally the best loot would be livestock which can be eaten.	• Hay • Farming Tools • Livestock	Not a very strong shelter as they are typically made from wood and wouldn't withstand any severe wind.	Few people would consider looting a barn.

Farm

Usefulness
4/5
Loot: 4/5
Shelter: 3/5
Risk: 3/5

A farm is an area of land that is devoted primarily to agricultural processes with the primary objective of producing food and other crops; it is the basic facility in food production.

Recommendation	Loot Description	Resources	Shelter	Risk - Moderate
Worth using as a base if there's nobody living there and the soil is fertile.	The most likely loot is grown food.	• Produce • Livestock • Farming Equipment • Hay	Generally farms have a house or two attached.	Quite a lot of people will head to farms, particularly if food is scarce. Farmers are likely to defend their fields by force to feed their own family.

Granary

Usefulness
2/5
Loot: 2/5
Shelter: 2/5
Risk: 1/5

A granary is a storehouse or room in a barn for threshed grain or animal feed.

Recommendation	Loot Description	Resources	Shelter	Risk - Low
Worth a quick look to see what the silos store but not useful as a shelter.	If it stores edible grain it would be worth looting, as the amount of food would be nearly endless.	• Grains • Wheats • Food Products	The silos can't be used as a shelter but there should be nearby administration buildings which could be useful as a shelter.	Few people would look at looting a granary, if at all.

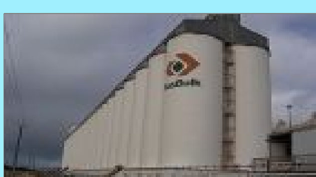
Greenhouse

Usefulness
3/5
Loot: 2/5
Shelter: 1/5
Risk: 1/5

A greenhouse is a structure with walls and roof made chiefly of transparent material, such as glass, in which plants requiring regulated climatic conditions are grown.

Recommendation	Loot Description	Resources	Shelter	Risk - Low
Could be worth using if there's a stronger building nearby to use as a base and if you keep the crops watered.	Potentially food if the crops are near harvesting time.	• Produce • Plants • Farming Tools	A weak shelter which may blow away during a hurricane.	Greenhouses are likely to be targets if food is scarce.

Silo



Usefulness
2/5
Loot: 2/5
Shelter: 2/5
Risk: 1/5

A silo is a structure for storing bulk materials. Silos are used in agriculture to store grain or fermented feed known as silage.

Recommendation	Loot Description	Resources	Shelter	Risk - Low
Worth a quick look to see what the silos store but not useful as a shelter.	If it stores edible grain it would be worth looting, as the amount of food would be nearly endless.	• Grain • Coal • Cement • Woodchips • Food Products • Sawdust	The silos can't be used as a shelter but there should be nearby administration buildings which could be useful as a shelter.	Very few people would seek to loot a silo, but depending on what is stored it could be quite valuable particularly if it's a type of edible grain.

Stable

Usefulness
1/5
Loot: 1/5
Shelter: 2/5
Risk: 1/5

A stable is a building in which livestock, especially horses, are kept. It most commonly means a building that is divided into separate stalls for individual animals.

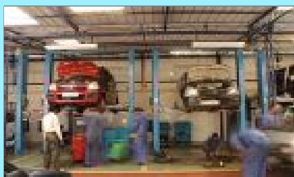
Recommendation	Loot Description	Resources	Shelter	Risk - Low
Not worth looting or using as a shelter.	Little in the way of loot but it may contain some animal medicines which could be useful.	• Horses • Animal Tools • Hay • Animal Medicines	Not a very 'homely' shelter but can be used as one if required.	Few people would look to loot a stable.

Commercial Buildings

Usually the first buildings people think about looting as they contain food, water and sometimes medical supplies.

Types
- Service Centre
- Arcade
- Gas Station
- Hotel
- Market
- Skyscraper
- Shopping Mall
- Supermarket
- Warehouse
- Restaurant
- Offices
- Cinema
- Casino
- Bank

Service Centre



Usefulness
1/5
Loot: 1/5
Shelter: 2/5
Risk: 1/5

An automobile repair shop (also known regionally as a garage or a workshop) is an establishment where automobiles are repaired by auto mechanics and technicians.

Recommendation	Loot Description	Resources	Shelter	Risk - Low
Not worth looting unless you need car parts or tools and not a very strong building.	Only car componentry, car cleaners and tools. There may be a vending machine on site.	• Tools • Car Parts • Tyres • Fuel • Car Oil	Generally a weak tin building which may get hot in summer.	Service centres will likely be abandoned as few items inside will help with a survival situation. However the items inside are generally fairly valuable.

Arcade

Usefulness
2/5
Loot: 1/5
Shelter: 3/5
Risk: 1/5

An amusement arcade is a venue where people play arcade games such as video games, pinball machines, electro-mechanical games, redemption games, merchandisers (such as claw cranes), or coin-operated billiards or air hockey tables.

Recommendation	Loot Description	Resources	Shelter	Risk - Low
Worth considering as a base but not worth looting beyond a few toys and candy.	Generally the only loot is a bit of money, electronics, childrens toys and some candy.	• Currency • Toys • Candy • Vending Machines	A decent shelter location which should keep your mind occupied even if there's no power. The machines can be moved to reinforce the entry.	A low risk due to the few items which can be looted.

Gas Station

Usefulness
2/5
Loot: 2/5
Shelter: 2/5
Risk: 3/5

A filling station is a facility that sells fuel and engine lubricants for motor vehicles. The most common fuels sold in the 2010s are gasoline and diesel fuel.

Recommendation	Loot Description	Resources	Shelter	Risk - Low
Not recommended for shelter but may be worth a look for some food items left behind.	Long life food is the most common item. Fuel can also be obtained directly from the underground canisters.	• Fuel • Vending Machines • Food • Water • Drinks	They have little shelter besides a small shop and the 'fuel roof' is likely to blow off in a hurricane.	There's a low risk of looting this facility once the initial looting is over. It becomes a 'moderate' risk in a disaster which makes fuel limited.

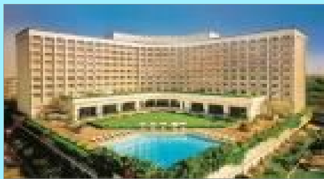
Motel

Usefulness
2/5
Loot: 2/5
Shelter: 2/5
Risk: 2/5

A motel is a hotel designed for motorists and usually has a parking area for motor vehicles.

Recommendation	Loot Description	Resources	Shelter	Risk - Moderate
Not worth looting but could be used as a shelter if no other is available.	General hospitality loot such as toothbrush, soaps, towels etc.	• General Appliances • Sheets • Vending Machines	Basic shelter from the elements.	Likely to be occupied and the loot would be common items at best.

Hotel



Usefulness
4/5
Loot: 3/5
Shelter: 3/5
Risk: 3/5

A hotel is an establishment that provides paid lodging on a short-term basis. Facilities provided include a bed, dresser, refrigerator and other kitchen facilities, upholstered chairs, a flat screen television, and en-suite bathrooms.

Recommendation	Loot Description	Resources	Shelter	Risk - Moderate
It could make a great place to live but the loot is unremarkable.	Mostly hospitality loot such as towels, soaps and vending machines. If there's a pool it can be used as water to purify.	• Food • Water • Vending Machines	Provides decent shelter depending on its construction. They often have great views and facilities such as a pool.	Very likely to be occupied due to the added facilities.

Market

Usefulness
1/5
Loot: 1/5
Shelter: 1/5
Risk: 1/5

A market, or marketplace, is a location where people regularly gather for the purchase and sale of provisions, livestock, and other goods.

Recommendation	Loot Description	Resources	Shelter	Risk - Low
Only worth looting early into a disaster, but the wood from the market stalls could be used for shelter building or repairs.	A wide selection of fruit, nuts and other long life foods are commonly available. You may also find the odd knick-knack or kids toy. Most food is home made and long life	• Food • Drinks • Firewood	Markets provide little shelter so seek alternative shelter against disasters.	Few people if any would likely hang around the market, particularly if it's already been looted.

Skyscraper

Usefulness
2/5
Loot: 1/5
Shelter: 2/5
Risk: 3/5

A skyscraper is a continuously habitable high-rise building that has over 40 floors and is taller than approximately 150m (492 ft). Historically, the term first referred to buildings with 10 to 20 floors in the 1880s. They often come in two different types, either business use or accommodation. These buildings are very tight and confining making chance of interation with other people very high, particularly with the elevators broken.

Recommendation	Loot Description	Resources	Shelter	Risk - Moderate
The unit skyscrapers would likely have better loot but the business ones would be safer to live in.	General business and stationary based loot.	• Limted Food • Water • Vending Machines	Skyscrapers provide good shelter from many disasters, but be careful when there's hurricanes, wars, terrorism or earthquakes around.	For business use, the building should be abandoned, but watch out for skyscraper units which may be highly occupied.

Shopping Mall

Usefulness
4/5
Loot: 5/5
Shelter: 3/5
Risk: 4/5

A shopping mall is a modern, chiefly North American, term for a form of shopping precinct or shopping centre, in which one or more buildings form a complex of shops representing merchandisers with interconnecting walkways that enable customers to walk from unit to unit.

Recommendation	Loot Description	Resources	Shelter	Risk - High
Not recommended for looting as everyone will likely head here.	Everything imaginable if you get there early.	• Food • Water • Drinks • Camping Gear • Electronics • Money • Everything Else	A risky place to make a shelter as some gangs may call them home. There may also be little light depending on the size of the mall.	A lot of people will head to malls due to the vast amounts of resources available. Even once it's been thoroughly looted it will still make a fairly strong base of operations.

Supermarket

Usefulness
4/5
Loot: 5/5
Shelter: 3/5
Risk: 4/5

A supermarket is a self-service shop offering a wide variety of food, beverages and household products, organized into sections and shelves.

Recommendation	Loot Description	Resources	Shelter	Risk - High
Generally supermarkets will be picked bare during a disaster, but you could find uses for nearly every item there.	Almost every kind of food you could ever need.	• Food • Water • Drinks	Provides a decent amount of shelter but will likely be very dark without natural light.	A dangerous location as everyone will want to stock up on food during disasters. Violence will occur frequently.

Warehouse

Usefulness
4/5
Loot: 4/5
Shelter: 4/5
Risk: 2/5

A warehouse is a building for storing goods. Warehouses are used by manufacturers, importers, exporters, wholesalers, transport businesses, customs, etc.

Recommendation	Loot Description	Resources	Shelter	Risk - Moderate
Have a look to see what it contains and whether it could be suitable for a base of operations.	Depending on what the warehouse stores could mean the difference between valuable items such as camping gear and junk like toys.	• Unknown (Whatever the warehouse stores) • Boxes • Firewood (Pallets)	A warehouse could make a great shelter due to the space inside. It allows storage of a huge amount of supplies. The echos in the room would also make it easy to hear tresspassers.	Warehouses are likely to be looted quickly if they contain valuable items.

Restaurant

Usefulness
3/5
Loot: 2/5
Shelter: 3/5
Risk: 2/5

A restaurant, or an eatery, is a business which prepares and serves food and drinks to customers in exchange for currency.

Recommendation	Loot Description	Resources	Shelter	Risk - Low
Could be useful as a base of operations, but little in the way of loot.	Loot would come down to small remnants of food and general kitchen items.	• Some Food • Drinks • Cutlery	They are generally built well and the tables and chairs can be used as firewood or blocking up doors and windows.	There is little to loot in restaurants and all the food would have likely gone off making it a low target for others to loot.

Office

Usefulness
3/5
Loot: 2/5
Shelter: 3/5
Risk: 2/5

An office is generally a room or other area where an organization's employees perform administrative work in order to support and realize objects and goals of the organization.

Recommendation	Loot Description	Resources	Shelter	Risk - Low
Generally not worth heading to unless you want lots of furniture or wood to burn.	Little in the way of loot but there may be some food in people's desks or vending machines.	• Vending Machines • Tinder (Paper) • Stationary • Computers	Provides a basic level of shelter and contains useful facilities such as break rooms and toilets.	Little risk due to the lack of lootable gear. It's not the most ideal place for a shelter either.

Cinema

Usefulness
3/5
Loot: 1/5
Shelter: 4/5
Risk: 1/5

A movie theatre, cinema, or cinema hall, also known as a picture house or the pictures, is a building that contains an auditorium for viewing films for entertainment.

Recommendation	Loot Description	Resources	Shelter	Risk - Low
Could make a great base, particularly due to people having to enter on the ground floor which gives you a tactical advantage.	Virtually no loot except maybe for snacks and lollies.	• Snack Foods • Vending Machines • Films	Great shelter and sound dampening as well as comfy chairs. However there will be no natural light reaching these rooms.	People should have all but forgotten cinemas in a disaster which makes them a great place for a base. Cinema/mall combinations are a little more risky however.

Casino

Usefulness
3/5
Loot: 2/5
Shelter: 4/5
Risk: 3/5

A casino is a facility which houses and accommodates certain types of gambling activities.

Recommendation	Loot Description	Resources	Shelter	Risk - Moderate
After the money has been looted it would make a great hideout due to the building strength.	A lot of money would be lootable if you can break open the machines. Vending machines may also be present.	• Food • Drinks • Money	This would make a fun base or hideout if you're into the atmosphere. Casinos are also generally built very strong and could withstand most disasters.	Quite likely to be looted early into a disaster but once the money has been taken then it would make a good base of operations due to the building strength.

Bank

Usefulness
4/5
Loot: 3/5
Shelter: 5/5
Risk: 4/5

A bank is a financial institution that accepts deposits from the public and creates credit.

Recommendation	Loot Description	Resources	Shelter	Risk - High
A perfect hideout if you can secure the whole building.	Lots of currency and possibly some gold, silver and jewels.	• Currency • Precious Metals • Jewellery	Generally a very strong structure able to withstand direct blasts and strong winds. The vault is the safest place during a hurricane.	The currency and other precious items are likely to be looted early on in any disaster and will be a hotspot for criminals.

Residential Buildings

Most people will bug-in inside their homes at first so these are off limits. Over time people will leave opening the ability to loot them.

Types
- Apartment Block
- Duplex
- House
- Townhouse
- Units

Apartment Block

Usefulness
3/5
Loot: 3/5
Shelter: 3/5
Risk: 3/5

A high-rise building is a tall building, as opposed to a low-rise building and is defined by its height differently in various jurisdictions. It is used as a residential, office building, or other functions including hotel, retail, or with multiple purposes combined.

Recommendation	Loot Description	Resources	Shelter	Risk - Moderate
Avoid apartments as the occupants will likely be on guard and will defend their property.	Regular household items.	• Water • Food • Household Items	Decent for shelter, however avoid during earthquakes and cyclones.	The density of people nearby and the sheer amount of rooms would make this a risky base.

Duplex

Usefulness
3/5
Loot: 3/5
Shelter: 3/5
Risk: 3/5

A duplex house plan has two living units attached to each other, either next to each other via townhouses or above each other like apartments.

Recommendation	Loot Description	Resources	Shelter	Risk - Low
Like apartments, these could be guarded by the occupants, but would make a decent base if they are abandoned.	Regular household items.	• Water • Food • Household Items	Good for sheltering if they are made from stong materials.	If they are abandoned then this would be a great location for a base or shelter.

House

Usefulness
3/5
Loot: 3/5
Shelter: 3/5
Risk: 3/5

A house is a building that functions as a home. They can range from simple dwellings such as rudimentary huts of nomadic tribes and the improvised shacks in shantytowns to complex, fixed structures of wood, brick, concrete or other materials containing plumbing, ventilation, and electrical systems.

Recommendation	Loot Description	Resources	Shelter	Risk - Low
The most common form of shelter, everyone will likely stay in their houses early in a disaster. A stronger structure would be better.	Regular household items.	• Water • Food • Household Items	A decent shelter based on the material of the house. Wood/Bricks/Metal.	If it is abandoned, a large house would make a great location for a base or shelter.

Townhouse

Usefulness **3/5** Loot: 3/5 Shelter: 3/5 Risk: 3/5	A townhouse, townhome, or town house as used in North America, Asia, Australia, South Africa and parts of Europe, is a type of terraced housing.

Recommendation	Loot Description	Resources	Shelter	Risk - Moderate
These are often protected on both sides and would make a decent base if it is abandoned.	Regular household items.	● Water ● Food ● Household Items	Good for sheltering if they are made from stong materials.	The density of people nearby and the sheer amount of rooms would make this a risky base.

Unit

Usefulness **3/5** Loot: 3/5 Shelter: 3/5 Risk: 3/5	A housing unit, or dwelling unit. is a structure or the part of a structure or the space that is used as a home, residence, or sleeping place by one person or more people who maintain a common household.

Recommendation	Loot Description	Resources	Shelter	Risk - Moderate
Units are generally too small to make effective bases, but can offer shelter temporarily.	Regular household items.	● Water ● Food ● Household Items	Good for sheltering if it is made from stong materials.	The density of people nearby and the sheer amount of rooms would make this a risky base.

Industrial Buildings

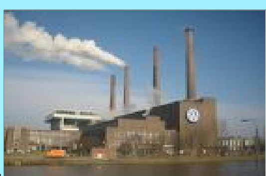
Description	Types
High in resources based on what the factory produces, these will typically be targeted first and looted quickly.	● Brewery ● Factory ● Winery ● Mill ● Refinery

Brewery

Usefulness **2/5** Loot: 1/5 Shelter: 3/5 Risk: 1/5	A brewery or brewing company is a business that makes and sells beer. The place at which beer is commercially made is either called a brewery or a beerhouse, where distinct sets of brewing equipment are called plant.

Recommendation	Loot Description	Resources	Shelter	Risk - Low
It is a strong building to make a base from, but could be hazardous.	It could contain various alcoholic and non-alcoholic drinks and vending machines.	● Drinks ● Vending Machines	A decently strong shelter location but could be a maze inside.	Not a lot of people would think to loot a brewery, but factories can also be quite dangerous.

Factory



Usefulness **3/5** Loot: 2/5 Shelter: 3/5 Risk: 1/5	A factory or manufacturing plant is an industrial site, usually consisting of buildings and machinery, or more commonly a complex having several buildings, where workers manufacture goods or operate machines processing one product into another.

Recommendation	Loot Description	Resources	Shelter	Risk - Low
Would make a strong facility to live in, but could be dangerous depending on what item is made.	It really depends on what that type of facility builds.	● Unknown (Depends on the type of factory) ● Vending Machines	Generally factories are built quite strong to withstand winds and other disasters. It may be quite a maze inside.	Not a lot of people would loot a factory, unless it makes an item that people need to survive. Factories can also be quite dangerous.

Winery

Usefulness **4/5** Loot: 3/5 Shelter: 4/5 Risk: 2/5	A winery is a building or property that produces wine, or a business involved in the production of wine, such as a wine company.

Recommendation	Loot Description	Resources	Shelter	Risk - Low
Worth using as a base to shelter in and for looting due to the wine.	Mostly wine and barrels but the occasional food item as well.	● Wines ● Firewood (Barrels) ● Glass Bottles ● Cork	Generally wineries have a basement to keep the wines cooler, these would be perfect to shelter in during a disaster.	Wines are quite sought after during disasters which could make this location dangerous.

Mill

Usefulness 2/5 Loot: 1/5 Shelter: 3/5 Risk: 1/5	A gristmill (also: grist mill, corn mill, flour mill, feed mill or feedmill) grinds cereal grain into flour and middlings.

Recommendation	Loot Description	Resources	Shelter	Risk - Low
Worth a look around for loot but unlikely to have much of use. Useful as a base.	Little in the way of loot except for flour and some tools.	• Grains • Flour	Generally slightly stronger than regular buildings making it useful for shelter.	Few, if any people will want to loot factories including mills.

Refinery

Usefulness 2/5 Loot: 1/5 Shelter: 4/5 Risk: 1/5	A refinery is a production facility composed of a group of chemical engineering unit processes and unit operations refining certain materials or converting raw material into products of value.

Recommendation	Loot Description	Resources	Shelter	Risk - Low
It would make a decent base of operations but you would need to bring your own food in. Little grass for crops.	Little loot if any beyond vending machines.	• Raw Materials • Refined Materials	It would make a decent shelter due to its metal construction.	Few people would venture into a refinery after a collapse due to the lack of useful resources and the maze-like construction.

2 Betterment Buildings

Buildings which are designed to improve people or make them healthy again.

Medical Buildings

These are the most desired resources and will be hit first if SHTF and the medical resources will be looted within a week.

Types
- Hospital
- Chemist
- Nursing Home
- Quarantine
- Asylum
- Doctor's Office
- Dentist

Hospital

Usefulness 4/5 Loot: 5/5 Shelter: 4/5 Risk: 4/5	A hospital is a health care institution providing patient treatment with specialized medical and nursing staff and medical equipment.

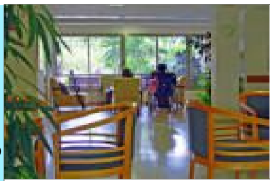
Recommendation	Loot Description	Loot	Shelter	Risk - Very High
Not recommended to go near due to the high risk of dying and the high chance it's already looted.	Stocked with medical gear which could save your life if needed. Lots of vending machines.	• First Aid Equipment • Trauma Equipment • Advanced Medical Eqp. • Vending Machines • Medical Books	Not a very useful location for a shelter as it will be hard to defend due to the many access points and everyone will try to loot what that can.	This is a high profile location and a lot of people will head there for treatment. There could be viruses in the air and it could be taken control of by gangs.

Chemist (Pharmacy)

Usefulness 4/5 Loot: 5/5 Shelter: 3/5 Risk: 4/5	Pharmacy is the science and technique of preparing, dispensing, and review of drugs and providing additional clinical services.

Recommendation	Loot Description	Resources	Shelter	Risk - High
Definitely worth looting if there's some left over medication. Not so useful as a shelter.	Heaps of different kinds of medication and some various forms of snacky food and powders.	• Drugs • Medication • Medical Equipment • Snack Foods	A general type of shelter, although it would be dark due to chemists rarely having windows.	A very high risk building due to the rarity and usefulness of medications. It will be one of the first buildings looted in a disaster.

Nursing Home



Usefulness
3/5
Loot: 4/5
Shelter: 3/5
Risk: 1/5

Nursing homes, also known as old people's homes, care homes, rest homes, and convalescent homes, provide residential care for elderly or disabled people that often includes around-the-clock nursing care.

Recommendation	Loot Description	Resources	Shelter	Risk - Low
Worth taking a look in for medication if it's abandoned. Not as useful for shelter.	Most of the worthwhile loot would be the left over medication.	● Food ● Water ● Medical Kits ● Medication	General standards of building construction but without the stairs typically.	Few people would consider the medication stored in nursing homes for the elderly but would instead go for chemists making this a low risk place.

Asylum

Usefulness
4/5
Loot: 3/5
Shelter: 4/5
Risk: 1/5

Psychiatric hospitals, also known as mental hospitals, mental health units, mental asylums or simply asylums, are hospitals or wards specializing in the treatment of serious mental disorders, such as major depressive disorder, schizophrenia and bipolar disorder.

Recommendation	Loot Description	Resources	Shelter	Risk - Low
Would make a great base of operations due to having a variety of different rooms including a makeshift 'soft prison cell'.	Most of the worthwhile loot would be the medication for the patients.	● Food ● Water ● Medical Kits ● Medication	It would make a perfect shelter with all the requires amenities, good vantage points and a large campus.	People would consider an asylum as a good place for resources, this makes it a low risk. Some wouldn't want to enter simply because of what may have happened inside.

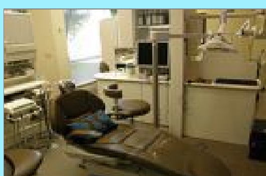
Doctor's Office

Usefulness
4/5
Loot: 4/5
Shelter: 4/5
Risk: 2/5

A doctor's office in American English, a doctor's surgery in British English, a doctor's room in Australian English or a doctor's practice, is a medical facility in which one or more medical doctors, usually general practitioners (GP), receive and treat patients.

Recommendation	Loot Description	Resources	Shelter	Risk - Moderate
Definitely worth taking a look around for any medical equipment left behind. Could also make a good base.	Great medical loot if it hasn't been taken already.	● Medical Equipment ● Trauma Equipment ● Medication ● Snack Foods	A typical modern building but with additional useful rooms such as the doctors office and treatment rooms.	Due to the amount of medical equipment in doctors offices this place will be hit hard and fast during disasters.

Dentist

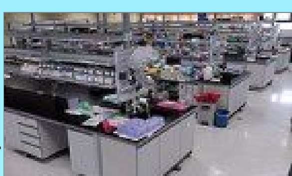


Usefulness
3/5
Loot: 3/5
Shelter: 3/5
Risk: 2/5

A dentist, also known as a dental surgeon, is a surgeon who specializes in dentistry, the diagnosis, prevention, and treatment of diseases and conditions of the oral cavity.

Recommendation	Loot Description	Resources	Shelter	Risk - Moderate
Worth a look around for useful medical items, particularly if you have tooth problems.	Doesn't have as much useful equipment as a doctors office, but still useful medical items.	● Dental Equipment ● Medical Equipment ● Snack Foods	A typical modern building with few changes.	Due to the amount of medical equipment this place will also be looted quite early on.

Laboratory



Usefulness
2/5
Loot: 2/5
Shelter: 3/5
Risk: 1/5

A laboratory is a facility that provides controlled conditions in which scientific or technological research, experiments, and measurement may be performed.

Recommendation	Loot Description	Resources	Shelter	Risk - Low
Not really worth looting unless you are in need of some uncommon chemicals or compounds.	Very little loot which most people would want. The chemicals may be of interest to some preppers.	● Various Chemicals ● Medical Kits ● Vending Machines	A typical modern building with few changes.	Few, if any people would loot a laboratory.

Educational Buildings

These will be largely deserted due to the lack of resources (and teachers) available and people often don't think of books in disasters.

Types
- Archives
- University
- Library
- Museum
- School

Archive

Usefulness
2/5
Loot: 1/5
Shelter: 4/5
Risk: 1/5

An archive is an accumulation of historical records or the physical place they are located.

Recommendation	Loot Description	Resources	Shelter	Risk - Low
Not worth looting but could be worth using as a base of operations if it has a basement.	Virtually nothing worth looting. The archives themselves could be used for burning.	• Tinder • Information	Due to the storage requirements of some information this building may have a basement where the archives are stored.	An extremely boring building which may be left untouched in a disaster.

Library

Usefulness
3/5
Loot: 2/5
Shelter: 3/5
Risk: 1/5

A library is a collection of sources of information and similar resources, made accessible to a defined community for reference or borrowing.

Recommendation	Loot Description	Resources	Shelter	Risk - Low
Could be worth looting if there's still books on survival or other topics you need.	Generally only books and perhaps a vendig machine or two. The books could be used for entertainment or burning.	• Information • Tinder • Vending Machines	A typical modern building with few changes.	Few people would loot a library early on in a disaster. Generally only the intelligent ones would come to a library for the information they need.

Museum

Usefulness
2/5
Loot: 2/5
Shelter: 3/5
Risk: 2/5

A museum is an institution that cares for (conserves) a collection of artefacts and other objects of artistic, cultural, historical, or scientific importance.

Recommendation	Loot Description	Resources	Shelter	Risk - Low
It's not worth visiting a museum unless it's a sturdy structure which would suit as a base.	Little worth looting.	• Information • Vending Machines	An often reinforced structure with large rooms makes this an ideal shelter.	A museum won't be useful in the way of loot, but the structure could be fairly strong if it's an older style built of stone.

School

Usefulness
2/5
Loot: 2/5
Shelter: 2/5
Risk: 3/5

A school is an educational institution designed to provide learning spaces and learning environments for the teaching of students under the direction of teachers. Most countries have systems of formal education, which is commonly compulsory.

Recommendation	Loot Description	Resources	Shelter	Risk - Moderate
Not worth looting or using as a shelter unless there's no others nearby.	The students of the school would know where the useful items are located and would be long gone by the time it's looted by others.	• Information • Vending Machines	Generally schools have slightly weaker buildings compared to others and wouldn't be useful in a disaster.	Students may have tendancies to return and destroy the school in a disaster. Some may be used as evac shelters.

University

Usefulness
3/5
Loot: 3/5
Shelter: 3/5
Risk: 3/5

A university is an institution of higher education and research which awards academic degrees in various academic disciplines.

Recommendation	Loot Description	Resources	Shelter	Risk - Moderate
Worth using as a base of operations but little in the way of loot.	Not a lot in the way of loot but there is likely to be a lot of books and various teaching utensils.	• Information • Vending Machines	Universities may have strong stone buildings which would be great against any natural disaster.	They generally have stronger and more creative buildings than schools, but are often hubs of activity and the inititiation point for protests.

Religious Buildings

People will often gather to religious buildings in hard times and combined with few resources it's advised to keep away.

Types
- Church
- Mosque
- Monastery
- Shrine
- Temple

Church

Usefulness
3/5
Loot: 1/5
Shelter: 3/5
Risk: 2/5

A church building or church house, often simply called a church, is a building used for Christian religious activities, particularly for Christian worship services.

Recommendation	Loot Description	Resources	Shelter	Risk - Low
Not worth looting but could serve as a shelter from disasters.	Little in the way of loot and not worth looting.	• Bibles • Pews / Chairs / Wood • Candles	Some churches are built with stone and are therefore stronger than modern buildings.	There's virtually nothing to loot in churches but people may come to them to seek God in times of hardship.

Mosque

Usefulness
3/5
Loot: 1/5
Shelter: 3/5
Risk: 3/5

A mosque is a place of worship for Muslims.

Recommendation	Loot Description	Resources	Shelter	Risk - Moderate
Avoid mosques due to little to loot and their potential to be used as a base by Muslims.	Little in the way of loot and not worth looting.	• Nothing	The structure could be fairly strong and may be used as a base.	There's little to loot in mosques and they are likely to be used as disaster hubs. May be guarded by radical Muslims.

Monastery

Usefulness
4/5
Loot: 4/5
Shelter: 4/5
Risk: 2/5

A monastery is a building or complex of buildings comprising the domestic quarters and workplaces of monastics, monks or nuns, whether living in communities or alone.

Recommendation	Loot Description	Resources	Shelter	Risk - Low
These would make an ideal location for a shelter or home base due to having all the needed supplies for sustaining life.	Little in the way of loot, generally only basic household belongings.	• Household Items • Personal Belongings	The structure may be made of stone which is ideal for a long term survival solution.	Most people won't think of a monastery in a disaster and they are often isolated from society with famland nearby.

Shrine

Usefulness
3/5
Loot: 1/5
Shelter: 4/5
Risk: 2/5

A shrine is a holy or sacred place, which is dedicated to a specific deity, ancestor, hero, martyr, saint, daemon, or similar figure of awe and respect, at which they are venerated or worshipped.

Recommendation	Loot Description	Resources	Shelter	Risk - Low
Not a very useful structure besides sheltering temporarily from a disaster.	Little in the way of loot and not worth looting.	• Little to no useful resources	The structure is often physically strong, but is often too small to be much use.	Few people are likely to head to, or use a shrine in a disaster besides basic sheltering from a current storm.

Temple

Usefulness
3/5
Loot: 1/5
Shelter: 4/5
Risk: 2/5

A temple is a structure reserved for religious or spiritual rituals and activities such as prayer and sacrifice.

Recommendation	Loot Description	Resources	Shelter	Risk - Low
A great location for sheltering in and would make a decent base of operations.	Little in the way of loot and not worth looting.	• Possibly food offerings	A physically strong building which would make an excellent shelter.	Not many people are likely to use a temple during a disaster beyond the adherents.

3 Government Buildings

Government owned buildings which will generally be harder to access than commercial buildings.

Government Buildings

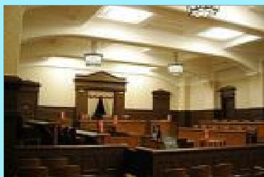
These often have good resources for a survival situation but will be first hit when SHTF.	**Types** • City Hall • Courthouse • Embassy • Water Treatment Plant	• Fire Station • Police Station • Post Office • Prison

City Hall

Usefulness **4/5** Loot: 2/5 Shelter: 5/5 Risk: 2/5	In local government, a city hall, town hall, civic centre, a guildhall, a Rathaus, or a municipal building, is the chief administrative building of a city, town, or other municipality.	

Recommendation	Loot Description	Resources	Shelter	Risk - Medium
An ideal building to use as a base if it is free and can be utilized.	Generic office supplies and vending machines.	• Office Supplies • Vending Machines	Generally very sturdy buildings, especially if made of stone. Perfect for sheltering in.	These are likely to be closed off or used to shelter evacuees during disasters. Either way they are likely to be populated.

Courthouse



Usefulness **2/5** Loot: 0/5 Shelter: 0/5 Risk: 0/5	A courthouse is a building that is home to a local court of law and often the regional county government as well, although this is not the case in some larger cities.

Recommendation	Loot Description	Resources	Shelter	Risk - Low
Not very useful for a base due to its limited exits and lack of windows. They are often connected to other buildings as well.	Almost nothing worth looting.	• Tinder (Paper) • Wood Benches	Typically a sturdy structure which would be good to sheltering in.	Likely to be abandonded during any disasters after law and order has collapsed.

Embassy

Usefulness **2/5** Loot: 0/5 Shelter: 3/5 Risk: 2/5	A diplomatic mission or foreign mission is a group of people from one state or an organisation present in another state to represent the sending state/organisation officially in the receiving state.

Recommendation	Loot Description	Resources	Shelter	Risk - Moderate
Not worth your time, however the building is often physically strong.	Little worth looting beyond stationery.	• Tinder (Paper)	Embassies can be physically tough buildings, which would work for temp shelter.	An embassy may be targeted if individuals have grievances against the country this embassy is connected to.

Fire Station

Usefulness **4/5** Loot: 4/5 Shelter: 5/5 Risk: 4/5	A fire station is a structure or other area for storing fire fighting apparatus such as fire engines and related vehicles, personal protective equipment, fire hoses and other specialized equipment.

Recommendation	Loot Description	Resources	Shelter	Risk - High
An excellent and reinforced location if you can use one as a base. It has a high risk of being targeted by others though.	Decent loot, but the structure itself is more important.	• Water • Medical Equipment • Fire Resistant Suits • Tough Vehicles	Fire stations are perfect for a shelter location as they are often reinforced.	A target for both gangs and rogue groups if they aren't controlled by the government.

Police Station

Usefulness **5/5** Loot: 5/5 Shelter: 5/5 Risk: 5/5	A police station (sometimes called a "station house" in the US) is a building which serves to accommodate police officers and other members of staff.

Recommendation	Loot Description	Resources	Shelter	Risk - High
Avoid this location unless you're sure it's unoccupied. The loot and shelter are well worth it if you can manage it.	Excellent loot, but will take some time to break into the vaults.	• Guns & Ammo • Comms • Defensive Weapons • Vehicles	Police stations are often built reinforced to withstand any kind of disaster.	This location will be targeted first by looters and will probably be occupied by someone, whether police or gangs at all times.

Post Office

Post Office

Usefulness
3/5
Loot: 1/5
Shelter: 2/5
Risk: 1/5

A Post office is a public department that services the people by transporting and delivering their mail across the country and between continents.

Recommendation	Loot Description	Resources	Shelter	Risk - Low
Not really worth looting or using as a shelter, but it's likely to be fairly safe.	Loot can vary wildly and is based off what is inside the packages.	• Tinder (Paper) • Packages with unknown contents	Not a great shelter location, but the warehouses are often a decent size.	These will likely be forgotten about in a disaster so they are relatively safe beyond rogue individuals breaking in.

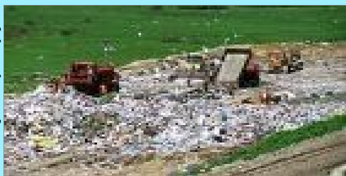
Prison

Usefulness
5/5
Loot: 5/5
Shelter: 5/5
Risk: 5/5

A prison, also known as a correctional facility, jail, penitentiary, detention centre, or internment facility is a facility in which inmates are forcibly confined and denied a variety of freedoms under the authority of the state.

Recommendation	Loot Description	Resources	Shelter	Risk - Very High
If you can get a prison, it is the ultimate in security and loot. However the risk is very high.	Everything you need to survive should be contained inside.	• Food & Water • Weapons • Medical Equipment	The ultimate shelter. Heavily reinforced with multiple layers of protection.	There may be dangerous prisoners hanging around during a disaster.

Landfill (Dump, Tip)



Usefulness
3/5
Loot: 4/5
Shelter: 2/5
Risk: 0/5

A landfill site is a site for the disposal of waste materials by burial. It is the oldest form of waste treatment.

Recommendation	Loot Description	Resources	Shelter	Risk - Very Low
This may be a decent location if there's a few buildings on site and the rubbish is separated into materials.	There is typically a lot of useful loot at the dump - you just have to find it.	• Wood • Metal • Electronics	Little to no shelter, although there is generally a structure on site somewhere.	The only real risk at dumps is cutting yourself on the landfill and the vermin which is likely to be present.

Military Buildings

Heavily fortified buildings with an abundance of survival resources, vehicles, medicine, weapons, food and water. Extremely dangerous areas.

Types
- Barracks
- Naval Base
- Air Base
- Bunker
- Missile Launch Facility

Castle

Usefulness
4/5
Loot: 3/5
Shelter: 5/5
Risk: 4/5

A castle is a type of fortified structure built during the Middle Ages by predominantly the nobility or royalty and by military orders.

Recommendation	Loot Description	Resources	Shelter	Risk - High
A brilliant location for a stronghold with lots of visibility and resistance to disasters.	Depending on what the castle is used for it may have different resources inside.	• Unknown	A location designed to be easily defendable combining thick walls with the ability to shoot back.	A lot of people will have the same idea and try to either loot or live in a castle so keep an eye out.

Military Base

Usefulness
5/5
Loot: 5/5
Shelter: 5/5
Risk: 5/5

A barracks is a building or group of buildings built to house soldiers.

Military Base

Recommendation	Loot Description	Resources	Shelter	Risk - Very High
Barracks will be heavily defended during wars and they may not ask questions before opening fire so it's recommended to only loot these or use it as a base if it's been abandoned.	This is probably the most lucrative location for finding items you require from food, water, weapons, explosives, defensible positions, medical equipment and much more.	• Weapons • Ammo • MREs • Explosives • Food • Water • Medical Kits • Trauma Equipment • Vehicles	There should be multiple reinforced buildings on most barracks which will be perfect for a hideout and protect against natural disasters.	The hardest part is getting in safely and making sure that everyone else didn't have the same idea and is hiding somewhere on the base. People will constantly be trying to get in to the base so take care. It's also very likely to be a target during war.

Naval Base

Usefulness
4/5
Loot: 5/5
Shelter: 4/5
Risk: 5/5

A naval base, navy base, or military port is a military base, where warships and naval ships are docked when they have no mission at sea or want to restock. Another location that will be heavily defenced during wars and times of disaster so don't loot unless it looks safe or its been abandoned.

Recommendation	Loot Description	Resources	Shelter	Risk - Very High
Large ships will have the best supply of resources if you're able to find one and gain entry. This is due to the inhabitants needing to survive on the ocean for long periods without restocking.	Not as lucrative as a barracks but will still have a lot of similarly good loot. You will have to find a way to search the boats as well, and a grounded boat could serve as a great hide out location.	• Weapons • Ammo • MREs • Food • Water • Medical Kits • Trauma Equipment • Ships	There should be a few reinforced buildings on the base. Ships are designed to be resistant to gunfire and bombs and also make a good base, however be sure to check they aren't slowly sinking.	Getting in will be tough and there could already be people occupying the buildings and ships. A lot of people will have the same idea and will try to loot the base as well. Be careful the ships aren't damaged if you choose to live on them and ensure they aren't sinking slowly. It's also a likely target during war.

Air Base

Usefulness
5/5
Loot: 5/5
Shelter: 5/5
Risk: 5/5

An air base (sometimes referred to as a military air base, military airfield, or air force base) is an aerodrome used as a military base by a military force for the operation of military aircraft. Another location that will be heavily defenced during wars and times of disaster so don't loot unless it looks safe or its been abandoned.

Recommendation	Loot Description	Resources	Shelter	Risk - Very High
An excellent location if you can manage to loot it or use it as a base of operations. It will be a very high target for the opposition during a war and will be a target for gangs and the government as well.	Likely to have the least impressive loot out of the three bases, but it will still have some good items that could be used. It's less likely to have weapons and explosives, but may have missiles, bombs or even nukes.	• Weapons • Ammo • MREs • Missiles / Nukes • Food • Water • Medical Kits • Trauma Equipment • Planes • Vending Machines	The buildings on the flight line are generally reinforced and soundproofed and would make ideal shelter locations - the air traffic control tower in particular can be used to keep a look out.	A likely target during war. Be careful about people already occupying the air base as they could be military members and would be heavily armed. Many people are likely to try and loot the base after you so watch out for others.

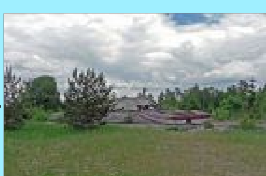
Bunker

Usefulness
5/5
Loot: 3/5
Shelter: 5/5
Risk: 5/5

A bunker is a defensive military fortification designed to protect people and valued materials from falling bombs or other attacks. Bunkers are mostly underground, in contrast to blockhouses which are mostly above ground.

Recommendation	Loot Description	Resources	Shelter	Risk - Very High
Perfect for a hideout if you can store vast amounts of food and water inside. You should secure the surrounding area so you can leave freely and get some sunlight too.	It may already contain food, water and weapons so be sure to have a look if you get the chance.	• Depends on what the bunker is being used as • Long Life Food • Long Life Water	The best shelter providing defence from direct blasts and gunfire. The best choice for a stronghold during a disaster.	Be careful not to be trapped underground as enemies may lure you in and then send in armed personnel to kill you. If you're sure the bunker is free from threats - reinforce/block any access points.

Missile Launch Facility



Usefulness
4/5
Loot: 2/5
Shelter: 5/5
Risk: 5/5

A missile launch facility, also known as an underground missile silo, launch facility (LF), or nuclear silo, is a vertical cylindrical structure constructed underground, for the storage and launching of intercontinental ballistic missiles (ICBMs). There won't be a lot in the way of loot but you could find something useful in the surrounding buildings. Its best use would be as a shelter if it's out in the middle of nowhere.

Recommendation	Loot Description	Resources	Shelter	Risk - Very High
Perfect for a hideout if you can store vast amounts of food and water inside, however it could be targeted during a war.	There may not be a lot in the way of loot, but	• Missiles / Nukes • Food • Water • Medical Kits	Provides the best shelter possible which should be able to sustain direct blasts. The best choice for a stronghold during a disaster.	Before you visit this location be sure that it's unlikely to be a target of enemy fire from ICBMs or Nukes. Gaining entry will be your first mission, especially if it's all locked up. Be careful if there's still a nuke or ICBM inside the silo as it could still be launched remotely.

Transport Buildings

All transport systems will be down and these will be largely deserted, however underground stations make strong bunkers and may be occupied.

Types
- Airport Terminal
- Bus Garage
- Train Station
- Lighthouse

Airport Terminal

Usefulness
3/5
Loot: 3/5
Shelter: 3/5
Risk: 4/5

An airport terminal is a building at an airport where passengers transfer between ground transportation and the facilities that allow them to board and disembark from an aircraft.

Recommendation
Makes a good stronghold if you can secure the facility and have a group. Worth taking a look for loot such as luggage and mail.

Loot Description
You could potentially find a lot of air mail which has been abandoned as well as luggage people forgot to collect.

Resources
- Food (Snacks)
- Water & Drinks
- Snack Foods
- Vending Machines
- Mail
- Luggage

Shelter
They would provide a decent amount of protection from natural disasters and could make a good stronghold especially if you use the air traffic control tower to your advantage.

Risk - High
Terminals could be guarded for a long time into a disaster so it's recommended to avoid them. People will often come in looking for items to loot.

Hangar

Usefulness
3/5
Loot: 3/5
Shelter: 3/5
Risk: 3/5

A hangar is a closed building structure to hold aircraft, or spacecraft. Hangars are built of metal, wood and concrete.

Recommendation
May be worth looting if you're in the area and especially if you need a plane, but not great as a shelter.

Loot Description
There won't be much to loot at hangars beside what's in the aircraft and the surroudning buildings.

Resources
- Aircraft Parts
- Tools

Shelter
Generally hangars can withstand strong wind and would make nice shelters.

Risk - Moderate
Smaller than an airport termal and therefore less likely to be stumbled upon by others, but still risky as people may want to access their personal planes to escape in.

Bus Garage

Usefulness
2/5
Loot: 2/5
Shelter: 2/5
Risk: 1/5

A bus garage, also known as a bus depot, bus base or bus barn, is a facility where buses are stored and maintained.

Recommendation
It's not recommended to use this location as a base, but only give it a quick sweep for useful loot. It would be useful if you can fit out a few buses with prepper gear and use them for transportation.

Loot Description
Not a lot to loot here besides what you can find on buses and in the luggage compartments.

Resources
- Buses
- Vending Machines
- Car Batteries

Shelter
You could use the buses as shelter. This is best done by parking them in such a way to maximize the defensive perimeter.

Risk - Low
Not many people would head to a bus garage to loot it.

Train Station

Usefulness
3/5
Loot: 1/5
Shelter: 2-5/5
Risk: 3/5

A train station, railway station, railroad station, or depot is a railway facility or area where trains regularly stop to load or unload passengers or freight. It generally consists of at least one track-side platform and a station building providing such ancillary services as ticket sales and waiting rooms.

Recommendation
Underground stations are best utilized for a base. Above ground stations are best looted and left. Little, if any loot.

Loot Description
There would really only be vending machines at stations.

Resources
- Vending Machines

Shelter
The level of shelter depends on whether the station is underground or not. 2 for above ground to 5 if it's underground. Underground shelters would work well for bases.

Risk - Moderate
Because of the number of access points to stations the risk is high to run into other people. Most stations are on the surface and don't provide much protection from the elements.

Signal Box

Usefulness
1/5
Loot: 1/5
Shelter: 1/5
Risk: 1/5

On a rail transport system, signalling control is the process by which control is exercised over train movements by way of railway signals and block systems to ensure that trains operate safely, over the correct route and to the proper timetable.

LOCATIONS
Government Buildings
Transport Buildings

Recommendation Not very useful besides a temporary stop on your way to somewhere else. It may contain some food.	**Loot Description** Little in the way of loot besides stationery, tinder and food.	**Resources** • Phone • Paperwork • Computer • Snack Foods	**Shelter** Useful as a temporary shelter from the elements.	**Risk - Low** Likely to be uninhabited due to its size and proximity from anything.

Harbour

Usefulness
3/5
Loot: 3/5
Shelter: 2/5
Risk: 3/5

A harbour or harbour is a sheltered body of water where ships, boats, and barges can be docked.

Recommendation You wouldn't inhabit the harbour itself, but one of the boats docked. You should know how to drive a boat if you hang around here.	**Loot Description** Boats often contain the essentials of survival and therefore make good looting targets.	**Resources** • Food & Water • Medication • Batteries / Power	**Shelter** Little to no shelter, and boats can be dangerous places to be in strong wind.	**Risk - Moderate** A lot of people may have their house boats docked in the harbour, so it will likely be inhabited.

Shipyard

Usefulness
2/5
Loot: 3/5
Shelter: 0/5
Risk: 0/5

A shipyard (also called a dockyard) is a place where ships are built and repaired.

Recommendation Potentially a great place to use as a base, however it's a concrete jungle and growing food would be tricky.	**Loot Description** Not a lot of loot, the ships may have basic survival items.	**Resources** • Few, if any useful resources. • There could be items on the ships.	**Shelter** Not a lot of shelter if it's an outside shipyard.	**Risk - Moderate** Most people aren't likely to think about shipyards in a disaster so it should be relatively quiet.

Ferry/Cruise Terminal

Usefulness
2/5
Loot: 1/5
Shelter: 3/5
Risk: 1/5

A ferry terminal, which may also be known as a passenger terminal, cruise terminal, marine terminal or maritime passenger terminal, is a structure in a port where ferries and possibly cruise ships pick up and drop off passengers and vehicles.

Recommendation These are similar to airports and therefore aren't very useful in a survival situation beyond a shelter.	**Loot Description** Very little to no useful loot.	**Resources** • Little to no loot.	**Shelter** It's a decent sized shelter, there's not much else to it.	**Risk - Low** These are likely to be completely abandoned with no cruiseliners running.

Lighthouse

Usefulness
3/5
Loot: 1/5
Shelter: 3/5
Risk: 2/5

A lighthouse is a tower, building, or other type of structure designed to emit light from a system of lamps and lenses and to serve as a navigational aid for maritime pilots at sea or on inland waterways.

Recommendation May work well as a base and a lookout point. Little loot.	**Loot Description** Not a lot in the way of loot beyond a typical office.	**Resources** • Snacks	**Shelter** Could make a viable shelter giving an amazing line of sight, but they are quite cramped.	**Risk - Moderate** Being so prominent in a landscape they may be a target for people.

Space Port

Usefulness
2/5
Loot: 1/5
Shelter: 4/5
Risk: 4/5

A spaceport or cosmodrome is a site for launching (or receiving) spacecraft, by analogy to seaport for ships or airport for aircraft.

Recommendation There's nothing really here to be of use in a survival situation.	**Loot Description** No loot beyond office supplies and snacks.	**Resources** • Food • Water • Vending Machines	**Shelter** The buildings are likely to be slightly reinforced with nothing else special about them.	**Risk - High** This area may be locked down by the government and possibly patrolled. People are likely to wander in wanting a look.

Infrastructure

Possible targets in a war and SHTF. These are likely to become gang headquarters for protection and to sell off the resources at a high cost.

Types
- Water Treatment Facility
- Power Substation
- Nuclear Power Plant
- Solar Farm
- Dam
- Data Centre

Water Treatment Facility

Water Treatment

Usefulness
4/5
Loot: 2/5
Shelter: 3/5
Risk: 1/5

Water treatment is any process that improves the quality of water to make it more acceptable for a specific end-use.

Recommendation	Loot Description	Resources	Shelter	Risk - Low
Great to have an unlimited supply of water and would be very helpful if growing food. Overall a decent location.	Not much in the way of loot besides water.	• Infinite Water • Water Purifiers	Usually a decently constructed building.	If municipal systems break down this will likely be abandoned quickly.

Power Substation

Power Substation

Usefulness
1/5
Loot: 0/5
Shelter: 1/5
Risk: 1/5

A substation is a part of an electrical generation, transmission, and distribution system.

Recommendation	Loot Description	Resources	Shelter	Risk - Low
These facilities are generally lightly protected by fences but usually have few useful resources and buildings.	None really.	• Snacks	o	It could be a target for local attacks, but most people would ignore these substations in disasters as the power is likely to have gone off long ago.

Nuclear Power Plant

Nuclear Power Plant

Usefulness
3/5
Loot: 1/5
Shelter: 4/5
Risk: 5/5

A nuclear power plant or nuclear power station is a thermal power station in which the heat source is a nuclear reactor.

Recommendation	Loot Description	Resources	Shelter	Risk - Very High
A nuclear power plant isn't a great choice for looting or using a a shelter due to the risks involved and the limited potential gains. Bring a radiation meter if you go.	Little usable loot.	• Snacks	They provide excellent shelter but at a large risk.	These plants could be targeted by enemies during a war. If hit, they will release radioactive particles for many kilometres, likely killing anyone in close proximity and irradiating crops & livestock.

Solar Farm

Solar Farm

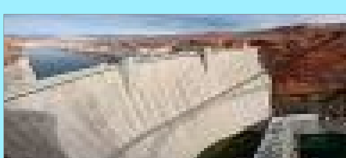
Usefulness
4/5
Loot: 4/5
Shelter: 1/5
Risk: 1/5

A photovoltaic power station, also known as a solar park, is a large-scale photovoltaic system (PV system) designed for the supply of merchant power into the electricity grid.

Recommendation	Loot Description	Resources	Shelter	Risk - Low
Using a solar farm as a base could work if you have some electrical knowledge and can use the panels to generate unlimited power.	You could potentially rewire the panels to generate unlimited solar power.	• Solar Panels • Unlimited Electricity	Limited to no shelter.	Almost no risk as they span such a wide location and won't be on people's minds.

Dam

Dam



Usefulness
4/5
Loot: 1/5
Shelter: 4/5
Risk: 3/5

A dam is a barrier that stops or restricts the flow of water or underground streams. Reservoirs created by dams not only suppress floods but also provide water for activities such as irrigation, human consumption, industrial use, aquaculture, and navigability.

Recommendation	Loot Description	Resources	Shelter	Risk - Moderate
A dam would make a great base if it's a hydro-dam. You could have unlimited water and power and have a strong shelter.	No loot beyond basic office supplies.	• Unlimited Water • Possibly Unlimited Power • Allowing Crossings	A very sturdy shelter capable of withstanding most disasters.	There's a risk of the dam breaking and being a target of an attack. People may also use it to cross.

Data Centre

Data Centre

Usefulness
2/5
Loot: 1/5
Shelter: 2/5
Risk: 0/5

A data centre is a building, dedicated space within a building, or a group of buildings used to house computer systems and associated components, such as telecommunications and storage systems.

Recommendation	Loot Description	Resources	Shelter	Risk - Very Low
Not a very useful location overall, and there's no windows.	Nothing really.	• PCs & HDDs • Servers	It would provide a decent shelter location.	Nobody will care about a data centre in a collapse.

4 Other Structures

This section contains all those buildings or locations that aren't covered above that may be of benefit.

Non Buildings

Locations that people may inhabit but doesn't generally have an interior.

Types
- Bridge
- Arena
- Theme Park
- Park
- Well
- Cemetery
- Tunnel
- The Subway
- Docks
- ATM

Bridge

Usefulness
1/5
Loot: 0/5
Shelter: 2/5
Risk: 2/5

A bridge is a structure built to span physical obstacles without closing the way underneath such as a body of water, valley, or road, for the purpose of providing passage over the obstacle, usually something that can be detrimental to cross otherwise.

Recommendation	Loot Description	Resources	Shelter	Risk - Low
Only use bridges as temporary shelters. Nothing in the way of loot.	No loot. If it's made of wood it could be used as firewood.	• Water Nearby	There may be some shelter under the bridge but it's inadequate for a long term stay.	Not many people would use a bridge as shelter, however people may need to cross a river and this would raise the risk level.

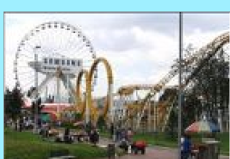
Arena

Usefulness
2/5
Loot: 0/5
Shelter: 0/5
Risk: 3/5

An arena, is an enclosed area, often circular or oval-shaped, designed to showcase theatre, musical performances, or sporting events.

Recommendation	Loot Description	Resources	Shelter	Risk - Moderate
Little - if any loot. Not suitable as a long term shelter due to the size and number of entrances.	Possibly vending machines and sporting merchandise.	• Growing Food • Vending Machines	Not ideal as a shelter if there's no roof. These are often opened as emergency shelters.	Others may have the same idea and shelter here. There are too many entrances to guard as a base.

Theme Park



Usefulness
3/5
Loot: 3/5
Shelter: 3/5
Risk: 3/5

An amusement park is a park that features various attractions, such as rides and games, as well as other events for entertainment purposes.

Recommendation	Loot Description	Resources	Shelter	Risk - Moderate
Not a lot of resources, but people may head here because of the 'thrill' factor. Could be a great base of operations if you control it all.	Theme parks generally only have packaged foods and a gift shop near the exit.	• Food • Long Life Foods • Toys • Collectables	Not a lot of shelter, but some of the underground rides would be good as a base of operations.	Because theme parks and disasters seem to by synonymous in movies these are likely to be frequently trafficked areas.

Park

Usefulness
2/5
Loot: 1/5
Shelter: 1/5
Risk: 3/5

A park is an area of natural, semi-natural or planted space set aside for human enjoyment and recreation or for the protection of wildlife or natural habitats.

Recommendation	Loot Description	Resources	Shelter	Risk - Moderate
Parks will attract a lot of people in disasters and should be avoided.	Almost nothing worth scavenging beside scrap metal.	• Scrap Metal • Wood	Limited use as a shelter. Structures could protect from the rain or hail.	During a disaster a lot of people are likely to head to the local park if their houses are damaged. They are also exposed from all sides.

Well

Well	**Usefulness** **2/5** Loot: 2/5 Shelter: 0/5 Risk: 1/5	A well is an excavation or structure created in the ground by digging, driving, or drilling to access liquid resources, usually water.

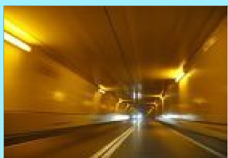
Recommendation	Loot Description	Resources	Shelter	Risk - Low
Not a location you would live around, but you could control the asset and sell the water once purified.	No loot besides the unpurified water.	● Unpurified Water	Provides no shelter.	o

Cemetery

Cemetery	**Usefulness** **1/5** Loot: 1/5 Shelter: 0/5 Risk: 0/5	A cemetery or graveyard is a place where the remains of dead people are buried or otherwise interred.

Recommendation	Loot Description	Resources	Shelter	Risk - Very Low
Not worth going to unless you want a location that will have extremely few people visiting.	No loot beyond gravestones, dirt and bits of metal.	● Stone ● Dirt ● Metal	There's very limited shelter in cemetaries beyond a few covered seats.	Few people, if any, would visit a cemetary in a disaster.

Tunnel



Tunnel	**Usefulness** **3/5** Loot: 1/5 Shelter: 5/5 Risk: 1/5	A tunnel is an underground passageway, dug through the surrounding soil/earth/rock and enclosed except for entrance and exit, commonly at each end.

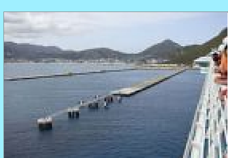
Recommendation	Loot Description	Resources	Shelter	Risk - Low
Useful as a temporary shelter from natural disasters and little more. Could be used as a base if both ends are blocked and guarded.	Little in the way of loot besides the contents of any vehicles inside.	● Vehicles and their contents	A tunnel would serve as an extremely strong shelter against natural disasters if used temporarily but aren't as useful as a base due to limited access points.	Few people would use a tunnel in a long term disaster particularly if there's no power. They are dangerous during heavy rain or earthquakes. Mind the carbon monoxide.

Metro (Subway, Underground)

Metro	**Usefulness** **4/5** Loot: 1/5 Shelter: 5/5 Risk: 3/5	Rapid transit or mass rapid transit (MRT), also known as heavy rail, metro, subway, tube, U-Bahn or underground, is a type of high-capacity public transport generally found in urban areas.

Recommendation	Loot Description	Resources	Shelter	Risk - Moderate
Excellent for a temporary shelter from disasters going on above ground, except for major flooding. It's not bad for use as a base.	Almost no loot except personal items on the abandoned trains and vending machines.	● Personal belongings ● Vending machines	Excellent shelter from the hazards going on above ground.	There are a few risks with the subway: Electrocution, oxygen deficiency, cave-ins, flooding and being cut off.

Dock



Dock	**Usefulness** **1/5** Loot: 0/5 Shelter: 1/5 Risk: 1/5	A dock is the area of water between or next to one or a group of human-made structures that are involved in the handling of boats or ships or such structures themselves.

Recommendation	Loot Description	Resources	Shelter	Risk - Low
Too exposed to be a home base, but useful for fishing.	Docked boats may have some useful survival items on board.	● Boat Supplies ● Fish	Provides limited to no shelter.	Very few resources besides the opportunity for fishing, however you will be exposed and can be cut off from the mainland easily.

ATM

Usefulness **2/5** Loot: 4/5 Shelter: 0/5 Risk: 3/5	An automated teller machine (ATM) is an electronic telecommunications device that enables customers to perform financial transactions, such as cash withdrawals or obtaining account information.

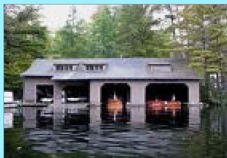
Recommendation It's recommended to ignore ATMs in a disaster as they are too high risk with little reward.	**Loot Description** Only contains money which may not be valuable in a long term disaster. Gear is much more important than money.	**Resources** • Currency	**Shelter** Provides no shelter.	**Risk - Moderate** A lot of people would go for ATMs in a disaster making this a moderate risk to try and loot. They are also often highly fixed down and have cameras focused on them.

Others

Little to no resources in these buildings. Most of what is scavenged will be from deserted vehicles.

Types
- Boathouse
- Repair Garage
- Hangar
- Parking Lot
- Oil Rig
- Community Centre
- Fast Food Restaurant
- Gym
- Workshop

Boathouse



Usefulness
2/5
Loot: 2/5
Shelter: 2/5
Risk: 0/5

A boathouse (or a boat house) is a building especially designed for the storage of boats, normally smaller craft for sports or leisure use.

Recommendation Not very useful unless you will be travelling via boat often to islands or something.	**Loot Description** Little to no loot besides what's on the boats. Use of the boats for travel is useful.	**Resources** • Boat Supplies • Fuel • Boat Parts	**Shelter** Provides limited shelter.	**Risk - Low** These will be generally overlooked in a disaster.

Parking Lot

Usefulness
1/5
Loot: 1/5
Shelter: 3/5
Risk: 0/5

A parking lot or car park, also known as a car lot, is a cleared area that is intended for parking vehicles. It could be a better base of operations if it's connected to a building and you have control of both the parking and building.

Recommendation Not useful for loot but may prove useful as a temporary shelter from incline weather.	**Loot Description** Little in the way of loot except for abandoned cars that may have been left there.	**Resources** • Abandoned Car Items • Fuel • Car Parts	**Shelter** Fair shelter if the car park is multi-storey but easy access from the ground and may not completely provide shelter from storms.	**Risk - Low** If the car park is underground, make sure it has sufficient drainage.

Self Storage

Usefulness
4/5
Loot: 5/5
Shelter: 3/5
Risk: 4/5

Self storage is an industry in which storage space, also known as "storage units" is rented to tenants, usually on a short-term basis.

Recommendation Worth taking a look in terms of looting and could also serve as a pretty good hideout with all the security cameras.	**Loot Description** Contains a huge range of various gear depending on what people store inside.	**Resources** • A little of everything	**Shelter** A decent shelter, no windows but plenty of storage space.	**Risk - High** Because people store their gear here, many people would want access to their stuff in a disaster. They also may have key access making it harder to defend.

Shed

Usefulness
2/5
Loot: 2/5
Shelter: 1/5
Risk: 0/5

A shed is typically a simple, single-story roofed structure in a back garden or on an allotment that is used for storage, hobbies, or as a workshop.

Recommendation Not a great shelter beyond a temporary one, no matter how big the shed.	**Loot Description** Various tools.	**Resources** • Tools • Vehicles	**Shelter** A flimsy shelter only useful for storage of items or getting out of the rain.	**Risk - Low** No risk.

Oil Rig

Usefulness
5/5
Loot: 4/5
Shelter: 5/5
Risk: 1/5

An oil platform, offshore platform, or offshore drilling rig is a large structure with facilities for well drilling to explore, extract, store, process petroleum and natural gas which lies in rock formations beneath the seabed. Oil rigs can be several hundred meters to over a kilometer long (around 1,000 feet to 3,000 feet).

Oil Rig				
Recommendation If you can make it to an oil rig you should be set for many months with all the resources that you need on board already.	**Loot Description** Because people have to survive on the rig for weeks at a time there should be ample supplies to get you started.	**Resources** • Food • Water • Various Tools • Medication	**Shelter** The ultimate shelter location from other people and also pretty resistant to natural disasters.	**Risk - Moderate** People may have the same idea as you and head to an oil rig. Also there may be people already bunking down on the rig. If you have complete control of it, it should be easy to defend.

Pub

Usefulness
3/5
Loot: 2/5
Shelter: 3/5
Risk: 3/5

A pub, or public house, is an establishment licensed to sell alcoholic drinks, which traditionally include beer and cider.

Recommendation Not the greatest choice as seen in Shaun of the Dead. They are often in town centres and may be frequented fairly often.	**Loot Description** Not a lot beyond simple foods and unhealthy drinks.	**Resources** • Snack Food • Drinks	**Shelter** Some pubs may be reinforced and would fair well in any disaster with strong wind.	**Risk - Moderate** People may head to the pub in times of disaster for a quick pint.

Community Centre

Usefulness
3/5
Loot: 0/5
Shelter: 0/5
Risk: 0/5

Community centres or community centres are public locations where members of a community tend to gather for group activities, social support, public information, and other purposes.

Recommendation A decent sized building for using as a base of operations which is often reasonably strong.	**Loot Description** Not a lot of loot beyond stationery and fliers.	**Resources** • Paper • Stationery	**Shelter** Often a reinforced building which is often used as an evac shelter.	**Risk - Moderate** This may be a hub of activity in the early stages of a disaster but will be forgotten soon after.

Fast Food Restaurant

Usefulness
3/5
Loot: 2/5
Shelter: 2/5
Risk: 1/5

A fast food restaurant, also known as a quick service restaurant (QSR) within the industry, is a specific type of restaurant that serves fast food cuisine and has minimal table service.

Recommendation It's best to avoid this if you have enough food stocked up. The food stored here will likely go off within a week.	**Loot Description** Generally food and kitchen utensils.	**Resources** • Food	**Shelter** It would only suffice as a temporary shelter.	**Risk - Low** If food is in shortage it will be looted early on in a disaster and then abandoned.

Gym

Usefulness
3/5
Loot: 1/5
Shelter: 2/5
Risk: 1/5

A gymnasium, also known as a gym, is a covered location for gymnastics, athletics, and gymnastic services.

Recommendation Not an ideal location to shelter in due to its many glass windows. It would likely be looted early on in a disaster.	**Loot Description** Only various types of health equipment.	**Resources** • Health Equipment • Snacks	**Shelter** It would only provide temporary shelter from the elements.	**Risk - Low** It is likely to be looted early on but then abandoned when there's nothing left.

Workshop

Usefulness
3/5
Loot: 4/5
Shelter: 3/5
Risk: 3/5

A workshop may be a room, rooms or building which provides both the area and tools that may be required for the manufacture or repair of manufactured goods.

Recommendation A workshop would be great to find a lot of tools but wouldn't work well as a base.	**Loot Description** Likely a good selection of useful tools which may be in high demand after a disaster.	**Resources** • Tools	**Shelter** A regular strength building for resisting natural disasters.	**Risk - Moderate** Depending on the tools inside, this may be a target for looters looking for valuable equipment. May be more prone to fires and chem leaks.

Folly

Usefulness
3/5
Loot: 2/5
Shelter: 2/5
Risk: 3/5

In architecture, a folly is a building constructed primarily for decoration, but suggesting through its appearance some other purpose, or of such extravagant appearance that it transcends the range of garden ornaments usually associated with the class of buildings to which it belongs.

Recommendation These kinds of buildings will attract people and could be dangerous.	**Loot Description** Not a lot of loot beyond general household equipment.	**Resources** • Household Items	**Shelter** Depending on the structure it could be a great location to shelter at.	**Risk - Moderate** Due to the unique design of structures like these, they will be targeted by gangs and individuals.

5 Transport

This contains any type of transport that may be abandoned which could have useful loot.

Abandoned Vehicles	**Bikes** • Bicycle • E-Scooter • Scooters • Mopeds • Motorbikes	**Cars** • Car • Electric Car • Tradesman Ute • Police Car • Roadside Assistance	**Light Rigid** • Minibus • Truck (General) • Ambulance • Parcel Van	**Medium Rigid** • Bus • Fire Engine • Garbage Truck	**Heavy Rigid** • Articulated Bus • Hauling Truck • Road Train	**Tram/Train** • Tram • Commuter Train • Sleeper Train • Freight Train	**Boats** • Light Boat • Ferry • Cruise Ship • Yacht • Hovercraft • Cargo Ship • Rescue Boats • Battleship • Aircraft Carrier	**Helicopters** • Private Helicopter • Tourism Helicopter • Transport Helicopter • Military Helicopter	**Planes** • Private Aircraft • Commercial Aircraft • Cargo Plane • Military Aircraft	**Military** • Light Utility Vehicle • APC • Tank

Bikes

Any type of vehicular transport which you mount and ride.

Bicycle

	Usefulness **4/5** Loot: 2/5 Shelter: 0/5 Risk: 1/5	**Description** A bicycle, also called a pedal cycle, bike, push-bike or cycle, is a human-powered or motor-assisted, pedal-driven, single-track vehicle, with two wheels attached to a frame, one behind the other. A bicycle rider is called a cyclist, or bicyclist.		
Recommendation The best unpowered transportation post-collapse.	**Loot Description** Not a lot unless you are looking to repair your own bike.	**Resources** • Bike Parts • Bike Torch • Water Bottle • Air Pump	**Shelter** Not useful as a shelter.	**Risk - Low** Bicycles are going to be a desirable item if there's no fuel or electricity available.

E-Scooter

	Usefulness **3/5** Loot: 1/5 Shelter: 0/5 Risk: 0/5	**Description** An e-scooter or electric kick scooter is an electric motorized scooter – a stand-up scooter powered by an electric hub motor in its front and/or rear wheel. It is generally designed with a large center deck on which the rider stands.		
Recommendation The best electric transportation post-collapse.	**Loot Description** The batteries (18650 cells) could be useful if taken out.	**Resources** • Batteries	**Shelter** Not useful as a shelter.	**Risk - Very Low** It will be hard to target a rider of an E-Scooter as they are pretty quick. The thief will also need the charger to make use of it.

Scooters

	Usefulness **4/5** Loot: 1/5 Shelter: 0/5 Risk: 0/5	**Description** A scooter (motor scooter) is a motorcycle with an underbone or step-through frame, a seat, a transmission that shifts without the operator having to operate a clutch lever, a platform for their feet, and with a method of operation that emphasizes comfort and fuel economy.		
Recommendation Probably the second best form of powered transport after a motorbike in a collapse. Nothing much to loot.	**Loot Description** Only fuel and the parts it contains.	**Resources** • Fuel • Scooter Parts	**Shelter** Not useful as a shelter.	**Risk - Very Low** o

Mopeds

	Usefulness **4/5** Loot: 1/5 Shelter: 0/5 Risk: 0/5	**Description** A moped is a type of small motorcycle, generally having a less stringent licensing requirement than full motorcycles or automobiles. Historically, the term exclusively meant a similar vehicle with both bicycle pedals and a motorcycle engine. Mopeds typically travel only slightly faster than bicycles on public roads.		
Recommendation o	**Loot Description** Only fuel and the parts it contains.	**Resources** • Fuel • Moped Parts	**Shelter** Not useful as a shelter.	**Risk - Very Low** o

Motorbikes

	Usefulness **4/5** Loot: 2/5 Shelter: 0/5 Risk: 0/5	**Description** A motorcycle (motorbike, bike, or, if three-wheeled, a trike) is a two or three-wheeled motor vehicle steered by a handlebar from a saddle-style seat. Motorcycle designs vary greatly to suit a range of different purposes: long-distance travel, commuting, cruising, sport (including racing), and off-road riding.		
Recommendation One of the best forms of powered transportation post-collapse, if you're alone.	**Loot Description** Only fuel and the parts it contains.	**Resources** • Fuel	**Shelter** Not useful as a shelter.	**Risk - Moderate** Because they would be desirable in a disaster, these will become a moderate risk to you.

Cars

A car, or an automobile, is a motor vehicle with wheels. Most definitions of cars state that they run primarily on roads, seat one to eight people.

Car

Usefulness **-/5** Loot: 0/5 Shelter: 0/5 Risk: 0/5	**Description** A car, or an automobile, is a motor vehicle with wheels. Most definitions of cars state that they run primarily on roads, seat one to eight people, have four wheels, and mainly transport people rather than cargo.			
Recommendation Cars generally don't have a lot of loot in them but they would be excellent for finding parts for other vehicles.	**Loot Description** Mostly car parts but you can also siphon fuel find snacks and some tools.	**Resources** • Car Parts • Fuel • Car Battery	**Shelter** Cars provide limited shelter from disasters. Ideally you want a building.	**Risk - Low** o

Electric Car

Usefulness **-/5** Loot: 0/5 Shelter: 0/5 Risk: 0/5	**Description** An electric car or electric vehicle (EV) is a passenger automobile that is propelled by an electric traction motor, using electrical energy as the primary source of propulsion. The term normally refers to a plug-in electric vehicle, typically a battery electric vehicle (BEV), which only uses energy stored in on-board battery packs.			
Recommendation The batteries may be worth salvaging and it could be used for parts. Otherwise not useful for shelter.	**Loot Description** o	**Resources** • Batteries	**Shelter** No more protection over a regular car.	**Risk - Low** o

Tradesman Ute

Usefulness **-/5** Loot: 0/5 Shelter: 0/5 Risk: 0/5	**Description** A ute, originally an abbreviation for "utility" or "coupé utility", is a term used in Australia and New Zealand to describe vehicles with a tonneau behind the passenger compartment, that can be driven with a regular driver's licence.			
Recommendation o	**Loot Description** o	**Resources** •	**Shelter** No more protection over a regular car.	**Risk - Moderate** o

Police Car

Usefulness **-/5** Loot: 0/5 Shelter: 0/5 Risk: 0/5	**Description** A police car is an emergency vehicle used by police for transportation during patrols and responses to calls for service. A type of emergency vehicle, police cars are used by police officers to patrol a beat, quickly reach incident scenes, and transport and temporarily detain suspects.			
Recommendation o	**Loot Description** o	**Resources** • Fuel • Car Battery • Comms Equipment	**Shelter** No more protection over a regular car.	**Risk - High** Police cars will draw the attention of anyone nearby which raises your risk profile. They will be sought after by criminals.

Roadside Assistance

Usefulness **-/5** Loot: 0/5 Shelter: 0/5 Risk: 0/5	**Description** Roadside assistance, also known as breakdown coverage, is a service that assists motorists, motorcyclists, or bicyclists whose vehicles have suffered a mechanical failure that either cannot be resolved by the motorist, or has prevented them from reasonably or effectively transporting the vehicle to an automobile repair shop.			
Recommendation o	**Loot Description** o	**Resources** • Fuel • Car Battery • Mechanic Tools • First Aid Kit	**Shelter** No more protection over a regular car.	**Risk - Moderate** o

Light Rigid

A light rigid (LR) vehicle is a motor vehicle with a gross vehicle mass (GVM) of more than 4.5 tonnes but less than 8 tonnes. LR vehicles can also be vehicles that can carry more than 12 passengers, including the driver.

Minibus

Usefulness **-/5** Loot: 0/5 Shelter: 0/5 Risk: 3/5	**Description** o			
Recommendation Great if you can get it working to haul preps. Average shelter from the elements and little in the way of loot.	**Loot Description** o	**Resources** •	**Shelter** No more protection over a regular car.	**Risk - Moderate** Not much in the way of loot, but these are excellent to move people and resources.

Truck (General)

LOCATIONS Transport Light Rigid Truck (General)

	**Usefulness** **3/5** Loot: 3/5 Shelter: 2/5 Risk: 3/5	**Description** o

Recommendation	Loot Description	Resources	Shelter	Risk - Moderate
May be worth looting. These vehicles typically transport food.	o	• Food • Fuel • CB Radio	o	o

Ambulance

LOCATIONS Transport Light Rigid Ambulance

	**Usefulness** **5/5** Loot: 4/5 Shelter: 3/5 Risk: 4/5	**Description** An ambulance is a medically-equipped vehicle used to transport patients to treatment facilities, such as hospitals. Typically, out-of-hospital medical care is provided to the patient during the transport. Ambulances are used to respond to medical emergencies by emergency medical services (EMS).

Recommendation	Loot Description	Resources	Shelter	Risk - High
Definitely worth looting if it is safe to do so, however you will probably find the good stuff is already gone. Makes a decent shelter location.	Medical items will go quickly in any disaster and this has nearly everything you need.	• Medical Gear • Medications • Comms Equipment • Car Parts	A decent shelter location if you hang out in the back during harsh weather.	A very lucrative item to loot in a disaster.

Parcel Van

LOCATIONS Transport Light Rigid Parcel Van

	**Usefulness** **-/5** Loot: 0/5 Shelter: 0/5 Risk: 0/5	**Description** A mail truck or post van is a type of delivery vehicle that is used to transport post.

Recommendation	Loot Description	Resources	Shelter	Risk - Low
o	o	• Fuel	o	o

Medium Rigid

LOCATIONS Transport Medium Rigid

A "medium rigid vehicle" refers to a truck or bus with a Gross Vehicle Mass (GVM) exceeding 8 tonnes, but with only two axles, allowing it to carry moderate loads while still maneuvering relatively easily in urban areas.

Bus

LOCATIONS Transport Medium Rigid Bus

	**Usefulness** **-/5** Loot: 0/5 Shelter: 0/5 Risk: 0/5	**Description** A bus is a motor vehicle that carries significantly more passengers than an average car or van, but fewer than the average rail transport. It is most commonly used in public transport, but is also in use for charter purposes, or through private ownership.

Recommendation	Loot Description	Resources	Shelter	Risk - Moderate
o	o	•	o	o

Fire Engine

LOCATIONS Transport Medium Rigid Fire Engine

	**Usefulness** **3/5** Loot: 0/5 Shelter: 0/5 Risk: 0/5	**Description** A fire engine or fire truck is a vehicle, usually a specially-designed or modified truck, that functions as a firefighting apparatus. The primary purposes of a fire engine include transporting firefighters and water to an incident as well as carrying equipment for firefighting operations in a fire drill.

Recommendation	Loot Description	Resources	Shelter	Risk - Moderate
o	o	• Water / Foam • Fuel • Comms Equipment	Due to their weight they would make a sturdy temporary shelter.	Most people won't want to loot a fire engine, but it will draw attention being a service vehicle.

Garbage Truck

LOCATIONS Transport Medium Rigid Garbage Truck

	**Usefulness** **1/5** Loot: 0/5 Shelter: 0/5 Risk: 0/5	**Description** A garbage truck is a truck specially designed to collect municipal solid waste and transport it to a solid waste treatment facility, such as a landfill, recycling center or transfer station. In Australia they are commonly called rubbish trucks, or garbage trucks, while in the U.K. dustbin lorry, rubbish lorry or bin lorry is commonly used.

Recommendation	Loot Description	Resources	Shelter	Risk - Very Low
Possibly worth looting for the medical kit. It makes a decent temporary shelter too.	o	• Fuel	o	Very few people would likely loot a garbage truck when there are better options nearby.

Heavy Rigid

A heavy rigid vehicle (HR vehicle) is a truck or bus with a gross vehicle mass (GVM) of more than 8 tonnes and at least three axles. HR vehicles are used to transport goods, people, and livestock.

Articulated Bus

Usefulness	Description
2/5 Loot: 0/5 Shelter: 0/5 Risk: 0/5	An articulated bus, also referred to as a slinky bus, bendy bus, tandem bus, vestibule bus, stretch bus, or an accordion bus, is an articulated vehicle, typically a motor bus or trolleybus, used in public transportation.

Recommendation	Loot Description	Resources	Shelter	Risk - Moderate
o	o	• Fuel	It will provide a decent amount of shelter if it's all you can find.	o

Hauling Truck

Usefulness	Description
4/5 Loot: 0/5 Shelter: 0/5 Risk: 0/5	A truck or lorry is a motor vehicle designed to transport freight, carry specialized payloads, or perform other utilitarian work. Trucks vary greatly in size, power, and configuration, but the vast majority feature body-on-frame construction, with a cabin that is independent of the payload portion of the vehicle.

Recommendation	Loot Description	Resources	Shelter	Risk - High
Worth looting if it's a food truck for a supermarket, and won't provide much shelter in a disaster.	o	• CB Radio	The cabin won't provide much more shelter than a car.	o

Road Train

Usefulness	Description
3/5 Loot: 0/5 Shelter: 0/5 Risk: 0/5	A road train, also known as a land train or long combination vehicle (LCV) is a semi-trailer used to move road freight more efficiently than single-trailer semi-trailers. It consists of one semi-trailer or more connected together with or without a prime-mover. It typically has to be at least three trailers and one prime-mover.

Recommendation	Loot Description	Resources	Shelter	Risk - High
Worth looting if it's got a resource that you need such as fuel, cattle or food.	You will likely get a LOT of a single type of item or resource such as fuel.	• Fuel • CB Radio	The cabin won't provide much more shelter than a car.	A road train is likely to be a high profile target in a disaster, particularly if it has a currently scarce resource.

Tram / Train

A train is a series of connected vehicles that run along a railway track and transport people or freight. Trains are typically pulled or pushed by locomotives (often known simply as "engines"), though some are self-propelled, such as multiple units or railcars.

Tram

Usefulness	Description
2/5 Loot: 0/5 Shelter: 0/5 Risk: 0/5	A tram (also known as a streetcar or trolley in Canada and the United States) is an urban rail transit in which vehicles, whether individual railcars or multiple-unit trains, run on tramway tracks on urban public streets; some include segments on segregated right-of-way.

Recommendation	Loot Description	Resources	Shelter	Risk - Moderate
o	o	•	Decent shelter from passing disasters and fairly wind resistant.	o

Commuter Train

Usefulness	Description
2/5 Loot: 0/5 Shelter: 0/5 Risk: 0/5	A train is a series of connected vehicles that run along a railway track and transport people or freight. Trains are typically pulled or pushed by locomotives (often known simply as "engines"), though some are self-propelled, such as multiple units or railcars.

Recommendation	Loot Description	Resources	Shelter	Risk - Low
o	o	• Few if any	Decent shelter from passing disasters and fairly wind resistant.	Early on, trains could be targeted, but when it's cooled down this will be a relatively safe location.

Sleeper Train

Usefulness	Description
3/5 Loot: 0/5 Shelter: 0/5 Risk: 0/5	The sleeping car or sleeper (often wagon-lit) is a railway passenger car that can accommodate all passengers in beds of one kind or another, for the purpose of sleeping.

Recommendation	Loot Description	Resources	Shelter	Risk - Moderate
o	o	• Food	o	o

Freight Train

Usefulness	Description
4/5 Loot: 0/5 Shelter: 0/5 Risk: 0/5	A freight train, also called a goods train or cargo train, is a railway train that is used to carry cargo, as opposed to passengers. Freight trains are made up of one or more locomotives which provide propulsion, along with one or more railroad cars (also known as wagons) which carry freight.

Recommendation	Loot Description	Resources	Shelter	Risk - High
Worthwhile looking in each of the shipping containers if you have the time, also makes a decent shelter from a passing disaster.	o	• Lots of misc cargo • Snacks • Diesel Fuel	A fairly strong shelter which should withstand most disasters, including strong wind.	Many others will likely see a freight train as an ideal thing to loot so you may run into others.

Boat

A boat is a watercraft of a large range of types and sizes, but generally smaller than a ship, which is distinguished by its larger size or capacity, its shape, or its ability to carry boats.

Light Boat

Usefulness 3/5 — Loot: 2/5, Shelter: 1/5, Risk: 0/5

Description
A boat is a watercraft of a large range of types and sizes, but generally smaller than a ship, which is distinguished by its larger size or capacity, its shape, or its ability to carry boats. Small boats are typically used on inland waterways such as rivers and lakes, or in protected coastal areas.

Recommendation	Loot Description	Resources	Shelter	Risk - Low
o	o	• Flares • Life Jackets • Fuel	Only really a good shelter from a flood, but you need to bail water.	o

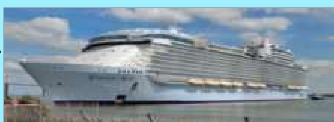
Ferry

Usefulness -/5 — Loot: 0/5, Shelter: 0/5, Risk: 0/5

Description
A ferry is a boat that transports passengers, and occasionally vehicles and cargo, across a body of water. A small passenger ferry with multiple stops, like those in Venice, Italy, is sometimes referred to as a water taxi or water bus.

Recommendation	Loot Description	Resources	Shelter	Risk - Moderate
o	o	• Flares • Life Jackets • Fuel • First Aid Kit	o	o

Cruise Ship



Usefulness 5/5 — Loot: 5/5, Shelter: 5/5, Risk: 5/5

Description
Cruise ships are large passenger ships used mainly for vacationing. Unlike ocean liners, which are used for transport, cruise ships typically embark on round-trip voyages to various ports of call, where passengers may go on tours known as "shore excursions".

Recommendation	Loot Description	Resources	Shelter	Risk - High
If you can get to one, a cruise ship is an excellent thing to loot. It also makes a perfect shelter from a disaster.	Near everything you could need to survive.	• Food & Water • Bedding • Fuel • First Aid Kit	An excellent shelter location which will shield you from basically every disaster.	Cruise ships would be a high risk to loot due to the amount of lootable items on board and its sheer size.

Yacht

Usefulness 3/5 — Loot: 0/5, Shelter: 0/5, Risk: 0/5

Description
A yacht is a sail- or motor-propelled watercraft made for pleasure, cruising, or racing. There is no standard definition, though the term generally applies to vessels with a cabin intended for overnight use. To be termed a yacht, as opposed to a boat, such a pleasure vessel should be at least 33 feet (10 m) in length and have good aesthetic qualities.

Recommendation	Loot Description	Resources	Shelter	Risk - Moderate
o	o	• Flares • Life Jackets • Fuel • First Aid Kit	o	o

Hovercraft

Usefulness 3/5 — Loot: 0/5, Shelter: 0/5, Risk: 0/5

Description
A hovercraft, also known as an air-cushion vehicle or ACV, is an amphibious craft capable of travelling over land, water, mud, ice, and various other surfaces.

Recommendation	Loot Description	Resources	Shelter	Risk - Moderate
o	o	• Fuel	o	o

Cargo Ship

Usefulness 5/5 — Loot: 5/5, Shelter: 5/5, Risk: 5/5

Description
A cargo ship or freighter is a merchant ship that carries cargo, goods, and materials from one port to another. Thousands of cargo carriers ply the world's seas and oceans each year, handling the bulk of international trade.

Recommendation	Loot Description	Resources	Shelter	Risk - High
An excellent location for a base of operations which will have a huge amount of loot on board. Think "The Day After Tomorrow".	Near everything you could need to survive.	• Food & Water • Medicine & First Aid • Flares	Would make an excellent place to shelter from disasters.	Cargo ships would be a high risk to loot due to the amount of items on board and its sheer size.

Rescue Boats

Usefulness	Description
-/5 Loot: 0/5 Shelter: 0/5 Risk: 0/5	A rescue boat is a boat rescue craft which is used to attend a vessel in distress, or its survivors, to rescue crew and passengers. It can be hand pulled, sail powered or powered by an engine. Lifeboats may be rigid, inflatable or rigid-inflatable combination-hulled vessels.

Recommendation	Loot Description	Resources	Shelter	Risk - Moderate
o	o	● Flares ● Life Jackets ● Fuel ● First Aid Kit	o	o

Battleship

Usefulness	Description
5/5 Loot: 5/5 Shelter: 5/5 Risk: 5/5	A battleship is a large, heavily armored warship with a main battery consisting of large-caliber guns, designed to serve as capital ships with the most intense firepower. Before the rise of supercarriers, battleships were among the largest and most formidable weapon systems ever built.

Recommendation	Loot Description	Resources	Shelter	Risk - Very High
If docked, it's a perfect base of operations, huge amount of loot and complete protection from any disaster.	Military loot, weapons, long term food, water	● Weapons ● Food & Water ● Fuel	o	Battleships would be a very high risk to loot due to the amount of items on board, its military status and its sheer size.

Aircraft Carrier

Usefulness	Description
5/5 Loot: 5/5 Shelter: 5/5 Risk: 5/5	An aircraft carrier is a warship that serves as a seagoing airbase, equipped with a full-length flight deck and hangar facilities for supporting, arming, deploying and recovering shipborne aircraft. Typically it is the capital ship of a fleet, as it allows a naval force to project seaborne air power far from homeland.

Recommendation	Loot Description	Resources	Shelter	Risk - Very High
If docked, it's a perfect base of operations, huge amount of loot and complete protection from any disaster.	Military loot, weapons, long term food, water	● Weapons ● Food & Water ● Fuel	o	Aircraft Carriers would be a very high risk to loot due to the amount of items on board, its military status and its sheer size.

Submarine

Usefulness	Description
5/5 Loot: 5/5 Shelter: 5/5 Risk: 5/5	A submarine (or sub) is a watercraft capable of independent operation underwater. The term "submarine" is also sometimes used historically or informally to refer to remotely operated vehicles and robots, or to medium-sized or smaller vessels (such as the midget submarine and the wet sub).

Recommendation	Loot Description	Resources	Shelter	Risk - Very High
If docked, this could make an excellent base of operations which is protected from virtually all disasters. Possible military loot.	Military loot, long term food, water	● Weapons ● Food & Water	o	Submarines would be a very high risk to loot due to the amount of items on board, its military status and its sheer size. Chance of sinking.

Helicopters

A helicopter is a type of rotorcraft in which lift and thrust are supplied by horizontally spinning rotors.

Private Helicopter

Usefulness	Description
2/5 Loot: 0/5 Shelter: 0/5 Risk: 0/5	A helicopter is a type of rotorcraft in which lift and thrust are supplied by horizontally spinning rotors. This allows the helicopter to take off and land vertically, to hover, and to fly forward, backward and laterally. These attributes allow helicopters to be used in congested or isolated areas where fixed-wing aircraft cannot land without a runway.

Recommendation	Loot Description	Resources	Shelter	Risk - Moderate
Not very useful unless you can fly one. Little loot except for snacks.	o	● First Aid Kit	Don't use this for shelter if it's a wind based event as it may flip over.	o

Tourism Helicopter

Usefulness	Description
2/5 Loot: 0/5 Shelter: 0/5 Risk: 0/5	A helicopter is a type of rotorcraft in which lift and thrust are supplied by horizontally spinning rotors. This allows the helicopter to take off and land vertically, to hover, and to fly forward, backward and laterally. These attributes allow helicopters to be used in congested or isolated areas where fixed-wing aircraft cannot land without a runway.

Recommendation	Loot Description	Resources	Shelter	Risk - Moderate
Not very useful unless you can fly one. Little loot except for snacks.	o	● First Aid Kit	Don't use this for shelter if it's a wind based event as it may flip over.	o

Transport Helicopter

Usefulness	Description
3/5 Loot: 2/5 Shelter: 2/5 Risk: 4/5	A cargo helicopter is a helicopter that is designed or converted for the carriage of cargo rather than passengers. Such aircraft generally feature one or more large doors for loading cargo. Passenger amenities are removed or not installed, although there are usually basic comfort facilities for the crew such as a galley, lavatory, and bunks.

Recommendation	Loot Description	Resources	Shelter	Risk - High
May have some useful cargo inside. Virtually impossible to fly yourself. Weak protection from disasters.	o	• First Aid Kit	Don't use this for shelter if it's a wind based event as it may flip over.	These are likely to be targets during long term disasters for having a military 'feel' to them which will draw people to loot it.

Military Helicopter

Usefulness
3/5
Loot: 2/5
Shelter: 2/5
Risk: 5/5

Description
A military helicopter is a helicopter that is either specifically designed for or converted for usage by a military. A military helicopter's mission is a function of its design or conversion. The most common use of military helicopters is airlift, but they can be modified or converted to perform other missions such as combat search and rescue (CSAR), medical evacuation (MEDEVAC), or armed with weapons for air support.

Recommendation	Loot Description	Resources	Shelter	Risk - Very High
May have some military items inside. Virtually impossible to fly yourself. Weak protection from disasters.	Very little, if any usable loot. People will look at it for the 'cool' factor.	• First Aid Kit • Survial Kit	Don't use this for shelter if it's a wind based event as it may flip over.	Military aircraft are priority targets in wars and for anyone wanting to take a closer look.

Planes

An aircraft is a vehicle that is able to fly by gaining support from the air. It counters the force of gravity by using either static lift or the dynamic lift of an airfoil, or, in a few cases, direct downward thrust from its engines.

Light Aircraft

Usefulness
4/5
Loot: 1/5
Shelter: 1/5
Risk: 3/5

Description
A light aircraft is an aircraft that has a maximum gross takeoff weight of 12,500 lb (5,670 kg) or less. Light aircraft are used as utility aircraft commercially for small-scale passenger and freight transport; for sightseeing, photography, cropdusting, and other aerial work.

Recommendation	Loot Description	Resources	Shelter	Risk - Moderate
If you can get this going and can fly one, it would make an excellent form of transport, but otherwise it's not useful to loot.	o	• First Aid Kit	Don't use this for shelter if it's a wind based event as it will flip over.	These would be a moderate target by looters and those who may need a small plane.

Wreckage Loot

Loot From the Plane Fuselage/Cockpit
- Shelter: The intact part of the fuselage offers immediate protection from sun, rain, and wind. It can be insulated with other materials.
- Signaling: The large, metallic surface can be reflective, used to flash signals to aircraft. The bright colours of the plane (if any) can increase visibility.
- Water Collection: Tarps or large sections of metal can be angled to collect rainwater.
- Tools: Any remaining tools in the cockpit or cargo hold (e.g., wrenches, screwdrivers, fire extinguisher, small axe, first aid kit if present).
- Wiring/Cables: Can be used for cordage, snares, or electrical ignitions if carefully handled (though unlikely to be useful for power).
- Plexiglass/Windows: Can be broken to create sharp edges for cutting, or possibly used as a solar still component.
- Insulation: Found within the walls and ceiling of the plane, this can be pulled out and used for warmth, padding, or fire-starting tinder.
- Fuel (Jet Fuel/AvGas): Extremely Dangerous, but can be used as a fire accelerant.
- Batteries: If intact, they could potentially power small devices or provide a spark for fire starting.
- Metal Sheeting/Panels: Can be cut or torn to make tools, containers, or additional reflective signal panels.
- Rubber Hoses/Piping: Might be usable for siphoning water or as rudimentary cordage.

Plane Seats
- Cushions/Padding: Excellent for insulation from the ground or for comfortable bedding materials.
- Fabric: Can be torn into strips for bandages, cordage or rags.
- Metal Frames: Can be bent or broken to create makeshift tools, splints, or anchors.
- Seatbelts: Strong webbing for cordage, lashing, or tourniquets. The buckles can be used as heavy-duty clips.

Wing & Landing Gear (damaged)
- Metal Sections: Large reflective surfaces for signaling, or can be broken down for smaller metal pieces.
- Fuel Tanks (if any remaining): Again, handle fuel with extreme caution.
- Wiring/Piping: Similar to fuselage components.
- Metal Poles/Struts: Can be used as digging tools, splints, or supports for a lean-to.
- Rubber Tires: Can be cut to make shoe soles, or burned for smoke signals (toxic).
- First Aid Kits: Critical in any disaster scenario.
- Knives/Multi-tools: Invaluable for cutting, prying, and general utility.
- Flashlights/Headlamps: Essential for night operations.
- Lighters/Matches: Fire starting.
- Sunscreen/Insect Repellent: Protection from environmental hazards.
- Any medications: Especially if any party members have chronic conditions.
- Glasses/Mirrors: For signaling or starting fire.
- Pens/Paper: For communication or journaling.
- Plastic Bags/Tarps: For water collection, shelter, or waterproofing.
- Ropes/Cordage (e.g., shoelaces, paracord bracelets): Multi-purpose.
- Electronics (phones, power banks): For emergency calls, light, or signal.
- Watches & Jewelry: Timekeeping, possibly a reflective surface.

Commercial Aircraft

Usefulness
2/5
Loot: 2/5
Shelter: 1/5
Risk: 3/5

Description
An airliner is a type of airplane for transporting passengers and air cargo. Such aircraft are most often operated by airlines. The modern and most common variant of the airliner is a long, tube shaped, and jet powered aircraft. The largest of them are wide-body jets which are also called twin-aisle because they generally have two separate aisles running from the front to the back of the passenger cabin.

Recommendation	Loot Description	Resources	Shelter	Risk - Moderate
The only useful loot you could find is snack foods. Avoid using one as a shelter.	Not likely to have much beyond snack foods.	• First Aid Kit	Don't use this for shelter if it's a wind based event as it will likely flip over.	A cargo plane will be a high risk due to its sheer size.

Wreckage Loot

Essential Survival Loot
- First Aid Kit(s): Commercial aircraft are required to carry multiple first aid kits. These are your absolute top priority for Ben's injury. Search the cockpit, galleys, and overhead bins. They contain bandages, antiseptics, pain relievers, and possibly even more advanced medical supplies like IV kits (in Enhanced Emergency Medical Kits - EEMKs, usually found on larger aircraft).
- Fire Extinguishers: Aircraft carry various types (Halon, water-based). While primarily for fire suppression, the canisters are strong metal, and Halon (while toxic to breathe directly) could theoretically be released to scare off animals, or the canister itself could be a tool. The contents might be useful for other chemical reactions, but use with extreme caution.
- Life Vests/Flotation Devices: Every seat cushion is a flotation device. These are crucial if you need to enter the water. They also often have whistles and reflective strips for signaling.
- Emergency Locator Transmitter (ELT): This is usually located in the tail section. If it deployed and is transmitting, it's your primary means of rescue. Learn how to activate it if it isn't automatic. There might also be Portable ELTs (PLBs) in the cockpit or a pilot's survival kit.

Pilot's Flight Bag/Cockpit Contents
- Maps/Charts: Invaluable for navigation and identifying your location. Even old ones can show general terrain.
- Pens/Pencils/Paper: For leaving notes, tracking time, drawing maps.
- Flashlights/Headlamps: With batteries, critical for night operations.
- Multi-tool/Knife: If the pilot had one, it's a goldmine.
- Survival Kit: Some pilots carry personal survival kits with fire starters, fishing line, signaling mirrors, etc.
- Logbooks/Manuals: Paper for tinder, or for detailed information about the aircraft (less useful for survival, but might have diagrams).

Shelter & Insulation
- Fuselage/Wings: The main body of the aircraft itself provides significant shelter from rain, sun, and wind. Sections can be cut or broken off to extend a lean-to or provide additional cover.
- Seat Cushions: Excellent for insulating the ground, providing bedding, or as additional flotation.
- Blankets/Pillows: Found in overhead bins or seat pockets, provide warmth and comfort.
- Cabin Insulation: The fibrous material within the walls and ceiling of the aircraft. Can be pulled out for warmth, padding, or very effective tinder.
- Overhead Bins/Compartments: Can be detached and used as containers or for small shelter structures.
- Plastic Panels: From interior walls or ceiling, can be used for waterproofing, groundsheets, or water collection.

Fire & Signaling
- Metal from Fuselage/Wings: Large, shiny pieces of aluminum can be polished to create signal mirrors.
- Wiring: Small gauge wires can be stripped for tinder (if shorted with a battery), or used for snares or fishing line.
- Batteries: From emergency lights, radios, or cockpit. Can provide a spark for fire starting (carefully!).
- Plastic/Rubber: Parts of seats, wiring insulation, or tires can be cut and used as fire accelerants (will produce toxic smoke, use judiciously for signals).
- Fuel: EXTREMELY DANGEROUS. Jet fuel (kerosene-based) or AvGas (gasoline-based for smaller planes) is highly flammable. Use only with extreme caution and away from the wreckage. A tiny amount can be used as fire accelerant.
- Reflective Strips: From life vests or emergency exits, can be used as signaling material.
- Whistles: Often attached to life vests. Loud and effective for signaling.

Tools & Cordage
- Seatbelts/Webbing: Extremely strong material for cordage, lashing, tourniquets, or improvising restraints.
- Metal from Structure: Broken pieces of aluminum or steel from the frame, landing gear, or engine can be sharpened or reshaped into crude tools (knives, digging tools, hammers) with effort.
- Plexiglass/Windows: Shattered pieces can provide sharp edges for cutting.
- Wiring/Cables: Various gauges, can be stripped and used for cordage, snares, or fishing line.

Fasteners (Bolts, Screws, Rivets): Small metal pieces that can be fashioned into hooks or awls.
- Hydraulic Hoses/Pipes: Can be cut and used for siphoning or as containers.
- Fire Axe (if present): On larger aircraft, a crash axe is often located in the cockpit for emergency egress. Invaluable for cutting, breaking, and prying.
- Galley Carts/Containers: If relatively intact, these metal or plastic containers can be used for storage, water collection, or carrying items.
- Kitchen Utensils (if in galley): Knives, spoons, forks can be adapted for various tasks.

Water & Food
- Beverages from Galley/Passenger Luggage: Cans of soda, juice, or bottled water. Prioritize these immediately.
- Sealed Food Rations: Depending on the airline and flight length, emergency food bars or sealed snacks may be in crew areas or emergency kits.
- Water from Toilets (last resort): While unappetizing, the water in the toilet cisterns (before flushing) is usually clean. The blue additive is non-toxic in small amounts.
- Water from Hot Water Boilers (galley): If any water remained in the system, it could be a small source.
- Plastic Bags/Liners: From trash cans or seat pockets, can be used for water collection (dew, rain) or a solar still.

Other Useful Items
- Mirrors: From lavatories or personal compacts, for signaling.
- Pens/Pencils: For writing messages, drawing maps, or small tools.
- Paper/Magazines/Safety Cards: Excellent tinder for fire starting.
- Towels/Napkins: For cleaning, bandages, or tinder.
- Airline Branded Items: Any plastic cups, trays, utensils can be repurposed as containers.
- Electronics: Phones, tablets, power banks (if charged) for light or emergency calls (if signal exists). Batteries can be harvested.
- Passenger Luggage/Carry-ons: Contains personal items like clothing (for warmth, bandages), toiletries (soap, toothpaste - for hygiene), books/magazines, and any personal survival gear passengers might have carried.
- Plastic Sheeting (from packaging/covers): Can be used for water collection, shelter, or solar still.

Cargo Plane

	Usefulness **4/5** Loot: 4/5 Shelter: 3/5 Risk: 4/5	**Description** A cargo aircraft (also known as a freighter) is a fixed-wing aircraft that is designed or converted for the carriage of cargo rather than passengers. Such aircraft generally feature one or more large doors for loading cargo. Passenger amenities are removed or not installed, although there are usually basic comfort facilities for the crew such as a galley, lavatory, and bunks in larger planes.

Recommendation There could be decent loot inside based on what it was carrying, but otherwise it doesn't make a useful shelter.	**Loot Description** o	**Resources** ● First Aid Kit	**Shelter** Don't use this for shelter if it's a wind based event as it will likely flip over.	**Risk - High** A cargo plane will be a high risk due to the cargo it may have and its sheer size.

Military Aircraft

	Usefulness **3/5** Loot: 2/5 Shelter: 1/5 Risk: 5/5	**Description** A military aircraft is any fixed-wing or rotary-wing aircraft that is operated by a legal or insurrectionary military of any type. Some military aircraft engage directly in aerial warfare, while others take on non-combat roles.

Recommendation May have some military items inside. Virtually impossible to fly yourself. Weak protection from disasters.	**Loot Description** There is likely going to be a survival kit and medical kit in the ejector seat.	**Resources** • Survival Kit • Medical Kit	**Shelter** Don't use this for shelter if it's a wind based event as it will likely flip over.	**Risk - Very High** Military aircraft are priority targets in wars and for anyone wanting to take a closer look.

Military

A military vehicle is any vehicle for land-based military transport and activity, including combat vehicles, both specifically designed for or significantly used by military. Most military vehicles require off-road capabilities and/or vehicle armor, making them heavy.

Light Utility Vehicle

	Usefulness **4/5** Loot: 2/5 Shelter: 3/5 Risk: 4/5	**Description** Military light utility vehicle, or simply light utility vehicle (LUV), is a term used for the lightest weight class military vehicle category. A Jeep-like four-wheel drive vehicle for military use by definition lighter than other military trucks and vehicles, inherently compact and usually with light or no armour, with short body overhangs for nimble all-terrain mobility, and frequently around 4-passenger capacity.

Recommendation May have some military items inside but very uneconomical to run. Fair protection from disasters.	**Loot Description** o	**Resources** • Military Items	**Shelter** Fair protection from disasters.	**Risk - High** Any military vehicle will be a target by other nations, gangs and individuals.

APC

	Usefulness **4/5** Loot: 3/5 Shelter: 4/5 Risk: 4/5	**Description** An armoured personnel carrier (APC) is a broad type of armoured military vehicle designed to transport personnel and equipment in combat zones. Since World War I, APCs have become a very common piece of military equipment around the world.

Recommendation May have some military items inside but uneconomical to run. Great protection from disasters.	**Loot Description** o	**Resources** • Military Items • Long Life Food • Weapons • First Aid Kit	**Shelter** Good protection from disasters.	**Risk - High** Any military vehicle will be a target by other nations, gangs and individuals.

Tank

	Usefulness **3/5** Loot: 3/5 Shelter: 4/5 Risk: 5/5	**Description** A tank is an armoured fighting vehicle intended as a primary offensive weapon in front-line ground combat. Tank designs are a balance of heavy firepower, strong armour, and battlefield mobility provided by tracks and a powerful engine; their main armament is often mounted within a turret.

Recommendation May have some military items inside but very uneconomical to run. Excellent protection from disasters.	**Loot Description** o	**Resources** • Military Items • Long Life Food	**Shelter** Excellent protection from disasters except flooding.	**Risk - Very High** You have a high chance of being targeted by enemy nations, gangs and rogue individuals.

Lootable Vehicle Items

A list of items which can be generally scavenged from vehicles:
Fuel: Fuel may be siphoned from vehicles or puncturing the tank with a container below. It may be expired however.
Rubber: Tyres and hoses contain a lot of rubber which can be used for construction or creating signal fires.
Engine Oil: Can be reused if the contaminants are removed.
Water: If filtered and there's no additives, water from the washer bay can be drunk.

6 Looting

This section details how to loot, what to look for and what to be aware of.

Overview

Upon first thought anyone would jump to the conclusion that looting is a criminal act and conjure pictures of a violent bunch of people breaking into areas affected by a disaster and stealing TVs and electronics. In fact there is quite a variety of looting types. The scenario mentioned was an example of basic theft and not the one that is recommended as it's done only for monetary gain for oneself.

Looter Types

The following rows detail different ways looting can be perceived and the outcomes from it.

Monetary Looting	The type of looting is done only for ones self interests either for money or entertainment purposes.	**Example Loot** • Electronics • Currency • Precious Metals	• Jewelry • Other Valuables
Survival Looting	Closer to scavenging than looting, where individuals seek out any forms of food, water and items that may assist in survival.	**Example Loot** • Canned Food • Matches • Water Filters	• Batteries • Duct Tape • Gas • Books

LOCATIONS Looting Looter Types

General Looting	Usually done by a member of a group who's job it is to go out every day and find useful items for their village/group/gang.	**Example Loot** ● Anything that can be used by a group of survivors.	
Component Looting	These people are interested in reusing electronics and internal components from abandoned items that may be useful in other ways such as repairs.	**Example Loot** ● Broken Electronics ● Springs ● Capacitors	● Antennas

Siphoning Fuel

This section demonstrates how you can quickly and easily siphon fuel from a vehicle using a variety of different ways. This skill can be handy in all sorts of situations, whether you run out of gas miles from civilization, need to winterize a vehicle, or simply want to refill your lawnmower without having to make a trip to the gas station.

Manual Suction

How to siphon fuel with your mouth or another form of suction.

1	Place the container in which you want to store fuel below the gas tank
2	Open the gas tank and insert a long plastic tube inside. To check if it is submerged, blow air into it, and you should hear bubbling noises.
3	Create a loop in the pipe, such that the other end is facing upwards. This mechanism helps control the gas flow better while sucking.
4	Take the end of the pipe facing you and begin sucking carefully. The transparency of the pipe will allow you to see the gas flowing through it.
5	Keep sucking until the gas reaches the bottom of the loop, which should be a foot away from your mouth. Remove it from your mouth and plug it shut with a finger.
6	Carefully lower this end into the open container, without pulling the other end of the pipe from within the tank. Once inside the container, remove the finger from the pipe, which will cause the gas to flow into it.
7	When you have removed enough gas, or if the container is about to get full, again clamp the end of the pipe shut. Raise this end higher than the level of the tank and unplug it to drain off the remaining gas back into the tank. Fix the lid back on the tank.

Two Pipes

How to siphon fuel with two pipes.

1	Get two transparent plastic pipes, such that one is much longer than the other.
2	Insert the longer pipe deep into the tank, and put its other end into an open container placed at a lower level than the tank.
3	Take the shorter pipe and insert one of its ends deep within the tank, such that both pipes have one end inside the tank.
4	Now, seal the tank opening by plugging a large wet cloth in it. The aim is to make the opening air-tight, despite the pipes going inside.
5	Take the open end of the short hose in your mouth and blow air into it. This is relatively safer than sucking gas out of the tank, but for more safety, connect it to a vacuum pump.
6	Blowing air inside the tank raises the pressure in it since the opening is sealed. This pressure acts on the gas surface, and forces it out through the other pipe.
7	To stop the gas flow, plug a finger on the end of the long pipe, and raise it higher than the gas tank. Carefully release the finger to drain the remaining fuel back into the tank.

With a Pump

How to siphon fuel with a fuel pump.

1	A vacuum pump works the same way as manually sucking the gas out, but protects the user from ingesting gasoline or its fumes. It's the best and most reliable way to siphon gas.
2	First, identify the input and output ends of the pump. This is vital, as inserting the wrong end will blow air into the tank, rather than drawing gas out of it.
3	Place an open container below the gas tank. Then, remove the tank lid.
4	Insert the input end of the pipe inside the tank until it gets submerged or reaches the bottom. Then, place the output end of the pipe inside the container.
5	Depending on the type of vacuum pump, you may have to press a bulb or turn a squeeze-valve to begin transferring the gas. Some pumps require repeated pressing, while others are automatic.
6	When the container is full, close the valve or raise the output end higher than the gas tank, after clamping it shut with a finger. Drain off the gas remaining in the pipe back into the tank.

Car Tipping

If you have enough people, you can tip a car on its side and wait for the fuel to come out. This is a semi-destructive method, the car will still run afterwards once it has been refueled but the mirrors and other extruding components will break off, therefore only do it to abandoned cars.

1	Take the fuel cap off the car.
2	Attach a funnel to a tube which covers the fuel valve. Some cars may require you to push in the metal flap which prevents siphoning.
3	Tip the car on its side until the fuel comes out, be sure it doesn't tip completely over crushing the fuel retriever.
4	Once you have the fuel, put the car back down.

Hole Drilling

You can drill a hole in the fuel compartment to get to the fuel. This is a destructive method and the car will likely be un-usable once drilled unless it's plugged back up again, therefore only do this to abandoned cars. This is also a dangerous method to choose as the fuel gas could ignite and cause an explosion. It has also been shown on movies that you can make a hole with a screwdriver and hammer, this is possible but its very difficult to get enough force to pierce the fuel canister due to having to be on the underside of the car.

LOCATIONS | Looting | Siphoning Fuel | Hole Drilling

WARNING: It's not full gas tanks that scare mechanics to work on, it's near-empty ones. Sticking a drill in an almost-empty tank could create a combustible spark that could quickly incinerate them and the vehicle.

1	Locate the fuel tank.
2	Drill a hole in the tank with a container to collect the fuel underneath.

Siphon-Proof Cars

All modern cars come with a siphon-proof filter in the gas tank. This consists of a metal flap which clamps shut and prevents any hose from entering the tank. To siphon gas from such a tank, you can either use the manual suction method or the siphon pump method. But for it to work, the metal flap has to be held open using a long object like a screwdriver or a chopstick. Using metallic objects like a screwdriver is not recommended, as it can create a spark which can be deadly. In case you are using one, make sure it is grounded with the car body. The best option is to wedge a chopstick into the tank opening to hold the flap open. Now, this allows siphoning of gas with a hose.

If required, a friend can hold the chopstick in place. Some cars come with a ball-shaped anti-siphon valve, which, while allowing gas-filling, does not allow the entry of pipes. The above methods do not work on such cars. Many products like the GasTapper are available in the market, which can be used to siphon fuel from cars with ball-shaped valves. They have a thin inlet pipe which passes into the tank through the space around the ball valve, and is connected to a suction pump.

Natural Disasters

Preparing for and surviving any natural disasters

"Preparedness is the only way we can combat a natural disaster."
John Quinlan

Introduction

Natural disasters can happen to anyone at any time. The type of disaster is often based on locality as some disasters may be more prevalent in certain areas. Know which ones are common in your area and prepare for them specifically but also taking note of the uncommon or rare ones.

Purpose	The aim of NATURAL DISASTERS is to provide the reader with the types of different naturally occurring disasters including in-depth information on how to survive any that may arise.
Lost?	● Pandemics can be found in the MAN-MADE DISASTERS category even though they can also be considered 'natural' to some. ● For information on supervolcanos, world wars and other planet-altering disasters, see the MASS DESTRUCTION section. ● For information on minor acts of nature, see the METEOROLOGY section. ● For a list of the most likely natural disasters by country, see the GEOGRAPHY section. ● For any small scale natural disasters which only affect one person or family, see the PERSONAL DISASTERS section. ● For a distraction from the current turmoil of the world, see the ENTERTAINMENT section.

Contents

1 Overview

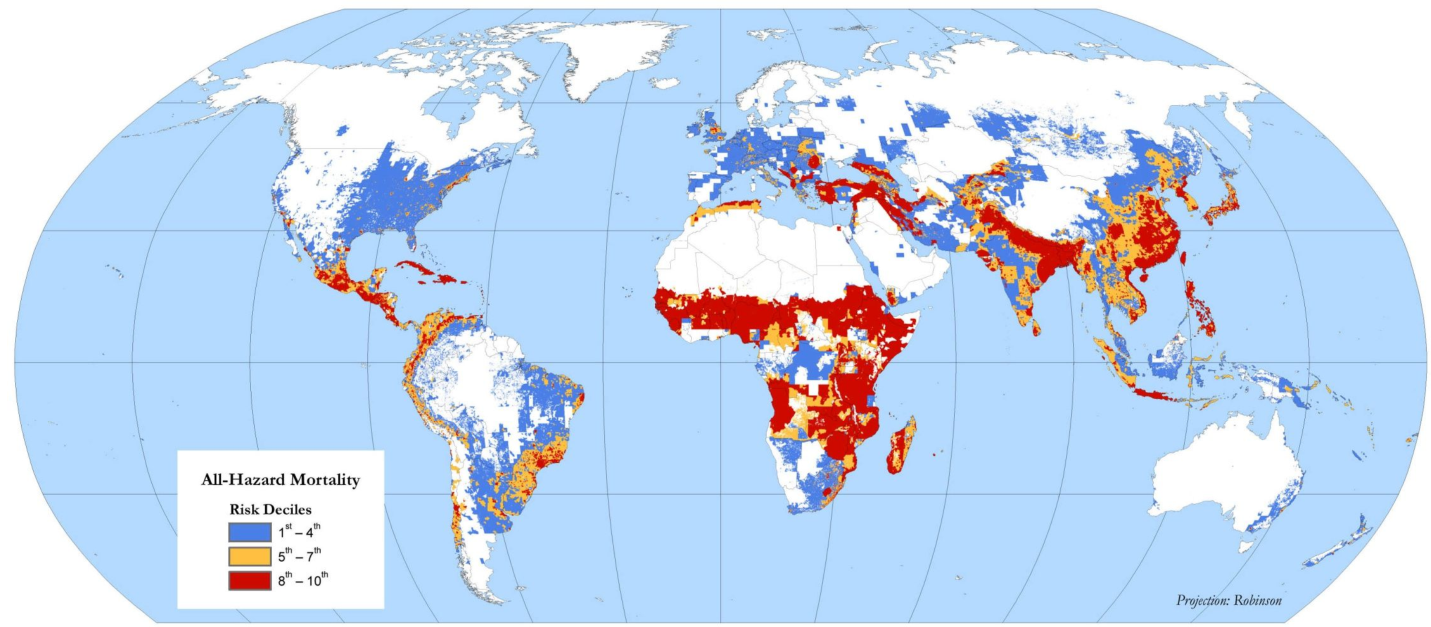
A natural disaster is a sudden event that causes widespread destruction, major collateral damage or loss of life, brought about by forces other than the acts of human beings. A natural disaster might be caused by earthquakes, flooding, volcanic eruption, landslide, hurricanes etc. To be classified as a disaster, it will have profound environmental effect and/or human loss and frequently causes financial loss.

Multihazard Risk Distribution

Below is a global multihazard mortality risks and distribution chart from 2005.

Multihazard risks were calculated by summing the vulnerability-weighed single-hazard mortality risk values for each grid cell across the six hazard types: Cyclones, Drought, Earthquakes, Floods, Landslides and Volcanoes.

I highly recommend moving out of any locations that are red or yellow.



2 Landslide

A landslide, also known as a landslip or mudslide, is a form of mass wasting that includes a wide range of ground movements, such as rockfalls, deep failure of slopes, and shallow debris flows. Landslides can occur underwater, in which case they are called submarine landslides, and in coastal and onshore environments. Although the action of gravity is the primary driving force for a landslide to occur, there are other contributing factors affecting slope stability. Typically, pre-conditional factors build up specific surface or sub-surface conditions that make a slope prone to failure, whereas the actual landslide often requires a trigger before being released.

Causes
Landslides occur when the slope changes from a stable to an unstable condition. A change in the stability of a slope can be caused by a number of factors, acting together or alone. Natural causes of landslides include:
● Groundwater (pore water) pressure acting to destabilize the slope
● Erosion of the toe of a slope by rivers or ocean waves
● Loss or absence of vertical vegetative structure, soil nutrients, and soil structure (e.g. after a wildfire – a fire in forests lasting for 3–4 days)
● Volcanic eruptions
● Weakening of a slope through saturation by snow melting, glaciers melting, or heavy rain
● Earthquakes adding loads to barely stable slope
● Earthquake-caused liquefaction destabilizing slopes

Landslide Aggravation
Landslides are aggravated by human activities such as:
● Deforestation, cultivation and construction, which destabilize the already fragile slopes
● Vibrations from machinery or traffic
● Earthwork which alters the shape of a slope, or which imposes new loads on an existing slope
● In shallow soils, the removal of deep-rooted vegetation that binds colluvium to bedrock
● Construction, agricultural or forestry activities (logging) which change the amount of water infiltrating the soil
● Blasting

Debris Flow
Slope material that becomes saturated with water may develop into a debris flow or mud flow. The resulting slurry of rock and mud may pick up trees, houses and cars, thus blocking bridges and tributaries causing flooding along its path. Debris flow is often mistaken for flash flood, but they are entirely different processes. Muddy-debris flows in alpine areas cause severe damage to structures and infrastructure and often claim human lives.

Muddy-debris flows can start as a result of slope-related factors and shallow landslides can dam stream beds, resulting in temporary water blockage. As the impoundments fail, a "domino effect" may be created, with a remarkable growth in the volume of the flowing mass, which takes up the debris in the stream channel. The solid–liquid mixture can reach densities of up to 2,000 kg/m3 (120 lb/cu ft) and velocities of up to 14 m/s (46 ft/s).

These processes normally cause the first severe road interruptions, due not only to deposits accumulated on the road (from several cubic metres to hundreds of cubic metres), but in some cases to the complete removal of bridges or roadways or railways crossing the stream channel. Damage usually derives from a common underestimation of mud-debris flows: in the alpine valleys, for example, bridges are frequently destroyed by the impact force of the flow because their span is usually calculated only for a water discharge.

For a small basin in the Italian Alps (area 1.76 km2 (0.68 sq mi)) affected by a debris flow, estimated a peak discharge of 750 m3/s (26,000 cu ft/s) for a section located in the middle stretch of the main channel. At the same cross section, the maximum foreseeable water discharge (by HEC-1), was 19 m3/s (670 cu ft/s), a value about 40 times lower than that calculated for the debris flow that occurred.

Earthflow
An Earthflow is the down slope movement of mostly fine-grained material. Earthflows can move at speeds within a very wide range, from as low as 1 mm/yr (0.039 in/yr) to 20 km/h (12.4 mph). Though these are a lot like mudflows, overall they are more slow moving and are covered with solid material carried along by flow from within. They are different from fluid flows which are more rapid.

Clay, fine sand and silt, and fine-grained, pyroclastic material are all susceptible to earthflows. The velocity of the earthflow is all dependent on how much water content is in the flow itself: the higher the water content in the flow, the higher the velocity will be. These flows usually begin when the pore pressures in a fine-grained mass increase until enough of the weight of the material is supported by pore water to significantly decrease the internal shearing strength of the material.

This thereby creates a bulging lobe which advances with a slow, rolling motion. As these lobes spread out, drainage of the mass increases and the margins dry out, thereby lowering the overall velocity of the flow. This process causes the flow to thicken. The bulbous variety of earthflows are not that spectacular, but they are much more common than their rapid counterparts.

They develop a sag at their heads and are usually derived from the slumping at the source. Earthflows occur much more during periods of high precipitation, which saturates the ground and adds water to the slope content. Fissures develop during the movement of clay-like material which creates the intrusion of water into the earthflows. Water then increases the pore-water pressure and reduces the shearing strength of the material.

Debris Slide
A debris slide is a type of slide characterized by the chaotic movement of rocks, soil, and debris mixed with water and/or ice. They are usually triggered by the saturation of thickly vegetated slopes which results in an incoherent mixture of broken timber, smaller vegetation and other debris. Debris avalanches differ from debris slides because their movement is much more rapid. This is usually a result of lower cohesion or higher water content and commonly steeper slopes. Steep coastal cliffs can be caused by catastrophic debris avalanches. These have been common on the submerged flanks of ocean island volcanos such as the Hawaiian Islands and the Cape Verde Islands.

Another slip of this type was Storegga landslide. Debris slides generally start with big rocks that start at the top of the slide and begin to break apart as they slide towards the bottom. This is much slower than a debris avalanche. Debris avalanches are very fast and the entire mass seems to liquefy as it slides down the slope. This is caused by a combination of saturated material, and steep slopes. As the debris moves down the slope it generally follows stream channels leaving a v-shaped scar as it moves down the hill. This differs from the more U-shaped scar of a slump. Debris avalanches can also travel well past the foot of the slope due to their tremendous speed.

Rock Avalanche
A rock avalanche, sometimes referred to as sturzstrom, is a type of large and fast-moving landslide. It is rarer than other types of landslides and therefore poorly understood. It exhibits typically a long run-out, flowing very far over a low angle, flat, or even slightly uphill terrain. The mechanisms favouring the long runout can be different, but they typically result in the weakening of the sliding mass as the speed increases.

Shallow Landslide
Landslide in which the sliding surface is located within the soil mantle or weathered bedrock (typically to a depth from few decimetres to some meters) is called a shallow landslide. They usually include debris slides, debris flow, and failures of road cut-slopes. Landslides occurring as single large blocks of rock moving slowly down slope are sometimes called block glides. Shallow landslides can often happen in areas that have slopes with high permeable soils on top of low permeable bottom soils. The low permeable, bottom soils trap the water in the shallower, high permeable soils creating high water pressure in the top soils. As the top soils are filled with water and become heavy, slopes can become very unstable and slide over the low permeable bottom soils. Say there is a slope with silt and sand as its top soil and bedrock as its bottom soil.

During an intense rainstorm, the bedrock will keep the rain trapped in the top soils of silt and sand. As the topsoil becomes saturated and heavy, it can start to slide over the bedrock and become a shallow landslide. R. H. Campbell did a study on shallow landslides on Santa Cruz Island, California. He notes that if permeability decreases with depth, a perched water table may develop in soils at intense precipitation. When pore water pressures are sufficient to reduce effective normal stress to a critical level, failure occurs.

Deep-Seated Landslide
Landslides in which the sliding surface is mostly deeply located below the maximum rooting depth of trees (typically to depths greater than ten meters). Deep-seated landslides usually involve deep regolith, weathered rock, and/or bedrock and include large slope failure associated with translational, rotational, or complex movement. This type of landslide potentially occurs in an tectonic active region like Zagros Mountain in Iran. These typically move slowly, only several meters per year, but occasionally move faster. They tend to be larger than shallow landslides and form along a plane of weakness such as a fault or bedding plane. They can be visually identified by concave scarps at the top and steep areas at the toe.

Tsunami
Landslides that occur undersea, or have impact into water e.g. significant rockfall or volcanic collapse into the sea, can generate tsunamis. Massive landslides can also generate mega tsunamis, which are usually hundreds of meters high. In 1958, one such tsunami occurred in Lituya Bay in Alaska.

Sinkhole

A sinkhole, also known as a cenote, sink, sink-hole, swallet, swallow hole, or doline (the different terms for sinkholes are often used interchangeably), is a depression or hole in the ground caused by some form of collapse of the surface layer. Most are caused by karst processes – the chemical dissolution of carbonate rocks or suffosion processes. Sinkholes vary in size from 1 to 600 m (3.3 to 2,000 ft) both in diameter and depth, and vary in form from soil-lined bowls to bedrock-edged chasms. Sinkholes may form gradually or suddenly, and are found worldwide.

Natural Processes

Sinkholes may capture surface drainage from running or standing water, but may also form in high and dry places in specific locations. Sinkholes that capture drainage can hold it in large limestone caves. These caves may drain into tributaries of larger rivers. The formation of sinkholes involves natural processes of erosion or gradual removal of slightly soluble bedrock (such as limestone) by percolating water, the collapse of a cave roof, or a lowering of the water table. Sinkholes often form through the process of suffosion. For example, groundwater may dissolve the carbonate cement holding the sandstone particles together and then carry away the lax particles, gradually forming a void. Occasionally a sinkhole may exhibit a visible opening into a cave below. In the case of exceptionally large sinkholes, such as the Minyé sinkhole in Papua New Guinea or Cedar Sink at Mammoth Cave National Park in Kentucky, an underground stream or river may be visible across its bottom flowing from one side to the other.

Sinkholes are common where the rock below the land surface is limestone or other carbonate rock, salt beds, or in other soluble rocks, such as gypsum, that can be dissolved naturally by circulating ground water. Sinkholes also occur in sandstone and quartzite terrains. As the rock dissolves, spaces and caverns develop underground. These sinkholes can be dramatic, because the surface land usually stays intact until there is not enough support. Then, a sudden collapse of the land surface can occur.

Artificial processes

Collapses, commonly incorrectly labeled as sinkholes also occur due to human activity, such as the collapse of abandoned mines and salt cavern storage in salt domes in places like Louisiana, Mississippi and Texas. More commonly, collapses occur in urban areas due to water main breaks or sewer collapses when old pipes give way. They can also occur from the overpumping and extraction of groundwater and subsurface fluids.

Sinkholes can also form when natural water-drainage patterns are changed and new water-diversion systems are developed. Some sinkholes form when the land surface is changed, such as when industrial and runoff-storage ponds are created; the substantial weight of the new material can trigger a collapse of the roof of an existing void or cavity in the subsurface, resulting in development of a sinkhole.

Warning Signs

Sinkholes rarely strike without giving some warning in the surrounding environment or in a nearby home. Here are signs to watch for that may indicate a problem:

- Trees or fence posts that tilt or fall
- Foundations that slant
- New small ponds that appear after rain
- Cracks in the ground
- Sudden drainage of a pond
- Rapid appearance of a hole in the ground
- Dips, depressions, slopes that appear in a yard
- Cracked tiles
- Cracked grout between tiles
- Dead patches of grass or plants
- Sinkholes in the neighbourhood
- Wilted vegetation in a limited area
- Well water that is discoloured or contaminated with debris
- Cracking or buckling of home's concrete slab
- Earthy odor in home after rain
- New or widening cracks
- Cracks in interior walls
- Cracks around door and window frames
- Presence of odd bugs like slugs and centipedes in the home
- Separation between walls and ceiling or floors
- Stairstep cracks in blocks or bricks
- Uneven floors, warping of hardwood, bulging or sagging sections
- Doors or windows that don't open or close easily
- Cracks in sheetrock near doors or windows

All homes are subject to some settling. Any of these signs could exist without the presence of a sinkhole; however, the presence of one or more calls for further careful observation and an abundance of caution.

Quicksand

Quicksand is a colloid consisting of fine granular material (such as sand, silt or clay) and water. Quicksand forms in saturated loose sand when the sand is suddenly agitated. When water in the sand cannot escape, it creates a liquefied soil that loses strength and cannot support weight. Quicksand can form in standing water or in upward flowing water (as from an artesian spring). In the case of upward flowing water, forces oppose the force of gravity and suspend the soil particles.

The saturated sediment may appear quite solid until a sudden change in pressure or shock initiates liquefaction. This causes the sand to form a suspension and lose strength. The cushioning of water gives quicksand, and other liquefied sediments, a spongy, fluid-like texture. Objects in liquefied sand sink to the level at which the weight of the object is equal to the weight of the displaced soil/water mix and the submerged object floats due to its buoyancy.

Soil liquefaction occurs in (partially) saturated soil when it is shaken by an earthquake or similar forces. The movement combined with an increase in pore pressure (of groundwater) leads to the loss of particle cohesion, causing buildings or other objects on that surface to sink. Quicksand condition occurs in upward flow when the Critical Hydraulic Gradient come in the Vicinity of unity.

Properties

Quicksand is a shear thinning non-Newtonian fluid: when undisturbed, it often appears to be solid ("gel" form), but a less than 1% change in the stress on the quicksand will cause a sudden decrease in its viscosity ("sol" form). After an initial disturbance—such as a person attempting to walk on it—the water and sand in the quicksand separate and dense regions of sand sediment form; it is because of the formation of these high volume fraction regions that the viscosity of the quicksand seems to decrease suddenly. Someone stepping on it will start to sink. To move within the quicksand, a person or object must apply sufficient pressure on the compacted sand to re-introduce enough water to liquefy it. The forces required to do this are quite large: to remove a foot from quicksand at a speed of 0.01 m/s would require the same amount of force as needed to lift a car.

It is impossible for a human to sink entirely into quicksand due to the higher density of the fluid. Quicksand has a density of about 2 grams per milliliter, whereas the density of the human body is only about 1 gram per milliliter. At that level of density, sinking beyond about waist height in quicksand is impossible. Even objects with a higher density than quicksand will float on it if stationary. Aluminum, for example, has a density of about 2.7 grams per milliliter, but a piece of aluminum will float on top of quicksand until motion causes the sand to liquefy.

Continued or panicked movement, however, may cause a person to sink further in the quicksand. Since this increasingly impairs movement, it can lead to a situation where other factors such as weather exposure, dehydration, hypothermia, tides or predators may harm a trapped person. Quicksand may be escaped by slow movement of the legs in order to increase viscosity of the fluid, and rotation of the body so as to float in the supine position (lying horizontally with the face and torso facing up).

An avalanche (also called a snowslide) is a cohesive slab of snow lying upon a weaker layer of snow in the snowpack that fractures and slides down a steep slope when triggered. Avalanches are typically triggered in a starting zone from a mechanical failure in the snowpack (slab avalanche) when the forces of the snow exceed its strength but sometimes only with gradual widening (loose snow avalanche). After initiation, avalanches usually accelerate rapidly and grow in mass and volume as they entrain more snow.

If the avalanche moves fast enough, some of the snow may mix with the air forming a powder snow avalanche, which is a type of gravity current. Slides of rocks or debris, behaving in a similar way to snow, are also referred to as avalanches. The remainder of this article refers to snow avalanches. The load on the snowpack may be only due to gravity, in which case failure may result either from weakening in the snowpack or increased load due to precipitation. Avalanches initiated by this process are known as spontaneous avalanches.

Avalanches can also be triggered by other loading conditions such as human or biologically related activities. Seismic activity may also trigger the failure in the snowpack and avalanches. Although primarily composed of flowing snow and air, large avalanches have the capability to entrain ice, rocks, trees, and other surficial material. However, they are distinct from mudslides which have greater fluidity, rock slides which are often ice free, and serac collapses during an icefall.

Avalanches are not rare or random events and are endemic to any mountain range that accumulates a standing snowpack. Avalanches are most common during winter or spring but glacier movements may cause ice and snow avalanches at any time of year. In mountainous terrain, avalanches are among the most serious objective natural hazards to life and property, with their destructive capability resulting from their potential to carry enormous masses of snow at high speeds.

Most avalanches occur spontaneously during storms under increased load due to snowfall. The second largest cause of natural avalanches is metamorphic changes in the snowpack such as melting due to solar radiation. Other natural causes include rain, earthquakes, rockfall and icefall. Artificial triggers of avalanches include skiers, snowmobiles, and controlled explosive work. Contrary to popular belief, avalanches are not triggered by loud sound; the pressure from sound is orders of magnitude too small to trigger an avalanche.

Avalanche initiation can start at a point with only a small amount of snow moving initially; this is typical of wet snow avalanches or avalanches in dry unconsolidated snow. However, if the snow has sintered into a stiff slab overlying a weak layer then fractures can propagate very rapidly, so that a large volume of snow, that may be thousands of cubic meters, can start moving almost simultaneously. A snowpack will fail when the load exceeds the strength. The load is straightforward; it is the weight of the snow.

However, the strength of the snowpack is much more difficult to determine and is extremely heterogenous. It varies in detail with properties of the snow grains, size, density, morphology, temperature, water content; and the properties of the bonds between the grains. These properties may all metamorphose in time according to the local humidity, water vapour flux, temperature and heat flux. The top of the snowpack is also extensively influenced by incoming radiation and the local air flow.

One of the aims of avalanche research is to develop and validate computer models that can describe the evolution of the seasonal snowpack over time. A complicating factor is the complex interaction of terrain and weather, which causes significant spatial and temporal variability of the depths, crystal forms, and layering of the seasonal snowpack.

Formation

Slab Avalanches	Slab avalanches form frequently in snow that has been deposited, or redeposited by wind. They have the characteristic appearance of a block (slab) of snow cut out from its surroundings by fractures. Elements of slab avalanches include the following: a crown fracture at the top of the start zone, flank fractures on the sides of the start zones, and a fracture at the bottom called the stauchwall. Slabs can vary in thickness from a few centimetres to three metres. Slab avalanches account for around 90% of avalanche-related fatalities in backcountry users.
Powder Snow Avalanches	The largest avalanches form turbulent suspension currents known as powder snow avalanches or mixed avalanches. These consist of a powder cloud, which overlies a dense avalanche. They can form from any type of snow or initiation mechanism, but usually occur with fresh dry powder. They can exceed speeds of 300 kilometres per hour (190 mph), and masses of 10000000 tonnes; their flows can travel long distances along flat valley bottoms and even uphill for short distances.
Wet Snow Avalanches	Wet snow avalanches are a low velocity suspension of snow and water, with the flow confined to the track surface. The low speed of travel is due to the friction between the sliding surface of the track and the water saturated flow. Despite the low speed of travel (~10–40 km/h), wet snow avalanches are capable of generating powerful destructive forces, due to the large mass and density. Wet snow avalanches can be initiated from either loose snow releases, or slab releases, and only occur in snow packs that are water saturated and isothermally equilibrated to the melting point of water.
Avalanche Pathway	As an avalanche moves down a slope it follows a certain pathway that is dependent on the slope's degree of steepness and the volume of snow/ice involved in the mass movement. The origin of an avalanche is called the Starting Point and typically occurs on a 30–45 degree slope. The body of the pathway is called the Track of the avalanche and usually occurs on a 20–30 degree slope. When the avalanche loses its momentum and eventually stops it reaches the Runout Zone. This usually occurs when the slope has reached a steepness that is less than 20 degrees.
Ice Avalanche	An ice avalanche occurs when a large piece of ice, such as from a serac or calving glacier, falls onto ice (such as the Khumbu Icefall), triggering a movement of broken ice chunks. The resulting movement is more analogous to a rockfall or a landslide than a snow avalanche. They are typically very difficult to predict and almost impossible to mitigate.

Terrain

Avalanche formation requires a slope shallow enough for snow to accumulate but steep enough for the snow to accelerate once set in motion by the combination of mechanical failure (of the snowpack) and gravity. The angle of the slope that can hold snow, called the angle of repose, depends on a variety of factors such as crystal form and moisture content. Some forms of drier and colder snow will only stick to shallower slopes, while wet and warm snow can bond to very steep surfaces.

In particular, in coastal mountains, such as the Cordillera del Paine region of Patagonia, deep snowpacks collect on vertical and even overhanging rock faces. The slope angle that can allow moving snow to accelerate depends on a variety of factors such as the snow's shear strength (which is itself dependent upon crystal form) and the configuration of layers and inter-layer interfaces. The snowpack on slopes with sunny exposures is strongly influenced by sunshine. Diurnal cycles of thawing and refreezing can stabilize the snowpack by promoting settlement. Strong freeze-thaw cycles result in the formation of surface crusts during the night and of unstable surface snow during the day. Slopes in the lee of a ridge or of another wind obstacle accumulate more snow and are more likely to include pockets of deep snow, wind slabs, and cornices, all of which, when disturbed, may result in avalanche formation.

Conversely, the snowpack on a windward slope is often much shallower than on a lee slope. Avalanches and avalanche paths share common elements: a start zone where the avalanche originates, a track along which the avalanche flows, and a runout zone where the avalanche comes to rest. The debris deposit is the accumulated mass of the avalanched snow once it has come to rest in the runout zone. For the image at left, many small avalanches form in this avalanche path every year, but most of these avalanches do not run the full vertical or horizontal length of the path.

The frequency with which avalanches form in a given area is known as the return period. The start zone of an avalanche must be steep enough to allow snow to accelerate once set in motion, additionally convex slopes are less stable than concave slopes, because of the disparity between the tensile strength of snow layers and their compressive strength. The composition and structure of the ground surface beneath the snowpack influences the stability of the snowpack, either being a source of strength or weakness.

Avalanches are unlikely to form in very thick forests, but boulders and sparsely distributed vegetation can create weak areas deep within the snowpack through the formation of strong temperature gradients. Full-depth avalanches (avalanches that sweep a slope virtually clean of snow cover) are more common on slopes with smooth ground, such as grass or rock slabs. Generally speaking, avalanches follow drainages down-slope, frequently sharing drainage features with summertime watersheds.

At and below tree line, avalanche paths through drainages are well defined by vegetation boundaries called trim lines, which occur where avalanches have removed trees and prevented regrowth of large vegetation. Engineered drainages, such as the avalanche dam on Mount Stephen in Kicking Horse Pass, have been constructed to protect people and property by redirecting the flow of avalanches. Deep debris deposits from avalanches will collect in catchments at the terminus of a runout, such as gullies and river beds.

Slopes flatter than 25 degrees or steeper than 60 degrees typically have a lower incidence of avalanches. Human-triggered avalanches have the greatest incidence when the snow's angle of repose is between 35 and 45 degrees; the critical angle, the angle at which human-triggered avalanches are most frequent, is 38 degrees. When the incidence of human triggered avalanches is normalized by the rates of recreational use, however, hazard increases uniformly with slope angle, and no significant difference in hazard for a given exposure direction can be found. The rule of thumb is: A slope that is flat enough to hold snow but steep enough to ski has the potential to generate an avalanche, regardless of the angle.

Snowpack Structure

The snowpack is composed of ground-parallel layers that accumulate over the winter. Each layer contains ice grains that are representative of the distinct meteorological conditions during which the snow formed and was deposited. Once deposited, a snow layer continues to evolve under the influence of the meteorological conditions that prevail after deposition. For an avalanche to occur, it is necessary that a snowpack have a weak layer (or instability) below a slab of cohesive snow.

In practice the formal mechanical and structural factors related to snowpack instability are not directly observable outside of laboratories, thus the more easily observed properties of the snow layers (e.g. penetration resistance, grain size, grain type, temperature) are used as index measurements of the mechanical properties of the snow (e.g. tensile strength, friction coefficients, shear strength, and ductile strength).

This results in two principal sources of uncertainty in determining snowpack stability based on snow structure: First, both the factors influencing snow stability and the specific characteristics of the snowpack vary widely within small areas and time scales, resulting in significant difficulty extrapolating point observations of snow layers across different scales of space and time. Second, the relationship between readily observable snowpack characteristics and the snowpack's critical mechanical properties has not been completely developed. While the deterministic relationship between snowpack characteristics and snowpack stability is still a matter of ongoing scientific study, there is a growing empirical understanding of the snow composition and deposition characteristics that influence the likelihood of an avalanche.

Observation and experience has shown that newly fallen snow requires time to bond with the snow layers beneath it, especially if the new snow falls during very cold and dry conditions. If ambient air temperatures are cold enough, shallow snow above or around boulders, plants, and other discontinuities in the slope, weakens from rapid crystal growth that occurs in the presence of a critical temperature gradient. Large, angular snow crystals are indicators of weak snow, because such crystals have fewer bonds per unit volume than small, rounded crystals that pack tightly together.

Consolidated snow is less likely to slough than loose powdery layers or wet isothermal snow; however, consolidated snow is a necessary condition for the occurrence of slab avalanches, and persistent instabilities within the snowpack can hide below well-consolidated surface layers. Uncertainty associated with the empirical understanding of the factors influencing snow stability leads most professional avalanche workers to recommend conservative use of avalanche terrain relative to current snowpack instability.

Weather

Avalanches can only occur in a standing snowpack. Typically winter seasons at high latitudes, high altitudes, or both have weather that is sufficiently unsettled and cold enough for precipitated snow to accumulate into a seasonal snowpack. Continentality, through its potentiating influence on the meteorological extremes experienced by snowpacks, is an important factor in the evolution of instabilities, and consequential occurrence of avalanches.

Conversely, proximity to coastal environments moderates the meteorological extremes experienced by snowpacks, and results in a faster stabilization of the snowpack after storm cycles. The evolution of the snowpack is critically sensitive to small variations within the narrow range of meteorological conditions that allow for the accumulation of snow into a snowpack.

Among the critical factors controlling snowpack evolution are: heating by the sun, radiational cooling, vertical temperature gradients in standing snow, snowfall amounts, and snow types. Generally, mild winter weather will promote the settlement and stabilization of the snowpack; conversely, very cold, windy, or hot weather will weaken the snowpack.

At temperatures close to the freezing point of water, or during times of moderate solar radiation, a gentle freeze-thaw cycle will take place. The melting and refreezing of water in the snow strengthens the snowpack during the freezing phase and weakens it during the thawing phase. A rapid rise in temperature, to a point significantly above the freezing point of water, may cause avalanche formation at any time of year.

Persistent cold temperatures can either prevent new snow from stabilizing or destabilize the existing snowpack. Cold air temperatures on the snow surface produce a temperature gradient in the snow, because the ground temperature at the base of the snowpack is usually around °C, and the ambient air temperature can be much colder.

When a temperature gradient greater than 10°C (50°F) change per vertical meter of snow is sustained for more than a day, angular crystals called depth hoar or facets begin forming in the snowpack because of rapid moisture transport along the temperature gradient. These angular crystals, which bond poorly to one another and the surrounding snow, often become a persistent weakness in the snowpack.

When a slab lying on top of a persistent weakness is loaded by a force greater than the strength of the slab and persistent weak layer, the persistent weak layer can fail and generate an avalanche. Any wind stronger than a light breeze can contribute to a rapid accumulation of snow on sheltered slopes downwind. Wind slab forms quickly and, if present, weaker snow below the slab may not have time to adjust to the new load. Even on a clear day, wind can quickly load a slope with snow by blowing snow from one place to another. Top-loading occurs when wind deposits snow from the top of a slope; cross-loading occurs when wind deposits snow parallel to the slope.

When a wind blows over the top of a mountain, the leeward, or downwind, side of the mountain experiences top-loading, from the top to the bottom of that lee slope. When the wind blows across a ridge that leads up the mountain, the leeward side of the ridge is subject to cross-loading. Cross-loaded wind-slabs are usually difficult to identify visually.

Snowstorms and rainstorms are important contributors to avalanche danger. Heavy snowfall will cause instability in the existing snowpack, both because of the additional weight and because the new snow has insufficient time to bond to underlying snow layers. Rain has a similar effect. In the short-term, rain causes instability because, like a heavy snowfall, it imposes an additional load on the snowpack; and, once rainwater seeps down through the snow, it acts as a lubricant, reducing the natural friction between snow layers that holds the snowpack together.

Most avalanches happen during or soon after a storm. Daytime exposure to sunlight will rapidly destabilize the upper layers of the snowpack if the sunlight is strong enough to melt the snow, thereby reducing its hardness. During clear nights, the snowpack can re-freeze when ambient air temperatures fall below freezing, through the process of long-wave radiative cooling, or both. Radiative heat loss occurs when the night air is significantly cooler than the snowpack, and the heat stored in the snow is re-radiated into the atmosphere.

European Avalanche Risk

Risk Level	Risk Level 1 (Low)	Risk Level 2 (Moderate)	Risk Level 3 (Considerable)	Risk Level 4 (High)	Risk Level 5 (Very High)
Snow Stability	Snow is generally very stable.	On some steep slopes the snow is only moderately stable. Elsewhere it is very stable.	On many steep slopes the snow is only moderately or weakly stable.	On most steep slopes the snow is not very stable.	The snow is generally unstable.
Flag					
Avalanche Risk	Avalanches are unlikely except when heavy loads are applied on a very few extreme steep slopes. Any spontaneous avalanches will be minor sloughs. In general, safe conditions.	Avalanches may be triggered when heavy loads are applied, especially on a few generally identified steep slopes. Large spontaneous avalanches are not expected.	Avalanches may be triggered on many slopes even if only light loads are applied. On some slopes, medium or even fairly large spontaneous avalanches may occur.	Avalanches are likely to be triggered on many slopes even if only light loads are applied. In some places, many medium or sometimes large spontaneous avalanches are likely.	Even on gentle slopes, many large spontaneous avalanches are likely to occur.

European Avalanche Size

Size	1 - Sluff	2 - Small	3 - Medium	4 - Large	
Runout	Small snow slide that cannot bury a person, though there is a danger of falling.	Stops within the slope.	Runs to the bottom of the slope.	Runs over flat areas (significantly less than 30°) of at least 50 m in length, may reach the valley bottom.	
Potential Damage	Unlikely, but possible risk of injury or death to people.	Could bury, injure or kill a person.	Could bury and destroy a car, damage a truck, destroy small buildings or break trees.	Could bury and destroy large trucks and trains, large buildings and forested areas.	
Physical Size	Length <50 m Volume <100 m³	Length <100 m Volume <1,000 m³	Length <1,000 m Volume <10,000 m³	Length >1,000 m Volume >10,000 m³	

4 Earthquake

An earthquake (also known as a quake, tremor or temblor) is the shaking of the surface of the Earth, resulting from the sudden release of energy in the Earth's lithosphere that creates seismic waves. Earthquakes can range in size from those that are so weak that they cannot be felt to those violent enough to toss people around and destroy whole cities. The seismicity, or seismic activity, of an area is the frequency, type and size of earthquakes experienced over a period of time. The word tremor is also used for non-earthquake seismic rumbling.

At the Earth's surface, earthquakes manifest themselves by shaking and displacing or disrupting the ground. When the epicentre of a large earthquake is located offshore, the seabed may be displaced sufficiently to cause a tsunami. Earthquakes can also trigger landslides, and occasionally volcanic activity. In its most general sense, the word earthquake is used to describe any seismic event — whether natural or caused by humans — that generates seismic waves. Earthquakes are caused mostly by rupture of geological faults, but also by other events such as volcanic activity, landslides, mine blasts, and nuclear tests. An earthquake's point of initial rupture is called its focus or hypocentre. The epicentre is the point at ground level directly above the hypocentre.

1 Phenomena

Foreshock

A foreshock is an earthquake that occurs before a larger seismic event (the mainshock) and is related to it in both time and space. The designation of an earthquake as foreshock, mainshock or aftershock is only possible after the full sequence of events has happened. Foreshock activity has been detected for about 40% of all moderate to large earthquakes, and about 70% for events of M>7.0. They occur from a matter of minutes to days or even longer before the main shock; for example, the 2002 Sumatra earthquake is regarded as a foreshock of the 2004 Indian Ocean earthquake with a delay of more than two years between the two events. Some great earthquakes (M>8.0) show no foreshock activity at all, such as the M8.6 1950 India - China earthquake. The increase in foreshock activity is difficult to quantify for individual earthquakes but becomes apparent when combining the results of many different events. From such combined observations, the increase before the mainshock is observed to be of inverse power law type. This may either indicate that foreshocks cause stress changes resulting in the mainshock or that the increase is related to a general increase in stress in the region.

The observation of foreshocks associated with many earthquakes suggests that they are part of a preparation process prior to nucleation. In one model of earthquake rupture, the process forms as a cascade, starting with a very small event that triggers a larger one, continuing until the main shock rupture is triggered. However, analysis of some foreshocks has shown that they tend to relieve stress around the fault. In this view, foreshocks and aftershocks are part of the same process. This is supported by an observed relationship between the rate of foreshocks and the rate of aftershocks for an event. An increase in seismic activity in an area has been used as a method of predicting earthquakes, most notably in the case of the 1975 Haicheng earthquake in China, where an evacuation was triggered by an increase in activity. However, most earthquakes lack obvious foreshock patterns and this method has not proven useful, as most small earthquakes are not foreshocks, leading to probable false alarms. Earthquakes along oceanic transform faults do show repeatable foreshock behaviour, allowing the prediction of both the location and timing of such earthquakes.

Aftershock

An aftershock is a smaller earthquake that occurs after a previous large earthquake, in the same area of the main shock. If an aftershock is larger than the main shock, the aftershock is redesignated as the main shock and the original main shock is redesignated as a foreshock. Aftershocks are formed as the crust around the displaced fault plane adjusts to the effects of the main shock. Most aftershocks are located over the full area of fault rupture and either occur along the fault plane itself or along other faults within the volume affected by the strain associated with the main shock.

Typically, aftershocks are found up to a distance equal to the rupture length away from the fault plane. The pattern of aftershocks helps confirm the size of area that slipped during the main shock. In the case of the 2004 Indian Ocean earthquake and the 2008 Sichuan earthquake the aftershock distribution shows in both cases that the epicentre (where the rupture initiated) lies to one end of the final area of slip, implying strongly asymmetric rupture propagation.

Aftershocks rates and magnitudes follow several well-established empirical laws:
- Omori's Law
- Båth's Law
- Gutenberg–Richter Law

Omori's Law
The frequency of aftershocks decreases roughly with the reciprocal of time after the main shock. This empirical relation was first described by Fusakichi Omori in 1894 and is known as Omori's law.

Båth's Law
The other main law describing aftershocks is known as Båth's Law and this states that the difference in magnitude between a main shock and its largest aftershock is approximately constant, independent of the main shock magnitude, typically 1.1–1.2 on the Moment magnitude scale.

Gutenberg–Richter Law
Aftershock sequences also typically follow the Gutenberg–Richter law of size scaling, which refers to the relationship between the magnitude and total number of earthquakes in a region in a given time period.

Dangers
Aftershocks are dangerous because they are usually unpredictable, can be of a large magnitude, and can collapse buildings that are damaged from the main shock. Bigger earthquakes have more and larger aftershocks and the sequences can last for years or even longer especially when a large event occurs in a seismically quiet area; see, for example, the New Madrid Seismic Zone, where events still follow Omori's law from the main shocks of 1811–1812. An aftershock sequence is deemed to have ended when the rate of seismicity drops back to a background level; i.e., no further decay in the number of events with time can be detected. Land movement around the New Madrid is reported to be no more than 0.2 mm (0.0079 in) a year, in contrast to the San Andreas Fault which averages up to 37 mm (1.5 in) a year across California. Aftershocks on the San Andreas are now believed to top out at 10 years while earthquakes in New Madrid are considered aftershocks nearly 200 years after the 1812 New Madrid earthquake.

Other Types

Blind Thrust
A blind thrust earthquake occurs along a thrust fault that does not show signs on the Earth's surface, hence the designation "blind". Such faults, being invisible at the surface, have not been mapped by standard surface geological mapping. Sometimes they are discovered as a by-product of oil exploration seismology; in other cases their existence is not suspected. Although such earthquakes are not amongst the most energetic, they are sometimes the most destructive, as conditions combine to form an urban earthquake which greatly affects urban seismic risk. Blind thrust faults generally exist near tectonic plate margins, in the broad disturbance zone.

They form when a section of the Earth's crust is under high compressive stresses, due to plate margin collision, or the general geometry of how the plates are sliding past each other. A weak plate under compression generally forms thrusting sheets, or overlapping sliding sections. This can form a hill and valley landform, with the hills being the strong sections, and the valleys being the highly disturbed thrust faulted and folded sections. After a long period of erosion the visible landscape may be flattened, with material eroded from the hills filling up the valleys and hiding the underlying hill-and-valley geology.

The valley rock is very weak and usually highly weathered, presenting deep, fertile soil; naturally, this is the area that becomes populated. Reflection seismology profiles show the disturbed rock that hides a blind thrust fault. If the region is under active compression these faults are constantly rupturing, but any given valley might only experience a large earthquake every few hundred years. Although usually of magnitude 6 to 7 compared to the largest magnitude 9 earthquakes of recent times, such a temblor is especially destructive because the seismic waves are highly directed, and the soft basin soil of the valley can amplify the ground motions tenfold or more. It is said that blind thrust earthquakes contribute more to urban seismic risk than the 'big ones' of magnitude 8 or more.

Doublet
Seismologists sometimes refer to a pair of similarly sized earthquake shocks that occur relatively closely spaced in time and location as an earthquake "doublet." This occurrence is distinct from the normal pattern of earthquake aftershocks. Aftershocks gradually diminish in magnitude and generally come from the same origin as a mainshock, whereas doublet earthquakes originate from a place other than the original earthquake rupture area. The first earthquake can be a considerable distance and time away from the second earthquake.

The magnitude of the second quake may even be slightly larger than the first. Earthquakes identified as doublets occur once or twice globally every year, making them far rarer than more typical earthquake patterns. In earthquake prone regions officials do not plan for doublet earthquakes occurring because they are so rare.

However, when they do occur, they have a high disaster potential. Some large earthquakes may be closely spaced doublet earthquakes, where the shaking from the rupture of the first fault or fault section overlaps with shaking from the rupture of a second fault section nearby. The two separate sources for these earthquakes are usually only identified by seismologists after extensive analysis, not in real time. Closely spaced doublet earthquakes could enhance tsunami risk or complicate tsunami warning efforts.

Interplate
An interplate earthquake is an earthquake that occurs at the boundary between two tectonic plates. Earthquakes of this type account for more than 90 percent of the total seismic energy released around the world. If one plate is trying to move past the other, they will be locked until sufficient stress builds up to cause the plates to slip relative to each other. The slipping process creates an earthquake with relative displacement on either side of the fault, resulting in seismic waves which travel through the Earth and along the Earth's surface.

Relative plate motion can be lateral as along a transform fault boundary, vertical if along a convergent boundary (i.e. subduction or thrust/reverse faulting) or a divergent boundary (i.e. rift zone or normal faulting), and oblique, with horizontal and lateral components at the boundary. Interplate earthquakes associated at a subduction boundary are called megathrust earthquakes, which are the most powerful earthquakes. Intraplate earthquakes are often confused with interplate earthquakes, but are fundamentally different in origin, occurring within a single plate rather than between two tectonic plates on a plate boundary.

The specifics of the mechanics by which they occur, as well as the intensity of the stress drop which occurs after the earthquake also differentiate the two types of events. Intraplate earthquakes have, on average, a higher stress drop than that of an interplate earthquake and generally higher intensity. Mechanically, interplate earthquakes differ from other seismic events in that they are caused by motion at the boundary between two tectonic plates. An interplate earthquake event occurs when the accumulated stress at a tectonic plate boundary are released via brittle failure and displacement along the fault.

There are three types of plate boundaries to consider in the context of interplate earthquake events:
● **Transform Plate Boundary:** Where two boundaries slide laterally relative to each other.
● **Divergent Plate Boundary:** Where two boundaries move apart.
● **Convergent Plate Boundary:** Where one plate moves towards, and potentially subducts beneath, another plate.

Precursory Tremors
Scientists have determined that interplate earthquakes are sometimes preceded by an irregular occurrence of small tremors. Precursory tremors are often associated with slow slip along a plate boundary. These precursory tremors can sometimes be identified within days or weeks of an interplate earthquake event and allow researchers to anticipate interplate earthquakes and introduce strategies to mitigate damage.

Intraplate
The term intraplate earthquake refers to a variety of earthquake that occurs within the interior of a tectonic plate; this stands in contrast to an interplate earthquake, which occurs at the boundary of a tectonic plate. Intraplate earthquakes are relatively rare compared to the more familiar boundary-located interplate earthquakes. Therefore, large intraplate earthquakes can inflict heavy damage with such areas' structures lacking seismic retrofitting. The surface of the Earth is made up of seven primary and eight secondary tectonic plates, plus dozens of tertiary microplates. The large plates move very slowly, owing to convection currents within the mantle below the crust.

Because they do not all move in the same direction, plates often directly collide or move laterally along each other, a tectonic environment that makes earthquakes frequent. Relatively few earthquakes occur in intraplate environments; most occur on faults near plate margins. By definition, intraplate earthquakes do not occur near plate boundaries, but along faults in the normally stable interior of plates. These earthquakes often occur at the location of ancient failed rifts, because such old structures may present a weakness in the crust where it can easily slip to accommodate regional tectonic strain.

Compared to earthquakes near plate boundaries, intraplate earthquakes are not well understood, and the hazards associated with them may be difficult to quantify. Many cities live with the seismic risk of a rare, large intraplate earthquake. The cause of these earthquakes is often uncertain. In many cases, the causative fault is deeply buried, and sometimes cannot even be found. Some studies have shown that it can be caused by fluids moving up the crust along ancient fault zones. Under these circumstances it is difficult to calculate the exact seismic hazard for a given city, especially if there was only one earthquake in historical times.

Megathrust
Megathrust earthquakes occur at subduction zones at destructive convergent plate boundaries, where one tectonic plate is forced underneath another. These interplate earthquakes are the planet's most powerful, with moment magnitudes (Mw) that can exceed 9.0. Since 1900, all earthquakes of magnitude 9.0 or greater have been megathrust earthquakes.

No other type of known terrestrial source of tectonic activity has produced earthquakes of this scale. During the rupture, one side of the fault is pushed upwards relative to the other, and it is this type of movement that is known as thrust. They are a type of dip-slip fault. A thrust fault is a reverse fault with a dip of 45° or less. Oblique-slip faults have significant components of different slip styles.

The term megathrust does not have a widely accepted rigorous definition, but is used to refer to an extremely large thrust fault, typically formed at the plate interface along a subduction zone such as the Sunda megathrust. The major subduction zone is associated with the Pacific and Indian Oceans and is responsible for the volcanic activity associated with the Pacific Ring of Fire. Since these earthquakes deform the ocean floor, they often generate a significant series of tsunami waves.

They are known to produce intense shaking for periods of time that can last for up to a few minutes. In Japan, the Nankai megathrust under the Nankai Trough is responsible for Nankai megathrust earthquakes and associated tsunamis. A study reported in 2016 found that the largest megathrust quakes are associated with downgoing slabs with the shallowest dip, so-called flat slab subduction.

Remotely Triggered
Remotely triggered earthquakes are a result of the effects of large earthquakes at considerable distance, outside of the immediate aftershock zone. The further one gets from the initiating earthquake in both space and time, the more difficult it is to establish an association. The physics involved in actually triggering an earthquake is complex. Most earthquake-generating zones are in a state of being close to failure. If such a zone were to be left completely alone, it would generate significant earthquakes spontaneously. Remote earthquakes, however, are in a position to disturb this critical state, either by shifting the stresses statically, or by dynamic change caused by passing seismic waves.

The first type of triggering may be due to static changes in the critical state. For example, after the magnitude 7.3 Landers earthquake struck California in 1992, it is said that "the earthquake map of California lit up like a Christmas tree". This event reinforced the idea of remotely triggered earthquakes, and pushed the hypothesis into the scientific mainstream. There is scientific evidence for a "long reach", mainly in the form of discrete element modelling used in the mining industry. If rock is modelled as discrete elements in a critical state, a single disturbance can influence a wide area. A smaller-scale example is when a small excavation in a valley triggers a landslide and brings down a whole mountainside.

Slow Earthquake
A slow earthquake is a discontinuous, earthquake-like event that releases energy over a period of hours to months, rather than the seconds to minutes characteristic of a typical earthquake. First detected using long term strain measurements, most slow earthquakes now appear to be accompanied by fluid flow and related tremor, which can be detected and approximately located using seismometer data filtered appropriately (typically in the 1–5 Hz band). That is, they are quiet compared to a regular earthquake, but not "silent" as described in the past. Slow earthquakes should not be confused with tsunami earthquakes, in which relatively slow rupture velocity produces tsunami out of proportion to the triggering earthquake. In a tsunami earthquake, the rupture propagates along the fault more slowly than usual, but the energy release occurs on a similar timescale to other earthquakes.

Causes
Earthquakes occur as a consequence of gradual stress increases in a region, and once it reaches the maximum stress that the rocks can withstand a rupture generates and the resulting earthquake motion is related to a drop in the shear stress of the system. Earthquakes generate seismic waves when the rupture in the system occurs, the seismic waves consist of different types of waves that are capable of moving through the Earth like ripples over water. The causes that lead to slow earthquakes have only been theoretically investigated, by the formation of longitudinal shear cracks that were analysed using mathematical models.

The different distributions of initial stress, sliding frictional stress, and specific fracture energy are all taken into account. If the initial stress minus the sliding frictional stress (with respect to the initial crack) is low, and the specific fracture energy or the strength of the crustal material (relative to the amount of stress) is high then slow earthquakes will occur regularly.

In other words, slow earthquakes are caused by a variety of stick-slip and creep processes intermediated between asperity-controlled brittle and ductile fracture. Asperities are tiny bumps and protrusions along the faces of fractures. They are best documented from intermediate crustal levels of certain subduction zones (especially those that dip shallowly — SW Japan, Cascadia, Chile), but appear to occur on other types of faults as well, notably strike-slip plate boundaries such as the San Andreas fault and "mega-landslide" normal faults on the flanks of volcanos.

Slow Earthquake
Faulting takes place all over Earth; faults can include convergent, divergent, and transform faults, and normally occur on plate margins. As of 2013 some of the locations that have been recently studied for slow earthquakes include: Cascadia, California, Japan, New Zealand, Mexico, and Alaska. The locations of slow earthquakes can provide new insights into the behaviour of normal or fast earthquakes. By observing the location of tremors associated with slow-slip and slow earthquakes, seismologists can determine the extension of the system and estimate future earthquakes in the area of study.

Types of Slow Earthquakes
- Low Frequency Earthquakes (LFE)
- Very Low Frequency Earthquakes (VLF)
- Slow Slip Events (SSE)
- Episodic Tremor and Slip (ETS)

Low Frequency Earthquakes
Low frequency earthquakes (LFEs) are seismic events defined by waveforms with periods far greater than those of ordinary earthquakes and abundantly occur during slow earthquakes. LFEs can be volcanic, semi-volcanic, or tectonic in origin, but only tectonic LFEs or LFEs generated during slow earthquakes are described here. Tectonic LFEs are characterized by generally low magnitudes ($M<3$) and have frequencies peaked between 1 and 3 Hz. They are the largest constituent of non-volcanic tremor at subduction zones, and in some cases are the only constituent.

Very Low Frequency Earthquakes
Very low frequency earthquakes (VLFs) can be considered a sub-category of low frequency earthquakes that differ in terms of duration and period. VLFs have magnitudes of approximately 3-3.5, durations around 20 seconds, and are further enriched in low frequency energy (0.03–0.02 Hz). VLFs predominantly occur with LFEs, but the reverse is not true. There are two major subduction zone settings where VLFs have been detected, 1) within the offshore accretionary prism and 2) at the plate interface down-dip of the seismogenic zone.

Slow Slip Events
Slow slip events (SSEs) are long lived shear slip events at subduction interfaces and the physical processes responsible for the generation of slow earthquakes. They are slow thrust-sense displacement episodes that can have durations up to several weeks, and are thus termed "slow". In many cases, the recurrence interval for slow slip events is remarkably periodic and accompanied by tectonic tremor, prompting seismologists to term episodic tremor and slip (ETS). Slow slip event's locus of displacement propagate along the strike of subduction interfaces at velocities of 5–10 kilometres per day during slow earthquakes in the Cascadia, and this propagation is responsible for the similar migration of LFEs and tremor.

Episodic Tremor and Slip
Slow earthquakes can be episodic (relative of plate movement), and therefore somewhat predictable, a phenomenon termed "episodic tremor and slip" or "ETS" in the literature. ETS events can last for weeks as opposed to "normal earthquakes" occur in a matter of seconds. Several slow-earthquake events around the world appear to have triggered major, damaging seismic earthquakes in the shallower crust. Conversely, major earthquakes trigger "post-seismic creep" in the deeper crust and mantle. Just like regular earthquakes, slow earthquakes can cause devastating tsunamis, such as the 2010 Mentawai earthquake and tsunami.

Submarine
A submarine, undersea, or underwater earthquake is an earthquake that occurs underwater at the bottom of a body of water, especially an ocean. They are the leading cause of tsunamis. The magnitude can be measured scientifically by the use of the moment magnitude scale and the intensity can be assigned using the Mercalli intensity scale. Understanding plate tectonics helps to explain the cause of submarine earthquakes. The Earth's surface or lithosphere comprises tectonic plates which average approximately 50 miles in thickness, and are continuously moving very slowly upon a bed of magma in the asthenosphere and inner mantle.

The plates converge upon one another, and one subducts below the other, or, where there is only shear stress, move horizontally past each other (see transform plate boundary below). Little movements called fault creep are minor and not measurable. The plates meet with each other, and if rough spots cause the movement to stop at the edges, the motion of the plates continue. When the rough spots can no longer hold, the sudden release of the built-up motion releases, and the sudden movement under the sea floor causes a submarine earthquake. This area of slippage both horizontally and vertically is called the epicentre, and has the highest magnitude, and causes the greatest damage.

As with a continental earthquake the severity of the damage is not often caused by the earthquake at the rift zone, but rather by events which are triggered by the earthquake. Where a continental earthquake will cause damage and loss of life on land from fires, damaged structures, and flying objects; a submarine earthquake alters the seabed, resulting in a series of waves, and depending on the length and magnitude of the earthquake, tsunami, which bear down on coastal cities causing property damage and loss of life.

Submarine earthquakes can also damage submarine communications cables, leading to widespread disruption of the Internet and international telephone network in those areas. This is particularly common in Asia, where many submarine links cross submarine earthquake zones such as the Ring of Fire.

Boundaries

The different ways in which tectonic plates rub against each other under the ocean or sea floor to create submarine earthquakes. The type of friction created may be due to the characteristic of the geologic fault or the plate boundary as follows. Some of the main areas of large tsunami producing submarine earthquakes are the Pacific Ring of Fire and the Great Sumatran fault.

Convergent Plate Boundary
The older, and denser plate moves below the lighter plate. The further down it moves, the hotter it becomes, until finally melting altogether at the asthenosphere and inner mantle and the crust is actually destroyed. The location where the two oceanic plates actually meet become deeper and deeper creating trenches with each successive action. There is an interplay of various densities of lithosphere rock, asthenosphere magma, cooling ocean water and plate movement for example the Pacific Ring of Fire.

Transform Plate Boundary
A transform-fault boundary, or simply a transform boundary is where two plates will slide past each other, and the irregular pattern of their edges may catch on each other. The lithosphere is neither added to from the asthenosphere nor is it destroyed as in convergent plate action. For example, along the San Andreas fault strike-slip fault zone, the Pacific Tectonic Plate has been moving along at about 5 cm/yr in a north-westerly direction, whereas the North American Plate is moving south-easterly.

Divergent Plate Boundary
Rising convection currents occur where two plates are moving away from each other. In the gap, thus produced hot magma rises up, meets the cooler sea water, cools, and solidifies, attaching to either or both tectonic plate edges creating an oceanic spreading ridge. When the fissure again appears, again magma will rise up, and form new lithosphere crust. If the weakness between the two plates allows the heat and pressure of the asthenosphere to build over a large amount of time, a large quantity of magma will be released pushing up on the plate edges and the magma will solidify under the newly raised plate edges, see formation of a submarine volcano.

Supershear

A supershear earthquake is an earthquake in which the propagation of the rupture along the fault surface occurs at speeds in excess of the seismic shear wave (S-wave) velocity. This causes an effect analogous to a sonic boom. During seismic events along a fault surface the displacement initiates at the focus and then propagates outwards.

Typically for large earthquakes the focus lies towards one end of the slip surface and much of the propagation is unidirectional (e.g. the 2008 Sichuan and 2004 Indian Ocean earthquakes). Theoretical studies have in the past suggested that the upper bound for propagation velocity is that of Rayleigh waves, approximately 0.92 of the shear wave velocity. However, evidence of propagation at velocities between S-wave and compressional wave (P-wave) values have been reported for several earthquakes in agreement with theoretical and laboratory studies that support the possibility of rupture propagation in this velocity range.

Evidence of rupture propagation at velocities greater than S-wave velocities expected for the surrounding crust have been observed for several large earthquakes associated with strike-slip faults. During strike-slip, the main component of rupture propagation will be horizontal, in the direction of displacement, as a Mode II (in-plane) shear crack. This contrasts with a dip-slip rupture where the main direction of rupture propagation will be perpendicular to the displacement, like a Mode III (anti-plane) shear crack.

The rupture velocity range between those of Rayleigh waves and shear waves remains forbidden for a Mode II crack (a good approximation to a strike-slip rupture). This means that a rupture cannot accelerate from Rayleigh speed to shear wave speed. In the "Burridge–Andrews" mechanism, supershear rupture is initiated on a 'daughter' rupture in the zone of high shear stress developed at the propagating tip of the initial rupture.

Because of this high stress zone, this daughter rupture is able start propagating at supershear speed before combining with the existing rupture. Experimental shear crack rupture, using plates of a photoelastic material, has produced a transition from sub-Rayleigh to supershear rupture by a mechanism that "qualitatively conforms to the well-known Burridge-Andrews mechanism".

The high rates of strain expected near faults that are affected by supershear propagation are thought to generate what is described as pulverized rocks. The pulverization involves the development of many small microcracks at a scale smaller than the grain size of the rock, while preserving the earlier fabric, quite distinct from the normal brecciation and cataclasis found in most fault zones. Such rocks have been reported up to 400 m away from large strike-slip faults, such as the San Andreas Fault. The link between supershear and the occurrence of pulverized rocks is supported by laboratory experiments that show very high strain rates are necessary to cause such intense fracturing.

Tsunami

A tsunami earthquake triggers a tsunami of a magnitude that is very much larger than the magnitude of the earthquake as measured by shorter-period seismic waves. The term was introduced by Hiroo Kanamori in 1972. Such events are a result of relatively slow rupture velocities. They are particularly dangerous as a large tsunami may arrive at a coastline with little or no warning.

A tsunami is a sea wave of local or distant origin that results from large-scale seafloor displacements associated with large earthquakes, major submarine slides, or exploding volcanic islands. The distinguishing feature for a tsunami earthquake is that the release of seismic energy occurs at long periods (low frequencies) relative to typical tsunamigenic earthquakes. Earthquakes of this type do not generally show the peaks of seismic wave activity associated with ordinary events.

A tsunami earthquake can be defined as an undersea earthquake for which the surface wave magnitude Ms differs markedly from the moment magnitude Mw, because the former is calculated from surface waves with a period of about 20 seconds, whereas the latter is a measure of the total energy release at all frequencies.

The displacements associated with tsunami earthquakes are consistently greater than those associated with ordinary tsunamigenic earthquakes of the same moment magnitude, typically more than double. Rupture velocities for tsunami earthquakes are typically about 1.0 km per second, compared to the more normal 2.5–3.5 km per second for other megathrust earthquakes. These slow rupture speeds lead to greater directivity, with the potential to cause higher run-ups on short coastal sections. Tsunami earthquakes mainly occur at subduction zones where there is a large accretionary wedge or where sediments are being subducted, as this weaker material leads to the slower rupture velocities.

Analysis of tsunami earthquakes such as the 1946 Aleutian Islands earthquake shows that the release of seismic moment takes place at an unusually long period. Calculations of the effective moment derived from surface waves show a rapid increase with decrease in the frequency of the seismic waves, whereas for ordinary earthquakes it remains almost constant with frequency. The duration over which the seabed is deformed has little effect on the size of the resultant tsunami for times up to several minutes. The observation of long period energy release is consistent with unusually slow rupture propagation velocities.

Slow rupture velocities are linked to propagation through relatively weak material, such as poorly consolidated sedimentary rocks. Most tsunami earthquakes have been linked to rupture within the uppermost part of a subduction zone, where an accretionary wedge is developed in the hanging wall of the megathrust. Tsunami earthquakes have also been linked to the presence of a thin layer of subducted sedimentary rock along the uppermost part of the plate interface, as is thought to be present in areas of significant topography at the top of the oceanic crust, and where propagation was in an up-dip direction, possibly reaching the seafloor.

On 15 June 1896 the Sanriku coast was struck by a devastating tsunami with a maximum wave height of 38.2 m, which caused more than 22,000 deaths. The residents of the coastal towns and villages were taken completely by surprise because the tsunami had only been preceded by a relatively weak shock. The magnitude of the tsunami has been estimated as Mt=8.2 while the earthquake shaking only indicated a magnitude of Ms=7.2. This discrepancy in magnitude requires more than just a slow rupture velocity. Modelling of tsunami generation that takes into account additional uplift associated with deformation of the softer sediments of the accretionary wedge caused by horizontal movement of the 'backstop' in the overriding plate has successfully explained the discrepancy, estimating a magnitude of Mw=8.0–8.1.

Earthquake Swarm
Earthquake swarms are events where a local area experiences sequences of many earthquakes striking in a relatively short period of time. The length of time used to define the swarm itself varies, but may be of the order of days, weeks, or months. They are differentiated from earthquakes succeeded by a series of aftershocks by the observation that no single earthquake in the sequence is obviously the main shock. Between February and April 2008 a swarm of 1,000 small magnitude quakes in the United States, referred to as the 2008 Reno earthquakes began in February and ended in November. During the 2011–12 El Hierro eruption. From July 2011 until October 2011, hundreds of small earthquakes were measured. The accumulated energy released by the swarm increased dramatically on 28 September. The swarm was due to the movement of magma beneath the island, and on 9 October indications of a submarine volcanic eruption were detected.

Causes

Fault Movement
In geology, a fault is a planar fracture or discontinuity in a volume of rock, across which there has been significant displacement as a result of rock-mass movement. Large faults within the Earth's crust result from the action of plate tectonic forces, with the largest forming the boundaries between the plates, such as subduction zones or transform faults.

Volcanism
A volcano tectonic earthquake is an earthquake induced by the movement (injection or withdrawal) of magma. The movement results in pressure changes in the rock around where the magma has experienced stress. At some point, the rock may break or move. The earthquakes may also be related to dike intrusion and may occur as earthquake swarms.

Induced Seismicity
Induced seismicity refers to typically minor earthquakes and tremors that are caused by human activity that alters the stresses and strains on the Earth's crust. Most induced seismicity is of a low magnitude. A few sites regularly have larger quakes, such as The Geysers geothermal plant in California which averaged two M4 events and 15 M3 events every year from 2004 to 2009.

Characteristics

Epicentre
The epicentre, epicentre or epicentrum in seismology is the point on the Earth's surface directly above a hypocentre or focus, the point where an earthquake or an underground explosion originates.

Hypocentre
A hypocentre (or hypocentre) is the point of origin of an earthquake or a subsurface nuclear explosion. In seismology, it is a synonym of the focus. The term hypocentre is also used as a synonym for ground zero, the surface point directly beneath a nuclear airburst.

Shadow Zone
A seismic shadow zone is an area of the Earth's surface where seismographs can only barely detect an earthquake after its seismic waves have passed through the Earth. When an earthquake occurs, seismic waves radiate out spherically from the earthquake's focus.

Seismic Waves
Seismic waves are waves of energy that travel through the Earth's layers, and are a result of earthquakes, volcanic eruptions, magma movement, large landslides and large man-made explosions that give out low-frequency acoustic energy. Many other natural and anthropogenic sources create low-amplitude waves commonly referred to as ambient vibrations.

P-Wave
A P-wave is one of the two main types of elastic body waves, called seismic waves in seismology. P-waves travel faster than other seismic waves and hence are the first signal from an earthquake to arrive at any affected location or at a seismograph. P-waves may be transmitted through gases, liquids, or solids.

S-Wave
In seismology, S-waves, secondary waves, or shear waves are a type of elastic wave, and are one of the two main types of elastic body waves, so named because they move through the body of an object, unlike surface waves. The S-wave moves as a shear or transverse wave, so motion is perpendicular to the direction of wave propagation. The wave moves through elastic media, and the main restoring force comes from shear effects.

Measurement

Seismometer
A seismometer is an instrument that measures motion of the ground, caused by, for example, an earthquake, a volcanic eruption, or the use of explosives. Records of seismic waves allow seismologists to map the interior of the Earth and to locate and measure the size of events like these.

Seismic Magnitude Scales
Seismic magnitude scales are used to describe the overall strength or "size" of an earthquake. These are distinguished from seismic intensity scales that categorize the intensity or severity of ground shaking (quaking) caused by an earthquake at a given location. Magnitudes are usually determined from measurements of an earthquake's seismic waves as recorded on a seismogram. Magnitude scales vary on the type and component of the seismic waves measured and the calculations used.

Seismic Intensity Scales
Seismic intensity scales categorize the intensity or severity of ground shaking (quaking) at a given location, such as resulting from an earthquake. They are distinguished from seismic magnitude scales, which measure the magnitude or overall strength of an earthquake.

3 Hazards

Earthquakes pose little direct danger to a person. You can't be shaken to death by an earthquake. Some movies show scenes with the ground suddenly opening up and people falling into fiery pits, but this just doesn't happen in real life.

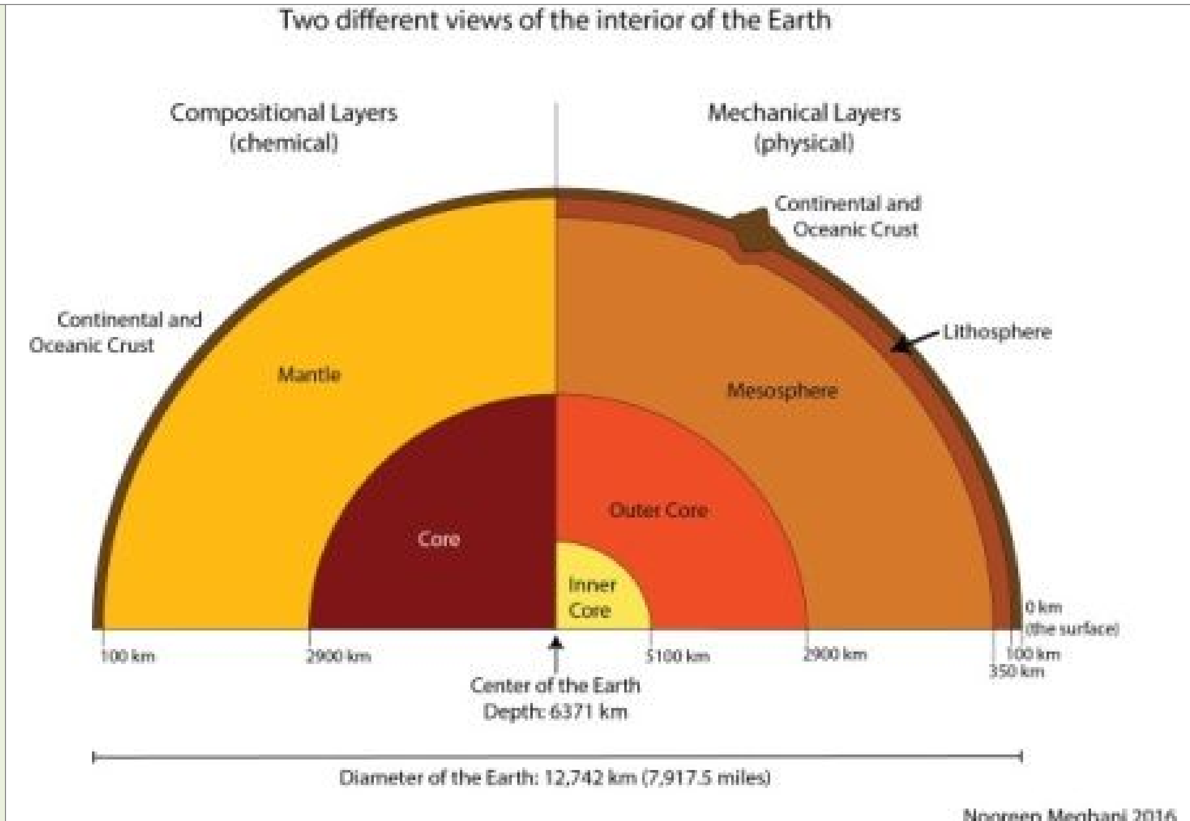
Ground Shaking	The first main earthquake hazard (danger) is the effect of ground shaking. Buildings can be damaged by the shaking itself or by the ground beneath them settling to a different level than it was before the earthquake (subsidence). Buildings can even sink into the ground if soil liquefaction occurs. Liquefaction is the mixing of sand or soil and groundwater (water underground) during the shaking of a moderate or strong earthquake. When the water and soil are mixed, the ground becomes very soft and acts similar to quicksand. If liquefaction occurs under a building, it may start to lean, tip over, or sink several feet. The ground firms up again after the earthquake has past and the water has settled back down to its usual place deeper in the ground. Liquefaction is a hazard in areas that have groundwater near the surface and sandy soil. Buildings can also be damaged by strong surface waves making the ground heave and lurch. Any buildings in the path of these surface waves can lean or tip over from all the movement. The ground shaking may also cause landslides, mudslides, and avalanches on steeper hills or mountains, all of which can damage buildings and hurt people.
Ground Displacement	The second main earthquake hazard is ground displacement (ground movement) along a fault. If a structure (a building, road, etc.) is built across a fault, the ground displacement during an earthquake could seriously damage or rip apart that structure.

Flooding	The third main hazard is flooding. An earthquake can rupture (break) dams or levees along a river. The water from the river or the reservoir would then flood the area, damaging buildings and maybe sweeping away or drowning people. Tsunamis and seiches can also cause a great deal of damage. A tsunami is what most people call a tidal wave, but it has nothing to do with the tides on the ocean. It is a huge wave caused by an earthquake under the ocean. Tsunamis can be tens of feet high when they hit the shore and can do enormous damage to the coastline. Seiches are like small tsunamis. They occur on lakes that are shaken by the earthquake and are usually only a few feet high, but they can still flood or knock down houses, and tip over trees.
Fire	The fourth main earthquake hazard is fire. These fires can be started by broken gas lines and power lines, or tipped over wood or coal stoves. They can be a serious problem, especially if the water lines that feed the fire hydrants are broken, too. For example, after the Great San Francisco Earthquake in 1906, the city burned for three days. Most of the city was destroyed and 250,000 people were left homeless. Most of the hazards to people come from man-made structures themselves and the shaking they receive from the earthquake. The real dangers to people are being crushed in a collapsing building, drowning in a flood caused by a broken dam or levee, getting buried under a landslide, or being burned in a fire.

4 Earth Composition

The structure of the Earth is divided into layers. These layers are both physically and chemically different. The Earth has an outer solid layer called the crust, a highly viscous layer called the mantle, a liquid layer that is the outer part of the core, called the outer core, and a solid centre called the inner core. The shape of the earth is an oblate spheroid, because it is slightly flattened at the poles and bulging at the equator. The boundaries between these layers were discovered by seismographs which showed the way vibrations bounced off the layers during earthquakes. Between the Earth's crust and the mantle is a boundary called the moho. It was the first discovery of a major change in the Earth's structure as one goes deeper.

Earth's Diameter
12,742 km
(7,917.5 mi)

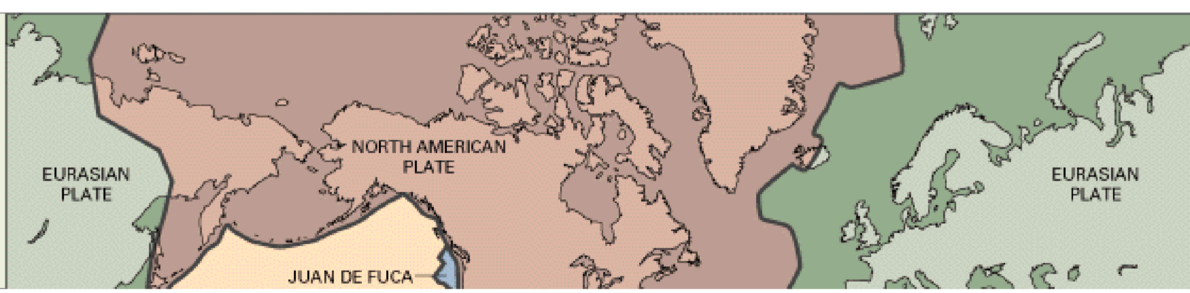


Lithosphere

A lithosphere is the rigid, outermost shell of a terrestrial-type planet, or natural satellite, that is defined by its rigid mechanical properties. On Earth, it is composed of the crust and the portion of the upper mantle that behaves elastically on time scales of thousands of years or greater. The lithosphere plates float on the semi-liquid aesthenosphere below. The Earth's crust ranges from 5–70 kilometres (3.1–43.5 mi) in depth and is the outermost layer. The thin parts are the oceanic crust, which underlie the ocean basins (5–10 km) and are composed of dense (mafic) iron magnesium silicate igneous rocks, like basalt. The uppermost mantle together with the crust constitutes the lithosphere. The crust-mantle boundary occurs as two physically different events.

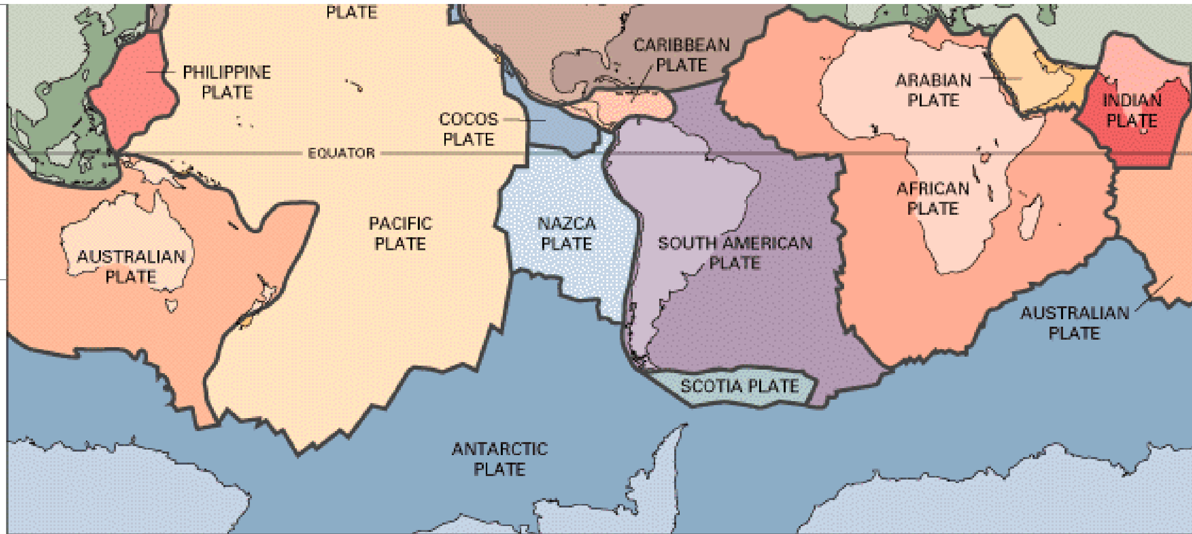
Depth
0-80km

Thickness
0-100kms



Composition
- Crust
- Moho

Right: The tectonic plates of the lithosphere on Earth.



The Crust (Lithosphere)

Depth 0-35km (0-22mi) **Thickness** 20-120kms **Temperature** 473-673K (200-400 °C) (392-752 °F)	The crust is the outermost layer of the Earth. It is made of solid rocks. It is mostly made of the lighter elements, silicon, oxygen, aluminium. Because of this, it is known as sial (silicon = Si; aluminium = Al) or felsic. The crust is a thin shell on the outside of the Earth, accounting for less than 1% of Earth's volume. It is the top component of lithosphere: a division of Earth's layers that includes the crust and the upper part of the mantle. The lithosphere is broken into tectonic plates that move, allowing heat to escape from the interior of the Earth into space. The crust lies on top of the mantle, a configuration that is stable because the upper mantle is made of peridotite and so is significantly denser than the crust. The boundary between the crust and mantle is conventionally placed at the Mohorovičić discontinuity, a boundary defined by a contrast in seismic velocity.

The crust of the Earth is of two distinctive types:
1. **Oceanic**: 5 km (3 mi) to 10 km (6 mi) thick and composed primarily of denser, more mafic rocks, such as basalt, diabase, and gabbro.
2. **Continental**: 30 km (20 mi) to 50 km (30 mi) thick and mostly composed of less dense, more felsic rocks, such as granite.

Because both continental and oceanic crust are less dense than the mantle below, both types of crust "float" on the mantle. This is isostasy, and it's also one of the reasons continental crust is higher than oceanic: continental is less dense and so "floats" higher. As a result, water pools in above the oceanic crust, forming the oceans.

The Moho (Mohorovičić Discontinuity)

Depth 35km (22mi) **Thickness** 500m	The moho, properly called the Mohorovičić discontinuity, is the boundary between the Earth's crust and the mantle. It was discovered by Croatian seismologist Andrija Mohorovičić in 1909. He discovered that seismograms of earthquakes showed two kinds of seismic waves. There is a shallow slower wave which arrives first, and a deep faster wave which arrives second. He reasoned that the deeper wave changed speed as it got just below the mantle. The reason it went faster was that the material of the mantle was different from that of the crust.

Mantle

Depth 35-2,890km **Thickness** 100-2,890km	**Composition** • Asthenosphere • Transition Zone • Upper Mantle • Lower Mantle • D" Layer	The mantle is the layer of the Earth right below the crust. It is made mostly of oxygen, silicon and the heavier element magnesium. It is known as sima (Si for silicon + ma for magnesium) or mafic. Earth's mantle extends to a depth of 2,890 km, making it the thickest layer of Earth. The mantle is divided into upper and lower mantle, which are separated by the transition zone. The mantle is composed of silicate rocks that are rich in iron and magnesium relative to the overlying crust. Although solid, the high temperatures within the mantle cause the silicate material to be sufficiently ductile that it can flow on very long timescales.

Asthenosphere

Depth 80-220km	The asthenosphere is underneath the lithosphere. It is about 100km thick, and is a region of the mantle that flows relatively easily. Reminder: It is not liquid. Something that appears to be solid on a short time scale can, in fact, be liquid. Glass is an example of an 'amorphous solid' – a material that is neither liquid nor solid. Over long periods of time glass can flow, forming (for example) windowpanes with thick bottoms and thin tops in old buildings. The mantle is like this. When it is under stress for long periods of time, it can flow. Due to the incredibly high temperatures and pressures near the centre of the Earth, the outer core is liquid iron and nickel, while the inner core is solid. The motion of the liquid outer core is what gives Earth its magnetic field.

Transition Zone

Depth 410-660km	The transition zone is the part of Earth's mantle that is located between the lower and the upper mantle, most strictly between the seismic-discontinuity depths of about 410 to 660 kilometres (250 to 410 mi), but more broadly defined as the zone encompassing those discontinuities, i.e., between about 300 and 850 kilometres (190 and 530 mi) depth. Earth's solid, rocky mantle, including the mantle transition zone (often abbreviated as MTZ), consists primarily of peridotite, an ultramafic igneous rock.

Upper Mantle

Depth 35-660km	**Temperature** 1,900K (1,626 °C) (2,958.8 °F)	The upper mantle of Earth is a very thick layer of rock inside the planet, which begins just beneath the crust (at about 10 km (6.2 mi) under the oceans and about 35 km (22 mi) under the continents) and ends at the top of the lower mantle at 670 km (420 mi). Temperatures range from approximately 500 K (227 °C; 440 °F) at the upper boundary with the crust to approximately 1,200 K (930 °C; 1,700 °F) at the boundary with the lower mantle. Upper mantle material that has come up onto the surface comprises about 55% olivine, 35% pyroxene, and 5 to 10% of calcium oxide and aluminum oxide minerals such as plagioclase, spinel, or garnet, depending upon depth.

Lower Mantle

Depth 660-2,890km	**Temperature** 1,900-3,000K (1,626-2,726 °C) (2,958-4939 °F)	The lower mantle, historically also known as the mesosphere, represents approximately 56% of Earth's total volume, and is the region from 660 to 2900 km below Earth's surface; between the transition zone and the outer core. The preliminary reference Earth model (PREM) separates the lower mantle into three sections, the uppermost (660–770 km), mid-lower mantle (770–2700 km), and the D layer (2700–2900 km). Pressure and temperature in the lower mantle range from 24–127 GPa and 1900–2600 K. It has been proposed that the composition of the lower mantle is pyrolitic, containing three major phases of bridgmanite, ferropericlase, and calcium-silicate perovskite. The high pressure in the lower mantle has been shown to induce a spin transition of iron-bearing bridgmanite and ferropericlase, which may affect both mantle plume dynamics and lower mantle chemistry.

D" Layer

Depth 2,740-2,890km	An approximately 200 km thick layer of the lower mantle directly above the CMB is referred to as the D" region ("D double-prime" or "D prime prime") and is sometimes included in discussions regarding the core–mantle boundary zone. The D" name originates from geophysicist Keith Bullen's designations for the Earth's layers. His system was to label each layer alphabetically, A through G, with the crust as 'A' and the inner core as 'G'.

Core

Core Total

Depth 2,890-6,360km	**Temperature** 3,000-7,000K (2,726-6,726 °C) (5,432-12,632 °F)	**Thickness** 2,890-6,360km	**Composition** ● Outer Core ● Inner Core

Outer Core

Depth 2,890-5,150km	**Temperature** 3,000-7,000K (2,726-6,726 °C) (5,432-12,632 °F)	The Earth's core is made of solid iron and nickel. Outer core is a liquid layer below the mantle. The average density of Earth is 5.515 g/cm3. Because the average density of surface material is only around 3.0 g/cm3, we must conclude that denser materials exist within Earth's core.

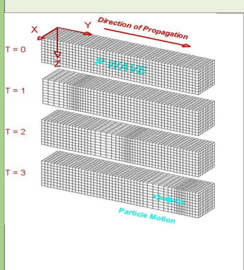
Inner Core

Depth 5,150-6,360km	**Temperature** 5,000-7,000K (4,726-6,726 °C) (9,032-12,632 °F)	The inner core was discovered in 1936 by Inge Lehmann and is generally believed to be composed primarily of iron and some nickel. Since this layer is able to transmit shear waves (transverse seismic waves), it must be solid. Inner core, is the very centre of the Earth.

5 Waves

Seismic waves are the waves of energy caused by the sudden breaking of rock within the earth or an explosion. They are the energy that travels through the earth and is recorded on seismographs. There are several different kinds of seismic waves, and they all move in different ways. The two main types of waves are body waves and surface waves. Body waves can travel through the earth's inner layers, but surface waves can only move along the surface of the planet like ripples on water. Earthquakes radiate seismic energy as both body and surface waves. Traveling through the interior of the earth, body waves arrive before the surface waves emitted by an earthquake. These waves are of a higher frequency than surface waves.

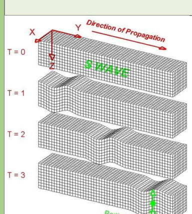
P Waves



The first kind of body wave is the P wave or primary wave. This is the fastest kind of seismic wave, and, consequently, the first to 'arrive' at a seismic station. The P wave can move through solid rock and fluids, like water or the liquid layers of the earth. It pushes and pulls the rock it moves through just like sound waves push and pull the air. Have you ever heard a big clap of thunder and heard the windows rattle at the same time? The windows rattle because the sound waves were pushing and pulling on the window glass much like P waves push and pull on rock.

Sometimes animals can hear the P waves of an earthquake. Dogs, for instance, commonly begin barking hysterically just before an earthquake 'hits' (or more specifically, before the surface waves arrive). Usually people can only feel the bump and rattle of these waves. P waves are also known as compressional waves, because of the pushing and pulling they do. Subjected to a P wave, particles move in the same direction that the wave is moving in, which is the direction that the energy is traveling in, and is sometimes called the 'direction of wave propagation'.

S Waves

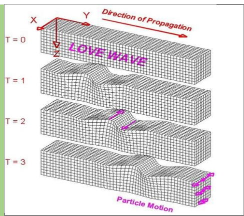


The second type of body wave is the S wave or secondary wave, which is the second wave you feel in an earthquake. An S wave is slower than a P wave and can only move through solid rock, not through any liquid medium. It is this property of S waves that led seismologists to conclude that the Earth's outer core is a liquid. S waves move rock particles up and down, or side-to-side--perpendicular to the direction that the wave is traveling in (the direction of wave propagation).

Surface Waves

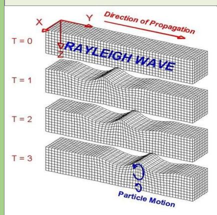
Travelling only through the crust, surface waves are of a lower frequency than body waves, and are easily distinguished on a seismogram as a result. Though they arrive after body waves, it is surface waves that are almost entirely responsible for the damage and destruction associated with earthquakes. This damage and the strength of the surface waves are reduced in deeper earthquakes.

Love Wave



The first kind of surface wave is called a Love wave, named after A.E.H. Love, a British mathematician who worked out the mathematical model for this kind of wave in 1911. It's the fastest surface wave and moves the ground from side-to-side. Confined to the surface of the crust, Love waves produce entirely horizontal motion.

Rayleigh Wave



The other kind of surface wave is the Rayleigh wave, named for John William Strutt, Lord Rayleigh, who mathematically predicted the existence of this kind of wave in 1885. A Rayleigh wave rolls along the ground just like a wave rolls across a lake or an ocean. Because it rolls, it moves the ground up and down, and side-to-side in the same direction that the wave is moving. Most of the shaking felt from an earthquake is due to the Rayleigh wave, which can be much larger than the other waves.

6 Measurement

Richter Scale

The Richter magnitude scale is a scale of numbers used to tell the size of earthquakes. Charles Richter developed the Richter Scale in 1935. His scale was based on the seismogram measured by a particular type of seismometer at a distance of 100 kilometres (62 mi) from the earthquake. Earthquakes 4.5 or higher on the Richter scale can be measured by tools all over the world. An earthquake a size that scores 3.0 is about 10 times the amplitude of one that scores 2.0. The energy that is released increases by a factor of about 32. Every increase of 1 on the Richter scale is 10, not 1, therefore it is a logarithmic scale. The earthquake with the biggest recorded magnitude was the Great Chilean Earthquake. It had a magnitude of 9.5 (approximately 9.5 on the Richter scale) and occurred in 1960. About 6,000 people died because of the earthquake.

Descriptor	Magnitude	Frequency	Damage
Micro	< 2.0	~8,000/Day	Micro (very small) earthquakes, people cannot feel these.
Very Minor	2.0-2.9	~1,000/Day	People do not feel these, but seismographs are able to detect them.
Minor	3.0-3.9	~134/Day	People often feel these, but they almost never cause damage.
Light	4.0-4.9	~17/Day	Objects inside houses are disturbed, causing noise. Things are rarely damaged.
Moderate	5.0-5.9	~2/Day	Buildings that are not built well may be damaged. Light objects inside a house may be moved.
Strong	6.0-6.9	~120/Year	Moderately powerful. May cause a lot of damage in a larger area.
Major	7.0-7.9	~18/Year	Can cause serious damage over larger areas.
Great	8.0-9.9	~1/20 Years	Massive damage is caused. Heavy objects are thrown into the air and cracks appear on the ground, as well as visible shockwaves. Overhead highways may be destroyed, and buildings are toppled.
Meteoric	10.0+	Unknown	There are no records of anything of this size. The vibration is about the same as that of a 24km (15 mile) wide meteor striking earth.

Mercalli Intensity Scale

The Mercalli intensity scale (or more precisely the Modified Mercalli intensity scale) is a scale to measure the intensity of earthquakes. Unlike with the Richter scale, the Mercalli scale does not take into account energy of an earthquake directly. Rather, they classify earthquakes by the effects they have (and the destruction they cause). When there is little damage, the scale describes how people felt the earthquake, or how many people felt it. Very often, non-geologists use this scale, because it is easier for people to describe what damage an earthquake caused, than to do calculations to get a value on the Richter scale.

Giuseppe Mercalli (1850-1914) originally developed the scale, with ten levels. In 1902, Adolfo Cancani extended the scale to include twelve levels. August Heinrich Sieberg completely rewrote the scale. For this reason, the scale is sometimes named Mercalli-Cancani-Sieberg scale, or MCS scale. The lower degrees of the Modified Mercalli Intensity scale generally deal with the manner in which the earthquake is felt by people. The higher numbers of the scale are based on observed damage to structures The large table gives Modified Mercalli scale intensities that are typically observed at locations near the epicentre of the earthquake.

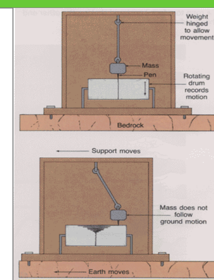
Mercalli Intensity Scale	Magnitude Correlation	Description
I. Not Felt	**<2.0**	Not felt by humans but technology is capable of sensing it.
II. Weak	**2.0 - 2.9**	Felt only by a few persons during sleep, especially on upper floors of buildings.
III. Weak	**2.0 - 3.9**	Felt quite noticeably by persons indoors, especially on upper floors of buildings. Many people do not recognize it as an earthquake. Standing motor cars may rock slightly. Vibrations similar to the passing of a truck. Duration estimated.
IV. Light	**3.9 - 4.9**	Felt indoors by many, outdoors by few during the day. At night, some awakened. Dishes, windows, doors disturbed; walls make cracking sound. Sensation like heavy truck striking building. Standing motor cars rocked noticeably.
V. Moderate	**4.0 - 5.9**	Felt by nearly everyone; many awakened. Some dishes, windows broken. Unstable objects overturned. Pendulum clocks may stop.
VI. Strong	**5.0 - 6.9**	Felt by all, many frightened. Some heavy furniture moved; a few instances of fallen plaster. Damage slight.

VII. Very Strong	**6.0 - 7.9**	Damage negligible in buildings of good design and construction; slight to moderate in well-built ordinary structures; considerable damage in poorly built or badly designed structures; some chimneys broken.
VIII. Severe	**7.0 - 8.0+**	Damage slight in specially designed structures; considerable damage in ordinary substantial buildings with partial collapse. Damage great in poorly built structures. Fall of chimneys, factory stacks, columns, monuments, walls. Heavy furniture overturned.
IX. Violent	**8.0+**	Damage considerable in specially designed structures; well-designed frame structures thrown out of plumb. Damage great in substantial buildings, with partial collapse. Buildings shifted off foundations.
X. Extreme	**8.0+**	Some well-built wooden structures destroyed; most masonry and frame structures destroyed with foundations. Rails bent.
XI. Extremely Dangerous	**9.0+**	Few, if any, (masonry) structures remain standing. Bridges destroyed. Broad fissures in ground. Underground pipe lines completely out of service. Earth slumps and land slips in soft ground. Rails bent greatly.
XII. Catastrophic	**10.0+**	Damage total. Waves seen on ground surfaces. Lines of sight and level distorted. Objects thrown upward into the air.

7 Seismograph

Most seismographs today are electronic, but a basic seismograph is made of a drum with paper on it, a bar or spring with a hinge at one or both ends, a weight, and a pen. The one end of the bar or spring is bolted to a pole or metal box that is bolted to the ground. The weight is put on the other end of the bar and the pen is stuck to the weight. The drum with paper on it presses against the pen and turns constantly. When there is an earthquake, everything in the seismograph moves except the weight with the pen on it. As the drum and paper shake next to the pen, the pen makes squiggly lines on the paper, creating a record of the earthquake.

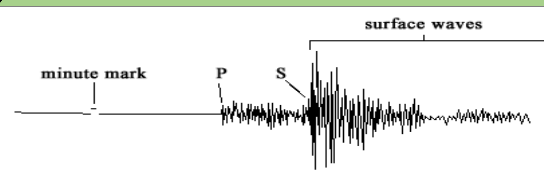
This record made by the seismograph is called a seismogram. By studying the seismogram, the seismologist can tell how far away the earthquake was and how strong it was. This record doesn't tell the seismologist exactly where the epicentre was, just that the earthquake happened so many miles or kilometres away from that seismograph. To find the exact epicentre, you need to know what at least two other seismographs in other parts of the country or world recorded. We'll get to that in a minute. First, you have to learn how to read a seismogram.



Reading a Seismogram

When you look at a seismogram, there will be wiggly lines all across it. These are all the seismic waves that the seismograph has recorded. Most of these waves were so small that nobody felt them. These tiny microseisms can be caused by heavy traffic near the seismograph, waves hitting a beach, the wind, and any number of other ordinary things that cause some shaking of the seismograph.

There may also be some little dots or marks evenly spaced along the paper. These are marks for every minute that the drum of the seismograph has been turning. How far apart these minute marks are will depend on what kind of seismograph you have.

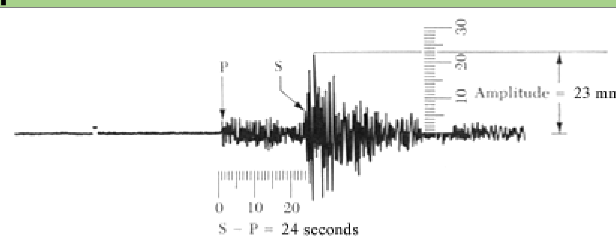


So which wiggles are the earthquake? The P wave will be the first wiggle that is bigger than the rest of the little ones (the microseisms). Because P waves are the fastest seismic waves, they will usually be the first ones that your seismograph records. The next set of seismic waves on your seismogram will be the S waves. These are usually bigger than the P waves. If there aren't any S waves marked on your seismogram, it probably means the earthquake happened on the other side of the planet. S waves can't travel through the liquid layers of the earth so these waves never made it to your seismograph. The surface waves (Love and Rayleigh waves) are the other, often larger, waves marked on the seismogram.

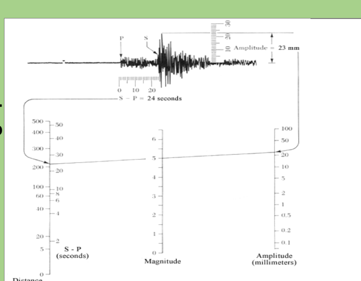
They have a lower frequency, which means that waves (the lines; the ups-and-downs) are more spread out. Surface waves travel a little slower than S waves (which, in turn, are slower than P waves) so they tend to arrive at the seismograph just after the S waves. For shallow earthquakes (earthquakes with a focus near the surface of the earth), the surface waves may be the largest waves recorded by the seismograph. Often they are the only waves recorded a long distance from medium-sized earthquakes.

Locating the Epicentre

To figure out just where that earthquake happened, you need to look at your seismogram and you need to know what at least two other seismographs recorded for the same earthquake. You will also need a map of the world, a ruler, a pencil, and a compass for drawing circles on the map. One minute intervals are marked by the small lines printed just above the squiggles made by the seismic waves (the time may be marked differently on some seismographs). The distance between the beginning of the first P wave and the first S wave tells you how many seconds the waves are apart. This number will be used to tell you how far your seismograph is from the epicentre of the earthquake.



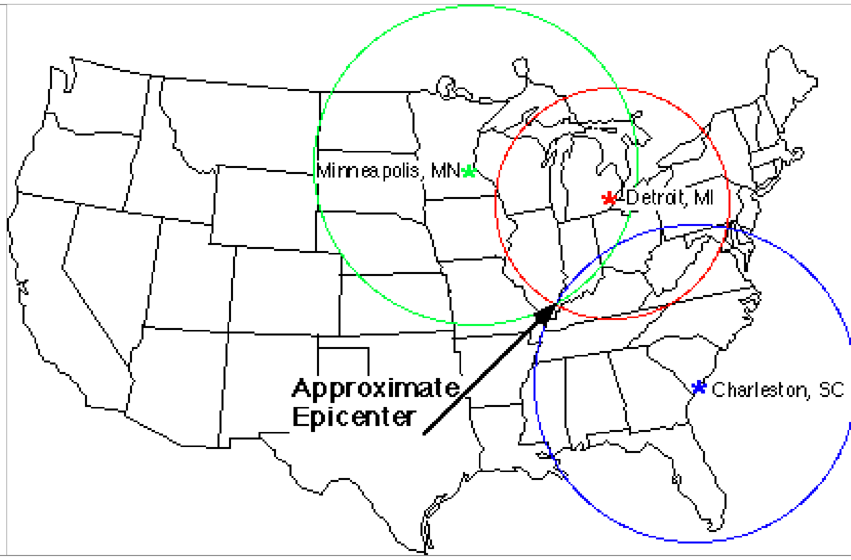
Finding Epicentre & the Magnitude



1. Measure the distance between the first P wave and the first S wave. In this case, the first P and S waves are 24 seconds apart.
2. Find the point for 24 seconds on the left side of the chart below and mark that point. According to the chart, this earthquake's epicentre was 215 kilometres away.
3. Measure the amplitude of the strongest wave. The amplitude is the height (on paper) of the strongest wave. On this seismogram, the amplitude is 23 millimetres. Find 23 millimetres on the right side of the chart and mark that point.
4. Place a ruler (or straight edge) on the chart between the points you marked for the distance to the epicentre and the amplitude. The point where your ruler crosses the middle line on the chart marks the magnitude (strength) of the earthquake. This earthquake had a magnitude of 5.0.

Finding the Epicentre

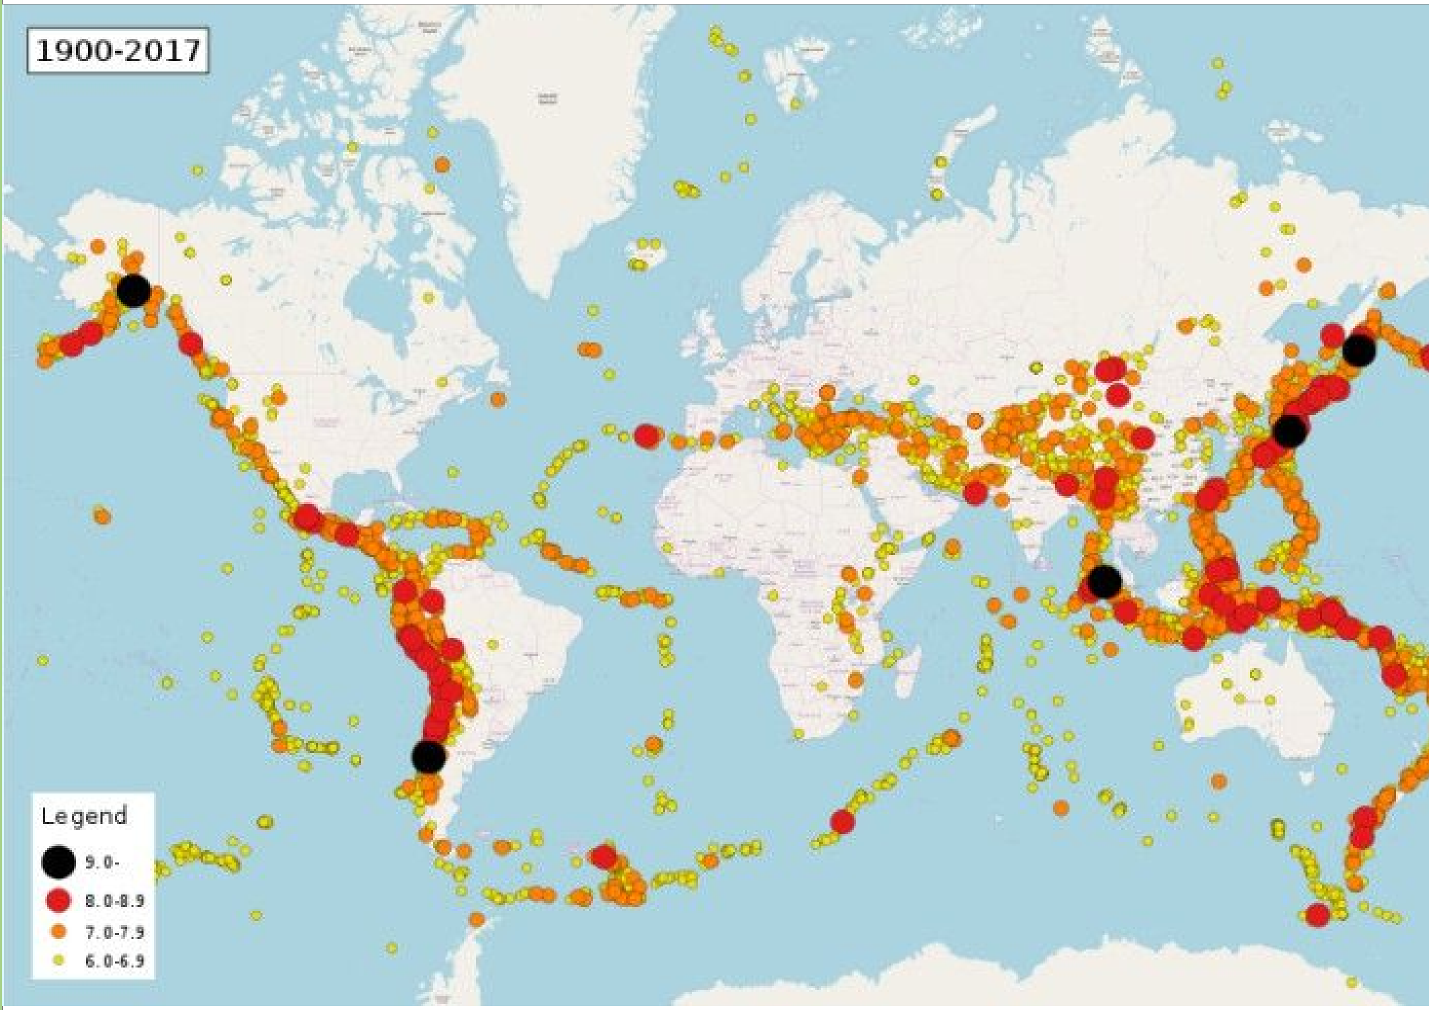
You have just figured out how far your seismograph is from the epicentre and how strong the earthquake was, but you still don't know exactly where the earthquake occurred. This is where the compass, the map, and the other seismograph records come in.



1	1. Check the scale on your map. It should look something like a piece of a ruler. All maps are different. On your map, one centimetre could be equal to 100 kilometres or something like that.
2	2. Figure out how long the distance to the epicentre (in centimetres) is on your map. For example, say your map has a scale where one centimetre is equal to 100 kilometres. If the epicentre of the earthquake is 215 kilometres away, that equals 2.15 centimetres on the map.
3	3. Using your compass, draw a circle with a radius equal to the number you came up with in Step #2 (the radius is the distance from the centre of a circle to its edge). The centre of the circle will be the location of your seismograph. The epicentre of the earthquake is somewhere on the edge of that circle.
4	4. Do the same thing for the distance to the epicentre that the other seismograms recorded (with the location of those seismographs at the centre of their circles). All of the circles should overlap. The point where all of the circles overlap is the approximate epicentre of the earthquake.

8 Earthquake History

Below is a map of all earthquakes 6.0 magnitude or higher since 1900. It's recommended to live somewhere far outside clusters of dots, but particularly the black and red ones.



Largest Earthquakes

A table of some of the biggest earthquakes ever recorded this century.

Location	Indonesia, Indian Ocean	Japan	Chile	Indonesia, Indian Ocean	Indonesia	Peru	Chile	Mexico	Peru	China	United States
Date	26 December 2004	11 March 2011	27 February 2010	11 April 2012	28 March 2005	23 June 2001	16 September 2015	8 September 2017	26 May 2019	12 May 2008	3 November 2002
Magnitude	9.2	9.1	8.8	8.6	8.6	8.4	8.3	8.2	8	7.9	7.9
Deaths	227,898	20,896	525	10	1300	100	14	98	2	87587	0

Frequency

These are the average frequencies of different sized earthquakes.

Magnitude	2-2.9	3-3.9	4-4.9	5-5.9	6-6.9	7-7.9	8+			
Annual Average	1,300,000	130,000	13,000	1,319	134	17	1			

9 Prediction

Earthquakes can't be precisely predicted, however you can estimate future quakes to a surprising level of accuracy by using a few basic techniques.

Earthquake Monitoring

The following is a list of websites you can monitor earthquakes from in real time. See the PREPAREDNESS > Situation Monitoring section for more monitoring programs related to other disasters.

Earthquake 3D (Online & Free)	http://www.earthquake3d.com/
Earthquake 3D Download (Free)	A downloadable earthquake viewer with only basic features. It still requires internet to download the latest earthquakes. http://www.wolton.net/quake.html

Earthquakes@GA (Online & Free)	https://earthquakes.ga.gov.au/
Latest Significant Earthquakes (Online & Free)	https://www.emsc-csem.org/Earthquake/significant_earthquakes.php

Deep Earthquakes

Prediction starts with locating deep earthquakes and their positioning on the planet. Deep earthquakes send shockwaves up to the surface over time and upon reaching the surface they manifest as surface quakes. Multiple deep earthquakes in close proximity start a relay effect which carries the wave across the globe setting off multiple quakes as it passes plates boundaries.

Quake Conversion
The depth of earthquakes has a substantial effect on future quake magnitudes in the same area. Find the depth of the quake then add the number to the strength of it and that's about the strength you should expect of a surface quake shortly after.

Depth - 150km Add - 0.3	Depth - 200km Add - 0.4	Depth - 250km Add - 0.5	Depth - 300km Add - 0.6	Depth - 350km Add - 0.7	Depth - 400km Add - 0.8	Depth - 450km Add - 0.9	Depth - 500km Add - 1.0	Depth - 550km Add - 1.1	Depth - 600km Add - 1.2	Depth - 650km Add - 1.3	Depth - 700km Add - 1.4

Dutchsinse (Michael Janitch) If trying to forecast earthquakes yourself is troublesome you should look up Dutchsinse's YouTube channel where he looks over all current earthquakes and offers his opinion.	**Website** www.dutchsinse.com/	**YouTube** https://www.youtube.com/channel/UCHE92x768p8h-fMrqhsnE1Q Or search for "Dutchsinse"

10 Preparation

How you can prepare for an earthquake of almost any scale in your area.

Earthquake Proofing

Look for any items around your home which may fall during an earthquake - particularly those which will cause hazards such as glass bottles. Go room-by-room and try shaking each piece of furniture, and securing anything that falls or is close to falling. If your area is particularly earthquake prone, designate a room where you'll head to. Have some mattresses ready which you can cover yourself with and some sort of reinforced frame to help prevent a roof collapse. Know how to turn off the electricity, water and gas. Have a pair of shoes handy in your preps to put on after an earthquake, as there's likely to be broken glass from windows and other unsecured items. Have a fire extinguisher in an accessible location and know how to use it. Take heavy objects off shelves. Fix or anchor tall furniture pieces to the wall so they can't fall.

11 Action

If You're Inside

- DROP to the ground; take COVER by getting under a sturdy table or other piece of furniture; and HOLD ON until the shaking stops. If there isn't a table or desk near you, cover your face and head with your arms and crouch in an inside corner of the building.
- Stay away from glass, windows, outside doors and walls, and anything that could fall, such as lighting fixtures or furniture.
- Stay in bed if you are there when the earthquake strikes. Hold on and protect your head with a pillow, unless you are under a heavy light fixture that could fall. In that case, move to the nearest safe place.
- Do not use a doorway except if you know it is a strongly supported, load-bearing doorway and it is close to you. Many inside doorways are lightly constructed and do not offer protection.
- Stay inside until the shaking stops and it is safe to go outside. Do not exit a building during the shaking. Research has shown that most injuries occur when people inside buildings attempt to move to a different location inside the building or try to leave.
- Don't use elevators.
- Be aware that the electricity may go out or the sprinkler systems or fire alarms may turn on.

If You're Outside

- Stay outside.
- Move away from buildings, streetlights, and utility wires.
- Once in the open, stay there until the shaking stops. The greatest danger exists directly outside buildings, at exits and alongside exterior walls.

If You're in a Vehicle

Pull over to the side of the road, stop, and set the parking brake. Avoid overpasses, bridges, power lines, signs and other hazards. Stay inside the vehicle until the shaking stops, then proceed carefully by avoiding fallen debris, cracked or shifted payment, and emergency vehicles. If a power line falls on the car, stay inside until a trained person removes the wire.

If You're on the Shore

Follow instructions above for your particular location. Then as soon as shaking reduces such that you are able to stand, walk quickly to high ground or inland as a tsunami may arrive soon. Don't wait for officials to issue a warning. Walk, rather than drive, to avoid traffic, debris, and other hazards.

NATURAL DISASTERS Earthquake Action If You'

If you are near a large body of water (the ocean or a large lake), move to higher ground as soon as you can safely do so. Tsunami waves can arrive within minutes. Go on foot. Roads and bridges may be damaged. If evacuation is impossible, go to the third or higher floor of a sturdy building or climb a tree. This should only be used as a last resort. Stay away from the coast until officials tell you it is safe to return. The danger may last for days. If you are not in a tsunami zone, evacuate your home or office only if there is damage to the building or the surrounding area is unsafe. Consider relocating somewhere safer such as a friend's house or a community shelter. If the building is undamaged, it can be safe to remain, even if the power is out, but you will want to find an alternative location if power is not restored within a few days. If you need to evacuate to a shelter, take only your "grab-and-go" bag (Step 3) with essentials such as medication, important documents, prescription eye wear, etc. Shelters have limited space.

12 Post-Earthquake

NATURAL DISASTERS Earthquake Post-Earthquake

Trapped

Trapped

If you're trapped inside a house or under rubble after an earthquake:
● Do not light a match as there could be cut gas lines and it will consume your oxygen faster.
● Do not move around or kick up dust.
● Cover your mouth, nose and eyes with a handkerchief or clothing.
● Tap on a pipe or wall so rescuers can locate you. Use a whistle if one is available. Shout only as a last resort. Shouting can cause you to inhale dangerous amounts of dust.
● If you are bleeding, put pressure on the wound and elevate the injured part.

NATURAL DISASTERS Earthquake Post-Earthquake Risks

Risks

Fire	If you are trained and have a fire extinguisher handy, put out small fires in your home or neighbourhood immediately. Call for help, but don't wait for the fire department. Large fires are a sign to evacuate.
Downed Power Lines	If you see downed power lines, consider them energized and stay well away from them. Keep others away from them also. Never touch downed power lines or any objects in contact with them.
Damaged Wiring	Shut off power at the main breaker switch if there is any damage to your house wiring. Leave the power off until the damage is repaired.
Broken Appliances	Unplug these as they could start fires when electricity is restored.
Gas Leaks	Shut off the main gas valve only if you suspect a leak because of broken pipes, the odour or sound of leaking natural gas, or you see the meter spinning quickly. Only the gas company can turn the gas back on after they check for leaks, so shut it off only if necessary. The phone book has detailed information on this topic. Do not use candles or matches. You could start a fire and there may also be gas leaks. Use your flashlights, battery powered lights, and light sticks.
Fallen Items	Beware of items tumbling off shelves when you open the doors of closets and cupboards.
Spills	Use extreme caution. Clean up any spilled medicines, drugs, or other non-toxic substances. Potentially harmful materials such as bleach, lye, garden chemicals, and gasoline or other petroleum products should be isolated or covered with an absorbent such as dirt or cat litter. When in doubt, leave your home.
Damaged Masonry	Stay away from chimneys and walls made of brick or block. They may be weakened and could topple during aftershocks. Don't use a fireplace with a damaged chimney. It could start a fire or let poisonous gases into your home.

NATURAL DISASTERS Earthquake Post-Earthquake Risks

RAL DISASTERS Earthquake Post-Earthquake

Contact

Register on the Red Cross "Safe and Well" website so people will know you are okay: SafeAndWell.org. Phone service may be out. When possible, text or call your out-of-area contact and tell them where you are, then stay off the phone. This will allow calls to be made for emergencies. Surf the (battery-powered) radio dial to find a station that is on the air. Listen for public announcements and alerts. Listen to your NOAA Weather Radio for emergency information. Smart phones and computers are a great resource for information, as long as you have power or can recharge your batteries.

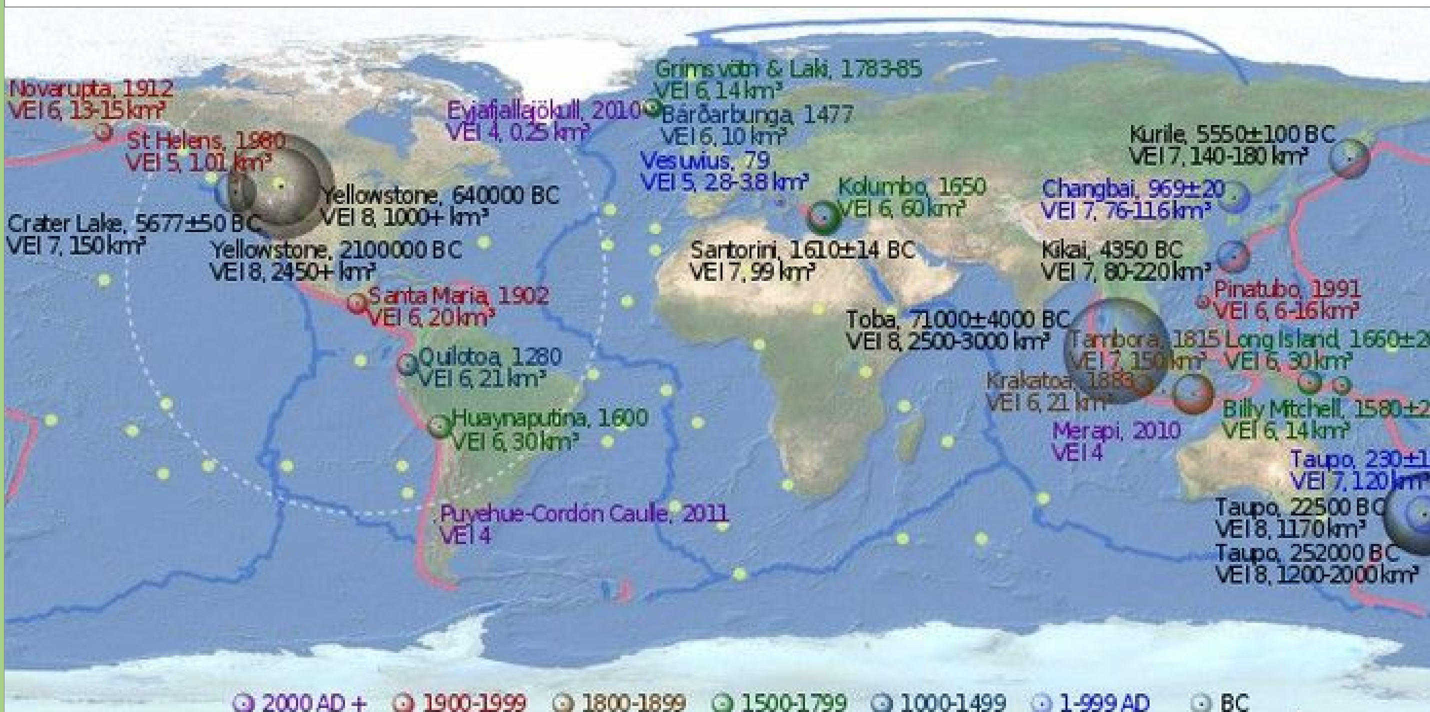
5 Volcano

A volcano is a rupture in the crust of a planetary-mass object, such as Earth, that allows hot lava, volcanic ash, and gases to escape from a magma chamber below the surface. Earth's volcanoes occur because its crust is broken into 17 major, rigid tectonic plates that float on a hotter, softer layer in its mantle. Therefore, on Earth, volcanoes are generally found where tectonic plates are diverging or converging, and most are found underwater. Volcanoes can also form where there is stretching and thinning of the crust's plates, e.g., in the East African Rift and the Wells Gray-Clearwater volcanic field and Rio Grande Rift in North America. This type of volcanism falls under the umbrella of "plate hypothesis" volcanism.

Volcanism away from plate boundaries has also been explained as mantle plumes. These so-called "hotspots", for example Hawaii, are postulated to arise from upwelling diapirs with magma from the core–mantle boundary, 3,000 km deep in the Earth. Volcanoes are usually not created where two tectonic plates slide past one another.

Erupting volcanoes can pose many hazards, not only in the immediate vicinity of the eruption. One such hazard is that volcanic ash can be a threat to aircraft, in particular those with jet engines where ash particles can be melted by the high operating temperature; the melted particles then adhere to the turbine blades and alter their shape, disrupting the operation of the turbine. Large eruptions can affect temperature as ash and droplets of sulfuric acid obscure the sun and cool the Earth's lower atmosphere (or troposphere); however, they also absorb heat radiated from the Earth, thereby warming the upper atmosphere (or stratosphere). Historically, volcanic winters have caused catastrophic famines.

This is a map of large volcano eruptions that have occured in the past. It's best to try and avoid living in these locations - just in case.



Previous Volcanos (By Date)	Mount Pinatubo Luzon, Philippines 1991, Jun 15 VEI 6 6-16 km3	Mount Tambora Lesser Sunda Islands, Indonesia 1815, Apr 10 VEI 7	Santa María Guatemala 1902, Oct 24 VEI 6	Krakatoa Indonesia 1883, Aug 26–27 VEI 6 At least 30,000 dead	Mount St. Helens Washington 1980 VEI 5 80,000-foot-tall plume of smoke, killing 57 people and destroying 200 homes

Categorisation

The Volcanic Explosivity Index (VEI) is a relative measure of the explosiveness of volcanic eruptions. They are logarithmic and each level in an increase by a factor of 10.

VEI Level	Description	Plume	Ejectable Material	Frequency	Tropo-spheric	Strato-spheric
VEI - 0	Effusive	<100m	0.00001 km³	Continuous	Negligible	None
VEI - 1	Gentle	100m-1km	0.001 km³	Daily	Minor	None
VEI - 2	Explosive	1km-5km	0.01 km³	2 Weeks	Moderate	None
VEI - 3	Catastrophic	3km-15km	0.1 km³	3 Months	Substantial	Possible
VEI - 4	Cataclysmic	>10km	1 km³	18 Months	Substantial	Definite
VEI - 5	Paroxysmic	>10km	10 km³	12 Years	Substantial	Significant
VEI - 6	Colossal	>20km	100 km³	50-100 Years	Substantial	Substantial
VEI - 7	Super-Colossal	>20km	500 km³	500-1,000 Years	Substantial	Substantial
VEI - 8	Mega-Colossal	>20km	1,000 km³	50,000 Years	Vast	Vast
VEI - 9	Extinction	>20km	10,000 km³	100,000 Years	Insane	Insane

Potential VEI 8 Supervolcano Locations

Yellowstone Caldera **Wyoming, United States**	The caldera and most of the park are located in the northwest corner of Wyoming. The major features of the caldera measure about 34 by 45 miles (55 by 72 km).
The Long Valley Caldera **California, United States**	The valley is one of the Earth's largest calderas, measuring about 20 miles (32 km) long (east-west), 11 miles (18 km) wide (north-south), and up to 3,000 feet (910 m) deep.

Valles Caldera Sandoval County, New Mexico, US	Last Eruption: 50,000–60,000 yrs. A 13.7-mile (22.0 km) wide volcanic caldera in the Jemez Mountains of northern New Mexico.
Lake Toba North Sumatra, Indonesia	The lake is about 100 kilometres (62 miles) long, 30 kilometres (19 mi) wide, and up to 505 metres (1,657 ft) deep.
Taupo Caldera New Zealand	
Aira Caldera	

Volcanic Components

Volcanic Ash (Tephra)

All explosive volcanic eruptions generate tephra, fragments of rock that are produced when magma or rock is explosively ejected. The largest fragments, blocks and bombs (>64 mm, 2.5 inches diameter), can be expelled with great force but are deposited near the eruptive vent. Lapilli-sized material (6-64 mm, 0.24-2.5 inches diameter) can be carried upward within in a volcanic plume and downwind in a volcanic cloud, but fall to the ground as the eruption cloud cools.

The smallest material, volcanic ash (<2 mm diameter) is both easily convected upward within the plume and carried downwind for very long distances; as it falls out of suspension it can potentially affect communities and farmland across hundreds, or even thousands, of square kilometres (miles). Ashfall rarely endangers human lives, but it can have devastating effects on the things that we rely upon from day to day. As a result of its fine-grained abrasive character and widespread distribution by wind, ashfall and volcanic ash clouds are a major hazard to aviation.

The primary hazard from Alaska volcanoes is ash clouds impacting aviation and ashfall reaching areas downwind, owing to widespread dispersal by wind. Ash fallout to the ground can pose significant disruption and damage to buildings, transportation, water and wastewater, power supply, communications equipment, agriculture, and primary production leading to potentially substantial societal impacts and costs, even at thicknesses of only a few millimetres or inches. Additionally, fine grained ash, when ingested can cause health impacts to humans and animals.

Impacts from ashfall are more complex and multi-faceted than for any of the other volcanic hazards. Variabilities include the distance from the eruption source, orientation and dispersion of the eruption cloud, the amount of ashfall received, physical and chemical properties of the ash, characteristics of the receiving environment (such as climate and land use), and the ability of affected community to adapt to ashfall.

Lava Flow

Lava flows are streams of molten rock that pour or ooze from an erupting vent. Lava is erupted during either nonexplosive activity or explosive lava fountains. The speed at which lava moves across the ground depends on several factors, including:
1. Type of lava erupted and its viscosity;
2. Steepness of the ground over which it travels;
3. Whether the lava flows as a broad sheet, through a confined channel, or down a lava tube; and
4. Rate of lava production at the vent.

Fluid basalt flows can extend tens of kilometres from an erupting vent. The leading edges of basalt flows can travel as fast as 10 km/h (6 mph) on steep slopes but they typically advance less than 1 km/h (0.27 m/s or about 1 ft/s) on gentle slopes. But when basalt lava flows are confined within a channel or lava tube on a steep slope, the main body of the flow can reach velocities >30 km/h (19 mph). Viscous andesite flows move only a few kilometres per hour (couple feet per second) and rarely extend more than 8 km (5 mi) from their vents.

Viscous dacite and rhyolite flows often form steep-sided mounds called lava domes over an erupting vent. Lava domes often grow by the extrusion of many individual flows >30 m (100 ft) thick over a period of several months or years. Such flows will overlap one another and typically move less than a few meters per hour. Everything in the path of an advancing lava flow will be knocked over, surrounded, buried, or ignited by the extremely hot temperature of lava. When lava erupts beneath a glacier or flows over snow and ice, meltwater from the ice and snow can result in far-reaching lahars.

If it enters a body of water or water enters a lava tube, the water may boil violently and cause an explosive shower of molten spatter over a wide area. Methane gas, produced as lava buries vegetation, can migrate in subsurface voids and explode when heated. Thick viscous lava flows, especially those that build a dome, can collapse to form fast-moving pyroclastic flows. Deaths caused directly by lava flows are uncommon because most move slowly enough that people can move out the way easily. Death and injury can result when onlookers approach an advancing lava flow too closely or their retreat is cut off by other flows. Deaths attributed to lava flows are often due to related causes, such as explosions when lava interacts with water, the collapse of an active lava delta that forms where lava enters a body of water, asphyxiation due to accompanying toxic gases, pyroclastic flows from a collapsing dome, and lahars from meltwater.

Other natural phenomena such as hurricanes, tornadoes, tsunami, fires, and earthquakes often destroy buildings, agricultural crops, and homes, but the owner(s) can usually rebuild or repair structures and their businesses in the same location. Lava flows, however, can bury homes and agricultural land under tens of meters of hardened black rock; landmarks and property lines become obscured by a vast, new hummocky landscape. People are rarely able to use land buried by lava flows or sell it for more than a small fraction of its previous worth.

Pyroclastic Flow

Pyroclastic flows contain a high-density mix of hot lava blocks, pumice, ash and volcanic gas. They move at very high speed down volcanic slopes, typically following valleys. Most pyroclastic flows consist of two parts: a lower (basal) flow of coarse fragments that moves along the ground, and a turbulent cloud of ash that rises above the basal flow. Ash may fall from this cloud over a wide area downwind from the pyroclastic flow.

Pyroclastic Flow Formation
● Collapse of eruption column: during a highly explosive eruption, the column ejected upwards into the atmosphere cools and can become too cool and dense to maintain upward momentum.
● "Boiling over" from eruptive vent: during an explosive eruption, material is erupted without forming a high plume and rapidly moves down slope.
● Collapse of lava domes or flows: The fronts of lava flows or domes can become so steep that they collapse due to gravitational force.

With rock fragments ranging in size from ash to boulders that travel across the ground at speeds typically greater than 80 km per hour (50 mph), pyroclastic flows knock down, shatter, bury or carry away nearly all objects and structures in their path. The extreme temperatures of rocks and gas inside pyroclastic flows, generally between 200-700°C (390-1300°F), can ignite fires and melt snow and ice. Pyroclastic flows vary considerably in size and speed, but even relatively small flows that move less than 5 km (3 mi) from a volcano can destroy buildings, forests, and farmland.

On the margins of pyroclastic flows, death and serious injury to people and animals may result from burns and inhalation of hot ash and gases. Pyroclastic flows generally follow valleys or other low-lying areas and, depending on the volume of rock debris carried by the flow, they can deposit layers of loose rock fragments to depths ranging from less than one meter to more than 200 m (up to about 700 ft).

Secondary hazards
● Eroding, melting and mixing with snow and ice, thereby sending a sudden torrent downstream.
● Damming or blocking streams in volcanic valleys, which may create lakes behind the blockage that eventually overtop and erode the blockage producing a rush of water and volcanic material downstream.
● Increasing the rate of stream runoff and erosion during rainstorms due to the creation of an easily eroded landscape with sparse vegetation.

Lahar

Lahar is an Indonesian term that describes a hot or cold mixture of water and rock fragments that flows down the slopes of a volcano and typically enters a river valley. Small seasonal events are sometimes referred to as "debris flows", especially in the Cascades. Lahars generally occur on or near stratovolcanoes, such as those of the Aleutian volcanic arc in Alaska and the Cascade Range in the Western U.S. A moving lahar looks like a roiling slurry of wet concrete, and as it rushes downstream, the size, speed, and amount of material carried can constantly change.

The initial flow may be relatively small, but a lahar may grow in volume as it entrains and incorporates anything in its path – rocks, soil, vegetation, and even buildings and bridges. The flowing slurry may consume additional water through melting of snow and ice or by engulfing river or lake water. Voluminous lahars commonly grow to more than 10 times their initial size as they move downslope.

In steep areas, lahars can exceed speeds of 200 km/hr (120 mi/hr), but as they move farther away from a volcano and decelerate in lowland areas, they eventually begin to deposit some of the load and decrease in size. Eruptions may trigger lahars by melting snow and ice or by ejecting water from a crater lake. Pyroclastic flows can generate lahars when extremely hot, flowing rock debris erodes, mixes with, and melts snow and ice as it travel rapidly down steep slopes.

Lahars can also be formed when high-volume or long-duration rainfall occurs during or after an eruption. On steep slopes, rainwater can easily erode and transport fine-grained, loose volcanic sediment and form a slurry, especially if vegetation has not had time to grow back on recent volcanic deposits. Some of the largest lahars begin as landslides of wet, hydrothermally altered rock on the steep flanks of volcanoes. These types of collapse and resultant lahars are natural events during a stratovolcano's life history and can occur long after it stops erupting. Lake breakout floods that occur without an eruption can also lead to lahars.

They commonly occur after a stream becomes blocked by a volcanic landslide or pyroclastic flow that forms a natural dam. The most frequent cause of a lake breakout is the overflow of water across a newly formed natural dam, followed by rapid erosion of the loose rock debris. By further erosion and entrainment of sediment and water, the initial flood can transform into a slurry and increase in volume as it races downvalley. Large lahars can crush, abrade, bury, or carry away almost anything in their paths. Buildings and valuable land may be partially or completely buried.

By destroying bridges and roads, lahars can also trap people in areas vulnerable to other hazardous volcanic activity, especially if the lahars leave fresh deposits that are too deep, too soft, or too hot to cross. Over a period of weeks to years after a volcanic eruption, the erosion and transportation of loose volcanic deposits can lead to severe flooding in areas far downstream from a volcano. Intense rainfall easily erodes loose sediment on steep slopes to produce lahars that travel onto flood plains and bury entire towns and valuable agricultural land.

Carbon Dioxide Gas

In an average year, volcanoes release between about 180 and 440 million tonnes of carbon dioxide. When this colourless, odourless gas is emitted from volcanoes, it typically becomes diluted to low concentrations very quickly and is not life threatening. However, because cold carbon dioxide gas is heavier than air it can flow into in low-lying areas where it can reach much higher concentrations in certain, very stable atmospheric conditions. This can pose serious risks to people and animals. In volcanic or other areas where CO2 emissions occur, it is important to avoid small depressions and low areas that might be CO2 traps. The boundary between healthy air and lethal gas can be extremely sharp; even a single step upslope may be adequate to escape death.

Sulphur Dioxide Gas

Sulphur dioxide is a colourless gas with a pungent odor that irritates skin and the tissues and mucous membranes of the eyes, nose, and throat. SO2 emissions can cause acid rain and air pollution downwind of a volcano—at Kīlauea volcano in Hawaii, high concentrations of sulphur dioxide produce volcanic smog (VOG) causing persistent health problems for downwind populations. During very large eruptions, SO2 can be injected to altitudes of greater than 10km into the stratosphere. Here, SO2 is converted to sulphate aerosols which reflect sunlight and therefore have a cooling effect on the Earth's climate. They also have a role in ozone depletion, as many of the reactions that destroy ozone occur on the surface of such aerosols.

Hydrogen Sulfide Gas

Hydrogen sulfide is a colourless, flammable gas with a strong, offensive odor. It is sometimes referred to as sewer gas. Interestingly, the human nose is more sensitive to H2S than any gas monitoring instrument we have today: air mixtures with as little as 0.000001% H2S are associated with a rotten egg smell. Unfortunately, however, our sense of smell is not a reliable alarm - at mixing ratios above about 0.01%, H2S becomes odourless and very toxic, causing irritation of the upper respiratory tract and, during long exposure, pulmonary edema. Exposure to 500 ppm can cause a human to fall unconscious in 5 minutes and die in an hour or less.

Hydrogen Halides

When magma ascends close to the surface, volcanoes can emit the halogens fluorine, chlorine and bromine in the form of hydrogen halides (HF, HCl and HBr). These species are all strong acids and have high solubility; therefore they rapidly dissolve in water droplets within volcanic plumes or the atmosphere where they can potentially cause acid rain. In an ash-producing eruption, ash particles are also often coated with hydrogen halides. Once deposited, these coated ash particles can poison drinking water supplies, agricultural crops, and grazing land.

6 Flood

A flood is an overflow of water that submerges land that is usually dry. In the sense of "flowing water", the word may also be applied to the inflow of the tide. Floods are an area of study of the discipline hydrology and are of significant concern in agriculture, civil engineering and public health. Flooding may occur as an overflow of water from water bodies, such as a river, lake, or ocean, in which the water overtops or breaks levees, resulting in some of that water escaping its usual boundaries, or it may occur due to an accumulation of rainwater on saturated ground in an areal flood. While the size of a lake or other body of water will vary with seasonal changes in precipitation and snow melt, these changes in size are unlikely to be considered significant unless they flood property or drown domestic animals.

Floods can also occur in rivers when the flow rate exceeds the capacity of the river channel, particularly at bends or meanders in the waterway. Floods often cause damage to homes and businesses if they are in the natural flood plains of rivers. While riverine flood damage can be eliminated by moving away from rivers and other bodies of water, people have traditionally lived and worked by rivers because the land is usually flat and fertile and because rivers provide easy travel and access to commerce and industry. Some floods develop slowly, while others such as flash floods can develop in just a few minutes and without visible signs of rain. Additionally, floods can be local, impacting a neighborhood or community, or very large, affecting entire river basins.

For a simulation of flooding based on elevation, see **https://www.floodmap.net/**

Subheadings

1 Types

Areal

Floods can happen on flat or low-lying areas when water is supplied by rainfall or snowmelt more rapidly than it can either infiltrate or run off. The excess accumulates in place, sometimes to hazardous depths. Surface soil can become saturated, which effectively stops infiltration, where the water table is shallow, such as a floodplain, or from intense rain from one or a series of storms. Infiltration also is slow to negligible through frozen ground, rock, concrete, paving, or roofs. Areal flooding begins in flat areas like floodplains and in local depressions not connected to a stream channel, because the velocity of overland flow depends on the surface slope. Endorheic basins may experience areal flooding during periods when precipitation exceeds evaporation.

Riverine (Channel)

Floods occur in all types of river and stream channels, from the smallest ephemeral streams in humid zones to normally-dry channels in arid climates to the world's largest rivers. When overland flow occurs on tilled fields, it can result in a muddy flood where sediments are picked up by run off and carried as suspended matter or bed load. Localized flooding may be caused or exacerbated by drainage obstructions such as landslides, ice, debris, or beaver dams. Slow-rising floods most commonly occur in large rivers with large catchment areas. The increase in flow may be the result of sustained rainfall, rapid snow melt, monsoons, or tropical cyclones.

However, large rivers may have rapid flooding events in areas with dry climate, since they may have large basins but small river channels and rainfall can be very intense in smaller areas of those basins. Rapid flooding events, including flash floods, more often occur on smaller rivers, rivers with steep valleys, rivers that flow for much of their length over impermeable terrain, or normally-dry channels. The cause may be localized convective precipitation (intense thunderstorms) or sudden release from an upstream impoundment created behind a dam, landslide, or glacier.

In one instance, a flash flood killed eight people enjoying the water on a Sunday afternoon at a popular waterfall in a narrow canyon. Without any observed rainfall, the flow rate increased from about 50 to 1,500 cubic feet per second (1.4 to 42 m3/s) in just one minute. Two larger floods occurred at the same site within a week, but no one was at the waterfall on those days. The deadly flood resulted from a thunderstorm over part of the drainage basin, where steep, bare rock slopes are common and the thin soil was already saturated.

Flash floods are the most common flood type in normally-dry channels in arid zones, known as arroyos in the southwest United States and many other names elsewhere. In that setting, the first flood water to arrive is depleted as it wets the sandy stream bed. The leading edge of the flood thus advances more slowly than later and higher flows. As a result, the rising limb of the hydrograph becomes ever quicker as the flood moves downstream, until the flow rate is so great that the depletion by wetting soil becomes insignificant.

Estuarine and Coastal

Flooding in estuaries is commonly caused by a combination of sea tidal surges caused by winds and low barometric pressure, and they may be exacerbated by high upstream river flow. Coastal areas may be flooded by storm events at sea, resulting in waves over-topping defenses or in severe cases by tsunami or tropical cyclones. A storm surge, from either a tropical cyclone or an extratropical cyclone, falls within this category. Research from the NHC (National Hurricane Center) explains: "Storm surge is an abnormal rise of water generated by a storm, over and above the predicted astronomical tides. Storm surge should not be confused with storm tide, which is defined as the water level rise due to the combination of storm surge and the astronomical tide. This rise in water level can cause extreme flooding in coastal areas particularly when storm surge coincides with normal high tide, resulting in storm tides reaching up to 20 feet or more in some cases."

Urban Flooding

Urban flooding is the inundation of land or property in a built environment, particularly in more densely populated areas, caused by rainfall overwhelming the capacity of drainage systems, such as storm sewers. Although sometimes triggered by events such as flash flooding or snowmelt, urban flooding is a condition, characterized by its repetitive and systemic impacts on communities, that can happen regardless of whether or not affected communities are located within designated floodplains or near any body of water. Aside from potential overflow of rivers and lakes, snowmelt, stormwater or water released from damaged water mains may accumulate on property and in public rights-of-way, seep through building walls and floors, or backup into buildings through sewer pipes, toilets and sinks.

In urban areas, flood effects can be exacerbated by existing paved streets and roads, which increase the speed of flowing water. The flood flow in urbanized areas constitutes a hazard to both the population and infrastructure. Some recent catastrophes include the inundations of Nîmes (France) in 1998 and Vaison-la-Romaine (France) in 1992, the flooding of New Orleans (USA) in 2005, and the flooding in Rockhampton, Bundaberg, Brisbane during the 2010–2011 summer in Queensland (Australia). Flood flows in urban environments have been studied relatively recently despite many centuries of flood events. Some recent research has considered the criteria for safe evacuation of individuals in flooded areas.

Catastrophic

Catastrophic riverine flooding is usually associated with major infrastructure failures such as the collapse of a dam, but they may also be caused by drainage channel modification from a landslide, earthquake or volcanic eruption. Examples include outburst floods and lahars. Tsunamis can cause catastrophic coastal flooding, most commonly resulting from undersea earthquakes.

2 Causes

Upslope Factors

The amount, location, and timing of water reaching a drainage channel from natural precipitation and controlled or uncontrolled reservoir releases determines the flow at downstream locations. Some precipitation evaporates, some slowly percolates through soil, some may be temporarily sequestered as snow or ice, and some may produce rapid runoff from surfaces including rock, pavement, roofs, and saturated or frozen ground. The fraction of incident precipitation promptly reaching a drainage channel has been observed from nil for light rain on dry, level ground to as high as 170 percent for warm rain on accumulated snow. Most precipitation records are based on a measured depth of water received within a fixed time interval. Frequency of a precipitation threshold of interest may be determined from the number of measurements exceeding that threshold value within the total time period for which observations are available. Individual data points are converted to intensity by dividing each measured depth by the period of time between observations. This intensity will be less than the actual peak intensity if the duration of the rainfall event was less than the fixed time interval for which measurements are reported.

Convective precipitation events (thunderstorms) tend to produce shorter duration storm events than orographic precipitation. Duration, intensity, and frequency of rainfall events are important to flood prediction. Short duration precipitation is more significant to flooding within small drainage basins. The most important upslope factor in determining flood magnitude is the land area of the watershed upstream of the area of interest. Rainfall intensity is the second most important factor for watersheds of less than approximately 30 square miles or 80 square kilometres. The main channel slope is the second most important factor for larger watersheds. Channel slope and rainfall intensity become the third most important factors for small and large watersheds, respectively. Time of Concentration is the time required for runoff from the most distant point of the upstream drainage area to reach the point of the drainage channel controlling flooding of the area of interest. The time of concentration defines the critical duration of peak rainfall for the area of interest. The critical duration of intense rainfall might be only a few minutes for roof and parking lot drainage structures, while cumulative rainfall over several days would be critical for river basins.

Downslope Factors

Water flowing downhill ultimately encounters downstream conditions slowing movement. The final limitation in coastal flooding lands is often the ocean or some coastal flooding bars which form natural lakes. In flooding low lands, elevation changes such as tidal fluctuations are significant determinants of coastal and estuarine flooding. Less predictable events like tsunamis and storm surges may also cause elevation changes in large bodies of water. Elevation of flowing water is controlled by the geometry of the flow channel and, especially, by depth of channel, speed of flow and amount of sediments in it.

Flow channel restrictions like bridges and canyons tend to control water elevation above the restriction. The actual control point for any given reach of the drainage may change with changing water elevation, so a closer point may control for lower water levels until a more distant point controls at higher water levels. Effective flood channel geometry may be changed by growth of vegetation, accumulation of ice or debris, or construction of bridges, buildings, or levees within the flood channel.

Coincidence

Extreme flood events often result from coincidence such as unusually intense, warm rainfall melting heavy snow pack, producing channel obstructions from floating ice, and releasing small impoundments like beaver dams. Coincident events may cause extensive flooding to be more frequent than anticipated from simplistic statistical prediction models considering only precipitation runoff flowing within unobstructed drainage channels. Debris modification of channel geometry is common when heavy flows move uprooted woody vegetation and flood-damaged structures and vehicles, including boats and railway equipment. Recent field measurements during the 2010–11 Queensland floods showed that any criterion solely based upon the flow velocity, water depth or specific momentum cannot account for the hazards caused by velocity and water depth fluctuations.

These considerations ignore further the risks associated with large debris entrained by the flow motion. Some researchers have mentioned the storage effect in urban areas with transportation corridors created by cut and fill. Culverted fills may be converted to impoundments if the culverts become blocked by debris, and flow may be diverted along streets. Several studies have looked into the flow patterns and redistribution in streets during storm events and the implication on flood modelling.

3 Effects

The primary effects of flooding include loss of life and damage to buildings and other structures, including bridges, sewerage systems, roadways, and canals. Floods also frequently damage power transmission and sometimes power generation, which then has knock-on effects caused by the loss of power. This includes loss of drinking water treatment and water supply, which may result in loss of drinking water or severe water contamination. It may also cause the loss of sewage disposal facilities. Lack of clean water combined with human sewage in the flood waters raises the risk of waterborne diseases, which can include typhoid, giardia, cryptosporidium, cholera and many other diseases depending upon the location of the flood.

Damage to roads and transport infrastructure may make it difficult to mobilize aid to those affected or to provide emergency health treatment. Flood waters typically inundate farm land, making the land unworkable and preventing crops from being planted or harvested, which can lead to shortages of food both for humans and farm animals. Entire harvests for a country can be lost in extreme flood circumstances. Some tree species may not survive prolonged flooding of their root systems.

Economic hardship due to a temporary decline in tourism, rebuilding costs, or food shortages leading to price increases is a common after-effect of severe flooding. The impact on those affected may cause psychological damage to those affected, in particular where deaths, serious injuries and loss of property occur. Urban flooding can cause chronically wet houses, leading to the growth of indoor mold and resulting in adverse health effects, particularly respiratory symptoms. Urban flooding also has significant economic implications for affected neighborhoods. In the United States, industry experts estimate that wet basements can lower property values by 10–25 percent and are cited among the top reasons for not purchasing a home. According to the U.S. Federal Emergency Management Agency (FEMA), almost 40 percent of small businesses never reopen their doors following a flooding disaster. In the United States, insurance is available against flood damage to both homes and businesses.

Benefits
Floods (in particular more frequent or smaller floods) can also bring many benefits, such as recharging ground water, making soil more fertile and increasing nutrients in some soils. Flood waters provide much needed water resources in arid and semi-arid regions where precipitation can be very unevenly distributed throughout the year and kills pests in the farming land. Freshwater floods particularly play an important role in maintaining ecosystems in river corridors and are a key factor in maintaining floodplain biodiversity.

Flooding can spread nutrients to lakes and rivers, which can lead to increased biomass and improved fisheries for a few years. For some fish species, an inundated floodplain may form a highly suitable location for spawning with few predators and enhanced levels of nutrients or food. Fish, such as the weather fish, make use of floods in order to reach new habitats. Bird populations may also profit from the boost in food production caused by flooding. Periodic flooding was essential to the well-being of ancient communities along the Tigris-Euphrates Rivers, the Nile River, the Indus River, the Ganges and the Yellow River among others. The viability of hydropower, a renewable source of energy, is also higher in flood prone regions.

4 Flood Safety Planning

At the most basic level, the best defense against floods is to seek higher ground for high-value uses while balancing the foreseeable risks with the benefits of occupying flood hazard zones. Critical community-safety facilities, such as hospitals, emergency-operations centers, and police, fire, and rescue services, should be built in areas least at risk of flooding. Structures, such as bridges, that must unavoidably be in flood hazard areas should be designed to withstand flooding. Areas most at risk for flooding could be put to valuable uses that could be abandoned temporarily as people retreat to safer areas when a flood is imminent. Planning for flood safety involves many aspects of analysis and engineering, including:

- Observation of previous and present flood heights and inundated areas,
- Statistical, hydrologic, and hydraulic model analyses,
- Mapping inundated areas and flood heights for future flood scenarios,
- Long-term land use planning and regulation,
- Engineering design and construction of structures to control or withstand flooding,
- Intermediate-term monitoring, forecasting, and emergency-response planning, and
- Short-term monitoring, warning, and response operations.

Each topic presents distinct yet related questions with varying scope and scale in time, space, and the people involved. Attempts to understand and manage the mechanisms at work in floodplains have been made for at least six millennia. In the United States, the Association of State Floodplain Managers works to promote education, policies, and activities that mitigate current and future losses, costs, and human suffering caused by flooding and to protect the natural and beneficial functions of floodplains – all without causing adverse impacts. A portfolio of best practice examples for disaster mitigation in the United States is available from the Federal Emergency Management Agency.

In many countries around the world, waterways prone to floods are often carefully managed. Defenses such as detention basins, levees, bunds, reservoirs, and weirs are used to prevent waterways from overflowing their banks. When these defenses fail, emergency measures such as sandbags or portable inflatable tubes are often used to try to stem flooding. Coastal flooding has been addressed in portions of Europe and the Americas with coastal defenses, such as sea walls, beach nourishment, and barrier islands.

In the riparian zone near rivers and streams, erosion control measures can be taken to try to slow down or reverse the natural forces that cause many waterways to meander over long periods of time. Flood controls, such as dams, can be built and maintained over time to try to reduce the occurrence and severity of floods as well. In the United States, the U.S. Army Corps of Engineers maintains a network of such flood control dams. In areas prone to urban flooding, one solution is the repair and expansion of man-made sewer systems and stormwater infrastructure.

Another strategy is to reduce impervious surfaces in streets, parking lots and buildings through natural drainage channels, porous paving, and wetlands (collectively known as green infrastructure or sustainable urban drainage systems (SUDS)). Areas identified as flood-prone can be converted into parks and playgrounds that can tolerate occasional flooding. Ordinances can be adopted to require developers to retain stormwater on site and require buildings to be elevated, protected by floodwalls and levees, or designed to withstand temporary inundation. Property owners can also invest in solutions themselves, such as re-landscaping their property to take the flow of water away from their building and installing rain barrels, sump pumps, and check valves.

Sandbagging

A simple guide on how to sandbag to protect a property against flooding. When placed correctly, sandbags can reduce the impact of flooding on your home or business. Sandbags will not stop the water completely but can reduce the amount of water entering your property.

Filling
- Only use sand to fill hessian bags. Do not use dirt.
- Only fill sandbag two-thirds full.
- Do not over fill the sandbag as it will be too heavy to carry.
- Do not tie the top of the sandbag, instead leave it open and place the next bag on top of the open end.
- Take care when filling and lifting the sandbag, to avoid injury.

Where
- Cover drainage holes in home e.g. showers, toilets, sinks to stop back flow of water.
- Place a small wall across doorways, at least the height of the expected water level. Be careful not to trap yourself inside.
- If available, plastic sheeting may be used under sandbags to reduce the seepage.
- For most buildings, to reduce the impact of flooding, sandbags should be placed over floor wastes and drains (e.g. laundry, shower and bath) to prevent backflow of grey water entering. Sandbags should be used in front of doorways /roller doors and brickwork vents.
- Most standard homes and buildings on a concrete slab can be protected with less than 25 sandbags.
- It is not always necessary to place a sandbag wall around your whole building to provide protection. This may only be necessary if it is on stumps or constructed of materials such as timber or bro sheeting. Before building a sandbag wall, consider how you would remove floodwater that could become trapped between the sandbag wall and your building. (e.g. pump, siphon or bailing bucket).

Where (cont.)
- Place a small sandbag wall across doorways. The number of layers required will be dependent on the expected flood height, however it is generally around two (2) sandbag rows high.
- Make sure that you have at least one doorway that you can use to access or exit the building – do this by building a wall that allows the door to still be opened (refer to photos overleaf).
- Air vents between brickwork may also require sandbags. Small vents may be covered with waterproof tape or plastic.
- Cover all drainage holes and floor drains to stop backflow of contaminated water.
- Protect air vents or drains with sandbags or tape.
- To avoid back flow of grey water block toilets with a small plastic bag of sand, weighed down by a larger sandbag.

Laying
- Lay sandbags like brickwork. Stagger rows so that the joins do not line up.
- Start at one end and work to the other end.
- Ensure the unfilled part of the bag is covered by the next bag.
- Tuck flap under the bag at the end of the row.
- If the sandbag wall is going to be more than five (5) bags high, you will need to lay two (2) rows wide.

TIP: Flattening the top of the sandbag row before adding the next row will help the structure.

Disposal
- Sturdy gloves should be worn when handling wet sandbags as they can contain chemicals, waste and diseases.
- Sandbags that have been in contact with floodwater need to be thrown away.
- Contact your local council to find out how to dispose of your sandbags safely.

Other Flood Protection

- Raising valuables off the floor may prevent damage to personal items from floodwater that may still enter.
- Lifting of curtains, rugs and bedding, and removing items from low cupboards may be necessary.
- Turn off power and gas at the mains.

5 History

This is a table of some of the deadliest floods in the world.

Event	1931 China Floods	1887 Yellow River Flood	1938 Yellow River Flood	Banqiao Dam Failure	2004 Indian Ocean Tsunami	1935 Yangtze River Flood	St. Felix's Flood, Storm Surge	Hanoi and Red River Delta Flood	1911 Yangtze River Flood	1911 Yangtze River Flood	
Location	China	China	China	China	Indonesia	China	Netherlands	North Vietnam	China	China	
Date	1931	1887	1938	1975	2004	1935	1530	1971	1911	1911	
Deaths	2.5m–3.7m	900K–2m	500K–700K	231K	230K	145K	100K+	100K	100K	100K	

6 Storm Surge

A storm surge, storm flood, tidal surge or storm tide is a coastal flood or tsunami-like phenomenon of rising water commonly associated with low pressure weather systems (such as tropical cyclones), the severity of which is affected by the shallowness and orientation of the water body relative to storm path, as well as the timing of tides. Most casualties during tropical cyclones occur as the result of storm surges. It is a measure of the rise of water beyond what would be expected by the normal movement related to tides. The two main meteorological factors contributing to a storm surge are a long fetch of winds spiraling inward toward the storm, and a low-pressure-induced dome of water drawn up under and trailing the storm's center.

Mechanics

At least five processes can be involved in altering tide levels during storms:

- The atmospheric pressure effect
- The direct wind effect
- The effect of the Earth's rotation
- The rainfall effect.
- The effect of waves near the shore

The pressure effects of a tropical cyclone will cause the water level in the open ocean to rise in regions of low atmospheric pressure and fall in regions of high atmospheric pressure. The rising water level will counteract the low atmospheric pressure such that the total pressure at some plane beneath the water surface remains constant. This effect is estimated at a 10 mm (0.39 in) increase in sea level for every millibar (hPa) drop in atmospheric pressure. Strong surface winds cause surface currents at a 45° angle to the wind direction, by an effect known as the Ekman Spiral. Wind stresses cause a phenomenon referred to as "wind set-up", which is the tendency for water levels to increase at the downwind shore and to decrease at the upwind shore.

Intuitively, this is caused by the storm blowing the water toward one side of the basin in the direction of its winds. Because the Ekman Spiral effects spread vertically through the water, the effect is proportional to depth. The pressure effect and the wind set-up on an open coast will be driven into bays in the same way as the astronomical tide. The Earth's rotation causes the Coriolis effect, which bends currents to the right in the Northern Hemisphere and to the left in the Southern Hemisphere. When this bend brings the currents into more perpendicular contact with the shore, it can amplify the surge, and when it bends the current away from the shore it has the effect of lessening the surge.

The effect of waves, while directly powered by the wind, is distinct from a storm's wind-powered currents. Powerful wind whips up large, strong waves in the direction of its movement. Although these surface waves are responsible for very little water transport in open water, they may be responsible for significant transport near the shore. When waves are breaking on a line more or less parallel to the beach, they carry considerable water shoreward. As they break, the water particles moving toward the shore have considerable momentum and may run up a sloping beach to an elevation above the mean water line, which may exceed twice the wave height before breaking. The rainfall effect is experienced predominantly in estuaries. Hurricanes may dump as much as 12 in (300 mm) of rainfall in 24 hours over large areas and higher rainfall densities in localized areas. As a result, surface runoff can quickly flood Streams and rivers. This can increase the water level near the head of tidal estuaries as storm-driven waters surging in from the ocean meet rainfall flowing downstream into the estuary.

Extratropical Storms
Similar to tropical cyclones, extratropical cyclones cause an offshore rise of water. However, unlike most tropical cyclone storm surges, extratropical cyclones can cause higher water levels across a large area for longer periods of time, depending on the system. In North America, extratropical storm surges may occur on the Pacific and Alaska coasts, and north of 31°N on the Atlantic Coast. Coasts with sea ice may experience an "ice tsunami" causing significant damage inland. Extratropical storm surges may be possible further south for the Gulf coast mostly during the wintertime, when extratropical cyclones affect the coast, such as in the 1993 Storm of the Century.

Reverse Storm Surge
Water can also be sucked away from shore prior to a storm surge. This was the case on the western Florida coast in 2017, just before Hurricane Irma made landfall, uncovering land usually underwater. This phenomenon is known as a reverse storm surge, or a negative storm surge.

7 Cloudburst

A cloudburst is an extreme amount of precipitation in a short period of time, sometimes accompanied by hail and thunder, which is capable of creating flood conditions. A cloudburst can suddenly dump large amounts of water e.g. 25 mm of precipitation corresponds to 25,000 metric tons/km2 (1 inch corresponds to 72,300 short tons over one square mile). However, cloudbursts are infrequent as they occur only via orographic lift or occasionally when a warm air parcel mixes with cooler air, resulting in sudden condensation. At times, a large amount of runoff from higher elevations is mistakenly conflated with a cloudburst. The term "cloudburst" arose from the notion that clouds were akin to water balloons and could burst, resulting in rapid precipitation. Though this idea has since been disproven, the term remains in use.

Properties
Rainfall rate equal to or greater than 100 millimetres (3.9 in) per hour is a cloudburst. However, different definitions are used, e.g. the Swedish weather service SMHI defines the corresponding Swedish term "skyfall" as 1 mm/min for short bursts and 50 mm/h for longer rainfalls. The associated convective cloud can extend up to a height of 15 kilometres (9.3 mi) above the ground. During a cloudburst, more than 20 millimetres (0.79 in) of rain may fall in a few minutes. The results of cloudbursts can be disastrous. Cloudbursts are also responsible for flash flood creation. Rapid precipitation from cumulonimbus clouds is possible due to the Langmuir precipitation process in which large droplets can grow rapidly by coagulating with smaller droplets which fall down slowly. It is not essential that cloudbursts occur only when a cloud clashes with a solid body like a mountain. They can also occur when hot water vapor mingles into the cold resulting in sudden condensation.

Record Cloudbursts

Locations
In the Indian subcontinent, a cloudburst usually occurs when a monsoon cloud drifts northwards, from the Bay of Bengal or Arabian Sea across the plains, then onto the Himalayas and bursts, bringing rainfall as high as 75 millimetres per hour. The uplands adjacent to the Front Range of Colorado and the streams which drain the Front Range are subject to occasional cloudbursts and flash floods. This weather pattern is associated with upslope winds bringing moisture northwestward from the Gulf of Mexico.

8 Monsoon

Monsoon is traditionally defined as a seasonal reversing wind accompanied by corresponding changes in precipitation, but is now used to describe seasonal changes in atmospheric circulation and precipitation associated with the asymmetric heating of land and sea. Usually, the term monsoon is used to refer to the rainy phase of a seasonally changing pattern, although technically there is also a dry phase. The term is sometimes incorrectly used for locally heavy but short-term rains, although these rains meet the dictionary definition of monsoon. The major monsoon systems of the world consist of the West African and Asia-Australian monsoons. The inclusion of the North and South American monsoons with incomplete wind reversal has been debated. The term was first used in English in British India and neighbouring countries to refer to the big seasonal winds blowing from the Bay of Bengal and Arabian Sea in the southwest bringing heavy rainfall to the area.

Strength of Impact
The impact of monsoon on the local weather is different from place to place. In some places there is just a likelihood of having a little more or less rain. In other places, quasi semi-deserts are turned into vivid green grasslands where all sorts of plants and crops can flourish. The Indian Monsoon turns large parts of India from a kind of semi-desert into green lands. In the Western Ghats it is crucial for farmers to have the right timing for putting the seeds on the fields, as it is essential to use all the rain that is available for growing crops.

Process

Monsoons are large-scale sea breezes which occur when the temperature on land is significantly warmer or cooler than the temperature of the ocean. These temperature imbalances happen because oceans and land absorb heat in different ways. Over oceans, the air temperature remains relatively stable for two reasons: water has a relatively high heat capacity (3.9 to 4.2 J g−1 K−1), and because both conduction and convection will equilibrate a hot or cold surface with deeper water (up to 50 metres).

In contrast, dirt, sand, and rocks have lower heat capacities (0.19 to 0.35 J g−1 K−1), and they can only transmit heat into the earth by conduction and not by convection. Therefore, bodies of water stay at a more even temperature, while land temperature are more variable. During warmer months sunlight heats the surfaces of both land and oceans, but land temperatures rise more quickly. As the land's surface becomes warmer, the air above it expands and an area of low pressure develops. Meanwhile, the ocean remains at a lower temperature than the land, and the air above it retains a higher pressure.

This difference in pressure causes sea breezes to blow from the ocean to the land, bringing moist air inland. This moist air rises to a higher altitude over land and then it flows back toward the ocean (thus completing the cycle). However, when the air rises, and while it is still over the land, the air cools. This decreases the air's ability to hold water, and this causes precipitation over the land. This is why summer monsoons cause so much rain over land.

In the colder months, the cycle is reversed. Then the land cools faster than the oceans and the air over the land has higher pressure than air over the ocean. This causes the air over the land to flow to the ocean. When humid air rises over the ocean, it cools, and this causes precipitation over the oceans. (The cool air then flows towards the land to complete the cycle.) Most summer monsoons have a dominant westerly component and a strong tendency to ascend and produce copious amounts of rain (because of the condensation of water vapor in the rising air). The intensity and duration, however, are not uniform from year to year.

Winter monsoons, by contrast, have a dominant easterly component and a strong tendency to diverge, subside and cause drought. Similar rainfall is caused when moist ocean air is lifted upwards by mountains, surface heating, convergence at the surface, divergence aloft, or from storm-produced outflows at the surface. However the lifting occurs, the air cools due to expansion in lower pressure, and this produces condensation.

Global Monsoon Summaries

The summaries and typical timeframes of monsoons around the world.

Location	Monsoon Sub-System	Average Date of Arrival	Average Date of Withdrawal	Notes
Northern Mexico	North American/Gulf of California-Southwest USA	Late May	September	Incomplete Wind Reversal, Waves
Tucson, Arizona, USA	North American/Gulf of California-Southwest USA	Early July	September	Incomplete Wind Reversal, Waves
Central America	Central/South American Monsoon	April	October	True Monsoon
Amazon Brazil	South American Monsoon	September	May	
Southeast Brazil	South American Monsoon	November	March	
West Africa	West African	Jun 22	Sep/Oct	Waves
Southeast Africa	Southeast Africa monsoon w/ Harmattan	Jan	March	
Kelantan, Malaysia	Indo-Australian/Borneo-Australian	October	March	
Phuket, Thailand	Indo-Australian	February/March	December	
Bangkok, Thailand	Indo-Australian/Indian-Indochina	April-May	Oct/Nov	Persistent
Yangon, Myanmar	Indo-Australian/Indian-Indochina	May 25	Nov 1	
Colombo, Sri Lanka	Indo-Australian	May 25	Dec 15	Persistent
Kerala, India	Indian monsoon	Jun 1	Dec 1	Persistent
Jakarta, Indonesia	Indo-Australian/Borneo-Australian	November	March	Abrupt
Lahore, Pakistan	Indian monsoon	Late July	Sep 1	
Dhaka, Bangladesh	Indo-Australian/Indian-Indochina	Mid June	October	Abrupt
Cebu, Philippines	Indo-Australian/Borneo-Australian	October	March	Abrupt
Kaohsiung, Taiwan	East Asian monsoon	May 10		
Taipei, Taiwan	East Asian monsoon	May 20		
Kagoshima, Japan	East Asian monsoon	Jun 10		
Seoul, South Korea	East Asian monsoon	Jul 10		
Hanoi, Vietnam	East Asian monsoon	May 20		
Beijing, China	East Asian monsoon	Jul 20		
Karachi, Pakistan	Indian monsoon	Jul 15	August	
Mumbai, India	Indian monsoon	Jun 10	Oct 1	
Darwin, Australia	Australian monsoon	Oct	April	

Monsoon Regions

Africa (West African and Southeast African)

The monsoon of western Sub-Saharan Africa is the result of the seasonal shifts of the Intertropical Convergence Zone and the great seasonal temperature and humidity differences between the Sahara and the equatorial Atlantic Ocean. It migrates northward from the equatorial Atlantic in February, reaches western Africa on or near June 22, then moves back to the south by October. The dry, northeasterly trade winds, and their more extreme form, the harmattan, are interrupted by the northern shift in the ITCZ and resultant southerly, rain-bearing winds during the summer. The semiarid Sahel and Sudan depend upon this pattern for most of their precipitation.

North America

The North American monsoon (NAM) occurs from late June or early July into September, originating over Mexico and spreading into the southwest United States by mid-July. It affects Mexico along the Sierra Madre Occidental as well as Arizona, New Mexico, Nevada, Utah, Colorado, West Texas and California. It pushes as far west as the Peninsular Ranges and Transverse Ranges of Southern California, but rarely reaches the coastal strip (a wall of desert thunderstorms only a half-hour's drive away is a common summer sight from the sunny skies along the coast during the monsoon). The North American monsoon is known to many as the Summer, Southwest, Mexican or Arizona monsoon. It is also sometimes called the Desert monsoon as a large part of the affected area are the Mojave and Sonoran deserts. However, it is debatable whether the North and South American weather patterns with incomplete wind reversal should be counted as true monsoons.

Asia (South Asian Monsoon)

The monsoon of South Asia is among several geographically distributed global monsoons. It affects the Indian subcontinent, where it is one of the oldest and most anticipated weather phenomena and an economically important pattern every year from June through September, but it is only partly understood and notoriously difficult to predict. Several theories have been proposed to explain the origin, process, strength, variability, distribution, and general vagaries of the monsoon, but understanding and predictability are still evolving. The unique geographical features of the Indian subcontinent, along with associated atmospheric, oceanic, and geophysical factors, influence the behavior of the monsoon. Because of its effect on agriculture, on flora and fauna, and on the climates of nations such as Bangladesh, Bhutan, India, Nepal, Pakistan, and Sri Lanka — among other economic, social, and environmental effects — the monsoon is one of the most anticipated, tracked, and studied weather phenomena in the region. It has a significant effect on the overall well-being of residents and has even been dubbed the "real finance minister of India".

Asia (Southwest Monsoon)

The southwestern summer monsoons occur from July through September. The Thar Desert and adjoining areas of the northern and central Indian subcontinent heat up considerably during the hot summers. This causes a low pressure area over the northern and central Indian subcontinent. To fill this void, the moisture-laden winds from the Indian Ocean rush into the subcontinent. These winds, rich in moisture, are drawn towards the Himalayas. The Himalayas act like a high wall, blocking the winds from passing into Central Asia, and forcing them to rise. As the clouds rise, their temperature drops, and precipitation occurs. Some areas of the subcontinent receive up to 10,000 mm (390 in) of rain annually. The southwest monsoon is generally expected to begin around the beginning of June and fade away by the end of September. The moisture-laden winds on reaching the southernmost point of the Indian Peninsula, due to its topography, become divided into two parts: the Arabian Sea Branch and the Bay of Bengal Branch.

Asia (Southwest Monsoon)

The Arabian Sea Branch of the Southwest Monsoon first hits the Western Ghats of the coastal state of Kerala, India, thus making this area the first state in India to receive rain from the Southwest Monsoon. This branch of the monsoon moves northwards along the Western Ghats (Konkan and Goa) with precipitation on coastal areas, west of the Western Ghats. The eastern areas of the Western Ghats do not receive much rain from this monsoon as the wind does not cross the Western Ghats. The Bay of Bengal Branch of Southwest Monsoon flows over the Bay of Bengal heading towards North-East India and Bengal, picking up more moisture from the Bay of Bengal. The winds arrive at the Eastern Himalayas with large amounts of rain. Mawsynram, situated on the southern slopes of the Khasi Hills in Meghalaya, India, is one of the wettest places on Earth. After the arrival at the Eastern Himalayas, the winds turns towards the west, travelling over the Indo-Gangetic Plain at a rate of roughly 1–2 weeks per state, pouring rain all along its way. June 1 is regarded as the date of onset of the monsoon in India, as indicated by the arrival of the monsoon in the southernmost state of Kerala.

Asia (Southwest Monsoon)

The monsoon accounts for nearly 80% of the rainfall in India. Indian agriculture (which accounts for 25% of the GDP and employs 70% of the population) is heavily dependent on the rains, for growing crops especially like cotton, rice, oilseeds and coarse grains. A delay of a few days in the arrival of the monsoon can badly affect the economy, as evidenced in the numerous droughts in India in the 1990s. The monsoon is widely welcomed and appreciated by city-dwellers as well, for it provides relief from the climax of summer heat in June. However, the roads take a battering every year. Often houses and streets are waterlogged and slums are flooded despite drainage systems. A lack of city infrastructure coupled with changing climate patterns causes severe economic loss including damage to property and loss of lives, as evidenced in the 2005 flooding in Mumbai that brought the city to a standstill. Bangladesh and certain regions of India like Assam and West Bengal, also frequently experience heavy floods during this season. Recently, areas in India that used to receive scanty rainfall throughout the year, like the Thar Desert, have surprisingly ended up receiving floods due to the prolonged monsoon season. The influence of the Southwest Monsoon is felt as far north as in China's Xinjiang. It is estimated that about 70% of all precipitation in the central part of the Tian Shan Mountains falls during the three summer months, when the region is under the monsoon influence; about 70% of that is directly of "cyclonic" (i.e., monsoon-driven) origin (as opposed to "local convection").

Asia (Northeast Monsoon)

Around September, with the sun fast retreating south, the northern land mass of the Indian subcontinent begins to cool off rapidly. With this air pressure begins to build over northern India, the Indian Ocean and its surrounding atmosphere still holds its heat. This causes cold wind to sweep down from the Himalayas and Indo-Gangetic Plain towards the vast spans of the Indian Ocean south of the Deccan peninsula. This is known as the Northeast Monsoon or Retreating Monsoon. While travelling towards the Indian Ocean, the dry cold wind picks up some moisture from the Bay of Bengal and pours it over peninsular India and parts of Sri Lanka. Cities like Chennai, which get less rain from the Southwest Monsoon, receive rain from this Monsoon. About 50% to 60% of the rain received by the state of Tamil Nadu is from the Northeast Monsoon. In Southern Asia, the northeastern monsoons take place from October to December when the surface high-pressure system is strongest. The jet stream in this region splits into the southern subtropical jet and the polar jet. The subtropical flow directs northeasterly winds to blow across southern Asia, creating dry air streams which produce clear skies over India. Meanwhile, a low pressure system known as a monsoon trough develops over South-East Asia and Australasia and winds are directed toward Australia.

Asia (East Asian Monsoon)

The East Asian monsoon affects large parts of Indo-China, Philippines, China, Taiwan, Korea and Japan. It is characterised by a warm, rainy summer monsoon and a cold, dry winter monsoon. The rain occurs in a concentrated belt that stretches east-west except in East China where it is tilted east-northeast over Korea and Japan. The seasonal rain is known as Meiyu in China, Jangma in Korea, and Bai-u in Japan, with the latter two resembling frontal rain. The onset of the summer monsoon is marked by a period of premonsoonal rain over South China and Taiwan in early May. From May through August, the summer monsoon shifts through a series of dry and rainy phases as the rain belt moves northward, beginning over Indochina and the South China Sea (May), to the Yangtze River Basin and Japan (June) and finally to North China and Korea (July). When the monsoon ends in August, the rain belt moves back to South China.

Australia

Also known as the Indo-Australian Monsoon. The rainy season occurs from September to February and it is a major source of energy for the Hadley circulation during boreal winter. The Maritime Continent Monsoon and the Australian Monsoon may be considered to be the same system, the Indo-Australian Monsoon. It is associated with the development of the Siberian High and the movement of the heating maxima from the Northern Hemisphere to the Southern Hemisphere. North-easterly winds flow down Southeast Asia, are turned north-westerly/westerly by Borneo topography towards Australia. This forms a cyclonic circulation vortex over Borneo, which together with descending cold surges of winter air from higher latitudes, cause significant weather phenomena in the region. Examples are the formation of a rare low-latitude tropical storm in 2001, Tropical Storm Vamei, and the devastating flood of Jakarta in 2007. The onset of the monsoon over the Maritime Continent tends to follow the heating maxima down Vietnam and the Malay Peninsula (September), to Sumatra, Borneo and the Philippines (October), to Java, Sulawesi (November), Irian Jaya and Northern Australia (December, January). However, the monsoon is not a simple response to heating but a more complex interaction of topography, wind and sea, as demonstrated by its abrupt rather than gradual withdrawal from the region. The Australian monsoon (the "Wet") occurs in the southern summer when the monsoon trough develops over Northern Australia. Over three-quarters of annual rainfall in Northern Australia falls during this time.

Europe

The European Monsoon (more commonly known as the return of the westerlies) is the result of a resurgence of westerly winds from the Atlantic, where they become loaded with wind and rain. These westerly winds are a common phenomenon during the European winter, but they ease as spring approaches in late March and through April and May. The winds pick up again in June, which is why this phenomenon is also referred to as "the return of the westerlies". The rain usually arrives in two waves, at the beginning of June and again in mid- to late June. The European monsoon is not a monsoon in the traditional sense in that it doesn't meet all the requirements to be classified as such. Instead the return of the westerlies is more regarded as a conveyor belt that delivers a series of low pressure centres to Western Europe where they create unsettled weather. These storms generally feature significantly lower than average temperatures, fierce rain or hail, thunder and strong winds. The return of the westerlies affects Europe's Northern Atlantic coastline, more precisely Ireland, Great Britain, the Benelux countries, Western Germany, Northern France and parts of Scandinavia.

7 Limnic Eruption

A limnic eruption, also referred to as a lake overturn, is a rare type of natural disaster in which dissolved carbon dioxide (CO2) suddenly erupts from deep lake waters, forming a gas cloud that can suffocate wildlife, livestock, and humans. Such an eruption may also cause tsunamis in the lake as the rising CO2 displaces water. Scientists believe earthquakes, volcanic activity, and other explosive events can serve as triggers for limnic eruptions. Lakes in which such activity occurs are referred to as limnically active lakes or exploding lakes. Some features of limnically active lakes include:

- CO2 saturated incoming water
- A cool lake bottom indicating an absence of direct volcanic interaction with lake waters
- An upper and lower thermal layer with differing CO2 saturations
- Proximity to areas with volcanic activity

Investigations of the Lake Monoun and Lake Nyos casualties led scientists to classify limnic eruptions as a distinct type of disaster event, even though they can be indirectly linked to volcanic eruptions.

History

Due to the largely invisible nature of the underlying cause (CO2 gas) behind limnic eruptions, it is difficult to determine to what extent eruptions have occurred in the past. In recent history, this phenomenon has been observed twice. The first recorded limnic eruption occurred in Cameroon at Lake Monoun in 1984, causing asphyxiation and death of 37 people living nearby. A second, deadlier eruption happened at neighbouring Lake Nyos in 1986, this time releasing over 80 million m3 of CO2, killing around 1,700 people and 3,500 livestock, again by asphyxiation. A third lake, Lake Kivu, rests on the border between the Democratic Republic of the Congo and Rwanda, and contains massive amounts of dissolved CO2. Sediment samples from the lake taken by Professor Robert Hecky (University of Michigan) showed an event caused living creatures in the lake to go extinct around every 1000 years, and caused nearby vegetation to be swept back into the lake. Limnic eruptions can be detected and quantified on a CO2 concentration scale by taking air samples of the affected region.

Causes

For a lake to undergo a limnic eruption, the water must be nearly saturated with gas. CO2 was the primary component in the two observed cases (Lake Nyos and Lake Monoun). In Lake Kivu, scientists are concerned about the concentrations of methane gas as well. CO2 may originate from volcanic gas emitted from under the lake or from decomposition of organic material. Before a lake is saturated, it behaves like an unopened carbonated beverage (e.g., a soft drink): the CO2 is dissolved in the water. In both the lake and the soft drink, CO2 dissolves much more readily at higher pressure (Henry's law). This is why bubbles in a can of soda form only after the can is opened; when the pressure is released, the CO2 comes out of solution. In the case of lakes, the bottom is at a much higher pressure; the deeper it is, the higher the pressure is at the bottom. Therefore huge amounts of CO2 can be dissolved in large, deep lakes. CO2 also dissolves more readily in cooler water, such as that found at a lake bottom. A small rise in water temperature can lead to the release of a large amount of CO2. Once a lake is saturated with CO2, it is very unstable, but a trigger is needed to set off an eruption. In the case of the 1986 Lake Nyos eruption, landslides were the suspected triggers, but a volcanic eruption, an earthquake, or even wind and rain storms are potential triggers.

Another possible cause of a limnic eruption is gradual gas saturation at specific depths which can trigger spontaneous gas development. For any of these cases, the trigger pushes some of the gas-saturated water higher in the lake, where pressure is insufficient to keep CO2 in solution. As bubbles start forming the water is lifted even higher in the lake (buoyancy), where yet more CO2 comes out of solution. This process forms a column of gas, at which point the water at the bottom of this column is pulled up by suction, and it, too, loses CO2 in a runaway process. This eruption discharges CO2 into the air and can even displace enough water to form a tsunami. Limnic eruptions are exceptionally rare for several reasons. First, a CO2 source must exist (regions with volcanic activity are most at risk). Second, the vast majority of lakes are holomictic (i.e., their layers mix regularly), preventing a buildup of dissolved gases. Only meromictic lakes do not mix and remain stratified, allowing CO2 to remain dissolved. It is estimated only one meromictic lake exists for every 1,000 holomictic lakes. Finally, a lake must be deep enough to have sufficient pressure to dissolve large amounts of CO2.

Consequences

Once an eruption occurs, a large CO2 cloud forms above the lake and expands to the surrounding region. Because CO2 is denser than air, it has a tendency to sink to the ground, simultaneously displacing breathable air, resulting in asphyxia. CO2 can make human bodily fluids highly acidic and potentially cause CO2 poisoning. As victims gasp for air, they actually accelerate asphyxia by inhaling CO2 gas. At Lake Nyos, the gas cloud descended into a nearby village where it settled, killing nearly everyone; casualties as far as 25 km (16 mi) were reportedcitation needed. A change in skin color on some bodies led scientists to hypothesize the gas cloud may have contained dissolved acid such as hydrogen chloride, though this hypothesis is disputed. Many victims were found with blisters on their skin, thought to have been caused by pressure ulcers, which were likely caused by low blood oxygen levels in those asphyxiated by carbon dioxide. Nearby vegetation was largely unaffected, except any growing immediately adjacent to the lake. There, vegetation was damaged or destroyed by a 24 m (79 ft) high tsunami caused by the violent eruption.

Degassing

Efforts are under way to develop a solution for removing the gas from these lakes and to prevent a build-up which could lead to another catastrophe. A team led by French scientist Michel Halbwachs began experimenting at Lake Monoun and Lake Nyos in 1990 using siphons to degas the waters of these lakes in a controlled manner. The team positions a pipe vertically in the lake with its upper end above the water surface. Water saturated with CO2 enters the bottom of the pipe and rises to the top. The lower pressure at the surface allows the gas to come out of solution. Only a small amount of water must be mechanically pumped initially through the pipe to start the flow. As saturated water rises, the CO2 comes out of solution and forms bubbles. The natural buoyancy of the bubbles draws the water up the pipe at high velocity resulting in a fountain at the surface.

The degassifying water acts like a pump, drawing more water into the bottom of the pipe, and creating a self-sustaining flow. This is the same process which leads to a natural eruption, but in this case it is controlled by the size of the pipe. Each pipe has a limited pumping capacity and several would be required for both Lake Monoun and Lake Nyos to degas a significant fraction of the deep lake water and render the lakes safe.

The deep lake waters are slightly acidic due to the dissolved CO2 which causes corrosion to the pipes and electronics, necessitating ongoing maintenance. There is some concern CO2 from the pipes could settle on the surface of the lake forming a thin layer of unbreathable air and thus potentially causing problems for wildlife.

Potential Danger

Lake Kivu is not only 2,000 times larger than Lake Nyos, but is also located in a far more densely populated area, with over two million people living along its shores, and the part within the Democratic Republic of the Congo is a site of active armed conflict and low state capacity for the DRC government. Lake Kivu has not reached a high level of CO2 saturation yet; if the water were to become heavily saturated, a limnic eruption would pose a great risk to human and animal life.

Two significant changes in Lake Kivu's physical state have brought attention to a possible limnic eruption: the high rates of methane dissociation and a rising surface temperature. Research investigating historical and present-day temperatures show Lake Kivu's surface temperature is increasing by about 0.12 °C per decade. Lake Kivu is in close proximity to potential triggers: Mount Nyiragongo (an active volcano which erupted in January 2002), an active earthquake zone, and other active volcanoes.

While the lake could be degassed in a manner similar to Lake Monoun and Lake Nyos, due to the size of Lake Kivu and the volume of gas it contains, such an operation would be expensive, running into the millions of dollars. A scheme initiated in 2010 to use methane trapped in the lake as a fuel source to generate electricity in Rwanda has led to a degree of CO2 degassing. During the procedure for extracting the flammable methane gas used to fuel power stations on the shore, some CO2 is removed in a process known as catalyst scrubbing. It is unclear whether enough gas will be removed to eliminate the danger of a limnic eruption at Lake Kivu.

8 Tsunami

A tsunami or tidal wave, also known as a seismic sea wave, is a series of waves in a water body caused by the displacement of a large volume of water, generally in an ocean or a large lake. Earthquakes, volcanic eruptions and other underwater explosions (including detonations, landslides, glacier calvings, meteorite impacts and other disturbances) above or below water all have the potential to generate a tsunami. Unlike normal ocean waves, which are generated by wind, or tides, which are generated by the gravitational pull of the Moon and the Sun, a tsunami is generated by the displacement of water.

Tsunami waves do not resemble normal undersea currents or sea waves because their wavelength is far longer. Rather than appearing as a breaking wave, a tsunami may instead initially resemble a rapidly rising tide. For this reason, it is often referred to as a "tidal wave", although this usage is not favoured by the scientific community because it might give the false impression of a causal relationship between tides and tsunamis.

Tsunamis generally consist of a series of waves, with periods ranging from minutes to hours, arriving in a so-called "internal wave train". Wave heights of tens of metres can be generated by large events. Although the impact of tsunamis is limited to coastal areas, their destructive power can be enormous, and they can affect entire ocean basins. The 2004 Indian Ocean tsunami was among the deadliest natural disasters in human history, with at least 230,000 people killed or missing in 14 countries bordering the Indian Ocean.

Causes

The principal generation mechanism (or cause) of a tsunami is the displacement of a substantial volume of water or perturbation of the sea. This displacement of water is usually attributed to either earthquakes, landslides, volcanic eruptions, glacier calvings or more rarely by meteorites and nuclear tests. The waves formed in this way are then sustained by gravity.

Seismicity
Tsunami can be generated when the sea floor abruptly deforms and vertically displaces the overlying water. Tectonic earthquakes are a particular kind of earthquake that are associated with the Earth's crustal deformation; when these earthquakes occur beneath the sea, the water above the deformed area is displaced from its equilibrium position. More specifically, a tsunami can be generated when thrust faults associated with convergent or destructive plate boundaries move abruptly, resulting in water displacement, owing to the vertical component of movement involved. Movement on normal (extensional) faults can also cause displacement of the seabed, but only the largest of such events (typically related to flexure in the outer trench swell) cause enough displacement to give rise to a significant tsunami, such as the 1977 Sumba and 1933 Sanriku events. Tsunamis have a small amplitude (wave height) offshore, and a very long wavelength (often hundreds of kilometres long, whereas normal ocean waves have a wavelength of only 30 or 40 metres), which is why they generally pass unnoticed at sea, forming only a slight swell usually about 300 millimetres (12 in) above the normal sea surface. They grow in height when they reach shallower water, in a wave shoaling process described below. A tsunami can occur in any tidal state and even at low tide can still inundate coastal areas.

Landslides
In the 1950s, it was discovered that larger tsunamis than had previously been believed possible could be caused by giant submarine landslides. These rapidly displace large water volumes, as energy transfers to the water at a rate faster than the water can absorb. Their existence was confirmed in 1958, when a giant landslide in Lituya Bay, Alaska, caused the highest wave ever recorded, which had a height of 524 metres (over 1700 feet). The wave did not travel far, as it struck land almost immediately. Two people fishing in the bay were killed, but another boat managed to ride the wave. Another landslide-tsunami event occurred in 1963 when a massive landslide from Monte Toc entered the Vajont Dam in Italy.

The resulting wave surged over the 262 m (860 ft) high dam by 250 metres (820 ft) and destroyed several towns. Around 2,000 people died. Scientists named these waves megatsunamis. Some geologists claim that large landslides from volcanic islands, e.g. Cumbre Vieja on La Palma in the Canary Islands, may be able to generate megatsunamis that can cross oceans, but this is disputed by many others. In general, landslides generate displacements mainly in the shallower parts of the coastline, and there is conjecture about the nature of large landslides that enter the water.

This has been shown to subsequently affect water in enclosed bays and lakes, but a landslide large enough to cause a transoceanic tsunami has not occurred within recorded history. Susceptible locations are believed to be the Big Island of Hawaii, Fogo in the Cape Verde Islands, La Reunion in the Indian Ocean, and Cumbre Vieja on the island of La Palma in the Canary Islands; along with other volcanic ocean islands. This is because large masses of relatively unconsolidated volcanic material occurs on the flanks and in some cases detachment planes are believed to be developing. However, there is growing controversy about how dangerous these slopes actually are.

Meteorological
Some meteorological conditions, especially rapid changes in barometric pressure, as seen with the passing of a front, can displace bodies of water enough to cause trains of waves with wavelengths comparable to seismic tsunamis, but usually with lower energies. These are essentially dynamically equivalent to seismic tsunamis, the only differences being that meteotsunamis lack the transoceanic reach of significant seismic tsunamis and that the force that displaces the water is sustained over some length of time such that meteotsunamis can't be modelled as having been caused instantaneously. In spite of their lower energies, on shorelines where they can be amplified by resonance, they are sometimes powerful enough to cause localised damage and potential for loss of life. They have been documented in many places, including the Great Lakes, the Aegean Sea, the English Channel, and the Balearic Islands, where they are common enough to have a local name, rissaga. In Sicily they are called marubbio and in Nagasaki Bay, they are called abiki. Some examples of destructive meteotsunamis include 31 March 1979 at Nagasaki and 15 June 2006 at Menorca, the latter causing damage in the tens of millions of euros.

Man-Made or Triggered Tsunamis
There have been studies of the potential of the induction of and at least one actual attempt to create tsunami waves as a tectonic weapon. In World War II, the New Zealand Military Forces initiated Project Seal, which attempted to create small tsunamis with explosives in the area of today's Shakespear Regional Park; the attempt failed. There has been considerable speculation on the possibility of using nuclear weapons to cause tsunamis near an enemy coastline. Even during World War II consideration of the idea using conventional explosives was explored. Nuclear testing in the Pacific Proving Ground by the United States seemed to generate poor results. Operation Crossroads fired two 20 kilotonnes of TNT (84 TJ) bombs, one in the air and one underwater, above and below the shallow (50 m (160 ft)) waters of the Bikini Atoll lagoon. Fired about 6 km (3.7 mi) from the nearest island, the waves there were no higher than 3–4 m (9.8–13.1 ft) upon reaching the shoreline. Other underwater tests, mainly Hardtack I/Wahoo (deep water) and Hardtack I/Umbrella (shallow water) confirmed the results. Analysis of the effects of shallow and deep underwater explosions indicate that the energy of the explosions doesn't easily generate the kind of deep, all-ocean waveforms which are tsunamis; most of the energy creates steam, causes vertical fountains above the water, and creates compressional waveforms. Tsunamis are hallmarked by permanent large vertical displacements of very large volumes of water which do not occur in explosions.

Characteristics

Tsunamis cause damage by two mechanisms: the smashing force of a wall of water travelling at high speed, and the destructive power of a large volume of water draining off the land and carrying a large amount of debris with it, even with waves that do not appear to be large. While everyday wind waves have a wavelength (from crest to crest) of about 100 metres (330 ft) and a height of roughly 2 metres (6.6 ft), a tsunami in the deep ocean has a much larger wavelength of up to 200 kilometres (120 mi). Such a wave travels at well over 800 kilometres per hour (500 mph), but owing to the enormous wavelength the wave oscillation at any given point takes 20 or 30 minutes to complete a cycle and has an amplitude of only about 1 metre (3.3 ft). This makes tsunamis difficult to detect over deep water, where ships are unable to feel their passage.

The velocity of a tsunami can be calculated by obtaining the square root of the depth of the water in metres multiplied by the acceleration due to gravity (approximated to 10 m/s2). When the wave enters shallow water, it slows down and its amplitude (height) increases. For example, if the Pacific Ocean is considered to have a depth of 5000 metres, the velocity of a tsunami would be the square root of $\sqrt{(5000 \times 10)} = \sqrt{50000} = \sim 224$ metres per second (735 feet per second), which equates to a speed of ~806 kilometres per hour or about 500 miles per hour. This is the formula used for calculating the velocity of shallow-water waves.

Even the deep ocean is shallow in this sense because a tsunami wave is so long (horizontally from crest to crest) by comparison. The reason for the Japanese name "harbour wave" is that sometimes a village's fishermen would sail out, and encounter no unusual waves while out at sea fishing, and come back to land to find their village devastated by a huge wave. As the tsunami approaches the coast and the waters become shallow, wave shoaling compresses the wave and its speed decreases below 80 kilometres per hour (50 mph).

Its wavelength diminishes to less than 20 kilometres (12 mi) and its amplitude grows enormously – in accord with Green's law. Since the wave still has the same very long period, the tsunami may take minutes to reach full height. Except for the very largest tsunamis, the approaching wave does not break, but rather appears like a fast-moving tidal bore. Open bays and coastlines adjacent to very deep water may shape the tsunami further into a step-like wave with a steep-breaking front.

When the tsunami's wave peak reaches the shore, the resulting temporary rise in sea level is termed run up. Run up is measured in metres above a reference sea level. A large tsunami may feature multiple waves arriving over a period of hours, with significant time between the wave crests. The first wave to reach the shore may not have the highest run-up. About 80% of tsunamis occur in the Pacific Ocean, but they are possible wherever there are large bodies of water, including lakes. They are caused by earthquakes, landslides, volcanic explosions, glacier calvings, and bolides.

Drawback
All waves have a positive and negative peak; that is, a ridge and a trough. In the case of a propagating wave like a tsunami, either may be the first to arrive. If the first part to arrive at the shore is the ridge, a massive breaking wave or sudden flooding will be the first effect noticed on land. However, if the first part to arrive is a trough, a drawback will occur as the shoreline recedes dramatically, exposing normally submerged areas. The drawback can exceed hundreds of metres, and people unaware of the danger sometimes remain near the shore to satisfy their curiosity or to collect fish from the exposed seabed. A typical wave period for a damaging tsunami is about twelve minutes.

Thus, the sea recedes in the drawback phase, with areas well below sea level exposed after three minutes. For the next six minutes, the wave trough builds into a ridge which may flood the coast, and destruction ensues. During the next six minutes, the wave changes from a ridge to a trough, and the flood waters recede in a second drawback. Victims and debris may be swept into the ocean. The process repeats with succeeding waves.

Tsunami Heights

Several terms are used to describe the different characteristics of tsunami in terms of their height:

Amplitude, Wave Height, or Tsunami Height	Amplitude of Tsunami refers to its height relative to the normal sea level. It is usually measured at sea level, and it is different from the crest-to-trough height which is commonly used to measure other type of wave height.
Run-up Height, or Inundation Height	The height reached by a tsunami on the ground above sea level, Maximum run-up height refers to the maximum height reached by water above sea level, which is sometimes reported as the maximum height reached by a tsunami.
Flow Depth	Refers to the height of tsunami above ground, regardless of the height of the location or sea level.
(Maximum) Water Level	Maximum height above sea level as seen from trace or water mark. Different from maximum run-up height in the sense that they are not necessarily water marks at inundation line/limit.

Warnings and Predictions

Drawbacks can serve as a brief warning. People who observe drawback (many survivors report an accompanying sucking sound), can survive only if they immediately run for high ground or seek the upper floors of nearby buildings. In 2004, ten-year-old Tilly Smith of Surrey, England, was on Maikhao beach in Phuket, Thailand with her parents and sister, and having learned about tsunamis recently in school, told her family that a tsunami might be imminent. Her parents warned others minutes before the wave arrived, saving dozens of lives. She credited her geography teacher, Andrew Kearney. In the 2004 Indian Ocean tsunami drawback was not reported on the African coast or any other east-facing coasts that it reached. This was because the wave moved downwards on the eastern side of the fault line and upwards on the western side. The western pulse hit coastal Africa and other western areas.

A tsunami cannot be precisely predicted, even if the magnitude and location of an earthquake is known. Geologists, oceanographers, and seismologists analyse each earthquake and based on many factors may or may not issue a tsunami warning. However, there are some warning signs of an impending tsunami, and automated systems can provide warnings immediately after an earthquake in time to save lives. One of the most successful systems uses bottom pressure sensors, attached to buoys, which constantly monitor the pressure of the overlying water column. Regions with a high tsunami risk typically use tsunami warning systems to warn the population before the wave reaches land.

On the west coast of the United States, which is prone to Pacific Ocean tsunami, warning signs indicate evacuation routes. In Japan, the community is well-educated about earthquakes and tsunamis, and along the Japanese shorelines the tsunami warning signs are reminders of the natural hazards together with a network of warning sirens, typically at the top of the cliff of surroundings hills. The Pacific Tsunami Warning System is based in Honolulu, Hawaiʻi. It monitors Pacific Ocean seismic activity.

A sufficiently large earthquake magnitude and other information triggers a tsunami warning. While the subduction zones around the Pacific are seismically active, not all earthquakes generate a tsunami. Computers assist in analysing the tsunami risk of every earthquake that occurs in the Pacific Ocean and the adjoining land masses.

As a direct result of the Indian Ocean tsunami, a re-appraisal of the tsunami threat for all coastal areas is being undertaken by national governments and the United Nations Disaster Mitigation Committee. A tsunami warning system is being installed in the Indian Ocean. Computer models can predict tsunami arrival, usually within minutes of the arrival time. Bottom pressure sensors can relay information in real time. Based on these pressure readings and other seismic information and the seafloor's shape (bathymetry) and coastal topography, the models estimate the amplitude and surge height of the approaching tsunami.

All Pacific Rim countries collaborate in the Tsunami Warning System and most regularly practise evacuation and other procedures. In Japan, such preparation is mandatory for government, local authorities, emergency services and the population. Some zoologists hypothesise that some animal species have an ability to sense subsonic Rayleigh waves from an earthquake or a tsunami. If correct, monitoring their behaviour could provide advance warning of earthquakes, tsunami etc.

However, the evidence is controversial and is not widely accepted. There are unsubstantiated claims about the Lisbon quake that some animals escaped to higher ground, while many other animals in the same areas drowned. The phenomenon was also noted by media sources in Sri Lanka in the 2004 Indian Ocean earthquake. It is possible that certain animals (e.g., elephants) may have heard the sounds of the tsunami as it approached the coast. The elephants' reaction was to move away from the approaching noise. By contrast, some humans went to the shore to investigate and many drowned as a result. Along the United States west coast, in addition to sirens, warnings are sent on television and radio via the National Weather Service, using the Emergency Alert System.

Meteotsunami

A meteotsunami or meteorological tsunami is a tsunami-like sea wave of meteorological origin. Meteotsunamis are generated when rapid changes in barometric pressure cause the displacement of a body of water. In contrast to "ordinary" impulse-type tsunami sources, a traveling atmospheric disturbance normally interacts with the ocean over a limited period of time (from several minutes to several hours). Tsunamis and meteotsunamis are otherwise similar enough that it can be difficult to distinguish one from the other, as in cases where there is a tsunami wave but there are no seismic records of an earthquake.

Only about 3% of historical tsunami events are known to have meteorological origins, although their true prevalence may be considerably higher than this because 10% of historical tsunamis have unknown origins, tsunami events in the past are often difficult to validate, and meteotsunamis may have previously been misclassified as seiche waves. Meteotsunamis are restricted to local effects because they lack the energy available to significant seismic tsunami. However, when they are amplified by resonance they can be hazardous. A meteotsunami that struck Nagasaki Bay on 31 March 1979 achieved a maximum wave height of 5 meters; there were three fatalities. A three-meter wave that hit the Chicago waterfront in 1954 swept people off of piers, drowning seven.

9 Blizzard

For more blizzard-like tips, see the #13 'Polar Vortex' category below.

A blizzard is a severe snowstorm characterized by strong sustained winds of at least 35 mph (56 km/h) and lasting for a prolonged period of time—typically three hours or more. A ground blizzard is a weather condition where snow is not falling but loose snow on the ground is lifted and blown by strong winds. Blizzards can have an immense size and usually stretch to hundreds or thousands of kilometres.

In the United States, the National Weather Service defines a blizzard as a severe snow storm characterized by strong winds causing blowing snow that results in low visibilities. The difference between a blizzard and a snowstorm is the strength of the wind, not the amount of snow. To be a blizzard, a snow storm must have sustained winds or frequent gusts that are greater than or equal to 56 km/h (35 mph) with blowing or drifting snow which reduces visibility to 400 m or 0.25 mi or less and must last for a prolonged period of time—typically three hours or more.

While severe cold and large amounts of drifting snow may accompany blizzards, they are not required. Blizzards can bring whiteout conditions, and can paralyze regions for days at a time, particularly where snowfall is unusual or rare. A severe blizzard has winds over 72 km/h (45 mph), near zero visibility, and temperatures of −12 °C (10 °F) or lower.

In Antarctica, blizzards are associated with winds spilling over the edge of the ice plateau at an average velocity of 160 km/h (99 mph). Ground blizzard refers to a weather condition where loose snow or ice on the ground is lifted and blown by strong winds. The primary difference between a ground blizzard as opposed to a regular blizzard is that in a ground blizzard no precipitation is produced at the time, but rather all the precipitation is already present in the form of snow or ice at the surface. The Australia Bureau of Meteorology describes a blizzard as, "Violent and very cold wind which is laden with snow, some part, at least, of which has been raised from snow covered ground."

Blizzard Preparation

General Preparation

Tips to prepare for blizzards if you know they're coming.

Buy Firewood	If you have a fireplace keep a pile of logs in a dry, close location.

Store Water	Pipes are likely to freeze so be sure to have enough water to ride out the disaster - but it's best to fill every container you can find with water.
Store Food	If you have the ability, take a trip to the shops and buy long life food which lasts a week minimum.
Charge Electronics	If you have any electronics be sure to charge them so they will last through the blizzard.
Buy Fuel	If you have a generator, buy some additional fuel to be sure you can last through the blizzard.
Protect Pipes	Protect your pipes from freezing by letting them slowly drip. Wrap pipes in newspaper or fabric to help insulate them. Open doors to expose the pipes to the warmer temperatures of the living rooms.

Sheltering

House Shelter

These are tips for sheltering inside your house during a blizzard.

Know Hypothermia Signs	Know the signs of hypothermia so you can treat it before it gets too far.
Avoid Alcohol	Alcohol can make your body more vulnerable in extremely low temperatures as it causes you to feel warmer.
Cautious Shovelling	Be extra cautious when shovelling snow as you could destabilise it and cause a mini avalanche, particularly snow on your roof.
Layer Up	Wear as many layers as you can to keep warm, however don't overheat yourself as this will cause sweat which will cool you rapidly when the layers are gone.
Seal Gaps	Any gaps in a building will cause a rapid cooling inside an otherwise closed location. Use wooden planks, plastic and duct tape to seal holes where possible.
Use Lights	Candles can be knocked over and cause a fire or eventually use up all the oxygen in a sealed room. However a candle is better than nothing if you need to see or require a heat source.

Car Shelter

These are tips for sheltering inside your car during a blizzard if you're unable to make it to a building.

Clear Exhaust	A blocked exhaust can cause carbon monoxide to enter the car and cause death.
Stay Visible	Turn your hazard lights on to signal to others you are there and to help prevent others crashing into you.
Stay in the Car	Staying in your car will provide an additional level of protection from the storm and keep heat around you easier. It also eliminates the wind chill factor. Head to a building if there is one visible and you know you have access or can get access but do not lose the car.
Keep Active	Do small exercises, such as clapping your hands or wiggling in your seat. This will help keep your heart rate and circulation at a safe level. When stuck in a confined space like a car, you will be more prone to poor circulation. Poor circulation contributes to frostbite.
Run the Car	Start your engine once an hour to help stay warm. Run the heat for no more than 20 minutes at a time. Make sure to keep checking that your exhaust is clean.
Stay Hydrated	Drink from your bottled water regularly. Eat from your emergency supplies. This will help to prevent hypothermia.

Outdoor Shelter

These are tips for sheltering inside your outside during a blizzard when there's no other shelter nearby.

Seek Shelter	This should be your top priority. Look for nearby buildings and cars. If none are available, look for any structure you can huddle under to protect from the wind and snow. Stay there until the storm passes or help arrives.
Seek Help	If you have a cell phone with you, try calling both your city's emergency number and any loved ones who may be able to help. If cell towers are down, turn your phone off to conserve power and try again later. Periodically shout for help in case someone is nearby who can assist you.
Stay Hydrated	Staying hydrated will help to prevent hypothermia. If you have a water bottle with you, drink from it. However, do not eat snow, as this will drop your body temperature, and snow often contains chemicals such as car exhaustion. Find a means of melting it first, and boil it if possible to make sure it is clean.
Minor Exercise	Clap your hands, wave your arms, kick your legs. This will keep your heart rate up and keep the blood circulating in your extremities. Good circulation will help to prevent frostbite.

Blizzard History

Iran Blizzard
The deadliest blizzard on record happened in Iran in February 1972 when 4,000 lives were lost. The Iran Blizzard dropped more than 10 feet of snow and lasted for six days across the northern and central regions of the country. In southern Iran, however, the numbers were much more drastic. They received 26 feet of snow, and two towns had no survivors. The snow took out power lines, buried towns, and crushed transportation. People were left without food, water, heat, and medical supplies. When the storm finally stopped for a 24-hour period, rescue workers tried to retrieve survivors but were largely unsuccessful. The storms started again, and they were forced to abandon the mission and left behind bread for anybody who could dig their way out of the snow tombs.

Carolean Death March
The second worst blizzard in history was in 1719 when 3,000 people between Sweden and Norway were killed. Referred to as the Carolean Death March, this storm occurred during the Great Northern War after Sweden lost territory to Russia and decided to move in on Norway. This attempt was unsuccessful and after King Charles XII of Sweden died, Swedish troops were ordered back to Sweden. While crossing the mountains, the blizzard hit. On the first night, 200 soldiers died. Horses died, equipment was burned for warmth, and supplies were left behind as the remaining soldiers tried to escape. Left on the mountainside, another 3,000 soldiers froze to death as some of the men arrived at the nearest town. Over the next few days and after finding lodging, battle fatigued and malnourished, another 700 men died.

Afghanistan Blizzard
The 2008 Afghanistan Blizzard is the third deadliest on record. In February 2008, this blizzard claimed the lives of 926 people. With temperatures reaching -22 degrees fahrenheit and nearly 6 feet of snow on the ground, this was one of the harshest winters ever for the country. Mountain villages were cut off from larger cities and people who walked into towns were taken to hospitals where feet and hands were amputated. In addition to human lives, hundreds of thousands of sheep and cattle were killed, leaving the people who survived without their primary source of income after the storm.

Deadliest Blizards

Name	Location	Date	Deaths	Description
1972 Iran Blizzard	Iran	1972	4,000	A seven day snowstorm in February 1972 dropped between 3 to 8 meters of snow (10-26 feet) on the nation of Iran. During the storm, temperatures fell to as low as -13 degree Fahrenheit.
Carolean Death March	Sweden/Norway	1719	3,000	The Carolean Death March is the disastrous retreat by a Swedish-Carolean army under the command of Carl Gustaf Armfeldt across the Tydal mountain range in Trøndelag around the new year 1718–1719.
Afghanistan Blizzard	Afghanistan	2008	926	A fierce blizzard that struck Afghanistan on the 10th of January 2008. Temperatures fell to a low of -30 C, with up to 180 centimetres of snow in the more mountainous regions.
Great Blizzard	USA	1888	400	Great Blizzard of 1888, winter storm that pummeled the Atlantic coast of the United States, from the Chesapeake Bay to Maine, in March 1888. The blizzard caused more than $20 million in property damage in New York City alone.
1993 North American Storm Complex	USA	1993	318	A large cyclonic storm that occurred on March to March 15, 1993, on the East Coast of North America. It is unique both because of its intensity as well as its massive size and wide reaching effect.
Schoolhouse Blizzard	USA	1888	235	The Schoolhouse Blizzard, hit the U.S. plains states on January 12, 1888. The blizzard came unexpectedly on a relatively warm day, and many people were caught unaware, including children in one-room schoolhouses.
Hakkōda Mountains Incident	Japan	1902	199	A group of Imperial Japanese Army soldiers became lost in a blizzard on the Hakkōda Mountains in Aomori Prefecture in northern Honshu, Japan, en route to Tashiro Hot Spring located in the Hakkōda Mountains.
North American Blizzard	USA	1996	154	On January 6, 1996, snow begins falling in Washington, D.C., and up the Eastern seaboard, beginning a blizzard that kills 154 people and causes over $1 billion in damages before it ends.
Armistice Day Blizzard	USA	1940	144	The intense early-season "panhandle hook" winter storm cut a 1,000-mile-wide (1600 km) swath through the middle of the country from Kansas to Michigan.
2008 Chinese Winter Storms	China	2008	133	A series of winter storm events that affected large portions of southern and central China, where it does not usually snow severely or extensively, starting on 25 January 2008 until 6 February 2008.

10 Cyclone / Hurricane

A tropical cyclone or hurricane is a rapidly rotating storm system characterized by a low-pressure centre, a closed low-level atmospheric circulation, strong winds, and a spiral arrangement of thunderstorms that produce heavy rain. Depending on its location and strength, a tropical cyclone is referred to by different names, including hurricane, typhoon, tropical storm, cyclonic storm, tropical depression, and simply cyclone.

A hurricane is a tropical cyclone that occurs in the Atlantic Ocean and north-eastern Pacific Ocean, and a typhoon occurs in the north-western Pacific Ocean; while in the south Pacific or Indian Ocean, comparable storms are referred to simply as “tropical cyclones” or “severe cyclonic storms”. “Tropical” refers to the geographical origin of these systems, which form almost exclusively over tropical seas.

"Cyclone" refers to their winds moving in a circle, whirling round their central clear eye, with their winds blowing counter clockwise in the Northern Hemisphere and blowing clockwise in the Southern Hemisphere. The opposite direction of circulation is due to the Coriolis effect. Tropical cyclones typically form over large bodies of relatively warm water.

They derive their energy through the evaporation of water from the ocean surface, which ultimately recondenses into clouds and rain when moist air rises and cools to saturation. This energy source differs from that of mid-latitude cyclonic storms, such as nor'easters and European windstorms, which are fuelled primarily by horizontal temperature contrasts. Tropical cyclones are typically between 100 and 2,000 km (62 and 1,243 mi) in diameter.

The strong rotating winds of a tropical cyclone are a result of the conservation of angular momentum imparted by the Earth's rotation as air flows inwards toward the axis of rotation. As a result, they rarely form within 5° of the equator. Tropical cyclones are also almost completely absent from Earth's south-western quartersphere, mainly because the shapes of the African and South American continents permit the Benguela and Humboldt Currents to cover ocean basins as far north as 5˚N with excessively cool water. Coastal regions are particularly vulnerable to the impact of a tropical cyclone, compared to inland regions. The primary energy source for these storms is warm ocean waters, therefore these forms are typically strongest when over or near water, and weaken quite rapidly over land.

Coastal damage may be caused by strong winds and rain, high waves (due to winds), storm surges (due to severe pressure changes), and the potential of spawning tornadoes. Tropical cyclones also draw in air from a large area—which can be a vast area for the most severe cyclones—and concentrate the precipitation of the water content in that air into a much smaller area. This continual replacement of moisture-bearing air by new moisture-bearing air after its moisture has fallen as rain, may cause extremely heavy rain and river flooding up to 40 kilometres (25 mi) from the coastline.

Subheadings

1 Characteristics

Wind Field
The near-surface wind field of a tropical cyclone is characterized by air rotating rapidly around a centre of circulation while also flowing radially inwards. At the outer edge of the storm, air may be nearly calm; however, due to the Earth's rotation, the air has non-zero absolute angular momentum. As air flows radially inward, it begins to rotate cyclonically (counter-clockwise in the Northern Hemisphere, and clockwise in the Southern Hemisphere) in order to conserve angular momentum.

At an inner radius, air begins to ascend to the top of the troposphere. This radius is typically coincident with the inner radius of the eyewall, and has the strongest near-surface winds of the storm; consequently, it is known as the radius of maximum winds. Once aloft, air flows away from the storm's centre, producing a shield of cirrus clouds.

The previously mentioned processes result in a wind field that is nearly axisymmetric: Wind speeds are low at the centre, increase rapidly moving outwards to the radius of maximum winds, and then decay more gradually with radius to large radii. However, the wind field often exhibits additional spatial and temporal variability due to the effects of localized processes, such as thunderstorm activity and horizontal flow instabilities. In the vertical direction, winds are strongest near the surface and decay with height within the troposphere.

Eye and Centre
At the centre of a mature tropical cyclone, air sinks rather than rises. For a sufficiently strong storm, air may sink over a layer deep enough to suppress cloud formation, thereby creating a clear "eye". Weather in the eye is normally calm and free of clouds, although the sea may be extremely violent. The eye is normally circular in shape, and is typically 30–65 km (19–40 mi) in diameter, though eyes as small as 3 km (1.9 mi) and as large as 370 km (230 mi) have been observed. The cloudy outer edge of the eye is called the "eyewall".

The eyewall typically expands outward with height, resembling an arena football stadium; this phenomenon is sometimes referred to as the stadium effect. The eyewall is where the greatest wind speeds are found, air rises most rapidly, clouds reach to their highest altitude, and precipitation is the heaviest. The heaviest wind damage occurs where a tropical cyclone's eyewall passes over land.

In a weaker storm, the eye may be obscured by the central dense overcast, which is the upper-level cirrus shield that is associated with a concentrated area of strong thunderstorm activity near the centre of a tropical cyclone. The eyewall may vary over time in the form of eyewall replacement cycles, particularly in intense tropical cyclones.

Outer rainbands can organize into an outer ring of thunderstorms that slowly moves inward, which is believed to rob the primary eyewall of moisture and angular momentum. When the primary eyewall weakens, the tropical cyclone weakens temporarily. The outer eyewall eventually replaces the primary one at the end of the cycle, at which time the storm may return to its original intensity.

Rapid Deepening (Rapid Intensification)
Rapid intensification is a meteorological condition that occurs when a tropical cyclone intensifies dramatically in a short period of time. The United States National Hurricane Centre defines rapid intensification as an increase in the maximum sustained winds of a tropical cyclone of at least 30 knots (35 mph; 55 km/h) in a 24-hour period.

External Conditions
In order for rapid deepening to occur, several conditions must be in place. Water temperatures must be extremely warm (near or above 30°C (86°F)), and water of this temperature must be sufficiently deep such that waves do not churn deeper cooler waters up to the surface. Wind shear must be low; when wind shear is high, the convection and circulation in the cyclone will be disrupted.

Internal Conditions
Usually, an anticyclone in the upper layers of the troposphere above the storm must be present as well—for extremely low surface pressures to develop, air must be rising very rapidly in the eyewall of the storm, and an upper-level anticyclone helps channel this air away from the cyclone efficiently. Hot towers have been implicated in tropical cyclone rapid intensification, though diagnostically has seen varied skill across basins.

Size
There are a variety of metrics commonly used to measure storm size. The most common metrics include the radius of maximum wind, the radius of 34-knot wind (i.e. gale force), the radius of outermost closed isobar (ROCI), and the radius of vanishing wind. An additional metric is the radius at which the cyclone's relative vorticity field decreases to 1×10^{-5} s^{-1}.

Cyclone ROCI Diameter
<2° Lat = Very Small
2°-3° Lat = Small
3°-6° Lat = Medium
6°-8° Lat = Large
>8° Lat = Very Large

On Earth, tropical cyclones span a large range of sizes, from 100–2,000 kilometres (62–1,243 mi) as measured by the radius of vanishing wind. They are largest on average in the northwest Pacific Ocean basin and smallest in the north-eastern Pacific Ocean basin. If the radius of outermost closed isobar is less than two degrees of latitude (222 km (138 mi)), then the cyclone is "very small" or a "midget". A radius of 3–6 latitude degrees (333–670 km (207–416 mi)) is considered "average sized". "Very large" tropical cyclones have a radius of greater than 8 degrees (888 km (552 mi)).

Observations indicate that size is only weakly correlated to variables such as storm intensity (i.e. maximum wind speed), radius of maximum wind, latitude, and maximum potential intensity. Size plays an important role in modulating damage caused by a storm. All else equal, a larger storm will impact a larger area for a longer period of time. Additionally, a larger near-surface wind field can generate higher storm surge due to the combination of longer wind fetch, longer duration, and enhanced wave setup. The upper circulation of strong hurricanes extends into the tropopause of the atmosphere, which at low latitudes is 15,000–18,000 metres (50,000–60,000 ft).

2 Formation

Worldwide, tropical cyclone activity peaks in late summer, when the difference between temperatures aloft and sea surface temperatures is the greatest. However, each particular basin has its own seasonal patterns. On a worldwide scale, May is the least active month, while September is the most active month. November is the only month in which all the tropical cyclone basins are active. In the Northern Atlantic Ocean, a distinct cyclone season occurs from June 1 to November 30, sharply peaking from late August through September. The statistical peak of the Atlantic hurricane season is September 10.

The Northeast Pacific Ocean has a broader period of activity, but in a similar time frame to the Atlantic. The Northwest Pacific sees tropical cyclones year-round, with a minimum in February and March and a peak in early September. In the North Indian basin, storms are most common from April to December, with peaks in May and November. In the Southern Hemisphere, the tropical cyclone year begins on July 1 and runs all year-round encompassing the tropical cyclone seasons, which run from November 1 until the end of April, with peaks in mid-February to early March.

The formation of tropical cyclones is the topic of extensive ongoing research and is still not fully understood. While six factors appear to be generally necessary, tropical cyclones may occasionally form without meeting all of the following conditions. In most situations, water temperatures of at least 26.5°C (79.7°F) are needed down to a depth of at least 50 m (160 ft); waters of this temperature cause the overlying atmosphere to be unstable enough to sustain convection and thunderstorms. Another factor is rapid cooling with height, which allows the release of the heat of condensation that powers a tropical cyclone.

High humidity is needed, especially in the lower-to-mid troposphere; when there is a great deal of moisture in the atmosphere, conditions are more favourable for disturbances to develop. Low amounts of wind shear are needed, as high shear is disruptive to the storm's circulation. Tropical cyclones generally need to form more than 555 km (345 mi) or five degrees of latitude away from the equator, allowing the Coriolis effect to deflect winds blowing towards the low pressure centre and creating a circulation.

Lastly, a formative tropical cyclone needs a pre-existing system of disturbed weather. Tropical cyclones will not form spontaneously. Low-latitude and low-level westerly wind bursts associated with the Madden-Julian oscillation can create favourable conditions for tropical cyclogenesis by initiating tropical disturbances.

3 Movement

Locations

Most tropical cyclones form in a worldwide band of thunderstorm activity near the equator, referred to as the Intertropical Front (ITF), the Intertropical Convergence Zone (ITCZ), or the monsoon trough. Another important source of atmospheric instability is found in tropical waves, which contribute to the development of about 85% of intense tropical cyclones in the Atlantic Ocean and become most of the tropical cyclones in the Eastern Pacific. The majority forms between 10 and 30 degrees of latitude away of the equator, and 87% forms no farther away than 20 degrees north or south. Because the Coriolis effect initiates and maintains their rotation, tropical cyclones rarely form or move within 5 degrees of the equator, where the effect is weakest. However, it is still possible for tropical systems to form within this boundary as Tropical Storm Vamei and Cyclone Agni did in 2001 and 2004, respectively.

Movement

The movement of a tropical cyclone (i.e. its "track") is typically approximated as the sum of two terms: "steering" by the background environmental wind and "beta drift". Environmental steering is the dominant term. Conceptually, it represents the movement of the storm due to prevailing winds and other wider environmental conditions, similar to "leaves carried along by a stream". Physically, the winds, or flow field, in the vicinity of a tropical cyclone may be treated as having two parts: the flow associated with the storm itself, and the large-scale background flow of the environment in which the storm takes place. In this way, tropical cyclone motion may be represented to first-order simply as advection of the storm by the local environmental flow. This environmental flow is termed the "steering flow". Climatologically, tropical cyclones are steered primarily westward by the east-to-west trade winds on the equatorial side of the subtropical ridge—a persistent high-pressure area over the world's subtropical oceans.

In the tropical North Atlantic and Northeast Pacific oceans, the trade winds steer tropical easterly waves westward from the African coast toward the Caribbean Sea, North America, and ultimately into the central Pacific Ocean before the waves dampen out. These waves are the precursors to many tropical cyclones within this region. In contrast, in the Indian Ocean and Western Pacific in both hemispheres, tropical cyclogenesis is influenced less by tropical easterly waves and more by the seasonal movement of the Inter-tropical Convergence Zone and the monsoon trough. Additionally, tropical cyclone motion can be influenced by transient weather systems, such as extratropical cyclones. In addition to environmental steering, a tropical cyclone will tend to drift slowly poleward and westward, a motion known as "beta drift".

This motion is due to the superposition of a vortex, such as a tropical cyclone, onto an environment in which the Coriolis force varies with latitude, such as on a sphere or beta plane. It is induced indirectly by the storm itself, the result of a feedback between the cyclonic flow of the storm and its environment. Physically, the cyclonic circulation of the storm advects environmental air poleward east of centre and equatorial west of centre.

Because air must conserve its angular momentum, this flow configuration induces a cyclonic gyre equatorward and westward of the storm centre and an anticyclonic gyre poleward and eastward of the storm centre. The combined flow of these gyres acts to advect the storm slowly poleward and westward. This effect occurs even if there is zero environmental flow.

Multiple Storm Interaction

A third component of motion that occurs relatively infrequently involves the interaction of multiple tropical cyclones. When two cyclones approach one another, their centres will begin orbiting cyclonically about a point between the two systems. Depending on their separation distance and strength, the two vortices may simply orbit around one another or else may spiral into the centre point and merge. When the two vortices are of unequal size, the larger vortex will tend to dominate the interaction, and the smaller vortex will orbit around it. This phenomenon is called the Fujiwhara effect, after Sakuhei Fujiwhara.

4 Landfall

The landfall of a tropical cyclone occurs when a storm's surface centre moves over a coastline. Storm conditions may be experienced on the coast and inland hours before landfall; in fact, a tropical cyclone can launch its strongest winds over land, yet not make landfall. NOAA uses the term "direct hit" to describe when a location (on the left side of the eye) falls within the radius of maximum winds (or twice that radius if on the right side), whether or not the hurricane's eye made landfall.

Dissipation
A tropical cyclone can cease to have tropical characteristics in several different ways. One such way is if it moves over land, thus depriving it of the warm water it needs to power itself, quickly losing strength. Most strong storms lose their strength very rapidly after landfall and become disorganized areas of low pressure within a day or two, or evolve into extratropical cyclones. There is a chance a tropical cyclone could regenerate if it managed to get back over open warm water. If it remains over mountains for even a short time, weakening will accelerate. Many storm fatalities occur in mountainous terrain, when diminishing cyclones unleash their moisture as torrential rainfall. This rainfall may lead to deadly floods and mudslides, as was the case with Hurricane Mitch around Honduras in October 1998. Without warm surface water, the storm cannot survive.

A tropical cyclone can dissipate when it moves over waters significantly below 26.5°C (79.7°F). This will cause the storm to lose its tropical characteristics, such as a warm core with thunderstorms near the centre, and become a remnant low-pressure area. These remnant systems may persist for up to several days before losing their identity.

This dissipation mechanism is most common in the eastern North Pacific. Weakening or dissipation can occur if it experiences vertical wind shear, causing the convection and heat engine to move away from the centre; this normally ceases development of a tropical cyclone. In addition, its interaction with the main belt of the Westerlies, by means of merging with a nearby frontal zone, can cause tropical cyclones to evolve into extratropical cyclones.

This transition can take 1–3 days. Even after a tropical cyclone is said to be extratropical or dissipated, it can still have tropical storm force (or occasionally hurricane/typhoon force) winds and drop several inches of rainfall.

In the Pacific Ocean and Atlantic Ocean, such tropical-derived cyclones of higher latitudes can be violent and may occasionally remain at hurricane or typhoon-force wind speeds when they reach the west coast of North America. These phenomena can also affect Europe, where they are known as European windstorms; Hurricane Iris's extratropical remnants are an example of such a windstorm from 1995. A cyclone can also merge with another area of low pressure, becoming a larger area of low pressure. This can strengthen the resultant system, although it may no longer be a tropical cyclone. Studies in the 2000s have given rise to the hypothesis that large amounts of dust reduce the strength of tropical cyclones.

5 Effects

Tropical cyclones out at sea cause large waves, heavy rain, flood and high winds, disrupting international shipping and, at times, causing shipwrecks. Tropical cyclones stir up water, leaving a cool wake behind them, which causes the region to be less favourable for subsequent tropical cyclones. On land, strong winds can damage or destroy vehicles, buildings, bridges, and other outside objects, turning loose debris into deadly flying projectiles. The storm surge, or the increase in sea level due to the cyclone, is typically the worst effect from landfalling tropical cyclones, historically resulting in 90% of tropical cyclone deaths. The broad rotation of a landfalling tropical cyclone, and vertical wind shear at its periphery, spawns tornadoes.

Tornadoes can also be spawned as a result of eyewall mesovortices, which persist until landfall. Over the past two centuries, tropical cyclones have been responsible for the deaths of about 1.9 million people worldwide. Large areas of standing water caused by flooding lead to infection, as well as contributing to mosquito-borne illnesses. Crowded evacuees in shelters increase the risk of disease propagation. Tropical cyclones significantly interrupt infrastructure, leading to power outages, bridge destruction, and the hampering of reconstruction efforts.

On average, the Gulf and east coasts of the United States suffer approximately US $5 billion (1995 US $) in cyclone damage every year. The majority (83%) of tropical cyclone damage is caused by severe hurricanes, category 3 or greater. However, category 3 or greater hurricanes only account for about one-fifth of cyclones that make landfall every year.

Although cyclones take an enormous toll in lives and personal property, they may be important factors in the precipitation regimes of places they impact, as they may bring much-needed precipitation to otherwise dry regions. Tropical cyclones also help maintain the global heat balance by moving warm, moist tropical air to the middle latitudes and polar regions, and by regulating the thermohaline circulation through upwelling.
The storm surge and winds of hurricanes may be destructive to human-made structures, but they also stir up the waters of coastal estuaries, which are typically important fish breeding locales. Tropical cyclone destruction spurs redevelopment, greatly increasing local property values. When hurricanes surge upon shore from the ocean, salt is introduced to many freshwater areas and raises the salinity levels too high for some habitats to withstand.

Some are able to cope with the salt and recycle it back into the ocean, but others can not release the extra surface water quickly enough or do not have a large enough freshwater source to replace it. Because of this, some species of plants and vegetation die due to the excess salt. In addition, hurricanes can carry toxins and acids onto shore when they make landfall. The flood water can pick up the toxins from different spills and contaminate the land that it passes over. The toxins are very harmful to the people and animals in the area, as well as the environment around them. The flooding water can also spark many dangerous oil spills.

6 Forecasting

Intense tropical cyclones pose a particular observation challenge, as they are a dangerous oceanic phenomenon, and weather stations, being relatively sparse, are rarely available on the site of the storm itself. In general, surface observations are available only if the storm is passing over an island or a coastal area, or if there is a nearby ship. Real-time measurements are usually taken in the periphery of the cyclone, where conditions are less catastrophic and its true strength cannot be evaluated. For this reason, there are teams of meteorologists that move into the path of tropical cyclones to help evaluate their strength at the point of landfall. Tropical cyclones far from land are tracked by weather satellites capturing visible and infrared images from space, usually at half-hour to quarter-hour intervals. As a storm approaches land, it can be observed by land-based Doppler weather radar.

Radar plays a crucial role around landfall by showing a storm's location and intensity every several minutes. Because of the forces that affect tropical cyclone tracks, accurate track predictions depend on determining the position and strength of high- and low-pressure areas, and predicting how those areas will change during the life of a tropical system. The deep layer mean flow, or average wind through the depth of the troposphere, is considered the best tool in determining track direction and speed.

If storms are significantly sheared, use of wind speed measurements at a lower altitude, such as at the 70 kPa pressure surface (3,000 metres or 9,800 feet above sea level) will produce better predictions. Tropical forecasters also consider smoothing out short-term wobbles of the storm as it allows them to determine a more accurate long-term trajectory. High-speed computers and sophisticated simulation software allow forecasters to produce computer models that predict tropical cyclone tracks based on the future position and strength of high- and low-pressure systems. Combining forecast models with increased understanding of the forces that act on tropical cyclones, as well as with a wealth of data from Earth-orbiting satellites and other sensors, scientists have increased the accuracy of track forecasts over recent decades.

However, scientists are not as skilful at predicting the intensity of tropical cyclones. The lack of improvement in intensity forecasting is attributed to the complexity of tropical systems and an incomplete understanding of factors that affect their development. New tropical cyclone position and forecast information is available at least every twelve hours in the Southern Hemisphere and at least every six hours in the Northern Hemisphere from Regional Specialized Meteorological Centres and Tropical Cyclone Warning Centres.

Long-Term Trends
While the number of storms in the Atlantic has increased since 1995, there is no obvious global trend; the annual number of tropical cyclones worldwide remains about 87 ± 10 (Between 77 and 97 tropical cyclones annually). However, the ability of climatologists to make long-term data analysis in certain basins is limited by the lack of reliable historical data in some basins, primarily in the Southern Hemisphere, while noting that a significant downward trend in tropical cyclone numbers has been identified for the region near Australia (based on high quality data and accounting for the influence of the El Niño-Southern Oscillation).

In spite of that, there is some evidence that the intensity of hurricanes is increasing. Kerry Emanuel stated, "Records of hurricane activity worldwide show an upswing of both the maximum wind speed in and the duration of hurricanes. The energy released by the average hurricane (again considering all hurricanes worldwide) seems to have increased by around 70% in the past 30 years or so, corresponding to about a 15% increase in the maximum wind speed and a 60% increase in storm lifetime.

Atlantic storms are becoming more destructive financially, as evidenced by the fact that five of the ten most expensive storms in United States history have occurred since 1990. According to the World Meteorological Organization, "recent increase in societal impact from tropical cyclones has been caused largely by rising concentrations of population and infrastructure in coastal regions."

The number and strength of Atlantic hurricanes may undergo a 50–70 year cycle, also known as the Atlantic Multidecadal Oscillation. Nyberg et al. reconstructed Atlantic major hurricane activity back to the early 18th century and found five periods averaging 3–5 major hurricanes per year and lasting 40–60 years, and six other averaging 1.5–2.5 major hurricanes per year and lasting 10–20 years.

7 Classifications

Tropical cyclones are classified into three main groups, based on intensity: tropical depressions, tropical storms, and a third group of more intense storms, whose name depends on the region. For example, if a tropical storm in the North-western Pacific reaches hurricane-strength winds on the Beaufort scale, it is referred to as a typhoon; if a tropical storm passes the same benchmark in the Northeast Pacific Basin, or in the North Atlantic, it is called a hurricane. In the Southern Hemisphere or the Indian Ocean storms of a tropical nature are referred to as tropical cyclones.

Tropical Depression	A tropical depression or tropical low is a tropical disturbance that has a clearly defined surface circulation with maximum sustained winds of less than 34 kn (39 mph; 63 km/h). Within the Southern Hemisphere, the depression can have gale force or stronger winds in one or more quadrants, but not near the centre.
Tropical Storm	A tropical storm is an organized system of strong thunderstorms with a defined surface circulation and maximum sustained winds between 34 knots (63 km/h) and 64 knots (119 km/h). At this point, the distinctive cyclonic shape starts to develop, although an eye is not usually present. Government weather services first assign names to systems that reach this intensity (thus the term named storm). Although tropical storms are less intense than a hurricane they can produce significant damage. The shear force of winds can blow off shingles, and air borne objects can cause damage to power lines, roofing and siding. More dangerous is the heavy rainfall causing inland flooding.

11 Drought

A drought is a period of below-average precipitation in a given region, resulting in prolonged shortages in the water supply, whether atmospheric, surface water or ground water. A drought can last for months or years, or may be declared after as few as 15 days. It can have a substantial impact on the ecosystem and agriculture of the affected region and harm to the local economy. Annual dry seasons in the tropics significantly increase the chances of a drought developing and subsequent bush fires. Periods of heat can significantly worsen drought conditions by hastening evaporation of water vapour.

Many plant species, such as those in the family Cactaceae (or cacti), have drought tolerance adaptations like reduced leaf area and waxy cuticles to enhance their ability to tolerate drought. Some others survive dry periods as buried seeds. Semi-permanent drought produces arid biomes such as deserts and grasslands. Prolonged droughts have caused mass migrations and humanitarian crisis. Most arid ecosystems have inherently low productivity. The most prolonged drought ever in the world in recorded history occurred in the Atacama Desert in Chile (400 Years).

Causes

Precipitation Deficiency
Mechanisms of producing precipitation include convective, stratiform, and orographic rainfall. Convective processes involve strong vertical motions that can cause the overturning of the atmosphere in that location within an hour and cause heavy precipitation, while stratiform processes involve weaker upward motions and less intense precipitation over a longer duration. Precipitation can be divided into three categories, based on whether it falls as liquid water, liquid water that freezes on contact with the surface, or ice. Droughts occur mainly in areas where normal levels of rainfall are, in themselves, low. If these factors do not support precipitation volumes sufficiently to reach the surface over a sufficient time, the result is a drought.

Drought can be triggered by a high level of reflected sunlight and above average prevalence of high pressure systems, winds carrying continental, rather than oceanic air masses, and ridges of high pressure areas aloft can prevent or restrict the developing of thunderstorm activity or rainfall over one certain region. Once a region is within drought, feedback mechanisms such as local arid air, hot conditions which can promote warm core ridging, and minimal evapotranspiration can worsen drought conditions.

Dry Season
Within the tropics, distinct, wet and dry seasons emerge due to the movement of the Intertropical Convergence Zone or Monsoon trough. The dry season greatly increases drought occurrence, and is characterized by its low humidity, with watering holes and rivers drying up. Because of the lack of these watering holes, many grazing animals are forced to migrate due to the lack of water in search of more fertile lands. Examples of such animals are zebras, elephants, and wildebeest. Because of the lack of water in the plants, bushfires are common. Since water vapor becomes more energetic with increasing temperature, more water vapor is required to increase relative humidity values to 100% at higher temperatures (or to get the temperature to fall to the dew point). Periods of warmth quicken the pace of fruit and vegetable production, increase evaporation and transpiration from plants, and worsen drought conditions.

El Niño
Drier and hotter weather occurs in parts of the Amazon River Basin, Colombia, and Central America during El Niño events. Winters during the El Niño are warmer and drier than average conditions in the Northwest, northern Midwest, and northern Mideast United States, so those regions experience reduced snowfalls. Conditions are also drier than normal from December to February in south-central Africa, mainly in Zambia, Zimbabwe, Mozambique, and Botswana. Direct effects of El Niño resulting in drier conditions occur in parts of Southeast Asia and Northern Australia, increasing bush fires, worsening haze, and decreasing air quality dramatically. Drier-than-normal conditions are also in general observed in Queensland, inland Victoria, inland New South Wales, and eastern Tasmania from June to August. As warm water spreads from the west Pacific and the Indian Ocean to the east Pacific, it causes extensive drought in the western Pacific. Singapore experienced the driest February in 2014 since records began in 1869, with only 6.3 mm of rain falling in the month and temperatures hitting as high as 35 °C on 26 February. The years 1968 and 2005 had the next driest Februaries, when 8.4 mm of rain fell.

Erosion and Human Activities
Human activity can directly trigger exacerbating factors such as over farming, excessive irrigation, deforestation, and erosion adversely impact the ability of the land to capture and hold water. In arid climates, the main source of erosion is wind. Erosion can be the result of material movement by the wind. The wind can cause small particles to be lifted and therefore moved to another region (deflation). Suspended particles within the wind may impact on solid objects causing erosion by abrasion (ecological succession). Wind erosion generally occurs in areas with little or no vegetation, often in areas where there is insufficient rainfall to support vegetation. Loess is a homogeneous, typically nonstratified, porous, friable, slightly coherent, often calcareous, fine-grained, silty, pale yellow or buff, windblown (Aeolian) sediment. It generally occurs as a widespread blanket deposit that covers areas of hundreds of square kilometers and tens of meters thick. Loess often stands in either steep or vertical faces. Loess tends to develop into highly rich soils. Under appropriate climatic conditions, areas with loess are among the most agriculturally productive in the world. Loess deposits are geologically unstable by nature, and will erode very readily. Therefore, windbreaks (such as big trees and bushes) are often planted by farmers to reduce the wind erosion of loess. Wind erosion is much more severe in arid areas and during times of drought. For example, in the Great Plains, it is estimated that soil loss due to wind erosion can be as much as 6100 times greater in drought years than in wet years.

Climatic Changes
Activities resulting in global climate change are expected to trigger droughts with a substantial impact on agriculture throughout the world, and especially in developing nations. Overall, global warming will result in increased world rainfall. Along with drought in some areas, flooding and erosion will increase in others. Paradoxically, some proposed solutions to global warming that focus on more active techniques, solar radiation management through the use of a space sunshade for one, may also carry with them increased chances of drought.

Types

As a drought persists, the conditions surrounding it gradually worsen and its impact on the local population gradually increases. People tend to define droughts in three main ways:

1	Meteorological drought occurs when there is a prolonged time with less than average precipitation. Meteorological drought usually precedes the other kinds of drought.
2	Agricultural droughts affect crop production or the ecology of the range. This condition can also arise independently from any change in precipitation levels when soil conditions and erosion triggered by poorly planned agricultural endeavors cause a shortfall in water available to the crops. However, in a traditional drought, it is caused by an extended period of below average precipitation.
3	Hydrological drought is brought about when the water reserves available in sources such as aquifers, lakes and reservoirs fall below the statistical average. Hydrological drought tends to show up more slowly because it involves stored water that is used but not replenished. Like an agricultural drought, this can be triggered by more than just a loss of rainfall. For instance, around 2007 Kazakhstan was awarded a large amount of money by the World Bank to restore water that had been diverted to other nations from the Aral Sea under Soviet rule. Similar circumstances also place their largest lake, Balkhash, at risk of completely drying out.

Consequences

One can divide the effects of droughts and water shortages into three groups: environmental, economic and social.

Environmental Effects	Lower surface and subterranean water-levels, lower flow-levels (with a decrease below the minimum leading to direct danger for amphibian life), increased pollution of surface water, the drying out of wetlands, more and larger fires, higher deflation intensity, loss of biodiversity, worse health of trees and the appearance of pests and dendroid diseases.
Economic Losses	Economic losses include lower agricultural, forests, game and fishing output, higher food-production costs, lower energy-production levels in hydro plants, losses caused by depleted water tourism and transport revenue, problems with water supply for the energy sector and for technological processes in metallurgy, mining, the chemical, paper, wood, foodstuff industries etc., disruption of water supplies for municipal economies.
Social Costs	Social costs include the negative effect on the health of people directly exposed to this phenomenon (excessive heat waves), possible limitation of water supplies, increased pollution levels, high food-costs, stress caused by failed harvests, etc. This explains why droughts and fresh water shortages operate as a factor which increases the gap between developed and developing countries.

Effects vary according to vulnerability. For example, subsistence farmers are more likely to migrate during drought because they do not have alternative food-sources. Areas with populations that depend on water sources as a major food-source are more vulnerable to famine. Drought can also reduce water quality, because lower water-flows reduce dilution of pollutants and increase contamination of remaining water-sources. Common consequences of drought include:

● Diminished crop growth or yield productions and carrying capacity for livestock
● Dust bowls, themselves a sign of erosion, which further erode the landscape
● Dust storms, when drought hits an area suffering from desertification and erosion
● Famine
● Habitat damage, affecting both terrestrial and aquatic wildlife.
● Diminished crop growth or yield productions and carrying capacity for livestock
● Dust bowls, themselves a sign of erosion, which further erode the landscape
● Dust storms, when drought hits an area suffering from desertification and erosion
● Famine
● Habitat damage, affecting both terrestrial and aquatic wildlife.
● Diminished crop growth or yield productions and carrying capacity for livestock
● Dust bowls, themselves a sign of erosion, which further erode the landscape
● Dust storms, when drought hits an area suffering from desertification and erosion
● Famine
● Habitat damage, affecting both terrestrial and aquatic wildlife.
● Hunger – drought provides too little water to support food crops.
● Malnutrition, dehydration and related diseases
● Mass migration, resulting in internal displacement and international refugees
● Reduced electricity production due to reduced water-flow through hydroelectric dams
● Shortages of water for industrial users.
● Snake migration, which results in snake-bites
● Social unrest
● War over natural resources, including water and food
● Wildfires, such as Australian bushfires, become more common during times of drought and may cause human deaths.
● Exposure and oxidation of acid sulfate soils due to falling surface- and ground-water levels.
● Cyanotoxin accumulation within food chains and water supply (some are among the most potent toxins known to science) can cause cancer with low exposure over the long term. High levels of microcystin appeared in San Francisco Bay Area salt-water shellfish and fresh-water supplies throughout California in 2016.

Protection

Agriculturally, people can effectively mitigate much of the impact of drought through irrigation and crop rotation. Failure to develop adequate drought mitigation strategies carries a grave human cost in the modern era, exacerbated by ever-increasing population densities. President Roosevelt on April 27, 1935, signed documents creating the Soil Conservation Service (SCS)—now the Natural Resources Conservation Service (NRCS). Models of the law were sent to each state where they were enacted. These were the first enduring practical programs to curtail future susceptibility to drought, creating agencies that first began to stress soil conservation measures to protect farm lands today. It was not until the 1950s that there was an importance placed on water conservation was put into the existing laws (NRCS 2014). Strategies for drought protection, mitigation or relief include:

Dams	Many dams and their associated reservoirs supply additional water in times of drought.
Cloud Seeding	A form of intentional weather modification to induce rainfall. This remains a hotly debated topic, as the United States National Research Council released a report in 2004 stating that to date, there is still no convincing scientific proof of the efficacy of intentional weather modification.
Desalination	Use of sea water for irrigation or consumption.

Drought Monitoring	Continuous observation of rainfall levels and comparisons with current usage levels can help prevent man-made drought. For instance, analysis of water usage in Yemen has revealed that their water table (underground water level) is put at grave risk by over-use to fertilize their Khat crop. Careful monitoring of moisture levels can also help predict increased risk for wildfires, using such metrics as the Keetch-Byram Drought Index or Palmer Drought Index.
Land Use	Carefully planned crop rotation can help to minimize erosion and allow farmers to plant less water-dependent crops in drier years.
Outdoor Water-Use Restriction	Regulating the use of sprinklers, hoses or buckets on outdoor plants, filling pools, and other water-intensive home maintenance tasks. Xeriscaping yards can significantly reduce unnecessary water use by residents of towns and cities.
Rainwater Harvesting	Collection and storage of rainwater from roofs or other suitable catchments.
Recycled Water	Former wastewater (sewage) that has been treated and purified for reuse.
Transvasement	Building canals or redirecting rivers as massive attempts at irrigation in drought-prone areas.

12 Thunderstorm

A thunderstorm, also known as an electrical storm, lightning storm, or thundershower, is a storm characterized by the presence of lightning and its acoustic effect on the Earth's atmosphere, known as thunder. Relatively weak thunderstorms are sometimes called thundershowers. Thunderstorms occur in a type of cloud known as a cumulonimbus. They are usually accompanied by strong winds, and often produce heavy rain and sometimes snow, sleet, or hail, but some thunderstorms produce little precipitation or no precipitation at all. Thunderstorms may line up in a series or become a rainband, known as a squall line. Strong or severe thunderstorms include some of the most dangerous weather phenomena, including large hail, strong winds, and tornadoes. Some of the most persistent severe thunderstorms, known as supercells, rotate as do cyclones. While most thunderstorms move with the mean wind flow through the layer of the troposphere that they occupy, vertical wind shear sometimes causes a deviation in their course at a right angle to the wind shear direction. Thunderstorms result from the rapid upward movement of warm, moist air, sometimes along a front. As the warm, moist air moves upward, it cools, condenses, and forms a cumulonimbus cloud that can reach heights of over 20 kilometres (12 mi).

As the rising air reaches its dew point temperature, water vapor condenses into water droplets or ice, reducing pressure locally within the thunderstorm cell. Any precipitation falls the long distance through the clouds towards the Earth's surface. As the droplets fall, they collide with other droplets and become larger. The falling droplets create a downdraft as it pulls cold air with it, and this cold air spreads out at the Earth's surface, occasionally causing strong winds that are commonly associated with thunderstorms. Thunderstorms can form and develop in any geographic location but most frequently within the mid-latitude, where warm, moist air from tropical latitudes collides with cooler air from polar latitudes. Thunderstorms are responsible for the development and formation of many severe weather phenomena. Thunderstorms, and the phenomena that occur along with them, pose great hazards. Damage that results from thunderstorms is mainly inflicted by downburst winds, large hailstones, and flash flooding caused by heavy precipitation. Stronger thunderstorm cells are capable of producing tornadoes and waterspouts.

There are four types of thunderstorms: single-cell, multi-cell cluster, multi-cell lines and supercells. Supercell thunderstorms are the strongest and most severe. Mesoscale convective systems formed by favorable vertical wind shear within the tropics and subtropics can be responsible for the development of hurricanes. Dry thunderstorms, with no precipitation, can cause the outbreak of wildfires from the heat generated from the cloud-to-ground lightning that accompanies them. Several means are used to study thunderstorms: weather radar, weather stations, and video photography. Past civilizations held various myths concerning thunderstorms and their development as late as the 18th century. Beyond the Earth's atmosphere, thunderstorms have also been observed on the planets of Jupiter, Saturn, Neptune, and, probably, Venus.

Subheadings

1 Life Cycle

Warm air has a lower density than cool air, so warmer air rises upwards and cooler air will settle at the bottom (this effect can be seen with a hot air balloon). Clouds form as relatively warmer air, carrying moisture, rises within cooler air. The moist air rises, and, as it does so, it cools and some of the water vapor in that rising air condenses. When the moisture condenses, it releases energy known as latent heat of condensation, which allows the rising packet of air to cool less than the cooler surrounding air continuing the cloud's ascension.

If enough instability is present in the atmosphere, this process will continue long enough for cumulonimbus clouds to form and produce lightning and thunder. Meteorological indices such as convective available potential energy (CAPE) and the lifted index can be used to assist in determining potential upward vertical development of clouds. Generally, thunderstorms require three conditions to form:

1. Moisture
2. An unstable airmass
3. A lifting force (heat)

All thunderstorms, regardless of type, go through three stages: the developing stage, the mature stage, and the dissipation stage. The average thunderstorm has a 24 km (15 mi) diameter. Depending on the conditions present in the atmosphere, each of these three stages take an average of 30 minutes.

Developing Stage

The first stage of a thunderstorm is the cumulus stage or developing stage. During this stage, masses of moisture are lifted upwards into the atmosphere. The trigger for this lift can be solar illumination, where the heating of the ground produces thermals, or where two winds converge forcing air upwards, or where winds blow over terrain of increasing elevation. The moisture carried upward cools into liquid drops of water due to lower temperatures at high altitude, which appear as cumulus clouds.

As the water vapor condenses into liquid, latent heat is released, which warms the air, causing it to become less dense than the surrounding, drier air. The air tends to rise in an updraft through the process of convection (hence the term convective precipitation). This process creates a low-pressure zone within and beneath the forming thunderstorm. In a typical thunderstorm, approximately 500 million kilograms of water vapor are lifted into the Earth's atmosphere.

Mature Stage

In the mature stage of a thunderstorm, the warmed air continues to rise until it reaches an area of warmer air and can rise no farther. Often this 'cap' is the tropopause. The air is instead forced to spread out, giving the storm a characteristic anvil shape. The resulting cloud is called cumulonimbus incus. The water droplets coalesce into larger and heavier droplets and freeze to become ice particles. As these fall, they melt to become rain. If the updraft is strong enough, the droplets are held aloft long enough to become so large that they do not melt completely but fall as hail. While updrafts are still present, the falling rain drags the surrounding air with it, creating downdrafts as well.

The simultaneous presence of both an updraft and a downdraft marks the mature stage of the storm and produces cumulonimbus clouds. During this stage, considerable internal turbulence can occur within, which manifests as strong winds, severe lightning, and even tornadoes. Typically, if there is little wind shear, the storm will rapidly enter the dissipating stage and 'rain itself out', but, if there is sufficient change in wind speed or direction, the downdraft will be separated from the updraft, and the storm may become a supercell, where the mature stage can sustain itself for several hours.

Dissipating Stage

In the dissipation stage, the thunderstorm is dominated by the downdraft. If atmospheric conditions do not support super cellular development, this stage occurs rather quickly, approximately 20–30 minutes into the life of the thunderstorm. The downdraft will push down out of the thunderstorm, hit the ground and spread out. This phenomenon is known as a downburst. The cool air carried to the ground by the downdraft cuts off the inflow of the thunderstorm, the updraft disappears and the thunderstorm will dissipate.

Thunderstorms in an atmosphere with virtually no vertical wind shear weaken as soon as they send out an outflow boundary in all directions, which then quickly cuts off its inflow of relatively warm, moist air, and kills the thunderstorm's further growth. The downdraft hitting the ground creates an outflow boundary. This can cause downbursts, a potential hazardous condition for aircraft to fly through, as a substantial change in wind speed and direction occurs, resulting in a decrease of airspeed and the subsequent reduction in lift for the aircraft. The stronger the outflow boundary is, the stronger the resultant vertical wind shear becomes.

2 Classification

There are four main types of thunderstorms: single-cell, multi-cell, squall line (also called multi-cell line) and supercell. Which type forms depends on the instability and relative wind conditions at different layers of the atmosphere ("wind shear"). Single-cell thunderstorms form in environments of low vertical wind shear and last only 20–30 minutes. Organized thunderstorms and thunderstorm clusters/lines can have longer life cycles as they form in environments of significant vertical wind shear, normally greater than 25 knots (13 m/s) in the lowest 6 kilometres (3.7 mi) of the troposphere, which aids the development of stronger updrafts as well as various forms of severe weather.

The supercell is the strongest of the thunderstorms, most commonly associated with large hail, high winds, and tornado formation. Precipitable water values of greater than 31.8 millimetres (1.25 in) favor the development of organized thunderstorm complexes. Those with heavy rainfall normally have precipitable water values greater than 36.9 millimetres (1.45 in). Upstream values of CAPE of greater than 800 J/kg are usually required for the development of organized convection.

Single-Cell
This term technically applies to a single thunderstorm with one main updraft. Also known as air-mass thunderstorms, these are the typical summer thunderstorms in many temperate locales. They also occur in the cool unstable air that often follows the passage of a cold front from the sea during winter. Within a cluster of thunderstorms, the term "cell" refers to each separate principal updraft. Thunderstorm cells occasionally form in isolation, as the occurrence of one thunderstorm can develop an outflow boundary that sets up new thunderstorm development. Such storms are rarely severe and are a result of local atmospheric instability; hence the term "air mass thunderstorm". When such storms have a brief period of severe weather associated with them, it is known as a pulse severe storm. Pulse severe storms are poorly organized and occur randomly in time and space, making them difficult to forecast. Single-cell thunderstorms normally last 20–30 minutes.

Multi-Cell Clusters
This is the most common type of thunderstorm development. Mature thunderstorms are found near the center of the cluster, while dissipating thunderstorms exist on their downwind side. Multicell storms form as clusters of storms but may then evolve into one or more squall lines. While each cell of the cluster may only last 20 minutes, the cluster itself may persist for hours at a time. They often arise from convective updrafts in or near mountain ranges and linear weather boundaries, such as strong cold fronts or troughs of low pressure. These type of storms are stronger than the single-cell storm, yet much weaker than the supercell storm. Hazards with the multicell cluster include moderate-sized hail, flash flooding, and weak tornadoes.

Multicell Lines
A squall line is an elongated line of severe thunderstorms that can form along or ahead of a cold front. In the early 20th century, the term was used as a synonym for cold front. The squall line contains heavy precipitation, hail, frequent lightning, strong straight line winds, and possibly tornadoes and waterspouts. Severe weather in the form of strong straight-line winds can be expected in areas where the squall line itself is in the shape of a bow echo, within the portion of the line that bows out the most. Tornadoes can be found along waves within a line echo wave pattern, or LEWP, where mesoscale low pressure areas are present. Some bow echoes in the summer are called derechos, and move quite fast through large sections of territory. On the back edge of the rain shield associated with mature squall lines, a wake low can form, which is a mesoscale low pressure area that forms behind the mesoscale high pressure system normally present under the rain canopy, which are sometimes associated with a heat burst. This kind of storm is also known as "Wind of the Stony Lake" in southern China.

Supercells
Supercell storms are large, usually severe, quasi-steady-state storms that form in an environment where wind speed or wind direction varies with height ("wind shear"), and they have separate downdrafts and updrafts (i.e., where its associated precipitation is not falling through the updraft) with a strong, rotating updraft (a "mesocyclone"). These storms normally have such powerful updrafts that the top of the supercell storm cloud (or anvil) can break through the troposphere and reach into the lower levels of the stratosphere, and supercell storms can be 24 kilometres (15 mi) wide. Research has shown that at least 90 percent of supercells cause severe weather. These storms can produce destructive tornadoes, extremely large hailstones (10 centimetres or 4 inches diameter), straight-line winds in excess of 130 km/h (81 mph), and flash floods. In fact, research has shown that most tornadoes occur from this type of thunderstorm. Supercells are generally the strongest type of thunderstorm.

Severe Thunderstorms
In the United States, a thunderstorm is classed as severe if winds reach at least 93 kilometres per hour (58 mph), hail is 25 millimetres (1 in) in diameter or larger, or if funnel clouds or tornadoes are reported. Although a funnel cloud or tornado indicates a severe thunderstorm, a tornado warning is issued in place of a severe thunderstorm warning. A severe thunderstorm warning is issued if a thunderstorm becomes severe, or will soon turn severe. In Canada, a rainfall rate greater than 50 millimetres (2 in) in one hour, or 75 millimetres (3 in) in three hours, is also used to indicate severe thunderstorms. Severe thunderstorms can occur from any type of storm cell. However, multicell, supercell, and squall lines represent the most common forms of thunderstorms that produce severe weather.

Mesoscale Convective Systems
A mesoscale convective system (MCS) is a complex of thunderstorms that becomes organized on a scale larger than the individual thunderstorms but smaller than extratropical cyclones, and normally persists for several hours or more. A mesoscale convective system's overall cloud and precipitation pattern may be round or linear in shape, and include weather systems such as tropical cyclones, squall lines, lake-effect snow events, polar lows, and mesoscale convective complexes (MCCs), and they generally form near weather fronts. Most mesoscale convective systems develop overnight and continue their lifespan through the next day. The type that forms during the warm season over land has been noted across North America, Europe, and Asia, with a maximum in activity noted during the late afternoon and evening hours. Forms of MCS that develop in the tropics are found in use either the Intertropical Convergence Zone or monsoon troughs, generally within the warm season between spring and fall. More intense systems form over land than over water. One exception is that of lake-effect snow bands, which form due to cold air moving across relatively warm bodies of water, and occurs from fall through spring. Polar lows are a second special class of MCS. They form at high latitudes during the cold season. Once the parent MCS dies, later thunderstorm development can occur in connection with its remnant mesoscale convective vortex (MCV). Mesoscale convective systems are important to the United States rainfall climatology over the Great Plains since they bring the region about half of their annual warm season rainfall.

Motion
The two major ways thunderstorms move are via advection of the wind and propagation along outflow boundaries towards sources of greater heat and moisture. Many thunderstorms move with the mean wind speed through the Earth's troposphere, the lowest 8 kilometres (5.0 mi) of the Earth's atmosphere. Weaker thunderstorms are steered by winds closer to the Earth's surface than stronger thunderstorms, as the weaker thunderstorms are not as tall. Organized, long-lived thunderstorm cells and complexes move at a right angle to the direction of the vertical wind shear vector. If the gust front, or leading edge of the outflow boundary, races ahead of the thunderstorm, its motion will accelerate in tandem. This is more of a factor with thunderstorms with heavy precipitation (HP) than with thunderstorms with low precipitation (LP). When thunderstorms merge, which is most likely when numerous thunderstorms exist in proximity to each other, the motion of the stronger thunderstorm normally dictates the future motion of the merged cell. The stronger the mean wind, the less likely other processes will be involved in storm motion. On weather radar, storms are tracked by using a prominent feature and tracking it from scan to scan.

Back-Building Thunderstorm
A back-building thunderstorm, commonly referred to as a training thunderstorm, is a thunderstorm in which new development takes place on the upwind side (usually the west or southwest side in the Northern Hemisphere), such that the storm seems to remain stationary or propagate in a backward direction. Though the storm often appears stationary on radar, or even moving upwind, this is an illusion. The storm is really a multi-cell storm with new, more vigorous cells that form on the upwind side, replacing older cells that continue to drift downwind. When this happens, catastrophic flooding is possible. In Rapid City, South Dakota, in 1972, an unusual alignment of winds at various levels of the atmosphere combined to produce a continuously training set of cells that dropped an enormous quantity of rain upon the same area, resulting in devastating flash flooding. A similar event occurred in Boscastle, England, on 16 August 2004, and over Chennai on 1 December 2015.

3 Hazards

Each year, many people are killed or seriously injured by severe thunderstorms despite the advance warning. While severe thunderstorms are most common in the spring and summer, they can occur at just about any time of the year.

Cloud-to-Ground Lightning

Cloud-to-ground lightning frequently occurs within the phenomena of thunderstorms and have numerous hazards towards landscapes and populations. One of the more significant hazards lightning can pose is the wildfires they are capable of igniting. Under a regime of low precipitation (LP) thunderstorms, where little precipitation is present, rainfall cannot prevent fires from starting when vegetation is dry as lightning produces a concentrated amount of extreme heat. Direct damage caused by lightning strikes occurs on occasion. In areas with a high frequency for cloud-to-ground lightning, like Florida, lightning causes several fatalities per year, most commonly to people working outside. Acid rain is also a frequent risk produced by lightning.

Distilled water has a neutral pH of 7. “Clean” or unpolluted rain has a slightly acidic pH of about 5.2, because carbon dioxide and water in the air react together to form carbonic acid, a weak acid (pH 5.6 in distilled water), but unpolluted rain also contains other chemicals. Nitric oxide present during thunderstorm phenomena, caused by the oxidation of atmospheric nitrogen, can result in the production of acid rain, if nitric oxide forms compounds with the water molecules in precipitation, thus creating acid rain. Acid rain can damage infrastructures containing calcite or certain other solid chemical compounds. In ecosystems, acid rain can dissolve plant tissues of vegetations and increase acidification process in bodies of water and in soil, resulting in deaths of marine and terrestrial organisms.

Hail

Any thunderstorm that produces hail that reaches the ground is known as a hailstorm. Thunderclouds that are capable of producing hailstones are often seen obtaining green coloration. Hail is more common along mountain ranges because mountains force horizontal winds upwards (known as orographic lifting), thereby intensifying the updrafts within thunderstorms and making hail more likely. One of the more common regions for large hail is across mountainous northern India, which reported one of the highest hail-related death tolls on record in 1888. China also experiences significant hailstorms. Across Europe, Croatia experiences frequent occurrences of hail.

In North America, hail is most common in the area where Colorado, Nebraska, and Wyoming meet, known as "Hail Alley". Hail in this region occurs between the months of March and October during the afternoon and evening hours, with the bulk of the occurrences from May through September. Cheyenne, Wyoming is North America's most hail-prone city with an average of nine to ten hailstorms per season.

In South America, areas prone to hail are cities like Bogotá, Colombia. Hail can cause serious damage, notably to automobiles, aircraft, skylights, glass-roofed structures, livestock, and most commonly, farmers' crops. Hail is one of the most significant thunderstorm hazards to aircraft. When hail stones exceed 13 millimetres (0.5 in) in diameter, planes can be seriously damaged within seconds. The hailstones accumulating on the ground can also be hazardous to landing aircraft.

Wheat, corn, soybeans, and tobacco are the most sensitive crops to hail damage. Hail is one of Canada's most costly hazards. Hailstorms have been the cause of costly and deadly events throughout history. One of the earliest recorded incidents occurred around the 9th century in Roopkund, Uttarakhand, India. The largest hailstone in terms of maximum circumference and length ever recorded in the United States fell in 2003 in Aurora, Nebraska, United States.

Tornadoes and Waterspouts

A tornado is a violent, rotating column of air in contact with both the surface of the earth and a cumulonimbus cloud (otherwise known as a thundercloud) or, in rare cases, the base of a cumulus cloud. Tornadoes come in many sizes but are typically in the form of a visible condensation funnel, whose narrow end touches the earth and is often encircled by a cloud of debris and dust.

Most tornadoes have wind speeds between 40 and 110 mph (64 and 177 km/h), are approximately 75 metres (246 ft) across, and travel several kilometers (a few miles) before dissipating. Some attain wind speeds of more than 300 mph (480 km/h), stretch more than 1,600 metres (1 mi) across, and stay on the ground for more than 100 kilometres (dozens of miles).

The Fujita scale and the Enhanced Fujita Scale rate tornadoes by damage caused. An EF0 tornado, the weakest category, damages trees but not substantial structures. An EF5 tornado, the strongest category, rips buildings off their foundations and can deform large skyscrapers. The similar TORRO scale ranges from a T0 for extremely weak tornadoes to T11 for the most powerful known tornadoes.

Doppler radar data, photogrammetry, and ground swirl patterns (cycloidal marks) may also be analyzed to determine intensity and award a rating. Waterspouts have similar characteristics as tornadoes, characterized by a spiraling funnel-shaped wind current that form over bodies of water, connecting to large cumulonimbus clouds. Waterspouts are generally classified as forms of tornadoes, or more specifically, non-supercelled tornadoes that develop over large bodies of water. These spiralling columns of air frequently develop within tropical areas close to the equator, but are less common within areas of high latitude.

Flash Flood

Flash flooding is the process where a landscape, most notably an urban environment, is subjected to rapid floods. These rapid floods occur more quickly and are more localized than seasonal river flooding or areal flooding and are frequently (though not always) associated with intense rainfall. Flash flooding can frequently occur in slow-moving thunderstorms and is usually caused by the heavy liquid precipitation that accompanies it. Flash floods are most common in densely populated urban environments, where few plants and bodies of water are present to absorb and contain the extra water. Flash flooding can be hazardous to small infrastructure, such as bridges, and weakly constructed buildings. Plants and crops in agricultural areas can be destroyed and devastated by the force of raging water. Automobiles parked within affected areas can also be displaced. Soil erosion can occur as well, exposing risks of landslide phenomena.

Downburst

Downburst winds can produce numerous hazards to landscapes experiencing thunderstorms. Downburst winds are generally very powerful, and are often mistaken for wind speeds produced by tornadoes, due to the concentrated amount of force exerted by their straight-horizontal characteristic. Downburst winds can be hazardous to unstable, incomplete, or weakly constructed infrastructures and buildings. Agricultural crops, and other plants in nearby environments can be uprooted and damaged. Aircraft engaged in takeoff or landing can crash. Automobiles can be displaced by the force exerted by downburst winds. Downburst winds are usually formed in areas when high pressure air systems of downdrafts begin to sink and displace the air masses below it, due to their higher density. When these downdrafts reach the surface, they spread out and turn into the destructive straight-horizontal winds.

Thunderstorm Asthma

Thunderstorm asthma is the triggering of an asthma attack by environmental conditions directly caused by a local thunderstorm. During a thunderstorm, pollen grains can absorb moisture and then burst into much smaller fragments with these fragments being easily dispersed by wind. While larger pollen grains are usually filtered by hairs in the nose, the smaller pollen fragments are able to pass through and enter the lungs, triggering the asthma attack.

Lightning

Lightning strikes the ground, the air, or inside clouds. There are roughly 5 to 10 times as many cloud flashes as there are cloud-to-ground flashes. There are two types of ground flashes: natural (those that occur because of normal electrification in the environment), and artificially initiated or triggered. Artificially initiated lightning includes strikes to very tall structures, airplanes, rockets and towers on mountains. Triggered lightning goes from ground to cloud, while "natural" lightning is cloud to ground.

In cloud-to-ground lightning (CG), a channel of negative charge, called a stepped leader, will zigzag downward in roughly 50-yard segments in a forked pattern. This stepped leader is invisible to the human eye, and shoots to the ground in less time than it takes to blink. As it nears the ground, the negatively charged stepped leader is attracted to a channel of positive charge reaching up, a streamer, normally through something tall, such as a tree, house, or telephone pole. When the oppositely-charged leader and streamer connect, a powerful electrical current begins flowing.

A return stroke of bright luminosity travels about 60,000 miles per second back towards the cloud. A flash consists of one or perhaps as many as 20 return strokes. We see lightning flicker when the process rapidly repeats itself several times along the same path. The actual diameter of a lightning channel is 2.5-5cm. (1-2 inches) A typical cloud-to-ground flash is a negative stepped leader that travels downward through the cloud, followed by an upward travelling return stroke. The net effect of this flash is to lower negative charge from the cloud to the ground. Less common, a downward travelling positive leader followed by an upward return stroke will lower positive charge to earth.

Cloud Flashes

Cloud flashes sometimes have visible channels that extend out into the air around the storm (cloud-to-air or CA), but do not strike the ground. The terms sheet lightning or intra-cloud lightning (IC) refers to lightning embedded within a cloud that lights up as a sheet of luminosity during the flash. A related term, heat lightning, is lightning or lightning-induced illumination that is too far away for thunder to be heard. Lightning can also travel from cloud-to-cloud (CC). Spider lightning refers to long, horizontally travelling flashes often seen on the underside of stratiform clouds.

Lightning Mapping Arrays provide three-dimensional mapping of lightning channel segments over the array. Up to thousands of points can be mapped for an individual lightning flash to reveal its location and the development of its structure. Large thunderstorms are capable of producing other kinds of electrical phenomena called transient luminous events (TLEs) that occur high in the atmosphere. They are rarely observed visually and not well understood. The most common TLEs include red sprites, blue jets, and elves.

Red Sprites can appear directly above an active thunderstorm as a large but weak flash. They usually happen at the same time as powerful positive CG lightning strokes. They can extend up to 60 miles from the cloud top. Sprites are mostly red and usually last no more than a few seconds, and their shapes are described as resembling jellyfish, carrots, or columns. Because sprites are not very bright, they can only be seen at night. They are rarely seen with the human eye, so they are most often imaged with highly sensitive cameras. Blue jets emerge from the top of the thundercloud, but are not directly associated with cloud-to-ground lightning.

They extend up in narrow cones fanning out and disappearing at heights of 25-35 miles. Blue jets last a fraction of a second and have been witnessed by pilots. Elves are rapidly expanding disk-shaped regions of glowing that can be up to 300 miles across. They last less than a thousandth of a second, and occur above areas of active cloud to ground lightning. Scientists believe elves result when an energetic electromagnetic pulse extends up into the ionosphere. Elves were discovered in 1992 by a low-light video camera on the Space Shuttle.

4 Preparedness

Most thunderstorms come and go fairly uneventfully; however, any thunderstorm can become severe, and all thunderstorms, by definition, present the danger of lightning. Thunderstorm preparedness and safety refers to taking steps before, during, and after a thunderstorm to minimize injury and damage. Preparedness refers to precautions that should be taken before a thunderstorm. Some preparedness takes the form of general readiness (as a thunderstorm can occur at any time of the day or year). Preparing a family emergency plan, for example, can save valuable time if a storm arises quickly and unexpectedly. Preparing the home by removing dead or rotting limbs and trees, which can be blown over in high winds, can also significantly reduce the risk of property damage and personal injury.

The National Weather Service (NWS) in the United States recommends several precautions that people should take if thunderstorms are likely to occur:

- Know the names of local counties, cities, and towns, as these are how warnings are described.
- Monitor forecasts and weather conditions and know whether thunderstorms are likely in the area.
- Be alert for natural signs of an approaching storm.
- Cancel or reschedule outdoor events (to avoid being caught outdoors when a storm hits).
- Take action early so you have time to get to a safe place.
- Get inside a substantial building or hard-topped metal vehicle before threatening weather arrives.
- If you hear thunder, get to the safe place immediately.
- Avoid open areas like hilltops, fields, and beaches, and don't be or be near the tallest objects in an area when thunderstorms are occurring.
- Don't shelter under tall or isolated trees during thunderstorms.
- If in the woods, put as much distance as possible between you and any trees during thunderstorms.
- If in a group, spread out to increase the chances of survivors who could come to the aid of any victims from a lightning strike.

Safety

While safety and preparedness often overlap, “thunderstorm safety” generally refers to what people should do during and after a storm. The American Red Cross recommends that people follow these precautions if a storm is imminent or in progress:
- Take action immediately upon hearing thunder. Anyone close enough to the storm to hear thunder can be struck by lightning.
- Avoid electrical appliances, including corded telephones. Cordless and wireless telephones are safe to use during a thunderstorm.
- Close and stay away from windows and doors, as glass can become a serious hazard in high wind.
- Do not bathe or shower, as plumbing conducts electricity.
- If driving, safely exit the roadway, turn on hazard lights, and park. Remain in the vehicle and avoid touching metal.

The NWS stopped recommending the "lightning crouch" in 2008 as it doesn't provide a significant level of protection and will not significantly lower the risk of being killed or injured from a nearby lightning strike.

5 Hailstorm

Hail is a form of solid precipitation. It is distinct from ice pellets (American sleet), though the two are often confused. It consists of balls or irregular lumps of ice, each of which is called a hailstone. Ice pellets fall generally in cold weather while hail growth is greatly inhibited during cold surface temperatures. Unlike other forms of water ice such as graupel, which is made of rime, and ice pellets, which are smaller and translucent, hailstones usually measure between 5 mm (0.2 in) and 15 cm (6 in) in diameter.

The METAR reporting code for hail 5 mm (0.20 in) or greater is GR, while smaller hailstones and graupel are coded GS. Hail is possible within most thunderstorms as it is produced by cumulonimbus, and within 2 nmi (3.7 km) of the parent storm. Hail formation requires environments of strong, upward motion of air with the parent thunderstorm (similar to tornadoes) and lowered heights of the freezing level. In the mid-latitudes, hail forms near the interiors of continents, while in the tropics, it tends to be confined to high elevations. There are methods available to detect hail-producing thunderstorms using weather satellites and weather radar imagery.

Hailstones generally fall at higher speeds as they grow in size, though complicating factors such as melting, friction with air, wind, and interaction with rain and other hailstones can slow their descent through Earth's atmosphere. Severe weather warnings are issued for hail when the stones reach a damaging size, as it can cause serious damage to human-made structures and, most commonly, farmers' crops.

Any thunderstorm which produces hail that reaches the ground is known as a hailstorm. Hail has a diameter of 5 millimetres (0.20 in) or more. Hailstones can grow to 15 centimetres (6 in) and weigh more than 0.5 kilograms (1.1 lb). Unlike ice pellets, hailstones are layered and can be irregular and clumped together. Hail is composed of transparent ice or alternating layers of transparent and translucent ice at least 1 millimetre (0.039 in) thick, which are deposited upon the hailstone as it travels through the cloud, suspended aloft by air with strong upward motion until its weight overcomes the updraft and falls to the ground.

Although the diameter of hail is varied, in the United States, the average observation of damaging hail is between 2.5 cm (1 in) and golf ball-sized (1.75 in). Stones larger than 2 cm (0.80 in) are usually considered large enough to cause damage. The Meteorological Service of Canada issues severe thunderstorm warnings when hail that size or above is expected.

The US National Weather Service has a 2.5 cm (1 in) or greater in diameter threshold, effective January 2010, an increase over the previous threshold of ¾-inch hail. Other countries have different thresholds according to local sensitivity to hail; for instance grape growing areas could be adversely impacted by smaller hailstones. Hailstones can be very large or very small, depending on how strong the updraft is: weaker hailstorms produce smaller hailstones than stronger hailstorms (such as supercells).

Formation
Hail forms in strong thunderstorm clouds, particularly those with intense updrafts, high liquid water content, great vertical extent, large water droplets, and where a good portion of the cloud layer is below freezing 0 °C (32 °F). These types of strong updrafts can also indicate the presence of a tornado. The growth rate of hailstones is impacted by factors such as higher elevation, lower freezing zones, and wind shear.

Size
The size of hailstones is best determined by measuring their diameter with a ruler. In the absence of a ruler, hailstone size is often visually estimated by comparing its size to that of known objects, such as coins. Using the objects such as hen's eggs, peas, and marbles for comparing hailstone sizes is imprecise, due to their varied dimensions. The UK organisation, TORRO, also scales for both hailstones and hailstorms. Terminal velocity of hail, or the speed at which hail is falling when it strikes the ground, varies. It is estimated that a hailstone of 1 centimetre (0.39 in) in diameter falls at a rate of 9 metres per second (20 mph), while stones the size of 8 centimetres (3.1 in) in diameter fall at a rate of 48 metres per second (110 mph). Hailstone velocity is dependent on the size of the stone, friction with air it is falling through, the motion of wind it is falling through, collisions with raindrops or other hailstones, and melting as the stones fall through a warmer atmosphere. As hail stones are not perfect spheres it is difficult to calculate their speed accurately.

Records

Megacryometeors, large rocks of ice that are not associated with thunderstorms, are not officially recognized by the World Meteorological Organization as "hail," which are aggregations of ice associated with thunderstorms, and therefore records of extreme characteristics of megacryometeors are not given as hail records.	**Heaviest Hail** 1.02 kg (2.25 lb); Gopalganj District, Bangladesh, 14 April 1986.	**Largest Diameter Officially Measured** 7.9 inches (20 cm) diameter, 18.622 inches (47.3 cm) circumference; Vivian, South Dakota, 23 July 2010.	**Largest Circumference Officially Measured** 18.74 inches (47.6 cm) circumference, 7.0 inches (17.8 cm) diameter; Aurora, Nebraska, 22 June 2003.	**Greatest Average Hail Precipitation** Kericho, Kenya experiences hailstorms, on average, 50 days annually. Kericho is close to the equator and the elevation of 7,200 feet contributes to it being a hot spot for hail. Kericho reached the world record for 132 days of hail in one year.

Hazards

NATURAL DISASTERS Thunderstorm Hailstorm Hazards

Hail can cause serious damage, notably to automobiles, aircraft, skylights, glass-roofed structures, livestock, and most commonly, crops. Hail damage to roofs often goes unnoticed until further structural damage is seen, such as leaks or cracks. It is hardest to recognize hail damage on shingled roofs and flat roofs, but all roofs have their own hail damage detection problems. Metal roofs are fairly resistant to hail damage, but may accumulate cosmetic damage in the form of dents and damaged coatings. Hail is one of the most significant thunderstorm hazards to aircraft. When hailstones exceed 0.5 inches (13 mm) in diameter, planes can be seriously damaged within seconds.

The hailstones accumulating on the ground can also be hazardous to landing aircraft. Hail is also a common nuisance to drivers of automobiles, severely denting the vehicle and cracking or even shattering windshields and windows. Wheat, corn, soybeans, and tobacco are the most sensitive crops to hail damage. Hail is one of Canada's most expensive hazards. Rarely, massive hailstones have been known to cause concussions or fatal head trauma. Hailstorms have been the cause of costly and deadly events throughout history. One of the earliest known incidents occurred around the 9th century in Roopkund, Uttarakhand, India, where 200 to 600 nomads seem to have died of injuries from hail the size of cricket balls.

Accumulations

NATURAL DISASTERS Thunderstorm Hailstorm Accumulations

Narrow zones where hail accumulates on the ground in association with thunderstorm activity are known as hail streaks or hail swaths, which can be detectable by satellite after the storms pass by. Hailstorms normally last from a few minutes up to 15 minutes in duration. Accumulating hail storms can blanket the ground with over 2 inches (5.1 cm) of hail, cause thousands to lose power, and bring down many trees. Flash flooding and mudslides within areas of steep terrain can be a concern with accumulating hail. Depths of up to 18 in (0.46 m) have been reported. A landscape covered in accumulated hail generally resembles one covered in accumulated snow and any significant accumulation of hail has the same restrictive effects as snow accumulation, albeit over a smaller area, on transport and infrastructure.

Accumulated hail can also cause flooding by blocking drains, and hail can be carried in the floodwater, turning into a snow-like slush which is deposited at lower elevations. On somewhat rare occasions, a thunderstorm can become stationary or nearly so while prolifically producing hail and significant depths of accumulation do occur; this tends to happen in mountainous areas, such as the July 29, 2010 case of a foot of hail accumulation in Boulder County, Colorado.

On June 5, 2015, hail up to four feet deep fell on one city block in Denver, Colorado. The hailstones, described as between the size of bumble bees and ping pong balls, were accompanied by rain and high winds. The hail fell in only the one area, leaving the surrounding area untouched. It fell for one and a half hours between 10 p.m. and 11:30 pm. A meteorologist for the National Weather Service in Boulder said, "It's a very interesting phenomenon. We saw the storm stall. It produced copious amounts of hail in one small area. It's a meteorological thing."

Tractors used to clear the area filled more than 30 dump-truck loads of hail. Research focused on four individual days that accumulated more than 5.9 inches (15 cm) of hail in 30 minutes on the Colorado front range has shown that these events share similar patterns in observed synoptic weather, radar, and lightning characteristics, suggesting the possibility of predicting these events prior to their occurrence. A fundamental problem in continuing research in this area is that, unlike hail diameter, hail depth is not commonly reported. The lack of data leaves researchers and forecasters in the dark when trying to verify operational methods. A cooperative effort between the University of Colorado and the National Weather Service is in progress. The joint project's goal is to enlist the help of the general public to develop a database of hail accumulation depths.

6 Derecho

NATURAL DISASTERS Thunderstorm Derecho

A derecho is a widespread, long-lived, straight-line wind storm that is associated with a fast-moving group of severe thunderstorms known as a mesoscale convective system and potentially rivaling hurricanic and tornadic forces.

Derechos can cause hurricane-force winds, tornadoes, heavy rains, and flash floods. In many cases, convection-induced winds take on a bow echo (backward "C") form of squall line, often forming beneath an area of diverging upper tropospheric winds, and in a region of both rich low-level moisture and warm-air advection. Derechos move rapidly in the direction of movement of their associated storms, similar to an outflow boundary (gust front), except that the wind remains sustained for a greater period of time (often increasing in strength after onset), and may exceed hurricane-force. A derecho-producing convective system may remain active for many hours and, occasionally, over multiple days.

A warm-weather phenomenon, derechos occur mostly in summer, especially during June, July, and August in the Northern Hemisphere, within areas of moderately strong instability and moderately strong vertical wind shear. However, derechos may occur at any time of the year, and can occur as frequently at night as during the day.

Various studies since the 1980s have shed light on the physical processes responsible for the production of widespread damaging winds by thunderstorms. In addition, it has become apparent that the most damaging derechos are associated with particular types of mesoscale convective systems that are self-perpetuating (meaning that the convective systems are not strongly dependent on the larger-scale meteorological processes such as those associated with blizzard-producing winter storms and strong cold fronts). In addition, the term "derecho" sometimes is misapplied to convectively generated wind events that are not particularly well-organized or long-lasting. For these reasons, a more precise, physically based definition of "derecho" has been introduced within the meteorological community.

Development

NATURAL DISASTERS Thunderstorm Derecho Development

Organized areas of thunderstorm activity reinforce pre-existing frontal zones, and can outrun cold fronts. The resultant mesoscale convective system (MCS) often forms at the point of the strongest divergence of the upper-level flow in the area of greatest low-level inflow and convergence. The convection tends to move east or toward the equator, roughly parallel to low-level thickness lines and usually somewhat to the right of the mean tropospheric flow. When the convection is strongly linear or slightly curved, the MCS is called a squall line, with the strongest winds typically occurring just behind the leading edge of the significant wind shift and pressure rise.

Classic derechos occur with squall lines that contain bow- or spearhead-shaped features as seen by weather radar that are known as bow echoes or spearhead echoes. Squall lines typically "bow out" due to the formation of a mesoscale high pressure system which forms within the stratiform rain area behind the initial convective line. This high pressure area is formed due to strong descending air currents behind the squall line, and could come in the form of a downburst. The size of the bow may vary, and the storms associated with the bow may die and redevelop.

During the cool season within the Northern Hemisphere, derechos generally develop within a pattern of mid-tropospheric southwesterly winds, in an environment of low to moderate atmospheric instability (caused by relative warmth and moisture near ground level, with cooler air aloft, as measured by convective available potential energy), and high values of vertical wind shear (20 m/s [72 km/h; 39 kn; 45 mph]) within the lowest 5 km [16,000 feet] of the atmosphere).

Warm season derechos in the Northern Hemisphere most often form in west to northwesterly flow at mid-levels of the troposphere, with moderate to high levels of thermodynamic instability. As previously mentioned, derechos favor environments of low-level warm advection and significant low-level moisture.

7 Microburst

A microburst is an intense small-scale downdraft produced by a thunderstorm or rain shower. There are two types of microbursts: wet microbursts and dry microbursts. They go through three stages in their cycle, the downburst, outburst, and cushion stages. A microburst can be particularly dangerous to aircraft, especially during landing, due to the wind shear caused by its gust front. Several fatal and historic crashes have been attributed to the phenomenon over the past several decades, and flight crew training goes to great lengths on how to properly recover from a microburst/wind shear event. When rain falls below the cloud base or is mixed with dry air, it begins to evaporate and this evaporation process cools the air. The cool air descends and accelerates as it approaches the ground. When the cool air approaches the ground, it spreads out in all directions.

High winds spread out in this type of pattern showing little or no curvature are known as straight-line winds. Dry microbursts produced by high based thunderstorms that generate little to no surface rainfall, occur in environments characterized by a thermodynamic profile exhibiting an inverted-V at thermal and moisture profile. Wet microbursts are downbursts accompanied by significant precipitation at the surface. These downbursts rely more on the drag of precipitation for downward acceleration of parcels as well as the negative buoyancy which tend to drive "dry" microbursts. As a result, higher mixing ratios are necessary for these downbursts to form (hence the name "wet" microbursts).

13 Polar Vortex

A polar vortex is an upper-level low-pressure area lying near one of the Earth's poles. There are two polar vortices in the Earth's atmosphere, overlying the North and South Poles. Each polar vortex is a persistent, large-scale, low-pressure zone that rotates counter-clockwise at the North Pole (called a cyclone) and clockwise at the South Pole, i.e., both polar vortices rotate eastward around the poles. The bases of the two polar vortices are located in the middle and upper troposphere and extend into the stratosphere. Beneath that lies a large mass of cold, dense Arctic air.

The interface between the cold dry air mass of the pole and the warm moist air mass farther south defines the location of the polar front. The polar front is centered, roughly at 60° latitude. A polar vortex strengthens in the winter and weakens in the summer due to its dependence on the temperature difference between the equator and the poles. The vortices span less than 1,000 kilometers (620 miles) in diameter, within which they rotate counter-clockwise in the Northern Hemisphere and in a clockwise fashion in the Southern Hemisphere. As with other cyclones, their rotation is driven by the Coriolis effect.

The vortices weaken and strengthen from year to year. When the vortex of the Arctic is strong, it is well defined, there is a single vortex, and the Arctic air is well contained; when weaker, which it generally is, it will break into two or more vortices; when very weak, the flow of Arctic air becomes more disorganized, and masses of cold Arctic air can push equatorward, bringing with them a rapid and sharp temperature drop. When the polar vortex is strong, there is a single vortex with a jet stream that is "well constrained" near the polar front. When the northern vortex weakens, it separates into two or more vortices, the strongest of which are near Baffin Island, Canada, and the other over northeast Siberia.

The Antarctic vortex of the Southern Hemisphere is a single low-pressure zone that is found near the edge of the Ross ice shelf, near 160 west longitude. When the polar vortex is strong, the mid-latitude Westerlies (winds at the surface level between 30° and 60° latitude from the west) increase in strength and are persistent. When the polar vortex is weak, high-pressure zones of the mid-latitudes may push poleward, moving the polar vortex, jet stream, and polar front equatorward. The jet stream is seen to "buckle" and deviate south. This rapidly brings cold dry air into contact with the warm, moist air of the mid-latitudes, resulting in a rapid and dramatic change of weather known as a "cold snap". Ozone depletion occurs within the polar vortices – particularly over the Southern Hemisphere – reaching a maximum depletion in the spring.

Identification

Polar cyclones are low-pressure zones embedded within the polar air masses, and exist year-round. The stratospheric polar vortex develops at latitudes above the subtropical jet stream. Horizontally, most polar vortices have a radius of less than 1,000 kilometres (620 mi). Since polar vortices exist from the stratosphere downward into the mid-troposphere, a variety of heights/pressure levels are used to mark its position. The 50 mb pressure surface is most often used to identify its stratospheric location. At the level of the tropopause, the extent of closed contours of potential temperature can be used to determine its strength. Others have used levels down to the 500 hPa pressure level (about 5,460 metres (17,910 ft) above sea level during the winter) to identify the polar vortex.

Duration & Power

Polar vortices are weakest during summer and strongest during winter. Extratropical cyclones that migrate into higher latitudes when the polar vortex is weak can disrupt the single vortex creating smaller vortices (cold-core lows) within the polar air mass. Those individual vortices can persist for more than a month. Volcanic eruptions in the tropics can lead to a stronger polar vortex during winter for as long as two years afterwards. The strength and position of the polar vortex shapes the flow pattern in a broad area about it. An index which is used in the northern hemisphere to gauge its magnitude is the Arctic oscillation. When the Arctic vortex is at its strongest, there is a single vortex, but normally, the Arctic vortex is elongated in shape, with two cyclone centers, one over Baffin Island in Canada and the other over northeast Siberia.

When the Arctic pattern is at its weakest, subtropic air masses can intrude poleward causing the Arctic air masses to move equatorward, as during the Winter 1985 Arctic outbreak. The Antarctic polar vortex is more pronounced and persistent than the Arctic one. In the Arctic the distribution of land masses at high latitudes in the Northern Hemisphere gives rise to Rossby waves which contribute to the breakdown of the polar vortex, whereas in the Southern Hemisphere the vortex is less disturbed. The breakdown of the polar vortex is an extreme event known as a sudden stratospheric warming, here the vortex completely breaks down and an associated warming of 30–50 °C (54–90 °F) over a few days can occur.

The waxing and waning of the polar vortex is driven by the movement of mass and the transfer of heat in the polar region. In the autumn, the circumpolar winds increase in speed and the polar vortex rises into the stratosphere. The result is that the polar air forms a coherent rotating air mass: the polar vortex. As winter approaches, the vortex core cools, the winds decrease, and the vortex energy declines. Once late winter and early spring approach the vortex is at its weakest. As a result, during late winter, large fragments of the vortex air can be diverted into lower latitudes by stronger weather systems intruding from those latitudes.

In the lowest level of the stratosphere, strong potential vorticity gradients remain, and the majority of that air remains confined within the polar air mass into December in the Southern Hemisphere and April in the Northern Hemisphere, well after the breakup of the vortex in the mid-stratosphere. The breakup of the northern polar vortex occurs between mid March to mid May. This event signifies the transition from winter to spring, and has impacts on the hydrological cycle, growing seasons of vegetation, and overall ecosystem productivity. The timing of the transition also influences changes in sea ice, ozone, air temperature, and cloudiness. Early and late polar breakup episodes have occurred, due to variations in the stratospheric flow structure and upward spreading of planetary waves from the troposphere.

As a result of increased waves into the vortex, the vortex experiences more rapid warming than normal, resulting in an earlier breakup and spring. When the breakup comes early, it is characterized by with persistent of remnants of the vortex. When the breakup is late, the remnants dissipate rapidly. When the breakup is early, there is one warming period from late February to middle March. When the breakup is late, there are two warming periods, one January, and one in March. Zonal mean temperature, wind, and geopotential height exert varying deviations from their normal values before and after early breakups, while the deviations remain constant before and after late breakups.

Scientists are connecting a delay in the Arctic vortex breakup with a reduction of planetary wave activities, few stratospheric sudden warming events, and depletion of ozone. Sudden stratospheric warming events are associated with weaker polar vortices. This warming of stratospheric air can reverse the circulation in the Arctic Polar Vortex from counter-clockwise to clockwise. These changes aloft force changes in the troposphere below. An example of an effect on the troposphere is the change in speed of the Atlantic Ocean circulation pattern.

A soft spot just south of Greenland is where the initial step of downwelling occurs, nicknamed the "Achilles Heel of the North Atlantic". Small amounts of heating or cooling traveling from the polar vortex can trigger or delay downwelling, altering the Gulf Stream Current of the Atlantic, and the speed of other ocean currents. Since all other oceans depend on the Atlantic Ocean's movement of heat energy, climates across the planet can be dramatically affected. The weakening or strengthening of the polar vortex can alter the sea circulation more than a mile beneath the waves. Strengthening storm systems within the troposphere that cool the poles, intensify the polar vortex. La Niña–related climate anomalies significantly strengthen the polar vortex.

Intensification of the polar vortex produces changes in relative humidity as downward intrusions of dry, stratospheric air enter the vortex core. With a strengthening of the vortex comes a longwave cooling due to a decrease in water vapor concentration near the vortex. The decreased water content is a result of a lower tropopause within the vortex, which places dry stratospheric air above moist tropospheric air. Instability is caused when the vortex tube, the line of concentrated vorticity, is displaced.

When this occurs, the vortex rings become more unstable and prone to shifting by planetary waves.The planetary wave activity in both hemispheres varies year-to-year, producing a corresponding response in the strength and temperature of the polar vortex. The number of waves around the perimeter of the vortex are related to the core size; as the vortex core decreases, the number of waves increase. The degree of the mixing of polar and mid-latitude air depends on the evolution and position of the polar night jet. In general, the mixing is less inside the vortex than outside. Mixing occurs with unstable planetary waves that are characteristic of the middle and upper stratosphere in winter.

Prior to vortex breakdown, there is little transport of air out of the Arctic Polar Vortex due to strong barriers above 420 km (261 miles). The polar night jet which exists below this, is weak in the early winter. As a result, it does not deviate any descending polar air, which then mixes with air in the mid-latitudes. In the late winter, air parcels do not descend as much, reducing mixing. After the vortex is broken up, the ex-vortex air is dispersed into the middle latitudes within a month. Sometimes, a mass of the polar vortex breaks off before the end of the final warming period. If large enough, the piece can move into Canada and the Midwestern, Central, Southern, and Northeastern United States.

This diversion of the polar vortex can occur due to the displacement of the polar jet stream; for example, the significant northwestward direction of the polar jet stream in the western part of the United States during the winters of 2013–2014, and 2014–2015. This caused warm, dry conditions in the west, and cold, snowy conditions in the north-central and northeast. Occasionally, the high-pressure air mass, called the Greenland Block, can cause the polar vortex to divert to the south, rather than follow its normal path over the North Atlantic.

14 Heatwave

A heat wave is a period of excessively hot weather, which may be accompanied by high humidity, especially in oceanic climate countries. While definitions vary, a heat wave is measured relative to the usual weather in the area and relative to normal temperatures for the season. Temperatures that people from a hotter climate consider normal can be termed a heat wave in a cooler area if they are outside the normal climate pattern for that area. The term is applied both to hot weather variations and to extraordinary spells of hot which may occur only once a century.

Severe heat waves have caused catastrophic crop failures, thousands of deaths from hyperthermia, and widespread power outages due to increased use of air conditioning. A heat wave is considered extreme weather, and a danger because heat and sunlight may overheat the human body. Heat waves can usually be detected using forecasting instruments so that a warning call can be issued.

A definition based on Frich et al.'s Heat Wave Duration Index is that a heat wave occurs when the daily maximum temperature of more than five consecutive days exceeds the average maximum temperature by 5 °C (9 °F), the normal period being 1961–1990. To be a heat wave such a period should last at least one day, but conventionally it lasts from several days to several weeks. In 1900, A. T. Burrows more rigidly defined a “hot wave” as a spell of three or more days on each of which the maximum shade temperature reaches or exceeds 90 °F (32.2 °C). More realistically, the comfort criteria for any one region are dependent upon the normal conditions of that area.

The World Meteorological Organization, defines a heat wave as 5 or more consecutive days of prolonged heat in which the daily maximum temperature is higher than the average maximum temperature by 9 °F or more. However, some nations have come up with their own criteria to define a heat wave. In the United States, definitions also vary by region; however, a heat wave is usually defined as a period of at least two or more days of excessively hot weather.

In the Northeast, a heat wave is typically defined as three consecutive days where the temperature reaches or exceeds 90 °F (32.2 °C), but not always as this ties in with humidity levels to determine a heat index threshold. The same does not apply to drier climates. A heat storm is a Californian term for an extended heat wave. Heat storms occur when the temperature reaches 100 °F (37.8 °C) for three or more consecutive days over a wide area (tens of thousands of square miles). The National Weather Service issues heat advisories and excessive heat warnings when unusual periods of hot weather are expected.

In Adelaide, South Australia, a heat wave is defined as five consecutive days at or above 35 °C (95 °F), or three consecutive days at or over 40 °C (104 °F). The Australian Bureau of Meteorology defines a heat wave as "three days or more of maximum and minimum temperatures that are unusual for the location". Until the introduction of this new Pilot Heatwave Forecast there was no national definition that described heatwave or measures of heatwave severity.

Formation
Heat waves form when high pressure aloft (from 10,000–25,000 feet (3,000–7,600 metres)) strengthens and remains over a region for several days up to several weeks. This is common in summer (in both Northern and Southern Hemispheres) as the jet stream 'follows the sun'. On the equator side of the jet stream, in the upper layers of the atmosphere, is the high pressure area. Summertime weather patterns are generally slower to change than in winter. As a result, this upper level high pressure also moves slowly. Under high pressure, the air subsides (sinks) toward the surface, warming and drying adiabatically.

This warmer sinking air creates a high level inversion that acts as a dome capping the atmosphere, inhibiting convection, thereby trapping high humidity warm air below it. Typically, convection is present along the periphery of the cap where the pressure becomes less. This peripheral convection, however, can add to the high pressure dome by ventilating the upper level outflow of the thunderstorms into it. The end result is a continual build-up of heat at the surface that people experience as a heat wave.

In the Eastern United States a heat wave can occur when a high pressure system originating in the Gulf of Mexico becomes stationary just off the Atlantic Seaboard (typically known as a Bermuda High). Hot humid air masses form over the Gulf of Mexico and the Caribbean Sea while hot dry air masses form over the desert Southwest and northern Mexico. The SW winds on the back side of the High continue to pump hot, humid Gulf air northeastward resulting in a spell of hot and humid weather for much of the Eastern States.

Health Effects
The heat index (below) is a measure of how hot it feels when relative humidity is factored with the actual air temperature. Hyperthermia, also known as heat stroke, becomes commonplace during periods of sustained high temperature and humidity. Older adults, very young children, and those who are sick or overweight are at a higher risk for heat-related illness. The chronically ill and elderly are often taking prescription medications (e.g., diuretics, anticholinergics, antipsychotics, and antihypertensives) that interfere with the body's ability to dissipate heat.

Heat Index Table

Temp ► / Relative Humidity ▼	86°F (30°C)	88°F (31°C)	90°F (32°C)	92°F (33°C)	94°F (34°C)	96°F (36°C)	98°F (37°C)	100°F (38°C)	102°F (39°C)	104°F (40°C)	106°F (41°C)

Mortality

Heat waves are the most lethal type of weather phenomenon in the United States. Between 1992 and 2001, deaths from excessive heat in the United States numbered 2,190, compared with 880 deaths from floods and 150 from hurricanes. The average annual number of fatalities directly attributed to heat in the United States is about 400. The 1995 Chicago heat wave, one of the worst in US history, led to approximately 739 heat-related deaths over a period of five days. Eric Klinenberg has noted that in the United States, the loss of human life in hot spells in summer exceeds that caused by all other weather events combined, including lightning, rain, floods, hurricanes, and tornadoes. Despite the dangers, Scott Sheridan, professor of geography at Kent State University, found that less than half of people 65 and older abide by heat-emergency recommendations like drinking lots of water.

In his study of heat-wave behavior, focusing particularly on seniors in Philadelphia, Phoenix, Toronto, and Dayton, Ohio, he found that people over 65 "don't consider themselves seniors." One of his older respondents said: "Heat doesn't bother me much, but I worry about my neighbors." According to the Agency for Health care Research and Quality, about 6,200 Americans are hospitalized each summer due to excessive heat, and those at highest risk are poor, uninsured or elderly. More than 70,000 Europeans died as a result of the 2003 European heat wave.

Psychological and Sociological Effects

In addition to physical stress, excessive heat causes psychological stress, to a degree which affects performance, and is also associated with an increase in violent crime. High temperatures are associated with increased conflict both at the interpersonal level and at the societal level. In every society, crime rates go up when temperatures go up, particularly violent crimes such as assault, murder, and rape. Furthermore, in politically unstable countries, high temperatures are an aggravating factor that lead toward civil wars. Additionally, high temperatures have a significant effect on income. A study of counties in the United States found that economic productivity of individual days declines by about 1.7% for each degree Celsius above 15°C (59°F).

Power Outages

Abnormally hot temperatures can cause electricity demand to increase during the peak summertime hours of 4 to 7 p.m. when air conditioners are straining to overcome the heat. If a hot spell extends to three days or more, however, nighttime temperatures do not cool down, and the thermal mass in homes and buildings retains the heat from previous days. This heat build-up causes air conditioners to turn on earlier and to stay on later in the day. As a result, available electricity supplies are challenged during a higher, wider, peak electricity consumption period. Heat waves often lead to electricity spikes due to increased air conditioning use, which can create power outages, exacerbating the problem. During the 2006 North American heat wave, thousands of homes and businesses went without power, especially in California. In Los Angeles, electrical transformers failed, leaving thousands without power for as long as five days. The 2009 South Eastern Australia Heat Wave caused the city of Melbourne, Australia to experience some major power disruptions which left over half a million people without power as the heat wave blew transformers and overloaded a power grid.

Wildfires

If a heat wave occurs during a drought, which dries out vegetation, it can contribute to bushfires and wildfires. During the disastrous heat wave that struck Europe in 2003, fires raged through Portugal, destroying over 3,010 square kilometres (1,160 sq mi) or 301,000 hectares (740,000 acres) of forest and 440 square kilometres (170 sq mi) or 44,000 hectares (110,000 acres) of agricultural land and causing an estimated €1 billion worth of damage. High end farmlands have irrigation systems to back up crops with.

Physical Damage

Heat waves can and do cause roads and highways to buckle and melt, water lines to burst, and power transformers to detonate, causing fires. See the 2006 North American heat wave article about heat waves causing physical damage. Heat waves can also damage rail roads, such as buckling and kinking rails, which can lead to slower traffic, delays, and even cancellations of service when rails are too dangerous to traverse by trains. Sun kinking is caused when certain types of rail design like short section rails welded together or fish plate rails expand and push on other sections of rail causing them to warp and kink. Sun kinking can be a serious problem in hotter climates like Southern USA, parts of Canada, the Middle East, etc. In the 2013 heatwave in England, gritters (normally only seen in snow) were sent out to grit melting tarmac roads.

15 Cold Wave

A cold wave (known in some regions as a cold snap or cold spell) is a weather phenomenon that is distinguished by a cooling of the air. Specifically, as used by the U.S. National Weather Service, a cold wave is a rapid fall in temperature within a 24-hour period requiring substantially increased protection to agriculture, industry, commerce, and social activities. The precise criterion for a cold wave is determined by the rate at which the temperature falls, and the minimum to which it falls. This minimum temperature is dependent on the geographical region and time of year. In the United States, a cold spell is defined as the national average high temperature dropping below 20 °F (−7 °C). A cold wave of sufficient magnitude and duration may be classified as a cold air outbreak (CAO).

Effects

A cold wave can cause death and injury to livestock and wildlife. Exposure to cold mandates greater caloric intake for all animals, including humans, and if a cold wave is accompanied by heavy and persistent snow, grazing animals may be unable to reach needed food and die of hypothermia or starvation. They often necessitate the purchase of foodstuffs to feed livestock at considerable cost to farmers. Cold spells are associated with increased mortality rates in populations around the world. Both cold waves and heat waves cause deaths, though different groups of people may be susceptible to different weather events.

In developed countries, more deaths occur during a heat wave than in a cold snap, though the mortality rate is higher in undeveloped regions of the world. Globally, more people die during cold weather than hot weather, due to the rise in diseases like cold, flu, and pneumonia. Extreme winter cold often causes poorly insulated water pipelines and mains to freeze. Even some poorly protected indoor plumbing ruptures as water expands within them, causing much damage to property and costly insurance claims.

Demand for electrical power and fuels rises dramatically during such times, even though the generation of electrical power may fail due to the freezing of water necessary for the generation of hydroelectricity. Some metals may become brittle at low temperatures. Motor vehicles may fail when antifreeze fails or motor oil gels, producing a failure of the transportation system. To be sure, such is more likely in places like Siberia and much of Canada that customarily get very cold weather.

Fires become even more of a hazard during extreme cold. Water mains may break and water supplies may become unreliable, making firefighting more difficult. The air during a cold wave is typically denser and thus contains more oxygen, so when air that a fire draws in becomes unusually cold it is likely to cause a more intense fire. Winter cold waves that aren't considered cold in some areas, but cause temperatures significantly below average for an area, are also destructive.

Areas with subtropical climates may recognize unusual cold, perhaps barely freezing, temperatures, as a cold wave. In such places, plant and animal life is less tolerant of such cold as may appear rarely. The same winter temperatures that one associates with the norm for Colorado, Ohio, or Bavaria are catastrophic to winter crops in places like Florida, California, or parts of South America that grow fruit and vegetables in winter.

Cold waves that bring unexpected freezes and frosts during the growing season in mid-latitude zones can kill plants during the early and most vulnerable stages of growth, resulting in crop failure as plants are killed before they can be harvested economically. Such cold waves have caused famines. At times as deadly to plants as drought, cold waves can leave a land in danger of later brush and forest fires that consume dead biomass. One extreme was the so-called Year Without a Summer of 1816, one of several years during the 1810s in which numerous crops failed during freakish summer cold snaps after volcanic eruptions that reduced incoming sunlight.

Countermeasures

In some places, such as Siberia, extreme cold requires that fuel-powered machinery to be used even part-time must be run continuously. Internal plumbing can be wrapped, and persons can often run water continuously through pipes. Energy conservation, difficult as it is in a cold wave, may require such measures as collecting people (especially the poor and elderly) in communal shelters. Even the homeless may be arrested and taken to shelters, only to be released when the hazard abates. Hospitals can prepare for the admission of victims of frostbite and hypothermia; schools and other public buildings can be converted into shelters.

People can stock up on food, water, and other necessities before a cold wave. Some may even choose to migrate to places of milder climates, at least during the winter. Suitable stocks of forage can be secured before cold waves for livestock, and livestock in vulnerable areas might be shipped from affected areas or even slaughtered. Smudge pots can bring smoke that prevents hard freezes on a farm or grove. Vulnerable crops may be sprayed with water that will paradoxically protect the plants by freezing and absorbing the cold from surrounding air.

Most people can dress appropriately and can even layer their clothing should they need to go outside or should their heating fail. They can also stock candles, matches, flashlights, and portable fuel for cooking and wood for fireplaces or wood stoves, as necessary. However caution should be taken as the use of charcoal fires for cooking or heating within an enclosed dwelling is extremely dangerous due to carbon monoxide poisoning. Adults must remain aware of the exposure that children and the elderly have to cold.

History

2019	In late January, an extreme cold wave hit the midwest of the United States, bringing temperatures below −30 °C (−22 °F), with all-time record lows set in several cities.
2018	Late February and early–mid March 2018, Europe. Easterly winds created bitter conditions twice during early spring 2018. Snow fell during both events. Storm Emma, which affected southern areas of Great Britain, brought up to 50 centimetres (20 in) of snow. Overall, 93 people across Europe died; 27 deaths occurred in Poland and 17 in the UK.
2017–2018	Cold wave starting late December 2017 (December 24 respectively), North America. A persistent wave of temperature extremes, including a cold wave, took place in Canada and the northeastern and central areas of the United States from Northern Canada to Mississippi, with temperatures in much of Canada of around −29 °C (−20 °F) and as low as −39 °C (−38 °F) in New York state, and as high as 21 °C (70 °F) and 31 °C (88 °F) in Sandberg and Los Angeles, respectively, in California.
2017	January 2017 European cold wave – A cold wave hit Central and East Europe on January 5. The lowest temperature was −45.4 °C (−49.7 °F) degrees. The cold caused at least 60 deaths. There was also massive snowfall.
2016	January 2016 East Asia cold wave – Caused over 100 known deaths across East Asia, South Asia and Southeast Asia.
2014-2015	February 2015 North American cold wave – During the second half of February 2015, temperature records were broken in both sides of the spectrum. Extreme warm records were broken in the western half of the United States and extreme cold records were broken in the eastern half. In addition to the extreme cold wave at its most brutal in the Great Lakes, Mid-Atlantic, and New England, snowfall was reported as far south as Tupelo, Mississippi; Huntsville, Alabama; and Shreveport, Louisiana. The cold wave became widespread and all the remaining mild conditions from the west were pushed into northern Mexico. The cold wave even extended well into early March, with a part of every U.S. state except Florida reporting a snow cover by March 1, 2015.
2012	Early 2012 European cold wave – As of February 11, 2012 at least 590 people died during a cold snap with temperatures falling below −35 °C (−31 °F) in some regions. Ukraine was the worst hit, with over 100 deaths related to the cold.
2009-2010	A cold wave affected much of the Deep South in the United States and Florida in January and February 2010.
2008	2008 Alaska cold wave – In early February, Alaska experienced the coldest temperatures for eight years, with Fairbanks nearing −50 °F (−45.6 °C) and Chicken, Alaska bottoming out at −72 °F (−57.8 °C), a mere eight °F (4.4 °C) away from the record of −80 °F (−62.2 °C). The first half of January also brought unusual cold weather and heavy snow to widespread regions of China and the Middle East.
2007	2007 Northern Hemisphere cold wave – All of Canada and most of the United States underwent a freeze after a two-week warming that took place in late March and early April. Crops froze, wind picked up, and snow drizzled much of the United States. Some parts of Europe also experienced unusual cold winter-like temperatures, during that time.

16 Tornado

A tornado is a rapidly rotating column of air that is in contact with both the surface of the Earth and a cumulonimbus cloud or, in rare cases, the base of a cumulus cloud. They are often referred to as twisters, whirlwinds or cyclones. Winds blow counter clockwise in the Northern Hemisphere and clockwise in the Southern. Tornadoes come in many shapes and sizes, and they are often visible in the form of a condensation funnel originating from the base of a cumulonimbus cloud, with a cloud of rotating debris and dust beneath it. Most tornadoes have wind speeds less than 110 miles per hour (180 km/h), are about 250 feet (80 m) across, and travel a few miles (several kilometres) before dissipating. Various types of tornadoes include the multiple vortex tornado, landspout and waterspout. Waterspouts are characterized by a spiralling funnel-shaped wind current, connecting to a large cumulus or cumulonimbus cloud.

They are generally classified as non-supercellular tornadoes that develop over bodies of water. These spiralling columns of air frequently develop in tropical areas close to the equator, and are less common at high latitudes. Other tornado-like phenomena that exist in nature include the gustnado, dust devil, fire whirls, and steam devil.

Tornadoes occur in North America, particularly in the area of the United States known as tornado alley, as well as in northern and east-central South America, Southern Africa, north-western and southeast Europe, western and south-eastern Australia, and New Zealand. Most tornadoes take on the appearance of a narrow funnel, a few hundred yards (meters) across, with a small cloud of debris near the ground. Tornadoes may be obscured completely by rain or dust. These tornadoes are especially dangerous, as even experienced meteorologists might not see them. Tornadoes can appear in many shapes and sizes.

In the United States, tornadoes are around 500 feet (150 m) across on average and travel on the ground for 5 miles (8.0 km). However, there is a wide range of tornado sizes. Weak tornadoes, or strong yet dissipating tornadoes, can be exceedingly narrow, sometimes only a few feet or couple meters across. One tornado was reported to have a damage path only 7 feet (2.1 m) long. On the other end of the spectrum, wedge tornadoes can have a damage path a mile (1.6 km) wide or more.

In terms of path length, the Tri-State Tornado, which affected parts of Missouri, Illinois, and Indiana on March 18, 1925, was on the ground continuously for 219 miles (352 km). Many tornadoes which appear to have path lengths of 100 miles (160 km) or longer are composed of a family of tornadoes which have formed in quick succession. Tornadoes often develop from a class of thunderstorms known as supercells.

Supercells contain mesocyclones, an area of organized rotation a few miles up in the atmosphere, usually 1–6 miles (1.6–9.7 kilometres) across. Most intense tornadoes (EF3 to EF5 on the Enhanced Fujita Scale) develop from supercells. In addition to tornadoes, very heavy rain, frequent lightning, strong wind gusts, and hail are common in such storms. A multiple-vortex tornado is a type of tornado in which two or more columns of spinning air rotate about their own axis and at the same time around a common centre. A multi-vortex structure can occur in almost any circulation, but is very often observed in intense tornadoes. These vortices often create small areas of heavier damage along the main tornado path.

Enhanced Fujita Scale

The Enhanced Fujita scale (EF-Scale) rates the intensity of tornadoes in the United States and Canada based on the damage they cause.

EF Rating	Wind Speed	Damage Severity	Damage Description
EF0	105–137kmh 65–85mph	Minor or no damage	Peels surface off some roofs; some damage to gutters or siding; branches broken off trees; shallow-rooted trees pushed over. Confirmed tornadoes with no reported damage (i.e., those that remain in open fields) are always rated EF0.
EF1	138–177kmh 86–110mph	Moderate damage	Roofs severely stripped; mobile homes overturned or badly damaged; loss of exterior doors; windows and other glass broken.
EF2	178–217kmh 111–135mph	Considerable damage	Roofs torn off well-constructed houses; foundations of frame homes shifted; mobile homes completely destroyed; large trees snapped or uprooted; light-object missiles generated; cars lifted off ground.
EF3	218–266kmh 136–165mph	Severe damage	Entire stories of well-constructed houses destroyed; severe damage to large buildings such as shopping malls; trains overturned; trees debarked; heavy cars lifted off the ground and thrown; structures with weak foundations are badly damaged.
EF4	267–322kmh 166–200mph	Devastating damage	Well-constructed and whole frame houses completely levelled; cars and other large objects thrown and small missiles generated.
EF5	>322kmh >200mph	Extreme damage	Strong-framed, well-built houses levelled off foundations are swept away; steel-reinforced concrete structures are critically damaged; tall buildings collapse or have severe structural deformations; some cars, trucks, and train cars can be thrown approximately 1 mile (1.6 km).

Tornado Protection

Protecting yourself from a tornado involves a multi-faceted approach, regardless of your specific region. It's about preparedness, rapid response, and knowing where to go when the threat is imminent.

Preparation

Understand Tornado Basics
- Tornado Watch: Conditions are favorable for tornadoes to develop in or near your area. This means "Be Prepared" and stay alert.
- Tornado Warning: A tornado has been sighted or indicated by radar. This means "Take Action Now" and seek immediate shelter.
- Tornadoes can be invisible (obscured by rain or at night) and can change direction quickly. Don't wait to see one.
- They are categorized by the Enhanced Fujita (EF) Scale based on damage caused (EF0 being weakest, EF5 strongest).

Develop a Family Emergency Plan
Designate a Safe Shelter. This is the most crucial step.
● Best Option: An underground area like a basement, storm cellar, or a specially constructed safe room. These offer the highest level of protection.
● Next Best: A small, interior room or hallway on the lowest level of a sturdy building, away from windows, doors, and outside walls. A bathroom, closet, or interior hallway often fits this description. The more walls between you and the outside, the better.
● Avoid: Mobile homes, manufactured homes (unless specifically anchored and reinforced to modern standards, but even then, evacuation is generally recommended), large open rooms (gyms, auditoriums), and areas directly under heavy objects on the floor above.
● Practice Drills: Regularly practice going to your designated safe place with all family members, including pets. Ensure everyone knows the plan.
● Account for Everyone: Have a plan for knowing who is where, especially if family members are separated (e.g., at work, school, daycare).
● Plan for Pets: Include pets in your plan; know where they will shelter (inside with you) and have their emergency supplies ready.

Prepare an Emergency Kit (Go-Bag / Disaster Kit): Keep essential items readily accessible in your designated shelter area or a grab-and-go bag
● Communication: Battery-powered or hand-crank radio (preferably a NOAA Weather Radio in the US), flashlight with extra batteries.
● Medical: Comprehensive first-aid kit, at least a 7-day supply of prescription medications, any necessary medical devices or supplies.
● Food & Water: At least 3 days' worth of non-perishable food that requires no cooking or refrigeration. 1 gallon (approx. 4 liters) of water per person per day. Manual can opener.
● Sanitation: Toilet paper, moist towelettes, garbage bags, ties for waste disposal.
● Safety: Whistle (to signal for help), dust mask (for debris), wrench or pliers (to turn off utilities), sturdy shoes, work gloves.
● Important Documents: Copies of identification, insurance policies, medical records, and emergency contacts in a waterproof container.
● Cash: ATMs and credit card machines may not work during power outages.
● Comfort Items: Blankets, sleeping bags, books/games for children, comfort items for pets.

Secure Your Property
● Loose Items: Secure or bring inside anything outdoors that could become a dangerous projectile in high winds (patio furniture, toys, garbage cans, grills, trampolines).
● Trees and Branches: Trim dead or weak branches from trees that are close to your home or overhanging power lines.
● Garage Doors: Reinforce garage doors, as they are often a weak point in homes during high winds.
● Roofs: While not "tornado-proofing," ensuring your roof is in good repair can help prevent some damage.

During a Tornado

Seek Shelter IMMEDIATELY: Do not wait until you see or hear the tornado. Tornadoes can be obscured by rain or occur at night. Time is of the essence.

At Home
● With a Basement/Storm Cellar: Go there immediately. Get under something sturdy (workbench, heavy table, stairs) and cover your head and neck with your arms, a mattress, heavy blankets, or a helmet (bicycle/motorcycle helmets can offer head protection).
● Without a Basement: Go to a small, interior room on the lowest level of your home, away from windows, doors, and outside walls. Examples include an interior closet, bathroom, or hallway. Get under sturdy furniture if possible. Protect your head and neck.
● Avoid: Windows, doors, outside walls, and large open rooms (e.g., living rooms, garages). Do not open windows – it doesn't help and wastes precious time.

In a Mobile Home or Manufactured Home
● EVACUATE IMMEDIATELY. These structures offer very little protection against tornadoes, even if anchored.
● Go to the nearest sturdy building, community storm shelter, or a designated safe room. If no solid shelter is nearby, lie flat in the nearest ditch or low-lying area and cover your head with your arms.

In a Vehicle
● Do NOT try to outrun a tornado in a vehicle. Cars, buses, and trucks are easily tossed. Tornadoes can move very quickly and change direction.
● If a sturdy building or designated shelter is nearby, get there immediately.
● If caught in extreme winds or flying debris, or if no sturdy shelter is available:
● Exit your vehicle and lie flat in a low-lying area like a ditch or ravine. Cover your head with your arms.
● Do NOT take shelter under an overpass or bridge. Wind speeds can actually increase due to a tunneling effect, making them extremely dangerous. You are safer in a low, flat location.
● As a last resort, if you cannot get out of the vehicle and into a lower area, stay in the vehicle, keep your seatbelt on, get as low as possible (below the windows), and cover your head with your arms or a blanket/jacket.

Outdoors (No Immediate Shelter)
● Get as low to the ground as possible. Lie down flat in a ditch, gully, or low spot.
● Protect your head and neck with your arms.
● Beware of rapid flooding from accompanying heavy rainfall.
● Stay away from trees, power lines, and anything that could become flying debris.

In Large Buildings (Schools, Hospitals, Stores, Office Buildings, Shopping Malls)
● Move to the innermost part of the building on the lowest possible floor.
● Stay away from windows and glass doorways.
● Avoid large, wide-span rooms (gymnasiums, auditoriums, large retail floors) as their roofs are more prone to collapse.
● Do not use elevators; use stairs.
● Crouch down and cover your head. If possible, get under something sturdy like a heavy counter or interior desk.

After the Tornado

1. Stay in Shelter
● Remain in your safe place until the tornado has fully passed and you receive an "all clear" from authorities. There might be more than one tornado.

2. Assess Injuries
● Check yourself and others for injuries. Provide first aid as needed. Call emergency services (e.g., 000 in Australia, 911 in North America) for serious injuries.

3. Be Aware of Hazards
● Stay clear of damaged buildings, downed power lines (assume they are live!), broken glass, and other debris.
● Be alert for fire hazards (gas leaks, broken wires).
● Use a flashlight, not candles, for light in damaged areas.

4. Communicate
- Use text messages or social media if phone lines are busy.
- Contact family and friends to let them know you are safe.
- Listen to battery-powered or hand-crank radio for official updates and instructions.

5. Safe Cleanup
- Wear sturdy shoes, long pants, work gloves, and masks when clearing debris.
- Do not eat or drink anything that has been impacted by the tornado or floodwaters.
- Document damage for insurance purposes with photos or videos.

Long Term Defence

Long Term Tornado Defence
Depending on location, various safe-haven areas have been prepared. The goal has been to avoid outer walls which might collapse when a roof section becomes airborne and the walls below lose their upper support: many interior rooms resist collapse longer, due to smaller walls interconnected to each other, while outer walls deflect the force of the winds. Because mobile homes typically lack foundation anchors and present a large surface-area sail (to catch wind), the advice has been to seek a safe haven elsewhere, such as in a stronger nearby building.

When a mobile home begins to roll, people have been injured by hitting objects inside, or being crushed when a trailer suddenly hits the ground and begins to collapse around them. In a multi-story building, an internal stairway (away from broken windows) often acts as a safe haven, due to the stairs reinforcing the walls and blocking any major debris falling from above. If a stairway is lined with windows, then there would be the danger of flying glass, so an interior stairway, or small inner room, would be preferable.

In private homes, some similar stairway rooms have been used, or an interior room/closet kept clear to quickly allow entry when a storm is seen or heard approaching (the wind roar intensifies, sounding like a swift "freight train" coming nearer, louder). With weeks or months to prepare, an interior safe room can be constructed, with space for emergency water, food and flashlights, and a telephone to call for rescue if the exit becomes blocked by falling debris.

Some above-ground safe rooms have been built with steel-rebar rods in cement-filled cinder blocks, to withstand winds of 250 miles per hour (400 km/h). Rural homes might have an outside storm cellar, or other external bunker, to avoid being trapped within a collapsing house. In rural homes, generators are also helpful to maintain power with enough fuel for a few days.

17 Wildfire

A wildfire or wildland fire is an uncontrolled fire in an area of combustible vegetation occurring in rural areas. Depending on the type of vegetation present, a wildfire can also be classified more specifically as a brush fire, bushfire, desert fire, forest fire, grass fire.

Wildfires can be characterized in terms of the cause of ignition, their physical properties, the combustible material present, and the effect of weather on the fire. Wildfires can cause damage to property and human life, although naturally occurring wildfires may have beneficial effects on native vegetation, animals, and ecosystems that have evolved with fire. High-severity wildfire creates complex early seral forest habitat (also called "snag forest habitat"), which often has higher species richness and diversity than unburned old forest. Many plant species depend on the effects of fire for growth and reproduction. Wildfires in ecosystems where wildfire is uncommon or where non-native vegetation has encroached may have strongly negative ecological effects.

Causes
- Arson
- Electronics Sparks
- Lightning
- Sparks from Rockfalls
- Spontaneous Combustion
- Volcanic Eruption

Wildfire behavior and severity result from a combination of factors such as available fuels, physical setting, and weather. Analyses of historical meteorological data and national fire records in western North America show the primacy of climate in driving large regional fires via wet periods that create substantial fuels, or drought and warming that extend conducive fire weather. Strategies for wildfire prevention, detection, and suppression have varied over the years. One common and inexpensive technique is controlled burning: intentionally igniting smaller fires to minimize the amount of flammable material available for a potential wildfire. Vegetation may be burned periodically to maintain high species diversity and limit the accumulation of plants and other debris that may serve as fuel.

Wildland fire use is the cheapest and most ecologically appropriate policy for many forests. Fuels may also be removed by logging, but fuels treatments and thinning have no effect on severe fire behavior when under extreme weather conditions. Wildfire itself is reportedly "the most effective treatment for reducing a fire's rate of spread, fireline intensity, flame length, and heat per unit of area", according to Jan Van Wagtendonk, a biologist at the Yellowstone Field Station. Building codes in fire-prone areas typically require that structures be built of flame-resistant materials and a defensible space be maintained by clearing flammable materials within a prescribed distance from the structure.

Subheadings

1. Physical Properties	**2. Wildfire Spread**	**3. Suppression**	**4. Airborne Hazards**
5. Preparation	**6. Evacuation**	**7. Post-Fire**	

1 Physical Properties

Wildfires occur when all the necessary elements of a fire triangle come together in a susceptible area: an ignition source is brought into contact with a combustible material such as vegetation, that is subjected to enough heat and has an adequate supply of oxygen from the ambient air. A high moisture content usually prevents ignition and slows propagation, because higher temperatures are needed to evaporate any water in the material and heat the material to its fire point.

Dense forests usually provide more shade, resulting in lower ambient temperatures and greater humidity, and are therefore less susceptible to wildfires. Less dense material such as grasses and leaves are easier to ignite because they contain less water than denser material such as branches and trunks. Plants continuously lose water by evapotranspiration, but water loss is usually balanced by water absorbed from the soil, humidity, or rain. When this balance is not maintained, plants dry out and are therefore more flammable, often a consequence of droughts.

A wildfire front is the portion sustaining continuous flaming combustion, where unburned material meets active flames, or the smoldering transition between unburned and burned material. As the front approaches, the fire heats both the surrounding air and woody material through convection and thermal radiation. First, wood is dried as water is vaporized at a temperature of 100 °C (212 °F). Next, the pyrolysis of wood at 230 °C (450 °F) releases flammable gases.

Finally, wood can smoulder at 380 °C (720 °F) or, when heated sufficiently, ignite at 590 °C (1,000 °F). Even before the flames of a wildfire arrive at a particular location, heat transfer from the wildfire front warms the air to 800 °C (1,470 °F), which pre-heats and dries flammable materials, causing materials to ignite faster and allowing the fire to spread faster. High-temperature and long-duration surface wildfires may encourage flashover or torching: the drying of tree canopies and their subsequent ignition from below.

Wildfires have a rapid forward rate of spread (FROS) when burning through dense uninterrupted fuels. They can move as fast as 10.8 kilometres per hour (6.7 mph) in forests and 22 kilometres per hour (14 mph) in grasslands. Wildfires can advance tangential to the main front to form a flanking front, or burn in the opposite direction of the main front by backing. They may also spread by jumping or spotting as winds and vertical convection columns carry firebrands (hot wood embers) and other burning materials through the air over roads, rivers, and other barriers that may otherwise act as firebreaks. Torching and fires in tree canopies encourage spotting, and dry ground fuels around a wildfire are especially vulnerable to ignition from firebrands.

Spotting can create spot fires as hot embers and firebrands ignite fuels downwind from the fire. In Australian bushfires, spot fires are known to occur as far as 20 kilometres (12 mi) from the fire front. Especially large wildfires may affect air currents in their immediate vicinities by the stack effect: air rises as it is heated, and large wildfires create powerful updrafts that will draw in new, cooler air from surrounding areas in thermal columns. Great vertical differences in temperature and humidity encourage pyrocumulus clouds, strong winds, and fire whirls with the force of tornadoes at speeds of more than 80 kilometres per hour (50 mph). Rapid rates of spread, prolific crowning or spotting, the presence of fire whirls, and strong convection columns signify extreme conditions.

Climate Effect
Heat waves, droughts, cyclical climate changes such as El Niño, and regional weather patterns such as high-pressure ridges can increase the risk and alter the behavior of wildfires dramatically. Years of precipitation followed by warm periods can encourage more widespread fires and longer fire seasons. Since the mid-1980s, earlier snowmelt and associated warming has also been associated with an increase in length and severity of the wildfire season, or the most fire-prone time of the year, in the Western United States.

Global warming may increase the intensity and frequency of droughts in many areas, creating more intense and frequent wildfires. A 2015 study indicates that the increase in fire risk in California may be attributable to human-induced climate change. A study of alluvial sediment deposits going back over 8,000 years found warmer climate periods experienced severe droughts and stand-replacing fires and concluded climate was such a powerful influence on wildfire that trying to recreate presettlement forest structure is likely impossible in a warmer future.

Intensity also increases during daytime hours. Burn rates of smoldering logs are up to five times greater during the day due to lower humidity, increased temperatures, and increased wind speeds. Sunlight warms the ground during the day which creates air currents that travel uphill. At night the land cools, creating air currents that travel downhill. Wildfires are fanned by these winds and often follow the air currents over hills and through valleys. Fires in Europe occur frequently during the hours of 12:00 p.m. and 2:00 p.m. Wildfire suppression operations in the United States revolve around a 24-hour fire day that begins at 10:00 a.m. due to the predictable increase in intensity resulting from the daytime warmth.

2 Wildfire Spread

Ground Fires	Fed by subterranean roots, duff and other buried organic matter. This fuel type is especially susceptible to ignition due to spotting. Ground fires typically burn by smouldering, and can burn slowly for days to months.
Crawling/Surface Fires	Fuelled by low-lying vegetation on the forest floor such as leaf and timber litter, debris, grass, and low-lying shrubbery. This kind of fire often burns at a relatively lower temperature than crown fires (<400°C (752°F)) and may spread at slow rate, though steep slopes and wind can accelerate the rate of spread.
Ladder Fire	Consume material between low-level vegetation and tree canopies, such as small trees, downed logs, and vines. Kudzu, Old World climbing fern, and other invasive plants that scale trees may also encourage ladder fires.
Crown/Canopy/Aerial Fires	Burn suspended material at the canopy level, such as tall trees, vines, and mosses. The ignition of a crown fire, termed crowning, is dependent on the density of the suspended material, canopy height, canopy continuity, sufficient surface and ladder fires, vegetation moisture content, and weather conditions during the blaze.

3 Suppression

Wildfire suppression depends on the technologies available in the area in which the wildfire occurs. In less developed nations the techniques used can be as simple as throwing sand or beating the fire with sticks or palm fronds. In more advanced nations, the suppression methods vary due to increased technological capacity. Silver iodide can be used to encourage snow fall, while fire retardants and water can be dropped onto fires by unmanned aerial vehicles, planes, and helicopters.

Complete fire suppression is no longer an expectation, but the majority of wildfires are often extinguished before they grow out of control. While more than 99% of the 10,000 new wildfires each year are contained, escaped wildfires under extreme weather conditions are difficult to suppress without a change in the weather. Wildfires in Canada and the US burn an average of 54,500 square kilometers (13,000,000 acres) per year.

Above all, fighting wildfires can become deadly. A wildfire's burning front may also change direction unexpectedly and jump across fire breaks. Intense heat and smoke can lead to disorientation and loss of appreciation of the direction of the fire, which can make fires particularly dangerous. For example, during the 1949 Mann Gulch fire in Montana, USA, thirteen smokejumpers died when they lost their communication links, became disoriented, and were overtaken by the fire. In the Australian February 2009 Victorian bushfires, at least 173 people died and over 2,029 homes and 3,500 structures were lost when they became engulfed by wildfire.

4 Airborne Hazards

The most noticeable adverse effect of wildfires is the destruction of property. However, the release of hazardous chemicals from the burning of wildland fuels also significantly impacts health in humans. Wildfire smoke is composed primarily of carbon dioxide and water vapor. Other common smoke components present in lower concentrations are carbon monoxide, formaldehyde, acrolein, polyaromatic hydrocarbons, and benzene. Small particulates suspended in air which come in solid form or in liquid droplets are also present in smoke. 80 -90% of wildfire smoke, by mass, is within the fine particle size class of 2.5 micrometers in diameter or smaller. Despite carbon dioxide's high concentration in smoke, it poses a low health risk due to its low toxicity.

Rather, carbon monoxide and fine particulate matter, particularly 2.5 µm in diameter and smaller, have been identified as the major health threats. Other chemicals are considered to be significant hazards but are found in concentrations that are too low to cause detectable health effects. The degree of wildfire smoke exposure to an individual is dependent on the length, severity, duration, and proximity of the fire. People are exposed directly to smoke via the respiratory tract though inhalation of air pollutants. Indirectly, communities are exposed to wildfire debris that can contaminate soil and water supplies.

5 Preparation

● Shut all windows and doors, leaving them unlocked. Remove flammable window shades, curtains and close metal shutters.
● Remove flammable window shades, curtains and close metal shutters.
● Move flammable furniture to the centre of the room, away from windows and doors.
● Leave your lights on so firefighters can see your house under smoky conditions.
● Gather up flammable items from the exterior of the house and bring them inside (patio furniture, children's toys, door mats, trash cans, etc.) or place them in your pool.
● Create and maintain an area approximately 30' away from you home that is free of anything that will burn, such as wood piles, dried leaves, newspapers, brush, and other landscaping that can burn.
● From 30 feet to 100 feet reduce or replace as much of the most flammable vegetation as possible and prune vegetation, create "fuel breaks," such as driveways, gravel walkways, and lawns.

● Work with neighbours to create spaces up to 200 feet around your homes where vegetation is thinned to remove underbrush and tall trees do not touch each other for continuous canopies.
● Connect garden hoses long enough to reach any area of the home and fill garbage cans, tubs, or other large containers with water.

Wildfire Evacuation Preparation
● Connect garden hoses to outside water valves or spigots for use by firefighters. Fill water buckets and place them around the house.
● Don't leave sprinklers on or water running, they can affect critical water pressure.
● Patrol your property and monitor the fire situation. Don't wait for an evacuation order if you feel threatened.
● Have a ladder available and place it at the corner of the house for firefighters to quickly access your roof.

6 Evacuation

There are only two options when it comes to wildfires. Staying in place or evacuating to a safer area.

● Cover-up to protect against heat and flying embers. Wear long pants, long sleeve shirt, heavy shoes/boots, cap, dry bandanna for face cover, goggles or glasses. 100% cotton is preferable.
● Ensure vehicle is full of fuel and ready to go with spare fuel if you are rural.
● Leave as soon as evacuation is recommended by fire officials to avoid being caught in fire, smoke or road congestion. Don't wait to be ordered by authorities to leave.
● Evacuating the forest fire area early also helps firefighters keep roads clear of congestion, and lets them move more freely to do their job. In an intense wildfire, they will not have time to knock on every door.
● Do not return to your home until fire officials determine it is safe. Notification that it is safe to return home will be given as soon as possible considering safety and accessibility.

7 Post-Fire

After a wildfire, hazards remain. Residents returning to their homes may be at risk from falling fire-weakened trees. Humans and pets may also be harmed by falling into ash pits.

Ash Pit

An ash pit is a remnant of a wildfire. It is a hole in the ground filled with ash, possibly containing hot embers beneath. It is one of the many hazards faced by those fighting wildfires. It is also a danger to residents and their pets returning after a wildfire has gone out. An ash pit may be imperceptible from the ground above, and can remain hot for days. Those accidentally walking into one may be severely burned or killed. After a wildfire has gone out, firefighters may detect ash pits from helicopters using infrared sensors. Then can then dig down into them, and extinguish them to prevent flare ups.

Causes
After a fire burns underground fuels, it can create a void that becomes filled with ash from the burned fuel. There are several environmental factors that increase the likelihood of an ash pit being formed. It may result from the presence of extensive root systems of trees and shrubs, as well as peat and deep duff covering mineral soil. Holes created by animals, such as coyote and badger dens, can become ash pits. Abandoned rodent holes can become filled with dry, organic debris. Once this debris is burned, an ash pit may be produced. Areas that have been modified by humans may also become hazardous ash pits. Examples include areas modified with heavy equipment, former bulldozer piles, as well as sawmill sites and timber yards.

Detection
An ash pit may sometimes be detected by the presence of white ash or swarms of insects hovering about. Nearly translucent smoke that quickly dissipates may be visible emanating from an ash pit when it is between the observer and the sun. Due to incomplete burning, an ash pit may also produce a smell of burning creosote or incomplete combustion.

Mitigation
Upon detection, marking or flagging ash pits is advised. Landscapes that have the potential to produce ash pits should be avoided.

18 Meteorite

A meteorite is a solid piece of debris from an object, such as a comet, asteroid, or meteoroid, that originates in outer space and survives its passage through the atmosphere to reach the surface of a planet or moon. When the object enters the atmosphere, various factors such as friction, pressure, and chemical interactions with the atmospheric gases cause it to heat up and radiate that energy.

It then becomes a meteor and forms a fireball, also known as a shooting star or falling star; astronomers call the brightest examples "bolides". Meteorites vary greatly in size. For geologists, a bolide is a meteorite large enough to create an impact crater. Meteorites that are recovered after being observed as they transit the atmosphere and impact the Earth are called meteorite falls. All others are known as meteorite finds.

As of August 2018, there were about 1,412 witnessed falls that have specimens in the world's collections. As of 2018, there are more than 59,200 well-documented meteorite finds. Meteorites have traditionally been divided into three broad categories: stony meteorites that are rocks, mainly composed of silicate minerals; iron meteorites that are largely composed of metallic iron-nickel; and stony-iron meteorites that contain large amounts of both metallic and rocky material.

Modern classification schemes divide meteorites into groups according to their structure, chemical and isotopic composition and mineralogy. Meteorites smaller than 2 mm are classified as micrometeorites. Extraterrestrial meteorites are such objects that have impacted other celestial bodies, whether or not they have passed through an atmosphere. They have been found on the Moon and Mars.

Subheadings

1. Fall Phenomena	**2. Meteorite Types**	**3. Meteorite Variations**	**4. Impact Damage**
5. Meteorite Protection			

1 Fall Phenomena

Most meteoroids disintegrate when entering the Earth's atmosphere. Usually, five to ten a year are observed to fall and are subsequently recovered and made known to scientists. Few meteorites are large enough to create large impact craters. Instead, they typically arrive at the surface at their terminal velocity and, at most, create a small pit. Large meteoroids may strike the earth with a significant fraction of their escape velocity (second cosmic velocity), leaving behind a hypervelocity impact crater. The kind of crater will depend on the size, composition, degree of fragmentation, and incoming angle of the impactor. The force of such collisions has the potential to cause widespread destruction. The most frequent hypervelocity cratering events on the Earth are caused by iron meteoroids, which are most easily able to transit the atmosphere intact.

Examples of craters caused by iron meteoroids include Barringer Meteor Crater, Odessa Meteor Crater, Wabar craters, and Wolfe Creek crater; iron meteorites are found in association with all of these craters. In contrast, even relatively large stony or icy bodies like small comets or asteroids, up to millions of tons, are disrupted in the atmosphere, and do not make impact craters. Although such disruption events are uncommon, they can cause a considerable concussion to occur; the famed Tunguska event probably resulted from such an incident.

Very large stony objects, hundreds of meters in diameter or more, weighing tens of millions of tons or more, can reach the surface and cause large craters, but are very rare. Such events are generally so energetic that the impactor is completely destroyed, leaving no meteorites. (The very first example of a stony meteorite found in association with a large impact crater, the Morokweng crater in South Africa, was reported in May 2006.

Several phenomena are well documented during witnessed meteorite falls too small to produce hypervelocity craters. The fireball that occurs as the meteoroid passes through the atmosphere can appear to be very bright, rivaling the sun in intensity, although most are far dimmer and may not even be noticed during daytime. Various colors have been reported, including yellow, green, and red. Flashes and bursts of light can occur as the object breaks up. Explosions, detonations, and rumblings are often heard during meteorite falls, which can be caused by sonic booms as well as shock waves resulting from major fragmentation events. These sounds can be heard over wide areas, with a radius of a hundred or more kilometers. Whistling and hissing sounds are also sometimes heard, but are poorly understood. Following passage of the fireball, it is not unusual for a dust trail to linger in the atmosphere for several minutes.

As meteoroids are heated during atmospheric entry, their surfaces melt and experience ablation. They can be sculpted into various shapes during this process, sometimes resulting in shallow thumbprint-like indentations on their surfaces called regmaglypts. If the meteoroid maintains a fixed orientation for some time, without tumbling, it may develop a conical "nose cone" or "heat shield" shape. As it decelerates, eventually the molten surface layer solidifies into a thin fusion crust, which on most meteorites is black (on some achondrites, the fusion crust may be very light colored). On stony meteorites, the heat-affected zone is at most a few mm deep; in iron meteorites, which are more thermally conductive, the structure of the metal may be affected by heat up to 1 centimetre (0.39 in) below the surface.

Reports vary; some meteorites are reported to be "burning hot to the touch" upon landing, while others are alleged to have been cold enough to condense water and form a frost. Meteoroids that experience disruption in the atmosphere may fall as meteorite showers, which can range from only a few up to thousands of separate individuals. The area over which a meteorite shower falls is known as its strewn field. Strewn fields are commonly elliptical in shape, with the major axis parallel to the direction of flight. In most cases, the largest meteorites in a shower are found farthest down-range in the strewn field.

When an asteroid (or comet) enters a planetary atmosphere at cosmic velocity, extremely high aerodynamic forces cause it to decelerate. The hypervelocity object also produces a strong shock wave as it passes through the atmosphere. Directly in front of it, at the apex of the bow shock, the atmosphere is compressed, heated, and ionized. Plasma temperatures can reach 25,000–30,000 K. The hot, opaque cap of plasma emits an enormous flux of thermal radiation that is absorbed by the leading surface of the impactor, causing rapid vaporization and ablation. If the body is small it completely ablates, leaving only a trail of ionized air and meteoritic vapor. If it is very large, it reaches the ground intact before a significant fraction of its mass can ablate and still moving at hypervelocity. It forms an impact crater.

2 Meteorite Types

Most meteorites are stony meteorites, classed as chondrites and achondrites. Only about 6% of meteorites are iron meteorites or a blend of rock and metal, the stony-iron meteorites. Modern classification of meteorites is complex. The review paper of Krot et al. (2007) summarizes modern meteorite taxonomy. About 86% of the meteorites are chondrites, which are named for the small, round particles they contain. These particles, or chondrules, are composed mostly of silicate minerals that appear to have been melted while they were free-floating objects in space. Certain types of chondrites also contain small amounts of organic matter, including amino acids, and presolar grains. Chondrites are typically about 4.55 billion years old and are thought to represent material from the asteroid belt that never coalesced into large bodies. Like comets, chondritic asteroids are some of the oldest and most primitive materials in the solar system.

Chondrites are often considered to be "the building blocks of the planets". About 8% of the meteorites are achondrites (meaning they do not contain chondrules), some of which are similar to terrestrial igneous rocks. Most achondrites are also ancient rocks, and are thought to represent crustal material of differentiated planetesimals.

One large family of achondrites (the HED meteorites) may have originated on the parent body of the Vesta Family, although this claim is disputed. Others derive from unidentified asteroids. Two small groups of achondrites are special, as they are younger and do not appear to come from the asteroid belt. One of these groups comes from the Moon, and includes rocks similar to those brought back to Earth by Apollo and Luna programs. The other group is almost certainly from Mars and constitutes the only materials from other planets ever recovered by humans.

About 5% of meteorites that have been seen to fall are iron meteorites composed of iron-nickel alloys, such as kamacite and/or taenite. Most iron meteorites are thought to come from the cores of planetesimals that were once molten. As with the Earth, the denser metal separated from silicate material and sank toward the center of the planetesimal, forming its core. After the planetesimal solidified, it broke up in a collision with another planetesimal.

Due to the low abundance of iron meteorites in collection areas such as Antarctica, where most of the meteoric material that has fallen can be recovered, it is possible that the percentage of iron-meteorite falls is lower than 5%. This would be explained by a recovery bias; laypeople are more likely to notice and recover solid masses of metal than most other meteorite types. The abundance of iron meteorites relative to total Antarctic finds is 0.4%. Stony-iron meteorites constitute the remaining 1%.

They are a mixture of iron-nickel metal and silicate minerals. One type, called pallasites, is thought to have originated in the boundary zone above the core regions where iron meteorites originated. The other major type of stony-iron meteorites is the mesosiderites. Tektites (from Greek tektos, molten) are not themselves meteorites, but are rather natural glass objects up to a few centimeters in size that were formed—according to most scientists—by the impacts of large meteorites on Earth's surface. A few researchers have favored tektites originating from the Moon as volcanic ejecta, but this theory has lost much of its support over the last few decades.

3 Meteorite Variations

This is a list of variables that can affect the damage of a meteorite.

Basic Variables

Diameter	Meteorites need to be around 20m (60ft) wide to make it to the ground intact, depending on what they are made of.
Density	
Shape	

Material	

Atmospheric Entry

Angle of Entry	
Velocity (Speed)	11km/s - 72km/s (60,000–69,000 km/h or 40,000–42,900 mph) is the average entry speed
Rotation	

Impact Damage

Energy	
Global Damage	
Crater	
Ejecta	

Post-Impact Damage

Thermal Radiation	
Seismic Effects	
Airblast	
Tsunami	

4 Impact Damage

The below table is the estimated damage for various sized meteorites upon impact. It is just a basic calculation and doesn't take into account many of the variables above.

Small

Diameter	2m (3.2ft)	3.3m (10.8 ft)	4m (13 ft)	5m (16 ft)	6.5m (21 ft)	8m (26 ft)	10m (32 ft)	13m (42 ft)	16m (52 ft)	20m (65 ft)	25m (82 ft)
Kinetic Energy (Megaton)	0.001	0.002	0.004	0.008	0.017	0.032	0.063	0.14	0.26	0.5	1
Airburst (Megaton)	0.001	0.002	0.004	0.008	0.017	0.032	0.063	0.14	0.26	0.5	1
Crater Size	0 km	0 km	0 km	0 km	0 km	0 km	0 km	0 km	0 km	0 km	0.5 km
Damage	None	Trivial	Very Small	Small	Notable	Notable		Window Breaker		Chelyabinsk	

Large

Diameter	33m (108 ft)	40m (131 ft)	50m (164 ft)	65m (213 ft)	80m (262 ft)	100m (328 ft)	125m (410 ft)	160m (524 ft)	200m (656 ft)	250m (820 ft)	
Kinetic Energy (Megaton)	2.2	4	7.8	17	32	63	122	256	500	977	
Airburst (Megaton)	1.5	2	2.8	4	6	8	11	16	22	31

5 Meteorite Protection

How you can protect yourself from a meteorite.

Flee	Generally the only sure way to defend yourself from a meteorite is to get out of its path if you know the trajectory long before it hits.
Bunkers	A deep underground bunker could survive a nearby meteorite impact, however you would need to know it's coming and be safe inside beforehand.
Space Programs	There are a number of space agencies looking into different ways they can divert or destroy incoming asteroids, however you should look into other alternatives for your personal safety.
Abandon Earth	If the world knows an impact is highly likely then they should do what they can to ensure humanities continued survival by sending ships into space and returning after the disaster.

19 Solar Flare

A solar flare is a sudden flash of increased Sun's brightness, usually observed near its surface. Flares are often, but not always, accompanied by a coronal mass ejection. Even the most powerful flares are barely detectable in the total solar irradiance (the "solar constant"). Solar flares occur in a power-law spectrum of magnitudes; an energy release of typically 1020 joules of energy suffices to produce a clearly observable event, while a major event can emit up to 1025 joules. Flares are closely associated with the ejection of plasmas and particles through the Sun's corona into outer space; flares also copiously emit radio waves. If the ejection is in the direction of the Earth, particles associated with this disturbance can penetrate into the upper atmosphere (the ionosphere) and cause bright auroras, and may even disrupt long range radio communication.

It usually takes days for the solar plasma ejecta to reach Earth. Flares also occur on other stars, where the term stellar flare applies. High-energy particles, which may be relativistic, can arrive almost simultaneously with the electromagnetic radiations. On July 23, 2012, a massive, potentially damaging, solar storm (solar flare, coronal mass ejection and electromagnetic radiation) barely missed Earth. According to NASA, there may be as much as a 12% chance of a similar event occurring between 2012 and 2022.

See **Mass Destruction > Space Event > Solar Flare** for more information.
Or see **Mass Destruction > EMP** for information on the effects of solar flares.

20 Geomagnetic Reversal

A geomagnetic reversal is a natural phenomenon where the Earth's magnetic north and south poles effectively swap places. It's not a sudden, instantaneous event, but rather a process that unfolds over hundreds to thousands of years.

If you're looking for the apocalyptic "Cataclysmic Pole Shift" event, head to the MASS DESTRUCTION section.

Our planet has a powerful magnetic field, which acts like a giant bar magnet, with a north magnetic pole and a south magnetic pole. This field is generated by the movement of molten iron in the Earth's outer core, a process known as the "geodynamo." During a geomagnetic reversal, the flow of molten iron in the core becomes unstable. This causes the magnetic field to weaken significantly – sometimes to less than 10% of its normal strength. During this weakening phase, the magnetic poles might wander erratically, even appearing in multiple locations, before eventually stabilizing in the opposite polarity.

So, where your compass needle currently points north, it would eventually point south. It's crucial not to confuse magnetic poles with geographic poles. The geographic poles are the points around which the Earth rotates (North Pole and South Pole), and they do not shift rapidly in a geomagnetic reversal. Geomagnetic reversals are a normal part of Earth's geological history. They have occurred many times in the past, but the timing is irregular and unpredictable.

The primary concerns during a geomagnetic reversal stem from the period when the magnetic field is significantly weakened.
● **Technology:** Earth's magnetic field acts as a shield, deflecting harmful charged particles from the sun (solar wind) and cosmic rays from deep space. A weakened field would allow more of this radiation to reach the Earth's upper atmosphere. This could disrupt or destroy satellites, which would impact GPS, satellite communications, weather forecasting, and other critical infrastructure. It could also induce strong currents in power grids on Earth's surface, potentially leading to widespread blackouts.
● **Navigation:** Compasses would become unreliable. Animals that use the Earth's magnetic field for navigation (like migratory birds, whales, and sea turtles) could become disoriented.
● **Human Health:** While the atmosphere still provides significant protection from cosmic radiation, some scientists suggest a very slight long-term increase in certain health risks, like skin cancer, due to increased radiation exposure at the surface. However, there's no evidence that past reversals have caused mass extinctions.

Overall, a geomagnetic reversal is a slow, natural process that the Earth has undergone many times. While it could pose significant challenges for our modern, technology-dependent civilization, it is not predicted to be an apocalyptic event for human life.

Protection

Protecting yourself from a geomagnetic reversal primarily involves preparing for the effects of a weakened or disrupted magnetic field, which are most likely to manifest as widespread power outages and technological disruptions. It's important to understand that a geomagnetic reversal is a very slow process (hundreds to thousands of years), not a sudden catastrophic event like an earthquake. However, the vulnerability to solar storms (which can happen at any time, but whose effects would be amplified during a weak magnetic field) is what most people are concerned about.

1. Prepare for Long-Term Power Outages
This is the most critical aspect of preparing for a geomagnetic reversal's effects.
● Emergency Kit (Go-Bag/Bug-Out Bag): Have a well-stocked kit with essentials for at least 3-5 days (food, water, first aid, shelter, warmth, comms).
● Water Storage & Purification: Store ample potable water (at least 4 liters per person per day for drinking and hygiene). Have water purification methods (filters, purification tablets, ability to boil water).
● Non-Perishable Food: Stock at least 2 weeks to a month's worth of non-perishable food that requires no cooking or refrigeration. Consider longer-term food storage options.
● Alternative Cooking Methods: Propane stove, rocket stove, BBQ, or ability to build a safe outdoor fire.
● Lighting: Flashlights, headlamps, lanterns (LED preferred) with plenty of spare batteries. Avoid candles for safety.
● Heating/Cooling: Non-electric heating options (e.g., wood stove if applicable and safe) and strategies for passive cooling.
● Hygiene & Sanitation: Soap, hand sanitizer, feminine hygiene products, waste disposal bags, camping toilet.
● First Aid & Medications: Comprehensive first aid kit, knowledge of basic first aid, and at least a month's supply of prescription medications.

NATURAL DISASTERS
Geomagnetic Reversal
Protection

2. Protect Electronics from Electromagnetic Pulses (EMPs) / Geomagnetically Induced Currents (GICs)
While a full geomagnetic reversal is slow, a severe solar storm (which could be more impactful during a reversal) can cause GICs that damage electronics.
● Faraday Cages: For truly critical electronics (e.g., a hand-crank radio, emergency charging devices, old laptop with important data), consider building or buying Faraday cages. These are enclosures made of conductive material that block electromagnetic fields. Simple ones can be made from metal trash cans with non-conductive lining.
● Surge Protectors: Install whole-house surge protectors and use high-quality surge protector power strips for sensitive electronics. This offers some protection from less severe surges, but won't stop a major GIC.
● Unplug Sensitive Electronics: During times of high solar activity warnings, unplug valuable electronics to isolate them from the grid.
● Hard Copies of Important Data: Don't rely solely on digital information. Print out essential documents, maps, survival guides, contact lists, and manuals.

3. Communication & Information
● Battery-Powered/Hand-Crank Radio: Crucial for receiving emergency broadcasts if regular communications fail.
● Two-Way Radios (Walkie-Talkies): For short-range communication with family members.
● Non-Cordless Landline Phone: If you still have a traditional landline, a non-cordless phone might work during a power outage.
● Family Communication Plan: Establish clear meeting points and out-of-area contacts in case local communication networks are down.
● Physical Maps & Compass: Learn how to use them for navigation as GPS might be unavailable.

4. Financial Preparedness
● Cash on Hand: Electronic banking and ATMs will be down during widespread power outages. Keep a significant amount of cash in small denominations.
● Emergency Fund: Have savings that can cover several months of expenses.

5. Vehicle Preparedness
● Keep Fuel Tank Full: Gas stations rely on electricity for pumps. A full tank ensures mobility if needed.
● Maintain Your Vehicle: Ensure your car is in good working order.

6. Skills and Knowledge
● Learn Basic Survival Skills: Fire starting, water purification, knot tying, basic first aid, shelter building.
● Gardening/Food Preservation: For long-term food security.
● Mechanical & Repair Skills: Ability to fix common household items or vehicles.
● Self-Defense: Basic self-defense knowledge.

7. Community & Networking
● Connect with Neighbors: Build relationships and identify skills within your community. Mutual aid networks can be invaluable.
● Join Local Preparedness Groups: Learn from others and share knowledge.

Man-Made Disasters

Surviving any man-made disasters you may encounter

"The object of war is not to die for your country but to make the other bastard die for his."
George S. Patton

Introduction

Another common set of disasters are those caused by man either purposefully or accidentally. Man made disasters can range from wars to shortages to economic crashes.

Purpose	The aim of MAN-MADE DISASTERS is to provide the reader with the types of different man-made disasters including in-depth information on how to survive any that mat arise.
Lost?	• For world wars and other planet-altering disasters, see the MASS DESTRUCTION section. • For wildfires, see the NATURAL DISASTERS section. • For disasters that are naturally occurring, see the NATURAL DISASTERS section. • For information on minor acts of nature, see the METEOROLOGY section. • For any small scale natural disasters which only affect one person or family, see the PERSONAL DISASTERS section. • For a distraction from the current turmoil of the world, see the ENTERTAINMENT section.

Contents

1 Doomsday Clock

The Doomsday Clock is a design that warns the public about how close we are to destroying our world with dangerous technologies of our own making. It is a metaphor, a reminder of the perils we must address if we are to survive on the planet. When the Doomsday Clock was created in 1947, the greatest danger to humanity came from nuclear weapons, in particular from the prospect that the United States and the Soviet Union were headed for a nuclear arms race. The Bulletin considered possible catastrophic disruptions from climate change in its hand-setting deliberations for the first time in 2007.

Current Time (2025)[n]

2 Local Disasters

A local disaster is any disaster that occurs on a fairly small scale such as a single street, city or town or part of a single state. Any events that have the chance for impacts felt around the globe are outside this category.

Subheadings

1. Vehicle Crash	2. Air Crash
3. Oil / Chemical Spill	4. Dam Failure
5. Blackout	6. Nuclear Accident

1 Vehicle Crash

A collision between two road vehicles or a vehicle and a structure.

Crash Preparation

These are tips on how you can prepare for a crash beforehand.

Tips

Phone Emergency Details	Make sure your phone's emergency contact details are up to date. Anyone can access the contact you list and they don't need your phone PIN/combination to find it as it's on the lock screen.

Gear

Reflective Triangles	You should have a set of reflective road markers to alert oncoming vehicles that there is danger ahead.
High-Vis Vest	This can be a lifesaver in the dark or in foggy circumstances. Be sure to put it on before you step out of the vehicle.
Window Breaker	Have this handy in case you need to break a window to escape.
First Aid Kit	Every vehicle should have a first aid kit of some kind and be in easy reach.
Pen & Paper	Sometimes you need to quickly jot down some details such as a crash you witnessed or someone breaking the law.

After the Crash

This is what you should do if you're involved in a minor or moderate vehicle crash.

1	Try to stay calm and think clearly. Do not think about fault, now is the time to review any current risks and the heath of those involved.
2	Check yourself for injuries and whether you can move or not.
3	Turn on the car's hazard/warning lights. (If the car hasn't flipped or rolled onto its top)
4	Check on any other passengers in your vehicle. (If the vehicle isn't leaking fuel or has any other dangers)
5	Freeze/save your dash cam's video recording so it doesn't record over the crash.
6	Put on your high-vis vests, especially if it's dark, rainy or foggy.
7	Help your vehicle occupants get to a safe location.
8	Have someone call for the police and for an ambulance (if needed).
9	Check on the injuries and mental state of the individuals in the other car.
10	Set up some high-vis reflectors further back down the road 3m (10ft) and 30m (100ft) to warn other vehicles of the crash.
11	Take pictures and videos of the incident.
12	Move both vehicles to a safe location out of the flow of traffic.
13	Contact your insurer or a towing company of your choice to arrange for your vehicle to be towed. (if required)

MAN-MADE DISASTERS | Local Disasters | Air

14	Exchange details with the owner of the other vehicle and witnesses and leave the crash site.

2 Air Crash

A collision of any aircraft with the ground, sea, structure or another aircraft.

Crash Preparation

If you can reach the seat in front
● Feet Flat and Back: Place both feet flat on the floor, slightly behind your knees. This helps prevent your legs from flailing forward and impacting the seat in front.
● Bend Forward: Bend your upper torso well forward. The goal is to reduce the distance between your head and the seat in front.
● Head Against Seat in Front: Place your head against the backrest of the seat directly in front of you.
● Hands flat on the seat in front: Place hands flat to the left and right beside your head against the seat in front.
● Hands on top of your head: Place one hand on top of the other on the back of your head, tucking your elbows in. (Note: Some US airlines and the FAA advise against placing hands behind the neck due to potential spinal loading, suggesting hands on thighs or holding wrists instead).
● Holding ankles/lower legs: Some variations suggest bending forward and grasping your ankles or lower legs.

If you cannot reach the seat in front (e.g., bulkhead row, more legroom)
● Feet Flat and Back: Same as above.
● Bend Forward: Bend forward as much as possible, tucking your chin to your chest.
● Place your hands on top of your head, tucking elbows in.
● Bend forward and place your hands in your lap, or grasp the sides of your own seat.
● Bend forward and place arms at the sides of your lower legs or hold your lower legs.

For Rear-Facing Seats (less common for passengers)
● Slide well back into the seat with your back and head firmly against the backrest.
● Fasten your lap belt tightly.
● Cross your arms in front of your chest.
● Place your legs together, with lower legs flexed backward as far as possible, and only the tips of your toes on the floor.

Important Considerations
● Listen to the Cabin Crew: The flight attendants are trained for emergencies. They will shout commands like "Brace! Brace!" or "Heads down! Stay down!" and demonstrate the position. Follow their instructions immediately and precisely.
● Maintain the Position: Stay in the brace position until the aircraft has come to a complete stop and the crew tells you it's safe to move.
● Secure Loose Items: Any loose items can become dangerous projectiles during an impact. Ensure your carry-on luggage is properly stowed under the seat in front of you or in the overhead bin.
● Pillows/Blankets: Do not use pillows or blankets between your body and the bracing surface, as they offer little energy absorption and can increase injury risk.
● Child Restraint Systems: For young children, approved child restraint systems in their own seat offer the best protection. Follow the manufacturer's instructions for bracing with these devices.

After the Crash

Before Anything Else: Your Mindset
● Stay Calm (as much as possible): Panic is a killer. Take a deep breath. Focus on one step at a time.
● Listen: Listen for any instructions from the flight crew. They are trained for this.

Immediate Post-Impact Actions (The "30-Second Rule")
The first 90 seconds (often called the "30-second rule" which means 30 seconds to impact and 60 seconds after impact) are the most critical for survival.

1. Assess Yourself
● Are you injured? Can you move your limbs?
● Are you disoriented?
● Do you smell smoke or fuel?

2. Unfasten Your Seatbelt
This is crucial. If you're disoriented, locate the buckle and unfasten it immediately. Don't waste time looking for it.

3. Get Out Quickly
● Follow the Lighted Path: Aircraft floors have emergency lights that illuminate the path to the nearest exit. Follow them.
● Ignore Personal Belongings: Do NOT try to retrieve carry-on luggage or personal items. They will slow you down and endanger others. Your life is more valuable than any possession.
● Move Quickly, Not Frantically: Stay low if there's smoke. Crawl if necessary.
● Push Through Obstacles: If there's debris, try to move it. If there are people blocking the aisle, try to get around them, but do not push violently.
● Help Others (if safe and quick): If someone right next to you is clearly incapacitated or trapped, a quick assist is commendable, but your primary goal is to get yourself and others out of immediate danger. Do not become trapped yourself trying to free someone.
● Locate Exits: Look for the nearest emergency exit. Remember from the safety briefing that your nearest exit might be behind you.

Upon Reaching an Exit
1. Assess the Exit
● Look Outside: Check for fire, water, or other hazards outside before opening it or deploying a slide. If it's blocked or dangerous, change exits.
● Wait for Crew Instruction (if possible): Flight attendants are trained to open exits and deploy slides. Follow their lead.
● Open if Necessary: If the crew is incapacitated and the exit appears safe, open it yourself if you know how. Reviewing the safety card before the flight helps with this.

2. Use the Escape Slide (if present)
● Remove High Heels/Sharp Objects: If you are wearing high heels or have sharp objects in your pockets (like pens), remove them to avoid puncturing the slide.
● Slide Correctly: Sit at the edge, feet first, arms out in front, and slide down. Don't hesitate; others are behind you. Jump if told to.
● Clear the Area: Once you reach the ground, immediately move away from the aircraft to make room for others and to clear potential explosions.

MAN-MADE DISASTERS Local Disasters Air Crash After the Crash

After Evacuation (Once You Are Outside)
1. Move Upwind and Uphill:
Upwind: Get away from smoke and fumes.
Uphill: If the crash is on water, move to higher ground. If on land, it helps with visibility and avoiding any fuel spills that might flow downhill.
Maintain Distance: Move at least 500 feet (about 150 meters) away from the wreckage. Aircraft can explode or catch fire, and debris can fly.

2. Assemble at a Designated Meeting Point (if given)
The crew may direct survivors to a specific assembly point away from the wreckage. Stick together.

3. Render First Aid (if trained and able)
Once clear of immediate danger, if you have first aid knowledge, assist those who are injured. Use items from the plane's first aid kit if available, or improvise.

4. Signal for Help
Use any signaling devices you have (e.g., whistle from your life vest, mobile phone if it works and has signal).
Create large, visible signals on the ground if in a remote area.
Build a fire (carefully, away from wreckage) to create smoke if in a wilderness area and need to signal.

5. Stay with the Group
Unless you have a very clear and superior plan, stay with the other survivors. There is safety in numbers, and rescuers will be looking for a group.

6. Conserve Resources
If in a remote area, be mindful of water, food, and energy.

Things NOT to Do
- Don't Inflate Life Vest Inside: If the plane crashes into water, do NOT inflate your life vest until you are out of the aircraft. An inflated vest can trap you inside the cabin.
- Don't Re-enter the Aircraft: Never go back into the burning or damaged aircraft for any reason.
- Don't Panic: As stressed earlier, panic leads to irrational decisions.

3 Oil / Chemical Spill

A spill of oil or chemicals into the local environment.

Spill Preparation

After the Spill

4 Dam Failure

A dam failure is a catastrophic type of failure characterized by the sudden, rapid, and uncontrolled release of impounded water or the likelihood of such an uncontrolled release. A dam is a barrier across flowing water that obstructs, directs or slows down the flow, often creating a reservoir, lake or impoundments. Most dams have a section called a spillway or weir over or through which water flows, either intermittently or continuously, and some have hydroelectric power generation systems installed. Dams are considered "installations containing dangerous forces" under International humanitarian law due to the massive impact of a possible destruction on the civilian population and the environment.

Dam failures are comparatively rare, but can cause immense damage and loss of life when they occur. In 1975 the failure of the Banqiao Reservoir Dam and other dams in Henan Province, China caused more casualties than any other dam failure in history. The disaster killed an estimated 171,000 people and 11 million people lost their homes.

Main Causes of Failure
- Sub-standard construction materials/techniques
- Spillway design error
- Geological instability caused by changes to water levels during filling or poor surveying
- Sliding of a mountain into the reservoir
- Poor maintenance, especially of outlet pipes
- Extreme inflow
- Human, computer or design error
- Internal erosion or piping, especially in earthen dams
- Earthquakes
- Intentional destruction (Operation Chastise)

Dam Failures

Dam	Statistics	Reason For Failure
Sempor Dam Central Java Province, Republic of Indonesia	Failure Date: 1967 Fatalities: 2,000	Flash floods over-topped the dam during construction.
Banqiao and Shimantan Dams Zhumadian, China	Failure Date: 1975 Fatalities: 171,000	Extreme rainfall, beyond the planned design capability of the dam, dumped on China by Typhoon Nina. 11 million people lost their homes. Dam would later be rebuilt between 1986 and 1993.
Machchu-2 Dam Morbi, India	Failure Date: 1979 Fatalities: 5,000	Heavy rain and flooding beyond spillway capacity. Old estimates were 1,800–25,000 but a 2011 book by Sandesara & Wooten refined the bracket to 5,000–10,000.

Val di Stava Dam Tesero, Italy	Failure Date: 1985 Fatalities: 268	Poor maintenance and low margin for error in design; outlet pipes failed leading to pressure on dam.
Gusau Dam Gusau, Nigeria	Failure Date: 2006 Fatalities: 40	Heavy flooding. Approximately 500 homes were destroyed, displacing 1,000 people.
Koshi Barrage Koshi Zone, Nepal	Failure Date: 2008 Fatalities: 250	Neglect ion of barrage and the building of barrage itself. The region however saw weak monsoon and multi-year drought preceding the barrage failure. The flood affected over 2.3 million people in the northern part of Bihar.
Kyzyl-Agash Dam Qyzylaghash, Kazakhstan	Failure Date: 2010 Fatalities: 43	Heavy rain and snowmelt. 300 people were injured and over 1000 evacuated from the village.
Mount Polley Tailings Dam Failure British Columbia, Canada	Failure Date: 4 Aug 2014 Fatalities: 0	Tailings dam collapse due to negligent operation; reservoir was overfilled beyond design parameters despite repeated warnings of the danger combined with a minor dam breach a few months before and fundamental design flaws.
Germano Mine Tailings Dams Mariana, Minas Gerais, Brazil	Failure Date: 5 Nov 2015 Fatalities: 24	One tailings dam collapse. One village destroyed, 600 people evacuated, 19 missing. Sixty-million cubic meters of iron waste sludge polluted Doce River, and the sea near the river's mouth.
Patel Dam Solai, Kenya	Failure Date: 10 May 2018 Fatalities: 47	Failed after several days of heavy rain.
Xe-Pian Xe-Namnoy Dam Attapeu Province, Laos	Failure Date: 23 Jul 2018 Fatalities: 36	Saddle dam under construction collapsed during rainstorms. 6600 people homeless, 98 missing.

Dam Failure Preparation

During a Dam Failure

5 Blackout

A power outage (also called a power cut, power failure or a blackout) is a short-term or a long-term loss of the electric power to a particular area. There are many causes of power failures in an electricity network. Examples of these causes include faults at power stations, damage to electric transmission lines, substations or other parts of the distribution system, a short circuit, or the overloading of electricity mains. Power failures are particularly critical at sites where the environment and public safety are at risk. Institutions such as hospitals, sewage treatment plants, mines, shelters and the like will usually have backup power sources such as standby generators, which will automatically start up when electrical power is lost. Other critical systems, such as telecommunication, are also required to have emergency power. The battery room of a telephone exchange usually has arrays of lead–acid batteries for backup and also a socket for connecting a generator during extended periods of outage.

Failure Types

Power outages are categorized into three different phenomena, relating to the duration and effect of the outage:

Permanent Fault	A permanent fault is a massive loss of power typically caused by a fault on a power line. Power is automatically restored once the fault is cleared.
Brownout	A brownout is a drop in voltage in an electrical power supply. The term brownout comes from the dimming experienced by lighting when the voltage sags. Brownouts can cause poor performance of equipment or even incorrect operation.
Blackout	A blackout is the total loss of power to an area and is the most severe form of power outage that can occur. Blackouts which result from or result in power stations tripping are particularly difficult to recover from quickly. Outages may last from a few minutes to a few weeks depending on the nature of the blackout and the configuration of the electrical network.

Causes of Failure

These are the different causes of power failures and their different chances of occurring in descending order.

Type	Percentage Chance	Example
Weather	42%	Weather of all types besides "Acts of God".
Malfunction	28%	A malfunction at any point along the distribution circuit.
Unknown	10.20%	Shutdowns that are never understood why they happened.
Human Error	8.40%	Errors such as accidentally pressing the wrong button.
Acts of God	4.70%	Include earthquakes, floods, landslides, vehicle accidents, and wildfires.
Explosion/Sabotage	1.90%	Terrorism, explosions or sabotage which destroy power assets.
Cyber Attack	1.90%	A digital attack on the power network to disable or shut it down.
Intentional Shutdown	1.90%	Planned maintenance and other intentional shutdowns.

Demand Overload	0.90%	When demand becomes too high, the network can shut itself down to preserve itself.

Restoring Power

Restoring power after a wide-area outage can be difficult, as power stations need to be brought back on-line. Normally, this is done with the help of power from the rest of the grid. In the total absence of grid power, a so-called black start needs to be performed to bootstrap the power grid into operation. The means of doing so will depend greatly on local circumstances and operational policies, but typically transmission utilities will establish localized 'power islands' which are then progressively coupled together. To maintain supply frequencies within tolerable limits during this process, demand must be reconnected at the same pace that generation is restored, requiring close coordination between power stations, transmission and distribution organizations.

Blackout Preparation

1. Create a Blackout Kit / Emergency Kit if you don't already
- Lighting
- Communication
- Food and Water
- First Aid & Medications
- Sanitation and Hygiene
- Warmth/Comfort
- Financial & Important Documents

2. Prepare Your Home
- Unplug electronics: Disconnect sensitive electronics (TVs, computers, routers) to protect them from power surges when electricity is restored.
- Keep refrigerator/freezer closed: Every time you open the door, cold air escapes.
- Know how to open garage doors manually: If they are electric.
- Gas stove safety: If you have a gas stove, you might be able to light the burners manually with a match (check your model's instructions). Ensure good ventilation.
- Alternative cooking: A BBQ, camp stove, or portable propane burner can be used outdoors only for cooking. Never use charcoal grills or fuel-burning stoves indoors due to carbon monoxide risk.

Heating (if in cold climate)
- Dress in layers.
- Close off unused rooms.
- Insulate windows with blankets or plastic sheeting.
- Safe alternative heaters (e.g., propane or kerosene heaters designed for indoor use with proper ventilation and a carbon monoxide detector). Never use outdoor heaters indoors.
- Fireplace (if you have one) with a supply of dry wood.

Cooling (if in hot climate)
- Open windows at night if cooler, close them during the day to keep heat out.
- Stay on lower floors.
- Take cool baths or showers if water is available.
- Wear light, loose clothing.

3. Develop a Family Plan
- Emergency meeting point: A safe place to meet if family members are separated.
- Out-of-area contact: A relative or friend outside your immediate area that family members can contact if local lines are down.
- Roles and responsibilities: Who does what during an outage (e.g., checking on neighbors, gathering supplies).
- Practice: Periodically review your plan and kit.

4. Before a Predicted Blackout
- Charge all devices: Phones, laptops, power banks, rechargeable batteries.
- Fill vehicle fuel tanks: Gas stations often cannot pump fuel without power.
- Fill bathtubs with water: For flushing toilets or non-drinking needs.
- Get cash.
- Check on vulnerable neighbours or family members.

During a Blackout

1. Stay Calm and Assess the Situation
- Don't Panic: Take a deep breath. Blackouts are often temporary.
- Determine the Scope: Is it just your house, or the whole street/neighborhood? Look out a window. If your neighbors also have no power, it's a larger outage. If not, check your circuit breaker (but only if it's safe and you know how).
- Safety First: Before doing anything else, ensure no immediate hazards like fallen power lines (stay far away from these!), gas leaks (smell for gas, listen for hissing, if detected, leave immediately and call emergency services from outside), or exposed wires.

2. Turn Off and Unplug Appliances
- Prevent Surges: Disconnect sensitive electronics (computers, TVs, gaming consoles, routers) to protect them from damage when power is restored, as surges can occur.
- Prevent Overload: Turn off light switches and major appliances (stoves, ovens, heaters, air conditioners). Leave just one light on in a visible location (like a lamp in the living room) so you know when power returns. This also prevents an overload when the power comes back on.

3. Provide Lighting
- Flashlights & Headlamps: Immediately grab your pre-staged flashlights or headlamps. Use these for general illumination.
- Battery-Powered Lanterns: Good for lighting a whole room.
- Avoid Candles: While they seem like an easy solution, candles are a significant fire risk, especially in the dark where you might knock them over. If you must use them, never leave them unattended and keep them away from anything flammable.

4. Maintain Communication
- Conserve Phone Battery: Limit phone use to essential calls. Texting often uses less battery and can get through when calls can't.
- Power Banks: Use your pre-charged power banks for your mobile phone.
- Car Charger: If your car has fuel, you can use it to charge devices (run the engine outdoors for ventilation, never in an enclosed space like a garage due to carbon monoxide risk).
- Battery-Powered Radio: Tune into local news or emergency broadcasts for updates on the outage and any safety instructions.
- Written Contacts: Have a physical list of emergency numbers (utility company, emergency services, family, neighbors).

MAN-MADE DISASTERS | Local Disasters | Blackout | During a Blackout

5. Manage Food and Water
- Refrigerator/Freezer: Keep doors closed! An unopened refrigerator will keep food cold for about 4 hours. A full freezer can maintain its temperature for approximately 48 hours (24 hours if half-full).
- Coolers: Use a cooler with ice (if available) for highly perishable items you might need to access frequently.
- Prioritize Food: Eat perishable foods from the fridge first. Non-perishable items from your emergency kit should be consumed later if the outage is prolonged.
- Water: Use your stored drinking water. If you rely on an electric pump for water, use water from your pre-filled bathtubs or other containers for flushing toilets or non-drinking needs.

6. Stay Warm or Cool (Depending on Climate)
Cold Climate
- Layer Up: Wear multiple layers of clothing.
- Blankets/Sleeping Bags: Use them for warmth.
- Close Off Rooms: Concentrate your activities in one room to conserve heat. Close doors to unused rooms.
- Insulate Windows: Hang blankets over windows to trap heat.
- Safe Heating: Only use alternative heaters (e.g., propane heaters) that are specifically designed for indoor use and ensure proper ventilation. Crucially, have a working carbon monoxide detector. Never use outdoor grills or generators indoors.

Hot Climate
- Stay Hydrated: Drink plenty of water.
- Close Curtains/Blinds: Block out sunlight during the day.
- Open Windows at Night: If it's cooler outside at night, open windows to let air circulate. Close them again before the sun gets strong in the morning.
- Cool Showers/Baths: If water is available.
- Light Clothing: Wear loose, light-colored clothing.
- Go to Cooler Areas: If possible, move to the lowest level of your home, as heat rises.

7. Safety and Well-being
- Carbon Monoxide: Be extremely cautious with any fuel-burning appliances (generators, grills, camp stoves). Always use them outdoors and far away from windows and doors. Carbon monoxide is an odorless, colorless, deadly gas. Have battery-powered carbon monoxide detectors.
- Check on Others: Reach out to elderly, ill, or vulnerable neighbors and family members who might need assistance.
- Entertainment: Have non-electronic forms of entertainment ready: books, board games, cards. It's a good time for conversation!
- Rest: Get sufficient rest.

8. When Power Returns
- Gradual Reconnection: Wait a few minutes after power is restored before plugging in sensitive electronics. Turn on appliances one by one to avoid overwhelming the circuit.
- Food Safety Check: Inspect refrigerated and frozen food. If perishable food has been at 40°F (4°C) or above for more than 4 hours, or if frozen food ● has thawed completely and been warm for more than 2 hours, throw it out. "When in doubt, throw it out!"

Check on Neighbours: Ensure they're okay and their power has returned safely.

6 Nuclear Accident

MAN-MADE DISASTERS | Local Disasters | Nuclear Accident

A nuclear accident such as Fukushima or Chernobyl.

INES Levels

The International Nuclear and Radiological Event Scale (INES) was introduced in 1990 by the International Atomic Energy Agency (IAEA) in order to enable prompt communication of safety-significant information in case of nuclear accidents. The scale is intended to be logarithmic, similar to the moment magnitude scale that is used to describe the comparative magnitude of earthquakes. Each increasing level represents an accident approximately ten times more severe than the previous level. Compared to earthquakes, where the event intensity can be quantitatively evaluated, the level of severity of a man-made disaster, such as a nuclear accident, is more subject to interpretation.

INES Level	Classification	Description & Impact
0	Deviation	No safety significance.
1	Anomaly	Overexposure of a member of the public in excess of statutory annual limits. Minor problems with safety components with significant defence-in-depth remaining. Low activity lost or stolen radioactive source, device or transport package.
2	Incident	Exposure of a member of the public in excess of 10 mSv. Exposure of a worker in excess of the statutory annual limits. Impact on radiological barriers and control: Radiation levels in an operating area of more than 50 mSv/h. Significant contamination within the facility into an area not expected by design. Impact on defence-in-depth: Significant failures in safety provisions but with no actual consequences. Found highly radioactive sealed orphan source, device or transport package with safety provisions intact. Inadequate packaging of a highly radioactive sealed source.
3	Serious Incident	Exposure in excess of ten times the statutory annual limit for workers. Non-lethal deterministic health effect (e.g., burns) from radiation. Impact on radiological barriers and control: Exposure rates of more than 1 Sv/h in an operating area. Severe contamination in an area not expected by design, with a low probability of significant public exposure. Impact on defence-in-depth: Near-accident at a nuclear power plant with no safety provisions remaining. Lost or stolen highly radioactive sealed source. Misdelivered highly radioactive sealed source without adequate procedures in place to handle it.
4	Accident with Local Consequences	Minor release of radioactive material unlikely to result in implementation of planned countermeasures other than local food controls. At least one death from radiation. Impact on radiological barriers and control: Fuel melt or damage to fuel resulting in more than 0.1% release of core inventory. Release of significant quantities of radioactive material within an installation with a high probability of significant public exposure.

5	**Accident with Wider Consequences**	Limited release of radioactive material likely to require implementation of some planned countermeasures. Several deaths from radiation. Impact on radiological barriers and control: Severe damage to reactor core. Release of large quantities of radioactive material within an installation with a high probability of significant public exposure. This could arise from a major criticality accident or fire.
6	**Serious Accident**	Significant release of radioactive material likely to require implementation of planned countermeasures
7	**Major Accident**	Major release of radioactive material with widespread health and environmental effects requiring implementation of planned and extended countermeasures.

Notable Accidents

A table of the most notable nuclear accidents in history and their INES level.

Location & Date	INES Level	Description
Mayak, Kyshtym, Russia September 29, 1957	6	The Kyshtym disaster was a radiation contamination incident that occurred at Mayak, a Nuclear fuel reprocessing plant in the Soviet Union. Unknown dead.
Sellafield aka Windscale fire, Cumberland, United Kingdom October 10, 1957	5	A fire at the British atomic bomb project destroyed the core and released an estimated 740 terabecquerels of iodine-131 into the environment. A rudimentary smoke filter constructed over the main outlet chimney successfully prevented a far worse radiation leak and ensured minimal damage. 0 Dead
Idaho Falls, Idaho, United States January 3, 1961	4	Explosion at SL-1 prototype at the National Reactor Testing Station. All 3 operators were killed when a control rod was removed too far. 3 Dead
Lucens reactor, Vaud, Switzerland January 21, 1969	5	On January 21, 1969, it suffered a loss-of-coolant accident, leading to a partial core meltdown and massive radioactive contamination of the cavern, which was then sealed. 0 Dead
Jaslovské Bohunice, Czechoslovakia January 5, 1976	4	Malfunction during fuel replacement. Fuel rod ejected from reactor into the reactor hall by coolant (CO2). 2 Dead
Jaslovské Bohunice, Czechoslovakia February 22, 1977	4	Severe corrosion of reactor and release of radioactivity into the plant area, necessitating total decommission. 0 Dead
Three Mile Island, Pennsylvania, United States March 28, 1979	5	Loss of coolant and partial core meltdown due to operator errors. There is a small release of radioactive gases. See also Three Mile Island accident health effects. 0 Dead
Chernobyl April 26, 1986	7	Overheating, steam explosion, fire, and meltdown, necessitating the evacuation of 300,000 people from Chernobyl and dispersing radioactive material across Europe. 64 + 4,000 Dead.
Ibaraki Prefecture, Japan September 30, 1999	4	Tokaimura nuclear accident killed two workers, and exposed one more to radiation levels above permissible limits. 2 Dead.
Fukushima, Japan March 11, 2011	7	A tsunami flooded and damaged the plant's 5 active reactors, drowning two workers. Loss of backup electrical power led to overheating, meltdowns, and evacuations. One man died suddenly while carrying equipment during the clean-up. The plant's 6th reactor was inactive at the time. 2+ Dead.

Nuclear Accident Preparation

Develop an Emergency Plan
- Evacuation vs. Shelter-in-Place: Know the difference. Official instructions will tell you which to do.
- Evacuation: Leaving the area before fallout arrives.
- Shelter-in-Place: Staying indoors in a protected space during and immediately after fallout arrives.
- Designated Shelters: Identify the strongest, most interior part of your home (e.g., basement, inner room with no windows). This will be your fallout shelter.
- Meeting Points: Establish an out-of-area contact person and a meeting place for family members if separated.
- Pet Plan: Include plans for your pets' safety.

Prepare a Comprehensive Emergency Kit (Go-Bag & Shelter-in-Place Kit)
Your standard emergency kit is a great start, but a nuclear event requires specific additions:

Communication
- Battery-powered or Hand-crank Radio: Crucial for official emergency broadcasts (AM/FM, NOAA weather radio if applicable to your country).
- Whistle: For signaling for help.
- Fully Charged Mobile Phones & Power Banks: For initial communication, but expect networks to be overwhelmed or down.

Shelter-in-Place Specifics
- Duct Tape & Plastic Sheeting: To seal windows, doors, and vents in your designated fallout shelter to prevent airborne particles from entering.
- Portable Air Filter (HEPA-rated): If available, for your shelter space.

Personal Protection
- N95/P100 Masks: Or other effective respiratory protection to filter radioactive particles from the air.
- Eye Protection: Goggles or safety glasses.
- Gloves: Heavy-duty work gloves.
- Full-Body Coverings: Rain gear, overalls, or extra clothing (e.g., long-sleeved shirts, pants) that can be easily removed and disposed of.

Medical
- Standard First Aid Kit: Enhanced with any specific prescription medications (multi-week supply if possible).
- Potassium Iodide (KI) Tablets: Only take these if instructed by public health authorities. KI protects the thyroid gland from absorbing radioactive iodine, which is often a component of fallout. It does not protect against other radioactive elements. Store in a cool, dark place.

Food and Water
- Non-perishable food: At least a 2-week supply for shelter-in-place (more is better). Focus on items that require no cooking or refrigeration.
- Water: At least 4 litres per person per day for drinking and sanitation, stored in sealed containers. Have extra for decontamination.
- Manual Can Opener.

Sanitation & Hygiene
- Wet Wipes, Hand Sanitizer: For cleaning when water is scarce.
- Garbage Bags & Twist Ties: For waste disposal and potentially for sealing off contaminated clothing.
- Buckets with lids: For an emergency toilet.

Tools & Miscellaneous
- Multi-tool/Knife.
- Map of your area.
- Cash in small denominations.
- Pet supplies: Food, water, carrier, leash.

Strengthen Your Designated Fallout Shelter
- Location: The best protection is usually in the center of a basement or an interior room on a ground floor in a building with thick walls. The denser the material, the more radiation it blocks.
- Supplies: Stock your shelter with your kit items, and also:
- Water for flushing and washing.
- Books, games, or other activities to pass the time.
- Battery-powered fan for ventilation (if safe to use without drawing in outside air).
- Practice Sealing: Know how to quickly seal doors, windows, and vents with duct tape and plastic sheeting if instructed.

Stay Informed and Know Your Local Authority
- Identify Official Sources: Know the emergency management agency for your area.
- Emergency Alert Systems: Understand how emergency alerts are disseminated in your area (e.g., sirens, SMS alerts, radio broadcasts).

During a Nuclear Accident

What to Do During a Nuclear Accident (General Steps if one were to occur)
- Seek Immediate Shelter: Get inside the nearest substantial building. Do not stay outdoors.
- Go to Your Designated Fallout Shelter: The most interior part of your home, away from windows.
- Seal the Shelter: Close all windows and doors. Turn off fans, air conditioners, and forced-air heating systems that draw in outside air. Use duct tape and plastic sheeting to seal gaps around doors and windows.
- Stay Tuned: Listen to your battery-powered radio for official instructions (shelter-in-place duration, evacuation routes, safety information).
- Stay Inside: Remain in your shelter until authorities say it's safe to leave. This could be for 24-72 hours or longer, depending on the severity and type of event.
- Decontaminate (Upon Entering Shelter): If you were outside during fallout, immediately remove outer layers of clothing before entering your shelter or an inner room. Place contaminated clothing in a sealed plastic bag. Take a shower if possible, washing skin and hair with soap and water (avoid scrubbing).
- Conserve Resources: Ration food and water.

Post-Accident Considerations
- Decontamination: Follow official guidance on how to decontaminate your home and belongings.
- Mental Health: A nuclear event can be extremely traumatic. Be aware of the psychological impacts and seek support if needed.
- Long-Term Planning: Be prepared for potential disruptions to infrastructure, food supplies, and daily life for an extended period.

3 Disease

A disease is a particular abnormal condition that negatively affects the structure or function of part or all of an organism, and that is not due to any external injury. Diseases are often construed as medical conditions that are associated with specific symptoms and signs. A disease may be caused by external factors such as pathogens or by internal dysfunctions. For example, internal dysfunctions of the immune system can produce a variety of different diseases, including various forms of immunodeficiency, hypersensitivity, allergies and autoimmune disorders. In humans, disease is often used more broadly to refer to any condition that causes pain, dysfunction, distress, social problems, or death to the person afflicted, or similar problems for those in contact with the person.

In this broader sense, it sometimes includes injuries, disabilities, disorders, syndromes, infections, isolated symptoms, deviant behaviours, and atypical variations of structure and function, while in other contexts and for other purposes these may be considered distinguishable categories. Diseases can affect people not only physically, but also mentally, as contracting and living with a disease can alter the affected person's perspective on life.

Pandemic

A pandemic is an epidemic of infectious disease that has spread across a large region; for instance multiple continents, or even worldwide. A widespread endemic disease that is stable in terms of how many people are getting sick from it is not a pandemic. Further, flu pandemics generally exclude recurrences of seasonal flu. Throughout history, there have been a number of pandemics, such as smallpox and tuberculosis. One of the most devastating pandemics was the Black Death, which killed over 75 million people in 1350. The most recent pandemics include the HIV pandemic as well as the 1918 and 2009 H1N1 pandemics. Diseases are labelled as man-made as the host typically spreads the disease, often without realizing. Humans have also created a vast array of diseases for the purpose of war, eliminating a type of people or simple because they can.

A pandemic is an epidemic occurring on a scale which crosses international boundaries, usually affecting a large number of people. Pandemics can also occur in important agricultural organisms (livestock, crop plants, fish, tree species) or in other organisms. The World Health Organization (WHO) has a six-stage classification that describes the process by which a novel influenza virus moves from the first few infections in humans through to a pandemic. This starts with the virus mostly infecting animals, with a few cases where animals infect people, then moves through the stage where the virus begins to spread directly between people, and ends with a pandemic when infections from the new virus have spread worldwide and it will be out of control until we stop it. A disease or condition is not a pandemic merely because it is widespread or kills many people; it must also be infectious. For instance, cancer is responsible for many deaths but is not considered a pandemic because the disease is not infectious or contagious.

Current Pandemics
HIV originated in Africa, and spread to the United States via Haiti between 1966 and 1972. AIDS is currently a pandemic, with infection rates as high as 25% in southern and eastern Africa. In 2006, the HIV prevalence rate among pregnant women in South Africa was 29.1%. Effective education about safer sexual practices and bloodborne infection precautions training have helped to slow down infection rates in several African countries sponsoring national education programs. Infection rates are rising again in Asia and the Americas. The AIDS death toll in Africa may reach 90–100 million by 2025.

Notable Pandemics

There have been a number of significant pandemics recorded in human history, generally zoonoses which came about with the domestication of animals, such as influenza and tuberculosis. There have been a number of particularly significant epidemics that deserve mention above the "mere" destruction of cities.

Plague of Athens 430 BC	430 BC. Possibly typhoid fever killed a quarter of the Athenian troops, and a quarter of the population over four years. This disease fatally weakened the dominance of Athens, but the sheer virulence of the disease prevented its wider spread; i.e. it killed off its hosts at a rate faster than they could spread it. The exact cause of the plague was unknown for many years. In January 2006, researchers from the University of Athens analysed teeth recovered from a mass grave underneath the city, and confirmed the presence of bacteria responsible for typhoid.
Antonine Plague 165–180 AD	Possibly smallpox brought to the Italian peninsula by soldiers returning from the Near East; it killed a quarter of those infected, and up to five million in all. At the height of a second outbreak, the Plague of Cyprian (251–266), which may have been the same disease, 5,000 people a day were said to be dying in Rome.
Plague of Justinian From 541 to 750	This was the first recorded outbreak of the bubonic plague. It started in Egypt, and reached Constantinople the following spring, killing (according to the Byzantine chronicler Procopius) 10,000 a day at its height, and perhaps 40% of the city's inhabitants. The plague went on to eliminate a quarter to a half of the human population that it struck throughout the known world. It caused Europe's population to drop by around 50% between 550 AD and 700 AD.
Black Death From 1331 to 1353	The total number of deaths worldwide is estimated at 75 million people. Eight hundred years after the last outbreak, the plague returned to Europe. Starting in Asia, the disease reached Mediterranean and western Europe in 1348 (possibly from Italian merchants fleeing fighting in Crimea), and killed an estimated 20 to 30 million Europeans in six years; a third of the total population, and up to a half in the worst-affected urban areas. It was the first of a cycle of European plague epidemics that continued until the 18th century. There were more than 100 plague epidemics in Europe in this period.
The Third Plague Pandemic Started in 1855	Began in China and spread to India, where 10 million people died. During this pandemic, the United States saw its first outbreak: the San Francisco plague of 1900–1904. Today, isolated cases of plague are still found in the western United States.

Previous Threats

Cholera	Since it became widespread in the 19th century, cholera has killed tens of millions of people. ● 1846–1860 cholera pandemic. Deeply affected Russia, with over a million deaths. A two-year outbreak began in England and Wales in 1848 and claimed 52,000 lives. Throughout Spain, cholera caused more than 236,000 deaths in 1854–55. It claimed 200,000 lives in Mexico. ● In 1866, there was an outbreak in North America. It killed some 50,000 Americans. ● In 1892, cholera contaminated the water supply of Hamburg, and caused 8,606 deaths. ● 1899–1923 cholera pandemic. Had little effect in Europe because of advances in public health, but Russia was badly affected again (more than 500,000 people dying of cholera during the first quarter of the 20th century). The sixth pandemic killed more than 800,000 in India. The 1902–1904 cholera epidemic claimed over 200,000 lives in the Philippines. ● 1961–75 cholera pandemic. Began in Indonesia, called El Tor after the new biotype responsible for the pandemic, and reached Bangladesh in 1963, India in 1964, and the Soviet Union in 1966. Since then the pandemic has reached Africa, South America, and central America.
Influenza	The Greek physician Hippocrates, the "Father of Medicine", first described influenza in 412 BC. The first influenza pandemic was recorded in 1580, and since then, influenza pandemics occurred every 10 to 30 years. ● The 1889–1890 flu pandemic, also known as Russian Flu, was first reported in May 1889 in Bukhara, Uzbekistan. By October, it had reached Tomsk and the Caucasus. It rapidly spread west and hit North America in December 1889, South America in February–April 1890, India in February–March 1890, and Australia in March–April 1890. The H3N8 and H2N2 subtypes of the Influenza A virus have each been identified as possible causes. It had a very high attack and mortality rate, causing around a million fatalities. ● The "Spanish flu", 1918–1919. First identified early in March 1918 in US troops training at Camp Funston, Kansas. By October 1918, it had spread to become a worldwide pandemic on all continents, and eventually infected about one-third of the world's population (or ≈500 million persons). Unusually deadly and virulent, it ended nearly as quickly as it began, vanishing completely within 18 months.

● The "Asian Flu", 1957–58. An H2N2 virus caused about 70,000 deaths in the United States. First identified in China in late February 1957, the Asian flu spread to the United States by June 1957. It caused about 2 million deaths globally.
● The "Hong Kong Flu", 1968–69. An H3N2 caused about 34,000 deaths in the United States. This virus was first detected in Hong Kong in early 1968, and spread to the United States later that year. This pandemic of 1968 and 1969 killed approximately one million people worldwide.
● Influenza A (H3N2) viruses still circulate today.

Typhus	Typhus is sometimes called "camp fever" because of its pattern of flaring up in times of strife. (It is also known as "gaol fever" and "ship fever", for its habits of spreading wildly in cramped quarters, such as jails and ships.) Emerging during the Crusades, it had its first impact in Europe in 1489, in Spain. During fighting between the Christian Spaniards and the Muslims in Granada, the Spanish lost 3,000 to war casualties, and 20,000 to typhus. In 1528, the French lost 18,000 troops in Italy, and lost supremacy in Italy to the Spanish. In 1542, 30,000 soldiers died of typhus while fighting the Ottomans in the Balkans. During the Thirty Years' War (1618–1648), about 8 million Germans were killed by bubonic plague and typhus. The disease also played a major role in the destruction of Napoleon's Grande Armée in Russia in 1812. During the retreat from Moscow, more French military personnel died of typhus than were killed by the Russians. Of the 450,000 soldiers who crossed the Neman on 25 June 1812, fewer than 40,000 returned. More military personnel were killed from 1500–1914 by typhus than from military action. In early 1813, Napoleon raised a new army of 500,000 to replace his Russian losses. In the campaign of that year, over 219,000 of Napoleon's soldiers died of typhus.

Typhus played a major factor in the Irish Potato Famine. During World War I, typhus epidemics killed over 150,000 in Serbia. There were about 25 million infections and 3 million deaths from epidemic typhus in Russia from 1918 to 1922. Typhus also killed numerous prisoners in the Nazi concentration camps and Soviet prisoner of war camps during World War II. More than 3.5 million Soviet POWs died out of the 5.7 million in Nazi custody.

Smallpox	Smallpox was a contagious disease caused by the variola virus. The disease killed an estimated 400,000 Europeans per year during the closing years of the 18th century. During the 20th century, it is estimated that smallpox was responsible for 300–500 million deaths. As recently as the early 1950s, an estimated 50 million cases of smallpox occurred in the world each year. After successful vaccination campaigns throughout the 19th and 20th centuries, the WHO certified the eradication of smallpox in December 1979. To this day, smallpox is the only human infectious disease to have been completely eradicated, and one of two infectious viruses ever to be eradicated.

Measles	Historically, measles was prevalent throughout the world, as it is highly contagious. According to the U.S. National Immunization Program, 90% of people were infected with measles by age 15. Before the vaccine was introduced in 1963, there were an estimated 3–4 million cases in the U.S. each year. Measles killed around 200 million people worldwide over the last 150 years. In 2000 alone, measles killed some 777,000 worldwide out of 40 million cases globally. Measles is an endemic disease, meaning that it has been continually present in a community, and many people develop resistance. In populations that have not been exposed to measles, exposure to a new disease can be devastating. In 1529, a measles outbreak in Cuba killed two-thirds of the natives who had previously survived smallpox. The disease had ravaged Mexico, Central America, and the Inca civilization.
Tuberculosis	One-third of the world's current population has been infected with Mycobacterium tuberculosis, and new infections occur at a rate of one per second. About 5–10% of these latent infections will eventually progress to active disease, which, if left untreated, kills more than half of its victims. Annually, 8 million people become ill with tuberculosis, and 2 million people die from the disease worldwide. In the 19th century, tuberculosis killed an estimated one-quarter of the adult population of Europe; by 1918, one in six deaths in France were still caused by tuberculosis. During the 20th century, tuberculosis killed approximately 100 million people. TB is still one of the most important health problems in the developing world.
Leprosy	Leprosy, also known as Hansen's disease, is caused by a bacillus, Mycobacterium leprae. It is a chronic disease with an incubation period of up to five years. Since 1985, 15 million people worldwide have been cured of leprosy. Historically, leprosy has affected people since at least 600 BC. Leprosy outbreaks began to occur in Western Europe around 1000 AD. Numerous leprosaria, or leper hospitals, sprang up in the Middle Ages; Matthew Paris estimated that in the early 13th century, there were 19,000 of them across Europe.
Malaria	Malaria is widespread in tropical and subtropical regions, including parts of the Americas, Asia, and Africa. Each year, there are approximately 350–500 million cases of malaria. Drug resistance poses a growing problem in the treatment of malaria in the 21st century, since resistance is now common against all classes of antimalarial drugs, except for the artemisinins. Malaria was once common in most of Europe and North America, where it is now for all purposes non-existent. Malaria may have contributed to the decline of the Roman Empire. The disease became known as "Roman fever". Plasmodium falciparum became a real threat to colonists and indigenous people alike when it was introduced into the Americas along with the slave trade. Malaria devastated the Jamestown colony and regularly ravaged the South and Midwest of the United States. By 1830, it had reached the Pacific Northwest. During the American Civil War, there were over 1.2 million cases of malaria among soldiers of both sides. The southern U.S. continued to be afflicted with millions of cases of malaria into the 1930s.
Yellow Fever	Yellow fever has been a source of several devastating epidemics. Cities as far north as New York, Philadelphia, and Boston were hit with epidemics. In 1793, one of the largest yellow fever epidemics in U.S. history killed as many as 5,000 people in Philadelphia—roughly 10% of the population. About half of the residents had fled the city, including President George Washington. In colonial times, West Africa became known as "the white man's grave" because of malaria and yellow fever.
Ebola Virus	The Western African Ebola virus epidemic (2013–2016) was the most widespread outbreak of Ebola virus disease (EVD) in history—causing major loss of life and socioeconomic disruption in the region, mainly in the countries of Guinea, Liberia, and Sierra Leone. The first cases were recorded in Guinea in December 2013; later, the disease spread to neighbouring Liberia and Sierra Leone, with minor outbreaks occurring elsewhere. It caused significant mortality, with the case fatality rate reported which was initially considerable, while the rate among hospitalized patients was 57–59%, the final numbers 28,616 people, including 11,310 deaths, for a case-fatality rate of 40%. The number of cases peaked in October 2014 and then began to decline gradually, following the commitment of substantial international resources. As of 8 May 2016, the World Health Organization (WHO) and respective governments reported a total of 28,646 suspected cases and 11,323 deaths (39.5%), though the WHO believes that this substantially understates the magnitude of the outbreak. The outbreak left about 17,000 survivors of the disease, many of whom report post-recovery symptoms termed post-Ebola syndrome, often severe enough to require medical care for months or even years.
	An additional cause for concern is the apparent ability of the virus to "hide" in a recovered survivor's body for an extended period of time and then become active months or years later, either in the same individual or in a sexual partner. In December 2016, the WHO announced that a two-year trial of the rVSV-ZEBOV vaccine appeared to offer protection from the variant of EBOV responsible for the Western Africa outbreak. The vaccine has not yet been given regulatory approval, but it is considered to be effective and is the only prophylactic which offers protection hence 300,000 doses have been stockpiled.
Zika Virus	In early 2015, a widespread epidemic of Zika fever, caused by the Zika virus in Brazil, spread to other parts of South and North America. It also affected several islands in the Pacific, and Southeast Asia. In January 2016, the World Health Organization (WHO) said the virus was likely to spread throughout most of the Americas by the end of the year. In November 2016 WHO announced the end of the Zika epidemic. In February 2016, WHO declared the outbreak a Public Health Emergency of International Concern as evidence grew that Zika can cause birth defects as well as neurological problems. The virus can be transmitted from an infected pregnant woman to her fetus, then can cause microcephaly and other severe brain anomalies in the infant. Zika infections in adults can result in Guillain–Barré syndrome. Prior to this outbreak, Zika was considered a mild infection, as most Zika virus infections are asymptomatic, making it difficult to determine precise estimates of the number of cases. In approximately one in five cases, Zika virus infections result in Zika fever, a minor illness that causes symptoms such as fever and a rash.
	The virus is spread mainly by the Aedes aegypti mosquito, which is commonly found throughout the tropical and subtropical Americas. It can also be spread by the Aedes albopictus ("Asian tiger") mosquito, which is distributed as far north as the Great Lakes region in North America. Men infected with Zika can transmit the virus to their sexual partners. A number of countries have issued travel warnings, and the outbreak is expected to reduce tourism significantly. Several countries have taken the unusual step of advising their citizens to delay pregnancy until more is known about the virus and its impact on fetal development. Furthermore, the outbreak raised concerns regarding the safety of athletes and spectators at the 2016 Summer Olympics in Rio de Janeiro.

Future Threats

Viral Hemorrhagic Fevers	Viral hemorrhagic fevers such as Ebola virus disease, Lassa fever virus, Rift Valley fever, Marburg virus and Bolivian hemorrhagic fever are highly contagious and deadly diseases, with the theoretical potential to become pandemics. Their ability to spread efficiently enough to cause a pandemic is limited, however, as transmission of these viruses requires close contact with the infected vector, and the vector only has a short time before death or serious illness. Furthermore, the short time between a vector becoming infectious and the onset of symptoms allows medical professionals to quickly quarantine vectors, and prevent them from carrying the pathogen elsewhere. Genetic mutations could occur, which could elevate their potential for causing widespread harm; thus close observation by contagious disease specialists is merited.

Antibiotic Resistance	Antibiotic-resistant microorganisms, sometimes referred to as "superbugs", may contribute to the re-emergence of diseases which are currently well controlled. For example, cases of tuberculosis that are resistant to traditionally effective treatments remain a cause of great concern to health professionals. Every year, nearly half a million new cases of multidrug-resistant tuberculosis (MDR-TB) are estimated to occur worldwide. China and India have the highest rate of multidrug-resistant TB. The World Health Organization (WHO) reports that approximately 50 million people worldwide are infected with MDR TB, with 79 percent of those cases resistant to three or more antibiotics. In 2005, 124 cases of MDR TB were reported in the United States. Extensively drug-resistant tuberculosis (XDR TB) was identified in Africa in 2006, and subsequently discovered to exist in 49 countries, including the United States. There are about 40,000 new cases of XDR-TB per year, the WHO estimates.

In the past 20 years, common bacteria including Staphylococcus aureus, Serratia marcescens and Enterococcus, have developed resistance to various antibiotics such as vancomycin, as well as whole classes of antibiotics, such as the aminoglycosides and cephalosporins. Antibiotic-resistant organisms have become an important cause of healthcare-associated (nosocomial) infections (HAI). In addition, infections caused by community-acquired strains of methicillin-resistant Staphylococcus aureus (MRSA) in otherwise healthy individuals have become more frequent in recent years.

SARS	In 2003 the Italian physician Carlo Urbani (1956–2003) was the first to identify severe acute respiratory syndrome (SARS) as a new and dangerously contagious disease, although he became infected and died. It is caused by a coronavirus dubbed SARS-CoV. Rapid action by national and international health authorities such as the World Health Organization helped to slow transmission and eventually broke the chain of transmission, which ended the localized epidemics before they could become a pandemic. However, the disease has not been eradicated. It could re-emerge. This warrants monitoring and reporting of suspicious cases of atypical pneumonia.
Influenza	Wild aquatic birds are the natural hosts for a range of influenza A viruses. Occasionally, viruses are transmitted from these species to other species, and may then cause outbreaks in domestic poultry or, rarely, in humans.
H5N1 (Avian Flu)	In February 2004, avian influenza virus was detected in birds in Vietnam, increasing fears of the emergence of new variant strains. It is feared that if the avian influenza virus combines with a human influenza virus (in a bird or a human), the new subtype created could be both highly contagious and highly lethal in humans. Such a subtype could cause a global influenza pandemic, similar to the Spanish flu, or the lower mortality pandemics such as the Asian Flu and the Hong Kong Flu. From October 2004 to February 2005, some 3,700 test kits of the 1957 Asian Flu virus were accidentally spread around the world from a lab in the US. In May 2005, scientists urgently called upon nations to prepare for a global influenza pandemic that could strike as much as 20% of the world's population. Avian flu cannot yet be categorized as a "pandemic", because the virus cannot yet cause sustained and efficient human-to-human transmission.

Cases so far are recognized to have been transmitted from bird to human, but as of December 2006, there have been very few (if any) cases of proven human-to-human transmission. Regular influenza viruses establish infection by attaching to receptors in the throat and lungs, but the avian influenza virus can only attach to receptors located deep in the lungs of humans, requiring close, prolonged contact with infected patients, and thus limiting person-to-person transmission.

Zika Virus	An outbreak of Zika virus began in 2015 and strongly intensified throughout the start of 2016, with over 1.5 million cases across more than a dozen countries in the Americas. The World Health Organisation warned that Zika had the potential to become an explosive global pandemic if the outbreak was not controlled.

Pandemic Supplies

The recommended supplies to have in a pandemic situation.

Plastic Sheeting	One of the most important items to have an abundance of in the home. It can do things as simple as separate a few rooms to becoming a way to safely transport those who have died from the pandemic. The sheeting can also be used to cover windows and doors if the pandemic gets out of hand. Have at least 200' for all your needs.
Disposable Gloves	These should be used all the time in a pandemic situation especially when handling food or items which a sick person has touched.
Disposable Foot Protection	These can cover your feet or go over your shoes to help prevent viruses settling on you if you enter a hazardous location.
Disposable Aprons	Helps in protecting the wearers front from a patient who is commonly sneezing or any other form of moving pathogens.
N95 Respirator Masks	These help to prevent pathogens from being breathed in via the nose or mouth.
Antiviral Masks	These help to prevent pathogens from being breathed in via the nose or mouth but are designed particularly against viruses.
Eye Protection	Helps protect your eyes from airborne viruses and other pathogens in the air.
Thermometers	Used to monitor fevers of patients.
Soap	A basic component of any hygiene or pandemic kit which will assist in keeping your body clean and virus free,
Antibacterial Soap	Hand washing should be a frequent component of any pandemic and this will help kill bacteria.
Duct Tape	Duct tape can be used to help seal off rooms with the plastic sheeting and other gaps that may be locate around the house.
Throat Lozenge	Used to help kill germs in the throat and to prevent tonsillitis.
Electrolytes	Helps the absorption of water into the body and provides some essential minerals the body needs.
Vitamin C	Always handy for any sickness.
Echinacea	Echinacea activates chemicals in the body that decrease inflammation, which reduce cold and flu symptoms.
Water Storage	Large amounts of water will be used in a pandemic to wash and clean people, rooms and for general drinking and cooking uses.
Water Filter	A heavy duty water filter should be owned as a backup to your water supply. Ensure it filters out pathogens such as viruses.
Biohazard Bags	A biohazard bag provides a high density isolation liner to provide maximum film strength for tough applications. They also feature star seal bottoms which allow equal weight distribution and leak resistance. Additionally, bags are red to indicate use for infectious waste or hazardous waste to warn others. The red infectious waste bags, right, are for the contagion that you'll want to burn to help stop the pandemic.

Vomit (Emesis) Bags	Bags which one can vomit into and are quite portable.
Indoor Trash Bags	Used for disposing non biohazard waste.
Facial Tissues	Used for wiping fluids, blowing your nose etc.
Tyvek Suit	A whole suit designed to resist bacteria and viruses and should be used when entering a hazardous zone or room.
Bodily Fluids Cleanup Kit	Used to clean up spread bodily fluids which are potentially contaminated like blood, urine or snot.
Air Filter Pump	If a room is sealed off to prevent the ingress of viruses you will need an air filter pump to bring fresh air into the room which has been filtered of all pathogens.
Face Shields	Unlike face masks these are thin pieces of cotton to help keep the germs of a sick person on themselves, such as when they sneeze.
Antidiarrheal	Helps to prevent diarrhoea.
Antiseptics	Kills pathogens in open wounds and cuts which is one of the easiest ways for viruses to enter the body.
The Survival Medicine Handbook	An extremely useful book for how to handle medical situations when there's no doctor nearby or you are in a remote location.
The Doomsday Book of Medicine	Another great book of medicine when there's no doctor around.

Case Fatality Rate

A case fatality rate (CFR) — sometimes called case fatality risk or case fatality ratio — is the proportion of deaths from a certain disease compared to the total number of people diagnosed with the disease for a certain period of time. A CFR is conventionally expressed as a percentage and represents a measure of disease severity. CFRs are most often used for diseases with discrete, limited time courses, such as outbreaks of acute infections. A CFR can only be considered final when all the cases have been resolved (either died or recovered). The preliminary CFR, for example, during the course of an outbreak with a high daily increase and long resolution time would be substantially lower than the final CFR.

- The CFR for the Spanish (1918) flu was >2.5%, but about 0.1% for the Asian (1956-58) and Hong Kong (1968-69) flus, and <0.1% for other influenza pandemics.
- Legionnaires' disease has a CFR of ≈15%.
- Yellow fever, even with treatment, has CFRs in the range of 20-50%.
- Bubonic plague has the best prognosis of the three main variants of plague, but if left untreated, has a CFR >60%.
- Ebola virus is among the deadliest viruses, with a CFR as high as 90%.
- Naegleriasis (also known as primary amoebic meningoencephalitis), caused by the unicellular Naegleria fowleri (a.k.a. the brain-eating amoeba), nearly always results in death, and so has a CFR >99%.
- Rabies virus is almost invariably fatal if left untreated, and so has a CFR approaching 100%; however, patients generally respond well to prompt, same-day treatment.
- Prion diseases are progressive and always fatal, regardless of treatment.

Disease	Treatment	CFR	Notes
Transmissible Spongiform Encephalopathies	Currently Incurable	100%	Includes Creutzfeldt–Jakob disease and all its variants, fatal familial insomnia, kuru, Gerstmann–Sträussler–Scheinker syndrome and others.
African Trypanosomiasis	Untreated	~100%	
Visceral Leishmaniasis	Untreated	~100%	
Fibrodysplasia Ossificans Progressiva	Currently Incurable	~100%	Death almost always results from complications of FOP, life expectancy is about 40 years
Tay–Sachs Disease (pre-adult)	Currently Incurable	~100%	Even with the most high quality care, infants with Tay–Sachs disease usually die within a few years of displaying the first symptoms. Juvenile with the disease are likely to die from the ages 5–15, while those who develop the disease as adults will probably be largely unaffected.
Primary Amoebic Meningoencephalitis, Naegleria Fowleri	Untreated	~99%	Amphotericin B has shown efficacy in the limited survivorship population. Around 7 documented survivors
Rabies	Untreated	~99%	Preventable with vaccines down to ~0% CFR and treatable with PEP but, once the symptoms manifest, the CFR is near 100%. Around 16 documented survivors after symptom onset, all but 3 did not receive any Rabies (specific) treatment at any time before symptom onset. Of those 3, only 1 survived without the use of a therapeutic coma
Balamuthia	Opportunistic & Untreated	~99%	2 survivors, both have permanent brain damage.
Glanders, Septicemic	Untreated	0.95	The rate drops significantly to >50% with treatment.
Smallpox Variola Major Specifically the Malignant (flat) or Hemorrhagic type	Untreated	~95%	The rate drops significantly to 10% with effective treatments. Eradicated.
Ebola Virus Disease – Specifically EBOV	Untreated & Unvaccinated	83–90%	Prognosis improved by early supportive treatments as seen in the West African epidemic and the Kivu outbreak.
AIDS/HIV Infection	Untreated	80–90%	Data are counted during the first 5 years of infection in developed countries. HIV is not lethal on its own but patients are usually killed by respiratory diseases, such as flu or pneumonia because of immunodeficiency caused by HIV virus.
Anthrax, Specifically the Pulmonary Form	Untreated & Unvaccinated	>85%	Early treatments lower the CFR to 45% as seen in the 2001 AMERITHRAX letter attacks. Monoclonal antibodies (Obilotoxaximab & Raxibacumab) could lower this further.
Macanine Alphaherpesvirus 1	Untreated	~80%	Early treatment including aciclovir can improve prognosis.

Aspergillosis Invasive Pulmonary Form	Opportunistic w/COPD, Tuberculosis and Immunocompromised	50–90%	
Smallpox, Variola Major (In Pregnant Women)	Unvaccinated	>65%	
Cryptococcal Meningitis	Co-infection with HIV	40–60%	6 month mortality is >=60% with fluconazole-based therapy and 40% with amphotercin-based therapy in research studies in low and middle income countries.
Influenza A Virus Subtype H5N1		~60%	
Bubonic Plague	Untreated & Unvaccinated	5–60%	
Tularemia, Pneumonic	Untreated	≤60%	
Anthrax, Gastrointestinal, Intestinal Type	Untreated & Unvaccinated	>50%	
Marburg Virus Disease (All Outbreaks Combined)	Untreated	23–90%	23% in 1967 when it was first identified and 90% in 2004-2005 when the worst outbreak of the disease occurred. Galidesivir has shown promise in treating Filoviridae
Plague, Pneumonic	Untreated & Unvaccinated	50%	
Tetanus, Generalized	Untreated & Unvaccinated	50%	CFR drops to 10–20% with effective treatment.
Reye's Syndrome		>40%	
Baylisascariasis		~40%	With occurrence of Neural Larva Migrans; early, aggressive treatment necessary for survival, but only 2 full recoveries from NLM ever documented
Plague, Septicemic	Untreated & Unvaccinated	30–50%	
Middle Eastern Respiratory Syndrome (MERS)		35%	Galidesivir has shown promise in treating Coronaviridae
Tularemia, Typhoidal	Untreated	3–35%	
Eastern Equine Encephalitis Virus		~33%	
Anthrax, Gastrointestinal, Oropharyngeal Type		10–50%	
Tuberculosis, HIV Negative	Vaccine	43%	Vaccines have been developed but have been frequently dismissed for having received controversial and improper testing on African populations.
Smallpox, Variola Major	Unvaccinated	30%	
Varicella (chickenpox) (In Newborns)	Untreated	~30%	Where the mothers develop the disease between 5 days prior to, or 2 days after delivery.
Cancer (Overall)	Treated	30%	~97% will die within five years if untreated.
Dengue Haemorrhagic Fever (DHF)	Untreated	26%	Dengue haemorrhagic fever is also known as severe dengue.
Hantavirus Pulmonary Syndrome (HPS)	Untreated	~21%	Galidesivir has shown promise in treating Bunyavirales
Leptospirosis		<5–30%	
Legionellosis		~15%	
Anorexia Nervosa		16%	
Meningococcal Disease	Untreated & Unvaccinated	10–20%	
Typhoid Fever	Untreated & Unvaccinated	10–20%	
Severe Acute Respiratory Syndrome (SARS)		11%	Galidesivir has shown promise in treating Coronaviridae
Intestinal Capillariasis	Untreated	~10%	
Visceral Leishmaniasis		~10%	
Botulism	Treated	<10%	Untreated foodborne botulism is thought to be ~50%
Diphtheria, Respiratory	Untreated & Unvaccinated	~5–10%	
Yellow Fever	Unvaccinated	8%	
Pertussis (Whooping Cough), (Infants in Developing Countries)	Unvaccinated	~3.7%	
Smallpox, Variola Major	Vaccinated	3%	
Spanish (1918) Flu	Treated	>2.5%	
Angiostrongyliasis		~2.4%	From Hawaiian cases.
Measles (rubeola) (in Developing Countries)	Unvaccinated	~1–3%	May reach 10–30% in some localities.

Brucellosis	Untreated	≤2%	
Hepatitis A (Adults > 50 Years Old)	Unvaccinated	~1.8%	
Lassa Fever		~1%	15% in hospitalized patients; higher in some epidemics.
Mumps Encephalitis	Unvaccinated	~1%	
Pertussis (whooping cough) (Children in Developing Countries)	Unvaccinated	~1%	For children 1–4 years old.
Smallpox, Variola Minor	Unvaccinated	1%	
Venezuelan Equine Encephalitis (VEE)		<1%	
Anthrax, Cutaneous		<1%	
Malaria		~0.3%	
Hepatitis A	Unvaccinated	0.1–0.3%	
Asian (1956–58) Flu		~0.1%	
Hong Kong (1968–69) Flu		~0.1%	
Coronavirus Disease 2019 (COVID-19)		~0.1%	Global
Influenza A, Typical Pandemics		<0.1%	
Varicella (Chickenpox), Adults	Unvaccinated	0.02%	This is 1:5,000.
Hand, Foot and Mouth Disease Children < 5 Years Old		0.01%	This is 1:10,000.
Varicella (Chickenpox), Children	Unvaccinated	0.001%	This is 1:100,000.

Pandemic Severity Index

The pandemic severity index (PSI) was a proposed classification scale for reporting the severity of influenza pandemics in the United States. The PSI was accompanied by a set of guidelines intended to help communicate appropriate actions for communities to follow in potential pandemic situations. Released by the United States Department of Health and Human Services (HHS) on February 1, 2007, the PSI was designed to resemble the Saffir-Simpson Hurricane Scale classification scheme. The index was replaced by the Pandemic Severity Assessment Framework in 2017, which uses quadrants based on transmissibility and clinical severity rather than a linear scale.

Category	Case Fatality Ratio	Example
1	Less than 0.1%	Seasonal flu and swine flu
2	0.1–0.5%	Asian flu and Hong Kong flu
3	0.5–1%	
4	1.0–2.0%	
5	2.0% or higher	1918 influenza pandemic

Basic Reproduction Number

The basic reproduction number (sometimes called basic reproductive ratio, or incorrectly basic reproductive rate, and denoted R0, pronounced R nought or R zero) of an infection can be thought of as the expected number of cases directly generated by one case in a population where all individuals are susceptible to infection. The definition describes the state where no other individuals are infected or immunized (naturally or through vaccination).

Values of R0 of well-known infectious diseases:

Disease	Transmission	R0
Measles	Airborne	12–18
Polio	Fecal–oral route	5–7
Rubella	Airborne droplet	5–7
Mumps	Airborne droplet	4–7
Pertussis	Airborne droplet	5.5
Smallpox	Airborne droplet	3.5–6
HIV/AIDS	Body fluids	2–5
SARS	Airborne droplet	2–5
Diphtheria	Saliva	1.7–4.3
COVID-19	Airborne droplet	1.4–3.9
Influenza (1918 pandemic strain)	Airborne droplet	1.4–2.8
Ebola (2014 Ebola outbreak)	Body fluids	1.5–2.5
Influenza (2009 pandemic strain)	Airborne droplet	1.4–1.6
Influenza (seasonal strains)	Airborne droplet	0.9–2.1
MERS	Airborne droplet	0.3–0.8

Outdoor Protection

There are items that you can include for protection outside the home on a daily basis. These items would not be part of your EDC or every day carry but would be better suited in something like a get home bag.

1	One of the most important pieces to have in that bag when prepping for a Pandemic is the N95 respirator. These are not very expensive and will protect your nose and throat from pathogens.
2	You will also want some basic meds stored at in your car as well. These meds should be for dealing with symptoms. Meds that will fight fever, diarrhoea and something for sore throat would all be great options. A non-drowsy medication for congestion would also help.
3	A basic trauma kit will also be vital. Remember that pathogens can enter your body through any damage in your skin or any orifice. If you are cut during a pandemic it will be crucial that you clean and cover that cut ASAP.

Pandemic Practises

These are good practises to apply when a pandemic is occurring.

Isolation	Isolation and treatment of people who have suspected or confirmed cases of pandemic influenza.
Voluntary Quarantine	Voluntary home quarantine of household contacts of those with suspected or confirmed pandemic influenza.
Dismiss Groups & Classes	Dismissing school classes and closing daycare centres.
Avoid Gatherings	Changing work schedules and cancelling large public gatherings.
Stock Up	Stock up on the list of pandemic supplies especially if a large outbreak is occurring.
Take Probiotics	Improve your intestinal flora now and especially during an outbreak. Have plenty of probiotics on hand and increase your intake of probiotics in supplements and in the foods you eat, like Acidophilus in kefir and yogurts.
Reduce Dependency	Antibiotics are over used in the United States and this compounds the problem of adaptive micro-organisms.
Survival Prescription	Ask your doctor to prescribe Tamiflu or Relenza as either medication may effectively treat avian flu. Alternatively, consider Boiron Oscillococcinum for Flu-like Symptoms. This homeopathic product helps relieve body aches, headache, fever, chills and fatigue.
Avoid Touching Items	Avoid as much as possible contact with pencils and pens, elevator buttons, doorknobs, coins, handrails and places where many other hands have touched, particularly during the flu season.
Avoid Touching Others	Avoid common gestures like shaking hands, patting backs and kissing to deter the spread of viruses.
Wash Hands Frequently	Before eating and after having been out and about, make it a routine to wash your hands with warm hot water and clean under the fingernails. Recite the alphabet twice and you'll have washed your hands for an adequate time.
Minimise Spread	Cover your mouth when you sneeze to avoid spreading droplets to your family. Turn your body away from someone coughing or sneezing.
Avoid Touching Yourself	(No not in THAT way) We touch our face, arms and legs quite frequently throughout the day, generally without even realizing it which can spread germs that have been picked up via that body part.
Avoid People	It's best to avoid people completely if possible to do so.
Wear a Mask	Masks can help prevent the inhalation of viruses in the air, but ensure the filtration membrane is fine enough or rated to stop virus particles. Most masks on the market today will not stop virus particles.
Wear Biohazard Suit	Helps to prevent bacteria and viruses from reaching your body.
Wear Goggles	Helps prevent viruses in the air from entering through your eye.
Quarantine Sick	If you have family members who are sick they should be quarantined from healthy people as early as possible to avoid the spread of germs.
Record Sickness	If someone in your family is sick take note of when symptoms started and log the progression of health to refer back to.
Research Sickness	Research possible illnesses and as much as you can on the current pandemic situation beyond your doors. The more you know the more you're able to defend against it.

Vaccine Development

In the United States, vaccine development and testing follow a standard set of steps. The first stages are exploratory in nature. Regulation and oversight increase as the candidate vaccine makes its way through the process.

Exploratory Stage	This stage involves basic laboratory research and often lasts 2-4 years. Federally funded academic and governmental scientists identify natural or synthetic antigens that might help prevent or treat a disease. These antigens could include virus-like particles, weakened viruses or bacteria, weakened bacterial toxins, or other substances derived from pathogens.
Pre-Clinical Stage	Pre-clinical studies use tissue-culture or cell-culture systems and animal testing to assess the safety of the candidate vaccine and its immunogenicity, or ability to provoke an immune response. Animal subjects may include mice and monkeys. These studies give researchers an idea of the cellular responses they might expect in humans. They may also suggest a safe starting dose for the next phase of research as well as a safe method of administering the vaccine. Researchers may adapt the candidate vaccine during the pre-clinical state to try to make it more effective. They may also do challenge studies with the animals, meaning that they vaccinate the animals and then try to infect them with the target pathogen. Many candidate vaccines never progress beyond this stage because they fail to produce the desired immune response. The pre-clinical stages often lasts 1-2 years and usually involves researchers in private industry.

MAN-MADE DISASTERS | Disease | Pandemic | Vaccine Development

IND Application	A sponsor, usually a private company, submits an application for an Investigational New Drug (IND) to the U.S. Food and Drug Administration. The sponsor describes the manufacturing and testing processes, summarizes the laboratory reports, and describes the proposed study. An institutional review board, representing an institution where the clinical trial will be conducted, must approve the clinical protocol. The FDA has 30 days to approve the application. Once the IND application has been approved, the vaccine is subject to three phases of testing.
Phase I Vaccine Trials	This first attempt to assess the candidate vaccine in humans involves a small group of adults, usually between 20-80 subjects. If the vaccine is intended for children, researchers will first test adults, and then gradually step down the age of the test subjects until they reach their target. Phase I trials may be non-blinded (also known as open-label in that the researchers and perhaps subjects know whether a vaccine or placebo is used). The goals of Phase 1 testing are to assess the safety of the candidate vaccine and to determine the type and extent of immune response that the vaccine provokes. In a small minority of Phase 1 vaccine trials, researchers may use the challenge model, attempting to infect participants with the pathogen after the experimental group has been vaccinated. The participants in these studies are carefully monitored and conditions are carefully controlled. In some cases, an attenuated, or modified, version of the pathogen is used for the challenge. A promising Phase 1 trial will progress to the next stage.
Phase II Vaccine Trials	A larger group of several hundred individuals participates in Phase II testing. Some of the individuals may belong to groups at risk of acquiring the disease. These trials are randomized and well controlled, and include a placebo group. The goals of Phase II testing are to study the candidate vaccine's safety, immunogenicity, proposed doses, schedule of immunizations, and method of delivery.
Phase III Vaccine Trials	Successful Phase II candidate vaccines move on to larger trials, involving thousands to tens of thousands of people. These Phase III tests are randomized and double blind and involve the experimental vaccine being tested against a placebo (the placebo may be a saline solution, a vaccine for another disease, or some other substance). One Phase III goal is to assess vaccine safety in a large group of people. Certain rare side effects might not surface in the smaller groups of subjects tested in earlier phases. For example, suppose that an adverse event related to a candidate vaccine might occur in 1 of every 10,000 people. To detect a significant difference for a low-frequency event, the trial would have to include 60,000 subjects, half of them in the control, or no vaccine, group. Vaccine efficacy is tested as well. These factors might include 1) Does the candidate vaccine prevent disease? 2) Does it prevent infection with the pathogen? 3) Does it lead to production of antibodies or other types of immune responses related to the pathogen?

After a successful Phase III trial, the vaccine developer will submit a Biologics License Application to the FDA. Then the FDA will inspect the factory where the vaccine will be made and approve the labeling of the vaccine. After licensure, the FDA will continue to monitor the production of the vaccine, including inspecting facilities and reviewing the manufacturer's tests of lots of vaccines for potency, safety and purity. The FDA has the right to conduct its own testing of manufacturers' vaccines.

Post-Licensure Monitoring of Vaccines	A variety of systems monitor vaccines after they have been approved. They include Phase IV trials, the Vaccine Adverse Event Reporting System, and the Vaccine Safety Datalink.
Phase IV Trials	Phase IV trial are optional studies that drug companies may conduct after a vaccine is released. The manufacturer may continue to test the vaccine for safety, efficacy, and other potential uses.
VAERS	The CDC and FDA established The Vaccine Adverse Event Reporting System in 1990. The goal of VAERS, according to the CDC, is "to detect possible signals of adverse events associated with vaccines." (A signal in this case is evidence of a possible adverse event that emerges in the data collected.) About 30,000 events are reported each year to VAERS. Between 10% and 15% of these reports describe serious medical events that result in hospitalization, life-threatening illness, disability, or death. VAERS is a voluntary reporting system. Anyone, such as a parent, a health care provider, or friend of the patient, who suspects an association between a vaccination and an adverse event may report that event and information about it to VAERS. The CDC then investigates the event and tries to find out whether the adverse event was in fact caused by the vaccination.

I highly recommend against taking the COVID-19 experimental vaccines. They haven't been extensively tested over a decade, it's an entirely new vaccine creation process and therefore issues could arise years after taking it. In the end however, it's your choice. For more information, see: https://christianity.fluidicice.com/vaccine

Zombie Apocalypse

MAN-MADE DISASTERS | Disease | Zombie Apocalypse

The proliferation of a virus turning people into zombies. Who knows, this may become a reality, or even something very similar but not quite zombies. The point is we have to be ready for anything and everything, plus this section was fun to make. A potential outbreak would likely be similar to one of the below scenarios so take note of how to deal with them. There may be a mix and match of zombies such as mostly conforming to "Walkers" but you don't need a shot to the head to kill them.

Zombie Attributes

Below is a list of the different types of zombie attributes that are likely to occur in an apocalypse. If an apocalypse occurs go through each category and highlight which ones apply to your scenario so you can prepare yourself. The left side categories are the easiest scenarios to survive while the further right you go the more likely you will die. Dot points are examples from Tv series and movies.

Zombie Origin

The origin of the infection. Not necessary to know but handy in developing an antidote.

Experimentation	A virus created in a lab either on purpose or by accident.
Animal Bite	Contracted from a bite of an infected animal.
Tainted Food	The disease was contracted from consuming something.
Radiation	The disease originated from a radioactive source.
Wireless	The disease originates from a wireless signal from a TV or radio station, effectively 'frenzying' anyone who is in its radius.
External Source	The disease originates from outside our planet.
Unknown	The origins of the disease is unknown.

Infection Spread

How the infection is spread.

No Spread	The infection can't be spread by any means.
Contraction Chance	On skin contact with the virus, there is a chance that you will contract the disease.

Blood Contact	The virus is spread by blood contact via open wounds or bites from anything that hosts the virus.
Air Spread	The virus is spread via air and anyone in the infected area contracts the disease.
Everyone Infected	Everyone is infected and becomes a zombie when they die regardless of contact.

Incubation Period

How fast the virus takes the person over from the point of infection.

Over a Week	You turn into a zombie in periods over a week. This makes it difficult to tell if you have the virus.
A Few Days	It takes a few days to become a zombie.
About 24 Hours	After contracting the virus it will takes about a day to become a zombie.
A Few Hours	It only takes a few hours to become a zombie.
About 15 Minutes	It takes about 15 minutes to become a zombie.
A Few Minutes	It takes a few minutes to become a zombie.
A Few Seconds	It takes a few seconds to become a zombie.
Instantly	You instantly turn into a zombie once bitten.

Incubation Signs

Any symptoms that show the conversion to zombie.

Death	The infected gets sicker until death.
Sickness	The infected become sicker and weaker as the disease ravages their body.
Viciousness	The infected person lashes out occasionally between periods of sanity.
Eye Changes	The eyes of the human change colour or become glazed as they turn.
No Symptoms	There are no signs that show someone is infected.

Zombie Conversion

In what form the conversion from human to zombie occurs.

Human Death	The human has to die first before becoming a zombie. ● Like Amy from the Walking Dead (Season 1)
Slow Conversion	The person slowly becomes more and more aggressive and zombie-like without dying first. ● Like Sam (The Dog) from I Am Legend
Instant Change	The person snaps instantly to become a zombie when the virus is contracted.

Zombie Speed

The speed is how fast the zombie moves when it's heading towards a target - such as prey.

Very Slow	The zombie has a hard time controlling its muscles so it ambles along slowly, easily walked away from.
Slow	The zombies can only move at a walking pace.
Average	They can move at about a power walking speed.
Fast	The zombies can run at a normal human pace.
Very Fast	The zombies can sprint at about a normal human sprinting speed.
Superhumanly Fast	The zombies can move faster then the normal human sprinting speed.

Zombie Intelligence

How smart the zombies are with relation to interacting with the environment.

Stupid	The zombies that head straight for you regardless of what's in the way, they can't interact with any items or climb.
Dull	Zombies that can navigate around objects and climb over small objects, they can climb simple objects.
Average	Average intelligence for a zombie which can climb some objects, open easy doors and navigate well and break into windows. They have average human smarts.
Smart	Zombies that can climb items which most humans can. They can also open doors and windows and break down weaker doors and some windows as well.
Genius	The zombies use tactics and can interact with all items normally. They can wield items and may attempt to ambush and flank you. (I Am Legend Zombies)

Zombie Powers

Any special powers the zombies have over regular people.

Super Strength	The zombies are able to lift heavy objects and tear people apart with their hands.
Super Jump	The zombies can jump unnaturally high.
Hive Mind	The zombies share a linked mind where they can use teamwork to accomplish things.

Zombie Needs

What the zombies need to survive.

Brains	The zombies can only eat brains to survive.
Food / Flesh	The zombies have to eat flesh to stay alive or it dies without nutrition.
Nothing	The zombies don't need any nutrition to stay alive and will stay alive indefinitely unless killed.

Zombie Desires

What the zombies want.

Animals	The zombies want to eat animals only.
Brains	The zombies want to eat brains only.
Flesh	The zombies want to eat any form of (living) flesh including animals, excluding other zombies.
All Flesh	The zombies want to eat any form of flesh including other zombies.

Dead Resurrection

If the virus can resurrect the human dead and recent dead.

No Resurrection	The virus can't resurrect the dead at all.

Recent Dead	The virus can resurrect the dead within a few days of dying.
Most Dead	The virus can resurrect everyone that has a semi-intact brain.

Animal Zombie

Can animals contract the virus and become animal zombies?

No	Animals can't contract the virus.
Yes	Animals can contract the virus and become animal zombies.

Zombie Survival

Whether the zombie can survive with missing limbs or not.

Complete	The zombie must be intact for it to survive. The regular rules of staying alive for humans apply.
Semi Complete	The zombie can be missing limbs such as arms or legs and still survive.
Quadriplegic	The zombie can be missing all of its limbs and still survive. (Must be beheaded to kill)
A Head	The zombie can be just a head and still survive.

Zombie Weaknesses

Any weaknesses the zombies may have.

Sunlight	The zombies cannot come in contact with sunlight or UV light. (I Am Legend zombies)
The Brain	If the zombies brain is destroyed, the zombie dies.
Fire	The zombies are repelled by fire. (Night of the Living Dead)
Lack of Vision	The zombies lose their ability to see over time. (High School of the Dead)
Coordination	The zombies can no longer perform coordinated motor skills such as climbing or open doors.

Zombie Death

If the zombie dies over a certain period.

Limited Life	The zombies have a limited lifespan and die as the brain degrades.
Limitless Life	The zombies have no lifespan and will stay alive until killed.

4 Civil Unrest

Civil disorder, also known as civil disturbance or civil unrest, is an activity arising from a mass act of civil disobedience (such as a demonstration, riot, or strike) in which the participants become hostile toward authority, and authorities incur difficulties in maintaining public safety and order, over the disorderly crowd. It is, in any form, prejudicial to public law and order.

The basic human element that ignites civil disorder is "the presence of a crowd." Individual behaviour is affected in a crowd because it provides a sense of anonymity. Members of a crowd often shift their moral responsibility from themselves to the crowd as a whole. The desire to imitate becomes stronger in a crowd, where those who are the least disciplined, or those who are weak in their convictions, will conform to a crowd's behaviour. This is true for both the crowd and the authorities in a civil disorder situation. Any number of things may cause civil disorder, whether it is a single cause or a combination of causes; however, most are born from political grievances, economic disputes or social discord, terrorism, or foreign agitators. Civil disorder arising from political grievances can include a range of events, from a simple protest to a mass civil disobedience. These events can be spontaneous, but are usually planned, and start out being non-violent. However, these events can turn violent when agitators attempt to provoke law enforcers into overreacting.

Civil disorder arising from economic disputes and social discord is usually emotionally charged. For example, impoverished people may protest actual, or perceived, injustices against them in respect to law enforcement, community services or political influence. The emotion of this protest is often amplified if cultural differences are present, which creates an atmosphere of scapegoating, animosity and mistrust. For example, tension between ethnic groups competing for jobs can erupt into civil disorder, which can be exasperated if jobs are scarce. In such emotionally charged environments, the likelihood of violence increases. Disaffected groups may organize civil disorder with the intent of provoking authorities to overreact, in order to embarrass the government, gain attention, or generate sympathy for their cause. Foreign nations may use surrogates to direct civil disorder, in order to advance a nation's interests. Surrogates can use overt or covert means to accomplish this end e.g. fund-raising, membership drives, infiltrating disaffected groups to increase their potential for violence, vandalism, crowd manipulation, etc. The goal is to provoke a target nation into overreacting, which creates a narrative of government repression, which can be used as propaganda.

Crowds

Formation

Exploiting a crowd's mood, radicals can manipulate and weaponize a crowd, using skilful agitation to coax the crowd's capacity for violence and turn it into a vengeful mob, directing the crowd's aggression and resentment at the agitator's chosen target. Tactical agitators can use media, and social media, to connect with potential crowd-members, and incite them to break the law, or to attempt to provoke others into doing so, without having any direct personal contact. Conversely, a skilled leader person can also calm, or divert, a crowd using strategic suggestions or commands, or appealing to them with reason in order to deescalate a situation.

Emotional contagion greatly influences crowd behaviour by providing the crowd a psychological sense of "unity." This sense may provide the crowd with the momentum to absorb a mob mentality, and to take on mob behaviour. Crowd-members feed off of each other's excitement, which produces a high state of collective emotion. The ideas crowd leaders rapidly transmit throughout the group, and also to bystanders, rubberneckers, and mass media.

When emotional contagion prevails, raw emotion is high while self-discipline is low. Personal prejudices and unsatisfied desires – usually restrained – are unabashedly released. This incentivizes crowd membership, as the crowd provides cover for individuals to do things they want to do, but would not dare try to do alone. This incentive can become greater for the crowd than its concern for law and authority, leading to unlawful and disruptive acts. Once the crowd engages in such acts, it effectively becomes a mob – a highly emotional, unreasonable, potentially violent crowd.

Behaviour

Crowd behaviour is the emotional needs, fears, and prejudices of the crowd members. It is driven by social factors such as the strength, or weakness, of leadership, moral perspective, or community uniformity, and also by psychological factors of suggestion e.g. imitation, anonymity, impersonality, emotional release, emotional contagion, panic, etc. During civil disorder, any crowd can be a threat to law enforcers because it is open to manipulation. This is because the behaviour of a crowd is under the direction of the majority of its members. While its members are usually inclined to obey the law, emotional stimuli, and the feeling of fearlessness that arises from being in a crowd, can cause crowd members to indulge in impulses, act on aggressions, and unleash rage. When law enforcement limits the full realization of these actions, the crowd will channel this hostility elsewhere, making the crowd a hostile and unpredictable threat to law enforcers. Crowds want to be directed, and can become frustrated by confusion and uncertainty; therefore, leadership can have a profound influence on the intensity and conduct of a crowd's behaviour.

The first person to authoritatively direct a crowd will likely be followed. Opportunity for radicals to take charge of a group emerge when no authoritative voice emerges, and the crowd becomes frustrated without direction. Panic, which is extremely and quickly contagious, also affects crowd behaviour by influencing their ability to reason, lending to frantic, irrational behaviour that cannot only endanger the crowd, but also others. During civil disorder, panic can set in when a crowd member realizes:

- He is in danger and fleeing is necessary to escape arrest or harm
- Few escape routes exist
- The few escape routes are congested with traffic
- His actions have caused harm to others
- When he has not dispersed the scene quickly enough, that his life, or freedom, is at risk from encroaching law enforcement agents

Tactics

The goal of demonstrators is to spur law enforcers to take actions that can be exploited as acts of brutality in order to generate sympathy for their cause, and/or to anger and demoralize the opposition. Crowds can use a range of tactics to evade law enforcement or to promote disorder, from verbal assault to distracting law enforcers to building barricades. The more well-planned tactics occur, the more purposeful the disorder.

For example, crowds may form human blockades to shut down roads, they may trespass on government property, they may try to force mass arrests, they may handcuff themselves to things or to each other, or they may lock arms, making it more difficult to separate them, or they might create confusion or diversions through the use of rock throwing, arson, or terrorist acts, making law enforcers seems forceful or excessive when trying to remove them.

Most participants of civil disorder engage on foot. However, organized efforts, often implore the use vehicles and wireless communication. Participants have been known to use scanners to monitor police frequencies, or transmitters to sabotage law enforcement communications. If a crowd turns violent, effectively becoming a "mob," it may execute physical attacks on people and property, such as by throwing homemade weapons like molotov cocktails, firing small arms, and planting improvised explosive devices.

If the violence is not pre-arranged, a crowd may resort to throwing rocks, bricks, bottles, etc. If violence is pre-arranged, the crowd can hide their weapons, or vandalism tools, well before the crowd formation, catching law enforcement by surprise.

Crowds may arm themselves with:

- Gas Masks
- Rocks
- Helmets
- Homemade Shields
- Improvised picket signs
- Molotov cocktails
- Paint bombs
- Pipes
- Safety goggles
- Wire cutters
- Umbrellas

A mob may erect barricades to impede, or prevent, the effectiveness of law enforcement. For example, they may use grappling hooks, chains, rope, or vehicles, to breach gates or fences. They may use sticks or poles to limit law enforcement's use of billy clubs and bayonets. They may overturn civilian vehicles to impede troops advancing to engage them, or vandalize law enforcement vehicles to try to spark over-reaction from law enforcement, or to incite further lawlessness from the mob.

Mobs often implore the use of fire or hidden explosive devices e.g. strapped to animals, masked in cigarette lighters or toys, rigged to directed vehicles, etc. Not only can they be used to create confusion or diversion, but they can also be used destroy property, and mask looting of mob participants, or provide cover for mob participants firing weapons at law enforcement. If law enforcement engages with the mob, in returning fire, any innocent casualties resulting from the chaos usually make law enforcement look undisciplined and oppressive.

Law Enforcement Behaviour

Like mob participants, law enforcers are also susceptible to crowd behaviour. Such tense confrontation can emotionally stimulate them, creating a highly emotional atmosphere all around. This emotional stimulation can become infectious throughout law enforcement agents, conflicting with their disciplined training. When emotional tension is high among law enforcement agents, they may breach their feeling of restraint and commit acts, against people in the mob, that they normally would suppress.

The emotional atmosphere can also make them highly susceptible to rumours and fear. Like mob members, law enforcement agents, acting as a group, can also lose their sense of individuality and develop a feeling of anonymity. Under emotional instability, individual prejudices, that any individual law enforcement agent may harbour against the mob, or against individual participants of the mob, may influence the behaviour of the law enforcement agent. Like the mob, these conditions make law enforcement actors more likely to imitate the behaviour of each other, which can result in a chain of biased, excessive, or otherwise, dangerous, behaviour in which law enforcement agents act upon mob agents as impersonal threats and not as human beings.

Such action is heightened in which law enforcement agents are monolithic, across race and ethnicity, as law enforcement will become more susceptible to framing the disorder as a confrontation between "them" and "us." Actions by law enforcement agents, motivated by emotion and prejudice, is often used as evidence against their ill will toward a crowd, or a mob, with their behaviour only further inflaming confrontation rather than reducing it. Under such situations, law enforcement agents are rarely held accountable for all their actions against a crowd.

Protest

A protest (also called a remonstrance, remonstration or demonstration) is an expression of bearing witness on behalf of an express cause by words or actions with regard to particular events, policies or situations. Protests can take many different forms, from individual statements to mass demonstrations. Protesters may organize a protest as a way of publicly making their opinions heard in an attempt to influence public opinion or government policy, or they may undertake direct action in an attempt to directly enact desired changes themselves. Where protests are part of a systematic and peaceful nonviolent campaign to achieve a particular objective, and involve the use of pressure as well as persuasion, they go beyond mere protest and may be better described as cases of civil resistance or nonviolent resistance. A protest itself may at times be the subject of a counter-protest. In such a case, counter-protesters demonstrate their support for the person, policy, action, etc. that is the subject of the original protest. In some cases, these protesters can violently clash.

Forms of Protest

These are some of the different forms of protest you may encounter.

Rally / Demonstration	Demonstration, rally, etc. without reference to marching or walking in a picket line or standing in a vigil. Reference to speeches, speakers, singing, preaching, often verified by indication of sound equipment of PA and sometimes by a platform or stage. Ordinarily will include worship services, speeches, briefings.
March	Reference to moving from one location to another; to be distinguished from rotating or walking in a circle with picket signs which by definition, constitutes a picket.

Vigil	These are almost always designated as such, although sometimes "silent witness," and "meditation" are code words; also see candlelight vigil; hunger/fasting vigil; If you find no designations re: vigils, meditations, silent witness, etc., but also no reference to sound systems or to marches, it may well be a vigil. Most vigils have banners, placards, or leaflets so that people passing by, despite silence from participants, can ascertain for what the vigil stands.
Picket	The modal activity is picketing; there may be references to picket line, to informational picketing; holding signs; "carrying signs and walking around in a circle". Holding signs or placards or banners is not the defining criteria; rather, it is holding or carrying those items and walking a circular route, a phrase sometimes surprisingly found in the permit application.
Civil Disobedience	Explicit protest that involves crossing barricade, sit-in of blacks where prohibited, use of "coloured" bathrooms, voter registration drives, crossing barricades, tying up phone lines.
Ceremony	These celebrate or protest status transitions ranging from birth, death dates of individuals, organizations or nations, seasons, to re-enlistment or commissioning of military personnel, to the anniversaries of same. These are sometimes referenced by presenting flowers or wreaths commemorating or dedicating or celebrating status transitions or its anniversary.
Motorcade	Electoral campaign and other issues.
Information Distribution	Tabling/ petition gathering, lobbying, letter-writing campaign, teach-ins.
Symbolic Display	Such as a Menorah, Creche Scene, graffiti, cross burnings, signs, standing displays.
Attack	A physical attack by a collective group (not-one-on-one assault, crime, rape). Boundary motivating attack is "other group's identity," as in gay-bashing, lynching. Can also include verbal attack and/or threats, too.
Riot / Melee	Large-scale (50+), use of violence by instigators against persons, property, police, or buildings separately or in combination, lasting several hours.
Strike / Slow Down	Regular air strike through failure of negotiations, or wildcat air strike. (Make note if a wildcat strike.)
Boycott	Organized refusal to buy or use a product or service, rent strikes.
Press Conference	If specifically named as such in report, and must be the predominant activity form. Could involve disclosure of information to "educate the public" or influence various decision-makers.
Organization Formation Announcement	Meeting or press conference to announce the formation of a new organization.
Conflict / Attack	This includes any boundary conflict in which no instigator can be identified, i.e. black/white conflicts, abortion/anti-abortion conflicts.
Lawsuit	Legal manoeuvre by social movement organization or group.

Typology

Abhishek Tiwari (8-B) and Lori Hall have devised a typology of six broad activity categories of the protest activities described in the Dynamics of Collective Action project.

Literal, Symbolic, Aesthetic and Sensory	Artistic, dramaturgical, and symbolic displays (street theatre, dancing, etc.). Use of images, objects, graphic arts, musical performances, or vocal/auditory exhibitions (speechmaking, chanting, etc.). Tactile exchanges of information (petitions, leaflets, etc.) and the destruction of objects of symbolic and/or political value. Highly visible and most diverse category of activity; impacts on society (police response, media focus, impact on potential allies, etc.) often are underestimated.
Solemnity and the Sacred	Vigils, prayer, rallies in format of religious service, candlelighting, cross carrying, etc., all directly related to Durkheimian sacred or some form of religious or spiritual practice, belief, or ideology. Events where sacred activity is the primary focus are rarely responded to by police with force or presence. Solemnity usually provides a distinct quietness or stillness, changing the energy, description, and interpretation of such events.
Institutional and Conventional	Institutionalized activity or activity highly dependent on formal political processes and social institutions (press conferences, lawsuits, lobbying, etc.). Often conflated with non-confrontational and nonviolent activities in research as the other or reference category. More acceptable because it operates, to some degree, within the system. Historically contentious issue in regard to the practice of protest due to this integration within the system.
Movement in Space	Marches or parades (processional activities) from one spatio-temporal location to another, with beginning or ending places sometimes chosen for symbolic reasons. Picket lines often used in labour strikes but can be used by nonlabor actors but the key differences between picket and processionals are the distance of movement. Events that take the form of a procession are logistically much more difficult to police (even if it is for the safety of protesters). Marches are some of the largest events in this period.
Civil Disobedience	Withholding obligations, sit-ins, blockades, occupations, bannering, camping, etc., are all specific activities which constitute the tactical form of civil disobedience. In some way, these activities directly or technically break the law. Usually given most attention by researchers, media, and authorities. Often conflated with violence and threats because of direct action and confrontational nature but should serve as a distinct category of action (both in the context of tactical/ strategic planning and in the control of activity).
Collective Violence and Threats	Collective violence such as pushing, shoving, hitting, punching, damaging property, throwing objects, verbal threats, etc., is usually committed by a relative few out of many protesters (even tens of thousands). Rare in occurrence, rarely condoned by the public or onlookers (particularly the media). Usually met with equivalent or overwhelming force in response to authorities. At times in U.S. history lauded as the only way to get results, but little empirical evidence violence succeeds in goal attainment.

Typology Examples

Direct Action

Some forms of direct action listed in this article are also public demonstrations or rallies.

- Protest march, a historically and geographically common form of nonviolent action by groups of people.
- Picketing, a form of protest in which people congregate outside a place of work or location where an event is taking place. Often, this is done in an attempt to dissuade others from going in ("crossing the picket line"), but it can also be done to draw public attention to a cause.
- Street protesters demonstrate in areas with high visibility, often employing handmade placards such as sandwich boards or picket signs in order to maximize exposure and interaction with the public.
- Lockdowns and lock-ons are a way to stop movement of an object, like a structure or tree and to thwart movement of actual protesters from the location. Users employ various chains, locks and even the sleeping dragon for impairment of those trying to remove them with a matrix of composted materials.
- Die-ins are a form of protest where participants simulate being dead (with varying degrees of realism). In the simplest form of a die-in, protesters simply lie down on the ground and pretend to be dead, sometimes covering themselves with signs or banners. Much of the effectiveness depends on the posture of the protesters, for when not properly executed, the protest might look more like a "sleep-in".

- Protest song is a song which protests perceived problems in society. Every major movement in Western history has been accompanied by its own collection of protest songs, from slave emancipation to women's suffrage, the labour movement, civil rights, the anti-war movement, the feminist movement, the environmental movement.
- Radical cheerleading. The idea is to ironically reappropriate the aesthetics of cheerleading, for example by changing the chants to promote feminism and left-wing causes. Many radical cheerleaders (some of whom are male, transgender or non-gender identified) are in appearance far from the stereotypical image of a cheerleader.
- Critical Mass bike rides have been perceived as protest activities. A 2006 New Yorker magazine article described Critical Mass' activity in New York City as "monthly political-protest rides", and characterized Critical Mass as a part of a social movement; and the UK e-zine Urban75, which advertises as well as publishes photographs of the Critical Mass event in London, describes this as "the monthly protest by cyclists reclaiming the streets of London."

Written Demonstration

Petitions	A petition is a request to do something, most commonly addressed to a government official or public entity. Petitions to a deity are a form of prayer called supplication.
Letters	To show political power by the volume of letters. For example, some letter writing campaigns especially with signed form letter.

Civil Disobedience Demonstrations

Public Nudity or Topfree	(to protest indecency laws or as a publicity stunt for another protest such as a war protest) or animal mistreatment (e.g. PETA's campaign against fur). See also Nudity and protest.
Sit-in	A sit-in or sit-down is a form of direct action that involves one or more people occupying an area for a protest, often to promote political, social, or economic change.
Photobombing	Photobombing or disrupting an event being broadcast live.
Raasta Roko	Raasta roko is a form of protest commonly practised in India. It usually involves large number of people preventing vehicular traffic from using a busy thoroughfare.
Silent Protest	Silent protest is an organized effort where the participants stay quiet to demonstrate disapproval. It is used as a form of civil disobedience and nonviolent resistance.

As a Residence

Peace Camp	Peace camps are a form of physical protest camp that is focused on anti-war activity. They are set up outside military bases by members of the peace movement who oppose either the existence of the military bases themselves, the armaments held there, or the politics of those who control the bases.
Formation of a Tent City	A tent city is a temporary housing facility made using tents or other temporary structures. State governments or military organizations set up tent cities to house evacuees, refugees, or soldiers. Informal tent cities may be set up without authorization by homeless people or protesters.
Camp for Climate Action	The Camps for Climate Action are campaign gatherings (similar to peace camps) that take place to draw attention to, and act as a base for direct action against, major carbon emitters, as well as to develop ways to create a zero-carbon society.

Destructive

Vandalism	Smashing windows or spraying graffiti is sometimes used as a form of protests, and is sometimes employed by black bloc groups.
Riot	Protests or attempts to end protests sometimes lead to rioting.
Self-Immolation	Self-immolation is the act of killing oneself for political or religious reasons particularly by burning, but also achieved through various means.
Suicide	The killing one oneself to make a point.
Hunger Strike	A hunger strike is a method of non-violent resistance or pressure in which participants fast as an act of political protest, or to provoke the feelings of guilt in others, usually with the objective to achieve a specific goal, such as a policy change. Most hunger strikers will take liquids but not solid food.
Bombing	The bombing of a significant location relating to the cause.

Non-Destructive

Silent Protests	Protests/Parades in which participants are nonviolent and usually silent, in attempt to avoid violent confrontation with Military or Police Forces. This tactic was effectively used during the Arab Spring in cities such as Tehran and Cairo.

Direct Action

Civil Resistance	Civil resistance is political action that relies on the use of nonviolent resistance by civil groups to challenge a particular power, force, policy or regime.
Nonviolent Resistance	Nonviolent resistance (NVR or nonviolent action) is the practice of achieving goals such as social change through symbolic protests, civil disobedience, economic or political noncooperation, satyagraha, or other methods, while being nonviolent.
Occupation	As an act of protest, occupation is a strategy often used by social movements and other forms of collective social action in order to take and hold public and symbolic spaces, buildings, critical infrastructure such as entrances to train stations, shopping centres, university buildings, squares, and parks.

Against a Government

Tax Resistance	Tax resistance is the refusal to pay tax because of opposition to the government that is imposing the tax, or to government policy, or as opposition to taxation in itself. Tax resistance is a form of direct action and, if in violation of the tax regulations, also a form of civil disobedience.
Conscientious Objector	A conscientious objector is an "individual who has claimed the right to refuse to perform military service" on the grounds of freedom of thought, conscience, or religion.
Flag Desecration	Flag desecration is a term that is applied to the desecration of flags, violation of flag protocol, or a various set of acts that intentionally destroy, damage, or mutilate a flag in public. In the case of a national flag, such action is often intended to make a political point against a country or its policies.
By Government Employees	
Bully Pulpit	A bully pulpit is a conspicuous position that provides an opportunity to speak out and be listened to.
Judicial Activism	Judicial activism refers to judicial rulings that are suspected of being based on personal opinion, rather than on existing law. It is sometimes used as an antonym of judicial restraint.
Job Action	
Strike Action	Strike action, also called labour strike, labour strike, or simply strike, is a work stoppage, caused by the mass refusal of employees to work. A strike usually takes place in response to employee grievances.
Walkout	In labour disputes, a walkout is a labour strike, the act of employees collectively leaving the workplace as an act of protest. A walkout can also mean the act of leaving a place of work, school, a meeting, a company, or an organization, especially if meant as an expression of protest or disapproval.
Work-to-Rule	Work-to-rule is an industrial action in which employees do no more than the minimum required by the rules of their contract, and precisely follow all safety or other regulations, which may cause a slowdown or decrease in productivity, as they are no longer working during breaks or during unpaid extended hours and weekends (checking email, for instance).
By Management	
Lockout	A lockout is a temporary work stoppage or denial of employment initiated by the management of a company during a labour dispute. That is different from a strike in which employees refuse to work. It is usually implemented by simply refusing to admit employees onto company premises and may include changing locks and hiring security guards for the premises.
By Tenants	
Rent Strike	A rent strike is a method of protest commonly employed against large landlords. In a rent strike, a group of tenants come together and agree to refuse to pay their rent en masse until a specific list of demands is met by the landlord.
By Consumers	
Boycott	A boycott is an act of voluntary and intentional abstention from using, buying, or dealing with a person, organization, or country as an expression of protest, usually for moral, social, political, or environmental reasons.
Consumer Court	Consumer Court is a special purpose court in India that deals with cases regarding consumer disputes, conflicts and grievances. They are judiciary hearings set up by the government to protect the consumers' rights.
Information	
Informative Letters	Informative letters, letter writing campaigns, letters to the editor.
Teach-in	A teach-in is similar to a general educational forum on any complicated issue, usually an issue involving current political affairs. The main difference between a teach-in and a seminar is the refusal to limit the discussion to a specific frame of time or a strict academic scope
Zine	A zine is a small-circulation self-published work of original or appropriated texts and images, usually reproduced via photocopier.
Soapboxing	A soapbox is a raised platform on which one stands to make an impromptu speech, often about a political subject. The term originates from the days when speakers would elevate themselves by standing on a wooden crate originally used for shipment of soap or other dry goods from a manufacturer to a retail store.
Civil Disobedience to Censorship	
Samizdat	Samizdat was a form of dissident activity across the Eastern Bloc in which individuals reproduced censored and underground publications by hand and passed the documents from reader to reader.
Graffiti	Graffit is writing or drawings made on a wall or other surface, usually as a form of artistic expression, without permission and within public view.
By Internet and Social Networking	
Blogging	Blogging and social networking have become effective tools to register protest and grievances. Protests can express views, news and use viral networking to reach out to thousands of people. With protests on the rise from the election season of 2016 going into 2017, protesters became aware that using their social media during protest could make them an easier target for government surveillance.
Literature, Art and Culture	
Culture Jamming	Culture jamming (sometimes guerrilla communication) is a tactic used by many anti-consumerist social movements to disrupt or subvert media culture and its mainstream cultural institutions, including corporate advertising.
Against Religious Institutions	
Recusancy	Recusancy was the state of those who refused to attend Anglican services during the history of England and Wales and of Ireland; these individuals were known as recusants.
Book Burning	Book burning is the ritual destruction by fire of books or other written materials, usually carried out in a public context. The burning of books represents an element of censorship and usually proceeds from a cultural, religious, or political opposition to the materials in question.

Strike

Strike action, also called labour strike, labour strike, or simply strike, is a work stoppage, caused by the mass refusal of employees to work. A strike usually takes place in response to employee grievances. Strikes became common during the Industrial Revolution, when mass labour became important in factories and mines. In most countries, strike actions were quickly made illegal, as factory owners had far more power than workers. Most Western countries partially legalized striking in the late 19th or early 20th centuries.

Strikes are sometimes used to pressure governments to change policies. Occasionally, strikes destabilize the rule of a particular political party or ruler; in such cases, strikes are often part of a broader social movement taking the form of a campaign of civil resistance. Notable examples are the 1980 Gdańsk Shipyard or 1981 Warning Strike, led by Lech Wałęsa. These strikes were significant in the long campaign of civil resistance for political change in Poland, and were an important mobilizing effort that contributed to the fall of the Iron Curtain and the end of communist party rule in eastern Europe.

Variations

Most strikes are undertaken by labour unions during collective bargaining as a last resort. The object of collective bargaining is for the employer and the union to come to an agreement over wages, benefits, and working conditions. A collective bargaining agreement may include a clause which prohibits the union from striking during the term of the agreement, known as a "no-strike clause". No-strike clauses arose in the United States immediately following World War II. Some in the labour movement consider no-strike clauses to be an unnecessary detriment to unions in the collective bargaining process. Generally, strikes are rare: according to the News Media Guild, 98% of union contracts in the United States are settled each of the 67 years without a strike. Occasionally, workers decide to strike without the sanction of a labour union, either because the union refuses to endorse such a tactic, or because the workers concerned are non-unionized. Such strikes are often described as unofficial. Strikes without formal union authorization are also known as wildcat strikes. In many countries, wildcat strikes do not enjoy the same legal protections as recognized union strikes, and may result in penalties for the union members who participate or their union. The same often applies in the case of strikes conducted without an official ballot of the union membership, as is required in some countries such as the United Kingdom.

A strike may consist of workers refusing to attend work or picketing outside the workplace to prevent or dissuade people from working in their place or conducting business with their employer. Less frequently workers may occupy the workplace, but refuse either to do their jobs or to leave. This is known as a sit-down strike. A similar tactic is the work-in, where employees occupy the workplace but still continue work, often without pay, which attempts to show they are still useful, or that worker self-management can be successful. For instance, this occurred with factory occupations in the Biennio Rosso strikes – the "two red years" of Italy from 1919 to 1920.

Another unconventional tactic is work-to-rule (also known as an Italian strike, in Italian: Sciopero bianco), in which workers perform their tasks exactly as they are required to but no better. For example, workers might follow all safety regulations in such a way that it impedes their productivity or they might refuse to work overtime. Such strikes may in some cases be a form of "partial strike" or "slowdown". During the development boom of the 1970s in Australia, the Green ban was developed by certain unions described by some as more socially conscious. This is a form of strike action taken by a trade union or other organized labour group for environmentalist or conservationist purposes. This developed from the black ban, strike action taken against a particular job or employer in order to protect the economic interests of the strikers.

Strikes may be specific to a particular workplace, employer, or unit within a workplace, or they may encompass an entire industry, or every worker within a city or country. Strikes that involve all workers, or a number of large and important groups of workers, in a particular community or region are known as general strikes. Under some circumstances, strikes may take place in order to put pressure on the State or other authorities or may be a response to unsafe conditions in the workplace. A sympathy strike is, in a way, a small scale version of a general strike in which one group of workers refuses to cross a picket line established by another as a means of supporting the striking workers.

Sympathy strikes, once the norm in the construction industry in the United States, have been made much more difficult to conduct due to decisions of the National Labour Relations Board permitting employers to establish separate or "reserved" gates for particular trades, making it an unlawful secondary boycott for a union to establish a picket line at any gate other than the one reserved for the employer it is picketing. A student strike has the students (sometimes supported by faculty) not attending schools. In some cases, the strike is intended to draw media attention to the institution so that the grievances that are causing the students to "strike" can be aired before the public; this usually damages the institution's (or government's) public image. In other cases, especially in government-supported institutions, the student strike can cause a budgetary imbalance and have actual economic repercussions for the institution.

Types

Strikebreakers
A strikebreaker (sometimes derogatorily called a scab, blackleg, or knobstick) is a person who works despite an ongoing strike. Strikebreakers are usually individuals who are not employed by the company prior to the trade union dispute, but rather hired after or during the strike to keep the organization running. "Strikebreakers" may also refer to workers (union members or not) who cross picket lines to work. Irwin, Jones, McGovern (2008) believe that the term "scab" is part of a larger metaphor involving strikes. They argue that the picket line is symbolic of a wound and those who break its borders to return to work are the scabs who bond that wound. Others have argued that the word is not a part of a larger metaphor but, rather, was an old-fashioned English insult whose meaning narrowed over time. "Blackleg" is an older word and is found in the late-nineteenth/early-twentieth century folk song from Northumberland, "Blackleg Miner". The term does not necessarily owe its origins to this tune of unknown origin. The song is, however, notable for its lyrics that encourage violent acts against strikebreakers.

Ani-Strike Action
Most strikes called by unions are somewhat predictable; they typically occur after the contract has expired. However, not all strikes are called by union organizations – some strikes have been called in an effort to pressure employers to recognize unions. Other strikes may be spontaneous actions by working people. Spontaneous strikes are sometimes called "wildcat strikes"; they were the key fighting point in May 1968 in France; most commonly, they are responses to serious (often life-threatening) safety hazards in the workplace rather than wage or hour disputes, etc. Whatever the cause of the strike, employers are generally motivated to take measures to prevent them, mitigate the impact, or to undermine strikes when they do occur.

Strike Preparation
Companies which produce products for sale will frequently increase inventories prior to a strike. Salaried employees may be called upon to take the place of strikers, which may entail advance training. If the company has multiple locations, personnel may be redeployed to meet the needs of reduced staff. Companies may also take out strike insurance prior to an anticipated strike, to help offset the losses which the strike would cause. One of the weapons traditionally wielded by already-established unions is strike action.

Some companies may decline entirely to negotiate with the union, and respond to the strike by hiring replacement workers. This may create a crisis situation for strikers – do they stick to their original plan and rely upon their solidarity, or is there a chance that the strike may be lost? How long will the strike last? Will strikers' jobs still be there if the strike fails? Are other strikers defecting from the strike?

Companies that hire strikebreakers typically play upon these fears when they attempt to convince union members to abandon the strike and cross the union's picket line. Unions faced with a strikebreaking situation may try to inhibit the use of strikebreakers by a variety of methods – establishing picket lines where the strikebreakers enter the workplace; discouraging strike breakers from taking, or from keeping, strikebreaking jobs; raising the cost of hiring strikebreakers for the company; or employing public relations tactics. Companies may respond by increasing security forces and seeking court injunctions.

Strike Breaking
Some companies negotiate with the union during a strike; other companies may see a strike as an opportunity to eliminate the union. This is sometimes accomplished by the importation of replacement workers, strikebreakers or "scabs". Historically, strike breaking has often coincided with union busting. It was also called 'Black legging' in the early 20th century, during the Russian socialist movement.

MAN-MADE DISASTERS | Civil Unrest | Strike | Types

Union Busting
One method of inhibiting or ending a strike is firing union members who are striking which can result in elimination of the union. Although this has happened it is rare due to laws regarding firing and "right to strike" having a wide range of differences in the US depending on whether union members are public or private sector. Laws also vary country to country. In the UK, "It is important to understand that there is no right to strike in UK law." Employees who strike risk dismissal, unless it is an official strike (one called or endorsed by their union) in which case they are protected from unlawful dismissal, and cannot be fired for at least 12 weeks. UK laws regarding work stoppages and strikes are defined within the Employment Relations Act 1999 and the Trade Union and Labour Relations (Consolidation) Act 1992. One of the most significant cases of mass-dismissals in the UK in 2005 involved the sacking of over 600 Gate Gourmet employees at Heathrow Airport, to which the media responded with outrage. Under the direction of Gate Gourmet's HR Director Andy Cook, according to BBC: "Gate Gourmet sacked more than 600 staff last week in a working practices row, prompting a walkout by British Airways ground staff that paralysed flights and stranded thousands of travellers in the UK." Andy Cook, Gate Gourmet's director of human resources at that time, said: "The company had not been looking to cut the size of the protests, only stop the minority engaged in harassment." Cook is now CEO of the UK labor relations advisory firm Marshall-James Global Solutions Ltd.

Lockout
Another counter to a strike is a lockout, the form of work stoppage in which an employer refuses to allow employees to work. Two of the three employers involved in the Caravan park grocery workers strike of 2003–2004 locked out their employees in response to a strike against the third member of the employer bargaining group. Lockouts are, with certain exceptions, lawful under United States labor law.

Violence
Historically, some employers have attempted to break union strikes by force. One of the most famous examples of this occurred during the Homestead Strike of 1892. Industrialist Henry Clay Frick sent private security agents from the Pinkerton National Detective Agency to break the Amalgamated Association of Iron and Steel Workers strike at a Homestead, Pennsylvania steel mill. Two strikers were killed, twelve wounded, along with two Pinkertons killed and eleven wounded. In the aftermath, Frick was shot in the neck and then stabbed by Alexander Berkman, surviving the attack, while Berkman was sentenced to 22 years in prison.

Riot

A riot is a form of civil disorder commonly characterized by a group lashing out in a violent public disturbance against authority, property or people. Riots typically involve theft, vandalism, and destruction of property, public or private. The property targeted varies depending on the riot and the inclinations of those involved. Targets can include shops, cars, restaurants, state-owned institutions, and religious buildings. Riots often occur in reaction to a grievance or out of dissent. Historically, riots have occurred due to poor people with no jobs or living conditions, governmental oppression, taxation or conscription, conflicts between ethnic groups, (race riot) or religions (sectarian violence, pogrom), the outcome of a sporting event (sports riot, football hooliganism) or frustration with legal channels through which to air grievances. While individuals may attempt to lead or control a riot, riots typically consist of disorganized groups that are frequently "chaotic and exhibit herd behavior."

However, there is a growing body of evidence to suggest that riots are not irrational, herd-like behavior, but actually follow inverted social norms. Today, some rioters have an improved understanding of the tactics used by police in riot situations. Manuals for successful rioting are available on the internet, with tips such as encouraging rioters to get the press involved, as there is more safety and attention with the cameras rolling.

Civilians with video cameras may also have an effect on both rioters and police. Dealing with riots is often a difficult task for police forces. They may use tear gas or CS gas to control rioters. Riot police may use less-than-lethal methods of control, such as shotguns that fire flexible baton rounds to injure or otherwise incapacitate rioters for easier arrest.

Classifications

These are the different classification of riots.

Police Riot	A police riot is a term for the disproportionate and unlawful use of force by a group of police against a group of civilians. This term is commonly used to describe a police attack on civilians, or provoking civilians into violence.
Prison Riot	A prison riot is a large-scale, temporary act of concerted defiance or disorder by a group of prisoners against prison administrators, prison officers, or other groups of prisoners. It is often done to express a grievance, force change or attempt escape.
Race Riot	In a race riot, race or ethnicity is the key factor. The term had entered the English language in the United States by the 1890s. Early use of the term referred to riots that were often a mob action by members of a majority racial group against people of other perceived races.
Religious Riot	In a religious riot, the key factor is religion. The rioting mob targets people and properties of a specific religion, or those believed to belong to that religion.
Student Riots	Student riots are riots precipitated by students, often in higher education, such as a college or university. Student riots in the US and Western Europe in the 1960s and the 1970s were often political in nature. Student riots may also occur as a result of oppression of peaceful demonstration or after sporting events. Students may constitute an active political force in a given country. Such riots may occur in the context of wider political or social grievances.
Urban Riots	Urban riots are riots in the context of urban decay, provoked by conditions such as discrimination, poverty, high unemployment, poor schools, poor healthcare, housing inadequacy and police brutality and bias. Urban riots are closely associated with race riots and police riots.
Sports Riots	Sports riots such as the Nika riots can be sparked by the losing or winning of a specific team or athlete. Fans of the two teams may also fight. Sports riots may happen as a result of teams contending for a championship, a long series of matches, or scores that are close. Sports are the most common cause of riots in the United States, accompanying more than half of all championship games or series. Almost all sports riots occur in the winning team's city.
Food Riots	Food and bread riots are caused by harvest failures, incompetent food storage, hoarding, poisoning of food, or attacks by pests like locusts. When the public becomes desperate from such conditions, groups may attack shops, farms, homes, or government buildings to obtain bread or other staple foods like grain or salt, as in the 1977 Egyptian Bread Riots.

Effects
The economic and political effects of riots can be as complex as their origins. Property destruction and harm to individuals are often immediately measurable. During the 1992 Los Angeles riots, 2,383 people were injured, 8,000 were arrested, 63 were killed and over 700 businesses burned. Property damage was estimated at over $1 billion. At least ten of those killed were shot by police or National Guard forces. Similarly, the 2005 civil unrest in France lasted over three weeks and spread to nearly 300 towns. By the end of the incident, over 10,000 vehicles were destroyed and over 300 buildings burned. Over 2,800 suspected rioters were arrested and 126 police and firefighters were injured. Estimated damages were over €200 Million. Many governments and political systems have fallen after riots, including:

- Russian Empire
- Ancien Régime
- British Raj in India, when bread and salt riots hastened the withdrawal in 1947

Riot Control and Laws
Riots are typically dealt with by the police, although methods differ from country to country. Tactics and weapons used can include attack dogs, water cannons, plastic bullets, rubber bullets, pepper spray, flexible baton rounds, and snatch squads. Many police forces have dedicated divisions to deal with public order situations. Some examples are the Territorial Support Group, Special Patrol Group, Compagnies Républicaines de Sécurité, Mobiele Eenheid, and Arrest units. The policing of riots has been marred by incidents in which police have been accused of provoking rioting or crowd violence. While the weapons described above are officially designated as non-lethal, a number of people have died or been injured as a result of their use. For example, seventeen deaths were caused by rubber bullets in Northern Ireland over the thirty five years between 1970 and 2005.

Risk of Arrest
A high risk of being arrested is even more effective against rioting than severe punishments. As more and more people join the riot, the risk of being arrested goes down, which persuades still more people to join. This leads to a vicious cycle, which is typically ended only by sufficient police or military presence to increase the risk of being arrested.

Civil War

A civil war, also known as an intrastate war in polemology, is a war between organized groups within the same state or country.The aim of one side may be to take control of the country or a region, to achieve independence for a region or to change government policies. The term is a calque of the Latin bellum civile which was used to refer to the various civil wars of the Roman Republic in the 1st century BC. A civil war is a high-intensity conflict, often involving regular armed forces, that is sustained, organized and large-scale.

Civil wars may result in large numbers of casualties and the consumption of significant resources. Most modern civil wars involve intervention by outside powers. According to Patrick M. Regan in his book Civil Wars and Foreign Powers (2000) about two thirds of the 138 intrastate conflicts between the end of World War II and 2000 saw international intervention, with the United States intervening in 35 of these conflicts. Civil wars since the end of World War II have lasted on average just over four years, a dramatic rise from the one-and-a-half-year average of the 1900–1944 period.

While the rate of emergence of new civil wars has been relatively steady since the mid-19th century, the increasing length of those wars has resulted in increasing numbers of wars ongoing at any one time. For example, there were no more than five civil wars underway simultaneously in the first half of the 20th century while there were over 20 concurrent civil wars close to the end of the Cold War. Since 1945, civil wars have resulted in the deaths of over 25 million people, as well as the forced displacement of millions more. Civil wars have further resulted in economic collapse; Somalia, Burma (Myanmar), Uganda and Angola are examples of nations that were considered to have had promising futures before being engulfed in civil wars.

Classification
James Fearon, a scholar of civil wars at Stanford University, defines a civil war as "a violent conflict within a country fought by organized groups that aim to take power at the center or in a region, or to change government policies". Ann Hironaka further specifies that one side of a civil war is the state. The intensity at which a civil disturbance becomes a civil war is contested by academics. Some political scientists define a civil war as having more than 1,000 casualties, while others further specify that at least 100 must come from each side. The Correlates of War, a dataset widely used by scholars of conflict, classifies civil wars as having over 1000 war-related casualties per year of conflict. This rate is a small fraction of the millions killed in the Second Sudanese Civil War and Cambodian Civil War, for example, but excludes several highly publicized conflicts, such as The Troubles of Northern Ireland and the struggle of the African National Congress in Apartheid-era South Africa.

Causes
According to a 2017 review study of civil war research, there are three prominent explanations for civil war: greed-based explanations which center on individuals' desire to maximize their profits, grievance-based explanations which center on conflict as a response to socioeconomic or political injustice, and opportunity-based explanations which center on factors that make it easier to engage in violent mobilization.

Greed
Scholars investigating the cause of civil war are attracted by two opposing theories, greed versus grievance. Roughly stated: are conflicts caused by who people are, whether that be defined in terms of ethnicity, religion or other social affiliation, or do conflicts begin because it is in the economic best interests of individuals and groups to start them? Scholarly analysis supports the conclusion that economic and structural factors are more important than those of identity in predicting occurrences of civil war.

Grievance
Most proxies for "grievance"—the theory that civil wars begin because of issues of identity, rather than economics—were statistically insignificant, including economic equality, political rights, ethnic polarization and religious fractionalization. Only ethnic dominance, the case where the largest ethnic group comprises a majority of the population, increased the risk of civil war. A country characterized by ethnic dominance has nearly twice the chance of a civil war. However, the combined effects of ethnic and religious fractionalization, i.e. the greater chance that any two randomly chosen people will be from separate ethnic or religious groups, the less chance of a civil war, were also significant and positive, as long as the country avoided ethnic dominance. The study interpreted this as stating that minority groups are more likely to rebel if they feel that they are being dominated, but that rebellions are more likely to occur the more homogeneous the population and thus more cohesive the rebels. These two factors may thus be seen as mitigating each other in many cases.

Opportunities
James Fearon and David Laitin find that ethnic and religious diversity does not make civil war more likely. They instead find that factors that make it easier for rebels to recruit foot soldiers and sustain insurgencies, such as "poverty—which marks financially & bureaucratically weak states and also favors rebel recruitment—political instability, rough terrain, and large populations" make civil wars more likely.

Other Causes

Other causes of civil war.

Bargaining Problems	In a state torn by civil war, the contesting powers often do not have the ability to commit or the trust to believe in the other side's commitment to put an end to war. When considering a peace agreement, the involved parties are aware of the high incentives to withdraw once one of them has taken an action that weakens their military, political or economical power.
Governance	Political scientist Barbara Walter suggests that most contemporary civil wars are actually repeats of earlier civil wars that often arise when leaders are not accountable to the public, when there is poor public participation in politics, and when there is a lack of transparency of information between the executives and the public.
Military Advantage	High levels of population dispersion and, to a lesser extent, the presence of mountainous terrain, increased the chance of conflict. Both of these factors favor rebels, as a population dispersed outward toward the borders is harder to control than one concentrated in a central region, while mountains offer terrain where rebels can seek sanctuary.
Population Size	The various factors contributing to the risk of civil war rise increase with population size. The risk of a civil war rises approximately proportionately with the size of a country's population.
Time	The more time that has elapsed since the last civil war, the less likely it is that a conflict will recur. The study had two possible explanations for this: one opportunity-based and the other grievance-based. The elapsed time may represent the depreciation of whatever capital the rebellion was fought over and thus increase the opportunity cost of restarting the conflict.

5 War

War is a state of armed conflict between states or societies. It is generally characterized by extreme aggression, destruction, and mortality, using regular or irregular military forces.

For Civil War see MAN-MADE DISASTERS > Civil Unrest > Civil War

Past Wars

War	Description
World War II 1939–1945 40-85mil Deaths Worldwide Fighting	World War II, also known as the Second World War, was a global war that lasted from 1939 to 1945. The vast majority of the world's countries—including all the great powers—eventually formed two opposing military alliances: the Allies and the Axis. A state of total war emerged, directly involving more than 100 million people from more than 30 countries. World War II was the deadliest conflict in human history, marked by 70 to 85 million fatalities, most of whom were civilians in the Soviet Union and China. It included massacres, the genocide of the Holocaust, strategic bombing, premeditated death from starvation and disease, and the only use of nuclear weapons in war.
World War I / Great War 1914–1918 20mil Deaths Worldwide Fighting	World War I also known as the First World War or the Great War, was a global war originating in Europe that lasted from 28 July 1914 to 11 November 1918. Contemporaneously described as "the war to end all wars", it led to the mobilisation of more than 70 million military personnel, including 60 million Europeans, making it one of the largest wars in history. It is also one of the deadliest conflicts in history, with an estimated nine million combatants and seven million civilian deaths as a direct result of the war, while resulting genocides and the resulting 1918 influenza pandemic caused another 50 to 100 million deaths worldwide.
Taiping Rebellion 1850–1864 20-100mil Deaths China	The Taiping Rebellion, which is also known as the Taiping Civil War or the Taiping Revolution, was a massive rebellion or civil war that was waged in China from 1850 to 1864 between the established Manchu-led Qing dynasty and the Hakka-led Taiping Heavenly Kingdom. Led by Hong Xiuquan, the self-proclaimed brother of Jesus Christ, the goals of the Taipings were religious, nationalist, and political in nature; they sought the conversion of the Chinese people to the Taiping's syncretic version of Christianity, the overthrow of the ruling Manchus, and a wholesale transformation and reformation of the state. Rather than simply supplanting the ruling class, the Taipings sought to upend the moral and social order of China.
Dungan Revolt 1862–1877 8-20mil Deaths China	The Dungan Revolt (1862–1877) or Tongzhi Hui Revolt was a mainly ethnic and religious war fought in 19th-century western China, mostly during the reign of the Tongzhi Emperor (r. 1861–1875) of the Qing dynasty. The term sometimes includes the Panthay Rebellion in Yunnan, which occurred during the same period. However, this article relates specifically to the uprising by members of the Muslim Hui and other Muslim ethnic groups in China's Shaanxi, Gansu and Ningxia provinces, as well as in Xinjiang, between 1862 and 1877.
Chinese Civil War 1927–1949 8mil Deaths China	The Chinese Civil War was a civil war in China fought between the Kuomintang (KMT)-led government of the Republic of China (ROC) and the Communist Party of China (CPC) lasting intermittently between 1927 and 1949. The war is generally divided into two phases with an interlude: from August 1927 to 1937, the KMT-CPC Alliance collapsed during the Northern Expedition, and the Nationalists controlled most of China. From 1937 to 1945, hostilities were put on hold, and the Second United Front fought the Japanese invasion of China with eventual help from the World War II Allies. The civil war resumed with the Japanese defeat, and the CPC gained the upper hand in the final phase of the war from 1945–1949, generally referred to as the Chinese Communist Revolution.
Russian Civil War 1917–1922 5-9mil Deaths Russia	The Russian Civil War was a multi-party civil war in the former Russian Empire immediately after the two Russian Revolutions of 1917, as many factions vied to determine Russia's political future. The two largest combatant groups were the Red Army, fighting for the Bolshevik form of socialism led by Vladimir Lenin, and the loosely allied forces known as the White Army, which included diverse interests favouring political monarchism, economic capitalism and alternative forms of socialism, each with democratic and anti-democratic variants. In addition, rival militant socialists and non-ideological Green armies fought against both the Bolsheviks and the Whites.
Napoleonic Wars 1803–1815 3.5-6mil Deaths Europe	The Napoleonic Wars (1803–1815) were a series of major conflicts pitting the French Empire and its allies, led by Napoleon I, against a fluctuating array of European powers formed into various coalitions, financed and usually led by the United Kingdom. The wars stemmed from the unresolved disputes associated with the French Revolution and its resultant conflict. The wars are often categorised into five conflicts, each termed after the coalition that fought Napoleon: the Third Coalition (1805), the Fourth (1806–07), the Fifth (1809), the Sixth (1813), and the Seventh (1815).
Second Congo War 1998–2003 2.5-5.4mil Deaths Central Africa	The Second Congo War (also known as the Great War of Africa or the Great African War, and sometimes referred to as the African World War) began in the Democratic Republic of the Congo in August 1998, little more than a year after the First Congo War, and involved some of the same issues. The war officially ended in July 2003, when the Transitional Government of the Democratic Republic of the Congo took power. Although a peace agreement was signed in 2002, violence has continued in many regions of the country, especially in the east. Hostilities have continued since the ongoing Lord's Resistance Army insurgency, and the Kivu and Ituri conflicts.
Bangladesh Liberation War 1971 2-3mil Deaths Bangladesh	The Bangladesh Liberation War, also known as the Bangladesh War of Independence, or simply the Liberation War in Bangladesh, was a revolution and armed conflict sparked by the rise of the Bengali nationalist and self-determination movement in what was then East Pakistan during the 1971 Bangladesh genocide. It resulted in the independence of the People's Republic of Bangladesh. The war began after the Pakistani military junta based in West Pakistan launched Operation Searchlight against the people of East Pakistan on the night of 25 March 1971. It pursued the systematic elimination of nationalist Bengali civilians, students, intelligentsia, religious minorities and armed personnel. The junta annulled the results of the 1970 elections and arrested Prime minister-designate Sheikh Mujibur Rahman. The war ended on 16 December 1971 after West Pakistan surrendered.
Vietnam War/Second Indochina War 1955–1975 800k-3.8mil Deaths Vietnam	The Vietnam War, also known as the Second Indochina War, and in Vietnam as the Resistance War Against America or simply the American War, was a conflict in Vietnam, Laos, and Cambodia from 1 November 1955 to the fall of Saigon on 30 April 1975. It was the second of the Indochina Wars and was officially fought between North Vietnam and South Vietnam. North Vietnam was supported by the Soviet Union, China, and other communist allies; South Vietnam was supported by the United States, South Korea, the Philippines, Australia, Thailand and other anti-communist allies. The war, considered a Cold War-era proxy war by some, lasted 19 years, with direct U.S. involvement ending in 1973, and included the Laotian Civil War and the Cambodian Civil War, which ended with all three countries becoming communist in 1975.

Mexican Revolution 1910–1920 1-2mil Deaths Mexico	The Mexican Revolution (Spanish: Revolución Mexicana) was a major armed struggle, lasting roughly from 1910-20, that transformed Mexican culture and government. Although recent research has focused on local and regional aspects of the Revolution, it was a genuinely national revolution. Its outbreak in 1910 resulted from the failure of the 31-year-long regime of Porfirio Díaz to find a managed solution to presidential succession. This meant there was a political crisis among competing elites and the opportunity for agrarian insurrection. Wealthy landowner Francisco I. Madero challenged Díaz in the 1910 presidential election, and following the rigged results, revolted under the Plan of San Luis Potosí. Armed conflict broke out in northern Mexico and Díaz was forced out. In the Treaty of Ciudad Juárez, Díaz resigned and went into exile, new elections were to occur in the fall, and an Interim Presidency under Francisco León de la Barra was installed. A new election was held in 1911, bringing Madero to the presidency.

Weapons

Hypersonic Missiles

A hypersonic weapon is a missile that travels at Mach 5 (6,174km/h, 3,836mph) or higher. That's at least five times the speed of sound, or about 1 mile per second. "Hypersonic weapons, however, are manoeuvrable and cruise at lower altitudes, making them more difficult to counter." For reference, commercial airliners fly subsonically, just below Mach 1 whereas modern fighter jets can travel supersonically at Mach 2 or Mach 3. "Once you reach Mach 5 you can't use your traditional jets and just make them go faster," Carrie Lee, a Rand Stanton Nuclear Fellow, explained. A traditional jet engine could operate up to Mach 3 or Mach 4 and so, anything travelling faster would need an altered system. You need a completely different design to unclutter the flow path and sustain combustion of the supersonic airflow inside the engine," said Rand senior engineer George Nacouzi.

The answer would then be a supersonic combustion ramjet (SCRAMJET), which can operate between Mach 5 and Mach 15. In order to maintain sustained hypersonic flight, a vehicle must also endure the extreme temperatures of flying at such speeds. "You can think of it as flying into a blowtorch," explained Rich Moore, senior engineer and Rand researcher. "The faster a vehicle flies, the pressure-temperature rises exponentially. So you have to have materials that can withstand high temperatures over a long period of time," Nacouzi added. "Hypersonic cruise missiles are powered all the way to their targets using an advanced propulsion system called a SCRAMJET. These are very, very fast. You may have six minutes from the time its launched until the time it strikes," Moore said. "We (The U.S.) don't currently have effective defences against hypersonic weapons because of the way they fly, i.e., they're manoeuvrable and fly at an altitude our current defence systems are not designed to operate at," he said. "Our whole defensive system is based on the assumption that you're gonna intercept a ballistic object."

Hypersonic Glide Vehicle

The Avangard (also known as Objekt 4202, Yu-71 and Yu-74) is a hypersonic glider, developed by Russia, that can be carried as a MIRV payload by the UR-100UTTKh, R-36M2 and RS-28 Sarmat heavy ICBMs. It can deliver both nuclear and conventional payloads. The system entered service in March 2018, and was unveiled by Russian President Vladimir Putin as one of the six new Russian strategic weapons.

Nuclear War

Nuclear warfare is a military conflict or political strategy in which nuclear weaponry is used to inflict damage on the enemy. Nuclear weapons are weapons of mass destruction; in contrast to conventional warfare, nuclear warfare can produce destruction in a much shorter time and can have a long-lasting radiological warfare result.

EMPs

An electromagnetic pulse (EMP), is a short burst of electromagnetic energy.
EMP interference is generally disruptive or damaging to electronic equipment, and at higher energy levels a powerful EMP event such as a lightning strike can damage physical objects such as buildings and aircraft structures.
See Mass Destruction > EMP for more.

6 Economy

Any economic based disasters.

Economic Collapse

Economic collapse is any of a broad range of bad economic conditions, ranging from a severe, prolonged depression with high bankruptcy rates and high unemployment, to a breakdown in normal commerce caused by hyperinflation, or even an economically caused sharp rise in the death rate and perhaps even a decline in population. Often economic collapse is accompanied by social chaos, civil unrest and a breakdown of law and order.

Cases
There are few well documented cases of economic collapse. One of the best documented cases of collapse or near collapse is the Great Depression, the causes of which are still being debated.

"To understand the Great Depression is the Holy Grail of macroeconomics." Ben Bernanke (1995)

Bernanke's comment addresses the difficulty of identifying specific causes when many factors may each have contributed to various extents. Past economic collapses have had political as well as financial causes. Persistent trade deficits, wars, revolutions, famines, depletion of important resources, and government-induced hyperinflation have been listed as causes.

In some cases blockades and embargoes caused severe hardships that could be considered economic collapse. In the U.S. the Embargo Act of 1807 forbade foreign trade with warring European nations, causing a severe depression in the heavily international trade-dependent economy, especially in the shipping industry and port cities, ending a great boom. The Union blockade of the Confederate States of America severely damaged the South's plantation owners; however, the South had little economic development. The blockade of Germany during World War I led to starvation of hundreds of thousands of Germans but did not cause economic collapse, at least until the political turmoil and the hyperinflation that followed. For both the Confederacy and Weimar Germany, the cost of the war was worse than the blockade.

Many Southern plantation owners had their bank accounts confiscated and also all had to free their slaves without compensation. The Germans had to make war reparations. Following defeat in war, the conquering country or faction may not accept paper currency of the vanquished, and the paper becomes worthless. (This was the situation of the Confederacy.) Government debt obligations, primarily bonds, are often restructured and sometimes become worthless. Therefore, there is a tendency for the public to hold gold and silver during times of war or crisis.

Effects of War & Hyperinflation on Wealth and Commerse
Hyperinflation, wars, and revolutions cause hoarding of essentials and a disruption of markets. In some past hyperinflations, workers were paid daily and immediately spent their earnings on essential goods, which they often used for barter. Store shelves were frequently empty. More stable foreign currencies, silver and gold (usually coins) were held and exchanged in place of local currency. The minting country of precious metal coins tended to be relatively unimportant. Jewelry was also used as a medium of exchange. Alcoholic beverages were also used for barter. Desperate individuals sold valuable possessions to buy essentials or traded them for gold and silver. In the German hyperinflation, stocks held much more of their value than paper currency. Bonds denominated in the inflating currency may lose most or all value.

Bank Holidays, Conversion or Confiscation of Accounts and New Currency
During severe financial crises, sometimes governments close banks. Depositors may be unable to withdraw their money for long periods, as was true in the United States in 1933 under the Emergency Banking Act. Withdrawals may be limited. Bank deposits may be involuntarily converted to government bonds or to a new currency of lesser value in foreign exchange. During financial crises and even less severe situations, capital controls are often imposed to restrict or prohibit transferring or personally taking money, securities or other valuables out of a country. To end hyperinflations a new currency is typically issued. The old currency is often not worth exchanging for new.

Examples

Weimar Germany

Following Germany's defeat in World War I, political instability resulted in murders and assassinations of hundreds of political figures. Germany's finances were heavily strained by the war and reparations in accordance with the Treaty of Versailles. Unable to raise enough in taxes to run the government and make war reparations, the government resorted to printing money which resulted in great hyperinflation. One book on the hyperinflation, which includes quotes and a few first hand accounts, is When Money Dies.

The hyperinflation eventually ended, it cleared government debt at the cost of the citizens' savings. Some believe that the hyperinflation of 1923 has helped fuel the eventual rise of the Nazi party and the rise of Hitler to power in 1933. Economists, however, tend to attribute Hitler's rise to the Deflation and the Great Depression beginning in 1929. Paul Krugman concluded that the 1923 hyperinflation didn't bring Hitler to power; it was the Brüning deflation and depression. Before 1929 the Nazi party was actually in decline with less than 3% of votes in the German federal election of 1928.

The Great Depression

While arguably not a true economic collapse, the decade of the 1930s witnessed the most severe worldwide economic contraction since the start of the Industrial Revolution. In the US, the Depression began in the summer of 1929, soon followed by the stock market crash of October 1929. American stock prices continued to decline in fits and starts until they hit bottom in July 1932. In the first quarter of 1933, the banking system broke down: asset prices had collapsed, bank lending had largely ceased, a quarter of the American work force was unemployed, and real GDP per capita in 1933 was 29% below its 1929 value.

The ensuing rapid recovery was interrupted by a major recession in 1937-38. The USA fully recovered by 1941, the eve of its entry in World War II, which gave rise to a boom as dramatic as the Depression that preceded it. While there were numerous bank failures during the Great Depression, most banks in developed countries survived, as did most currencies and governments. The most significant monetary change during the depression was the demise of the gold standard by most nations that were on it.

In the U.S., the dollar was redeemable in gold until 1933 when U.S. citizens were forced to turn over their gold (except for 5 ounces) for fiat currency (See: Executive Order 6102) and were forbidden to own monetary gold for the next four decades. Subsequently, gold was revalued from $20.67 per ounce to $35 per ounce. U.S. dollars remained redeemable in gold by foreigners until 1971. Gold ownership was legalized in the U.S. in 1974, but not with legal tender status.

As bad as the Great Depression was, it took place during a period of high productivity growth, which caused real wages to rise. The high unemployment was partly a result of the productivity gains, allowing the number of hours of the standard work week to be cut while restoring economic output to previous levels after a few years. Workers who remained employed saw their real hourly earnings rise because wages remained constant while prices fell; however, overall earnings remained relatively constant because of the reduced work week. Converting the dollar to a fiat currency and devaluing against gold ensured the end of deflation and created inflation, which made the high debt accumulated during the 1920s boom easier to repay, although some of the debt was written off.

Economic Collapse of Soviet Communism

During the 1980s, the Eastern Bloc, which relied on a stagnant form of planned economy, experienced a decade-long period of stagflation, and eventual collapse from which it did not recover, culminating with revolutions and the fall of communist regimes throughout Central and Eastern Europe and eventually in the Soviet Union. The process was accompanied by a gradual but important easing of restrictions on economic and political behaviour in the late 1980s, including the satellite states.

The collapse in the USSR was characterized by an increase in the death rate, especially by men over 50, with alcoholism a major cause. There was also an increase in violent crime and murder. The Russian population peaked in the 1990s and is lower today than two decades ago, as the demographics of Russia show. A firsthand account of conditions during the economic collapse was told by Dmitry Orlov, a former USSR citizen who became a US citizen but returned to Russia for a time during the crisis.

Russian Financial Crisis of 1998

After more or less stabilizing after the disintegration of the USSR, a severe financial crisis took place in the Russian Federation in August 1998. It was caused by low oil prices and government expenditure cuts after the end of the Cold War. Other nations of the former Soviet Union also experienced economic collapse, although a number of crises also involved armed conflicts, like in the break-away region Chechnya. The default by Russia on its government bonds in 1998 led to the collapse of highly leveraged hedge fund Long Term Capital Management, which threatened the world financial system. The U.S. Federal Reserve organized a bailout of LTCM which turned it over to a banking consortium.

Venezuela

Since 2013, Venezuela has been suffering an economic crisis. It's the worst in Venezuelan history, caused by the economic policies of the president, Nicolás Maduro the successor of Hugo Chávez, the fall in oil prices and internal and external factors. Since 2014, Venezuela's GDP has been in recession, falling more 40%. The economy has collapsed, causing shortages of basics goods, economic downturn and hyperinflation since 2017. Also, there are drastic increases in the crime, corruption, poverty and hunger. Thousands of Venezuelans have fled to neighboring countries.

Causes of the Great Depression

The causes of the Great Depression in the early 20th century have been extensively discussed by economists and remain a matter of active debate. They are part of the larger debate about economic crises. The specific economic events that took place during the Great Depression are well established. There was an initial stock market crash that triggered a "panic sell-off" of assets. This was followed by a deflation in asset and commodity prices, dramatic drops in demand and credit, and disruption of trade, ultimately resulting in widespread unemployment (over 13 million people were unemployed by 1932) and impoverishment. However, economists and historians have not reached a consensus on the causal relationships between various events and government economic policies in causing or ameliorating the Depression.

Current mainstream theories may be broadly classified into two main points of view. The first are the demand-driven theories, from Keynesian and institutional economists who argue that the depression was caused by a widespread loss of confidence that led to underconsumption. The demand-driven theories argue that the financial crisis following the 1929 crash led to a sudden and persistent reduction in consumption and investment spending.

Once panic and deflation set in, many people believed they could avoid further losses by keeping clear of the markets. Holding money therefore became profitable as prices dropped lower and a given amount of money bought ever more goods, exacerbating the drop in demand. Second, there are the monetarists, who believe that the Great Depression started as an ordinary recession, but that significant policy mistakes by monetary authorities (especially the Federal Reserve) caused a shrinking of the money supply which greatly exacerbated the economic situation, causing a recession to descend into the Great Depression.

Related to this explanation are those who point to debt deflation causing those who borrow to owe ever more in real terms. There are also several various heterodox theories that reject the explanations of the Keynesians and monetarists. Some new classical macroeconomists have argued that various labor market policies imposed at the start caused the length and severity of the Great Depression. The Austrian school of economics focuses on the macroeconomic effects of money supply and how central banking decisions can lead to malinvestment. Marxist economists view the Great Depression, with all other economic crises, as a symptom of the cyclical nature of capitalism and the instability that is inherent in the capitalist model.

The Black Swan Theory

The black swan theory or theory of black swan events is a metaphor that describes an event that comes as a surprise, has a major effect, and is often inappropriately rationalized after the fact with the benefit of hindsight. The term is based on an ancient saying that presumed black swans did not exist – a saying that became reinterpreted to teach a different lesson after black swans were discovered in the wild.

The theory was developed by Nassim Nicholas Taleb to explain:
1. The disproportionate role of high-profile, hard-to-predict, and rare events that are beyond the realm of normal expectations in history, science, finance, and technology.
2. The non-computability of the probability of the consequential rare events using scientific methods (owing to the very nature of small probabilities).
3. The psychological biases that blind people, both individually and collectively, to uncertainty and to a rare event's massive role in historical affairs.

Unlike the earlier and broader "black swan problem" in philosophy (i.e. the problem of induction), Taleb's "black swan theory" refers only to unexpected events of large magnitude and consequence and their dominant role in history. Such events, considered extreme outliers, collectively play vastly larger roles than regular occurrences.:xxi More technically, in the scientific monograph 'Silent Risk', Taleb mathematically defines the black swan problem as "stemming from the use of degenerate metaprobability".

Economic Bubble

An economic bubble or asset bubble (sometimes also referred to as a speculative bubble, a market bubble, a price bubble, a financial bubble, a speculative mania, or a balloon) is a situation in which asset prices appear to be based on implausible or inconsistent views about the future. It could also be described as trade in an asset at a price or price range that strongly exceeds the asset's intrinsic value. While some economists deny that bubbles occur, the causes of bubbles remain disputed by those who are convinced that asset prices often deviate strongly from intrinsic values.

Many explanations have been suggested, and research has recently shown that bubbles may appear even without uncertainty, speculation, or bounded rationality, in which case they can be called non-speculative bubbles or sunspot equilibria. In such cases, the bubbles may be argued to be rational, where investors at every point are fully compensated for the possibility that the bubble might collapse by higher returns. These approaches require that the timing of the bubble collapse can only be forecast probabilistically and the bubble process is often modelled using a Markov switching model. Similar explanations suggest that bubbles might ultimately be caused by processes of price coordination.

More recent theories of asset bubble formation suggest that these events are sociologically driven. For instance, explanations have focused on emerging social norms and the role that culturally-situated stories or narratives play in these events. Because it is often difficult to observe intrinsic values in real-life markets, bubbles are often conclusively identified only in retrospect, once a sudden drop in prices has occurred. Such a drop is known as a crash or a bubble burst. In an economic bubble, prices can fluctuate erratically and become impossible to predict from supply and demand alone.

Asset bubbles are now widely regarded as a recurrent feature of modern economic history dating back as far as the 1600s. The Dutch Golden Age's tulip mania (in the mid-1630s) is often considered the first recorded economic bubble. Both the boom and the burst phases of the bubble are examples of a positive feedback mechanism (in contrast to the negative feedback mechanism that determines the equilibrium price under normal market circumstances).

Types of Bubbles

These are the different types of economic bubbles.

Equity Bubble	An equity bubble is characterised by tangible investments and the unsustainable desire to satisfy a legitimate market in high demand. These kind of bubbles are characterised by easy liquidity, tangible and real assets, and an actual innovation that boosts confidence. Two instances of an equity bubble are the Tulip Mania and the dot-com bubble.
Debt Bubble	A debt bubble is characterised by intangible or credit based investments with little ability to satisfy growing demand in a non-existent market. These bubbles are not backed by real assets and are characterized by frivolous lending in the hopes of returning a profit or security. These bubbles usually end in debt deflation causing bank runs or a currency crisis when the government can no longer maintain the fiat currency. Examples include the Great Depression and The Great Recession.

Impact

The impact of economic bubbles is debated within and between schools of economic thought; they are not generally considered beneficial, but it is debated how harmful their formation and bursting is. Within mainstream economics, many believe that bubbles cannot be identified in advance, cannot be prevented from forming, that attempts to "prick" the bubble may cause financial crisis, and that instead authorities should wait for bubbles to burst of their own accord, dealing with the aftermath via monetary policy and fiscal policy.

In addition, the crash which usually follows an economic bubble can destroy a large amount of wealth and cause continuing economic malaise; this view is particularly associated with the debt-deflation theory of Irving Fisher, and elaborated within Post-Keynesian economics. A protracted period of low risk premiums can simply prolong the downturn in asset price deflation as was the case of the Great Depression in the 1930s for much of the world and the 1990s for Japan. Not only can the aftermath of a crash devastate the economy of a nation, but its effects can also reverberate beyond its borders.

Effect Upon Spending

Another important aspect of economic bubbles is their impact on spending habits. Market participants with overvalued assets tend to spend more because they "feel" richer (the wealth effect). Many observers quote the housing market in the United Kingdom, Australia, New Zealand, Spain and parts of the United States in recent times, as an example of this effect. When the bubble inevitably bursts, those who hold on to these overvalued assets usually experience a feeling of reduced wealth and tend to cut discretionary spending at the same time, hindering economic growth or, worse, exacerbating the economic slowdown.

In an economy with a central bank, the bank may therefore attempt to keep an eye on asset price appreciation and take measures to curb high levels of speculative activity in financial assets. This is usually done by increasing the interest rate (that is, the cost of borrowing money). Historically, this is not the only approach taken by central banks. It has been argued that they should stay out of it and let the bubble, if it is one, take its course.

MAN-MADE DISASTERS | Economy | Economic Collapse | Economic Bubble

Possible Causes

In the 1970s, excess monetary expansion after the U.S. came off the gold standard (August 1971) created massive commodities bubbles. These bubbles only ended when the U.S. Central Bank (Federal Reserve) finally reined in the excess money, raising federal funds interest rates to over 14%. The commodities bubble popped and prices of oil and gold, for instance, came down to their proper levels. Similarly, low interest rate policies by the U.S. Federal Reserve in the 2001–2004 are believed to have exacerbated housing and commodities bubbles. The housing bubble popped as subprime mortgages began to default at much higher rates than expected, which also coincided with the rising of the fed funds rate.

It has also been variously suggested that bubbles may be rational, intrinsic, and contagious. To date, there is no widely accepted theory to explain their occurrence. Recent computer-generated agency models suggest excessive leverage could be a key factor in causing financial bubbles. Puzzlingly for some, bubbles occur even in highly predictable experimental markets, where uncertainty is eliminated and market participants should be able to calculate the intrinsic value of the assets simply by examining the expected stream of dividends.

Nevertheless, bubbles have been observed repeatedly in experimental markets, even with participants such as business students, managers, and professional traders. Experimental bubbles have proven robust to a variety of conditions, including short-selling, margin buying, and insider trading. While there is no clear agreement on what causes bubbles, there is evidence to suggest that they are not caused by bounded rationality or assumptions about the irrationality of others, as assumed by greater fool theory. It has also been shown that bubbles appear even when market participants are well-capable of pricing assets correctly. Further, it has been shown that bubbles appear even when speculation is not possible or when over-confidence is absent.

More recent theories of asset bubble formation suggest that they are likely sociologically-driven events, thus explanations that merely involve fundamental factors or snippets of human behavior are incomplete at best. For instance, qualitative researchers Preston Teeter and Jorgen Sandberg argue that market speculation is driven by culturally-situated narratives that are deeply embedded in and supported by the prevailing institutions of the time. They cite factors such as bubbles forming during periods of innovation, easy credit, loose regulations, and internationalized investment as reasons why narratives play such an influential role in the growth of asset bubbles.

Liquidity

One possible cause of bubbles is excessive monetary liquidity in the financial system, inducing lax or inappropriate lending standards by the banks, which makes markets vulnerable to volatile asset price inflation caused by short-term, leveraged speculation. For example, Axel A. Weber, the former president of the Deutsche Bundesbank, has argued that "The past has shown that an overly generous provision of liquidity in global financial markets in connection with a very low level of interest rates promotes the formation of asset-price bubbles."

According to the explanation, excessive monetary liquidity (easy credit, large disposable incomes) potentially occurs while fractional reserve banks are implementing expansionary monetary policy (i.e. lowering of interest rates and flushing the financial system with money supply); this explanation may differ in certain details according to economic philosophy. Those who believe the money supply is controlled exogenously by a central bank may attribute an 'expansionary monetary policy' to said bank and (should one exist) a governing body or institution; others who believe that the money supply is created endogenously by the banking sector may attribute such a 'policy' with the behavior of the financial sector itself, and view the state as a passive or reactive factor.

This may determine how central or relatively minor/inconsequential policies like fractional reserve banking and the central bank's efforts to raise or lower short-term interest rates are to one's view on the creation, inflation and ultimate implosion of an economic bubble. Explanations focusing on interest rates tend to take on a common form, however: When interest rates are set excessively low, (regardless of the mechanism by which it is accomplished) investors tend to avoid putting their capital into savings accounts. Instead, investors tend to leverage their capital by borrowing from banks and invest the leveraged capital in financial assets such as stocks and real estate.

Risky leveraged behavior like speculation and Ponzi schemes can lead to an increasingly fragile economy, and may also be part of what pushes asset prices artificially upward until the bubble pops. Simply put, economic bubbles often occur when too much money is chasing too few assets, causing both good assets and bad assets to appreciate excessively beyond their fundamentals to an unsustainable level. Once the bubble bursts, the fall in prices causes the collapse of unsustainable investment schemes (especially speculative and/or Ponzi investments, but not exclusively so), which leads to a crisis of consumer (and investor) confidence that may result in a financial panic and/or financial crisis; if there is monetary authority like a central bank, it may be forced to take a number of measures in order to soak up the liquidity in the financial system or risk a collapse of its currency.

This may involve actions like bailouts of the financial system, but also others that reverse the trend of monetary accommodation, commonly termed forms of 'contractionary monetary policy'. Some of these measures may include raising interest rates, which tends to make investors become more risk averse and thus avoid leveraged capital because the costs of borrowing may become too expensive; others may include certain countermeasures that may be taken pre-emptively during periods of strong economic growth include having the central monetary authority increase capital reserve requirements and attempting to implement regulation that checks and/or prevents processes leading to over-expansion and excessive leveraging of debt.

Ideally, such countermeasures lessen the impact of a downturn by strengthening financial institutions while the economy is strong. Advocates of perspectives stressing the role of credit money in an economy often refer to (such) bubbles as "credit bubbles", and look at such measures of financial leverage as debt-to-GDP ratios to identify bubbles. Typically the collapse of any economic bubble results in an economic contraction termed (if less severe) a recession or (if more severe) a depression; what economic policies to follow in reaction to such a contraction is a hotly debated perennial topic of political economy.

Possible Causes (Social Psychology Factors)

Greater Fool Theory	Greater fool theory states that bubbles are driven by the behavior of perennially optimistic market participants (the fools) who buy overvalued assets in anticipation of selling it to other speculators (the greater fools) at a much higher price. According to this explanation, the bubbles continue as long as the fools can find greater fools to pay up for the overvalued asset. The bubbles will end only when the greater fool becomes the greatest fool who pays the top price for the overvalued asset and can no longer find another buyer to pay for it at a higher price. This theory is popular among laity but has not yet been fully confirmed by empirical research.
Extrapolation	Extrapolation is projecting historical data into the future on the same basis; if prices have risen at a certain rate in the past, they will continue to rise at that rate forever. The argument is that investors tend to extrapolate past extraordinary returns on investment of certain assets into the future, causing them to overbid those risky assets in order to attempt to continue to capture those same rates of return. Overbidding on certain assets will at some point result in uneconomic rates of return for investors; only then the asset price deflation will begin. When investors feel that they are no longer well compensated for holding those risky assets, they will start to demand higher rates of return on their investments.
Herding	Another related explanation used in behavioral finance lies in herd behavior, the fact that investors tend to buy or sell in the direction of the market trend. This is sometimes helped by technical analysis that tries precisely to detect those trends and follow them, which creates a self-fulfilling prophecy. Investment managers, such as stock mutual fund managers, are compensated and retained in part due to their performance relative to peers. Taking a conservative or contrarian position as a bubble builds results in performance unfavorable to peers. This may cause customers to go elsewhere and can affect the investment manager's own employment or compensation. The typical short-term focus of U.S. equity markets exacerbates the risk for investment managers that do not participate during the building phase of a bubble, particularly one that builds over a longer period of time. In attempting to maximize returns for clients and maintain their employment, they may rationally participate in a bubble they believe to be forming, as the risks of not doing so outweigh the benefits.

Moral Hazard	Moral hazard is the prospect that a party insulated from risk may behave differently from the way it would behave if it were fully exposed to the risk. A person's belief that they are responsible for the consequences of their own actions is an essential aspect of rational behavior. An investor must balance the possibility of making a return on their investment with the risk of making a loss – the risk-return relationship. A moral hazard can occur when this relationship is interfered with, often via government policy.

Stages of an Economic Bubble

According to the economist Charles P. Kindleberger, the basic structure of a speculative bubble can be divided into 5 phases:
- Substitution: increase in the value of an asset
- Takeoff: speculative purchases (buy now to sell in the future at a higher price and obtain a profit)
- Exuberance: a state of unsustainable euphoria.
- Critical stage: begin to shorten the buyers, some begin to sell.
- Pop (crash): Prices plummet

Identifying Asset Bubbles
Economic or asset price bubbles are often characterized by one or more of the following:

1	Unusual changes in single measures, or relationships among measures (e.g., ratios) relative to their historical levels. For example, in the housing bubble of the 2000s, the housing prices were unusually high relative to income. For stocks, the price to earnings ratio provides a measure of stock prices relative to corporate earnings; higher readings indicate investors are paying more for each dollar of earnings.
2	Elevated usage of debt (leverage) to purchase assets, such as purchasing stocks on margin or homes with a lower down payment.
3	Higher risk lending and borrowing behavior, such as originating loans to borrowers with lower credit quality scores (e.g., subprime borrowers), combined with adjustable rate mortgages and "interest only" loans.
4	Rationalizing borrowing, lending and purchase decisions based on expected future price increases rather than the ability of the borrower to repay.
5	Rationalizing asset prices by increasingly weaker arguments, such as "this time it's different" or "housing prices only go up."
6	A high presence of marketing or media coverage related to the asset.
7	Incentives that place the consequences of bad behavior by one economic actor upon another, such as the origination of mortgages to those with limited ability to repay because the mortgage could be sold or securitized, moving the consequences from the originator to the investor.
8	International trade (current account) imbalances, resulting in an excess of savings over investments, increasing the volatility of capital flow among countries. For example, the flow of savings from Asia to the U.S. was one of the drivers of the 2000s housing bubble.
9	A lower interest rate environment, which encourages lending and borrowing.

Examples of Asset Bubbles

- Cryptocurrency Bubble (2011–2018)
- Rhodium Bubble of 2008: (increase from $500/oz to $9000/oz in July 2008, then down to $1000/oz in January 2009)
- United States Housing Bubble (2002–2006)
- 1997 Asian Financial Crisis (1997)
- The Dot-Com Bubble (US) (1995–2000)
- Gold and Silver Bubble (1976–1980)

Examples of Aftermaths of Bubbles

- Panic of 1837
- Great Depression
- Lost Decade (Japan)
- Early 2000s recession
- Great Recession

Stock Market Crash

A stock market crash is a sudden dramatic decline of stock prices across a significant cross-section of a stock market, resulting in a significant loss of paper wealth. Crashes are driven by panic as much as by underlying economic factors. They often follow speculative stock market bubbles. Stock market crashes are social phenomena where external economic events combine with crowd behavior and psychology in a positive feedback loop where selling by some market participants drives more market participants to sell.

Generally speaking, crashes usually occur under the following conditions: a prolonged period of rising stock prices and excessive economic optimism, a market where P/E ratios (Price-Earning ratio) exceed long-term averages, and extensive use of margin debt and leverage by market participants. Other aspects such as wars, large-corporation hacks, changes in federal laws and regulations, and natural disasters of highly economically productive areas may also influence a significant decline in the stock market value of a wide range of stocks. All such stock drops may result in the rise of stock prices for corporations competing against the affected corporations.

There is no numerically specific definition of a stock market crash but the term commonly applies to steep double-digit percentage losses in a stock market index over a period of several days. Crashes are often distinguished from bear markets by panic selling and abrupt, dramatic price declines. Bear markets are periods of declining stock market prices that are measured in months or years. Crashes are often associated with bear markets, however, they do not necessarily go hand in hand. The crash of 1987, for example, did not lead to a bear market. Likewise, the Japanese bear market of the 1990s occurred over several years without any notable crashes.

Major Crashes in the U.S.

These are a list of major market crashes in the United States.

Panic of 1907	In 1907 and in 1908, the NYSE fell by nearly 50% due to a variety of factors, led by the manipulation of copper stocks by the Knickerbocker company. Shares of United Copper rose gradually up to October, and thereafter crashed, leading to panic. A number of investment trusts and banks that had invested their money in the stock market fell and started to close down. Further bank runs were prevented due to the intervention of J. P. Morgan. The panic continued to 1908 and led to the formation of the Federal Reserve in 1913.
Wall Street Crash of 1929	The economy had been growing for most of the Roaring Twenties. It was a technological golden age, as innovations such as the radio, automobile, aviation, telephone, and the power grid were deployed and adopted. Companies that had pioneered these advances, like Radio Corporation of America (RCA) and General Motors, saw their stocks soar. Financial corporations also did well, as Wall Street bankers floated mutual fund companies (then known as investment trusts) like the Goldman Sachs Trading Corporation. Investors were infatuated with the returns available in the stock market, especially by the use of leverage through margin debt.

October 19, 1987	The mid-1980s were a time of strong economic optimism. From August 1982 to its peak in August 1987, the Dow Jones Industrial Average (DJIA) grew from 776 to 2722. The rise in market indices for the 19 largest markets in the world averaged 296 percent during this period. The average number of shares traded on the NYSE(New York Stock Exchange) had risen from 65 million shares to 181 million shares.
Crash of 2008–2009	On September 16, 2008, failures of massive financial institutions in the United States, due primarily to exposure to packaged subprime loans and credit default swaps issued to insure these loans and their issuers, rapidly devolved into a global crisis. This resulted in a number of bank failures in Europe and sharp reductions in the value of stocks and commodities worldwide. The failure of banks in Iceland resulted in a devaluation of the Icelandic króna and threatened the government with bankruptcy. Iceland obtained an emergency loan from the International Monetary Fund in November. In the United States, 15 banks failed in 2008, while several others were rescued through government intervention or acquisitions by other banks. On October 11, 2008, the head of the International Monetary Fund (IMF) warned that the world financial system was teetering on the "brink of systemic meltdown". The economic crisis caused countries to close their markets temporarily. On October 8, the Indonesian stock market halted trading, after a 10% drop in one day.

The Times of London reported that the meltdown was being called the Crash of 2008, and older traders were comparing it with Black Monday in 1987. The fall that week of 21% compared to a 28.3% fall 21 years earlier, but some traders were saying it was worse. "At least then it was a short, sharp, shock on one day. This has been relentless all week." Business Week also referred to the crisis as a "stock market crash" or the "Panic of 2008".

Mitigation Strategies
One mitigation strategy has been the introduction of trading curbs, also known as "circuit breakers", which are a trading halt in the cash market and the corresponding trading halt in the derivative markets triggered by the halt in the cash market, all of which are affected based on substantial movements in a broad market indicator. Since their inception, circuit breakers have been modified to prevent both speculative gains and dramatic losses within a small time frame.

United States
There are three thresholds, which represent different levels of decline in the DJIA in terms of points. These thresholds are set at the beginning of each quarter to establish a specific point value. For example, in the second quarter of 2011, Threshold 1 was a drop of 1200 points, Threshold 2 was 2400 points, and Threshold 3 was 3600 points. If Threshold 2 is breached before 1 pm, the market closes for two hours. If such a decline occurs between 1 pm and 2 pm, there is a one-hour pause. The market would close for the day if stocks sank to that level after 2 pm. If Threshold 3 is breached, the market would close for the day, regardless of the time.

Hyperinflation

In economics, hyperinflation is very high and typically accelerating inflation. It quickly erodes the real value of the currency, as the prices of most or all goods increase. This causes people to minimize their holdings in that currency as they usually switch to more stable foreign currencies. Prices typically remain stable in terms of other currencies. Unlike low inflation, where the process of rising prices is protracted and not generally noticeable except by studying past market prices, hyperinflation sees a rapid and continuing increase in nominal prices, the nominal cost of goods, and in the supply of money. Typically, however, the general price level rises even more rapidly than the money supply as people try ridding themselves of the devaluing currency as quickly as possible. As this happens, the real stock of money (i.e., the amount of circulating money divided by the price level) decreases considerably.

Causes

While there can be a number of causes of high inflation, most hyperinflations have been caused by government budget deficits financed by money creation. A necessary condition for hyperinflation is the use of paper money, instead of gold or silver coins. Most hyperinflations in history, with some exceptions, such as the French hyperinflation of 1789-1796, occurred after the use of fiat currency became widespread in the late 19th century. Hyperinflation occurs when there is a continuing (and often accelerating) rapid increase in the amount of money that is not supported by a corresponding growth in the output of goods and services. The price increases that result from the rapid money creation creates a vicious circle, requiring ever growing amounts of new money creation to fund government deficits. Hence both monetary inflation and price inflation proceed at a rapid pace. Such rapidly increasing prices cause widespread unwillingness of the local population to hold the local currency as it rapidly loses its buying power.

Instead they quickly spend any money they receive, which increases the velocity of money flow; this in turn causes further acceleration in prices. This means that the increase in the price level is greater than that of the money supply. This results in an imbalance between the supply and demand for the money (including currency and bank deposits), causing rapid inflation. Very high inflation rates can result in a loss of confidence in the currency, similar to a bank run. Usually, the excessive money supply growth results from the government being either unable or unwilling to fully finance the government budget through taxation or borrowing, and instead it finances the government budget deficit through the printing of money. Governments have sometimes resorted to excessively loose monetary policy, as it allows a government to devalue its debts and reduce (or avoid) a tax increase. Inflation is effectively a regressive tax on the users of money, but less overt than levied taxes and is therefore harder to understand by ordinary citizens. Inflation can obscure quantitative assessments of the true cost of living, as published price indices only look at data in retrospect, so may increase only months later.

Effects

Hyperinflation effectively wipes out the purchasing power of private and public savings; distorts the economy in favour of the hoarding of real assets; causes the monetary base, whether specie or hard currency, to flee the country; and makes the afflicted area anathema to investment. One of the most important characteristics of hyperinflation is the accelerating substitution of the inflating money by stable money—gold and silver in former times, then relatively stable foreign currencies after the breakdown of the gold or silver standards (Thiers' Law).

If inflation is high enough, government regulations like heavy penalties and fines, often combined with exchange controls, cannot prevent this currency substitution. As a consequence, the inflating currency is usually heavily undervalued compared to stable foreign money in terms of purchasing power parity. So foreigners can live cheaply and buy at low prices in the countries hit by high inflation. It follows that governments that do not succeed in engineering a successful currency reform in time must finally legalize the stable foreign currencies (or, formerly, gold and silver) that threaten to fully substitute the inflating money. Otherwise, their tax revenues, including the inflation tax, will approach zero.

Enactment of price controls to prevent discounting the value of paper money relative to gold, silver, hard currency, or other commodities fail to force acceptance of a paper money that lacks intrinsic value. If the entity responsible for printing a currency promotes excessive money printing, with other factors contributing a reinforcing effect, hyperinflation usually continues. Hyperinflation is generally associated with paper money, which can easily be used to increase the money supply: add more zeros to the plates and print, or even stamp old notes with new numbers. Historically, there have been numerous episodes of hyperinflation in various countries followed by a return to "hard money". Older economies would revert to hard currency and barter when the circulating medium became excessively devalued, generally following a "run" on the store of value.

Aftermath

Hyperinflation is ended by drastic remedies, such as imposing the shock therapy of slashing government expenditures or altering the currency basis. One form this may take is dollarization, the use of a foreign currency (not necessarily the U.S. dollar) as a national unit of currency. An example was dollarization in Ecuador, initiated in September 2000 in response to a 75% loss of value of the Ecuadorian sucre in early 2000. But usually the "dollarization" takes place in spite of all efforts of the government to prevent it by exchange controls, heavy fines and penalties. The government has thus to try to engineer a successful currency reform stabilizing the value of the money. If it does not succeed with this reform the substitution of the inflating by stable money goes on.

Thus it is not surprising that there have been at least seven historical cases in which the good (foreign) money did fully drive out the use of the inflating currency. In the end the government had to legalize the former, for otherwise its revenues would have fallen to zero. Hyperinflation has always been a traumatic experience for the people who suffer it, and the next political regime almost always enacts policies to try to prevent its recurrence. Often this means making the central bank very aggressive about maintaining price stability, as was the case with the German Bundesbank, or moving to some hard basis of currency, such as a currency board. Many governments have enacted extremely stiff wage and price controls in the wake of hyperinflation, but this does not prevent further inflation of the money supply by the central bank, and always leads to widespread shortages of consumer goods if the controls are rigidly enforced.

Currency

In countries experiencing hyperinflation, the central bank often prints money in larger and larger denominations as the smaller denomination notes become worthless. This can result in the production of unusually large denominations of banknotes, including those denominated in amounts of 1,000,000,000 or more.

By late 1923, the Weimar Republic of Germany was issuing two-trillion mark banknotes and postage stamps with a face value of fifty billion marks. The highest value banknote issued by the Weimar government's Reichsbank had a face value of 100 trillion marks. At the height of the inflation, one US dollar was worth 4 trillion German marks. One of the firms printing these notes submitted an invoice for the work to the Reichsbank for 32,776,899,763,734,490,417 (33 quintillion) marks.

The largest denomination banknote ever officially issued for circulation was in 1946 by the Hungarian National Bank for the amount of 100 quintillion pengő (100,000,000,000,000,000,000, or 1020; 100 million million million) image. The banknotes did not show the numbers in full: "hundred million b.-pengő" ("hundred million trillion pengő") and "one milliard b.-pengő" were spelled out instead. This makes the 100,000,000,000,000 Zimbabwean dollar banknotes the note with the greatest number of zeros shown.

The Post-World War II hyperinflation of Hungary held the record for the most extreme monthly inflation rate ever – 41,900,000,000,000,000% (4.19 × 1016% or 41.9 quadrillion percent) for July 1946, amounting to prices doubling every 15.3 hours. By comparison, recent figures (as of 14 November 2008) estimate Zimbabwe's annual inflation rate at 89.7 sextillion (1021) percent. The highest monthly inflation rate of that period was 79.6 billion percent, and a doubling time of 24.7 hours. In figures, that is 79,600,000,000%.

Hyperinflation Examples

The following are examples of hyperinflation of other countries throughout recent history. These have been added to detail what happened and to educate you on how hyperinflation effects the economy. Understanding how it works will give you an upper hand in surviving in a country where your money is worth noticeably less every hour.

Austria	In 1922, inflation in Austria reached 1,426%, and from 1914 to January 1923, the consumer price index rose by a factor of 11,836, with the highest banknote in denominations of 500,000 Austrian krones. After World War I, essentially all State enterprises ran at a loss, and the number of state employees in the capital, Vienna, was greater than in the earlier monarchy, even though the new republic was nearly one-eighth of the size. Observing the Austrian response to developing hyperinflation, which included the hoarding of food and the speculation in foreign currencies, Owen S. Phillpotts, the Commercial Secretary at the British Legation in Vienna wrote: "The Austrians are like men on a ship who cannot manage it, and are continually signalling for help. While waiting, however, most of them begin to cut rafts, each for himself, out of the sides and decks. The ship has not yet sunk despite the leaks so caused, and those who have acquired stores of wood in this way may use them to cook their food, while the more seamanlike look on cold and hungry. The population lack courage and energy as well as patriotism."	**Start and End Date** Oct. 1921 – Sep. 1922 **Peak Month and Rate of Inflation** Aug. 1922, 129%
China	As the first user of fiat currency, China was also the first country to experience hyperinflation. Paper currency was introduced during the Tang Dynasty, and was generally welcomed. It maintained its value, as successive Chinese governments put in place strict controls on issuance. The convenience of paper currency for trade purposes led to strong demand for paper currency. It was only when discipline on quantity supplied broke down that hyperinflation emerged. The Yuan Dynasty (1271–1368) was the first to print large amounts of fiat paper money to fund their wars, resulting in hyperinflation. Much later, the Republic of China went through hyperinflation from 1948–49. In 1947, the highest denomination bill was 50,000 yuan. By mid-1948, the highest denomination was 180,000,000 yuan. The 1948 currency reform replaced the yuan by the gold yuan at an exchange rate of 1 gold yuan = 3,000,000 yuan. In less than a year, the highest denomination was 10,000,000 gold yuan.	**Start and End Date** Jul. 1943 – Aug. 1945 **Peak Month and Rate of Inflation** Jun. 1945, 302% **Start and End Date** Oct. 1947 – Mid. May 1949 **Peak Month and Rate of Inflation** Apr 5,070%

In the final days of the civil war, the Silver Yuan was briefly introduced at the rate of 500,000,000 Gold Yuan. Meanwhile, the highest denomination issued by a regional bank was 6,000,000,000 yuan (issued by Xinjiang Provincial Bank in 1949). After the renminbi was instituted by the new communist government, hyperinflation ceased, with a revaluation of 1:10,000 old Renminbi in 1955.

MAN-MADE DISASTERS | Economy | Hyperinflation | Hyperinflation Examples

Germany	By November 1922, the value in gold of money in circulation had fallen from £300 million before World War I to £20 million. The Reichsbank responded by the unlimited printing of notes, thereby accelerating the devaluation of the mark. In his report to London, Lord D'Abernon wrote: "In the whole course of history, no dog has ever run after its own tail with the speed of the Reichsbank." Germany went through its worst inflation in 1923. In 1922, the highest denomination was 50,000 Marks. By 1923, the highest denomination was 100,000,000,000,000 (1014) Marks. In December 1923 the exchange rate was 4,200,000,000,000 (4.2 × 1012) Marks to 1 US dollar. In 1923, the rate of inflation hit 3.25 × 106 percent per month (prices double every two days). Beginning on 20 November 1923, 1,000,000,000,000 old Marks were exchanged for 1 Rentenmark, so that 4.2 Rentenmarks were worth 1 US dollar, exactly the same rate the Mark had in 1914.	**Start and End Date** Jan. 1920 – Jan. 1920 **Peak Month and Rate of Inflation** Jan. 1920, 56.9% **Start and End Date** Aug. 1922 – Dec. 1923 **Peak Month and Rate of Inflation** Nov. 1923, 29,525%
Hungary	The Treaty of Trianon and political instability between 1919 and 1924 led to a major inflation of Hungary's currency. In 1921, in an attempt to stop inflation, the national assembly of Hungary passed the Hegedűs reforms, including a 20% levy on bank deposits. This action precipitated a mistrust of banks by the public, especially the peasants, and resulted in a reduction in savings and in the amount of currency in circulation. Unable to tax adequately, the government resorted to printing money, and in 1923 inflation in Hungary reached 98% per month. Between the end of 1945 and July 1946, Hungary went through the worst inflation ever recorded. In 1944, the highest denomination was 1,000 pengő. By the end of 1945, it was 10,000,000 pengő. The highest denomination in mid-1946 was 100,000,000,000,000,000,000 (1020) pengő. A special currency, the adópengő – or tax pengő – was created for tax and postal payments.	**Start and End Date** Aug. 1945 – Jul. 1946 **Peak Month and Rate of Inflation** Jul. 1946, 41.9 quadrillion percent

The value of the adópengő was adjusted each day, by radio announcement. On 1 January 1946 one adópengő equaled one pengő. By late July, one adópengő equaled 2,000,000,000,000,000,000,000 or 2×1021 (2 sextillion) pengő. When the pengő was replaced in August 1946 by the forint, the total value of all Hungarian banknotes in circulation amounted to 1/1,000 of one US dollar. This is the most severe known incident of inflation recorded, peaking at 1.3 × 1016 percent per month (prices double every 15 hours). The overall impact of hyperinflation: On 18 August 1946, 400,000,000,000,000,000,000,000,000,000 or 4×1029 pengő became 1 forint.

Venezuela	Venezuela's hyperinflation began in November 2016. Inflation of Venezuela's bolivar fuerte (VEF) in 2014 reached 69% and was the highest in the world. In 2015, inflation was 181%, the highest in the world and the highest in the country's history at that time, 800% in 2016 and over 4,000% in 2017, with Venezuela spiralling into hyperinflation. While the Venezuelan government "has essentially stopped" producing official inflation estimates as of early 2018, one estimation of the rate at that time was 5,220%, according to inflation economist Steve Hanke of Johns Hopkins University. Inflation has affected Venezuelans so much that in 2017, some people became video game gold farmers and could be seen playing games such as RuneScape to sell in-game currency or characters for real currency. In many cases, these gamers made more money than salaried workers in Venezuela even though they were earning just a few dollars per day.	**Start and End Date** Nov. 2016 – ongoing **Peak Month and Rate of Inflation** Apr. 2018, 234%

In the Christmas season of 2017, some shops would no longer use price tags since prices would inflate so quickly, so customers were required to ask staff at stores how much each item was. The International Monetary Fund estimated in 2018 that Venezuela's inflation rate would reach 1,000,000% by the end of the year. In July 2018, Hyperinflation in Venezuela was sitting 33,151%, "the 23rd most severe episode of hyperinflation in history".

Overpopulation

Human overpopulation occurs when the ecological footprint of a human population in a specific geographical location exceeds the carrying capacity of the place occupied by that group. Overpopulation can further be viewed, in a long term perspective, as existing when a population cannot be maintained given the rapid depletion of non-renewable resources or given the degradation of the capacity of the environment to give support to the population. The term human overpopulation also refers to the relationship between the entire human population and its environment: the Earth, or to smaller geographical areas such as countries.

Overpopulation can result from an increase in births, a decline in mortality rates, an increase in immigration, or an unsustainable biome and depletion of resources. It is possible for very sparsely populated areas to be overpopulated if the area has a meagre or non-existent capability to sustain life (e.g. a desert). Advocates of population moderation cite issues like quality of life, carrying capacity and risk of starvation as a basis to argue against continuing high human population growth and for population decline.

Scientists suggest that the human impact on the environment as a result of overpopulation, profligate consumption and proliferation of technology has pushed the planet into a new geological epoch known as the Anthropocene.

Peak Oil

Peak oil is the theorized point in time when the maximum rate of extraction of petroleum is reached, after which it is expected to enter terminal decline. Peak oil theory is based on the observed rise, peak, fall, and depletion of aggregate production rate in oil fields over time. It is often confused with oil depletion; however, whereas depletion refers to a period of falling reserves and supply, peak oil refers to peak, before terminal depletion occurs. The concept of peak oil is often credited to geologist M. King Hubbert whose 1956 paper first presented a formal theory. The concept of peak oil is often credited to geologist M. King Hubbert whose 1956 paper first presented a formal theory.

Some observers, such as petroleum industry experts Kenneth S. Deffeyes and Matthew Simmons, predicted there would be negative global economy effects after a post-peak production decline and subsequent oil price increase because of the continued dependence of most modern industrial transport, agricultural, and industrial systems on the low cost and high availability of oil. Predictions vary greatly as to what exactly these negative effects would be. While the notion that petroleum production must peak at some point is not controversial, the assertion that this must coincide with a serious economic decline, or even that the decline in production will necessarily be caused by an exhaustion of available reserves, is not universally accepted.

Oil production forecasts on which predictions of peak oil are based are sometimes made within a range which includes optimistic (higher production) and pessimistic (lower production) scenarios. A 2013 study concluded that peak oil "appears probable before 2030," and that there was a "significant risk" that it would occur before 2020, and assumed that major investments in alternatives will occur before a crisis, without requiring major changes in the lifestyle of heavily oil-consuming nations. Pessimistic predictions of future oil production made after 2007 state either that the peak has already occurred, that oil production is on the cusp of the peak, or that it will occur soon. The rate of discovery of new petroleum deposits peaked worldwide during the 1960s and has never approached these levels since.

Peak Coal

The term Peak coal is used to refer to the point in time at which coal production and consumption reaches its maximum, after which, it is assumed, production and consumption will decline steadily. The term was originally used in connection with M. King Hubbert's Hubbert peak theory, in which the finite nature of the resource determines a constraint on production. However, since the expansion of renewable energy particularly in electricity generation, the term is now commonly used with reference to a peak in coal demand, which may already have occurred. According to M. King Hubbert's Hubbert peak theory, peak coal is the point in time at which the maximum global coal production rate is reached, after which, according to the theory, the rate of production will enter a terminal decline. Coal is a fossil fuel formed from plant matter over the course of millions of years. It is a finite resource and thus considered to be a non-renewable energy source. There are two different possible peaks: one measured by mass (i.e. metric tons) and another by energy output (i.e. petajoules). The world average heat content per mass of mined coal rose from 8,020 BTU/lb. in 1989 to 9,060 BTU/lb. in 1999. Since 1999, the world average heat content of mined coal has been fairly steady, and was 9,030 BTU/lb. in 2011.

The estimates for global peak coal extraction vary wildly. Many coal associations suggest the peak could occur in 200 years or more, while scholarly estimates predict the peak to occur as soon as the immediate future. Research in 2009 by the University of Newcastle in Australia concluded that global coal extraction could peak sometime between the present and 2048. A 2007 study by the German Energy Watch Group predicted that global peak coal extraction may occur sometime around 2025 at 30 percent above the 2005 rate. Although reserves of coal remain abundant, consumption of coal has declined in many countries. In 2016 Scotland closed its last coal-fired power plant. This decline has resulted from the replacement of coal-fired electricity by gas and renewable energy, along with the decline of the steel industry in some countries. As a result, the term "peak coal" is now used primarily to refer to a peak and subsequent decline in global and national coal consumption. In 2016 experts estimated that China, the world's largest coal consumer, reached peak coal in 2013, and that the world may have passed peak coal.

However, in 2017, for the first time in four years, demand for coal rose. As of 2015, China accounted for 50.0 percent of world coal consumption. Chinese coal consumption fell in 2014 and 2015. The last previous decline in Chinese coal consumption had been in 1997 and 1998. While consumption in China and the United States declined in 2015, that of India continued to rise and, in 2015, India surpassed the United States and became the world's second-largest consumer of coal. As of 2011, the top coal-extracting countries were China (46% of world extraction), United States (13%), India (7.8%), Australia (5.4%), and Indonesia (4.9%). Four out of five of these largest coal-extracting countries, the exception being the United States, had experienced significant increases in coal extraction over the previous decade.

Peak Gas (Fuel)

Peak gas is the point in time at which the maximum global natural gas (fossil gas) production rate will be reached, after which the rate of production will enter its terminal decline. Natural gas is a fossil fuel formed from plant matter over the course of millions of years. It is a finite resource and thus considered to be a non-renewable energy source. The concept of peak gas follows from Hubbert peak theory, which is most commonly associated with peak oil. Hubbert saw gas, coal and oil as natural resources, each of which would peak in production and eventually run out for a region, a country, or the world.

Since Hubbert's initial predictions in 1956, "the proper application of ever more powerful statistical techniques has reduced much of the uncertainty about the supply of oil and natural gas". The world gets almost one quarter of its energy from natural gas. The consumption of natural gas has nearly doubled in the last 30 years. The most important energy agencies in the world are forecasting increases in natural gas demand in the next 20 years. The largest increments in future gas demand are expected to come from developing countries.

Hubbert's original peak theory predicts that natural gas will experience three equally spaced events: first, the rate of discoveries will peak, then X years later reserves will peak, and finally X years after peak reserves, gas production will peak at the same rate as the previous peak of discoveries.

7 Famine

A famine is a widespread scarcity of food, caused by several factors including war, inflation, crop failure, population imbalance, or government policies. This phenomenon is usually accompanied or followed by regional malnutrition, starvation, epidemic, and increased mortality. Every inhabited continent in the world has experienced a period of famine throughout history. In the 19th and 20th century, it was generally Southeast and South Asia, as well as Eastern and Central Europe that suffered the most deaths from famine. The numbers dying from famine began to fall sharply from the 2000s. Some countries, particularly in sub-Saharan Africa, continue to have extreme cases of famine. Since 2010, Africa has been the most affected continent in the world. As of 2017, the United Nations has warned some 20 million are at risk in South Sudan, Somalia, Nigeria and Yemen. The distribution of food has been affected by conflict. Most programmes now direct their aid towards Africa.

Definitions

According to the United Nations humanitarian criteria, even if there are food shortages with large numbers of people lacking nutrition, a famine is declared only when certain measures of mortality, malnutrition and hunger are met. The criteria are:

- At least 20% of households in an area face extreme food shortages with a limited ability to cope
- The prevalence of acute malnutrition in children exceeds 30%
- The death rate exceeds two people per 10,000 people per day

The declaration of a famine carries no binding obligations on the UN or member states, but serves to focus global attention on the problem.

Decline of Famine

In the 16th and 17th century, the feudal system began to break down, and more prosperous farmers began to enclose their own land and improve their yields to sell the surplus crops for a profit. These capitalist landowners paid their labourers with money, thereby increasing the commercialization of rural society. In the emerging competitive labour market, better techniques for the improvement of labour productivity were increasingly valued and rewarded. It was in the farmer's interest to produce as much as possible on their land in order to sell it to areas that demanded that product. They produced guaranteed surpluses of their crop every year if they could.

By the 1590s, these trends were sufficiently developed in the rich and commercialized province of Holland to allow its population to withstand a general outbreak of famine in Western Europe at that time. By that time, the Netherlands had one of the most commercialized agricultural systems in Europe. They grew many industrial crops such as flax, hemp and hops. Agriculture became increasingly specialized and efficient. The efficiency of Dutch agriculture allowed for much more rapid urbanization in the late sixteenth and early seventeenth centuries than anywhere else in Europe. As a result, productivity and wealth increased, allowing the Netherlands to maintain a steady food supply.

By 1650, English agriculture had also become commercialized on a much wider scale. The last peacetime famine in England was in 1623–24. There were still periods of hunger, as in the Netherlands, but no more famines ever occurred. Common areas for pasture were enclosed for private use and large scale, efficient farms were consolidated. Other technical developments included the draining of marshes, more efficient field use patterns, and the wider introduction of industrial crops. These agricultural developments led to wider prosperity in England and increasing urbanization. By the end of the 17th century, English agriculture was the most productive in Europe. In both England and the Netherlands, the population stabilized between 1650 and 1750, the same time period in which the sweeping changes to agriculture occurred. Famine still occurred in other parts of Europe, however. In Eastern Europe, famines occurred as late as the twentieth century.

During the 20th century, an estimated 70 million people died from famines across the world, of whom an estimated 30 million died during the famine of 1958–61 in China. The other most notable famines of the century included the Bengal famine of 1943 caused by the Japanese occupation of Burma and the policies of Churchill, famines in China in 1928 and 1942, and a sequence of famines in Russia and elsewhere in the Soviet Union, including the Russian famine of 1921–22 and Soviet famine of 1932–1933, caused by the policies of Lenin and Stalin. A few of the great famines of the late 20th century were: the Biafran famine in the 1960s, the Khmer Rouge-caused famine in Cambodia in the 1970s, the North Korean famine of the 1990s and the Ethiopian famine of 1983–85. The latter event was reported on television reports around the world, carrying footage of starving Ethiopians whose plight was centered around a feeding station near the town of Korem. This stimulated the first mass movements to end famine across the world.

BBC newsreader Michael Buerk gave moving commentary of the tragedy on 23 October 1984, which he described as a "biblical famine". This prompted the Band Aid single, which was organized by Bob Geldof and featured more than 20 pop stars. The Live Aid concerts in London and Philadelphia raised even more funds for the cause. Hundreds of thousands of people died within one year as a result of the famine, but the publicity Live Aid generated encouraged Western nations to make available enough surplus grain to end the immediate hunger crisis in Africa.

Until 2017, worldwide deaths from famine had been falling dramatically. The World Peace Foundation reported that from the 1870s to the 1970s, great famines killed an average of 928,000 people a year. Since 1980, annual deaths had dropped to an average of 75,000, less than 10% of what they had been until the 1970s. That reduction was achieved despite the approximately 150,000 lives lost in the 2011 Somalia famine. Yet in 2017, the UN officially declared famine had returned to Africa, with about 20 million people at risk of death from starvation in Nigeria, in South Sudan, in Yemen, and in Somalia.

Famine Scales

Paul Howe and Stephen Devereux set forth a measurement of famine with scales for both "intensity" and "magnitude", incorporating many of the developments of recent decades. The intensity scale is:

Famine Intensity Scale

Level	Phrase	Lives	Livelihood
0	Food Secure	Crude Mortality Rate (CMR) < 0.2/10,000/day and/or Wasting < 2.3%	Cohesive social system; food prices stable; Coping strategies not utilized
1	Food Insecure	0.2 <= CMR <0.5/10,000/day and/or 2.3% <= Wasting < 10%	Cohesive social system; Food prices unstable; Seasonal shortages; Reversible coping strategies taken
2	Food Crisis	0.5 <= CMR < 1/10,000/day, 10% <= Wasting < 20%, and/or prevalence of oedema	Social system stressed but largely cohesive; Dramatic rise in food and basic items prices; Adaptive mechanisms begin to fail; Increase in irreversible coping strategies
3	Famine	1 <= CMR < 5/10,000/day, 20% <= Wasting < 40%, and/or prevalence of oedema	Clear signs of social breakdown; markets begin to collapse; coping strategies exhausted and survival strategies (migration in search of help, abandonment of weaker members of the community) adopted; affected population identifies food scarcity as the major societal problem
4	Severe Famine	5 <= CMR <15/10,000/day, Wasting >= 40%, and/or prevalence of oedema	Widespread social breakdown; markets close; survival strategies widespread; affected population identifies food scarcity as the major societal problem
5	Extreme Famine	CMR >= 15/10,000/day	Complete social breakdown; widespread mortality; affected population identifies food scarcity as the major societal problem

Famine Magnitude Scale

Framework
Using this framework, each famine would receive a Magnitude designation, but locations within the affected region would be classified at varying Intensities. The 1998 southern Sudan famine would be a C: Major Famine, with an intensity of 5: Extreme famine in Ajiep village ranging to 3: Famine in Rumbek town. In comparison, the 2000 Ethiopian famine in Gode district would be classified as a B: Moderate famine, and would thus should demand proportionally less of the limited resources available for famine relief.

Category	Phrase	Mortality Range
A	Minor Famine	0-999
B	Moderate Famine	1,000-9,999
C	Major Famine	10,000-99,999
D	Great Famine	100,000-999,999
E	Catastrophic Famine	1,000,000 and over

While each organization working in famine-related areas has its own operational interpretation of specific indicators, the Howe-Devereaux framework has been widely adopted as a common framework by which famine warning and famine relief may be discussed worldwide, in particular in the use of the intensity scale. This has led organizations such as the World Food Programme to refrain from referring to the 2005 Niger food crisis as a famine, as indicators had not deteriorated into a Level 3: Famine.

Future Famines

The Guardian reports that in 2007 approximately 40% of the world's agricultural land is seriously degraded. If current trends of soil degradation continue in Africa, the continent might be able to feed just 25% of its population by 2025, according to UNU's Ghana-based Institute for Natural Resources in Africa. As of late 2007, increased farming for use in biofuels, along with world oil prices at nearly $100 a barrel, has pushed up the price of grain used to feed poultry and dairy cows and other cattle, causing higher prices of wheat (up 58%), soybean (up 32%), and maize (up 11%) over the year. In 2007 Food riots have taken place in many countries across the world.

An epidemic of stem rust, which is destructive to wheat and is caused by race Ug99, has in 2007 spread across Africa and into Asia. Beginning in the 20th century, nitrogen fertilizers, new pesticides, desert farming, and other agricultural technologies began to be used to increase food production, in part to combat famine. Between 1950 and 1984, as the Green Revolution influenced agriculture] world grain production increased by 250%. Developed nations have shared these technologies with developing nations with a famine problem.

However, as early as 1995, there were signs that these new developments may contribute to the decline of arable land (e.g. persistence of pesticides leading to soil contamination, salt accumulation due to irrigation, erosion). In 1994, David Pimentel, professor of ecology and agriculture at Cornell University, and Mario Giampietro, senior researcher at the National Research Institute on Food and Nutrition (INRAN), estimated the maximum U.S. population for a sustainable economy at 200 million.

According to geologist Dale Allen Pfeiffer, coming decades could see rising food prices without relief and massive starvation on a global level. Water deficits, which are already spurring heavy grain imports in numerous smaller countries, may soon do the same in larger countries, such as China or India. The water tables are falling in many countries (including Northern China, the US, and India) due to widespread overconsumption. Other countries affected include Pakistan, Iran, and Mexico. This will eventually lead to water scarcity and cutbacks in grain harvest. Even while overexploiting its aquifers, China has developed a grain deficit, contributing to the upward pressure on grain prices. Most of the three billion people projected to be added worldwide by mid-century will be born in countries already experiencing water shortages.

After China and India, there is a second tier of smaller countries with large water deficits – Algeria, Egypt, Iran, Mexico, and Pakistan. Four of these already import a large share of their grain. Only Pakistan remains marginally self-sufficient. But with a population expanding by 4 million a year, it will also soon turn to the world market for grain. According to a UN climate report, the Himalayan glaciers that are the principal dry-season water sources of Asia's biggest rivers – Ganges, Indus, Brahmaputra, Yangtze, Mekong, Salween and Yellow – could disappear by 2350 as temperatures rise and human demand rises.

Approximately 2.4 billion people live in the drainage basin of the Himalayan rivers. India, China, Pakistan, Afghanistan, Bangladesh, Nepal and Myanmar could experience floods followed by severe droughts in coming decades. In India alone, the Ganges provides water for drinking and farming for more than 500 million people.

Causes

Definitions of famines are based on three different categories—these include food supply-based, food consumption-based and mortality-based definitions. Some definitions of famines are:
- Blix – Widespread food shortage leading to significant rise in regional death rates.
- Brown and Eckholm – Sudden, sharp reduction in food supply resulting in widespread hunger.
- Scrimshaw – Sudden collapse in level of food consumption of large numbers of people.
- Ravallion – Unusually high mortality with unusually severe threat to food intake of some segments of a population.
- Cuny – A set of conditions that occurs when large numbers of people in a region cannot obtain sufficient food, resulting in widespread, acute malnutrition.

Food shortages in a population are caused either by a lack of food or by difficulties in food distribution; it may be worsened by natural climate fluctuations and by extreme political conditions related to oppressive government or warfare. The conventional explanation until 1981 for the cause of famines was the Food availability decline (FAD) hypothesis. The assumption was that the central cause of all famines was a decline in food availability. However, FAD could not explain why only a certain section of the population such as the agricultural laborer was affected by famines while others were insulated from famines. Based on the studies of some recent famines, the decisive role of FAD has been questioned and it has been suggested that the causal mechanism for precipitating starvation includes many variables other than just decline of food availability. According to this view, famines are a result of entitlements, the theory being proposed is called the "failure of exchange entitlements" or FEE. A person may own various commodities that can be exchanged in a market economy for the other commodities he or she needs. The exchange can happen via trading or production or through a combination of the two. These entitlements are called trade-based or production-based entitlements.

Per this proposed view, famines are precipitated due to a breakdown in the ability of the person to exchange his entitlements. An example of famines due to FEE is the inability of an agricultural laborer to exchange his primary entitlement, i.e., labor for rice when his employment became erratic or was completely eliminated. According to the Physicians for Social Responsibility (PSR), global climate change is additionally challenging the Earth's ability to produce food, potentially leading to famine. Some elements make a particular region more vulnerable to famine. These include poverty, population growth, an inappropriate social infrastructure, a suppressive political regime, and a weak or under-prepared government. According to a FEWSNET report, "Famines are not natural phenomena, they are catastrophic political failures."

Climate and Population Pressure
Thomas Malthus's Essay on the Principle of Population has made popular the theory that many famines are caused by imbalance of food production compared to the large populations of countries whose population exceeds the regional carrying capacity. However, Professor Alex de Waal, Executive Director of the World Peace Foundation, refutes the Malthus theory, looking instead to political factors as major causes of recent (over the last 150 years) famines. Historically, famines have occurred from agricultural problems such as drought, crop failure, or pestilence. Changing weather patterns, the ineffectiveness of medieval governments in dealing with crises, wars, and epidemic diseases such as the Black Death helped to cause hundreds of famines in Europe during the Middle Ages, including 95 in Britain and 75 in France. In France, the Hundred Years' War, crop failures and epidemics reduced the population by two-thirds. The failure of a harvest or change in conditions, such as drought, can create a situation whereby large numbers of people continue to live where the carrying capacity of the land has temporarily dropped radically.

Famine is often associated with subsistence agriculture. The total absence of agriculture in an economically strong area does not cause famine; Arizona and other wealthy regions import the vast majority of their food, since such regions produce sufficient economic goods for trade. Famines have also been caused by volcanism. The 1815 eruption of the Mount Tambora volcano in Indonesia caused crop failures and famines worldwide and caused the worst famine of the 19th century. The current consensus of the scientific community is that the aerosols and dust released into the upper atmosphere causes cooler temperatures by preventing the sun's energy from reaching the ground. The same mechanism is theorized to be caused by very large meteorite impacts to the extent of causing mass extinctions.

Famine Prevention

Relief technologies, including immunization, improved public health infrastructure, general food rations and supplementary feeding for vulnerable children, has provided temporary mitigation to the mortality impact of famines, while leaving their economic consequences unchanged, and not solving the underlying issue of too large a regional population relative to food production capability. Humanitarian crises may also arise from genocide campaigns, civil wars, refugee flows and episodes of extreme violence and state collapse, creating famine conditions among the affected populations. Despite repeated stated intentions by the world's leaders to end hunger and famine, famine remains a chronic threat in much of Africa, Eastern Europe, the Southeast, South Asia, and the Middle East.

In July 2005, the Famine Early Warning Systems Network labelled Niger with emergency status, as well as Chad, Ethiopia, South Sudan, Somalia and Zimbabwe. In January 2006, the United Nations Food and Agriculture Organization warned that 11 million people in Somalia,[Kenya, Djibouti and Ethiopia were in danger of starvation due to the combination of severe drought and military conflicts. In 2006, the most serious humanitarian crisis in Africa was in Sudan's region Darfur. Frances Moore Lappé, later co-founder of the Institute for Food and Development Policy (Food First) argued in Diet for a Small Planet (1971) that vegetarian diets can provide food for larger populations, with the same resources, compared to omnivorous diets.

Noting that modern famines are sometimes aggravated by misguided economic policies, political design to impoverish or marginalize certain populations, or acts of war, political economists have investigated the political conditions under which famine is prevented. Economist Amartya Sen states that the liberal institutions that exist in India, including competitive elections and a free press, have played a major role in preventing famine in that country since independence. Alex de Waal has developed this theory to focus on the "political contract" between rulers and people that ensures famine prevention, noting the rarity of such political contracts in Africa, and the danger that international relief agencies will undermine such contracts through removing the locus of accountability for famines from national governments. The demographic impacts of famine are sharp.

Mortality is concentrated among children and the elderly. A consistent demographic fact is that in all recorded famines, male mortality exceeds female, even in those populations (such as northern India and Pakistan) where there is a male longevity advantage during normal times. Reasons for this may include greater female resilience under the pressure of malnutrition, and possibly female's naturally higher percentage of body fat. Famine is also accompanied by lower fertility.

Famines therefore leave the reproductive core of a population—adult women—lesser affected compared to other population categories, and post-famine periods are often characterized a "rebound" with increased births. Even though the theories of Thomas Malthus would predict that famines reduce the size of the population commensurate with available food resources, in fact even the most severe famines have rarely dented population growth for more than a few years. The mortality in China in 1958–61, Bengal in 1943, and Ethiopia in 1983–85 was all made up by a growing population over just a few years. Of greater long-term demographic impact is emigration: Ireland was chiefly depopulated after the 1840s famines by waves of emigration.

Food Security
Long term measures to improve food security, include investment in modern agriculture techniques, such as fertilizers and irrigation, but can also include strategic national food storage. World Bank strictures restrict government subsidies for farmers, and increasing use of fertilizers is opposed by some environmental groups because of its unintended consequences: adverse effects on water supplies and habitat. The effort to bring modern agricultural techniques found in the Western world, such as nitrogen fertilizers and pesticides, to the Indian Sub-continent, called the Green Revolution, resulted in decreases in malnutrition similar to those seen earlier in Western nations.

This was possible because of existing infrastructure and institutions that are in short supply in Africa, such as a system of roads or public seed companies that made seeds available. Supporting farmers in areas of food insecurity, through such measures as free or subsidized fertilizers and seeds, increases food harvest and reduces food prices. The World Bank and some rich nations press nations that depend on them for aid to cut back or eliminate subsidized agricultural inputs such as fertilizer, in the name of privatization even as the United States and Europe extensively subsidized their own farmers.

Relief
There is a growing realization among aid groups that giving cash or cash vouchers instead of food is a cheaper, faster, and more efficient way to deliver help to the hungry, particularly in areas where food is available but unaffordable. The United Nations' World Food Program (WFP), the biggest non-governmental distributor of food, announced that it will begin distributing cash and vouchers instead of food in some areas, which Josette Sheeran, the WFP's executive director, described as a "revolution" in food aid.

The aid agency Concern Worldwide is piloting a method through a mobile phone operator, Safaricom, which runs a money transfer program that allows cash to be sent from one part of the country to another. However, for people in a drought living a long way from and with limited access to markets, delivering food may be the most appropriate way to help. Fred Cuny stated that "the chances of saving lives at the outset of a relief operation are greatly reduced when food is imported. By the time it arrives in the country and gets to people, many will have died."

US Law, which requires buying food at home rather than where the hungry live, is inefficient because approximately half of what is spent goes for transport. Fred Cuny further pointed out "studies of every recent famine have shown that food was available in-country—though not always in the immediate food deficit area" and "even though by local standards the prices are too high for the poor to purchase it, it would usually be cheaper for a donor to buy the hoarded food at the inflated price than to import it from abroad."

Deficient micronutrients can be provided through fortifying foods. Fortifying foods such as peanut butter sachets (see Plumpy'Nut) have revolutionized emergency feeding in humanitarian emergencies because they can be eaten directly from the packet, do not require refrigeration or mixing with scarce clean water, can be stored for years and, vitally, can be absorbed by extremely ill children. WHO and other sources recommend that malnourished children—and adults who also have diarrhea—drink rehydration solution, and continue to eat, in addition to antibiotics, and zinc supplements.

There is a special oral rehydration solution called ReSoMal which has less sodium and more potassium than standard solution. However, if the diarrhea is severe, the standard solution is preferable as the person needs the extra sodium. Obviously, this is a judgment call best made by a physician, and using either solution is better than doing nothing. Zinc supplements often can help reduce the duration and severity of diarrhea, and Vitamin A can also be helpful.

The World Health Organization underlines the importance of a person with diarrhea continuing to eat, with a 2005 publication for physicians stating: "Food should never be withheld and the child's usual foods should not be diluted. Breastfeeding should always be continued." Ethiopia has been pioneering a program that has now become part of the World Bank's prescribed recipe for coping with a food crisis and had been seen by aid organizations as a model of how to best help hungry nations. Through the country's main food assistance program, the Productive Safety Net Program, Ethiopia has been giving rural residents who are chronically short of food, a chance to work for food or cash. Foreign aid organizations like the World Food Program were then able to buy food locally from surplus areas to distribute in areas with a shortage of food.

Peak Food

Peak production refers to the point at which the growth in production of a crop, animal or other foodstuff begins to slow down. From this time, production will continue to increase but at a decelerating rate. This is the first stage of a process that typically continues with a flattening of production and then a decrease. Peak production is the point at which things begin to go wrong, acting as a warning signal of what is to come.

Peak Food Year The years at what foods reached their peaks.	• 1985 - Maize • 1988 - Rice • 1988 - Fish • 1989 - Dairy	• 1993 - Eggs • 1996 - Meat • 2000 - Vegetables • 2004 - Wheat	• 2004 - Milk • 2006 - Poultry • 2007 - Sugarcane • 2009 - Soybeans	

8 Terrorism

Terrorism is the use of intentionally indiscriminate violence as a means to create terror, or fear, to achieve a financial, political, religious or ideological aim. It is used in this regard primarily to refer to violence against peacetime targets or in war against non-combatants.

Bioterrorism (Biological Threat)

MAN-MADE DISASTERS · Terrorism · Bioterrorism

A biological attack is the intentional release of a pathogen (diseasecausing agent) or biotoxin (poisonous substance produced by a living organism) against humans, plants, or animals. An attack against people could be used to cause illness, death, fear, societal disruption, and economic damage. An attack on agricultural plants and animals would primarily cause economic damage, loss of confidence in the food supply, and possible loss of life. It is useful to distinguish between two kinds of biological agents:

- Transmissible agents that spread from person to person (e.g., smallpox, Ebola) or animal to animal (e.g., foot and mouth disease).
- Agents that may cause adverse effects in exposed individuals but that do not make those individuals contagious to others (e.g., anthrax, botulinum toxin).

Availability of Agents

The Centers for Disease Control and Prevention (CDC) lists the biothreat agents considered to pose the highest threat (see Table 1). Once obtained, agents must be cultured or grown in quantity and then processed for use in an attack ("weaponized"). Agents can be:

- Isolated from sources in nature. The threat agents in Table 1 are either biotoxins or agents that cause zoonotic diseases (that occur in wildlife and are transmissible to humans)—except for smallpox, which is solely a human disease and has been eradicated from nature.
- Acquired from laboratories or bioweapons stockpile. Smallpox virus is officially studied in only two laboratories in the world. Anthrax is widely studied in labs. Hemorrhagic fever viruses are studied only in limited high-security locations. Most high threat agents had been studied and stockpiled in bioweapons programs outside the United States until as recently as the 1990s.
- Synthesized or genetically manipulated in a laboratory. This would require expertise and access to advanced technology

How Biological Agents Could Be Disseminated

For an attack on people, biological agents could be disseminated in one or more of the following ways:

- Aerosol dissemination is the dispersal of an agent in air from sprayers or other devices. The agent must be cultured and processed to the proper size to maximize human infections, while maintaining the agent's stability and pathogenicity (ability to produce illness). An aerosol attack might take place outdoors in a populated area or indoors, e.g., in the ventilation system of a building, in the subway, on planes. It takes expertise to process biological agents to maximize the effect of aerosol dissemination, but even relatively crude devices could have an impact.
- Food or water, especially ready-to-eat food (vegetables, salad bars) could be intentionally contaminated with pathogens or toxins. The water supply is less vulnerable because dilution, filtration, and the addition of chlorine can kill most disease-causing organisms.
- Human carriers could spread transmissible agents by coughing, through body fluids, or by contaminating surfaces. Most agents would make people ill or incapacitated before they become highly contagious, thereby reducing transmission of the disease.
- Infected animals can cause people to become ill through contact with the animals or contaminated animal products.
- Insects naturally spread some agents such as plague bacteria (vector borne illnesses) and potentially could be used in an attack.
- Physically distributed through the U.S. mail or other means.

For an agricultural attack:

- A point introduction of an infected plant or animal or its fluids could spread disease through the rest of the crop or livestock. Agricultural biothreat agents (e.g., foot and mouth disease, avian influenza, soy bean rust, and karnal bunt of wheat) do not have to be aerosolized to be effectively disseminated.

Preparation

- Build an Emergency Supply Kit.
- Make a Family Emergency Plan.
- Check with your doctor to make sure everyone in your family has up-to-date immunizations.
- Consider installing a High-Efficiency Particulate Air (HEPA) filter in your furnace return duct, which will filter out most biological agents that may enter your house.

Table 1

Diseases/Agents Listed by the CDC as Potential Bioterror Threats (as of March 2005)

CATEGORY A: Easily disseminated and/or contagious; high mortality rates; might disrupt society; requires special action for public health preparedness.

Bacteria (single-celled organisms):
- Anthrax (Bacillus anthracis)
- Plague (Yersinia pestis)
- Tularemia (Francisella tularensis)

Viruses (DNA or RNA requiring other host cells to replicate):
- Smallpox (Variola major virus)
- Viral Hemorrhagic Fevers: Ebola, Marburg, Lassa,
- Machupo (various families of viruses)

Biotoxins (poisonous substances produced by living organisms):
- Botulism (Clostridium botulinum toxin)

CATEGORY B: Moderately easy to disseminate; moderate illness rates, low mortality; requires enhanced diagnostic capacity, surveillance.

Bacteria:
- Brucellosis (Brucella species)
- Glanders (Burkholderia mallei)
- Melioidosis (Burkholderia pseudomallei)
- Psittacosis (Chlamydia psittaci)
- Food safety threats (e.g., Salmonella species, Escherichia coli O157:H7, Shigella)
- Water safety threats (e.g., Vibrio cholerae, Cryptosporidium parvum)

Viruses:
- Viral encephalitis (Alphaviruses)

Rickettsia (micro-organisms that live in cells):
- Q fever (Coxiella burnetii)
- Typhus fever (Rickettsia prowazekii)

Biotoxins:
- Epsilon toxin of Clostridium perfringens
- Ricin toxin from castor beans
- Staphylococcal enterotoxin B

CATEGORY C: Emerging infectious diseases that could be a future threat. (not all-inclusive)

Viruses:
- Examples are Nipah virus and Hantavirus

Table 2

Onset, Health Impacts, and Treatments for Some Agents of Concern.

Disease (agent)	Incubation Period	Symptoms
HIGH THREAT AGENTS		
Anthrax (Bacillus anthracis) (inhalational)	Typically 1–6 days, but up to 42	Fever, cough, profound sweats malaise, fatigue, myalgiaus
Plague (Yersinia pestis)	1–7 days (usually 2–3 days)	Fever, cough, shortness of breath, sore lymph nodes
Tularemia (Francisella tularensis)	1–21 days (avg 3–6)	Fever, cough, pneumonia, headache
Marburg (Viral hemorrhagic fever)	4–21 days	Sudden onset, fever, headache, followed by vomiting and diarrhea, rash, generalized bleeding in severe cases
Ebola (Viral hemorrhagic fever)	4–21 days	Sudden onset, fever, headache, followed by vomiting and diarrhea, rash, generalized bleeding in severe cases
Smallpox (Variola major virus)	7–17 days (avg 12)	Fever, aches, after 2–4 days rash appears
Botulism (Clostridium botulinum toxin)	12 hours–5 days	Muscle paralyzing illness
LOWER THREAT AGENTS		
Cholera (Vibrio cholerae)	4 hours–5 days (usually 2–3 days)	Sudden onset of voluminous watery diarrhea, vomiting, cramps, dehydration
Glanders (Burkholderia mallel)	1–14 days via aerosol	Pneumonia with or without blood poisoning, ulcers in nose, mouth, throat and lungs
Q fever (Coxiella burnetii)	7–41 days	Flu-like illness that can lead to pneumonia and hepatitis
Encephalitis (Alphaviruses)	2–6 days	Fever, aches, pain behind the eye, nausea, vomiting
Ricin (Ricinus communis)	18–24 hours	Can shut down organ function

Impact of a Pathogen Release

• Detection of a Biological Attack
Unlike a chemical or nuclear attack, a biological attack may go undetected for hours, days, or potentially weeks (depending on the agent) until people, animals, or plants show symptoms of disease. If there are no immediate signs of the attack as with the anthrax letters, a biological attack will probably first be detected by local health care workers observing a pattern of unusual illness or by early warning monitoring systems that detect airborne pathogens. Evidence of an attack may appear in animals before humans.

• The Area Affected
For an aerosol release, the area affected would depend on the quantity of agent released, whether the release is indoors or outdoors, and weather conditions. Agents released outdoors would disperse roughly in the direction of the prevailing wind and could degrade with sunlight and by drying out from environmental exposure. Agents released indoors could initially have a higher concentration. Sometimes agents can be re-aerosolized by machinery, foot traffic, or other means.

• Finding the Cause and Source of Illness
There may be uncertainties about crucial facts such as the exact location or extent of the initial release, the type of biological agent used, and likelihood of additional releases. Laboratory scientists will work quickly to identify the specific agent. Epidemiologists will attempt to trace the path of infections back toward a single person, vector (insect or animal), vehicle (food or water), or other point of origin. Attribution of a biological attack is typically much more difficult than attribution of a conventional terrorist attack.

Dangers

Impact on Human Health
Biothreat agents have the potential to produce a life-threatening illness. Biotoxins are essentially poisons that can be fatal at high enough doses. Table 2 lists health impacts and medical treatments for the Category A and some Category B agents. Even a small amount of some biothreat agents released in air could result in significant loss of life, depending on a number of factors that include the:
- Infectivity of the agent (how many particles are needed to cause illness).
- Lethality of the agent.
- Length of time it takes to detect and treat those who are exposed or have become ill.

Dose Response in Humans
The exact infectious dose (the number or organisms needed to make one sick) of most biological agents is unknown; approximate doses are extrapolated from animal studies. Whether a person becomes ill after exposure to a biological agent depends on a number of factors including:
- Type and amount of agent taken into the body.
- Duration of exposure.
- Route of exposure (inhalation, ingestion, insect bite).
- “Host” factors (e.g., age, immune status, other illnesses of the person exposed).

MAN-MADE DISASTERS Terrorism Bioterrorism Dangers

Differences in Intentional vs. Natural Outbreaks of Disease
Naturally occurring outbreaks of category A agents have become rare because of improved living standards, hygiene, and health services in developed nations. For example, human bubonic plague,which was transmitted by rats and fleas to humans in past centuries resulting in large losses of life, has virtually been wiped out. However, agents used in an aerosol attack may act differently than naturally occurring outbreaks and could produce a form of the disease with a shorter time of onset of illness, making timely diagnosis, treatment, and containment more difficult.

Spread of Diseases
Some transmissible (contagious) diseases can spread through respiratory droplets from coughing and sneezing or when a person comes in contact with a surface harboring a virus or bacteria and then touches their mouth or nose. The viral hemorrhagic fevers and cholera are spread by direct contact with body fluids or feces. People infected with contagious diseases may widely disseminate the disease by travel.

Psychological Impact
Psychological responses following a bioterrorism event may include anger, fear, and social isolation. Following the 2001 anthrax attacks, thousands of people who thought they were infected sought treatment. Trying to distinguish those who haven't been infected could complicate medical centers' ability to treat those who have been exposed and infected, especially when diagnoses are unclear.

Protection

During a declared biological emergency:
1. People in the group or area that authorities have linked to exposure who have symptoms that match those described should seek emergency medical attention.
2. Use common sense, practice good hygiene and cleanliness to avoid spreading germs.

People who are potentially exposed should:
1. Follow instructions of health care providers and other public health officials.
2. Expect to receive medical evaluation and treatment. Be prepared for long lines. If the disease is contagious, persons exposed may be quarantined.

If people become aware of a suspicious substance nearby, they should:
1. Quickly get away.
2. Cover their mouths and noses with layers of fabric that can filter the air but still allow breathing.
3. Wash with soap and water.
4. Contact authorities.
5. Watch TV, listen to the radio, or check the Internet for official news and information including the signs and symptoms of the disease, if medications or vaccinations are being distributed, and where to seek medical attention if they become sick.
6. Seek emergency medical attention if they become sick.

Medical Treatment
Table 2 lists general medical treatments for several biothreat agents. In general, bacterial illnesses are treated with antibiotics, and viral illnesses are treated with supportive care, although there are a few specific medications to treat viral infections. Biotoxins are treated with antidotes or antitoxins, if available. Vaccines can prevent or mitigate the effects of a disease. The smallpox vaccine may provide protection even if given 1–4 days after exposure, and the anthrax vaccine can be given after inhalation exposure if accompanied by treatment with antibiotics for a number of weeks.

Controlling the Spread of Contagious Diseases
Methods to control contagious disease include isolation, quarantine, barrier methods (gloves, filter masks, eye protection), and hand washing. Rapid identification of potentially infected persons increases the effectiveness of these methods.

Long Term Consequences

Monitoring and Clean-up
After a biological agent has been identified, officials will take steps to characterize how long the agent will persist. Clean-up within buildings may entail the use of gas or liquid decontaminants to kill the agent. For example, chlorine dioxide gas was released through ventilation systems of buildings contaminated with anthrax. In some cases, multiple rounds of decontamination may be necessary. Decisions regarding how much clean-up is necessary will depend on:
● The amount of agent released.
● How far the agent has spread.
● How the space will be used following clean-up.

Long-term Health Consequences Following Exposure
The long-term health consequences for those who survive exposure to biological attack agents are unknown. A long-term medical surveillance program would likely be established to monitor potential health effects of those exposed.

Economic Impact of an Agricultural Attack
Once detected, an act of agricultural bioterrorism may quickly halt the movement and export of livestock or the affected crop, resulting in potentially severe economic consequences for producers, shippers, and consumers. It may also disrupt normal travel and commerce.

Anthrax

People in areas where anthrax is released would also need to know how to get antibiotics, how to create a family medical history, and how to recognize the symptoms of anthrax. In some cases, you may be able to pick up antibiotics for others in your household. If you live with family members, it's important to keep a medical history for each person in your family, including:

● Medical conditions
● Allergies
● Any medicines they are taking
● Each child's weight

Exposure

What to Do if You Think You Have Been Exposed to Anthrax
If you think you may have been exposed to anthrax, you need to go to a doctor right away and explain why you think you may have been exposed. Doctors can prescribe antibiotics to prevent you from getting sick. There is no test a doctor can give you that determines if you have been exposed to anthrax. The only way exposures can be determined is through a public health investigation.

If you already have symptoms of anthrax, it's important to get medical care as quickly as possible to have the best chances for a full recovery.

Anthrax is NOT contagious. You cannot catch anthrax from another person the way you might catch a cold or the flu. In rare cases, person-to-person transmission has been reported with cutaneous anthrax, where discharges from skin lesions might be infectious.

Symptoms

MAN-MADE DISASTERS Terrorism Bioterrorism Anthrax

The symptoms of anthrax depend on the type of infection and can take anywhere from 1 day to more than 2 months to appear. All types of anthrax have the potential, if untreated, to spread throughout the body and cause severe illness and even death.

Cutaneous anthrax symptoms can include:
- A group of small blisters or bumps that may itch
- Swelling can occur around the sore
- A painless skin sore (ulcer) with a black center that appears after the small blisters or bumps
  - Most often the sore will be on the face, neck, arms, or hand

Inhalation anthrax symptoms can include:
- Fever and chills
- Chest Discomfort
- Shortness of breath
- Confusion or dizziness
- Cough
- Nausea, vomiting, or stomach pains
- Headache
- Sweats (often drenching)
- Extreme tiredness
- Body aches

Gastrointestinal anthrax symptoms can include:
- Fever and chills
- Swelling of neck or neck glands
- Sore throat
- Painful swallowing
- Hoarseness
- Headache, Nausea and vomiting, especially bloody vomiting
- Diarrhea or bloody diarrhea
- Flushing (red face) and red eyes
- Stomach pain
- Fainting
- Swelling of abdomen (stomach)

Injection anthrax symptoms can include:
- Fever and chills
- A group of small blisters or bumps that may itch, appearing where the drug was injected
- A painless skin sore with a black center that appears after the blisters or bumps
- Swelling around the sore
- Abscesses deep under the skin or in the muscle where the drug was injected

Injection anthrax symptoms are similar to those of cutaneous anthrax, but injection anthrax can spread throughout the body faster and be harder to recognize and treat than cutaneous anthrax. Skin and injection site infections associated with injection drug use are common and do not necessarily mean the person has anthrax.

Antibiotics

Antibiotics can prevent anthrax from developing in people who have been exposed but have not developed symptoms. Antibiotics work in two main ways, by killing the anthrax or by stopping the anthrax from growing. When the anthrax can't grow anymore, it dies. Two of the antibiotics that could be used to prevent anthrax are:

- Ciprofloxacin
- Doxycycline

Each of these antibiotics offers the same protection against anthrax. Anthrax spores typically take 1 to 7 days to be activated, but some spores can remain inside the body and take up to 60 days or more before they are activated. Activated spores release toxins—or poisons—that attack the body, causing the person to become sick. That's why people who have been exposed to anthrax must take antibiotics for 60 days. This will protect them from any anthrax spores in their body when the spores are activated.

Anthrax spores can take up to 60 days or more to be activated in the body, therefore you should take antibiotics for the full 60 days.

What is the usual dose of doxycycline for PEP of anthrax?
The full PEP regimen is 60 days. During an anthrax emergency, recipients may receive an initial 10-day supply to begin doxycycline therapy; public health officials will announce whether recipients need more doxycycline and how to get additional quantities of the drug.

- Children weighing 76 lbs (35 kg) or more and Adults (≥ 18 years): Take one tablet (100 mg) by mouth every 12 hours (one tablet in the morning and one tablet in the evening) each day with a full glass of water (with or without food or milk). For those who cannot swallow tablets, provide the crushing and mixing directions (which can also be found by searching "doxycycline crushing instructions" on www.cdc.gov). These instructions are appropriate only for 100 mg tablets.
- Children weighing less than 76 lbs (35 kg): Weight-based dosing (2.2 mg/kg) every 12 hours (one dose in the morning and one dose in the evening) each day. Provide the crushing and mixing directions (which can also be found by searching "doxycycline crushing instructions" on www.cdc.gov). These instructions are appropriate only for 100 mg tablets.

- Children weighing less than 30 lbs (14kg): Children weighing less than 30 lbs (14 kg) should receive priority for doxycycline oral suspension, dosed by weight every 12 hours (one dose in the morning and one dose in the evening) each day. For convenience, the table below provides dosing by weight-range based on 2.2 mg/kg derived calculation.3 Doses in the table below are specific to doxycycline powder for oral suspension in the 25 mg/5 mL concentration only.

  - Follow the instructions provided with the oral suspension to mix the doxycycline powder with water before dispensing the drug to the recipient. Write the dose on the bottle and mark the dose with a line on the oral syringe.
  - Tell the recipient to shake the oral suspension very well (15 seconds) before each use.

Smallpox

Thanks to a successful worldwide vaccination effort in the 20th century, smallpox has been wiped out. No one has gotten smallpox naturally since 1977. However, it is possible that variola virus (the virus that causes smallpox) could be used in a biological attack (an intentional release of viruses, bacteria, or other germs that can sicken or kill people, livestock, or crops). Public health authorities prepare for a possible but unlikely biological attack that uses smallpox as a weapon.

There is no immediate, direct threat of a bioterrorist attack using smallpox. No bioterrorist attack using smallpox has happened in modern times. Throughout history, though, some people have used smallpox to their advantage by deliberately infecting their enemies with the disease.

Why is Smallpox a Concern?
Public health authorities are concerned about smallpox because it is a serious—even deadly—disease. Today, there are only two labs in the world that are approved to have the smallpox virus for research: the Centers for Disease Control and Prevention (CDC) in the United States and the Russian State Centre for Research on Virology and Biotechnology in the Russian Federation.

There is credible concern that in the past some countries made the virus into weapons, which may have fallen into the hands of terrorists or other people with criminal intentions. The last natural outbreak of smallpox in the United States happened in 1949. The last naturally spread case in the entire world happened in 1977. The World Health Assembly declared smallpox eradicated in 1980. Even a single confirmed case of smallpox today would be considered an emergency.

If the virus that causes smallpox were used in a bioterrorist attack, people who come into contact with the virus would be at risk of getting sick. By 1972, the smallpox vaccine was no longer given routinely in the United States. As a result, most people born in the United States after 1972 have not been vaccinated against the disease. Some people have been vaccinated through the military or because they were part of Smallpox Response Teams that were formed after the 9/11 terrorist attacks. These vaccination efforts are part of the larger plan to prepare for a bioterrorist attack. However, the vaccine does not give lifelong immunity, and people who have been vaccinated against smallpox before may still need to be revaccinated in a smallpox emergency.

Glanders

Glanders is a disease that usually affects horses, donkeys, and mules. While the disease still occurs in certain parts of the world, no animal in the United States has gotten sick with glanders since the 1940s. Though not common, people have gotten glanders from sick animals. People who are in close contact with animals that have glanders are more likely to get the disease than those who are not.

In the past, the germs that cause glanders, the bacteria called Burkholderia mallei, have been used as a biological weapon during war. It is possible that these germs could be used again in a biological attack. A biological attack is the intentional release of germs that can sicken or kill people, livestock, or crops. Public health authorities study this disease to be prepared if a biological attack ever happens.

Why might glanders be used as a weapon?
If people or groups wanted to use germs as a weapon, they might use the germs that causes glanders because they:

Cause a disease that can make people very sick. Without prompt treatment with specific antibiotics, people sick with glanders can die.
Cause a disease that is rare and not well-known, which might make it more difficult for healthcare providers to diagnose a person with glanders quickly and accurately.
Have been used as a biological weapon in the past.

How dangerous is glanders?
Glanders can be a serious disease. Without treatment with specific antibiotics, as many as 9 of every 10 people who get it die. When people with glanders get treatment with the correct antibiotics, up to 5 of 10 people die.

People sick with glanders often need to be hospitalized for treatment. Even after they are well enough to go home, people who have had glanders need to take antibiotics for several months. This long period of treatment makes sure the antibiotics kill all the glanders germs in the person's body and prevents the disease from coming back.

It can also be difficult to diagnose glanders quickly. The symptoms of glanders are the same as more common diseases like community-acquired pneumonia, the flu, or tuberculosis. Only a few people are diagnosed with glanders each year in the entire world. Because glanders in humans is so rare, most doctors are unfamiliar with the disease.

What might an attack with glanders look like?
A biological attack that releases glanders germs into the air, water, or food supply might put many people at risk for getting sick. For example, if the germs that cause glanders were released into the air in a crowded place, many people might inhale them. Or, if the germs were put into food, people who eat the contaminated food would eat the germs, too. Anyone who comes into contact with these germs is in danger of getting sick with glanders.

It might not be known right away that there had been an attack because you cannot see, smell, or taste the germs. An attack might not be noticed until doctors begin to see many people sick with fevers and respiratory illnesses. Once doctors diagnose patients with glanders, they will work with public health authorities to find out how the patients came into contact with the glanders germs.

Melioidosis

Melioidosis is a disease caused by germs that occur naturally in certain parts of the world, such as Southeast Asia and northern Australia. The only place these germs, called Burkholderia pseudomallei, occur naturally in the United States is Puerto Rico. Usually, people in the United States (outside of Puerto Rico) who get the disease have traveled and come into contact with the germs in one of these places where they occur naturally. One reason public health authorities study the disease is because it is possible that the germs that cause melioidosis might be used in a biological attack. A biological attack is the intentional release of germs that can sicken or kill people, livestock, or crops.

Why might germs that cause melioidosis be used as a weapon?
If people or groups wanted to use germs as a weapon, they might use the germs that cause melioidosis because:

- They are found in nature in certain parts of the world.
- They cause a disease that can make people very sick. Without prompt treatment with specific antibiotics, people sick with melioidosis can die.
- In the past, some countries that have used bioweapons during war have used germs closely related to the one that causes melioidosis.

How dangerous is melioidosis?
Melioidosis can be a serious disease. Melioidosis germs are naturally resistant to many commonly used antibiotics, which makes the disease difficult to treat. There are a few antibiotics that are effective, though. Without treatment, up to 9 out of every 10 people who get it die. When people with melioidosis get treatment with the correct antibiotics, fewer than 4 out of 10 people die. Medical treatment in an intensive care facility can decrease deaths even more. Only 2 out of 10 people die when they get this level of medical treatment.

People with certain medical conditions are more likely than others to get melioidosis if they come into contact with the germs that cause it. Some of these conditions are diabetes, heavy alcohol use, chronic lung disease, chronic kidney disease, and others that affect the immune system.

People sick with melioidosis frequently need to be hospitalized for treatment. Even after they are well enough to go home, people who have had melioidosis need to take antibiotics for several months. This long period of treatment makes sure the antibiotics kill all the melioidosis germs in the person's body and prevents the disease from coming back.

It can also be hard to diagnose melioidosis quickly. The symptoms of melioidosis are the same as more common diseases like community-acquired pneumonia, the flu, or tuberculosis. There are only a few people diagnosed with melioidosis each year in the United States. Those who get melioidosis usually come into contact with the germs that cause it when they are traveling or living in a country where it is found naturally. Because there are so few people in the United States who get melioidosis, most doctors are unfamiliar with the disease.

During a Biological Threat

The first evidence of an attack may be when you notice symptoms of the disease caused by exposure to an agent. In the event of a biological attack, public health officials may not immediately be able to provide information on what you should do. It will take time to figure out exactly what the illness is, how it should be treated and who is in danger.

During a Threat

- Watch TV, listen to the radio or check the Internet for official news and information including:
  - Signs and symptoms of the disease
  - Areas in danger
  - If medications or vaccinations are being distributed
  - Where to seek medical attention if you become ill
- If you become aware of a suspicious substance, quickly get away.

- Cover your mouth and nose with layers of fabric that can filter the air but still allow breathing. Examples include two to three layers of cotton such as a t-shirt, handkerchief or towel.
- Depending on the situation, wear a face mask to reduce inhaling or spreading germs.
- If you have been exposed to a biological agent, remove and bag your clothes and personal items. Follow official instructions for disposal of contaminated items.
- Wash yourself with soap and water and put on clean clothes.
- Contact authorities and seek medical assistance. You may be advised to stay away from others or even to quarantine.
- If your symptoms match those described and you are in the group considered at risk, immediately seek emergency medical attention.
- Follow the instructions of doctors and other public health officials.
- Avoid crowds.
- Wash your hands with soap and water frequently.
- Do not share food or utensils.

After a Biological Threat

Pay close attention to all official warnings and instructions on how to proceed. Medical services for a biological event may be handled differently due to increased demand. The basic procedures and medical protocols for handling exposure to biological agents are the same as for any infectious disease.

Chemical Threat

Modern Terrorism History

A list of some of the biggest modern history terrorist attacks.

Event	Country	Date	Deaths	Perpetrator
Cinema Rex Fire	Iran	1978	420	Unknown
Air India Flight 182 Bombing	Canada	1985	329	Babbar Khalsa
1990 Massacre of Sri Lankan Police Officers	Sri Lanka	1990	774	LTTE
Oklahoma City Bombing	United States	1995	168	Timothy McVeigh and Terry Nichols
September 11 Attacks	United States	2001	2,996	al-Qaeda
2007 Yazidi Communities Bombings	Iraq	2007	795+	Unknown
2008 Christmas Massacres	Uganda	2008	620	Lord's Resistance Army
Camp Speicher Massacre	Iraq	2014	1,566+	Islamic State of Iraq and the Levant
Baga Massacre	Baga, Borno State, Nigeria	Jan 3-7 2015	150+	Boko Haram
Bombing	Sinai, Egypt	31 Oct 2015	224	Islamic State
Bombing	Baghdad, Iraq	3 July 2016	342+	Islamic State
Suicide truck bombing	Mogadishu, Somalia	14 Oct 2017	655	Al-Shabaab (Suspected)
Car bombing and shooting	Bir al-Abed, Egypt	24 Nov 2017	311	Islamic State
Suicide bombings, shootings, hostage taking	As-Suwayda	25 Jul 2018	255	Islamic State

Civil Disorder

A form of collective violence interfering with the peace, security, and normal functioning of the community.

Political Terrorism

Violent criminal behaviour designed primarily to generate fear in the community, or substantial segment of it, for political purposes.

Non-Political Terrorism

Terrorism that is not aimed at political purposes but which exhibits "conscious design to create and maintain a high degree of fear for coercive purposes, but the end is individual or collective gain rather than the achievement of a political objective".

Quasi-Terrorism

The activities incidental to the commission of crimes of violence that are similar in form and method to genuine terrorism but which nevertheless lack its essential ingredient. It is not the main purpose of the quasi-terrorists to induce terror in the immediate victim as in the case of genuine terrorism, but the quasi-terrorist uses the modalities and techniques of the genuine terrorist and produces similar consequences and reaction. For example, the fleeing felon who takes hostages is a quasi-terrorist, whose methods are similar to those of the genuine terrorist but whose purposes are quite different.

Limited Political Terrorism

Genuine political terrorism is characterized by a revolutionary approach; limited political terrorism refers to "acts of terrorism which are committed for ideological or political motives but which are not part of a concerted campaign to capture control of the state".

Official or State Terrorism

Referring to nations whose rule is based upon fear and oppression that reach similar to terrorism or such proportions. It may be referred to as Structural Terrorism defined broadly as terrorist acts carried out by governments in pursuit of political objectives, often as part of their foreign policy.

9 Cyberattack

In computers and computer networks an attack is any attempt to expose, alter, disable, destroy, steal or gain unauthorized access to or make unauthorized use of an asset. A cyberattack is any type of offensive maneuver that targets computer information systems, infrastructures, computer networks, or personal computer devices. An attacker is a person or process that attempts to access data, functions or other restricted areas of the system without authorization, potentially with malicious intent. Depending on context, cyberattacks can be part of cyberwarfare or cyberterrorism. A cyberattack can be employed by sovereign states, individuals, groups, society or organizations, and it may originate from an anonymous source. A product that facilitates a cyberattack is sometimes called a cyberweapon.

A cyberattack may steal, alter, or destroy a specified target by hacking into a susceptible system. Cyberattacks can range from installing spyware on a personal computer to attempting to destroy the infrastructure of entire nations. Legal experts are seeking to limit the use of the term to incidents causing physical damage, distinguishing it from the more routine data breaches and broader hacking activities. Cyberattacks have become increasingly sophisticated and dangerous.

Attack Types

An attack can be active or passive.
● An "active attack" attempts to alter system resources or affect their operation.
● A "passive attack" attempts to learn or make use of information from the system but does not affect system resources (e.g., wiretapping).
An attack can be perpetrated by an insider or from outside the organization;

● An "inside attack" is an attack initiated by an entity inside the security perimeter (an "insider"), i.e., an entity that is authorized to access system resources but uses them in a way not approved by those who granted the authorization.
● An "outside attack" is initiated from outside the perimeter, by an unauthorized or illegitimate user of the system (an "outsider"). In the Internet, potential outside attackers range from amateur pranksters to organized criminals, international terrorists, and hostile governments.

Passive

● Computer and network surveillance
● Network
  ○ Wiretapping
  ○ Fiber tapping
  ○ Port scan
  ○ Idle scan
● Host
  ○ Keystroke logging
  ○ Data scraping
  ○ Backdoor

Active

● Denial-of-service attack
  ○ DDos or Distributed Denial of service attack is an attempt made by the hacker to block access to a server or a website that is connected to the Internet. This is achieved using multiple computerized systems, which overloads the target system with requests, making it incapable of responding to any query.
● Spoofing
● Mixed threat attack
● Network
  ○ Man-in-the-middle, Man-in-the-browser
  ○ ARP poisoning
  ○ Ping flood & Ping of death
  ○ Smurf attack

- Host
  - Buffer, Heap and Stack overflow
  - Format string attack

Syntactic Attacks

- **Viruses**

A virus is a self-replicating program that can attach itself to another program or file in order to reproduce. The virus can hide in unlikely locations in the memory of a computer system and attach itself to whatever file it sees fit to execute its code. It can also change its digital footprint each time it replicates making it harder to track down in the computer.

- **Worms**

A worm does not need another file or program to copy itself; it is a self-sustaining running program. Worms replicate over a network using protocols. The latest incarnation of worms make use of known vulnerabilities in systems to penetrate, execute their code, and replicate to other systems such as the Code Red II worm that infected more than 259,000 systems in less than 14 hours. On a much larger scale, worms can be designed for industrial espionage to monitor and collect server and traffic activities then transmit it back to its creator.

- **Trojan Horses**

A Trojan horse is designed to perform legitimate tasks but it also performs unknown and unwanted activity. It can be the basis of many viruses and worms installing onto the computer as keyboard loggers and backdoor software. In a commercial sense, Trojans can be imbedded in trial versions of software and can gather additional intelligence about the target without the person even knowing it happening. All three of these are likely to attack an individual and establishment through emails, web browsers, chat clients, remote software, and updates.

Semantic Attacks

Semantic attack is the modification and dissemination of correct and incorrect information. Information modified could have been done without the use of computers even though new opportunities can be found by using them. To set someone into the wrong direction or to cover your tracks, the dissemination of incorrect information can be utilized.

India and Pakistan

There were two such instances between India and Pakistan that involved cyberspace conflicts, started in 1990s. Earlier cyber attacks came to known as early as in 1999. Since then, India and Pakistan were engaged in a long-term dispute over Kashmir which moved into cyberspace. Historical accounts indicated that each country's hackers have been repeatedly involved in attacking each other's computing database system. The number of attacks has grown yearly: 45 in 1999, 133 in 2000, 275 by the end of August 2001. In 2010, Indian hackers laid a cyber attack at least 36 government database websites going by the name "Indian Cyber Army". In 2013, Indian hackers hacked the official website of Election Commission of Pakistan in an attempt to retrieve sensitive database information. In retaliation, Pakistani hackers, calling themselves "True Cyber Army" hacked and defaced ~1,059 websites of Indian election bodies.

Attack Process

Phases of the Intrusion Kill Chain

1. Reconnaissance	Research, identification and selection of targets.
2. Weaponization	Pairing remote access malware with exploit into a deliverable payload. (e.g. Adobe PDF and Microsoft Office files)
3. Delivery	Transmission of weapon to target. (e.g. Via email attachments, websites, links or USB drives)
4. Exploitation	Once delivered, the weapon's code is triggered, exploiting vulnerable applications or systems.
5. Installation	The weapon installs a backdoor on a target's system allowing persistent access.
6. Command & Control	Outside server communicates with the weapons providing "hands on keyboard access" inside the target's network.
7. Actions on Objective	The attacker works to achieve the objective of the intrusion, which can include destruction of data, or intrusion of another target.

Previous Attacks

China

China's People's Liberation Army (PLA) has developed a strategy called "Integrated Network Electronic Warfare" which guides computer network operations and cyberwarfare tools. This strategy helps link together network warfare tools and electronic warfare weapons against an opponent's information systems during conflict. They believe the fundamentals for achieving success is about seizing control of an opponent's information flow and establishing information dominance. The Science of Military and The Science of Campaigns both identify enemy logistics systems networks as the highest priority for cyber-attacks and states that cyberwarfare must mark the start if a campaign, used properly, can enable overall operational success.

Focusing on attacking the opponent's infrastructure to disrupt transmissions and processes of information that dictate decision-making operations, the PLA would secure cyber dominance over their adversary. The predominant techniques that would be utilized during a conflict to gain the upper hand are as follows, the PLA would strike with electronic jammers, electronic deception and suppression techniques to interrupt the transfer processes of information. They would launch virus attacks or hacking techniques to sabotage information processes, all in the hopes of destroying enemy information platforms and facilities.

The PLA's Science of Campaigns noted that one role for cyberwarfare is to create windows of opportunity for other forces to operate without detection or with a lowered risk of counterattack by exploiting the enemy's periods of "blindness", "deafness" or "paralysis" created by cyber-attacks. That is one of the main focal points of cyberwarefare, to be able to weaken your enemy to the full extent possible so that your physical offensive will have a higher percentage of success.

Estonia

The 2007 cyberattacks on Estonia were a series of cyberattacks which began on 27 April 2007 and targeted websites of Estonian organizations, including Estonian parliament, banks, ministries, newspapers and broadcasters, amid the country's disagreement with Russia about the relocation of the Bronze Soldier of Tallinn, an elaborate Soviet-era grave marker, as well as war graves in Tallinn. The attacks triggered a number of military organizations around the world to reconsider the importance of network security to modern military doctrine. The direct result of the cyberattacks was the creation of the NATO Cooperative Cyber Defence Centre of Excellence in Tallinn.

Ethiopia

In an extension of a bilateral dispute between Ethiopia and Egypt over the Grand Ethiopian Renaissance Dam, Ethiopian government websites have been hacked by the Egypt-based hackers in June 2020.

Iran
On 8 February 2020, the telecommunication network of Iran witnessed extensive disruptions at 11:44 a.m. local time, which lasted for about an hour. The Ministry of Information and Communications Technology of Iran confirmed it as a Distributed Denial of Service (DDoS) attack. The Iranian authorities activated the "Digital Fortress" cyber-defense mechanism to repel. Also known as DZHAFA, it led to a drop of 75 percent in the national internet connectivity.

Israel
In April 2020, there were attempts to hack into Israel's water infrastructure of the Sharon central region by Iran, which was thwarted by Israeli cyber defenses. The cyberattack intended to introduce dangerous levels of chlorine into the Israeli water supply.

Russia
During the 2018 FIFA World Cup, Russia countered and stopped around 25 million cyber attacks on IT Infrastructure.
In June 2019, Russia has conceded that it is "possible" its electrical grid is under cyberattack by the United States. The New York Times reported that American hackers from the United States Cyber Command planted malware potentially capable of disrupting the Russian electrical grid.

Ukraine
A series of powerful cyber attacks began 27 June 2017 that swamped websites of Ukrainian organizations, including banks, ministries, newspapers and electricity firms.

Infrastructure Targets

Once a cyber-attack has been initiated, there are certain targets that need to be attacked to cripple the opponent. Certain infrastructures as targets have been highlighted as critical infrastructures in times of conflict that can severely cripple a nation. Control systems, energy resources, finance, telecommunications, transportation, and water facilities are seen as critical infrastructure targets during conflict. A new report on the industrial cybersecurity problems, reportedly has found a 10-fold increase in the number of successful cyber-attacks on infrastructure Supervisory Control and Data Acquisition (SCADA) systems since 2000. Cyberattacks that have an adverse physical effect are known as cyber-physical attacks.

Control Systems	Control systems are responsible for activating and monitoring industrial or mechanical controls. Many devices are integrated with computer platforms to control valves and gates to certain physical infrastructures. Control systems are usually designed as remote telemetry devices that link to other physical devices through internet access or modems. Little security can be offered when dealing with these devices, enabling many hackers or cyberterrorists to seek out systematic vulnerabilities. Paul Blomgren, manager of sales engineering at cybersecurity firm explained how his people drove to a remote substation, saw a wireless network antenna and immediately plugged in their wireless LAN cards. They took out their laptops and connected to the system because it wasn't using passwords. "Within 10 minutes, they had mapped every piece of equipment in the facility," Blomgren said. "Within 15 minutes, they mapped every piece of equipment in the operational control network. Within 20 minutes, they were talking to the business network and had pulled off several business reports. They never even left the vehicle."
Energy	Energy is seen as the second infrastructure that could be attacked. It is broken down into two categories, electricity and natural gas. Electricity also known as electric grids power cities, regions, and households; it powers machines and other mechanisms used in day-to-day life. Using US as an example, in a conflict cyberterrorists can access data through the Daily Report of System Status that shows power flows throughout the system and can pinpoint the busiest sections of the grid. By shutting those grids down, they can cause mass hysteria, backlog, and confusion; also being able to locate critical areas of operation to further attacks in a more direct method. Cyberterrorists can access instructions on how to connect to the Bonneville Power Administration which helps direct them on how to not fault the system in the process. This is a major advantage that can be utilized when cyber-attacks are being made because foreign attackers with no prior knowledge of the system can attack with the highest accuracy without drawbacks. Cyberattacks on natural gas installations go much the same way as it would with attacks on electrical grids. Cyberterrorists can shutdown these installations stopping the flow or they can even reroute gas flows to another section that can be occupied by one of their allies. There was a case in Russia with a gas supplier known as Gazprom, they lost control of their central switchboard which routes gas flow, after an inside operator and Trojan horse program bypassed security.
Finance	Financial infrastructures could be hit hard by cyber-attacks as the financial system is linked by computer systems. Money is constantly being exchanged in these institutions and if cyberterrorists were to attack and if transactions were rerouted and large amounts of money stolen, financial industries would collapse and civilians would be without jobs and security. Operations would stall from region to region causing nationwide economic degradation. In the U.S. alone, the average daily volume of transactions hit $3 trillion and 99% of it is non-cash flow. To be able to disrupt that amount of money for one day or for a period of days can cause lasting damage making investors pull out of funding and erode public confidence. A cyberattack on a financial institution or transactions may be referred to as a cyberheist. These attacks may start with phishing that targets employees, using social engineering to coax information from them. They may allow attackers to hack into the network and put keyloggers on the accounting systems. In time, the cybercriminals are able to obtain password and keys information. An organization's bank accounts can then be accessed via the information they have stolen using the keyloggers. In May 2013, a gang carried out a US$40 million cyberheist from the Bank of Muscat.
Telecommunications	Cyberattacking telecommunication infrastructures have straightforward results. Telecommunication integration is becoming common practice, systems such as voice and IP networks are merging. Everything is being run through the internet because the speeds and storage capabilities are endless. Denial-of-service attacks can be administered as previously mentioned, but more complex attacks can be made on BGP routing protocols or DNS infrastructures. It is less likely that an attack would target or compromise the traditional telephony network of SS7 switches, or an attempted attack on physical devices such as microwave stations or satellite facilities. The ability would still be there to shut down those physical facilities to disrupt telephony networks. The whole idea on these cyber-attacks is to cut people off from one another, to disrupt communication, and by doing so, to impede critical information being sent and received. In cyberwarfare, this is a critical way of gaining the upper-hand in a conflict. By controlling the flow of information and communication, a nation can plan more accurate strikes and enact better counter-attack measures on their enemies.
Transportation	Transportation infrastructure mirrors telecommunication facilities; by impeding transportation for individuals in a city or region, the economy will slightly degrade over time. Successful cyber-attacks can impact scheduling and accessibility, creating a disruption in the economic chain. Carrying methods will be impacted, making it hard for cargo to be sent from one place to another. In January 2003 during the "slammer" virus, Continental Airlines was forced to shut down flights due to computer problems. Cyberterrorists can target railroads by disrupting switches, target flight software to impede airplanes, and target road usage to impede more conventional transportation methods. In May 2015, a man, Chris Roberts, who was a cyberconsultant, revealed to the FBI that he had repeatedly, from 2011 to 2014, managed to hack into Boeing and Airbus flights' controls via the onboard entertainment system, allegedly, and had at least once ordered a flight to climb. The FBI, after detaining him in April 2015 in Syracuse, had interviewed him about the allegations.
Water	Water as an infrastructure could be one of the most critical infrastructures to be attacked. It is seen as one of the greatest security hazards among all of the computer-controlled systems. There is the potential to have massive amounts of water unleashed into an area which could be unprotected causing loss of life and property damage. It is not even water supplies that could be attacked; sewer systems can be compromised too. There was no calculation given to the cost of damages, but the estimated cost to replace critical water systems could be in the hundreds of billions of dollars. Most of these water infrastructures are well developed making it hard for cyber-attacks to cause any significant damage, at most, equipment failure can occur causing power outlets to be disrupted for a short time.

MA	Cy	Inf		**Hospitals**	Hospital as an infrastructure is one of the major assets to have been impacted by cyberattacks. These attacks could "directly lead to deaths." The cyberattacks are designed to deny hospital workers access to critical care systems. Recently, there has been a major increase of cyberattacks against hospitals amid covid-19 pandemic. Hackers lock up a network and demand ransom to return access to these systems. The ICRC and other human rights group have urged law enforcement to take "immediate and decisive action" to punish such cyberattackers.

Personal Disasters

Disasters that can happen to you and your family personally

"You don't learn to fly if you're not prepared to crash."
Joe Brooks

Introduction

Personal Disasters typically only affect one household or one person, but can change that person's life forever. A personal crisis occurs when an individual can no longer cope with a situation. Personal disasters often come by surprise and have life-altering impacts and effects that can last decades.

Purpose	The aim of PERSONAL DISASTERS is to help the reader through any personal disasters they may be facing, such as house fires, bankruptcies, car crashes, illness and injuries, separation and abuse. It also contains a disaster recovery section which is aimed at providing useful goals in the event you are separated from society after an event such as a plane crash.
Lost?	• For information on minor acts of nature which could affect you personally, see the METEOROLOGY section. • See the MAN-MADE DISASTERS section for slightly larger personal disasters which affect more than a few people. • See the NATURAL DISASTERS section for information on catastrophies caused by nature. • For a distraction from the current turmoil of the world, see the ENTERTAINMENT section.

Contents

1 Property Loss

House Loss / Fire

A loss of an entire home and most assets inside is devastating and can make it impossible to recoup the loss without insurance.

Theft / Mugging

These can cause permanent trauma and an insecurity in public spaces.

PERSONAL DISASTERS

Property Lo

Vehicle Collision / Crash

Any form of vehicle crash such as a car, plane or boat - even if there's no physical injuries.

2 Illness & Injury

Death / Suicide

Traumatic grief and/or separation may include the death of a parent, primary caretaker, or sibling; abrupt and/or unexpected, accidental, or premature death or homicide of a close friend, family member, or other close relative.

Illness / Injury

Trauma can occur when a person experiences an unintentional injury or accident, a physical illness, or medical procedures that are extremely painful and/or life threatening.

3 Money

Bankruptcy

Bankruptcy is a legal process where you're declared unable to pay your debts. Your trustee can sell your assets including your house and property.

Job Loss

A job loss can be felt immediately and cause worry about how you will feed your family or whether you will lose your house.

Legal Conflict

An abrupt legal case for battle for possessions or being sued for cash.

4 Abuse

Physical Abuse / Assault

Physical abuse or assault is defined as the actual or attempted infliction of physical pain (with or without the use of an object or weapon), including the use of severe corporeal punishment. Federal law defines child abuse as any act, or failure to act, which results in death, serious physical or emotional harm, sexual abuse, or exploitation of a child.

Sexual Abuse / Rape

Sexual abuse or assault includes unwanted or coercive sexual contact, exposure to age-inappropriate sexual material or environments, and sexual exploitation. Any type of sexual contact or behaviour that occurs without the explicit consent of the recipient.

Emotional Abuse

Emotional abuse and psychological maltreatment are considered acts of commission (other than physical or sexual abuse) against an individual. These kinds of acts, which include verbal abuse, emotional abuse, and excessive demands or expectations, may cause an individual to experience conduct, cognitive, affective, or other mental disturbances.

Bullying

Bullying is unwanted, aggressive behaviour among school-aged children that involves a real or perceived power imbalance. The behaviour is repeated, or has the potential to be repeated, over time. Both kids who are bullied and who bully others may experience serious, lasting problems. Trauma can be a consequence of bullying, which can lead to mental health issues, substance use, and suicide, particularly if there is a prior history of depression or delinquency.

5 Trauma

Historical Trauma

Historical trauma is a form of trauma that impacts entire communities. It refers to the cumulative emotional and psychological wounding, as a result of group traumatic experiences, that is transmitted across generations within a community. Unresolved grief and anger often accompany this trauma and contribute to physical and behavioural health disorders. This type of trauma is often associated with racial and ethnic population groups in the United States who have suffered major intergenerational losses and assaults on their culture and well-being.

War / Terrorism / Violence

Exposure to acts of war-, terrorism-, or political-related violence such as bombing, shooting, and looting can cause trauma in an individual.

Military Trauma

Military trauma refers to both the impact of deployment and trauma-related stress on people who are deployed and their families. Significant numbers of returning service men and women experience mental and/or substance use disorders associated with military trauma and/or military sexual trauma.

6 Separation

Parent / Caretaker Separation

Abrupt, unexplained and/or indefinite separation from a parent, primary caretaker, sibling or possession due to uncontrollable circumstances.

Losing Friends

Losing close friends.

Losing Treasured Possessions

People can often feel a very strong attachment to items they treasure or which have an extremely sentimental value. This can be heartbreaking if you lose the item such as if it's destroyed in a fire, stolen or you're forced to part with it. Items may include gifts from lovers, rare valuables, childhood items, religious symbols, achievements, items from deceased people, collectables or photos of family. Nothing lasts forever and eventually every item will be destroyed in one way or another.

In some circumstances it's possible to recover the possessions you have lost. Below is a list of how this is possible.

Possession Loss	Recovery Options	Coping with the Loss
Theft	The police may be able to assist in the recovery of an item if you can provide enough information.	Generally thieves go for items which have a high value, so it's usually possible to purchase the item again after you save your money.
Lost / Missing	If an item is missing there is still the option you will find it again. Try to retrace your steps or stop and think where it could be. Look in places you haven't considered before.	Until you find the item, or have clear evidence it has been destroyed or stolen then there is always hope that you will find it again.
Burnt / Destroyed	There's little you can do to recover the item in this case. If it's partially burnt you may be able to recover some of the item.	At least you still have what's left of the item in your possession. Your only other option would be to recreate it or find something of similar sentimental value.

Forced Selling	Sometimes you are forced to sell an item because you're low on money. If you still have the details of the seller, you may be able to buy it back, or if you tell them what it means to you, they might even give it back.	If the buyer won't sell you the item back or return it then you have to accept that it is gone. Try not to dwell on the hope of one day getting it back since that will only cause more pain.
Corrupted	TPE has become corrupted many times and there are usually options you can try to recover the file depending on what file type it is. It's important to keep regular backups of important content, both nearby and off site.	You may need to accept the loss if you cannot recover the data. This may involve having to do a lot of the work over again.
Encrypted	There is always the option of data recovery companies if you can provide the device and any previously known passwords. Be sure to keep the 'key' file if you encrypt anything - which was my mistake.	If you aren't willing to pay to have the item recovered by an encryption service, or you can't afford it, then you may have to accept that those photos/videos/files are gone.
Deleted	Deleted items can usually be recovered if you haven't written more files to the drive. Find and install good file recovery software on a separate drive.	If the item has been permanently deleted you will have to try to obtain the file again or recreate it from what you can remember. Do this as early as you can while it's in your memory.
Broken & Unrepairable	If an item is unrepairable due to the parts for it not being made anymore you may be able to 3D print or have another company design a replacement part for it or recreate it entirely.	You could always keep the broken item if it means that much to you, or try to repair it in whatever way you can. At least you have the original item in your possession unlike some of the other ways above.

Forced Displacement

Forced displacement is a traumatic event that occurs when people face political persecution and are forced to relocate to a new home (as an immigrant or through political asylum) or become a refugee.

Neglect

Neglect is the most common form of abuse reported to child welfare authorities. However, it does not occur only with children. It can also happen when a primary caregiver fails to give an adult the care they need, even though the caregiver can afford to, or has the help to do so. Neglect also includes the failure to provide an individual with basic needs such as food, clothing, or shelter. It can also mean not providing medical or mental health treatment or prescribed medicines. Neglect also includes exposing someone to dangerous environments, abandoning a person, or expelling them from home.

Jail / Incarceration

Being jailed can cause trauma from an abrupt change in circumstances, scenery and people such as not being with your children or partner.

7 Other

Any other kinds of personal disasters which can affect someone.

Substance Addiction

An addiction usually stems from a primary event and can cause depression, suicide, violence and incarceration

Gambling Addiction

Self Harm

8 Disaster Recovery

You've just crash-landed on an island, there are multiple injuries among the passengers, the pilot and crew are dead - what do you do? It may sounds like a game we play where we have 5 items to take with us, but this has been a very real situation for many people. The below section will help you understand and cope with the situation until you are rescued.

This article will have a general flow and order of what to do to survive and get help as well as a section on each of the specialised incidents that can happen. It is assumed that the world is functioning as per normal with rescue services employed after realizing the plane never arrived at its destination. Remember that every situation is different and you should only use this as a general guide to help you plan your next move.

The approximate time each step will take and the estimated time into the disaster is labelled next to the step as follows:

(<10m,~5m)
< / > = Less / More Than
~ = Approximate

First Minutes

What you should do in the first few minutes of a disaster.

Step Name (Step Time, Time Into Disaster)	Summary	Description

Get out of danger

Step Name (Step Time, Time Into Disaster)	Summary	Description
Personal Safety Check (<30s,~0s)	Get out of danger	Ensure there's no risk of further injury to yourself. Risks may include: Explosions, drowning, aftershocks and extreme environments or conditions. If there is a risk of injury or death, immediately attempt to negate or reduce the effects of it. Like escaping from of a sinking plane or getting away from leaking fuel.

Check yourself for injuries

Step Name (Step Time, Time Into Disaster)	Summary	Description
Self Check (<1m,~30s)	Check yourself for injuries	Firstly check yourself for injuries including cuts, scrapes, broken bones, bruises and ensure your mental capacity is clear and you aren't in shock. There is no use assisting others if you aren't in a physical or mental state to help or you may make a huge mistake. Any cuts you have could get infected depending on where you are. Be sure to apply the proper treatment. If you aren't in a solid state of mind and body you won't have the capacity to continue the next steps.

Treat your physical and mental injuries

Step Name (Step Time, Time Into Disaster)	Summary	Description
Compose/ Treat Yourself (<1m,~2m)	Treat your own injuries, physical and mental	Ensure you are in a proper mental state to proceed especially if you have witnessed people dying or the death of someone you know. Without being in a correct state of mind you will only make mistakes from now on so try to push the shock of everything into the back of your mind until later. Only treat any major injuries you have which will prevent you from being fully effective in the future. This allows more time for medical triage on the others who are injured who may have life threatening injuries. Injuries which should be treated are heavy bleeding, concussions, dislocations, broken bones and anything that will render you unable to proceed.

Assess possible threats

Step Name (Step Time, Time Into Disaster)	Summary	Description	
General Safety Assessment (<3m,~2m)	Assess possible threats	Before doing anything else ensure there's no risk of further injury to you or anyone else. Note down the possible risks that could occur in your mind. This safety check only covers the current point in time ignoring future risks and extends to cover everyone else in the area.	**Possible Risks** ● Leaking Fuel ● Unstable Structure ● Aftershocks ● Falling Objects ● Crazed Individuals ● Electrocution ● Suffocation

Negate safety risks

Step Name (Step Time, Time Into Disaster)	Summary	Description
Safety Procedure (<2m,~5m)	Negate safety risks	If there are serious safety risks, attempt to negate them if possible. If there is fuel leaking after a plane crash, try to move people away from the crash unless it puts them in a greater risk such as freezing conditions. Attempt to put out any fires if you stay close to the wreckage.

First Hour

What you should do in the first hours of a disaster.

Evaluate situation and keep calm

Step Name (Step Time, Time Into Disaster)	Summary	Description
Evaluate (<2m,~7m)	Evaluate situation and keep calm	Do a quick scan of the assets nearby. If a precious resource like fuel or water is leaking - attempt to save it by putting a bucket underneath. The secondary objective is to find a medical kit if possible. This step should only take 2 minutes maximum as causalities will require medical assistance ASAP.

Assess the injuries of others using triage

Step Name (Step Time, Time Into Disaster)	Summary	Description
Medical Evaluation (<5m,~10m)	Assess the injuries of others using triage	There are bound to be some form of injuries in a disaster whether physical or emotional. Take notes on and check on the medical health of all the other people involved. Ask if they take any regular prescriptions at intervals which they need to survive such as insulin. Use the medical triage to categorise the injured. See the Medical section.

Treat others injuries

Step Name (Step Time, Time Into Disaster)	Summary	Description
Treat Injuries (<45m,~30m)	Treat others injuries	If you have the medical knowledge begin treating the wounded starting with the most dire first - unless they will die either way. If you don't have prior medical knowledge, do the best you can, most vehicles will have some sort of medical kit in them. Use the medical section in this document for a refresher. Lay the dead out together if applicable, as vermin and animals will likely feed on them overnight if left exposed. Take notes of the dead such as name, age and time of death for cataloguing later. Attempt to stabilize everyone if possible and get others to assist you by looking after other people.

PERSONAL DISASTERS | Disaster Recovery | First Hour

Signal for help

Contact Help (<45m,~30m)	Signal for help	If you are in an area with reception or see other aircraft or ships in the area attempt to signal them. Continue to the next step if there are no other people in sight and there's no mobile reception.

Turn off un-needed electronic devices

Resource Conservation (<45m,~30m)	Turn off un-needed electronic devices	Save all the electricity you can on every device you can, as you may need it later. Enable power saving features on the phones that need to be on. (Especially the one with this guide) The energy is limited and could be used later to power the more essential devices such as a radio and communication equipment. Close all un-needed apps and dim the screen to a level that is suitable. Transfer this guide and any other useful resources to an SD card or other removable device.

Establish a leader, a plan, and assign people to tasks

Establish a Leader (<15m,~1h)	Establish a leader, a plan, and assign people to tasks	It's important to have some form of leader in dangerous situations as it will ease people's minds. The leader does not have to be you, unless you wish to take up the role. Being a prepper and having this guide, I highly recommend you put yourself forward if you have the knowledge. If people fight for leadership, just drop the matter and continue to provide medical help to others and other skills you possess. If you are the leader, delegate tasks to other uninjured people around you who seem stable and ask everyone if they have any medical or other useful skills. Work out what the next steps are in your disaster plan. You can use this article as a guide if you possess it however keep in mind that it's not disaster specific.	**Tasks for Others** ● Resource Scavenging ● Scouting ● Medical Care ● Comforting ● Protection

First Days

What you should do in the first days of a disaster.

Work together to generate a plan to follow

Leadership Plan (<15m,~1h)	Work together to generate a plan to follow	Take note of what resources you have, how many people there are and what condition they are in, how many have died already, etc.	**Plan Topics** ● Sick People ● Troublesome People ● Resources ● Signalling ● Labour Division

Check Resources

Resource Audit (<30m,~1h 15m)	Check Resources	Establish what items and materials you have to work with and ensure they aren't wasted by desperate people. Recover any useful objects such as weapons, clothing and signalling devices and put them in a pile. Keep any food and water together and protected from the elements and those who will try to take it. Ration all food and water and have someone keep guard over it if necessary.

Cover bodies

Cover Bodies (<30m,~1h 15m)	Cover bodies	The bodies (if any) should be concealed for now to keep morale high and prevent predators. This may be difficult if there are people who have lost their grip on reality and are expecting their loved one to wake up.

Monitor health of individuals

Medical Monitoring (<15m,~1h 45m)	Monitor health of individuals	Keep monitoring the progress of patients every 15 minutes and attend them if they get worse. There should be a person other than the leader assigned to assisting the injured at all times.

Find bearings, look for resources

Minor Scouting (<15m,~2h)	Find bearings, look for resources	Try to find your bearings if possible and where you are in the world. Look around your location, is it day or night, winter or summer, what types of animals live around these parts, what's the weather, what climate is it etc.

Move to a secure location

Positioning (<15m,~2h)	Move to a secure location	After scouting work out whether you should move away from the current location or stay by the wreck. Staying by the wreck provides a lot of resources to scavenge, shelter and makes it easier for rescuers to find you. The reasons for leaving include possible chance of explosion, unsafe environment or threat of animals hunting the dead.

Build a campfire

Build a Fire (<30m,~2h)	Build a campfire	To cook food, restore morale, deter animals and sterilize. Use car or plane fuel to help start the fire.

Build a signal fire

Construct a Signal Fire (<30m,~3h)	Build a signal fire	Assemble a signal fire ready to light if an aircraft or boat approaches. Ensure you put leafy greens on top to provide the maximum amount of smoke. Keep a campfire lit at all times to make it easy to light the signal.

Build a SOS sign

Construct an SOS Sign (<30m,~3h)	Build a SOS sign	Using any materials available in an open space, create a large SOS or HELP sign on the ground. Make each letter many meters wide at a minimum to be visible from the sky. Use reflective materials if possible and ones that won't blow away in strong wind.

Construct a shelter

Construct Shelter (<1-2hrs,~4h)	Construct a shelter	If necessary, create a temporary shelter from nearby materials for weather protection. If it's night create a shelter anyway for a greater sense of protection and a defence against wild animals. The shelter time may vary wildly depending on how many people you need to shelter and how many people assist. Shelter also includes making temporary beds for the injured.	**Shelter Reasons** • Weather Protection • Animal Protection • Camouflage • Warmth

Protection from future threats

Future Threats (<30m,~5h)	Protection from future threats	After scouting you should know what possible threats may occur such as incline weather, wild animals or night. Begin setting up safeguards for threats such as building a shelter if there is no suitable place and night is approaching. After this step you should proceed with the most needed priorities first and focus on the others later.	**Priorities** • Safety • Air • Defence • Shelter • Water • Food

Acquire safe drinking water

Acquire Water	Acquire safe drinking water	By now the requirement for water will be rather high with a lot expended creating shelters. Look for an alternative source and attempt to set up water boiling points.

Distribute food and water

Distribute Food / Water	Distribute food and water	Hand out rationed amounts of food to everyone to keep energy levels up. Priority should be given for the sick, pregnant and the heavy lifters. Don't let people take more than they need or eat less than they should.

Have Communications Equipment Ready

Communications (<15m,~6h)	Have Communications Equipment Ready	If you have a form of communication such as a radio or signal flare attempt to use it to make contact to rescuers. Only use the signal flare if you can hear an aircraft - even if you can't see it or it's hidden by clouds - use it at night for the best effect. Delegate someone to the radio or communications method if possible to try and make contact.

Restore morale

Keep up Morale (<15m,~7h)	Restore morale	Chat with people and ask them about their lives, what skills they have and how they got here. Keep attending people's wounds and enquires if you are the leader.

First Weeks

What you should do in the first weeks of a disaster.

Organize a Night Watch

Night Watch (<12h,~Dusk)	Organize a Night Watch	As the night approaches organise a watch to take care of the injured, stoke the fire, watch for predators and keep an eye on the sky for search parties. A good watch should be taken in turns of about 3-4 hours which are easily divisible by 12 and will ensure the rest of each individual in the party.

Find food

PERSONAL DISASTERS
Disaster Recovery
First Week

Food Acquisition (<3h,~Dawn)	Find food	Some of the party should attempt to find food sources via foraging, hunting or fishing. This step could be held off until day 3 or so if necessary.

Clear land for heli/plane landing

Land Clearing (<1-3d,~Day 2+)	Clear land for heli/plane landing	You should clear a plot of land if required for a safe location for helicopters to land. 50-75m diameter should be wide enough. If you have ample time clearing a landing strip for aircraft may also be beneficial. It should be about 600m-1km long on flat ground. Ignore this if there's not enough land, it's too difficult or there's a lack of food or water.

Bury any bodies

Bury Bodies (<3h,~3d)	Bury any bodies	Bury any bodies and animals within three days to prevent the spread of disease and avoids attracting wild animals. This activity will consume a lot of effort and should only be done if food and water is ample. An alternate version of this could be moving the bodies out of sight and far from the camp site. Visible bodies will drain morale as well a introducing disease and predators. If desired animals can be eaten for food instead of buried.

First Months

What you should do in the first months of a disaster if you still haven't been rescued or there is nobody to rescue you.

First Years

What you should do in the first years of a disaster if you still haven't been rescued or there is nobody left to rescue you.

9 Specific Incidents

These are specific crash situations you may find yourself in. This section is designed to get you back to civilization.

Land Breakdown (Unknown Location)

Your car breaks down, you are unable to fix the problem and people rarely/never pass by.

Land Crash (Unknown Location)

Either a car crash between another vehicle or an obstacle and people rarely/never pass by.

Air Crash (Into Land)

A plane has crashed and you've been stranded in an unknown location on land.

Air Crash (Into Water)

A plane has crashed and you've been stranded in an unknown location at sea.

Adrift

You are adrift at sea in an uncontrollable floating object.

PERSONAL DISASTERS

Specific Incidents

Lost

Lost at Sea

You are lost at sea in a controllable boat.

Shipwrecked (Onto Land)

A boat crashes onto land, a sandbank or offshore rocks.

Disaster Triggers

Any adverse effects that may be triggered from disasters

"Worrying will never improve the outcome."
Unknown

Introduction

Disaster triggers are any adverse effects that <u>have been</u>, or <u>could be</u> triggered by a disaster such as power loss from a hurricane. They typically only arise from larger disasters that make news such as truck collisions, cyclones and pandemics. You can essentially use this category to predict what may occur from a disaster and plan ahead.

Purpose	The aim of DISASTER TRIGGERS is to provide a list of potential future outcomes to prepare for based on various current scenarios.
Lost?	• For a list of (non-world ending) natural disasters, see NATURAL DISASTERS. • For a list of (non-world ending) man-made disasters, see MAN-MADE DISASTERS. • For a distraction from the current turmoil of the world, see the ENTERTAINMENT section.

Contents

1 Conflict

These are any adverse effects that can come from conflict and violence during a disaster.

Terms Used	**Description:** A description of the disaster. **Causes:** What causes the disaster. **Symptoms:** What are the symptoms of this occurring. **Affects (Object):** The physical objects this disaster affects. **Effects (From):** The effects that occur from this disaster unfolding. **Alternatives:** Alternative solutions to this disaster. **Escalation:** Other effects this disaster may trigger. **Prepper Solution:** The solution most optimal for preppers.

Violence (Person to Person)

Conflict over resources whether it's food, water or precious metals.

Causes	Symptoms	Affects (Object)	Effects (From)	Alternatives (To Violence)	May Trigger
• Desperation • Hunger • Thirst • Hatred	• Arguments • Poised Body Position • Threats • A Direct Approach • Eye Contact • Clenched Fist	• Those Involved • Bystanders • Moral Ethics	• Injury • Death • Robbery • Emotional Trauma • Arrest	• Leave • Concede Defeat • Surrender • Win • Amicable Agreement	• Riots • Law Enforcement Action

Prepper Solution
Avoid confrontation to prevent injury and maintain your goods.

Looting & Theft

Stealing of resources from another person who is away from that location.

Causes	Symptoms	Affects (Object)	Effects (From)	Alternatives	May Trigger
• Desperation • Hunger • Thirst • Greed	• Suspicious Movements • Concealed Goods	• Recipient of Theft • Local Businesses • Local Customers	• Injury • Death • Emotional Trauma • Arrest	• Purchasing • Crafting Your Own	• Law Enforcement Action

Prepper Solution
Find out how much and what you have remaining and if you can survive off it, bug out if necessary.

Destruction

A person or group of people destroying cars, building and property.

Causes	Symptoms	Affects (Object)	Effects (From)	Alternatives	May Trigger
• Fun • Boredom • Sending a Message • Retaliation • Oppression	• Held Weapons • Chanting / Shouting	• The Destroyed Objects • Possessions Owner	• Injury • Death • Arrest • Violence	• Calming Activities • Supporting Yourself	• Fires • Explosions • Violence

Prepper Solution
Avoid confrontation unless your home is under threat, then use any necessary force if required.

Protests

A large gathering of people protesting a change, law, inequality or a decision.

Causes	Symptoms	Affects (Object)	Effects (From)	Alternatives	May Trigger
• Inequality • Anger • Frustration	• Picket Signs • Chanting • Mass Gathering • Similar Colours	• Objects of Protest	• Law Changes • Nothing • Violence • Arguments • Arrest	• Petitions • Change • Adapt	• Law Enforcement Action • Violence

Prepper Solution
Avoid protest areas and blend in to the environment, bug out if the situation is dangerous.

Riots (Group Violence)

A group of people protesting a common cause which often involves violence.

Causes	Symptoms	Affects (Object)	Effects (From)	Alternatives	May Trigger
• Sending a Message • Hatred • Change • Revolution • Fun	• Crowds in the Streets • Often Televised • Destruction	• Homes • Cars • Businesses • People	• Building Damage • Injury • Fires • Police Force • Arrest	• Protests • Petitions	• Law Enforcement Action • Fires • Violence

Prepper Solution
Avoid riot areas and blend in, bug out if the situation is dangerous or defend your home with force if needed.

Mugging & Robbery

A robbery of valuables from a person who is at the scene.

Causes	Symptoms	Affects (Object)	Effects (From)	Alternatives	May Trigger
• Desperation • Hunger • Thirst • Greed • Fun	• Being Alone • Night Situation • Being Followed	• The Muggee • Bystanders • Moral Ethics	• Injury • Death • Arrest	• Giving Freely • Fighting Back	• Violence • Injury

Prepper Solution
Comply with direction unless you see a way out. Restock supplies at home if possible.

2 Amenity Losses

The losses of any basic amenities such as electricity or water.

Electrical Loss

Electrical Grid Loss

A widespread loss of electricity from homes, businesses and shops.

Causes	Symptoms	Affects (Object)	Effects (From)	Alternatives (To Electricity)	May Trigger
• No Energy Source • Damaged Assets • Loss of Labour Force • Weather Events	• No Electricity	• All electrical appliances without a battery connected to mains	• No Light • No Heating / Cooling • Little Communication • No Elevators • No Automatic Doors	• Candles • Breeze / Blanket • Books • Solar Panels / Battery	• Phone Network Loss • Internet Loss • Tv / Radio Signal Loss • GPS Loss • Electronics Loss • Computer / ATM Loss • Retail Closures • Riots • Use of Generators

Prepper Solution
Use solar systems, use a generator, use less electricity or simplify your lifestyle.

EMP Electronics Loss

A widespread destruction of most electronic devices due to an electromagnetic pulse.

Causes	Symptoms	Affects (Object)	Effects (From)	Alternatives (To Electricity)	May Trigger
• No Energy Source • Damaged Assets • Loss of Labour Force • Weather Events	• No Electricity	• All electrical appliances without a battery connected to mains	• No Light • No Heating / Cooling • Little Communication • No Elevators • No Automatic Doors	• Candles • Breeze / Blanket • Books • Solar Panels / Battery	• Phone Network Loss • Internet Loss • Tv / Radio Signal Loss • GPS Loss • Electronics Loss • Computer / ATM Loss • Retail Closures • Riots • Use of Generators

Prepper Solution
Use solar systems, use a generator, use less electricity or simplify your lifestyle.

Water Loss

Water Loss

The loss of a clean water source to your house.

Causes	Symptoms	Affects (Object)	Effects (From)	Alternatives (To Tap Water)	May Trigger
• Loss of Labour Force • Damaged Assets • Lack of Water • Water Contamination • Weather Events	• No Water • Low Pressure • Dirty Water	• All taps and water distribution points	• No Drinking Water • Can't Clean • Can't Bathe • Fights for Water • Scouting for Water • Water Purification • Waterborne Illnesses	• Streams • Ocean • Lakes • House Water	• Thirst • Riots • Relocation • Water Purchases

Prepper Solution
Acquire water from clean rivers, streams or lakes and purify it at home.

Water Contamination

Any form of contaminated tap water by bacteria, colour, particles etc.

Causes	Symptoms	Affects (Object)	Effects (From)	Alternatives (To Tap Water)	May Trigger
• Floods • Terrorist Attack • Lack of Water • Malicious Intent • Poor Maintenance	• Particulate in Water • Muddy Water • Waterborne Illnesses • Coloured Water • No Visible Signs	• All taps and water distribution points	• No Drinking Water • Can't Clean • Can't Bathe • Fights for Water • Scouting for Water • Water Purification Req. • Waterborne Illnesses	• Streams • Ocean • Lakes • Filtration • Sterilization	• Thirst • Protests • Riots • Relocation • Water Purchases

Prepper Solution
Purify the water at home.

Gas (LPG) Loss

Gas (LPG) Loss

The loss of mains gas to your home.

Causes	Symptoms	Affects (Object)	Effects (From)	Alternatives (To Using Gas)	May Trigger
• Loss of Labour Force • Pipe Destruction	• No Gas • Low Pressure	• Gas Stoves • Some Hot Water Systems • Some Air Conditioners	• Can't Cook • Can't Heat	• Gas Canisters • Electrical Stoves • Fire	• Explosions • Protests • Heating Loss • Cooking Loss

Prepper Solution
Use canister gas, cook on electric systems or over a fire. Use solar or electric hot water.

Gas Pressure Loss

DISASTER TRIGGERS | Amenity Losses | Gas Loss | Gas Pressure Loss

The loss of mains gas to your home.

Causes	Symptoms	Affects (Object)	Effects (From)	Alternatives (To Using Gas)	May Trigger
• Loss of Labour Force • Pipe Destruction	• No Gas • Low Pressure	• Gas Stoves • Some Hot Water Systems • Some Air Conditioners	• Can't Cook • Can't Heat	• Gas Canisters • Electrical Stoves • Fire	• Explosions • Protests • Heating Loss • Cooking Loss

Prepper Solution
Use canister gas, cook on electric systems or over a fire. Use solar or electric hot water.

Sewage & Disposal Loss

Sewage Loss

The blockage of sewage pipes, drains and disposal systems.

Causes	Symptoms	Affects (Object)	Effects (From)	Alternatives (To Sewage Systems)	May Trigger
• Loss of Labour Force • Damaged Assets • Weather Events	• Toilet Blockage • Bad Smells • Waste Disposal in Yard	• Toilets • Water Disposal • Drains and Sinks	• Blocked Toilet • Bad Smells • Illnesses	• Dig a Hole • Portaloo • Camping Toilet	• Relocation • Unsanitary Conditions • Stench • Protests • Riots

Prepper Solution
Install a composting toilet or bury your waste.

Waste Disposal Loss

The halting of waste disposal services such as bin collection and recycling.

Causes	Symptoms	Affects (Object)	Effects (From)	Alternatives (To Waste Removal)	May Trigger
• Loss of Labour Force • No Fuel • Damaged Facilities	• Build up of waste in streets • Unsanitary conditions • Blocked streets • Proliferation of vermin	• Bins • Streets • Vermin Population • Illnesses	• Dumping of Rubbish • Living in Squalor	• Bury Rubbish • Use Biodegradable Items	• Unsanitary Conditions • Stench • Rubbish Dumping • Protests • Riots

Prepper Solution
Try not to generate waste, bury decomposable waste or recycle all items somewhere else.

Fuel Loss

Petrol (Gas) Loss

The lack of all forms of fuel for motor vehicles, planes and machinery.

Causes	Symptoms	Affects (Object)	Effects (From)	Alternatives (To Using Fuel)	May Trigger
• Peak Fuel • Lack of Fuel Imported • Mass Panic	• Fuel Stations Closed • Fuel Queues • Cars running out of fuel • Blocked Streets	• Cars • Buses • Trucks • Boats • Planes • Some Machinery	• No Transport • No Generators • No Food • No Shop Items	• Walk • Bike • Create Own Fuel • Electric Cars	• Protests • Riots • Food Hoarding • Violence • Crime

Prepper Solution
Use a vehicle that runs on a common fuel, no fuel (electric), fuel that can be stored years or a fuel which can be created at home.

Diesel Loss

The lack of all forms of fuel for motor vehicles, planes and machinery.

Causes	Symptoms	Affects (Object)	Effects (From)	Alternatives (To Using Fuel)	May Trigger
• Peak Fuel • Lack of Fuel Imported • Mass Panic	• Fuel Stations Closed • Fuel Queues • Cars running out of fuel • Blocked Streets	• Cars • Buses • Trucks • Boats • Planes • Some Machinery	• No Transport • No Generators • No Food • No Shop Items	• Walk • Bike • Create Own Fuel • Electric Cars	• Protests • Riots • Food Hoarding • Violence • Crime

Prepper Solution
Use a vehicle that runs on a common fuel, no fuel (electric), fuel that can be stored years or a fuel which can be created at home.

Oil Loss

The lack of all forms of fuel for motor vehicles, planes and machinery.

Causes	Symptoms	Affects (Object)	Effects (From)	Alternatives (To Using Fuel)	May Trigger
• Peak Fuel • Lack of Fuel Imported • Mass Panic	• Fuel Stations Closed • Fuel Queues • Cars running out of fuel • Blocked Streets	• Cars • Buses • Trucks • Boats • Planes • Some Machinery	• No Transport • No Generators • No Food • No Shop Items	• Walk • Bike • Create Own Fuel • Electric Cars	• Protests • Riots • Food Hoarding • Violence • Crime

Prepper Solution
Use a vehicle that runs on a common fuel, no fuel (electric), fuel that can be stored years or a fuel which can be created at home.

DISASTER TRIGGERS | Amenity Losses

Communication Loss

Phone Network Loss (Mobile Towers Only)

The loss of 2G, 3G, 4G, 4GX and 5G networks.

Causes	Symptoms	Affects (Object)	Effects (From)	Alternatives (To Mobiles)	May Trigger
• Network Damage • EMP • Solar Flare • CIA/FBI Safety Measure • Frequency Blocker	• No Reception	• Mobile Phones • Shop Wireless Payments	• Can't make calls • Can't receive calls • No Messages	• Two Way Radio • Own Network • HAM Radio • Local Internet (WiFi)	• Panic • Protests • Losing Direction

Prepper Solution
Use landline internet, HAM radio, CB radio, Local Messaging App or walkie-talkies instead.

Internet Loss (All Forms)

The loss of all forms of internet whether it's home cable, wifi or mobile internet.

Causes	Symptoms	Affects (Object)	Effects (From)	Alternatives (To Internet)	May Trigger
• Network Damage • Internet Censorship • Frequency Blocker	• No Connection	• Computers • Phones • Shops	• No News • No Data Acquisition	• Newspapers • Two Way Radio	• Panic • Protests

Prepper Solution
Predownload vital information while the internet is available. Or purchase my Prep Drive for a quick way to have offline prepper data.

Tv & Radio Signal Loss

The loss of airborne communication methods.

Causes	Symptoms	Affects (Object)	Effects (From)	Alternatives (To Tv / Radio)	May Trigger
• EMP • Solar Flare • Frequency Blocker	• Static	• Television • Radio	• No News • No Data Acquisition	• Newspapers	• Panic • Protests

Prepper Solution
Get your news via newspaper, internet and word of mouth instead.

GPS Loss

The loss of all navigation systems such as GPS, GNSS, GLONASS, BDS etc.

Causes	Symptoms	Affects (Object)	Effects (From)	Alternatives (To GPS's)	May Trigger
• Satellite Destruction • Solar Flare	• No Positional Data	• GPS Devices • Mobile Phones • Vehicle Navigation	• No Positional Location	• Printed Maps • Offline Maps	• Plane Crashes • Losing Direction

Prepper Solution
Swap to paper maps and dead reckoning for position acquisition if bugging out. See the NAVIGATION section for more information.

Magnetic Shift

The loss or major alteration of earth's magnetic fields.

Causes	Symptoms	Affects (Object)	Effects (From)	Alternatives (To Compasses)	May Trigger
• Pole Shift	• No Compass Movement • Wrong Compass	• Compasses • Electromagnetism	• Becoming Lost	• Printed Maps • Offline Maps • GPS	• Losing Direction

Prepper Solution
Swap to paper maps and dead reckoning for position acquisition.

Electronics Loss

Electronics Loss

The loss of all electronic devices with a CPU or transistor.

Causes	Symptoms	Affects (Object)	Effects (From)	Alternatives (To Electrical Equipment)	May Trigger
• EMP • Solar Flare	• Electronics Fail to Function	• All electronics with a cup or transistor not inside a faraday cage	• No Transport • No Computers • No Communication • No Navigation	• Varies	• Panic • No Transport

Prepper Solution
Learn to survive without technology.

Computer Loss

The loss of computers and computation devices controlling security systems, automatic doors, boom gates, health systems, road signs, venting fans etc.

Causes	Symptoms	Affects (Object)	Effects (From)	Alternatives (To Using Shops)	May Trigger
● Hacking Attack ● Virus ● EMP ● Solar Flare	● Closing of Retailers ● Blocked Entry ● Theft ● Inaccessible Areas	● Security Cameras ● POS Machines ● Central Air Conditioners ● Elevators ● Escalators ● Automatic Doors ● Health Systems ● Boom Gates ● Venting Fans	● No Withdrawals ● No Card Transactions ● The Use of Cash ● No Automation	● Stock Up ● Have Cash On Hand ● Have Barter Items	● Panic ● Bank Shutdowns ● Economic Crash ● Starvation ● Becoming Trapped

Prepper Solution
Have cash on hand and a supply of resources at home to outlast the disaster.

Major Server Loss

Modern computers that rely on constant contact with the internet are uncontactable.

Causes	Symptoms	Affects (Object)	Effects (From)	Alternatives (To Using ATMs or Shops)	May Trigger
● Hacking Attack ● Virus ● EMP ● Solar Flare	● Closing of Retailers ● Downed Websites ● Using Cash Only	● ATMs ● POS Machines ● Checkouts ● Online Shopping	● Few Withdrawals ● Few Card Transactions ● The Use of Cash ● No Automation	● Stock Up ● Have Cash On Hand ● Have Barter Items	● Panic ● Shop Closures ● Bank Shutdowns ● Economic Crash ● Starvation

Prepper Solution
Have cash on hand and a supply of resources at home to outlast the disaster.

Bank / Payment / ATM Loss

The loss of bank systems, payment facilities, ATMs and point of sale systems.

Causes	Symptoms	Affects (Object)	Effects (From)	Alternatives (To Using ATMs or Banks)	May Trigger
● Hacking Attack ● Virus ● EMP ● Solar Flare	● Closing of Retailers ● Using Cash Only ● Theft	● ATMs ● POS Machines ● Checkouts ● Online Shopping	● No Withdrawals ● No Card Transactions ● The Use of Cash ● No Automation	● Stock Up ● Have Cash On Hand ● Have Barter Items	● Panic ● Bank Shutdowns ● Economic Crash ● Starvation

Prepper Solution
Have cash, bullion and barter items (food, water, alcohol, medical supplies) on hand plus a supply of resources at home to outlast the disaster.

Retail Closures

Retail Closures

The mass closure of retailers, shops and businesses.

Causes	Symptoms	Affects (Object)	Effects (From)	Alternatives (To Using Shops)	May Trigger
● Weather Events ● Economy Causes ● Loss of Labour Force ● Mass Panic	● Closed Signs ● Low Stock ● High Prices	● Shops ● Retailers ● Consumers	● Can't Buy Resources ● Looting ● Riots	● Use Stored Supplies ● Barter ● Forage	● Panic ● Starvation ● Riots ● Violence

Prepper Solution
Have food and water stores stocked up to last the entire disaster.

Bank Closures

Bank closures country-wide.

Causes	Symptoms	Affects (Object)	Effects (From)	Alternatives (To Using Banks)	May Trigger
● Economic Crash ● National Debt ● Weak Dollar ● Hacking ● No Electricity ● Strikes	● Closure of Smaller Banks ● Economic Depression	● Banks ● People's Money	● Can't Pay Bills ● Can't Purchase Items	● Bartering	● Riots ● Foreclosure ● Homelessness

Prepper Solution
Stock up on bullion, barter items and withdraw money early.

3 Physical Losses

The loss or destruction of any form of physical asset such as buildings, bridges or roads.

Highway Parking Lot

The roads are severely blocked.

Causes	Symptoms	Affects (Object)	Effects (From)	Alternatives (To Continuing On)	May Trigger
● Panic ● Crashes	● News Headlines ● Mandatory Evacuations	● Highways ● Roads ● Transport	● Road Rage ● People Shortcutting	● Drive Home ● Abandon Car ● Bug In	● Death by Extreme Weather

Prepper Solution
Find an alternate route or return home.

Road Destruction / Blockage

Destruction or blockage of major roads.

Causes	Symptoms	Affects (Object)	Effects (From)	Alternatives (To Continuing On)	May Trigger
• Earthquakes • Collisions • Stopped Vehicles • Trees	• Road Debris • Major Disaster • Car Queues	• All Transport	• Empty Shelves • No Fuel • Can't Travel	• Return Home • Alternate Route	• Food Shortages • Shop Closures • Riots

Prepper Solution
Stock up on supplies or bug out early.

Building Destruction

Destruction of buildings such as shops and other people's homes are destroyed beyond simple repairs.

Causes	Symptoms	Affects (Object)	Effects (From)	Alternatives (To Staying Put)	May Trigger
• Weather Event • Fire • Riots	• Approaching Storm • News Headlines • Street Gangs / Looters	• Other Homes • Businesses • Shops • Bridges	• Riots • Thieves • Destruction	• Bug Out	• Panic • Riots • Lootings • Muggings

Prepper Solution
Bug out or bug in if your building is standing. Stock up on supplies.

Home Loss

Your home is destroyed beyond simple repairs.

Causes	Symptoms	Affects (Object)	Effects (From)	Alternatives (To Living in Ruins)	May Trigger
• Weather Event • Fire • Riots • Repossession • Bankruptcy	• Approaching Storm • Street Gangs / Looters	• House • Possessions	• No Shelter • Elements Exposure • Injury / Death • Possessions Loss	• Find New Shelter • Rebuilding • Salvage Home	• Homelessness • Weather Effects

Prepper Solution
Bug out to your shelter or friends home or live off the land and build your own shelter.

Job Loss

Any way you can lose your job.

Causes	Symptoms	Affects (Object)	Effects (From)	Alternatives (To Having a Job)	May Trigger
• Failing Economy • Business Cutbacks • Workplace Destroyed • Unethical Behaviour	• Economic Instability • Bad Work Ethic • Falling Profits • Falling Shares	• The Individual • Their Family • The Company	• Lack of Money • Depression	• Self-Sufficiency • Use Saved Money • Retirement	• Homelessness • Divorce

Prepper Solution
Keep a stockpile of funds at home and become more self-sufficient.

4 Societal Breakdown

Any form of societal breakdown which affects the running of the country.

Government Shutdown

The shutdown of the government and other systems.

Causes	Symptoms	Affects (Object)	Effects (From)	Alternatives (To Using a Government)	May Trigger
• Strikes • War • Invasion • Presidential Decree	• Chaos • Martial Law	• All Citizens	• No Gov. Pay • Monument Shutdown • Looting • Murders • Crime	• Custom Government • Citizen-maintained Resources • No Government	• Riots • Gang Violence • Protests • Violence

Prepper Solution
Protect your home and assets and start to develop a network for a street/suburb defence partnership.

Bank Shutdown

Banks failing or declaring bankruptcy.

DISASTER TRIGGERS | Societal Breakdown | Bank Shutdown

Causes	Symptoms	Affects (Object)	Effects (From)	Alternatives (To Using Banks)	May Trigger
• Panic • Bankruptcy • Mismanagement • Fraud	• Halted Withdrawals	• Bank Customers • Shareholders	• Violence • Crime • Money Withdrawals • Potential Starvation	• Cash • Bullion (Gold/Silver) • Barter	• Civil Unrest • Riots • Protests • Violence • Bank Runs • Bank Shutdown • Banking Panic

Prepper Solution
Store money and bullion at home as well as tradable items.

Bank Run

DISASTER TRIGGERS | Societal Breakdown | Bank Run

A large number of people withdrawing their money from a single bank at the same time.

Causes	Symptoms	Affects (Object)	Effects (From)	Alternatives (To Using Banks)	May Trigger
• Panic • Bank Closures • Bankruptcy • Lockdowns • Impending Crash	• Long Bank Lines • Bank Closure • Chaos at Banks	• Banks • Bank Customers • Shareholders • Economy	• Violence • Crime • Money Withdrawals • ATM Vandalism • Potential Starvation	• Cash • Bullion (Gold/Silver) • Barter	• Riots • Protests • Violence • Bank Shutdown • Banking Panic

Prepper Solution
Store money and bullion at home as well as tradable items.

Banking Panic

DISASTER TRIGGERS | Societal Breakdown | Banking Panic

A large number of people withdrawing their money from multiple banks at the same time.

Causes	Symptoms	Affects (Object)	Effects (From)	Alternatives (To Using Banks)	May Trigger
• Declining Economy • Bank Closures • Market Crashing	• Long Bank Lines • Bank Closures • Chaos at Banks	• Banks • Bank Customers • Shareholders • Economy	• Violence • Crime • Money Withdrawals • Economic Collapse • Economic Depression • ATM Vandalism • Potential Starvation	• Cash • Bullion (Gold/Silver) • Barter	• Riots • Protests • Violence • Bank Runs • Systematic Banking Crisis

Prepper Solution
Store money and bullion at home as well as tradable items.

Withdrawl Suspension

DISASTER TRIGGERS | Societal Breakdown | Withdrawl Suspension

Banks prevent consumers from withdrawing their money or they set a minimum bank balance requirement.

Causes	Symptoms	Affects (Object)	Effects (From)	Alternatives (To Using Cash)	May Trigger
• Bank/ATM Runs • Banking Panic • Economic Collapse	• Long Bank Lines • Bank Closures • Chaos	• Banks • Bank Customers • Shareholders	• Violence • Crime • Money Withdrawals • Economic Collapse • Economic Depression • ATM Vandalism • Potential Starvation	• Cash • Bullion (Gold/Silver) • Barter	• Riots • Protests • Violence • Systematic Banking Crisis

Prepper Solution
Divide your money up between cash, bullion and the rest split up between multiple banks.

Systematic Banking Crisis

DISASTER TRIGGERS | Societal Breakdown | Systematic Banking Crisis

Wipeout of almost all banking capital resulting in a chain of bankruptcies.

Causes	Symptoms	Affects (Object)	Effects (From)	Alternatives (To Using Cash)	May Trigger
• Declining Economy • Economic Collapse	• Long Bank Lines • Bank Closures • Chaos	• Banks • Bank Customers • Shareholders • National Economy	• Violence • Crime • Money Withdrawals • Economic Collapse • Economic Depression • ATM Vandalism • Potential Starvation	• Cash • Bullion (Gold/Silver) • Barter	• Riots • Protests • Violence • Bank Runs

Prepper Solution
Store money and bullion at home as well as tradable items.

Hyperinflation

ER TRIGGERS | wn | Crisis

The inflation of a fiat currency due to mismanagement of the money supply.

DISASTER TRIGGERS | Societal Breakdown | Systematic Banking

Causes	Symptoms	Affects (Object)	Effects (From)	Alternatives (To Money)	May Trigger
• Banking Mismanagement • Economic Collapse • Rapid Consumer Spending • Printing Money • COVID Spending	• Higher Prices • Rapidly Rising Prices • More Spending	• The Entire Nation • Those in Fiat Money	• Violence • Crime • Money Withdrawls • Worthless Currency • Banks Halt Trading • Money Spending • Great Depression	• Self Sufficiency • Use Bullion • Not Needing to Buy • Trading/Swapping	• Riots • Protests • Violence • Bank Runs • Rapid Spending

Prepper Solution
It's best to spend all the money you have while it's still worth something. Buy long life food, water and water purification filters, solar panels and anything that will help you live off the grid easier.

Military Shutdown

DISASTER TRIGGERS | Societal Breakdown | Military Shutdown

The shutdown of the military and defence systems.

Causes	Symptoms	Affects (Object)	Effects (From)	Alternatives (To the Military)	May Trigger
• Strikes • War • Lack of Funds • Government Shutdown • Coup	• Lack of Military • Closed Barracks	• Military Personnel • Government Workers	• Invasion • Chaos • Crime • Looting	• Personal Self Defence • Neighbourhood Watch/Defence	• Riots • Gangs • Violence • Invasion

Prepper Solution
Flee to the quietest corner of the country as soon as possible and ride out the disaster.

Police Shutdown

DISASTER TRIGGERS | Societal Breakdown | Police Shutdown

The shutdown or closure of police stations.

Causes	Symptoms	Affects (Object)	Effects (From)	Alternatives (To Relying on the Police)	May Trigger
• Strikes • Too Few Police • Fear • Government Shutdown	• Increased Crime • Lack of Police • Slower Response Times	• Police Officers • Criminals	• Chaos • Crime • Looting • Violence	• Personal Self Defence • Instant Justice • Neighbourhood Watch/Defence	• Unrest • Riots • Violence

Prepper Solution
Be your own security, use surveillance and be ready with weapons loaded.

Prison Shutdown

Prison Shutdown

DISASTER TRIGGERS | Societal Breakdown | Prison Shutdown | Prison Shutdown

The closure or abandonment of prisons.

Causes	Symptoms	Affects (Object)	Effects (From)	Alternatives (To Living Near a Prison)	May Trigger
• Government Shutdown • Strikes • Too Few Staff	• Failing Government • Strikes	• Prisons • Guards • Criminals • General Population	• Chaos • Crime • Looting • Violence • Murder	• Leave the Area	• Riots • Gangs • Violence • Unrest

Prepper Solution
Take a note of all the local prisons and ensure you don't live too close and avoid the areas as much as possible.

Prison Break

DISASTER TRIGGERS | Societal Breakdown | Prison Shutdown | Prison Break

The escaping or release of convicts from a prison before their time has been served.

Causes	Symptoms	Affects (Object)	Effects (From)	Alternatives (To Living Near a Prison)	May Trigger
• Lack of Staff • Pandemic • Overpopulation • Building Weaknesses	• News Coverage • People Walking Out • Surge in Crime	• Nearby Population • Crime Statistics	• Rising Crime Rate • Murders	• Leave the Area • Buy a Weapon • Start a neighborhood watch	• Riots • Gangs • Violence • Unrest • Surge in Crime

Prepper Solution
o

Train / Tram / Subway Shutdown

DISASTER TRIGGERS | Societal Breakdown | Train / Tram / Subway

The shutdown of commercial trains and subway systems.

Causes	Symptoms	Affects (Object)	Effects (From)	Alternatives (To Trams and Trains)	May Trigger
• No Electricity • Lack of Utilization • Damaged Rail System • Rail Blockage • Government Shutdown • Pandemic	• Locked Gates • Closed Signs • No Lights or Staff	• Commuters • Drivers	• Becoming Stuck • Can't Travel • Change of Plans	• Walking • Driving • Boat • Cycling • Flying	• Being Stuck • Becoming Lost • Can't Travel

Prepper Solution
Use alternative transport such as buses, taxis, cycling or walking.

Ferry / Boat Shutdown

The shutdown of the commercial ferry and boating systems.

Causes	Symptoms	Affects (Object)	Effects (From)	Alternatives (To Ferries and Boats)	May Trigger
● Strikes ● Lack of Utilization ● No Fuel ● Flooded Rivers / Lakes ● Government Shutdown ● Pandemic	● Locked Gates ● Closed Signs ● No Lights or Staff	● Commuters ● Boat Drivers	● Becoming Stuck ● Can't Travel ● Change of Plans	● Walking ● Driving ● Train ● Cycling ● Flying	● Being Stuck ● Becoming Lost ● Can't Travel

Prepper Solution
Use alternative transport such as buses, taxis, cycling or walking.

Airline Shutdown

The shutdown of commercial airlines.

Causes	Symptoms	Affects (Object)	Effects (From)	Alternatives (To Flying)	May Trigger
● Terrorist Threats ● Lack of Utilization ● Struggling Economy ● Finance Problems ● No Aircraft Fuel ● Pandemic ● No Electricity	● Locked Doors ● Closed Signs ● No Lights or Staff	● Commuters ● Pilots	● Becoming Stuck ● Can't Travel ● Change of Plans	● Walking ● Driving ● Train ● Cycling ● Boat	● Being Stuck ● Becoming Lost

Prepper Solution
Use alternative transport such as buses, taxis, cycling or walking.

Total Transport Shutdown

The shutdown of all modes of transport.

Causes	Symptoms	Affects (Object)	Effects (From)	Alternatives (To Transport)	May Trigger
● Economy Problems ● Pandemic ● Terrorist Threats ● No Electricity	● Locked Doors ● Closed Signs ● No Lights or Staff	● Everyone ● Commuters	● Becoming Stuck ● Can't Travel ● Change of Plans	● Walking ● Possibly Driving	● Being Stuck ● Becoming Lost

Prepper Solution
The only alternative is walking to where you need to go, however it's recommended that you avoid moving.

Supermarket Closure

The closure of supermarkets and other food stores.

Causes	Symptoms	Affects (Object)	Effects (From)	Alternatives (To Using Supermarkets)	May Trigger
● Lack of Food ● Blocked Highways ● Farmer Strike ● No Electricity	● Locked Doors ● Closed Signs ● No Lights or Staff	● Shoppers ● Employees ● Truck Drivers ● Farmers	● Can't Buy Food ● Can't Buy Items ● Can't Buy Supplies	● Foraging ● Gardening ● Bartering	● Starvation ● Illness

Prepper Solution
Have a stockpile of food and water in your home to last the entirety of the disaster.

Hospital Closure

The closure of hospitals which may include the transfer of patients.

Causes	Symptoms	Affects (Object)	Effects (From)	Alternatives (To Hospitals)	May Trigger
● Over-Occupation ● Widespread Disease ● Pandemic ● Lack of Staff ● Medical Hazards ● Infiltration ● Lack of Security ● Government Shutdown ● No Electricity	● Long Waiting Lines ● Closed Gates ● Keep Out Signs ● No Lights or Staff ● No Ambulances	● Hospitals ● Medical Supplies ● Ambulances	● Death ● Illness ● Disease	● Self Medication ● Veterinarian	● Riots ● Pandemic

Prepper Solution
Know first aid and other medical procedures and have a stockpile of medicine and first aid kits.

School / TAFE / College Shutdown

The closure of schools.

Causes	Symptoms	Affects (Object)	Effects (From)	Alternatives (To Learn With)	May Trigger
● Weather Disaster ● Fear ● Pandemic ● Threats ● Shootings ● Lack of Students	● Locked Gates ● Keep Out Signs ● No Lights or Staff	● Students ● Teachers	● Unable to Learn ● Loss of Teacher Jobs ● Less Intelligence	● Home Study ● Not Studying	● Riots

Prepper Solution
Home-schooling kids or self taught learning from books and the internet.

5 Suspended Rights

Any inalienable rights which you should be entitled to as a human, which have been suspended or removed.

Freedom of Speech

A principle that supports the freedom of an individual or a community to articulate their opinions and ideas without fear of retaliation, censorship, or sanction.

Causes	Symptoms	Affects (Object)	Effects (From)	Alternatives	May Trigger
• Increased Power • Political Correctness • Keep Truth Secret	• Censorship • Blocked Content	• Internet • Speeches	• New Laws • Internet Censorship	• Don't Speak Out • Meet in Person • Find Other Ways	• Riots • Violence • Civil Unrest

Prepper Solution
Download all the information you can while it's available and speak your mind when you have the chance.

Right of Grievance

The right to publicly show disapproval in the form of gatherings, strikes and petitions.

Causes	Symptoms	Affects (Object)	Effects (From)	Alternatives	May Trigger
• Past Grievances • Unrest at Events	• Strikes • Unrest • Riots	• Businesses • Employees • Payments	• Curfew • Ban on Strikes	• Quitting Your Job • Boycotting	• Riots • Violence • Destruction

Prepper Solution
Try to lay low and avoid standing out. Avoid use of systems where the strikes are occurring.

Right to Bear Arms

The right to possess a gun for your own defence.

Causes	Symptoms	Affects (Object)	Effects (From)	Alternatives	May Trigger
• Shootings • Law Change • New Leader	• Continual Shootings • Riots • Protests • News Announcements • Gun Shop Closures	• Weapons Bearers • Guns • Ammo	• New Gun Laws • Gun Hoarding • Violence • Riots	• Bows • Crossbows • Slingshots • Other Weapons • No Weapons	• Riots • Violence

Prepper Solution
Storing guns and ammo for future use, adapting to the new laws or building your own guns and ammo.

Martial Law

The imposition of direct military control of normal civilian functions of government, especially in response to a temporary emergency such as invasion or major disaster.

Causes	Symptoms	Affects (Object)	Effects (From)	Alternatives	May Trigger
• Weather Events • Invasion • War • Military Coup	• Notification of Suspension • Riots	• All Citizens	• Possible Curfew • Civil Law Suspension • Civil Rights Suspension • Application of Military Justice on Citizens	• Comply • Rebel • Revolt	• Riots • Violence

Prepper Solution
As a prepper you will generally want to stay under the radar and inside your house.

Right to Information

The closing of schools and the withholding or censorship of knowledge.

Causes	Symptoms	Affects (Object)	Effects (From)	Alternatives	May Trigger
• New Leader • Leaked Information • To Withhold Power • High Intelligence Levels	• Closing of Schools • Internet Censorship • Book Burning	• Kids/Students • Internet • Books	• Decreased Knowledge • Internet Censorship	• Information Hoarding • Reading • Data Swapping • Knowledge Swapping • The Dark Web	• Riots • Violence • Dumber Generations

Prepper Solution
Educating yourself is the optimal solution to ensure your education is up to standards.

Right to Truth

Access to information such as news, weather, and worldwide events without them being altered in any way by higher authorities.

DISASTER TRIG	Suspended R	Right to Truth							
				Causes ● Making Money ● Power ● Avoiding Panic ● False Racism	**Symptoms** ● Lying Media ● Conflicting News ● Lack of News ● No News ● Book Burning	**Affects (Object)** ● Entire Population	**Effects (From)** ● We Become Pawns ● They Gain Power ● They Gain Money ● Mind Control	**Alternatives** ● Alternate News Outlets ● Don't Read News ● Research News Yourself ● Read the Bible	**May Trigger** ● Revolts ● Revolution ● Riots ● Destruction
				Prepper Solution We have to keep in mind that what we read may not be the complete truth and that there are objectives behind most news articles.					

Mass Destruction

Disasters that could end life on entire continents or earth completely

"We will not prematurely or unnecessarily risk the costs of worldwide nuclear war in which even the fruits of victory would be ashes in our mouth."
John F. Kennedy

Introduction

This section contains scenarios for mass destruction and are based around world altering or world destroying scenarios that can affect an entire continent such as huge meteors or supervolcanos. If you're looking for general information on wars, see the MAN-MADE DISASTERS category.

Purpose	The aim of MASS DESTRUCTION is to list plausible scenarios which can end life on entire continents or end life of earth completely. It also includes information on rebuilding society if one of these events does occur.
Lost?	• For a list of (non-world ending) natural disasters, see NATURAL DISASTERS. • For a list of (non-world ending) man-made disasters, see MAN-MADE DISASTERS. • For the weapons which are likely to cause this level of destruction, see WARFARE. • For a distraction from the current turmoil of the world, see the ENTERTAINMENT section. • If you're struggling with a chaotic world and can't see the good in it, see the RELIGION > Christianity section. • For a list of triggers which could cause a global war, see DISASTER TRIGGERS.

Contents

1 Natural Events

These are the natural events that could end life on an entire continent or the entire planet as opposed to regular natural disasters which generally only occur in a specific region.

Supervolcano

A supervolcano is a large volcano that has had an eruption of magnitude 8, which is the largest value on the Volcanic Explosivity Index (VEI). This means the volume of deposits for that eruption is greater than 1,000 cubic kilometres (240 cubic miles).

Supervolcanoes occur when magma in the mantle rises into the crust but is unable to break through it and pressure builds in a large and growing magma pool until the crust is unable to contain the pressure. This can occur at hotspots (for example, Yellowstone Caldera) or at subduction zones (for example, Toba). Large-volume supervolcanic eruptions are also often associated with large igneous provinces, which can cover huge areas with lava and volcanic ash. These can cause long-lasting climate change (such as the triggering of a small ice age) and threaten species with extinction. The Oruanui eruption of New Zealand's Taupo Volcano was the world's most recent VEI-8 eruption.

Known Supervolcanos
- Yellowstone (U.S.)
- Mount Vesuvius (Italy)
- Popocatepetl (Mexico)
- Sukurajima (Japan)
- Galeras (Colombia)
- Mount Marapi (Indonesia)
- Mount Nyiragongo (Kongo)
- Ulawun (Papua New Guinea)
- Taal (Phillipines)
- Mauna Loa (Hawaii)

See the NATURAL DISASTERS > Volcano section for more information on volcanos.

Megaquake

A megaquake is an earthquake with a magnitude of 9.0 or higher. These cause extreme damage and can be felt half way around the globe.

Megathrust Earthquake

Megathrust earthquakes occur at subduction zones at destructive convergent plate boundaries, where one tectonic plate is forced underneath another, caused by slip along the thrust fault that forms the contact between them. These interplate earthquakes are the planet's most powerful, with moment magnitudes (Mw) that can exceed 9.0. Since 1900, all earthquakes of magnitude 9.0 or greater have been megathrust earthquakes. No other type of tectonic activity of terrestrial origin has produced earthquakes of this scale.

Biblical Earthquakes

There's four colossal earthquakes found in the Bible which are still yet future. They start at about magnitude 8.5 and goes up to one that shakes the entire planet causing every mountain to crumble. They are found in the: 6th Seal, 7th Seal, 7th Trumpet and the 7th Bowl. The 7th Bowl is the one which shakes the entire planet. Watch out out for them, and if they happen, read Revelation.

Cataclysmic Pole Shift

The Cataclysmic Pole Shift Hypothesis is a claim that proposes a rapid and dramatic change in the Earth's geographic poles – meaning the physical North and South Poles where the planet's axis of rotation meets its surface.

Unlike a geomagnetic reversal (where only the magnetic poles swap), this hypothesis suggests the Earth's entire solid outer layer (the lithosphere, comprising the crust and upper mantle) somehow slips or shifts dramatically over the molten liquid outer core. This shift is proposed to happen very quickly, over days, weeks, or at most a few centuries, as opposed to the geological timescales of millions of years observed for accepted "true polar wander" (a very slow, continuous reorientation of the Earth's axis).

Consequences

Catastrophic Consequences Envisioned
If such a rapid shift were to occur, the imagined consequences are indeed cataclysmic:

● Massive Earthquakes and Volcanic Eruptions: The sudden displacement of the crust would cause unimaginable tectonic stress, leading to earthquakes of unprecedented magnitude and widespread volcanic activity.
● Gigantic Tsunamis: As continents are abruptly moved through the oceans, colossal tsunamis would be generated, potentially hundreds or thousands of meters high, inundating vast coastal and even inland areas.
● Radical Climate Change: Regions would instantly find themselves at vastly different latitudes. Tropical areas could be plunged into polar cold, and polar regions could move into the tropics, causing immediate and widespread devastation to ecosystems and life that cannot adapt fast enough.
● Global Flooding: Beyond tsunamis, proponents often suggest widespread global flooding as oceans are displaced.

2 War Events

This section focuses on war related events and nuclear weapons that could end life on a massive scale. Such as EMPs, Neutron Bombs and Radiation.

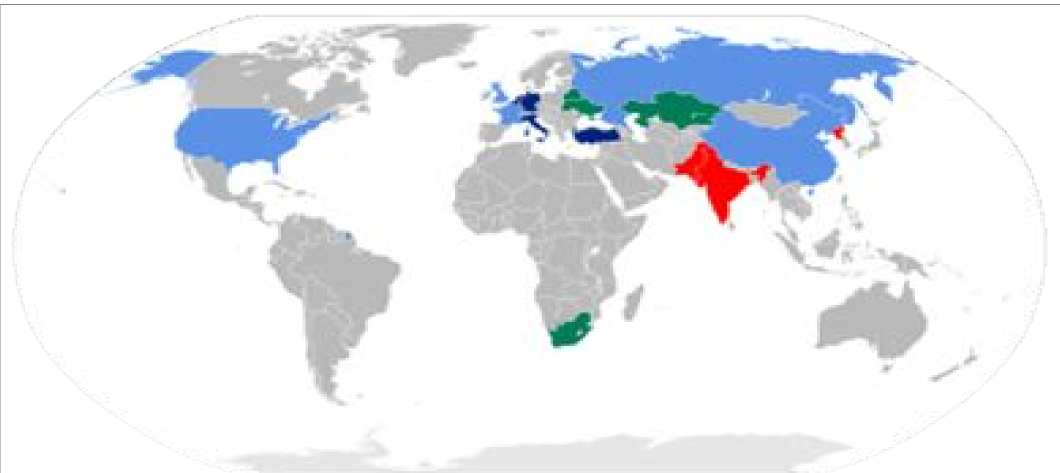
Subheadings

		1. Nuclear Weapons	**2. Neutron Bomb**	**3. EMP**	**4. Radiation**		

1 Nuclear Weapons

Any form of nuclear weapons which can destroy vast regions and render them uninhabitable. The Tsar Bomba is the largest bomb ever made and detonated in 1961. It contained 57 megatons of TNT.

Nuclear Country Map
A map of the nuclear countries around the world. Best utilized for looking for new places to live.



Map Legend	**Light Blue** NPT-designated nuclear weapon states (China, France, Russia, United Kingdom, United States)		**Red** Other states with nuclear weapons (India, North Korea, Pakistan)		**Yellow** Other states presumed to have nuclear weapons (Israel)		**Navy Blue** NATO member nuclear weapons sharing states (Belgium, Germany, Italy, Netherlands, Turkey)		**Green** States formerly possessing nuclear weapons (Belarus, Kazakhstan, South Africa, Ukraine)		
Warhead Count 2021[n]	**United States** 6,185	**Russia** 6,490	**United Kingdom** 215	**France** 280	**China** 320	**India** 170+	**Pakistan** 160	**North Korea** 40	**Israel** 90		

Nuclear Types

These are the types of nuclear weapons and nuclear particles.

A-Bombs	Fission (A-Bombs) are the most basic nuclear weapon and are incorporated into the other weapon classes. This bomb's power comes from splitting heavy nuclei (plutonium and uranium) with neutrons; as the uranium or plutonium split each atom releases great amounts of energy - and more neutrons. The daughter neutrons cause an extremely fast nuclear chain reaction. Fission bombs are the only type of nuclear bomb used in war so far. This is the most likely type of bomb to be used by terrorists.
H-Bombs	Fusion (H-Bombs), using the incredible heat of a fission bomb 'spark plug', compress and heat deuterium and tritium which fuse, releasing immense amounts of energy. Also known as thermonuclear weapons since high temperatures are required to fuse deuterium and tritium; such weapons are usually many hundreds of times more powerful than the bombs that destroyed Nagasaki and Hiroshima. The bulk of the US and Russian strategic arsenal are these types of bombs.
Alpha Particles	These are the weakest and, during an attack, are virtually non-existent as a threat. Alpha particles will survive for only a couple inches in the air before they are absorbed by the atmosphere. They possess a minuscule threat from the exterior, however, they will be fatal if ingested or inhaled. Standard clothing will help protect you from Alpha particles.
Beta Particles	These are faster than Alpha particles and can penetrate further. They will travel for up to 10 meters (10 yards) before they are absorbed into the atmosphere. Exposure to beta particles is not fatal unless exposed for prolonged periods; which may cause "Beta burns," almost like painful sunburn. They pose a serious threat, however, to the eyes, should they be exposed for a prolonged period. Once again this is harmful if ingested or inhaled, and clothing will help prevent Beta burns.
Gamma Rays	Gamma rays are the deadliest. They can travel for nearly a mile in the air and penetrate just about any kind of shielding. Therefore gamma radiation will cause severe damage to the internal organs even as an external source. Sufficient shielding will be required. A shelter's PF against radiation will tell you how many times less a person inside the shelter will receive radiation compared to open space. For example, RPF 300 means that you will receive 300 times less radiation in the shelter than in the open.
Exposure	Avoid exposure to Gamma radiation. Try not to spend more than 5 minutes exposed. If you are in a rural area, try finding a cave, or a fallen log into which you can crawl. Otherwise just dig a trench to lie in, with stacked earth around you.

Nuclear Damage Examples

These are the damage radii for the different components of surface blast nuclear explosions including the damage and the distance the resulting radiation fallout can travel.

Blast Damage Descriptions

Radiation	500 rem radiation dose; without medical treatment, there can be expected between 50% and 90% mortality from acute effects alone. Dying takes between several hours and several weeks.
Fireball	Maximum size of the nuclear fireball; relevance to lived effects depends on height of detonation. If it touches the ground, the amount of radioactive fallout is significantly increased.
Air Blast 20psi	At 20 psi overpressure, heavily built concrete buildings are severely damaged or demolished; fatalities approach 100%. Often used as a standard benchmark for heavy damage in cities.
Air Blast 5psi	At 5 psi overpressure, most residential buildings collapse, injuries are universal, fatalities are widespread. Often used as a standard benchmark for medium damage in cities.
Air Blast 1psi	At a around 1 psi overpressure, glass windows can be expected to break. This can cause many injuries in a surrounding population who comes to a window after seeing the flash of a nuclear explosion (which travels faster than the pressure wave). Often used as a standard benchmark for light damage in cities.
Thermal Radiation	Third degree burns extend throughout the layers of skin, and are often painless because they destroy the pain nerves. They can cause severe scarring or disablement, and can require amputation. 100% probability for 3rd degree burns at this yield is 9.5 cal/cm2.
1000 Rads/h	Estimated total-dose fallout contours- for a surface burst (52% fission) with a 24.14km/h (15 mph) (4 Beaufort Scale) wind.

10 Rads/h	Estimated total-dose fallout contours- for a surface burst (52% fission) with a 24.14km/h (15 mph) (4 Beaufort Scale) wind.
1 Rads/h	Estimated total-dose fallout contours- for a surface burst (52% fission) with a 24.14km/h (15 mph) (4 Beaufort Scale) wind.

Nuclear Blast Protection (Within the damage zone of the explosion)

Blast Energy Distribution **Blast:** 40-50% **Thermal Radiation:** 30-50% **Ionizing Radiation:** 5% **Residual Radiation:** 5-10%	**Hydrodynamic Front** The thin, dense shell consisting of high temperatures and radiation which cause gas to move outward radially. The front acts like a piston that pushes against and compresses the surrounding medium to make a spherically expanding shock wave.	**Reinforce** If time permits, build up the bunker using as many dense materials on every wall as possible to reduce the levels of radiation.	If you're within the blast radiation radius or potential radiation range (factoring wind) - stay inside for 2 days absolute minimum.	**Blast Wave** **Static Overpressure:** The sharp increase in pressure exerted by the shock wave. **Dynamic Pressures:** drag exerted by the blast winds required to form the blast wave. These winds push, tumble and tear objects.

Radiation Exposure
If you believe you're in a radiation zone or will be exposed to radiation you should take a Potassium Iodide pill every 24 hours to saturate your thyroid gland. See the "Radiation" section below for more details.

2 Neutron Bomb

A neutron bomb is a low yield thermonuclear weapon designed to maximize lethal neutron radiation in the immediate vicinity of the blast while minimizing the physical power of the blast itself. This kills the living proteins in the area while leaving the real estate untouched, useful if the invader wants to move in to the existing structures afterwards. The neutron release generated by a nuclear fusion reaction is intentionally allowed to escape the weapon, rather than being absorbed by its other components. The neutron burst, which is used as the primary destructive action of the warhead, is able to penetrate enemy armour more effectively than a conventional warhead, thus making it more lethal as a tactical weapon.

Concept
In a standard thermonuclear design, a small fission bomb is placed close to a larger mass of thermonuclear fuel. The two components are then placed within a thick radiation case, usually made from uranium, lead or steel. The case traps the energy from the fission bomb for a brief period, allowing it to heat and compress the main thermonuclear fuel. The case is normally made of depleted uranium or natural uranium metal, because the thermonuclear reactions give off massive numbers of high-energy neutrons that can cause fission reactions in the casing material. These can add considerable energy to the reaction; in a typical design as much as 50% of the total energy comes from fission events in the casing. For this reason, these weapons are technically known as fission-fusion-fission designs.

Use
Neutron bombs are purposely designed with explosive yields lower than other nuclear weapons. Since neutrons are scattered and absorbed by air, neutron radiation effects drop off rapidly with distance in air. As such, there is a sharper distinction, relative to thermal effects, between areas of high lethality and areas with minimal radiation doses. All high yield (more than c. 10 kiloton) nuclear bombs, such as the extreme example of a device that derived 97% of its energy from fusion, the 50 megaton Tsar Bomba, are not able to radiate sufficient neutrons beyond their lethal blast range when detonated as a surface burst or low altitude air burst and so are no longer classified as neutron bombs, thus limiting the yield of neutron bombs to a maximum of about 10 kilotons. The intense pulse of high-energy neutrons generated by a neutron bomb is the principal killing mechanism, not the fallout, heat or blast. Although neutron bombs are commonly believed to "leave the infrastructure intact", with current designs that have explosive yields in the low kiloton range, detonation in (or above) a built-up area would still cause a sizable degree of building destruction, through blast and heat effects out to a moderate radius, albeit considerably less destruction, than when compared to a standard nuclear bomb of the exact same total energy release or "yield".

Effects

Upon detonation, a near-ground airburst of a 1 kiloton neutron bomb would produce a large blast wave and a powerful pulse of both thermal radiation and ionizing radiation, and non-ionizing radiation in the form of fast (14.1 MeV) neutrons. The thermal pulse would cause third degree burns to unprotected skin out to approximately 500 meters. The blast would create pressures of at least 4.6 psi out to a radius of 600 meters, which would severely damage all non-reinforced concrete structures. At the conventional effective combat range against modern main battle tanks and armoured personnel carriers (< 690–900 m), the blast from a 1 kt neutron bomb would destroy or damage to the point of nonusability almost all un-reinforced civilian buildings. Using neutron bombs to stop an enemy armoured attack by rapidly incapacitating crews with a dose of 8000+ rads of radiation would require exploding large numbers of them to blanket the enemy forces, destroying all normal civilian buildings within c. 600 meters of the immediate area. Neutron activation from the explosions could make many building materials in the city radioactive, such as zinc coated steel/galvanized steel (see area denial use below).

Because liquid-filled objects like the human body are resistant to gross overpressure, the 4–5 psi blast overpressure would cause very few direct casualties at a range of c. 600 m. The powerful winds produced by this overpressure, however, could throw bodies into objects or throw debris at high velocity, including window glass, both with potentially lethal results. Casualties would be highly variable depending on surroundings, including potential building collapses. The pulse of neutron radiation would cause immediate and permanent incapacitation to unprotected outdoor humans in the open out to 900 meters, with death occurring in one or two days. The median lethal dose (LD50) of 600 rads would extend to between 1350 and 1400 meters for those unprotected and outdoors, where approximately half of those exposed would die of radiation sickness after several weeks. A human residing within, or simply shielded by, at least one concrete building with walls and ceilings 30 cm (12 in) thick, or alternatively of damp soil 24 inches thick, would receive a neutron radiation exposure reduced by a factor of 10. Even near ground zero, basement sheltering or buildings with similar radiation shielding characteristics would drastically reduce the radiation dose. Furthermore, the neutron absorption spectrum of air is disputed by some authorities, and depends in part on absorption by hydrogen from water vapour. Thus, absorption might vary exponentially with humidity, making neutron bombs far more deadly in desert climates than in humid ones.

3 EMP

A nuclear electromagnetic pulse is a burst of electromagnetic radiation created by nuclear explosions. The resulting rapidly changing electric and magnetic fields may couple with electrical and electronic systems to produce damaging current and voltage surges. The specific characteristics of any particular nuclear EMP event vary according to a number of factors, the most important of which is the altitude of the detonation.

HEMP	In military terminology, a nuclear warhead detonated tens to hundreds of kilometres above the Earth's surface is known as a high-altitude electromagnetic pulse (HEMP) device. Effects of a HEMP device depend on factors including the altitude of the detonation, energy yield, gamma ray output, interactions with the Earth's magnetic field and electromagnetic shielding of targets.

Characteristics - E1	The E1 pulse is the very fast component of nuclear EMP. E1 is a very brief but intense electromagnetic field that induces very high voltages in electrical conductors. E1 causes most of its damage by causing electrical breakdown voltages to be exceeded. E1 can destroy computers and communications equipment and it changes too quickly (nanoseconds) for ordinary surge protectors to provide effective protection against it, although there are special fast-acting surge protectors (such as those using TVS diodes) that will block the E1 pulse. E1 is produced when gamma radiation from the nuclear detonation ionizes (strips electrons from) atoms in the upper atmosphere. This is known as the Compton effect and the resulting current is called the "Compton current". The electrons travel in a generally downward direction at relativistic speeds (more than 90 percent of the speed of light).
Characteristics - E2	The E2 component is generated by scattered gamma rays and inelastic gammas produced by neutrons. This E2 component is an "intermediate time" pulse that, by the IEC definition, lasts from about 1 microsecond to 1 second after the explosion. E2 has many similarities to lightning, although lightning-induced E2 may be considerably larger than a nuclear E2. Because of the similarities and the widespread use of lightning protection technology, E2 is generally considered to be the easiest to protect against.
Characteristics - E3	E3 is a very slow pulse, lasting tens to hundreds of seconds. It is caused by the nuclear detonation's temporary distortion of the Earth's magnetic field. Like a geomagnetic storm, E3 can produce geomagnetically induced currents in long electrical conductors, damaging components such as power line transformers. Because of the similarity between solar-induced geomagnetic storms and nuclear E3, it has become common to refer to solar-induced geomagnetic storms as "Solar EMP." "Solar EMP," however, does not include an E1 or E2 component.

Effects

Nuclear EMP Effects
An energetic EMP can temporarily upset or permanently damage electronic equipment by generating high voltage and high current surges; semiconductor components are particularly at risk. The effects of damage can range from imperceptible to the eye, to devices being literally blown apart. Cables, even if short, can act as antennas to transmit pulse energy to equipment.

Starfish Prime Example
1.44 megaton bomb detonated 400 kilometres (250 mi) above the mid-Pacific Ocean. It caused electrical damage in Hawaii, about 1,445 kilometres (898 mi) away from the detonation point, knocking out about 300 streetlights. A 10 kiloton bomb can easily be 40% as powerful as the 1.44 megaton Starfish Prime at producing EMP.

Below are the effects of an EMP.

Range	The pulse can easily span continent-sized areas, and this radiation can affect systems on land, sea, and air. A large device detonated at 400–500 km (250 to 312 miles) over Kansas would affect all of the continental U.S. The signal from such an event extends to the visual horizon as seen from the burst point.
Cars	An EMP would probably not affect most cars, despite modern cars' heavy use of electronics, because cars' electronic circuits and cabling are likely too short to be affected. In addition, cars' metallic frames provide some protection. However, even a small percentage of cars breaking down due to an electronic malfunction could cause traffic jams.
Humans & Animals	Although large amounts of voltage can get accumulated in electrical conductors after an EMP, it will generally not flow out into human or animal bodies, and thus contact is safe.
Small Electronics	An EMP has a smaller effect, the shorter the length of an electrical conductor; though other factors affect the vulnerability of electronics as well, so there is no one cutoff length that determines whether some piece of equipment will survive. However, small electronic devices, such as wristwatches and cell phones, would most likely withstand an EMP.
Effectiveness	Factors that control weapon effectiveness include altitude, yield, construction details, target distance, intervening geographical features, and local strength of the Earth's magnetic field.

Radar Blackout
Nuclear blackout, also known as fireball blackout or radar blackout, is an effect caused by explosions of nuclear weapons that disturbs radio communications and causes radar systems to be blacked out or heavily refracted so they can no longer be used for accurate tracking and guidance. Within the atmosphere, the effect is caused by the large volume of ionized air created by the energy of the explosion, while above the atmosphere it is due to the action of high-energy beta particles released from the decaying bomb debris. At high altitudes, the effect can spread over large areas, hundreds of kilometres. The effect slowly fades as the fireball dissipates.

Blackout is a special concern in missile defence systems, where the effect can be used to defeat ground based radars by producing large opaque areas behind which approaching warheads cannot be seen. Depending on the reaction time of the interceptors, this may render them useless as the approaching warheads re-appear too late for the interceptor to develop a track and fire its missile.

Protection

A Faraday cage or Faraday shield is an enclosure used to block electromagnetic fields. A Faraday shield may be formed by a continuous covering of conductive material or in the case of a Faraday cage, by a mesh of such materials. A Faraday cage operates because an external electrical field causes the electric charges within the cage's conducting material to be distributed such that they cancel the field's effect in the cage's interior. This phenomenon is used to protect sensitive electronic equipment from external radio frequency interference (RFI). Faraday cages are also used to enclose devices that produce RFI, such as radio transmitters, to prevent their radio waves from interfering with other nearby equipment.

Faraday cages cannot block stable or slowly varying magnetic fields, such as the Earth's magnetic field (a compass will still work inside). A common misconception is that a Faraday cage provides full blockage or attenuation; this is not true. The reception or transmission of radio waves, a form of electromagnetic radiation, to or from an antenna within a Faraday cage is heavily attenuated or blocked by the cage, however, a Faraday cage has varied attenuation depending on wave form, frequency or distance from receiver/transmitter, and receiver/transmitter power.

4 Radiation

Measuring Radioactivity
Ionizing radiation can be measured using units of electron volts, ergs, and joules. The electron-volt (abbreviated eV) is a unit of energy associated with moving electrons around.

Measuring Dose
Placing your body near a radioactive source results in exposure. To evaluate the hazard from this exposure one must compute the absorbed dose. This is defined as the energy imparted to a defined mass of tissue. Dose is generally not uniform over the body. A radioactive substance can be selectively taken up by different organs or tissue.

Radiation doses are often calculated in the units of rad (short for radiation absorbed dose). One rad is 100 ergs/gram, in other words, 100 ergs of energy absorbed by one gram of a given body tissue. An erg is one-ten-millionth of a joule. One hundred rad equals one Joule/kilogram (J/kg), which also equals one Gray (Gy), the standard international unit for measuring radiation dose.

Geiger Counter
Geiger counters are used to detect radioactive emissions, most commonly beta particles and gamma rays. Radioactivity can be measured in order to discover the amount of radiation a material emits or the amount of radiation absorbed by a human or mammal.

Geiger Counter Measurement
The unit for measuring radioactive emissions is the **Becquerel (Bq)**. The Bq indicates the number of decays per second. The **roentgen** equivalent in man (rem) is an older standardized unit for measuring absorbed dose. The **mrem**, 1000th of that unit, is the unit used today in medicine.

Radiation Measurements

Rem (Roentgen Equivalent Man) Dose Equivalent	A unit of equivalent absorbed dose of radiation which takes into account the relative biological effectiveness of different forms of ionizing radiation. Rem Dose = Rad Dose x Quality (Q) Millirem (mrem) - 1/1000 **Beta/Gamma Rads:** Q = 1, Q1 Means: 1 Rem = 1 Rad **Alpha Radiation:** Q = 20, Rems equal 20 times rads. **Neutrons:** Q = 10. **Equivalent:** rem = rad x Q
Sievert (Sv) Dose Equivalent	A unit of equivalent absorbed dose equal to 100 rem. **nanosievert (nSv)** - one thousand millionth of a sievert (1/1,000,000,000) **microsievert (µSv)** - one millionth of a sievert (1/1,000,000) **millisievert (mSv)** - one thousandth of a sievert (1/1,000) **Equivalent:** 1 Sv = 100 rem Sv = Gy x Q
Rad (Radiation Absorbed Dose) Absorbed Dose	A unit of absorbed dose of radiation. Rad is a measure of the amount of energy deposited in tissue. **Equivalent:** 1 rad = 100 erg/gram
Gray (Gy) Absorbed Dose	A unit of absorbed radiation dose equal to 100 rad. Gray is a measure of deposition of energy in tissue. **nanogray (nGy)** - one thousand millionth of a gray (1/1,000,000,000) **microgray (µGy)** - one millionth of a gray (1/1,000,000) **milligray (mGy)** - one thousandth of a gray (1/1,000) **Equivalent:** 1 Gy = 100 rad
Curies (Ci) Radioactivity	(Succeeded by Bq) The traditional unit of radioactivity, equal to the radioactivity of one gram of pure radium-226. **Equivalent:** 1 Ci = 37 billion dps = 37 billion Bq
Becquerels (Bq) Radioactivity	The standard international unit of radioactivity equal to one disintegration per second. **Equivalent:** 1 Bq = 27 pCi
Disintegrations Per Second (dps)	The number of subatomic particles (e.g. alpha particles) or photons (gamma rays) released from the nucleus of a given atom over one second. One dps = 60 dpm (disintegrations per minute). **Equivalent:** 1 dps = 1 Bq
Coulomb/kilogram (C/kg) Exposure	A SI derived unit of exposure to ionizing radiation equal to the amount of gamma or x-rays required to produce ions in an element of air resulting in a charge of one Coulomb per one kilogram of that element under standard conditions.
Roentgen (r) Exposure	The roentgen (symbol R) or röntgen (in German) is a legacy unit to measure radiation exposure. It was defined as the quantity of x-rays that produce 2.580 × 10-4 coulombs of charge collected per unit mass (kilograms) of air at standard temperature and pressure (STP): 1 R = 0.000258 coulombs per kilogram (Ckg-1) of air.

Nuclear Radiation Prevention

These are different methods of reducing radiation exposure.

Time	The longer that humans are subjected to radiation the larger the dose will be. The advice in the nuclear war manual entitled "Nuclear War Survival Skills" published by Cresson Kearny in the U.S. was that if one needed to leave the shelter then this should be done as rapidly as possible to minimize exposure.
Distance	Increasing distance from the radiation source reduces the dose according to the inverse-square law for a point source. Distance can sometimes be effectively increased by means as simple as handling a source with forceps rather than fingers.
Shielding	Matter attenuates radiation in most cases, so placing any mass (e.g., lead, dirt, sandbags, vehicles) between humans and the source will reduce the radiation dose. This is not always the case, however; care should be taken when constructing shielding for a specific purpose.
Reduction	Where radioactive contamination is present, a gas mask, dust mask, or good hygiene practices may offer protection, depending on the nature of the contaminant.
Tablets	Potassium iodide (KI) tablets can reduce the risk of cancer in some situations due to slower uptake of ambient radioiodine. Although this does not protect any organ other than the thyroid gland, their effectiveness is still highly dependent on the time of ingestion which would protect the gland for the duration of a twenty-four-hour period. They do not prevent acute radiation syndrome as they provide no shielding from other environmental radionuclides.
Fractation of Dose	If an intentional dose is broken up into a number of smaller doses, with time allowed for recovery between irradiations, the same total dose causes less cell death. Even without interruptions, a reduction in dose rate below 0.1 Gy/h also tends to reduce cell death. This technique is routinely used in radiotherapy.
Reinforcements	Begin reinforcing your shelter from the inside by stacking dirt around the walls or anything else you can find. If in a trench, then create a roof, but only if materials are nearby; don't expose yourself when not necessary. Canvas from a parachute or tent will help stop fallout debris from piling on you, though it will not stop Gamma rays. It is impossible, at a very fundamental physical level, to completely shield from all radiation. It can only be reduced to a tolerable level.

Radiation Reductions	**These Elements Reduce Radiation Penetration to 1/1000** **Steel:** 21 cm (0.7 feet) **Rock:** 90 cm (3 ft) **Concrete:** 66 cm (2.2 ft) **Wood:** 2.6 m (8.8 ft) **Soil:** 1 m (3.3 ft) **Ice:** 2 m (6.6 ft) **Snow:** 6 m (20-22 ft)
Tablets	**Potassium iodide (KI)** Take 1 IOSat tablet every 24 hours radiation is nearby.
Effective Dose	The probability of a harmful effect from radiation exposure depends on what part or parts of the body are exposed. Some organs are more sensitive to radiation than others. A tissue weighting factor (WT) is used to take this into account. When an equivalent dose to an organ is multiplied by the tissue weighting factor for that organ the result is the effective dose to that organ. The unit of effective dose is the sievert (Sv). **(Use weighting underneath)**
Tissue Weighting Factor	**Bone-marrow (red), colon, lung, stomach, breast, remaining tissues** (0.12,0.72) **Gonads** (0.08,0.08) **Bladder, oesophagus, liver, thyroid** (0.04,0.16) **Bone surface, brain, salivary glands, skin** (0.01,0.04)
Shelter Duration	Shelter for an absolute minimum of 28 hours (2 days) as most of the iodine will have decayed at that point. The reason for this is to avoid the "fission products" created by a nuclear blast. The most deadly of these is radioactive iodine. Iodine has a half life of 8 days - therefore 8 days shelter is recommended.
Clothing	Wear all clothing (hats, gloves, goggles, closed sleeve shirt, etc.), especially when outside to help prevent Beta burns. Decontaminate by shaking your clothes constantly and washing, with water, any exposed skin; settled residue will eventually cause burns.

Radiation Facts

Ionizing Radiation
Ionizing radiation is the high-energy radiation that causes most of the concerns about radiation exposure during military service. Ionizing radiation contains enough energy to remove an electron (ionize) from an atom or molecule and to damage DNA in cells.

Ionizing Sources
1. Nuclear Weapons
2. Radioactive Material
3. Calibration and Measurement Sources
4. X-rays
5. Space

Non-iodizing Radiation
Low-energy radiation that includes radiation from sources such as sunlight, microwaves, radio frequencies, radar and sonar.

Ground bursts start with a much higher initial radiation level because the materials destroyed and vaporized are mixed with the bomb debris. Another key contributor to this initial high level of radiation is the secondary activation of radiation caused by direct neutron interaction with these debris.

Radiation Diseases
- All cancers
- Non-malignant thyroid nodular disease
- Parathyroid adenoma
- Posterior subcapsular cataracts
- Tumors of the brain and central nervous system

Radiation 7/10 Rule
Every seven-fold increase in time reduces the radiation by a factor of 10.
7 hours - 1/10th.
49 Hours (2d) - 1/100th.
14 Weeks - 1/10,000th.

Never look at a nuclear weapon exploding as it will blind you. Based on the nuclear kt detonation of the explosion you want to get far away from the max distance radiation can travel.

Half-Life
- Iodine 131 - 8 Days
- Caesium 134 - 2Y
- Caesium 137 - 7Y
- Ruthenium 103 - 39 Days
- Ruthenium 106 - 1Y

Half-Life
- Strontium 90 - 30Y
- Plutonium 239 - 100Y
- Uranium 234 - 247k/Y
- Uranium 235 - 710m/Y
- Uranium 238 - 4.5b/y

Radiation Lethality Dose
Rads < 100: Typically produce no immediate symptoms other than blood changes.
Rads 100-200: Delivered to the entire body in less than a day may cause acute radiation syndrome, (ARS) but is usually not fatal.
Rads 200-1000: Delivered in a few hours will cause serious illness with poor outlook at the upper end of the range.
Rads > 1000: Whole body doses are almost invariably fatal.
See the MEDICAL section for more information.

3 Space Events

These are events of mass destruction that originate from space.

Solar Flare

A solar flare is a sudden flash of increased Sun's brightness, usually observed near its surface. Flares are often, but not always, accompanied by a coronal mass ejection. Even the most powerful flares are barely detectable in the total solar irradiance (the "solar constant"). Solar flares occur in a power-law spectrum of magnitudes; an energy release of typically 1020 joules of energy suffices to produce a clearly observable event, while a major event can emit up to 1025 joules. Flares are closely associated with the ejection of plasmas and particles through the Sun's corona into outer space; flares also copiously emit radio waves.

If the ejection is in the direction of the Earth, particles associated with this disturbance can penetrate into the upper atmosphere (the ionosphere) and cause bright auroras, and may even disrupt long range radio communication. It usually takes days for the solar plasma ejecta to reach Earth. Flares also occur on other stars, where the term stellar flare applies. High-energy particles, which may be relativistic, can arrive almost simultaneously with the electromagnetic radiations.

On July 23, 2012, a massive, potentially damaging, solar storm (solar flare, coronal mass ejection and electromagnetic radiation) barely missed Earth. According to NASA, there may be as much as a 12% chance of a similar event occurring between 2012 and 2022.

Solar flares affect all layers of the solar atmosphere (photosphere, chromosphere, and corona). The plasma medium is heated to tens of millions of kelvins, while electrons, protons, and heavier ions are accelerated to near the speed of light. Flares produce electromagnetic radiation across the electromagnetic spectrum at all wavelengths, from radio waves to gamma rays. Most of the energy is spread over frequencies outside the visual range and so the majority of the flares are not visible to the naked eye and must be observed with special instruments. Flares occur in active regions around sunspots, where intense magnetic fields penetrate the photosphere to link the corona to the solar interior. Flares are powered by the sudden (timescales of minutes to tens of minutes) release of magnetic energy stored in the corona. The same energy releases may produce coronal mass ejections (CMEs), although the relationship between CMEs and flares is still not well understood.

X-rays and UV radiation emitted by solar flares can affect Earth's ionosphere and disrupt long-range radio communications. Direct radio emission at decimetric wavelengths may disturb the operation of radars and other devices that use those frequencies. Solar flares were first observed on the Sun by Richard Christopher Carrington and independently by Richard Hodgson in 1859 as localized visible brightenings of small areas within a sunspot group. Stellar flares can be inferred by looking at the lightcurves produced from the telescope or satellite data of variety of other stars. The frequency of occurrence of solar flares varies, from several per day when the Sun is particularly "active" to less than one every week when the Sun is "quiet", following the 11-year cycle (the solar cycle). Large flares are less frequent than smaller ones.

Cause
Flares occur when accelerated charged particles, mainly electrons, interact with the plasma medium. Evidence suggests that the phenomenon of magnetic reconnection leads to this copious acceleration of charged particles. On the Sun, magnetic reconnection may happen on solar arcades – a series of closely occurring loops following magnetic lines of force. These lines of force quickly reconnect into a lower arcade of loops leaving a helix of magnetic field unconnected to the rest of the arcade. The sudden release of energy in this reconnection is the origin of the particle acceleration. The unconnected magnetic helical field and the material that it contains may violently expand outwards forming a coronal mass ejection.

This also explains why solar flares typically erupt from active regions on the Sun where magnetic fields are much stronger. Although there is a general agreement on the source of a flare's energy, the mechanisms involved are still not well understood. It is not clear how the magnetic energy is transformed into the kinetic energy of the particles, nor is it known how some particles can be accelerated to the GeV range (109 electron volt) and beyond. There are also some inconsistencies regarding the total number of accelerated particles, which sometimes seems to be greater than the total number in the coronal loop. Scientists are unable to forecast flares.

Measurement
The classification system for solar flares uses the letters A, B, C, M or X, according to the peak flux in watts per square metre. (W/m2) Each letter represents a 10-fold increase in energy output. So an X is ten times an M and 100 times a C. Within each letter class there is a finer scale from 1 to 9.

Classifications
Peak Flux Range at 100-800 picometre (watts/square metre)
A - < 10^−7
B - 10^−7 – 10^−6
C - 10^−6 – 10^−5
M - 10^−5 – 10^−4
X - > 10^−4

Effects	**A, B, C Class Flares** C-class and smaller flares are too weak to noticeably affect Earth.	**M Class Flares** Can produce minor radio disruptions.	**X Class Flares** Can overload the power grid causing widespread blackouts.	

Hazards
Solar flares strongly influence the local space weather in the vicinity of the Earth. They can produce streams of highly energetic particles in the solar wind or stellar wind, known as a solar proton event. These particles can impact the Earth's magnetosphere (see main article at geomagnetic storm), and present radiation hazards to spacecraft and astronauts. Additionally, massive solar flares are sometimes accompanied by coronal mass ejections (CMEs) which can trigger geomagnetic storms that have been known to disable satellites and knock out terrestrial electric power grids for extended periods of time.

The soft X-ray flux of X class flares increases the ionization of the upper atmosphere, which can interfere with short-wave radio communication and can heat the outer atmosphere and thus increase the drag on low orbiting satellites, leading to orbital decay. Energetic particles in the magnetosphere contribute to the aurora borealis and aurora australis. Energy in the form of hard x-rays can be damaging to spacecraft electronics and are generally the result of large plasma ejection in the upper chromosphere.

The radiation risks posed by solar flares are a major concern in discussions of a manned mission to Mars, the Moon, or other planets. Energetic protons can pass through the human body, causing biochemical damage, presenting a hazard to astronauts during interplanetary travel. Some kind of physical or magnetic shielding would be required to protect the astronauts. Most proton storms take at least two hours from the time of visual detection to reach Earth's orbit. A solar flare on January 20, 2005 released the highest concentration of protons ever directly measured, giving astronauts as little as 15 minutes to reach shelter.

Geomagnetic Storm Impacts

While geomagnetic storms don't affect human health, these events can affect power grids, communication devices and satellite operations and pose threats to any astronauts currently living in space. To that end, NOAA has developed a 5-level scale, ranging from G1 to G5, to rate any incoming geomagnetic activity, giving a crucial way to quantify the expected impacts.

G1 - Minor	G1 storms may trigger weak power grid fluctuations and have some minor impacts on satellite operations. But it means a good show of the Northern Lights up in Canada and Alaska. NOAA estimates G1 conditions may be in effect for 900 days per 11-year (roughly 4,000-day) solar cycle.
G2 - Moderate	NOAA suggests high-latitude power systems may experience voltage alarms while long-duration G2 storms may cause transformer damage. HF radio propagation may also fade at higher latitudes. Views of the Northern Lights eke down into the far northern reaches of the United States. These G2 conditions are around on average for about 360 days of the 11-year solar cycle.
G3 - Strong	Once storm levels reach G3, intermittent satellite navigation and low-frequency radio navigation problems may occur, and HF radio may be intermittent, NOAA says. Voltage corrections may be needed on power systems, and false alarms may be triggered on some protection devices. According to NOAA, the Northern Lights can reach as far south as Washington and Oregon, and Illinois with this kind of storm activity. Forecasters say these conditions may be observed on average about 130 days per 11-year solar cycle.

G4 - Severe	Power system administrators may be feeling like their hands are getting full as there could be widespread voltage control issues. Satellite and space operations may see surface charging and tracking issues. Satellite navigation could be degraded for hours, HF radio propagation would be sporadic, and low-frequency radio navigation could be disrupted. On the literal bright side, the Northern Lights may be seen as far south as Alabama and Northern California! Forecasters estimate these conditions occur on about 60 days total over any given 11-year solar cycle.
G5 - Extreme	Luckily, storm levels of this magnitude are relatively rare. Still, when they occur, power systems may see widespread voltage control problems and some grid systems may experience complete collapse or blackouts, and transformers may suffer damage. Pipeline currents could reach hundreds of amps, HF radio propagation may be impossible in many areas for 1-2 days, and satellite navigation may be degraded for days as well, NOAA says. But if the skies are clear, a brilliant and intense display of the Northern Lights may reach as far south as Florida and Texas. These kinds of strong geomagnetic conditions may only appear around four days per 11-year solar cycle.

Observations

Flares produce radiation across the electromagnetic spectrum, although with different intensity. They are not very intense in visible light, but they can be very bright at particular atomic lines. They normally produce bremsstrahlung in X-rays and synchrotron radiation in radio.

Optical Observations
Richard Carrington observed a flare for the first time on 1 September 1859 projecting the image produced by an optical telescope through a broad-band filter. It was an extraordinarily intense white light flare. Since flares produce copious amounts of radiation at Hα, adding a narrow (≈1 Å) passband filter centered at this wavelength to the optical telescope, allows the observation of not very bright flares with small telescopes. For years Hα was the main, if not the only, source of information about solar flares. Other passband filters are also used.

Radio Observations
During World War II, on February 25 and 26, 1942, British radar operators observed radiation that Stanley Hey interpreted as solar emission. Their discovery did not go public until the end of the conflict. The same year Southworth also observed the Sun in radio, but as with Hey, his observations were only known after 1945. In 1943 Grote Reber was the first to report radioastronomical observations of the Sun at 160 MHz. The fast development of radioastronomy revealed new peculiarities of the solar activity like storms and bursts related to the flares. Today ground-based radiotelescopes observe the Sun from c. 15 MHz up to 400 GHz.

Space Telescopes
Since the beginning of space exploration, telescopes have been sent to space, where they work at wavelengths shorter than UV, which are completely absorbed by the atmosphere, and where flares may be very bright. Since the 1970s, the GOES series of satellites observe the Sun in soft X-rays, and their observations became the standard measure of flares, diminishing the importance of the Hα classification. Hard X-rays were observed by many different instruments, the most important today being the Reuven Ramaty High Energy Solar Spectroscopic Imager (RHESSI).

Prediction
Current methods of flare prediction are problematic, and there is no certain indication that an active region on the Sun will produce a flare. However, many properties of sunspots and active regions correlate with flaring. For example, magnetically complex regions (based on line-of-sight magnetic field) called delta spots produce the largest flares. A simple scheme of sunspot classification due to McIntosh, or related to fractal complexity is commonly used as a starting point for flare prediction. Predictions are usually stated in terms of probabilities for occurrence of flares above M or X GOES class within 24 or 48 hours. The U.S. National Oceanic and Atmospheric Administration (NOAA) issues forecasts of this kind.

Gamma-Ray Burst

In gamma-ray astronomy, gamma-ray bursts (GRBs) are extremely energetic explosions that have been observed in distant galaxies. They are the brightest electromagnetic events known to occur in the universe. Bursts can last from ten milliseconds to several hours. After an initial flash of gamma rays, a longer-lived "afterglow" is usually emitted at longer wavelengths (X-ray, ultraviolet, optical, infrared, microwave and radio). The sources of most GRBs are billions of light years away from Earth, implying that the explosions are both extremely energetic (a typical burst releases as much energy in a few seconds as the Sun will in its entire 10-billion-year lifetime) and extremely rare (a few per galaxy per million years). The intense radiation of most observed GRBs is thought to be released during a supernova or superluminous supernova as a high-mass star implodes to form a neutron star or a black hole. A subclass of GRBs (the "short" bursts) appear to originate from the merger of binary neutron stars.

The cause of the precursor burst observed in some of these short events may be the development of a resonance between the crust and core of such stars as a result of the massive tidal forces experienced in the seconds leading up to their collision, causing the entire crust of the star to shatter. The sources of most GRBs are billions of light years away from Earth, implying that the explosions are both extremely energetic (a typical burst releases as much energy in a few seconds as the Sun will in its entire 10-billion-year lifetime) and extremely rare (a few per galaxy per million years).

All observed GRBs have originated from outside the Milky Way galaxy, although a related class of phenomena, soft gamma repeater flares, are associated with magnetars within the Milky Way. It has been hypothesized that a gamma-ray burst in the Milky Way, pointing directly towards the Earth, could cause a mass extinction event. GRBs were first detected in 1967 by the Vela satellites, which had been designed to detect covert nuclear weapons tests; this was declassified and published in 1973.

Following their discovery, hundreds of theoretical models were proposed to explain these bursts, such as collisions between comets and neutron stars. Little information was available to verify these models until the 1997 detection of the first X-ray and optical afterglows and direct measurement of their redshifts using optical spectroscopy, and thus their distances and energy outputs. These discoveries, and subsequent studies of the galaxies and supernovae associated with the bursts, clarified the distance and luminosity of GRBs, definitively placing them in distant galaxies.

Timing

Short Gamma-Ray Bursts
Events with a duration of less than about two seconds are classified as short gamma-ray bursts. These account for about 30% of gamma-ray bursts, but until 2005, no afterglow had been successfully detected from any short event and little was known about their origins. Since then, several dozen short gamma-ray burst afterglows have been detected and localized, several of which are associated with regions of little or no star formation, such as large elliptical galaxies and the central regions of large galaxy clusters. This rules out a link to massive stars, confirming that short events are physically distinct from long events. In addition, there has been no association with supernovae. The true nature of these objects was initially unknown, and the leading hypothesis was that they originated from the mergers of binary neutron stars or a neutron star with a black hole. Such mergers were theorized to produce kilonovae, and evidence for a kilonova associated with GRB 130603B was seen.

Long Gamma-Ray Bursts
Most observed events (70%) have a duration of greater than two seconds and are classified as long gamma-ray bursts. Because these events constitute the majority of the population and because they tend to have the brightest afterglows, they have been observed in much greater detail than their short counterparts. Almost every well-studied long gamma-ray burst has been linked to a galaxy with rapid star formation, and in many cases to a core-collapse supernova as well, unambiguously associating long GRBs with the deaths of massive stars. Long GRB afterglow observations, at high redshift, are also consistent with the GRB having originated in star-forming regions.

Ultra-Long Gamma-Ray Bursts
These events are at the tail end of the long GRB duration distribution, lasting more than 10,000 seconds. They have been proposed to form a separate class, caused by the collapse of a blue supergiant star, a tidal disruption event or a new-born magnetar. Only a small number have been identified to date, their primary characteristic being their gamma ray emission duration. The most studied ultra-long events include GRB 101225A and GRB 111209A. The low detection rate may be a result of low sensitivity of current detectors to long-duration events, rather than a reflection of their true frequency. A 2013 study, on the other hand, shows that the existing evidence for a separate ultra-long GRB population with a new type of progenitor is inconclusive, and further multi-wavelength observations are needed to draw a firmer conclusion.

Rate of Occurrence
Gamma ray bursts can have harmful or destructive effects on life. Considering the universe as a whole, the safest environments for life similar to that on Earth are the lowest density regions in the outskirts of large galaxies. Our knowledge of galaxy types and their distribution suggests that life as we know it can only exist in about 10% of all galaxies. Furthermore, galaxies with a redshift, z, higher than 0.5 are unsuitable for life as we know it, because of their higher rate of GRBs and their stellar compactness. All GRBs observed to date have occurred well outside the Milky Way galaxy and have been harmless to Earth. However, if a GRB were to occur within the Milky Way and its emission were beamed straight towards Earth, the effects could be harmful and potentially devastating for the ecosystems. Currently, orbiting satellites detect on average approximately one GRB per day. The closest observed GRB as of March 2014 was GRB 980425, located 40 megaparsecs (130,000,000 ly) away (z=0.0085) in an SBc-type dwarf galaxy. GRB 980425 was far less energetic than the average GRB and was associated with the Type Ib supernova SN 1998bw. Estimating the exact rate at which GRBs occur is difficult; for a galaxy of approximately the same size as the Milky Way, estimates of the expected rate (for long-duration GRBs) can range from one burst every 10,000 years, to one burst every 1,000,000 years. Only a small percentage of these would be beamed towards Earth. Estimates of rate of occurrence of short-duration GRBs are even more uncertain because of the unknown degree of collimation, but are probably comparable.

Energetics and Beaming

Gamma-ray bursts are very bright as observed from Earth despite their typically immense distances. An average long GRB has a bolometric flux comparable to a bright star of our galaxy despite a distance of billions of light years (compared to a few tens of light years for most visible stars). Most of this energy is released in gamma rays, although some GRBs have extremely luminous optical counterparts as well. GRB 080319B, for example, was accompanied by an optical counterpart that peaked at a visible magnitude of 5.8, comparable to that of the dimmest naked-eye stars despite the burst's distance of 7.5 billion light years. This combination of brightness and distance implies an extremely energetic source.

Assuming the gamma-ray explosion to be spherical, the energy output of GRB 080319B would be within a factor of two of the rest-mass energy of the Sun (the energy which would be released were the Sun to be converted entirely into radiation). Gamma-ray bursts are thought to be highly focused explosions, with most of the explosion energy collimated into a narrow jet. The approximate angular width of the jet (that is, the degree of spread of the beam) can be estimated directly by observing the achromatic "jet breaks" in afterglow light curves: a time after which the slowly decaying afterglow begins to fade rapidly as the jet slows and can no longer beam its radiation as effectively.
Observations suggest significant variation in the jet angle from between 2 and 20 degrees. Because their energy is strongly focused, the gamma rays emitted by most bursts are expected to miss the Earth and never be detected. When a gamma-ray burst is pointed towards Earth, the focusing of its energy along a relatively narrow beam causes the burst to appear much brighter than it would have been were its energy emitted spherically. When this effect is taken into account, typical gamma-ray bursts are observed to have a true energy release of about 1044 J, or about 1/2000 of a Solar mass (M⊙) energy equivalent—which is still many times the mass-energy equivalent of the Earth (about 5.5 × 1041 J).

This is comparable to the energy released in a bright type Ib/c supernova and within the range of theoretical models. Very bright supernovae have been observed to accompany several of the nearest GRBs. Additional support for focusing of the output of GRBs has come from observations of strong asymmetries in the spectra of nearby type Ic supernova and from radio observations taken long after bursts when their jets are no longer relativistic.

Effects on Earth

Earth's atmosphere is very effective at absorbing high energy electromagnetic radiation such as x-rays and gamma rays, so these types of radiation would not reach any dangerous levels at the surface during the burst event itself. The immediate effect on life on Earth from a GRB within a few parsecs would only be a short increase in ultraviolet radiation at ground level, lasting from less than a second to tens of seconds. This ultraviolet radiation could potentially reach dangerous levels depending on the exact nature and distance of the burst, but it seems unlikely to be able to cause a global catastrophe for life on Earth. The long-term effects from a nearby burst are more dangerous. Gamma rays cause chemical reactions in the atmosphere involving oxygen and nitrogen molecules, creating first nitrogen oxide then nitrogen dioxide gas. The nitrogen oxides cause dangerous effects on three levels.

First, they deplete ozone, with models showing a possible global reduction of 25-35%, with as much as 75% in certain locations, an effect that would last for years. This reduction is enough to cause a dangerously elevated UV index at the surface. Secondly, the nitrogen oxides cause photochemical smog, which darkens the sky and blocks out parts of the sunlight spectrum. This would affect photosynthesis, but models show only about a 1% reduction of the total sunlight spectrum, lasting a few years. Thirdly, the elevated nitrogen levels in the atmosphere would wash out and produce nitric acid rain. Nitric acid is toxic to a variety of organisms, including amphibian life, but models show that it cannot reach levels that would cause a serious global effect.

The nitrates might in fact be of benefit to some plants. All in all, a GRB within a few parsecs, with its energy directed towards Earth, will mostly damage life by raising the UV levels during the burst itself and for a few years thereafter. Models show that the destructive effects of this increase can cause up to 16 times the normal levels of DNA damage. In its worst form, a GRB will instantly evaporate anyone alive it comes into contact with and due to its distant origin by the time it reaches earth the divergence would likely encompass a whole side of it.

GRB Candidates
No gamma-ray bursts from within our own galaxy, the Milky Way, have been observed, and the question of whether one has ever occurred remains unresolved. In light of evolving understanding of gamma-ray bursts and their progenitors, the scientific literature records a growing number of local, past, and future GRB candidates. Long duration GRBs are related to superluminous supernovae, or hypernovae, and most luminous blue variables (LBVs), and rapidly spinning Wolf–Rayet stars are thought to end their life cycles in core-collapse supernovae with an associated long-duration GRB. Knowledge of GRBs, however, is from metal-poor galaxies of former epochs of the universe's evolution, and it is impossible to directly extrapolate to encompass more evolved galaxies and stellar environments with a higher metallicity, such as the Milky Way.

WR 104: A nearby GRB candidate
A Wolf–Rayet star in WR 104, about 8,000 light-years (2,500 pc) away, is considered a nearby GRB candidate that could have destructive effects on terrestrial life. It is expected to explode in a core-collapse-supernova at some point within the next 500,000 years and it is possible that this explosion will create a GRB. If that happens, there is a small chance that Earth will be in the path of its gamma ray jet.

Meteor/NEO

Disambiguation
How to tell the different space phenomenon apart.

Asteroid	A relatively small, inactive, rocky body orbiting the Sun.
Comet	A relatively small, at times active, object whose ices can vaporize in sunlight forming an atmosphere (coma) of dust and gas and, sometimes, a tail of dust and/or gas.
Meteoroid	A small particle from a comet or asteroid orbiting the Sun.
Meteor	The light phenomena which results when a meteoroid enters the Earth's atmosphere and vaporizes; a shooting star.

Meteorite	A meteoroid that survives its passage through the Earth's atmosphere and lands upon the Earth's surface.

Comet Size and Frequency

Impactor Diameter	Kinetic Energy at Atmospheric Entry	Kinetic Energy at Impact	Crater Diameter	Frequency (Years)
100m (330 ft)	47 Mt	3.8 Mt	1.2 km (0.75 mi)	5,200
130m (430 ft)	103 Mt	31.4 Mt	2 km (1.2 mi)	11,000
150m (490 ft)	159 Mt	71.5 Mt	2.4 km (1.5 mi)	16,000
200m (660 ft)	376 Mt	261 Mt	3 km (1.9 mi)	36,000
250m (820 ft)	734 Mt	598 Mt	3.8 km (2.4 mi)	59,000
300m (980 ft)	1,270 Mt	1,110 Mt	4.6 km (2.9 mi)	73,000
400m (1,300 ft)	3,010 Mt	2,800 Mt	6 km (3.7 mi)	100,000
700m (2,300 ft)	16,100 Mt	15,700 Mt	10 km (6.2 mi)	190,000
1,000m (3,300 ft)	47,000 Mt	46,300 Mt	13.6 km (8.5 mi)	440,000

Collision Effects

Assuming the colliding body is at least 1km+ diameter. Initial impact creates a vast fireball that kills anyone who can see it. Ejecta - material hurled into the air from the impact blasts into space and showers a large area--half of the world, perhaps--with flaming debris. The sky becomes filled with millions of small meteors, a shower of particles that burn up in the atmosphere on their way down. It is as if the sky itself has caught fire. The heat unleashed by this rain of incandescent debris ignites forests and cities, burning them to embers.

Then dust from the impact and smoke from the fires girdles the earth, plunging our planet into a so-called impact winter. Sunlight completely disappears for a month or so after a collision with a one-kilometre object; a 10-kilometer object might block out the sun for a year or more. Temperatures drop, and there is no light for photosynthesis. Plants die, animals die. Animals that happen to live underground, where roots and other food sources are not destroyed, have a relatively good chance of survival.

During the impact it unleashes billions of tons of sulphur-laden dust. The heat of the impact also creates nitrogen oxides. The sulphurous stuff and nitrogen oxides make a corrosive acid rain that strips bare any surviving vegetation. The acid rain runs into the oceans and kills marine organisms, especially along the continental shelves. Nitrogen oxides and debris tossed into the stratosphere by the initial blast would destroy the ozone layer within days. The impact and subsequent fires also release a tremendous amount of carbon dioxide into the atmosphere.

Asteroid Composition

An asteroid's composition is mainly determined by how close it is to the Sun. The asteroids that are nearest the Sun are mostly made of carbon, with smaller amounts of nitrogen, hydrogen and oxygen, while the ones further away are made up of silicate rock. Silicates are very common on Earth and in the Solar System. They are made up of oxygen and silicon, the number one and number two most abundant elements in the Earth's crust. The metallic asteroids are composed of up to 80% iron and 20% a mixture of nickel, iridium, palladium, platinum, gold, magnesium and other precious metals such as osmium, ruthenium and rhodium. There are a few that are made up of half silicate and half metallic.

The platinum group metals are some of the most rare and useful elements on Earth. According to Planetary Resources, a company that hopes to mine asteroids in space, those metals exist in such high concentrations on asteroids that a single 500-meter platinum-rich asteroid can contain more platinum group metals than have ever been mined on Earth throughout human history. Other minerals have been found on asteroids that have been visited by our spacecraft. For example, the Hayabusa spacecraft landed on Itokawa, a spud-shaped, near-Earth asteroid, and found it consists mainly of the minerals olivine and pyroxene, a mineral composition similar to a class of stony meteorites that have pelted Earth in the past.

In addition to the metals, the elements to create water are present in asteroids and there are indications that asteroids contain water or ice in their interiors, and there's even evidence that water may have flowed on the surface of at least one asteroid. Observations of Vesta from the Dawn mission show gullies that may have been carved by water. The theory is that when a smaller asteroid or comet slams into a bigger asteroid, the small asteroid or comet could release a layer of ice in the bigger asteroid.

The force of the impact briefly turned the ice into water, which flowed across the surface, creating the gullies. But asteroids may have changed over time. It is also thought that chemical reactions over the millennia or more recent impacts they may have endured also effects the composition of asteroids. Some experienced high temperatures after they formed and partly melted, with iron sinking to the centre and forcing basaltic (volcanic) lava to the surface. Only one such asteroid, Vesta, is known to have this type of surface.

Facts

- Every day, Earth is bombarded with more than 100 tons of dust and sand-sized particles.
- About once a year, an automobile-sized asteroid hits Earth's atmosphere, creates an impressive fireball, and burns up before reaching the surface.
- Every 2,000 years or so, a meteoroid the size of a football field hits Earth and causes significant damage to the area.
- Only once every few million years, an object large enough to threaten Earth's civilization comes along. Impact craters on Earth, the moon and other planetary bodies are evidence of these occurrences.
- Space rocks smaller than about 25 meters (about 82 feet) will most likely burn up as they enter the Earth's atmosphere and cause little or no damage.
- If a rocky meteoroid larger than 25 meters but smaller than one kilometre (a little more than 1/2 mile) were to hit Earth, it would likely cause local damage to the impact area.
- We believe anything larger than one to two kilometres (one kilometre is a little more than one-half mile) could have worldwide effects. At 5.4 kilometres in diameter, the largest known potentially hazardous asteroid is Toutatis.

Meteor/Comet Size Effects

These are the likely effects that a meteor or comet strike would have on the planet based on their size.

Meteor Size	Damage	Damage Description
<30m	No Damage	Airburst in upper atmosphere, no significant ground damage.
30m-100m	Airburst	Airburst in lower atmosphere, causes damage similar to nuclear bomb blast above ground. Over ocean, no damage.
100m-1km	Regional	Surface impact, on land, makes crater a couple to a couple of tens of km across. In the sea, raises a tsunami that can cause shoreline damage one to a few thousand km distance from the impact point.
1km-10km	Global	An impact into land or sea may raise enough dust into the stratosphere to cause global climatic catastrophe, leading to mass starvation, disease and general disruption of social order.
10km+	Extinction	Possible mass extinction, certainly to some species and possibly humans.

4 Lifeform Events

These are any forms of other life which try to eliminate humanity.

Artificial Intelligence

The rise and attempted take-over of artificial intelligence will ignite a war between humans and machines. See the WARFARE > Electronic Warfare section for details on types of AI technology and robots.

AI Home Invasion

An invasion of privacy in your home by a trusted insider such as a smart assistant.

Protecting Yourself

Human Controlled Uprising

A controlled uprising is the take-over of robots or artificial intelligence with a human behind them.

Conscious Uprising

A conscious uprising is the take-over of artificial intelligence who went rogue which have no controlling human force behind them. A movie example would be "I, Robot" or "The Matrix".

Disabling/Destroying AI

Modern Weapons

Guns are useful in most wars as the componentry of the robots can be shattered by bullets which should render them useless.

EMP

An imp is likely the best defence we have against the machines which will destroy their transistors.

Fluctuating-Pole Pulse
Modulates the general magnetic field to have a greater effect on electrons in surrounding conductive material.

Single-Pole Pulse

Explosively Pumped (EPFCG)
Uses a directed explosion to "force" the magnetic field in a linear direction.

See the ELECTRICITY section for details on building an EMP device.

Solar Flares

The only other method of strong defence against AI is a naturally occurring solar flare. Solar flares may be able to destroy AI, but flares are randomly timed and their strengths are often so weak they don't affect earth.

Power Removal

Power Source
A popular way to render AI helpless is to cut off their power supply in whatever form that would be. They are likely to find alternative sources immediately or have already been looking if their primary source is knocked out. Just make sure they don't turn to a 'human' source if you cut off their access to a power source.

Power Dependencies
- Solar
- Wind/Water
- Chemical
- Heat
- Nuclear
- Humans (The Matrix)

Extraterrestrial Life

Extraterrestrial life is hypothetical life which may occur outside Earth and which did not originate on Earth. Such life might range from simple prokaryotes (or comparable life forms) to intelligent beings and even sapient beings, possibly bringing forth civilizations which might be far more advanced than humanity. The science of extraterrestrial life in all its forms is known as astrobiology. Since the mid-20th century, active ongoing research has taken place to look for signs of extraterrestrial life. This encompasses a search for current and historic extraterrestrial life, and a narrower search for extraterrestrial intelligent life. Depending on the category of search, methods range from the analysis of telescope and specimen data to radios used to detect and send communication signals.

The concept of extraterrestrial life, and particularly extraterrestrial intelligence, has had a major cultural impact, chiefly in works of science fiction. Over the years, science fiction communicated scientific ideas, imagined a wide range of possibilities, and influenced public interest in and perspectives of extraterrestrial life. One shared space is the debate over the wisdom of attempting communication with extraterrestrial intelligence. Some encourage aggressive methods to try for contact with intelligent extraterrestrial life. Others—citing the tendency of technologically advanced human societies to enslave or wipe out less advanced societies—argue that it may be dangerous to actively call attention to Earth.

In Christianity the Bible describes a multitude of different life forms in higher dimensions such as angels, demons and cheribum. The foundational belief is that God created earth and the universe with humans as the only creation. However, in Revelation it outlines why demons will disrobe from their current dimension and enter ours in the last days claiming to be aliens. This will coincide with the disappearance of Christians from earth.

Hynek's Scale

MASS DESTRUCTION
Lifeform Events
Extraterrestrial Life
Hynek's Scale

These are the different 'close encounters' you can have with an alien lifeform.

1st	**Close Encounters of the First Kind**	Visual sightings of an unidentified flying object, seemingly less than 500 feet away, that show an appreciable angular extension and considerable detail.
2nd	**Close Encounters of the Second Kind**	A UFO event in which a physical effect is alleged. This can be interference in the functioning of a vehicle or electronic device; animals reacting; a physiological effect such as paralysis or heat and discomfort in the witness; or some physical trace like impressions in the ground, scorched or otherwise affected vegetation, or a chemical trace.
3rd	**Close Encounters of the Third Kind**	UFO encounters in which an animated creature is present. These include humanoids, robots, and humans who seem to be occupants or pilots of a UFO.
	Close Encounters of the Third Kind (Bloecher Subtypes)	**A:** An entity is observed only inside the UFO. **B:** An entity is observed inside and outside the UFO. **C:** An entity is observed near to a UFO, but not going in or out. **D:** An entity is observed. No UFOs are seen by the observer, but UFO activity has been reported in the area at about the same time. **E:** An entity is observed, but no UFOs are seen and no UFO activity has been reported in the area at that time. **F:** No entity or UFOs are observed, but the subject experiences some kind of "intelligent communication".
4th	**Close Encounters of the Fourth Kind**	A UFO event in which a human is abducted by a UFO or its occupants. This type was not included in Hynek's original close encounters scale. Hynek's erstwhile associate Jacques Vallee argued in the Journal of Scientific Exploration that the "Fourth Kind" should refer to "cases when witnesses experienced a transformation of their sense of reality", so as to also include non-abduction cases where absurd, hallucinatory or dreamlike events are associated with UFO encounters.
5th	**Close Encounters of the Fifth Kind**	A UFO event that involves direct communication between aliens and humans. This type of close encounter was named by Steven M. Greer's CSETI group and is described as bilateral contact experiences through conscious, voluntary, and proactive human-initiated cooperative communication with extraterrestrial intelligence.
6th	**Close Encounters of the Sixth Kind**	Death of a human or animal associated with a UFO sighting, although some might consider this as a more severe example of a second-kind encounter.
7th	**Close Encounters of the Seventh Kind**	The creation of a human/alien hybrid, either by sexual reproduction or by artificial scientific methods.

Unidentified Flying Objects (UFOs)

UFOs

An unidentified flying object (UFO) is any aerial phenomenon that cannot immediately be identified or explained. Most UFOs are identified on investigation as conventional objects or phenomena. The term is widely used for claimed observations of extraterrestrial spacecraft. UFOs can often be attributed with glowing lights, metallic objects or virtually any other shaped object floating in the sky. They may fly in a pattern, change lighting colours and be bigger than football fields. No UFOs have been deemed to come from outer space as it's known but instead from inner space as if from an alternative dimension.

Notable US Cases
- The Roswell UFO incident (1947) involved New Mexico civilians, local law enforcement officers, and the U.S. military, the latter of whom allegedly collected physical evidence from the UFO crash site.
- The Mantell UFO incident January 7, 1948
- The Betty and Barney Hill abduction (1961) was the first reported abduction incident.
- In the Kecksburg UFO incident, Pennsylvania (1965), residents reported seeing a bell shaped object crash in the area. Police officers, and possibly military personnel, were sent to investigate.
- The Travis Walton abduction case (1975): The movie Fire in the Sky (1993) was based on this event, but greatly embellished the original account.
- The "Phoenix Lights" March 13, 1997
- 2006 O'Hare International Airport UFO sighting
- The 2004 USS Nimitz UFO incident and 2014 USS Theodore Roosevelt UFO incidents

Identification of UFOs

Studies show that after careful investigation, the majority of UFOs can be identified as ordinary objects or phenomena. The most commonly found identified sources of UFO reports are:
- Astronomical objects (bright stars, planets, meteors, re-entering man-made spacecraft, artificial satellites, and the Moon)
- Aircraft (aerial advertising and other aircraft, missile launches)
- Balloons (toy balloons, weather balloons, large research balloons)
- Other atmospheric objects and phenomena (birds, unusual clouds, kites, flares)
- Light phenomena mirages, Fata Morgana, ball lightning, moon dogs, searchlights and other ground lights, etc.
- Hoaxes

A 1952–1955 study by the Battelle Memorial Institute for the USAF included these categories as well as a "psychological" one.

Less than one percent of cases Allan Hendry investigated were hoaxes and most sightings were actually honest misidentifications of prosaic phenomena. Hendry attributed most of these to inexperience or misperception.

Associated Claims

Besides anecdotal visual sightings, reports sometimes include claims of other kinds of evidence, including cases studied by the military and various government agencies of different countries (such as Project Blue Book, the Condon Committee, the French GEPAN/SEPRA, and Uruguay's current Air Force study). A comprehensive scientific review of cases where physical evidence was available was carried out by the 1998 Sturrock panel, with specific examples of many of the categories listed below.

● Radar contact and tracking, sometimes from multiple sites. These have included military personnel and control tower operators, simultaneous visual sightings, and aircraft intercepts. One such example were the mass sightings of large, silent, low-flying black triangles in 1989 and 1990 over Belgium, tracked by NATO radar and jet interceptors, and investigated by Belgium's military (included photographic evidence). Another famous case from 1986 was the Japan Air Lines flight 1628 incident over Alaska investigated by the Federal Aviation Administration (FAA).
● Photographic evidence, including still photos, movie film, and video.
● Claims of physical trace of landing UFOs, including ground impressions, burned or desiccated soil, burned and broken foliage, magnetic anomalies, increased radiation levels, and metallic traces. A well-known example from December 1980 was the USAF Rendlesham Forest incident in England. Another occurred in January 1981 in Trans-en-Provence and was investigated by GEPAN, then France's official government UFO-investigation agency. Project Blue Book head Edward J. Ruppelt described a classic 1952 CE2 case involving a patch of charred grass roots.
● Physiological effects on people and animals including temporary paralysis, skin burns and rashes, corneal burns, and symptoms superficially resembling radiation poisoning, such as the Cash-Landrum incident in 1980.
● Animal/cattle mutilation cases, which some feel are also part of the UFO phenomenon.

● Biological effects on plants such as increased or decreased growth, germination effects on seeds, and blown-out stem nodes (usually associated with physical trace cases or crop circles)
● Electromagnetic interference (EM) effects. A famous 1976 military case over Tehran, recorded in CIA and DIA classified documents, was associated with communication losses in multiple aircraft and weapons system failure in an F-4 Phantom II jet interceptor as it was about to fire a missile on one of the UFOs.
● Apparent remote radiation detection, some noted in FBI and CIA documents occurring over government nuclear installations at Los Alamos National Laboratory and Oak Ridge National Laboratory in 1950, also reported by Project Blue Book director Edward J. Ruppelt in his book.
● Claimed artifacts of UFOs themselves, such as 1957, Ubatuba, Brazil, magnesium fragments analyzed by the Brazilian government and in the Condon Report and by others. The 1964 Lonnie Zamora incident also left metal traces, analyzed by NASA. A more recent example involves a tear drop-shaped object recovered by Bob White and was featured in a television episode of UFO Hunters but was later found to be waste metal residue from a milling machine.
● Angel hair and angel grass, possibly explained in some cases as nests from ballooning spiders or chaff.

Conspiracy Theories

UFOs are sometimes an element of conspiracy theories in which governments are allegedly intentionally "covering up" the existence of aliens by removing physical evidence of their presence, or even collaborating with extraterrestrial beings. There are many versions of this story; some are exclusive, while others overlap with various other conspiracy theories.

In the U.S., an opinion poll conducted in 1997 suggested that 80% of Americans believed the U.S. government was withholding such information. Various notables have also expressed such views. Some examples are astronauts Gordon Cooper and Edgar Mitchell, Senator Barry Goldwater, Vice Admiral Roscoe H. Hillenkoetter (the first CIA director), Lord Hill-Norton (former British Chief of Defense Staff and NATO head), the 1999 French COMETA study by various French generals and aerospace experts, and Yves Sillard. It has also been suggested by a few paranormal authors that all or most human technology and culture is based on extraterrestrial contact.

Alien Sightings

An alien sighting is the visible seeing of an otherworldly creature other than of human origin. Aliens and UFOs have been known to have a sulphur smell, the exact same of demons.

Alien Invasion

An invasion of any non earth life form with the intention of eliminating human life on earth. The alien invasion is a common imagination of science fiction stories and film, in which extraterrestrials invade the Earth either to exterminate and supplant human life, enslave it under an intense state, harvest people for food, steal the planet's resources, or destroy the planet altogether. Assuming they are invading earth on space ships they must be far superior in technology to us which would give us little if no chance to survive.

If aliens have shown up to earth, 'abducted' millions of people (only believing Christians), they're all male and they come from inner-space or another dimension rather than outer space, read the rapture guide below. This was all foretold in the Bible…

5 The Rapture

This section is an excerpt from "The Rapture Survival Guide". Find the full version at: www.fluidicice.com/TRSG

So what is the Rapture?
The Rapture, otherwise known as "the Harpazo" is a Christian religious event in which the believers saved in Jesus Christ and those younger than the accountable age vanish from earth instantly "in the twinkling of an eye" meeting Jesus in the air. Those who aren't saved through Jesus and were left behind on earth will be subject to 7 years of the wrath of God, known as the Tribulation.

Following the instant disappearance of believers from earth, and consequently, the standing aside by the 'restrainer' (the Holy Spirit), there will be utter chaos in the world as people seek to recover from and understand what happened. If you're one of these people - you have found the answers to what's happening, along with the Bible as your primary source of proof. Be warned that there will be a "lie" (2 Thessalonians 2:11) that is so powerful it will deceive even the most intelligent people. Many Christians believe that this lie will be an alien abduction deception of some sort as it's the only other plausible reason that could explain the disappearance from a secular and scientific viewpoint. However since the Bible isn't explicit on what this 'lie' is, keep all other options open.

Immediately after the rapture, the antichrist (someone who puts themself in *place* of God) can begin their rise to power, gaining notoriety and influence all over the world and solving its problems with ease. Once he has gained notoriety on the world stage he will make an existing covenant with Israel - even more spectacular, allowing the Jews to build the third temple and worship again. This covenant initiates the 7 year tribulation which is the period God pours out plagues on the planet in an attempt to bring His nation of Israel and those who dwell on the earth back to Him. Three and a half years (halfway) into this covenant, the antichrist sits on the throne in this new temple in Jerusalem and declares himself to be god, initiating the second half of the tribulation.

At this point, the antichrist will double down on his intent to slaughter all Jews and newly converted Christians throughout the entire globe and all those who refuse to take his 'mark' - The Mark of the Beast, which will be *on or in* someone's right hand or forehead. The Bible says this mark (666) will need to be 'calculated' and won't be easily identifiable, but it will be his number and not your own personal identification number. (Revelation 13:18) You CAN become saved through Jesus after the rapture happens, but your life will be much tougher with the antichrist hunting down all those who oppose him.

During this rise and reign of the antichrist, God will be pouring out His just judgements on this increasingly sinful world which will cause utter devastation on the planet and ultimately cause the nations of the world to come together to battle God at Armageddon. Then comes Jesus' second triumphant return with all those who were raptured previously. Jesus will destroy all those who rejected Him and claim His throne in Jerusalem, ruling the world for 1,000 years known as the millennium.

That's the rapture and a summary of the end times as described in the Bible. You don't have to believe it, because it's certainly an unbelievable series of events, but when they start to fulfil themselves, come back and keep reading. "The only barrier to truth is the presumption that you already have it." - Chuck Missler

"The only barrier to truth is the presumption that you already have it."
Chuck Missler

I highly recommend watching the video below before you continue reading the remainder of this document. It will give you the basics of what just happened and what's coming in the future. Skip to 3:38 for the beginning of the dialogue.

Subheadings

1 Introduction

The terms above are discussed in greater detail below to help you understand God's plan for the gentiles (non Jews) and the plan for His nation of Israel in the final chapter of earth. So keep reading and feel free to print, copy, email and disseminate this guide to anyone and everyone seeking truth in these 'biblical' times as there are no copyrights on it.

If some of these prophecies such as the rapture have already been fulfilled and you're seeking answers, please keep reading! If anything, the events in the book of Revelation can be used to verify that the Bible is absolute truth and given from a loving God *outside* of space and time. It's absolutely critical that you understand this before continuing on or you'll tend to disregard the essential points.

There are plenty of other events which have to be fulfilled in the near future such as the global government and the one world religion. However these three are very distinct events which will be hard to miss, as they will garner global media coverage when they occur. To find out more on these events, download 'The Rapture Survival Guide (TRSG)' at: **www.fluidicice.com/TRSG**

Millions Vanish From Earth!
Jesus calls the believing Christians home, before His wrath
(Download TRSG for this section)

The Destruction of Damascus
Damascus will be destroyed and never inhabited again
(Download TRSG for this section)

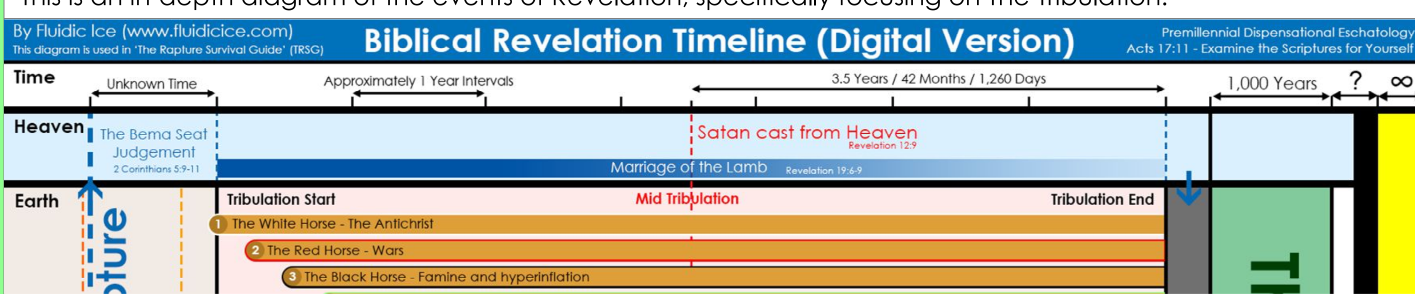
The Attempted Invasion of Israel
Russia, Iran, Turkey, Libya and Syria will surprise attack Israel simultaneously but utterly fail
(Download TRSG for this section)

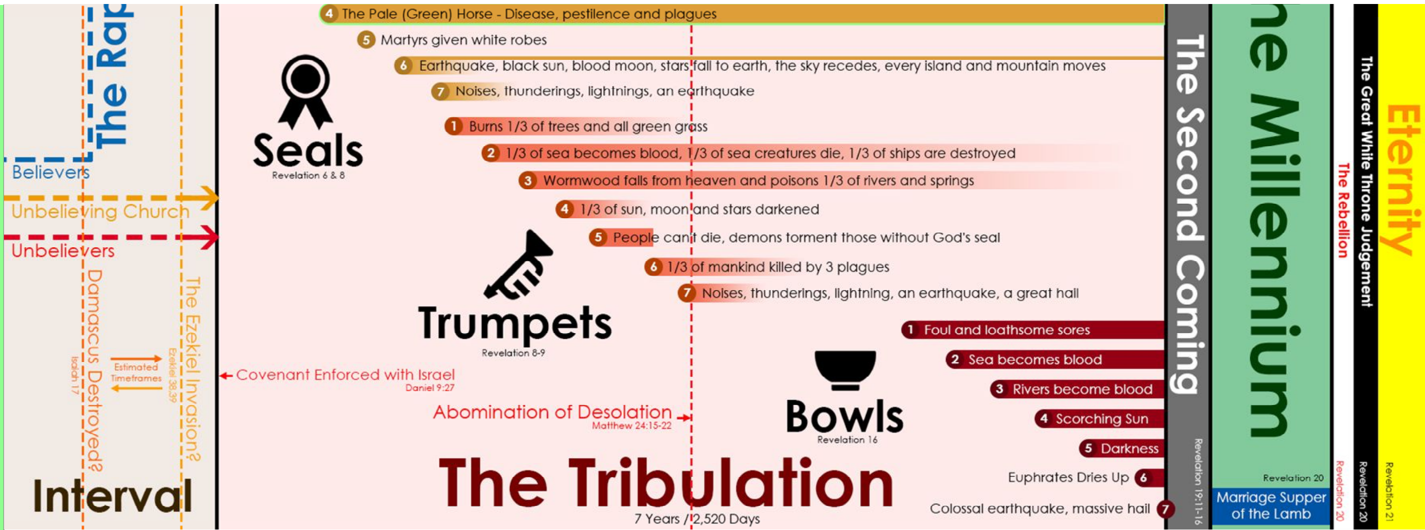
2 Timeline Diagram

Below is a diagram of how these end time events could unfold, based on a premillennial dispensational view of Christianity. It can be used to refer back to when reading through the rest of the guide as you won't understand each event without further study. The full diagram may be a bit daunting on first glance, but after reading the scriptures (mostly Revelation and 2 Thessalonians) you should slowly be able to work out what each event signifies and where you sit in God's end times timeline.

The Bible covers this 7 year tribulation period in better detail than any other time, however there still are a few gaps which must be 'guessed'. I recommend finding which Seal, Trumpet or Bowl the world is currently experiencing and read on - watching out for the next sign described in the Bible. If anything, it can be used to prove the validity and accuracy of God's word to help keep you strong in the faith. For previously fulfilled prophecies, take a look at the "Christianity > Evidence for God > Fulfilled Prophecies" section.

This is an in-depth diagram of the events of Revelation, specifically focusing on The Tribulation:





For an easier reading experience I recommend downloading the high-definition diagrams from my website www.fluidicice.com/TRSG. Or just do a web search for "fluidic ice revelation timeline" to find it.

TLDR Below: *The horizontal axis is time and the vertical axis splits up the events in heaven and on earth. If you draw a vertical line anywhere on the diagram, any horizontal lines that intersect with it* *may* *be occurring at that time. Colours have a relationship with anything else that colour.*

The Timeline Link

3 The Rapture

Left Behind?

So the rapture's happened, and the world is in absolute chaos! What do I do???

Left Behind?

Were you unsure about Christianity or even rejected God completely but have since seen that millions of people have vanished from the earth, who strangely were all born-again Christians and young children? This is the prophesised rapture or "harpazo" and it's the biblical event where God pulls his church from the earth so he can pour out his wrath on the nations and those who haven't accepted Him.

You've missed the bus, but that won't stop you from getting into heaven if you become a born again Christian and follow Jesus' teachings from now on. However it will be an extremely dangerous period of time and Christians will almost certainly be killed for their faith by their friends, neighbours, the global government and the antichrist, but isn't eternal life in heaven with God worth dying for? The fact that the Rapture even happened should be substantial evidence that there is a God. You may have even heard about the rapture previously but brushed it aside as a "tale of mythical proportions" or the "ranting of religious nuts".

With many hundreds of thousands to millions of people on earth instantly disappearing, chaos would have likely ensued across the entire planet as cars crash, planes will fall from the sky, utilities break down, homes engulfed in fires and utter chaos and panic everywhere as parents frantically look for their young children who are missing. The lack of people to fulfil jobs will delay production, and transportation across the country will grind to a halt, exacerbated by the array of crashed vehicles on the road. Some important leaders may also disappear, leaving nations leaderless for a period of time or causing people to fight for control. After people realize that millions are missing, looters may likely to go house to house hoping it won't be occupied. Many evildoers and spiritualists will rejoice that the people holding back the planet have been removed so they can continue to 'fix' the planet.

The rapture may have occurred prior to an election causing chaos and swaying the results tremendously in favour of someone else. With the withdrawal of the born-again Christians from earth, and consequentially the holy spirit who indwells them, the world will get out of hand rapidly as Christians were the salt and light of the earth. In the same way that salt slows meat from going rancid, so too will the earth rot and decay faster with a vertical plummet into evil and lawlessness worldwide.

The second the rapture happens, satan will kick his final plan into motion in an attempt to deceive everyone on earth who is left behind, to cover up the true reason of the disappearances. The last thing he wants is for people to realize this is the rapture and to turn back to God. As discussed above this deception will most likely involve an 'Alien Abduction' lie which will be caused by demons creating shapes and signs in the sky and will eventually lead to the 'landing' of a UFO. More on this is discussed below.

The fact that you've been left behind should be a wake up call that you aren't currently going to heaven if you die today or even when Jesus returns at His Second Coming.

The good news is that you have slightly longer than 7 years (from the rapture) before His return to commit your life to Him and become a Christian. However with the impending devastation that is to come, you likely have much less time to live than that...

Watch For
- The instant disappearance of millions of people from earth - born again believers in Christ, likely excluding much of the Catholic and other 'apostate' churches.
- The disappearance of all young children

Below is a list of notable people and groups who probably **won't** be taken in the rapture, so don't be deceived by anything they say if they remain behind:

The Pope	Contrary to what the world believes, the Pope is more ungodly than most other people on the planet. He doesn't talk about the blood of Jesus, he doesn't tell people they are sinful and need to be saved and he is trying to align all religions into a One World Religion.
The Catholic Church	The Catholic Church is unfortunately mislead by the pope today who picks and chooses what they believe in the Bible. Therefore many people who attend these catholic churches have never accepted Jesus into their life.
Other 'Christian' Churches	Other apostate Christian churches which believe in Jesus but have strayed from the truth likely won't be raptured. This could include: Seventh Day Adventists, Pentecostal Churches, Christian Science, Jehovah's Witnesses and more. It comes down to a personal belief in Jesus and not the church they are part of.

All Other Religions	People in all other religions such as Buddhism, Hinduism, Islam, Judaism, Sikhism, etc, won't be raptured.
These are the people who **will** be taken in the rapture:	
Born-Again Christians	All believers in Christ who have accepted Jesus as their Lord and Saviour, believing that He died and rose again will be taken. This includes Jews who have accepted Christ even though the majority of Israel will go through the tribulation.
Young Children	Young children who have not yet reached the "age of accountability" will also be taken in the rapture leaving parents frantic.
Unborn Babies	This isn't mentioned in the Bible, however can you imagine a scenario where Christ calls a believing mother home and not the baby inside her? Fetuses of non-believers are a grey area and could go either way. If unborn babies are included in the "Young Children" category - there's going to be a lot of miscarriages and vanishing fetuses at the time of the rapture.

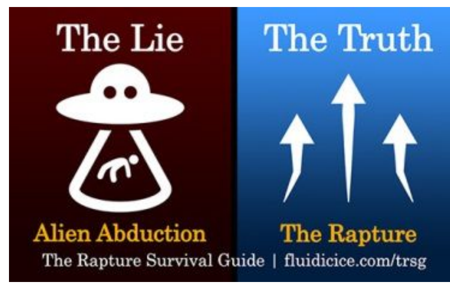
The Alien Deception

I can't overstate how important it is to NOT be deceived after the rapture. God Himself will send a strong delusion to deceive the world, which even the wise will find irresistible to believe. *"That they all may be condemned who did not believe the truth but had pleasure in unrighteousness."* (2 Thessalonians 2:11-12) The only plausible way to explain away the disappearance of millions from earth is to blame it on otherworldly beings such as aliens.

It's my personal conviction that when we're raptured and we meet Him in the air, we will shine brightly as many points of light (Matthew 13:43) in the sky, all across the globe, which could be "the lie" that explains away the disappearance of people. Each person a different brightness based on the works they did on earth during their life. (Daniel 12:3) But of course it could be something else entirely.

Don't believe any alien narrative that satan concocts to explain it away. Even the Catholic Church themselves said they are preparing to receive an alien into their midst which they will baptize. Spiritualists will also call the removal of Christians from the planet "good" because it's simply the earth cleansing itself from those who are a detriment to it.

Do not to be deceived by their lies - instead seek earnestly the word of God. Besides, isn't the rapture the ultimate proof that He exists? If you don't believe yet, keep reading to hear about more future events to validate the Bible. An example is that the future world leader - the antichrist, will have a deadly head/eye wound and a right arm wound which have been healed.



Have you noticed the sheer amount of Hollywood movies that involve aliens in recent years? How about the fact they usually prefer to take children for themselves?

This is no accident. This lie has been slowly planted in the hearts of those directing Hollywood movies by none other than satan himself to continue the grand deception God gives the world when the born-again believers leave.

People may not care much, or might even be thrilled about the disappearance of Christians from the earth, but when it comes to their own children they will be wanting answers!

The rapture, the disappearance of children, COVID-19, the civil unrest and the continuation of natural disasters on the planet will bring the world to its knees in desperation for a leader to end the suffering and unite the world. Enter the antichrist to provide all the answers people have been seeking.

An excellent video explaining how aliens are eluded to in the Bible can be found below, or scan the code to the right:

Return of the Nephilim Session 2

Chuck Missler - Return of the Nephilim Session 2
https://youtu.be/91wtHi-F0oM?t=2557 (Start at 42:37 for the part on aliens)

Why Aliens?
There are quite a number of reasons why the most likely cover-up for the rapture will be an alien abduction:
- The lie (2 Thessalonians 2) will need to be something otherworldly since no human technology can cause millions of people to vanish.
- Aliens have slowly been integrated with our culture by satan over hundreds of years until now. The thought of other life is now relatively accepted in society being backed by the lie of evolution.
- In the past, demons have frequently disguised themselves as aliens, and people who have encountered them (demons) have claimed abduction experiences which shares a common theme of possession when studied carefully.
- The Vatican has openly discussed baptising an alien. Because of this, it explains why the Pope and much of the Catholic church will be left behind.
- As of 2020, an Israeli space security chief has stated "They have been waiting until today for humanity to develop and reach a stage where we will understand, in general, what space and spaceships are".
- Daniel 2:43 "...They will mingle with the seed of men..." This implies that the 'they' aren't human.
- Governments currently claim that "aliens are real and secretly in contact with America and Israel".
- There was a committee comment in a COVID-19 relief bill giving the U.S. Government 180 days to reveal what they know on UFOs.

Be sure to read your Bible daily to solidify your faith in the rapture and to avoid the doctrines of demons which will undoubtedly take hold in those days. Whatever happens right after the rapture will be sent by God, to give those who rejected Him over to their depraved activities:

2 Thessalonians 2:11-12
11 *And for this reason God will send them strong delusion, that they should believe the lie,*
12 *that they all may be condemned who did not believe the truth but had pleasure in unrighteousness.*

Another point to note is that the Qanon movement is another group of people who believes that there may be a time coming where everyone on earth will be 'enlightened'. However they are just another medium of deception. Read the Bible.

I warn you about the coming King and the wrath of God because I am a watchman on the wall as per verse 6 below. If I see the destruction that's coming and don't warn others, God will require the blood of those people from me. Again I say, turn from your wicked ways, repent from your sins, believing and accepting that Jesus died and rose again on the third day. He Loves You!

Ezekiel 33:3-6
3 *When he sees the sword coming upon the land, if he blows the trumpet and warns the people,*
4 *then whoever hears the sound of the trumpet and does not take warning, if the sword comes and takes him away, his blood shall be on his own head.*
5 *He heard the sound of the trumpet, but did not take warning; his blood shall be upon himself. But he who takes warning will save his life.*
6 *But if the watchman sees the sword coming and does not blow the trumpet, and the people are not warned, and the sword comes and takes any person from among them, he is taken away in his iniquity; but his blood I will require at the watchman's hand.'*

Satan will also use the rapture to push for the formation of the one world government and the one world religion. The devil is the father of lies and he will do everything in his power to cause deception, even to the point of showing sightings of UFOs to appear in the sky for all to see in an attempt to bring everyone together under one banner.

Since all Christians would have been taken to meet Jesus in the air, and then to heaven, there will be nobody on earth to spread His gospel in a time when people will be most desperately seeking answers. So if you believe the disappearance must have been the rapture, and you believe in Jesus, please share this document everywhere possible so that others may be saved. Some recommendations include: Email, Facebook, Parler, Gab, Pocketnet.app, Facebook chat, YouTube, Rumble, Twitter, Instagram, Text Messages, Word of Mouth, Mail Drops, printed copies on the street, Reddit, personal websites, blogs, forums, whatsapp, tumblr, pinterest, LinkedIn, snapchat, billboards, TV advertisements and anything else you can think of. For my own tracts head to:
www.christianity.fluidicice.com/tracts

4 Post-Rapture

Post-Rapture

Post-Rapture

Lawlessness will rise daily and the world will become increasingly desperate for answers on what's happening across the planet. Millions of jobs will be left empty which will affect the food and produce markets, industrial, construction and every other facet of society today. The speed of the earth's downward trajectory will increase dramatically and the nations of the world will desperately seek a leader to lift the world out of these debilitating times.

It will get so bad that presidents and the elites will seek to form a global government to help kerb the natural and man made disasters. They will take away people's rights, lock them down, throw them in prison and will likely kill many who resist. People will literally go insane when the 'aliens' reveal themselves and will loot, burn and destroy what they can - believing the world is about to end. If you find yourself living in these perilous times, accept Jesus, because you may not live much longer considering the 'biblical' judgements to come.

For many weeks after the rapture, people will be in utter shock at what happened and is still happening around the planet! First the disappearance of millions of people and then the arrival of extraterrestrial life. By this point the aliens would have likely made contact with humanity 'revealing themselves' as peaceful beings who only wish to 'enlighten' the human race with advanced ideas to help solve the world's problems.

Satan is a master of deception and he's been plotting this lie for centuries to get the majority of the world to believe the rapture was of alien origin. Most people will believe it - since there will be some form of proof visible in the sky worldwide, as well as being broadcast on live TV. These 'aliens' will eventually reveal themselves and will probably speak on live interviews in human languages which they will probably explain by saying they've been monitoring humans for decades.

The part of the guide below is conjecture based off the verse in Daniel 2:43 that says "...they will mingle with the seed of men...". This means that 'they' can't be human. So according to this verse, the aliens will have to integrate themselves with humans until such as day they will have sexual relations with human women (and men) just like the days of Noah! Read Genesis 19 paying particular attention to verse 5 to realise that the inhabitants of Sodom wanted to have sexual relations with those angels.

Remember that in the Bible, angels are never referred to in any gender other than masculine. Therefore all fallen angels and demons are male and if these 'aliens' are all male too it would just prove even more that they're demons which have left their first habitation (Jude 1:6). By 'habitation' (or in the Greek "oiketerion"), the Bible means they disrobed from their spiritual body in higher dimensions to be able to enter our dimension.

The time between the rapture and the tribulation is unknown, but it likely won't be longer than a few years due to the dark powers that want to unite this planet under a global government for total control, and the sooner they achieve this, the sooner they control the planet. During this time, everyone will be trying to recover from the chaos of the rapture while allowing the antichrist - the mouthpiece of satan himself to rise to power with 'all the solutions'.

Deception

There will be a lot of theories and deception after the rapture occurs, as is stated in **2 Thessalonians 2:11-12**. If you're reading this and millions of people have vanished then take heed of what the Bible says and keep reading God's word. Throughout the Bible Jesus warns not to be deceived by anyone, but test what you're told to see if it's of the holy spirit or not. (Acts 17:11)

I'm writing this section in 2018 and I ***know*** the rapture will happen at some point in the future. I can't tell the future, I just put my faith in the word of God which has repeatedly proven itself with past and future prophecies. Satan is the price of the power of the air and if one thing is evil today - it's the broadcasts that are making their way into our homes which can only be described as the mouthpiece of the devil, so stay vigilant and away from these forms of technology which can flood your home with lies.

2 Thessalonians 2:11-12
11 *And for this cause God shall send them strong delusion, that they should believe a lie:*
12 *That they all might be damned who believed not the truth, but had pleasure in unrighteousness.*

Signs

A major sign of Christ's return post-rapture is war and dissension among groups of people. The book of Revelation tells us that the Tribulation Period is filled with constant war that will escalate until the entire world is involved. This war will be terrible, ceaseless and unending. The Bible says that as we move toward the end times, there will be many talks of conflicts, border skirmishes, race wars and national battles. World military spending has now reached one trillion dollars. The arms trade is big business and a world war with our current technology and nuclear/hypersonic weapons would be devastating to the entire planet.

As we get closer and closer to the end times, there will be ever frequent natural disasters, hunger and famine. If you look around the world right now, there are millions of people going hungry, despite God blessing us with a fertile and abundant planet. There will also be major earthquakes which scientists have said are overdue as well as the spread of new diseases. We have noticed an epidemic of new diseases breaking out that we have not been able to control the spread of such as ebola, COVID-19 and new strains of the flu.

Many wonder what the worlds current devastation is telling us. Combined, they should be fairly obvious signs of Christ's soon return which will be about 7 years after the enforcement of the covenant by the antichrist or 3.5 years after he declares himself as god in the temple. This gives those who are unsaved a second and even third checkpoint, showing there's not long until His return.

For the rest of this guide see 'The Rapture Survival Guide (TRSG)', downloadable at: https://fluidicice.com/TRSG

5 Accepting Jesus

This is absolutely the most important section in the entire guide, outlining the path to eternal salvation as described in the Bible. Your acceptance or denial of Jesus will affect where you spend eternity, and every soul lives forever, it's just a matter of location. A prerequisite for becoming saved is knowing that God exists and that He created you, the universe and heavens.

God wrote the Bible through man to *further* prove His existence to us alongside the wondrous and spectacular world around us. There are countless incredible facts about the Bible that prove it had to be designed outside of space and time. For a few of these amazing insights read the 'Evidence for God' section in 'Christianity'.

Salvation

A	**Admit that you are a sinner.** Any gap between God's perfect law and our imperfect obedience is called sin, which everyone has committed. ● "For all have sinned, and come short of the glory of God;" (Romans 3:23) ● "There is none righteous, no, not one;" (Romans 3:10) ● "If we say that we have not sinned, we make him a liar, and his word is not in us." (1 John 1:10) ● "For the wages of sin is death, but the gift of God is eternal life in Christ Jesus our Lord." (Romans 6:23)
B	**Believe in your heart that Jesus Christ died for your sins, was buried, and that God raised Jesus from the dead on the third day, taking the punishment you deserved.** Jesus said: "I am the way, the truth, and the life: no man comes unto the Father but by me." (John 14:6) Your own good works cannot save you, no matter how good a person you are, and wouldn't the creator of heaven set the bar for entry? ● "For God so loved the world, that he gave his only begotten Son, that whosoever believes in him should not perish, but have everlasting life." (John 3:16) ● "But God commends his love toward us, in that, while we were yet sinners. Christ died for us." (Romans 5:8)
C	**Call upon the name of the Lord and confess that Jesus Christ is Lord.** Through prayer, invite Jesus into your heart to become your personal Lord and Saviour. There is an example prayer below. ● "If you shall confess with your mouth the Lord Jesus, and shall believe in your heart that God raised him from the dead, you will be saved." (Romans 10:9)

The Sinner's Prayer
"Lord Jesus, I am a sinner and am in need your forgiveness. I believe you are the Son of God who died on the cross for my sins and rose from the dead on the third day. Thank you for bearing my sins and giving me the gift of eternal life. I am ready and willing to trust you as my Lord and Saviour and to turn from my sin. I now invite you into my heart as my personal Saviour. Amen."

"Whoever calls on the name of the Lord shall be saved."
Joel 2:32 / Acts 2:21 / Romans 10:13

Once you've prayed this prayer, believing it with all your heart, you're saved by the power of the blood of Jesus! He paid that ultimate price of our sin, sacrificing Himself so that we may live. However it's easy to say something with your mouth, what takes real effort is living out a life in pursuit of Jesus, walking according to His will for you and leaving your old sinful ways behind.

Below are some more verses related to salvation and justification, as well as some next steps you should take as a new Christian to help cement your faith. If there's one thing that satan despises, it's new Christians. So be prepared to battle against the spiritual forces of wickedness by praying and reading your Bible daily as well as putting on your spiritual armour.

- ***Ephesians 2:8-9*** *"For by grace you have been saved through faith, and that not of yourselves; it is the gift of God, not of works, lest anyone should boast."*
- ***2 Corinthians 5:17*** *"Therefore, if anyone is in Christ, he is a new creation; old things have passed away; behold, all things have become new."*
- ***Luke 13:5*** *"I tell you, no; but unless you repent you will all likewise perish."*
- ***Galatians 2:16*** *"Knowing that a man is not justified by the works of the law but by faith in Jesus Christ, even we have believed in Christ Jesus, that we might be justified by faith in Christ and not by the works of the law; for by the works of the law no flesh shall be justified."*
- ***1 Corinthians 15:3-4*** *"How that Christ died for our sins according to the scriptures; And that he was buried, and that he rose again the third day according to the scriptures"*

Christian Content

Many people will realize that the Christians they ignored their whole life were right and will attempt to seek the truth of what happened in scripture and prophecy updates. Unfortunately this will be extremely difficult with possible electricity and internet outages, lies being proliferated by news outlets and the remaining spiritual leaders denying that it was the rapture. Christian content may be pulled from the entire internet by those in power further increasing the difficulty of finding truth. For an online list of my content backups (the same links as below), head to: **https://www.fluidicice.com/backups**

Google Backup

6 Rebuilding Society

After destruction on a massive scale, society will need to be rebuilt from the ground up. This sections covers how that can be achieved and where to start.

Rebuild Your Life

Rebuild Your Neighbourhood

Rebuild Your Town

Addendum

A selection of additional information to compliment TPE

"The only place success comes before work is in the dictionary."
Vince Lombardi

Introduction

This category contains any extra information which doesn't belong to any another category but should still be included in the document. To search for terms you don't understand in the below dictionary use Ctrl+F or the programs/apps built in search feature. If you're looking for basic prepper terms you can find them under the preparedness heading below or the PREPAREDNESS category.

Purpose	The aim of ADDENDUM is to catalogue any additional information which compliments TPE into one location.
Lost?	• For reader tips and information on using this guide, see the PRELUDE section. • For a list of the categories in this document, see the CONTENTS section. • For a list of the wonderful people who made TPE possible, see the MAINTENANCE section. • For a list of updates made to this document, see the MAINTENANCE section.

Contents

1 Media

Keeping informed and media in general is vital in today's society, you need to know what's happening around you and getting advice, tips and making friends with other preppers. This section is aimed at keeping you informed and gaining more knowledge about preparedness as well as where to find fact during SHTF. If you're looking for monitoring websites to keep track of the world, see PREPAREDNESS > Situation Monitoring.

The following colours are a legend for all forms of media to help quality content stand out and to help assist readers find what they want quicker.

Blue - Quality Content
This content has: Clear audio, use of clip on mics, HD Cameras, short intros, well written, easy navigation, entertaining and above all - valuable information. Non quality channels may also have great content but their electronic gear, microphones and editing could be better. If your website or content isn't blue, chances are I haven't had time to look over it and see the content yet. Just send me an email requesting to consider your website for the quality background.

Subheadings

1 Media Today

Media is everywhere in the world today form the internet, Tv, radio, newspaper, verbal news etc. The sharing of knowledge, warnings and news helps us prepare for the future and know what's headed our way. Below is a selection of media forms in a functioning society.

Print / Written	Print media has dropped significantly over the last decade with the rise of digital news. If news has to travel from across the ocean, it will take many days if not weeks to be spread around the new shore.
Television	Television is the second most common proliferation source of news today.
Radio	Even though it's not as frequently used as television today, radio can provide some invaluable information during disasters and can be transmitted around the planet with ease.
Online	Currently online news is the most used source of news today due to its instant transmission time and ease of use.
Social	Social news is the verbal transmittal of news from person to person and currently is the third most used form of transferring news. This style of news will be vital in a world without electronics and most forms will regress to the days where legends were told over fires or in the street.
Research	Research is news that is conducted by yourself to determine the facts of the situation. This is extremely rare today but will probably be one of the highest ranking news methods in a SHTF situation. An example may be looking up what is likely to happen after a disaster or war, such as researching a tsunami and watching out for one then warning others if there is a chance of one.

2 Keeping Informed

Staying up to date with what's happening in the world when all the vital methods of communications are down is of utmost importance. Knowing about risks such as hurricanes, aftershocks, tsunami's and enemy bombers heading your way can keep you alive if you can be warned ahead of time. Simply because there's no conventional means of getting informed such as Tv or the internet doesn't mean that aren't people transmitting the information. The section below will help you find these communication methods or understanding and predicting the situation if there is nobody around.

For a list of useful news websites go to the PREPAREDNESS > Situation Monitoring section.

6 YouTube

The following are YouTube channels related to preparedness, survival and offshoots of either of these topics. If you would like your channel added, please send me an email linking your channel name and content type and I'll add it to the next version if the content is preparedness related. See the introduction in the ADDENDUM > Media section for more information on quality content and how to obtain the status. To find a channel listed below just paste or type the name of the channel in bold into YouTube. I can't continuously update the Subs and Vids counter very often, however when they are updated, I update them all at once so the playing field remains level between the channels.

Of course to use this section when SHTF occurs I recommend either watching or downloading some videos to watch when there's no internet. Look up YouTube downloaders to find a variety of programs that can be used to snatch videos from the web and save them for later watching on your computer. 4K Video Downloader is quite cheap and and automatically download entire channels and any updates from then on.

Downloading YouTube Videos

As preppers, knowledge can be the biggest asset in a grid-down situation. It can allow you to 'loan' skills and ascertain quicker results than if we attempted to try things ourselves without any prior knowledge. One of these biggest hubs of knowledge right now is the video streaming website YouTube. I'm sure most of you visit daily and learn from some of the greats including Southern Prepper 1, Sensible Prepper, The Provident Prepper, City Prepping and Canadian Prepper.

However these essential resources aren't much use if the internet goes down. We need a way to store this information for use in a grid-down situation when we need it most. Below I will dive into how you can download videos to create an 'Offline Prepper Video Archive'.

I'm going to go ahead and predict that preparedness content won't be readily available for too much longer due to a range of storms heading our way, including:
- The internet won't last long in any major conflict, and we seem to be on the verge of a world war.
- Hacking and ransomware has become much more common which could easily take out the internet in an entire country.
- Big Tech companies are actively silencing those who don't agree with their agenda, and that includes Preppers.
- YouTube is taking steps to block third party downloaders like those mentioned below.
- Prepping is anti-mainstream and Governments certainly don't want their populations to be self-reliant as this means less income for them.
- Infrastructure is aging worldwide and isn't being maintained to the standards it should be, this includes electrical grids and internet networks.
- World Governments are actively censoring information and filtering it for their advantage – such as what currently occurs in China, Iran, North Korea and more.

Whatever the reason you want to download preparedness videos, there are a couple ways to achieve it. This list is by no means conclusive, as there are probably hundreds of different programs and websites that can download YouTube videos.

Download Videos on a Phone Using an App (NewPipe) (Single Videos Only, Easy to Use)
An easy way to download single videos is by using NewPipe. Just download and install the app and then search for a video you want to download and hit that download button. Then you just have to choose your settings like the quality of the video and whether you want the whole video or you just want to extract the audio from it.

Download Videos Using 4K Video Downloader (Paid) (Bulk Downloads, Easy to Use)
This is by far the simplest way to download a huge amount of videos at once and it doesn't require lots of setting up like JDownloader or Stacher below. All you have to do is paste anything from links to playlists by using the "Paste Link" button at the top and it will download each video in a playlist, one at a time – or even multiple at a time based on your settings. (Just don't download them too quickly or YouTube will block your IP address and then you won't be able to download or watch any videos!)

If you close the window 4K will resume where you left off which is an extremely handy feature so you don't lose track of where you're up to and what's been downloaded so far. The only issue I've found is that the video can sometimes fail to download correctly and ends up being unplayable. If this happens all I have to do is delete the unfinished file and copy and paste the link again. The title "4K Video Downloader" is a bit of a misnomer, since you can select any resolution you want to download in and not just 4K.

Download Videos Using JDownloader (Free) (Bulk Downloads, Precise Download Control, Complex)
JDownloader requires FFMPEG to be installed, but it can do this automatically with a connection to the internet.

To get started with JDownloader (called JD from here on), firstly install the software and then proceed with the FFMPEG installation which will pop up automatically if it's not already installed. Make sure JD is running and then head over to YouTube and copy the link to any video you want to download. Swap back to JD and you should see that it has automatically parsed the link you copied and populated the "LinkGrabber" tab up the top with a bunch of different files if you click the "+" to the left. You don't need most of these, so before we go further we're going to change some settings.

Head to 'Settings' and you should see the 'Plugins' section up the top. Click in the "Please choose a plugin" area and remove whatever's there, and start to type "YouTube" – clicking it when it shows up. When selected you will see a LOT of different options available to you which may seem daunting, but to keep it simple I will let you know my settings and you can work from there.

Under "Allowed Media Types":
(Just un-tick all the other options until only the below options remain)
- Type: Audio, Video
- Filetype: MP4
- 3D/360: 2D
- Image/Video Resolution: 480p (Or whatever your quality preference is)
- Fps: 60, 50, 30, 24

Go to "Settings" > "Settings" > "General" and at the very top you can set the folder where the downloads will be saved. It's best to create a new folder called "JDownloader" in a drive which has a good amount of space. (at least 10+ Gigabytes)

Once you've done that, head back to the "LinkGrabber" tab and delete the top row that has the box icon to the left of it by right-clicking it and going 'Delete'. Then re-copy the YouTube link you copied before and let it parse it. (If you've disabled the automatic link parsing, you can manually scan links with the "Add New Links" button in the bottom left. You should hopefully now only see one file available to download if the link you copied wasn't a playlist. If you're happy with the selection scheduled for download, you can press the blue download button on the far top left side under "File". Then just sit back and let the files download.

Once it reaches 100% it's downloaded and you can right click the video file and choose "Open Download Directory" to open the folder where you saved it. If you want you can also double click the file to play it from JD.

If you encounter any issues with the download, you should try updating to the latest JD version as YouTube often patches their website which breaks the download capabilities of most downloaders. If you still have issues you could search for the issue you are having in a search engine.

Download Videos Using Stacher (Free) (Bulk Downloads, Imprecise Control)
Stacher is a free program used to download YouTube videos and playlists. It requires FFMPEG like JDownloader above but unfortunately you have to install it manually this time. Just head to the link above and download the executable for your operating system. To install it, just use a browser to look up "how to install FFMPEG". But I have included a bried summary below:

FFMPEG Installation for Windows
Download the latest binaries from the yt-dlp maintained repo. Once downloaded, in Stacher click the 'Tools' menu and select the Import ffmpeg *.zip option. A dialog will appear where you can select your downloaded zip file. Once selected, wait for Stacher to extract the zip and install the files to the stacher home directory. When complete, you will get a message indicating ffmpeg has been set up.

Once installed and the FFMPEG files have been copied then you can start downloading after a few settings tweaks! First, click the little download icon in the top right corner to choose your video settings. You don't have much control over the quality, but at least it's easy use. I recommend just choosing "MP4" if you're a beginner. You should also set the download folder. To do so, click the "Stacher" button at the top and then choose "Settings". From there you can set the download folder where the videos will be saved – I recommend a folder called "Stacher" so it's obvious.

A little further down you will see the "Output Filename" option. If you want exactly the same filename as the video you are downloading, then click on the unlock icon, delete whatever text is in the field and click the "title" button below it. (Note: The button doesn't work unless you click the actual text of the button). Exit the settings menu using the pink button at the bottom and finally head to YouTube and copy the link to a video or playlist you want to download, then swap back to Stacher and paste it in the field at the top and press enter.

Stacher will parse the link and either begin the download if the link is for a single video or it will give you options to download any of the videos in the playlist link. In this case you just have to un-tick any videos you don't want to download and click the "Download Selected" button. That's about it for Stacher. If you have questions or issues, have a look at the Stacher Getting Started page.

Video Quality
There are usually a range of resolution choices when downloading videos which can be quite confusing if you aren't familiar with them. Below I'll quickly go over the most common ones so you have an idea of what type you want to go with to have the best medium between quality and low file size.

In general I try to match the type of content with the appropriate quality type. So I use 480p by default for 85% of everything I download and then bump it up to 720p for detailed tutorials and download in audio/MP3 for a couple which I don't need to see anything on. It may be worth considering using 360p as your default quality since having the video and trying to make out what is on-screen would be better than not having that video at all due to space issues. Just something to think about.

MP3	You don't have to download the entire video if you only need the audio. This is the most condensed way to convey information besides text and is recommended if you don't need to see what's happening. For example, some of Canadian Prepper's videos have the camera aimed at a book or the wall while he discusses various preparedness topics, this is one of the examples where downloading the video in MP3 would be ideal. Another would be video podcasts, where having the video isn't necessary as anything visual is generally explained in detail.
144p	The lowest video quality YouTube deals in. Extremely hard to make out detail on-screen. Not recommended to download videos in.
240p	It's watchable, but still quite useless if you need to see fine details such as a video on tying knots.
360p	This is the lowest quality I will download videos in. It's not bad if you are watching some wide-angle instructional videos.
480p	A decent quality to be able to see what you need, but also comes in a fairly small file size. I use this quality by default unless it's a video with fine details.
720p	HD Quality – This is probably the upper limit you would want to download the bulk of your videos in as they take up quite a bit of space. This quality is perfect for videos showing programming code, knitting tutorials or any videos where a whiteboard is drawn on.
1080p	Full HD Quality – Similar quality to what you get streamed to your TV at home. I would only download 1080p if you need to see ultra fine details such as soldering circuit boards.
4K	Ultra HD Quality – An insane quality and a waste of space for downloading prepping videos. Very few YouTubers upload videos in 4K too.

Video Frames Per Second (FPS)
Some videos give you the option to choose between 30 FPS and 60 FPS. This is the count of how many images are displayed on-screen within one second – hence 'Frames Per Second'. It makes the video appear smoother and more life-like. There's not really any need to download videos in 60 FPS, unless there's a lot of fast movements happening which you need to see in detail.

What to Download
When it comes choosing what you want to download you can pretty much download whatever takes your fancy, but in the interest of preparedness related topics, there's a few categories you definitely need to address, such as:
- Preparedness Topics – Gear, Water, Bugging In/Out, Shelter, Planning, SHTF
- Survival – Bushcraft, Foraging, Living off the land.
- Medical – First Aid, Trauma, iFAKs, Herbalism
- Homesteading – Animal Husbandry, Breeding, Land Management
- Gardening – Farming, Permaculture, Harvesting, Seeds
- Food – Cooking, Recipes, Preserving
- Tactical – Stealth, Combat, Tactics, Home Defence, Situational Awareness
- Weapons – Guns, Bows, Swords, Conceal Carry
- DIY – Carpentry, Welding, Plumbing, Electrical
- Education – Math, Physics, Science, Biology
- Entertainment – Cat Videos, Gaming Videos, (Whatever you enjoy watching on YouTube outside of prepping)
- Kids – Videos or TV shows for kids to keep them entertained.
- Faith – Religious Sermons, Bible Reading, Commentaries
- Truth – Always the first casualty in war, question everything for the sake of your personal health and look into both sides of any argument for any topic you support. Be your own expert and don't simply trust those who claim to be those experts

You will want to avoid downloading videos with limited SHTF use, such as current news updates. Focus more on the "How Do I" videos and tutorials rather than the here and now.

Recommended YouTubers
See the top of the Media section above for the recommended preparedness based YouTubers.

Storage Options
So, you've now downloaded a ton of prepper videos. How do you store all of this data? This becomes the primary issue after you've begun downloading entire channels every other week. I know I've filled an entire hard drive with YouTube videos, even downloading at just 480p. To answer this question I had to look at how I was planning on watching the videos. After some thought I figured I would be watching them on either my phone or tablet since there probably won't be AC power to run my desktop or laptop for any decent length of time. These devices both have USB-C connectors, so I knew I wanted a hard drive that could be plugged directly into them without the need for an external power brick like some hard drives have.

After some searching I found the one I was looking for, a Samsung 1TB T7 SSD. This hard drive is USB-C and can be plugged straight into my phone or tablet without the need for external power, and lets me watch any of the content on it directly. Sure, it drains my device's battery a little quicker, but I also have the option to copy some of the videos to my device's storage to watch later when I need it.

I managed to fit 15,388 videos onto my 1TB YouTube SSD with an average quality of 480p. So that means on average, each video is about 60mb. To utilize this data, I can either search for specific YouTube channels manually or search for a specific term like "water filter" to find what exactly I'm looking for in my archive. Overall it's the perfect solution for the problem I was looking to solve and now I feel much more prepared knowing that I have all of this knowledge readily accessible. Remember that this data is meant to be watched now so you have this knowledge BEFORE a disaster, don't just let it sit there collecting dust.

Fiction Post-Apocalyptic

Some fictional post-apocalyptic books relating to disasters.

One Second After William R. Forstchen	The novel deals with an unexpected electromagnetic pulse attack on the United States as it affects the people living in and around the small American town of Black Mountain, North Carolina.
One Year After William R. Forstchen	Two years since nuclear weapons were detonated above the United States and brought America to its knees. After months of suffering starvation, war, and countless deaths, the survivors of Black Mountain, North Carolina, are beginning to recover technology and supplies they had once taken for granted.
The Final Day William R. Forstchen	Since the detonation of nuclear weapons above the United States more than two years ago, the small town of Black Mountain, North Carolina has suffered famine, civil war, and countless deaths. Now, after defeating a new, tyrannical federal government, John Matherson and his community intend to restore their world to what it was before the EMP apocalypse. For the most part, they are succeeding.
Going Home A. American	When Morgan Carter's car breaks down 250 miles from his home, he figures his weekend plans are ruined. But things are about to get much, much worse: the country's power grid has collapsed. There is no electricity, no running water, no Internet, and no way to know when normalcy will be restored—if it ever will be. An avid survivalist, Morgan takes to the road with his prepper pack on his back.

Surviving Home A. American	In A. American's first novel, Going Home, readers were introduced to Morgan Carter, the resourceful, tough-as-nails survivalist who embarks on a treacherous 250-mile journey across Florida following the collapse of the nation's power grid. Now reunited with his loving wife and daughters in this follow-up to Going Home, Morgan knows that their happiness is fleeting, as the worst is yet to come. Though for years Morgan has been diligently preparing for emergency situations, many of his neighbours are completely unready for life in this strange new world—and they're starting to get restless.
Escaping Home A. American	After the collapse of the nation's power grid, America is under martial law—and safety is an illusion. As violence erupts around him, Morgan Carter faces one of his most difficult decisions yet: whether to stay and defend his home, or move to a more isolated area, away from the prying eyes of the government. He and his family are hesitant to leave their beloved Lake County, but with increasingly suspicious activities happening in a nearby refugee camp, all signs point towards defecting. Morgan and his friends aren't going to leave without a fight, though—and they'll do anything to protect their freedoms.
Alas, Babylon Pat Frank	"Alas, Babylon." Those fateful words heralded the end. When a nuclear holocaust ravages the United States, a thousand years of civilization are stripped away overnight, and tens of millions of people are killed instantly. But for one small town in Florida, miraculously spared, the struggle is just beginning, as men and women of all backgrounds join together to confront the darkness.
299 Days Glen Tate	299 Days: The Preparation, the first book in the 299 Days series, depicts the inner struggles Grant must face as he exists in a social system he recognizes as unsustainable and on the verge of collapse, but one in which he has built his life around. What begins as a return to his roots, self-sufficiency and independence, becomes a full blown move to prepare for what may come. It's not as well written as some of the other books here.
The Andromeda Strain Michael Crichton	The United States government is given a warning by the pre-eminent biophysicists in the country: current sterilization procedures applied to returning space probes may be inadequate to guarantee uncontaminated re-entry to the atmosphere. Two years later, seventeen satellites are sent into the outer fringes of space to collect organisms and dust for study. One of them falls to earth, landing in a desolate area of Arizona. Twelve miles from the landing site, in the town of Piedmont, a shocking discovery is made: the streets are littered with the dead bodies of the town's inhabitants, as if they dropped dead in their tracks.
Lights Out David Crawford	The novel examines how normal Americans might cope with a true national disaster shutting down the nations electrical grid and follows the downward spiral created by such an event.
Expatriates - A Novel of the Coming Global Collapse James Wesley Rawles	Since America's socioeconomic collapse, a newly radicalized Islamic government has swept through the Pacific southeast! The Jeffords---a family of Christian missionaries living in the Philippines---must use every survival skill they know if they're going to safely navigate through rough waters, food shortages, and enemy combatants. If they can reach Australia, will they be safe? And for how long?
The Old Man and the Wasteland Nick Cole	Forty years after the destruction of civilization... Man is reduced to salvaging the ruins of a broken world.
The Savage Boy Nick Cole	The second story in Nick Cole's suspenseful odyssey into the dark heart of the Post-Apocalyptic American Southwest.
The Road is a River Nick Cole	The Road is a River concludes Nick Cole's fantastic Wasteland Saga.

Permaculture

A list of the best permaculture books.

Introduction to Permaculture Bill Mollison	Introduction to Permaculture is an updated and revised version of the first two permaculture books, Permaculture One (Mollison and Holmgren, 1978) and Permaculture Two (Mollison, 1979), and replaces them.
Permaculture: A Designer's Manual Bill Mollison	Permaculture (permanent agriculture) is the conscious design and maintenance of agriculturally productive ecosystems which have the diversity, stability, and resilience of natural ecosystems. It is the harmonious integration of landscape and people providing their food, energy, shelter, and other material and non-material needs in a sustainable way. Without permanent agriculture there is no possibility of a stable social order. Permaculture design is a system of assembling conceptual, material, and strategic components in a pattern which functions to benefit life in all its forms.
Gaia's Garden Toby Hemenway	Many people mistakenly think that ecological gardening—which involves growing a wide range of edible and other useful plants—can take place only on a large, multiacre scale. As Hemenway demonstrates, it's fun and easy to create a "backyard ecosystem" by assembling communities of plants that can work cooperatively and perform a variety of functions.
Edible Forest Gardens Dave Jacke & Eric Toensmeier	One of the most thorough references for a permaculturist in North America's temperate climate. It is one of the few books on Permaculture which is not simply restating what has already been written. Instead it is intended for someone who already understands Permaculture. This book not only explains how to fill the niches needed in the design of properties, it includes a vast amount of information on over 600 plants and how they fill various niches.
The Ultimate Guide to Permaculture Nicole Faires	While this may not be the best Permaculture book when compared to all of the above, the distinct advantage of this book is its price. For the introduction to permaculture you get from this book it can often be found for significantly less than most of the books above in this list, anywhere from 50% to 85% less than some of the books above.
Restoration Agriculture Mark Shepard	Restoration Agriculture explains how we can have all of the benefits of natural, perennial ecosystems and create agricultural systems that imitate nature in form and function while still providing for our food, building, fuel and many other needs - in your own backyard, farm or ranch. This book, based on real-world practices, presents an alternative to the agriculture system of eradication and offers exciting hope for our future.
Sepp Holzer's Permaculture: A Practical Guide to Small-Scale, Integrative Farming and Gardening Sepp Holzer	Sepp Holzer farms steep mountainsides in Austria 1,500 meters above sea level. His farm is an intricate network of terraces, raised beds, ponds, waterways and tracks, well covered with productive fruit trees and other vegetation, with the farmhouse neatly nestling amongst them. This is in dramatic contrast to his neighbours' spruce monocultures. In this book, Holzer shares the skill and knowledge acquired over his lifetime. He covers every aspect of his farming methods, not just how to create a holistic system on the farm itself, but how to make a living from it.

Gardening

A list of some great gardening books.

The All You Can Eat Gardening Handbook Cam Mather	There's never been a better time to grow your own food as we face the converging challenges of the financial crisis, climate change, water shortages, peak oil, and 6.5 billion people worldwide competing for a limited amount of food.

All New Square Foot Gardening Mel Bartholomew	"Top 10 Gardening Best-Seller."-Publishers Weekly "This is a good, competent gardening book, well written & sensibly presented."-Library Journal "How to get more from less is one of life's major challenges today.
CA$H from Square Foot Gardening Mel Bartholomew	Demonstrates square foot gardening techniques, discusses planning, soil preparation, transplanting, and harvesting, and gives advice on selling surplus produce.
The Vegetable Gardener's Bible: Discover Ed's High-Yield W-O-R-D System for All North American Gardening Regions Edward C. Smith	A comprehensive guide to growing your own fruit and vegetables. It offers practical advice ranging from building raised beds, planning your veg patch to making your own compost.
The Botany of Desire Michael Pollan	The Botany of Desire: A Plant's-Eye View of the World is a 2001 nonfiction book by journalist Michael Pollan.

Homesteading

A list of some great homesteading books.

Strategic Relocation-North American Guide to Safe Places Joel Skousen	This is the long-awaited update of Mr. Skousen's classic book on relocation for security. Nearly 3/4 of this 3rd Edition is rewritten and it is expanded to 349 pages. In the process, the authors created all new graphics, charts and tables. There is also a new section on international retreat potential and 200 additional pages of analysis on every state and province of the US and Candada, complete with colour maps.
The Encyclopedia of Country Living Carla Emery	From craft culture to survivalists, preppers, homesteaders, urban farmers, and everyone in between there is a desire for a simpler way of life—a healthier, greener, more self-sustaining and holistic approach to modern life.
The Modern Survival Retreat Ragnar Benson	Modern retreaters have a new enemy to fear - our own government. In this companion to the classic book The Survival Retreat, Ragnar answers such vital questions as how to identify exactly who threatens your freedom, when to occupy your retreat and how to fight the government when it goes hard-core against you.
You Can Farm: The Entrepreneur's Guide to Start & Succeed in a Farming Enterprise Joel Salatin	Have you ever desired, deep within your soul, to make a comfortable full-time living from a farming enterprise? Too often people dare not even vocalize this desire because it seems absurd. It's like thinking the unthinkable.
Back to Basics: A Complete Guide to Traditional Skills (Back to Basics Guides) Abigail R. Gehring	Anyone who wants to learn basic living skills—the kind employed by our forefathers—and adapt them for a better life in the twenty-first century need look no further than this eminently useful, full-colour guide.
The Encyclopedia of Country Living, 40th Anniversary Edition Carla Emery	From craft culture to survivalists, preppers, homesteaders, urban farmers, and everyone in between there is a desire for a simpler way of life—a healthier, greener, more self-sustaining and holistic approach to modern life.

Firearms

A list of the best firearms books.

Boston's Gun Bible Boston T. Party	Boston's Gun Bible goes into great detail about the pros and cons of various defensive weaponry, equipment, and the philosophy behind their appropriate usage. The work is markedly political, obviously pro gun, and has a rather witty "screw the hoplophobes" tone.
Survival Guns Mel Tappan	Survival Guns remains the definitive book for anyone interested in the practical use of firearms and related weapons for defence, food gathering, and predator and pest control under conditions of long-term, self-sufficient living.
Blue Book of Gun Values S. P. Fjestad	The firearms industry standard is back with the new 38th Edition Blue Book of Gun Values! This edition has been updated with current market trends, values, and 2017 makes and models. With 2,512 pages covering 1,500+ manufacturers, nearly 30,000 gun model descriptions, and over 180,000 prices.
The Secure Home Joel Skousen	This book covers all the types of mechanical systems, including alternative equipment for heating, cooling, and power generation, using multiple sources - wood, water, wind, solar, and various types of combustible fuel. This new 4th edition is a complete textual update and contains all the latest technology on solar systems and lithium-ion batteries.
Flayderman's Guide to Antique American Firearms and Their Values Norm Flayderman	Contains gun identification for more than 4,000 antique American firearm models and variants, extensively described with all marks and specifications necessary for quick identification.
Ultimate Sniper 2006 Maj. John L. Plaster	An Advanced Training Manual for Military and Police Snipers
U.S. Army Ranger Handbook U.S. Army	This handbook offers the techniques and tactics that make U.S. Army Rangers the best soldiers in the world. These highly trained, easily deployable, and widely skilled infantrymen specialize in airborne assault, raids, recovery of personnel and equipment, and airfield seizure, among other difficult and dangerous missions.
Principles of Personal Defence Jeff Cooper	This new edition of Cooper's classic Principles of Personal Defence - with a fitting tribute by firearms expert Louis Awerbuck and all-new drawings by renowned illustrator Paul Kirchner - presents his timeless theory of individual defensive behaviour clearly, concisely and practically.

Health

A list of the best health books.

The Survival Medicine Handbook: A guide for when help is NOT on the way Joseph & Amy Alton	The Survival Medicine Handbook (tm) is not your standard first aid book. It assumes that no hospital or doctor is available in the aftermath of a catastrophic event. This book will give you the tools to handle injuries and illness for when YOU might be the end of the line with regards to your family's medical well-being.
Herbal First Aid and Health Care Kyle D. Christensen	Herbal First Aid is a first aid manual which describes the treatment and management of first aid emergencies and other primary and secondary care with an emphasis on the application of herbal medicine. This book includes detailed protocols in treating first aid emergencies as well as protocols for not so urgent care.
Special Operations Forces Medical Handbook U.S. Army	Nearly 140 comprehensive illustrations show the proper techniques for medical care, from basic first-aid and orthopedics to instructions for emergency war surgery and even veterinary medicine. Questions are listed so that the medic can obtain an accurate patient history and perform a complete physical examination.
The Herbal Medicine-Maker's Handbook: A Home Manual James Green	THE HERBAL MEDICINE-MAKER'S HANDBOOK is an entertaining compilation of natural home remedies written by one of the great herbalists, James Green, author of the best-selling THE MALE HERBAL. Writing in a delightfully personal and down-home style, Green emphasizes the point that herbal medicine-making is fundamental to every culture on the planet and is accessible to everyone.
Where There Is No Doctor: A Village Health Care Handbook David Werner	Useful for health workers, clinicians, and others involved in primary health care delivery and health promotion programs, with millions of copies in print in more than 75 languages, the manual provides practical, easily understood information on how to diagnose, treat, and prevent common diseases.
Where There Is No Dentist Murray Dickson	Community health workers, educators and individuals from around the world use Where There Is No Dentist to help people care for their teeth and gums. From preventing and treating common dental problems to making low-cost equipment, this title covers essential topics in oral health and hygiene.
Where There Is No Vet Bill Forse	Where There is No Vet is more than just a book on first aid for animals. It aims to help people keep their animals healthy. It covers a wide range of topics that affect the health of livestock, from diarrhoea to rinderpest, from helpful traditional remedies to the uses of modern medicines and vaccines. It includes advice on the care, feeding, and handling of animals.
Wilderness Medicine, 5th Edition Paul S. Auerbach	New chapters on judgment and decision-making and mental health. First-aid topics--patient assessment, shock, soft tissue injury, burns, fractures and dislocations, and chest, head, and abdominal injury. How to handle environmental problems--heat, cold, water, altitude, and poisonous plants and animals.

Classic Novels

Children's Books

A list of the best children's books.

Alice's Adventures in Wonderland Lewis Carroll	Alice eagerly delves into a rabbit hole of imagination, meeting some of the quirkiest characters in literature, from the Mad Hatter to the Queen of Hearts. This is Carroll's parody of Victorian society, and the complications of children growing up.
The Adventures of Tom Sawyer Mark Twain	Be transported back to the Mississippi towns of Twain's own childhood. The exciting adventures of Tom Sawyer are full of nostalgia for an innocent childhood, mixed with the tension of a worldly reality of poverty, superstition, and slavery.
Grimm's Fairy Stories Jacob Grimm	This classic children's book is a home to the world's most famous fairy tales. From Sleeping Beauty and Cinderella, to Rapunzel and Little Red Riding Hood, among many more.
Peter and Wendy J. M. Barrie	Barrie's imagination has brought joy to millions of children around the world. His tales of the boy who never grew up, Captain Hook, the Lost Boys, and, of course, Wendy, offer a perfect world in which to escape to.
Gulliver's Travels Jonathan Swift	When Lemuel Gulliver is cast adrift, he has to fight for his survival against a number of groups of strange and surreal societies. These societies are Swift holding a mirror up to ourselves, our own principles and values, and our own crude behaviours.
Charlie And The Chocolate Factory Roald Dahl	Mr Willy Wonka is the most extraordinary chocolate maker in the world. And do you know who Charlie is? Clutching their Golden Tickets, they arrive at Wonka's chocolate factory. But what mysterious secrets will they discover?

Literary Classics

A list of the best literary classics. Most of these are free to download from www.gutenberg.org/

A Tale of Two Cities Charles Dickens	A twisting and complex tale of London and Paris during the period of the French Revolution. This is a novel intertwined with sly humour, masterful prose, and a gang of Dickens' most loved characters.
Les Misérables Victor Hugo	An instantly popular novel showcasing the dark underbelly of 19th century Paris. Hugo makes clear his criticisms of the French political system throughout this dense web of larger-than-life characters and plot twists.
David Copperfield Charles Dickens	This tragi-comic novel was the novel Dickens' was most proud of. This is a story of a lowly peasant on a mission to become a successful novelist, passing through the lives of innumerable fascinating characters on the way.
Dracula Bram Stoker	A renowned Gothic horror, in which Stoker sets the benchmark for what vampires should be for modern authors. This is a tale of Count Dracula's migration from Transylvania to England, in search of fresh blood.
The Call of The Wild Jack London	Based on London's philosophy about life's struggles and nature's power, The Call of The Wild is an enduring masterpiece. Follow Buck, the central canine character, on his journey from luxury to slavery as he is passed between masters to endure conditions he could never have imagined.
The Iliad Homer	Written over 2000 years ago, The Iliad is one of the greatest war stories ever told. Through this sprawling epic, Greek mythology is interwoven with intense character development, as the Greeks make a final attack on Troy.
The Odyssey Homer	The Odyssey is in effect the sequel to The Iliad. This is an epic poem following the moral and physical endurance of Odysseus after the Trojan War, on his adventurous journey home.
Great Expectations Charles Dickens	Pip's desire to become a wealthy gentleman sees him caught up in crime, guilt, revenge, love, and "great expectations". This is not only a story of rags to riches, but also one of moral redemption.
Heart of Darkness Joseph Conrad	This dark, exciting allegory tells the story of seaman Marlow as he searches through the heart of Africa for the infamous ivory trader, Kurtz. Shining a glaring light on how Western civilization gained its power, this short novel forces us to question our values and principles in a fundamental way.
Ulysses James Joyce	Ulysses is a modernist novel, telling the story of Leopold Bloom and Stephen Dedalus in Dublin, 1904. Not for the faint-hearted, this is a book that is as elusive and difficult as it is rewarding.

Don Quixote Miguel de Cervantes Saavedra	Known as being the "first modern novel", this is an experimental tale of the adventures and misadventures of knight-errant Don Quixote and his squire. Influential to hoards of great writers, this 1000-page novel is well worth the effort.
Pride and Prejudice Jane Austen	A witty tale of love, fortune, and flirting between the ever popular Mr Darcy, and Elizabeth Bennet, as the latter struggles with the manners and morality of the early 19th century landed gentry.
Robinson Crusoe Daniel Defoe	Shipwrecked on an uninhabited island, Robinson Crusoe must learn to survive, with just his pipe, tobacco, and knife as tools. This is more than just a survival tale, with contemplation (and a Christian message) at the centre. This book can be found in its entirety in the ENTERTAINMENT section of this guide.
Treasure Island Robert Louis Stevenson	On a voyage to a faraway island, Jim is searching for his fortune. Along his journey, as he becomes a man, his friendship with his shipmates explores the complex relationship between good and evil.
Wuthering Heights Emily Brontë	The subject of this original English novel is the intense love between Heathcliff and Catherine Earnshaw. Unfortunately, that love is far from simple, destroying not just the lovers, but also those close to them.
The Thirty-Nine Steps John Buchan	Set in World War I, this is an espionage thriller that's unremittingly popular. From boredom in London, to hiding from the Germans in Scotland, this is a tale loved so much that it's been adapted to film many times over.
Moby Dick Herman Melville	A deep exploration into the human mind, and faith, Captain Ahab is on a quest against an allusive, terrifying creature. Packed with metaphors about life and society, this is a book that truly stands the test of time.
The Picture of Dorian Gray Oscar Wilde	Dorian Gray sells his soul so that his portrait will age, rather than himself. Free to act in as many sinful and hedonistic ways as possible, the only way Dorian can see the state of his soul, is to gather the courage to make eye contact with that fateful painting.
The Importance of Being Earnest Oscar Wilde	This satirical look at the social conventions of Victorian London tells a light-hearted story of mistaken identities and secret romances.
Frankenstein Mary Shelley	As life is given to the lifeless, a cautionary tale is told of the "progress" of science. Frankenstein is a being created from stolen body parts. A being that rapidly descends from innocence to evil to enact violent revenge on his creator.
The Adventures of Sherlock Holmes Sir Arthur Conan Doyle	A series of short stories, these detective tales show nothing but story-telling genius. Each tale keeps you hooked from the outset, as Sherlock Holmes solves one complex case after another.
The Great Gatsby F. Scott Fitzgerald	Much more than a novel, this is an allegory of the American Dream. You'll be transported to the decadent Jazz age of 1920s America as Jay Gatsby does all he can to win the affections of Daisy Buchanan.
The Scarlet Letter Nathaniel Hawthorne	This is the novel that introduces you to the first ever heroine of American literature: Hester Prynne, as she struggles with an illegitimate birth. It's this birth that causes two sides of Hester's self to clash, provoking a fascinating look at the relation one has with oneself.
Three Men in a Boat Jerome Klapka	This hilarious story of (you guessed it) three men in a boat is full of quips that'll leave you in stitches, even today. What's meant to be an enjoyable jaunt up the River Thames soon turns into a series of comic misadventures.

Sci-Fi

A list of the best sci-fi books.

The Time Machine H. G. Wells	A dystopian novella from 1895, this isn't just the novel that popularized the idea of time travel. It also earned H.G. Wells the title of "The Father of Science Fiction". This book is a must for any sci-fi geek.
The Iron Heel Jack London	London's critique of capitalist society is told alongside the struggles of a socialist revolution spearheaded by the infamous "Brotherhood of Man".
Around The World in 80 Days Jules Verne	Follow the misadventures of Phileas Fogg after he bets a friend that he can travel around the world in 80 days or less by any means possible (including elephant). This fast-paced voyage has gripped readers ever since the book was first published in 1872.
The Strange Case of Dr. Jekyll and Mr. Hyde Robert Louis Stevenson	This Gothic horror is known as one of the most original pieces of fiction ever written. A potion developed by Dr. Jekyll serves to transform the polite gentleman into something twisted and sinister. Something perhaps resembling the real self of Dr Jekyll?
The Coming Race Edward Bulwer-Lytton	Taking inspiration from Charles Darwin's theory of evolution, this is a dystopian view of a future world. A future world where subterranean populations show an imaginary future where technological progress and physical perfection are raised above all else.
The Lost World Arthur Conan Doyle	This mysterious island, home to prehistoric creatures, hasn't only inspired readers' imaginations since 1912. It's also the direct inspiration for the Jurassic Park movies. In a location that evolution has barely touched, follow journalist Malone and Professor Challenger as they explore this untouched land.

8 Documentaries

Disaster related documentaries which will provide some entertainment and possibly some advice.

American Blackout - National Geographic	The National Geographic Channel's fictionalized account of a 10-day blackout following a major cyber attack draws on previous events and expert opinions to paint a rather bleak picture. **https://www.youtube.com/watch?v=zNfJkMPTtWQ**	**Duration - 1h 27m**
After Armageddon - Full Movie	The plot centres around the Johnson family of Los Angeles, California, one of a small number of families to survive a global pandemic that, according to the opening of the film, occurs "sometime in the future..." The disease began as a particularly virulent flu strain in Southeast Asia. Efforts made to contain the virus in that portion of the world are ineffective as global transportation networks carry infected individuals all around the world. **https://www.youtube.com/watch?v=OtP80Z08lfg**	**Duration - 1h 27m**
The World Without Oil Documentary	A possible unfolding of how a world without oil would occur. **https://www.youtube.com/watch?v=WY4BB3HFi5g**	**Duration - 58m**

Aftermath - When the Earth Stops Spinning	An example of what disasters may occur if the earth stops spinning over a few years. **https://www.youtube.com/watch?v=m7ys1zrY7nc**	**Duration - 45m**
World War A - When Aliens Attack	Are there extraterrestrials and what will happen when aliens attack us? **https://www.youtube.com/watch?v=Lrfr06Sj3vQ**	**Duration - 52m**
San Andreas Fault Earthquake Prediction	In this edition of Documentary films, we are going to take you through a journey where you can learn about the San Andreas Fault earthquake prediction. **https://www.youtube.com/watch?v=LpFyWPTX2ug**	**Duration - 1h 0m**
Tsunami - Documentary Movie - Deadly Tsunamis and Mega Tsunamis	The unfolding of a tsunami and how it would affect life. **https://www.youtube.com/watch?v=-cezuj0wVC8**	**Duration - 50m**
MegaQuake Could Hit North America - BBC	A look at a possible mega earthquake in North America and how it would unfold. **https://www.youtube.com/watch?v=vEgLjgnv_3c**	**Duration - 47m**
National Geographic | Evacuate Earth - Documentary HD	How we would evacuate earth in the face of impending disaster. **https://www.youtube.com/watch?v=_obe0kziaxE**	**Duration - 1h 29m**
Life After People	How the world will unfold if humans just disappeared. **https://www.youtube.com/watch?v=GyEUyqfrScU**	**Duration - 1h 25m**
Last Days On Earth	The top 7 most likely ways the world could end. **https://www.youtube.com/watch?v=LWZSDi1TV8Y**	**Duration - 1h 22m**
Yellowstone Supervolcano	A detailed timeline of a supervolcano eruption at Yellowstone that will affect the world. **https://www.youtube.com/watch?v=WFaFfdOzPP8**	**Duration - 1h 27m**

9 Tv Series

Tv shows which have something to do with prepping or survival which may be of interest during any disaster, you may also learn something.

Doomsday Preppers (A Must Watch)	Doomsday Preppers was an American reality television series that aired on the National Geographic Channel from 2011 to 2014. The program profiles various survivalists, or "preppers", who are preparing to survive the various circumstances that may cause the end of civilization, including economic collapse, societal collapse, and electromagnetic pulse. The quality of their preparations is graded by the consulting company Practical Preppers, who provide analysis and recommendations for improvements.	**4 Seasons 54 Episodes**
The Walking Dead	The Walking Dead is an American post-apocalyptic horror television series that is based on the comic book series of the same name. Rick Grimes, awakens from a coma discovering a world overrun by zombies, commonly referred to as "walkers". Grimes reunites with his family and becomes the leader of a group he forms with other survivors. Together they struggle to survive and adapt in a post-apocalyptic world filled with walkers and opposing groups of survivors, who are often more dangerous than the walkers themselves.	**10 Seasons**
Survivorman	This poor guy is really out in the wild by himself. So he'd have to set up his camera, then redo whatever he was doing. It was a tirelessly long process for him. Yet, he'd do it just to show you that surviving on your own is actually something that can happen.	**8 Seasons 51 Episodes**
Man vs. Wild	Bear Grylls is going to appear on this list multiple times. The reason? He is a great survivalist. He usually films himself in a location where someone might end up stranded whether by an accident taking place or for any number of reasons really. Then he shows you how he would take on these situations. It is really quite interesting, and you could learn some tips from him as well.	**7 Seasons 73 Episodes**
Alone	Follows the self-documented daily struggles of 10 individuals (7 paired teams in season 4) as they survive in the wilderness for as long as possible using a limited amount of survival equipment. With the exception of medical check-ins, the participants are isolated from each other and all other humans. They may "tap out" at any time, or be removed due to failing a medical check-in. The contestant (or team in Season 4) who remains the longest wins a grand prize of $500,000.	**7 Seasons 76 Episodes**
Out of the Wild: The Alaska Experiment	This television show is one of many that is based around Alaska. It is one of the last true frontiers left in America. So people find it fascinating when people can survive the harsh conditions and actually learn to thrive in a place that can be both beautiful and unforgiving too.	**3 Seasons 16+ Episodes**
The Island	This is a TV show that is hosted by Bear Grylls. He sends a group of modern men to an island with nothing but the clothes they are wearing and a few survival tools. So they must hunt, gather, and build anything that they need and must survive in the wilderness. Plus, they have to videotape everything! This is a true test of what you are made of in this day in age.	**6 Seasons 38 Episodes**
Dude, You're Screwed	They take the best of the best in the world of survival and put them to the test. You have a group of well-versed outdoorsmen that take turns kidnapping one guy in the mix. Then they randomly drop the selected guy into a rough environment. They must survive until they find their pick-up location.	**2 Seasons 15 Episodes**
The Colony	This is a science-fiction drama Tv series that is based in the near future. A group of rebels decides to invade Los Angeles. Some people are going with those that invaded and some are fighting against them and paying a high price for doing so. But this story follows a couple who have to decide which side of the fence they are going to be on when it could determine if they ever see their son again, who they were separated from when the invasion happened.	**3 Seasons 36 Episodes**

ADDENDUM | Media | Tv Series

Extreme Survival	This television show is hosted by Ray Mears. He travels the globe in an effort to survive and explore many different locations. For example, some shows are filmed in the desert. While others are filmed in the jungle and Alaska as well.	**3 Seasons 18 Episodes**
Running Wild with Bear Grylls	Bear Grylls take Hollywood by storm and definitely jerks them out of their comfort zone. Actually, he takes really famous actors and plunges them into survival situations. They not only have to survive together, but he teaches the celebrities a thing or two along the way.	**5 Seasons 43 Episodes**
Beyond Survival	Les Stroud is Survivorman. On this new adventure, though, he isn't going it alone. He is taking some of his good friends with him. Then they travel to some really remote locations in Africa to meet with indigenous tribes. They learn new survival skills from these tribes and even get to participate in tribal ceremonies.	**1 Season 10 Episodes**
Survive This	This show is enough to send most modern kids into panic mode. Les Stroud takes a group of kids into the wilderness. But they must leave all electronics at home. He tests them and teaches them how to survive. It is really interesting to see how kids respond to this new reality.	**2 Seasons 26 Episodes**
Surviving Disaster	This is a show based around a Navy Seal, Cade Courtley. He teaches survival skills that many viewers will need if they find themselves in an unimaginable situation. So if you would like to stockpile some knowledge in the event you end up in a situation you never dreamed you would, then you'll want to check this show out.	**1 Season 10 Episodes**
Survival with Ray Mears	This is a three-part documentary where Ray Mears actually goes to different locations and tracks predatory animals in their natural habitats. So as you can imagine this is a fascinating series with some tense points considering the type of animals that are being tracked.	**2 Seasons 12 Episodes**
I Shouldn't Be Alive	Have you ever lived through something and thought, " I really shouldn't have survived that." If so, then you can probably identify with this show. Basically, they re-enact stories of people who were in difficult and unexpected survival situations who actually survived them.	**6 Seasons 58 Episodes**
Wild Food	This is actually a wildlife cooking show. Ray Mears travels the globe to go into natural habitats of natural cuisine. Then he discovers cooking methods from the locals and shares how you can prepare food from the wild as well.	**1 Season 5 Episodes**
Ray Mears' Bushcraft	Ray Mears continues on his journey to educate everyone about how to survive in the wild. He travels all over and puts himself in many different survival situations. So through his different journeys, hopefully, people can learn many different ways to survive no matter what situation they find themselves in.	**2 Seasons 10 Episodes**
Jeremiah	This is another science-fiction television show that many may love. It is about a boy who is living in a time when only a decade ago a virus came through and wiped out anyone above the age of puberty. Now, he is trying to find the safe haven his father once told him about so he can continue his survival.	**2 Seasons 35 Episodes**
Lone Target	Joel Lambert was a Navy Seal and is now starring in his own TV show where he has to evade being captured. So an elite squad of military trained people has to track him down in a remote location. Joel uses survival skills and evasion techniques to make it to his pick-up point.	**2 Seasons 12 Episodes**
Hunting Chris Ryan (Documentary)	Chris Ryan gets dumped into an extreme survival situation. In the midst of this situation, he is also being hunted by a trained 4 man team. So Chris must use his survival skills to survive, avoid capture, and make it to his rendezvous point on time.	**3 Episodes**
Survivorman Ten Days	Les Stroud is a survivalist. He is the Survivorman. In this miniseries, he shows you how to survive on your own in the wilderness. But he doesn't just show you how to survive for an evening. Oh no. In this series, he shows you how to survive for 10 whole days.	**1 Season 5 Episodes**
Storm Chasers	This is another excellent show that I love to watch. You have a group of scientists that go out into the world to chase down some of the deadliest storms. Then when they find one, they put down the claws on their specially made vehicle to collect scientific data. It is a wild ride!	**5 Seasons 36 Episodes**

10 Movies

Realistic End of the World

These are movies about a massive disaster or the end of the world with a plausible probability of them ever occurring on earth.

Supervolcano (2005) ?% Positive Reviews (Semi-Documentary)	Yellowstone is a park, but it's also the deadliest volcano on Earth. Beneath it, a sleeping 'dragon' is stirring. When an earthquake opens a crack for magma to seep through, other warning signs of an eruption start popping up, but they are ignored or dismissed as 'minor'. But when they learn an eruption will happen, panic breaks out through people of the USA and the world. This is a tale told from former Yellowstone scientists, who recall the final days before Yellowstone erupted, and everything changed forever.
The Day After Tomorrow (2004) 44% Positive Reviews	What if we are on the brink of a new Ice Age? This is the question that haunts climatologic Jack Hall. Hall's research indicates that global warming could trigger an abrupt and catastrophic shift in the planet's climate. While Jack warns the White House of the impending climate shift, his 17 year-old son Sam finds himself trapped in New York City where he and some friends have been competing in a high school academic competition. He must now cope with the severe flooding and plummeting temperatures in Manhattan.

Fictional End of the World

These are movies about a massive disaster or the end of the world with an extremely unlikely probability of them ever occurring on earth.

War of the Worlds (2005) 74% Positive Reviews	This is a contemporary retelling of H.G. Wells' seminal sci-fi classic. The adventure/thriller reveals humankind's extraordinary battle against an extra-terrestrial invasion fleet, as seen through the eyes of one American family. Located somewhere in the New England United States, the family -- like millions of others around the globe -- is forced to take refuge from the aliens' highly advanced weapons and impenetrable shields, which are unstoppable against anything that mankind can throw at them. Unable to fight back and finding it more and more difficult to remain hidden from the aliens, the human race faces the end of its existence.

2012 (2009) 40% Positive Reviews	Disaster movie maven Roland Emmerich (Independence Day, The Day After Tomorrow) crafts this apocalyptic sci-fi thriller following the prophecy stated by the ancient Mayan calendar, which says that the world will come to an end on December 21, 2012. When a global cataclysm thrusts the world into chaos, divorced writer and father Jackson Curtis (John Cusack) joins the race to ensure that humankind is not completely wiped out. Chiwetel Ejiofor, Danny Glover, Amanda Peet, Thandie Newton, and Oliver Platt round out the cast of this end-of-the-world thriller co-scripted by the director and his 10,000 B.C. writer/composer, Harald Kloser.
28 Days Later (2002) 86% Positive Reviews	After breaking into a primate research facility, a group of animal rights activists discover caged chimps chained up before banks of screens displaying horrifying, violent images. Ignoring the warnings of the terrified researcher who maintains that the chimps are infected, they begin to free the animals and are immediately subjected to a bloody attack from the enraged creatures. Twenty-eight days later, Cycle courier Jim awakes from a coma in the deserted intensive care unit of a London hospital. He wanders out into a church where he finds dead bodies piled in heaps on the chapel floor.
28 Weeks Later (2007) 71% Positive Reviews	The devastating rage virus that annihilated the British Isles mysteriously resurfaces in Goya Award-winning director Juan Carlos Fresnadillo's sequel to the Danny Boyle-directed horror hit that terrified audiences worldwide by offering a breathless new take on the familiar zombie mythos. Six months has passed since the rage virus caused British residents to indiscriminately murder and destroy everything in their paths, and now the U.S. military has declared victory in the war against the rapidly spreading infection.
The Road (2009) 73% Positive Reviews	"The Road" is a post-apocalyptic dramatic thriller about a father and his son walking alone through burned America. Nothing moves in the ravaged landscape save the ash on the wind. It is cold enough to crack stones, and when the snow falls it is gray. The sky is dark. Their destination is the coast, although they don't know what, if anything, awaits them there. They have nothing; just a pistol to defend themselves against the lawless bands that stalk the road, the clothes they are wearing, a cart of scavenged food -- and each other.
The Cabin in the Woods (2012) 92% Positive Reviews	Five friends go to a remote cabin in the woods. Bad things happen.
The Day (2011) 29% Positive Reviews	The Day follows a group of five survivors in a post-apocalyptic world as they travel through a bleak environment in an attempt to find food, shelter, and a safe place to stop running from tribes of savage cannibals that roam the country-side. They hope to plant two jars of seeds that they either stole or found during their journey. There was at some point twelve in their group, but it is not known how the others died or how long the remaining five have been on the run.
The Day the Earth Stood Still (2008) 21% Positive Reviews	In this contemporary reinvention of the 1951 science fiction classic, renowned scientist Dr. Helen Benson finds herself face to face with an alien called Klaatu, who travels across the universe to warn of an impending global crisis. When forces beyond Helen's control treat the extraterrestrials as a hostile and deny his request to address the world's leaders, she and her estranged stepson Jacob quickly discover the deadly ramifications of Klaatu's claim that he is "a friend to the Earth." Now Helen must find a way to convince the entity who was sent to destroy us that mankind is worth saving--but it may be too late. The process has begun.
The Happening (2008) 18% Positive Reviews	"The Happening" is a lightning-paced, heart-pounding paranoid thriller about a family on the run from an inexplicable and unstoppable event that threatens not only humankind, but the most basic human instinct of them all--survival.
Sunshine (2007) 76% Positive Reviews	As the sun begins to dim along with humankind's hope for the future, it's up to a desperate crew of eight astronauts to reach the dying star and reignite the fire that will bring life back to planet Earth in this tense psychological sci-fi thriller that re-teams 28 Days Later director Danny Boyle with writer Alex Garland and producer Andrew Macdonald. The skies are darkening, and the outlook for planet Earth is grim. Though the encroaching darkness at first seems unstoppable, scientists have concocted one desperate last-ditch plan to buy the human race a temporary reprieve from the grim future that looms just past the horizon.
I Am Legend (2007) 69% Positive Reviews	I Am Legend is a 2007 American post-apocalyptic science fiction horror drama film based on the novel of the same name, directed by Francis Lawrence and starring Will Smith, who plays US Army virologist Robert Neville. The story is set in New York City after a virus, which was originally created to cure cancer, has wiped out most of mankind, leaving Neville as the last human in New York, other than nocturnal mutants. Neville is immune to the virus and he works to develop a cure while defending himself against the hostile mutants.
30 Days of Night (2007) 51% Positive Reviews	30 Days of Night is a 2007 American horror film based on the comic book miniseries of the same name. The film is directed by David Slade and stars Josh Hartnett and Melissa George. The story focuses on an Alaskan town beset by vampires as it enters into a thirty-day long polar night.
Reign of Fire (2002) 40% Positive Reviews	In present-day London, twelve-year-old Quinn watches as his mother, a construction engineer inadvertently wakes an enormous fire-breathing beast from its centuries-long slumber. Twenty years later, much of the world has been scarred by the beast and its offspring. As a fire chief, Quinn is responsible for warding off the beasts and keeping a small community alive as they eke out a meagre existence. Into their midst comes a hotshot American, Van Zan, who says he has a way to kill the beasts and save mankind--a way Quinn's never seen done.
Geostorm 16% Positive Reviews	The Dutch Boy Program staves off natural disasters but somehow a Geostorm is approaching many countries. Jake Lawson, a technology designer, is tasked with saving the world from this disaster.

Comedic End of the World

Zombieland (2009) 90% Positive Reviews	A cowardly shut-in named Columbus (Jesse Eisenberg) is forced to join up with a seasoned zombie slayer named Tallahassee (Woody Harrelson) in order to survive the zombie apocalypse. As Tallahassee sets out on a mission to find the last Twinkie on Earth, the duo meets up with Wichita (Emma Stone) and Little Rock (Abigail Breslin), two young girls who have resorted to some rather unorthodox methods to survive amidst the chaos. Reluctant partners in the battle against the undead, all four soon begin to wonder if it might be better to simply take their chances alone.
Zombieland: Double Tap (2019) 67% Positive Reviews	Zombie slayers Tallahassee, Columbus, Wichita and Little Rock leave the confines of the White House to travel to Graceland in Memphis, Tenn. Along the way, they encounter other post-apocalyptic warriors and a group of survivors who find refuge in a commune. The scrappy fighters must now rely on their wits and weapons more than ever as they soon find themselves in a relentless battle against smarter, faster and seemingly indestructible zombies.
Cockneys vs Zombies (2012) 74% Positive Reviews	A bunch of east-easters fight their way out of a zombie infested London, lead by an unlikely gang of amateur banks robbers and foul-mouthed plucky pensioners. Starring Michelle Ryan, Honour Blackman and Harry Treadaway. The undead are brown bread.

Miracle Mile (1988) 88% Positive Reviews	Miracle Mile starts conventionally enough, with bashful musician Anthony Edwards going ga-ga over waitress Mare Winningham. After a pleasant if somewhat quirky day together, Edwards and Winningham plan a tete-a-tete at the all-night restaurant where the girl works. While preparing to call her on a pay phone, Edwards intercepts a frantic call from a soldier stationed at a Midwestern missile silo. The message: nuclear warheads have been launched, and it's only 70 minutes to Armageddon! This unsettling news casts severe doubts over the future of Edwards' and Winningham's relationship.

11 Programs

A list of useful computer programs that have something to do with preparedness in one way or another.

Pc Programs

Programs for personal computers that will be of benefit to preppers.

MOBAC (Mobile Atlas Creator) *Free*	Map creator for Pc allowing a maximum download of 500K tiles from a range of maps. Get version 1.8 for Google Maps and Google Terrain. Mobile Atlas Creator (formerly known as TrekBuddy Atlas Creator) is an open source (GPL) program which creates offline atlases for GPS handhelds and cell phone applications like TrekBuddy, AndNav and other Android and WindowsCE based applications. As source for an offline atlas Mobile Atlas Creator can use a large number of different online maps such as OpenStreetMap and other online map providers. I recommend version 1.8 because it has more map sources.
Winhttrack *Free*	HTTrack is a free (GPL, libre/free software) and easy-to-use offline browser and downloader utility. It allows you to download a Web site from the Internet to a local directory, building recursively all directories, getting HTML, images, and other files from the server to your computer. HTTrack arranges the original site's relative link-structure. Simply open a page of the "mirrored" website in your browser, and you can browse the site from link to link, as if you were viewing it online. HTTrack can also update an existing mirrored site, and resume interrupted downloads. HTTrack is fully configurable, and has an integrated help system.
GNU Wget *Free*	GNU Wget is a free software package for retrieving files using HTTP, HTTPS, FTP and FTPS the most widely-used Internet protocols. It is a non-interactive command line tool, so it may easily be called from scripts, cron jobs, terminals without X-Windows support, etc.

Offline Wikipedia Readers

These can be used for reading offline Wikipedia backups that have been previously downloaded.

XOWA	XOWA is a free, open-source application that helps download Wikipedia to a computer.
Kiwix	Kiwix is by far the largest offline distribution of Wikipedia to date. As an offline reader, Kiwix works with a library of contents that are zim files: you can pick & choose whichever Wikimedia content, as well as TED talks, PhET maths&physics simulations, etc.
WikiTaxi	WikiTaxi is an offline-reader for wikis in MediaWiki format. It enables users to search and browse popular wikis like Wikipedia, Wikiquote, or WikiNews, without being connected to the Internet.
Aarddict	Aard Dictionary is an Offline Wikipedia reader. No images. Cross-Platform for Windows, Mac, Linux, Android, Maemo.
BzReader	BzReader is an offline Wikipedia reader with fast search capabilities. It renders the Wiki text into HTML and doesn't need to decompress the database. Requires Microsoft .NET framework 2.0.

12 Apps

This section contains a list of a bunch of apps that will be lifesaving in a disaster situation. A lot will change if a SHTF event occurs and this will most certainly include the ceasing of the internet – at least on a local scale. Without this lifesaving resource we will have to either revert to books, shared experience or even trial and error again as this once operational collection of human knowledge will cease to exist.

Along with this, ALL technology that once relied on even a momentary connection to the internet will no longer work. You will be astonished to find out what seemingly 'offline' applications required this great resource. That's where the below list of apps comes in. I've done extensive testing on a huge array of preparedness related apps to see which ones can be used completely offline and which ones 'phone home' to check for Google Play, a license or which require additional downloads before they work.

I have left out a lot of the apps which come packaged with Android these days, such as a Light/Torch, Camera and Calculator. Generally these all work when your phone is 'offline' so there's no real need to download a backup – but it's still good to have a second option anyway.

AFWall+ (Free) (Root Required)	This is the first app I install onto any new phone. It's a firewall which can block any and ALL applications you wish. Since I use a Google keyboard for the swype texting capability, I first install this app and then set it to automatically block ALL newly installed apps so they can never connect to the internet. I also use this feature to test whether new apps require the internet or not.
Alpine Quest (Free/Paid $12 USD)	Simply put – it's the best mapping app that I've had the pleasure of using. It's online but can also be used completely offline if you have the maps pre-downloaded. You can draw points, lines, paths and areas on the map, measure distance, slopes, angles and auto route paths via roads. It supports an unlimited number of markers and allows sorting, activation and deactivation by folder or individually.
Kiwix (Free)	Kiwix is an offline Wikipedia reader. Again you will have to pre-download the data files (some are 80 GB+) but the information you have at your fingers will be life saving. There is a HUGE variety of data files you can download. I have included some of the most pertinent downloads below. All of these downloads are also free to use – there are no copyright restrictions so feel free to share them.

- The Complete Wikipedia Collection (No Pictures – a much smaller file size) (60 Gb)
- The Complete Wikipedia Collection (With Pictures) (109 Gb)
- Wikipedia Geography (No Pictures) (0.6 Gb)
- Wiktionary – The Complete English Dictionary (8.8 GB)
- OpenStreetMap Wiki – Information on geography (889 MB)
- iFixit Device Repair Manuals – Repair manuals for electronics (2.9 GB)
- Military Medicine Ebooks on military medicine (82 MB)
- Prunelle Books for Children (375 MB)
- Library of Knots (27 MB)
- Water Treatment Libray (20 MB)
- WikiMed Medical Encyclopedia (With Pics) (6 Gb)
- Cheatography – Cheat sheets on various topics (7.2 GB)

- Q&A Amateur Radio Guides – Questions asked by radio enthusiasts (65 MB)
- Wikispecies – Catalogue of all species (3 GB)
- Q&A Home Improvement – Questions asked about DIY (929 MB)
- Wikibooks – Open Source Books (4.6 GB)
- Off The Grid – Off-Grid Topics (172 MB)
- Food for Preppers – Food Preparation Skills & Recipes (97 MB)
- Prepper Medical Library (69 MB)
- Project Gutenberg Book Library – A collection of free books (74 GB)
- Project Gutenberg English Library – A collection of free books (May contain some or all of the above) (86.3 GB)
- Ready.gov – Emergency Management Planning (1.9 GB)
- Urban Prepper Topics (386 MB) (Videos)
- Canadian Prepper – Prepping Food Videos (4.6 GB) (Videos)
- Canadian Prepper – Winter Prepping Videos (3.4 GB) (Videos)
- Canadian Prepper – Bug Out Concepts Videos (8.4 GB) (Videos)
- TED Talks – Apocalypse Survival Guides (561 MB) (Videos)
- Q&A The Great Outdoors – Questions asked about camping, hiking, navigating etc (130 MB)
- WikiHow – How to do almost anything (51.2 GB)
- Kahn Academy – Tutorials on a wide range of topics (180 GB) (Videos)
- CrashCourse – Educational Videos (50 GB) (Videos)

There are a couple of downloads with the text "Videos" after them, this just means that it includes video files, however it's easier just to download any video files of preppers via a YouTube downloader. See my blog Here for info on how to get started downloading from YouTube.

There is SO MUCH MORE in the links below if you want to search for yourself for other topics of interest.

You can explore the Kiwix library at https://library.kiwix.org/. Click on the actual little blue 'Download' button to download the file. Here is the list of Wikipedia Kiwix dumps: https://dumps.wikimedia.org/other/kiwix/zim/wikipedia/. Note, if you speak English, be sure to download the ones that have "en" in them. There are also a lot of other websites hosting Kiwix files to download including torrents (since these are free to download), the most reliable would be Reddit.

LocalSend (Free)	LocalSend is a file transfer app which allows you to move apps, music, files or even movies between devices wirelessly without the need for the internet. You may not have a working computer in a SHTF situation and this would make it easier to transfer needed data across. I recommend having this app on a USB-C USB to give to friends and family so you can transfer wirelessly from then on.
KDE Connect (Free)	Another wireless file transfer program since you may have issues with one or the other,
Survival Manual (Free)	This is a survival manual built into an app. It has all the categories you would expect such as Power, Food, Water, Navigation, Signaling, Self Defense and is completely offline.
ReadEra (Free/Paid)	You're bound to have a lot of eBooks and PDFs on your device, so why not pair that with a good quality PDF/EPUB/MOBI reader? This one is one of the best rated out there and supports a lot of great features. The only downside I can see is that the paid version doesn't support offline use – however the free version has more than enough features for just reading books or how-to manuals on your device. I would also grab a second e-Reader like Lithium (EPUBs Only) or Moon+ Reader.
Bible (Free)	As a Christian one of the most important apps is going to be my Bible. This is a fully offline Bible once the translations are downloaded, and the downloads are free – so do that as soon as you install it. You have a good selection of translations, including some in other languages. A good alternative is the Blue Letter Bible (free) if you want to read the scriptures in KJV as this is the only pre-downloaded version. Another I like is e-Sword (Paid) which comes with KJV and KJV with Strong's Numbers pre-loaded so you don't have to download anything. An added benefit of e-Sword is that you can buy additional commentaries, devotionals and even biblical maps which can be used with the app to supplement your studies.
App Manager (Free) (Root Preferred)	App Manager is a powerful tool for managing the apps on your device. For starters it can backup entire apps to share with friends or to restore later. The backups include any extra downloaded files that come with the apps (if the right boxes are ticked) so if you have downloaded extras such as Bible translations in the app above, you can restore those without needing an internet connection again! It can also block trackers in apps and gives you a lot of useful information about the app, including what permissions it has – and even lets you turn on and off permissions manually with Root. Occasionally I need to grant storage access to Alpine Quest manually to be able to locate the maps I have on my phone, and this is the app I use to do so. Also, for particular apps with annoying sounds and music when I don't need to listen to I can disable the permission to output audio to silence it.
Binary Eye (Free)	Binary Eye is a FOSS (Free Open Source Software) barcode scanner. It can support every kind of barcode and QR code out there. This would be most useful if you have QR codes on all of your prepper containers so you can keep track of what's in them without everyone knowing.
Darker Pro (Paid – $3.00/Free)	Darker is an app which can lower the brightness of your screen far below what you normally can – down to 0 if you really want. Its primary purpose would be to reduce the amount of light your phone outputs to stay concealed if you're bugging out as well as saving your night vision partially. It would save a bit of battery life as well.
Pingcoin (Free)	This app can be used to verify the authenticity of silver and gold coins by 'pinging' it near the device's microphone. If the resonant frequency matches the data stored by the app, then it returns as positively identified. This would be great to use as an added layer of protection if you barter with precious metals in a grid down situation. To 'ping', hold the coin with your thumb and pointer in the center of the coin and with the other hand, flick your pointer nail on the edge of the coin to make a pinging sound.
Unit Converter (Free / Extra Purchases)	Everyone needs a good unit converter when SHTF. This one has a clean interface and as many conversions as you could ever need which are all offline.
A Compass (Free)	There are so many compass apps it's hard to pick just one. Give some a go and test it for it's offline capability. Some bonus features you will want to look for are altimeter, barometer, ruler and maybe GPS functionality.
NextRadio Free Live FM Radio (Free)	Unlike a lot of the other radios on the app store, this one is fully offline, however you need a U.S. smartphone that contains the FM Radio chipset (which may need to be activated). You also need wired earphones to act as the antenna to pick up the signals (and thus you need a phone with a 3.5mm audio jack). If you have a phone based outside the U.S. then it most likely won't have the FM chip required – but you can always check just in case.

Musicolet (Free)	You're most likely going to want to listen to music during a bug out situation to unwind. This app is not only fully offline but it's easily one of the best free music players out there. Just pre-load all your music and set up some playlists and you're good to go. A good runner up FOSS (Free Open Source Software) equivalent is Metro.
Games (2D / Low Battery Drain) (Free)	These are the 2D or 'low battery drain' games. A lot of games cause the battery to drain rapidly, so I have separated them into those which consume a lot of battery, and those that don't. ● Shattered Pixel Dungeon (Free) A fun little dungeon RPG game with lots of twists. ● Hashi (Bridges) (Free) A puzzle game where you connect each of the islands with the correct number of lines. ● Crossword (Just grab any which you like the look of and test it to see if it's offline capable) ● Sudoku (Same again here) ● Nonograms – A puzzle game where you have to fill in a board often to draw an image, using clues from around the edges. ● Okay? (Free/Donate) A simple yet addictive ball bouncing puzzle game. ● My Boy! (Free & Paid) A GameBoy Advance Emulator. (Supply your own game files) Play all the classic GBA games. ● DraStic (Paid) An NDS Emulator (Supply your own game files) A great emulator for playing all your favourite NDS games. ● Word Master Pro (Free & Paid) A fun scrabble remake with lots of customability. ● Gurgle (Free) 5 Letter Word Guessing Game. Similar to mastermind if you have ever played the popular board game. ● Grim Quest (Free & App Purchases) An Old School RPG
Games (3D / High Battery Drain) (Free)	Once in a while you may just need a 3D/Battery Intensive game to play to take your mind off the world. These are my favourites below: ● Tiny Room Stories Town Mystery (Free & Paid) A fantastic 3D puzzle 'escape room' style game. ● Golf Peaks (Paid) A neat little card golf game. ● 20 Minutes Till Dawn (Free & Paid) A bullet-hell style shooter. ● Meridian 157 Series A point and click series of games. (Free & Paid) ● Professor Layton Series Three amazing puzzle games which make you think alongside thrilling storylines. (Paid) ● The Room Series A series of 4 amazing 3D Puzzle Games. (Paid)
Emergency Apps	These apps are generally Australian based in nature, but you could find similar ones that suit your location better. ● My Bushfire Plan (Free) A bushfire emergency plan. This is an Australian based app, but the content is applicable wherever you live. ● What3Words (Free) An app to help you tell emergency services your location using 3 words. It's technically offline since you can find what 3 words apply to your current location, but you won't be able to see the map without internet. ● Australian Bites and Stings (Free) A little app to let you know what to do in the event of a bite, sting or attack from a wild animal in Australia.
Markor (Free)	Markor is an offline notepad based around privacy and ease of use. I use it day to day for my note-keeping and prepper 'todo' lists. Notes are stored as .txt files and are easily backed up.
Drugs Dictionary (Free)	This is a list of drugs available including information on the uses, side effects, interactions, overdoses and often more. There are multiple drug dictionary apps available which are pretty much all offline so you don't have to just stick with this one. Remember 2 is 1 and 1 is none, so get a few of these kinds of apps.
GPSTest (Free)	A great app which helps you identify issues with your GPS if you think it may be inaccurate or isn't working at all.
Offline Language Translator (Free)	Who knows, this may come in handy at one point or another if you're trying to communicate with someone and there's a language barrier. This app requires downloads before it works so be sure to download all of the languages you think you'll need. You can also back up the language packs using "App Manager" listed above to transfer the data to a new device or to give to someone else without the need for the internet to re-download them.
Suntimes (Free)	A nice little app to track the sun and moon risings and sets. It can help to know how long you have to find shelter and what time you should leave camp to stay concealed etc. Version 0.15.7 works for me offline.
Root Explorer (Free & Paid) (Root Required)	I use this all the time to search for files which are normally hidden to the average user, especially to back up add-ons to apps like the Offline Translator and the Bible apps above. However you need a phone that has been rooted and I understand not a lot would be as it's a complex process to do for the first time.
First Aid by the American Red Cross	Very useful for medical information and step by step guides.
First Aid – American Red Cross	A free first aid manual.
Pet First Aid – American Red Cross	A first aid manual for pets.
Repeater Book	A repeater book for operating HAM radios.
Cargo Decoder	A guide to what is in trucks or tankers nearby. Enter the 4 digit number from the DOT placard and learn about the substance.
TruckerPath	Find gas stations, bathrooms, food and rest areas.
Knots 3D (Free)	This app includes pretty much all of the knots you would ever need and lets you play the typing videos back slowly so you can see in detail how it's tied.
MSD Medical Apps (Free)	● MSD Manual Consumer, ● MSD Manual Professional, ● MSD Obstetrics, ● MSD Veterinary Manual These apps are basically medical textbooks in app form and are completely free to use. By default the Consumer and Professional apps come as text-only information but you have the ability to download all the pictures in one go for offline use. The pictures typically add a few hundred megabytes to the file size of the app. Furthermore you have the ability to download all of the videos used throughout the app for free too, however this comes at a much larger size cost. When I downloaded them all on the Consumer app, it came in at 8Gb. You can also use 'AppManager' to backup the apps pictures into an extractable archive format for re-adding the photos without an internet connection, or for sharing the app with others.

Testing Mobile Apps Offline

There are a lot of apps which fail to work offline for a multitude of reasons, generally these fall into the below categories:

The app is entirely online	These are apps such as Facebook, Instagram, Spotify, Amazon, YouTube, Gmail, etc – who's sole function is to communicate on the internet. It's obvious these won't work in a grid-down situation.

ADDENDUM Media Apps Testing Mobile Apps Offline

A paid or free offline app that uses Google Play	These are apps which have been bought, but when opened they check for a connection with Google Play to verify a license. Most often they close themselves after you tap the 'okay' button if it can't connect, so they can't be used. Some of these apps only try to validate a license once every so often, so they may trick you into thinking they can be used offline. This is why I recommend to test all your apps thoroughly BEFORE SHTF. Note: Some apps which even contain the word 'Offline' in the title may fall in this category and really aren't offline at all.
A paid or free app that checks for updates	Apps that are technically offline, but which try to connect to the internet on certain parts of the app to provide extra information. These apps may try to connect as soon as they are loaded up – which causes them to freeze unless they have connectivity. Others try to load on certain parts of the app and then throw an error on the screen and may kick you off the app if they can't find that connection. Generally these issues aren't app-breaking and it can still be used offline as long as that internet check isn't the first thing it attempts. My automation app Tasker has some extra online 'help' topics which can't be loaded, however everything else in the app works perfectly. Another example is the game Endurance: Dead Space, which used to load perfectly, but recent updates cause the game to freeze on boot-up due to a check for either Google Play or internet connectivity.
Apps that require additional data to be downloaded	There are some apps which work offline, but need additional data for them to function properly. Some example include Alpine Quest (needs maps), Bibles (Often come a single translation or none at all), Language Translators (Usually just let you download the data you need to save space)
Apps with In-App Purchases	These kind of apps are not offline friendly since to restore the data, an internet connection is requires to re-validate your purchases. Generally the free portion of the app works perfectly though, but don't go purchasing IAPs with the expectation that they will work offline.

App License Checks
Just because an app has been purchased doesn't mean that it's going to try to verify a license and therefore fail the offline check. (since they normally just close down if they aren't verified) I've purchased a lot of apps through Google Play which work flawlessly when downloaded via Aurora and transferred to my deGoogled phone. However about 50% of the time, they do try to verify their license and then I'm stuck with an app which I've paid for that doesn't work on my primary phone. In this case I look for a 'modded' version which will work offline and doesn't check for a license. It's a grey area, but since I've purchased the app anyway there should be no issues on the developer's end right?

Checking Offline Capability
If you have an app you use on a daily basis and want to find out whether it can be used offline, just install AFWall+ (if you phone is rooted/jailbroken) or NetGuard if it's not. Uninstall the app in question (backing any data up beforehand if required) and then reinstall it and block it with your firewall before you open it for the first time. To make testing offline capability easier, AFWall+ can be set to 'allow selected apps' which automatically blocks them (since they start unticked), rather than 'block selected apps' where the apps are only blocked if you select them.

Saving Apps for Offline Use (Root Required)
If you're downloading apps from the Google Play storefront you will notice that you can't save the .apk files to transfer to another device or to reinstall them later. This can be solved by using the 'App Manager' app and root access.

First install 'App Manager' if you haven't already. Then open it up and give it root access. You should be presented with a screen that shows all your installed apps alphabetically. Search for the app you want to backup and tap and hold on it to bring up an action menu. On the right you will see a 'Save APK" button, press that. Your app will be recompiled and saved into your main storage 'AppManager > apks' folder. That's your app, so move it from there if you want it elsewhere. This is when I would rename the app so I know where it came from and what version it is. E.g: "Alpine Quest v4.3.5". I also add other information such as where I downloaded it from (Google Play), whether it works offline or not, whether it has ADs or In-App Purchases, but you can make it your own and choose your own style.

13 Mapping

ADDENDUM Media Mapping

This section has info on how to download your own offline maps for your preferred mapping software using MOBAC.

So, you want to download some local maps for offline use during a disaster but aren't sure how to get started?

The aim of this blog is to let you know what you need, what's involved and how it all works when the internet has been taken offline. I will try to keep it as concise and simple as possible to support everyone, from the very beginner to someone who has used some offline mapping software before. It's written in a progressive order for beginners based around downloading offline maps in MOBAC (Mobile Atlas Creator), as well as some alternatives if that is too complex. You can also search for the heading you want to know more about if you've used MOBAC before, or want to use alternative map downloading methods – such as downloading maps in apps directly.

What are offline maps?
Offline maps are any saved digital maps which can be viewed without an internet connection. At its simplest level it could be a saved single picture of a map, such as a PNG or JPEG image. At its most complex level it's a downloaded array of tiny pieces of a larger map which can be be called upon to render a section of any location within its bounds. For example, if you open Google Maps you can zoom into any location and the online server will download the map pieces you need to view that area.

It does NOT download the entire map at once, as this can be many terabytes in size and would entirely fill your phone, tablet or laptop many, many times over. It would also take weeks to download even if you could. This is why we need to select a specific region to download. It gets more complex than this, such as differing levels of detail, but I will go into more depth later on this. Maps created in MOBAC can be easily updated if you retain the source tiles and don't delete the cache (previously downloaded information).

Why would I need a digital offline map?
As Steve Poplar from The Poplar Report says – "How long do you think the internet will stay up during World War 3?". It's a very good question, and one which I believe can only be truthfully answered with: "Less than 24 hours", and that's if it hasn't already been taken out long before an official 'announcement' of a global war.

Without the internet, almost everything we take for granted will be taken away from us instantly, including maps. Imagine being in a foreign city when the internet goes down and having to manually find your way back home. As one primarily focused on Digital Preparedness, I actively seek alternatives to being connected to the internet at every turn, so let's get started with offline maps.

How do offline maps work?
Generally when you open a map like Google Maps, your device sends a request to the internet server which replies with a bunch of tile images of the area you're looking at and arranges them in the correct order. An offline map is simply one which takes those same tiles from the local storage on your device, rather than the internet. However this requires having to download ALL the tiles beforehand, most likely including ones which you will never likely view.

The sizes of maps vary wildly, but generally the photographic maps (such as satellite view) take up 4x the space of the standard road maps (such as Google Maps). With this in mind, the biggest size a single map can get is about 5 Gigabytes if it's a satellite view of a very densely populated area. On average though standard maps are between 500 megabytes (Mb) to 700 Mb.

You may also be wondering whether your GPS (Global Positioning System) will work when there's no internet. It's a very good question, but put simply – Yes, GPS will work even when the internet is down since the GPS signals are broadcast by satellites down to earth 24/7 unlike telephone towers which supply the internet and are a likely target of hacking during civil, or world wars.

GPS transmitters are a one-way device – They can transmit but don't need to receive anything back from your device as your coordinates are calculated based on the data received from the satellites. Mobile towers on the other hand are in constant two-way communication since your device requests information from the towers multiple times for every web page, streamed video or streamed song that you play. To use the offline maps, you technically don't even need to utilize GPS since you could always use nearby landmarks and search the map manually to triangulate where you are.

If you're desperate, you can also use a sextant and charts to determine your location and enter them on your chosen navigation app to view where you are if you have the maps downloaded. However this is an extreme example, as it's very unlikely you will be SO lost that you have no idea where you are.

What can offline mapping software do?
Once you have a map downloaded then the real fun can begin! (Most of the features in this section are from Alpine Quest, however all of the other apps are likely to have the same features) Firstly you can position placemarks (AKA landmarks) to store important information at any specific location on a map. Placemarks can mark the position of a cache, remind you of hazards in an area, let you know that there are wild edibles here – the possibilities are limitless.

Placemarks aren't just 'dumb' markers either. They can be assigned a graphic, a comment and even a photograph or audio clip so you can remember what was at that location. They can be automatically interacted with so that if you walk within 50 meters of one, your phone will vibrate or send you an alert. They aren't limited to points either, you can create routes of multiple placemarks in a line which can show your bug-out route or any other route you want to track, such as railway lines, rivers or hiking tracks. You can also create a polygonal shapes using the area tool which you can fill in with a specified colour to highlight dangerous regions or mark territories.

In the hiking mode, the map can rotate with you so you can keep an eye on the landmarks you're headed towards. Oh and don't forget the driving mode which is basically Google Maps navigation (albeit a bit glitchier). Most mapping software also has route recording which can plot your current position over time including speed, altitude and more all presented in a fancy graph. The apps can also show your current position, your current bearing and the distance from your position to your destination. You can also 'track' loaded paths and be notified when you stray from them too far – a great help to prevent you getting too lost.

Any maps can also be modified in a number of ways to make life easier for you. They can be rotated, dimmed, or stacked with other maps if you need to view a few of them at once – such displaying as a mobile tower coverage map on top of a regular map. I know you're here for offline maps – but most of the software can also do online maps as well if you prefer to have the latest and greatest maps open and only want to switch to the downloaded ones once you lose the internet.

Should I just use paper maps?
The alternatives to digital maps such as printed road maps and topographic maps are definitely recommended to have as a backup to your digital maps. (Remember that EMPs are still a possibility, which can destroy any modern electronics). But in the words of other wise preppers, 2 is 1 and 1 is none. This simply refers to the need to have multiple backups for each of our preps, which includes maps. So yes, you should have a printed map of your local area in your Bug-Out-Bag, perhaps a printed road map in your car and a couple more printed maps of the regions around you in case your bug-out plans change.

Can I use offline Google Maps?
If you aren't familiar, Google maps can save a select location of a map to your phone's storage for use when there's no internet. There are however a lot of caveats with this approach which I will go into below:
1) Offline areas that you downloaded on your phone or tablet need to be updated at least every 30 days. This is the primary reason why using downloaded Google Maps won't work in an extended disaster, although it "should" work fine to find your way home in the early stages of a disaster. There is no way to extend or disable this timeframe as per the link below so as soon as you hit that 30 day limit, you lose access to everything.

Can You Stop Google Downloaded Maps Expiring?

2) You don't have precise control over the resolution or region of the map you want to download. It's really up to Google to determine how much data is downloaded and what zoom level it goes to. Additionally the downloaded maps are often more focused on the road and includes features for navigating by car and often leaves out a lot of other functionality.

3) Downloading offline areas isn't available in some regions because of contractual limitations, language support, address formats, or other reasons. Depending on where you are, you may not be able to download your regional maps at all.

4) It's not easy to export your placemarks, and the more you invest in Google's ecosystem the more trapped you become in it. For many reasons, I would advise against giving ANY kind of information to a major tech company, and by using Google Maps you are earning them revenue one way or another.

If you would like to download some Google Maps anyway, have a look at the links below:
Android – Downloading Maps with Google Maps (How To)
Apple – Downloading Maps with Google Maps (How To)

Types of Maps
There are a lot of different kinds of maps you can download which each have their benefits and specific uses. I will go into more detail about each type below so you can choose which one will best suit your requirements. I'm guessing you're looking to download a map of your local area for your bug-out route or to have the local terrain on hand for emergency navigation purposes.

In this case I recommend a few 'Road Maps' and some 'Topographic Maps'. You may also be looking to keep track of important landmarks or resources in an area such as wild edibles and to use for locating streams and avoiding populated areas. For this I recommend the Satellite Maps primarily and some topographic maps to supplement them.

● All-in-One Map / Road Map
These are shaded, polygonal maps which include all terrain features in detail including roads, parks and structures.

E.G. Google Maps
E.G. Bing Maps
E.G. Open Street Map

● Topographic Map
Similar to the all-in-one maps but these also include elevation contour lines or shading to show slopes. Generally they have less detail than the All-in-One maps due to not being able to zoom in as much.

E.G. Google Maps (Click "Layers" then "Terrain" to enable topo view)
E.G. NGMDB USA Topo
E.G. Australia QLD Topo

● Satellite Map
These maps show the satellite footage of the area. These are excellent for determining the flora of an area, showing paths, small rivers (which aren't visible on the above maps) and other useful landmarks. This map isn't as useful as the Satellite Hybrid map, since there are no labels, however in some circumstances the labels hide important terrain features. I don't recommend this above the below map unless you have specific reasons to avoid map labels.

E.G. Google Maps (Clicking "Layers" should turn on Satellite view automatically, and then hover over "Layers", click "More" and un-tick "Labels")
E.G. Bing Maps (Turn on "Satellite" in the menu in the top right and un-tick "Details".)

● Satellite Hybrid Map
The satellite hybrid map is the same as the regular satellite map except it includes labels overlaid on top so you can navigate easier.

E.G. Google Maps (Clicking "Layers" should turn on Satellite view automatically)
E.G. Bing Maps (Turn on "Satellite" in the menu in the top right)

● Other Maps
There are MANY more map types which you may be interested in, including maritime maps, hiking maps, 4WD maps, game maps, population density maps, hunting maps etc, but you can look into these for yourself if you are interested.

E.G. Open Street Maps (Turn on the map you want on the right side)
Note: 3D Maps such as Google Earth, cannot be downloaded in 3D.

If you would like more information on the maps above, or you want to download the .bsh files to download them yourself in MOBAC click here. BSH files are the files which populate the "Map Source" list in the top left of MOBAC – so if you're missing Google maps in the newer versions, you can download it from the link above and put it in the MOBAC "mapsources" folder. (Only works in some versions)

How do I use offline maps?
To get started in offline mapping you will need to work out how the maps will be viewed. My maps are stored on my Android phone and Android tablet on the internal memory. I then use the app "Alpine Quest" to act as the interface to view and manipulate the maps. So work out now what devices you will want to view the maps on, whether that's a smartphone, a tablet, an e-ink device or even a Garmin navigator. I haven't used Apple devices before, but all you need for offline maps to work is the ability to copy the downloaded maps to its storage, and of course the app itself which you will be using – so check the App Store for one of the below first.

If you aren't sure what mapping/navigation program you will be using, here are a few suggestions:
● Alpine Quest – $13 USD (4.6★) (Free Trial Available)
alpinequest.net
"AlpineQuest is the complete solution for all outdoor activities and sports, including hiking, running, trailing, hunting, sailing, geocaching, off-road navigation and much more. You can access and store locally a large range of on-line topographic maps, which will remain available even while being out of cell coverage. AlpineQuest also supports on-board file based maps, like MemoryMap maps."

An amazing mapping app which can be completely used offline or online if you wish. It's packed full of every feature you could ever need for navigation, mapping, exploration and prepping. You can purchase a copy directly from Google Play, or from their website above. I use this on all of my Android devices for tracking locations, routes and points of interest.

● OSMAnd – $30 USD (4.6★) (Free Trial Available)
osmand.net
"OsmAnd is a map and navigation app for Android and iOS. It uses the OpenStreetMap map database for its primary displays, but is an independent app not endorsed by the OpenStreetMap Foundation."
A second piece of mapping software I own. It's excellent, but I have grown accustomed to Alpine Quest for my primary mapping software.

● BackCountry Navigator TOPO GPS – $15 (3.7★) (Free Trial Available)
backcountrynavigator.com
"Download topographic maps for an offline outdoor navigator! Use your phone or tablet as an off-road topographic mapping handheld GPS! Explore beyond cell coverage for hiking and other recreation. Download topo maps in advance, so you won't need cell coverage for navigation. Use storage memory for maps."
I own this one too, but after using it for some time, I just preferred Alpine Quest.

● Orux Maps – $4.49 USD (4.4★)
oruxmaps.com
"Orux Maps is an Online and offline map viewer. You can use different map formats, like GeoPDF from USGS store, GeoTIFF maps, .ozf2, .img garmin (vectorial, no full support is provided), .mbtiles, and others."

● Garmin Devices
Creating Custom Maps to an Outdoor Handheld Garmin Device
You can create custom maps for some Garmin handheld navigation devices if you already own one, however you may be limited on storage space depending on the model you get – ideally you would want about 20 GB of storage for a good selection of maps.

There are more navigation apps than the ones listed above, but I'm sticking to a few well known ones which are also compatible with MOBAC (Mobile Atlas Creator) – the map creation software, but more on that later. If you want a wider selection, have a look at the compatible list on the MOBAC page. Keep in mind that any maps you download must be in one of the specific formats listed on MOBAC, and these mapping formats cannot (easily) be converted between different apps.

For example if I downloaded a map in the AlpineQuestMap format (AQM), I can only use that map with Alpine Quest and can't just use it with OSMAnd. (However once MOBAC has successfully downloaded a map in any format such as AQM, and has the downloaded tiles still in memory – you can then export those same tiles into a different format, for example OSMAND without having to download them all again – and the export will only take a minute)

While researching for this blog, I found this software which can apparently convert maps between different formats. It costs, so I would only look into buying it if you are REALLY into mapping.

How much detail do I need?
Downloading maps can become tremendously space intensive if you're looking to download them in the greatest detail on a wide scale. To put things into perspective, I will go over how many tiles are in the entire planet based on the zoom level (see the chart below). The zoom level is the depth to which a map can be zoomed into which provides more detail. Have you noticed that when you zoom into Google Maps, the last set of tiles disappears and new ones appear of the same region, but in more detail? This is going up a zoom level.

Some maps can be zoomed into 21 times which gives you extreme quality of information, but at the cost of using a lot more space. Other maps can only be zoomed into level 15 to provide a decent amount of detail but it may be hard to distinguish different buildings at that scale. The detail you want in a map is bound by limits on the the upper and lower bounds of the map (yes, some maps only start at a lower zoom level such as 4, which means you have to zoom in a bit before anything appears on the map).

Some maps only go to zoom level 15 – such as the Google Terrain map, so that will be your hard limit when deciding how deep to go, however you will be able to cover a wider area easier due to there being less tiles. Keep in mind that for every tile on a level, four tiles replace it on the zoom level lower than it – this is why the scale below id multiplied by 4 every level you go down.

Below is a chart of the number of tiles in the entire world at a particular zoom level:

Zoom	Total Worldwide Tiles	Map Scale	Zoom	Total Worldwide Tiles	Map Scale
z0	1	1:1,183,315,101	z11	4,194,304	1:577,790
z1	4	1:591,657,550	z12	16,777,216	1:288,895
z2	16	1:295,828,775	z13	67,108,864	1:144,447
z3	64	1:147,914,387	z14	268,435,456	1:72,223
z4	256	1:73,957,193	z15	1,073,741,824 (billion)	1:36,111
z5	1,024	1:36,978,596	z16	4,294,967,296	1:18,055
z6	4,096	1:18,489,298	z17	17,179,869,184	1:9,027
z7	16,384	1:9,244,649	z18	68,719,476,736	1:4,513
z8	65,536	1:4,622,324	z19	274,877,906,944	1:2,256
z9	262,144	1:2,311,162	z20	1,099,511,627,776 (trillion)	1:1,128
z10	1,048,576 (million)	1:1,155,581	z21	4,398,046,511,104	0.433333333

The hard limit to MOBAC's total downloadable tile count is 500,000, so according to the chart above, if you wanted to download the entire world, you can only download it at z9 as this is closest value lower than the 500k maximum.

For my Google Maps archive, I chose to go with zoom 18 since it's the first level where you can see the individual house numbers. I have included the other values I went with below to assist in your decision if you get stuck:
● Google Maps (Select Regions) – Zoom Level 18 (I can see the house numbers at this level)
● Google Terrain (Australia-Wide) – Zoom Level 15 (Good enough to hike with and see the terrain, also the maximum zoom)
● Microsoft Hybrid Satellite (Select Regions) – Zoom Level 17 (Good detail to file size ratio)
● Queensland Topographic (Entire State) – Zoom Level 15 (The maximum it zooms to)
● Worldwide Satellite Map – Zoom Level 9 (The maximum allowable limit in MOBAC) (I use this to find cities around the world if needed)

From now on I will refer to the different zoom levels as z then the level. E.G. z18 for Zoom Level 18.

Downloading Maps In-App
Rather than downloading maps via MOBAC (more details in the section below) which is a much more powerful (but complex) way to download maps, I will quickly touch on how you can download maps using the in-app downloaders which can save both time and effort if you want a less complex way to get started.

Most of the apps listed above support in-app downloads which are then stored in the app on the device's hard drive. Generally these maps must be downloaded every time you swap to a new phone or tablet unless you back them up manually and transfer them every time. However you may find that the stored files cannot be found or copied without rooting your phone.

I'm not able to go over how to download maps in all of the apps above, so I have included links on how to do it for the top two I use:
● Alpine Quest – Downloading a Map
● OSMAnd – Downloading Map Files (You download map 'packages' in this app rather than dragging a rectangular region to download)

What do you need to get started downloading with MOBAC?
If you're still reading then you must be interested in downloading some maps! Below are the physical items you will need to get started:
● An Internet Connection (ideally with 1-4 GB+ worth of data spare per map you want to download)
● A Laptop or Desktop PC running Windows
● A mobile device
● Between $5-$30 depending on which app you want to use (Or you can use the free versions)

What you should know before starting:
- What you want to do with the map?

Do you want to plot and store you bug-out route ready for emergencies? Store important locations for future recall, such as caches and wild edibles? Perhaps you just want it to be a bare map which you can navigate off in an emergency.
- What regions you want to download?

It's wise to have a couple of very detailed maps (z18) of your immediate area and your bug-out location(s) including frequently traveled routes. Some lower zoom levels (z15) of a wider diameter around your home including all of your bug out routes in their entirety. And finally some very low level zooms (z9) of the entire planet so you can track overseas events if necessary.
- Know the style of map you want to download (Road, Topographic, Satellite, etc)

Remember that there are a huge variety of maps that may interest you and will supplement your bug-out plan in an emergency. I have maps of cell phone tower coverage which can be placed partially transparent over any other map, as well as population density maps which can also go over other maps to show me the danger hot-spots that I should avoid when bugging out.

1. How do I download a map?

Firstly ensure you know the details of the maps you will be creating:
- What mapping software are you using? (Alpine Quest, OSMAnd, etc)
- What maps do I want to download? (Google Maps, Bing Maps, OpenStreetMaps, etc)

On your Windows PC, download the map creation software MOBAC. On the main page scroll down to "Download" and get the latest version. You may want to consider downloading version 1.8 if you want to download any of Google's maps, as they have been removed in the later versions – however the newer ones have less issues and support a wider range of mapping software file types. Newer versions may require an extra Java installation, but it will let you know on opening whether you need to downloading anything extra or not.

2. Extract & Open MOBAC

This should be pretty self-explanatory but if you have any issues, leave a comment below.
If you don't have extraction software, you will also need to download Zip Extractor.
(Note: Create a folder and put the .zip file inside it before extracting, or it will make a mess after extraction)

Open the application by double clicking on the "Mobile Atlas Creator.exe" file after extracting the archive in you preferred extractor tool such as WINRAR or Zip Extractor.

When you first open MOBAC you are presented with a selection to choose your atlas style, if you don't know what app you will be using yet you can just choose any for now. When that is closed you will see the map of the world on the right and all your settings for export on the left. (If you are seeing red X's on the map, try selecting the "OpenStreetMap Public Transport" map in the top left. Try moving around the map by holding the right mouse button and dragging to move the map where you want it. You can scroll to zoom in or out. Note how the map updates with new tiles as you zoom in and out.

These are the different zoom levels being downloaded from the internet and updated on your display in MOBAC. Up the top you will see the zoom level bar which shows you what your current zoom level is. What you see is the live version of the map – nothing is downloaded yet beyond what you request to see on-screen. Try changing the map style in the top left corner and seeing what different types there are. Some of the maps are only limited to a certain region such as Europe, the USA or Australia. So if you see red X's after clicking on a map – you are most likely zoomed into a region without coverage, so try zooming out.

3. Change the Map Settings for Download

First select the map source you want to download in the top drop-down, whether that's 'Google Maps' or something else. (Note: Only MOBAC 1.8 or earlier will have the Google Maps options)

Then tick ALL the boxes of the zoom levels that you want to download. If you want to download from z0 to z15, then tick each of them. The selectable zoom levels will change based upon your map selection above, so some will range from z0-z15 and others will go from z0 to z21. If a map only shows up to zoom level 15 then that's as detailed as that map can get. I recommend selecting from z0 up to and including z18 while you follow along with this tutorial as it will make it easier to understand how everything works.

4. Work out the Map Size

Next set the 'Grid Zoom' size at the top of the screen and set it to "12". This will give you a good range to select the areas you want while getting as close to MOBACs 500,000 maximum tile count as possible. If you don't select the Grid Zoom level then it's virtually impossible to have perfectly seamless tiles without downloading duplicate areas since you can drag and select any pixel on the screen. Now drag a rectangle across the map 10×9 squares across the region you want to download. This is the maximum number of squares you can download within MOBACs limit at this zoom level (z18). You can re-drag and select a shape as many times as you like until you've got it right, however you can only draw a single selection rectangle as it will remove your previous one. You can also modify the shape to suit different landmasses which have unique shapes. Some examples of other rectangles you can use are below:

Shape	Total Squares	Tile Count
30×3	90	491,538
22×4	88	480,640
18×5	90	491,538
15×6	90	491,538
13×7	91	497,001
11×8	88	480,612
10×9	90	491,538
9×9	81	442,391
9×10	90	491,538
8×11	88	480,612
7×13	91	497,001
6×15	90	491,538
5×18	90	491,538
4×22	88	480,640
3×30	90	491,538

So if you wanted to, according to the data above, you could use a bunch of 22W x 4H rectangles to save long strips of a map if you didn't want to use a more square-ish rectangle such as a 9×10. Keep in mind though that the 22×4 only covers 480,640 tiles, whereas the 9×10 gets a lot closer to the 500k maximum at 491,538 tiles. Therefore it's more efficient to choose grids that cover more tiles. There is no minimum tile selection, but it's recommended to select a few tiles to get the hang of how it works, and to save time waiting for the download. Try zooming into your home and selecting a 1×2 or 4×4 grid around it to start with.

Once you've made your selection, have a look at the tile count under the "Zoom Levels" menu in MOBAC. If your total tile count is under 500k then you can head on to the next step. If you are over, then you will have to either un-tick your highest zoom level as per the last step OR you can select less tiles to download.

5. Set the map name

If you create enough maps you will need a way to organize each section so you know what region each map covers, what zoom level it is and the date that it was created. To do this I have created a picture showing the coverage of any high zoom maps which I have downloaded. Whenever I want to update my maps, I use the corresponding picture as a guide to be sure I select the same regions I have previously so I don't overlap areas or miss some tiles. It's highly recommended you do something similar to keep track of your regions. All you really need to do is screenshot MOBAC and use paint to draw rectangles around the zones and then stick a name across it.

My formula for the map title is:
(State/Country) (Location) – (Map Type) (Zoom) (Date)
E.G: Australia QLD Brisbane – Google Maps z18 2024-01

I only really update my maps once or twice per year, so I have just included the year and the month, but if you want to be precise, then you can include the day as well.

ADDENDUM Media Mapping

6. Add the Map Selection to the Queue
Once you've decided on a naming format you can enter this into MOBAC's "Name" field and click "Add Selection". Then you can copy the same name, right click the "Unnamed Atlas" field with the purple icon, press "Rename" and paste the name again. The purple sphere where you pasted the second value is generally used for the over-arching type of map, much like a folder which holds lots of a similar files.

So if you want, you can specify the region you are downloading multiple files from, such as 'USA – Tennessee – Google Maps z18' which could have multiple Tennessee regions in it. You can add as many map selections you want under the purple icon to cover that whole region and they will all download in order, however let's just start with one for now.

7. Check the Settings
Before starting the download you should click the 'Settings' button. Have a browse through each of the settings and change any you want. Some you may want to change is:
● the 'Unit System' if you want Imperial measurements,
● the 'Map Sources' tab if you want to hide some of the mapping selections on the top left,
● the 'Tile Update' tab if you want your tiles to expire earlier,
● the 'Map Size' setting which I would set to the biggest size possible (1048575),
● the 'Directories' setting if you want to change the output folder and
● the 'Network' > 'Network Connections' setting to 4, 6, 8 or 10 to download the map a little faster at the risk of getting an IP ban. (An IP ban is when a server blocks your computer for accessing it's data due to misuse – which is technically what you are doing since downloading SOME maps violates the terms and conditions – for example, Google's maps. This is why I recommend only increasing it slightly to save a bit of time) (Note: This value is limited to 6 in the newer versions of MOBAC)

Another setting to make note of (but needs no modification at the moment) is the 'Tile Store' setting which allows you to see how much space the temporarily stored tiles are occupying. This is fine to delete if you have successfully created a map and aren't planning on using the tile data again to create another mapping format of the same region.

8. Create the Atlas
Once you've changed all the settings you want, then you can create the map!
First ensure that you have the correct profile selected for the mapping software you are using under 'Atlas Settings', so "AlpineQuestMap (AQM)" for Alpine Quest.

Then hit that 'Create Atlas' button and let it do its thing. (I recommend doing a very small test first to get used to how MOBAC downloads. My suggestion would be to do a single tile or two exactly above your location)

The download can take up to a few hours depending on how big your selection is, but you can watch the progress with the bar. (Note: The progress bar is glitched on the earlier versions of MOBAC, so 66% is technically 100% complete)

MOBAC Download Errors
Occasionally if you have a dodgy internet connection you will see (and hear – in the form of 'ping error sounds') that there are tile download errors. Don't worry about these until the end.

If you get enough errors on a single map download, it will pause the download and ask you if you want to continue to try and download the map. This is a good opportunity to check your internet connection and clicking continue.

Once you reach the end of the download, you will have a complete map which is ready to transfer to your device to test out. If you received more then about 10 tile errors then I recommend deleting that map from the hard drive and clicking 'Create Atlas' again. MOBAC will skip all the tiles which were successfully downloaded and only download the missing or expired ones. You can repeat this as many times as you wish until you have no (or very few) tile download failures.

9. Transfer to Device
Once you have a map file, all you need to do now is transfer it to your device and point the application to where your maps are stored. Most of the time you will have to give it access to your device's storage before it becomes visible, but it will usually ask you for this permission automatically.

10. Play with it!
That's all you need to do to have offline maps. Once the maps are loaded then you can play with the app to figure out what it can do and how you can use those maps. Try to plot your bug-out route on it and save a few important landmarks that will help you on your journey, such at the closest water sources, hazards and wild food.

How can I keep the MOBAC maps updated?
In step 7 of the process above you would have had a look at the Settings menu and might have seen the 'Tile Update' tab up the top. This is where you can set the expiry data on the tiles that are downloaded if no data has been supplied from the website during download. Simply set the expiry time you want, and then follow the steps above and MOBAC will automatically check whether each tile is up to date, and re-download it if it's not. This is the easiest way to update your stored map tiles and will generally save quite a bit of data. However this comes at the cost of having to store ALL of the downloaded tiles on your PC which can easily chew up a lot of space.

If you choose to delete the tile data between downloads you will just have to download all of the tiles again from scratch, but this isn't an issue especially if you only update your maps every year since they would have all expired by then anyway.

14 Mirroring Websites

Mirroring Websites

This is a selection of websites worth mirroring (downloading) in their entirety for use when the internet doesn't work. Website sizes can vary dramatically from 1Gb to over 100Gb. It depends if you download pictures or not. The websites with sizes under them are ones I've previously downloaded and should be around that size.

Downloader Programs
● HTTRACK
● Cyotek WebCopy
● PageNest
● Getleft

If using HTTRACK be sure to set the rules:
● Max Number of Links to 10,000,000
● Maximum External Depth to 0.
● Max Transfer Rate to 250,000.
● Keep the thread count low to ease server load,

Happy Preppers (4.1Gb)	A large collection of information on basically all topics prepping.	https://happypreppers.com/
Backdoor Survival	Various preparedness tips over hundreds of pages.	https://www.backdoorsurvival.com/
Modern Survival Blog	A blog dedicated to everything survival and prepping.	https://modernsurvivalblog.com/

ADDENDUM

Media

Mirroring Websites

True Prepper	Posting a few articles a day, this website covers nearly every prepping topic.	https://www.trueprepper.com/
Ready Nutrition	A website for all things preparedness and food related.	https://readynutrition.com/
The Prepper Journal	High quality content and a lot of blog posts.	https://theprepperjournal.com/
Graywolf Survival	Great advice, reviews and tips on preparedness.	https://graywolfsurvival.com/
Doom and Bloom	A huge array of medical advice.	https://www.doomandbloom.net/
Drugs.com (50gb+)	A list of all known drugs and compatibilities between them.	https://www.drugs.com/
CDC	A list of known medical ailments, symptoms and treatments.	https://www.cdc.gov/
Instructables	How to create almost anything.	https://www.instructables.com/
Art of Manliness	Tips on being a man as well as survival, shaving etc.	https://www.artofmanliness.com/
How Stuff Works	Information on how almost everything works.	https://www.howstuffworks.com/
Ehow	A guide on how to do anything yourself.	https://www.ehow.com/
WebMD	An online diagnoser website for every ailment.	https://www.webmd.com/
Encyclopedia Britannica	An encyclopedia for 'everything'.	https://www.britannica.com/
Survivopedia (8.8Gb)	Lots of blogs and details on becoming a better prepper.	https://www.survivopedia.com/
The Organic Prepper	Great blogs, lots of great information.	https://www.theorganicprepper.com/
The Old Farmer's Almanac	Complete database of farming almost all types of food.	https://www.almanac.com/
Plants For A Future	A database of all known "useful" plants with edible, medicinal and other uses.	https://pfaf.org/
Army Study Guide	A collection of military information to learn.	https://www.armystudyguide.com/

15 Collections

These are collections of resources such as books, apps, webpages, documents, eBooks, etc that can be downloaded together. They will prove useful in times of peril and help you to survive or rebuild humanity.

Wikipedia

Download the entirety of Wikipedia in English without pictures is about 12Gb - 226 Gb. All text content is multi-licensed under the Creative Commons Attribution-ShareAlike 3.0 License and the GNU Free Documentation License. For offline wikipedia readers look at the "Pc Programs" section to find offline Wikipedia readers. It's recommended to download it via a torrent to save Wikipedia's bandwidth.

CD3WD

CD3WD was a project that focused on assisting in third world development by making technical documents and other relevant information easily available to all people. Created by Alex Weir in 2003, the concept was to share useful DIY guides and technical information for free using CDs. The name CD3WD comes from "CD for the Third World Development". In later versions of the project the archive was distributed on DVD. The last version that is available online (the 2012 version) was a total of 6 DVDs (core set) and 32 DVDs of extra educational content.

CD3WD March 2015 (13gb): Excellent database full of useful preparedness related topics, just make sure to change the folders name so all the links aren't broken.

Torrent Magnet Link: magnet:?xt=urn:btih:24E750EFD6640A89EB0D664633904F5BD0BA4AB6&dn=CD3WD+survival+skills+enc	The magnet link is too large to wrap so the cell is left unwrapped. Just copy the magnet link cell and remove the preceding text.

Alternative Download
An alternative download of 6 DVDs can be found at:
Link: https://ftpmirror.your.org/pub/misc/cd3wd/cd3wd%202012%206%20dvds/

A small selection of books from the collection can be found at:
Link: http://www.journeytoforever.org/farm_library/cd3wdbooks.html

Project Gutenberg

A collection of over 57,000 free eBooks on every subject. The books were written long ago and their copyrights have expired. Robinson Crusoe is included in the ENTERTAINMENT section if you want to read it.

https://www.gutenberg.org/

Pole Shift Survival Library

Pole Shift survival Lib, Mar 2015 (9.9gb).
https://pastebin.com/gxfm3J7b

Torrent Magnet Link: magnet:?xt=urn:btih:4AB61FA0458904380B542C6AAD5064DBE7DE247C&dn=PoleShift+Survival+Files&t	The magnet link is too large to wrap so the cell is left unwrapped. Just copy the magnet link cell and remove the preceding text.

Reddit Survival Library

A 30gb selection of all things survival related.

Link: https://www.reddit.com/r/Survival/comments/ug5v1/building_the_ultimate_survival_library_please/

196 Survival Ebooks

A nice selection of eBooks for end of the world scenarios to rebuild society.

Link: http://www.themodernsurvivalist.com/archives/2471

The Survivor Library

Thousands of public domain books to download for free or you can buy the collection on USB or Blu-Ray. They can be downloaded either individually or assisted with Jdownloader if you provide the link to the pages. There's 158 categories of books to download with on average 20 PDF's each page. (In Aug 2018)

Link: http://www.survivorlibrary.com/index.php/library-download

Dictionary Library

A database of most known words in .CSV format. Useful in SHTF if you're unfamiliar with a term. I have converted the .csv files to one .xlsx file to make them easier to search and removed the spaces which halved the file size. Unfortunately it was too big (7Mb) to include in the dictionary section of this sheet so it's an add-on.

Link: https://www.bragitoff.com/wp-content/uploads/2016/03/Dictionary-in-csv.zip

Ultimate Database

A list of the optimal information you would need for a worst case disaster including the rebuilding of humanity. If you want the most compact size possible, then I recommend a few of the basic sheets including TPE. Sizes below are recommendations of what you should have stored.

Essential Information

Essential Totals 1,330 Gb	**Wikipedia** A download of all the major articles on Wikipedia excluding pictures. (25gb)	**Survival/Preparedness Manuals** A large collection of manuals with information on how to live off the land. (50gb)	**How To Manuals** Information on how to perform tasks from brewing to medical to blacksmithing to construction. (500gb)	**Educational Books** Every educational topic that's possible to learn such as maths, chemistry, physics, history, languages etc. (500gb)	**Plant Database** A database of all edible and poisonous plants including pictures for identification which is easily searchable. (5gb)
Digital Maps Worldwide maps as well as detailed topographic local maps. Include satellite maps if possible. (250gb)					

Personal Information

Personal Totals 11 Gb	**Important Documents** Resume, Birth Certificate, Passport etc. (1gb)	**Photos** Family pictures and pictures of your life, etc. (10gb)			

Other Information

Other Totals 16,070 Gb	**Famous Texts** Shakespeare, Plato, Freud, etc. (10gb)	**Fictional Novels** To help pass the time and keep the mind occupied. (20gb)	**Historic/Religious Texts** Manuscriptures and very old scrolls. (10gb)	**Music Collection** Beethoven, Mozart, Bublé, Imagine Dragons etc. (1TB)	**Movie Collection** The most popular and influential movies of all time. (5TB)
Tv Collection The best rated Tv shows of all time. (10TB)	**News/Newspapers** To save the recent history of news which may have caused the disaster. (30gb)				

2 Conversions

Throughout this spreadsheet you'll likely need to be able to work out area, volume, size, ratio, angles and more, all of which follows below. Below are a multitude of conversions and formulas you can use on projects to adapt measurements to your local units. Most cells are small to keep this section compact, so zoom in to read them.

Subheadings

1. Constants	**2. Equivalencies**	**3. Equivalency Tables**	**4. Number Conversions**
5. Conversion Factor	**6. Shape Formulas**		

1 Constants

A mathematical constant is a number, which has a special meaning for calculations. For example, the constant π means the ratio of the length of a circle's circumference to its diameter which is the same for any circle.

Pi (to 100 Places)	3.1415926535 8979323846 2643383279 5028841971 6939937510 5820974944 5923078164 0628620899 8628034825 3421170679…	Pi is the key constant in any equation that involves circular or harmonic motion.
Euler's Number	2.7182818284 5904523536 02874713527…	Euler's number is used to determine compound interest, which is extremely vital in understanding the time value of money.
The Golden Ratio	1.61803398875…	The golden ratio is often used in financial technical analysis to attempt to determine when a market will continue its path or reverse. Observed very frequently in nature.
Planck's Constant	6.62607004 × 10-34 m2 kg / s	Some writers speculate that this Uncertainty Principle can be used to determine stability and sustainability of a financial instrument.
Avogadro's Constant	6.02214179×10^{23}	Avogadro's constant is an interesting relationship between a multitude of different chemical properties.
Speed of Light	• 299,792,458 m/s • 186,282 mi/s	The speed of light is used in many different mathematical formulas and in analysing space travel. N.B: The speed of light is actually slowing down.
Speed of Sound	• 343 m/s • 1,235 km/h • 1,125 ft/s • 767 mph	The speed of sound is the distance travelled per unit time by a sound wave as it propagates through an elastic medium.
Gravitational Constant (G)	6.67300 x 10^-11 m^3 kg^-1 s^-2	G helps determine the force between two masses. Knowledge of G is crucial for any civil, mechanical, or aerospace engineer.
Boltzmann's Constant	1.380650 x 10^23 joule per Kelvin	Boltzman constant explains why ice cubes melt in warm water, but are not spontaneously created in tepid water, among other uses.
Imaginary Unit I	i' equals the square root of -1, which means that i squared is equal to -1.	Negative numbers don't have square roots. Math had advanced to the point where saying 'there is no square root of negative numbers' was holding back a lot of progress.
Euler's Identity	e^(i*pi) = -1	What this conceptually describes is walking along the edge of a unit circle in the complex plane, half way around. Until the real value is -1.

2 Equivalencies

These are the conversions between numbers and similar unit types if you don't have time to utilize the formulas below.

Scientific Notation
Sometimes when a number is too large or small scientific notation is used to shorten the resulting answer. 1e+x simply means to move the decimal place to the right by x amount. 1e-x means to move the decimal place to the left by x amount.
- 1e+6 = 1,000,000 = One million
- 1e-6 = 0.000001 = A millionth
- 6.35e+9 = 6,350,000,000 = 6.35 Billion

Numbers

Small Numbers
Tenth - 0.1
Hundredth - 0.01
Thousandth - 0.001
Millionth - 0.000,001 - (1e-6)
Billionth - 0.000,000,001 - (1e-9)
Trillionth - 0.000,000,000,001 - (1e-12)
Quadrillionth - 0.000,000,000,000,001 - (1e-15)
Quintillionth - 0.000,000,000,000,000,001 - (1e-18)
Sextillionth - 0.000,000,000,000,000,000,001 - (1e-21)
Septillionth - 0.000,000,000,000,000,000,000,001 - (1e-24)
Octillionth - 0.000,000,000,000,000,000,000,000,001 - (1e-27)
Nonillionth - 0.000,000,000,000,000,000,000,000,000,001 - (1e-30)
Decillionth - 0.000,000,000,000,000,000,000,000,000,000,001 - (1e-33)

Large Numbers
One - 1
Ten - 10
Hundred - 100 - (1e+2)
Thousand - 1,000 - (1e+3)
Million - 1,000,000 - (1e+6)
Billion - 1,000,000,000 - (1e+9)
Trillion - 1,000,000,000,000 - (1e+12)
Quadrillion - 1,000,000,000,000,000 - (1e+15)
Quintillion - 1,000,000,000,000,000,000 - (1e+18)
Sextillion - 1,000,000,000,000,000,000,000 - (1e+21)
Septillion - 1,000,000,000,000,000,000,000,000 - (1e+24)
Octillion - 1,000,000,000,000,000,000,000,000,000 - (1e+27)
Nonillion - 1,000,000,000,000,000,000,000,000,000,000 - (1e+30)
Decillion - 1,000,000,000,000,000,000,000,000,000,000,000 - (1e+33)

Metric Prefix Negative
deci - 0.1
centi - 0.01
milli - 0.001
micro - 0.000,001
nano - 0.000,000,001
pico - 0.000,000,000,001
femto - 0.000,000,000,000,001

Metric Prefix Positive
deca - 10
hecto - 100
kilo - 1,000
mega - 1,000,000
giga - 1,000,000,000
tera - 1,000,000,000,000
peta - 1,000,000,000,000,000

Temperature (Approximate) °C/°F/°K

Subfreezing				**Boiling**
-100°C = -148°F = 173.15°K				80°C = 176°F = 353.15°K
-90°C = -130°F = 183.15°K				90°C = 194°F = 363.15°K
-80°C = -112°F = 193.15°K	**Cold**	**Average**	**Hot**	100°C = 212°F = 373.15°K
-70°C = -94°F = 203.15°K	-10°C = 14°F = 263.15°K	15°C = 59°F = 288.15°K	40°C = 104°F = 313.15°K	150°C = 302°F = 423.15°K
-60°C = -76°F = 213.15°K	-5°C = 23°F = 268.15°K	20°C = 68°F = 293.15°K	45°C = 113°F = 318.15°K	200°C = 392°F = 473.15°K
Freezing	0°C = 32°F = 273.15°K	25°C = 77°F = 298.15°K	50°C = 122°F = 323.15°K	**Molten**

1L = 0.26 Gal	100L = 26.41 Gal	10,000L = 2,641.72 Gal	

3 Equivalency Tables

Equivalency tables are designed to quickly and easily covert between different units of the same measurement type such as millimetres and centimetres which are both length measurements. Below is an example of an equivalency table for metric lengths. Put simply, the vertical columns show how many other units make up 1 of the bolded unit. So looking below, at the blue column, 1 centimetre equals 10,000 micrometres or 0.01 metres (1/100th).

The horizontal columns (in green below) are a bit more complex to understand and depend if you're in the whole numbers (right of the bold unit) or fractions (left of the bold unit). If you're in the whole numbers, that's how many bolded units it takes to make up the new unit type. An example of this is if you look right of the centimetre row you'll see that 100 centimetres equals 1 metre, you just have to ignore the bolded "1" if you decide to read it horizontally. Going left from the bolded row shows you how many one of the other unit type is in relation to your selected unit. For example if you go left from "1 Centimetre" you'll get to 0.1, this signifies that 1 millimetre is 0.1 of a centimetre, or 1/10th. Again, going left from 1 metre will give you 0.01, which means 1 centimetre is 0.01 of a metre or 1/100th.

If you want to convert a number from one unit to another, say 1587 millimetres to metres all you need to do is look in the vertical millimetre column and find the metre convergence cell (0.001). Make sure you don't use the horizontal table for conversions! Then multiply your original number (1587) by this factor (0.001). 1587 x 0.001 = 1.587 metres. The resulting answer will be in the unit you are converting to, in this case, metres. If you read it incorrectly you would have gotten 1,587,000.

Generally you will only want to use the vertical method to find and convert values.

Micrometre	**1 Micrometre**	1,000	10,000	1,000,000	**Micrometre**						
Millimetre	0.001	**1 Millimetre**	10	1,000	**Millimetre**						
Centimetre	0.000,1	0.1	**1 Centimetre**	100	**Centimetre**						
Metre	0.000,001 (millionth)	0.001 (1/1000th)	0.01 (1/100th)	**1 Metre**	**Metre**						

Metric Length

Picometre	**1 Picometre**	100	1,000	1,000,000	1,000,000,000	10,000,000,000	1,000,000,000,000	1,000,000,000,000,000			**Picometre**
Ångström	0.01	**1 Ångström**	10	10,000	10,000,000	100,000,000	10,000,000,000	10,000,000,000,000			**Ångström**

15/32 = 0.46875 = 46.875%
21/32 = 0.65625 = 65.625%
3/5 = 0.6 = 60%
3/7 = 0.428571 = 42.8571%

6/7 = 0.857143 = 85.7143%
5/8 = 0.625 = 62.5%
4/9 = 0.444444 = 44.4444%
8/9 = 0.888889 = 88.8889%
7/10 = 0.7 = 70%
3/11 = 0.272727 = 27.2727%
6/11 = 0.545455 = 54.5455%
9/11 = 0.818182 = 81.8182%
7/12 = 0.583333 = 58.3333%
5/16 = 0.3125 = 31.25%
13/16 = 0.8125 = 81.25%
5/32 = 0.15625 = 15.625%

11/32 = 0.34375 = 34.375%
17/32 = 0.53125 = 53.125%
23/32 = 0.71875 = 71.875%
29/32 = 0.90625 = 90.625%
4/5 = 0.8 = 80%
4/7 = 0.571429 = 57.1429%
7/8 = 0.875 = 87.5%
5/9 = 555556 = 55.5556%
9/10 = 0.9 = 90%
4/11 = 0.363636 = 36.3636%
7/11 = 0.636364 = 63.6364%
10/11 = 0.909091 = 90.9091%

11/12 = 0.916667 = 91.6667%
7/16 = 0.4375 = 43.75%
15/16 = 0.9375 = 93.75%
7/32 = 0.21875 = 21.875%
13/32 = 0.40625 = 40.625%
19/32 = 0.59375 = 59.375%
25/32 = 0.78125 = 78.125%
31/32 = 0.96875 = 96.875%

5 Conversion Factor

These are conversion factors which you multiply the number with to get the result. Any conversions with "precise" under them are the entire conversion factor and 100% accurate. Useful for measuring precious metals. Conversions without "precise" are generally good enough to be used in home projects and may have dropped a few decimal places. The exchange rate of money and barterable goods is included to give a general idea of value.

Distance	**Inches to Cm** Inch x 2.54	**Cm to Inches** Cm x 0.3937	**Sq/cm to Sq/Inch** Sq/cm x 0.16	**Sq/Inch to Sq/cm** Sq/Inch x 6.45	**Feet to Metres** Feet x 0.3048	**Metres to Feet** Metres x 3.2808	**Yards to Metres** Yards x 0.9144	**Metres to Yards** Metre x 1.0936	**Miles to Kilometres** Miles x 1.6093	**Kilometres to Miles** Kilometre x 0.6214	
Volume	**Cubic Meter to Cubic Feet** Cubic Metre x 35.32	**Cubic Feet to Cubic Metre** Cubic Feet x 0.03	**Cubic Metre to Litre** Cubic Metre x 1000	**Litre to Cubic Metre** Litre x 0.001	**Litre to Cubic Decimetre** Litre x 1	**Litres to Gallons** Litres x 0.22	**Gallons to Litres** Gallons x 4.55	**Drops to Millilitres** Drops x 0.05	**Millilitres to Drops** Millilitres x 20		

Area	**Hectares to Acres** Hectares x 2.47	**Acres to Hectares** Acres x 0.41									
Angles	**Degrees to Radians** Degrees x 0.01745329252 (Precise)	**Radians to Degrees** Radians x 57.295779513 (Precise)

6 Shape Formulas

This section is formulas for finding perimeter, area, surface area and volume. Remember that two characters besides each other implies that they are multiplied.
Ex: bh = b h = b x h

Congruence	Two objects are congruent if one can be transformed into the other by a sequence of rotations, translations, and/or reflections.
Similarity	Two objects are similar if one can be transformed into the other by a uniform scaling, together with a sequence of rotations, translations, and/or reflections.
Isotopy	Two objects are isotopic if one can be transformed into the other by a sequence of deformations that do not tear the object or put holes in it.

2D Shapes

Circle	A circle is a shape consisting of all points in a plane that are a given distance from a given point, the centre; equivalently it is the curve traced out by a point that moves in a plane so that its distance from a given point is constant.
Square	In geometry, a square is a regular quadrilateral, which means that it has four equal sides and four equal angles (90-degree angles, or (100-gradian angles or right angles).
Rectangle	A rectangle is a quadrilateral with four right angles. It can also be defined as an equiangular quadrilateral, since equiangular means that all of its angles are equal (360°/4 = 90°).
Triangle	A triangle is a polygon with three edges and three vertices. It is one of the basic shapes in geometry.
Rhombus	A rhombus (plural rhombi or rhombuses) is a quadrilateral whose four sides all have the same length. Another name is equilateral quadrilateral
Parallelogram	A parallelogram is a simple (non-self-intersecting) quadrilateral with two pairs of parallel sides. The opposite or facing sides of a parallelogram are of equal length and the opposite angles of a parallelogram are of equal measure.
Kite	A kite is a quadrilateral whose four sides can be grouped into two pairs of equal-length sides that are adjacent to each other. In contrast, a parallelogram also has two pairs of equal-length sides

2D Sides

This is a list of two-dimensional geometric shapes in Euclidean and other geometries.

1 Side - Henagon	9 Sides - Nonagon	17 Sides - Heptadecagon	70 Sides - Heptacontagon
2 Sides - Digon	10 Sides - Decagon	18 Sides - Octadecagon	80 Sides - Octacontagon
3 Sides - Triangle	11 Sides - Hendecagon	19 Sides - Enneadecagon	90 Sides - Enneacontagon
4 Sides - Quadrilateral	12 Sides - Dodecagon	20 Sides - Icosagon	100 Sides - Hectogon
5 Sides - Pentagon	13 Sides - Tridecagon	30 Sides - Triacontagon	1,000 Sides - Chiliagon
6 Sides - Hexagon	14 Sides - Tetradecagon	40 Sides - Tetracontagon	10,000 Sides - Myriagon
7 Sides - Heptagon	15 Sides - Pentadecagon	50 Sides - Pentacontagon	1,000,000 Sides - Megagon
8 Sides - Octagon	16 Sides - Hexadecagon	60 Sides - Hexacontagon	Infinite - Apeirogon

2D Area

Square **a^2** a = height	**Rectangle** **ab** a = length b = height	**Parallelogram** **bh** b = width h = height	**Trapezoid** **$h/2\ (b1 + b2)$** h = height b1 = long side b2 = short side	**Circle** **πr^2** r = radius	**Ellipse** **$\pi\ r1\ r2$** r1 = long radius r2 = short radius
Triangle **(½b) h** b = the base side h = height	**Equilateral Triangle** **$\sqrt{3}/4\ (a^2)$** $\sqrt{3}/4$ = 0.433012701… a = any side	**Rhombus** **D d / 2** D = Large Diagonal d = Small Diagonal	**Regular Polygon** **(P / 2) a** P = Perimeter a = apothem		

2D Perimeter

Square **4s** s = side	**Rectangle** **2l + 2w** l = length w = width	**Triangle** **a + b + c**	**Circle (Circumference)** **$2\pi r$ or πd** d = diameter		

Oval/Ellipse Perimeter (Circumference) This row finds the circumference of an oval which is useful when finding the amount of material needed to drape over a hooped swag. This formula is only an approximation as the true formula would take much more calculating.	**Approximate Formula** P = 4 x (a + b) x (0.78539816339) Centre to Long Side: a Centre to Short Side: b	I have swapped out ($\pi \div 4$) with the 0.78… number in the previous cell to save a calculation.

3D Shapes

Tetrahedron Faces - 4 Face Shape - Triangle Edges - 6 Vertices - 4	**Hexahedron (Cube)** Faces - 6 Face Shape - Square Edges - 12 Vertices - 8	**Octahedron** Faces - 8 Face Shape - Triangle Edges - 12 Vertices - 6	**Dodecahedron** Faces - 12 Face Shape - Hexagon Edges - 30 Vertices - 20	**Icosahedron** Faces - 20 Face Shape - Triangle Edges - 30 Vertices - 12	

Triangles	• **Equilateral:** All three sides are equal • **Isosceles:** Two sides are equal • **Scalene:** All sides are different	• **Angle - Acute:** All angles are acute • **Angle - Obtuse:** One angle is obtuse • **Angle - Right:** One angle is right	

3D Surface Area

Cube **$6s^2$** s = side length	**Rectangular Prism** **2(lw + lh + wh)** l = length w = width h = height	**Prism** **2 x b + p x h** b = area of base p = perimeter of base h = height	**Cylinder** **$2\pi r\ (r + h)$** r = radius h = height	**Hollow Cylinder** **$2\pi rh + 2\pi Rh + 2(\pi R^2 - \pi r^2)$** R = radius of the outer r = radius of the inner h = height	**Cone** **$\pi r\ (r + s)$** r = radius h = height
Pyramid **ph / 2 + b** p = perimeter of the base h = the length of the slanted edge b = area of base	**Sphere** **$4\pi r^2$** r = radius	**Hemisphere** **$3\pi r^2$** r = radius			

3D Volume

Cube **s^3** s = side length	**Rectangular Prism** **l w h** l = length w = width h = height	**Prism** **b h** b = area of base h = height	**Cylinder** **$\pi\ r^2\ h$** r = radius h = height	**Hollow Cylinder** **$\pi h(R^2 - r^2)$** R = radius of the outer r = radius of the inner	**Cone** **$1/3\ \pi r^2\ h$** r = radius h = height
Pyramid **1/3 bh** b = area of base h = height	**Sphere** **$4/3\ \pi r^3$** r = radius	**Hemisphere** **$2/3\ \pi r^3$** r = radius	**Ellipsoid** **$4/3\ \pi\ a\ b\ c$** a = radius 1 b = radius 2 c = radius 3		

5 Other Functions

Algebra	• **Line Slope:** (y2 - y1) / (x2 - x1) • **Points Midpoint:** (x1 + x2) / 2 x (yz + y2) / 2 • **Point Distance:** sqrt((x2-x1)² + (y2-y1)²) • **Pythagorean Theorem:** $a^2 + b^2 = c^2$ • **Internal Triangle Angles** = 180°		
Statistics	• Speed = Distance / Time • Probability = Desired Outcomes / Possible Outcomes		
Percentages	• **% of Number:** n (x / 100) • **% of x into y:** (100x) / y • **What no n is x % of:** (100n) / x • **Percent to Fraction:** x% = x / 100		

Trigonometry

SOH CAH TOA
A helpful mnemonic for remembering the definitions of the trigonometric functions sine, cosine, and tangent.

Sine = Opposite / Hypotenuse
Opposite = the side of the triangle directly opposite the angle Θ
Hypotenuse = the longest side of the triangle

	Cosine = Adjacent / Hypotenuse Adjacent = the side of the triangle nearest the angle Θ (that creates the angle) that is not the hypotenuse Hypotenuse = the longest side of the triangle
	Tangent = Opposite / Adjacent Opposite = the side of the triangle directly opposite the angle Θ Adjacent = the side of the triangle nearest the angle Θ (that creates the angle) that is not the hypotenuse
	• Cosecant Θ = Hypotenuse / Opposite • Secant Θ = Hypotenuse / Adjacent • Cotangent Θ = Adjacent / Opposite • Sin^2 Θ + Cos^2 Θ = 1 • Sin Θ / Cos Θ = Tan Θ

Angle Relationships	sin(−a)=−sin a cos(−a)=cos a tan(−a)=−tan a sin(π−a)=sin a cos(π−a)=−cos a tan(π−a)=−tan a	sin(π+a)=−sina cos(π+a)=−cosa tan(π+a)=tana sin(π÷2−a) = cos a cos(π÷2−a) = sin a tan(π÷2−a) = 1÷ tan a	sin(π÷2+a)=cos a cos(π÷2+a)=−sin a tan(π÷2+a)=−1÷tan a sin(3π÷2−a)=−cos a cos(3π÷2−a)=−sin a tan(3π÷2−a)=1÷tan a	sin(3π÷2+a)=−cos a cos(3π÷2+a)=sin a tan(3π÷2+a)=−1÷tan a	
Formulas	**Sum Formulas** • sin(a + b) = sin a × cos b + sin b × cos a • cos(a + b) = cos a × cos b − sin a × sin b • tan(a + b) = (tana + tan b) ÷ (1 − tan a × tan b)		**Difference Formulas** • sin(a − b) = sin a × cos b − sin b × cos a • cos(a − b) = cos a × cos b + sin a × sin b • tan(a − b) = (tan a − tan b) ÷ (1 + tan a × tan b)		**Double Angle Formulas** • sin(2a) = 2 × sin a × cos a • cos(2a) = cos^2 a − sin^2 a • tan(2a) = (2 × tan a) ÷ (1 − tan^2 a)

Other

Geometry	**Euler's Polyhedral Formula** F + V = E + 2 F: Face V: Vertex E: Edge	**Sum of interior angles of a regular polygon** Si = (n − 2) × 180° n: Number of sides			
Consumer Math	• **Discount:** Price x Discount Rate • **Sale Price:** Price - Discount • **Discount Rate:** Discount / Price		• **Interest:** Principal x Interest Rate x Time • **Tips:** Cost x Tip Rate • **Commission:** Cost x Commission Rate		

Programming Functions

A function is a unit of code that is often defined by its role within a greater code structure. Specifically, a function contains a unit of code that works on various inputs, many of which are variables, and produces concrete results involving changes to variable values or actual operations based on the inputs.

3 Dictionary

This is the dictionary of most of the terms used in this document. Your best bet to find what you're looking for is by using 'Ctrl+F' on PCs or the built-in search function on any mobile PDF reader you're using. If you search from this point in the document on, you will almost only get dictionary results - unless you search from the top again. This is an intended feature so you don't get usage of the terms rather than the definition of it.

Animal Husbandry

Parturition	Act of giving birth.
Alpha Animal	The animal that ranks highest in its social group.
Aphagia	Unable to eat, due either to physical or neurological conditions.
Artificial Insemination	Placing semen into the female reproductive tract (usually the cervix or uterus) by means other than natural intromission. (also referred to as “service” or “cover”)
Autonomous	A species living or conducting itself completely independent of others: self-determining, subject to its own laws. When applied to the consideration of animals and their relationship to humans - are the animals free from dependence on humans for well-being? If so, they are autonomous.
Barrow	A young castrated male pig.
Battery Cages	Cages for housing of egg-laying chickens. The cages have water sources and feeders. Battery cages usually are placed on top of each other in such a way that there is a roof to prevent excretions from falling on birds below. The number of hens housed in each cage depends on its size and specified guidelines for space allowance.
Beak Trimming	Removal by laser or hot knife of the distal portion (tip) of the beak in chicks. This is done in some operations to reduce injuries from pecking by other birds.
Crate	A pen area that allows lying down and standing up but prevents the animal from turning around or leaving the crate. Gestation crates house pregnant sows (female pigs). Farrowing crates house sows near and after giving birth to off-spring (piglets). Veal crates are used to house some young diary calves being raised for the purpose of producing veal.
Declawing	Surgical removal of claws and last (most distal) bones of the toes of cats but has been used for other animals at times.
Dehorning	Removal of horns or horn buds of calves and goat kids.
Estrus	Period of sexual receptivity of females of several species and preparatory for mating activity. Sometimes called “heat.”
Ethology	The study of animal behavior.
Farrowing	The process of giving birth (parturition) in swine.
Feticide	Male harassment of pregnant females carrying the fetus of another male, apparently to cause abortion. Has been observed in wild or feral horses.

Fight/Flight Distance	Distance at which an organism will have a response (normally behavioral) upon the approach of another organism or object.
Gene Pharming	The use of transgenic animals (and sometimes plants) to produce medicines or other pharmaceutical products.
Gestation	Time elapsing from conception until birth.
Infanticide	Killing of young of the same species. An example would be a male bear killing cubs of a female. This will cause the female to come back into reproductive receptivity or estrus. Also seen with feral cats.
Kainism	Killing siblings.
Matriarch	A predominant female in a social hierarchy.
Non-Ambulatory Disabled Cattle	Cattle that cannot rise from a recumbent position or cannot walk, including, but not limited to, those with broken appendages, severed tendons or ligaments, nerve paralysis, fractured vertebral column or metabolic conditions.
Roughage	Feed that is high in fiber, low in digestible nutrients, and low in energy (e.g., hay, straw, silage, and pasture).
Sapience	Awareness of being aware that comes with sentience.
Speciesism	Placing the interest of one chosen species above the interests of another species.
Tail Biting	Mouthing, chewing, or rigorous biting of the tails of other pigs. Tail biting can lead to injury and death.
Veal	Meat from very young cattle (under 3 months of age). Veal typically comes from dairy bull calves.
Vivisection	Act of operating or experimenting on living animals.
Zoonosis	Animal disease (bacterial, fungal, parasitic, viral, or prion) transmissible to humans. Examples include tuberculosis and rabies.
Zoophobia	An excessive fear of animals by humans.

Animals

Aging	Process of determining time lapse since sign was made, taking into consideration vegetation damage, rain, sun, and other natural elements.
Backing	Walking, usually across a road or natural barrier, in a backward motion, generally in an attempt to camouflage track by an incorrect direction of travel.
Broken Twigs	Small particles or twigs, which are uniquely broken in such a way as to indicate damage from human footwear.
Bruising	Footfall damage to vegetation.
Brushing Out	Using a branch, grass, or clothing article, in an attempt to brush or erase tracks from an area.
Compressed Areas	Areas of ground surface compressed in a manner which give an indication of human footfalls.
Continuity of Sign	The evidence of footfalls in proper sequence along a line of sign, generally unidentifiable.
Counter-tracking	Countering a tracker's efforts to track you.
Crying	The natural weeping of vegetation fluids resulting from footfall damage.
Cutting for Sign	An operation used principally along natural barriers to locate human sign.
Deception (Camouflage)	Attempting to confuse, disguise or conceal sign by walking backward, brushing out, or other means. To deceive or confuse direction of travel, number of persons, or presence of sign.
False Trails	Leaving a good trail, or sign, into a poor sign area, then departing on another route.
Flagged	Leaves or grass turned in direction of travel, showing the underside surfaces.
Flankers	The two members to the right and left, behind a point person, who make up a tracking team.
Grass Trail	The bending, intertwining of grass or brush indicating human passage.
Heel Marks	The curved mark or depression on the ground surface made by the walking motion of the heel portion of the shoes.
Healing	A process with live vegetation in which human damage is repaired. Used to age sign.
Inventing Sign	Seeing sign that is not present, usually because of fatigue and/or a "need" to see it. To fabricate within the "mind's eye."
Light Angle	The correct angle for seeing sign utilizing the primary light source.
Line of Sign	The continuity of sign evidencing human passage.
Littering	Scattered debris, rubbish, or human feces that are sign of human presence.
Natural Barriers	Areas such as streams, banks, and roads, which generally interrupt human passage, and show sign well.
Place Last Seen (PLS)	Place where witness or evidence indicates the subject was last seen.
Perimeter Cut	A sign cut method of limiting a search area, or locating sign along natural barriers.
Point Person	The principal tracking person who is in front of other team members and generally (on the ground) identifying each footprint step-by-step.
Prime Sign Area	The area of correct size and location in relation to other sign, in which the next print should be located.
Sand Trap	Dirt areas, occurring naturally or man-made, which, by their nature, show sign well.
Scuff Mark	The mark or sign caused by footgear contacting the ground surface.
Shine	The light reflection from human footfall damage or compression.
Sign	Evidence of a person's passage.
Sign Cutting	The skill of locating, following and identifying evidence of human passage.
Sign Cutting Stick	A stick, or other suitable object, used as a sign cut aid for measuring, marking, and locating prime sign areas.
Signature Track	Footprint evidence clearly displaying unique characteristics so as to be unmistakably identifiable.
Stride	Sign cut measurement from tip of toe of one normal walking step to back of heel of the next successive step.
Toe Digs	The indented mark or sign left in a normal walking motion when one foot propels the body forward.
Tracking Team	Ideally, a three-person team, each with specific functions, following a line of sign.
Transfer	The evidence of dirt or debris being carried by footgear and re-deposited on succeeding footfalls.

Backpacks

MOLLE	MOLLE stands for Modular Lightweight Load-carrying Equipment and it is a convenient system invented by the military for Bugging Out. It replaced the ALICE system.
Base Weight	The weight of your backpack plus all the gear that's inside it, but not counting consumables like food, water and fuel. Your Base Weight is mostly determined by your "Big 3" items: sleeping bag, backpack and shelter. Most backpackers should shoot for a Base Weight of 15-20lbs. Ultralight backpackers have a Base Weight of 10-12lbs or less.

Bivy Sack (or Bivvy Sack)	A waterproof sack that goes over your sleeping bag to add warmth and protection from the elements. Some hikers carry them as an emergency shelter, while others hikers may use it as their primary shelter, or to add more protection and warmth to another tarp shelter.
Hump	To begrudgingly carry an excessively heavy load. It's often the responsibility of the guide or leader of a group to carry a ton of extra group gear that they wouldn't normally take. Climbers also often have to Hump in their entire gear rack until they get to the base of their climb.
Slackpacking	Carrying a minimal load of food, water and gear, usually because someone else in your group is Humping everything else, or because you're planning to stay in Huts along your route.
The Big Three (or 3)	The three most essential pieces of gear that any backpacker carries: sleeping bag, backpack and shelter. These items also tend to be the heaviest, so those looking to go Ultralight often look to these 3 items to cut the most from their Base Weight.
UL (or Ultralight)	The goal of going Ultralight is to carry a Base Weight of less than 10-12lbs. There are many reasons for going Ultralight and most of them boil down to the fact that you can hike farther, faster, and see more without getting as tired and with less chance of injury. The trade-off with carrying less gear is that you need more experience and skills (which weigh nothing).
Binding	Binding occurs in the inside of a backpack as a way to sew and attach different parts of the bag together, like the lining and inner compartments with a bag's outer shell.
Buckles	Buckles are used in a backpack that has a shoulder harness or sternum strap as a way to connect the harness to the strap.
D Ring	A D Ring is a part of a zipper puller, it refers to the "D" shaped piece that connects the zipper teeth to the puller and can be made in metal or plastic with a variety of color and aesthetic finishings.
Hip Padding	Padding that extends from the back of the backpack and straps in the front. Similar to the sternum strap and shoulder harness, hip padding is most commonly seen in outdoor and travel backpacks for weight distribution.
Lining	The lining in a backpack refers to the material that's used inside a backpack's compartments. These can vary depending on the bag's shape, price, and construction, but typically
Padded Shoulder Strap	A padded shoulder strap is when a strap has extra cushioning or support in the form of a padded material like foam (like EPE or EVA) or mesh as opposed to a strap only containing a singular material type.
Shoulder Harness	Upper section of the backpack straps that provides shoulder support. Commonly seen in outdoor backpacks or travel backpacks that require reduced weight load on the shoulders, but less seen in everyday or work backpacks.
Sternum Strap	A strap that extends across your chest when the backpack is worn. Similar to a shoulder harness, it's most commonly seen in larger backpacks for outdoors and travel.
Stitching	Stitching occurs throughout a backpack from the outer straps and materials to the inner main compartments. Some backpacks require different stitching methods from bar-tacking for extra durability and strength to leather backpacks that require more stitches per inch than a backpack made from a woven material like nylon or canvas.
Strap	A piece of woven fabric that connects the top to the back of the backpack that's made to fit around your shoulders. They can be made from different types of materials and commonly feature the same material as a bag's outer shell.
Strap Adjuster / Tri-Glide	A strap adjuster, also known as tri-glide, is a plastic or metal piece that is connected to a backpack's strap and allows for adjustment of a bag's webbing to change the height of how high or low a backpack lies on your back.
Trims	Trims are commonly seen in bags that feature leather and are used as an aesthetic detail inside a bag's compartments or on the outer facing areas like straps or pockets.
Water Bottle Pocket	A water bottle pocket can be found on the outside or inside of a backpack for storing water bottles. An outer pocket allows for easy, quick access on the go.
Webbing	Webbing in a backpack is a piece of woven material (often a type of nylon) that connects the bottom of a backpack's strap to the bottom base of a backpack. The webbing can be adjusted via a strap adjuster for changing how high or low the bag sits on your back.
Zipper	Metal or plastic piece that allows for the opening and closing of a bag or a bag's internal compartments. Zippers commonly come in either metal or nylon material and can also be made to be waterproof or finished with different color options (learn more about the history of the zipper).
Zipper Pullers	While a zipper refers to the entire zipper from the teeth to the puller, a zipper puller itself is the part of a zipper that one is able to grab to open and close a zipper's teeth. A zipper puller can be made from plastic, metal, or a range of materials including real leather and vegan leather.
Clamshell Opening	Backpack opens like a clamshell. Three sides can be upzipped, leaving one side to act like a hinge. Another name for this is suit-case style opening since the panel can lay flat. You'll most often see this on travel bags or backpacks of larger capacity.
Splayed Opening	Very similar to clamshell/suitcase openings except that they may not necessary open all the way. You'll see this often in techy backpacks—the splayed opening allows you to open a hard-shelled backpack. Some backpacks have a splayed opening that can be converted to clamshell.
Roll-Top Opening	Are tops that… roll down. Once rolled, these openings are usually held down by buckles or hooks on both sides. The benefit of these are that they allow you to expand the volume of the backpack upwards and are also more effective at keeping water out than zippers. Hence camping dry sacks are roll-tops. On the downside, they are not as convenient to open and close as zippers.
Drawstring Tops (or cinch cord)	Are tightened via a string that can be clamped to hold the opening closed. These are common in large trekking backpacks because they can open very wide to allow you to fit large items like tents and sleeping bags inside. They're often accompanied by a lid.
Lid	A cap that sits on the top of the backpack. Many trekking backpacks have this as a floating lid that provide a cap over drawstring openings to keep water out and are buckled down. Smaller backpacks with lids often use zippers instead.
Central Zipper	Some newer bags have a more unique design with zippers that open down the middle of the backpack's front face. This reduces the amount you need to unzip and opens up the bottom of the bag, allowing you to access contents near the bottom.
Kangaroo Pockets	Are elastic pouches that are frequently seen on the front face of hiking backpacks. They usually aren't secured by zippers or other hardware but are a really easy and quick place to stow small items or relatively flat items like a shovel. They're often stretchy so jackets can also be stowed there.

ADDENDUM Backpacks

Hydration Sleeve	Hold water bladders or pouches and are usually accompanied by some sort of port that allows you to thread the bladder's tube out of the bag and a clip on the shoulder strap to hold it in place.
Tech Sleeves / Laptop Sleeves	Hold modern electrical devices. One thing to look out for in the laptop sleeves is whether or not the laptop will have any padding on the bottom of the bag or if it's suspended from the bottom.
Load-Lifter Straps	(or sometimes called stabilizer) Relieve your shoulders from some of the weight of the backpack by bringing the bag forward to bring the center of mass inward.
Sternum Straps	Help disburse the weight of the backpack off your shoulders a little bit, but not very much. It's main purpose is to prevent the shoulder straps from sliding off your arms when moving around and to tug them inward a bit so your arms can move freely.
Additional Stabilizer Straps	Sometimes found on the waist belt. Similar to the load-lifter straps, these straps pull the backpack closer to you (in this case they pull the bottom of the back closer to your butt) to improve balance by bringing the center of gravity closer to where it would naturally be if you weren't wearing a backpack.
Pig Snout (lash point)	Those square/diamond-shaped patches with two-slits in them? They have a purpose! These are lash points and allow you to tie items to the outside of your backpack or hook up a carabiner. Remind you of a certain animal's nose?
Grab Handles / Haul Straps	Typically, a backpack will have some sort of handle at the top between the shoulder straps. These grab handles range from a simple layer of nylon webbing to fully-padded grips. Larger bags with more features may also have multiple grab handles around the other sides of the bag.
Compression Straps	Help reduce the size of your bag when it's not fully packed and minimize your bag's appearance. They're also useful lash points to attach/hold gear and are most typically on the sides of the bag, but can also be found on the bottom.
Gear Loops	Outdoorsy packs often have loops on the front face that allow you to strap in items like trekking poles, axes, shovels, or picks. To use the loop for axes and picks, drop the handle all the way through the loop and rotate the handle upward to be secured by the elastic hook at the top of the bag.
Lumbar Padding	Large trekking bags will often also have some sort of lumbar padding for your lower back. This point is where a lot of the weight of the pack might sit or rub against your body.
Air Flow Channels	Help ventilate your back and delay the onset of your sweaty mess. The ridges are typically shaped to try to balance comfort with airflow and also reduce the surface area of your back against the backpack. In hot weather, though, they won't be able to prevent your back from getting sweaty. But at least they'll delay it.
Daisy Chains	Are a number of webbing loops sewn in a linear series that are basically a whole bunch of lash points lined up. Useful for attaching small items when you're hiking.
MOLLE system / PALS	Like daisy chains, but on steroids. MOLLE is an acronym for modular lightweight load-carrying equipment and allows users to attached gear to an array of nylon webbing. These rows of webbing are called PALS (pouch attachment ladder system). MOLLE systems are a standard for tactical gear and are used by the current generation of backpacks used by the US Army and many other NATO armed forces.
Tie Out Loops	Can be used in place of daisy chains and are essentially a few tiny loops stitched around the perimeter of the bag. These loops can be used as attachment points for elastic cords or twine to hold gear and add virtually no weight to the bag.
Pass-Through / Eyelet / Hydration Port	All names for what is essentially a small hole in a backpack. They're intended to allow you to pass a cable, wire, or tube through the fabric of the backpack and can be seen with a variety of uses (e.g., tubes for water bladders or cables for headphones).
Rain Fly	Since some backpacks are not as water resistant as others, they may come with a rain fly. These rain ponchos for backpacks just provide an extra layer of protection from the elements. Some backpacks come with them included or attached, but you can also buy them separately.
Luggage Strap / Pass-Through	Travel backpacks usually have a wide strap on the back panel that allows you to attach it to the handle of a rolling luggage. It's a very convenient feature, but just be careful if you're using a large backpack. It may outweigh a small rolling luggage and cause it to tip forward if you try to stand it up.
Zipper Teeth	The small ridges that interlock to form a sealed chain.
Zipper Chain	The continuous piece formed when the two halves of teeth are interlocked.
Zipper Sliders	The device that moves up and down the chain to open and close the zipper.
Zipper Pull Tab	The "handle" that's used to pull the zipper up and down, often with an extension tied to it for easier use.
Zipper Tape	The fabric on the sides of the teeth and chain.
Zipper Stops	The parts at the top and bottom that prevent the zipper from sliding off the chain.
Zipper Garage	A covering at the end of zipper where the slider can be parked to prevent water from leaking through the slider.
Zipper Aqua Guard	A design that uses a polyurethane laminated tape that is more water resistant than traditional fabrics to improve the water-resistance of the zipper.
Hooks (G-hooks)	Around backpacks, you might also find various hooks, often in the shape of a "G". These have a variety of uses, but can be used on compression straps, for attachments like nets (e.g., the helmet net on the NYA-EVO), or even closing mechanisms like the Lander. The problem with G-hooks is that how well the operate often depends on how tightly the hooks fit into the loops.
Buckles	Are the hardware pieces that fasten together (e.g., on hip belts and sternum straps). They're usually made of plastic but you might occasionally see metals ones too, often something lightweight like aluminum.
Adjusters	Are what we call the hardware pieces used to adjust the length of the straps. They usually also have a tab that you can pull outward to make it easier to loosen the straps.
Magnets	Magnets are incorporated into buckles and lid flaps. Look for Fidlock components. They make smooth magnetic buckles that are just addictive to play with.
Frame	Many backpacks feature a frame to provide structural support and give the bags a consistent shape. Most frames are internal and can be either a a stiff tube that follows the perimeter of the bag or a sheet frame that's usually buried inside the back panel. External frames usually sit further away from your torso and while they increase the air ventilation against your back, but tend to be more top-heavy.

Barter

Barter	In trade, a system of exchange in which participants in a transaction directly exchange goods or services for other goods or services without using a medium of exchange, such as money. Economists distinguish barter from gift economies in many ways; barter, for example, features immediate reciprocal exchange that is not delayed in time. In most developed countries, barter usually only exists parallel to monetary systems to a very limited extent. Market actors use barter as a replacement for money as the method of exchange in times of monetary crisis, such as when currency becomes unstable (e.g. by hyperinflation or a deflationary spiral) or simply unavailable for conducting commerce.
Trade Dollars	The medium of exchange used between trade exchange members in place of cash in a non- reciprocal trade transaction. The IRS values a trade dollar the same as a U.S. Dollar.
Organized Barter	Networks that utilize a common medium of exchange.
Reciprocal Trade	A trade where two parties exchange products or services of equivalent values.
Non-Reciprocal Trade	An indirect exchange between two or more parties, usually accomplished through a third-party broker.
Cost of Goods	The direct cost required to replace that which is sold.
Cost of Trade Dollars	The direct cash cost incurred to use one trade dollar, usually the company's own wholesale cost of goods.
Wholesale Buying Power	The ability through trade to sell products or services to new customers at a price higher than the price paid for the product or service traded and therefore to receive in return a product or service of greater value than the cash dollar costs in the item originally traded.
Barter Leverage	The difference between the cash dollar amount invested in a product or service traded and the value received in the trade.
Deficit	Spending more trade dollars than you have earned, therefore having a negative trade balance. See IRTA's Advisory Memo on Deficits.
Arbitrage	The practice of taking advantage of a price difference between two or more markets by striking a combination of matching deals that capitalize upon the imbalance, with the profit being the difference between the market prices.
Trade	The cashless exchange or goods and services.

Blacksmithing

Forge	The setup for burning coal at a very high temperature in order to heat metal to a temperature that makes it malleable. A forge, if indoors or partially enclosed will have some kind of vent set up to guide the smoke and ash away from the blacksmith. And a forge has some kind of a blower that will blow air onto the hot coals (from underneath). This flow of air will raise the temperature of the coals.
Anvil	A large metal object that a blacksmith uses to hammer on.
Hardy Hole	This is a hole in the top of the anvil that you can insert tools into. These tools are called Hardy Tools. And they come in a wide variety of shapes and sizes. These hardy holes vary in size depending on the size of the anvil.
Borax	This is a commonly available cleaning compound that comes in powder form. It is used by blacksmiths as a flux to help in the process of forge welding.
Pritchel Hole	A round hole on the top surface of the anvil that is used as a punch so you can punch holes through metal.
Drawing Out	Extending the length of a piece of metal. This is done by heating and hammering.
Forging	The art and skill of heating metal and hammering it into shape and form.
Forge Welding	Heating two or more pieces of metal to the melting point where they will be joined together into a single piece of metal. They become homogenous.
Farrier	A blacksmith who specializes is shoeing horses and oxen.
Annealing	The process of heating up a metal so it is softer and malleable, able to be worked on the forge. Typically this is about 2/3rds of the melting point of the metal. With steel it is 50F above the temperature of final ferrite stability.
Bolster	A small piece of metal or wood on a knife where the blade meets the handle. The picture above shows a bolster.
Fuller	A groove down the length of a blade and usually on both sides. It makes the blade lighter and stronger with less whipping action upon swinging. The picture above shows a fuller in a Japanese Katana.
Scale	This is a layer of oxides that forms a black coating on the steel as it is heated. Hammering the steel breaks this off in flakes and it is easily brushed off with a wire brush.
Scarf Welding	This is a technique of welding two pieces of metal together where the joint is angular.
Butt Welding	The Parts are butted together
Lap Welding	The Parts are overlapped.

Camp Craft

Communication

RACES	Radio Amateur Civil Emergency Services
REACT	Radio Emergency Associated Communications Teams
ADSL	Asymmetric Digital Subscriber Line: A method for moving data over regular phone lines. An ADSL circuit carries much more data than a modem can encode on a regular phone connection. ADSL rides on the regular phone wires coming into the subscriber's premises (twisted pair copper).
AM	Amplitude Modulation: A modulation method in which the carrier amplitude changes with the input signal amplitude.
Bandwidth	1. Bandwidth (BW) is a range of frequencies, or information, that a circuit can handle or the range of frequencies that a signal contains or occupies. Example: An AM broadcast radio channel in the US has a bandwidth of 10kHz, meaning that it occupies a 10kHz-wide band, such as the frequencies from 760kHz to 770kHz.
Base Station	A base station (or basestation) is a wireless transceiver at a fixed location (e.g. atop a telephone pole) which is part of a wireless communications network, e.g. the cell phone network. Typically, the base station connects to any cell phones in its area and relays the calls to the wired network. A femto base station is a smaller, personal base station which might cover a home or building and connect via a DSL Internet connection.

Bluetooth	A technology that allows voice and data connections between a wide range of mobile and stationary devices through short-range digital two-way radio. For instance, it specifies how mobile phones, Wireless Information Devices (WIDs), computers and PDAs interconnect with each other, with computers, and with office or home phones.
Broadband	A transmission medium with enough bandwidth to carry multiple voice, video, or data channels simultaneously. This technique is used, for example, to provide fifty CATV channels on one coaxial cable; or to provide Internet access over cable TV; or to add DSL to a voice-grade telephone line.
CAT3	Category 3: Refers to Ethernet cabling that satisfies the criteria for the EIA/TIA-568 standard's Category 3, which allows data transfers up to 10Mbps.
CAT5	Category 5: Refers to Ethernet cabling that satisfies the criteria for the EIA/TIA-568 standard's Category 5, which allows data transfers up to 100Mbps.
DBS	Direct Broadcast Satellite: A system which broadcasts directly from satellite to the subscriber (end user). Prominent examples in the US are DirecTV and Dish network.
Class A	The simplest type of amplifier, class A amplifiers are those in which the output transistors conduct (i.e. do not fully turn off) irrespective of the output signal waveform. This type of amplifier is typically associated with high linearity but low efficiency.
Class AB	Class AB amplifiers combine Class A and Class B to achieve an amplifier with more efficiency than Class A but with lower distortion than class B. This is achieved by biasing both transistors so they conduct when the signal is close to zero (the point where class B amplifiers introduce non-linearities). The transistors transition to class B operation for large excursions.
Class B	Class B amplifiers are those in which the output transistors only conduct during half (180 degrees) of the signal waveform. To amplify the entire signal two transistors are used, one conducting for positive output signals and the other conducting for negative outputs. Class B amplifiers are much more efficient than class A amplifiers, but have high distortion due to the crossover point when the two transistors transition from on to off.
Class C	A class C amplifier is a form of switching amplifier in which the transistors are on for less than a half cycle (less than 180 degrees) -- often, much less. For instance, the transistor may be on only during the top 10% of the signal excursion, delivering just a pulse. Class C amps are very efficient because the transistors are off most of the time and when they are on, they are in full conduction. They deliver high distortion and are often used in RF circuits, where tuning circuits restore some of the original signal and reduce distortion. They are also used in low-fidelity applications where the distortion is not important, such as a siren speaker driver.
Class D	Class D amplifiers are those that output a switching waveform, at a frequency far higher than the highest audio signal that needs to be reproduced. The low-pass filtered, average value of this waveform corresponds to the actual required audio waveform. Class D amplifiers are highly efficient (often up to 90% or higher) since the output transistors are either fully turned on or off during operation. This completely eliminates the use of the linear region of the transistor which is responsible for the inefficiency of other amplifier types. Modern Class D amplifiers achieve fidelity comparable to class AB.
Class G	Class G amplifiers are similar to class AB amplifiers except they use two or more supply voltages. When operating at low signal levels, the amplifier uses a lower supply voltage. As the signal level increases, the amplifier automatically picks the appropriate supply voltage. Class G amplifiers are more efficient than class AB amplifiers since they use the maximum supply voltage only when required, while a class AB amplifier always uses the maximum supply voltage.
Class H	Class H amplifiers modulate the supply voltage to the amplifier output devices so that it is never higher than necessary to support the signal swing. This reduces dissipation across the output devices connected to that supply and allows the amplifier to operate with an optimized class AB efficiency regardless of output power level. Class H amplifiers are generally more complex than other designs, with extra control circuitry required to predict and control the supply voltage.
Click-and-Pop	Click-and-pop refers to the unwanted transient signals in the audio band that are reproduced by the headphone and/or speaker when the audio device driving it is either: powered up (power applied) powered down (power removed) brought out of shutdown (power applied previously) forced into shutdown (power still applied)
Click/Pop Reduction	A feature that eliminates "clicks" and "pops" — unwanted transient noise signals during power-up, shutdown, connection, etc.
dB	Decibels: A method for specifying the ratio of two signals. dB = 10 times the log of the ratio of the power of the two signals. This is equal to 20 times the ratio of their voltages, if the signals are driving equal impedances.
dBm	A unit that defines a signal level by comparing it to a reference level. The reference level of 0dBm is defined as 1mW. The signal level in dBm is 10 times the log of the signal's power over that of the 0dBm reference.
DDI	Digital Data Input
Distortion	In systems that handle electrical signals, distortion is a generally unwanted change in the signal. Not all signal alterations are considered distortion. For instance, a uniform delay or a linear attenuation or amplification would generally not be considered distortion.
Dithering	A common technique to improve digitizing when quantization noise (quantization error/noise) can no longer be treated as random. A small amount of random noise is added to the analog input signal. This added noise causes the digital output to randomly toggle between two adjacent codes, thereby avoiding thresholding effect.
Diversity	In radio systems, diversity is a method of improving the reliability and capacity by using multiple communication channels to carry each signal.
DMT	Discrete Multitone data Transmission
DSL	A mechanism for providing high-speed digital communications (e.g. Internet access) over a standard phone line.
DTMF	Dual Tone Multiple Frequency (DTMF) is a signaling method developed by Bell Labs for sending telephone dialing information over the same analog, voice-quality phones lines that carry voice. Each digit is encoded as the sum of two sine wave bursts, of different frequencies. The two-tone method was chosen because it can be reliably distinguished from voice and normal phone conversations are highly unlikely to falsely trigger the DTMF receiver.
DWDM	Dense Wave Division Multiplexing: The technology by which the frequencies of light carried on a single optical fiber are subdivided into discrete wavelengths, allowing for the greater transmission of data.
Dynamic Range	The range, in dB, between the noise floor of a device and its defined maximum output level.
Ethernet	A family of network protocols based on asynchronous frames. The Ethernet framing structure provides a flexible payload container with basic addressing and error detection mechanisms.

ADDENDUM

Dictionary

Communication

GHz	Gigahertz
Gigabit	1 billion bits-per-second.
GLONASS	The Russian Global Navigation Satellite System
GPS	Global Positioning System: A satellite- based navigation system in which two or more signals, received from satellites, are used to determine the receiver's position on the globe.
GSM	Global System for Mobile Communications: A land, mobile, pan-European, digital, cellular radio-communications system.
HDTV	High-definition television: an all-digital system for transmitting a TV signal with far greater resolution than the analog standards (PAL, NTSC, and SECAM). A high-definition television set can display several resolutions, (up to two million pixels versus a common television set's 360,000). HDTV offers other advantages such as greatly improved color encoding and the loss-free reproduction inherent in digital technologies.
HSDPA	High-Speed Downlink Packet Access (HSDPA) is a 3G radio interface standard in the HSPA family for wireless and cellular handsets or datacards that increase the datarate and improve the traffic handling of existing UMTS standards.
HSPA	High-Speed Packet Access (HSPA) is a collection of radio interface standards for wireless and cellular handsets or datacards that increase the datarate and improve the traffic handling of existing UMTS standards.
Internet Protocol (IP)	Standard method for data transfer used on the Internet. Also known as IP or TCP/IP.
IR	Infrared: Light that has a frequency below the visible light spectrum, used for remote controls, line-of-sight wireless data, and night vision applications, among others.
kHz	Kilohertz
LAN	Local Area Network: A computer network, usually within one building, that connects computers, file and mail servers, storage, peripherals, and other devices in a way that permits data interchange and sharing of resources. Ethernet and WiFi (802.11) are common examples.
LOP	Loss of power
LOS	Loss of signal
mA	Milliampere, or milliamp: 1/1000 of an Ampere. Ampere is the basic unit for measuring electrical current.
MHz	Megahertz (MHz): Measurement of frequency -- million cycles per second.
NTSC	NTSC is the color television standard established by the National Television Standards Committee in the United States in 1953. The NTSC standard's distinguishing feature was that it added color to the original 1941 black and white television standard in such a way that black and white TVs continued to work.
PAL	Phase alternate line: A television standard used in most of Europe. Similar to NTSC, but uses subcarrier phase alternation to reduce the sensitivity to phase errors that would be displayed as color errors. Commonly used with 626-line, 50Hz scanning systems, with a subcarrier frequency of 4.43362MHz.
Receiver	A circuit that accepts signals from a transmission medium (which can be wireless or wired) and decodes or translates them into a form that can drive local circuits.
RF	Radio Frequency: An AC signal of high enough frequency to be used for wireless communications.
RFI	Radio Frequency Interference: Unwanted noise from RF sources.
SDTV	Standard Definition Television: Digital formats that do not achieve the video quality of HDTV, but are at least equal, or superior to, NTSC pictures. SDTV may have either 4:3 or 16:9 aspect ratios, and includes surround sound. Variations of fps (frames per second), lines of resolution, and other factors of 480p and 480i make up the 12 SDTV formats in the ATSC standard.
T1	T1 is standard for digital transmission in the United States. It is a digital transmission link with a capacity of 1.544Mbps. T1 uses two pairs of normal twisted wires, the same as found in most residences. T1 normally handles 24 voice conversations, each one digitized at 64kbps. With more advanced digital voice encoding techniques, T1 can handle more voice channels.
T3	A type of data connection capable of transmitting a digital signal at 44Mbps. T3 lines are often used to link large computer networks, such as those that comprise the Internet.
TCP/IP	Transmission Control Protocol/Internet Protocol: The protocols or conventions that computers use to communicate over the Internet.
Television	A system for transmitting picture and sound over a distance, primarily via the standards for NTSC, PAL, or HDTV.
Transceiver	A device that contains both a transmitter and receiver. Common misspellings: Transciever, Tranceiver, Transeiver, Transiever, Tranciever, Transcever.
Transfer	Transfer refers to the amount of data transferred across a digital interface, exclusive of any extra bits used to encode the data. The number of data transfers is less than the number of bits transmitted when encoded data has more bits than the raw data. As an example, a PCIe serial bus uses 10 bits to encode eight data bits.
Transmitter	A circuit that accepts signals or data in and translates them into a form that can be sent across a medium (transmitted), usually over a distance. The medium can be wireless or wired.
Tx	Transmit
UWB	Ultra-Wideband (UWB) is a communications technology that employs a wide bandwidth (typically defined as greater than 20% of the center frequency or 500MHz). UWB is usually used in short-range wireless applications but can be sent over wires. Ultra-Wideband advantages are that it can carry high data rates with low power and little interference.
VLF	Very-low frequency
VoIP	Voice over Internet Protocol: Method for transmission of voice (or fax) calls over the Internet.
VU	Volume unit
WAN	Wide Area Network: Any Internet or network that covers an area larger than a single building.
WHDI	WHDI (Wireless Home Digital Interface) is a standard that enables wireless delivery of uncompressed HDTV throughout the home with video rates of up to 1080p in the 5GHz unlicensed band.
Wideband	A classification of the information capacity or bandwidth of a communication channel. Wideband is generally understood to mean a bandwidth between 64kbits/s and 2Mbit/s.
Wireless	Radio-frequency devices, circuits, or communications methods.
WLAN	Wireless Local Area Network
Rx	Receive
FM	Frequency Modulation: A modulation method in which the carrier frequency changes with the input signal amplitude.

Analogue	Analogue is a conventional method of transmitting data. Standard landline telephones use analogue technology. It is distinct from digital technology, which provides for greater quality and speed of data transmission.
Download	Downloading is the method by which users access and save or "pull down" software or other files to their own computers from a remote computer via the Internet.
Encryption	Encryption is the process of converting electronic data to an unrecognisable or encrypted form, one that cannot be easily understood by unauthorised parties.
FTP	File transfer protocol (FTP) is a common method of transferring files via the internet from one host to another host.
Internet	A set of interconnected networks that allow computers in different locations to exchange information. The Internet includes services such as the world wide web, electronic mail, file transfer protocol (FTP), chat and remote access to networks and computers.
Intranet	An intranet is basically a private, internal internet specific to an organisation or group.
Modem	A modem is a device that allows computers to transmit information to each other via ordinary telephone lines.
Phishing	Phishing is a type of email fraud in which the perpetrator sends out emails that appear to come from a legitimate service or reputable company, such as a bank or an email service provider. These emails aim to lure recipients to reveal confidential information that the perpetrator can use for their financial advantage - for example, online banking log-in details and passwords.
Malware	Malware is short for malicious software. It refers to a software program that has been developed to do harm to other computers. Types of malware include viruses, worms and spyware.
Server	A server is a computer that handles requests for data, email, file transfers, and other network services from other computers.
Virus	A virus is a piece of programming code inserted into other programming to cause damage. Viruses can be sent in many forms but are often transmitted via email messages that, when opened, may erase data or cause damage to your hard disk. Some viruses are able to enter your email system and send themselves to other people in your list of contacts.
Wi-Fi	Wi-Fi is a technology that allows computers and other devices to communicate via a wireless signal. Essentially, it means you can browse the internet without tripping over phone cords.
WPA	Wi-Fi protected access (WPA) is a security protocol used in wi-fi networks. It is an improvement on WEP because it offers greater protection through more sophisticated data encryption.

Contents

Addendum

Symbols	"÷" or "/" means divide, "x" or "*" means multiply
Apothem	The apothem (sometimes abbreviated as apo) of a regular polygon is a line segment from the centre to the midpoint of one of its sides. Equivalently, it is the line drawn from the centre of the polygon that is perpendicular to one of its sides.
Lateral Surface	The lateral surface of an object is the area of all the sides of the object, excluding the area of its base and top.
Acute Angle	An angle less than 90°.
Adjacent	Adjacent sides are next to each other and are joined by a common vertex.
Algebra	Algebra is the branch of mathematics where symbols or letters are used to represent numbers.
Angle	An angle is formed when two straight lines cross or meet each other at a point. The size of an angle is measured by the amount one line has been turned in relation to the other.
Approximate	An approximate value is a value that is close to the actual value of a number.
Arc	Part of a circumference of a circle.
Area	The amount of space a shape takes up. E.g. the area of the lawn is 35 square metres.
Asymmetrical	A shape which has no lines of symmetry.
Average	A value to best represent a set of data. There are three types of average - the mean, the median and the mode.
Axis	An axis is one of the lines used to locate a point in a coordinate system.
Bearing	A three digit angle measured from north in a clockwise direction.
BIDMAS	A way of remembering the order in which operations are carried out. It stands for Brackets - Indices - Division - Multiplication - Addition - Subtraction.
Bisect	To divide an angle or shape exactly in half.
Brackets	Used to determine the order in which operations are carried out.
Chord	A straight line drawn from one point on the edge of a circle to another.
Circumference	The perimeter of a circle.
Coefficient	The number in front of an algebraic symbol. For example the coefficient of 5x is 5.
Congruent	If you can place a shape exactly on top of another then they are said to be congruent. You may rotate, reflex or translate the shape.
Constant	A letter or symbol whose value always stays the same. The constant Π is a common example.
Cube Number	The product when an integer is multiplied by itself twice. For example 5 cubed = 5 x 5 x 5 = 125.
Cuboid	A 3D shape with all sides made from rectangles.
Cumulative Frequency	A running total of the frequencies, added up as you go along.
Decagon	A ten sided polygon.
Decimal	Not a whole number or integer. For example, 3.6 or 0.235.
Denominator	The bottom part of a fraction.
Diameter	The distance across a circle which passes through the centre.
Difference	Subtract the smaller value from the larger value to find the difference between two numbers.

ADDENDUM Dictionary Addendum

Distribution	How data is shared or spread out.
Equal	Used to show two quantities have the same value.
Equilateral Triangle	A triangle with all sides and angles the same size.
Estimate	To find an approximate answer to a more difficult problem. E.g. 31.2 x 5.94 is roughly equal to 30 x 6 = 180.
Expand	To multiply out brackets in an expression. For example, 2(3x + 7) = 6x + 14.
Expression	A collection of terms which can contain variables (letters) and numbers. E.g. 4pq - q + 7
Factor	A number that divides another number exactly. E.g. 4 is a factor of 12.
Factorise	To put an expression into brackets by taking out a common factor. For example, 20x + 15y = 5(4x + 3y).
Figures	Another name for numbers. For example one thousand and fifty in figures is 1050.
Formula	An equation used to describe a relationship between two or more variables.
Frequency	How many times something happens. Another word for 'total'.
Frequency Density	The frequency divided by the class width.
Gradient	How steep a line is. Found by dividing the distance up by the distance across.
HCF	Stands for 'highest common factor'. It is the largest factor common to a set of numbers. E.g. The HCF of 16 and 24 is 8.
Heptagon	A seven sided polygon.
Hexagon	A six sided polygon.
Histogram	A diagram drawn with rectangles where the area is proportional to the frequency and the width is equal to the class interval.
Hypotenuse	The longest side on a right angled triangle.
Increase	To make an amount larger.
Indices	Another name for powers such as ^{2} or ^{3}.
Integer	A whole number.
Inter-quartile range (IQR)	The difference between the upper and lower quartile.
Irrational	A decimal which is never ending. It must also not be a recurring decimal.
Justify	Another word for 'explain'. Often crops up on your maths exam. E.g. 'Calculate the mean and range for each player. Who is the better player Justify your answer.'
LCM	Stands for 'lowest common multiple'. It is the smallest multiple common to a set of numbers. E.g. The LCM of 3 and 4 is 12.
Locus	A collection of points which are the same distance from another point or line.
Lower Range	The smallest value in a set of data.
Mean	A type of average found by adding up a list of numbers and dividing by how many numbers are in the list.
Median	The middle value when a list of numbers is put in order from smallest to largest. A type of average.
Mode	The most common value in a list of numbers. If two values are tied then there is two modes. If more than two values are tied then there is no mode. A type ofaverage.
Multiple	A number which is part of another number's times table. E.g. 35 is a multiple of 5.
Natural Number	A positive integer.
Negative	A value less than zero.
Nonagon	A nine sided polygon.
Numerator	The top part of a fraction.
Obtuse Angle	An angle between 90° and 180°.
Octagon	An eight sided polygon.
Operation	An action which when applied to one or more values gives an output value. The four most common operations are addition. subtraction, multiplication and division.
Parallel	Two or more lines which are always the same distance apart.
Parallelogram	A quadrilateral with two pairs of parallel sides.
Pentagon	A five sided polygon.
Perimeter	The distance around a shape.
Perpendicular	Two or more lines which meet at right angles.
Pi (Π)	An irrational constant used when calculating the area and circumference of circles. It is approximately equal to 3.14.
Polygon	A shape made from straight lines.
Positive Number	A number greater than zero.
Prime	A number which has exactly two factors. The number one and itself.
Prism	A 3D shape with the same cross section all along its length.
Probability	A measure of how likely an event is to occur.
Product	The answer when two values are multiplied together.
Quadratic Equation	An equation where the highest power is two. For example $x^2 + 4x + 6 = 0$ is a quadratic equation.
Quadrilateral	A four sided polygon.
Radius	The distance from the centre of a circle to its circumference. The plural of radius is radii.
Random Sampling	A method of choosing people at random for a survey.
Range	The largest number take away the smallest value in a set of data.
Rational	A decimal number which ends or is recurring.
Reciprocal	The reciprocal of any number is 1 divided by the number. E.g. the reciprocal of 3 is 1/3., the reciprocal of 3/4 is 4/3.
Recurring	A decimal which never ends but repeats all or parts of the sequence of numbers after the decimal point. E.g 0.333333 or 0.141414.
Reflex Angle	An angle greater than 180°.
Regular	A shape with all sides and angles the same size.
Remainder	The amount left over when a number cannot be divided exactly. For example, 21 divided by 4 is 5 remainder 1.
Right Angle	An angle of 90°.
Rotation	To turn a shape using an angle, direction and centre of rotation.
Round	To reduce the amount of significant figures or decimal places a number has. For example £178 rounded to the nearest £10 is £180.
Scale Factor	How many times larger or smaller an enlarged shape will be.

Segment	An area of a circle enclosed by a chord.
Sequence	A list of numbers which follows a pattern. For example 6, 11, 16, 21, …
Simplify	To write a sum, expression or ratio in its lowest terms. For example 4:10:6 can be simplified to 2:5:3.
Solid	A 3D shape.
Solve	To find the missing value in an equation.
Speed	How fast an object is moving. Average speed = Total distance divided by time taken.
Square Number	The product when an integer is multiplied by itself. For example, 1, 4, 9, 16, 25, 36, 49, 64, 81, 100.
Sum	The answer when two or more values are added together.
Surface Area	To total area of all sides on a 3D shape.
Symmetrical	A shape which has at least one line of symmetry.
Tally	A system of counting where every group of four vertical lines is followed by a horizontal line to easily count in steps of five.
Tangent	A straight line that just touches a point on a curve. A tangent to a circle is perpendicular to the radius which meets the tangent.
Term	A number, variable or combination of both which forms part of an expression.
Transformation	The collective name for reflections, rotations, translations and enlargements.
Translation	To move a shape from one position to another by sliding in the x-axis followed by the y-axis.
Trapezium	A quadrilateral with one pair of parallel sides.
Tree Diagram	A method of solving probability questions by listing all the outcomes of an event. Probabilities are calculated by multiplying down the branches.
Triangle	A three sided polygon.
Triangular Number	A sequence of numbers generated by adding one more than was added to find the previous term. For example, 1, 3, 6, 10, 15, 21, …
Units	A quantity used to describe a measurement. Examples are kilograms, metres and centilitres.
Upper Range	The largest value in a set of data.
Value	A numerical amount or quantity.
Variable	A letter which we don't know the value of.
Volume	The amount an object can hold. E.g. a bottle of cola has a volume of 2 litres.
X-Axis	The horizontal axis on a graph. The line going across the page.
Y-Axis	The vertical axis on a graph. The line going from top to bottom.
Y-Intercept	The value of the y-coordinate when a graph crosses the y-axis.
Z-Axis	Represents the depth of an object when working with 3D coordinates.
Amicable Numbers	Pairs of numbers for which the sum of the divisors of one number equals the other number, e.g. 220 and 284, 1184 and 1210.
Arithmetic	The part of mathematics that studies quantity, especially as the result of combining numbers (as opposed to variables) using the traditional operations of addition, subtraction, multiplication and division. (the more advanced manipulation of numbers is usually known as number theory)
Asymptote	A line that the curve of a function tends towards as the independent variable of the curve approaches some limit (usually infinity) i.e. the distance between the curve and the line approaches zero.
Axiom	A proposition that is not actually proved or demonstrated, but is considered to be self-evident and universally accepted as a starting point for deducing and inferring other truths and theorems, without any need of proof.
Base n	The number of unique digits (including zero) that a positional numeral system uses to represent numbers, e.g. base 10 (decimal) uses 0, 1, 2, 3, 4, 5, 6, 7, 8 and 9 in each place value position; base 2 (binary) uses just 0 and 1; base 60 (sexagesimal, as used in ancient Mesopotamia) uses all the numbers from 0 to 59; etc.
Bayesian Probability	A popular interpretation of probability which evaluates the probability of a hypothesis by specifying some prior probability, and then updating in the light of new relevant data
Bell Curve	The shape of the graph that indicates a normal distribution in probability and statistics
Coefficients	The factors of the terms (i.e. the numbers in front of the letters) in a mathematical expression or equation, e.g. in the expression 4x + 5y2 + 3z, the coefficients for x, y2 and z are 4, 5 and 3 respectively.
Combinatorics	The study of different combinations and groupings of numbers, often used in probability and statistics, as well as in scheduling problems and Sudoku puzzles.
Complex Number	A number expressed as an ordered pair comprising a real number and an imaginary number, written in the form a + bi, where a and b are real numbers, and i is the imaginary unit. (equal to the square root of -1)
Congruence	Two geometrical figures are congruent to one another if they have the same size and shape, and so one can be transformed into the other by a combination of translation, rotation and reflection.
Continued Fraction	A fraction whose denominator contains a fraction, whose denominator in turn contains a fraction, etc, etc.
Correlation	A measure of relationship between two variables or sets of data, a positive correlation coefficient indicating that one variable tends to increase or decrease as the other does, and a negative correlation coefficient indicating that one variable tends to increase as the other decreases and vice versa.
Cubic Equation	A polynomial having a degree of 3 (i.e. the highest power is 3), of the form ax3 + bx2 + cx + d = 0, which can be solved by factorization or formula to find its three roots.
Derivative	A measure of how a function or curve changes as its input changes, i.e. the best linear approximation of the function at a particular input value, as represented by the slope of the tangent line to the graph of the function at that point, found by the operation of differentiation.
Differential Equation	An equation that expresses a relationship between a function and its derivative, the solution of which is not a single value but a function. (has many applications in engineering, physics economics, etc)
Differentiation	The operation in calculus (inverse to the operation of integration) of finding the derivative of a function or equation.
Expected Value	The amount predicted to be gained, using the calculation for average expected payoff, which can be calculated as the integral of a random variable with respect to its probability measure. (the expected value may not actually be the most probable value and may not even exist, e.g. 2.5 children)

Exponentiation	The mathematical operation where a number (the base) is multiplied by itself a specified number of times (the exponent), usually written as a superscript an, where a is the base and n is the exponent, e.g. 43 = 4 x 4 x 4.
Factor	A number that will divide into another number exactly, e.g. the factors of 10 are 1, 2 and 5.
Factorial	The product of all the consecutive integers up to a given number (used to give the number of permutations of a set of objects), denoted by n!, e.g. 5! = 1 x 2 x 3 x 4 x 5 = 120.
Fibonacci Numbers (Series)	A set of numbers formed by adding the last two numbers to get the next in the series: 0, 1, 1, 2, 3, 5, 8, 13, 21, 34, 55, 89, …
Function	A relation or correspondence between two sets in which one element of the second (codomain or range) set ƒ(x) is assigned to each element of the first (domain) set x, e.g. ƒ(x) = x2 or y = x2 assigns a value to ƒ(x) or y based on the square of each value of x.
Geometry	The part of mathematics concerned with the size, shape and relative position of figures, or the study of lines, angles, shapes and their properties.
Hyperbola	A smooth symmetrical curve with two branches produced by the section of a conical surface.
Hyperbolic Geometry	A non-Euclidean geometry based on a saddle-shaped plane, in which there are no parallel lines and the angles of a triangle sum to less than 180°.
Infinite Series	The sum of an infinite sequence of numbers (which are usually produced according to a certain rule, formula or algorithm).
Infinitesimal	Quantities or objects so small that there is no way to see them or to measure them, so that for all practical purposes they approach zero as a limit. (an idea used in the developement of infinitesimal calculus)
Infinity	A quantity or set of numbers without bound, limit or end, whether countably infinite like the set of integers, or uncountably infinite like the set of real numbers. (represented by the symbol ∞)
Irrational Numbers	Numbers that can not be represented as decimals (because they would contain an infinite number of non-repeating digits) or as fractions of one integer over another, e.g. π, √2, e.
Line	In geometry, a one-dimensional figure following a continuous straight path joining two or more points, whether infinite in both directions or just a line segment bounded by two distinct end points.
Linear Equation	An algebraic equation in which each term is either a constant or the product of a constant and the first power of a single variable, and whose graph is therefore a straight line, e.g. y = 4, y = 5x + 3.
Linear Regression	A technique in statistics and probability theory for modelling scattered data by assuming an approximate linear relationship between the dependent and independent variables.
Logarithm	The inverse operation to exponentiation, the exponent of a power to which a base (usually 10 or e for natural logarithms) must be raised to produce a given number, e.g. because 1,000 = 103, the log10 100 = 3.
Magic Square	A square array of numbers where each row, column and diagonal added up to the same total, known as the magic sum or constant. (a semi-magic square is a square numbers where just the rows and columns, but not both diagonals, sum to a constant)
Matrix	A rectangular array of numbers, which can be added, subtracted and multiplied, and used to represent linear transformations and vectors, solve equations, etc.
Mersenne Number	Numbers that are one less than 2 to the power of a prime number, e.g. 3 (22 - 1); 7 (23 - 1); 31 (25 - 1); 127 (27 - 1); 8,191 (213 - 1); etc.
Modulus	A number by which two given numbers can be divided by integer division, and produce the same remainder, e.g. 38 ÷ 12 = 3 remainder 2, and 26 ÷ 12 = 2 remainder 2, therefore 38 and 26 are congruent modulo 12, or (38 ≡ 26) mod 12.
Natural Numbers	The set of positive integers (regular whole counting numbers), sometimes including zero.
Negative Numbers	Any integer, ration or real number which is less than 0, e.g. -743, -1.4, -√5 (but not √-1, which is an imaginary or complex number).
Non-Euclidean Geometry	Geometry based on a curved plane, whether elliptic (spherical) or hyperbolic (saddle-shaped), in which there are no parallel lines and the angles of a triangle do not sum to 180°.
Normal (Gaussian) Distribution	A continuous probability distribution in probability theory and statistics that describes data which clusters around the mean in a curved “bell curve”, highest in the middle and quickly tapering off to each side.
Number Line	A line on which all points correspond to real numbers (a simple number line may only mark integers, but in theory all real numbers to +/- infinity can be shown on a number line).
Ordinal Numbers	An extension of the natural numbers (different from integers and from cardinal numbers) used to describe the order type of sets i.e. the order of elements within a set or series.
Parabola	A type of conic section curve, any point of which is equally distant from a fixed focus point and a fixed straight line.
Perfect Number	A number that is the sum of its divisors (excluding the number itself), e.g. 28 = 1 + 2 + 4 + 7 + 14.
Permutation	A particular ordering of a set of objects, e.g. given the set {1, 2, 3}, there are six permutations: {1, 2, 3}, {1, 3, 2}, {2, 1, 3}, {2, 3, 1}, {3, 1, 2}, and {3, 2, 1}.
Platonic Solids	The five regular convex polyhedra (symmetrical 3-dimensional shapes): the tetrahedron (made up of 4 regular triangles), the octahedron (made up of 8 triangles), the icosahedron (made up of 20 triangles), the cube (made up of 6 squares) and the dodecahedron (made up of 12 pentagons).
Polar Coordinates	A two-dimensional coordinate system in which each point on a plane is determined by its distance r from a fixed point (e.g. the origin) and its angle θ (theta) from a fixed direction (e.g the x axis).
Prime Numbers	Integers greater than 1 which are only divisible by themselves and 1.
Plane	A flat two-dimensional surface (physical or theoretical) with infinite width and length, zero thickness and zero curvature.
Pythagoras' (Pythagorean) Theorem	The square of the hypotenuse of a right angled triangle is equal to the sum of the squares of the two sides (a2 + b2 = c2).
Quadratic Equation	A polynomial equation with a degree of 2 (i.e. the highest power is 2), of the form ax2 + bx + c = 0, which can be solved by various methods including factoring, completing the square, graphing, Newton's method and the quadratic formula.

Quaternions	A number system that extends complex numbers to four dimensions (so that an object is described by a real number and three complex numbers, all mutually perpendicular to each other), which can be used to represent a three-dimensional rotation by just an angle and a vector.
Quintic Equation	A polynomial having a degree of 5 (i.e. the highest power is 5), of the form ax5 + bx4 + cx3 + dx2 + ex + f = 0, not solvable by factorization into radicals for all rational numbers.
Rational Numbers	Numbers that can be expressed as a fraction (or ratio) a/b of two integers (the integers are therefore a subset of the rationals), or alternatively a decimal which terminates after a finite number of digits or begins to repeat a sequence.
Real Numbers	All numbers (including natural numbers, integers, decimals, rational numbers and irrational numbers) which do not involve imaginary numbers (multiples of the imaginary unit i, or the square root of -1), may be thought of as all points on an infinitely long number line.
Reciprocal	A number which, when multiplied by x yields the multiplicative identity 1, and can therefore be thought of as the inverse of multiplication, e.g. the reciprocal of x is $1/x$, the reciprocal of $3/5$ is $5/3$.
Sequence	An ordered set whose elements are usually determined based on some function of the counting numbers, e.g. a geometric sequence is a set where each element is a multiple of the previous element; an arithmetic sequence is a set where each element is the previous element plus or minus a number.
Subset	A subsidiary collection of objects that all belong to, or is contained in, an original given set, e.g. subsets of {a, b} could include: {a}, {b}, {a, b} and {}.
Surd	The n-th root a number, such as $\sqrt{5}$, the cube root of 7, etc.
Tensor	A collection of numbers at every point in space which describe how much the space is curved, e.g. in four spatial dimensions, a collection of ten numbers is needed at each point to describe the properties of the mathematical space or manifold, no matter how distorted it may be.
Theorem	A mathematical statement or hypothesis which has been proved on the basis of previously established theorems and previously accepted axioms, effectively the proof of the truth of a statement or expression.
Transcendental Number	An irrational number that is "not algebraic", i.e. no finite sequence of algebraic operations on integers (such as powers, roots, sums, etc.) can be equal to its value, examples being π and e. For example, $\sqrt{2}$ is irrational but not transcendental because it is the solution to the polynomial x2 = 2.
Transfinite Numbers	Cardinal numbers or ordinal numbers that are larger than all finite numbers, yet not necessarily absolutely infinite.
Triangular Number	A number which can be represented as an equilateral triangle of dots, and is the sum of all the consecutive numbers up to its largest prime factor - it can also be calculated as $n(n + 1)/2$, e.g. $15 = 1 + 2 + 3 + 4 + 5 = 5(5 + 1)/2$.
Trigonometry	The branch of mathematics that studies the relationships between the sides and the angles of right triangles, and deals with and with the trigonometric functions (sine, cosine, tangent and their reciprocals).
Vector	A physical quantity having magnitude and direction, represented by a directed arrow indicating its orientation in space.
Vector Space	A three-dimensional area where vectors can be plotted, or a mathematical structure formed by a collection of vectors.
Addend	Any one of a set of numbers that are added. For example, in 5 + 3 + 1, the addends are 5, 3, and 1.

Cooking

Dutch Oven	A cast iron pot that can cook food on the hot coals of a campfire.
Solar Oven	A cardboard box lined with aluminium foil to bake food using the sun's energy.
Ghee	Ghee is clarified butter. The solids are removed from the butter, eliminating LDLs, or "bad" cholesterol.
Pressure Canner	A pressure canner is a safe way to fresh preserve foods and avoid botulism. Temperature and timing are crucial to achieve a delicious and safe finished product. While a water bath canner heats to 100°C (212°F) pressure canning brings the temperature to 115°C (240°F).
Vagabond Stove	Also called a "Buddy Burner," you can make this stove from a #10 can (about the size of an old fashioned coffee can).
Volcano Stove	A volcano stove is the brand name of a highly rated collapsible cook stove that takes three fuel sources. It's often called an "oven" though it's really a stove, because it's well suited to work with a Dutch Oven.
Al Dente	Italian term used to describe pasta that is cooked until it offers a slight resistance to the bite.
Bake	To cook by dry heat, usually in the oven.
Barbecue	Usually used generally to refer to grilling done outdoors or over an open charcoal or wood fire. More specifically, barbecue refers to long, slow direct- heat cooking, including liberal basting with a barbecue sauce.
Baste	To moisten foods during cooking with pan drippings or special sauce to add flavor and prevent drying.
Batter	A mixture containing flour and liquid, thin enough to pour.
Beat	To mix rapidly in order to make a mixture smooth and light by incorporating as much air as possible.
Blanch	To immerse in rapidly boiling water and allow to cook slightly.
Blend	To incorporate two or more ingredients thoroughly.
Boil	To heat a liquid until bubbles break continually on the surface.
Broil	To cook on a grill under strong, direct heat.
Caramelize	To heat sugar in order to turn it brown and give it a special taste.
Chop	To cut solids into pieces with a sharp knife or other chopping device.
Clarify	To separate and remove solids from a liquid, thus making it clear.
Cream	To soften a fat, especially butter, by beating it at room temperature. Butter and sugar are often creamed together, making a smooth, soft paste.
Cure	To preserve meats by drying and salting and/or smoking.
Deglaze	To dissolve the thin glaze of juices and brown bits on the surface of a pan in which food has been fried, sauteed or roasted. To do this, add liquid and stir and scrape over high heat, thereby adding flavor to the liquid for use as a sauce.
Degrease	To remove fat from the surface of stews, soups, or stock. Usually cooled in the refrigerator so that fat hardens and is easily removed.
Dice	To cut food in small cubes of uniform size and shape.
Dissolve	To cause a dry substance to pass into solution in a liquid.
Dredge	To sprinkle or coat with flour or other fine substance.

ADDENDUM ADDENDUM ADDENDUM ADDENDUM UM

Dictionary

Cooking

Drizzle	To sprinkle drops of liquid lightly over food in a casual manner.
Dust	To sprinkle food with dry ingredients. Use a strainer or a jar with a perforated cover, or try the good, old-fashioned way of shaking things together in a paper bag.
Fillet	As a verb, to remove the bones from meat or fish. A fillet (or filet) is the piece of flesh after it has been boned.
Flake	To break lightly into small pieces.
Flambe	To flame foods by dousing in some form of potable alcohol and setting alight.
Fold	To incorporate a delicate substance, such as whipped cream or beaten egg whites, into another substance without releasing air bubbles. Cut down through mixture with spoon, whisk, or fork; go across bottom of bowl, up and over, close to surface. The process is repeated, while slowing rotating the bowl, until the ingredients are thoroughly blended.
Fricassee	To cook by braising; usually applied to fowl or rabbit.
Fry	To cook in hot fat. To cook in a fat is called pan-frying or sauteing; to cook in a one-to-two inch layer of hot fat is called shallow-fat frying; to cook in a deep layer of hot fat is called deep-fat frying.
Garnish	To decorate a dish both to enhance its appearance and to provide a flavorful foil. Parsley, lemon slices, raw vegetables, chopped chives, and other herbs are all forms of garnishes.
Glaze	To cook with a thin sugar syrup cooked to crack stage; mixture may be thickened slightly. Also, to cover with a thin, glossy icing.
Grate	To rub on a grater that separates the food in various sizes of bits or shreds.
Gratin	From the French word for "crust." Term used to describe any oven-baked dish--usually cooked in a shallow oval gratin dish--on which a golden brown crust of bread crumbs, cheese or creamy sauce is form.
Grill	To cook on a grill over intense heat.
Grind	To process solids by hand or mechanically to reduce them to tiny particles.
Julienne	To cut vegetables, fruits, or cheeses into thin strips.
Knead	To work and press dough with the palms of the hands or mechanically, to develop the gluten in the flour.
Lukewarm	Neither cool nor warm; approximately body temperature.
Marinate	To flavor and moisturize pieces of meat, poultry, seafood or vegetable by soaking them in or brushing them with a liquid mixture of seasonings known as a marinade. Dry marinade mixtures composed of salt, pepper, herbs or spices may also be rubbed into meat, poultry or seafood.
Meuniere	Dredged with flour and sauteed in butter.
Mince	To cut or chop food into extremely small pieces.
Mix	To combine ingredients usually by stirring.
Pan-Broil	To cook uncovered in a hot fry pan, pouring off fat as it accumulates.
Pan-Fry	To cook in small amounts of fat.
Parboil	To boil until partially cooked; to blanch. Usually this procedure is followed by final cooking in a seasoned sauce.
Pare	To remove the outermost skin of a fruit or vegetable.
Peel	To remove the peels from vegetables or fruits.
Pickle	To preserve meats, vegetables, and fruits in brine.
Pinch	A pinch is the trifling amount you can hold between your thumb and forefinger.
Pit	To remove pits from fruits.
Planked	Cooked on a thick hardwood plank.
Plump	To soak dried fruits in liquid until they swell.
Poach	To cook very gently in hot liquid kept just below the boiling point.
Puree	To mash foods until perfectly smooth by hand, by rubbing through a sieve or food mill, or by whirling in a blender or food processor.
Reduce	To boil down to reduce the volume.
Refresh	To run cold water over food that has been parboiled, to stop the cooking process quickly.
Render	To make solid fat into liquid by melting it slowly.
Roast	To cook by dry heat in an oven.
Saute	To cook and/or brown food in a small amount of hot fat.
Scald / Coddle	To bring to a temperature just below the boiling point.
Scallop	To bake a food, usually in a casserole, with sauce or other liquid. Crumbs often are sprinkled over.
Score	To cut narrow grooves or gashes partway through the outer surface of food.
Sear	To brown very quickly by intense heat. This method increases shrinkage but develops flavor and improves appearance.
Shred	To cut or tear in small, long, narrow pieces.
Sift	To put one or more dry ingredients through a sieve or sifter.
Simmer	To cook slowly in liquid over low heat at a temperature of about 180°. The surface of the liquid should be barely moving, broken from time to time by slowly rising bubbles.
Skim	To remove impurities, whether scum or fat, from the surface of a liquid during cooking, thereby resulting in a clear, cleaner-tasting final produce.
Steam	To cook in steam in a pressure cooker, deep well cooker, double boiler, or a steamer made by fitting a rack in a kettle with a tight cover. A small amount of boiling water is used, more water being added during steaming process, if necessary.
Steep	To extract color, flavor, or other qualities from a substance by leaving it in water just below the boiling point.
Sterilize	To destroy micro organisms by boiling, dry heat, or steam.
Stew	To simmer slowly in a small amount of liquid for a long time.
Stir	To mix ingredients with a circular motion until well blended or of uniform consistency.
Toss	To combine ingredients with a lifting motion.
Truss	To secure poultry with string or skewers, to hold its shape while cooking.
Whip	To beat rapidly to incorporate air and produce expansion, as in heavy cream or egg whites.
Bone	To bone a piece of meat is to remove the bone from it.
Butterfly	Butterflying food refers to splitting it through the centre to thin it out, but not cutting through it entirely.

Cartouche	A cartouche refers to a piece of greaseproof or baking paper that is used to create a lid over a pot or saucepan. Usually cut in a circle and placed over a dish with a small amount of liquid. In the instance of poaching it stops steam from escaping, it can also prevent skins from developing on sauces.
Clarify	Most often refers to butter, where the milk solids and water are rendered from the butterfat. This is done by gently melting the butter, allowing the two to separate and then skimming off the solids.
Confit	Regularly recognised with duck, but can include other meats, where the meat is cooked in its own fat (or other fat if necessary) at a low heat.
Curdle	When egg-based mixtures are cooked too quickly and the protein separates from the liquids, leaving a lumpy mixture behind.
Cut In	A method of blending, usually for pastry, where a fat is combined with flour. The method often refers to using a pastry blender to mix butter or shortening into the flour until the mixture is the size of peas.
Dice	A knife skill cut – the exact measurement changes but the shape is always a small square.
Dollop	A small amount of soft food that has been formed into a round-ish shape. Yoghurt, whipped cream and mashed potatoes are all examples of foods that can be dolloped.
Dress	Dress has two definitions when it comes to cooking, firstly to coat foods (mostly salad leaves) in a sauce. It also refers to preparing poultry, fish and venison for cooking, which essentially is breaking them down off of their carcasses and sectioning the meat.
Deep Fry	To cook food in a deep layer of hot oil.
Infuse	To allow the flavour of an ingredient to soak into a liquid until the liquid takes on the flavour of the ingredient.
Julienne	Refers to a knife skill cut where the shape resembles matchsticks.
Macerate	The soaking of an ingredient, usually fruit, in a liquid so that it takes on the flavour of the liquid. Can also be used to soften dried fruit.
Pane	To coat in breadcrumbs.
Panade	A mixture of starch and liquid that's added to ground meat for hamburger patties/meatballs. Usually a mixture of bread, breadcrumbs or panko with milk, buttermilk or yoghurt.
Poach	To cook in gently bubbling liquids such as a stock or a broth.
Puree	Cooked food, usually vegetables, that have been mashed or blended to form a paste-like consistency.
Roux	A roux is a flour and fat mixture cooked together, which acts as a thickener in soups, stews and sauces.
Reconstitute	To restore a dried food to original consistency, or to change its texture, by letting it soak in warm water.
Steep	Similar to infuse, steeping is the process of allowing dried ingredients to soak in a liquid until the liquid has taken on the flavour of the ingredient.
Shallow Fry	To cook food in a shallow layer of preheated oil.
Sweat	This refers to the gentle cooking of vegetables in butter or oil under a lid, so that their natural liquid is released to aid the cooking process. Often vegetables cooked this way will end up looking translucent.
Temper	To temper is the process of adding a small quantity of a hot liquid to a cold liquid in order to warm the cold liquid slightly. This is often be done before adding delicate ingredients to a hot mixture, where their format may be affected. An example of this would be adding eggs to a hot mixture – in order to prevent them curdling or scrambling you would add a little of the hot mix to the eggs and incorporate before adding the eggs into the heated mixture. Another example would be adding a cornflour slurry to a hot mixture; a little of the hot mixture is added to the slurry to temper the temperature before adding the mix back to the main mixture.
Whisk	The process of using a whisk to incorporate air into food or to blend ingredients together smoothly.
Zest	Refers to removing the outer part of citrus (called the zest) either by using a grater, a peeler or a knife.

Defence

TDS	Time, Distance and Shielding. Three types of protective measures commonly associated with hazardous materials training.
TRACEM	Acronym used to identify the six types of harm one may encounter at a terrorist incident: Thermal, Radioactive, Asphyxiation, Chemical, Etiological and Mechanical.

Disaster Recovery

Disaster Triggers

DCO	Disaster Coordinating Office
EMA	Emergency Management Agency
EMI	Emergency Management Institute
EOC	Emergency Operations Centre
EOP	Emergency Operations Plan
EPIRB	Emergency Position Indicating Radio Beacon - The marine version of the "ELT". It will float and is manually activated or activated when submerged in the water.
ERT	Emergency Response Team (FBI)
FEMA	Federal Emergency Management Agency
IC	Incident Commander - The individual responsible for the management of all incident operations.
ICC	Incident Command Centre
ICISF	International Critical Incident Stress Foundation
ICP	Incident Command Post - That location at which the primary command functions are executed.
ICS	Incident Command System

ADDENDUM Dictionary Disaster Triggers

Incident Command Post	That location at which the primary command functions are executed.
IPP	Initial Planning Point
MERS	Mobile Emergency Response System (FEMA)
NDPO	National Domestic Preparedness Office
NERRTC	National Emergency Response and Rescue Training Centre
ROC	Regional Operations Centre (FEMA)
RRT	Regional Response Team
Sizeup	The rapid mental evaluation of the factors that influence an incident. Sizeup is the first step in determining a course of action.
VOAD	Voluntary Organizations Active in Disaster

Economy

Bank Run	A bank run (also known as a run on the bank) occurs when a large number of people withdraw their money from a bank, because they believe the bank may cease to function in the near future.
Capital Flight	Capital flight, in economics, occurs when assets or money rapidly flow out of a country, due to an event of economic consequence. Such events could be an increase in taxes on capital or capital holders or the government of the country defaulting on its debt that disturbs investors and causes them to lower their valuation of the assets in that country, or otherwise to lose confidence in its economic strength.
Bankruptcy	Bankruptcy is a legal status of a person or other entity who cannot repay debts to creditors. In most jurisdictions, bankruptcy is imposed by a court order, often initiated by the debtor.
Liquidation	Liquidation is the process in law and business by which a company is brought to an end in the United Kingdom, Republic of Ireland and United States. The assets and property of the company are redistributed. Liquidation is also sometimes referred to as winding-up or dissolution, although dissolution technically refers to the last stage of liquidation.
Insolvency	Insolvency is the state of being unable to pay the money owed, by a person or company, on time; those in a state of insolvency are said to be insolvent. There are two forms: cash-flow insolvency and balance-sheet insolvency.
Accounting Liquidity	In accounting, liquidity (or accounting liquidity) is a measure of the ability of a debtor to pay their debts as and when they fall due. It is usually expressed as a ratio or a percentage of current liabilities. Liquidity is the ability to pay short-term obligations.
Fractional-Reserve Banking	Fractional-reserve banking is the common practice by commercial banks of accepting deposits, and making loans or investments, while holding reserves at least equal to a fraction of the bank's deposit liabilities. Reserves are held as currency in the bank, or as balances in the bank's accounts at the central bank. Fractional-reserve banking is the current form of banking practiced in most countries worldwide.
Absolute Advantage	The ability of a party (whether an individual, firm, or country) to produce a greater quantity of a good, product, or service than competitors using the same amount of resources.
Adaptive Expectations	A hypothetical process by which people form expectations about what will happen in the future based on what has happened in the past.
Aggregate Demand (AD)	The total demand for final goods and services in an economy at a given time. It specifies the amounts of goods and services that will be purchased at all possible price levels. Aggregate demand can also be interpreted as the demand for the gross domestic product of a country. It is often called effective demand, though this term also has a distinct meaning.
Autarky	The quality of being self-sufficient; the term is usually applied to political states or their economic systems. Autarky exists whenever an entity can survive or continue its activities without external assistance or international trade. If a self-sufficient economy also deliberately refuses all trade with the outside world, then it is called a closed economy.
Average Cost	A quantity equal to the total cost divided by the number of goods produced (the output quantity, Q). It is also equal to the sum of variable costs (total variable costs divided by Q) plus average fixed costs (total fixed costs divided by Q).
Bank	A financial institution that accepts deposits from the public and creates credit. Lending activities can be performed either directly or indirectly through capital markets. Due to their importance in the financial stability of a country, banks are highly regulated in most countries. Most nations have institutionalized a system known as fractional reserve banking, under which banks hold liquid assets equal to only a portion of their current liabilities.
Bond	In finance, an instrument of indebtedness of the bond issuer to the holders. The most common types of bonds include municipal bonds and corporate bonds. The bond is a debt security, under which the issuer owes the holders a debt and (depending on the terms of the bond) is obliged to pay them interest (the coupon) or to repay the principal at a later date, termed the maturity date.
Break-Even	The point at which total cost and total revenue are equal, i.e. "even". There is no net loss or gain, and one has "broken even", though opportunity costs have been paid and capital has received the risk-adjusted, expected return. In short, all costs that must be paid are paid, and there is neither profit nor loss.
Budget Set	All possible consumption bundles that someone can afford given the prices of goods and the person's income level. The budget set is bounded above by the budget line. Graphically speaking, all the consumption bundles that lie inside and on the budget constraint form the budget set. By most definitions, budget sets must be compact and convex.
Capital	Any asset that can enhance one's power to perform economically useful work. Capital goods, real capital, or capital assets are already-produced, durable goods or any non-financial asset that is used in production of goods or services. Capital is distinct from land (or non-renewable resources) in that capital can be increased by human labor. At any given moment in time, total physical capital may be referred to as the capital stock (which is not to be confused with the capital stock of a business entity).
Capital Cost	A fixed, one-time expense incurred on the purchase of land, buildings, construction, and equipment used in the production of goods or in the rendering of services. In other words, it is the total cost needed to bring a project to a commercially operable status. Whether a particular cost is capital or not depends on many factors, such as accounting, tax laws, and materiality.
Capital Flight	Occurs when money or assets rapidly flow out of a country due to an event of economic consequence. Such events may include an increase in taxes on capital or capital holders or the government of the country defaulting on its debt that disturbs investors and causes them to lower their valuation of the assets in that country or otherwise to lose confidence in its economic strength.
Capital Good	A durable good that is used in the production of goods or services. Capital goods are one of the three types of producer goods, the other two being land and labour, which are also known collectively as primary factors of production. This classification originated with classical economics and has remained the dominant method for classification.

Central Bank	Commercial banking system of their respective countries. In contrast to a commercial bank, a central bank possesses a monopoly on increasing the monetary base in the state, and usually also prints the national currency, which usually serves as the state's legal tender. Central banks also act as a "lender of last resort" to the banking sector during times of financial crisis. Most central banks usually also have supervisory and regulatory powers to ensure the solvency of member institutions, prevent bank runs, and prevent reckless or fraudulent behavior by member banks.
Commodity	Is an economic good or service that has full or substantial fungibility: that is, the market treats instances of the good as equivalent or nearly so with no regard to who produced them.
Compound Interest	The addition of interest to the principal sum of a loan or deposit; it is often interpreted as "interest on interest". Compound interest is the result of reinvesting interest, rather than paying it out, so that interest in the next period is then earned on the principal sum plus any previously accumulated interest.
Consumer Confidence	An economic indicator that measures the degree of optimism that consumers feel about the overall state of the economy and their personal financial situation.
Consumption	According to mainstream economists, only the final purchase of goods and services by individuals constitutes consumption, while other types of expenditure — in particular, fixed investment, intermediate consumption, and government spending — are placed in separate categories (see consumer choice).
Consumption Function	A mathematical function which describes a relationship between consumption and disposable income. The concept is believed to have been introduced into macroeconomics by John Maynard Keynes in 1936, who used it to develop the notion of a government spending multiplier.
Creditor	A person or a firm that lends money to a borrower.
Currency	Money in any form when in actual use or circulation as a medium of exchange, especially circulating banknotes and coins. A more general definition is that a currency is a "system" of money (monetary units) in common use, especially within a particular nation.
Debt	Total money owed.
Debtor	A debtor is an entity that owes a debt to another entity.
Deflation	In economics, deflation is a decrease in the general price level of goods and services. Deflation occurs when the inflation rate falls below 0% (a negative inflation rate). Inflation reduces the value of currency over time, but deflation increases it.
Demand Shock	In economics, a demand shock is a sudden event that increases or decreases demand for goods or services temporarily. A positive demand shock increases aggregate demand (AD) and a negative demand shock decreases aggregate demand. Prices of goods and services are affected in both cases. When demand for goods or services increases, its price (or price levels) increases because of a shift in the demand curve to the right.
Depreciation	In economics, depreciation is the gradual decrease in the economic value of the capital stock of a firm, nation or other entity, either through physical depreciation, obsolescence or changes in the demand for the services of the capital in question.
Depression	In economics, a depression is a sustained, long-term downturn in economic activity in one or more economies. It is a more severe economic downturn than a recession, which is a slowdown in economic activity over the course of a normal business cycle.
Discretionary Income	Money available after one pays taxes.
Disinflation	Disinflation is a decrease in the rate of inflation – a slowdown in the rate of increase of the general price level of goods and services in a nation's gross domestic product over time. It is the opposite of reflation. Disinflation occurs when the increase in the "consumer price level" slows down from the previous period when the prices were rising.
Disposable Income	Money available after one pays taxes and obligatory bill payments.
Dissaving	Dissaving is negative saving. If spending is greater than disposable income, dissaving is taking place. This spending is financed by already accumulated savings, such as money in a savings account, or it can be borrowed.
Economic Growth	Economic growth is the increase in the inflation-adjusted market value of the goods and services produced by an economy over time. It is conventionally measured as the percent rate of increase in real gross domestic product, or real GDP.
Economy	An economy (from Greek οικος – "household" and νέμομαι – "manage") is an area of the production, distribution, or trade, and consumption of goods and services by different agents. Understood in its broadest sense, 'The economy is defined as a social domain that emphasize the practices, discourses, and material expressions associated with the production, use, and management of resources'.
Equilibrium	The point at which quantity demanded and quantity supplied are equal and both consumer and producer are satisfied.
Equilibrium Price	The market price at which both the supplier and consumer will trade and both are satisfied.
Equity	Equity or economic equality is the concept or idea of fairness in economics, particularly in regard to taxation or welfare economics. More specifically, it may refer to equal life chances regardless of identity, to provide all citizens with a basic and equal minimum of income, goods, and services or to increase funds and commitment for redistribution.
Exchange Rate	In finance, an exchange rate is the rate at which one currency will be exchanged for another. It is also regarded as the value of one country's currency in relation to another currency.
Excludability	In economics, a good or service is called excludable if it is possible to prevent people (consumers) who have not paid for it from having access to it. By comparison, a good or service is non-excludable if non-paying consumers cannot be prevented from accessing it.
Rivalrous	In economics, a good is said to be rivalrous or rival if its consumption by one consumer prevents simultaneous consumption by other consumers, or if consumption by one party reduces the ability of another party to consume it.
Federal Reserve System	The central bank of the United States, created by Congress in 1913 and charged with the duty of regulating the money supply and monitoring its member banks.
Finance	Finance is a field that is concerned with the allocation (investment) of assets and liabilities over space and time, often under conditions of risk or uncertainty. Finance can also be defined as the art of money management.
Financial Institution	Any firm, such as a bank, that is in the business of holding money for those who save and lending money to those who need loans.
Financial Risk	The risk assumed by a saver or investor on future outcomes that involve financial losses and gains.
Fixed Cost	In economics, fixed costs, indirect costs or overheads are business expenses that are not dependent on the level of goods or services produced by the business.

ADDENDUM Dictionary Economy

Foreign Exchange Market	The foreign exchange market (Forex, FX, or currency market) is a global decentralized or over-the-counter (OTC) market for the trading of currencies.
Free Market	In economics, a free market is a system in which the prices for goods and services are determined by the open market and by consumers. In a free market, the laws and forces of supply and demand are free from any intervention by a government or other authority and from all forms of economic privilege, monopolies and artificial scarcities.
Free Trade	Trading with other countries with little or no trade barriers.
Functions of Money	The four classic functions or uses of money as summarized by William Stanley Jevons in 1875: a medium of exchange, a common measure of value (or unit of account), a standard of value (or standard of deferred payment), and a store of value. This analysis later became a fundamental concept of macroeconomics. Most modern textbooks now list only three functions, that of medium of exchange, unit of account, and store of value, not considering a standard of deferred payment as a distinguished function, but rather subsuming it in the others.
Good	In economics, goods are materials that satisfy human wants and provide utility, for example, to a consumer making a purchase of a satisfying product. A common distinction is made between goods that are tangible property, and services, which are non-physical.
Government Revenue	The total revenue received by all three levels of government (federal, state, and local) in the form of taxes and tariffs.
Gross Domestic Product (GDP)	Gross domestic product (GDP) is a monetary measure of the market value of all the final goods and services produced in a period of time, often annually. GDP (nominal) per capita does not, however, reflect differences in the cost of living and the inflation rates of the countries; therefore using a basis of GDP per capita at purchasing power parity (PPP) is arguably more useful when comparing differences in living standards between nations.
Hyperinflation	Monetary inflation occurring at an extremely high rate.
Import	An import is a good brought into a jurisdiction, especially across a national border, from an external source. The party bringing in the good is called an importer. An import in the receiving country is an export from the sending country. Importation and exportation are the defining financial transactions of international trade.
Income Distribution	In economics, income distribution is how a nation's total GDP is distributed amongst its population. Income and its distribution have always been a central concern of economic theory and economic policy. Classical economists such as Adam Smith, Thomas Malthus, and David Ricardo were mainly concerned with factor income distribution, that is, the distribution of income between the main factors of production, land, labour and capital.
Income Effect	The change in consumption resulting from a change in income.
Inflation	Inflation is a sustained increase in the general price level of goods and services in an economy over a period of time. When the general price level rises, each unit of currency buys fewer goods and services; consequently, inflation reflects a reduction in the purchasing power per unit of money – a loss of real value in the medium of exchange and unit of account within the economy.
Interest	Interest, in finance and economics, is payment from a borrower or deposit-taking financial institution to a lender or depositor of an amount above repayment of the principal sum (that is, the amount borrowed), at a particular rate. It is distinct from a fee which the borrower may pay the lender or some third party.
Interest Rate	An interest rate is the amount of interest due per period, as a proportion of the amount lent, deposited or borrowed (called the principal sum). The total interest on an amount lent or borrowed depends on the principal sum, the interest rate, the compounding frequency, and the length of time over which it is lent, deposited or borrowed.
Investment	Spending for the production and accumulation of capital and additions to inventories.
Investment Fund	An investment fund is a way of investing money alongside other investors in order to benefit from the inherent advantages of working as part of a group.
Wage Labour	Wage labour (also wage labor in American English) is the socioeconomic relationship between a worker and an employer, where the worker sells their labour power under a formal or informal employment contract. These transactions usually occur in a labour market where wages or salaries are market-determined.
Law of Demand	An economic rule stating that quantity demanded and price move in opposite directions, i.e. as demand increases, price decreases, and vice versa.
Liability	In financial accounting, a liability is defined as the future sacrifices of economic benefits that the entity is obliged to make to other entities as a result of past transactions or other past events, the settlement of which may result in the transfer or use of assets, provision of services or other yielding of economic benefits in the future.
Loan	In finance, a loan is the lending of money by one or more individuals, organizations, or other entities to other individuals, organizations etc. The recipient (i.e. the borrower) incurs a debt, and is usually liable to pay interest on that debt until it is repaid, and also to repay the principal amount borrowed.
Marginal Cost	The incremental cost of producing one additional unit.
Marginal Revenue	The additional income from selling one more unit of a good; sometimes equal to price.
Market	A market is one of the many varieties of systems, institutions, procedures, social relations and infrastructures whereby parties engage in exchange. While parties may exchange goods and services by barter, most markets rely on sellers offering their goods or services (including labor) in exchange for money from buyers.
Market Failure	In economics, market failure is a situation in which the allocation of goods and services by a free market is not efficient, often leading to a net social welfare loss. Market failures can be viewed as scenarios where individuals' pursuit of pure self-interest leads to results that are not efficient – that can be improved upon from the societal point of view.
Market Structure	The structure of a market as a whole, taking into consideration two main factors: the number of firms in the market and whether goods offered are identical, similar, or differentiated.
Money	Money is any item or verifiable record that is generally accepted as payment for goods and services and repayment of debts, such as taxes, in a particular country or socio-economic context. The main functions of money are distinguished as: a medium of exchange, a unit of account, a store of value and sometimes, a standard of deferred payment. Any item or verifiable record that fulfils these functions can be considered as money.
Monopoly	A monopoly exists when a specific person or enterprise is the only supplier of a particular commodity. This contrasts with a monopsony which relates to a single entity's control of a market to purchase a good or service, and with oligopoly which consists of a few sellers dominating a market.
Mortgage Loan	A mortgage loan or, simply, mortgage is used either by purchasers of real property to raise funds to buy real estate, or alternatively by existing property owners to raise funds for any purpose, while putting a lien on the property being mortgaged. The loan is "secured" on the borrower's property through a process known as mortgage origination.

Mutual Fund	A mutual fund is a professionally managed investment fund that pools money from many investors to purchase securities. These investors may be retail or institutional in nature.
National Tax	Any tax paid to a national or federal government, e.g. income tax, tariffs, and social security taxes.
National Wealth	The total value of capital and private property that is owned within a country.
Natural Monopoly	A natural monopoly is a monopoly in an industry in which high infrastructural costs and other barriers to entry relative to the size of the market give the largest supplier in an industry, often the first supplier in a market, an overwhelming advantage over potential competitors. This frequently occurs in industries where capital costs predominate, creating economies of scale that are large in relation to the size of the market; examples include public utilities such as water services and electricity.
Rivalry	In economics, a good is said to be rivalrous or rival if its consumption by one consumer prevents simultaneous consumption by other consumers, or if consumption by one party reduces the ability of another party to consume it. A good is considered non-rivalrous or non-rival if, for any level of production, the cost of providing it to a marginal (additional) individual is zero.
Oligopsony	An oligopsony is a market form in which the number of buyers is small while the number of sellers in theory could be large. This typically happens in a market for inputs where numerous suppliers are competing to sell their product to a small number of (often large and powerful) buyers.
Per Capita	A unit of account per person, usually placed at the end of an economic indicator.
Perfect Competition	A market structure in which a large number of firms all produce identical products.
Personal Property	Possessions such as jewelry, furniture, and real estate that people can amass through time.
Physical Capital	All human-made goods that are used to produce other goods and services, such as tools, machines, and buildings.
Price	The amount of money it takes to buy a product or produce a product.
Price Ceiling	A government-regulated maximum price that can be legally charged for a good or service. Governments use price ceilings to protect consumers from conditions that could make commodities prohibitively expensive. Such conditions can occur during periods of high inflation, in the event of an investment bubble, or in the event of monopoly ownership of a product, all of which can cause problems if imposed for a long period without controlled rationing, leading to shortages.
Price Floor	A government-regulated minimum price that can be legally charged for a good or service. Two common price floors are minimum wage laws and supply management in Canadian agriculture.
Price Index	A normalized average of price relatives for a given class of goods or services in a given region and during a given period of time. It is a statistic designed to help to compare how these price relatives, taken as a whole, differ between geographical locations or time periods. Notable price indices include consumer price index, producer price index, and GDP deflator.
Profit	In economics, profit in the accounting sense of the excess of revenue over cost is the sum of two components: normal profit and economic profit. All understanding of profit should be broken down into three aspects: the size of profit, the portion of the total income, and the rate of profit (in comparison to the initial investment).
Progressive Tax	A tax schedule that states that the more income one earns, the higher the tax rate will be.
Proportional Tax (Flat Tax)	A tax schedule that states that regardless of income, the same tax rate will be applied to all income earners.
Quantity Demanded	The amount of a good or service that a consumer is able and willing to purchase at a given market price.
Quantity Supplied	The amount of a good or service that a supplier is able and willing to produce at a given market price.
Quantity Theory of Money	In monetary economics, the quantity theory of money (QTM) states that the general price level of goods and services is directly proportional to the amount of money in circulation, or money supply.
Quota	A limited quantity of a product that can be produced, imported, or exported.
Real GDP	Gross domestic product that has been adjusted for inflation by applying the price deflator.
Recession	Part of the business cycle in which a nation's output (real GDP) does not grow for at least six months.
Reflation	Reflation is the act of stimulating the economy by increasing the money supply or by reducing taxes, seeking to bring the economy (specifically price level) back up to the long-term trend, following a dip in the business cycle. It is the opposite of disinflation, which seeks to return the economy back down to the long-term trend.
Regressive Tax	A tax schedule that states that the more income one earns, the lower the tax burden.
Retail Sales	Purchases of finished goods and services by households and firms.
Revenue	Total income from sales of output.
Risk Aversion	In economics and finance, risk aversion is the behavior of humans (especially consumers and investors), who, when exposed to uncertainty, attempt to lower that uncertainty.
Saving	Saving is income not spent, or deferred consumption. Methods of saving include putting money aside in, for example, a deposit account, a pension account, an investment fund, or as cash. Saving also involves reducing expenditures, such as recurring costs.
Scarcity	Scarcity is the limited availability of a commodity, which may be in demand in the market. Scarcity also includes an individual's lack of resources to buy commodities.
Service	In economics, a service is a transaction in which no physical goods are transferred from the seller to the buyer. The benefits of such a service are held to be demonstrated by the buyer's willingness to make the exchange.
Shortage	In economics, a shortage or excess demand is a situation in which the demand for a product or service exceeds its supply in a market. It is the opposite of an excess supply (surplus).
Shrinkflation	In economics, shrinkflation is the process of items shrinking in size or quantity, or even sometimes reformulating or reducing quality while their prices remain the same or increase. In 2009 Mars reduced the size of their Mars bar from 62.5 grams to 58 grams, while the price remained at 37 pence. Tetley tea bags were sold in boxes of 88 instead of 100.
Stagflation	In economics, stagflation, or recession-inflation, is a situation in which the inflation rate is high, the economic growth rate slows, and unemployment remains steadily high. It presents a dilemma for economic policy, since actions intended to lower inflation may exacerbate unemployment, and vice versa.
Standard of Living	An individual's or a socioeconomic class's standard of living is the level of wealth, comfort, material goods, and necessities available to them in a certain geographic area, usually a country.
State Tax	Any tax paid to a state government, e.g. sales taxes, state income tax, and license plate fees.
Substitute Good	A product that can satisfy the utility of another.
Sunk Costs	In economics and business decision-making, a sunk cost (also known as retrospective cost) is a cost that has already been incurred and cannot be recovered.

ADDENDUM Dictionary Economy

Supply	The total amount of a certain type of good that has been produced and is available.
Supply and Demand	In microeconomics, supply and demand is an economic model of price determination in a market. It postulates that, holding all else equal, in a competitive market, the unit price for a particular good, or other traded item such as labor or liquid financial assets, will vary until it settles at a point where the quantity demanded (at the current price) will equal the quantity supplied (at the current price), resulting in an economic equilibrium for price and quantity transacted.
Supply Schedule	A chart that lists how much of a good a supplier will offer at different prices.
Supply Shock	A sudden shortage of a good.
Surplus	In mainstream economics, economic surplus, also known as total welfare or Marshallian surplus (after Alfred Marshall), refers to two related quantities. Consumer surplus or consumers' surplus is the monetary gain obtained by consumers because they are able to purchase a product for a price that is less than the highest price that they would be willing to pay.
Tariff	A tariff is a tax on imports or exports between sovereign states. It is a form of regulation of foreign trade and a policy that taxes foreign products to encourage or safeguard domestic industry. Tariffs are the simplest and oldest instrument of trade policy. Traditionally, states have used them as a source of income.
Tax	A tax is a compulsory financial charge or some other type of levy imposed upon a taxpayer (an individual or other legal entity) by a governmental organization in order to fund various public expenditures. A failure to pay, along with evasion of or resistance to taxation, is punishable by law.
Tax Rate	In a tax system, the tax rate is the ratio (usually expressed as a percentage) at which a business or person is taxed. There are several methods used to present a tax rate: statutory, average, marginal, and effective. These rates can also be presented using different definitions applied to a tax base: inclusive and exclusive.
Terms of Trade	The rules that countries impose on each other in order to trade with each other.
Total Cost	In economics, total cost (TC) is the total economic cost of production and is made up of variable cost, which varies according to the quantity of a good produced and includes inputs such as labour and raw materials, plus fixed cost, which is independent of the quantity of a good produced and includes inputs that cannot be varied in the short term: fixed costs such as buildings and machinery, including sunk costs if any. Since cost is measured per unit of time, it is a flow variable.
Trade	Trade involves the transfer of goods or services from one person or entity to another, often in exchange for money. A system or network that allows trade is called a market.
Transaction Cost	Is a cost in making any economic trade when participating in a market.
Trough	In economics, a trough is a low turning point or a local minimum of a business cycle. The time evolution of many variables of economics exhibit a wave like behaviour with local maxima (peaks) followed by local minima (troughs). A business cycle may be defined as the period between two consecutive peaks.
Underemployment	Working at a job for which one is overqualified, or working part-time when full-time work is desired.
Unemployment	Under-utilization of any factor of production, most commonly referring to labor.
Unskilled Labor	Labor that requires no specialized skills, education, or training to perform.
Utilitarianism	Utilitarianism is a family of consequentialist ethical theories that promotes actions that maximize happiness and well-being for the majority of a population.
Utility	The usefulness of a good or service in satisfying a need or a want.
Value	Economic value is a measure of the benefit provided by a good or service to an economic agent. It is generally measured relative to units of currency, and the interpretation is therefore "what is the maximum amount of money a specific actor is willing and able to pay for the good or service"?
Value-Added Tax (VAT)	A value-added tax (VAT), known in some countries as a goods and services tax (GST), is a type of tax that is assessed incrementally, based on the increase in value of a product or service at each stage of production or distribution. VAT essentially compensates for the shared services and infrastructure provided in a certain locality by a state and funded by its taxpayers that were used in the elaboration of that product or service.
Variable Cost	Any cost that changes in proportion to the amount of goods or services that a business produces. Variable costs are also the sum of marginal costs over all units produced.
Velocity of Money	Refers to how fast money passes from one holder to the next. It can refer to the income velocity of money, which is the frequency with which the average same unit of currency is used to purchase newly domestically produced goods and services within a given time period. In other words, it is the number of times one unit of money is spent to buy goods and services per unit time.
Wage	A wage is monetary compensation (or remuneration, personnel expenses, labor) paid by an employer to an employee in exchange for work done. Payment may be calculated as a fixed amount for each task completed (a task wage or piece rate), or at an hourly or daily rate (wage labour), or based on an easily measured quantity of work done.
Wealth	Wealth is the abundance of valuable financial assets or physical possessions which can be converted into a form that can be used for transactions. This includes the core meaning as held in the originating old English word weal, which is from an Indo-European word stem. A community, region or country that possesses an abundance of such possessions or resources to the benefit of the common good is known as wealthy.
Wealth Effect	The change in spending that accompanies a change in perceived wealth. Usually the wealth effect is positive: spending changes in the same direction as perceived wealth.
Welfare	Welfare is a type of government support for the citizens of that society. Welfare may be provided to people of any income level, as with social security (and is then often called a social safety net), but it is usually intended to ensure that the poor can meet their basic human needs such as food and shelter. Welfare attempts to provide poor people with a minimal level of well-being, usually either a free- or a subsidized-supply of certain goods and social services, such as healthcare, education, and vocational training.
Willingness to Accept	In economics, willingness to accept (WTA) is the minimum amount of money that a person is willing to accept to abandon a good or to put up with something negative, such as pollution.
Willingness to Pay	Willingness to pay (WTP) is the maximum price at or below which a consumer will definitely buy one unit of a product. This corresponds to the standard economic view of a consumer reservation price. Some researchers, however, conceptualize WTP as a range.
Yield	In finance, the yield on a security is the amount of cash (in percentage terms) that returns to the owners of the security, in the form of interest or dividends received from it. Normally, it does not include the price variations, distinguishing it from the total return. Yield applies to various stated rates of return on stocks (common and preferred, and convertible), fixed income instruments (bonds, notes, bills, strips, zero coupon), and some other investment type insurance products (e.g. annuities).

ADDENDUM Dictionary Ec

Zero-Sum	In game theory and economic theory, a zero-sum game is a mathematical representation of a situation in which each participant's gain or loss of utility is exactly balanced by the losses or gains of the utility of the other participants. If the total gains of the participants are added up and the total losses are subtracted, they will sum to zero. Thus, cutting a cake, where taking a larger piece reduces the amount of cake available for others, is a zero-sum game if all participants value each unit of cake equally (see marginal utility).

Electricity

Voltage (E)	The electric force of work required to move current through an electric circuit, measured in units of volts.
Voltage (V)	The unit of measurement of voltage in an electric circuit, denoted by the symbol V.
Current (I)	The flow of free electrons in one general direction, measured in units of amps.
Amp (A)	The unit of measurement of electric current, denoted by the symbol A.
Direct-Current (DC)	Current that flows continually in one direction.
Alternating-Current (AC)	Current that flows in a circuit in a positive direction and then reverses itself to flow in a negative direction.
Resistance (R)	The electrical “friction” that must be overcome through a device in order for current to flow when voltage is applied.
Ohm (Ω)	The unit of measurement of resistance in an electric circuit, denoted by the symbol Ω.
Inductance (H)	The property that causes the current to lag the voltage, measured in units of henries.
Capacitance (F)	The property that causes the current to lead the voltage, measured in units of farads.
Energy (Wh)	The amount of electric work (real power) consumed or utilized in an hour. The unit of measurement is the watt hour.
Power (P)	The combination of electric current and voltage causing electricity to produce work. Power is composed of two components: real power and reactive power
Volt-Ampere (VA)	The unit of both real and reactive power in an electric circuit.
Real Power	The resistive portion of a load found by taking the cosine of the angle that the current and voltage are out of phase.
Watt (W)	The unit of real power in an electric circuit.
Reactive Power	The reactive portion of a load, found by taking the sine of the angle that the current and voltage are out of phase.
Var (Q)	The unit of reactive power in an electric circuit.
Power Factor (pf)	The ratio of real power to reactive power.
Frequency (f)	The number of complete cycles made per second, measured in units of hertz.
Hertz (Hz)	Units of frequency (equal to 1 cycle per second)
Conductors	Materials that have many free electrons and are good transporters for the flow of electric current.
Insulators	Materials that have hardly any free electrons and inhibit or restrict the flow of electric current.
Series Resistive Circuit	All of the resistive devices are connected to each other so that the same current flows through all the devices.
Parallel Resistive Circuit	Each resistive device is connected across a voltage source. The current in the parallel path divides and only a portion of the current flows through each of the parallel paths.
AWG (American Wire Gauge)	A numbering system to classify wire size based upon the number of steps required to draw the wire as it is being manufactured. The greater the gage number of wire, the smaller the wire.
Circular Mil	The area contained in a circle having a diameter of 1/1000 inch. (0.0254mm)
Anode	A positively charged electrode.
Cathode	A negatively charged electrode.
Compound	A pure substance composed of more than one element.
Conductor	A substance or medium that conducts heat, light, sound, or especially an electric charge.
Electrode	A solid electric conductor through which an electric current enters or leaves an electrolytic cell.
Ion	A charged particle.
Oxidation	The loss of electrons by a compound or ion.
Reduction	The gain of electrons by a compound or ion.
HVAC	Heating, Ventilation and Air Conditioning
Alternator	A device which converts mechanical energy into electrical energy.
Ammeter	An instrument for measuring the flow of electrical current in amperes. Ammeters are always connected in series with the circuit to be tested.
Ampere-Hour	A unit of measure for battery capacity. It is obtained by multiplying the current (in amperes) by the time (in hours) during which current flows. For example, a battery which provides 5 amperes for 20 hours is said to deliver 100 ampere - hours.
Amplifier	A device of electronic components used to increase power, voltage, or current of a signal.
Amplitude	A term used to describe the maximum value of a pulse or wave. It is the crest value measured from zero.
Armature	The movable part of a generator or motor. It is made up of conductors which rotate through a magnetic field to provide voltage or force by electromagnetic induction. The pivoted points in generator regulators are also called armatures.
Capacitor	A device which stores electrical energy. Commonly used for filtering out voltage spikes.
Current	Movement of electricity along a conductor. Current is measured in amperes.
Cycle	The change in an alternating electrical sine wave from zero to a positive peak to zero to a negative peak and back to zero.
Cycling	The process by which a battery is discharged and recharged.
Discharge	To remove electrical energy from a charged body such as a capacitor or battery.
Electrical Field	The region around a charged body in which the charge has an effect.
Electrochemical	The relationship of electricity to chemical changes and with the conversions of chemical and electrical energy. A battery is an electrochemical device.

Electrolyte	Any substance which, in solution, is dissociated into ions and is thus made capable of conducting an electrical current. The sulfuric acid - water solution in a storage battery is an electrolyte.
Electromagnet	Core of magnetic material, generally soft iron, surrounded by a coil of wire through which electrical current is passed to magnetize the core.
Electromagnetic Induction	The process by which voltage is induced in a conductor by varying the magnetic field so that lines of force cut across the conductor.
Electronics	The control of electrons (electricity) and the study of their behavior and effects. This control is accomplished by devices that resist, carry, select, steer, switch, store, manipulate, and exploit the electron.
Frequency	The number of pulse or wave cycles that are completed in one second. Frequency is measured in Hertz, as in 60Hz (hertz) per second.
Gate	A logic circuit device which makes a YES or NO (one or zero) decision (output) based on two or more inputs.
Generator	A device which converts mechanical energy into electrical energy.
Grounded Circuit	A connection of any electrical unit to the frame, engine, or any part of the tractor or machine, completing the electrical circuit to its source.
Inductance	The property of an electric circuit by which an electromotive force (voltage) is induced in it by a variation of current either in the circuit itself or in a neighboring circuit.
Insulator	A substance or body that resists the flow of electrical current through it.
Integrated Circuit	An electronic circuit which utilizes resistors, capacitors, diodes, and transistors to perform various types of operations. The two major types are Analog and Digital Integrated Circuits.
Inverter	A device with only one input and one output; it inverts or reverses any input.
Ion	An atom having either a shortage or excess of electrons.
Isolation Diode	A diode placed between the battery and the alternator. It blocks any current flow from the battery back through the alternator regulator when the alternator is not operating.
Light Emitting Diode	A solid - state display device that emits infrared light when a forward - biased current flows through it.
Microprocessor	An integrated circuit combing logic, amplification and memory functions.
Milliampere	1/1,000,000 ampere.
Motor	A device which converts electric energy into mechanical energy.
Multimeter	A testing device that can be set to read ohms (resistance), voltage (force), or amperes (current) of a circuit.
Mutual Induction	Occurs when changing current in one coil induces voltage in a second coil.
Ohm's Law	Ohm's Law states that when an electric current is flowing through a conductor, such as a wire, the intensity of the current (in amperes) equals the electromotive force (volts) driving it, divided by the resistance of the conductor. The flow is in proportion to the electromotive force, or voltage, as long as the resistance remains the same.
Parallel Circuit	A circuit in which the circuit components are arranged in branches so that there is a separate path to each unit along which electrical current can flow.
Piezo Electric Device	A device made of crystalline materials, such as quartz, which bend or distort when force or pressure is exerted on them. This pressure forces the electrons to move.
Plate	A solid substance from which electrons flow. Batteries have positive plates and negative plates.
Polarity	A collective term applied to the positive (+) and negative (-) ends of a magnet or electrical mechanism such as a coil or battery.
Pole	One or two points of a magnet at which its magnetic attraction is concentrated.
Pole Shoes	Iron blocks fastened to the inside of a generator or motor housing around which the field or stator coils are wound. The pole shoes may be permanent or electro - magnets.
Potentiometer	A variable resistor used as a voltage divider.
Power Switch Transistor	The part responsible for switching off the primary circuit that causes high voltage induction in the secondary winding in an electronic ignition system.
Printed Circuit Board	A device used to hold integrated circuit components in place and provide current paths from component to component. Copper pathways are etched into the board with acid.
Proton	A particle which, together with the neutron constitutes the nucleus of an atom. It exhibits a positive charge of electricity.
Pulse	A signal that is produced by a sudden ON and OFF of direct current (DC) within a circuit.
Pulse-Width-Modulated	A digital electronic signal which consists of a pulse generated at a fixed frequency. The information transmitted by the signal is contained in the width of the pulse. The width of the pulse is changed (modulated) to indicate a corresponding change in the information being transmitted, such as throttle command.
Rectifier	A device (such as a vacuum tube, commutator, or diode) that converts alternating current into direct current.
Regulator	A device which controls the flow of current or voltage in a circuit to a certain desired level.
Relay	An electrical coil switch that uses a small current to control a much larger current.
Reluctance	The resistance that a magnetic circuit offers to lines of force in a magnetic field.
Resistance	The opposing or retarding force offered by a circuit or component of a circuit to the passage of electrical current through it. Resistance is measured in ohms.
Rheostat	A resistor used for regulating a current by means of variable resistance; rheostats allow only one current path.
Semiconductor	An element which has four electrons in the outer ring of its atoms. Silicon and germanium are examples. These elements are neither good conductors nor good insulators. Semiconductors are used to make diodes, transistors, and integrated circuits.
Sensor	A small coil of fine wire in the distributor on electronic ignition systems. The sensor develops an electromagnetic field that is sensitive to the presence of metal. In monitors and controllers, they sense operations of machines and relay the information to a console.
Series Circuit	A circuit in which the parts are connected end to end, positive pole to negative pole, so that only one path is provided for current flow.

Electricity

Series-Parallel Circuit	A circuit in which some of the circuit components are connected in series and others are connected in parallel.
Short	This occurs when one part of a circuit comes in contact with another part of the same circuit, diverting the flow of current from its desired path.
Shunt	A conductor joining two points in a circuit so as to form a parallel circuit through which a portion of the current may pass.
Slip-Ring	In a generator, motor, or alternator, one of two or more continuous conducting rings from which brushes take, or deliver to, current.
Solenoid	A tubular coil used for producing a magnetic field. A solenoid usually performs some type of mechanical work.
Solid-State Circuits	Electronic (integrated) circuits which utilize semiconductor devices such as transistors, diodes and silicon controlled rectifiers.
Stator	The stationary part of an alternator in which another part (the rotor) revolves.
Sulfation	The formation of hard crystals of lead sulfate on battery plates. The battery is then "sulfated."
Switch	A device which opens or closes electrical pathways in an electrical circuit.
Tachometer	An instrument for measuring rotary speed; usually revolutions per minute.
Transformer	A device made of two coil windings that transfers voltage from one coil to the next through electromagnetic induction. Depending upon the number of windings per coil, a transformer can be designed to step - up or step - down its output voltage from its input voltage. Transformers can only function with alternating current (AC).
Trimmer Resistor	A resistor used in applications where only a small resistance change is needed.
Volt	A unit of electrical pressure (or electromotive force) which causes current to flow in a circuit. One volt is the amount of pressure required to cause one ampere of current to flow against one ohm of resistance.
Voltage	That force which is generated to cause current to flow in an electrical circuit. It is also referred to as electromotive force or electrical potential. Voltage is measured in volts.
Voltage Regulator	A device that controls the strength of a magnetic field produced by a generator or alternator. It prevents the battery from being overor undercharged during high - or low - speed operation of the generator or alternator.
Voltmeter	An instrument for measuring the force in volts of an electrical current. This is the difference of potential (voltage) between different points in an electrical circuit. Voltmeters are connected across (parallel to) the points where voltage is to be measured.
Watt	A unit of measure for indicating the electrical power applied in a circuit. It is obtained by multiplying the current (in amperes) by the electrical pressure (in volts) which cause it to flow. That is: watts = amperes x volts.
Watt-Hour	A unit of electrical energy. It indicates the amount of work done in an hour by a circuit at a steady rate of one watt. That is, watthours = ampere - hours x volts.
Wave	A signal that is produced by varying a continuous flow of current within a circuit. Waveforms can be created by either AC or DC current.
Winding	The coiling of a wire about itself or about some object. Often identified as a series winding, a shunt winding, etc.

Entertainment

Field Dressing

Fire

Arson	The crime of intentionally or maliciously lighting structures, wildland areas, cars or other property on fire.
Auto Reignition	A process used in gas burners to control ignition devices based on whether a burner flame is lit.
Autoignition Temperature	The lowest temperature at which a substance will spontaneously ignite in a normal atmosphere without an external source of ignition, such as a flame or spark.
Campfire	A fire lit at a campsite, to serve the following functions: light, warmth, a beacon, an insect and/or apex predator deterrent, to cook, and for a psychological sense of security.
Char Cloth	A swatch of fabric made from vegetable fibre (such as linen, cotton or jute) that has been converted via pyrolysis into a slow-burning fuel of very low ignition temperature.
Ember	A glowing, hot coal made of greatly heated wood, coal, or other carbon-based material that remain after, or sometimes precede a fire.
Feather Stick	A length of wood which has been shaved to produce a head of thin curls. It is sometimes used when starting an outdoor fire or campfire when dry tinder is difficult to find. It is often used in conjunction with charcloth.
Ferrocerium	A man-made metallic material that gives off a large number of hot sparks at temperatures at 3,000°F (1,650°C) when scraped against a rough surface (pyrophoricity), such as ridged steel.
Fire Ring	A construction or device used to contain campfires and prevent them from spreading and turning into wildfires.
Fire Striker	A piece of high-carbon steel used for striking a spark, usually kept in a tinderbox together with flint and tinder.
Fire Triangle	A simple model for understanding the necessary ingredients for most fires. The triangle illustrates the three elements a fire needs to ignite: heat, fuel, and an oxidizing agent (usually oxygen).
Firelighter	Small solid fuel tablets sold as a consumer product and designed to replace kindling in starting a fire.
Flint	A hard, sedimentary cryptocrystalline form of the mineral quartz, categorized as a variety of chert. It occurs chiefly as nodules and masses in sedimentary rocks, such as chalks and limestones. Inside the nodule, flint is usually dark grey, black, green, white, or brown in colour, and often has a glassy or waxy appearance. A thin layer on the outside of the nodules is usually different in colour, typically white and rough in texture.

ADDENDUM | Dictionary | Fire

Flint Spark Lighter	A type of lighter used in many applications to safely light a gaseous fuel to start a flame. It is most commonly used for bunsen burners and oxyacetylene welding torches.
Fuel	Any material that stores energy that can later be extracted to perform mechanical work in a controlled manner. Most fuels used by humans undergo combustion, a redox reaction in which a combustible substance releases energy after it ignites and reacts with the oxygen in the air.
Gas Lighter	A device which is used to ignite the gas stove. It is used in gas stoves which do not have automatic ignition system. It uses a physical phenomenon called piezo-electric effect to generate an electric spark which ignites the combustible gas from the stove burner.
Lighter	A portable device used to generate a flame. It consists of a metal or plastic container filled with a flammable fluid or pressurized liquid gas, a means of ignition, and some provision for extinguishing the flame.
Match	A typical modern match is made of a small wooden stick or stiff paper. One end is coated with a material that can be ignited by frictional heat generated by striking the match against a suitable surface.
Potassium Permanganate	Sometimes included in survival kits as a fire starter, water sterilizer and for creating distress signals on snow.
Pyromania	Impulse control disorder in which individuals repeatedly fail to resist impulses to deliberately start fires, in order to relieve tension or for instant gratification.
Smoulder	The slow, low-temperature, flameless form of combustion, sustained by the heat evolved when oxygen directly attacks the surface of a condensed-phase fuel.
Sodium Permanganate	Chemically similar to potassium permanganate, but it is generally less desirable because it is more expensive to produce.
Solar Spark Lighter	A pocket-sized stainless steel parabolic mirror, shaped to concentrate sunlight on a small prong holding combustible material at the focal point.
Tinder	Easily combustible material used to ignite fires by rudimentary methods. A small fire consisting of tinder is then used to ignite kindling.
Tinderbox	A small container containing flint, firesteel, and tinder (typically char cloth, but possibly a small quantity of dry, finely-divided fibrous matter such as straw), used together to help kindle a fire. Tinderboxes fell out of general usage when matches were invented.
Wood Ash	The residue powder left after the combustion of wood. Main producers of wood ash are wood industries and power plants.
Wood Fuel	Wood used as fuel. The burning of wood is currently the largest use of energy derived from a solid fuel biomass.
Zip Cube	Packaged small blocks of solid fuel containing kerosene, sold as a firelighter.
Rattan	Rattan is the name for roughly 600 species of old world climbing palms belonging to subfamily Calamoideae. The rattan creepers are often used as rope in survival situations.
Air Attack	Using airplanes or helicopters to help control a ground cover fire. Aircraft can also be used logistically to transport crews, supplies, and equipment.
Air Tanker	Any fixed-wing aircraft used to drop retardant or water on a wildland fire.
Anchor Point	A term associated with attack methods. Refers to an advantageous location, usually one with a barrier to fire spread, from which to start constructing a fire line. Used to minimize the chance of being "flanked" by the fire while constructing the fire line. Most anchor points originate at or near the area of origin (rear of fire).
Aspect	A topography term for direction towards which a slope faces.
Backfiring	When attacking a wildland fire using the indirect attack method, intentionally setting fire to fuels inside the control line to reduce fuel and contain a rapidly spreading fire. Backfiring provides a wide defense perimeter and may be further employed to change the force of the fire's convective column.
Black Line	When putting in control lines, the process of burning out any pockets of unburned fuels.
Blowup	A dangerously rapid increase in fire spread.
Brush	Shrubs and stands of short, scrubby trees that do not reach merchantable size, generally 3' to 20' in height.
Brush Engine	Any light, mobile vehicle having limited pumping and water capacity, designed for initial attack knockdown of a small wildland fire.
Burning Out	When attack on the wildland fire is direct, or parallel with the control line, intentionally setting fire to unburned islands of fuel inside the control line to strengthen the line.
Candling	Burning aerial canopy of one single tree from ground up.
Canopy	The foliage or leaf covering on fuel stock.
Cat Line	A fire line constructed by a bulldozer.
Cat Pile	A berm left by a bulldozer that might contain smoldering fuels.
Chain	A fire behavior term used to figure fire perimeter size and rate of spread. One chain equals 66 feet.
Cold Trailing	To control a partly dead fire's edge by carefully inspecting and feeling with bare hands for any remaining embers or coals.
Conduction	The transfer of heat from one place to another without movement of the medium.
Conflagration	A raging, destructive fire. Often used to describe a fire burning under extreme fire weather. The term is also used when a wildland fire burns into a wildland/urban interface, destroying many structures.
Contain Fire	When firefighters or other resources stop the forward progress of a fire but have not put in all control lines.
Control Line	A term used for all constructed or natural fire barriers used to control a fire.
Control of Fire	When firefighters and/or other resources completely surround and leave no open line on the fire perimeter.
Convection	The transfer of heat by physical movement of a heated medium from one place to another. The convective column of a wildland fire can provide the medium.
Crown Fire	Any fire that advances from top to top of trees or brush that is more or less independent of the surface fire.
Direct Attack	Attacking the fire on its burning edge or close to it. A direct attack is usually made on a wildland fire that is moving slowly and is not too hot for firefighters to operate close to the fire's edge with equipment.
Division	The largest segment of a geographical fire perimeter. A division supervisor is in charge of operational activities with the division. Letters are assigned to describe a division.

Drift Smoke	Smoke that has drifted from its point of origin and lost its original billowing form. Drift smoke can fill in canyons under stable air masses and make it difficult to see spot fires.
Drop	A term associated with air attack. Refers to dropped cargo, firefighters, or retardant.
Dry Lightning Storm	A lightning storm where little or no rain reaches the ground.
Duff	Matted, partly decomposed leaves, twigs, and bark beneath trees and brush.
Extended Attack	Fires that go beyond three burning periods.
Extreme Fire Behavior	When a wildland fire is influenced by adverse winds, fuels, adverse topography, or any combination of the above. High rates of spread, spotting, and thermal outputs are associated with extreme fire behavior.
Fine Fuel Moisture	A term expressing the moisture level (in percentage) found in fine fuels (such as grass).
Finger	Long, narrow extensions from the main body of the fire.
Fire Behavior	The manner in which a wildland fire develops; how fuels ignite, flame development, and fire spread.
Fire Break	An existing barrier, man-made or natural, that will stop or slow an oncoming wildland fire.
Fire Flank	The sides of a wildland fire between the tail and the head. Can be identified with compass directions, left and right, hot or cold.
Fire Line	The part of a control line that is scraped or dug down to mineral soil.
Fire Perimeter	The entire length of the outer edge of the fire.
Fire Retardant	Any substance or chemical applied to wildland fuels to slow the rate of combustion or reduce flammability, generally expressed as long-term or short-term. Long-term retardants are generally chemical based, whereas short-term retardants are primarily thickened soapy water.
Fire Season	The period of the year when wildland fires are most likely to occur.
Fire Storm	Violent convective columns caused by large continuous areas of fire, often appearing as tornado-like whirls. Can also occur from uneven terrain as fire spreads through an area. Are associated with extreme fire behavior.
Firing Team	Experienced wildland firefighters and firing boss in charge of carrying out backfiring or burn-out function.
Firing Out	Also called firing. The intentional setting on fire of fuels between the control line and the main body of fire in either a backfiring or burning-out operation.
Flanking	Attacking a wildland fire by working the sides of the fire between the head and rear.
Flash Fuels	Fuels like grass, leaves, pine needles, and tree moss that ignite readily and burn rapidly. Also called fine fuels.
Gradient Winds	Wind created by differing barometric pressures between high and low air-pressure systems.
Head of a Fire	The most active part of a wildland fire. A developing wildland fire can have multiple heads.
Heavy Fuels	Fuels of large diameter such as logs, snags, and large tree limbs. These ignite slowly and burn slow but hot.
Hose Lay	Connecting sections of fire hose together from the fire pump to the fire location with designated sections of line controlled by use of water.
Incendiary Fire	A wildland fire willfully set by anyone to burn wildland or property not owned or leased by this person.
Indirect Attack	A method of attack in which the control line is located along a natural barrier, firebreak, creek, river, or paved road. This attack method may be used in conjunction with backfiring.
Initial Attack (IA)	The first-alarm assignment (resources and personnel) dispatched to a wildland incident.
Live Fuel Moisture (LFM)	A term describing moisture levels (expressed in percentage) found in brush and trees.
Local Wind	A wind whose velocity and direction is determined by local heating and cooling (diurnal cycle). Local winds are low velocity, averaging less than 10 mph.
Major Fire	Generally, a fire of the size or complexity that it requires a large force of fire resources and personnel and several days to control.
Mop-up	After the fire has been controlled, all actions required to make the fire "safe", prior to being called out. This includes trenching, falling snags, and checking all control lines.
Parallel Firing Method	A method where hand-tool crews operate 100 yards parallel to the fire's edge and burn out as they complete the fire line.
Progressive Hose Lay	A hose lay used on a wildland fire, usually on the flanks, to follow up a hand line made by crews or as a means of making a "wet line" along the fire's edge. Major components of this lay include 1 1/2-inch hose as a main feeder line with 1-inch hose branched off it, usually every 100 to 150 feet.
Project Fires	Fires that require a large amount of logistical and service support to suppress. Fires that need a supervisor in each of the five major functions of ICS.
Rate of Spread (ROS)	A fire behavior term used to express relative horizontal growth of a wildland fire. Expressed in total perimeter growth in chains per hour. One chain equals 66 feet.
Rear of Fire	The portion of a fire opposite the head. The slowest burning part of the fire.
Relative Humidity	A weather term. The amount of moisture in a given parcel of air expressed as a percentage of the maximum amount that parcel of air could hold at the same air temperature.
Surface Fire	A fire that burns surface litter like dry pine needles and leaves.
Thermal Belts	In mountainous regions, the middle third of the slopes that remain active with fire during evening hours. This is due to down-canyon "falling" winds that pool cooler air in canyon bottoms but leave the middle part of the slope active.
Topography	An accurate and detailed description of a place, including land surface configuration, both man-mad and natural. Topography can be described in terms like "level", "steep", "broken", or "rolling".
Trenching	The action of digging trenches on a side slope to catch any material that might roll across the control lines.
Undercut Line	A control line constructed below a fire on a slope.
Virga	A weather term describing moisture falling from clouds but not reaching the earth's surface.
Wet Line	Control line put in by means of a progressive hose lay using 1 1/2-inch feeder line with 1-inch branch lines every 100 to 150 feet.
Wye	A hose fitting permitting two or more lines to be taken from a single supply line. Used frequently in progressive hose lays on wildland fires.

Fishing

Action (Fishing Rod)	This has to do with the amount of flex in the rod and the way the rod curves when under load, i.e. fighting fish or casting. Defining rod action tends to get a bit confusing but in Australia I believe it can simply be applied to the type of game you're chasing. For example, big, hard fighting fish that need strong line and heavy lures will need a Heavy to Extra Heavy Action Rod. The opposite can apply to light action rods. Medium action rods lay in the middle and are the most common action fishing rod.
Action (Fishing Lure)	How the lure moves through the water.
Bait	This can be a general term to describe any natural or man made item used to attract fish. Or it can be applied specifically to natural food items that a fish would eat.
Barb (Hook)	Is a angular piece that juts out from a hook just below the point to make it harder for a fish to dislodge the hook once the hook has been set.
Barbless (Hook)	Does not have a "barb" to enable an easier removal of a hook, and less damage to fish.
Burn and Kill	This is a term used to describe a method of lure retrieval where you quickly retrieve the "bait" and then stop suddenly to let it pause in the water.
Butt (Fishing Rod)	This is the base or handle of the fishing rod.
Jigging	Is a method of using a "bait" in a vertical up and down motion by lifting and lowering the fishing rod to entice a fish to "strike".
Leader or Trace	These include fluorocarbon, monofilament and wire. They are the last length of line that connects to your hook, lure, fly etc.
Main Line	The is the bulk of fishing line that is wrapped around a fishing reel and provides the primary connection from reel to rig.
Memory	Memory refers to the lines ability to maintain a shape. Fishing line is usually wound around something round like a spool. You have probably noticed that monofilament line will have bends in it when relaxed. This is because it has "memory" of what it has been doing most of the time, which is wound in a circle around a spool. No memory allows better casting.
Blade Bait	A weighted, fish-shaped blade made with a swinging hook and designed for fishing deep.
Buzzbait	These "safety pin" wire lures for surface fishing have a propeller blade on one wire and a weighted body, skirt and hook on the other.
Casting Spoon	A spoon-shaped metal or hard plastic lure that wobbles to attract fish. They can be fitted with a fixed (solid) hook or swinging hook, that has a single, double or treble points.
Crankbait	A fish-like hard lure or plug designed to swim under the surface, often made of plastic or wood. Some are combined with replaceable soft plastic tails.
Chumming	A fishing technique by which bait or scent is released into the water to attract fish to take a lure or baited hook. Chum consists of live, dead, ground-up or prepared baits and scents and is used in fresh and saltwater.
Hook	A metal wire device shaped like a "J" with an opening or "eye" at one end to which the line is tied and a point at the other end to catch the fish. Circle hooks have an angled point. Double and treble hooks have two or three points, respectively.
Jig	Sometimes called "bucktails", these weighted-body (often lead) lures are molded on special hooks and rigged with a hair tail or soft plastic skirt or worm.
Line	Specialized "string" used for fishing. Nylon monofilament line is the most popular. Other lines are made of different materials, including braided fibers and wire. FLY LINE is a specialized line made of a plastic coating on a core, and often made tapered (changing diameter) to make fly casting easier. (To preserve good fishing, take any discarded line with you when you leave. Discarded line can snag and harm wildlife, and kill fish, turtles, frogs, birds and small mammals.)
Lure	Any artificial item designed to attract fish and fitted with hooks. These include flies, hard plastic or wood lures (or plugs), soft plastic imitations, large offshore skirted baits, metal spoons, lead-head lures (jigs), bladed lures, spinners, spinnerbaits.
Reel	A mechanical device for holding and spooling fishing line. Reels have a line spool, brake to slow running fish, handle to retrieve line and foot for clamping to a rod. Reel styles include CASTING (revolving spool), SPINNING (line coiling off stationary spool); SPINCAST, (like spinning but with a nose cone), and FLY (storing thick fly line/backing and to fight big fish).
Rod	A long lever, usually made of fiberglass, graphite or composite materials and used to catch fish. Different types are available, such as rods for spinning, fly fishing, spincast, bait casting, boat fishing, offshore trolling, surf fishing, jetty/pier fishing, etc. Most rods have a reel-holding clamp and guides through which the line runs.
Pelagic	Refers to fish who inhabit the open oceans and who are generally found in the middle or upper water column.
Rig	Is a collection of "terminal tackle" used together in an arrangement to target a fish species. Generally it will include at least 2, possibly all, of the following; line, hook/s, swivel/s, sinker and float.
Running Sinker	This is a "sinker" that is unrestricted and free to move up and down the main line.
Setting the Hook	Is about increasing tension on the fishing line to embed the hook in a fishes mouth when you feel the fish has engaged the "bait".
Sinker	Is a weight used to sink line and bait in the water.
Snag	Basically a "structure" that you have or could potentially hook on to.
Snap	Is a piece of equipment that is commonly used to attach fishing line to lures and enable quick lure changes.
Swivel	Is a piece of equipment that attaches two lines together and spins independently so that the line doesn't twist.
Strike (Angler)	This refers to "setting the hook" by pulling the fishing rod away from the fish (towards yourself) to tighten the line and hook the fish.
Strike (Fish)	Refers to a fish attacking the "bait".
Structure	Is the physical formation of an object/s or landscape in relation to fish habitat, either underwater, on or just above the waters surface. These can be natural or man made for example, trees, rocks, pylons, jetties, bridges, FADs, bomboras, reefs, rock shelfs, islands, mangroves, steep drop offs, breakwalls, reeds, even weed beds can fall under the "Structure" definition when fishing.
Sinker	A weight of lead or other metals designed to sink a hooked bait or lure.
Snap	A small device similar to a dog leash snap, tied to the line and used for attachment and quick release of hooks, rigs and lures.
Soft Plastic Lures	Made of a soft plastic to resemble a worm, lizard, crayfish, shrimp or generic wiggling creature. Often sold in bulk to be rigged on a hook by the angler.
Spinner	Spinner blades rotate around the straight wire shaft of these weighted-body treble-hook lures.
Spinnerbait	"Safety pin" style wire lures with one or more spinner blades on the end of one wire, and a weighted body, skirt and hook on the other. Used to fish around structure such as trees and stumps.
Strike	Any "hit" by a fish taking a lure or bait.

Structure Spoon	Both casting and vertical jigging techniques are used for fishing these swinging hook heavy metal lures.
Tackle Box	A box or bag with special compartments and features to hold terminal tackle, lures, hooks, and other fishing gear.
Terminal Tackle	A general term for describing bobbers, sinkers, hooks, rigs, snaps, swivels and other gear used at the end of a line.
Trolling	A method of slowly running a boat while trailing lures or bait. This fishing method is used to cover a lot of water and to find fish.
Trolling Spoon	A large spoon that is trailed, or trolled, behind a boat to catch fish.
Taper (Fishing Rod)	Rod taper refers to the way the rod narrows from butt to tip. This effects the action of a fishing rod. A rod that flexes mostly at the tip has a fast taper and a rod that flexes through it's entire length has a slow taper. Generally speaking fast taper is better for lure fishing and slow taper is better for bait fishing.
Terminal Tackle	This is a term used to describe any gear that is used at or near the end of a fishing line (the "fishy" end). Hooks, Sinkers, Jig Heads, Swivels, Snaps, Floats, Lures etc all fall into this category.
Trolling	It the process of dragging a type of "bait" behind a watercraft to catch fish.
Walk the Dog	Is used to describe a style of action that surface lures like pencils or stickbaits impart when being retrieved in combination with a special rod technique.
Topwater Lure	Lures made of hard plastic, wood, hollow rubber/plastic and designed to float on the surface to attract fish when twitched or moved.
Tube Bait	Made of soft plastic, these tubular lures are fished with special weighted hooks inserted into the hollow body.
Weedless Spoon	Wobbling spoons made with a fixed hook and guard for fishing weeds.

Fitness

Activities of Daily Living (ADLs)	Physical tasks of everyday living, such as bathing, and walking up the stairs. ADLs are usually factored in to a person's basal metabolic rate, so tracking calories burned for these types of movement isn't recommended when trying to lose weight.
Aerobic Exercise	Any rhythmic activity that increases the body's need for oxygen by using large muscle groups continuously for at least 10 minutes. The term aerobic means "with oxygen."
Agonist Muscle	A muscle that is very effective in causing a certain joint movement. Also called the prime mover.On a biceps curl, the biceps is the agonist muscle that flexes the elbow joint.
Amenorrhea	The absence of menstruation, commonly found in women with a very low body fat percentage and/or exercise excessively.
Anaerobic Exercise	Short lasting, high intensity activity, where the demand for oxygen from the exercise exceeds the oxygen supply.
Angina Pectoris	Chest pain due to lack of blood flow (oxygen) to the heart.
Antagonist Muscle	A muscle that causes movement at a joint in a direction opposite to that of the joint's agonist (prime mover).
Beta-Blockers	Type of medication that reduces heart rate. Exercisers who take beta-blockers will have a lower heart rate at rest and during exercise, so the target heart rate formula cannot be used in this case.
Bioelectrical Impedance	This method of measuring body composition is based on the fact that the lean tissue of the body is much more conductive due to its higher water content than fat tissue. The more lean tissue present in the body, the greater the conductive potential, measured in ohms.
Body Composition	Amount of fat vs. lean muscle tissue in the human body.
Body Mass Index (BMI)	Measure of the relationship between height and weight; calculated by dividing weight in kilograms by height in centimeters squared.
Caffeine	A stimulant found in coffee, tea, chocolate, and some soft drinks that increases heart contractions, oxygen consumption, metabolism, and urinary output.
Calisthenics	Exercising using one's own body weight which helps develop muscular tone.
Cardiorespiratory Fitness	Measure of the heart's ability to pump oxygen-rich blood to the muscles. Also called cardiovascular or aerobic fitness.
Cardiovascular System	A complex system consisting of the heart and blood vessels; transports nutrients, oxygen, and enzymes throughout the body and regulates temperature, water levels of cells, and acidity levels of body components.
Circuit Training	Takes the participant through a series of exercise stations (which could also include strength training), with relatively brief rest intervals between each station. The purpose is to keep the heart rate elevated near the aerobic level without dropping off. The number of stations may range from 4 to 10.
Concentric Muscle Action	Force produced while the muscle is shortening in length.
Continuous Training	This is the most common type of sustained aerobic exercise for fitness improvement, slowly adding more time to the workout to increase endurance.
Cool Down	Lowering of body temperature following vigorous exercise. The practice of cooling down after exercise involves slowing down your level of activity gradually.
Core	A muscle group comprised of the abdominals, lower back, obliques, and hips.
Cortisol	A hormone secreted by the adrenal gland that makes stored nutrients more readily available to meet energy demands. These hormone levels increase under stress, which can stimulate your appetite, leading to weight gain or difficulty losing weight.
Cross-Training	An individualized combination of all aerobic-training methods, characterized by a variety of intensities and modes.
Detraining Principle	This principle says that once consistent exercise stops, you will eventually lose the strength that you built up. Without overload or maintenance, muscles will weaken in two weeks or less.
Diastolic Blood Pressure	The pressure exerted by the blood on the vessel walls during the resting portion of the cardiac cycle, measured in millimeters of mercury.The diastolic number is the bottom of the fraction. 120/80 is an average value for normal blood pressure (80 is the diastolic number). Mild high blood pressure is considered to be between 140/90 and 160/95. High blood pressure is defined by a value greater than 160/95.
DOMS (Delayed Onset Muscle Soreness)	Muscle soreness or discomfort that appears 12 to 48 hours after exercise. It is most likely due to microscopic tears in the muscle tissue, and it usually requires a couple of days for the repair and rebuilding process to be completed. The muscle tissue grows back stronger, leading to increased muscle mass and strength.

Eccentric Contraction	A lengthening of the muscle during its contraction; controls speed of movement caused by another force.
Ectomorph	A body shape characterized by a narrow chest, narrow shoulders and long, thin muscles.
Electrolytes	Salts (ions) found in bodily fluids. Pertaining to exercise, your body loses electrolytes (sodium, potassium) when you sweat. These electrolytes need to be replaced to keep concentrations constant in the body, which is why many sports drinks include electrolytes.
Endomorph	A body shape characterized by a round face, short neck , wide hips, and heavy fat storage.
Endorphins	Opiate-like hormones that are manufactured in the body and contribute to natural feelings of well-being.
EPOC (Excess Post-Exercise Oxygen Consumption)	This explains why your breathing rate remains heavy for a few minutes after finishing a workout. Your body needs more oxygen after a workout in order to restore the oxygen stores in the blood and tissues, and to meet the oxygen requirements of the heart rate, which is still elevated.
Epinephrine	Also called adrenaline, a hormone that stimulates body systems in response to stress.
Ergogenic Aids	A substance, appliance, or procedure that improves athletic performance.
Eustress	"Good" stress that presents opportunities for personal growth. (Exercise is an example of this. It puts stress on the body and its systems, but the results of this stress are positive.)
Exercise metabolic rate (EMR)	The energy expenditure that occurs during exercise.
Fast Twitch Muscle Fibers	Fibers that are better-suited for high-force, short duration activities because they contain more stores for anaerobic energy utilization.
Fixed Resistance	Strength training exercises that provide a constant amount of resistance throughout the full range of motion. Examples include free weights and resistance bands.
Flexibility	The measure of the range of motion, or the amount of movement possible, at a particular joint.
Graded Exercise Test (Incremental Exercise Test)	An exercise test involving a progressive increase in work rate over time. Often graded exercise tests are used to determine the subject's maximum oxygen consumption or lactic threshold.
Heart Rate Reserve (HRR)	Difference between resting and maximal heart rate.
Heat Cramps	Muscle cramps that occur during or following exercise in warm or hot weather.
Heat Exhaustion	A heat stress illness caused by significant dehydration resulting from exercise in warm or hot conditions; frequent precursor to heat stroke.
Heat Stroke	A deadly heat stress illness resulting from dehydration and overexertion in warm or hot conditions; can cause body core temperature to rise from normal to 100 or 105 degrees Fahrenheit in just a few minutes.
High-Density Lipoprotein (HDL)	Retrieves cholesterol from the body's cells and returns it to the liver to be metabolized. Also referred to as "good" cholesterol.
High Impact	Activities that place more stress on the bones and joints, where your limbs are actually making contact with the ground or other surface with force. Examples include: walking, running, step aerobics, and sports that involve impact, like basketball or tennis.
Hydrostatic (Underwater) Weighing	This method of measuring body composition is considered the "gold standard" and is based on the assumption that density and specific gravity of lean tissue is greater than that of fat tissue. By comparing test subject's mass measured underwater and out of the water, body composition may be calculated.
Hyperplasia	An increase in the number of cells in a tissue; usually in reference to fat or muscle cells.
Hypertrophy	An increase in cell size (girth), usually in reference to fat or muscle cells.
Hypothermia	A life-threatening condition in which heat is lost from the body faster than it is produced.
Incremental Exercise Test (Graded Exercise Test)	An exercise test involving a progressive increase in work rate over time. Often these tests are used to determine the subject's maximum oxygen consumption or lactic threshold.
Interval Training	Repeated intervals of exercise interspersed with intervals of relatively light exercise. This type of training provides a means of performing large amounts of high-intensity exercise in a short period of time.
Isokinetic Exercise	Exercise in which the rate of movement is constantly maintained through a specific range of motion even though maximal force is exerted.
Isometric Exercise	Any activity in which the muscles exert force but do not visibly change in length. For example, pushing against a wall or carrying a bag of groceries.
Isotonic Exercise	Any activity in which the muscles exert force and change in length as they lift and lower resistance. For example, bicep curls or leg extensions.
Karvonen Formula	One of the most effective methods used to calculate target heart rate. It factors resting heart rate into the equation.
Ketosis	A condition in which the body adapts to prolonged fasting or carbohydrate deprivation by converting body fat to ketones, which can be used as fuel for some brain activity. The real danger in ketosis is that ketones are acidic, and high levels of ketones make the blood abnormally acid.
Lactic Acid	Once thought of as a waste substance that builds up in the muscles when they are not getting enough oxygen, leading to muscle fatigue and soreness. Now, experts believe that lactic acid is beneficial to the body, acting as a "fuel" to help people continue high-intensity (anaerobic) exercise even when oxygen consumption is low.
Lactic Threshold	The point at which the level of lactic acid in the blood suddenly increases (during exercise). This is a good indication of the highest sustainable work rate. Also known as anaerobic threshold.
Lean Mass	Total weight of your muscle, bone, and all other body organs. (Everything in the body besides fat.)
Low-Density Lipoprotein (LDL)	Transports cholesterol and triglycerides from the liver to be used in various cellular processes. Also referred to as "bad" cholesterol.
Low Impact	Activities that place less stress on the bones and joints. These are better for people with joint pain, and overweight individuals whose weight can hurt their joints. Examples include: swimming, elliptical, cycling, and other activities where your feet (or other body parts) aren't touching the ground with force or where you are somehow supported.
Max VO 2	(V02 Max) Highest amount of oxygen one can consume during exercise. The higher this number, the more you are cardiovascularly fit and capable of increased levels of intensity.
Mesomorph	A body shape characterized by a large chest, long torso, solid muscle structure and significant strength.

MET	An expression of the energy it takes to sit quietly. It is frequently used as a measure of intensity on cardiovascular machines (treadmill, stationary bike, etc.) For example, moderate intensity activities are those that get you moving fast enough or strenuously enough to burn off three to six times as much energy per minute as you do when you are sitting quietly, measured as 3-6 METs.
Moderate Intensity	Activities that range from 40-60% of max heart rate. These activities cause a slightly increased rate of breathing, and feel light to somewhat-hard. Individuals doing activity at this intensity can easily carry on a conversation.
Muscle Fibers	Individual muscle cells that are the functional components of muscles.
Muscular Endurance	The ability of the muscle to perform repetitive contractions over a prolonged period of time.
Muscular Strength	The ability of the muscle to generate the maximum amount of force.
Obesity	A weight disorder generally defined as an accumulation of fat beyond that considered normal for a person based on age, sex, and body type.
One-Rep Max (1 RM)	The amount of weight/resistance that can be lifted or moved once, but not twice; a common measure of strength.
Opposing Muscles	Muscles that work in opposition to the ones you are training. For example, the bicep is the opposing muscle to the triceps; the hamstring is the opposing muscle to the quadriceps.
Osteoporosis	A disease characterized by low bone mass and deterioration of bone tissue, which increases risk of fracture.
Overload Principle	This principle says that in order to train muscles, they must work harder than they are accustomed to. This “overload” will result in increased strength as the body adapts to the stress placed upon it.
Overuse Injuries	Injuries that result from the cumulative effects of repetitive (day-after-day) stresses placed on tendons, muscles, and joints.
Percent Grade	Measure of the elevation of a treadmill.
Physical Fitness	The ability to perform regular to vigorous physical activity without great fatigue.
Pilates	Exercise programs that combine dynamic stretching with movement against resistance.
Plateau	Point in an exercise program where no additional progress is being made (gains in strength, weight loss, increased endurance, etc). One way to break through a plateau is to change the kind of activity you are doing or something about your current activity- adding hills, increasing speed, increasing distance, etc.
PNF Stretching	Proprioceptive neuromuscular facilitation (PNF) stretching is a static stretch of a muscle immediately after maximally contracting it.
Primary Prevention	Actions designed to stop problems before they start.
Pronation	To turn or rotate (the foot) so that the inner edge of the sole bears the body's weight.
Plyometric Training	Exercises that enable a muscle to reach maximal force production in as short a time as possible. For example, jumping from a 3 ft. stool to the ground and immediately springing back up to another stool.
Rate of Perceived Exertion (RPE)	Scale of 1-10 that rates how you are feeling (both physically and mentally) as it relates to exercise fatigue.
Repetition	The number of times an exercise is repeated within a single exercise “set.”
Resting HR	Rate at which your heart beats at rest (while sitting or being inactive). Low resting heart rates are a good measure of health and fitness.
Resting Metabolic Rate (RMR)	Number of calories expended to maintain the body during resting conditions. Also referred to as basal metabolic rate.
Set	A basic unit of a workout containing the number of times (repetitions) a specific exercise is done (e.g. do 3 sets of 5 repetitions with 100 pounds).
Shin Splint	Generic term used to describe pain in the lower leg, either on the medial (inside) or lateral side (outside) of the shin bone.
Sit and Reach Test	A common fitness test that determines flexibility (of the hamstrings and lower back).
Skinfold Caliper Test	A method of determining body fat whereby folds of skin and fat at various points on the body are grasped between thumb and forefinger and measured with calipers.
Skin Fold Measurements	This method of measuring body composition assumes that substantial fat is proportional to overall body fat, and thus by measuring several sites, total body fat may be calculated.
Slow Twitch Muscle Fibers	Fibers that are better-suited for low-force, long duration activities because they possess more endurance enzymes.
Specificity of Training Principle	This principle says that only the muscle or muscle group you exercise will respond to the demands placed upon it. By regularly doing curls, for example, the muscles involved (biceps) will become larger and stronger, but curls will have no effect on the muscles that are not being trained. Therefore, when strength training, it is important to strengthen all of the major muscles.
Static Stretching	A low force, high-duration stretch where the muscle is held at the greatest possible length for up to 30 seconds.
Strength Training (Resistance Training)	The process of exercising with progressively heavier resistance for the purpose of strengthening the musculoskeletal system.
Systolic Blood Pressure	The pressure exerted on the vessel walls during ventricular contraction, measured in millimeters of mercury. The systolic number is the top of the fraction. 120/80 is an average value for normal blood pressure (120 is the systolic number). Mild high blood pressure is considered to be between 140/90 and 160/95. High blood pressure is defined by a value greater than 160/95.
Tai Chi	An ancient Chinese form of exercise, widely practiced in the West today, that promotes balance, coordination, stretching, and meditation.
Talk Test	Method to ensure you are working out at a level where you can answer a question but not comfortably carry on a conversation. This is a good intensity level for weight loss and improved physical fitness.
Tapering	The process athletes use to reduce their training load for several days prior to competition.
Target Heart Rate (THR)	The recommended range is 60-85% of your maximum heart rate. It represents a pace that ensures you are training aerobically and can reasonably be maintained.
Tension Principle	This principle says that tension is created by resistance, which can come from weights, bands, machines, or body weight.
Testosterone	The steroid hormone produced in the testes; involved in growth and development of muscle mass. Since men have more testosterone than women, they are able to gain muscle mass more easily.
Thyroid	Endocrine gland located in the neck that secretes T3 and T4 (hormones), which increase metabolic rate.
Type I Muscle Fibers	Fibers that contain large numbers of oxidative enzymes and are highly fatigue resistant (more prevalent in endurance athletes).
Type IIA Muscle Fibers	Fibers that contain biochemical and fatigue characteristics that are between Type IIB and Type I fibers (the best of both worlds).

Type IIB Muscle Fibers	Fibers that have a relatively small number of mitochondria, a limited capacity for aerobic metabolism, and are less resistant to fatigue than slow fibers (more prevalent in sprinters and power lifters).
Variable Resistance	Strength training exercises that change the amount of resistance throughout the full range of motion.
Vigorous Intensity	Activities above 60% of max heart rate. These activities cause an increased rate of breathing, sweating, and feel somewhat-hard to hard.
Waist to Hip Ratio	A calculation of the proportion of fat stored on your body around your waist and hips. Formula: waist measurement divided by hip measurement. Women should have a ratio of 0.8 or less; men should have a ratio of .95 or less.
Warm Up	To prepare for an athletic event (whether a game or a workout session) by exercising, stretching, or practicing for a short time beforehand.
Yoga	A variety of Indian traditions geared toward self-discipline and the realization of unity; includes forms of exercise widely practiced in the West today that promote balance, coordination, flexibility, and meditation.

Food

Food Grade Bucket	Food grade buckets are white buckets made specifically for food storage. They will help store food for upwards of 25-years, keeping food airtight, safe and dry.
Gamma Lid	An airtight lid that is used for plastic containers that are food grade.
Mason Jars	Simple glass jars that are used for canning food.
Mylar Bags	Bags that are used to provide a barrier between stored survival food and sunlight.
Oxygen Absorbers	When you use oxygen absorbers with proper packaging and sealing, you'll greatly reduce the oxygen in your food. It's important to use oxygen absorbers with gas flushing / vacuum packaging to absorb virtually all oxygen and absorb any oxygen that may permeate the package.
SuperPail	Brand name for a food grade bucket, which usually contains grains or freeze dried foods.
Zeer Pot	A zeer pot is a simple device to keep your foods cold without electricity. A zeer pot keeps it cool through evaporation. A zeer pot requires two clay pots (one nested inside the other with a layer of wet sand in between), water and a cover.
Ababai	Ababai comes from the Caricacae family of fruits, which also contains the Mau Mau, and some forms of papaya. It is considered an exotic fruit in the United States. It is imported from Chile, as Chile is the only country in the world that exports this luscious fruit. Very few countries grow Ababai and then only for their local market. It is a protected fruit in Chile and was only recently available for export.
Abais	A French term that describes puff pastry that has been rolled very thin or sponge cake that has been cut very thin for dessert preparation.
Abalone	Abalone are shellfish of the univalve family, meaning they only have one shell, unlike bivalves such as clams that consist of two shells. This edible gastropod belongs to the same family as the sea slug and is related to the snail. Out of its shell, it resembles a large scallop. They are found in United States, Japan, Australia, Mexico, and Indo-Pacific Region.
Absinthe (AB-sinth)	An anise-flavored liqueur that is made by steeping wormwood and other aromatic herbs (hyssop, lemon balm, and angelica) in alcohol. The drink is distinguished by its dazzling blue-green clarity due to its chlorophyll content.
Acetomel	A mixture of honey and vinegar that produces sweet-sour syrup. Traditionally used to preserve fruits.
Acidify	To add acid (lemon juice or vinegar) to a culinary preparation to made a dish slightly acid, sour, or piquant.
Acidulated Water	It is a solution of 5 to 6 parts water to 1 part acid (typically the acid ingredient is lemon juice or vinegar). Since the flesh of certain fruits and vegetables, such as apples and pears, will darken when exposed to air unless used immediately after cutting, they are dropped into an acidulated water to stop this process.
Aerate (ER-ayt)	Aerate means the same as "sift." To pass dry ingredients through a fine-mesh sifter so large pieces can be removed. The process also incorporates air to make ingredients like flour, lighter.
After Taste	Taste which returns to the mouth after ingestion of certain foods and beverages.
Agar-Agar	Processed seaweed, grayish white in color and comes in sticks, flakes, granules or powder. It is a vegetarian gelatin. After it is soaked in cold water, it becomes bouncy, resilient, and crisp . It is used mostly for cold oriental dishes that contain chicken, meat, and vegetables. In the old days, before the introduction of gelatin, agar-agar was also used as a thickening agent in making cold jellied dishes. Once soaked in boiling water, it melts into a gelatinous substance.
Ahi (AH-hee)	Ahi tuna is simply yellow fin tuna. It is a term used in Hawaii to describe this variety of tuna, which is distinguished from the other variety of tuna, known as blue fin.
Aiguillette	Long, thin slices of poultry of fish.
Aioli (eye-YO-lee)	The French word for garlic is "ail." Aioli is garlic-flavored mayonnaise made from pounded cloves of garlic, egg yolks, oil, and seasoning. Just before it is served, lemon juice and a little cold water are added. It is served as a sauce for a variety of garnishes and main courses. The Italian for aioli is "aglio," the Spanish is "ajo" and "allioil."
Akutaq	Also known as aqutuk, ackutuk, or Eskimo Ice Cream. Not the creamy ice cream as we know it, but a concoction made from reindeer fat or tallow, seal oil, freshly fallen snow or water, fresh berries, and sometimes ground fish. Air is whipped in by hand so that it slowly cools into foam. It is eaten as a desert, a meal, a snack, or a spread.
Al dente (ahl-DEN-tay)	In Italian the phrase means "to the tooth" and is a term used to describe the correct degree of doneness when cooking pasta, risotto, and vegetables. The food should have a slight resistance (chewy) when biting into it, but should not be soft, overdone, or have a hard center.
Al Forno (ahl FOHR-noh)	An Italian term to describe a dish that is "oven baked" or "oven roasted."
All-Purpose Flour	All-purpose flour is made from a blend of high-gluten hard wheat and low-gluten soft wheat. It is a fine-textured flour milled from the inner part of the wheat kernel and contains neither the germ (the sprouting section) nor the bran (the outer husk). By law, in the United States, all flours not containing wheat germ must have niacin, riboflavin, and thiamin added. Most all-purpose flours are labeled "enriched," indicating that these nutrients have been
Allspice	The dried, unripe berry of a small tree. It is available ground or in seed form. Allspice can be used in a variety of dishes such as pickles, casseroles, cakes, and puddings. Also known as Jamaica Pepper. It is the fruit of the evergreen pimiento tree. The flavor resembles a blend of cloves, cinnamon, and nutmeg. This spice is used in both sweet and savory cooking and can be purchased whole or ground.

Almond	It is the kernel of the fruit of the almond tree that is native of the warmer parts of western Asia and North Africa. It belongs to the same group of plants as the rose, plum, cherry, and peach. The seed is rounded at one end and pointed at the other, and covered with a thin brown coat.
Amaranth	Amaranth is from the Greek for "never-fading flower" or "everlasting." It is an annual herb, and therefore not a true grain. It has broad leaves and large flower heads that produce thousands of tiny, protein-rich seeds. There are hundreds of varieties of amaranth. It is grown for its leaves-some varieties are good in salad, some are delicious steamed or stir-fried-and its somewhat peppery seeds. Amaranth can be cooked as a cereal.
Anaheim Chile (An-uh-hime)	Mild, long green chile peppers that are named after the area near Los Angeles where they were first cultivated. Also known as Chile Verde (green), Chile Colorado (red) or the California Long Green, the Anaheim Chile is light green in color and slightly bent . It is the most commonly found variety in the United States.
Ancho Powder	It is ground ancho (pablano) chile peppers. In other words, it is a chile powder. Ancho Chili is a dark Smokey chili with a deep rich flavor and mild to medium heat. Their flavor is somewhat sweet and a little raisin like. This pepper is the most commonly used in authentic Mexican cooking and is a staple in red chili and tamales. Ancho Powder is a terrific choice for those who are looking for a "milder" taste in their cooking. Use Ancho Powder just as you would salt or pepper. Sprinkle on pasta, baked potatoes, vegetables, soups, pizza, popcorn and more. Also try it to season chicken, stews, potatoes, vegetables and, of course, Mexican dishes.
Angel Food Cake	Angel Food Cake is also known as foam-style cake. They are made with a large quantity of egg whites and no shortening or leavening. Angel Food or "angel cake" is thought to be a takeoff of the cornstarch cake and the sponge cake.
Angostura Bitters	Named after a town in Venezuela and made in Trinidad from roots, bark, leaves, and alcohol. It is used in small amounts to lend an aromatic and slightly bitter element to mixed drinks. It is best known as the essential ingredient of the popular cocktail called the "Manhattan."
Antipasto (ahn-tee-PAH-sto)	The term antipasto, usually translated as "appetizer" in English. It literally means "before the meal" and denotes a relatively light dish designed to stimulate the palate before the service of more substantial courses.
Appetizer (apy-tizer)	It is a small portion of bite-size food which is served before a main meal as the first course in order to stimulate the appetite. If served before a meal it should be small. They may be hot or cold, plated, or served as finger food. If served at a cocktail party, it is usually called hors d' oeuvres.
Apple Charlotte	Apple Charlotte consists of layers of cake or breadcrumbs, sugar, butter, and apples.
Applejack	A brandy made by distilling apple cider. The name is also given to a beverage produced by freezing hard cider.
Arracheras	The Mexican term for fajitas or skirt steak.
Arrack (Ah-RAK)	Also called arak. It is an anise-flavored liqueur, often homemade. It is a popular aperitif in the Middle East. It is a distilled from grapes, dates, and other fruits. In its countries of origin, it is included in cooking in some recipes for fish stews.
Arrowroot	A fine, dry white powdered starch made from a tropical root and exported from the British West Indies. It is named for its curative properties in treating arrow wounds.
Au Bleu	The French term for the method of preparing fish the instant after it is killed. Used especially for trout, as in "truite au blue," when the freshly killed fish is plunged into a boiling court bouillon, which turns the skin a metallic blue color.
Au (saw)	It is a French term that has the same meaning as "a la" meaning "in the manner of," "in the style of," and "according to" In cooking, this phrase designates the style of preparation or a particular garnish.
Au Beurre (bur)	Made with or in butter
Au Bleu (blo)	Means blue and describes the process where freshly killed fish is plunged into boiling water and poached until the skin of the fish has a bluish tinge.
Bagel (BAY-guhl)	Bagel derives from the Yiddish word beygl, which comes from the German word beugel meaning a "bracelet." Bagels are bread rolls in the shape of a doughnut or an old-fashioned curtain ring. The brown crust is obtained on the rolls by first boiling them in water and then baking them in an oven.
Baked Alaska	A dessert that consists of a sponge cake that is covered with ice cream, then with a layer of stiffly beaten egg whites, and lastly put in a hot oven to be browned. Also known as omelette la norvienne, Norwegian omelette, omelette surprise, and glace au four.
Baker's Dozen	The "baker's dozen" refers to providing 13 baked items for the price of 12. This originated as a way to avoid shortchanging the customer. Bakers who shorted (cheated) customers could be punished severely-such as losing a hand to an axe! This allowed that one of the 13 could be lost, eaten, burnt, or ruined in some way, leaving the baker with the original legal dozen. The practice can be seen in the Baker Guild codes of the Worshipful Company of Bakers in London, 12th century.
Baking Powder	It is a leavener that consists of a combination of baking soda, cream of tartar, and a moisture absorber (like cornstarch). It has the action of yeast but it acts much more quickly. It is used in batters where there is no acid present. Baking powder acts immediately upon addition of water, therefore a filler (usually cornstarch) is added to absorb the moisture and prevent premature activity. Various baking powders were sold in the first half of the 19th century. Check out the History of Baking Powder.
Baking Soda	Baking soda, which is the alkaline element bicarbonate of soda, is used solely as a chemical leavener in baking. Because it is not premixed with an acid, as is baking powder, it is used alone in baked goods where other ingredients, which also contain acid, are present (yogurt, buttermilk, lemon juice, or sour cream). When the baking soda and acid are combined, they neutralize each other, causing carbon dioxide gas bubbles to form. The bubbles make the dough or batter grow bigger, or rise. Baking soda is more volatile than baking powder because it begins to act the minute you moisten it with the wet ingredients. You must put whatever you are baking right in the oven once the baking soda has been activated. See also bicarbonate of soda.
Baklava (BAHK-lah-vah)	A popular middle eastern (especially Greece and Turkey) pastry that is made with buttered layers of phyllo dough. How it is traditionally made depends on the region. In some areas, it is made with walnuts; in other areas, it is made with pistachios or almonds. Sometimes dried fruit is added between the layers. Baklava consists of 30 or more sheets of phyllo dough brushed with lots of butter, and layered with finely chopped nuts. After baking, a syrup of honey, rose water and lemon juice (sometimes spiced with cinnamon, cardamom, cloves, etc) is poured over the pastry and allowed to soak in. This dessert is known as baglawa in Syrian and Lebanese.
Balti	Balti is an Indian dish, which may have originated in Northwest Pakistan. It is a form of a meat curry, but one that's cooked quickly (like a stir-fry. The spice mix used to flavor the dish is a combination of seeds (coriander, cardamom, cumin, black mustard, fennel, wild onion, and fenugreek). It can be made as either a masala paste or used dry.
Bard	Refers to the practice of surrounding or enveloping meat with pork fat. The fat keeps the meat moist while it cooks.

ADDENDUM Dictionary Food

Base	Base is a soup reduction paste similar to bouillon, but richer, more flavorful, and less salty. You can find it in the soup section of the super market. It comes in a jar and must be refrigerated after opening.
Baste	To spoon, brush or pour drippings or liquid over a food before or during cooking in order to prevent drying, to add flavor, or to glaze it.
Batter	The name of many semi-liquid, floury mixtures of flour, water or milk (or both) or some other liquid. It also usually includes sugar and eggs. Batters may be thin or thick (but even when thick, they must be fluid enough to drop from a spoon). When thin, they should pour out like creamy milk.
Bavarois	It is a light mousse, usually made with chocolate, praline or fruit.
Beaten Biscuit	Southerners describe beaten biscuits as a cross between a soda cracker and a baking powder biscuit. To achieve the right texture and lightness, the dough had to be beaten hard (usually with a mallet) for at least half an hours. The purpose of the beating was to incorporate air into the mixture (this was a time in history before the invention of baking powder). They were a very heavy biscuit, not like our present day baking powder biscuits.
Beef Stroganoff (STROH-guh-noff)	A dish that consists of thin slices of tender beef (usually tenderloin or top loin), onions, and sliced mushrooms. The ingredients are quickly sauteed in butter and combined with a sour-cream sauce. It is usually accompanied by rice pilaf.
Beef Wellington	It is a choice fillet of beef (often flambeed in brandy) that is covered with liver pate and sliced mushrooms. The meat is then placed in a case of puff pastry and baked in a hot oven.
Beignets (ben-YAYS)	Puffy squares of deep-fried dough dusted with powdered sugar. The word beignet comes from the early Celtic word “bigne” meaning “to raise.” Beignet is also French for “fritter.” It is a New Orleans specialty that is a fried, raised piece of yeast dough, usually about two inches in diameter or two inches square. After being fried, they are sprinkled with sugar or coated with various icings. It is like a sweet doughnut, which is square-shaped, and minus the hole. Traditional fare at New Orleans coffee houses, most notably Cafe du Monde in the French Quarter.
Beurre (burr)	This is the French word for “butter.”
Bias-Slice	Slicing a food crosswise at a 45-degree angle.
Bicarbonate of Soda	Another common name for baking soda is bicarb which is short for bicarbonate of soda or sodium bicarbonate. Baking soda, is a naturally occurring substance that is present in all living things. It helps living things maintain the pH balance necessary for life. Baking Soda is made from soda ash, also known as sodium carbonate. It is found in all grocery stores in the baking section.
Biscotti (bee-SKAWT-tee)	In Italian, biscotti means, “twice cooked.” The word biscotto is derived from bis (twice) and cotto (cooked). Biscotti is also the generic term for cookies in Italian. The dough is formed into logs and baked until golden brown. The logs are then sliced, and the individual biscotti are baked again to give them their characteristic dryness. The shelf life of biscotti are three to four months without preservatives or additives. Other countries have their version of this cookie – Dutch rusk, French biscotte, and the German zwieback.
Bisque (bisk)	A bisque is a thick, rich, creamy sauce in the form of a puree. Bisque in French means a “shellfish soup.” The word is a corruption of “biscuit,” as the soup was cooked twice to thicken it. Bisques in the 18th century were made of poultry and game, not with shellfish as they usually are today.
Bistro (BEES-troh)	(1) In France, a bistro used to be a bar that also sold wine. Sometimes, they would have one or two tables and the wife of the owner would have made a dish she would sell. Today a bistro is a small neighborhood restaurant with a comforting, predictable menu and reliable daily specials. It functions as a home away from home for many people, drawn by the familiar atmosphere, honest food and consistent prices. (2) Bistro also means a style of cooing (simple home cooking – it is similar to old-fashioned American food). It is a return to the era before fast food, before speed and convenience became more important than flavor and quality, but not quite to the complexity of old school French cooking.
Black/Blood Pudding	This is one of the famous blood dishes that Scottish people love. It usually accompanies other fried dishes, such as bacon and eggs. While it might seem shocking to eat blood, do not forget that all meat dishes contain blood and it’s the basis, with fat, of gravy. Blood dishes are popular all over Europe, especially in Transylvania.
Blackened	A cooking technique where meat or fish is usually seasoned with a Cajun spice mixture and then cooked in a cast-iron skillet that has been heated almost red-hot. This technique gives the food an extra crispy crust and sears in the juices. It is also guaranteed to set off your smoke detector–unless the battery is dead!
Bleu Cheese	Also called fromage bleu. It is the French name for a group of Roquefort-type (blue-veined) cheeses made in the Roquefort area in southeastern France. Roquefort-type cheeses made in the United States are called blue cheese.
Bloom	(1) To soften gelatin in cool liquid before using in the dish you are making. Blooming gelatin is a step integral to ensuring the smooth texture of a finished product. It involves sprinkling the powdered gelatin into a liquid and letting it sit for 3 to 5 minutes. Then, when the mixture is heated, the gelatin will dissolve evenly. You can bloom gelatin in just about any liquid. Avoid the fresh juices of tropical fruits such as papaya, kiwi, mango, and pineapple as they contain an enzyme that will eat the gelatin. Pasteurizing kills the enzymes in these fruits, so canned or frozen juices are fine. (2) The term is also used when allowing the casing on smoked sausage to darken at room temperature after it has been smoked.
Bocconcini	(1) Bocconcini means “a mouthful” and refers to small nuggets (about 1-inch in diameter) of fresh mozzarella. They are usually sold packed in whey or water. (2) It can also describe tempting Italian dishes.
Bombe (bahm)	Bombe is French for a “bomb” which was used in a cannon. In France, they had at one time, a spherical mold for food shaped like a round bomb. Originally it was made of copper and had a tight lid so that it could be buried with its contents in salted ice to keep the contents frozen. It is a dessert made with two different ice cream mixtures. The first is a simple plain ice cream, which is used to line a mold. T he second is a more elaborate ice cream mixture (usually with a strong flavoring), which, is used as a filling. The bombe is usually decorated when it is complete with crystallized fruit. It is then frozen and served cold as a dessert.
Bon Appetit (bon a-pet-tite)	French phrase that literally means “good appetite” or “enjoy your meal.”
Bonne Femme	A French phrase indicating that a dish has been cooked simply (with vegetables and stock).
Borscht	Also known as borsch and borsch. A beef soup that originated in Ukraine and is considered their national soup. his delicious soup is served in many variations with up to 25 different ingredients, which usually contain either beef, cabbage, or chicken with dumplings stuffed with meat, mushrooms, or vegetables. The best known of these soups is a cold version based on beets and served with sour cream, but hot versions are also very common.
Bottarga	Also known as bottarga di muggine. It is salted Mediterranean salted tuna or mullet roe. Bottarga is made with gray mullet in Sardinia and tuna in Sicily. The term Bottarga, from the Arabic bot-ah-rik, means “raw fish eggs. This delicacy is a specialty of the islands of Sardinia and Sicily.The mullet’s eggs, after being extracted, in their protective sacs, are washed and purified, put under salt, rinsed and laid to dry. The aging process takes four to five months. The dried eggs are then pressed and vacuum packed. The color of the roe goes from yellow-gold to dark amber; the change of color does not affect the quality or taste.

Boudin Noir	A blood sauce that is sometimes called "black pudding." It is served grilled and usually accompanied with mashed potatoes.
Boudin Rouge	Also called red boudin, it is a blood sausage.
Bouillabaisse (Boo-yuh-BAYS)	The name probably derives from the French phrase bouillepeis, meaning "bubble of fish." Although called a soup, this is really a main dish or a stew, a full meal in itself. Bouillabaisse has many regional variations based on the different local fish. The favorite place for bouillabaisse in Marseilles, France is the cabanon, a modest shed erected along the seashore by local people who used it for fishing, and gatherings with family and close friends.
Bouillon (BOO-yahn)	It is the French word for broth. It is a clear soup made from cooking meat, vegetables, poultry, or fish in water. The liquid that is strained after cooking is the bouillon, which can form the base for soups and sauces. Bouillon is available on the market in the liquid, cube, granule, and packet forms.
Braise (brayz)	Braising is basically a slow-cooking method for tough cuts of meat or poultry and even stringy vegetables. They are cooked slowly in a small amount of liquid in a covered pan. Stews and pot roasts are among the dishes prepared this way. Braising may be done in a covered container in the oven, on the range, or in a covered steam kettle or fry pan. In all the moist-heats methods of cooking, the moisture or liquid not only conducts heat to a product, but it interacts with the food being cooked and can influence the final taste and texture of a product.
Brine	Brining is like a marinade as it keeps food moist and tender. Brining or salting is a way of increasing the moisture holding capacity of meat resulting in a moister product when it is cooked. One of the great things about brining is that there are so few rules. Most brines start with water and salt — traditionally, 3/4 pound of salt per gallon of water, but since we're not concerned with the brine as a preservative, you can cut back on the salt.
Broccolini	A new hybrid vegetable that is sure to make a statement at your dinner table. Technically a cross between broccoli and Chinese kale, this vegetable looks more like a broccoli-asparagus mix. Broccolini comes in bunches of 17-20 stalks and has a shelf life of 2 weeks in the refrigerator from date of purchase. Broccolini is a great source of Vitamin C, Vitamin A and potassium, and has no fat. It can be cooked and eaten the same as broccoli: blanched, steamed, sauteed, poached, roasted, fried or grilled. It is 100% edible, so there's no need to remove any of the stems, making a wonderful presentation on the plate with its long slender stems.
Brochette	(1) Small portions of meat, chicken liver, or seafood that is coe on a skewer (usually sauteed or grilled). Food cooked "en brochette" is cooked on a skewer. Also known as kabob, a la broche, or shish ka bob. It is derived from the word "broche," meaning, "pointed tool." (2) Brochette is also used by confectioners to thread fruit in before candying them.
Brunch	A combination of the words for breakfast and lunch, and which is neither breakfast nor lunch, which combines some of the features of both and is served mid-morning.
Bruschetta (broo-SKEH-tah)	Traditional Italian garlic bread. Grilled slices of bread are brushed with extra-virgin olive oil and fresh garlic.
Bubble and Squeak	In English dish of equal parts mashed potatoes and chopped cooked cabbage mixed together and fried until well browned. Originally, the dish included chopped boiled beef. The name is said to come from the sounds the potato-cabbage mixture makes as it cooks (some say it's from the sounds one's stomach makes after eating bubble and squeak).
Bubble Tea	Bubble Tea is the catch-all name for endless unusual names of this drink such as: tapioca pearl drink, tapioca ball drink, pearl shake, pearl tea, black pearl tea, big pearl, boba tea, boba ice tea, boba nai cha, milk tea, bubble drink, zhen zhu nai cha, momi, momi milk tea, QQ, BBT, PT, and possibly many other names. This drink is far from the plain-looking tea that you are generally familiar with and it. It is non-alcoholic and non-carbonated.
Buckle/Crumble	Also called crumble. Is a type of cake made in a single layer with berries added to the batter. It is usually made with blueberries. The topping is similar to a streusel, which gives it a buckled or crumpled appearance.
Bulgogi	Bulgogi is marinated strips of beef cooked over charcoal on a grill. It is the best known and most popular of all Korean foods. Beef is most often identified with bulgogi, but even pork, chicken, lamb, squid, and octopus can be cooked bulgogi style. Foreigners consider it the national dish of Korea. It is often prepared at the table on small grills and accompanied by kimchi, a spicy pickled cabbage. In Korean, the word bul means "fire" and gogi means "meat." The word is commonly translated as Korean barbecue, thought it literally means "fire meat."
Bully Beef	A term used in Great Britain for corned beef.
Burgoo	Burgoo is a savory stew made from a varying array of ingredients that is popular in Kentucky. It is often cooked in enormous iron kettles outdoors over an open flame. Cooking can take as long as 30 hours and flavor improves as it ages. It has been said that burgoo is more of a concept than a recipe. This is because there are as many different ways to prepare burgoo as there are people who prepare it.
Burrito (burr-EE-toe)	A large (10") flour tortilla filled with any number of ingredients, which can include beans, beef, or pork. The tortillas are rolled and then sealed by tucking the ends under. They can be eaten like this or topped with salsa, lettuce, tomato, cheese, and guacamole.
Butter Ghee	Clarified butter and ghee are not the same. Ghee is clarified butter that has been cooked longer to remove all the moisture, and the milk solids are browned (caramelized) in the fat and then strained out. This gives a rich nutty taste. Ghee has a longer shelf life, both refrigerated and at room temperature. It is traditionally used in Indian cuisine.
Salted Butter	The most popular kind of butter in the U.S. is made from fresh cream with no less than 80 percent butterfat. This butter is lightly salted. Salted butter lasts longer than unsalted butter. When used for frying, salted butter scorches much more easily than unsalted.
Cafe Noir	French for black coffee (coffee without cream or milk).
Caffe (kah-FEH)	It is the Italian term for "coffee." In Italy, the term caffe usually refers to a small cup of espresso coffee.
Calzone (kahl-ZOH-nay)	An Italian word meaning "a trouser leg." It is a pizza crust rolled out and topped with all the ingredients of a normal pizza except tomato, then folded over to a half-moon or crescent-shaped turnover. The tomato sauce is sprinkled on top and it then goes into the oven. It is lightly drizzled with olive oil upon its emergence.
Canape (KAN-uh-pay)	A French term that consists of bite-size bits of savory food spread on edible bases (toasted or untoasted bread) and garnished or decorated. They are served as snacks (appetizers) at cocktail and buffet parties.
Candlenut	Candlenut is the name of a tropical nut used in Malaysian cuisine. It derives its peculiar name from the fact that the oil of the nut is also used to make candles. Candlenuts are available only roasted, whole, or in pieces, because raw they are highly toxic. The function of the candlenut in satays or curries is to flavor and thicken.
Cannellini Bean (kan-eh-LEE-nee)	A large white Italian kidney bean that's great in soups and stews.
Cannoli/Cannola (cah-KNOW-lee)	They are sometimes called "Turkish hats." The cannoli is perhaps the best-known Sicilian pastry and is part of Sicily's ancient tradition of pastry and dessert making. It is made by stuffing cylinders of fried dough (wafer shells) with a mixture of ricotta or custard, candied fruit, chocolate, and other ingredients. Originally, the pastry was flavored with wine, and in Sicily this is still done. They are traditionally prepared for festivities at Carnival time (though nowadays they are to be found all year round).

Cantaloupe (KAN-tuh-lohp)	A variety of muskmelon. It is found in many shapes and sizes. Because of trade usage, cantaloupe has become the name commonly applied to muskmelons grown in the U.S.
Capellini (ka-pel-LEE-nee)	In Italian, capellini means, "thin hair." This is one of the very thin varieties of flat spaghetti. Also called angel hair pasta.
Capers (KAY-per)	Capers are the unopened green flower buds of the Capparis Spinosa, a wild and cultivated bush grown mainly in the Mediterranean countries, notably southern France, Italy, and Algeria. They are now also grown in California. They range in size from that of a tiny peppercorn (the petite variety from southern France and considered the finest) to some as large as the tip of your little finger (from Italy). They generally come in brine but can also be found salted and sold in bulk. Either way, rinse before using to flush away as much salt as possible.
Caponate (kah-poh-NAH-tah)	A Sicilian vegetable dish made of various ingredients, but usually includes cooked eggplant, celery, capers, anchovies, chile peppers, olives, tomatoes, vinegar, and onions.
Caprese (kah-PREH-seh)	In the style of Capri. such a sauce is usually made from lightly cooked tomatoes, basil, olive oil, and mozzarella, to use on pastas, meats, fish, or salads. Check out this very easy-to-make Caprese salad: Mozzarella, Tomato and Basil Plate.
Carbonara	Carbonara in Italian means "charcoal" or "coal," and "alla carbonara" means "in the manner of the coal miners." In Italy, the names of dishes generally tell us where or with whom they originated: dishes called Bolognese come from Bologna, alla Romana from Rome, Neapolitan from Naples; anything marinara is prepared in the manner of sailors, puttanesca is favored by hookers, and carbonara comes to us from the charcoal makers or wood cutters. A classic Roman dish is Spaghetti alla Carbonara.
Carpaccio (karh-PAH-chee-oh)	Carpaccio is a classic Italian dish of paper-thin slices of raw beef, served with salt, pepper, and olive oil. The term also means very thin slices of meat, fish, and/or vegetables.
Cassata (kas-ata)	There are two theories on where cassata derives it name from; (1) A term in Arabic, "quas at," meaning the round bowl in which this sweet was originally made. (2) Other sources say that the word derives from the Latin word caseus (cheese) which would clearly refer to the ricotta cheese, one of the main ingredients needed for making cassata. Cassata is a spectacular Sicilian dessert of ricotta, candied fruit, pistachios, sugar, chocolate, liqueur soaked sponge cake and green pistachio icing.
Casserole (kasa-rol)	The word casserole is derived from the Old French word casse and the Latin word cattia meaning a "frying pan or saucepan." As often happens in history, the name of the cooking utensil was used for the dish name. (1) A casserole is an ovenproof or flameproof dish or pan that has a tight lid. It is used to cook meat and vegetables slowly. (2) A casserole is also a stew or ragout consisting of meat and vegetables, which are put in a casserole dish at the same time and cooked by stewing.
Caviar/Caviare (KA-vee-ahr)	Caviar is from the Persian word "khav-yar" meaning "cake of strength," because it was thought that caviar had restorative powers and the power to give one long life. Caviar is from the salted roe (eggs) of several species of sturgeon (it was originally prepared in China from carp eggs). The carp is really a goldfish and is the only fish besides the sturgeon that has gray colored eggs. Up until 1966, any fish roe that could be colored black was called caviar. Then the Food and Drug Administration defined the product, limiting it to sturgeon eggs. It takes up to twenty years for the female sturgeon fish to mature before it produces eggs (called berries).
Beluga (buh-LOO-guhl)	The Russian name for a sturgeon found in the Black and Caspian Seas (they can grow up to 2,000 pounds). It is the largest of the sturgeon family and is considered the finest caviar. The eggs are light to dark gray in color.
Malossol (MAHL-oh-sahl)	The Russian for "little salt" or "lightly salted." Only eggs in prime condition are prepared and labeled t his way (caviar prepared "malosol" are considered fresh).
Oscietre	This is spelled many ways, including "ossetra", "oestrova", and " osietr". This is the second largest species of sturgeon and is the Russian name for the Caspian Sea sturgeon roe that is dark brown to golden in color with large granules and a delicate skin.
Salmon Roe	The eggs of the Atlantic Salmon. They are large and bright red and they are excellent for garnishing dishes.
Sevruga	The smallest eggs of a sturgeon with a fine dark gray (almost black) color. It is considered of lower quality than the Beluga and Osetra caviar.
Tobiko	The Japanese name for a flying fish roe. They have very small red eggs with a crunchy texture
Cayenne Pepper (kiy-ann)	The cayenne is one of the most widely used peppers in the world. The cayenne is about 3 to 5 times hotter than the jalapeno, and when ripe, has it's own distinct, slightly fruity flavor. Heat range is 6-7.
Chafing Dish	The chafing dish is a metal pan, with a water basin, which is heated by an alcohol lamp and used for cooking at the table.
Chakalaka	A very hot and spicy South African cooked vegetable relish/sauce/salad (in some ways it is like a Mexican salsa) that usually includes tomatoes, garlic, chile peppers, grated carrots, and grated cabbage with beans or diced cauliflower. Preparing chakalaka is very much an individual thing, and depends on what you have available. A traditional dish with the black community that is now popular in the urban areas as well as a side dish at barbecues.
Champignon (sham-pee-NYOHN)	French word for an edible mushroom.
Chanterelle Mushrooms (shan-tuh-REHL)	These trumpet-shaped mushrooms flourish in the wilderness areas of the Pacific Northwest and a few places on the east coast. The European and Asian varieties are usually about the size of a thumb. But on the west coast, Chanterelles can be larger than a foot wide and heavier than two pounds. They smell a bit like apricots, have a mild, nutty flavor, and a chewy texture.
Chapon (shad-PONH)	A small piece from end of French loaf, a slice, or a cube of bread that has been rubbed over with a clove of garlic, first dipped in salt. Placed in bottom of salad bowl before arranging salad. A chapon is often used in vegetable salads and gives an agreeable additional flavor.
Chayote (chi-OH-tay)	The chayote is a pear-shaped member of the gourd family. Also called vegetable pear, mirliton (southern United States), choko (Australia and New Zealand). Several varieties of chayote exist, but the commonly available one has thick apple-green skin and generally weighs 1/2 to 1 pound. Thr crisp flesh is mild in flavor, falling somewhere between cucumber and summer squash.
Cheese	Cheese is a food made from the curds of milk pressed together to form a solid. Through the centuries, cheese has been made from the milk of any milk-producing animal, from the ass to the zebra. Today it is most commonly made from milk of cows, goats, or sheep, with a small fraction from water buffaloes. The differences in cheeses come from the way the curds are drained, cut, flavored, pressed, the bacteria involved, the type and length of curing in caves, cellars, or under refrigeration, and a host of other subtle to severe variations.
Soft Cheese	These include the fresh, unripened cheeses such as cottage, cream, farmer, or pot cheese that need only a starter, perhaps buttermilk, and a few hours before they're ready to eat. More complex soft cheeses include quickly ripened brie and camembert, as well as those made with added cream, known as double-cremes and triple-cremes; all have thin, white edible rinds with creamy to runny interiors and are ready to eat within a few days or weeks.
Semi-Soft Cheese	With this group are cheeses ripened three ways: bacteria- or yeast-ripened mildly flavored cheeses such as Italian fontina and Danish havarti. Also included are blue-veined cheeses such as gorgonzola, Roquefort, and English Stilton that are ripened by the presence of "penicillium" molds.

Firm Cheese	Originally termed "farmhouse cheese" but now mostly made in factories, these cheeses are formed into wheels or blocks, usually with a wax coating to seal out molds and external bacteria. This category includes cheddar, Edam, Gouda, Swiss cheese, Jarlsberg, etc. hese are generally aged a few weeks to more than a year.
Hard Cheese	These are the carefully aged cheeses with grainy textures that are primarily intended for grating. These include Asiago, Parmesan, and Romano. The aging process takes form one year to over seven years.
Sous-Chef	This position means "the under chief" in French. This is person is second in command and takes responsibility for the kitchen operations if the chef is absent.
Chef de Partie	Also known as a "station chef" or "line cook", is in charge of a particular area of production. In large kitchens, each station chef might have several cooks and/or assistants. In most kitchens however, the station chef is the only worker in that department. Line cooks are often divided into a hierarchy of their own, starting with "First Cook", then "Second Cook", and so on as needed. The Chef de Partie is in charge of any of the following kitchen positions:
Sauce Chef or Saucier	The person responsible for sauteed items and many different sauces. Traditionally, it is the third person in command. This is usually the highest position of all the stations:
Boulanger	The bread cook.
Confiseur	The candy cook.
Fish Cook/Poissonier	The fish cook – all fish and shellfish items and their sauces.
Friturier	The deep fry cook.
Grillardin	The grill cook.
Cherimoya (chehr-uh-MOY-ah)	The heart-shaped cherimoya is sometimes referred to as a custard apple, which describes its appearance and texture. The taste, however, is uniquely its own. Cherimoya combines the flavors of pineapple, mango, banana, and papaya into a slightly fermented flavor of the tropics. They are available November through April with the largest supply in February and March. Ripe cherimoyas are dull brownish-green in color and give to pressure when gently squeezed. Eat within a day or two. If fruit is pale green and firm, store at room temperature until slightly soft and then refrigerate, carefully wrapped individually in paper towels, for up to 4 days. Peel fruit with a sharp knife and cut into cubes, discarding the dark black seeds. Add to fruit salads or puree and incorporate into a mousse, custard, or pie filling.
Chervil (CHER-vuhl)	Chervil is a mild-flavored herb and a member of the parsley family. It has dark green curly leaves that have parsley-like flavor with overtones of anise. Chervil is generally used fresh rather than dried, although it is available in dried form. Though most chervil is cultivated for its leaves alone, the root is edible and was, in fact, enjoyed by early Greeks and Romans. It is one of the main classic ingredients in Fines Herbes (along with chives, parsley and tarragon), a finely chopped herb mixture that should be added to cooked foods shortly before serving because their delicate flavor can be diminished when boiled.
Chess Pie	Chess pies are a Southern specialty that has a simple filling of eggs, sugar, butter, and a small amount of flour. Some recipes include cornmeal and others are made with vinegar. Flavorings, such as vanilla, lemon juice, or chocolate are also added to vary the basic recipe.
Chevre Cheese (SHEHV-ruh)	Chevre is the French word for goat and for the fresh goat's milk cheese. Goat cheeses are not usually aged, so they are fresh and creamy looking with a fairly mild, salty flavor. They are French in origin. This cheese can be molded into any shape. They come plain or coated with herbs and pepper. Used for relishes, appetizers, sauces, and compliments any cheese board.
Chicken Cacciatora	Cacciatore means "hunter's style." See cacciatore. This dish developed in central Italy and has many variations. It is considered a country-style dish in which chicken pieces are simmered together with tomatoes and mushrooms. The dish originated in the Renaissance period (1450-1600) when the only people who could afford to enjoy poultry and the sport of hunting were the well to do, This dish developed in central Italy and has many variations.
Chicken Kiev (kee-EHV)	Also called Tsiplenokovo Po-Kievski. A boned and flattened chicken breast that is then rolled around a chilled piece of herbed butter. It is then breaded and fried. This poultry dish is also called "Chicken Supreme."
Chicken Marengo	Originally made with crayfish and chicken. Today, the crayfish is usually left out. Chicken Marengo today is chicken cut into pieces, browned in oil, and then cooked slowly with peeled tomatoes, crushed garlic, parsley, white wine and cognac, seasoned with crushed pepper and served with fried eggs on the side (with or without crayfish, also on the side) and toast or croutons, doubling as Dunand's army bread.
Chicory (chick-ory)	A herb of which the roots are dried, ground, and roasted. It is now used to flavor coffee (there is a popular belief that chicory smoothes out coffee).
Chiffonade (shihf-uh-NAHD	(1) This is a French word, which comes from the word "chiffon" which means, "rag". In culinary terms, a chiffonade describes a way of cutting herbs and lettuces into thin strips or shreds, which look a bit like rags. (2) Chiffonade is also a dish consisting of a mixture of green vegetables (such as spinach, lettuce, and sorrel) which are shredded or cut finely into ribbons (sometimes melted butter is added). It is used to form a bed for a dish such as egg mayonnaise or as a garnish for soups.
Chimichanga (chim-me-CHAN-gaz)	A burrito prepared with your choice of meat, vegetables, and spices that are rolled up to form a large spring roll, either deep fried or grilled deep-fried, and served on a bed of lettuce with cheese and mild sauce. The chimichanga or "chimi" is the quintessential Tucson, Arizona food item, which has achieved a cult status in that city. The residents of Tucson take their "chimis" very seriously and would prefer to pay more money so as not to be served a smaller one with fewer ingredients. They love the large, gigantic ones. Every restaurant and Mom and Pop eatery has his or her own version of this favorite dish.
Chipotle Chile (chih-POHT-lay)	A chipotle pepper is simply a smoked jalapeno pepper. These chilies are usually a dull tan to coffee color and measure approximately 2 to 4 inches in length and about an inch wide. It is sold either dried or canned with adobo sauce. Most of the natural heat of the jalapeno is retained in the process. Chipotle peppers are very hot, and they can easily over power dishes and recipes. Chipotles are available dried whole, powdered, pickled, and canned in Adobo sauce.
Converture	A term generally used to describe high-quality chocolate used by professional bakers in confectionery and baked products. It has more cocoa butter than regular chocolate. It's specially formulated for dipping and coating things like truffles.
Cholent (CHUH-lent)	Cholent is traditional Jewish cuisine served on the Sabbath. Whether the hamin of Sephardic communities, the cholent of Ashkenazic ones, or a fusion of the two, it is still favored by many for Shabbat, particularly on a cold winter day.
Chop Suey	Chop Suey is the English pronunciation of the Cantonese words tsap seui (tsa-sui in Mandarin), which means, "mixed pieces." It is a Chinese-American dish consisting of bits of meat or chicken, bean sprouts, onions, mushrooms, etc., cooked in its own juices and served with rice. Most Chinese are not fond of Chop Suey as it is mainly popular with non Chinese-Americans. According to the Chinese-Americans, its presence on a restaurant's menu is often times a harbinger of bad food to come . It is only served in Chinese restaurants that cater to American customers.
Chorizo (CHORE-ee-so)	A highly seasoned Mexican sausage that is made with ground pork and hot peppers. It is sold fresh or dried and usually encased in narrow casings, but also sold in bulk in some markets. Mexican chorizo is made with fresh pork, while the Spanish version uses smoked pork.

ADDENDUM	Dictionary	Food		**Choux Pastry (shoo)**	Choux derives from the French work "chou" which means "cabbage." It was used to describe layered pastry, as the layers were thought to resemble the leaves of cabbage. It is a kind of pastry made from smooth dough consisting of flour, water, salt, butter, eggs, and sometimes sugar. This pastry is used for cream puffs, eclairs, beignets, and other dishes requiring a puff pastry.
				Chowder	Chowder comes from the French word "cauldron," meaning a cooking kettle. Vegetables or fish stewed in a cauldron thus became know as chowder in English speaking nations (a corruption of the name of the pot or kettle in which they were cooked).
				Chow Mein	A Chinese-American dish consisting of stewed vegetables and meat with fried noodles. It comes from the Mandarin Chinese words ch'ao mien meaning "fried noodles." It is thought that this Chinese dish was brought to America by the Chinese laborers and cooks for the Transcontinental Railway in the 1850s.
				Chutney (CHUHT-nee)	The word comes from the Hindustani word chatni, which means "a hot, spicy condiment." Originally this word referred to a sweet and spicy preserve of fruit, vinegar, sugar, and spices that was used exclusively in Indian cooking. American chutneys are less spicy and very sweet. They are used more as jams or preserves. However, with the advent of "fusion cuisine" and with all culinary terms bandied about rather loosely these days, a chutney can be just about any topping or accompaniment, somewhat sweet, usually made with fruit and used the way we do salsas.
				Cilantro (SEE-lan-trow)	Cilantro is the Spanish word for coriander leaves. It is also sometimes called Chinese or Mexican parsley. Technically, coriander refers to the entire plant. It is a member of the carrot family. Chopped fresh leaves are widely used in Mexican and Tex-Mex cooking, where they are combined with chiles and added to salsas, guacamoles, and seasoned rice dishes. Most people either love it or hate it.
				Cincinnati Chili	The main differences between Cincinnati and Texas chili is that the Cincinnati Chili calls for some sweet spices and the way you start cooking the meat. The sauce has a thinner consistency that is more like a topping and is mixed with an unusual and secret blend of spices that includes cinnamon, chocolate, or cocoa, allspice, and Worcestershire sauce. Cincinnati Chili is truly the unofficial food of the city of Cincinnati, Ohio, and is the most chili-crazed city in the United States. Cincinnati prides itself on being a true chili capital with over 180 chili parlors.
				Cioppino (chuh-PEE-noh)	It is a fish stew that is considered San Francisco's signature dish. It is a descendant of the various regional fish soups and stews of Italian cooking. The best way to make Cioppino, is as you like it. It can by prepared with as many as a dozen kinds of fish and shellfish. It all depends on what the day's catch is like and what your own personal choice is. The origin of the word is something of a mystery and many historians believe that it is Italian-American for "chip in."
				Citron (SIHT-ron)	(1) Citron is a semi-tropical citrus fruit like a lemon, but larger and less acidic. It grows as an irregular, open-headed shrub or small tree with large, light green leaves. The flowers are purple on the outside and are followed by large, oblong or ellipsoid fruits. The peel is very thick and is rough and yellow on the outside and white inside. They were originally grown in Europe out of interest for its fragrant fruits, but later, the white pulp was used raw, being served as a salad or with fish.
				Citronella (sih-truh-NEHL-uh)	It is also known as lemongrass. It is a stiff tropical grass that resembles a large fibrous green onion. It is an essential herb in southeast Asian cooking. It adds a lemony flavor to dishes.
				Clotted Cream	Traditionally served with tea and scones in England. It is a 55% minimum milk fat product made by heating unpasturized milk to about 82 degrees C, holding them at this temperature for about an hour and then skimming off the yellow wrinkled cream crust that forms (until the cream separates and floats to the surface). It is also known as Devonshire cream. It will last up to four days if refrigerated in a tightly-sealed container.
				Club Sandwich	It is a sandwich with cooked chicken breast and bacon, along with juicy ripe tomatoes and crisp lettuce layered between two or three slices of toasted bread with mayonnaise.
				Cobb Salad	Typically a Cobb Salad consists of chopped chicken or turkey, bacon, hard cooked eggs, tomatoes, avocado, cheddar cheese, and lettuce. It is served with crumbled blue cheese and vinaigrette dressing. The original recipe for Cobb salad included avocado, celery, tomato, chives, watercress, hard-boiled eggs, chicken, bacon, and Roquefort cheese.
				Cobbler	(1) An iced drink made of wine or liqueur, sugar, and citrus fruit. Served in a Collins or highball glass garnished with fruit. (2) Cobblers are an American deep-dish fruit dessert or pie with a thick crust (usually a biscuit crust) and a fruit filling (such as peaches, apples, berries). Some versions are enclosed in the crust, while others have a drop-biscuit or crumb topping.
				Cochon De Lati	Translated from French to English, the word literally means, "pig in milk." To make this Cajun pig roast, use a suckling (young) pig to get the finest pork flavor. The Cajuns of southwest Louisiana have always enjoyed their pork, but consider a Cochon De Lait to be a special treat. Historically, men cooked the pig over an outdoor fire, while the women prepare other dishes inside the house. Many Cajuns consider the crackling skin the best part of the Cochon De Lait.
				Coffee Milk (kaw-fee milk)	A lot like chocolate milk but with coffee-flavored syrup. It is milk with sweet coffee syrup added (two tablespoons of coffee syrup to 8 ounces of milk). The drink is served either by the glass or the half-ping (in a waxed-cardboard carton). In 1993, after much political debate, it was made "The Official State Drink of Rhode Island." Rhode Island is the only place in the world where you can get this drink. If you travel more than ten miles from the state border, no one will know what you're talking about.
				Colcannon	Colcannon is a famous Irish dish using mashed potatoes and cabbage that is served in a fluffy pile with a well in the center filled with melted butter, so that you can dip each forkful into the butter before eating it. It gets its name from the old name "cole" for cabbage, which we still use in the term cole slaw or cabbage salad. In most Irish cookbooks, kale is used instead of cabbage. Also known as Kale Cannon or Kailkenny. In Scotland this dish is also known as Rumbledethumps. Traditionally eaten at Lughnasa or Samhain, the Irish version of Thanksgiving. Colcannon is a national Irish dish of sorts and it is traditional to put coins in the Colcannon (kids absolutely love this tradition).
				Coleslaw (kol-slaw)	A cold salad made with shredded cabbage mixed with mayonnaise as well as a variety of ingredients.
				Compote (KAHM-poht)	(1) Compote refers to a chilled dish of fresh or dried fruit that has been slowly cooked in sugar syrup, which may also contain alcohol or liqueur and sometimes spices. Slow cooking is important for the fruit to retain its shape. (2) Also called compotier. It refers to a deep, stemmed dish (usually silver or glass) used to hold fruit, nuts, or candy.
				Condensed Milk	Condensed Milk is pure cow's milk properly combined with unadulterated cane sugar. The waster content of the milk is evaporated.
				Confit (kon-FEE)	It is French term used to describe a way of preserving meat (usually pork, goose or duck). It is derived from an ancient method of preserving meat whereby it is salted and slowly cooked in its own fat. The meat or poultry is salted first and then slowly cooked in its own rendered fat. The resulting confit is then packed in crocks and sealed with more fat. Confit can be refrigerated up to 6 months. Confit d'oie and confit de canard are preserved goose and preserved duck, respectively. You can eat it cold, thinly sliced, in salads, or use it to add to hot dishes such as the French specialty "cassoulet".
				Consomme (kon-somay)	It is from the Latin word "consummare" meaning to "finish perfectly" and "raise to the highest point of achievement." Consomme is considered one of the finest of soups.It is a clear soup and it is essential to use stock made from raw meat, which has been clarified by the addition of beaten egg white and clean eggshells.

Consomme Diane -	It is made with game.
Consomme Amiral -	It is made with fish.
Consomme Madrilene -	It is a beef consomme with cubes of beef or chicken and vegetables julienne.
Banquet Consomme -	It contains vegetables julienne and smoked salmon.
Consomme Frappe -	Is an iced or chilled clear soup.

Fuel

CAS / CAS RN	A CAS Registry Number, also referred to as CASRN or CAS Number, is a unique numerical identifier assigned by the Chemical Abstracts Service (CAS) to every chemical substance described in the open scientific literature, including organic and inorganic compounds, minerals, isotopes, alloys and nonstructurable materials.

Gardening

Gear

Geography

Homesteading

Hunting

Antlers	The bony growths on a buck's head. They're called racks or horns too, but horns do not fall off; it's just a misnomer. Deer, elk, and moose have antlers.
Bag/Daily Limit	The legal number of animals of a certain species you can kill each day.
Bed	Where a deer actually lays down, they leave an oval depression in the grass or snow. Larger beds usually belong to bucks.
Bedding Area	A place where deer will rest and sleep during the day; usually this is found in dense thickets or places where they can easily hide.
Bleating	Does make a whiny bleat noise to communicate with each other and signal they are in estrous.
Blowing	Often following a "white flag", deer will snort loudly (i.e., "blow") to alert other deer about a threat.
Broadside	The most ethical shot at a deer is when they are standing perpendicular to you so you can see one entire side of their body. A broadside shot to the vitals is a quickly-killed deer.
Brow Tine	The first antler tine nearest to a buck's head.
Browsing	Deer are adapted to eat woody shrubs and herbaceous plants quickly by roughly tearing off large chunks and continuing on their walk.
Buck	A male deer.
Busted / Spooked	When deer or other game smell, see, or hear you, they will get nervous and/or leave the area quickly.
Button Back	A male fawn deer that only has little bumps for antlers in its first year. These are generally considered legal does because their antlers are less than 3 inches long and can be confused for does in the field.
Can Call	An accessory piece of hunting equipment, this call is typically in the shape or a small can and sounds like a doe bleating, which they use to communicate with other deer.
Doe	A female deer.
Estrous	When does are ready to mate, they are "in estrous", much like a dog is "in heat".
Fawn	A fawn is a deer that was born the spring of the same calendar year. Can be a newborn with spots or look like a small deer at 6 months old.
Feeding Area	A place where deer will eat during the night, whether that includes a corn field, food plot, young forest, or shrub patch.
Field Dressing	After shooting a deer, you need to remove the entrails quickly so the meat doesn't spoil. Also called "gutting".
Fork Buck / Forkhorn	A male deer with a forked tine on each side of its head, but no more than 4 points or tines.
Funnel	A narrow area where topography and/or habitat features cause deer to converge on a single trail. For example, where a forest is pinched by fields on each side.
Glassing	Using binoculars or a spotting scope to look for wild game from a good vantage point.
Grunt Tube	A tubular deer call that sounds like a buck grunting, which they typically do during the rut.
Grunting	Bucks make a low-pitched grunt at each other to signal aggression, especially during the breeding season (rut).
Gut Shot	The region of a deer that holds the stomach, intestines, liver, and various other organs. A gut shot is to be avoided as it is likely to slowly kill a deer, but it is extremely difficult to find them.
Harvest	A popular term in wildlife management circles, the act of killing or "taking" an animal. It's unpopular with many hunters due to the gardening analogy, whereas hunting is the act of taking a life.
Horns	A permanent bony protrusion from an animal's head. See the difference from "Antlers" above. Cows, sheep, goats, or antelope have horns.
Mast	The fruit or nuts of trees, including apples, pears, berries, grapes, acorns, walnuts, etc.

Mature	A deer is considered mature by most people when it reaches 3 1/2 years old.
Possession Limit	The legal number of animals of a certain species you can physically have in your possession (in the freezer, canned, etc.). This may be more than the daily bag limit.
Processing	The process of skinning, quartering, and cutting all the meat off of a deer carcass. Doing this yourself can be intimidating, but you know exactly how the meat is treated this way too.
Quartering / Butchering	The act of cutting the "quarters" off of a deer while processing/butchering it. The quarters include all four legs.
Quartering (Shot)	When a deer is slightly facing away from or towards you. Quartering away shots are great for bow hunters or gun hunters, but a quartering to shot should be avoided.
Rattling	A hunter uses two antlers to make it sound like bucks fighting, which can lure a mature buck into shooting range. Generally more useful in areas with little hunting pressure and lots of mature deer.
Rub	When a buck rubs its antlers against a tree to mark its territory, strengthen its neck, or remove its velvet, it scrapes the bark away. Commonly found in areas bucks like to hang out.
Ruminant	Like cows, deer quickly feed on plants while they can, and then lie down to chew their cud. This cud-chewing, combined with their four-chambered stomach, digests the food when they're in the safety of their bed.
Rut / Pre-Rut / Post-Rut	The rut is when deer enter the peak of their breeding season (i.e., they breed the most). The pre-rut includes the weeks leading up to the rut, while the post-rut includes the weeks after it.
Scent Drag	A piece of rope with a cloth at the end. The cloth is usually sprayed with a deer scent and drug through the woods behind a hunter to make it smell like a deer traveled the same path.
Scope	Magnifying optics usually mounted to the top of a rifle that allow you to make an accurate long-distance shot at an animal.
Scouting	The act of investigating a hunting property before you actually hunt it. A scouting trip helps you to find good hunting locations based off of wildlife sign.
Scrape	A scratched area on the ground (usually about 1-3 feet across) where a buck or doe leaves scent from its hooves and urinates into it to communicate to other deer in the area.
Shed / Shed Antler	As bucks enter late winter, the antlers on their head will fall off so they can start growing new ones in the spring.
Sign	The evidence left behind from animals, including tracks, trails, beds, rubs, scrapes, etc.
Spike Buck	A male deer with only one tine on each side of its head, forming a spike.
Stamp	Some wild game species (e.g., waterfowl, pheasants, etc.) may require you to purchase a special additional stamp. The proceeds from these stamps will generally support additional conservation efforts for that species.
Still-Hunting	Walking very slowly through the woods, trying to ambush an animal before they see/hear you.
Tag	In addition to your hunting license, you will have a field tag. This paper slip will contain basic harvest data about your animal, and serves to validate or fulfill your license.
Tines	The single bony extensions on an antler. Also called "points". For example, an 8-pointer would have 8 tines (4 on each antler).
Velvet	In the spring and summer, velvet is living tissue that covers the development of deer antlers, making it one of the fastest-growing tissue in the world. They usually shed this tissue before hunting season.
Venison	Meat from a deer is called venison.
Vitals	The chest cavity of a deer that holds the heart and lungs. A shot with a bow or rifle in the vitals will usually quickly kill a deer and is the most ethical shot.
White Flag	When white-tailed deer retreat, they raise their white tails to show a predator they were spotted. Not a good sign.

Hygiene

Adequate Hygiene	Level of hygiene sufficient for the prevention of public health risk.
Biohazard Bag	Bag used to secure biohazard waste that requires microbiological inactivation in an approved manner for final disposal. Such bags must be disposable and impervious to moisture and have sufficient strength to preclude tearing or bursting under normal conditions of usage and handling.
Cleaning	Removal of visible dirt or particles through mechanical action, normally undertaken on a routine and frequent basis. The cleaning process and some products used for cleaning also result in disinfection.
Disinfection	The procedure whereby measures are taken to control or kill infectious agents on a human or animal body, on a surface or in or on baggage, cargo, containers, conveyances and goods by direct exposure to chemical or physical agents.
Control Measures	Those steps in the drinking-water supply that directly affect drinking-water quality and that collectively ensure that drinking-water consistently meets health-based targets. They are activities and processes applied to prevent hazard occurrence.
Food Contact Surfaces	Surfaces of equipment and utensils with which food normally comes in contact. These include the areas of ice machines over the ice chute to the ice bins.
Food Handling Area	Any area where food is stored, processed, prepared or served.
Food Preparation Area	Any area where food is processed, cooked or prepared for service.
Food Service Area	Any area where food is presented to passengers or crew members (excluding individual cabin service).
Food Storage Area	Any area where food or food products are stored.
Food Transport Area	Any area through which unprepared or prepared food is transported during food preparation, storage and service operations (excluding individual cabin service).
Non-Food Contact Surfaces	All exposed surfaces, other than food contact or splash contact surfaces, of equipment located in food storage, preparation and service areas.
Non-Toxic Materials	Materials that, when used in the water distribution system, do not introduce harmful or injurious ingredients or substances into the water.

ADDENDUM | Dictionary | Hygiene

Sewage	Any liquid waste that contains animal or vegetable matter in suspension or solution, including liquids that contain chemicals in solution.
Splash Contact Surfaces	Surfaces that are subject to routine splash, spillage or other soiling during normal use.
Area Sampling	Collection and analysis of representative samples of air in common work areas to find out the concentrations of any contaminants that are present.
Contaminant	An unwanted substance (for example, radioactive, biological or chemical) that is likely to hurt the quality of the work environment. Chemicals that may be present in the form of dusts, fumes, gases or vapors are the most common workplace contaminants.
Hygiene Practices	A broad term for personal health practices that may reduce or prevent the exposure of a worker to chemical or biological substances. Hygiene practices include: not smoking, eating or drinking in the work area washing up before breaks and meals, removing contaminated clothing before leaving work, and keeping street clothes separate from contaminated work clothing.
Abrasion	The wearing away or cleaning by friction. Abrasion can also relate to the wearing away of a floor finish film by friction.
Abrasive	A product that works by abrasion. Products such as cleaners, polishes and pads may contain an abrasive.
Alcohols	Organic compounds that contain one or more hydroxyl groups (-OH functional groups) in each molecule. Alcohols used in cleaners include ethyl, methyl, propyl and butyl.
Aliphatic Solvents	These are sometimes referred to as paraffins. They are also referred to as straight chain or open chain solvents. Kerosene, Odorless Mineral Spirits and Mineral Seal Oil are examples of aliphatic solvents.
Ammonia	An alkaline gas composed of nitrogen and hydrogen. Aqueous solutions of with 5-10% ammonia are sold as household ammonia.
Build-Up	A heavy deposit of floor finish, wax, dirt and grime. It is caused by adding layer after layer of floor finish over dirt without deep scrubbing the old layers away first. These build-ups are frequently found along baseboards and corners.
Calcium Carbonate	An inorganic compound that occurs naturally as chalk and limestone. Its very slight solubility in water is a chief cause of "hardness" in water.
Caustic	Strong alkaline substance which irritates the skin.
Chlorinated Solvents	An organic solvent that contains chlorine atoms as part of the molecular structure. Examples include methylene chloride and trichloroethylene.
Chlorine Bleach	A group of strong oxidizing agents commonly sold in an approximately 5% solution of sodium hypochlorite. Care should be taken to never mix chlorine bleach with ammonia or hydrochloric acid.
Cleanser	A powdered or liquid cleaning product containing abrasives, surfactants and frequently a bleach.
Cloud Point	The temperature at which a surfactant becomes insoluble in water. This becomes important when designing detergents for use in hot water.
Coagulation	An irreversible process in which a number of emulsion droplets coalesce, leading to complete separation of the emulsion.
Defoamers	Substance used to reduce or eliminate foam.
Detergent	A washing and cleaning agent with a composition other than soap. Detergents unlike soaps are less sensitive to minerals in water.
Dispersing Agent	A material that reduces the cohesive attraction between like particles.
Dwell or Contact Time	Describes the time that a cleaning agent is left on a surface before rinsing.
Emulsification	The action of breaking up fats, oils and other soils into small particles which are then suspended in a solution.
Flocculation	A reversible process in which a number of emulsion droplets stick together to form a cluster which can be broken up by mechanical action restoring the emulsion to its original form.
Micelle	A spherical grouping of detergent molecules in water. Oils and greases dissolve in the hydrophobic center of the micelle.
Neutral Cleaner	A floor cleaner that has a pH that is compatible with the finish to be cleaned. Generally this means a pH of between 7-9. Higher pH floor cleaners can attack the floor finish and dull it.
Oxidation	To combine with oxygen. Slow oxidation is typified by the rusting of a metal.
Oxidizing Agent	A substance that accepts electrons in an oxidation-reduction reaction. A substance that causes the oxidation of a reactant molecule.
Phosphates	A substance that is added to a detergent to increase its water softening ability.
Porous	A surface that was many tiny openings. A porous surface will require more finish or sealer to fill and smooth out these openings.
Reagent	A substance used to start a chemical reaction. In the laboratory, hydrochloric acid, sulfuric acid and sodium hydroxide are reagents.
Saturated	Describes a solution that will not dissolve any more solute at a given temperature. Any more solute will remain as crystals.
Solvents	A liquid which dissolves another substance. Water is the most common solvent.
Surfactant	Substances which lower the surface tension of water. These surface-active agents modify the emulsifying, foaming, dispersing, spreading and wetting properties of a product.
Suspension	The process of a cleaning agent holding insoluble dirt particles in the cleaning solution and keeping them from redepositing on a clean floor.
Synergistic	Chemicals that when combined have a greater effect than the sum of the two independently.
Synthetic Detergents	These are sometimes called soapless detergents. They are typically made from by-products of refining crude oil. They do not form a scum in hard water and lather better than soaps.
Thinner	A liquid used to reduce the viscosity of a coating and that will evaporate before or during the cure of a film.
Titration	A procedure that uses a neutralization reaction to determine the normality (the number of equivalents per liter of solution) of an unknown acid or base solution.
Universal Solvent	Water is called the universal solvent because it dissolves both ionic compounds and polar molecular compounds. Water usually cannot dissolve nonpolar molecules.

Viscosity	The thickness of a liquid which determines pourability. Water has a viscosity of 1 centipoise. The resistance to flow is measured in relationship to water in centipoise.
Wetting Agent	A chemical which reduces surface tension of water, allowing it to spread more freely.

Knots

Bight	Any part of a rope between the ends. Also a curved section of a rope within a knot being tied.
Crossing Point	The place where ropes cross in the making of a loop.
Elbow	Two or more loops in close proximity to each other.
Loop	A bight becomes a loop when the two ropes cross. If the working end is crossed over the standing line, it is an overhand loop. It is an underhand loop if the working end runs under the standing part.
Working End	The active end being used to tie the knot.
Standing End	The end not being used in the tying of the knot. The rope part that is not being used is called the standing part.
UIAA	Union International des Associations d'Alpinisme

Language

Light

Zenith	The zenith is an imaginary point directly "above" a particular location, on the imaginary celestial sphere. "Above" means in the vertical direction opposite to the apparent gravitational force at that location. The opposite direction, i.e. the direction in which gravity pulls, is toward the nadir. The zenith is the "highest" point on the celestial sphere.

Boating

Adrift	Loose and out of control. Typically applied to a ship or vessel that has lost power and is unable to control its movement.
Aft	Any part of the ship closer to the stern than you currently are.
All Hands	The entire ship's crew to include all officers and enlisted.
Aye, Aye	Response acknowledging and understanding a command.
Bow	Front of the ship.
Below	Any deck beneath the one you are currently on.
Carry On	An order given to continue work or duties.
Cast Off	To throw off, to let go, to unfurl.
Colours	Raising and lowering of the National Ensign, the American flag and organization flags.
Fathom	Unit of measurement generally used for depth from sea level to sea floor.
General Quarters	Battle stations. Generally set when the ship is about to engage in battle or hostile activities.
Jettison	To throw or dispose of something over the side of ship.
Ladder	Also known as a ladder well. Much like civilian stairs however much steeper.
Leave	Vacation time nearly completely free unless an emergency recall occurs.
Shore Leave	Permission to leave the ship/base to enjoy non-work activities.
Mid-Watch	Tends to be the midnight to 0400 watch. Also known as "balls to four" due to military time equivalent 0000-0400.
Port Side	Left hand side of the ship.
Quarters	Generally the morning assembly of all hands for muster and accountability.
Starboard	Right hand side of the ship.
Stern	Rear of the ship.
Taps	Lights out, time to sleep.
Working Aloft	Working above the highest deck, generally performing maintenance on the ship's mast or antennas.
Sea Mine	A naval mine is a self-contained explosive device placed in water to damage or destroy surface ships or submarines.
Torpedo	A modern torpedo is a self-propelled weapon with an explosive warhead, launched above or below the water surface, propelled underwater towards a target, and designed to detonate either on contact with its target or in proximity to it.
Turret	A gun turret (or turret) is a location from which weapons can be fired that affords protection, visibility, and some cone of fire.
Aircraft Carrier	An aircraft carrier is a warship that serves as a seagoing airbase, equipped with a full-length flight deck and facilities for carrying, arming, deploying, and recovering aircraft.
Battleship	A battleship is a large armoured warship with a main battery consisting of large calibre guns.
Battlecruiser	The battlecruiser, or battle cruiser, was a type of capital ship of the first half of the 20th century. They were similar in size, cost, and armament to battleships, but they generally carried less armour in order to attain faster speeds.
Cruiser	A cruiser is a type of warship. The term has been in use for several hundred years, and has had different meanings throughout this period.
Destroyer	In naval terminology, a destroyer is a fast, manoeuvrable long-endurance warship intended to escort larger vessels in a fleet, convoy or battle group and defend them against smaller powerful short-range attackers.
Frigate	A frigate is any of several types of warship, the term having been used for ships of various sizes and roles over the last few centuries.
Hovercraft	A hovercraft, also known as an air-cushion vehicle or ACV, is a craft capable of travelling over land, water, mud, ice, and other surfaces.
Submarine	A submarine (or simply sub) is a watercraft capable of independent operation underwater. It differs from a submersible, which has more limited underwater capability.
Torpedo Boat	A torpedo boat is a relatively small and fast naval ship designed to carry torpedoes into battle.

Navigation

Adjustable Compass	A compass whose azimuth circle can be rotated relative to the lubber's line.
Azimuth Circle	A circular compass scale graduated in angular units: degrees, cardinal points, or other units, usually clockwise from north or 0°.
Bearing	The angular direction to a landmark.
Boxing Mark	A box, arrow, line, or other mark permanently fixed to point to the N or 0° index on a compass azimuth circle. The boxing mark is usually part of the capsule. To "box" a compass, align the compass needle or card with the boxing mark, north-to-north, or with N or 0° on the azimuth circle.
Capsule	A sealed transparent case which houses the compass needle, the azimuth circle, and the boxing mark. The capsule may be filled with liquid to amp needle or card swinging.
Card	An azimuth circle mounted on a compass needle. The card rotates relative to the lubber's line.
Course	Angular direction of travel.
Fix	The position indicated by the intersection of two or more lines of bearing.
Landmark	A recognizable real object in the terrain.
Lubber's Line	A line or mark on the compass body that points toward the direction of travel. Simple compasses may use north or 0° on the azimuth circle as a lubber's line. On sighting compasses the sight centreline is the lubber's line.
Magnetic Declination	Easterly or westerly angular difference between the direction to the earth's geometric and magnetic poles.
Magnetic Inclination	The vertical component of the earth's magnetic field which causes compasses needles to dip.
Map Object	A picture or symbol used on a map to represent a landmark or other object.
Needle	A magnetized pointer resting on a pivot in the capsule, free to rotate relative to the lubber's line and azimuth circle.
North - Grid North	The direction to the earth's geometric north pole along a meridian.
North - Magnetic North	The apparent direction to the earth's magnetic north pole, not usually indicated by a grid on maps. This net magnetic north comprises all the magnetic effects acting on your compass.
True North	The direction to the earth's geographic north pole, indicated in life approximately by Polaris; indicated on maps by DMS scales and tick marks along the map borders.
Orienteering Compass	An adjustable compass with special features that make it more convenient to use in the field with maps.
Orienting Lines	Visible lines in the capsule engraved parallel to the boxing mark; used as reference lines when marking angles on the map with an orienting compass.
Sighting Compass	A compass with a mirror or peep sight aligned with the lubber's line.
Simple Compass	A compass with the lubber's line fixed at north or 0°, and a fixed azimuth circle.
Magnet	A body which has the property of at. tracting iron or other magnets. Its molecules are aligned.
Magnetic North	The direction sought by the north pole end of a magnet, such as a magnetic needle, in a horizontal position. It is near the geographic north pole of the Earth.
Magnetic South	The opposite direction from magnetic north towards which the south pole end of a magnet, such as a magnetic needle, is attracted when in a horizontal position. It is near the geographic south pole of the Earth.
Magnetism	The property inherent in the molecules of certain substances, such as iron, to become magnetized, thus making the substance into a magnet.
Natural Magnet	A magnet which occurs in nature, such as a lodestone. Its property of magnetism has been imparted by the magnetic effects of the Earth.

Nutrition

RDI	Recommended Dietary Intake. The Recommended Daily Intake is the daily intake level of a nutrient that is considered to be sufficient to meet the requirements of 97–98% of healthy individuals in every demographic in the United States.

Offence

Personal Disasters

Plants

Medicinal Uses

Acrid	Causes heat and irritation when applied to the skin.
Adaptogen	Helps the body 'rise' to normal stress situations, thus preventing the many chronic degenerative diseases.
Alterative	Causes a gradual beneficial change in the body, usually through improved nutrition and elimination, without having any marked specific action.
Anaesthetic	Numbs the feeling in a local or general area of the body.
Analgesic	Relieves pain.
Anaphrodisiac	Reduces sexual desire.
Anodyne	Relieves pain, it is milder than an analgesic.
Antacid	Counters excess acidity in the stomach.
Anthelmintic	Expels parasites from the gut.
Antiaphonic	Restores the voice.
Antiarthritic	Treats arthritis.
Antiasthmatic	Treats asthma.
Antibacterial	Kills bacteria.
Antibilious	Corrects the secretions of bile.
Antibiotic	An agent that inhibits or destroys a living organism. It usually refers to bacteria or other micro-organisms and is probably synonymous with Antibacterial.
Anticholesterolemic	Prevents the build up of cholesterol.
Anticoagulant	Removes blood clots.
Antidandruff	Treats dandruff.
Antidermatosic	Prevents or cures skin complaints.
Antidote	Counters poisoning.
Antiecchymotic	Prevents or treats bruising.
Antiemetic	Prevents vomiting.
Antifungal	An agent that inhibits or destroys fungi. Used in the treatment of various fungal problems such as candida.
Antihaemorrhoidal	Treats haemorrhoids (piles). This would probably be best added to another heading.
Antihalitosis	Reduces bad breath.
Antihydrotic	Reduces perspiration.
Antiinflammatory	Reduces inflammation of joints, injuries etc.
Antiperiodic	Counteracts recurring illnesses such as malaria.
Antiphlogistic	Reduces inflammation.
Antipruritic	Treats itching of the skin.
Antipyretic	Treats fevers.
Antirheumatic	Treats rheumatism.
Antipanic	Reduces panic and anxiety issues.
Antipsoriatic	Applied on the skins surface locally to treat psoriasis.
Antiseborrheic	Effective in seborrheic dermatitis (dandruff).
Antiarrhythmic	Suppresses abnormal rhythms of the heart (cardiac arrhythmias).
Antidepressant	Helps relieve symptoms of depression, social anxiety disorder and dysthymia.
Antidiarrhoeal	Provides symptomatic relief for diarrhoea.
Anticonvulsant	Used in the treatment of epileptic seizures.
Antineoplastics	Used in the treatment of metastatic colon cancer.
Appetite Stimulants	Appetite stimulants can help you eat more food and reduce your risk for malnutrition.
Appetite Suppressant	Can target both hunger and satiety to help you eat less.
Antianxiety	Is a medication or other intervention that inhibits anxiety.
Antiscorbutic	A plant rich in vitamin C that is used to counteract scurvy.
Antiscrophulatic	Counteracts scrofula. (TB, especially of the lymph glands)
Antiseptic	Preventing sepsis, decay or putrefaction, it destroys or arrests the growth of micro-organisms.
Antispasmodic	Relaxes muscular spasms and cramps, calming nervous irritation.
Antitumor	Preventing, or effective against, tumors, it is used in the treatment of cancer. Probably synonymous with Cytotoxic.
Antitussive	Prevents or relieves coughing.
Antivinous	Treats addiction to alcohol.
Antiviral	Treats virus diseases.
Aperient	A mild laxative.
Aphrodisiac	Increases the sexual appetite.
Appetizer	Improves the appetite.
Aromatherapy	Plants whose essential oils are used in Aromatherapy.
Aromatic	Having an agreeable odour and stimulant qualities.
Astringent	Produces contraction in living tissue, reducing the flow of secretions and discharges of blood, mucus, diarrhoea etc.
Bach	Plants used in the Bach flower remedies.
Balsamic	A healing and soothing agent.
Birthing Aid	Used in facilitating birth, but not just to cause uterine contrctions.

ADDENDUM Dictionary Plants Medicinal Uses

Bitter	Increases the appetite and stimulates digestion by acting on the mucous membranes of the mouth. Also increases the flow of bile, stimulates repair of the gut wall lining and regulates the secretion of insulin and glucogen.
Blood Purifier	Purifies the blood.
Blood Tonic	Support your immune defences and improve digestive function.
Cancer	Used in the treatment of cancer.
Cardiac	Used in the treatment of heart problems.
Cardiotonic	A tonic for the heart.
Carminative	Reduces flatulence and expels gas from the intestines.
Cathartic	A strong laxative but less violent than a purgative.
Cholagogue	Increases the flow of bile and its discharge from the body.
Contraceptive	Prevents fertilization occurring in females.
Cytostatic	Slows or controls the growth of tumours.
Cytotoxic	Destroys body cells. Used in the treatment of diseases such as cancer, where it is targeted against the cancer cells.
Decongestant	Removes phlegm and mucous, especially from the respiratory system.
Demulcent	Soothes, lubricates and softens irritated tissues, especially the mucous membranes.
Deobstruent	Clears obstructions from the natural ducts of the body.
Deodorant	Masks smells.
Depurative	Eliminates toxins and purifies the system, especially the blood.
Detergent	A cleansing agent, used on wounds etc. It removes dead and diseased matter.
Diaphoretic	Induces perspiration.
Digestive	Aids digestion.
Disinfectant	Used for cleaning wounds.
Diuretic	Acts on the kidneys, promoting the flow of urine.
Emetic	Induces vomiting.
Emmenagogue	Promotes or increases the menstrual flow. In early stages of pregnancy it can induce an abortion.
Emollient	Softens the skin, causing warmth and moisture.
Enuresis	Treats bed wetting.
Errhine	Produces sneezing.
Expectorant	Clears phlegm from the chest by inducing coughing.
Febrifuge	Reduces fevers.
Foot Care	Plants that are used in various ways to treat foot problems.
Galactofuge	Stops or reduces the flow of milk in a nursing mother.
Galactogogue	Promotes the flow of milk in a nursing mother.
Haemolytic	Breaks down red blood corpuscles to separate haemoglobin.
Haemostatic	Controls internal bleeding.
Hallucinogenic	Causes the mind to hallucinate.
Hepatic	Acts on the liver (for better or worse!).
Homeopathy	A plant used in homeopathic treatments.
Hydrogogue	A purgative that causes an abundant watery discharge.
Hypnotic	Induces sleep.
Hypoglycaemic	Reduces the levels of sugar in the blood.
Hypotensive	Reduces blood pressure, it is used in the treatment of high blood pressure.
Infertility	Used in treating problems of human fertility.
Irritant	Causes irritation or abnormal sensitivity in living tissue.
Kidney	Used in the treatment of kidney diseases.
Laxative	Stimulates bowel movements in a fairly gentle manner.
Lenitive	Soothing, palliative.
Lithontripic	Removes stones from the kidney, bladder etc.
Miscellany	Various medicinal actions that need more clarification.
Mouthwash	Treats problems such as mouth ulcers.
Mydriatic	Dilates the pupils of the eyes.
Narcotic	Relieves pain, induces drowsiness and gives a sense of well-being.
Nervine	Stimulates and calms the nerves.
Nutritive	A food for convalescents to help restore strength.
Odontalgic	Treats toothache (temporary measure only) and other problems of the teeth and gums.
Ophthalmic	Treats eye complaints.
Oxytoxic	Hastens parturition and stimulates uterine contractions. See also birthing aids.
Parasiticide	Treats external parasites such as ringworm.
Pectoral	Relieves respiratory diseases, a remedy for chest diseases.
Plaster	Used in the treatment of broken bones.
Poultice	A moist, usually warm or hot, mass of plant material applied to the skin in the treatment of burns etc.
Purgative	A drastic laxative causing a cleansing or watery evacuation of the bowels, usually with a griping pain.
Refrigerant	Cools the body.
Resolvent	Breaks down tumours. This might be placed under antitumor.
Restorative	Restores consciousness or normal physiological activity.
Rubefacient	A counter-irritant and external stimulant, it produces inflammation and redness of the skin.
Salve	Soothes and heals damaged skin.
Sedative	Gently calms, reducing nervousness, distress and irritation.
Sialagogue	Stimulates the secretion of saliva.
Skin	Plants used in miscellaneous treatments for the skin.
Sternutatory	Promotes sneezing and nasal discharges.

Stimulant	Excites or quickens activity of the physiological processes. Faster acting than a tonic but differing from a narcotic in that it does not give a false sense of well-being.
Stings	Used in the treatment of stings and insect bites.
Stomachic	Aids and improves the action of the stomach.
Styptic	An astringent that stops bleeding by contracting the blood vessels.
TB	Plants used in the treatment of tuberculosis.
Tonic	Improves general health. Slower acting than a stimulant, it brings steady improvement.
Uterine Tonic	A tonic for the uterus. See also oxytoxic.
Vasoconstrictor	Narrows the blood vessels, thereby increasing blood pressure.
Vasodilator	Widens the blood vessels, thereby reducing blood pressure.
VD	Used in the treatment of venereal disease.
Vermifuge	Expels and kills internal parasites.
Vesicant	A blistering agent.
Vulnerary	Promotes the healing of wounds.
Warts	Used in the treatment of warts, corns etc.
Women's Complaints	A very vague title, it deals with a miscellany of problems peculiar to the female sex.
Antiflatulent	Alleviation or prevention of excessive intestinal gas.
Antihistamine	Benadryl helps relieve runny nose, sneezing, itchy or watery eyes, and nose or throat itching.

Other Uses

Adhesive	Glues.
Alcohol	Used for fuel etc. (this is wood alcohol, it is not the sort that can be drunk.
Baby Care	Various plants that can be used in place of items such as nappies.
Basketry	Plant used in making baskets and other items such as chairs. Includes plants that are only used as an ornamental addition.
Beads	Used as necklaces etc.
Bedding	Used as a lining for sleeping on or putting fruits etc on.
Besom	A type of broom.
Biomass	Provides a large quantity of plant material that can be converted into fuel etc.
Blotting Paper	Plant that can be used to make blotting paper.
Bottles	Plants that can be used as bottles.
Broom	Used for sweeping the floor etc.
Brush	Used for cleaning clothes, as a paintbrush etc.
Buttons	Plants that can be used as buttons. Not including making buttons from wood.
Charcoal	Used for fuel, drawing, deodorant, filter, fertilizer etc.
Cleanser	For various materials. Perhaps best included under separate headings.
Compost	Plants used for activating compost heaps, providing biomass for composting, using as instant compost etc.
Containers	Plants, such as gourds, that can be used as containers. Does not include baskets or containers made from wood.
Cork	Including any plants used as a cork substitute. Cork is used for insulation (sound or heat), fire-retardant, bottle stops etc.
Cosmetic	Used to improve the physical appearance of a person.
Cotton Wool	Plants that can be used as substitutes for cotton wool.
Deodorant	A pleasant smelling plant that is used on the body to mask the human smell.
Disinfectant	Plants used for disinfecting.
Dye	Plants that provide dyes.
Essential	Essential oils that are used in perfumery, medicines, paint solvents, insect repellents etc.
Fencing	Plants that can be used for fencing.
Fertilizer	Provides a concentrated solid plant food.
Fibre	Used for making cloth, rope, paper etc.
Filter	Used to strain out particles from liquids.
Fire Retardant	Plants that do not easily burn and can be used in barrier plantings to limit the spread of forest fires.
Friction Sticks	Used for starting fires when there are no matches.
Fruit Ripening	Substances that promote the premature or rapid ripening of fruits.
Fuel	Usually wood, plant materials that have been mentioned as being a good fuel.
Fungicide	Arrests the growth of, or kills, fungi.
Furniture	A few miscellaneous uses that do not fit easily into other headings.
Green Manure	Fast-growing plants that can be used to increase the fertility of the soil.
Gum	Gums have a wide range of uses, especially as stabilizers, emulsifiers, thickening agents, adhesives etc.
Hair	Plants used as hair shampoos, tonics, to treat balding etc.
Hedge	Plants that can be grown as hedges.
Herbicide	Plants or plant extracts that can inhibit the growth of other plants.
Incense	Aromatic plants that can be burnt to impart a pleasant smell, repel insects and disinfect closed areas.
Ink	Plants that can be used as an ink.
Insecticide	Kills insects.
Insulation	Providing insulation against extremes of temperature, sound or electricity.
Kindling	Plant material that burns easily and can be used for starting fires.
Lacquer	A type of varnish.
Latex	A source of rubber.
Leather	Substitutes, that is.
Lighting	Plants that can be used as torches etc. See also Oil and Wax.
Lining	Used for lining boxes, baskets etc so that fragile items can be more safely carried in them.
Liquid Feed	Plants that can be used to make a liquid fertilizer.
Litmus	Used for testing whether a substance is acid or alkaline.
Miscellany	A rag-bag of items that are difficult to categorise.
Mordant	Used for making a dye more permanent, it also affects the colour of the dye.

Mulch	Used for covering the ground to conserve the nutrients in the soil.
Musical	Specific mention of plants used as musical instruments. Does not include the various woods that can be used for making musical instruments.
Nails	A few woods are tough enough to be used in place of metal nails in certain circumstances.
Needles	Used for sewing, darning etc.
Oil	Vegetable oils have many uses, as lubricants, lighting, soap and paint making, waterproofing etc. This does not include the edible oils unless they are also mentioned as having other uses.
Packing	Used as a filler in boxes etc in order to protect the contents.
Paint	Plants used directly as a paint. Does not include oil plants and dyes that can be used as ingredients in paints.
Paper	Related to the entry for Fibre, these plants have been specifically mentioned for paper making.
Parasiticide	Kills external body parasites such as hair lice.
Pectin	A substance that is used to thicken jams etc and as a culture medium in laboratories.
Pencil	A couple of plants especially mentioned for making the tubes that pencil leads fit into.
Pins	Used as needles and pins in sewing etc. Also used to lance boils, extract splinters from the skin etc.
Pioneer	Plants, usually trees and shrubs, that can be used to reforest land.
Pipes	For carrying water etc.
Pitch	Used for waterproofing, in paints etc.
Plant Breeding	Used in producing new species of plants or improved varieties.
Plant Support	Usually bamboos, used as canes in the garden for holding up plants.
Plaster	Used for covering walls.
Polish	Plants used to give a shine to metals, wood etc.
Pollution	Plants used to combat pollution.
Potash	Used for making glass, soap and as a fertilizer.
Pot-Pourri	Aromatic plants used to impart a pleasant smell to an area.
Preservative	For food, or for treating wood, ropes etc.
Raffia	A substitute for that material.
Repellent	Plants that are said to deter but not necessarily kill various mammals, birds, insects etc.
Resin	Used in perfumery, medicines, paints, soap making etc. This also includes turpentine, which is extracted from many resins and used as a preservative, water proofer etc.
Roofing	Used to give a waterproof roof to buildings. See also Thatching.
Rooting Hormone	Substances that can be used to promote the production of roots in plant cuttings.
Rootstock	Plants used as the rootstock for grafting scions onto.
Rust	Plants that can be used to prevent or treat rust.
Sandpaper	Plants used to smooth rough wooden surfaces by means of abrasion.
Scourer	Used for cleaning pots, pans, plates etc.
Shelterbelt	Wind resistant plants than can be grown to provide shelter in the garden etc.
Size	Used on materials, paper etc to give a surface that will take ink, dyes etc.
Soap	Plants used directly as a soap substitute.
Soap Making	Plants used as an ingredient in making soaps. Does not include the essential oils, dyes and oils that are also used in making soap.
Soil Conditioner	Plants grown to improve the structure of the soil. See also Green manures.
Soil Reclamation	Plants that can be grown in such circumstances an the spoil tips of mines in order to restore fertility.
Soil Stabilization	Plants that can be grown in places such as sand dunes in order to prevent erosion by wind, water or other agents.
Starch	Used as a fabric stiffener.
Straw	For drinking with.
Strewing	Plants, usually aromatic, that are strewn on the floor to give a nice smell, repel insects etc.
String	Plants that can be used as they are as a temporary string or can be easily made into a string. See also Fibre.
Stuffing	Used in making soft toys, mattresses, pillows etc.
Tannin	An astringent substance obtained from plants, it is used medicinally, as a dye and mordant, stabilizer in pesticide etc.
Teeth	Plants used to clean and care for the teeth.
Thatching	Used for making thatched roofs.
Tinder	Used for starting fires. See also Kindling.
Varnish	Plants that can be used as a varnish without any special treatment. Does not include varnishes made from oils etc.
Waterproofing	Does what it says. See also Pitch and Oil.
Wax	Used for making candles etc.
Waxed Paper	Substitutes that is.
Weather Forecasting	A few plants that are supposed to help us forecast the weather.
Weather Protection	Plants that can be used to give the body protection from severe weather.
Weaving	Items such as grass and palm leaves that are woven together for making mats, baskets etc. See also Basket making and Fibre.
Wick	Used as a wick for candles, lamps etc.
Wood	A list of the trees and shrubs that are noted for having useful wood.

Population

Preparedness

Alpha Strategy	The practice of storing extra consumable items, as a hedge against inflation, and for use in barter and charity. Coined by John Pugsley.
BO	Bug Out
BI	Bug In

ADDENDUM | Dictionary | Preparedness

BOB	Bug-out bag
BOL	Bug-out location
BOV	Bug-out vehicle
C.M.E	Coronal Mass Ejection
EDC	Everyday carry
E.M.P	Electromagnetic Pulse
EOTW	End of the world
EROL	Excessive rule of law. Describes a situation where a government becomes oppressive and uses its powers and laws to control citizens.
G.O.O.D.	Get out of Dodge (city). Fleeing urban areas in the event of a disaster. Coined by James Wesley Rawles.
I.N.C.H.	I'm Never Coming Home bag. Is a pack that has everything you need to walk out into the woods and never return to society.
Pollyanna or Polly	Someone who is in denial about the disruption that might be caused by the advent of a large scale disaster.
Prepper	A synonym for survivalist that came into common usage during the early 2000s. Used interchangeably with survivalist much as retreater was in the 1970s. Refers to one who is prepared or making preparations.
SHTF	S*** (or Stuff) hits the fan.
TEOTWAWKI	The end of the world as we know it
YOYO	You're on your own
M.R.E.	Meal Ready to Eat
I.F.A.K.	Individual First Aid Kit
J.I.C.	Just in case
WROL	Without rule of law. Describes a potential lawless state of society.
Sheeple	Sheeple refers to people who always follow the crowd and are mostly unable to think for themselves.
Grid Down	Means the power grid has gone down, likely as a result of a CME or EMP.
#10 can	Specially formulated for long term food storage, a #10 can is approximately 7 x 6-1/4 inches. The specification refers to the can's physical size and does not measure the can's contents, which may vary. A freeze dried pasta dish might contain 2 lbs. of food equivalent to 26-30 servings.
#2.5 can	2.5 can is about the size of a classic baking powder can. It's roughly 1/4 the size of a #10 can. Future Essentials offers a variety of #2.5 cans of freeze dried foods that are around .10 ounces.
Berkey	A "Big Berkey" water filtration system is a name brand for a popular gravity fed water filtration system that looks a bit like a coffee urn. A berkey can remove fluoride and other toxins. A Berkey is sufficient for everyday use and for filtering raw water from a lake or stream.
Bug Out	To bug out is to bail out of the current location of uncertain circumstance and potential danger and head to safer a territory. See also Bug Out Bag. Conversely, "bugging in" is hunkering down and staying at home in hiding.
Bug In	Bugging in means to stay at a specific current location until it is safer to move out. Although, it depends on the kind of SHTF situation, when in crises, bugging in, alongside bugging out, is among the first actions preppers consider.
Bug Out Bag	A bug out bag contains life essential gear pre-packed (usually in a backpack) in which a Prepper will use to escape. Included at minimum is a 72-hour supply of food and water per person.
MAG	Mutual Aid Group which consists of people who meet to discuss ideas, plans and strategies on emergencies in that particular area.
Peak Oil	Peak Oil is term used to describe a period in which the peak of the extraction of oil is reached, and what follows is a steady decline, until there is no more oil to be consumed. It follows a basic path; an observed rise in the aggregate production rate of oil, and then there is the period where the rise gradually climbs to a peak period, and after that there is a gradual fall into depletion.
P.E.R.K	This is an acronym for Personal Emergency relocation kit. This is a variant of a BOB that is used for an emergency relocation, maybe a retreat from imminent danger. Although preppers usually carry about E.D.C which includes things needed in day to day activities, bugged out Bags (See BOB above), and Personal Survival Kit (See PSK below), PERK is set of items that are needed for an emergency retreat.
PSK	This is an acronym that means Personal Survival Kit. It involves items needed to survive in harsh conditions.
SOL	This is an acronym that means Sh** out of luck. It is used to describe a helpless situation, and it is a variation of the phrase "out of luck".
BSTS	Better safe than sorry
BUG	Backup Gun
CCW	Concealed Carry Weapon
EOD	End of Days
EOTW	End of the world
FAK	First Aid Kit
GHB	Get Home Bag
HEMP	High Altitude Electromagnetic Pulse
JIC	Just In Case
NBC	Nuclear Biological Chemical
TPTB	The Powers That Be
YOYO	You're On Your Own
Big Berkey	A family water filtration system that can remove harmful bacteria and toxins from water
Doomer	Somebody who believes disaster is coming and chaos will ensue. These are hardcore preppers.
Survival Cache	A collection of survival items that you bury or hide at a location away from your home; the survival cache would ideally be buried in between your house and your bug out location so you can resupply yourself en route.
Faraday Cage	An improvised device that can shield the electronic items inside from an EMP attack or solar flare.
Two is One, One is None	When your life is on the line, you live by Murphy's Law (whatever can go wrong, will go wrong). That means a crucial piece of survival gear is going to break, so always have a second piece in case the first one fails.

Rendezvous Point	A pre-determined location where you meet up with your survival group before continuing to evacuate to your designated bug out location.
Rule of Threes	You can live for three minutes without oxygen, three hours without shelter in harsh environments, three days without water, and three weeks without food.
Off-Grid	Going off-grid is a lifestyle choice to live without electricity to be self reliant without any help from the outside. Many preppers choose to set up a homestead or compound without electricity, and complete with food and water sources to live a self-sufficient lifestyle.
Grid Down	A "Grid down" situation could be a simple blackout, or something more ominous as an Electro-Magnetic Pulse where civilization could take months or years to recover.
Molon Labe	A classic term used by patriots, Molon labe , means "Come and take them [my guns]." An expression of defiance, preppers use the Greek phrase to assert their Second Amendment rights. It's a declaration of warning to anyone who thinks they could confiscate the guns.
SCAR (Bag)	A term I coined meaning "Survival Comforts And Redundancies". This is a themed bag packed with preparedness gear that you don't necessarily need but will make your journey much easier. An example being a "barter" bag which only contains items you will trade, but can be abandoned if you lack the space in your vehicle.

Psychology

Recipes

Tsp	A Teaspoon or 4.9ml
Tbsp	A Tablespoon or 14.7ml
Pinch	Between 1/16 and 1/8 of a teaspoon
Bunch	4-7

Religion

Shelter

Shelter

Construction

Ant cap (ant capping or termite shield)	A metal shield, usually made of galvanised iron, that is placed on top of a wall, pier or stump supporting timber members. Ant caps extend on all open sides and are turned down at 45 degrees to expose and delay the movement of termites (white ants) from the soil to timber portions of a building.
Architrave (cover mould or door/window lining)	Moulding surrounding a door or window opening to cover the joint between the frame and the wall finish.
Baluster	A small post, often turned or decorated, used to support a handrail or fill the space below a handrail.
Balustrade	A series of balusters supporting stair handrail, landing, platform or bridge. They are also used as the collective name for the entire framed enclosure guarding the side of a stair, landing or platform.
Barge / Gable Boards	Sloping boards along a gable covering the ends of roof timbers and protecting them from rain. Old barge boards can be scallop shaped or otherwise decorated.
Batten	Timber member of small, rectangular cross-section. Sometimes used to screen the undercroft area.
Box Gutter	A gutter often with both sides built along the roof slope. Used in valleys or behind parapets.
Bearer	Sub-floor structural timber member supporting floor joists.
Cap (Capping)	Uppermost part on top of a piece of work, often used to provide a cover (ie. ridge capping).
Chimney Breast	Wall of the chimney that projects into the room and contains the fireplace and flues.
Cornice	Externally - overhanging moulding at the top of a wall to deflect dripping. Internally - plastered moulding covering the joint between the wall and ceiling.
Dado	Finishing of the lower part of an interior wall from skirting to waist height, usually in a darker colour then the rest of the wall.
Damp-Proof Course	Impermeable barrier just above ground level at the base of the wall to prevent rising damp. Modern damp-proof courses are generally made from 0.5 millimetre thick, black, polyethylene sheeting. One of the oldest types of damp-proof courses is made up of tar and sand. Another type of impermeable barrier that was traditionally used was glazed hard-burnt ceramic, similar in size and shape to bricks.
Door Furniture	Metal accessories for a door, including hinges, handles, locks, bolts, latches and escutcheons (a metal plate surrounding the keyhole, sometimes covered by a metal key drop for protection).
Dormer	Vertical window through a sloping roof, usually provided with its own pitched roof.
Drip Moulding	A groove or projection under an overhanging edge designed to throw water off at the outer edge so it does not flow back to the building.
Eaves	Lower edge of a roof which projects beyond the wall as an overhang.
Fanlight	Glazed opening over the door but within the doorframe.
Fascia Board	Board set on edge, fixed to the rafter ends, wall plate or wall to carry the gutter under the eaves.
Flashing	Strip of impervious material, usually flexible metal (such as galvanised iron, lead or copper) used to cover a joint where water could otherwise penetrate.

ADDENDUM | Dictionary | Shelter | Construction

Fretwork	Wood cut into decorative patterns (with a fret or jigsaw).
Gable	Triangular part of the end wall of a building with a sloping roof. A roof with a gable at one or both ends.
Hood (Window Hood)	Protecting and projecting element over the outside of an opening to throw off water.
Joist	Wooden or steel beam supporting a floor (floor joist) or ceiling (ceiling joist). Steel beam sections are generally called rolled steel joists (RSJs).
Mortar	Mix of sand, lime and sometimes cement used for rendering, pointing or laying bricks or stone.
Mullion	Vertical dividing member of a frame between door or window lights.
Parapet	Low wall guarding the edge of a roof, bridge, balcony, etc or part of a wall that extends above the roof.
Pediment	Gable-shaped, decorative feature above a parapet, portico, doors, windows, etc.
Pointing	Raking out mortar joints and pressing into them a surface mortar to finish a masonry wall.
Quoins	Dressed stones at the corners of buildings, usually laid so that their faces are alternately large and small. Originates from the French word 'coin' (corner)
Rafter	One of the sloping pieces of timber forming the roof framework and supporting the roof covering.
Rainwater Head (Rainwater Sump)	Funnel or box-shaped rainwater fitting for collecting and discharging roof water from a gutter into a downpipe.
S-trap	A trap in which the outlet leg is vertical and parallel with the inlet leg.
Sarking (Sarking Membrane)	Pliable, water-resistant membrane located beneath the roof covering or external wall cladding to collect and discharge water that may penetrate. often combined with reflective foil to provide thermal insulation benefits.
Sill	Lowest horizontal member at the bottom of a window or door frame.
Sash	Glass-fitted framed window unit which can be moved by pivoting or sliding, can be divided into smaller panes and is identified as top and bottom sash in a double-hung window.
String Course	Decorative, usually projecting, thin horizontal course of brick or stone, often continuing the line of the masonry window sills.
Threshold	Step or sill of timber or other material at the foot of an external door.
Transom	Horizontal dividing member of a frame between window lights or separating a door from a fanlight above.
Truss	Framework of timbers or metal bars, usually based on a series of triangles to create a rigid beam to the roof or span a space or form a bracket.
Ventilator	An implement for ventilating a roof to allow hot air to escape.
Wall Plate	Timber laid longitudinally on top of the wall where ends of rafters are placed.
Weep Hole	Small drain hole for water used to drain water collecting behind retaining walls and prevent hydrostatic pressure developing.
Window Furniture	Metal accessories for a window which include hinges, locks, stay bars (to hold casement windows in an open position) etc.
Accessory Dwelling Unit (ADU)	A self-contained apartment that is either attached to a principal dwelling or in a separate structure on the same property. Typically the principal dwelling is an owner-occupied single family house. Sometimes called an "in law" apartment.
Affordable Housing	Housing for someone earning less than 80% of the Area Median Income that they can afford. Housing is considered affordable if you spend less than 30% of your income on housing (for homeownership this is mortgage principal, interest, taxes, insurance and any mandatory association fees).
Cluster Development	Building homes on smaller lots so the same number of homes is clustered on a smaller portion of the total available land. The remaining land, which would have been allocated to individual home sites, is now converted into protected open space and shared by the residents of the subdivision and possibly the entire community. The main objective of cluster development is to allow residential, or even commercial, development while still protecting the area's environmental features, allowing for more open space, and protecting farmland and the character of rural communities.
Cohousing	Cohousing is an intentional community of private homes clustered around shared space. Each attached or single family home has traditional amenities, including a private kitchen. Shared spaces typically feature a common house, which may include a large kitchen and dining area, laundry, and recreational spaces. Shared outdoor space may include parking, walkways, open space, and gardens. Neighbors also share resources like tools and lawnmowers.
Community Land Trust	A model for affordable housing whereby a community-based non-profit owns land and leases it to homeowners with a 99 year renewable lease. This increases access to land and removes the land from speculation.
Compact Development	Aims for a more efficient use of land through higher-density planning. It can be applied in new urban development as well as redevelopment projects such as infill or brownfield development. Benefits of compact development include: reducing sprawl; reducing dependency on private car use; creating walkable environments; increasing economic efficiency in delivering basic urban services.
Cottage Housing	Is a new model of clustered single family housing that provides a transition between single family housing neighborhoods and higher density areas, creating a development pattern that maximizes land values, reduces infrastructure costs and provides housing next to services.
Density Bonuses	A zoning tool that permits developers to build more housing units, taller buildings, or more floor space than normally allowed, in exchange for provision of a defined public benefit, such as a specified number or percentage of affordable units included in the development.
Home Energy Rating System (HERS) Rater	Someone who analyzes the energy use of your planned building project before construction and then inspects and tests the home to see that it meets energy efficiency standards.
Inclusionary Zoning	A tool that can be used by municipalities to ensure adequate affordable housing is included in the normal course of real estate development. It requires a portion of the housing units in certain real estate developments to be reserved as affordable to low- and moderate-income households.
Infill Development	Building in areas that already have significant development vs. clearing natural spaces for construction. For small homes, this may mean looking for "back yards" or empty lots in existing neighborhoods big enough to create a new building lot or an ADU.
Manufactured Homes	A manufactured home is any home factory-built in the U.S. to the HUD Title 6 construction standards (commonly known as 'the HUD-code'). The HUD-code took effect June 15, 1976. A manufactured home is built on a permanent chassis to ensure transportability. However, typically a manufactured home is not moved from its initial installed site.
Modular Homes	A modular home is any home factory-built to a local state code. A modular home can be built as an "on-frame" or "off-frame" modular. On-frame will be built on a permanent chassis, whereas, the off-frame modular will be built with removal of the chassis frame in mind. An off-frame modular will usually require additional cranes to assist with home placement. Modular homes are, more often than not, attached to private land.

Mobile Home	A mobile home is a factory-built home that is 1) built before June 15, 1976, and 2) not built to a uniform building code.
Tiny House Movement	It is a social movement where people are choosing to downsize the space they live in. The typical American home is around 2,600 square feet, whereas the typical small or tiny house is between 100 and 400 square feet. Tiny houses come in all shapes, sizes, and forms, but they enable simpler living in a smaller, more efficient space. People are joining this movement for many reasons, but the most popular reasons include environmental concerns, financial concerns, and the desire for more time and freedom.
Small Homes	Small homes range anywhere between 400 to 1500 square feet depending on the number of inhabitants and their lifestyles. In most cases, though, 400 to 1000 square feet is what most people in the tiny housing world consider small but it's all really a matter of opinion. (Source: Tiny House Talk) For this project we are generally discussing homes in the 400-900 sq ft range. The average home size in the Northeast in 2010 was 2,613 sq ft.
Small Lot Zoning	Zoning that allows for greater density than typical suburban growth patterns and is often more consistent with historic development patterns of downtowns and villages. May allow for less frontage or acreage required per dwelling. Specific examples may include "flag lots" or other infill lots, zero lot line development, no frontage or acreage requirements, setting lot size per square feet of units instead of size by number of units, bonus densities, cottage housing development or other strategies that look at use intensity.
Smart Growth	Strategies that focus the creation of new homes in areas with infrastructure (sewer, water, transportation) and services (shopping, jobs, etc.).
Stationery Homes	House built on a permanent foundation, crawl space or on permanent piers approved by a building inspector.
YIMBY (Yes In My Back Yard)	A grassroots movement to promote the creation of new affordable housing through smart growth strategies in response to the "Not In My Back Yard" (NIMBY) attitudes that developers often face when new housing is planned.
Zero-Lot-Line Development	A development option where side yard restrictions are reduced and the building abuts a side lot line. Overall unit-lot densities are therefore increased. Zero-lot-line development can result in increased protection of natural resources.
Zero-Net Energy	A Zero-Net Energy building is one that is optimally efficient, and over the course of a year, generates energy onsite, using clean renewable resources, in a quantity equal to or greater than the total amount of energy consumed onsite.

Skills

Survival

Search & Rescue Terms

Survivalism	A primarily American movement of individuals or groups who actively prepare for emergencies, including possible disruptions in social or political order, on scales from local to international.
Aircraft Coordinator (ACO)	A person who coordinates the involvement of multiple aircraft in SAR operations.
Aeronautical Drift (Da)	Drift caused by bailout trajectory or aircraft gliding distance
Aeronautical Position	Initial position of a distressed aircraft at the time of re-entry, engine failure, aircrew ejection or bailout.
Aircraft Glide	Maximum ground distance an aircraft could cover during descent.
Alert Phase	A situation wherein apprehension exists as to the safety of an aircraft or marine vessel, and of the persons on board.
Alerting Post	Any facility intended to serve as an intermediary between a person reporting an emergency and a rescue coordination centre or rescue sub-centre.
ARGOS	A satellite-based location and data collection system.
AusSAR (see JRCC)	Australian Search and Rescue: a functional description of the Australian Maritime Safety Authority's role in maritime and aviation SAR coordination, communications, and the provision of SAR units. AusSAR does not exist a discrete entity inside AMSA. Whilst the description "AusSAR" is readily understood by other participants in SAR, the term JRCC Australia is preferred.
Awareness Range	Distance at which a search scanner can first detect something different from its surroundings but not yet recognise it.
Awareness Stage	A period during which the SAR system becomes aware of an actual or potential incident.
Captain	Master of a ship or pilot-in-command of an aircraft, commanding officer of a warship or an operator of any other vessel.
Checksum Digit	A digit that is appended to a numeric data element and used to verify its accuracy. Checksum digits are computed by adding the digits of the data element.
Coast Earth Station (CES)	Maritime name for an Inmarsat shore-based station linking ship earth stations with terrestrial communications networks.
Conclusion Stage	A period during a SAR incident when SAR facilities return to their regular location and prepare for another mission.
Coordinated Search Pattern	Multi-unit pattern using vessel(s) and aircraft.
Coordinated Universal Time (UTC)	International term for time at the prime meridian.
COSPAS-SARSAT System	An international satellite system designed to provide distress alert and location data from 406MHz distress beacon signals.
Course	The intended horizontal direction of travel of a craft
Coverage Factor (C)	For parallel sweep searches, Coverage Factor (C) is computed as the ratio of sweep width (W) to track spacing (S). C = W/S.
Craft	Any air or sea-surface vehicle, or submersible of any kind or size.
Datum	A geographic point, line, or area used as a reference in search planning
Datum Area	Area where it is estimated that the search object is most likely to be located.
Datum Line	A line, such as the distressed craft's intended track line or a line of bearing, which defines the centre of the area where it is estimated that the search object is most likely to be located.
Datum Point	A point, such as a reported or estimated position, at the centre of the area where it is estimated that the search object is most likely to be located.
Dead Reckoning (DR)	Determination of position of a craft by adding to the last fix the craft's course and speed for a given time.

Digital Selective Calling (DSC)	A technique using digital codes which enables a radio station to establish contact with, and transfer information to, another station or group of stations.
Direction of Current	Direction toward which a current is flowing. Also called set.
Direction of Waves, Well or Seas	Direction from which the waves, swells, or seas are moving.
Direction of Wind	Direction from which the wind is blowing.
Distress Phase	A situation wherein there is reasonable certainty that a vessel/aircraft, or person, is threatened by grave and imminent danger and requires immediate assistance.
Ditching	The forced landing of an aircraft on water.
Drift	The movement of a search object caused by environmental forces.
Drift Error (De)	See Total drift error.
Emergency Phase	Emergency phases are based on the level of concern for the safety of persons or craft that may be in danger. The three levels of emergency are classified as Uncertainty, Alert, and Distress.
False Alarm	Distress alert initiated for other than an appropriate test, by communications equipment intended for alerting, when no distress situation actually exists.
False Alert	Distress alert received from any source, including communications equipment intended for alerting, when no distress situation actually exists, and a notification of distress should not have resulted.
Fetch	The distance over which the wind blows in a constant direction, without obstruction.
Field Search Coordinator	Term for SMC who coordinates land searches only.
Field Search Headquarters	Land equivalent of a RCC
First RCC	RCC affiliated with the shore station that first acknowledges a distress alert, and which will accept responsibility for all subsequent SAR coordination unless and until coordination is transferred to another RCC.
Fix	A geographical position determined by visual reference to the surface, referencing to one or more radio navigation aids, celestial plotting, or other navigation device.
Forward Looking Infrared (FLIR)	An imaging system, mounted on board surface vessels or aircraft, designed to detect thermal energy (heat) emitted by targets and convert it into a visual display.
General Communications	Operational and public correspondence traffic other than distress, urgency and safety messages, transmitted or received by radio.
Global Maritime Distress and Safety System (GMDSS)	A global communications service based upon automated systems, both satellitebased and terrestrial, to provide distress alerting and promulgation of maritime safety information for mariners.
Global Navigation Satellite System (GNSS)	Worldwide position and time determination system that includes one or more satellite constellations and receivers.
Great Circle Route	The shortest course between two points on the surface of a sphere. It lies in a plane that intersects the sphere's centre.
Ground Speed (GS)	The speed an aircraft is making relative to the earth's surface.
Heading	The horizontal direction in degrees magnetic in which a craft is pointed.
Hypothermia	Abnormal lowering of internal body temperature (heat loss) from exposure to cold air, wind or water.
Indicated Air Speed (IAS)	The aircraft speed shown on the air speed indicator gauge. IAS corrected for instrument error and atmospheric density equals true air speed.
Initial Position Error (X)	The estimated probable error of the initially reported position of a SAR incident.
Inmarsat Ltd	Formally the International Maritime Satellite Organisation.
International Maritime Satellite Organisation (Inmarsat)	A system of geostationary satellites for worldwide mobile communications services, and which support the Global Maritime Distress and Safety System and other emergency communications systems.
Instrument Flight Rules (IFR)	Rules governing the procedures for conducting instrument flight. Also a term used by pilots and controllers to indicate type of flight plan.
Instrument Meteorological Conditions (IMC)	Meteorological conditions expressed in terms of visibility, distance from cloud, and ceiling less than the minima specified for visual meteorological conditions.
Joint Rescue Coordination Centre (JRCC)	A rescue coordination centre responsible for both aeronautical and maritime search and rescue incidents.
Knot (kt)	A unit of speed equal to one nautical mile per hour.
Last Known Position (LKP)	The Last Known Position is a term used in search planning to indicate the last known location of the person, marine craft or aircraft the subject of a search and /or rescue mission. It is also known by its acronym LKP. The LKP may be a boat ramp where a small craft was launched, a reporting point or navigation aid where an aircraft last reported its position or the location where it can be confirmed a person was last sighted e.g., at the start of a walking track. The Last Known Position differs from the other term used in marine search planning of Splash Point or SP.
Leeway (LW)	The movement of a search object through water caused by winds blowing against exposed surfaces.
Land Earth Station (LES)	Land Earth Station (Inmarsat) – synonymous with CES.
Local User Terminal (LUT)	An earth receiving station that receives beacon signals relayed by COSPAS-SARSAT satellites, processes them to determine the location of the beacons, and forwards the signals.
MAYDAY	The distress signal "MAYDAY" is used to indicate that a craft or person is threatened by grave and imminent danger and requires immediate assistance. It has precedence over all other communications. The distress message is preceded by the word MAYDAY spoken three times. The word is pronounced 'Mayday' from the French m'aider (help me). Any subsequent messages including selfidentification, position, nature of distress and other useful information, forms the distress message.
MEDEVAC	Evacuation of a person for medical reasons.
Meteorological Visibility	The maximum range at which a large object, such as landmasses or mountains, can be seen. Also referred to as Meteorological Range.
Mission Control Centre (MCC)	Part of the COSPAS-SARSAT system that accepts alert messages from the local user terminal(s) and other mission control centres to distribute to the appropriate rescue coordination centres or other search and rescue points of contact.

Narrow-Band Direct Printing (NBDP)	Automated telegraphy, as used by the NAVTEX system and telex-over-radio.
NAVAREA	One of 16 areas into which the International Maritime Organization divides the world's oceans for dissemination of navigation and meteorological warnings.
NAVTEX	Telegraphy system for transmission of maritime safety information, navigation and meteorological warnings and urgent information to ships. NAVTEX is not provided in Australia - see SafetyNet.
On-scene	The search area or the actual distress site.
On-scene Coordinator (OSC)	A person designated to coordinate search and rescue operations within a specified area.
On-scene Endurance	The amount of time a facility may spend at the scene engaged in search and rescue activities.
Overall Coordination	The responsibility of the SAR authority to prosecute a SAR operation for a given target in accordance with Volume 1, Chapter 1, section 1.2, Appendix B or the SAR authority best placed to coordinate efforts of the response agencies that may become involved in a SAR action.
Overdue	A situation where a craft has failed to arrive at its intended destination when expected and remains missing.
PAN-PAN	The international radiotelephony urgency signal. When repeated three times, indicates uncertainty or alert, followed by nature of urgency. The urgency signal "PAN PAN" is used to indicate that the calling station has a very urgent message to transmit covering the safety of a ship, aircraft or person. It has precedence over all other communications, except distress traffic. The urgency message is preceded by the words 'PAN PAN' spoken three times. The words are pronounced 'Pan pan' from the French panne (a breakdown).
Personal Locator Beacon (PLB)	Personal radio distress beacon for alerting and transmitting homing signals.
Pilot-in-command	The pilot responsible for the operation and safety of the aircraft during flight time.
Planning Stage	A period during a SAR incident when an effective plan of operations is developed.
Position	A geographical location normally expressed in degrees and minutes of latitude and longitude.
Positioning	Process of determining a position that can serve as a geographical reference for conducting a search.
Possibility Area	(1) The smallest area containing all possible survivor or search object locations. (2) For a scenario, the possibility area is the smallest area containing all possible survivor or search object locations that are consistent with the facts and assumptions used to form the scenario.
Primary Swell	The swell system having the greatest height from trough to crest.
Probability Area	The area in which a missing craft and/or survivors are most likely to be found taking into account possible errors in the navigation of the missing craft and of the search craft.
Probability of Detection (POD)	The probability of the search object being detected, assuming it was in the areas that were searched. POD is a function of coverage factor, sensor, search conditions and the accuracy with which the search facility navigates its assigned search pattern. Measures sensor effectiveness under the prevailing search conditions.
Rescue	An operation to retrieve persons in distress, provide for their initial medical or other needs, and deliver them to a place of safety.
Rescue Coordination Centre (RCC)	The centre from which a SAR incident is controlled and coordinated. The Centre is known by various terms such as the Rescue Coordination Centre, Major Incident Room, Operations Room or Base Station. For the purposes of this manual these centres will be known generically as the Rescue Coordination Centre or RCC.
Rhumb Line	A line of constant bearing that cuts meridians at the same angle. It is a straight line between two points on a Mercator projection chart.
SafetyNET	Communications service provided via Inmarsat-C for promulgation of maritime safety information, including shore-to-shop relays of distress alerts and communications for search and rescue coordination.
SAR Datum Buoy	Droppable floating beacon used to determine actual sea current, or to serve as a location reference.
Scenario	A consistent set of known facts and assumptions describing what may have happened to the survivors and/or craft.
Sea	Condition of the surface resulting from waves and swells.
Sea Current (SC)	The residual current when currents caused by tides and local winds are subtracted from local current. It is the main, large-scale flow of ocean waters.
Search	An operation, normally coordinated by a rescue coordination centre, using available personnel and facilities to locate persons in distress.
Search and Rescue Authority	The authority within an Administration with overall responsibility for establishing and providing SAR services and ensuring that planning for those services is properly coordinated. The national SAR authority in Australia is the Australian Maritime Safety Authority with each of the States and Territories Polices services and the Department of Defence being the SAR Authorities within their jurisdictions. In Australia, the SAR Authority takes on the roles of the SAR Coordinator as described in the IAMSAR Manual.
Search Action Plan	Message, normally developed by the SMC, for passing instructions to SAR facilities and agencies participating in a SAR mission.
Search and Rescue Briefing Officer	An officer appointed, usually by the SMC, to brief departing SAR facilities and debrief returning SAR facilities.
Search and Rescue Case	Any potential or actual distress about which a facility opens a documentary file, whether or not SAR resources are dispatched.
Search and Rescue Coordinating Communications	Communications necessary for the coordination of facilities participating in a search and rescue operation.
Search and Rescue Facility	Any mobile resource, including designated search and rescue units, used to conduct search and rescue operations. The terms unit and asset maybe interchangeable with facility.
Search and Rescue Incident	Any situation requiring notification and alerting of the SAR system and which may require SAR operations.
Search and Rescue Liaison Officer	An officer assigned to promote coordination during a SAR mission.
Search and Rescue Mission Coordinator (SMC)	The suitably trained or qualified official temporarily assigned to coordinate a response to an actual or apparent distress situation. In Australia, the acronym SARMC is also used in some jurisdictions. Throughout this manual, the terms SMC and SARMC are synonymous. Some jurisdictions also use the term A/SARMC to describe the SMC's assistants.
Search and Rescue Plan	A general term used to describe documents which exist at all levels of the national and international search and rescue structure to describe goals, arrangements, and procedures which support the provision of search and rescue services.

ADDENDUM Dictionary Survival Search & Rescue Terms

Search and Rescue Point of Contact (SPOC)	Rescue coordination centres and other established and recognised national points of contact that can accept responsibility to receive COSPAS-SARSAT alert data to enable the rescue of persons in distress.
Search and Rescue Region (SRR)	An area of defined dimensions, associated with the national rescue coordination centre (JRCC Australia), within which search and rescue services are provided.
Search and Rescue Service	The performance of distress monitoring, communication, coordination and search and rescue functions, including provision of medical advice, initial medical assistance, or medical evacuation, through the use of public and private resources, including cooperating aircraft, vessels and other craft and installations.
Search and Rescue Stage	Typical steps in the orderly progression of SAR missions. These are normally Awareness, Initial Action, Planning, Operations, and Mission Conclusion.
Search and Rescue Unit (SRU)	An aircraft, vessel of search team with equipment suitable for the expeditious conduct of search and rescue operations.
Search Area	The area determined by the search planner to be searched. This area may be subdivided into search sub-areas for the purpose of assigning specific responsibilities to the available search facilities.
Search Endurance (T)	The amount of "productive" search time available at the scene also known as Available Search Hours (ASH). This figure is usually taken to be 85% of the on-scene endurance, leaving a 15% allowance for investigating sightings and navigating turns at the ends of search legs.
Search Facility Position Error (Y)	Probable error in a search craft's position, based on its navigational capabilities.
Search Object	A ship, aircraft, or other craft missing or in distress or survivors or related search objects or evidence for which a search is being conducted.
Search Pattern	A procedure assigned to an SRU for searching a specified area.
Search Radius	The actual search radius used to plan the search and to assign search facilities. It is usually based on adjustments to the optimal search radius that are needed for operational reasons.
Secondary Swells	Swell systems of less height than the primary swell.
SECURITE	The safety signal 'SECURITÉ' indicates that the station is about to transmit a message concerning the safety of navigation or providing an important meteorological warning. The safety message is preceded by the word "SECURITE" spoken three times. The word is pronounced 'See-cure-e-tay' from the French sécurité.
Sensors	Human senses (sight, hearing, touch, etc.), those of specially trained animals (such as dogs), or electronic devices used to detect the object of a search.
Set	Direction towards which a current flows
Situation Report (SITREP)	Reports, from the OSC to the SMC or the SMC to interested agencies, to keep them informed of on-scene conditions and mission progress.
Splash Point	A term used in marine search planning to indicate a known point of distress. Also referred to by its acronym SP.
SOS	Internationally recognised signal of distress, made by any method of signalling.
Surface Drift	Vector sum of total water current and leeway. Sometimes called Total Drift.
Surface Picture (SURPIC)	A list or graphic display from a ship reporting system of information about vessels in the vicinity of a distress situation that may be called upon to render assistance.
Surface Position	The position of the search object on the earth's surface at the time of initial distress, or its first contact with the earth's surface.
Sweep Width (W)	A measure of the effectiveness with which a particular sensor can detect a particular object under specific environmental conditions.
Swell	Condition of the surface caused by a distant wind system. The individual swell appears to be regular and smooth with considerable distance between rounded crests.
Swell Direction	The direction from which a swell is moving. The direction toward which a swell is moving is called the down swell direction.
Swell Face	The side of the swell toward the observer. The backside is the side away from the observer. These definitions apply regardless of the direction of swell movement.
Swell Velocity	Velocity with which the swells advance with relation to a fixed reference point, measured in knots.
Time of Closest Approach (TCA)	Time during a satellite pass when the satellite is closest to a signal source.
Total Drift Error (De)	Sum of the individual drift errors from the time of the incident until datum. Used when determining Total Probable Error (E).
Total Probable Error (E)	The estimated error in the datum position. It is the square root of the sum of the squares of the total drift error, initial position error, and search facility position error.
Total Water Current (TWC)	The vector sum of currents affecting search objects.
Track Spacing (S)	The distance between adjacent parallel search tracks.
Triage	The process of sorting survivors according to medical condition and assigning them priorities for emergency care, treatment, and evacuation.
True Air Speed (TAS)	The speed an aircraft is travelling through the air mass. TAS corrected for wind equals ground speed.
Uncertainty Phase	A situation wherein uncertainty exists as to the safety of an aircraft or a marine vessel, and of the persons on board.
Unreported	A situation where a craft has failed to report its location or status when expected and remains missing.
Vector	A graphic representation of a physical quantity or measurement, such as wind velocity, having both magnitude and direction.
Visual Flight Rules (VFR)	Rules governing procedures for conducting flight under visual meteorological conditions. In addition, used by pilots and controllers to indicate type of flight plan.
Visual Meteorological Conditions (VMC)	Meteorological conditions expressed in terms of visibility, distance from cloud, and ceiling equal to or better than specified minima.
Wave (or Chop)	The condition of the surface caused by local wind and characterised by irregularity, short distance between crests, whitecaps, and breaking motion.
Wind-Corrected Heading	The actual heading an aircraft is required to fly to make good an intended course.

Wind Current (WC)	The water current generated by wind acting upon the surface of water over a period of time.

Security

General

Alert	Term used for physical signs a canine or horse gives when they are interested in something. Canines may alert by barking, horses may alert by placing their ears forward, distending their nostrils, focusing their eyes, stopping forward movement, etc.
Attraction Search	Search based on the idea that the victim is alive, willing to be found and will, upon hearing or seeing signs of rescue, make them self and their position known.
Bastard Search	A search in which, for one reason or another and unknown to the searchers, there is no subject, as the subject is elsewhere rather than in the search area.
Bloodhound	A search dog that is remarkable for its keen sense of smell and often used as tracking/trailing canines.
Briefing	A meeting before a search in which information is disclosed to the search teams in order to initiate and properly execute the search.
CISD	Critical Incident Stress Debriefing
Confinement Search	Also a containment measure. Search in which the object is to confine the subject to a specific area.
Debriefing	A meeting after a search or after a team has been called in, in which all information found is disclosed and where suggestions can be made for the future.
DOD	Department of Defence
ETA	Estimated Time of Arrival
ETD	Estimated Time of Departure
FBI	Federal Bureau of Investigation
FLIR	Forward Looking Infrared - A thermal imaging device designed to be aircraft mounted, usually on a helicopter, that can detect heat sources at night. Useful in locating persons on foot, in concealed vehicles, aircraft wreckage, and other heat sources.
FTL	Field Team Leader
FTM	Field Team Member
FRP	Federal Response Plan
Grid Search	All searchers move forward on a line. They are spaced closely together. This search is slow and methodical and takes a lot of time.
Handler	The person who controls and directs a canine during a search. This person is usually, but does not have to be, the owner or trainer of the canine.
Hasty Search	A search whose purpose is to cover the most obvious places a subject might be in the least time possible. Usually the first kind of search tactic to be utilized.
Helibase	A location within the general incident area for parking, fuelling, maintenance and loading of helicopters.
Helispot	A location where a helicopter can take off and land.
HRT	Hostage Rescue Team (FBI)
IC	Incident Commander
ICC	Incident Command Centre
ICISF	International Critical Incident Stress Foundation
ICP	Incident Command Post
ICS	Incident Command System
ISAR	Inland Search and Rescue – A search management class taught by the U.S. Coast Guard and U.S. Air Force OR Introduction to Search And Rescue - A basic search and rescue course taught by the National Association for Search and Rescue.
JIC	Joint Information Centre
JOC	Joint Operations Centre
JTF	Joint Task Force
JTTF	Joint Terrorism Task Force
LKP	Last Known Position - The last known location for the missing subject as determined by physical evidence such as a discarded object or a footprint. In the case of an aircraft, the LKP may be the last reported point or the last observed radar position.
MACC	Multi-Agency Coordination Centre
MATF	Multi-Agency Task Force
Mission Coordinator	The person designated by the legal responsible authority to coordinate and manage on-scene operations during a specific SAR incident. Depending upon the management system used and the organizations involved, this person may be called the Mission Coordinator, On-Scene Commander or Incident Commander.
MLPI	Managing the Lost Person Incident.
MLSO	Management of Land Search Operations.
Mock Search	Staged training that is set up to approximate as closely as possible, a real search effort.
Mountaineering	The art of mountain climbing usually for recreational purposes, but may be for rescue purposes.
Mutual Aid Search	A search that is too large scale to be handled by one organization. One or more organizations or groups outside the initial group are called in to assist in the effort.
NASAR	National Association for Search and Rescue
Night Vision	A monocular or binocular piece of equipment that allows you to see in near total darkness by intensifying existing light. It may also be utilized in total darkness with an infrared attachment. Night vision is very useful for search and rescue missions.
NRP	National Response Plan - A federally mandated plan that integrates domestic prevention, preparedness, response and recovery plans into one all-discipline, all-hazards plan.
NSARS	National Search and Rescue School - A national school which conducts search management programs administered by the U.S. Coast Guard and the U.S. Air Force.

Overhead Team	A highly trained, quick response SAR management team that can respond to assist with search planning, coordination and operations. The overhead team usually consists of a search manager and one or two assistants.
Perimeter Search	A search of an outside line that is believed to be across the direction of travel of the subject. The object is to cut the trail and find tracks or other evidence of the subject being there.
Plan of Action	A written document that consolidates all of the operational actions to be taken by various personnel in order to stabilize the incident.
PLB	Personal Locator Beacon - The personal version of the “ELT” designed to be carried by a person on foot. It is manually activated.
PLS	Point (or Place) Last Seen - The location where the missing subject was actually seen by another person.
POA or PA	Probability of Area (chances that the subject, or clues, are in the area being searched).
POD or PD	Probability of Detection (chances of finding the subject or clues given that they are in the area being searched).
POS or PS	Probability of Success (chances of being successful with a particular search in a given area).
Rural SAR	A search and rescue mission conducted in an area often given to farming or to woodland and is usually sparsely to moderately populated.
SAC	Special Agent in Charge
SAR	Search and Rescue
SAR Emergency	Any SAR incident, whether related to any other type of incident or not, that requires the utilization of resources to resolve, due to the threat or potential threat to human life.
Search Manager	The individual "managing" the search operations. Also known as “MSO” for Managing Search Operations or “MLPI” for Managing the Lost Person Incident or “ISAR” for Inland Search and Rescue Specialist or "NSARS" for National Search and Rescue School.
SIOC	Strategic Information and Operations Centre (FBI)
SOG	Standard Operating Guidelines
SOP	Standard Operating Procedures
Sound Sweep Search	An attraction search in which all searchers call out, whistle or make some other sound at a prescribed time and then are all quiet and listening for an answer during a second prescribed time.
Staging Area	That location where incident personnel and equipment gather and are assigned.
Strike Team	Specified combinations of the same kind and type of resources, with common communication and a leader.
Task Force	A combination of single resources assembled for a particular need.
Tracking Canine	A search dog that will follow the ground scent of a person who has passed through an area in which the dog is searching.
Trailing Canine	A search dog that will follow the scent trail of a specific individual, after the dog has been allowed to smell an article or object that has been in contact with that individual. The trailing dog is scent discriminating (the ability to distinguish the scent of one person and follow it).
Tracker	An individual who can detect and follow signs of human passage.
UC	Unified Command A method for all agencies or individuals who have jurisdictional responsibility at the incident, to contribute to determining overall objectives for the incident and selection of a strategy to achieve the objectives.
Unity of Command	The concept by which each person within an organization reports to one and only one designated person.
Urban Search and Rescue	A search and rescue mission conducted in moderately to heavily populated areas given primarily to business and residential development.
Urgency Profile	A way to determine the urgency of each individual search and rescue mission. The combination of factors affecting the urgency will help determine not only how quickly to respond, but the nature and level of response as well. On the Urgency Profile chart, the lower the numerical value, the more urgent the response should be.
USAR	Urban Search and Rescue
USFS	United States Fire Service
USSS	United States Secret Service
Wilderness SAR	A search and rescue mission conducted in an area generally uncultivated and uninhabited and often inaccessible by roads.
Area of Interest	The area of concern to a commander relative to the objectives of current or planned operations, including their areas of influence, operations and/or responsibility, and areas adjacent thereto.
Battlespace	Those geographical, physical and virtual areas; that includes the traditional domains of land, air and sea, space, the electromagnetic spectrum and cyberspace, which are of concern to a commander. Note: Also embraces the social, political and temporal contexts in which conflict is waged.
Close Combat	Combat carried out with direct fire weapons, against identifiable individuals, supported by indirect fire, air-delivered fires and non-lethal engagement means. Note: Close combat defeats or destroys the enemy forces or seizes and retains ground.
Engagement Area	A target area of interest, where action has been planned to reduce the effect of an adversary’s combat power.
Improvised Explosive Device (IED)	A device placed or fabricated in an improvised manner incorporating destructive, lethal, noxious, pyrotechnic or incendiary chemicals and designed to destroy, incapacitate, harass or distract. It may incorporate military stores, but is normally devised from non-military components.
Reconnaissance	A mission undertaken to obtain, by visual observation or other detection methods, information about the activities and resources of an enemy or potential enemy, or to secure data concerning the meteorological, hydrographic or geographic characteristics of a particular area.
Rules of Engagement	Directives issued by a competent military authority, which specify the circumstances and limitations under which forces will initiate and/or continue combat engagement with other forces encountered.
Situational Awareness	Knowledge and understanding of the current situation, which promotes timely, relevant and accurate assessment of friendly, enemy and other options within the battlespace in order to facilitate decision making.
Standing Operating Procedure	A set of instructions covering those features of operations which lend themselves to a definite or standardised procedure without loss of effectiveness. The procedure is applicable unless ordered otherwise.

CGI	Corrugated Galvanised Iron
EA	Engagement Area
EOD	Explosive Ordnance Disposal
IED	Improvised Explosive Device
IR	Infra-red
NFE	Night Fighting Equipment
NTM	Notice To Move
NVG	Night Vision Goggles
OFOF	Orders For Opening Fire
OHP	Overhead Protection
OP	Observation Post
VBIED	Vehicle-Borne Improvised Explosive Device
ASAP	As Soon As Possible
BBDA	Back Blast Danger Area
Bde	Brigade
BMA	Brigade Maintenance Area
C/S	Call Sign
DUSTOFF	Dedicated Undying Support To Our Friendly Forces
DZ	Drop Zone
FARP	Forward Arming and Refuelling Point
fmn	Formation
HE	High Explosive
HEAT	High Explosive Antitank
HEDP	High Explosive Dual Purpose
INTSUM	Intelligence Summary
IPE	Individual Protection Equipment
LDFSW	Light Direct Fire Support Weapon
LOA	Left Of Arc
LP	Landing Point
LZ	Landing Zone
MDFSW	Medium Direct Fire Support Weapon
MOPP	Mission Oriented Protective Postures
PRI	Priority
PSM	Primary Speech Module
SMK	Smoke
ROA	Right Of Arc
WIA	Wounded In Action
KIA	Killed In Action

Administrative

Cantonment	A temporary or semi-permanent military quarters; in South Asia, the term cantonment also describes permanent military stations.
Logistics	Military logistics is the discipline of planning and carrying out the movement and maintenance of military forces.
Materiel	Materiel, more commonly matériel, refers to military technology and supplies in military and commercial supply chain management.
Military Supply Chain Management	Military supply chain management is a cross-functional approach to procuring, producing and delivering products and services for military applications.
Staging Area	In military usage, a staging area is a place where troops or equipment in transit are assembled or processed. Often and historically this military staging area has been termed a point d'appui, which is often on high ground and sometimes coincident with a significant prehistoric monument.

Intelligence

Signals Intelligence (SIGINT)	Is intelligence-gathering by interception of signals, whether communications between people or from electronic signals not directly used in communication.
Electronic Intelligence (ELINT)	Electronic signals intelligence (ELINT) refers to intelligence-gathering by use of electronic sensors. Its primary focus lies on non-communications signals intelligence.
High-frequency Direction Finding	(nicknamed huff-duff) is the common name for a type of radio direction finding employed especially during the two world wars.
Communications Intelligence (COMINT)	Is intelligence-gathering by interception of signals, whether communications between people or from electronic signals not directly used in communication.
Human Intelligence (HUMINT)	Human intelligence is intelligence gathered by means of interpersonal contact, as opposed to the more technical intelligence gathering disciplines such as signals intelligence (SIGINT), imagery intelligence (IMINT) and measurement and signature intelligence (MASINT).
Imagery Intelligence (IMINT)	Imagery intelligence (IMINT) is an intelligence gathering discipline which collects information via satellite and aerial photography.
Measurement and Signature Intelligence (MASINT)	Measurement and signature intelligence (MASINT) is a technical branch of intelligence gathering, which serves to detect, track, identify or describe the signatures (distinctive characteristics) of fixed or dynamic target sources.
Open-source Intelligence (OSINT)	Open-source intelligence (OSINT) is data collected from publicly available sources to be used in an intelligence context.

On Land

Demilitarized Zone (DMZ)	A demilitarized zone is an area in which treaties or agreements between nations, military powers or contending groups forbid military installations, activities or personnel.
No Man's Land	Land that is not occupied or, more specifically, land that is under dispute between countries or areas that will not occupy it because of fear or uncertainty, or for tactical or strategical considerations.
Artillery	Includes any engine used for the discharge of large projectiles in war.
Artillery Battery	An organized group of artillery pieces (previously artillery park).

Doctrinal

Ambush	Carrying out a surprise attack on an enemy that passes a concealed position.
Artillery Barrage	A line or barrier of exploding artillery shells, created by continuous and co-ordinated fire of a large number of guns.
Battalia	An army or a subcomponent of an army such as a battalion in battle array (common military parlance in the 17th century).
Blockade	A ring of naval vessels surrounding a specific port or even an entire nation. The goal is to halt the importation of goods which could help the blockaded nation's war effort.
Booby Trap	A booby trap is a device or setup that is intended to kill, harm, or surprise a person or animal, unknowingly triggered by the presence or actions of the victim.
Breach	A gap in fortified or battle lines.
Breakout	Exploiting a breach in enemy lines so that a large force (division or above) passes through.
Bridgehead	A bridgehead is the strategically important area of ground around the end of a bridge or other place of possible crossing over a body of water which at time of conflict is sought to be defended or taken over by the belligerent forces.
Charge	A large force heads directly to an enemy to engage in close quarters combat, with the hope of breaking the enemy line.
Chequered Retreat	A line or battalion, alternately retreating and facing about in the presence of an enemy, exhibiting a deployment like chequered squares.
Column	A military column is a formation of soldiers marching together in one or more files in which the file is significantly longer than the width of ranks in the formation.
Counterattack	A counterattack is a tactic employed in response to an attack, with the term originating in "war games". The general objective is to negate or thwart the advantage gained by the enemy during attack, while the specific objectives typically seek to regain lost ground or destroy the attacking enemy (this may take the form of an opposing sports team or military units).
Counter-Battery Fire	Counter-battery fire (sometimes called counter-fire) is a battlefield military activity to defeat the enemy's indirect fire elements (guns, rocket launchers, artillery and mortars), including their target acquisition, command and control components.
Coup De Grâce	A death blow intended to end the suffering of a wounded soldier; also applied to severely damaged ships (called scuttling when applied to friendly ships).
Coup De Main	A swift pre-emptive strike.
Debellatio	To end a war by complete destruction of a hostile state. More severe than sacking.
Decisive Victory	An overwhelming victory for one side, often shifting the course of conflict.
Defilade	A unit or position is "defiladed" if it is protected from direct exposure to enemy fire; see also Hull-down.
Dustoff	Medical evacuation of wounded from the field of battle by air, bringing them to a higher level of medical care and treatment, e.g. from an aid station to a combat support hospital or other treatment facilities.
Echelon Formation	A military formation in which members are arranged diagonal.
Encirclement	Encirclement is a military term for the situation when a force or target is isolated and surrounded by enemy forces.
Enfilade	A unit (or position) is "enfiladed" when enemy fire can be directed along the long axis of the unit. For instance, a trench is enfiladed if the enemy can fire down the length of the trench. May also refer to placing a unit in a position to enfilade, or the position so enfiladed.
Envelope	The pincer movement, or double envelopment, is a military manoeuvre in which forces simultaneously attack both flanks (sides) of an enemy formation.
Extraction Point	The location designated for reassembly of forces and their subsequent transportation out of the battle zone.
Fabian Strategy	Avoiding pitched battles to wear down the enemy in a war of attrition.
Fighting Withdrawal	Pulling back military forces while maintaining contact with the enemy.
File	A single column of soldiers.
Flanking Manoeuvre	To attack an enemy or an enemy unit from the side, or to manoeuvre to do so.
Forlorn Hope	A band of soldiers or other combatants chosen to take the leading part in a military operation, such as an assault on a defended position, where the risk of casualties is high.
Frontal Assault / Attack	An attack toward the front of an enemy force.
Garrison	A body of troops holding a particular location on a long-term basis.
Guerrilla Tactics	Attacking the enemy and the subsequent breaking off of contact and retreating; also referred to as "hit-and-run tactics".
Hors de combat	A unit out of the fight, surrendered, wounded (when incapacitated), and so on.
Infantry Square	Historically an infantry square, also known as a hollow square, is a combat formation an infantry unit forms in close order usually when threatened with cavalry attack.
Infiltration	In warfare, infiltration tactics involve small independent light infantry forces advancing into enemy rear areas, bypassing enemy front-line strongpoints, possibly isolating them for attack by follow-up troops with heavier weapons.
Interdiction	To attack and disrupt enemy supply lines.
Killing Field	A killing field, in military science, is an area in front of a defensive position that the enemy must cross during an assault and is specifically intended to allow the defending troops to incapacitate a large number of the enemy.
Lodgement	An enclave made by increasing the size of a bridgehead.
Melee	Melee or pell-mell battle generally refers to disorganized close combat in battles fought at abnormally close range with little central control once it starts.

Mobile Columns	Or movable columns - in contrast to stationary troops troupes sédentaire. This may be used as a bureaucratic description to describe the function for which troops are raised for example the regiments of the Highland Fencible Corps were raised for garrison duties while Scottish line regiments in the British Army were raised to fight anywhere; or it may be an operational description.
No Quarter Given	All enemy troops are to be killed, even those who surrender. Also referred to as "take no prisoners".
Overwatch	When one small unit provides support for another.
Patrolling	Patrolling is a military tactic. Small groups or individual units are deployed from a larger formation to achieve a specific objective and then return.
Parthian Shot	The Parthian shot is a light horse military tactic made famous in the West by the Parthians, an ancient Iranian people. While in real or feigned retreat their horse archers would turn their bodies back in full gallop to shoot at the pursuing enemy.
Phalanx	The phalanx was a rectangular mass military formation, usually composed entirely of heavy infantry armed with spears, pikes, sarissas, or similar pole weapons.
Pickets	Sentries or advance troops specifically tasked with early warning of contact with the enemy. A soldier who has this job is on "picket duty", and may also be referred to as a "lookout."
Pincer Manoeuvre	The pincer movement, or double envelopment, is a military manoeuvre in which forces simultaneously attack both flanks (sides) of an enemy formation.
Pitched Battle	A pitched battle or set piece battle is a battle in which both sides choose the fighting location and time. Either side has the option to disengage before the battle starts or shortly thereafter.
Pocket	A salient, also known as a bulge, is a battlefield feature that projects into enemy territory. The salient is surrounded by the enemy on multiple sides, making the troops occupying the salient vulnerable.
Pyrrhic Victory	A victory paid for so dearly that it potentially could lead to a later defeat ("a battle won, a war lost"). Raid.
Raid	Raiding, also known as depredation, is a military tactic or operational warfare mission which has a specific purpose and is not normally intended to capture and hold a location but instead finish with the raiding force quickly retreating to a previous defended position prior to enemy forces being able to respond in a coordinated manner or formulate a counter-attack.
Rank	A single line of soldiers.
Reconnaissance	In military operations, reconnaissance or scouting is the exploration outside an area occupied by friendly forces to gain information about natural features and other activities in the area.
Retreat	Withdrawal of troops from a battlefield (can be either orderly or unorderly; fighting or by rout).
Rout	Disorderly withdrawal of troops from a battlefield following a defeat, either real or perceived.
Sack	The destruction and looting of a city, usually after an assault.
Safe-Guard	Individual soldiers or detachments placed to prevent resources (often farms full of crops and livestock) from being looted or plundered.
Salients	A pocket or "bulge" in a fortified or battle line. The enemy's line facing a salient is referred to as a "re-entrant".
Scorched Earth	Deliberate destruction of resources, in order to deny their use to the enemy.
Scuttling	The deliberate destruction of a ship to prevent its capture and use by an enemy. Commonly used as a coup de grâce, but has also been a protest (as after the First World War).
Shield Wall	The massed use of interconnected shields to form a wall in battle.
Shield Wall (Fortification)	The highest and thickest wall of a castle protecting the main assault approach.
Shoot and Scoot	A type of fire-and-movement tactic used by artillery to avoid counter-battery fire.
Siege	A military blockade of a city or fortress with the intent of conquering by force or attrition, often accompanied by an assault in the later phase.
Siege en régle	A siege where a city or fortress is invested but no bombardment or assault takes place. Instead, the besieger attempts to persuade the defenders to surrender through negotiation, inducement, or through privations such as starvation. This may be done because the fortress is too strong for the attackers to capture through bombardment and assault.
Circumvallation	A line of fortifications built by the attackers around the besieged fortification facing towards it.
Contravallation	A second line of fortifications behind the circumvallation facing away from the enemy fort to protect the besiegers from attacks by allies of the besieged.
Escalade	The act of scaling defensive walls or ramparts with the aid of ladders, a prominent feature of siege warfare in medieval times.
Chevaux De Frise	Sword blades chained together to incapacitate people trying to charge into a breach in the walls.
Investment	Surrounding an enemy fort (or town) with armed forces to prevent entry or escape.
Military Mining	Undermining of defence positions either fortifications or enemy front line trenches.
Sapping	Digging approach trench towards enemy fortifications within range of the besieged guns.
Siege Engines	Specialised weapons used to overcome fortifications of a besieged fort or town; in modern times, the task has fallen to large artillery pieces.
Siege Train	Specialised siege artillery moved in a column by road or by rail.
Siege Tower	A wooden tower on wheels constructed to protect assailants and ladders while approaching the defensive walls of a fortification.
Sortie	A sudden attack against a besieging enemy from within a besieged fort or town.
Surrender at Discretion	Unconditional surrender instead of surrendering with terms.
Skirmish	Skirmishers are light infantry or cavalry soldiers in the role of skirmishing—stationed to act as a vanguard, flank guard, or rearguard, screening a tactical position or a larger body of friendly troops from enemy advances.
Vedette	A mounted sentry or outpost, who has the function of bringing information, giving signals or warnings of danger, etc.
Withdrawal	Retreat (i.e., pulling back) of troops from a battlefield (can be either orderly or unorderly; fighting or by rout)

Engineering

Banquette	A banquette is a small foot path or elevated step along the inside of a rampart or parapet of a fortification. Musketeers atop it were able to view the counterscarp, or fire on enemies in the moat.
Bartizan	A cylindrical turret or sentry post projecting beyond the parapet of a fort or castle
Bastion	A bastion or bulwark is a structure projecting outward from the curtain wall of a fortification, most commonly angular in shape and positioned at the corners.
Bastion Fortress	A star-shaped fortress surrounding a town or city.
Battery	An artillery position, which may be fortified.
Berm	A berm is a level space, shelf, or raised barrier (usually made of compacted soil) separating two areas. It can serve as a fortification line, a border/separation barrier, in industrial settings, or in many other applications.
Blast Wall	A barrier for protection from high explosive blast.
Blockhouse	a) Medieval and Renaissance - a small artillery tower, b) 18th and 19th centuries - a small colonial wooden fort, c) 20th century - a large concrete defensive structure.
Breastwork	A breastwork is a temporary fortification, often an earthwork thrown up to breast height to provide protection to defenders firing over it from a standing position.
Bunker	A heavily fortified, mainly underground, facility used as a defensive position; also commonly used as command centres for high-level officers.
Caponier	A defensive firing position either projecting into, or traversing the ditch of a fort.
Carnot Wall	A wall pierced with loopholes, sited above the scarp of a ditch but below the rampart.
Casemate	A vaulted chamber for protected storage, accommodation or if provided with an embrasure, for artillery.
Castle	A castle is a type of fortified structure built during the Middle Ages by predominantly the nobility or royalty and by military orders.
Arrow Slit	An arrowslit (often also referred to as an arrow loop, loophole or loop hole, and sometimes a balistraria) is a narrow vertical aperture in a fortification through which an archer can launch arrows.
Barbican	A barbican is a fortified outpost or gateway, such as an outer defence to a city or castle, or any tower situated over a gate or bridge which was used for defensive purposes.
Chemin de ronde	A chemin de ronde—also called an allure, alure or, more prosaically, a wall-walk—is a raised protected walkway behind a castle battlement.
Concentric Castle	A concentric castle is a castle with two or more concentric curtain walls, such that the inner wall is higher than the outer and can be defended from it. The word concentric does not imply that these castles were circular; in fact, if taken too literally, the term is quite misleading.
Drawbridge	A drawbridge or draw-bridge is a type of movable bridge typically associated with the entrance of a castle and a number of towers, surrounded by a moat.
Gatehouse	A gatehouse is an entry control point building, enclosing or accompanying a gateway for a town, religious house, castle, manor house, or other fortification building of importance.
Keep	A keep is a type of fortified tower built within castles during the Middle Ages by European nobility.
Moat	A moat is a deep, broad ditch, either dry or filled with water, that is dug and surrounds a castle, fortification, building or town, historically to provide it with a preliminary line of defence.
Machicolation	A machicolation is a floor opening between the supporting corbels of a battlement, through which stones or other material, such as boiling water or boiling cooking oil, could be dropped on attackers at the base of a defensive wall.
Murder-Hole	A murder hole or meurtrière is a hole in the ceiling of a gateway or passageway in a fortification through which the defenders could fire, throw or pour harmful substances or objects, such as rocks, arrows, scalding water, hot sand, quicklime, tar, or boiling oil, down on attackers.
Portcullis	A portcullis (from the French porte coulissante, "sliding door") is a heavy vertically-closing gate typically found in medieval fortifications, consisting of a latticed grille made of wood, metal, or a combination of the two, which slides down grooves inset within each jamb of the gateway.
Citadel	A citadel is the core fortified area of a town or city. It may be a fortress, castle, or fortified centre.
Counterscarp	The opposing side of a ditch in front of a fortification, i.e., the side facing it.
Counter Mine	Anti-siege tunnel dug by a fortification's defenders below an attacker's mine with the intent of destroying it before the attackers are able to damage (the foundations of) the fortification's walls.
Defensive Fighting Position	For example, a rifle pit, sangar or fox hole.
Dragon's Teeth	Triangular obstacles acting as roadblocks for armoured vehicles.
Dutch Water Line	A series of water-based defensive measures designed to flood large areas in case of attack.
Embrasure	An opening in a parapet or casemate, for a gun to fire through.
Fascine	Is a bundle of sticks or similar, were used in military defences for revetting (shoring up) trenches or ramparts, especially around artillery batteries, or filling in ditches and trenches during an attack.
Flèche	An arrow shaped outwork, smaller than a ravelin or a lunette, with 2 faces with a parapet and an open gorge.
Fort	A fortification is a military construction or building designed for the defence of territories in warfare, and is also used to solidify rule in a region during peacetime.
Gabion	A large basket filled with earth, used to form a temporary parapet for artillery.
Glacis	A bank of earth sloping away from the fort, to protect it from direct artillery fire.
Gorge	Opening at the rear of an outwork for access by defending troops from the main defensive position.
Lunette	An outwork consisting of a salient angle with two flanks and an open gorge.
Magazine	A protected place within a fort, where ammunition is stored and prepared for use.
Outwork	A minor defence, built or established outside the principal fortification limits, detached or semidetached.
Parapet	A wall at the edge of the rampart to protect the defenders.
Pillbox	A small concrete guard post.
Polygonal Fort	A later type of fort without bastions.

Rampart	The main defensive wall of a fortification.
Ravelin	A triangular fortification in front of bastion as a detached outwork.
Redan	A V-shaped salient angle toward an expected attack, made from earthworks or other material.
Redoubt	A fort or fort system usually consisting of an enclosed defensive emplacement outside a larger fort, which can be constructed of earthworks, stone or brick.
Reduit	An enclosed defensive emplacement inside a larger fort; provides protection during a persistent attack.
Sangar	A small temporary fortified position with a breastwork originally of stone, but built of sandbags and similar materials in modern times.
Sally Port	A sally port is a secure, controlled entryway to a fortification or prison. The entrance is usually protected by some means, such as a fixed wall on the outside, parallel to the door—which must be circumvented to enter and prevents direct enemy fire from a distance.
Sconce	A small protective fortification, such as an earthwork, often placed on a mound as a defensive work for artillery.
Sea Fort	A coastal fort entirely surrounded by the sea, either built on a rock or directly onto the sea bed.
Slighting	The deliberate destruction of an (abandoned) fortification without opposition from its (former) occupants and/or defenders.
Sortie	A sortie (from the French word meaning exit) is a deployment or dispatch of one military unit, be it an aircraft, ship, or troops, from a strongpoint.
Star Fort	A star-shaped fortress surrounding a town or city (also known as Bastion fortress or Trace italienne).
Tenaille	An advanced pincer-shaped defensive work in front of the main defences of a fortress.
Terreplein	The fighting platform on top of a rampart, behind the parapet.
Tête-de-pont	A temporary defensive work defending a bridge at the end closest to the enemy.
Trace Italienne	A star-shaped fortress surrounding a town or city (also known as Bastion fortress or star fort).
Trench	Trench warfare is a type of land warfare using occupied fighting lines consisting largely of military trenches, in which troops are well-protected from the enemy's small arms fire and are substantially sheltered from artillery.
Defile	A geographic term for a narrow pass or gorge between mountains. It has its origins as a military description of a pass through which troops can march only in a narrow column or with a narrow front.
Blockade	A blockade is an effort to cut off supplies, war material or communications from a particular area by force, either in part or totally.
Crossing the Tee	Crossing the T or capping the T is a classic naval warfare tactic used from the late 19th to mid 20th centuries, in which a line of warships crosses in front of a line of enemy ships, allowing the crossing line to bring all their guns to bear while receiving fire from only the forward guns of the enemy.
Vanguard	The leading part of an advancing military formation.
Line Astern	In naval warfare, the line of battle is a tactic in which a naval fleet of ships forms a line end to end. Its first use is disputed, variously claimed for dates ranging from 1502 to 1652, with line-of-battle tactics in widespread use by 1675.
Raking Fire	In sailing naval warfare, raking fire is fire directed perpendicular to the long axis of an enemy ship from ahead or astern.
Scuttling	Scuttling is the deliberate sinking of a ship by allowing water to flow into the hull.
Weather Gage	The weather gage (sometimes spelled weather gauge) is the advantageous position of a fighting sailing vessel relative to another.

Tools

Transport

DOT	Department of Transportation
ELT	Emergency Locator Transmitter - A low-power transmitting device carried on light aircraft as required by federal law, and on most military aircraft. It is impact activated and transmits a distinctive sweeping tone that can be detected by aircraft mounted or hand-held direction finding (DF) equipment.
100MW	The "100 Mile Wilderness" is a remote stretch of the AT in northern Maine. The 100 Mile Wilderness is known for being very remote and grueling, with limited resupply options along the way. It's on my list of best New England Hikes.
Alpine Zone	The area near the tops of tall peaks where it's too windy and the soil is too thin to allow trees or large plants to grow. The exact altitude where the alpine zone starts can vary between regions and even mountains in similar regions, due to local weather patterns. Alpine Zones are usually covered in snow fields or Talus.
AMC	The "Appalachian Mountain Club" has a huge presence in the White Mountains of New Hampshire, as well as throughout some of the more popular backcountry destinations across New England. The run a number of high-end Huts.
AT	The "Appalachian Trail," a 2,184 mile long trail between Springer Mountain in Georgia and Mount Katahdin in Maine.
Beta	Beta is specific, insider information about a hike, usually coming from someone who just completed it. A lot of times you can get good beta about an upcoming hike by talking to people in town or on message boards. They might tell you about specific tricky spots, shortcuts, Caches or other good-to-know information.
Biner	Short for carabiner, those metal clips that climbers use to secure rope, slings and other gear. Often used by hikers to attach things to their pack or hang things up around camp.
Blaze	A colored mark, usually painted or nailed to a tree, about 4 inches tall by 2 inches wide. These are used to help guide hikers if the trail gets hard to follow or makes an abrupt turn. Some areas use color-coded systems to help hikers figure out which trail they're on.
Bluebird Day	A day marked by completely cloudless, clear blue skies. Such great weather has been known to cause a strong sense of euphoria and a hearty fist pump, especially when hiking up in Alpine Zones.
Book Time	Book Time is a reference to the estimated amount of time a hike should take, following this simple formula: 30 minutes for each mile plus 30 minutes for each 1,000 feet of elevation gain along the hike. It's the formula that the AMC and many others use to provide a ballpark estimate of a hike's duration.

Bushwhack	Bushwhacking is the process of travelling off-trail, sometimes through dense trees, branches and bushes. While trails are usually wide and clear, Bushwacking off-trail may be much slower since the hiker is required to detour around — or fight their way through — the bushes and trees in their way.
Cache	A Cache is a place where you store gear, food and other supplies before a long trip. The Cache is usually on or near the trail, allowing you to resupply when you reach it.
Cairn	A structure made of rocks used to mark a trail where trees aren't present for Blazes, like in Alpine Zones. Some are just loose piles while others are more decorative.
Camel Up	Cameling Up is a process to help you stay hydrated without needing to carry lots of heavy water bottles during your hike. When you reach a water source, you refill quickly -- usually with an inline filter like a Sawyer Mini -- and then gulp down all the water immediately before heading off down the trail again. This allows you to get the water into your system quickly while avoiding the need to carry heavy, full water bottles (~2.5 pounds per liter!) on the hike. A technique commonly used by Ultralight hikers.
Cat Hole	A small hole that you dig in order to bury poop and toilet paper. Only use Cat Holes in areas with at least 6-8" of soil and Detritus. In Alpine Zones, deserts and other areas, you may be expected to pack out your human waste in a plastic bag.
CDT	The "Continental Divide Trail," a 3,100 mile long trail, following the Continental Divide along the Rocky Mountains and traversing Montana, Idaho, Wyoming, Colorado, and New Mexico.
Col (or "Notch")	A col is the lowest point on the ridge between two peaks. Sometimes referred to as a "Notch" or "Saddle," it is the point where you stop descending one peak and start ascending the next one.
Contour Lines	Contour Lines appear on Topographic Maps and represent a line between all nearby points at the same elevation. If Contour Lines are close together in an area, that means it changes elevation quickly and is very steep. Contour lines tend to form circles around mountains (if the inner lines are higher elevation) or lakes (if the inner ones are lower elevation), and also point upstream when crossing over rivers.
Cowboy Camping	Cowboy Camping entails setting up camp the way the cowboys did out west -- under the open sky. Generally it's a sleeping bag on the ground with no tarp or tent overhead. It can be a great way to enjoy a clear, starry night, but make sure there's no rain in the forecast so you don't wake up soaking wet!
Declination (or Magnetic Declination)	Declination refers to the angle between "Magnetic North" (where your compass needle points) and "True North" (a straight line from you towards the actual North Pole). Depending on where in the world you are, these two measurements can differ by as much as 50°, so it's important to know the local Declination if you'll be taking precise bearings or doing any serious map and compass navigation.
Detritus (or Duff)	All of the leaves, pine needles, branches, sticks and other dead and decaying plant materials that cover most forest floors. In autumn when the leaves have just fallen, this can be many inches thick.
Dirtbag	An avid outdoorsman or woman who eschews the comforts of civilization in order to more fully realize their outdoor passion. Often dirty with unkempt hair and living in a vehicle, they're usually seen wearing flannel shirts and ski boots or climbing shoes.
EMS	While it might sometimes refer to "Emergency Medical Services," if someone is talking about gear that they bought at EMS, they're probably referring to "Eastern Mountain Sports," an outdoor retailer based in New England.
False Peak (or False Summit)	Depending on the shape of a mountain, you may look up the trail and think you see the peak just ahead. But once you reach that spot, you may be dismayed to see that it was just a shoulder or small bump - a False Peak - and that the real peak still likes farther up the trail.
FKT	The "Fastest Known Time" is the record for completing a section of trail (usually a Thru Hike) in the shortest possible time. There usually isn't a single authority that tracks FKT, instead it's up to the community to verify GPS data or social media posts the hiker made along the way to ensure the new record is "legit," although FKT records can still be somewhat controversial.
Ford	A Ford is a river crossing that involves getting your feet wet. If you anticipate a Ford on your trip, you'll usually bring sandals or a change of footwear to use -- never barefoot! Ideally, the water won't come much higher than your knees so that there's less risk of being swept away. Make sure you have a plan in case you lose your footing so that you and your stuff don't wash away. Trekking poles can help with stability during Fords. If the water level is very low, a Ford may turn into a simple, quick Rock Hop.
Glissade	Sliding down a snow-covered field on your rear end, like sledding without the sled. A much faster (and more fun) way to descend steep snow fields, just be careful that you can control your speed and direction so you don't slide into a tree or off a cliff.
GORP	Traditionally, Good Old Raisins and Peanuts. Some claim it's Granola, Oats, Raisins, Peanuts. Either way, it's usually a big bag full of salty and savory snacks that you eat by the handful.
GPS	The "Global Positioning System" is a constellation of satellites run by the US Military that powers everything from the turn-by-turn directions in your phone to the location tracking in your favorite navigation device.
Herd Path	An unofficial trail that's formed when a large numbers of hikers decide to all follow a similar footpath over time, similar to how game trails are formed by animals. They're usually created as hikers take a natural shortcut or easier path around some obstacle.
Hut	Huts can vary from dilapidated old sheds to full-service hotels. They are a permanent backcountry shelter with four walls and roof that can sleep any number of backpackers, depending on their size.
HYOH	Meaning "Hike Your Own Hike," the idea that we should all live and let live on the trail.
JMT	The "John Muir Trail" is a 210 mile trail that follows a section of the PCT. Almost entirely above 8,000 ft of elevation, much of the trail is in the Alpine Zone, with gorgeous big-mountain views and wildflowers.
Lean-to (or Leanto)	A sturdy shelter built along popular trails that consists of a raised floor, roof and three walls. They usually fit anywhere from four to a dozen backpackers. With one wall left open, lean-tos allow you to escape wind and precipitation while still performing camp chores like cooking.
LNT (or Leave No Trace)	"Leave No Trace" is a series of 7 principles designed to help backpackers and campers think about ways to minimize the impact that their presence has on the natural environment.
MEC	"Mountain Equipment Co-op" is the largest outdoor retailer in Canada. Originally catering specifically to alpine mountaineers, they've been moving to focus on a wider audience of outdoor enthusiasts.
Monorail	Monorail is the term used to describe the narrow band of snow and ice that remains down the center of a trail into late spring, even after most of the other snow has melted. It forces hikers to either walk on it like a balance beam or else forces them into the mud on either side.
NOBO	Short for "North Bound." A term used to describe Thru Hikers that start at the southern terminus of a long trail and head north.

NOLS	The "National Outdoor Leadership School" is one of the largest and most well-known outdoor education programs. They lead trips all over the world for students and adults of all ages. The also teach a number of wilderness medicine classes like WFR through their Wilderness Medicine Institute (WMI).
NPS	The National Park Service in the United States, in charge of running and protecting the National Parks.
PCT	The "Pacific Crest Trail," a 2,654 miles long trail through Washington, Oregon, and California following the highest portion of the Sierra Nevada and Cascade Range.
Peak Bagging	The process of summiting (or "bagging") a collection of related peaks in an area. It's like going through a to-do list of challenging but rewarding hikes. Popular Peak Bagging lists include the "New Hampshire 4000 Footers" (48 peaks) and the "Colorado Fourteeners" (53 peaks).
Posthole	When hiking through fresh, deep snow, Postholing is when each step you take sinks far down into the snow, sometimes burying your entire leg. Postholing is extremely tiring and slow-going. Groups of hikers will often switch up the person in the front, allowing the old leader the easier task of following in the new leader's footsteps (or Postholes).
PUD	"Pointless Ups and Downs" are areas of annoyingly rolling terrain that don't actually result in any elevation gain. Despite some trails going up and over several 30' hills in a row, that section would appear as "flat" terrain on most Topographic Maps, causing extra frustration for any unsuspecting hikers. Knowing about PUDs ahead of time requires getting good Beta.
Redline	To have "Redlined" an area means that you've hiked every single inch of trail in it, including all of the major trails as well as all of the smaller connector sections. Print out a map of the area you want to Redline and trace all the trails you've already done with a red marker. Whatever is left uncovered is where you hike next. You've completed a Redline attempt when every section of every trail is "Redlined out". It's the ultimate measure of really knowing an area like the back of your hand.
Rock Hop	A Rock Hop is a river or stream crossing that can be done without getting your feet wet. Generally done by hopping from rock to rock through a low-running channel of water. A Rock Hop is generally faster and safer than a Ford.
SAR	Stands for "Search and Rescue," they're almost always volunteers who leave their families and careers behind when backcountry enthusiasts get themselves into trouble.
Scree	A field of loose rocks smaller than the size of your head. It can be very tricky to keep your footing in a Scree field. The small rocks will often move or slide underfoot, making it very tricky to avoid ankle or knee injuries.
Section Hike	When someone isn't able to complete a Thru Hike in one contiguous effort, they may instead choose to complete the trail over a longer period by hiking smaller sections of it and returning to society in between. A term popularized by Phillip Werner.
SOBO	Short for "South Bound." A term used to describe Thru Hikers that start at the northern terminus of a long trail and head south.
Stealth Camp (or Dispersed Camp)	To setup a low-impact campsite in a more pristine nook, away from more heavily-used campsites. It can be useful to help avoid bugs, bears, mice and other creatures that have become accustomed to campers' presence in a certain area. Stealth camping is frowned upon by many since it is hard to do well and truly Leave No Trace. In popular areas, it's better to centralize the human traffic to one area to avoid leaving marks and blemishes all over the landscape.
Switchbacks	When a trail zig-zags back-and-forth up a very steep section of terrain. It adds distance to a trail but also makes it easier to hike - think of climbing straight up a ladder versus covering the same height on a very long ramp. Switchbacks also help prevent erosion on steep slopes, so be sure to follow the trail and avoid the temptation to cut straight up.
Talus	A field of larger boulders that often requires hands and feed to scramble over. Route-finding can be very slow and laborious through Talus fields. Commonly found in Alpine Zones.
Thru Hike	Hiking an entire trail contiguously from end-to-end, usually at least 100 miles over more than a week. Famous Thru Hikes include the Appalachian Trail (AT) and Pacific Crest Trail (PCT).
Thru Hiker	Someone who is in the process of completing a Thru Hike.
Topo (or Topographic)	Topography focuses on the shape and features of the land — hills and valleys, rivers and lakes. A topographic map (or "Topo Map") is one that shows the natural features of a landscape, including Contour Lines of similar elevation.
Trail Angel	A local who isn't actively hiking the trail but does nice things for hikers who are. Trail Angels may run van shuttles from the trailhead into town, or leave Caches of snacks or beer along the trail.
Trail Name	Often Thru Hikers will adopt a moniker or nickname while they're on the trail. It usually has an interesting backstory and tends to be given by another Thru Hiker after a particularly memorable experience. It can be a way for the Thru Hiker to dissociate their "real" identity back home with the antics they're up to on the trail.
Trail Magic	Trail Magic is a surprise treat or Cache left on the trail for future hikers to enjoy. Sometimes they're intentionally left by Trail Angels and sometimes they're lost or discarded items that earlier hikers left behind.
Trailhead	The trailhead is the place where your hike starts or stops -- where you cross over from being in civilization to being in the backcountry. Most trailheads have a parking lot and many offer free maps or signs with information about the hikes you can access from them.
Triple Crown	The crowning accomplishment of Thru Hiking the AT, PCT. and CDT.
Zero Day (or Take a Zero)	A zero day is when you spend two nights in a row in the same campsite and don't do any hiking during the day. This can be used on longer Thru Hikes to help recover from injury, rest, or wait out a storm.

Warfare

Water

Adsorption	The process by which molecules of a substance, such as a gas or a liquid, collect on the surface of another substance, such as a solid. The molecules are attracted to the surface but do not enter the solid's minute spaces as in absorption.
Bacteria	Simple, single cell organisms that are found everywhere on earth. They are essential for maintaining life and performing essential "services", such as composting, aerobic degradation of waste, and digesting food in our intestines. Some types, however, can be pathogenic and cause mild to severe illnesses. Bacteria obtain nutrients from their environment by excreting enzymes that dissolve complex molecules into more simple ones, which can then pass through the cell membrane.

Biofilm	A thin, slimy film of bacteria that adheres to surfaces, which are regularly in contact with water. The structure of biofilms is quite complex consisting of colonies of bacteria and other microorganisms such as yeasts, fungi, and protozoa. Biofilms can be a problem for drinking water supply (pipe fouling). But they are also widely used water purification (e.g. biosand filters, slow sand filtration) or in biological wastewater treatment (e.g. rotating biological contactor, trickling filter). Synonyms: Schmutzdecke
Colloidal Silver	Colloidal silver are tiny silver particles suspended in liquids - commonly distilled water. They are used as disinfectant in ceramic filters, preventing bacterial growth and assisting inactivation of bacteria.
Cryptosporidium	Cryptosporidium is a protozoan that can cause gastro-intestinal illness with diarrhoea in humans.
Escherichia Coli	Escherichia Coli is a type of bacteria that inhabits the intestinal tract of humans and other mammals. It is not necessarily harmful, but it is used as an indicator of faecal contamination of water.
Evapotranspiration	The combined loss of water from a surface by evaporation and plant transpiration. It is the process by which water is transferred from vegetated soil to the atmosphere.
Filtration	A mechanical separation process using a porous medium (e.g., cloth, paper, sand bed, or mixed media bed) that captures particulate material and permits the liquid or gaseous fraction to pass through. The size of the pores of the medium determines what is captured and what passes through.
Giardia	Giardia lives inside the intestines of infected humans or other animals. Individuals become infected through ingesting or coming into contact with contaminated food, soil, or water. The Giardia parasite originates from contaminated items and surfaces that have been tainted by the faeces of an infected animal.
White Water	Untainted tap water.
Grey Water	Or 'sullage' is all wastewater generated in households or office buildings from streams without faecal contamination.
Black Water	Wastewater containing faeces, urine and flushwater from flush toilets along with anal cleansing water.
Kelly Kettle	Kelly Kettle is the trade name for a chimney style kettle intended for rapid boiling.
Soft Water	Soft water is surface water that contains low concentrations of ions and in particular is low in ions of calcium and magnesium. Soft water naturally occurs where rainfall and the drainage basin of rivers are formed of hard, impervious and calcium poor rocks.
Hard Water	Water that has high mineral content. Hard water is formed when water percolates through deposits of limestone and chalk which are largely made up of calcium and magnesium carbonates.
Potable Water	Any water that is fit for consumption.
Freshwater	Water that contains less than 1,000 mg per litre of dissolved solids. Generally more than 500mg/L is undesirable for drinking.
Artesian Water	Ground water that is under pressure when tapped by a well and is able to rise above the level at which it is first encountered.
Lentic Waters	Ponds or lakes, as in standing water.
Lotic Waters	Flowing waters, as in streams and rivers.
Saline Water	Water that contains significant amounts of dissolved solids. Fresh Water - <1k ppm Slightly Saline - 1k-3k ppm Moderate Saline - 3k-10k ppm Highly Saline - 10k-35k ppm
Desalinization	The removal of salts from saline water to provide freshwater.
Aquifier	A geologic formation(s) that is water bearing. A geological formation or structure that transmits water, such as to wells and springs.
Estuary	A place where fresh and salt water mix, such as bay, salt marsh or where a river enters an ocean.
Ground Water	Water that flows or seeps down and saturates soil or rock, supplying springs and wells. The upper surface of the saturate zone is called the water table.
Absorption Chiller	Absorption chillers are refrigerators that use heat energy as an input, rather than mechanical energy. Absorption chillers are useful, where electricity is no available or where there is an easily available source of heat (e.g. sun, hot water). The heat is used to evaporate a liquid to a gas. The gas then moves to the condenser where the heat dissipates and the gas is turned back into a liquid. Then, the cooled liquid is directed into the evaporator, where it turns into a gas and pulls heat from the air. Then the gas moves from the evaporator into the compressor and the process starts again.
Accumulation System	An accumulation tank or a continuously fed batch is characterised by an increasing effective reactor volume with time. When the reactor is full and reaction time is over, it is emptied and refilled again as batch reactors.
Acidic	Acidic is an adjective describing the properties of having a pH below 7. Its opposite is alkaline or basic.
Aeroponic	Aeroponics is the process of growing plants in an air or mist environment without the use of soil or an aggregate medium. The word "aeroponic" is derived from the Greek meanings of "aero" (air) and "ponos" (labour). Unlike hydroponics, which uses water as a growing medium and essential minerals to sustain plant growth, aeroponics is conducted without a growing medium. Aeroponic equipment involves the use of sprayers, misters, foggers, or other devices to create a fine mist of water to deliver nutrients to plant roots. Because water is used in aeroponics to transmit nutrients, it is sometimes considered a type of hydroponics.
Air Stripping	Air stripping is the transferring of volatile components of a liquid into an air stream. It is a chemical engineering technology used for the purification of groundwater and wastewater containing volatile compounds.
Algal Bloom	A rapid increase in the population of algae in an aquatic system, e.g. as a result of an excess of nutrients (particularly phosphorus and nitrogen). As more algae and plants grow, others die. This dead organic matter becomes food for bacteria that decompose it. With more food available, the bacteria increase in number and use up the dissolved oxygen in the water. When the dissolved oxygen content decreases, many fish and aquatic insects cannot survive.
Alkalinity	The alkalinity measures the capacity of water to neutralise acids. The alkalinity depends on amount of carbonates, bicarbonates, hydroxides, and occasionally borates, silicates and phosphates. Alkalinity stabilises water at pH levels around 7 (neutral). However, high water acidity decreases alkalinity and may cause harmful conditions for aquatic life. Alkalinity is expressed in ppm or mg of calcium carbonate per litre (mg/L $CaCO_3$).
Anaerobic Filter	An anaerobic filter is a fixed-bed biological reactor with one or more filtration chambers in series. As wastewater flows through the filter, particles are trapped and organic matter is degraded by the active biomass that is attached to the surface of the filter material. Anaerobic filters are similar to septic tank, with the difference, that wastewater, once entered into the tank must flow downwards (anaerobic downflow filter) or upwards through a filter media (anaerobic upflow filter). Anaerobic filters are used as secondary treatment in household-level or decentralised wastewater treatment systems. As for any anaerobic digestion process, biogas can be recovered and transformed to energy or light.

Anal Cleansing Water	Anal Cleansing Water is water used to cleanse oneself after defecating and/or urinating; it is generated by those who use water, rather than dry material, for anal cleansing. The volume of water used per cleaning typically ranges from 0.5 L to 3 L.
Aquaculture	Aquaculture refers to the controlled cultivation of aquatic plants and animals such as fish, crustaceans and aquatic plants. Aquaculture can be part of an integrated sanitation system making use of nutrients and heat from pre-treated wastewater.
Aquaponic	Aquaponics is the symbiotic cultivation of plants and aquatic animals in a recirculating environment. Aquaponic comes from the two words aquaculture and hydroponic. The main aim of such systems is the recycling of the nutrients contained in the water from aquatic animal effluent. The system contain of to interlinked compartement, one for growing plants and one for growing aquatic animals. The plants take up the nutrients, allowing them to grow and reducing or eliminating the water's toxicity for the aquatic animal. Thus the water can be recirculated back to the animal pond where it will be charged again by nutrients.
Aquifer	An aquifer is a wet underground layer of water-bearing permeable rock or unconsolidated materials (gravel, sand, or silt) from which groundwater can usefully be extracted using a water well.
Artesian Spring	Artesian springs occur when water is trapped between impervious layers and is forced to the surface under pressure. At these springs, the water comes out of the ground vertically.
Backwash	One of the best ways to clean a water system's filter is to backwash it, meaning reversing the flow and increasing the velocity at which water passes back through the filter. This, in effect, blasts the clogged particles off of the filter. Although every filter is unique, the principles of backwashing are similar for all of them. The disadvantage with backwashing is that it requires energy-driven pumps and the backwash water and sludge has to be treatment (e.g. in waste stabilisation ponds) before safe discharge or reuse.
Bacteria	Simple, single cell organisms that are found everywhere on earth. They are essential for maintaining life and performing essential "services", such as composting, aerobic degradation of waste, and digesting food in our intestines. Some types, however, can be pathogenic and cause mild to severe illnesses. Bacteria obtain nutrients from their environment by excreting enzymes that dissolve complex molecules into more simple ones, which can then pass through the cell membrane.
Bank Filtration	Bank filtration is the infiltration of surface water, mostly from a river system, into a groundwater system induced by water abstraction close to the surface water e.g. a river bank. This water abstraction is commonly done by operating wells. As the water flows through the soil, it is filtered and the quality is improved. In the context of developing or newly-industrialised countries, BF may bring relief by replenishing stressed groundwater resources with surface water, which receives treatment while percolating through the soil and is mixed with the groundwater aquifer.
Bio-Char	Bio-char is a fine-grained charcoal produced from pyrolysis: the slow burning of organic matter in a low- or no-oxygen environment. Bio-char is promoted as a soil additive in order to enhance the soil black carbon content and thus the soil water and nutrient retention capacity.
Biofilm	A thin, slimy film of bacteria that adheres to surfaces, which are regularly in contact with water. The structure of biofilms is quite complex consisting of colonies of bacteria and other microorganisms such as yeasts, fungi, and protozoa. Biofilms can be a problem for drinking water supply (pipe fouling). But they are also widely used water purification (e.g. biosand filters, slow sand filtration) or in biological wastewater treatment (e.g. rotating biological contactor, trickling filter).
Biogas	Biogas is the common name for the mixture of gases released from anaerobic digestion. Biogas is comprised of methane (50 to 75%), carbon dioxide (25 to 50%) and varying quantities of nitrogen, hydrogen sulphide, water vapour and other components. Biogas can be collected and burned for fuel (like propane).
Biological Treatment	The biological treatment of waste and wastewaters consist in the use of microbial activity (bacteria, funghi and other microorganisms) for the degradation and decomposing of biodegradable pollution. This is in contrast to chemical treatment, which relies on chemicals to transform or remove contaminants from waste.
Biomass	Biomass refers to plants or animals cultivated using the water and/or nutrients flowing through a sanitation system. It may include fish, insects, vegetables, fruit, forage or other beneficial crops, which can be utilized for food, feed, fibre and fuel production.
Biosolid	Biosolids, also referred to as treated sludge, is a term used to denote the by-product of wastewater treatment. Biosolids are generally rich in organic matter and nutrients and it can therefore be used as a soil amendment. Depending of the applied wastewater treatment, the resulting biosolids may require further treatment for the removal of pathogens before reuse.
Blackwater	Blackwater is the mixture of urine, faeces and flushwater along with anal cleansing water (if water is used for cleansing) and/or dry cleansing materials. Blackwater contains the pathogens of faeces and the nutrients of urine that are diluted in the flushwater.
Bottle Irrigation	The bottle is first filled up with water and then placed upside down in the ground next to the plant. Because of its density the water is only released slowly into the ground to reach the roots.
Bottled Water	Bottled water is widely available in both industrialised and developing countries. Consumers purchase packaged drinking-water for reasons such as taste, convenience or fashion, but safety and potential health benefits are also important considerations. Bottled water is most commonly sold in glass or disposable plastic bottles. Bottled water also comes in various sizes, from single servings to large carboys holding up to 80 litres.
Brackish Water	Brackish water contains more salt than fresh water and less than salt water. It is commonly found in estuaries, which are the lower courses of rivers where they meet the sea, and aquifers, which are stores of water underground.
Brownwater	Brownwater is the mixture of faeces and flushwater, and does not contain urine. It is generated by urine-diverting flush toilets and, therefore, the volume depends on the volume of the flushwater used. The pathogen and nutrient load of faeces is not reduced, only diluted by the flushwater. Brownwater may also include Anal Cleansing Water (if water is used for cleansing) and/or Dry Cleansing Materials.
Capillary Water	Capillary water is held in pores that are small enough to hold water against gravity, but not so tightly that roots cannot absorb it. This water occurs as a film around soil particles and in the pores between them and is the main source of plant moisture. As this water is withdrawn, the larger pores drain first. The finer the pores, the more resistant they are to removal of water. As water is withdrawn, the film becomes thinner and harder to detach from the soil particles. This capillary water can move in all directions in response to suction and can move upwards through soil for up to two meters, the particles and pores of the soil acting like a wick.
Capillary Zone	The capillary zone is the area in the soil where water can rise up slightly through the cohesive force of capillary action. It is generally an intermediate zone in the vadose zone between the dry zone, above the groundwater table.
Centralised Water Supply	Centralised (drinking) water supply refers to the centralised treatment and purification of water sources and subsequent distribution to different water users (households, industry, agriculture) through a large water distribution network.

ADDENDUM	Dictionary	Water	**Cesspit**	A cesspit is an ambiguous term either used to describe an underground holding tank or a soak pit. An underground pool (also called cesspool) is a tank pit used for the temporary collection and storage of faeces, excreta or faecal sludge. The pit is lined with bricks or concrete, covered with a slab and needs to be emptied frequently. When soil conditions allow, the pit is not constructed watertight (similar to a soak pit) allowing liquid to leach out, while solids decay and collect in the base. A soak pit requires less frequent emptying but leachate infiltration may cause groundwater pollution.
			Charcoal	Charcoal is a lightweight, black, porous material similar to coal. It consists of carbon (about 50 to 95 %) and volatile chemicals and ash. Charcoal is usually produced by slow pyrolysis, the heating of wood, sugar, bone char, or other substances in the absence of oxygen. It can also be produced by some enzymatic conversion of organic mater. The backbones of charcoal are polycondensed aromatic moieties which are chemically and biologically persistent. Charcoal is a valuable soil amendment (see also terra preta), retaining nutrients at their surface and improving the soil structure leading to enhanced water and air retention.
			Chemical Sedimentation	Chemical sedimentation is like normal sedimentation but coagulants are used in order to neutralise repelling surface charge of particles. Once these repelling surface charges are neutralised, the particles attach to each other forming clusters and flocs, which become heavier and therefore settle more easily to the bottom.
		Water	**Chemical Treatment**	Chemical treatment of wastewaters uses chemicals to degrade and remove pollutant or pathogens form wastewaters. In regard to wastewater, a typical chemical treatment is the co-precipitation of iron and phosphorus (e.g. in activated sludge systems). Other common chemical treatments are advanced oxidation processes (e.g. ozonation) used, where pollutants are toxic to bacteria and a biological treatment is not possible. A typical drinking water chemical treatment is chlorination
			Chlorination	Chlorination generally refers to the addition of chlorine to water or sewage in order to kill pathogen and achieve disinfection.
			Chlorine Residual	Chlorine residual is a level of chlorine remaining in water after initial treatment. It constitutes an important safeguard against the risk of subsequent microbial recontamination and inhibits the growth of bacteria.
			Coagulant	Coagulants are chemicals used to enhance sedimentation. Coagulants neutralise surface charges of repelling particules, allowing them to approach, attach and form clusters. The clusters are larger in size and heavier and thus more easy to settle and remove from the water. See also coagulation or chemical sedimentation.
		Water	**Coagulation**	The destabilization of particles in water by adding chemicals (e.g., aluminium sulphate or ferric chloride) so that they can aggregate and form larger flocs. Coagulation is often used in combination with flocculation.
ADDENDUM			**Coagulation-Flocculation**	Coagulation and floculation describe the chemical process of contact and adhesion whereby the particles of a dispersion (colloids) form larger-size cluster (flocs or flakes) allowing them to be more easely removed from water (e.g. by settling). The coagulation-flocculation processes facilitate the removal of suspended and colloidal particles. It's used in the first stage of solids-liquids separation: settling, flotation or filtration.
			Colloidal Silver	Colloidal silver are tiny silver particles suspended in liquids. They are used as disinfectant in ceramic filters, preventing bacterial growth and assisting inactivation of bacteria.
			Combined Sewer	Combined sewers collect blackwater, greywater and stormwater runoff in one ant the same single pipe system. Combined sewers provoke the pollution of little polluted water by mixing it with heavily polluted water. This particularly results in pollution when sewers overflow during heavy rain periods. As combined sewers need to be large, they can also be more expensive to install. Today, combined sewers are perceived as obsolete and in newer construction separated sewer systems are installed instead, although many systems remain combined as the replacement of an existing systems would be too expensive.
		Water	**Compost Filter**	A compost filter is a novel alternative pre-treatment method. Wastewaterflows through an aerobic filter. Solids (toilet paper, faeces) are held back in the filter, liquids are pumped to a secondary treatment facility (e.g. constructed wetland or waste stabilisation pond). There are two types of compost filters: chamber filter or hanging bags.
			Compressor	Compressors are similar to pumps: both increase the pressure on a fluid and both can transport the fluid through a pipe. The increased pressure can directly be transformed into mechanical energy.
ADDENDUM			**Condominal Sewer**	Condominial sewerage is the application of simplified sewerage coupled with consultations and on-going interactions between users and agencies during planning and implementation. The term is used primarily in Latin America and is derived from the term condominio/condominium (housing block).
			Confined Aquifers	Saturated permeable soil (sand or gravel) capped by an impermeable layer.
		Water	**Conjunctiveuse**	Conjunctive use describes the combined use of groundwater and surface water. In order to achieve higher water reliability, the natural hydrologic connection between ground and surface water is used as efficiently as possible. The idea of this management approach is to use surface water when the water table is high and change to groundwater when the water table is low.
			Cooling Tower	Cooling towers are one of the most common water recycling technologies in use by industry today. By taking advantage of water's high heat of evaporation, cooling towers offer effective and relatively inexpensive cooling for a wide range of industrial uses. 2/3 industrial water is used for cooling water (removal of heat). In some industries such as electric power plants or oil refineries, even up to 90% of intake water is used for cooling. Cooling water is easy to treat and sometimes even of quite a good quality. It can therefore easily be reused for example for washing processes. However, once used for washing and eventually contaminated, an appropriate treatment system before reuse is required.
			Cooling Water	Cooling water is the water used in industry to remove heat from processes. 2/3 industrial water is used as cooling water (removal of heat). In some industries such as electric power plants or oil refineries, even up to 90% of intake water is used as cooling. Cooling water is often not much polluted and can easily be reused for instance for cleaning processes. The heat, stored in the water after cooling can also be reused in other industrial or agricultural processes that require heating instead of cooling.
ADDENDUM		Water	**Decentralised Water Supply**	Decentralised supply systems offer the possibility to provide safe drinking water where centralised supply systems are not feasible for economic or political reasons (e.g. in rural communities or informal settlements). Decentralised water supply refers to the small-scale purification and distribution o water. The decentralised treatment systems fall into three main categories: point-of-use systems (POU), point-of-entry systems (POE), and small-scale systems (SSS). POU and POE systems are designed for individual households while SSS can provide for community water supply, for emergency water supply in camps, or to purify water for sale in water kiosks. The choice of decentralised supply system depends on the local context and includes such factors as ease of use, maintenance needs, dependence on other utilities (e.g. electricity, fuel supply), and cost.
			Deep Dug Well	Deep dug wells are dug wells over 20 metres in depth, thus, unlikely to get contaminated but costly to construct.
		Water	**Deep Shaft**	Deep shafts are enhanced biological wastewater treatment systems. They are based on the process of activated sludge systems but particularly adapted where land is in short supply. Oxygen is injected into a return sewage stream, which is injected into the base of a deep columnar tank buried in the ground. As the sewage rises the oxygen forced into solution by the pressure at the base of the shaft breaks out as molecular oxygen providing a highly efficient source of oxygen for the microorganisms contained in the activated sludge. The rising oxygen and injected return sludge provide the physical mechanism for mixing. Mixed sludge and wastewater is decanted at the surface, the sludge is again enriched in oxygen while the supernatant continuously flows out of the system. The efficiency of deep shaft treatment can be high but they require high skilled labour for both, construction and operation and maintenance and large amount of energy.
			Deep Well	A deep well is a hand-dug water well ranging more than 7m in depth and about 1.5m in diameter.

Dehydration of Faeces	When faeces are stored in the absence of moisture (i.e., urine), they dehydrate into a crumbly, white-beige coarse, flaky material or powder. The moisture naturally present in the faeces evaporates and/or is absorbed by the drying material (e.g., ash, sawdust, lime) that is added to them. Dehydration by adding dry organic material and long-term storage at high ambient temperature is the simplest treatment in order to transform faeces into a product that is safe for reuse as soil conditioner or disposal.
Dehydration Vaults	Dehydration vaults are used to collect, store and dry (dehydrate) faeces. Faeces will only dehydrate when the vaults are well ventilated, watertight to prevent external moisture from entering, and when urine and anal cleansing water are diverted away from the vaults. See also dehydration of faeces.
Desludging	The process of removing the accumulated sludge from a sanitation storage or treatment facility (e.g. pit toilet, septic tank).
Dewatering	The process of reducing the water content of a sludge or slurry. Dewatered sludge may still have significant moisture content, but it typically is dry enough to be conveyed as a solid (e.g., shovelled).
Digestate	The solid and/or liquid material remaining after undergoing anaerobic digestion.
Dioxins	Dioxins are a class of chemical contaminants that are formed during combustion processes such as waste incineration, forest fires, and backyard trash burning, as well as during some industrial processes such as paper pulp bleaching and herbicide manufacturing. The most toxic chemical in the class is 2,3,7,8-tetrachlorodibenzo-para-dioxin (TCDD). The highest environmental concentrations of dioxin are usually found in soil and sediment, with much lower levels found in air and water. Humans are primarily exposed to dioxins by eating food contaminated by these chemicals.
Direct Surface Groundwater Recharge	In direct groundwater recharge water moves from storage above-ground (e.g. a spreading basin or ditch) to the aquifer via soil percolation. Most of the existing large-scale artificial recharge schemes in Western countries make use of this technique. In general direct surface recharge systems based on percolation have relatively low construction costs and are easy to operate and maintain.
Disinfection	The elimination of (pathogenic) microorganisms by inactivation (using chemical agents, radiation or heat) or by physical separation processes (e.g., membranes). The process is used for water purification or for advanced or tertiary wastewater treatment.
Disinfection By-Product	The use of chemical disinfectants in water treatment usually results in the formation of chemical by-products, some of which are potentially hazardous. If chlorination is practised, the trihalomethanes, of which chloroform is the major component, are likely to be the main disinfection by-products, together with the chlorinated acetic acids in some instances. However, the risks to health from these by-products are extremely small in comparison with the risks associated with inadequate disinfection, and it is important that disinfection should not be compromised in attempting to control such by-products.
Dissolved Oxygen	The concentration of oxygen dissolved in water, expressed in mg/l or as percent saturation, where saturation is the maximum amount of oxygen that can theoretically be dissolved in water at a given altitude and temperature.
Drinking Water	Freshwater that is chemically and biologically safe for human consumption, naturally or by purification.
Drip Irrigation	In drip irrigation, water flows through a filter into special drip pipes, with emitters located at different spacing. Water is discharged through the emitters directly into the soil near the plants through a special slow-release device. If properly designed, installed, and managed, drip irrigation may help achieve water conservation by reducing evaporation and deep drainage as compared to other types of irrigation such as flood or overhead sprinklers since water can be more precisely applied to the plant roots.
Dry Cleansing Material	Dry Cleansing Materials are solid materials used to cleanse one-self after defecating and/or urinating(e.g., paper, leaves, corncobs, rags or stones). Depending on the system, Dry Cleansing Materials may be collected and separately disposed of. Although extremely important, a separate menstrual hygiene products like sanitary napkins and tampons is often forgotten. In general (though not always), they should be treated along with the solid waste generated in the household.
Dry Toilet	A dry toilet is a toilet that operates without flushwater. The dry toilet may be a raised pedestal on which the user can sit, or a squat pan over which the user squats. In both cases, excreta (both urine and faeces) fall through a drop hole.
Drying Bed	Drying beds are either planted or unplanted sealed shallow ponds filled with several drainage layers and designed for the separation of the solid from the liquid fraction of (faecal) sludge from latrines, septic tanks, biogas reactors, trickling filters, etc. Sludge is dried naturally by a combination of percolation and evaporation and evapotranspiration. When drying beds are covered with plants, evaporation is enhanced by transpiration (evapotranspiration). See also planted drying beds and unplanted drying bed.
Effluent	Effluent is the general term for a liquid that leaves a technology, typically after blackwater or sludge has undergone solids separation or some other type of treatment. Effluent originates at either a collection and Storage or a (semi-) centralized treatment technology. Depending on the type of treatment, the effluent maybe completely sanitized or may require further treatment before it can be used or disposed of.
End-of-pipe	End-of-pipe techniques are methods used to remove already formed contaminants from a stream of air, water, waste, product or similar (instead of using cleaner production options). These techniques are called 'end-of-pipe' as they are normally implemented as a last stage of a process before the stream is disposed of or delivered.
Evaporation	The phase change from liquid to gas that takes place below the boiling temperature and normally occurs on the surface of a liquid.
Evaporation Bed	Evapotranspiration beds are an alternative secondary treatment solution for greywater, pre-treated effluents from septic tanks, anal cleansing water or urine from urine diversion toilets in areas with high groundwater tables, or with soils that prevent wastewater percolation and where the productive reuse of these wastewater flowstreams is not a preferred option. The respective wastewater effluents are discharged into sealed up receptacles where the water evaporates from the soil or transpires from the plants growing there in a process called evapotranspiration. The dissolved organic matter is removed by bacteria and the remaining nutrients are taken up by plants.
Evapotranspiration	The combined loss of water from a surface by evaporation and plant transpiration. It is the process by which water is transferred from vegetated soil to the atmosphere.
Excreta	Excreta consists of urine and faeces that is not mixed with any flushwater. Excreta is small in volume, but concentrated in both nutrients and pathogens. Depending on the quality of the faeces, it has a soft or runny consistency.
Facultative Pond	A lagoon that forms the second treatment stage in waste stabilisation ponds (WSPs). It is a shallow pond (1 to 2m) consisting of an aerobic zone close to the surface and a deeper, anaerobic zone. AS algae grow on the surface they produce oxygen, which is consumed by aerobic bacteria in the middle of the pond degrading the BOD. In the lower zones of the pond, anaerobic digestion takes place.
Faecal Coliform	Faecal coliforms are a group of bacteria (e.g. Escherichia coli) present in excreta. They are not necessarily harmful, but they are present in high numbers and relatively easy to detect. Therefore they are used to indicate the presence of other faecal bacteria, which may be present in small numbers only, but associated to a high health risk.

ADDENDUM	Dictionary	Water	**Faecal Sludge**	Faecal sludge comes from onsite sanitation technologies, and has not been transported through a sewer. It is raw or partially digested, a slurry or semisolid, and results from the collection, storage or treatment of combinations of excreta and blackwater, with or without greywater. Examples of onsite technologies include pit latrines, unsewered public ablution blocks, septic tanks, aqua privies, and dry toilets. Faecal sludge management includes the storage, collection, transport, treatment and safe enduse or disposal of faecal sludge. Faecal sludge is highly variable in consistency, quantity, and concentration.
ADDENDUM	Dictionary	Water	**Faeces**	Faeces refer to (semi-solid) excrement that is not mixed with urine or water. Depending on diet, each person produces approximately 50 L per year of faecal matter. Fresh faeces contain about 80% water. Of the total nutrients excreted, faeces contain about 12% N, 39% P, 26% K and have 107 to 109 faecal coliforms in100 mL.
ADDENDUM	Dictionary	Water	**Fermentation**	Fermentation is the second step of anaerobic digestion. Fermentative bacteria transform sugars and other monomeric organic products from hydrolysis into organic acids, alcohols, carbon dioxide (CO2), hydrogen (H) and ammonia (NH3).
ADDENDUM	Dictionary	Water	**Fertigation**	The combined irrigation and fertilisation is called fertigation. There are different way how fertigation can be done: mixing chemical fertiliser with irrigation water; using partly treated wastewater which contains still nutrients; mixing (separately collected) urine as a nutrient source and mixing it to the irrigation water. Fertigation helps saving freshwater resources and decreases the dependency on depleting mineral fertilisers. Generally, drip irrigation and subsurface drip irrigation are the most appropriate application method for fertigation.
ADDENDUM	Dictionary	Water	**Filter**	Water filters remove impurities (chemical, microbiological, physical etc.) from water. Different technologies are applied such as means of a fine physical barrier, a chemical process or a biological process.
ADDENDUM	Dictionary	Water	**Filtrate**	The liquid that has passed through a filter.
ADDENDUM	Dictionary	Water	**Filtration**	A mechanical separation process using a porous medium (e.g., cloth, paper, sand bed, or mixed media bed) that captures particulate material and permits the liquid or gaseous fraction to pass through. The size of the pores of the medium determines what is captured and what passes through.
ADDENDUM	Dictionary	Water	**First Flush Device**	First flush devices are used in rooftop rainwater harvesting (RTRWH) systems, in order to prevent debris, dirt, dust and droppings that collect on the catchment area from entering the collection and storage tank. Different types exist, such as float valve types, overflow flow types, flow rate types or electronic conductivity types. First flush diverter devices improve water quality, reduce tank maintenance and protect pumps.
ADDENDUM	Dictionary	Water	**Fixed-film System**	Fixed-film systems (also attached-growth systems) are biological wastewater treatment processes that employ a inert medium such as rock, plastic, wood, or other natural or synthetic solid material, that will support attached growth of biomass on its surface and within its porous structure. Wastewater comes into contact with the film contaiining the active fixed biomass either by pumping the water past the media in packed towers (i.e. trickling filter) or by moving the media past the wasewater to be treated (e.g. rotating biological contactor).
ADDENDUM	Dictionary	Water	**Floc**	A very fine, fluffy mass formed by the aggregation of fine suspended particles, as in a precipitate. See also flocculation.
ADDENDUM	Dictionary	Water	**Flocculation**	The process by which the size of particles increases as a result of particle collision. Particles form aggregates or flocs from finely divided particles and from chemically destabilized particles and can then be removed by settling or filtration. Flocculation is often used in combination with coagulation.
ADDENDUM	Dictionary	Water	**Flotation**	The process whereby lighter fractions of a wastewater, including oil, grease, soaps, etc., rise to the surface, and thereby can be separated.
ADDENDUM	Dictionary	Water	**Flush Urinal**	A flush urinal is a urinal used with water to flush away the urine. There are manual and automated flush techniques. Installing a flush urinal results in increased water consumption and the generation of the corresponding amount of wastewater. Waterless urinals, which work without water, have become increasingly popular.
ADDENDUM	Dictionary	Water	**Flushwater**	Flushwater is the water discharged into the User Interface to transport the content and/or clean it. Freshwater, rainwater, recycled Greywater, or any combination of the three can be used as a flushwater source.
ADDENDUM	Dictionary	Water	**Fog Drip**	Fog drip is a method to harvest the water contained in the fog. Fog harvesting provides a cheap complementary water source for arid and semiarid, rural regions. As the wind blows the fog through specially designed nets (fog collectors), tiny droplets of condensed water form on the mesh and are collected in a gutter and transported to a storage site. The collected water does meet the WHO standards and can be used as drinking water. One large fog collector, with a 40 m2 collecting surface, can produce up to an average of 200 litres per day throughout the year, costs around 1000 to 1500 USD each and can last 10 years.
ADDENDUM	Dictionary	Water	**Fossa Alterna**	The Fossa Alterna is a short cycle alternating, waterless (dry) double pit technology. Compared to the double VIP which is just designed to collect, store and partially treat excreta, the Fossa Alterna is designed to make an earth-like product that can be used as a nutrient-rich soil conditioner. The Fossa Alterna is dug to a maximum depth of 1.5 m and requires a constant input of cover material (soil, ash, and/or leaves).
ADDENDUM	Dictionary	Water	**Fouling**	Fouling refers to the accumulation of unwanted material on solid surfaces, most often in an aquatic environment. The fouling material can consist of either living organisms (biofouling) or a non-living substance (inorganic or organic). Fouling is usually distinguished from other surface-growth phenomena in that it occurs on a surface of a component, system or plant performing a defined and useful function, and that the fouling process impedes or interferes with this function.
ADDENDUM	Dictionary	Water	**Freshwater**	Water naturally occurring on the Earth's surface (lakes, rivers, etc) and underground (groundwater in aquifers and underground streams). Freshwater is characterized by having low concentrations of dissolved salts and other total dissolved solids. The term specifically excludes seawater and brackish water.
ADDENDUM	Dictionary	Water	**Gravel Pack**	Gravel pack is graded granular material placed in a thin zone around the screens in order to increase the effective hydraulic diameter of the borehole and to help inhibit the movement of sediments into the borehole. Gravel pack material should be chosen to retain most of the unconsolidated formation material, and screen openings are then selected to retain about 90% of the gravel pack. Gravel packs are 100- 200 mm thick.
ADDENDUM	Dictionary	Water	**Gravitational Water**	Gravitational water is held in large soil pores and rapidly drains out under the action of gravity within a day or so after rain. Plants can only make use of gravitational water for a few days after rain.
ADDENDUM	Dictionary	Water	**Gravity Spring**	Gravity springs flow on a natural underground slope to the surface. The water flows more or less horizontally out of the ground.
ADDENDUM	Dictionary	Water	**Grease Trap**	The goal of the grease trap is to trap oil and grease so that it can be easily collected and removed from water. Grease traps are chambers made out of brickwork, concrete or plastic, with an odour-tight cover. Baffles or tees at the inlet and outlet prevent turbulence at the water surface and separate floating components from the effluent. A grease trap can either be located directly under the sink, or, for larger amounts of oil and grease, a bigger grease interceptor can be installed outdoors. Generally grease traps are fitted at garages, restaurants and other commercial premises where large quantities of oil or grease are discharged into wastewater.
ADDENDUM	Dictionary	Water	**Green Water**	The precipitation on land that does not run off or recharge the groundwater but is stored in the soil or temporarily stays on top of the soil or vegetation. Eventually, this part of precipitation evaporates or transpires through plants. Green water can be made productive for crop growth (although not all green water can be taken up by crops, because there will always be evaporation from the soil and because not all periods of the year or areas are suitable for crop growth).

Grey Water Footprint	Grey water footprint is a concept used for water footprint accounting. It refers to the volume of water needed to dilute pollutants to such an extent that the quality of the ambient water remains above agreed water quality standards.
Greywater	Greywater is the total volume of water generated from washing food, clothes and dishware, as well as from bathing, but not from toilets. It may contain traces of Excreta (e.g., from washing diapers) and, therefore, also pathogens. Greywater accounts for approximately 65% of the wastewater produced in households with flush toilets.
Grit	Grit includes sand, gravel, cinder, or other heavy solid materials that are "heavier" (higher specific gravity) than the organic biodegradable solids in the waste water. Grit also includes eggshells, bone chips, seeds, coffee grounds, and large organic particles, such as food waste.
Grit Chamber	Where subsequent water or wastewater treatment technologies could be hindered or damaged by the presence of sand, grit chambers (or sand traps) allow for the removal of heavy inorganic fractions by settling. There are three general types of grit chambers: horizontal-flow, aerated, or vortex chambers. All of these designs allow heavy grit particles to settle out, while lighter, principally organic particles remain in suspension.
Groundwater	Water that is located beneath the earth's surface. The groundwater level may be located several centimetres, or up to a hundred metres below the surface. It is generally of good quality and can be used as drinking water. Therefore, care should be taken to not contaminate groundwater with leaching sewage.
Groundwater Dam	Groundwater dams store water under the ground in sufficient quantities for livestock and minor irrigation as well as domestic use. Groundwater dams can be divided into two types: sand dams and subsurface dams. This technology is used in arid and semi-arid regions, where water shortage is a problem during dry periods.
Groundwater Recharge	Treated effluent and/or stormwater can be directly discharged into receiving water bodies (such as rivers, lakes, etc.) or into the ground to recharge aquifers. Surface groundwater recharge is the planned, man-made increase of groundwater levels. By improving its natural replenishment capacities and percolation from surface waters into aquifers, the amount of groundwater available for abstraction is increased. This is particularly useful in areas where water and groundwater resources are heavily utilised and acute problems with dropping watersheds, soil salinization, saltwater intrusion in coastal areas or water scarcity in general exist. Subsurface groundwater recharge refers to the different recharge techniques (generally injection or recharge wells) that release treated effluent and/or collected stormwater underground and directly replenish groundwater aquifers (without soil percolation).
Hand Pump	Hand pumps (alias manual pumps or human-powered pumps) are a type of water-lifting device mainly serving community water supplies that can be operated manually. Human-powered pumps also include foot pumps and rope and bucket systems with or without a windlass or shadouf.
Hand-Dug Well	The traditional and still most common method of obtaining groundwater in rural areas of the developing world is by means of dug wells, mostly hand-dug wells. With the prior knowledge that groundwater is present and rather close to the surface, a hole (5-30 metres) is dug until the groundwater level is reached. Inflowing groundwater is collected and can be extracted with the help of pumps or buckets.
Heavy Metal	Heavy metals are relatively dense metals (e.g. cadmium, chromates, lead, and mercury). They are usually found in commercial and industrial wastewater. Many heavy metals can have a toxic effect on living beings and in wastewater treatment, they need the to be source controlled. Most biological wastewater treatment don't remove heavy metals (although phytoremediation can be used to remove the heavy metals from the water)
Helminth	A parasitic worm, i.e. one that lives in or on its host, causing damage. Some examples that infect humans are roundworms (e.g., Ascaris and hookworm) and tapeworms. The infective eggs of helminths can be found in excreta, wastewater and sludge. They are very resistant to inactivation and may remain viable in faeces and sludge for several years.
High-Strength Wastewater	High-strength wastewater means it contains greater amounts of organic components (such as fats, oils, and greases) than residential wastewater. It can also mean the effluent contains large quantities of suspended solids or high amounts of certain chemicals, such as disinfectants. Any or all of these components can interfere with the normal biological processes most onsite sanitation systems use. These characteristics vary from day to day, even from hour to hour, and they can have a major impact on how a biological system performs. The major concern of having high organic loading in wastewater is physical clogging. But high organic load may cause anaerobic conditions leading to odour problems and poor performance.
Household-level Drinking Water Treatment	Household-level approaches to drinking water treatment and safe storage are also commonly referred to as managing the water at the "point-of-use". This term or its abbreviation "POU" typically describe the same procedures as other abbreviations derived from household water treatment, like "HHWT" or "HWT" or "HWTS" (The "S" in "HWTS" refers to safe storage). "Household water management" is also commonly used, and can encompass both treatment and storage. All these terms can refer to a variety of treatment procedures, for example, with chlorine or other chemical disinfectants, sunlight or UV lamps, various filters, or flocculation-disinfection formulations.
Household-level Water Treatment and Safe Storage	Household-level approaches to drinking water treatment and safe storage are also commonly referred to as managing the water at the "point-of-use". This term or its abbreviation "POU" typically describe the same procedures as other abbreviations derived from household water treatment, like "HHWT" or "HWT" or "HWTS". (The "S" in "HWTS" refers to safe storage.) "Household water management" is also commonly used, and can encompass both treatment and storage. All these terms can refer to a variety of treatment procedures, for example, with chlorine or other chemical disinfectants, sunlight or UV lamps, various filters, or flocculation-disinfection formulations.
Human-Powered Water Distribution	Where there is no or no sufficient supply of fresh or drinking water, nor motorised vehicles to distribute it, water distribution is human-powered. Human-powered water distribution refers to the use of jerry cans and small recipients to fetch water from a centralised distribution point (e.g. river, lake, borehole, shallow well). Either people collect and transport the water themselves or they buy it from mobile vendors that often use small barrels on wheels to transport the water and sell it door-to-door. The effort of ensuring water supply can be high for single families or communities and its price is often higher than that of a well managed public piped distribution system.
Humification	Humification describes the process of sludge treatment in planted dewatering/drying beds. The sludge is loaded on the bed and dewatered by percolation in the filter and by evapotranspiration through the plants. The root system of the plants maintains the permeability of the sludge layer. The sludge is be added intermittently. Sludge has to be removed only once every 5 -10 years depending on design. The final product has is very well mineralized and has a soil-like structure. The long solids retention period and pathogen die-off and allows direct reuse of the solids in agriculture. Percolate quality considerably improves by the presence of plant (compared to unplanted drying beds) but may still require a polishing treatment.
Hydraulic Conductivity	Permeability in fluid mechanics and the earth sciences (commonly symbolised k). It is the measure of the ability of a porous material (often, a rock or unconsolidated material) to allow fluids (e.g. water) to pass through it.
Hydraulic Gradient	The hydraulic gradient is the difference of the height of the water table from one distance to another. The liquid will flow along the hydraulic gradient from where the hydraulic head is highest to where it is lowest by gravity due to the difference in pressure.

Hydrogen Peroxide	Hydrogen peroxide (H2O2), a colourless water-like liquid, is one of the most versatile, reliable and environmentally friendly oxidising agents. The relative safety and simplicity of its uses has led to the development of a number of applications in water treatment such as odour removal, disinfection or metal removal. Hydrogen peroxide is also used in advanced oxidation processes (AOP) and can be combined with catalysts or other oxidisers to produce reactive oxygen species (ROS) able to attack a wide range of organic compounds and microorganisms. The production of hydrogen peroxide is usually performed at industrial scale but can also be done directly in drinking water (or pre-treated wastewater) by electrolysis.
Hydrolysis	Hydrolysis describes the cleavage of a chemical compound through the reaction with water. Thereby, a hydrogen atom (H) is added to one part of the split chain, while the remaining hydroxyl group of the water (OH) is added to the other. Hydrolysis is the first step of anaerobic digestion in which insoluble complex molecules such as carbohydrates and fats are broken down to short sugars, fatty acids and amino acids.
Hydroponic	Hydroponic means the cultivation of plants in water without soil. Nutrients, essential for the growth of the plants are thereby provided from the water.
Hydropower	When the mechanical energy from flowing or falling water is used to produce energy, this is called hydropower.
Hydropower Small Scale	Hydropower uses the power of moving water (kinetic energy) to generate electricity. Small-scale hydropower produces between 1 and 30 MW. Small-scale hydropower systems can be installed in small rivers, streams or in the existing water supply networks, such as drinking water or wastewater networks. In contrast with large-scale hydropower systems, small-scale hydropower can be installed with little or negligible environmental impact on wildlife or ecosystems, mainly because the majority of small hydropower plants are run-of-river schemes or implemented in existing water infrastructure. Due to its versatility, low investment costs, and as a renewable energy source, small-scale hydropower is a promising option for producing sustainable, inexpensive energy in rural or developing areas.
Hydroxyapatite	Hydroxylapatite, also called hydroxyapatite, is a naturally occurring mineral form of calcium apatite with the formula $Ca_5(PO_4)_3$ but is usually written $Ca_{10}(PO_4)_6(OH)_2$ to denote that the crystal unit cell comprises two entities. HAP is a natural mineral and demonstrated to be a very effective and biocompatible adsorbent for fluoride removal from contaminated water (MOURABET et al. 2015; MOHAMMAD et al. 2017). Elevated concentrations of fluoride in drinking water are a serious health concern, with dental and skeletal fluorosis being the most commonly reported fluoride-related diseases.
Hyperthermophile	Hyperthermophiles are organisms (e.g. bacteria, worms, funghi etc.) that prefer extremely hot environments (80 to 120°C).
Imhoff Tank	The Imhoff tank is a primary treatment technology for raw wastewater, designed for solid-liquid separation and digestion of the settled sludge. It consists of a V-shaped settling compartment above a tapering sludge anaerobic digestion chamber with gas vents.
In Situ Rainwater Harvesting	In situ rainwater harvesting techniques are water catchment methods located within cropland. This is achieved by allowing rainwater to infiltrate into the soil and preventing water runoff. Ex situ systems on the other hand are located outside the field.
Industrial Wastewater	Industrial wastewater refers to water that has been used from industries and is refused. Industrial wastewater is either biodegradable and can be treated or reused similar to blackwater or greywater; or it contains pollutant that are not biodegradable and require an advanced oxidation process for treatment. Often, industrial wastewater also just contains heat, which can be reused for energy generation or other processes (e.g. aquaculture).
Infiltration Basins	Huge basins or ponds are used for collecting water for direct surface groundwater recharge via percolation. For effective artificial recharge highly permeable soils are suitable, but a water layer should always be maintenaned to ensure good infiltration. High turbidity of the water used for recharge can lead to clogging of the soil layer.
Influent	The general name for the liquid that enters into a system or process (e.g., wastewater). The effluent of one process is the influent of the next.
Ion Exchange	The exchange of ions of the same charge between an insoluble solid and a solution in contact with it, used in water-softening and other purification and separation processes.
Irrigation	Irrigation is the artificial application of water to land or soil especially to assist in growing agricultural crops in dry areas or during periods of inadequate rainfall. To reduce dependence on freshwater and maintain a constant source of water for irrigation throughout the year, wastewater that has had secondary treatment (i.e., physical and biological treatment) can be used for irrigation.
Jerrycan	Jerrycans are light, plastic containers that are readily available and can be easily carried by one person.
Lacto-Fermentation	The lacto-fermentation process (also lactic acid fermentation) is a biological anaerobic degradation process (similar to silage production process in agriculture), but without gas formation. During this process, sugars such as glucose, fructose, and sucrose, are converted into cellular energy and the metabolic by-product lactic acid. Lacto-fermentation is used throughout the world to preserve foods. When the acidity rises due to lactic acid fermenting organisms, many other pathogenic microorganisms are killed. Yogurt and sauerkraut are some of the most famous products produced by lacto-fermentation. Most lactic acid bacteria obtain energy only from the metabolism of sugars and hence are usually restricted to habitats in which sugars are present. The two most important subgroups of the lactic acid bacteria depend on the nature of the products formed from the fermentation of sugars: one group, called homofermentative, produces a single fermentation product, lactic acid, whereas the other group, called heterofermentative, produces other products, mainly ethanol and CO2 as well as lactate. Even though anaerobe, most lactic acid bacteria have the advantage not to be sensitive to O2, allowing them to grow in its presence as well as in its absence (they are aerotolerant anaerobes).
Lake	Lakes are discrete, largely isolated ecosystems in which the interplay between physical, biogeochemical and organismal processes can be studied, understood, and put to use in effective management.
Landfill	A landfill is a land disposal site for waste, which is designed to protect from environmental pollution and health risks. It is not the same as an open dump. Landfills are built to concentrate the waste in compacted layers to reduce the volume and monitored for the control of liquid and gaseous effluent in order to protect the environment and the human health. In reality, the term is often also used for unprotected waste dumping sites.
Leach Field	A leach field, or drainage field, is a network of perforated pipes that are laid in underground gravel-filled trenches to dissipate the effluent from a water-based collection and storage/treatment or (semi-)centralized treatment technology. They allow for a further treatment of the effluent and to recharge groundwater bodies.
Lime	The common name for calcium oxide (quicklime, CaO) or calcium hydroxide (slaked or hydrated lime, Ca(OH)2). It is a white, caustic and alkaline powder produced by heating limestone. Slaked lime is less caustic than quicklime and is widely used in water/wastewater treatment and construction (for mortars and plasters).
Low-Flush Toilet	A low-flush or low flow toilet is a flush toilet that uses significantly less water than a full-flush toilet. That means, they use 4 to 6 litres instead of the 8 to 20 litres. Low-flush toilets use a special design of the cistern and the siphon in order to allow the removal of faeces and excreta with less water. Most often, they also include a-dual flush system, with one flush being designed for urine only using less than half a litre for flushing. Today, there are many suppliers of different models of low-flush toilets all over the world. Low-flush toilets reduce the water consumption, however, low-flush toilet still require large amounts of fresh water and with certain models, users have to flush even twice in order to achieve the complete removal of faeces from the bowl.

ADDENDUM | Dictionary | Water

Low-Pressure Membranes	Low-pressure membranes are used for microfiltration and ultrafiltration.
Low-Rate Digestion	Low-rate anaerobic digestion processes do not retain biomass and the relatively long HRT is equal to the SRT. These processes are adapted for the treatment of homogeneous high-strength wastes, such as agricultural slurries or municipal organic wastes.
Low-Solids Digestion	Low-rate anaerobic digestion systems are classified according to the percentage of total solids (TS) in the waste stream. Wet digestion means that the TS content is lower than 20 %.
Managed Aquifer Recharge	Managed Aquifer Recharge (MAR) is a concept that seeks to deliberately increase the amount of water stored in an aquifer, which is then recovered by pumping. MAR comprises a large number of injection-recovery techniques. By storing water underground, loss of water to evaporation can be drastically reduced and the water savings returned to other users such as the environment, towns or irrigators. MAR offers several advantages when compared with the more traditional use of surface water reservoirs, the total volume of water that could be stored in aquifers worldwide is several orders of magnitude greater than that available in surface dams. MAR is often used as a synonym for "artificial groundwater recharge" (including recharge [2022-from the surface] and from [2023-below the surface]) despite the fact that it is not an artificial recharge of aquifers but a well controlled measure to replenish depleted and over-exploited aquifers.
Manhole	A manhole is the top opening to a sewer system. A person can enter it to maintain the sewer. If it is not in use, it is covered with a cap to avoid injuries.
Membrane	A pliable, sheet-like structure acting as a boundary, lining, or partition. Can be used for filtration. Depending on the pore size, different qualities of filtration can be reached.
Micro Basin	Micro basins are small rainwater catchment pools surrounded on all sides by stonewalls or earth ridges. This allows storing rainwater and using it for small-scale tree and bush planting, enabling increased growth of plants if there is moisture deficit.
Microcatchment	Microcatchments are contoured areas concentrating and infiltrating rainwater. Therefore, more water is protected from evaporation and available for plants.
Microfiltration	A kind of low-pressure membrane filtration process in which contaminants are removed from a fluid (liquid & gas) by passage through a microporous membrane (typically with a pore size of 0.1 to 10 micrometres).
Micron	Metric unit for linear dimensions. One micron or micrometer corresponds to 0.000001 m or 1x10^-6 m.
Microorganism	Any cellular or non-cellular microbiological entity capable of replication or of transferring genetic material (e.g., bacteria, viruses, protozoa, algae or fungi).
Micropollutant	Pollutant that despite their extremely low concentration have an significant effect (e.g., trace organic compounds) Pharmaceuticals and hormones are two groups of micropollutants which are causing increasing concern for their effects on the endocrine system and sexual development of aquatic animals.
Moisture Control	Moisture control in SSWM refers to the use of adapted methods of agriculture and forestry in order to minimise the loss of water from the soil.
Municipal Solid Waste	Municipal solid waste is all kind of waste generated by households (domestic wastes) and commercial establishments. The collection and safe treatment of municipal solid waste is a key factor of sanitation and improved health of citizens. In general the management of municipal solid waste includes its collection by the municipality or another governmental body and its appropriate treatment or reuse.
Municipal Wastewater	Municipal wastewater generally refers to the wastewater collected in sewer systems, including domestic wastewater (black- and greywater from households) as well as effluents from institutions, businesses and industries.
Nanofiltration	A kind of high-pressure membrane filtration process in which particles which are in the range of 1 to 10 nanometres are removed. Such particles are for instance ions of heavy metals. To remove all soluble particles, one would need an even finer process (i.e. reverse osmosis).
Natural Coagulant	Natural coagulants are coagulants derived from plants and other locally available materials from the surrounding nature. Typical natural coagulants are prickly pear cactus, moringa seeds, broad beans and fava beans, which can be used for enhanced sedimentation as a pre-treatment step of drinking water.
Natural Organic Matter	Natural organic matter is broken down organic matter that comes from plants and animals in the environment. Organic matter is a collective term, assigned to the realm of all of this broken down organic matter. Basic structures are created from cellulose, tannin, cutin, and lignin, along with other various proteins, lipids, and sugars. It is very important in the movement of nutrients in the environment and plays a role in water retention on the surface of the planet.
Natural Water Purification	Microorganisms in soils, wetlands and riparian areas utilise or break down numerous chemical and biological contaminants in the water and thereby purify it.
Nephelometric Turbidity Unit	The Nephelometric Turbidity Unit is used in water treatment in order to describe the turbidity of a liquid and is measured with a calibrated nephelometer, an instrument for measuring the size and concentration of particles suspended in a liquid or gas by means of the ligh it scatters.
Nitrogen	Nitrogen is a chemical element which can be found in fresh water and wastewater in many different forms. In wastewater for example mainly organic nitrogen which comes from the rejections of food can be found. This nitrogen is an essential nutrient and can lead to algal bloom, eutrophication and water pollution. In its reduced form (ammonium, NH_4^+ and ammonia NH_3), it is transformed into nitrate, a process which consumes a lot of oxygen leading to oxygen depletion in the water. Nitrate (NO_3^-) is also a drinking water pollutant while nitrite (NO_2^-) is toxic to fish. Nitrite can be transformed to nitrate and nitrate can be transformed to gazeous nitrogen gas (N_2) and released to the atmosphere (denitrification). Nitrogen is also an important constituent of fertilisers used for food production. Today, nitrogen used for food production is mainly mineral nitrogen which is mined consuming huge amounts of energy. By recycling nitrogen contained in wastewater, the pollution of ecosystems could be reduced and the energy consumption by nitrogen mining avoided.
Non-Biodegradable Wastewater	Wastewater from industry, businesses or agriculture, that contains chemical pollution, which is toxic for microorganisms and can therefore not be treated by biological wastewater treatment units. In order to degrade the toxic chemicals, other processes such as advanced oxidation processes (AOP) need to be applied. Often, it is possible to degrade first the toxics with AOPs after which the wastewater becomes biodegradable and can be treated as municipal wastewater. This can reduce costs, as generally AOPs require more technical know-how and energy.
Non-Planted Filter	Pre-treated greywater is applied intermittently to the surface of a filter media, percolates through an unsaturated filter zone where physical, biological and chemical processes treat the water. The treated greywater is collected in a drainage network or infiltrates the underlying soil.
Non-Point Pollution	Nonpoint source pollution generally results from land runoff, precipitation, atmospheric deposition, drainage, seepage or hydrologic modification. The term "nonpoint source" refers to any source of water pollution that does not meet the legal definition of "point source".

On-site Storage and Treatments	Human excreta and wastes, if not directly transported to a centralised sewer system, need to be collected in order to prevent odour, fly breeding and health risk from pathogens. Sometimes, such collection facilities also include directly a treatment or pre-treatment of the collected products.
On-site Wastewater Treatment	On-site wastewater treatment is used to treat wastewater from one or several households or institutions and business and to return treated wastewater back into the immediate environment. Such systems are based on the principle of low organisation and maintenance. The main advantage is the lower costs, because the systems do not require large collection networks and generally work without technical energy and are constructed with locally available materials.
Onsite Sanitation	A sanitation system in which excreta and wastewater are collected, stored and/or treated on the plot where they are generated. There are two main categories of on-site sanitation technologies: 'wet' which require water for flushing; and 'dry' which do not require any water for flushing.
Open Defecation Field	Excreta disposal system for ex-situ (camp) situations with the presence of a large number of people. It is only recommended as an extreme short-term solution and when enough space is available. In practice, this method does not seem to be very widely implemented. The system should also include hand-washing facilities, supervision, and excreta should be covered with soil as soon as possible.
Overhung Latrine	An overhung latrine consists of a superstructure and floor built over water. A squat hole in the floor allows excreta to fall directly, or via a chute into the water below. Overhung latrines are rarely appropriate (due to the direct pollution of water) and should only be considered if other options are not possible, such as in areas prone to continued flooding. The receiving water must be sufficiently deep throughout the year, preferably should be saline to prevent human consumption, and should be flowing away from settlements.
Oxidation	In chemistry, oxidation describes the process of combining or becoming combined with oxygen. Oxidation can take place chemically or it can be catalysed by a microbial process (by bacteria). In wastewater treatment, oxidation means when bacteria oxidise organic loads in the wastewater in a fast single step process leading to the production of CO2 and heat. The process rate increases along with increasing temperature. Examples of application of oxidation are Trickling Filters, Rotating Biological Contactors, Aerobic Ponds, Aerated ponds, Activated sludge, etc.
Ozonation	Ozonation is a water treatment process that destroys microorganisms and degrades organic pollutants through the infusion of ozone, a gas produced by subjecting oxygen molecules to high electrical voltage.
pH	The measure of acidity or alkalinity of a substance. A pH value below 7 indicates that it is acidic, a pH value above 7 indicates that it is basic (alkaline). It can be measured by a pH meter, titration, or indicator (e.g. litmus) stripes.
Parasite	An organism that lives on or in another organism (its host). Parasites exist in a huge variety, including animals, plants, and microorganisms. Ectoparasites live on the surface of the host (e.g., ticks, mites, lice, fleas, and many insects infesting plants). Endoparasites live in the gut or tissues (e.g., many kinds of worm), and cause varying degrees of damage or disease to the host. Parasite comes from the Greek words parasitos (eating at another's table), which is composed of para (alongside) and sitos (food).
Pasteurisation	Pasteurisation is a process of heating a food, typically liquid, to a specific temperature for a definite length of time. This process leads to the partial sterilisation of this food through reducing heat-sensitive vegetative cells to an extent that it is not harmful for human consumption and without major changes in the chemistry of the food. Unlike sterilisation, pasteurisation is not intended to kill all microorganisms in the food. Instead pasteurisation aims to reduce the number of viable pathogens so they are unlikely to cause disease. Pasteurisation is mostly known in connection with milk and is named after French microbiologist Louis Pasteur.
Pathogen	A microorganism or other agent that causes disease.
Percolation	The movement of liquid through a filtering medium with the force of gravity.
Permeate	The clear fluid that passes through the membrane in a membrane filtration process.
Persian Wheel	Device to lift water, particularly for agricultural purposes. It consists of an endless chain of buckets, typically with an individual capacity of 8-15 litres mounted on a drum and submerged in water to the required depth. The drum is connected to a toothed wheel held in a vertical plane by a long shaft usually kept below ground level. The vertical toothed wheel is geared with a large toothed horizontal wheel connected to a horizontal beam. This beam is yoked to a pair of animals. The animals move in a circle to turn the drum and raise the water. Water is released when the bucket reaches the top.The average discharge rate from a Persian wheel is about 160-170 litres/min from a depth of 9m with one pair of bullocks. The Persian wheel can be used to raise water from a depth of up to 20 m but its efficiency is reduced at depths below 7.5 metres.
Pit Composting Toilet	Composting toilets using a pit (above the ground) as a composting chamber. Typical pit composting toilets are the arborloo or the fossa alterna.
Pit Latrine	The single pit latrine is one of the most widely, cheapest and easiest used sanitation technologies. It is made out of a latrine superstructure, a slab and a pit. Excreta, along with anal cleansing materials (water/solids) are deposited in the pit. To avoid people falling in the pit and increase convenience and reduce odour, a slab with a hole is used to cover the pit. Lining the pit prevents it from collapsing and provides support to the superstructure but the underground of the latrine should be water pervious. When the latrine is filled up, it needs to be emptied or closed and relocated. By constructing twin pits (the double pit latrine), it should be possible to dig out a filled pit, after it has stood for a year, without any objectionable smell, whilst the other pit is in use. Pit latrines are part of the improved sanitation options. However, odour and fly nuisance are very common and due to soil infiltration there is danger of groundwater contamination, especially in densely populated areas.
Plankton	Plankton is the small and microscopic organisms drifting or floating in the sea or fresh water, consisting chiefly of diatoms, protozoans, small crustaceans, and the eggs and larval stages of larger animals. Many animals are adapted to feed on plankton, esp. by filtering the water.
Planted Drying Beds	A planted drying bed is similar to an Unplanted Drying Bed, but has the added benefit of transpiration and enhanced sludge treatment due to the plants. The key improvement of the planted bed over the unplanted bed is that the filters do not need to be desludged after each feeding/drying cycle. Fresh sludge can be directly applied onto the previous layer; the plants and their root systems maintain the porosity of the filter. The percolate or leachate needs to be collected and treated before reuse or disposal.
Planting Pits	Planting pits are used as a precipitation harvesting method preventing water runoff and thereby increasing infiltration and reducing soil erosion. Basically, holes are dug 50-100 cm apart from each other with a depth of 5-15 cm in order to prevent water runoff. Planting pits are most suitable on soil with low permeability, such as silt and clay. They are applicable for semi-arid areas for annual and perennial crops (such as sorghum, maize, sweet potato, bananas, etc.). One main advantage is their simple implementation and maintenance.
Pour Flush Toilet	A pour flush toilet is like a regular cistern flush toilet except that the water is poured in by the user, instead of coming from the cistern above. When the water supply is not continuous, any cistern flush toilet can become a pour flush toilet.
Pre-Treatment	Pre-treatment is the preliminary removal of wastewater or sludge constituents, such as oil, grease, and various solids (e.g., sand, fibres and trash). Built before a conveyance or treatment technology, pre-treatment units can retard the accumulation of solids and minimize subsequent blockages. They can also help reduce abrasion of mechanical parts and extend the life of the sanitation infrastructure. See also primary treatment.

Pre-Treatment Products	Pre-treatment products are materials separated from blackwater, brownwater, greywater or sludge in preliminary treatment units, such as screens, grease traps or grit chambers. Substances like fats, oil, grease, and various solids (e.g. sand, fibres and trash), can impair transport and/or treatment efficiency through clogging and wear. Therefore, early removal of these substances is crucial for the durability of a sanitation system.
Precipitation	Environment: any water that comes from the atmosphere: rainwater, stormwater, fog, dew, snow etc. OR Chemistry: when a solid substance is produced from a liquid during a chemical process
Precipitation Harvesting	Precipitation harvesting refers to the controlled collection of precipitation (rain, fog, dew, snow, etc.) to complement water supply.
Pressure Filter	Rapid sand filters can be constructed as pressure filters. They are used for water purification purposes and consist of closed vessels containing beds of sand or of other granular material through which water is forced under pressure. These filters are frequently used in certain industrial situations, and a number have been installed for public water supplies. As their initial cost may be high, especially when their component parts have to be imported, their principal use is in industrialised countries.
Pressure System Unit	A prefabricated pressure sewer unit (normally made from plastic) is designed for outside placement. The pressure unit includes a grinding pump which is activated as soon as the stored wastewater reaches a pre-defined level.
Pressurised Sewers	Pressurised sewers, or pressure sewers differ form conventional gravity collection systems, because they break down large solids in a grinder pumping station before they are transported through the collection system. The pressure sewer system consist of a series of centrifugal grinder pumps moving finely ground effluent and material along a network of sewers (generally small-diameter). The primary effluent is delivered to the dwelling tank by traditional gravity drainage methods before being ground. Their watertight design and the absence of manholes eliminate extraneous flows into the system. Thus, the systems are an effective solution where conventional systems are impractical such as rocky, hilly and/or water-charged terrain. Moreover, this system requires only shallow trenches and relatively small-diameter piping. Thus, it is also adapted to areas with housing density and where the terrain does not allow gravity flow.
Primary Disinfection	The application of a disinfectant at the drinking water treatment plant, with a primary objective to achieve the necessary microbial inactivation.
Primary Treatment	The first major stage in wastewater treatment that removes solids and organic matter mostly by the process of sedimentation or flotation. Examples of primary treatment technologies include septic tanks, biogas settlers, etc. See also pre-treatment.
Protozoa	A diverse group of unicellular eukaryotic organisms, including amoeba, ciliates, and flagellates. Some can be pathogenic and cause mild to severe illnesses.
Pyrolysis	Pyrolysis is the process of the heating biomass, in the absence of oxygen, transforming to charcoal. The fewer oxygen is present during the process, the more black carbon is contained in the charcoal. Black carbon, due to its polycyclic aromatic structure, is chemically and microbiologically stable and persists in the environment over centuries.
Rainwater Harvesting	Rainwater harvesting refers to the capturing and storing of rainwater and the taking of measures to keep it clean. Rainwater can be harvested through a variety of ways: capturing the rain on rooftops or its run-off (e.g. seasonal flood water) in local catchment systems (e.g. rock catchment, subsurface or surface dams). Rain collected from rooftops or small-scale rock catchments is generally used for domestic use, while large-scale rock catchment, ground catchment and dam catchment systems are used for livestock, nurseries, small-scale irrigation and only sometimes for domestic use.
Rapid Gravity Filters	Rapid sand filters can be constructed as gravity filters. They are used for water purification purposes and essentially consist of an open-topped box (usually made of concrete), drained at the bottom, and partly filled with a filtering medium. Fresh water is admitted to the space above the medium and flows downward under the action of gravity. Purification takes place during this downward passage and the treated water is discharged through the under-drains.
Rapid Sand Filter	Rapid sand filtration is a physical drinking water purification method. As freshwater flows through a sand- and gravel bed, the majority of suspended particles are removed. Rapid sand filters provide rapid and efficient removal of relatively large suspended particles but they cannot provide safe drinking water unless pre-treatment (i.e. coagulation-flocculation) and post-treated (e.g. chlorine disinfection) is applied.
Recharge Wells	Recharge or injection wells are subsurface groundwater recharge techniques used to directly discharge water into deep water-bearing zones. Recharge wells can be cased with the material covering the aquifer. If this material is unconsolidated, a screen can be placed in the well in the zone of injection. Recharge wells are suitable only in areas where a thick impervious layer exists between the surface of the soil and the aquifer that is to be replenished. They are also advantageous in areas where land is scarce (as [2022-surface groundwater recharge] requires large areas for infiltration). A relatively high rate of recharge can be attained with this method.
Reclaimed Water	Reclaimed water, sometimes called recycled water, is former wastewater (e.g. treated blackwater and greywater; stormwater) that has been treated to remove solids and certain organic or microbiological pollution in order to be used in agriculture, or to recharge groundwater aquifers. This is done for sustainability and water conservation, rather than discharging the treated wastewater to surface waters such as rivers and oceans.
Retention Basin	Retention basins are among the most frequently implemented storm water management systems. They are used to collect surface runoff and to improve water quality by natural processes such as sedimentation, decomposition, solar disinfection and soil filtration. In comparison to dry ponds (which hold runoff for a limited period of time and then release the stored water at once), retention basins constantly keep standing water allow for the development of an ecosystem. This allows settled particles to be treated biologically (GDSDS 2005). Water from retention ponds can be reused for groundwater recharge, irrigation or any other purpose, after further treatment if required. As a natural system, retention basins do not require energy or high-tech appliances. Primary implementation costs of retention basins are high and constant maintenance is inevitable, as otherwise pollutant export and erosion can occur (UNHSC 2010).
Reverse Osmosis	Osmosis is a natural phenomenon in which water passes through a semipermeable barrier from the side with lower solute concentration to the higher solute concentration side. Water flow continues until chemical potential equilibrium of the solvent is established. At equilibrium, the pressure difference between the two sides of the membrane is equal to the osmotic pressure of the solution. To reverse the flow of water (solvent), a pressure difference greater than the osmotic pressure difference is applied; as a result, separation of water from the solution occurs as pure water flows from the high concentration side to the low concentration side. This phenomenon is termed reverse osmosis (it has also been referred to as hyperfiltration). A reverse osmosis (R-O) membrane acts as the semipermeable barrier to flow in the R-O process, allowing selective passage of a particular species (solvent, usually water) while partially or completely retaining other species (solutes).
Rill Erosion	Rill erosion occurs as runoff begins to form small concentrated channels. As rill erosion begins, erosion rates increase dramatically due to the resulting concentrated higher velocity flows. Rill can be repaired by tilling or normal cultivation operation and should be repaired as soon as possible in order to prevent gullies from forming.
River	A river is a natural watercourse, usually freshwater, flowing towards an ocean, a lake, a sea, or another river. In a few cases, a river simply flows into the ground or dries up completely before reaching another body of water. Small rivers may also be called by several other names, including stream, creek, brook, rivulet, tributary and rill.

River Regime	River regime can described as one of two characteristics of a reach of an alluvial river: (1) The variability in its discharge throughout the course of a year in response to precipitation, temperature, evapotranspiration, and drainage basin characteristics and (2) a series of characteristic power-law relationships between discharge and width, depth, and slope.
Rooftop Rainwater Harvesting	Rooftop rainwater harvesting is the most common type of rainwater harvesting (RWH) for domestic use. It is a simple low-cost technique that requires a minimum of specific expertise and that offers many benefits. Rainwater is collected on the roof and transported to a storage reservoir via gutters, where it supplies water at the point of use. Rainwater harvesting can supplement other water sources when they become scarce or are of low quality like brackish groundwater or polluted surface water in the rainy season. However, rainwater quality may be affected by air pollution, animal or bird droppings, insects, dirt and organic matter. Therefore regular maintenance (cleaning, repairs, etc.) and treatment before water use is very important (e.g. filtration or/and disinfection).
Roughing Filters	Roughing filters are used to separate solid matter from water. Some solid particles suspended in water are so small and light that they do not settle in a normal sedimentation tank. The same sedimentation tank can be improved by filling it with rough filter material such as gravel. Roughing filters usually consist of sedimentation tanks filled with differently sized filter material decreasing successively in size in the direction of flow. The bulk of solid particles is separated by the coarse filter medium located next to the filter inlet. The subsequent medium and fine filter media further reduce the concentration of suspended solids. Roughing filters are operated with small hydraulic loads - filtration velocity is usually about 0.3-1.5 m/h.
Runoff	The portion of precipitation that does not infiltrate the ground and runs overland.
Runoff Coefficient	The assignment of the runoff coefficient (C) is somewhat subjective. At the time the runoff producing rainfall occurs, the coefficient varies with topography, land use, vegetal cover, soil type and moisture content of the soil. In selecting the runoff coefficient, consider the future characteristics of the watershed. If land use varies within a watershed, you must consider watershed segments individually, and you can calculate a weighted runoff coefficient value.
Safe Water	Water that is safe to drink, in general potable water, or water that is treated at the Point of Use (POU), is commonly referred to as safe water.
Sand Dam	A sand dam is a small dam built on and into the riverbed of a seasonal sand river. Its purpose is to capture and store water beneath sand: sand is transported during periods of high flow and accumulates upstream of a sand dam, resulting in additional groundwater storage capacity of riverbed and –banks. This reservoir fills during the wet season, providing water to cover dry periods.
Sand River	Dry and sandy riverbeds are seasonal watercourses that transport runoff-water from catchment areas to rivers or swamps once or several times a year. Dry riverbeds are also called ephemeral streambeds, seasonal watercourses or sand rivers. Most of the rainwater that is being transported downstream in riverbeds occurs as floods of several meters height. Sand rivers are only suitable as sand dams if coarse sand is available and the river is bedded on impervious bedrock (or clay like black cotton soil).
Sanitation	The means of safely collecting and hygienically disposing of excreta and liquid wastes for the protection of public health and the preservation of the quality of public water bodies and, more generally, of the environment. See also environmental sanitation.
Sanitation System	Sanitation is as a multi-step process in which human excreta and wastewater are managed from the point of generation to the point of use or ultimate disposal. A Sanitation System is a context-specific series of technologies and services for the management of these wastes (or resources), i.e., for their collection, containment, transport, transformation, utilisation or disposal. A sanitation system is comprised of Products (i.e. waste, organic wastewater, excreta, blackwater, greywater, etc.) that travel through functional groups, which contain Technologies that can be selected according to the context. By selecting a Technology for each Product from each applicable Functional Group, one can design a logical Sanitation System. A sanitation system also includes the management, operation and maintenance (O&M) required to ensure that the system functions safely and sustainably.
Sanitised	Hygienised describes any wastewater product (e.g. faeces, blackwater etc.) that has undergone a transformation which turns it into a hygienically safe product for handling, reuse or disposal.
Screening	Screening is a wastewater pre-treatment, which aims to prevent coarse solids, such as plastics, rags and other trash, from entering a sewage system or treatment plant. Solids get trapped by inclined screens or bar racks. The spacing between the bars usually is 15 to 40 mm, depending on cleaning patterns. Screens can be cleaned by hand or mechanically raked. The latter allows for a more frequent solids removal and, correspondingly, a smaller design.
Scum	Scum is the general name given to the floating layer of dirt or froth on the surface of a liquid. It is also used to describe the layer of solids formed by wastewater constituents that float to the surface of a tank or reactor (e.g., oil and grease).
Secondary Disinfection	The application of a disinfectant, either at the exit of the treatment plant or in the distribution system, with the objective of ensuring that a disinfectant residual is present throughout the distribution system, thus preventing recontamination of water.
Secondary Treatment	Follows primary treatment to achieve the removal of biodegradable organic matter and suspended solids from wastewater effluent. Nutrient removal (e.g., phosphorus) and disinfection can be included in the definition of secondary treatment or tertiary treatment, depending on the configuration.
Sedimentation	Gravity settling of particles in a liquid such that they accumulate. It is one of the most basic water treatments for both drinking water and wastewater.
Sedimentation / Thickening Ponds	Sedimentation or thickening ponds are settling ponds that allow sludge to thicken and dewater. The effluent is removed and treated, while the thickened sludge can be further treated in a subsequent technology.
Semipermeable	Allowing passage of certain, especially small, molecules or ions but acting as a barrier to others. Use of biological and synthetic membranes.
Separate Sewers	Separate sewerage consists in the separate collection of municipal wastewaters (blackwater from toilets, greywater and industrial wastewater) and surface run-off (rainwater and stormwater). The separate collection prevent the overflow of sewer systems and treatment stations during rainy periods and the mixing of the relatively little polluted surface run-off with chemical and microbial pollutants from the municipal wastewater. The design of the sewers and the (semi-) centralised treatment stations thus needs to consider the volume of the wastewater only and the surface run-off and rainwater can be reused (e.g. for landscaping or agriculture) after a simplified treatment.
Septic Tank	A septic tank is a watertight chamber made of concrete, fibreglass, PVC or plastic, through which blackwater and greywater flows for primary treatment. Settling and anaerobic processes reduce solids and organics, but the treatment is only moderate.
Sewage	Waste matter that is transported through the sewer. It contains generally excreta (urine or faeces) and water (blackwater), grey water and may also contain other wastes (e.g. kitchen waste).
Sewer	An open channel or closed pipe used to convey sewage.

Shadouf	The simplest and cheapest method of lifting groundwater from an open dug well or surface water source is by means of a rope and a bucket. The job of drawing water from the well can be made easier by adding a "windlass" (a horizontal cylinder with a winch which can be turned to raise the bucket on a rope) or a "Shadouf" (an upright frame with a long pole suspended on top with the bucket hanging from one end and a weight which serves as the counterpoise of a lever at the other). The basic Shadouf consists of a rope, pole, bucket and counterweight and is capable of lifting water up to 4 metres. The counterweight can be just a heavy rock, however, in the more advanced picottah design, one person guides the bucket while the other acts as a moving counterweight. The Shadouf is generally used for lifting water from unlined wells, streams or ponds for irrigating small fields. Approximately 60 litres/min can be lifted from a depth of 2 to 3 metres. **Advantages** ● A relatively inexpensive traditional technology, which can be locally made and maintained. ● Easy to operate ● Relatively efficient (30-60%) **Disadvantages** ● Limited to lifts of less than 4 metres ● Limited water yield, 60 l/min suitable for small fields
Shallow Dug Well	Shallow dug wells usually are dug wells up to 5 metres in depth. Construction is fast and easy but the wells are likely to get contaminated.
Shallow Well	A shallow well is a hand-dug water well ranging up to 7m in depth and about 1.5m in diameter.
Simplified Sewer	A simplified sewer describes a sewerage network that is constructed using smaller diameter pipes laid at a shallower depth and at a flatter gradient than conventional sewers. The simplified sewer allows for a more flexible design at lower costs.
Single Pit	The single pit is one of the most widely used sanitation technologies. Excreta, along with anal cleansing materials (water or solids) are deposited into a pit. Lining the pit prevents it from collapsing and provides support to the superstructure. A single pit latrine consists of a toilet superstructures and a single pit to be filled up, emptied and filled up again. To improve pit latrines, aeration or an additional pit can be added (see single VIP, double VIP or double pit latrine).
Siphon	A siphon is instrument, usually in the form of a tube bent to form two legs of unequal length, for conveying liquid over the edge of a vessel and delivering it at a lower level. Siphons may be of any size; they are used in civil engineering to transfer water or other fluids over elevations. The action depends upon the influence of gravity (not, as sometimes thought, on the difference in atmospheric pressure—a siphon will work in a vacuum) and upon the cohesive forces that prevent the columns of liquid in the legs of the siphon from breaking under their own weight. Water has been lifted more than 35 feet (11 m) by a siphon.
Slow Sand Filter	Slow sand filtration is a biological, physical and chemical purification process. As the water flows through a porous filter-bed, its quality improves considerably by reduction of the number of micro-organisms, viruses, protozoa, turbidity, heavy metals, organic matter, iron and arsenic.
Sludge	Sludge is a mixture of solids and liquids, containing mostly excreta and water, in combination with sand, grit, metals, trash and/or various chemical compounds. A distinction can be made between faecal sludge and wastewater sludge. Faecal sludge comes from onsite sanitation technologies, i.e., it has not been transported through a sewer. It can be raw or partially digested, a slurry or semisolid, and results from the collection and storage/treatment of excreta or blackwater, with or without greywater. For a more detailed characterization of faecal sludge refer to Strande et al., 2014. Wastewater sludge (also referred to as sewage Sludge) is sludge that originates from sewer-based wastewater collection and (semi-) centralized treatment processes. The sludge composition will determine the type of treatment that is required and the end-use possibilities.
Sludge Thickening	Sludge thickening consists in the separation of solids and liquids in order to process each separately (e.g. composting for the solid and waste stabilisation ponds or infiltration for the liquid). It can be done in thickening ponds (settling tanks or sedimentation ponds) or planted and unplanted drying beds.
Sludge Treatment	Sludge treatment describes the processes used to manage and dispose of the sludges produced from human excreta or from the treatment of wastewater.
Sludge Treatment Facility	This is a drying bed system of the sludge from a septic tank. The sludge is allowed to dry after mixing with lime, fly fly ash/charcoal, sawdust, corncobs plus the indigenous microorganisms.
Sludge Volume Index	Sludge Volume Index (SVI) is a very important indicator that determines your control or rate of desludging on how much sludge is to be returned to the aeration basin and how much to take it out from the system. It actually serves as a very important empirical measurement that can be used as a guide to maintain sufficient concentration of activated sludge in the aeration basin whereby too much or too little can be considered detrimental to the system's overall health.
Soak Pit	A soak pit, also known as a soakaway or leach pit, is a covered, porous-walled chamber that allows water to slowly soak into the ground. Pre-settled effluent from a collection and storage/treatment or (Semi-) centralized treatment technology is discharged to the underground chamber from which it infiltrates into the surrounding soil.
Soil Aquifer Treatment	Soil Aquifer Treatment is an artificial groundwater recharge method. Water is introduced into the groundwater under controlled conditions via soil percolation. Soil aquifer treatment is either used to artificially augment the groundwater level in order to withdraw freshwater at a later stage or as a barrier to prevent saltwater or contaminants from entering the aquifer. During percolation, soil filtration occurs and the water remains some time in the aquifer where mixing and may some other physical and chemical reaction occur, so it can be used as reclaimed water (treated blackwater) or relatively little polluted water (e.g. pre-treated greywater or stormwater).
Soil Compaction	Compaction resulting from heavy vehicles putting strong pressure on the soil and reduceing pore volume. Consequently, oxygen and water are squeezed out and can hardly infiltrate again.
Soil Solarisation	Soil solarisation is a non-pesticidal method of controlling soilborne pests by placing plastic sheets on moist soil during periods of high ambient temperature. The plastic sheets allow the sun's radiant energy to be trapped in the soil, heating the upper levels. Solarisation during the hot summer months can increase soil temperature to levels that kill many disease-causing organisms (pathogens), nematodes, and weed seed and seedlings. It leaves no toxic residues and can be easily used on a small or large scale. Soil solarisation also improves soil structure and increases the availability of nitrogen (N) and other essential plant nutrients.
Solar Pasteurisation	Solar pasteurisation is the process of pasteurisation using solely solar thermal energy. It is mostly applied for water. It is applied by using a solar cooker that can absorb solar thermal energy and transmit it to a black container e.g. a black jar. Typically, the significant time of heating by solar heat and cooling down contributes to the pasteurisation process. Applied to water, the solar pasteurisation (heating to 60°C (140°F)) can inactivate both bacteria and rotaviruses, the main causes for severe diarrhea in children.
Solar Water Disinfection	Solar water disinfection - the SODIS method - is a simple procedure to disinfect drinking water. Contaminated water is filled in a transparent PET-bottle or glass bottle and exposed to the sun for 6 hours. During this time, the UV-radiation of the sun kills diarrhoea generating pathogens.
Solid Waste	Solid waste refers to the products that are thrown away by households, agriculture and industry because they do not assign any value to the material anymore. It is generally classified into organic waste, which can be used for the production of biogas or compost; or non-organic waste which either can be recycled as a material (e.g. PET) or, if there is no possibility for recycling anymore, needs to be incinerated and disposed off.

Spate Irrigation	Spate irrigation diverts seasonal flood water from valleys, rivers, riverbeds and gullies onto farm land situated at lower elevation than the origin of the flood water. In sandy riverbeds flood water seeps into the voids between sand particles pushing air to the surface where it forms thousands of air bubbles making the floodwater appear to be boiling.
Spring	When groundwater makes its way to the earth's surface and emerges as small water holes or wet spots, this feature is referred to as a spring.
Spring Catchment Area	The spring catchment area is divided into immediate catchment area and the enlarged catchment area. The immediate catchment area is where human activity is not allowed. It is defined by a watershed specialist and should be fenced off immediately. The enlarged catchment area extends further beyond the immediate catchment area. Here some form of human activity may be allowed with the advice of a watershed specialist.
Stored Urine	Stored Urine is Urine that has been hydrolysed naturally over time, i.e., the urea has been converted by enzymes into ammonia and bicarbonate. Stored Urine has a pH of approximately 9. Most pathogens cannot survive at this pH. After 6 months of storage, the risk of pathogen transmission is considerably reduced.
Stormwater	Stormwater is the general term for the rainfall runoff collected from roofs, roads and other surfaces before flowing towards low-lying land. It is the portion of rainfall that does not infiltrate into the soil.
Stream Erosion	Valley or stream erosion occurs with continued water flow along a linear feature. The erosion is both downward, deepening the valley, and head ward, extending the valley into the hillside. In the earliest stage of stream erosion, the erosive activity is dominantly vertical, the valleys have a typical V cross-section and the stream gradient is relatively steep. When some base level is reached, the erosive activity switches to lateral erosion, which widens the valley floor and creates a narrow floodplain. The stream gradient becomes nearly flat, and lateral deposition of sediments becomes important as the stream meanders across the valley floor. In all stages of stream erosion, by far the most erosion occurs during times of flood, when more and faster-moving water is available to carry a larger sediment load. In such processes, it is not the water alone that erodes: suspended abrasive particles, pebbles and boulders can also act erosively as they traverse a surface.
Subsurface Groundwater Recharge	Subsurface groundwater recharge conveys water directly into an aquifer without the filtration or oxidation that occurs when water percolates naturally through an unsaturated zone.
Subsurface Irrigation	Subsurface drip irrigation is a variation of the conventional surface drip irrigation. The laterals are buried in a depth below the soil surface depending mostly on the tillage practices and the crop to be irrigated. It is using water more efficiently than traditional irrigation techniques like surface irrigation by minimising evaporation.
Sullage	A historical term for greywater.
Supernatant	The liquid lying above a solid residue after settling, sedimentation, or other processes.
Surface Disposal and Storage	Surface disposal refers to the stockpiling of sludge, faeces or other materials that cannot be used elsewhere. Once the material has been taken to a surface disposal site, it is not used later. Storage refers to temporary stockpiling. It can be done when there is no immediate need for the material and a future use is anticipated, or when further hygienization and drying is desired before application.
Surface Groundwater Recharge	Artificial surface groundwater recharge refers to different groundwater recharge techniques that release effluent from above the ground into the groundwater aquifer via soil percolation.
Surface Irrigation	Surface irrigation is an umbrella term for irrigation methods (the three most common methods are: basin, border and furrow) in which water is distributed by gravity over the surface of a field.
Surface Water	A natural or man-made water body that appears on the surface, such as a stream, river, lake, pond, or reservoir. Surface water, unlike groundwater is generally of bad quality and need treatment before human consumption because it accumulates pathogens, metals, nutrients and chemicals as it flows across contaminated surfaces.
Surfactants	Organic compounds with a hydrophilic (attracted by water) head and a hydrophobic (repelled by water) end. Surfactants reduce the surface tension of water by adsorbing at the air-water interface. They also reduce the interfacial tension between oil and water by adsorbing at the liquid-liquid interface. Surfactants are the main components of cleaning products.
Tertiary Treatment	Follows secondary treatment to achieve enhanced removal of residual suspended solids and other pollutants from effluent. Nutrient removal (e.g., phosphorus) and disinfection can be included in the definition of secondary treatment or tertiary treatment, depending on the configuration.
Thermophilic Composting	Composting is possible at high temperatures (thermophilic composting) and at low temperatures (ambient or mesophilic composting). Thermophilic composting is faster and more efficient to inactivate pathogens, but it requires specific optimal conditions to take place (moisture content of 50 to 60 %, C/N ratio of 30 to 35) and can therefore be difficult to manage.
Toilet	Toilets are sanitation facilities at the user interface that allow the safe and convenient urination and defecation. Toilets can be combined with onsite storage and/or treatment and are then referred to as toilet systems such pit latrines, VIPs, UDDTs, composting toilet systems or terra preta toilet systems.
Total Dissolved Solid	The total dissolved solids is the content of all inorganic and organic substances contained in a liquid in molecular, ionized or micro-granular (colloidal) suspended form. Generally the operational definition is that the solids must be small enough to survive filtration through a sieve the size of two micrometers.
Total Solid	The residue that remains after filtering a water or sludge sample and drying it at 105°C (expressed in mg/L). It is the sum of Total Dissolved Solids (TDS) and Total Suspended Solids (TSS).
Total Suspended Solid	The total suspended solids correspond to the total solid particulate matter contained in water. They are generally removed by sedimentation and settling or floating. Suspended solids can lead to the development of sludge deposits and anaerobic conditions if untreated wastewater is discharged into the aquatic environment.
Total Volatile Solid	Total volatile solids are those solids that can volatise and be burned off when the total solids are ignited (500 +/- 50 °C).
Toxins	Toxins are substances that can harm aquatic and human life. They are created by a wide variety of human practices and products like heavy metals, pesticides and organic compounds like PCB's.
Transpiration	Water loss of the plant to the atmosphere through the plants stoma.
Treated Water	Water that has been chemically or biological polluted, but after having been treated is now safe to be reused or discharged to the environment.
Trench Latrine	Excreta disposal system especially suited for emergency situations. Shallow or deep trench latrines (from 15 to 200cm) are pit latrines with trenches instead of slabs and superstructure. They can be arranged as simple trench latrines or as multiple trench latrines. In the latter case they are an improvement of an open defecation field. They should be at a distance of 15-30m from any groundwater source and the bottom of any latrine at least 1.5m above the water table. Latrines should be backfilled when full to within 0.2m from the slab.

Trickling Filter	A trickling filter is a fixed-bed, biological reactor that operates under (mostly) aerobic conditions. Pre-settled wastewater is continuously 'trickled' or sprayed over the filter made out of rocks, gravel, plastic modules. As the water migrates through the pores of the filter, organics are degraded by the biofilm covering the filter material.
Trihalomethane (THM)	THMs are chemical compounds in which three of the four hydrogen atoms of methane (CH4) are replaced by halogen atoms. They are environmental pollutants and are known to be carcinogenic. Disinfection of drinking water with chlorine can cause the formation of THM if organic matter (THM precursors) is present. See also DBPs.
Turbidity	Turbidity is a measure of the degree to which the water loses its transparency due to the presence of suspended particulates.
Ultra Violet Radiation	Ultraviolet radiation spans wavelengths from about 10 nm to 400 nm and is an important component of sunlight although the ozone layer prevents much of it from reaching the earth's surface. It is seperated in UV-A, UV-B and UV-C light. UV-C and UV-B light have a damaging effect on DNA and can therefore act as a desinfectant (killing microbes) or cause skin cancer and genetic mutation.
Ultrafiltration	A kind of low-pressure membrane filtration process in which hydrostatic pressure forces a liquid against a semipermeable membrane. Suspended solids and solutes of high molecular weight are retained, while water and low molecular weight solutes pass through the membrane (typically with a pore size of l 0.1–to 0.01 micrometres).
Unplanted Drying Beds	An unplanted drying bed is a simple, permeable bed that, when loaded with sludge, collects percolated leachate and allows the sludge to dry by evaporation. Approximately 50% to 80% of the sludge volume drains off as liquid or evaporates. The sludge, however, is not effectively stabilized or sanitized. Unplanted drying beds need to be desludged regularly. The percolate or leachate needs to be collected and treated before reuse or disposal. See also planted drying beds.
Unsaturated Zone	The unsaturated zone is the portion of the subsurface above the groundwater table. The soil and rock in this zone contains air as well as water in its pores. In some places the unsaturated zone is absent, as is common where there are lakes and marshes, and in some places it is hundreds of meters thick, as is common in arid regions. Hydrologically, the unsaturated zone is often the main factor controlling water movement from the land surface to the aquifer. Flow rates and chemical reactions in the unsaturated zone control whether, where, and how fast contaminants enter groundwater supplies.
Urea	The organic molecule (NH2)2CO that is excreted in urine and that contains the nutrient nitrogen. Over time, urea breaks down into carbon dioxide and ammonium, which is readily used by organisms in soil.
Urinal	A urinal is used only for collecting urine. Urinals are generally for men, although models for women have also been developed. Most urinals use water for flushing, but waterless urinals are becoming increasingly popular.
Urine	Urine is the liquid produced by the body to rid itself of urea and other waste products. In this context, the urine product refers to pure urine that is not mixed with faeces or water. Depending on diet, human urine collected from one person during one year (approx. 300 to 550 L) contains 2 to 4 kg of nitrogen. With the exception of some rare cases, urine is sterile when it leaves the body.
Urine Diversion	Urine diversion devices collect urine separately from faeces and from water (or with minimal flush water). A urine diversion toilet has two outlets with two collection systems: one for urine and one for faeces in order to keep these two excreta or wastewater fractions separate.
Urine Storage	Urine storage is the simplest and cheapest way to hygienise separately collected urine in order to reuse it safely in agriculture. Urine is generally sterile but contains most of the plant nutrients excreted by humans. To hygienise urine, it is stored for one up to six or more month, depending on estimated risk of cross-contamination with faeces. The sanitising effect comes from a combination of the rise of pH (due to the transformation of urea to ammonium by the naturally present enzyme urease), the raise of temperature and time.
Urine Storage Tank	When urine cannot be used immediately or transported using a conveyance technology (e.g. jerrycans), it can be stored onsite in containers or tanks. The storage tank must then be moved or emptied into another container for transport.
UV-A Radiation	The longest ultraviolet radition, UV-A, lies within 315 and 400 nm. Most of it passes through the atmosphere and reaches the earth surface.
UV-B Radiation	Ultraviolet radiation within 280 and 315 nm. UV-B can be directly absorbed by DNA and is therefore carcinogenic and can kill microorganisms. Most of it in natural sunlight is filtred out by the ozone layer and only some few percent of the solar spectre contain UV-B.
UV-C Radiation	Ultraviolet radation within 100 and 280 nm. Almost all of UV-C light from the natural solar light is filtred out in the atmosphere.
Vault Composting Toilet	Composting toilet using an above vault as a composting chamber (e.g. continuous composting, concrete or brick double-vaults or movable containers).
Vector	An organism (most commonly an insect) that transmits a disease to a host. For example, flies are vectors as they can carry and transmit pathogens from faeces to humans.
Ventilated Improved Pit	The single VIP is a ventilated improved pit. It is an improvement over the single pit because continuous airflow through the ventilation pipe vents odours and acts as a trap for flies as they escape towards the light.
Vermicomposting	Vermicomposting is the process of using earthworms to break down organic waste in order to create a faster than normal composting. The worm population is self regulating and will increase to the point where available food and space constrain further expansion. The process must be monitored for such parameters as moisture content and temperature but is not labor-intensive. Compared to ordinary soils, the earthworm castings (the material produced from the digestive tracts of worms) contain much more nitrogen (N), phosphorus (P) and potassium (K). They are rich in humic acids and improve the structure of the soil if used as a soil conditioner. The worms are placed in bedding made of loose materials such as coconut husk or shredded paper in a shallow box or tub and fed with soft organic matter such as kitchen waste. After about two months the compost can be harvested by putting the compost in the shape of a cone and scrapping of the top layers. The worms go to the bottom of the cone as they run away from light. Vermicomposting is a popular sustainable low-cost treatment for organic solid wastes (kitchen wastes, plant wastes). It is also applied to treat fecal matter, such as human excreta in the form of sewage sludge, sieved blackwater or faeces. Vermicomposting is also used to produce Terra Preta.
Vertical Flow Constructed Wetland	A vertical flow constructed wetland is a planted filter bed that is drained at the bottom. Wastewater is poured or dosed onto the surface from above using a mechanical dosing system. The water flows vertically down through the filter matrix to the bottom of the basin where it is collected in a drainage pipe. The important difference between a vertical and horizontal flow constructed wetland is not simply the direction of the flow path, but rather the aerobic conditions.
Vertical Garden	The term vertical garden refers to any kind of construction and support structure for growing plants in an upwards-directed, vertical way and thereby efficiently and productively making use of the existing space for food or other kind of plant production. A huge variety of different designs and concepts are available including greywater towers, green walls or living walls. The reuse of different composts (e.g. compost, vermicompost or terra preta) from household wastes and reclaimed water (e.g. greywater) or urine can be considered in vertical gardening allowing to enhance food production and to close the nutrient and water cycle at a local level.

Viredox	The Vyredox method for water purification was developed in Finland and is now also used in Sweden and some other countries. It oxidises the ferrous ion, which is soluble in water, to the ferric ion, which is insoluble, before the water enters the well.
Wadi	A valley, gully, or streambed in northern Africa and southwest Asia that remains dry except during the rainy season. Wadis are often used for spate irrigation.
Waste Stabilisation Pond	Waste stabilisation ponds are large, manmade water bodies used for the treatment of wastewater by the means of naturally occurring processes, such as solar light, wind, and microbial activity. There are three types of ponds, anaerobic ponds, facultative ponds and aerobic or maturation ponds, each with different treatment and design characteristics. The ponds can be used individually, or linked in a series for improved wastewater treatment. Investment and operation costs are relatively low, but large surface areas far from housings are required.
Wastewater	Used water from any combination of domestic, industrial, commercial or agricultural activities, surface runoff/stormwater, and any sewer inflow/infiltration. Wastewater from sanitation contains one or more of the following products: excreta, faeces, urine, blackwater, brownwater, flushwater, dry cleansing material, cleansing water.
Wastewater Collection	In order to facilitate treatment and reuse of wastewater, it has to be collected. Wastewater can either be collected in a centralised sewer system, or, in the absence of this, with a system of human-powered or mechanised vehicles (cartage).
Wastewater Reuse at Home	This is the title of the factsheet that describes the various ways that wastewater reuse can be practiced at the household level. Water use optimisation means resistance to chronic and short-term water scarcity and cost and energy savings for water supply and wastewater treatment as less water is required and less polluted water produced. Besides installing water saving appliances, source separation and reuse of different types of wastewater is a way to optimise water use at home. Depending on the type, quality and quantity of water, wastewater can either be reused directly, or treated and reused (recycled).
Wastewater Treatment	Wastewater treatment means the treatment of wastewater and related products (e.g. blackwater, faecal sludge, greywater, non-biodegradable waters, etc.) for safe reuse or disposal in order to minimise health risks for people and protect the environment from pollution.
WATA technology	The WATA technology allows the local production of sodium hypochlorite (active chlorine) for water treatment and disinfection purposes. Antenna Foundation developed a range of devices, suitable for the production of various volumes to serve a variety of implementation needs.
Water Footprint	The water footprint expresses human appropriation of freshwater in volume terms. It counts the direct and indirect freshwater (blue water, grey water and green water) used to produce a product, but can also be applied to consumers, companies, nations, areas. It can be used as an indicator that provides information on the volume, location, time and source of water used and can be compared to water availability at the affected water bodies in order to assess risk of water scarcity and pollution.
Water Use	Quantitatively, this is 50 litres of water per day.
Water Pasteurisation Indicator	A Water Pasteurisation Indicator (WAPI) is a simple thermometer that indicates when water has reached pasteurisation temperature and is safe to drink. It consists of a small polycarbonate tube that contains a soybean wax that melts when water or milk is heated enough to be pasteurised (65˚C/149˚F). Since water pasteurises at temperatures well below its boiling point, WAPIs save time and fuel.
Water Purification	Water purification describes a process during which contaminants such as organic material, pathogens or chemical substances are removed from raw water. Water purification can either denominate the process of making water safe for human consumption, but the term is also used for other cleansing processes to make water suitable for e.g. industrial or agricultural uses. Water purification includes physical processes such as filtration or sedimentation, or chemical processes such as chlorination or use of sunlight which contains ultraviolet light.
Water Risk Map	A Water Risk Map gives an overview of the water risk in a geographic area with regard to for example baseline water stress, seasonal variability, drought severity, groundwater stress and flood occurrence. Various Water Risk Maps are open source available online.
Water Sources	This term denominates the different sources of water, including shallow or deep groundwater, precipitation, surface water, or desalinised seawater. Preserving existing water sources (e.g. through moisture control techniques or water-saving technologies in households, industry and agriculture), resulting in a decreased water use, can also be considered part of water sources, as water saved becomes available for other purposes.
Water Table	The level below the earth's surface, which is saturated with water. It corresponds to the level where water is found when a hole is dug or drilled. A groundwater table is not static and can vary by season, year or usage.
Water Use	This term denominates the consumption of water for different purposes, without which no life would be possible on earth. Water use is generally divided into household use, industrial and commercial use, and agricultural use.
Water Use Efficiency	Water use efficiency includes any measure that reduces the amount of water used per unit of any given activity, consistent with the maintenance or enhancement of water quality. Generally, efficient water use is defined as the ratio between the actual volume of water used for a specific purpose and the volume extracted or derived from a supply source for that same purpose.
Water-borne Diseases	Water-related diseases include: those due to micro-organisms and chemicals in water people drink; diseases like schistosomiasis which have part of their lifecycle in water; diseases like malaria with water-related vectors; drowning and some injuries; others such as legionellosis carried by aerosols containing certain micro-organisms.
Waterless Urinal	Waterless urinals function without water. They have two important advantages compared to flush urinals: They save water and they allow the collection of undiluted urine, which is a valuable resource as fertiliser in agriculture.
Well Casing	Casing used in boreholes is tubular material that provides support to the walls of the borehole and may be either temporary (used by the driller during drilling of the borehole and subsequently withdrawn) or permanent (forming part of the final construction of the completed borehole). Selection of casing material should be based upon water quality, borehole depth and diameter, drilling methods, local regulations and cost.
Well Development	All drilling methods alter the hydraulic characteristics of formation materials in the vicinity of the borehole. Development of a borehole after completion of drilling forms part of the normal drilling procedure. Development procedures are designed to restore or improve these characteristics to maximise the performance of the borehole by improving specific capacity and hydraulic efficiency. Well development methods include: overpumping, surging, jetting, hydro-fracturing, and other supplementary development methods.
Well Rehabilitation	Well rehabilitation of dug or drilled wells becomes necessary if operating wells lack in providing adequate water quality or quantity as the well becomes contaminated or clogged through natural processes or in consequence of emergencies (e.g. floods, seawater intrusion, etc.). It involves the cleaning and disinfection of the well and sometimes the application of well development procedures.
Well Remediation	The term well remediation is used in the oil industry. It refers to the cleaning of oil wells to improve performance and requires utterly different methods than the rehabilitation of water wells.

Well Screen	A well screen is a filtering device that allows groundwater to enter the well. It provides structural support but prevents sediment from entering, especially in unconsolidated strata. Proper screen design and selection is important for the hydraulic efficiency of the well, as well as for the longevity and long-term cost of the structure. Screens should have maximum open area to create minimum resistance to flow into the hole, but at the same time must minimise sediment ingress and provide adequate structural strength. Optimising each of these criteria for a particular well is the essence of screen design.
Wet Well	Sewage is fed into and stored in an underground pit, commonly known as a wet well. The well is equipped with electrical instrumentation to detect the level of sewage present. When the sewage level rises to a predetermined point, a pump will be started to lift the sewage upwards.
Yellow Water	Yellowwater refers to urine mixed with flushing water.

Weapons

Meteorology

NOAA	National Oceanic and Atmospheric Administration - A mobile weather data collection and forecasting facility including personnel, which can be utilized within the incident area.
NWS	National Weather Service

Maintenance

Document updates, user tips, credits and FAQs

"Learning is a lifetime process, but there comes a time when we must stop adding and start updating."
Robert Breault

Introduction

This section is for logging content between versions to keep track of what's been done and what's left to do. It also contains known problems that need fixing in the future. Any modifications to this document are logged below as individual entries per category that was modified. Updates are logged for ease of seeing what's new in the document and when a certain section was added. Small fixes such as spelling, grammar, capitalisation etc are not documented.

Purpose	The aim of MAINTENANCE is to keep track of the content added to The Preparedness Encyclopedia and to help show readers the enormous amount of work it's taken to produce such a document.
Lost?	• For reader tips and information on using this guide, see the PRELUDE section. • For a list of the categories in this document, see the CONTENTS section.

Contents

1 Additional Reader Tips

These are additional reader tips to help anyone get the most out of reading this document. It also includes settings and fixes that might be beneficial while reading TPE on different programs and devices.

Headings

Headings are found everywhere in the guide and span vertically and horizontally so it's easier to see when you change sections.

Category Heading	The first type of heading is for the category, spanning the row from the "A" column and includes a "jump to top" button, and a percentage that section is complete. It is hashed for easier recognition. Example: Column "A" and the heading entitled 'PRELUDE' above is an example of a category heading.
Subcategory Heading	The second is the subcategory heading spanning the row from the "B" column. It splits the category down into smaller sections to assist in finding what you want easier. Example: Column "B" and the heading entitled 'Reader Tips' above is an example of a Subheading.

MAINTENANCE | Additional Reader Tips | Headings | Subheadings

Sub-Subcategory Heading	The third is the sub-subcategory heading spanning the row from the "C" column and takes on the same colour as it. Example: Column "C" and the heading entitled 'Headings' above is an example of a Sub-Subheading. The green heading above is an example of the Sub-Subcategory.

Sub-Sub-Subcategory Headings

Sub-Sub-Subcategory Heading	The fourth is the sub-sub-subcategory heading spanning the row from the "D" column and takes on the same colour as it. Example: Column "D" and the white heading above is an example of a Sub-Sub-Subcategory.

Additional Heading

Additional Heading	An additional subcategory (if required) is shown with colours matching that categories theme. This is only used if a section requires even more division such as the "GARDENING" section. Example: The heading entitled 'Additional Heading' above is an example of one.

2 Developer Tips

MAINTENANCE | Developer Tips

These are tips for working on the spreadsheet to make editing easier. They should only be used if you're editing the sheet otherwise they will have no impact so continue on to the CONTENTS section. The spreadsheet was made in Microsoft Excel 2010 and any other spreadsheet application (not the same version) will most likely skew the sheet. Unfortunately due to its size this sheet occasionally becomes corrupt while I'm working on it, so now I back it up to 3 places every iteration.

There are a few sections that require updating from time to time due to the information being prone to changing frequently. This information can be found by searching the following 'Update Marker' without the brackets or spaces: " ⁿ ". Cells with Red text to the right side of the column means it's a comment about that row and should be removed when it's resolved. I have also tested splitting the sheet into multiple tabs but there was no performance gain so I will leave it as one long sheet. It will also be more difficult to change sections on mobile devices if it's split in ~70 parts.

These are the recommended programs to edit TPE. Ordered by speed of running and editing the sheet.	**Pc (Editing)** 1. Microsoft Excel 2010 (The one I use) 2. Microsoft Excel 2007 3. Microsoft Excel 2013 4. Microsoft Excel 2016 (Laggy) 5. Google Sheets (Not as fast as Excel)	**Mobile Editing** ● Can't edit on mobile device without it taking an extremely long time to load. It may also crash randomly.	

Picture Quality	Picture quality is based on how much information it gives, detailed pictures are a bigger filesize and may take up multiple cells whereas simple pictures are 1-2kb. The largest ones can be found in the GEOGRAPHY section under "World Map" and can be deleted to save about 3Mb. 'Almost' all pictures are all compressed to save space.
Laggy Characters	The accented character "é" when used in the vertical columns causes extreme lag. This likely applies to other accented characters as well.
Widths	Column widths are 25 units and default row widths are 16.5 units.
Searching for New Line Characters	Use Ctrl + J to add a new line in the Excel search box.
Fix Vertical Text	General + Distributed + No Wrap + 90° This re-aligns the columns vertical text so it's centred and in the middle of the cell.
(Excel) Disable Double Click Jump	File > Options > Advanced > Untick "Enable fill handle and cell drag and drop" Stops the teleporting that happens when you double click between cells.
Backups	Use the "Always Create Backup" Option when saving. This just creates a backup file in case it becomes corrupted.
Hiding Excess Cells	Select Cell/Column > HOLD Shift + Tap End + Tap Arrow > Right Click > "Hide" Hides columns and rows which aren't used.
RAM Overload Problem	At all costs when pasting data into row "R" make sure the entire hidden row isn't selected. **Symptom:** When creating new rows the sheet may crash or lag and the RAM jumps into the gigabytes instantly. **Fix:** Unhide all hidden columns and delete the infinite rows of text.
Jump To Top	When reading the Excel version: Use the up arrow to the left of each heading title to jump to the top of the sheet. To reach an arrow quickly, select the "A" vertical column and press the up or down arrow.
Jumping Categories	Jump up and down categories, subcategories and sub subcategories (in Excel) by selecting the merged cell to the far left and pressing the up or down arrow to jump to the next one (Pc only). The further the column to the left, the faster you jump sections.
Content Limits	No informational text will go beyond column "Q" giving 11 cells working space per row plus the header row "E".
Column Height Fixers	Column "R" contains numbers which maintain a minimum column height so all the text is readable if some cells in that row are merged.
Row Visibility	At 100% zoom all rows up to "M" should be visible on a 1080p screen for ease of reading. Up to row "Q" on 1440p." Up to row "Z" on 4K.
Cell Border Colour	The cell border colour in "Theme Colours" is the last grey color on the first row. Otherwise it is colour: R: 128, G:128, B:128.
Text Indents	● Rows that touch column "D" have 2 indents. ● Rows that are further inside the guide have 1 indent. ● Other rows may be determined on a case by case basis.

Developer Settings

Change Units to Cm	Start > Excel Options > Advanced > Display > Ruler Units
Cell Shading / Pattern	Ctrl + 1 to access cell shading options.

Cell Alignment	Quotes (") at the start of a cell aligns the text to the right side. Therefore use a ^ symbol before it to center it or a ' to align it left.
Excel Version Bolding	There's a problem when editing the document in different excel versions where the " symbols are exchanged for '. This causes cell font to be bolded when edited and the ' symbol has to be removed.
Add Developer Mode	"Start > Excel Options > Customize Ribbon > Developer" Unlocks a few extra features you can use.
Jumping to Top	"Start > Excel Options > Advanced > Lotus Compatibility > Tick Transition Navigation Keys" This puts the hyperlink at the top of the page when jumping sections.
Expand Button Location	"Data Tab > Outline Setting Corner Button > Untick "Summary rows below detail" This puts the groupings button at the top of the selection instead of the bottom.
Cell Widths	Col A-D/F/R Widths: 3 Col E/G-Q Widths: 25 1 Row Width: 16.5 2 Row Width: 27
Reading Font	Best read in the "Century Gothic Bold" font. Fonts in "Entertainment" may vary due to requirements. Typical font size is 10pt. The header font is: "Bookman Old Style".
Heading Sizes & (Row Height)	● Category Heading (A): (3+25+2) Heading: 120pt, Description: 30pt, Quote: 20pt ● Column B: 80pt (8) ● Column C: 60pt (6) ● Column D: 40pt (4) ● Column E: 30pt (3)

Cell Supporter Update Table
The supporter cell is the "Q" column and maintains the height of any merged cells. This table shows the difference between the font size 10 (Old Format) and the font size 20 (New Format). By updating the font size it will take fewer key presses to update the height, albeit with less control over the height of the row. To convert to the new system, open up replace (Ctrl + F), hit Options and tick the "Match entire cell contents" button then search for the numbers in the table below from biggest to smallest, replacing them with the "New Format" value. To Search multiple rows use the (Ctrl + J) shortcut to add a new line. Once they are all done you can resize the text in column "R" to 20 rather than 10. To add the ^ symbol as a prefix to rows, set the font format in the Find and Replace window to 'center'.

PREPAREDNESS	RECIPES	RELIGION	SHELTER	SKILLS	SECURITY	SURVIVAL	TRANSPORT	WARFARE	WATER	WEAPONS	

Rendering

PDF Rendering
These are the guidelines on rendering the guide as a PDF document to maximise the sheet and so the page numbers line up each version. These settings are accessed in the "Page Layout" menu and the "Margins > Custom Margins" menu.

Rendering - 'Page'
- Print Entire Workbook
- Orientation = Portrait
- Scaling = Fit All Columns to One Page Width
- Height = Automatic
- Size = A4 Page
- Print Quality = 1200 dpi

Rendering - 'Margin'
- Top Margin = 0.6
- Bottom Margin = 0.6
- Left Margin = 0.6
- Right Margin = 0.6
- Header = 0
- Footer = 0

Rendering - 'Footer'
- Left = "The Preparedness Encyclopedia - Version 0.0.0"
- Centre = "Page &[Page]"
- Right = "By Fluidic Ice - www.fluidicice.com/TPE"
- Untick - Align with Page Margins
- Gridlines - View
- Headings - View

Rendering - 'Sheet'
- Print Area = $A$1:$R$20431 (Change number to the max row count - if it isn't already)
- Gridlines - View
- Headings - View

Page Breaks
Page breaks have been added to the top of each category to start it on a new page. Some additional page breaks have been added to assist in the readibility of critical sections such as the eastern world map in the GEOGRAPHY section.

Page Breaks
- Category Start
- Eastern World Map

Other Page Breaks
-

If a page break hasn't been manually defined it will be automatically generated. Manual page breaks have longer dotted lines compared to the shorter dotted lines for automatic ones.

Unwanted Content - Search Values
The following items are used to find unwanted content in the spreadsheet.

- [1] to [500]
- [clarification needed]
-
- <nb>
- [citation needed]

- [vague]
- [specify]
- "Queensland"

Developer Excel Limitations
Excel Limitations to keep in mind.

Max Rows	Max Columns	Max Column Width	Max Row Height	Max Page Breaks	Max characters in a cell	Maximum number of line feeds per cell	Sheets in a workbook	Colors in a workbook	Undo Levels
1,048,576	16,384	255 characters	409 points	1,026	32,767	253	Limited by available memory (default is 3)	16 million colors	100

Exporting Checklist

The following tips should be followed in order when exporting TPE.

Pre-Export

Check and update the document prior to exporting:
1. Save the document as a new file of the version release number. E.g. 7.00 if the current version is 6.80.
2. Check the version number and date is current at the top of the document
3. Update the footer text to the current version
4. Update the % complete and the other statistics in MAINTENANCE > Updates > Version #
5. Update the condensed updates section directly under the 'Updates' section
6. Fix the header columns by re-aligning them, (General, Distributed, 90°)
7. Update the PRELUDE > Introduction > Statistics section
8. Update any Prep Drive references if required
9. Ensure the Updates category is up to date and the "This Version" marker is moved
10. Ensure row spacers in column "Q" are hidden.

Conversion

Convert the document to PDF:
1. Save and close TPE if it's open, to ensure all updates are saved.
2. Convert TPE to PDF using www.ilovepdf.com, then clear the browser cookies from the past hour.
3. Check that it exported correctly, didn't get cut off at the bottom and that row text isn't cut off.
4. If there were issues, fix them and re-export, then repeat #2.

Editing

Using Adobe DC, make the following changes to the document:
1. Add bookmarks to every primary category and Christianity.
2. Update the file size of the document in the MAINTENANCE section
3. Update the 'Number of Pages' in "CONTENTS > Categories"
4. Update the page counts for each category in the CONTENTS section
5. Add PDF bookmarks to the primary categories
6. Hyperlink every category in CONTENTS
7. Hyperlink every link in INTRODUCTION
8. Hyperlink the Rapture shortcuts

Releasing

Releasing TPE:
1. Upload TPE .PDF to fluidicice.com
2. Upload TPE .XLSX to fluidicice.com
3. Release to the TPE Mailing List for a week
4. Write a blog post on the new TPE version
5. Post the new version on Reddit.com
6. Post the new version on Facebook.com

Exporting Checklist Via Excel
The following checklist describes how to release a new version on PDF via Excel's built in features. To "print" to PDF Adobe Acrobat needs to be installed with the add on to allow exporting as PDF.

Formulas

These formulas are here so they don't lag the sheet and can be calculated prior to exporting.

Formula Name	Find the word count on a row	Count All Words (Change total row counts and use in cell E:4)	Days Since Creation		
Formula	="Approx Number of Words" & CHAR(10) & (ROUND(SUMPRODUCT((LEN(TRIM($G12:$Q12))-LEN(SUBSTITUTE($G12:$Q12," ",""))+1),--(TRIM($G12:$Q12)<>"")) / COUNTA($G12:$Q12), 0)) * COUNTA($G12:$Q12)	=SUMPRODUCT(LEN(TRIM(E5:Q19928))-LEN(SUBSTITUTE(E5:Q19928," ",""))+1)	="Sheet Creation Date" & CHAR(10) & "01 July 2017" & CHAR(10) & "(" & ROUND(TODAY() - DATE(2017,7,1),0) & " Days Ago)"		

Macros

The following are the macros in this sheet so if they become corrupt it's easy paste them again. This row is a fixed size because some macros are huge and thus can only be read with the excel file.

Macro Name	Macro
Page Number Generator Last Update: v8.43	See below

```
Sub PageNumberGenerator_Click()

    'Message to inform users to not click anything while it calculates the number of pages.
    MsgBox "The page numbers for each category are now going to be processed. Please click OK and then wait until it's been completed otherwise the program will crash if you click again."

    'Have to scroll to the bottom of the document and then back so this macro can recalculate the max number of pages - A message will let the user know if they missed this step.

    Dim categories As Variant 'Initializes the category defined names

```

Known Problems

These are known errors that I'm working on fixing.

Problems

1	In columns "A-D", If the merged cells are too tall for the looped text - it doesn't display for some parts of the column.
2	The .xlsx spreadsheet may not open in mobile Excel due to its size.

3	When using colored text, the color 'bleeds' over to nearby cells.
4	Text is hard to read on mobile devices when scrolled out to a full page.
5	Maximum row heights aren't tall enough to contain much text. (Limitation of Excel)

3 Content Credit

This section outlines and credits the people responsible for the resources used throughout this document such as the pictures and icons. The percentage denotes how much of that content type makes up TPE.

Content	The content throughout TPE is drawn from: ● Wikipedia (www.wikipedia.org) (65%) ● Fluidic Ice - Personal knowledge and experience (www.fluidicice.com) (15%) ● Other websites (7%) ○ Wikihow (www.wikihow.com) ● Artificial Intelligence Engines (5%) ● eBooks - With summarised content (5%) ○ Wikibooks (www.wikibooks.org) ● Physically Owned Books - With summarised content (2%) ● Content Creators - People who let me use their content in TPE (1%) ○ All quotes are by the original people who made them.
Icons	All icons are purchased on a subscription at: ● Iconfinder (www.iconfinder.com) (100%) The icon designers: ○ Dutchicon (www.iconfinder.com/dutchicon) (98%) ○ 13ree design (www.iconfinder.com/13ree.design) (1%) ○ Webalys (www.iconfinder.com/webalys) (1%)
Pictures	The pictures are supplied by either: ● Wikimedia Commons (www.commons.wikimedia.org) (85%) ● Shutterstock (www.shutterstock.com) (10%) ● Pixabay (pixabay.com) (5%) ● Artificial Intelligence (0%)
Conversion	TPE is converted to PDF using: ● ILovePDF - Free Resource (www.ilovepdf.com/excel_to_pdf) Highly recommended website - it's the only one that seems to render the PDF correctly.
Editing	TPE is edited using: ● Adobe Acrobat DC (www.ilovepdf.com/excel_to_pdf)

If you have any copyright issues please contact me via my website.

4 Contributions

Thank you tremendously to all the individuals in the supporters section below for their encouragement, support and input on TPE.

If you wish to contribute to the guide, please email me what topic you would like to assist on and the row/cell number (and the title of the row in case it's changed row count since then) you would like to add or amend and paste the new data.

Leaving Feedback
If you would like to leave feedback - please email it to me with your preferred alias and I'll add it below. Email is at the top. Feedback given on other platforms will be automatically added but will be taken off if requested.

Celebrity A celebrity is any individual with a website, channel, book, Tv series or podcast related to prepping, self-sufficiency or survival which is decently popular. Celebrities will have a starred name in the supporters section.	**Time is Money** If you contribute to the writing of this guide each cell you write/update (accurately) will be equivalent to 0.1 point.	**Download Latest** Ensure you download the latest version prior to adding content as it may have already been added.	**Star Contributors** People with over 1,500 points will be given their own cell at the top as gratitude to your contributions.	**Organisation** Supporter names are listed by date and will not be re-ordered by money, rank or celebrity status. There will be 10 names per cell.

Donations	Donations are highly appreciated as I've spent extensive hours compiling this guide to help any and all it falls into the possession of. Any donations will be converted to AUD and then to points at 3x the rate, so by donating $20 AUD you'll get 60 points added to the supporters section below. If it's $20 USD that's donated you'll get around 87 points. Your money will literally go into the writing of this guide. For every dollar that's donated I will sit down and spend 1 extra minute working on this spreadsheet. Even then 1/3 of all donations will be donated again to those in third world countries without access to clean water.

Donation amounts also stack with contribution, so if you donate $100 and you update 100 cells of the sheet, you'll have 310 points.
100 x 3 + (100 / 10)

Donations are preferred over contribution as I have a certain quality and accuracy level I want to meet for this sheet. Donation point counts aren't listed beside names, but the colours reflect how much someone has donated or worked on the sheet. I have a sheet tracking the points so I can add to the totals if more is donated.

If you'd like to donate, please see the TPE page on my website: **www.fluidicice.com/TPE**

MAINTENANCE Contributions

Donation Split This is like the fire triangle of donations, so try to donate in an amount divisible by 3! Donations will push me to keep working on the guide even more than I usually do. Here's how they will be used:	**Third 1** One third of all donations will be donated towards providing clean water for third world countries via missions trips. Using salt water electrolysis!	**Third 2** One third will go towards acquiring more information for the guide such as purchasing databases, website bills, books, server costs and content research etc.	**Third 3** One third will buy me a coffee occasionally or whatever I need at the time to keep me alive and working on the sheet.

Contribution	Edit the current version of the spreadsheet that you have and take note of where (which row number) you are adding new cells to. Extract the new data you added to a clean spreadsheet and email me your edits. You can have edits to multiple sections just ensure they are separated and are marked clearly which sections and subsections they are from. Detail in an email to me what category you're updating and what row you would like it added to as well as the heading and subcategories if any. I will add it to the next released version after vetting the information for accuracy. To edit single cells, do exactly the same but you don't need it in spreadsheet form, just email the data you would like changed. This is particularly useful if you want to update your own book / website or other content.

Contribution Guidelines Contribution is somewhat difficult due to the mix formatting in the guide. Recently I've been trying to upgrade sections to the new larger font "Word Format" for ease of reading. However currently most sections are the older and tinier "Excel Format" which is aimed at a higher density of information to keep the sheet small. Just use the smaller single cell or "Excel" format if you're adding content as it's easy to adapt to the larger style. Try to keep each cell to under 11 lines if using the excel format, moving it to an adjacent cell if required for ease of reading on mobile platforms. Link the source of the information if required. If you are the source, only link your website if the data pertains to the information given.	**Styling (Excel Fmt)** ● Font: Century Gothic ● Size: 10pt ● Colour: Black ● Alignment: Centre ● Single Cells ● Bold Headings	**Styling (Word Fmt)** ● Font: Century Gothic ● Size: 20pt ● Colour: Black ● Alignment: Left ● Merged Cells ● 30pt Bold Headings

Information Credits
The credits for information throughout the guide can be found via the link in column "F". Just copy and paste the cell into a web browser to find additional information and the origination of the information. I try not to copy the content directly but interpret it and then re-type it into the spreadsheet. Content without a link in column "F" is most likely my own authorship and researched by me. Unless I forgot to add it which is always a possibility.

MAINTENANCE Supporters

5 Supporters ★

Supporters are listed chronologically per colour with 5 names per cell. These people have either donated, assisted with information or given valuable feedback. If you donate enough to reach a new category you will be moved up in the next release. Please contact me if you wish for your name to be changed or removed. Note that the numbering system and colours may change over time if I alter the point number ranges. However your points respective to everyone else won't change.

To become a supporter you can either:
- Donate
- Add Information
- Blog Review TPE
- Video Review TPE
- Submit Detailed Feedback

Supporter Tiers

1. Blue Tier (1-49)

2. Green Tier (50-149)

3. Orange Tier (150-299)

4. Red Tier (300-499)

5. ☆ Star Contributors (500+) ☆

Supporter Effects

Bold (Donator)	*Italics* (Contributor)	Underlined (Multiple Donator)	*Star* (Celebrity)	#Hashtag# (Sharer)	@Amper@ (Vid Review)

MAINTENANCE Supporters Star Contributors

☆ Star Contributors ☆

Contributors with 500+ points are transferred to star contributors to highlight the amazing impact they are having. You can have a message with your name so type as much as you want, but the font size will be adjusted to fit. Choose your own background style, text, border and shading colours if you want or the default will be used.

☆ **Ben McKeamish** ☆
Have I not commanded you? Be strong and of good courage; do not be afraid, nor be dismayed, for the Lord your God is with you wherever you go." Joshua 1:9
-~-~-~-~-~-~-~-~-~-~-

MAINTENANCE Supporters Red Tier

Red Tier

Those in the Red Tier have between 300 and 499 points. They can have a short message beside their name.

Example Name
This is an example message. The text is shrunk to fit in the square.

Orange Tier

Those in the Orange Tier have between 150 and 299 points. They get three choice words under their name to represent themselves.

Example Name
Coder, Prepper, Minimalist

Justin G				

Green Tier

Those in the Green Tier have between 50 and 149 points. Their name will just be shown.

Example Name

Mark G	**Roman P**	**Caleb A**	**Kirk B**	**Evan W**
David H				

Blue Tier

Those in the Blue Tier have between 1 and 49 points. Their name will just be shown.

Example Name

David H	**Sapper John**	**Nick A**	**Aunt Bea**	**Luis R**
Viviana P	**Dustin S**	**ByungJin Y**	**Jeff H**	**Kelsey K**
Jesus C	**James C**	**Brian R**		

6 Feedback

This sections contains any feedback both positive and negative I've received from various sources such as Email, Reddit, YouTube or Twitter. Feedback is automatically added here if I see it but can be removed if you wish by emailing me. I often come back here to read them to inspire me to keep working on it.

Positive

This is the positive feedback I've received on TPE via email, Reddit and other social media.

Name	Version	Comment
Ballisticklyterminal	v4	Damn, You seem to be really invested in this. This is really cool.
ker95	v4	Thank you for sharing! I've downloaded the pdf & will take a look at it
roolthemall	v4	This is awesome, great points from what I've gone over so far. Thanks!
subaruderek	v4	Appreciate the sharing of a large resource, just found this so haven't dug in really. From what I've seen so far I look forward to getting into it. Bravo
ker95	v4	Wow - this was a labor (probably of love, but labor none the less). Well done! This is going to take a while for me to go through. You have compiled an amazing amount of helpful information - excellent job!!
apestilence1	v4	Honestly, thank you for this. You're a saint.
areyouolsen	v4	This is awesome, dude. Thanks a lot!
ker95	v4	I, of course, went directly to the natural disaster we most likely face - hurricane. Ended up doing a 'find' and searching through the document (haven't made it all the way through). Pro - I don't know how you could have done it any other way because you have made your information as all-encompassing as possible, addressing multiple issues/scenarios/information/concerns.
StormCaller02	v4	Wow, thanks for the fantastic resource!
ZiggyIsMyName	v5	This is amazing!!!!
cysghost	v5	This is awesome! Similar to something I was trying to put together, but have been too busy for at the moment.
mikramero	v5	I want to thank you a lot. Great work.
LatinaViking	v5	I haven't even opened the file yet, but I'm amazed at your effort. I'm a physician and I plan on going through the medical part of it and see if I can contribute to it somehow. If you would like, of course. Thank you so much for sharing it with us. :)
-Noxxy-	v5	You absolute legend
vzei	v5	I've been wondering if anyone had put together some collection of resources that could help you survive and rebuild if s*** hit the fan. I never expected someone would curate all the information in one resource though. Thanks for all time and effort you took to put this together!
ufoO0Oo	v5	Great work, thank you for sharing. And nice website ツ
HomunculusEmeritus	v5	FluidicIce you magnificent bastard, I was all set to ask for a PDF but your link to it was the first thing I saw. Thank you.
c-two-the-d	v5	Holy wow!!! Thank you.
1qax2wsx	v5	Coming back to this later when I'm on my pc!
Cyliciana	v5	THANK YOU SO MUCH!! I can't donate at the moment, but will in the future. As someone who is just starting to get more serious about prepping, this a "god-send" for me!
Juggernaut78	v5	Holy f***! Thank you!!!
kingpoff	v5	Absolutely superb job....
lakecitybrass	v5	Great job.
apestilence1	v5	This man is the Messiah of prepping
shadley0000	v5	I haven't reviewed this whole 800 page document but it is clear a serious amount of time and effort went into it. Nice work and thanks for sharing it

MAINTENANCE Feedback Positive

Dogmeat_Jones	v5	Very nice.
newPrivacyPolicy	v5	I've only just begun to scratch the surface of this document, but I'm impressed with the amount of work this represents. Thank you.
DiarrheaVagina	v6	This is incredible! Thanks so much for sharing!
survivaljournal	v6	Excellent resource, thank you for all the hard work.
BrandoJC	v6	Amazing amount of work and detail! As someone who falls in the Level 1 "Wannabe" level of preparedness, this is exactly what I was hoping to find! Can't thank you enough!
OctaveTheory	v6	This is probably the most impressive thing i have seen in years. Thank you.
ImpossibleBridge	v6	thanks for your efforts brother. let us know if we can be of any help. Cheers
Alaric_Silvertongue	v6	Wanted to say that TPE is a fantastic document! Only had a brief few chances to look through it, but it's got a huge wealth of info.
dumblederp	v6	thanks dude.
hybridfrost	v6	This is very impressive work! Thanks for sharing!
prepperjo616	v6	Awesome! Ive been downloading wiki's to my phone as well.
rasputinspastry	v6	I think this guide is just so impressive in that it is all one source... I know many of us have seen the comments/posts about "what book or books would you recommend for a disaster/TEOTWAWKI situation" and while I think we would all agree there are single "right" answers, TPE's guide comes the closest.
CompleX999	v6	Do you have any idea what your 63 days of works have done? I love you man.
br0adband	v6	Thanks for your efforts, and I can't even begin to comprehend why anyone would downvote this, seriously. But then again, Humans are pretty stupid sometimes, who knows. :D
leeser11	v6	Holy s***! I'm amazed at people that put a ton of effort and skill into something like this just to give it away for the benefit of internet strangers! Thank you so much !
DKDCbye	v6	I'm so in love with this PDF! Thank you! I'll be giving private feedback via email later on today when I get home but again, thank you for taking the time to put this together
thegreatoutdoors44	v6	I love you, thank you so much Chris
[deleted user]	v6	Love the guide - and since it's a PDF I was able to upload to my personal library in Google Books so it's also available on my phone and tablet - given that in an extended emergency I would probably find it more likely I have those, and it would be easier to keep those charged up enough to use. Of course you then have to make sure you "Download to Device" as well - since 4G LTE might not be universally available during an apocalypse :-)
KipsterED	v6	Same here. I greatly appreciate you offering this for free but the amount of effort you put in to it is amazing. I would pay a little something for it.
paleochris	v6	What an amazing compendium of information! Thanks for you great work :)
whodunnit2019	v6	Wow thank you so much !!
zsepthenne	v6	Thank you!
tortugavelozzzz	v7	Absolutely amazing update!! I honestly had such a hard time zooming in and out on my 6 inch cell phone screen, this is 100 times better, thank you so very much for all the effort, I can't believe that a 1400+ page survival enciclopedia is being offered for free, thank you so much and I sincerely hope you get lots of donations.
Level_62	v7	I do think that the "conspiracy" section was quite good and highlighted what so many people refuse to admit.
TheDragonLake	v7	I started downloading and just browsing the table of contents on the main page. 1212 pages, lordy this is gonna be one heck of a read.
Dbajram	v7	Very interesting. Thank you for sharing!
GPGrieco	v8	This is such an amazing resource. Thank you so much for publishing this for everyone!
tooawkwrd	v8	I downloaded TPE expecting it to be a cut/paste cobbled together pile of information. You've sincerely blown me away with the organization and visual coding implemented. I obviously haven't read through it yet but can immediately see how useful this resource is. Sincerely, thank you not only for the incredibly hard work but also for the part of you that wants to share it rather than monetize it.
its_teotwawki	v8	Incredible work! I'll be poring over this for a good long while. Thank you so much!
Myghael	v8	I guess this is prime example of a content to have downloaded in every device, thank you very much!
economic-salami	v8	Amazing work, thank you so much for sharing.
Cybertron436	v8	Well done man. I'm sure this will benefit a lot of people. Thank you
Brend155	v8	OP how kind of you to share hard work, well done
lunagazer8	v8	You are amazing!
kaybek	v8	This is fantastic content! Thank you for all the work you've put into this. Do you mind if I share this elsewhere with links to your site and fully crediting you?
GroupSleep	v8	This is truly a work of art, seriously. Good job. I plan on downloading it and throwing it on devices and the cloud. Thanks.
ilovekitty1	v8	WOW! Very impressive!
Tonykbg	v8	Great work!
elfieray	v8	Blimey! Thank you for your this excellent resource!
mudpizza	v8	Looks impressive, but not gonna lie, having chapters about Rapture / Second Coming threw me off a bit
bobthecan	v8	Things like this are why this sub is so important for people right now. Knowledge sharing is power. Things look grim but people helping people help themselves will push us forward. Thank you for the effort.
FlyingJaffaCake	v8	Wow. This is immense.
ActivateNow	v8	THIS IS AMAZING! Thank you!
V1ND1C4T0R	v8	Damn this is fantastic. I will be deep diving I to this when I get home from work!!
rhoymand	v8	saved to my gDrive and will eventually print out. Thanks!

Critique/Negative

MAINTENANCE Feedback Negative

This is the critique and negative feedback section. This category may have duplicate information to the 'Fixes & Additions' section below - as that is where I work from to make changes to the document. You many not have meant your feedback to be 'negative' but it's listed here as potential changes I can make.

Name	Version	Comment
ker95	v4	Con - information is scattered. (When searching for a term like hurricane)

universalists_unite	**v5**	I have been trying to read this but I hate to say it really is unusable in its current pdf or spreadsheet form. If I export it as text and remove all the extra white spaces and all the duplicate words/headings it is a fraction of the size. It has grown tremendously, has good content, and deserves to be useable...Sorry for the criticism.
Avadon7	**v5**	Maybe did not get more upvotes since posting time not optimal? **Juggernaut78** I think he means that it didn't get as many upvotes as it obviously deserves because the time of day which it was uploaded people were either sleeping or out about their day. **Haunting_Guarantee** https://dashboard.laterforreddit.com/analysis/?subreddit=preppers&threshold=5
ElectricTaser	**v5**	Looks like a labor of love. Just glanced at a few sections so far. As a knife aficionado, under gear- tools- Knives; Best brands Ka Bar, Gerber, and Schrade? No, no no. So many better options. Fixed blades I recommend personally look at Mora, Esee, Bark River, (inexpensive like $10 to a $$$few hundred dollars) and so many others (dozens) before those three.
Pfoenix	**v6**	Amazing work. I'm not too happy about the explosives section though. The anarchist cookbook is outdated, misleading and sometimes dangerous (at least regarding this topic. Don't know enough about the other stuff). A fifty-cent sized pile of thermite won't burn through an engine block. If the hood is made of steel it probably won't even burn through that. Nitrogen triiodide (the touch explosive) is too sensitive. Things that will set it off: sunlight, loud noises, it's own weight if piled too high, carefully wrapping it in a piece of paper. Don't mix tetrachloroethylene with aluminum. Especially not finely divided aluminum. Carbon tetrachloride and aluminum might not kill you immediately but it's still a bad idea. Handling those two chemicals is a bad idea in general.I'm the last person to tell you to not include explodey things. But don't use instructions from a book written by a 19 yo in the 70s.
Cool_Bastard	**v6**	To be honest...I was interested. But, after clicking and then seeing that I had to a) download something, and b) I notice the Paypal button at the bottom, I quickly exited without reading anything else. I was also confused with the top links that said "games," not really knowing what to think or how games had anything to do with the survivor/prepper encyclopedia. Yes, I'm guilty of skimming and not reading indepth, but I don't think I'm alone here (on the web) when doing it. Some suggestions, for what they're worth: Change the font and look. It looked...sci-fi-gamey, I presume "Games" means prepper games? If so, maybe say that instead of just games. Then it's clearer to idiots such as myself. Have the encyclopedia all online and also as a download for an option. That way people can see what it is before downloading. Just like Wikipedia puts everything online but still offers printable versions of what you want, if you want. Change the Paypal button into a "Donate" link in the top nav bar. That way it won't scare people like me away who associate downloading with paying, like I did. Yes, I understand it's just a donation option, but it's still a visceral feeling I get when I see the damn Paypal button...I just don't like it; would rather see a "donate" or "contribute" link and click if I felt like it.

Fixes & Additions

This section is for the fixes, additions and changes people recommend I make to the document. I will strive to work on a few of them every update. Below is the example format of the fixes feedback.

Example	**v0**	Example text about the desired fix or addition.	**Fixed** / **Partially Fixed** / **Unfixed** / **In Progress** / **Irrelevant** (Additional Information)

Name	Version	Comment	Fixed
ker95	**v5**	You need to have a donate button somewhere obvious. If it's there, I couldn't find it :)	**Fixed** Added a more obvious donation button
cygshost	**v5**	Would love to see if I could adapt this to a mobi file for the kindle paper white (along with a whole bunch of other stuff).	**Unfixed**
SlowingDownAGif	**v5**	Conversions -> Shape formulas -> Surface Area Formulas (3D Shapes) -> Pyramid: the formula is incorrect.	**Fixed**
OlliesFreeOxen	**v5**	I'd love stuff for complete rebuilding of society. Like making antibiotics, plants for medicinal and scavenging purposes, how to gather seed for future crops, tanning hides, etc etc. pioneer level stuff. You need a go fund me for this work you put in at least.	**Unfixed**
SlowingDownAGif	**v5**	Conversions -> Other functions -> Trigonometry -> doesn't superscript the 2 on my computer, so "sin2 θ + cos2 θ = 1" is easily mistakable for "sin 2θ + cos 2θ = 1"	**Fixed**
SlowingDownAGif	**v5**	Preparedness -> Assessing Vulnerabilities -> Team Vulnerability -> Age: otehrs -> others.	**Fixed**
SlowingDownAGif	**v5**	Gear -> Gear descriptions -> Weapons -> Ammo -> Ammo (For Guns): I don't think you fletch bullets.	**Fixed**
SlowingDownAGif	**v5**	Gear -> Gear Lists INCH Gear (I'm Never Coming Home): definitely -> indefinitely, I'm guessing?	**Fixed**
SlowingDownAGif	**v5**	Preparedness -> SHTF Decisions -> Bug-Out Flowchart: Although I can follow the flowchart, I don't understand what the colon-separated numbers represent.	**Fixed**
SlowingDownAGif	**v5**	Gear -> Gear descriptions -> Food -> Spork / Other Utensils -> Materials: why do you call plastic utensils unbreakable?	**Irrelevant / Fixed**

MAINTENANCE	Feedback	Fixes & Additions	SlowingDownAGif	v5	By page 12 I was really wishing there was a glossary at the beginning (BOB, SCAR, SHTF, BOL, etc). These might be common knowledge on this sub, but as a new reader I didn't know what they meant.	**Fixed** Added the terms in the Introduction section
MAINTENANCE	Feedback	Fixes & Additions	SlowingDownAGif	v5	Gear -> Gear descriptions -> Medication, First Aid Kit, Trauma Kit, Dental Kit, Hygiene, and Misc: I think these five sections have a ways to go. I see the same "4/5 Size 5/5 Weight 3/5 Durability 4/5 Usefulness" on almost all of these, despite very wide ranges of importance. One of the things I've been really appreciating up until this point is help prioritizing where I should put my attention, and these sections don't do that for me.	**Partially Fixed** There was a big GEAR section change in version 7
MAINTENANCE	Feedback	Fixes & Additions	twistedfairyprepper	v5	In resource harvesting i'd also add to build a seed bank of heirloom seeds and non native varieties that thrive where you live and learn uses for them in preserving and medication. I'd also recommend building your seed bank to include cannabis as the uses for hemp fibre and the flowers healing power should put it top of the crop list.	**Partially Fixed** Added information on seeds
MAINTENANCE	Feedback	Fixes & Additions	TheGrapestShowman	v5	I read through much of the document. Lots of good info. I might suggest a format that is more standardized, such as a chapter book with an index, rather than a spread sheet. Other than that, great work. Kudos.	**Fixed** Version 7 converted everything to a 'word format'
MAINTENANCE	Feedback	Fixes & Additions	clamchowderz	v5	Recommend changing HTTP to HTTPS via SSL certificate. Safari is giving a "not secured" site warning. I'm sure everything is fine, but for those of us who look for this, it's good practice:) thanks for taking the time to create this document, awesome work!	**Fixed** My website is now secured
MAINTENANCE	Feedback	Fixes & Additions	mikramero	v5	I love your work. Have you ever thought about to put all in a smartphone app? For us, it's maybe better to handle than a 700 pages PDF, and you can monetize your hard work by selling your app.	**In Progress**
MAINTENANCE	Feedback	Fixes & Additions	makeworld	v6	I encourage you to release it under a Creative Commons license, and attribute any content that isn't yours. That'll help keep it free forever. And even if you do produce a book, releasing some sort of free PDF would still be great for the community.	**Partially Fixed** Added the creative commons licence
MAINTENANCE	Feedback	Fixes & Additions	Alaric_Silvertongue	v6	I would like to offer one suggestion specific to the idea of rebuilding society (as a total stranger on the internet). The addition of basic information to restart a chemical industry of sorts. The ability to make quicklime and slacked lime, potash and some other fairly basic chemicals allows for the creation of soap. There are other fairly basic processes for capturing wood gas, creating acids and bases and so on that all have uses in rebuilding society (eg chemical fertilizers and building materials). I'd include making glass and distillation here as well.	**In Progress** Adding "Rebuilding Society" to Mass Destruction
MAINTENANCE	Feedback	Fixes & Additions	Pfoenix	v6	Amazing work. I'm not too happy about the explosives section though. The anarchist cookbook is outdated, misleading and sometimes dangerous (at least regarding this topic. Don't know enough about the other stuff).	**Fixed** Removed the potentially dangerous explosives section
MAINTENANCE	Feedback	Fixes & Additions	bunningsnag69	v6	Please release as a hardcopy book once done. If you do release a hardcopy then include 10-20 pages of blank lined paper for note taking and if possible a plastic pocket for storing a local map Looks great though looking forward to reading it sometime	**Unfixed** Can't solve until TPE is complete
MAINTENANCE	Feedback	Fixes & Additions	bunningsnag69	v6	An area in defence for either creating your own weapons or things that can be bought legally in countries such as our Australia or other strict countries. A section for things like lock picking or siphoning fuel out of a car, or how to break a window safely and things like that.	**Fixed** Added all these sections.
MAINTENANCE	Feedback	Fixes & Additions	universalists_unite	v6	I have been trying to read this but I hate to say it really is unusable in its current pdf or spreadsheet form. If I export it as text and remove all the extra white spaces and all the duplicate words/headings it is a fraction of the size. It has grown tremendously, has good content, and deserves to be useable...Sorry for the criticism.	**Fixed** Conversion to the 'Word' format is complete
MAINTENANCE	Feedback	Fixes & Additions	NOFF44	v6	Hi, I've downloaded the pdf but don't get how to read through it. Could you give me some tips on how to get started? Oh I can open the pdf and I get the chapters. I just dont get how the rosters work. I cant seem to find in which direction to read the file :/	**Fixed** Conversion to the 'Word' format is complete
MAINTENANCE	Feedback	Fixes & Additions	tortugavelozzzz	v7	Quick suggestion if I may, on Page 16 BOB-Medical: 4 cheap, readily available and extremely important things to add: Imodium, Activated charcoal, A styptic hemostatic coagulation powder such as Celox (for deep cuts and any other hemorragic situation), & Oral rehydrating salts such as these: Oral Rehydration Salts ORS, New Formula for Electrolyte Replacement and Dehydration. One of the worse killers is dehydration due to diarrhea, however the oral rehydration salts are vital when you're simply doing any strenuous activities in hot weather, as you can easily pass out, or at best be severely weakened, from an electrolitic imbalance plus loss of fluid due to excessive sweating. Activated charcoal works great in case of poisoning. All of these things are light, cheap, and readily available. And in some regions I would also add antihelmitics (dewormers) as intestinal parasites are more common than malaria in many parts of the world.	**Unfixed**
MAINTENANCE	Feedback	Fixes & Additions	Dbajram	v7	You're using Excel to edit? Any thoughts on using LibreOffice calc? Foss, and therefore easy to install on any machine you'd have.	**Irrelevant** I haven't used it, but I may consider it in the future.
MAINTENANCE	Feedback	Fixes & Additions	Nick A	v9	I noticed one spelling error on page 3 of v9.01 (" which has happaned multiple times", the "happened" got a typo to it. . .).	**Fixed**

7 FAQs

This section answers the common questions people most commonly ask relating to TPE. It also includes statements that people often remark during use.

Common Questions

Question	**My website/channel or podcast isn't listed under ADDENDUM > Media, can I get it added?**	**I would like my website or channel to be listed as "Quality Content".**	**I would like my website or channel to be listed as "Quality Content".**	**Can I re-upload the spreadsheet elsewhere?**	**I've found spelling mistakes in the sheet.**
Answer	You can send an email to me with a link to your content requesting that you would like to be added. And if your content is preparedness based you will be added.	To be eligible for Quality Content you have to pass a visual inspection of your content. Details are listed in the ADDENDUM > Media section.	To be eligible for Quality Content you have to pass a visual inspection of your content. Details are listed in the ADDENDUM > Media section.	I'd prefer it if you didn't as (ordinary) people can't verify that the re-upload is safe as they don't understand checksums. Sites like oldversion are welcome to upload previous versions of TPE as I delete older versions when I bring out new ones.	If you find a spelling mistake, please let me know via email what word(s) and where they are found. However being Australian I spell some words differently such as "Defence" instead of "Defense".
Question	**How long did the guide take to make?**	**You used my content without permission.**	**How can I contribute to the guide?**	**I want to donate anonymously**	**I donated but my name isn't on the credits this version.**
Answer	Right at the top of the guide is a stat showing how many hours I've worked on the sheet based on number of cells with text and the average time spent on each one.	Most of the content is my own work, however let me know what you believe to be an infringement and I can reword it. Otherwise survival of the human race is more important than copyrights.	You help is greatly appreciated through donations, shares and letting me know what content you would like to see in the guide.	You can send money without any information exchange by donating with bitcoin as some preppers are highly secretive about their lifestyle.	I may have accidentally forgetten to add you to the list so please just send me an email with the date you donated and I'll add you to added to the next release.
Question	**Why did you start TPE?**	**How do you say TPE so it flows off the tongue?**	**The spreadsheet displays white areas with no information after scrolling fast.**	**The page numbers are off in the CONTENTS section.**	**I have more subs on my YouTube channel than is displayed, can you update it?**
Answer	That's answered in the PRELUDE section.	In casual conversation you can either say it like the letters T, P, E. Otherwise "Teepee" is one less syllable and contains all 3 letters in the right order. "Hey bro, have you read the teepee?"	This seems to be a problem with the later versions of excel (notably the 2016 version) and has nothing to do with pc power. I recommend using Excel 2010.	This is due to a new formula I'm working on to generate the correct page numbers. However due to differences in exporting software this can result in variations.	Unfortunately it's very difficult to keep those stats live for every channel. But I do update them all about twice a year. Request an update and I'll do my best to renew it.

Answer					

Mobile Questions

Question	**Links don't work on the mobile version when using Google Sheets.**	**The sheet crashes when trying to open it in Excel for mobile.**	**The excel sheet runs really slowly on mobile platforms.**	**The excel sheet takes ages to load on mobile.**	**Does the sheet work on E-reader devices?**
Answer	Unfortunately this is the case until I find a solution. However using the search function to find what you need may be much faster out in the field.	Try to use Google Sheets instead to open the spreadsheet or download the PDF version.	Unfortunately that's going to be a problem with so much information packed into a sheet. Splitting it into tabs doesn't speed it up either. Try using the PDF version instead.	Due to the size of the spreadsheet this is just a fact, however a faster device may help a little as it only takes 10s on the Samsung Galaxy S8+.	This is uncharted waters as I don't own an E-reader. Transfer the PDF to it and let me know how it looks, (patricularly the ENTERTAINMENT answers sections) or better yet, send pictures.

User Questions

Question	**EquestrianKnight via Reddit** "I have not looked at the link yet, but i have a question about your design philosophy. My biggest issue with similar things i can find elsewhere is how HUGE the library or reference becomes. How did you decide what to add, and what to leave out? How big is it (in mb/gb or pages) now? Do you feel like it includes a focused collection on the essentials, or more of a "everything you might need" sort of approach?
Answer	Understandably these kinds of things can grow to a monumental size over time, for TPE I'm trying to limit it to 100mb as a hard limit for the future, but also try to reduce the size wherever possible by limiting pictures. Most of the information is pure text to keep things simple but the larger and more complicated concepts have pictures of a few kilobytes. I've seen book collections over multiple gigabytes in size and my aim is to replace all the unnecessary content with a small and portable form factor. Accurate and useful content is what I've been working towards and if sections or content isn't read I can always remove it. Currently it's 38mb and about 600 pages (Version 5), but it's designed to be Ctrl+F'd to find what you need in your current situation. However pre-reading should be done to get to grips with preparedness basics. As for content it's more of an "everything you might need" approach including the essentials. Sure, there's sections that might not be needed for some people but others may find it vital.

Question	
Answer	

My Questions

This section is for questions that I have for all you readers out there. You can answer by emailing me which can be found on my website, or through my websites contact form.

Question	**Where do you mostly use TPE and how has it helped in the past?**	**How can I fix the text in column "A" and "B" so that it stretches down the whole merged cell?**	**Why can't I export TPE myself in Excel? Because it crashes every time no matter what version I use.**	**Why is my macro button moving randomly around and resizing when I run any macros?**	
Additional Details		In some large categories the REPT() text doesn't span the whole length of the cell.		It's easy to lose in the sheet due to it shrinking and changing cells.	

8 Updates

This is the update history grouped by version number to keep a track of what update was made and when. Updates are added left to right, top to bottom.

The Legend

Markers	**+** A plus above text means this is a new addition to the document.	**–** A minus above text means this content has been removed.	**~** A tilde symbol means this section has been modified or changed.		
Text	**+ / – / ~** A single marker means that a small amount has been altered. (Around 1 row)	**++ / – – / ~~** Two markers means that a fair amount of information has been altered. (Around a complete subsection)	**+++ / – – – / ~~~** Three markers means that a huge amount of content has been altered. (Multiple subsections to an entire category)	**+++++** Five plus' means that this is the first release version and contains everything previously added which was undocumented.	
Templates	**Template** Added (additions) to the (CATEGORY) section.				

A green cell signifies a category addition:	**+++** Added the ______ category	**A red cell signifies a category removal:**	**– – –** Removed the ______ category	**A purple cell signifies a change or fix:**	**~~~** Fixed the ______		

Version Summaries

Below is a quick summary of the different versions before getting into more detail further below.

Version 0 Never Released	The pre-release version, containing 80 categories and a completion percent of 40.5%
Version 1 January 2019	Version 1 is the first official release of TPE featuring 80 categories and the beginning of updates and fixes.
Version 2 February 2019	Version 2 saw the transferral of all content from columns "S" on, to the main document, the columns were then deleted to make printing easier. There was also huge updates to the GEAR and INTRODUCTION sections.
Version 3 April 2019	Version 3 added the WARFARE category and updated a lot of content in the ANIMAL IDENTIFICATION and NATURAL REMEDIES categories.
Version 4 May 2019	Version 4 updated the category headings including a related icon for each one. There were also large updates to the NATURAL DISASTERS and MEDICAL - GENERAL sections. It also saw the removal of blank rows from the bottom of the sheet. Page breaks were added to separate categories. This was the first version released on Reddit.
Version 5 June 2019	Version 5 had large updates to the FIRE, PREPAREDNESS and LANGUAGE sections. There was also updates to the headings for categories and subcategories to make them easier to distinguish. This was the second version released on Reddit.
Version 6 September 2019	Version 6 consists of a lot of fixes recommended by reddit users and a big update to the MEDICAL - GENERAL section. The GEAR section was recreated to make it easier to read and follow along with and the Earthquake section was updated a lot. This was the third version released on Reddit.
Version 7 January 2020	Version 7 features a HUGE visual update converting 60%+ of the existing guide to a "Word Format" with a larger font and merged cells making it easier to read on mobile devices. There are three new categories: INTRODUCTION, NEWS and CONSPIRACIES. The pre-existing INTRODUCTION category was renamed to PRELUDE to make room for the new and improved INTRODUCTION category. There are a lot of smaller visual updates throughout the guide besides the larger change but overall there's not a lot of new content in this release. This is the first version that contains PDF bookmarks to make navigating the document much easier.
Version 8 May 2020	Version 8 features the conversion of the rest of the 'excel' format categories to the new, larger and easier to read style. A title page was added to make it feel more like a book. There are also major updates to the INJURY, ELECTRICITY and LOCATIONS categories and a smaller update to the Pandemic section in MAN-MADE DISASTERS. The COMPACT LIVING section was removed.
Version 9 Sep 2020	Version 9 is another visual update to every category in TPE making better use of the whole width of the sheet and making it simpler, easier to navigate and easier to read. There have also been large updates to multiple categories such as ILLNESS, WEAPONS and ENTERTAINMENT. 16 categories have either been removed or been merged with similar categories to reduce the overall number and to assist in quicker information retrieval. There are also new "Purpose" and "Lost?" rows at the top of each category to assist in finding what you're looking for. A lot of content that would likely never be used has been removed from many categories.
Version 10 April 2021	Version 10 is another partial visual update featuring 20% larger text to all content, larger headings, subcategory icons and new category title pages. A lot of content throughout the guide has been updated and new information added. A few major sections have been added such as 'Search and Rescue' to SURVIVAL and infiltration type skills to SECURITY. 6 categories have been merged with others to help reduce clutter and some larger unnecessary sections have been removed. Multiple subheading contents sections were added to the larger headings to make it even easier to find what you're looking for. Overall version 10 should provide an easier reading experience with quicker searchability for needed information.
Version 11 June 2025	Version 11 has been very delayed, but features a lot of new content updates, filling in gaps and adding additional content to many different categories. The Prepping Goals has been added to help new preppers to find a path to starting out. LOCATIONS was also vastly filled in with a lot of content to help you find suitable shelter locations in a SHTF scenario. The shelf life of foods in FOOD was finally converted to a semi-word format. Finally, the MEDICATIONS section was completely re-written and filled out with new, more useful content with a survival focus. Overall version 11 provides a more complete document on the essential preparedness topics.

Version 0

These versions are pre-release and were never uploaded publically. They often went though large name and formatting changes. When I first started the sheet it was called "PQG" for Prepper Quick Guides. The sheet was in early infancy with most categories having very little information.

Release Date	Categories	Percent Complete	Total Hours Worked	Hours Since Last Version	File Size
None	80 (+80)	0-40.5%	N/A	N/A	N/A

Updates

+++++ The pre-release version, containing 80 categories and a completion percent of 40.5%

+ Changed the Update Marker text.	+ Added more recipes to RECIPES.										

Version 7

Version 7 features a HUGE visual update converting 60%+ of the existing guide to a "Word Format" with a larger font and merged cells making it easier to read on mobile devices. There are three new categories: INTRODUCTION, NEWS and CONSPIRACIES. The pre-existing INTRODUCTION category was renamed to PRELUDE to make room for the new and improved INTRODUCTION category. There are a lot of smaller visual updates throughout the guide besides the larger change but overall there's not a lot of new content in this release. This is the first version that contains PDF bookmarks to make navigating the document much easier.

Version 7 was the fourth version released to the public via Reddit at:
https://www.reddit.com/r/preppers/comments/eprdxe/the_preparedness_encyclopedia_tpe_v7/

Release Date	Categories	Percent Complete	Total Hours Worked	New Hours Worked	File Size

+ Added New Pictures to GARDENING	++ Added a title page to the start of the document	~ Moved around some content in the NEWS section	– Removed the groupings	~ Updated the economy icon	~ Finished Converting 'SHTF Planning' in PREPAREDNESS to the new "Word" format.						

Version 9

Version 9 is another visual update to every category in TPE making better use of the whole width of the sheet and making it simpler, easier to navigate and easier to read. There have also been large updates to multiple categories such as ILLNESS, WEAPONS and ENTERTAINMENT. 16 categories have either been removed or been merged with similar categories to reduce the overall number and to assist in quicker information retrieval. There are also new "Purpose" and "Lost?" rows at the top of each category to assist in finding what you're looking for. A lot of content that would likely never be used has been removed from many categories.

Version 9 was not released to the public on Reddit, but instead was a 'silent' update via my website and the free TPE mailing list. Sign up to the mailing list so you don't miss any future updates.

Release Date	Categories	Percent Complete	Total Hours Worked	New Hours Worked	File Size
Sep 2020 (+123 Days)	65 (-16)	66.7% (+8.2%)	2,537.8 (105.7 Days)	+280.2h (+11.6 Days Straight)	56.0 Mb (+0.6 Mb)

Updates

Version 10

Version 10 is another partial visual update featuring 20% larger text for (almost) all content, larger headings, subcategory icons and new category title pages. A lot of content throughout the guide has been updated and new information added. A few major sections have been added such as 'Search and Rescue' to SURVIVAL and infiltration type skills to SECURITY. 6 categories have been merged with others to help reduce clutter and some larger unnecessary sections have been removed. Multiple subheading contents sections were added to the larger headings to make it even easier to find what you're looking for. Overall version 10 should provide an easier reading experience with quicker searchability for needed information.

Version 10 was the sixth version released to the public via Reddit at:
https://www.reddit.com/r/preppers/comments/muc9ff/the_preparedness_encyclopedia_tpe_version_10/

Release Date	Categories	Percent Complete	Total Hours Worked	New Hours Worked	File Size

Version 11

CURRENT VERSION

Version 11 is a content update, filling in gaps and adding additional content to many different categories. The Prepping Goals has been added to help new preppers to find a path to starting out. LOCATIONS was also vastly filled in with a lot of content to help you find suitable shelter locations in a SHTF scenario. The shelf life of foods in FOOD was finally converted to a semi-word format. Finally, the MEDICATIONS section was completely re-written and filled out with new, more useful content with a survival focus.

Version 11 was the seventh version released to the public via:
- The TPE Mailing List (Request to join at: **https://fluidicice.com/tpe**)
- Reddit: (TBA)
- Facebook: (TBA)
